Claim.—The arrangement of the hopper *K*, rod and valve *y W*, vibrating screen *R*, operated by eccentric *t* and rod *u*, pipe *k*, fan *J*, distributing board *x*, beaters *I*, crank *q*, and gearing *p o m l*, forming a portable oat-dusting machine, constructed as herein set forth.

83,055.—E. R. FERRY, New Haven, Conn.—*Safety Bridle.*—October 13, 1868.—The lower ends of the cheek straps are fixed to the upper ones of the cheek bars, which are jointed to the bit bar and which have arms connected by a strap, with eyes in their outer ends, through which the driving reins pass, a cheek rein being also attached by snap hooks.

Claim.—1. The cheek bars *E E*, provided with the levers *c c*, for the passage of the driving reins, when connected to the bar *a* by the swivel joint *b*, whereby either rein is adapted to be pulled to guide the horse without pressing the cheek bars against the sides of his mouth, as herein shown and described.

2. The combination of the detachable cheek rein *J* with the driving reins *I*, when said parts are used in connection, or applied with the cheek straps *D D* and the bit *F*, all arranged substantially as and for the purpose specified.

83,056.—JOHN C. FISH, Barnstable, Mass.—*Carriage Curtain Fastening.*—October 13, 1868.—At the opening of each hole and slit into the eye is an elastic, stitched in between the outer side leather and the inner side of a strong patch which surrounds and strengthens the slit and hole, the head of the button being oblong and tapering on top.

Claim.—1. A carriage curtain having button holes, each with an inserted elastic across the head of the slit thereof, substantially as shown and described.

2. In combination with each button, having an oblong crown-shaped head, an elastic, which holds the edge of the eye close to the sides of the shank, substantially as shown and described.

83,057.—NATHAN C. FOLGER, New Orleans, La.—*Churn.*—October 13, 1868.—The churn is fixed, by means of bands, rods, and braces, above the rockers, under which springs are placed to give them a reverse action, a curved extension furnishing the means of operation by the hand or foot.

Claim.—The arrangement of the churn *A*, with relation to the rockers *D*, when the latter are provided with the springs *F*, and all the parts are constructed and united in the manner and by the means substantially as herein described, for the purpose set forth.

83,058.—WILMER D. GRIDLEY, New Britain, Conn.—*Toy Pistol.*—October 13, 1868.—By inserting the arrow into the barrel and pressing it against the spring the catch will be made to engage the spring

and hold it firmly, until released by the trigger, when the arrow is discharged.

Claim.—The barrel and stock *a b*, in one piece, spring *e*, trigger spring *i f*, spring *g*, and orifice *d*, substantially as and for the purpose described.

83,059.—JOHN A. HAFNER, Commerce, Mo.—*Horse Power.*—October 13, 1868.—The horse power in starting transmits its force with gradually increasing effect upon the machine to be driven, but when the spring is wound up power is imparted in a direct and positive manner.

Claim.—The combination of the shaft *C*, wheel *F*, (or casing *D*,) and coiled spring *a*, when said spring is provided with an interior coiled rubber spring, *e*, to support the exterior spring, and relieve the strain thereon, all substantially as shown and described.

83,060.—WILLIAM S. HENSON, New York, N. Y.—*Engine Governor.*—October 13, 1868.—The centrifugal balls, which regulate the motion of the engine by the elevation and depression of the spindle, swing upon vertically oblique axes which give the balls perfect freedom of motion in responding to the influences which cause them to rise and fall.

Claim.—The revolving spindle *A*, collar *F*, and ball *K*, connected to which are the forked arms *C C*, cross heads *M M*, balls *D D*, and pivoted bars *I I*, the several parts being constructed, arranged, and operating substantially in the manner as specified.

83,061.—ROZANDER S. HIGGINS, Olney, Ill.—*Plow.*—October 13, 1868.—Friction upon the landside is obviated by the coulter which counteracts the "side draft." Friction upon the sole of the plow also is avoided.

Claim.—The combination of the prolonged coulter *I* with its rearwardly-curved cutting point *i'*, and the obliquely presented share *D*, so arranged that its sole does not run in contact with the floor of the furrow, all constructed and operating as and for the purposes herein specified.

83,062.—LEWIS HOVER, Chicago, Ill.—*Iron Door.*—October 13, 1868.—The two doors afford additional protection in case of fire, when the iron is liable to warp. They are geared together so as to open and close simultaneously.

Claim.—The combination of the outer and inner doors, *B B*, and their cogged hinges *A A*, when secured by the double latch *D*, or its equivalent, all substantially as and for the purposes herein shown and specified.

83,063.—C. A. HOWARD, Pontiac, Mich.—*Horse Hay Fork.*—October 13, 1868.—The contiguous corrugated faces of the enlarged ends of the fork arms are forced together by the action of the lever upon inclined planes on the outer side of one of the enlargements. An interposed spring throws the enlargements apart when the position of the lever admits of it.

Claim.—1. The parts *A* and *B* of a horse hay fork, provided with corrugated, grooved, or otherwise roughened surfaces, arranged to be locked together in any preferred position, by a lever and inclined ways, substantially as and for the purpose described.

2. The combination, with the parts *A* and *B*, arranged to be locked as described, of a spring for separating them for unlocking, substantially as and for the purpose described.

83,064.—FRANCIS HOWLETT, West Rupert, Vt. and CHARLES R. SHERMAN, Salem, N. Y.—*Gearing for Grindstone.*—October 13, 1868.—The bearing block may, together with the driving wheel, be set up toward the pinion, or transferred from one side to the other thereof.

Claim.—The slotted adjustable block *G*, carrying the wheel *E*, and adapting it for adjustment with the pinion *D*, substantially as and for the purpose described.

83,065.—CHARLES W. HOYT, South Norwalk, Conn.—*Pump.*—October 13, 1868.—The piston rods of the two pump cylinders are connected to the ends of the "brake," to which motion is imparted from a

vibrating lever through the medium of chains and pulley.

Claim.—The arrangement herein shown and described of the operating lever *E*, chains *D*, pulleys *a b*, and brake *C*, with relation to the double-acting pump *A B*, all as set forth for the purpose specified.

83,066.—BENJAMIN IRVING, New York, N. Y.—*Fuel from Spent Tan Bark.*—October 13, 1868.—The bark is soaked and passed through rollers, whence it emerges in a flocky, fibrous mass; it is then pressed into blocks.

Claim.—The new manufacture of compressed fuel from spent or refuse tan bark, by the method or process of forming it into blocks, or other suitable shapes, for fuel and transportation, substantially as hereinbefore described.

83,067.—D. W. JAMESON, Warren, Ohio.—*Machine for Grinding the Cutters of Mowing Machines.*—October 13, 1868.—This device is for holding harvester cutters to the action of an ordinary grindstone, and enables the teeth to be successively brought under treatment in such a manner as to secure uniformity in the grinding.

Claim.—The standards or arms *F*, hinged or pivoted to the bridge tree *E*, in combination with the adjustable frame *G*, arranged and operating conjointly, as and for the purpose substantially as set forth.

83,068.—C. H. B. KELLOGG, Tontogany, Ohio.—*Horse Hay Fork.*—October 13, 1868.—The fork being imbedded in the hay, the hooks are protruded laterally by depressing the central rod, which is then retained in its relation to the handle by the catch. The hay being elevated, the latch is disengaged by a trip cord acting on the lever, whereupon the fork slides upon the rod and discharges the load by drawing in the hooks.

Claim.—A hay fork, constructed and operating substantially as shown and described, that is to say, with the head *A*, central rod *B*, hooks *C C*, rods *E E*, catch *i*, and lever *K*, arranged substantially as described for the purposes set forth.

83,069.—JAMES LAFETRA, New York, N. Y.—*Cake Mixer.*—October 13, 1868.

Claim.—The arrangement of the beater *D E*, and the quadrangular yoke *F*, bearing the standing fingers *G*, suspended from the cover *B*, in such a manner that the beater is permitted to revolve while the yoke *F* and its fingers remain stationary, as herein described, for the purpose specified.

83,070.—N. P. LINDERGREEN, Boston, Mass.—*Packing Can.*—October 13, 1868.—Designed to strengthen the can at the corners and avoid projecting seams or joints.

Claim.—As a new article of manufacture, an octagonal sheet-metal can, having four narrow and four wide sides, made of four sheets of metal, connected by joints, constructed and arranged as herein shown and described.

83,071.—JOHAN LINNEMANN, Copenhagen, Denmark.—*Spade.*—October 13, 1868.—The spade is adapted for use as a saw, for convenience in carrying the same, as in the army, on a march, when the handle may be carried on the knapsack and the blade otherwise disposed of.

Claim.—1. The blade of a spade, constructed with one or both of its vertical edges serrated, substantially as described.

2. In combination with the blade and handle socket of a spade, a detachable handle, *B*, substantially as and for the purpose set forth.

83,072.—JAMES G. LUCAS, Newark, N. J.—*Work Table Appliance.*—October 13, 1868.

Claim.—The device or appliance, composed of the annular spool holder *B*, pin cushion *A*, mirror *E*, scissors-holding clasps *d*, emery case *C*, serving also as a thimble holder, and thread cutter *D*, the whole arranged substantially as and for the purpose specified.

83,073.—SAMUEL LUSTEN, Linesville, Pa.—*Compound for Tanning.*—October 13, 1868.—Japonica

glauber salts, alum, saltpeter or niter, sulphur, yellow ocher, chrome yellow, extract smart weed, and common salt, mixed together in hot water.

Claim.—The compound composed of the above ingredients, combined in the proportions set forth.

83,074.—WILSON McCLURE, Sinking Spring, Ohio.—*Animal Trap.*—October 13, 1868.—When the trap is sprung the cross-head bar is impelled downward by its spring, driving the spikes to the only place of access to the bait, and thus impaling the game. The trip lever aids in holding down the spike bar.

Claim.—The described arrangement of the spring H, roller G, bar D, cross-head E, spikes F, spring K, roller J, trip lever I, and bait rod L, with relation to each other, the bottom A, posts B, sides C, and removable casing M, all operating as described, for the purpose specified.

83,075.—D. W. C. McMASTER, Southborough, Mass.—*Line Holder.*—October 13, 1868.—The inner disk is ribbed upon its back as well as upon its outer face, and is forced against the wooden fixture in the act of securing the line between the disks, the holder being thereby prevented from turning upon its supporting pin.

Claim.—The disks B C, constructed as described, with the radial ribs, and arranged with relation to each other and the fixture A, in the manner herein set forth, for the purpose specified.

83,076.—FRANCIS M. MEDDOCK, Mainsville, Ohio.—*Device for Heating Railroad Cars.*—October 13, 1868.—The car is heated by steam admitted to its hollow, metallic floor.

Claim.—The steam chamber B beneath the car floor, traversed longitudinally by steam pipes D, which are attached, as between adjacent cars, by flexible connections E, and which are provided in the chamber of each car with branch pipes F and valves *g*, operatable from the inside of the car, and adapted to be closed or opened, as the necessities of each car in the train may require, substantially as described.

83,077.—JONATHAN MELEY, Trenton, Tenn.—*Grave Mound.*—October 13, 1868.—The mound thus made will not be distorted by the sinking of the grave.

Claim.—The grave mound, when formed by coating the raised portion A with a layer of cement, inclosed by the brick border, and covered with a compact coating of shells, C, as herein shown and described.

83,078.—JOSHUA MERRILL, Boston, Mass.—*Machine for Bending Wood.*—October 13, 1868.—The toothed roll not only feeds the stave blank, so as to bend it against the shaping block, but crimps the under side thereof, making the curvature permanent. The degree of curvature is determined by the longitudinal inclination of the block, which may be varied by the screw.

Claim.—1. In combination with the toothed feed roll *b*, the concave shaper block *c*, constructed and arranged relatively to the roll, substantially as shown and described.

2. In combination with the toothed feed roll, a shaper block, made adjustable, substantially as set forth.

83,079.—JOHN F. MILLIGAN, St. Louis, Mo.—*Baling Press.*—October 13, 1868.

Claim.—Combining the screw-threaded shaft D, sectors D', and platen C, the toggle levers G, and rods E, in the manner herein shown and described.

83,080.—EDWARD J. MOORE, Westfield, N. Y.—*Churning Apparatus.*—October 13, 1868.—Designed as an improvement on his patent of April 17, 1868, and having reference mainly to the connections between the operating lever and the dasher shaft, the intention being to hold the latter to a strictly vertical path as it reciprocates.

Claim.—1. The combination of the pivoted bars J, H, F, and G with the lever E and dasher shaft I, substantially as described, for the purpose specified.

2. The combination of the connecting rod L with the heavy or weighted lever K, and with the parallel levers or bars F, substantially as herein shown and described and for the purpose set forth.

3. Extending the pivoted bars H above the lever E, and connecting them with the dasher handle I, by means of the short connecting bars J, substantially as herein shown and described, and for the purpose set forth.

4. Extending the heavy or weighted lever K through the upright D, and pivoting it at or near its center, substantially as herein shown and described.

83,081.—WILLIAM MOREHOUSE, Buffalo, N. Y.—*Nut-locking Device.*—October 13, 1868.—Grooves admit of the insertion of the branches or arms of the locking device behind the nut, and when this is effected the shoulder bears against one edge of the nut, and the extremities of the arms may be turned up against the opposite edge without danger of starting the nut.

Claim.—The forked nut-locking device D, constructed with a shoulder, *b'*, and with separated portions *b b*, substantially as and for the purpose described.

83,082.—G. M. MORROW, Clarksville, Ohio.—*Machine for Turning Broom Handles.*—October 13, 1868.—The mandrel has a pair of beveled cutters for cutting off the rough corners of the handle; also a tapering bit, oscillating on a pivot, and acted on by a spring, a lever being connected with the cutter by a link, and the bit being controlled by plates connected with catches, projections resting on the flanges of the cam wheels attached to a shaft, there being further on the mandrel a third beveled cutter, with its cutting edge flatwise thereto, so that by their movements the various work is effected.

Claim.—1. Controlling the cutters through the medium of the plates, sliding at right angles to each other, the catches *n n'* and the cam wheels E constructed to operate substantially as described.

2. The combination of the sliding plates M M', N N, catches *m m'*, *n n'*, wheels E, having flanges *n''*, and shaft E', with the hollow mandrel K, pivoted lever *r a*, link *r'*, cutters *l l''*, and springs *s s'*, substantially as described, for the purpose specified.

83,083.—SAMUEL MOSHER, Winchester, Ill.—*Combined Hub and Box for Wheels.*—October 13, 1868.

Claim.—The combination of set screws *e* with flange C and washer *s*, the whole constructed and arranged substantially as specified.

83,084.—P. M. PAPIN, St. Louis, Mo.—*Ladder.*—October 13, 1868.—The single rail has fixed at the bottom, spreading feet, on which are sliding feet spiked in the ends to strike and hold in the ground truss rods with a cross-bar and angle blocks, being also connected with the rail to prevent oscillations and give greater stability.

Claim.—The rail A, spreading feet A¹, sliding feet A², truss rods *b*, cross-bar *b*¹, angle blocks *b*², and hook C, the whole being combined and arranged in the manner described, and for the purpose set forth.

83,085.—ALEXANDER G. PATTON, Troy, N. Y.—*Cooking Stove.*—October 13, 1868.—A water reservoir at the top of the stove, with a flue above extending into it, has beneath it a warming closet, the top plate of the stove being so placed that its additional aperture is in front of the mouth of the flue of the reservoir controlled by a damper, and by the arrangement of the flues, under and above the oven and on the side and over the warming closet and reservoir, heat is properly imparted to them all.

Claim.—1. A stove, so constructed as to embrace within itself a water-heating reservoir and a warming closet, both of which form a constituent part of said stove, the same being arranged substantially as shown and described.

2. The flue 8, formed in the water reservoir, substantially as and for the purpose shown and described.

3. The construction of the vertical-descending flue or flues 2 2, for directing the greatest portion

of the heat toward the ends of the oven, by means of the curved form of the fixed reservoir plates, as shown and described.

4. The arrangement of the fixed water-reservoir, with reference to the flues 6 and 7, which surround said water reservoir, substantially as shown and described.

5. The arrangement of the damper 9, with reference to the flue 8 and the additional aperture in the cover, G, of the stove.

6. The arrangement of flues 1, 2, 3, 4, 5, 6, 7, and 8, substantially as and for the purpose described.

83,086.—ALEXANDER G. PATTON, Troy, N. Y.—*Cooking Stove.*—October 13, 1868.

Claim.—1. A stove, having combined within it a second or extra oven and a water-heating reservoir, which form constituent parts thereof, substantially in the manner shown and described.

2. The combination of the water reservoir E and the second or extra oven F, when forming fixed or permanent parts of a cooking stove, and arranged substantially as and for the purpose specified.

3. The arrangement of the flues 1, 2, 3, 4, 5, 6, and 7, with reference to the ovens C F and water reservoir E, when constructed as herein shown and described.

83,087.—WILLIAM H. PAYNE, Janesville, Wis.—*Hames Fastener.*—October 13, 1868.

Claim.—1. Drawing the hames together by means of a levered cog wheel, D C, and toothed bar A, substantially as herein shown and described.

2. The combination of the toothed bar A, cap B, cog wheel C, (having a lever, D, formed upon or attached to it,) and slotted bar E, with each other, substantially as herein shown and described, and for the purpose set forth.

83,088.—ADOLPH PEARL, New York, N. Y.—*Dampening Apparatus for Copying Press.*—October 13, 1868.—A leather-covered roller is carried with a yoke in connection with a capillary cushion which projects from a water bath, so that being moistened by pouring water over it, it is kept so, as well also the roller, by the action of its conduit.

Claim.—The combination of the leather-covered dampening roller B, the moistened cushion D, and the water bath in the case A, substantially as described, and for the purpose herein set forth.

83,089.—F. K. PLUMBLY, Buffalo, N. Y.—*Planing Machine.*—October 13, 1868.—The plane is secured to a slotted bar which slides on an adjustable rest pin. An adjustable gauge-block fits on the slotted bar and regulates the depth of the erozes to be planed.

Claim.—The combination of the hand plane A with the suspending rod B, box D, rest pin C, and gauge block E, all constructed to operate substantially as described.

83,090.—ROYAL P. PRATT, Hartford, Conn.—*Awning.*—October 13, 1868; antedated October 6, 1868.—The pulley and end block are connected together by longitudinal rods, around which the awning is wound. Cords, arranged for turning the end flaps inward, so as to roll up smoothly, pass through pulleys, held by springs in tubes, the spring being used to draw the pulleys back into the tubes.

Claim.—1. The combination of the pulley D and end block G with the rods I and J, when constructed and arranged substantially as herein described, for the purpose of winding up and sustaining an awning.

2. The cords *m n o p q*, arranged as herein described, for the purpose of raising and folding under the end flaps of an awning.

3. The combination of the cord *m n o p q*, the slotted tube K, and the spring *s*, or its equivalent, constructed and operating substantially as herein specified.

83,091.—JULIO H. RAE, Syracuse, N. Y.—*Electrical Amalgamator.*—October 13, 1868.—Designed as an improvement on his patent of February 5, 1867. A cylindrical drum, lined with corrugated copper, is provided with two heads, on the inner sides of which are secured zine beaters. By intro-

ducing the ore, mereury and an exeiting liquid and rotating the drum, a galvanic current is produced, which assists in separating the gold, &c.

Claim.—The drum A, provided with a lining and with a beater, representing the two elements of a galvanic battery, said beater serving also to bring all the particles of the pulverized ore in intimate contact with the mereury, substantially as herein shown and described.

83,092.—FRANKLIN RANSOM, Buffalo, N. Y.—*Condenser.*—October 13, 1868.—A condensing vessel is arranged at the crown of a siphon, the longer leg of which carries off the injection water, while the short leg constitutes the injection pipe in which atmospheric pressure will raise the water to a height corresponding to the degree of vacuum obtained. A portion of the condensing water is thrown directly from a secondary pipe in contact with the steam, and falls in one side of the condenser and is fed to the boiler.

Claim.—1. The arrangement with the condenser A, and main induction pipe B, of the overflow pipe *d*, and small pipes *d*¹ *d*², as herein set forth.

2. The arrangement of the secondary injection pipe I, in relation to the partitioned condenser A and boiler feed pipe J, as set forth.

83,093.—EDWARD F. RATE, Cedar County, Iowa.—*Corn Cultivator.*—October 13, 1868.—Levers, attached to the handles of the shovels, are secured to a roller which is rotated by a handle, thus raising or lowering the plows, the depth of which is regulated by bars connecting the levers with the shovels.

Claim.—The levers A and J, roller F, and regulating bars D, when constructed and arranged substantially as and for the purposes herein specified.

83,094.—EDWARD REICHARD, Washington, Mo.—*Animal Trap.*—October 13, 1868.—A spherical lobe forms the rear of the trap, and a hinged lobe folds within the fixed lobe when the trap is open. A coiled spring causes the hinged lobe to close when the bait lever releases a spring which holds the hinged lobe open.

Claim.—1. The trap, formed of the base A, the fixed lobe B, journal D, spring E, and movable lobe C, substantially as and for the purposes set forth.

2. The combination of the trip lever *f*, the spring *e*, its cam *e*¹, and detent spring *b*, substantially as and for the purposes set forth.

3. The spring catch G, in combination with the lobe C, when arranged to secure said lobe to the base plate A, by the detent *g*, substantially as set forth.

83,095.—HUGH REID, St. Louis, Mo.—*Valve Motion for Steam Engines.*—October 13, 1868.—The vacuum valve is operated by toggle joints which are connected together by a pin which works in slots in forked arms on a rod operated by the rock shaft. A spring holds the valve closed, but as the toggle arms pass a vertical position they make a rapid movement and the valve is opened and the steam ejected rapidly into a pipe leading to an atmospheric valve. When the vacuum valve is closed the steam overcomes the pressure of the atmosphere and opens the atmospheric valve and escapes.

Claim.—1. The forked rod D, its ends *d* slotted at *d*¹, the pins *e*, with the toggle links E, cross-head F, and spring G, combined substantially as set forth.

2. The rock shaft B, in combination with the rod D, links E, valve stem *e*, and valve C, substantially as set forth.

3. The combination of the valve C, the exhaust pipe A, the discharge pipe H, and atmospheric valve I, as set forth.

83,096.—GEORGE RICHARDS and DAVID STICKLAND, Richland Centre, Wis.—*Fanning Mill.*—October 13, 1868.—Two ends of a board, provided with a flange at its rear edge, fit in inclined grooves in the sides of a shoe. The top of the case forms the bottom of the hopper and is provided with a wide slot through which the grain enters the shoe, the opening being regulated by a gate which is operated by rods connecting with a lever held by a ratchet bar on the outside of the case. Projecting wings

on the fans deflect the currents of air entering the machine and throw them in a direct line through the shoe. The bag holder can be inserted in any of the posts.

Claim.—1. The adjustable, sliding, flanged board K, constructed and arranged substantially as herein shown and described, in combination with the shoe I, as and for the purpose set forth.

2. Suspending the shoe I in the center of the shoe chamber, by means of the springs J, substantially in the manner herein shown and described, and for the purpose set forth.

3. The combination of the sliding gate M, connecting rod or rods N, lever O, and ratchet bar P with each other and with the opening in the top of the case A, substantially as herein shown and described, and for the purpose set forth.

4. The rectangular hopper Q, constructed and arranged substantially as herein shown and described, in combination with the hopper-shaped top of the case A, as and for the purpose set forth.

5. The fans D, formed with projecting wings *d'* upon their central parts, substantially as herein shown and described, and for the purpose set forth.

6. The bag holder W, constructed substantially as herein shown and described, in combination with one of the posts B of the frame of the mill, as and for the purpose set forth.

7. The receiving measure, formed by the combination of the sliding gate Y and rod Z with the box X, substantially as herein shown and described, and for the purpose set forth.

83,097.—WILLIAM H. ROGERS, New York, N. Y.—*Pocket Safe for Friction Match Cord.*—October 13, 1868.

Claim.—1. The match safe A, constructed substantially as described, or in any equivalent manner, whereby the coil match and the tube E may be properly secured and used, substantially as set forth.

2. In combination with a friction match cord, the tube E, either hinged or attached to a match safe, or box, or not, and either cut away on one or both sides, substantially as and for the purposes described.

83,098.—JEREMIAH SCHROY, Fortville, Ind.—*Fruit Picker.*—October 13, 1868; antedated October 2, 1868.

Claim.—The curved metal plate C, connected to the outer ends of the irregular-shaped hoop B, and provided at its upper portion with a series of narrow slots for forming the comb teeth, pointed as shown, and used in combination with the pole A and conveyor F, to operate substantially as set forth.

83,099.—LOUIS SCHULZE, Louisville, Ky.—*Beer Cooler.*—October 13, 1868.—The beer flowing over the bottom of troughs which are kept cool by water flowing under them in an opposite direction, is agitated by paddles which cause all the particles to come in contact with the cooling surface.

Claim.—1. A beer-cooling apparatus, consisting of a series of contiguous and connecting double-bottomed pipes or channels, one above another, in vertical line, and inclined toward each other, when said pipes or channels are made with square sides and bottoms, substantially as and for the purposes set forth.

2. A beer-cooling apparatus, consisting of a series of contiguous and connecting double-bottomed pipes or channels, one above the other, in vertical line, the water channels of which, at the contiguous ends, are so constructed that they can be opened, substantially as and for the purposes set forth.

3. A beer-cooling apparatus, consisting of a series of contiguous and connecting double-bottomed pipes or channels, one above the other, in vertical line, the water channels of which, at contiguous ends, are closed by a packing of water-proof material, non-conductor of heat, substantially as and for the purposes described.

4. In a beer-cooling apparatus, the application, in combination with water for cooling purposes, of a blast of air which has been passed over ice, and strikes the beer at right angles to its flow, substantially as and for the purposes set forth.

5. The combination, in a beer cooler, of the double-bottomed channels B, with perforated air pipes E, substantially as and for the purposes set forth.

6. The combination, in a beer cooler, of the rollers *j*, provided with paddles *k*, with the double-bottomed channels B, substantially as and for the purposes described.

83,100.—CONRAD SEIMEL, Green Point, N. Y.—*Soldering Vessel.*—October 13, 1868.—The troughs are provided with shelves at their upper edges which project inward and downward, leaving spaces between their inner edges wide enough to allow the corners of the cans to extend down into the solder. These troughs are heated by a series of gas jets.

Claim.—1. The stand A, in combination with the troughs B B and the gas apparatus C, as herein described, for the purpose specified.

2. The troughs B, in combination with the shelves *b*, as and for the purpose set forth.

83,101.—JOHN SHAW, Brooklyn, N. Y.—*Lawn Mower.*—October 13, 1868; patented in England January 23, 1864.

Claim.—Folding the cutting end of lawn-mowing machines up toward the handle end, for the purpose of being used for rolling only.

83,102.—PERRY W. SMITH, Abingdon, Ill.—*Buckle.*—October 13, 1868.—A metal plate is provided on each side with transverse clasps with a tongue attached at opposite ends on each side. The strap is buckled in one clasp and the end placed under the back of the other clasp.

Claim.—As an article of manufacture, the within-described double buckle, when constructed and operating substantially as and for the purposes herein set forth.

83,103.—EDWARD J. STEPHENS, Pawtucket, R. I.—*Machinery for Printing Yarn.*—October 13, 1868.—The invention relates to the means employed for causing the color-feeding rolls to skip, during the revolution of the printing cylinder, all those ribs which are to be furnished with some color other than that which they supply respectively.

Claim.—In combination with suitable ribbed printing cylinders, A A, a series of furnishing color rollers, D D, hung in yielding bearings, and operated by means of pinions G, with teeth of variable depth, or the equivalents thereof, in the manner substantially as described, for the purposes specified.

83,104.—J. HENRY STIMPSON, Boston, Mass.—*Gas Furnace for Heating Soldering Tools.*—October 13, 1868.—Improvement on subject of his patent of May 12, 1857. Gas, conducted within the cones, ascends into the perforated cylinders and is there burned. Draught is secured by inclining the cylinders. The outer wire cylinder is of a fine texture, to confine the flame; the inner is a coarser structure, to protect the other from the tool. The mouth pieces serve as guides in inserting the soldering irons.

Claim.—The gas furnace for heating soldering tools, consisting of the double cones A B, supporting the inclined cylinders D E, containing the perforated cylinders F G, composed each of two parts, $f^1 f^2$, $g^1 g^2$. Said cylinders D E, connected at their rear ends by the mouth pieces $d^3 e^3$, and at their forward ends by the curved pipes $h^2 h^3$, all arranged and operating as described for the purpose specified.

83,105.—SAMUEL L. SWEENEY, Morrison, Ill.—*Corn Planter.*—October 13, 1868.—The dropping of the seed is made intermittent by the reciprocating axial movement of a plate in the hopper, which plate derives motion through connecting rods from an arm coupled with one of the covering wheels by a spring catch so as to be readily disengaged.

Claim.—1. The combination of the roller wheel G, arm H, rod I, and oscillating plate F, arranged to operate substantially as and for the purpose set forth.

2. The combination of the wheel G, the arm H, connecting rods I and N, with the two oscillating wheels F, arranged substantially as set forth.

3. The combination of the wheel G with holes G', and arm H with holes H', for connecting and disconnecting the wheels and the dropping mechanism, substantially as set forth.

83,106.—JAMES TAYLOR, Canton, N. Y.—*Sugar Juice Evaporator.*—October 13, 1868.

Claim.—The described construction of the pan A, having its sides extended to form legs *f f*, and the side walls of the fire box, the latter provided with the door *h* at one end, and the chimney B at the other, all arranged to be moved upon the wheels *e*, away from or over the grate D, formed between the ways C, as herein set forth, for the purpose specified.

83,107.—E. A. THOMAS, Philadelphia, Pa.—*Seam-joint for Cans, &c.*—October 13, 1868.

Claim.—A side seam or joint for sheet-metal cans or boxes, composed of a dovetailed projection, *a*, struck or swaged up on the lapped edges of the metal, and then hammered or closed down, substantially as herein shown and described.

83,108.—JOHN L. THOMAS, Alliance, Ohio.—*Steam Generator.*—October 13, 1868.—The float and its connections admit the water to the boiler and shut it off mechanically, and the wheels respectively indicate the water level and open a steam-whistle valve in case of a dangerous decrease of water.

Claim.—1. The combination of the float B, chain C, and weight J, with the serrated wheel D, graduated wheel E, adjustable plate *i*, slotted arm *h*, cock G, and pipe F, as herein set forth.

2. The arrangement of the pipe *o*, lever R, and adjustable pin S, with reference to the wheel D and whistle P, as herein described.

83,109.—GEORGE M. THOMPSON, Boston, Mass.—*Device for Stretching Telegraph Wires.*—October 13, 1868.—The instrument is applied by moving it forward upon and against the wire, so as to force the jaws open to receive it; then on pulling the instrument it grasps the wire tightly.

Claim.—The within described instrument for stretching telegraph wires, consisting essentially of the plate or bar A and jaws C C, as set forth.

83,110.—J. J. THOMPSON, Richwood, Ohio.—*Hay Rake and Loader.*—October 13, 1868.—The teeth which take the hay from the pendent rake at the rear of the machine are fixed in rolls which are journaled upon the periphery of a large rotating drum. When the rolls arrive at the point where the hay is received by the carrier the rolls are turned so as to adapt the teeth to free themselves of hay.

Claim.—The combination of the rotating device F' H, rake G, endless carrier D, pins or fingers *w* and stationary plate I *i*², all constructed, arranged, and operating in the manner and for the purpose set forth.

83,111.—J. J. THOMPSON and V. F. COLLIER, Richwood, Ohio.—*Cultivator.*—October 13, 1868.

Claim.—The combination in a quadruple plow or cultivator, of the inner movable beams B B, staples *b b*, rod F, plates D D, outer stationary beams B' B', tongue A, plate I, and handles L L, all applied in the manner and for the purpose set forth.

83,112.—E. H. TOBEY, Bridgeport, Conn., assignor to himself and A. R. HALE.—*Sash Lock.*—October 13, 1868.—The bolt and cylinder are applied to one sash and a keeper is fixed to the other. When the bolt is pushed into the keeper it is turned, causing its laterally-projecting stud to pass from one slot into another.

Claim.—The arrangement of the bolt A within the cylinder C, when the said cylinder is provided with the two slots *a* and *d*, and the bolt with the stud *f*, to operate in the said slots, substantially in the manner specified.

83,113.—AUGUSTUS TUFTS, Malden, Mass.—*Diaphragm Bellows for Dry Gas Meter.*—October 13, 1868; antedated October 3, 1868.—Improvement on the subject of the patent granted NATHANIEL TUFTS, Aug. 14 1860, and numbered 29,639. Designed to prevent the heat of the soldering iron from burning or scorching the leather and melting the matter upon the winding cord.

Claim.—A gas-meter bellows in which one head is annular, with an attached flange, to which the

flexible material of the bellows is secured, and in which head the opening through which the "former" is extracted in parts is closed by soldering the disk *i* at its edge, which is remote from the cord *h*, which secures the flexible material *g* to the flange *e*, substantially as described.

83,114.—H. D. WALLEN, Jr., Fort Columbus, N. Y.—*Caloric Engine.*—October 13, 1868.—The cylinders communicate with each other through ports opening from the heating chamber of one cylinder into the adjacent heating chamber of the other. The ports are opened and closed by valves. "Lost motion" devices cause the pistons to move and rest alternately. One piston rests at the terminus of its stroke while the other is moving toward it, time being thus afforded for the air to be received by and heated in the respective air chambers of the pistons, which are non-acting for the time being. The expanded air of the first cylinder escapes into the second heating chamber and assists in propelling the second piston.

Claim.—1. The two parallel cylinders A B, when arranged side by side, and provided at both ends with air-heating chambers A' A'', B' B'', and the valve gear, to cause the alternate movement and resting of the pistons, all substantially as shown and described.

2. The rock shafts P P', having arms *e*, R R', the connecting rods S S' T, and angular lever T', substantially as herein shown and described, in combination with and arranged with relation to the shaft M, slotted plate U, slotted arm V, and cross heads R'', as set forth.

83,115.—SAMUEL W. WILCOX, Mendon, Mass.—*Paper Cutter and Ruler.*—October 13, 1868.—A pin inserted through one of the perforations may form an axis upon which to turn the ruler, so as to draw circles with a pencil inserted through another of the perforations.

Claim.—1. A paper cutter, provided with a series of parallel slits for ruling parallel lines, substantially as herein described.

2. The construction of a ruler with a perforated scale, substantially as and for the purpose herein set forth.

83,116.—ELIHU WILDER, Chicopee Falls, Mass.—*Stop Motion and Indicator for Knitting Machine.*—October 13, 1868.—A pin on a slide projects into the cam groove of a cylinder keyed upon the driving shaft, and the slide is consequently reciprocated. At each forward movement it acts upon a bolt and pawl, and gives a slight impulse to a ratchet wheel, which having been thus gradually turned to a certain position, operates through a shaft and fingers upon a pawl lever, to release the lever which carries the belt-tightening pulley, whereupon the lever drops and motion ceases to be transmitted to the knitting mechanism.

Claim.—1. The shaft H, carrying the adjustable fingers *h h' h''*, substantially as described.

2. The combination of the bolt G with the pawl G', and ratchet G'', and shaft H, carrying the fingers *h h' h''*, made adjustable, and held in position by set screws or thumb screws, and operating upon the pawl of a ratchet, for the purpose of stopping the machine at any number of rounds or stitches, substantially as set forth.

3. The combination of the shaft H, having adjustable fingers, *h h' h''*, with the ratchet G'', pawl G', bolt G, sliding bar E', having the trip dog E, and the cam-grooved cylinder C applied to a knitting machine, substantially as described.

83,117.—ORIN O. WITHERELL, Lewiston, Me.—*Chain Pump Valve.*—October 13, 1868.

Claim.—The plates A B, having the links D D secured upon the elastic plate C and washer F, by means of the countersunk screw E extending centrally through the plate and washer, between the ends of the link, into a nut, G, between the ends of the link upon the plate B, as herein described and shown.

83,118.—WILLIAM H. YEATON, Philadelphia, Pa.—*Pipe Coupling.*—October 13, 1868.—Especially ap-

plicable to railroad trains, for coupling the pipes which convey steam or warm water from car to car. Preparatory to uncoupling, the plug is turned so as to cut off communication between the pipes, and the yoke is depressed to permit one portion to be withdrawn from the other. The handle of the plug retains the yoke in its locking position.

Claim.—1. The combination of the portions A and B of the coupling with the yoke D, the whole being constructed and arranged substantially as and for the purpose described.

2. The plug C, adapted to the portion B of the coupling, and having a handle, *i*, arranged in respect to the yoke D, substantially as set forth.

3. The combination, with the yoke D, of a lid or bonnet, F, having lugs *t t*, and hinged or otherwise adapted to the portion B of the coupling, for the purpose specified.

83,119.—RICHARD YEILDING, Detroit, Mich.—*Manufacture of Iron and Steel.*—October 13, 1868.—Crude iron or ore in a molten state is treated with an injection of petroleum oil, intermixed with saltpeter and potash. The molten metal may then be treated in like manner to a solution of oil and prussiate of potash, for which latter oxide of copper, oxide of zinc, and corrosive sublimate may be substituted.

Claim.—1. The process of fusing and refining metal, and decarbonizing iron.

2. The converting of iron into carbonized steel.

3. The converting of iron into malleable steel, and the use of the foregoing articles, in the manner and for the purposes herein set forth, and the general combination of the principles, and the use of the articles, combined and separately, and for the use of the oil alone, in the manner and for the purposes set forth in the foregoing specifications.

83,120.—MRS. J. H. MOTT, Washington, D. C.—*Tablecloth Protector.*—October 13, 1868.

Claim.—A table protecting apron, formed with raised edges *a a*, and attaching straps *e e* and *e*, the whole constructed and arranged substantially as described, for the purposes specified.

83,121.—HENRY TINDALL, Chicago, Ill.—*Process of Roasting and Chloridizing Ore.*—October 13, 1868.—The ore during the roasting process is treated with dry chlorine gas.

Claim.—The process of treating ores, substantially such as is above described.

83,122.—HENRY TINDALL, Chicago, Ill.—*Furnace for Roasting and Chloridizing Ores.*—October 13, 1868.—An extra furnace and apparatus are provided for the generation of chlorine gas, which, being admitted to the roasting chamber, and having a specific gravity greater than that of the products of combustion and of the vapors emanating from the ore, forms a stationary stratum, in passing through which the escaping particles of metal are arrested. They then remingle with the ore in the form of chlorides.

Claim.—1. A furnace for treating ores, in which the operation of desulphurizing and chloridizing or chlorinating such ores is performed simultaneously with the roasting of the same, substantially in the manner described.

2. The chamber E of the furnace, as composed of a metal bottom, with metal sides and roof, said bottom and sides being protected from the action of the sulphur, substantially as shown and described.

3. The combination of the chamber E and the gas-generating apparatus, substantially as shown and described.

4. The combination of the ore-supplying conduit and the chamber E, substantially as shown and described.

5. The arrangement of the sole or hearth with reference to the chute P, substantially as shown and described.

6. The arrangement of the walls or partitions C C', by which they are made to support the sole or hearth, substantially as shown and described.

7. The arrangement of the car R with reference to the chute P and chamber E, substantially as shown and described.

83,123.—ORRIN COLLIER, Sacramento, Cal., assignor to himself and ERVA B. SILLIMAN, same place.—*Piston-rod Packing.*—October 13, 1868.—The interior of the cage communicates with the source of pressure, so that the impelling fluid operates to keep the rings snugly against the piston rod and the face of the gland. The body of the gland, instead of entering the cage, projects outward, and, being lined with soft metal, serves as an extended support for the piston rod. It also affords attachment for an oil cup.

Claim.—1. The metal rings *a* and *b*, as constructed, so that they both have about the same amount of surface bearing against the rod, and both about the same amount of surface bearing against the face of the gland, whereby the two shall wear equally, substantially as described.

2. The construction of the packing with reference to the stuffing box, whereby a free space is left around the rings, so as to allow them to move freely with the rod, if it should not work perfectly true.

3. The gland C and the lining E, with the oil cup F, when arranged substantially as and for the purposes herein described.

83,124.—GEORGE S. ACKER, Kalamazoo, assignor to himself and H. A. LACEY, Detroit, Mich.—*Car Coupling.*—October 20, 1868.

Claim.—The plates J and K, thimble L, hasp M, and channel N, in connection with the link I and pin D, and draw bar A, when arranged and operating substantially as and for the purposes set forth.

83,125.—EDWARD ANDREWS, Pottsville, Pa.—*Boiler Safety Valve.*—October 20, 1868; antedated October 9, 1868.—The valve box incloses both the pressure valve and the valve opening inward, and a lever, the end of which operates on the piston, and, being connected to the yoke, allows the pressure to be regulated on the valve. When the pressure overcomes the weight on the lever, the valve opens, the steam escapes into the box operated, the piston opens the double valve, and the surplus steam escapes.

Claim.—1. The arrangement and combination of the balanced valve E with the valve J, lever H, piston K, and yoke D.

2. The arrangement of the box B, inclosing the valves J and W and lever H.

83,126.—H. P. ANDREWS and M. E. RAWSON, Cleveland, Ohio.—*Inkstand.*—October 20, 1868.—The top plate has a sliding cover with a pressure plate arranged in connection with elastic stopples and two reservoirs with supply cups, by which means the fluid is raised or returned.

Claim.—1. An ink-elevating elastic air sack, constructed with a perforated corking end which is of thicker material than the body of the sack, substantially as described.

2. The horizontally-sliding cover D, pressure plate F, one or more air chambers E, and one or more ink reservoirs G, combined and operating substantially as described.

3. The cover D, pivoted at *b*, and extended into a lever beyond said pivoted point, and connected with a laterally-rocking or rolling plate F, substantially in the manner described.

4. The ink reservoir G G, in combination with a case, A, which is provided with a removable top and means for effecting the raising of ink into supply cups by the movement of a single cover to said cups, substantially as described.

83,127.—GEORGE W. BISHOP, Baltimore, Md.—*Revenue Stamp for Liquor Barrels.*—October 20, 1868; antedated October 6, 1868.

Claim.—1. The oblong plate A, provided with flanges on the sides, and with a central box, B, when constructed substantially as and for the purposes specified.

2. The "stamp" C, made of soft metal, and provided with pins *b b*, as described, and used with the beveled box B, substantially as set forth.

3. The combination of the perforated slide D with the box B in the plate A, and stamp C, when used as and for the purposes specified.

4. The forms *i i'*, placed in the plate A, under the slide D, as and for the purposes specified.

83,128.—WILLIAM H. BOND and GEORGE G. LEE, Syracuse, N. Y.—*Grooving Machine*.—October 20, 1868.—The face of the arm is channeled out for a square bar with different grooves on three faces, and a plain upward face, which being adjusted with a grooved roller, is ready for outside seaming. On the bar being turned to present a grooved rolling face, and putting a plain-faced treading roller in place of the grooved one, the machine is adapted for seaming either inside or outside.

Claim.—An arm, B, when constructed in such manner as to alternately present a plain or grooved rolling face, as desired, substantially as and for the purpose herein described.

83,129.—EDWARD W. BRETTELL, Elizabeth, N. J.—*Permutation Lock*.—October 20, 1868.—An improvement on his patent of August 27, 1867.

Claim.—The hollow wheel B, pawl *t*, with its arms *r* and *s*, in combination with the inner circular tumblers and the ease A, all constructed and arranged to operate in the manner and for the purpose set forth.

83,130.—LYMAN D. BURCH, Sherburne, N. Y.—*Plow Point*.—October 20, 1868.—On the back of the point where the end of the mold board laps on it, a stout rib, with branches, is formed. Stays or ribs are fixed on the ends of the wings, extending beyond them on the back side, lapping over the mold board.

Claim.—1. The ribs or braces D, D¹, and D², constructed and operating substantially as described.

2. The stays E and E', constructed and operating substantially as described.

83,131.—BEAUMAN BUTLER and CHARLES F. RAMSAY, St. Johnsbury, Vt.—*Saw Frame*.—October 20, 1868.—The handle end is rigid, the straining rod being fastened in the center to the cross bar and also to the upper end piece, while the screw-threaded free end of the rod passes through the lower end piece, between which and the cross bar is placed an elastic cushion or a spring, they being also connected by a bolt in slotted ears.

Claim.—1. The saw frame, constructed substantially as above described, with a rigid end, A A' C E, and a flexible end, B C E'.

2. The provision, in a buck-saw frame, of the spring or cushion G G', substantially as and for the purpose set forth.

3. The slotted ears I I, or their equivalent, employed to connect the cross bar and end piece, and permit mutual play between them, substantially as described.

83,132.—GEORGE COLES, London, and JAMES ARCHIBALD JACQUES and JOHN AMERICUS FANSHAW, Tottenham, England.—*Hose, and Machine for Making Hose*.—October 20, 1868.—Patented in England August 17, 1864. A core is prepared by covering a rope with sheet rubber, and lubricating the smooth surface by French chalk. It is then surrounded with a thin coating of rubber, placed in a plaiting machine with a covering of cotton, and coated with a caoutchouc paste, and then vulcanized.

Claim.—1. As a new article of manufacture, flexible hose, when constructed substantially as and for the purpose specified.

2. The apparatus, constructed as described, whereby alternate layers or plies of yarn or thread are laid helically round the core in opposite directions, as herein set forth and shown.

83,133.—J. L. COLES and DAVID H. COLES, New York, N. Y.—*Feeding Mechanism for Sewing Machines*.—October 20, 1868.—The rear end of the feed bar forms a ring in which is a cam slide which, being acted on by a cam disk and spring, receives and conveys to the bar a reciprocating motion, while by means of a screw it is set closer to the disk, and the length of the stitch changed.

Claim.—1. The cam slide C, in combination with the feed bar A, substantially as and for the purpose described.

2. The feed bar A, in combination with the cam

slide C, constructed as described, and its mechanism for adjustment, as and for the purpose set forth.

3. The adjusting screw G, in combination with the cam slide C and feed bar A, substantially as and for the purpose described.

83,134.—EDWARD A. COOPER, Buffalo, N. Y.—*Snap Hook*.—October 20, 1868.—The tongue, having a hinge pin jointed to it, and a spring to keep it in place, is hinged to the shank, which has a groove, for the spring, with an opening partly covered by a cross bar into which one end of the spring is inserted.

Claim.—The hook A, cast with hinge pin *c*, and cross bar *h*, in combination with the grooved tongue D and bow spring *h*, when the parts are arranged and secured together in the manner described.

83,135.—GEORGE G. CRESSEY, Philadelphia, Pa.—*Venting Core*.—October 20, 1868; antedated October 8, 1868.—The box has a guide plate carrying prints corresponding to the patterns, and another and lower one having wires which pass through the centers of the prints and form appropriate cores for the molds.

Claim.—The box E, its plate G, and prints H, in combination with the sliding plate F, and its pointed wires K, and the mechanism herein described, or its equivalent, for imparting the desired movements to the said plates.

83,136.—THOMAS L. CUTHBERT, Charleston County, S. C., assignor to himself, NATHANIEL LEVIN, and EDWARD J. MARKS.—*Boat Detaching Apparatus*.—October 20, 1868.—Two stout oval hoops are connected to a bar hung on pulley blocks, constituting a frame hammock, on the outsides of which are attached hollow cylindrical floats, cable chains being hung from the ship's side to the ends of the inner float to prevent swagging.

Claim.—The "marine cradle," by which ships' boats or yawls may be lowered and detached, in the manner described in the above specification, or any other substantially the same, and which will produce the intended effect.

83,137.—C. N. CUTTER, Worcester, Mass., assignor to DAVIS, HILL & CO., same place.—*Lock for Trunks, Pianos, &c.*—October 20, 1868.—The tongue is hinged between ears fastened to the face-plate, while a spring, also fastened to the face-plate, presses upon it to hold in place when unlocked and folded up in the plate.

Claim.—1. The combination, with the face-plate D, of the hinged tongue C, substantially as and for the purposes set forth.

2. The combination, with the face-plate D, of the hinged tongue C and spring E, substantially as and for the purposes set forth.

83,138.—CHARLES DE BERGUE.—Westminster, Great Britain.—*Track Lifter*.—October 20, 1868.—The lever lies within a recessed bed-plate, and is hinged to it at one end, having at its other end a screwed hole to receive the lifting screw, which rests on a seating in the plate.

Claim.—The within-described instrument, consisting of the metal bed-plate *a*, pivoted lever *b*, and operating screw *c*, the whole constructed and operating substantially as and for the purpose herein set forth.

83,139.—WILLIAM H. DEILY, Syeamore, Ill.—*Stove Pipe Damper*.—October 20, 1868.

Claim.—The two-part case, formed by the parts A and M, having flanges D B for supporting the joints of the pipe, and a recess inside, in which a damper, H, is made to operate for regulating the draught, substantially as and for the purpose set forth.

83,140.—FREDERICK W. DEVOE, New York, N. Y.—*Nozzle for Cans*.—October 20, 1868.—The bottom of the nozzle is sealed by a thin plate soldered with the nozzle to the can. When the contents of the can are required for use, the plate is cut out. A chamber for placing printed directions is formed between the plate and a cap placed over the nozzle.

Claim.—1. The plate C, made separate from the nozzle and can, in combination with the nozzle and

the can, substantially as and for the purpose herein specified.

2. The box formed within the nozzle by the closed bottom C, and the cap or stopper, substantially as herein described.

83,141.—JOB DYSON, New Britain, Conn.—*Cloth Drawers*.—October 20, 1868.

Claim.—Cloth drawers made by forming each half or leg portion in one piece, with the seam down the back of the leg, and an opening B, suitably located to form the body connection of the two legs, substantially as shown and described.

83,142.—JOHN C. ECKERT, Dayton, Ohio.—*Railroad Car Heater*.—October 20, 1868.—In case of accident to a car, a vase on the top of the stove is displaced, which releases a knob connected to a hinged shutter resting over the fire basket, and causes the said shutter to drop and cover the fire. An arm attached to the shutter supports a vertically sliding door, and when the shutter drops, the arm is withdrawn, and the door closes.

Claim.—1. The knob or trigger N, in combination with the vase, for the purpose set forth.

2. The inner catch T, with the shutter P, its spring S, and arm Q, as herein described and shown.

3. The falling door or shutter C, and spring E, acting in combination with the slot D, the lever F, and slide G, arranged to operate substantially as herein described and for the purposes set forth.

83,143.—SPENCER ELLSWORTH, Lacon, Ill.—*Paper Cutting Machine*.—October 20, 1868.—The carriage has ribs which fit in grooves on a bar, one of said ribs being adjustable by means of a screw to tighten up the carriage when it has become loose. The bar is raised or lowered by means of a treadle, which is held in position by a toothed plate.

Claim.—1. The combination of the bar or way C, the sliding carriage D, the vertically-adjustable knife K, and screw S, all arranged, constructed, and operating in the manner and for the purposes herein set forth.

2. The combination of the bar C, provided with the grooves *c*, the carriage D, provided with the rib *b*, and adjustable rib *d*, and the screw L, all arranged to operate in the manner and for the purposes described.

3. The combination of the bar C, carriage D, knife K, screw S, movable rib-guide *d*, and screw L, all arranged in the manner and for the purposes specified and shown.

4. The combination of the bar C, frame A, rods F, springs G, treadle N, and toothed plate P, arranged to operate as specified, and for the purposes set forth.

83,144.—WILLIAM F. ENSIGN, Troy, N. Y.—*Permutation Lock*.—October 2, 1868.—A slot in the tumbler, in which the device is placed for preventing the bolt from being withdrawn, is closed or locked by a slide working in the slot and held by the tumbler next in the pack.

Claim.—In combination, the interlocking of the wheels or tumblers, and closing of the gateway in the wheels by the slides, as shown and described.

83,145.—ROBERT E. FERGUSON, Chicago, Ill.—*Washing Machine*.—October 20, 1868.

Claim.—The arrangement of the wringer-rib I, centrally over the tub of the machine, when supported upon a bar or bars C D, which at the same time incloses and protects the gearing of the machine from the water expressed from the clothes by the wringer, all constructed and operating as and for the purposes specified.

83,146.—MARIA J. FOSS, Charlestown, Mass.—*Combined Skirt and Hose Supporter*.—October 20, 1868.—Elastic hose supporters are attached to hip pads, which latter are secured to the skirt supporter.

Claim.—The skirt supporter B, to which are attached the hose supporters D, the latter being provided with hip pads C, and the whole being combined and arranged substantially as set forth.

83,147.—THEODORE F. FRANK, Buffalo, N. Y.—*Machine for Carbureting Air*.—October 20, 1868.—The carbureting chamber, regulating compartment,

and the water tank in which the air drum revolves, are arranged one above the other in an upright cylinder, which is supported in a frame provided with cross pieces, from which the weights are suspended that operate the air drum. An elevated tube in the regulating vessel prevents it from overflowing, and also the escape of gas when the machine is at rest.

Claim.—1. An upright cylindrical vessel, forming the carbureting chamber D, regulating compartment G, and water tank I, containing the air drum H, arranged respectively one above the other, and with the supporting frame A A' B, and operating weights W W, substantially in the manner and for the purpose set forth.

2. The combination and arrangement of the elevated pipe *h* with the regulating vessel G G', substantially as and for the purpose specified.

83,148.—SAMUEL FRIEND and JOHN McCOLLOM, Decatur, Ill.—*Splint Knife*.—October 20, 1868.—Designed for making splints for baskets, and is operated like a spoke-shave.

Claim.—The construction and arrangement of the stock A, flat rectangular knife blade B, secured thereto by means of the stirrups *a a*, and adjusted by means of the set screws *b b*, curved metal spring apron C, secured to the beveled under side of said stock A, its outer end projecting therefrom and guiding the splints, as herein set forth for the purpose specified.

83,149.—HANNAH C. GASKIN, Union Vale, N. Y.—*Plastic Composition*.—October 20, 1868.—Designed for making imitations of leaves, flowers, &c., and can be molded into figures of any shape.

Claim.—1. A plastic composition of flour or starch, treated substantially as described, in combination with glue, resin, gum, or other equivalent substance, as described.

2. The new article of plastic manufacture, substantially as described.

83,150.—LORENZO D. GILLET, Rochester, and HENRY W. INMAN, Detroit, Mich.—*Rein Holder*.—October 20, 1868.—A lever is pivoted to a bed-plate which is secured to the front of the wagon. The reins are placed between the end of the lever and the bed-plate, and held by the spring pressing against the lever.

Claim.—The construction of a rein holder, with bed-plate A, curved lever F, and spring D, arranged and operating substantially as herein described.

83,151.—JOHN M. GITCHELL, Haverhill, assignor to J. F. MORSE, North Haverhill, N. H.—*Seed Planter*.—October 20, 1868.—A roller placed in the rear of the covers has bearings in a vibrating frame which is pivoted to the sides of the hopper. The feeding slide is reciprocated by a pitman connecting with a crank on a shaft to which a cone is secured, which latter is revolved by a belt from a cone on the roller shaft.

Claim.—For effecting the reciprocating movements of the slider F, by means of the wheel or roller H, the combination of the vibratory frame G, the pulleys, the cranked shaft, and the pitman, arranged with the slider, the wheel shaft, and the hopper, in manner and to operate with an endless band or chain, substantially as specified.

83,152.—WILLIAM GLASGOW, Jr., and JOHN G. WOOD, St. Louis, Mo.—*Manufacture of Shot*.—October 20, 1868.—An annular charcoal furnace is arranged to slide vertically on the outside of the tube containing the liquid.

Claim.—1. The method herein described of producing shot, consisting substantially in dropping the metal, in a molten state, through a column of glycerine, oil, or other similar fluid, instead of air.

2. The heating of said column at or near the top, so that the molten shot shall first impinge upon the heated portion of the medium and be quickly cooled by its descent into the cooler portion of the same.

3. The employment of an adjustable heating apparatus, so arranged and operating as to impart heat to any desired part of the cooling column, substantially as and for the purpose set forth.

4. The construction of the cooling reservoir with

a lateral branch for the withdrawal of the shot, substantially as herein shown and described.

83,153.—KARL GUDENOGE, San Francisco, Cal.—*Billiard Table*.—October 20, 1868.—The top of the table is formed of papier maché laid upon the horizontal frame work and secured by glue.

Claim.—The construction of a billiard table by the arrangement of the longitudinal slats *a a*, transverse slats *b b*, longitudinal rails *c c c*, and alternate wide boards or pieces *d d d*, placed edgewise, and held by the transverse bars *e e e*, or equivalents, substantially as and for the purpose described, in combination with the *papier maché* or pasteboard bed *A*, applied and prepared as specified.

83,154.—JACOB HAESSEL, St. Louis, Mo.—*Combined Plow and Harrow*.—October 20, 1868.—Two adjustable removable harrows are hinged to the shovel so as to allow their rear ends to be opened outwardly.

Claim.—The arrangement of the harrows *D* with the plow *A B*, in the manner shown and described.

83,155.—JOHN D. HAMPSHIRE, Paper Mills Post Office, Md.—*Corn Harvester*.—October 20, 1868.—Oblique bars gather the corn and present it properly to the saw. The cut corn is carried on the saw and kept in position by the reel; as the stalks increase in quantity a spring bar is forced outwardly and causes a hook on the discharging bar to engage with notches in the saw, thus forcing the bar around. The bow retains the discharged stalks until all have been discharged from the saw, and rises as the discharging bar moves back.

Claim.—1. The circular saw or cutter *E*, perforated with holes *k*, and arranged, in connection with the spring bar *O*, bar *Q*, and discharging bar *R*, to operate in the manner substantially as and for the purpose set forth.

2. The bow *U*, connected with the discharging bar *R*, and arranged to operate in connection therewith, substantially in the manner as and for the purpose set forth.

3. The reel *M*, in combination with the circular saw or cutter *E*, arranged to operate substantially as and for the purpose specified.

4. The combination of the saw or cutter *E*, reel *M*, spring bar *O*, bar *Q*, discharging bar *R*, and bow *U*, all arranged to operate in the manner substantially as and for the purpose set forth.

83,156.—T. C. HENDRY, Union Point, Ga., assignor to himself and R. B. SMITH, same place.—*Auger Handle*.—October 20, 1868.—The lower part of the socket, in which the auger shank fits, is provided with ratchet teeth which engage with corresponding teeth on the shank and lock the auger when boring. On the upper side of the socket are radial notches in which projections on the under side of the auger head fit when the auger is withdrawn from the hole.

Claim.—The combination of the socket *A*, formed by two tubes, *a* and *b*, crossing each other, with the handle *B* made adjustable in the socket *b*, and the auger shank *c*, having a ratchet thereon, extending up through the tube *a*, and handle *B*, all constructed and arranged substantially as and for the purposes herein specified.

83,157.—A. L. HILL, Decatur, Ill.—*Fastening for Cheek Hooks and Terrets*.—October 20, 1868.—A screw provided with a flat head with the corners turned up is passed through, and the corners on the head pressed into the leather. The terret is made to fit on the screw.

Claim.—The screw *B*, with a flat head, *D*, having its corners, *a*, turned upward, and used for connecting the terret or cheek hook *A*, when said terret or hook is provided with a female screw in the shank, all substantially as herein shown and described.

83,158.—FRANK A. HILL, Marysville, Cal.—*Seeding Machine*.—October 20, 1868.

Claim.—The frame *A*, provided with the shares or teeth *H*, in combination with seed box *D*, provided with the toothed shafts *E E*, rotated in opposite directions from the wheels *B B*, and also pro-

vided with the fixed and adjustable perforated plates *e e'*, all arranged to operate in the manner substantially as and for the purpose set forth.

83,159.—GEORGE H. HOAGLAND, Port Jervis, N. Y.—*Railroad Axle*.—October 20, 1868; antedated October 10, 1868.

Claim.—A wrought-iron axle, constructed with steel journal casings, extending about midway into the eye of the wheel, substantially as and for the purposes specified.

83,160.—JOHN L. HOLT, Providence, R. I.—*Toy*.—October 20, 1868.—The figures are provided with swinging limbs which are made to oscillate by the force of gravity to assume grotesque positions and motions.

Claim.—1. The toy, consisting of the self-sustaining pendulum *A B C*, and of the figures or images *E E*, having loose-swinging limbs or part *F F* attached thereto, so that constantly-varying pictures and positions are produced, substantially as described.

2. The pins *e*, when provided with the fastening arms *d*, and when secured to the images *E*, to suspend the limbs *F*, as specified.

3. The disk *D*, when provided with a socket, or with its equivalent, the spring *g*, and when so arranged that figures or images *E* can be easily fastened to and removed from it, as specified.

4. The manner herein shown and described of fastening the sustaining plates *G* to the figures *E*, by cutting pointed portions *h* out of the former, and fastening them to the figures as set forth.

5. The manner herein shown and described of suspending the members *F* from the figures *E*, by fastening tubes *i* to the figures, and pins *j* to the members, and securing and arranging all as herein shown and described.

83,161.—B. A. HOPKINS, Sodus, N. Y.—*Feed-water Heater for Steam Boilers*.—October 20, 1868.—The feed water and exhaust steam commingle and travel together in the exhaust pipe a sufficient distance to bring the water to the boiling point by the condensation of the steam.

Claim.—The exhaust pipe *C e*, and cold-water pipe *E*, in connection with the tank *D d f*, all constructed, arranged, and operating as herein shown and described, and for the purpose set forth.

83,162.—FRANK M. HORNING, East Pike, N. Y.—*Steam Generator*.—October 20, 1868.—Compressed air is forced into the chamber in which the fuel is consumed and the products of combustion are forced into and through the water in the boiler, the currents being deflected on entering the boiler by wings which cause a circulation of the water. The ashes are prevented from entering the boiler by a cap placed over the openings in the tube conveying the gases.

Claim.—1. The scroll sheets *v*, in combination with the fire box *A* and air vessel *B*, whereby the air from the latter is heated before being discharged into the fire box, substantially as herein shown and described.

2. The port *J*, constructed as described, and containing the fuel box *K*, in combination with the pipes *L N*, fire box *A*, and air vessel *B*, operating substantially as described, to supply fuel to the fire box.

3. The hot-air pipe *V*, having the cap *l* and perforations *2*, arranged with relation to the furnace *A* and pipe *F*, whereby to separate the ashes from the heated gases, so that the former will not be forced into the generator, substantially as herein shown and described.

4. The arrangement of the hot-air pipe *V* within the water supply pipes, whereby the former is protected by an annular sheet of water, substantially as herein shown and described.

5. The spiral blades *x*, arranged as described, within the generators *D E*, whereby the heated gases are deflected as they enter the generator, substantially as herein set forth and shown.

83,163.—J. S. HOUGHTON and CHARLES B. REES, Philadelphia, Pa.—*Ventilating Fruit Houses*.—October 20, 1868.—The heat and vapors pass from the pre-

serving chambers through a hollow wall into a ventilated loft.

Claim.—The combination and arrangement of the open spaces or flues B, in the walls A, with the preserving room C, and ventilated loft D, substantially as described.

83,164.—HENRY HOWE, Oneonta, N. Y.—*Harvester.*—October 20, 1868.—Designed as an improvement on his patent of July 15, 1868.

Claim.—The pinions *a b*, hung loosely on the ends of the countershaft E, and connected respectively with sliding spring clutches *c d*, or their equivalents, and meshing into the internal gearing of the driving wheels C and D, respectively, the pinion *a*, on the opposite side of the cutting apparatus, being smaller than *b*, substantially as described, for the purpose of balancing the strain of the machine, and for allowing it to cut when it turns a corner, as specified.

83,165.—AMASA HOWLAND, Sandy Hill, N. Y.—*Vat for Cylinder Paper Machines.*—October 20, 1868.—The vat is provided with a false bottom extending nearly across the true bottom. Shelves are secured to the sides of the vat above the false bottom which deflect the currents of pulp entering and cause a horizontal current under the gathering cylinder.

Claim.—1. The construction of my improved vat, for the purpose and in the manner above set forth and described.

2. The introduction of the pulpy fluid in such a manner as to create currents across the under or lateral surface of the gathering cylinder, substantially in the manner and for the purpose above described.

83,166.—BENJAMIN IRRGANG, Philadelphia, Pa.—*Chimney Cowl.*—October 20, 1868.—The doors are so arranged that if a current of air is so strong as to interfere with the draught they will be closed. Shields prevent the access of currents of air between the edges of the doors and the cap, in case of a sudden change of wind.

Claim.—A ventilator or cowl, having inclined sides, with openings, to which are fitted doors, hinged at their lower edges, and shields projecting from the cowl at the sides of the doors, all substantially as and for the purpose described.

83,167.—ALEXANDER IRWIN, Madison, Ind.—*Mode of Putting Up Starch for Use.*—October 20, 1868.

Claim.—Forming the wet starch into cubical packages, of uniform size and equal weight, as a new process of manufacture.

83,168.—D. H. ISENGER, McLean, Ill.—*Saw Filing Machine.*—October 20, 1868.—The file-stock spindle slides in lugs on a swivel which is secured to a plate having bearings on a longitudinal guide rod. A small rod secured to the file stock slides through a plate pivoted on the spindle, and a proper face inclination is given to the file by adjusting the plate.

Claim.—The construction and arrangement of the bar *a*, swivel mechanism *d e e*, slotted plate *f*, guide rod *g*, arm *h*, and file stock *k n i*, all operating as described, in connection with the saw clamps B B, for the purpose specified.

83,169.—RALPH H. ISHAM, Brooklyn, N. Y.—*Steam Generator.*—October 20, 1868.—A series of perforated tubes placed in the furnace above the fire parallel to the grate bars are supported at their front ends by a semi-oval tube, and at their rear ends in a box which receives the exhaust steam and distributes it to the tubes. The steam is diffused over the entire surface of the fire.

Claim.—The construction and combination of the box distributor B, and tube C, with the boiler A, substantially as set forth.

83,170.—JOHN JACKSON, Owego, N. Y.—*Carriage Spring.*—October 20, 1868.

Claim.—The combination of the twist of steel, the circular arm, the strap or chain for the arm to play on, the ratchet wheel and lever to adjust or change the power of the spring to carry either a light or heavy load.

83,171.—W. W. JACOBS, Hagerstown, Md.—*Vapor Burner.*—October 20, 1868.—An improvement on his patent of November 5, 1867. The generator is made adjustable, and non-conducting disks are attached to it and to the screw cap of the wick tube, so that the flame may be regulated, and the parts safely handled.

Claim.—1. The annular wooden disk C, secured, between metallic plates *h i*, to the generator F, as herein shown and described, whereby the said generator may be adjusted without inconvenience from heat, the heat radiating from the parts E F, not being conducted by the disk C.

2. The lamp burner, constructed as described, and consisting of the generator F, perforated at J, wick tube E, annular wooden disks B C, and metallic plates *h i c d*, all arranged and combined to operate in the manner and for the purpose herein set forth.

83,172.—ALBERT JEFFERS, Lynn, Mass.—*Machine for Molding, Rounding, and Channeling Soles of Boots and Shoes.*—October 20, 1868.

Claim.—1. The combination, in an organized machine, of mechanisms for molding and channeling and rounding a sole, under the arrangement, and for operation, substantially as herein set forth.

2. As a means of molding a sole, the combination of the molding block *w*, and the supporting last or bed *x*, the former being supported by and swiveled to the sliding frame *b*, and operated by the cam groove *u* or its equivalent, and the latter provided with a series of points or spurs *b b¹*, &c.; the whole being substantially as hereinbefore referred to and explained.

3. For actuating the movements of the sliding frame *b*, the combination of the weight or its equivalent, applied as described, with the cam groove and the tripper *s*, essentially as explained.

4. In combination with the cam groove and tripper last mentioned, the employment of the deflector *n²*, applied and operating in manner and for the purpose as before explained.

5. For effecting the alternate movements of the screw, and as a consequence the reciprocating movements of the bed, the employment of the two semi-clutches *h¹ h²*, operating in connection with a collar, *g¹*, revolved by the endless belts *k¹ l¹*, and adjusted and controlled by the shipping bar *m¹* and its adjuncts, for the purpose as hereinbefore referred to and explained.

6. In combination with the last described arrangement of parts, the employment of the locking bolts *r²*, actuated by a suitable device, the purpose of such bolts being as before explained.

7. The head stock of the machine, as composed of the segmental dovetailed block *s¹*, the supporting lever plate or carriage *t¹*, the plate or carriage *v¹*, the swiveling plate *x¹*, the carriage *z¹*, and the tool carrier *g²*, under the general combination and arrangement as before alluded to and described.

8. The mode of applying the carriage *z¹* to the swiveling plate *x¹*, before described, that is, by means of the coiled springs *a³ a³*, applied to the shaft, as explained, the latter being provided with the lever or handle, in manner as before set forth; and, in combination with the springs *a³ a³*, shaft *e²*, and handle *e²*, the employment of the bent spring *i²*, in manner and operating as before explained.

9. Applying the cutter head *n²* to its supporting carriage, in such manner as to turn it into a vertical position, or to remove it from contact with the bed *x* essentially as described.

10. In combination with the swiveling plate *x¹*, the employment of the friction rollers *y² y²*, for the purpose of maintaining the cutting knife *k²*, parallel to the edge of the bed *x*, as before explained.

83,173.—WILLIAM H. JOHNSON, Philadelphia, Pa.—*Screw Socket for Brush Handles.*—October 20, 1868.—The cast screw socket has knife-edge ribs, which, as the socket is driven into the block, are forced into the wood, and with a flange around its front end, having ears for screws, is thus fastened to the block.

Claim.—A cast screw socket having a flange *a*, ears *c e*, and longitudinal ribs *e*, to be inserted in the body of the brush, substantially in the manner hereinbefore described, and for the purpose specified.

83,174.—SAMUEL D. KIMBLE, Allegheny City, Pa.—*Carriage Brake*.—October 20, 1868.—A circular disk attached to a notched wheel is pivoted to the hub, two levers being so arranged that their ends near the hub catch into the wheel, and are operated by and in connection with two levers parallel to the pole, and connected with a vibrating lever, having a strap with ropes passing through a guide attached to the tongue of the wagon.

Claim.—The disk A and notched wheel A^2 , with the levers B and B' , when connected with the hub A and axletree R , as described, in combination with the crank lever D , levers C and C' , strap E , cords E^1 and E^2 , and neck yoke G with its devices, when constructed, combined, and arranged, substantially as herein described and for the purpose set forth.

83,175.—JESSE B. KURTZ, Davisburg, Pa.—*Horse Hay Fork*.—October 20, 1868.—The center tine is formed of two pieces fastened together by screws through cross blocks, in the slots of which runs up and down a bar connected to the points inside the tine, which is operated by a lever, a knife being substituted when desired for the point of the tine.

Claim.—The center tine A , provided with side tines $C C$, in combination with the knife H , constructed substantially as shown and described, and operating as and for the purposes herein set forth.

83,176.—ROBERT S. LAIRD and WILLIAM F. STONE, Sandwich, Ill.—*Rain-water Cut-off*.—October 20, 1868.—The water-spout is inserted and hinged into a pipe which moves on a curved slide with an opening, and which is slid back and forth on a plate having under it nozzles to which pipes are fixed to direct the water, by moving the joint from one opening to another in the plate.

Claim.—The combination and arrangement of the hinged pipe C , slide D , and flanged plate F , provided with two nozzles $m m$, all constructed, arranged, and operated for a direct lateral movement, in the manner and for the purpose set forth.

83,177.—ISAAC LAMPLUGH, Peoria, Ill.—*Method of Welding Tires*.—October 20, 1868; antedated October 3, 1868.

Claim.—The combination of the tire A , provided with a V -shaped notch at each end, within which is inserted a diamond-shaped plug, B , which is welded to and forms a part of the tire, in the manner and for the purposes set forth.

83,178.—CHARLES F. LANG, of Venedy, Ill.—*Fruit Gatherer*.—October 20, 1868.—Rigid hooks are fixed to a head piece at the end of a long pole, and below them is a sliding head, with hooks, actuated by a sliding rod, so that on being closed up against the rigid hooks they can both be inserted between the branches, and when separated, while the branch is held back by the rigid hooks, the fruit pulled off by the others drops into the sack below.

Claim.—The combination of the head piece A^1 , hooks a , sliding head C , hooks c , guides D , operating handle E , and pouch B , substantially as and for the purposes set forth.

83,179.—EDWIN S. LAWRENCE, Worcester, Mass.—*Manufacture of Card Clothing*.—October 20, 1868.—In a back, made of layers of paper pressed together and moistened, are set card teeth alternately on either side, which, forced in, cause a bulge to be formed around each, and when dried, serve as supporting gums.

Claim.—1. Card clothing, made or composed of a series of teeth set in paper backs, A , in a moistened state, and then dried, substantially as and for the purposes set forth.

2. Card clothing, made or composed of a series of teeth set in wet or moistened paper backs, and then the sides of the backs subjected to pressure while the drying operation is completed, substantially as and for the purposes set forth.

3. Card clothing, made or composed of a series of teeth, C , set in moistened or wet paper backs, in the manner above described, whereby the teeth are supported by elevations or gums, b , substantially as shown in the drawings.

83,180.—WILLIAM LEDLIE and GEORGE L. GRAY, Jefferson, Ill.—*Hand Seed Drill*.—October 20, 1868.—Inside of the hopper is a feed roller with arms, by which the seed is carried to the V -shaped opening having slides, and through a funnel into a tube connected with the furrow opener.

Claim.—1. The combination of the oscillating seed hopper C , having the feed roller E therein, with the tube c , having the funnel d attached, and the furrow opener D , all constructed and arranged substantially as described.

2. The V -shaped opening in the hopper, with the slides f and i , arranged to operate substantially as and for the purpose set forth.

83,181.—STEPHEN R. LEWIS, Rockford, Ill.—*Turning Lathe*.—October 20, 1868.—The tool rest receives an up-and-down motion by means of a rack operated by a pinion upon the same shaft with the segment wheel.

Claim.—The combination and arrangement of the tool rests F and I , with the cutting tools secured thereto, with segment wheel K , and pinion K' , and racks J and L , the whole constructed substantially as described, and operating as and for the purpose set forth.

83,182.—JOHN LIGHTFOOT, Lower House, near Bernley, England.—*Printing Certain Textile Fabrics and Yarns*.—October 20, 1868.

Claim.—1. As novel, the making of blue and green colors from this and the previously-described solutions, in such a manner that the indigotine remains combined or mixed with such a small proportion of tin that none, or nearly none, is fixed in the fiber, by the subsequent processes, and consequently that there is no tin lake found with the dye-stuff, to spoil the purity of the blue and green.

2. I am aware that carbonate of potash has, most probably, been used to fix fast blue and green made with indigo and tin, but I am not aware that it has been used to fix aluminous and ferruginous mordants at the same time, and I therefore claim the use of carbonate of potash for fixing simultaneously indigotine colors and mordants intended for dyeing.

3. I am also aware that alkaline silicates have been used to fix mordants intended for dyeing, and that even they have been proposed to be used cool, and stronger than in the usual way of using them as cowdung substitutes; but what, to the best of my belief, has not been done is the simultaneous fixing of ordinary mordants and indigotine colors by alkaline silicates, and I therefore claim their use for this purpose, to whatever manner they may be employed.

83,183.—THOMAS LODGE, New Lisbon, Ohio.—*Shifting Buggy Top*.—October 20, 1868.—The front ends of the frame are fastened to the upper side of a handle by a screw hook, to which is attached a spring lever which is turned by it.

Claim.—The spring levers $G G$, in combination with screw hook F , button or head F' , handle B , frame C , standards D , and angle irons E , on seat A , all constructed to operate in the manner substantially as described.

83,184.—OBADIAH LOVE, Saxenburg, Pa.—*Fence*.—October 20, 1868.—The rails, notched across their edges so as to lock the panels, are supported by a single post in the center of each panel, or one each side of the panels, which are interlocked, their ends being fastened by hasps and staples.

Claim.—The fence above described, consisting essentially of the rails $A A$, posts $B C$, hasps $D D$, and staples $E E$, all said parts being constructed and combined together in the manner and for the purposes set forth.

83,185.—JOSEPH J. LURVEY, North Prairie, Wis.—*Divider for Harvesters*.—October 20, 1868.—The lower arm of the bifurcated cutter, inside and near its end, has a socket to slip over the shoe, in the rear of which are ears to admit screws, the upper arm being curved up, and the inner edges of both being beveled on the inside, while a vibrating arm is so pivoted to the cutter as to cause it to cut both sides.

Claim.—The described divider, when constructed

of the bifurcated part and the vibrating cutting arm, the whole being attached and operated substantially as and for the purpose set forth.

83,186.—W. I. LYMAN, Springfield, Mass.—*Rotary Steam Engine.*—October 20, 1868.—A hollow internal cylinder, moved by a piston, with four arms jointed centrally, gives motion to the shaft to which it is attached, the steam chest being a cylindrical chamber with ports entering at the curved sides, so that each arm has in turn the full measure of steam from the supply to the exhaust.

Claim.—The arrangement of the ports B and B', on each side of the chest, with the four-armed piston hinged centrally, and head C, substantially as herein shown and described.

83,187.—STEPHEN MAHURIN, Clayton, Ill., assignor to himself and WILLIAM MONTGOMERY, same place.—*Rotary Cultivator.*—October 20, 1868.—The outer end of the left-hand shaft, of three toothed shafts, is connected by means of a crank and intermediate mechanism with a toothed bar fitted in the rear of a slot, through which the seed is discharged by a reciprocating motion to the bar from the roller shaft, being regulated by a slide attached to the frame of the hopper, the two harrows being also jointed to the inclined pendent bars of the draught pole.

Claim.—1. The rotary toothed shafts C, two or more, in combination with the reciprocating toothed bar E, operated from one of the shafts C, substantially as and for the purpose set forth.

2. The combination of the reciprocating toothed bar E, with the slot *g*, in the front side of the hopper F, and the adjustable slide *h*, attached to the pivoted frame F', all arranged substantially in the manner as and for the purpose specified.

3. The harrows H H, attached by hinges or joints *j j*, in combination with the rotary toothed shafts and the seed-distributing apparatus, all arranged substantially as and for the purpose set forth.

83,188.—H. N. J. MANSFIELD, Malone, N. Y.—*Piston for Steam Engines.*—October 20, 1868.—The follower is provided with an upper and lower lip, so constructed that the upward pressure of the steam shall be sufficient to exactly counterbalance the weight of the piston head and rod.

Claim.—The construction of the piston head for horizontal cylinders, with the projecting lip A and indentation A', near its periphery, whereby to obtain upward pressure of steam, all substantially as herein set forth.

83,189.—E. B. MARSHALL, Atlanta, Ga.—*Wheelbarrow.*—October 20, 1868.—The springs relieve the handles or shafts of the weight of the load, so that the load does not have to be sustained by the propelling power.

Claim.—The springs D, made of wood, iron, steel, or other suitable material, and attached to vehicles of any description, substantially as and for the purposes herein set forth.

83,190.—E. B. MARSHALL, Atlanta, Ga.—*Station Indicator.*—October 20, 1868.

Claim.—The movable and reversible rim A, when so arranged, with the names of the different stations inscribed upon it, and in combination with a clock, that said clock will show at a glance when the train or conveyance is due at any or all stations on the road, substantially as and for the purpose herein set forth.

83,191.—JAMES MARTIN, Jersey City, assignor to HENRY MARTIN, Keyport, N. J.—*Brick Machine.*—October 20, 1868.—The molds are brought under the hoppers by a roller situated crosswise above the frame, and carried by pivoted vibrating bars, connected by rods with arms on a rock shaft, which latter has a crank arm on a pin catching into the pawl pivoted to a lever.

Claim.—The arrangement and combination of the rock shaft E', spring pawl H, lever D', and G, and rods or connections *h C'*, with the lever I, substantially as shown and described for the purpose set forth.

83,192.—IGNACE MATHEI, Antwerp, Belgium.—*Apparatus for Storing Petroleum.*—October 20, 1868.—Two rows of posts allow barrels to pass between them, thick boards being attached by metal cross ties, forming planes inclined each one oppositely to the next above or below, and side strips preventing lateral displacement, while half circles aid the passage of the barrels from one incline to another.

Claim.—1. The herein described method of storing or warehousing petroleum, mineral oils, and other liquids, by the employment of a series of inclined planes, arranged in a reservoir or basin of water, substantially in the manner shown and set forth.

2. An apparatus for warehousing petroleum and other like liquids, constructed substantially in the manner herein specified.

83,193.—HERRMAN MAUCH, Providence, R. I.—*Instrument for Attaching Buttons to Fabrics.*—October 20, 1868.—A sliding die in the upper jaw is operated by a spring to produce the required pressure, another spring operating between the jaws to force them apart, and as the pinners close, by an end thrust, the button or hook is held while its spurs are pressed into the leather.

Claim.—1. The arrangement of a spring, B, with a side opening in the jaw, operating substantially as and for the purpose specified.

2. The combination of the sliding die C with its spring F and the spring B, substantially as described.

83,194.—EDWARD MAYNARD, Tarrytown, N. Y.—*Double Barreled Fire-arm.*—October 20, 1868.—The barrels are passed through a double ferrule, or are hinge jointed, one being allowed to play freely, while the other is secured to it, the ferrule, or the ends may receive a staple, the arms of which are fixed in a recess in the other barrel, one being rigid, the other free to play in it.

Claim.—Two or more separate gun barrels, so united and attached together, by means of a projecting ring, plate, staple, or other equivalent device, firmly secured to one barrel, and embracing or entering the adjacent barrel, or a lug or plate projecting therefrom, as to allow any one of them to expand and contract longitudinally, independently of the other, without changing or affecting the relative position of their axes, substantially as herein set forth.

83,195.—WILLIAM A. MIDDLETON, Harrisburg, Pa.—*Bracket and Rack.*—October 20, 1868.

Claim.—The combination of the bracket S M B with the two series of arms *a a' b b' c c' d d'*, with or without the hooks, as and for the purpose specified.

83,196.—JAMES MONTGOMERY, Croton Landing, N. Y.—*Beam and Girder.*—October 20, 1868; antedated October 10, 1868.—The beam is so constructed that the principal weight of metal will be located in points where the chief tensile and compressive forces will be sustained. Additional beams may be secured together by bolts passing through their webs.

Claim.—1. A beam or girder, formed with heads A A, connected, by converging shoulders C C, to a web B, which tapers from both heads toward its mid-width or transverse center, substantially as and for the purpose explained.

2. Jointing together two or more of my improved beams, in substantially the manner herein described, so as to make them mutually support each other.

3. The flanges D, for supporting the flooring E, in the manner specified.

4. In combination with a beam or girder, constructed as set forth in the first clause, the bolt or key H h, applied and operating as explained.

83,197.—PETER MOUGEY, Marshallsville, Ohio.—*Farm Gate.*—October 20, 1868.—The gate plate, with a small motion, sets over the main gate post, and is connected by rods with the crank parts of the carriage levers, a rod hung on the post having on the lower end a crank inserted into the plate, being provided at its upper end with a double crank setting

around the post, and attached by a rod to the arm on the gate latch.

Claim.—1. The operating gate plate M, when constructed with a central hole, of the same shape and nearly the same size as the cross section of the gate post C, and used around said gate post, and in combination with the rods L K and carriage levers I I', J J', substantially as for the purpose herein specified.

2. The peculiar arrangement and combination of the latch E with arm F, the rod G, double crank rod d H b, and gate plate M, the several parts being constructed and arranged as shown, and used in combination with the gate C A B D, and latch post P, substantially as and for the purpose herein specified.

83,198.—J. W. NEAL and A. J. TRUXELL, Big Lick, Va.—*Cockle and Garlic Separator.*—October 20, 1868; antedated October 9, 1868.—An improvement on his patent of July 16, 1867. The cylinders are adjusted at any angle and so arranged that the lower ends may be inclined more or less to suit the kind of grain which passes from the hopper over or between their sides and slides down, while the cockle and garlic are caught in the holes or recesses.

Claim.—The arrangement of the cylinders B B, having perforated metal faces, upon the frame A, in such a manner that one end of each cylinder is elevated above the other, so that the grain will pass from the hopper C down in between the cylinders, and pass down the inclined plane thus formed, all constructed and used as specified.

83,199.—JOHN NORRIS, Mount Pleasant, Md.—*Hot Air Attachment to Cooking Stoves.*—October 20, 1868.—The oven door has a deep bay, from the top of which projects a short tube or collar, on which rests a pipe covered by a cap, while another cap covers the collar, when the pipe is detached from it.

Claim.—As an attachment to a "ten plate" stove the oven door, constructed with a bay, E, and collar E', and having connected therewith the pipe F, provided with the caps e m, the whole operating in the manner and for the purposes specified.

83,200.—JOSEPH PARKIN and JAMES H. SMITH, Cleveland, Ohio.—*Machine for Molding Sheet Metal Window and Door Caps.*—October 20, 1868.

Claim.—The adjustable auxiliary roller K, rollers C C', adjustable standards B, and guide L, all combined and arranged to operate in the manner as and for the purpose set forth.

83,201.—LOUIS J. PARSONS, New Bedford, Mass.—*Mode of Binding the Edges of Rein Holders.*—October 20, 1868.—Flanges on the metallic frame prevent the rein holes from tearing out at the corners. A clasp on top of the frame secures the flap covering to the front of the rein holes.

Claim.—The metallic frame B² for binding the edges of the "rein holes" in carriage boots and horse blankets, and securing the flap which covers the front of rein hole in boots, made and applied substantially in the manner shown and described.

83,202.—LOUIS J. PARSONS, New Bedford, Mass.—*Adjustable Mosquito-bar Frame.*—October 20, 1868.—The mosquito-bar frame is made with knees which slip into ferrules of which the short ones are secured by nuts, and the long ones screwed on with spiral springs, a handle being provided by which to put it in or take it out of the window frame.

Claim.—A metallic mosquito-bar frame, in combination with springs and screws, as herein set forth and described, for the purpose specified.

83,203.—LOUIS J. PARSONS, New Bedford, Mass.—*Whip Socket.*—October 20, 1868.—The socket is made in longitudinal sections, joined at their lower ends, or to a bottom piece, by springs or hinges, and held at top by an elastic band.

Claim.—Making whip sockets in longitudinal sections, connected together at the bottom by springs or hinges, and held together at the top by an elastic band as herein set forth and described.

83,204.—LOUIS J. PARSONS, New Bedford, Mass.—*Thill Guard.*—October 20, 1868.—The metallic

guard is firmly secured to the thill, and curved over the axle, so that if the coupling break, the thill will be held to it.

Claim.—The metallic safety guard C, for thills of carriages, constructed and operating substantially as and for the purpose set forth and described, and applied in any practical manner.

83,205.—LOUIS J. PARSONS, New Bedford, Mass.—*Mode of Fastening Apron Hooks to the Dasher Falls of Carriages.*—October 20, 1868.—A metallic clasp is so bent as to form a loop for the eye of the "apron hook," and has lips upon its back, by which the clasp is secured to the "fall."

Claim.—Securing hooks or rings to "dasher-falls" by metallic clasp B², substantially in the manner described.

83,206.—YARNALL RAKESTROW, Whitehouse, Ohio.—*Plow.*—October 20, 1868.—The point, which, with the cutter, is made of one piece of steel, forms a continuation to the landside and standard, being attached thereto by a bolt.

Claim.—The point F and cutter G, in combination with standard C, substantially as set forth.

83,207.—ABRAM REESE, Pittsburg, Pa.—*Rolling Horseshoe Blanks.*—October 20, 1868.—A pair of cylindrical rolls is provided with collars and grooves, prints and creasers, and in parts flattened or cut away so as to roll the blanks in continuous bars from suitable iron bars run through them.

Claim.—1. Dispensing with the collar on the rolls, which, in machines heretofore made, confine the inner edge of the shoe blank, by arranging the prints i i, one or more, and collar b', on a smooth-faced roll A', and without any confining collar, in the manner shown and described.

2. The arrangement of the part collar d and prints e alternately with each other, on the face of the roll, and opposite to the full collar b, so as to limit the spread of the iron at the heel parts of the blank or bar, and, at the same time, permit the free spread of the iron over the prints e, at and near the toe parts of the blank or bar, substantially as hereinbefore set forth.

83,208.—C. L. REHN, Philadelphia, Pa.—*Machine for Soldering Sheet-metal Boxes.*—October 20, 1868.—The boxes are placed, one at a time, upon the disk, with their lower edges immersed in the solder thereon; the operation is completed by holding them there an instant and then removing them.

Claim.—The concave disk F, arranged to revolve above a series of gas burners, or equivalent heaters, as and for the purpose herein set forth.

83,209.—C. L. REHN, Philadelphia, Pa.—*Machine for Making Metal Boxes.*—October 20, 1868.—The operation of this machine is similar to that described in the English patent of W. E. Gedge, June 28, 1866. The hinging of the frame facilitates the changing of the cylinders, and enables them to be readily turned to an upright position. The adjustability of the several parts adapts the machine for the manufacture of boxes of different sizes.

Claim.—1. Hinging the machine at a a, so that it may be turned to either a vertical or horizontal position, for the purpose described.

2. The standard p, rendered adjustable upon the frame of the machine, as described, so that its levers J and K may be adjusted to suit the size of the cylinder upon which they are caused to bear.

3. The lever K, with its spring t and blade u, when operated by the lever J, as described.

4. The bar I, secured to the frame of the machine, and rendered adjustable upon the same, in the manner and for the purpose set forth.

5. The adjustable flanged guide blocks m m, for the purpose specified.

6. The lever H, when actuated by a spring k, as described.

83,210.—DANIEL C. RIPLEY, Birmingham, Pa.—*Manufacture of Glassware.*—October 20, 1868.—The object is to obviate the waste that usually occurs in the manufacture of glass stoppers and other small articles owing to the surplus of glass left in the press-

ing fount, after the quantity necessary for the articles to be manufactured has been forced therefrom.

Claim.—The construction of a compound mold for making articles of pressed glassware, substantially as described, in which the pressing fount shall itself be a mold, and shall, at the same time, be connected by a sprue or sprues with another mold, or with other molds, for forming the same or other articles of glass-ware.

83,211.—EZRA RIPLEY, Troy, N. Y.—*Toy Pistol.*—October 20, 1868.—The striking lever, being released by the trigger, derives a forward impulse from the belt spring, and acts percussively upon the projectile, either directly or through the medium of a follower.

Claim.—1. The combination of the striking lever A, belt spring B, and stud or support, C, for the belt spring and lever, with the stock D E and barrel or projectile holder F, with or without a sliding follower, G, therein, all constructed and arranged to operate substantially as and for the purpose herein set forth.

2. The combination of a trigger catch, H, striking lever A, belt spring B, stud C, stock D E, and projectile holder F, with or without a follower therein, all constructed and arranged to operate substantially as herein described.

83,212.—WILLIAM ROEMER, Newark, N. J.—*Traveling Bag.*—October 20, 1868.—The staples hold together the hinged jaws of the frame, at or near their ends.

Claim.—A frame for traveling bags or valises being bulged at *n* and *m*, to form, in combination with plates *v* and *w*, attached on the under side, recesses or bearings for staples A or B, to relieve the lock from strain, as described, constructed, and arranged as herein specified.

83,213.—BENJAMIN D. SANDERS, Wellsburg, W. Va.—*Nut.*—October 20, 1868.—The nut, when entirely screwed in, has a tendency to press inward, or toward the bolt, the particles of the object through which the bolt passes. The effect is to support the bolt laterally and prevent the nut from working loose.

Claim.—A metallic nut for screw bolts, having a concave or conical depression in the lower face, around the eye, substantially as and for the purpose described.

83,214.—BENJAMIN D. SANDERS, Wellsburg W. Va.—*Nut.*—October 20, 1868.

Claim.—1. A metallic nut for screw bolts, having a body of square or other polygonal shape, with a cylindrical collar on its lower face, and a conical or concave depression around the eye, substantially as hereinbefore described.

2. A metallic nut for screw bolts, having one or more recesses or steps around the eye, with a concavity or depression on its lower face, substantially as and for the purpose described.

83,215.—D. SCHILLING, Brooklyn, N. Y.—*Water Closet.*—October 20, 1868.—The depression of the seat causes the partial rotation of a roller in the hopper above, the effect being to discharge into the excrement receptacle, or chamber surrounding the same, a quantity of disinfecting material.

Claim.—A water closet, privy, or other seat, when provided with a receptacle or receptacles for a deodorizing or disinfecting agent or agents, in combination with an arrangement of mechanism, substantially as herein described, by which such disinfectants can be discharged into the chamber or space about the bowl, &c., or into it, substantially as and for the purpose described.

83,216.—BENJAMIN F. SHAFER, Dayton, Ohio, assignor to himself and WILLIAM K. YOUNG, same place.—*Swing.*—October 20, 1868.—The feet of the occupant rests upon the treadle, and as he extends his limbs, the swing moves forward. The backward movement is effected by the weight of the person.

Claim.—The permanent arms E E, the pivoted arms D D, and treadle F, constructed, arranged, and operating substantially as described, and for the purpose specified.

83,217.—THOMAS J. SHEARS, Ypsilanti, Mich.—*Carriage Spring.*—October 20, 1868.—Subsidiary or strengthening springs are introduced between the bends of the spring proper.

Claim.—The combination of the springs in the form described, composed of the coil springs F, or rubber springs G, with the subsidiary springs H, when arranged substantially as herein described.

83,218.—PIUS L. SHEPLER and SAMUEL L. IRWIN, Whitehouse, Ohio.—*Wash Boiler.*—October 20, 1868.—Ebullition in the boiler causes the water to ascend in the chambers at the ends; the water passes thence into tubes which distribute it upon the clothes, and is then drawn down through the latter in consequence of the tendency to a vacuum below the false bottom.

Claim.—The perforated sliding extension tube E, in combination with the chambers B, the grated false bottom J, provided with button G, and the lugs H, on the boiler A, substantially as and for the purposes set forth.

2. The ears C, in connection with the chambers B, and the pit bottom of the boiler A, substantially as described.

3. The combination of all the above-named parts with the faucet I, when arranged and operating substantially as and for the purposes herein specified.

83,219.—R. H. ST. JOHN, Bellefontaine, Ohio.—*Tucking Device for Sewing Machine.*—October 20, 1868.—A gauge plate is secured to the hinged handle and is provided with an extension which guides the cloth. When operating, the gauge plate rests upon the cloth and pushes it against a shoulder, above which the folding plate is secured. An adjustable guide causes the tuck which is just formed to be fed in a line parallel to the plait which is being stitched.

Claim.—1. The pressure gauge plate C, applied to the free end of a hinged handle, B, substantially as and for the purpose described.

2. The pressure gauge plate C on the hinged handle B, in combination with the folding plate D, substantially as described.

3. The pressure gauge plate C on the hinged handle B, in combination with an adjustable guide, *f*, and a folding plate, substantially as described.

4. The vertically-adjustable gauge plate C, constructed with an extension guide, *e*, upon it, in combination with a shoulder, *s*, and extension guide, *i*, formed on base plate, A, and a horizontally adjustable slide, D, substantially as described.

83,220.—JAMES S. STONE and GEORGE W. CHAMBERLIN.—Fitchburg, Mass.—*Bird Trap.*—October 20, 1868.—The bird steps on a platform which drops and causes a lever to release the end of a spring to which the end of the loop is secured. The beveled edges of the case insure the loop catching above the feet of the bird.

Claim.—1. The combination of the case, and its catch mechanism, with the spring B and noose C, the whole constructed and operating in the manner and for the purposes above set forth and described.

2. The beveled surface J, for the purpose of throwing up the noose C, substantially as set forth.

83,221.—RICHARD DUNN SYMONS, JOHN TREMELLING HARRY, and SAMUEL STEPHENS, Grass Valley, Cal.—*Ore Separator and Concentrator.*—October 20, 1868.—A yoke provided with arms is secured to a half-round shaft which fits in a corresponding aperture in the driving shaft, so as to be raised and lowered to stir up the sand. The driving shaft revolves in a hollow shaft, and is actuated by gearing placed in a chamber beneath the bottom of the vessel. The gearing also actuates hammers which, striking against the side of the case, cause the heavier particles in the vessel to fall to the bottom.

Claim.—1. In combination with the pan or tub A and chamber H, the yoke B provided with stirrers or agitators D D D' and annular ring D², or their equivalents, substantially as and for the purpose described.

2. The hollow vertical shaft F' and driving shaft F, with a half-round opening, in which the half-round depending spindle E of the yoke sets, substantially as described, for the purposes set forth.

3. The pins L L, on the gear I I', which operate the hammer, the weighted arm M M, and the hammers N N, the whole constructed and arranged to operate substantially as and for the purpose described.

83,222.—JOHN BLAKE TARR, Fair Haven, Mass.—*Manufacture of Steel Ingots.*—October 20, 1868.—The steel while in a liquid state is subjected to pressure in a mold and is formed into hollow or solid ingots.

Claim.—Forming a hollow ingot under pressure, as herein described.

83,223.—JOHN BLAKE TARR, Fair Haven, Mass.—*Cast-steel Tire.*—October 20, 1868.—Two rings forming the sides of the mold are placed on a bed and melted steel poured between them. A ring is placed upon the surface of the steel and pressure is applied to it by means of a hydrostatic engine.

Claim.—1. The machine for making a compressed steel ear wheel tire, substantially as described.

2. As a new and improved article of manufacture, a compressed steel tire for a ear wheel, made separate from, and adapted for being shrunk upon, the central portion of such wheel, substantially as described.

83,224.—JOHN BLAKE TARR, Fair Haven, Mass.—*Steam Engine.*—October 20, 1868.—The steam from the boiler flows into the valve chest of the pump, and is forced from there through a coil of pipes in the furnace, where it is superheated, into the steam chest of engine.

Claim.—1. The mode of working an engine by steam which is reheated after it leaves the boiler, and when cut off from the boiler by the action of the pump, substantially as described.

2. A pipe or pipes leading from a steam boiler to the valve chest of an engine through a furnace, and provided with a forcing pump, which is operated by said engine, substantially as described.

3. In combination with a steam pipe, C, leading direct from a boiler to an engine, and provided with a cut-off valve, the means for taking steam from said pipe, C, superheating it, and then conducting the superheated steam to the valve chest of said engine, substantially as described.

83,225.—FREDERICK TUDOR, Boston, Mass.—*Screw Bolt.*—October 20, 1868.—The bolt is provided with two screw threads of different pitches but running in the same direction. This bolt is used where ordinary bolts are loosened by vibrations.

Claim.—The within-described screw bolt as an article of manufacture.

83,226.—GEORGE WALTERS and THOMAS SHAFER, Phoenixville, Pa.—*Wrought-iron Column.*—October 20, 1868.—Longitudinal skewback bars are secured to the peripheries of ring bands. Said bars have grooved flanges to receive the side edges of segmental bars.

Claim.—An improved wrought-iron or steel column, of which the shaft is formed by the combination of the ring bands A, skewback bars B, and binding bars C, with each other, said parts being constructed and arranged and joined to the base and capital, substantially as herein shown and described and for the purpose set forth.

83,227.—MAHLON WARNE, Philadelphia, Pa.—*Head Rest.*—October 20, 1868.

Claim.—The combination of a curved rod or bow, B, a padded strip, A, secured at the ends to the ends of the bow, and a strap secured to the bow, and adapted for attachment to the ceiling of a car, for the purpose specified.

83,228.—MAHLON WARNE, Philadelphia, Pa.—*Policeman's Mace.*—October 20, 1868.—The head is secured to a rod, which slides in a tubular handle and is prevented from being withdrawn by an enlargement on the end.

Claim.—1. A mace, having a rigid handle or stem of metal and a hollow head of India rubber, or other elastic material, filled with shot, or its equivalent.

2. The combination of the tubular handle A, sliding rod B, its head D, and enlargement *d*.

83,229.—MAHLON WARNE, Philadelphia, Pa.—*Sabot.*—October 20, 1868.—A metal plate is secured to the sole of the boot by a screw at the back, and a T-shaped strip at the front. A strip of cloth is passed through slots in this plate, the ends being properly fastened.

Claim.—1. The T-shaped strip *k*, secured at two of its ends to a plate, A, and having in the other end an opening for the reception of a button on the plate, substantially as and for the purpose described.

2. A strip, D, of cloth, or equivalent fabric, secured to the plate A, in the manner described.

83,230.—GEORGE R. WEBER, Springfield, Ill.—*Washing Machine.*—October 20, 1868.—A number of fingers are secured radially around the dasher, which latter is attached to an adjustable rod connecting with a lever pivoted to a standard on the tub. A rod catches in the handle when it is necessary to rinse the clothes or let them drip.

Claim.—The combination of standard B, fixed to the side of the tub A, lever C, adjustable rod D, rigid fingers E E, used in connection with a common tub, and so arranged that clothes may be elevated and drained by the fastening device F E.

83,231.—HENRY WESTON and GEORGE C. LANGTRY, Dayton, Nevada.—*Concentrator for Dressing Ores.*—October 20, 1868.—The table receives a rapid vibratory motion, which causes the sand and water to be discharged on one side and the sulphurets at the other side.

Claim.—1. A copper-lined table, D, with a longitudinal depression, O, and imparting to the said table a rectilinear, alternate motion by means of the crank pin K, working in the curved slot J, or their equivalents, substantially as and for the purpose described.

2. The manner of suspending the table to the rock shaft and adjusting shaft, by the hangers F F, jointed arms G G, and the beam I, for operating the said rock shaft, substantially as described.

3. The shackle rod M, attached to the arm L of the adjusting shaft, for raising and lowering the edge of the table, and the springs T T, constructed and arranged to operate substantially as and for the purposes specified.

83,232.—GEORGE D. WOODWORTH, Chicago, Ill.—*Stove Grate.*—October 20, 1868.—Grate bars of triangular form, provided with slots, project inwardly from the outer rim of the grate toward a rotating center piece. A sharp edge is formed on the outer rim of the grate, which breaks the coal that falls between the rim and inclosure of the stove.

Claim.—1. The combination of the rotating, independent center E, whether provided with teeth *d* or not, with a grate, A, arranged to operate substantially in the manner herein described.

2. In combination with the rotating center E, a stirrer or flange, H, to operate substantially as and for the purposes set forth.

3. Constructing the teeth *b* with slots *e*, substantially in the manner and for the purposes herein specified.

4. Providing the rim A with a wire edge, *a*, as and for the purposes shown and described.

83,233.—CALVIN ADAMS, Pittsburg, Pa.—*Post Auger.*—October 20, 1868.—On the front edge of the arms are placed V-shaped "plows" for loosening the ground more rapidly than can be done by the plain edge of the arm.

Claim.—A post auger, with one or more plows, constructed and arranged on the arms, and operating substantially as and for the purpose shown and described.

83,234.—LEVI ADAMS, Amherst, Mass.—*King Bolt and Whiffletree Plate for Vehicles.*—October 20, 1868.

Claim.—The two plates, constructed as described, the one, A, provided with the parallel flanges *a a*, semi-annular groove *b*, and opening *e*; the other, B, provided with the parallel flanges *d d*, semi-annular

ledge *e*, projection *f*, tubular pendant *g*, and reach extension *h*, all arranged and operating as described, for the purpose specified.

83,235.—CLARK ALVORD, Courtland, Wis.—*Drag Bar for Cultivator.*—October 20, 1868.—The cultivator tooth is pivoted to a bolt in a slot in the lower timber. The upper timber is secured rigidly at one end and held by a clasp at the other end, which latter when moved forward increases the elasticity of the upper timber.

Claim.—1. The compound drag bar, as above described and shown.

2. The construction of the cultivator tooth, and fastening it to the drag bar by passing the bolt through the angle, as above described and shown.

3. The movable clasp, in combination with the drag bar as above described and shown, and for the purposes above set forth.

83,236.—E. F. ANDERSON, Mansfield, Conn.—*Outline Map to Teach Geography, &c.*—October 20, 1868.

Claim.—The construction of an outline map, and the names of different divisions or parts thereof, so that the said names may be attached or detached, substantially in the manner as herein set forth.

83,237.—JAMES S. BALDWIN, Newark, N. J.—*Elevator for Buildings.*—October 20, 1868.—The platform is secured to one end of a rope which passes over a pulley and is secured to the wrist pin of a crank which receives a regular motion through a spur wheel and pinion. When the crank is on the center, the platform is at rest and the passengers step on or off.

Claim.—The automatic elevator, constructed and applied as and for the purpose set forth.

83,238.—W. H. BARRY, Rabbit River, Mich.—*Harrow.*—October 20, 1868.—The overlapping of the bars prevents any obstruction from entering between the ends of the longitudinal bars. The wings are attached to iron bars having hooks and eyes for fastening them together.

Claim.—1. The combination of the overlapping guard bars B and E with the forward ends of the parts D and A, substantially as herein shown and described, and for the purpose set forth.

2. The described arrangement of the curved metallic bars C C, and straight bars F, with relation to each other, the central part A of the harrow, the wings D, and guards B E, as herein described, for the purpose specified.

83,239.—JOHN A. BASSETT, Salem, Mass.—*Apparatus for the Manufacture of Illuminating Gas.*—October 20, 1868.—The air is compelled to pass under the surface of a floating perforated disk and escapes at the periphery, impregnated with hydrocarbon.

Claim.—1. In an apparatus for carbureting air, the disk C, made of wood, floating upon the surface of the hydrocarbon liquid, and partially immersed therein.

2. The disk C, having radiating channels formed upon the under surface, for the purpose substantially as described.

83,240.—J. W. BATES, Glencoe, Minn.—*Bag Tie.*—October 20, 1868.—The cord is passed through the rear end of the block, then wound around itself, and then drawn through a slot reaching to the other hole.

Claim.—The arrangement of the wooden block A, having the holes a^1 a^2 and the slot a^3 , terminating in the hole a^2 , with the cord C, all applied to the bag in the manner herein described and shown.

83,241.—MORITZ BAUMGARTEN, Jr., New Haven, Conn.—*Valve Arrangement for Organs.*—October 20, 1868.—An improvement on his patent of June 12, 1866. The several valves, one on each chest, are attached to a single rod which opens and positively closes the valves.

Claim.—The valves P R S, in number corresponding to the number of wind chests, constructed in the manner described, and arranged and fixed upon the

valve rod L, so as to be operated in their respective chambers, substantially in the manner herein set forth.

83,242.—HIRAM BECKWITH, Grass Lake, Mich.—*Railway Switch.*—October 20, 1868.—A bell crank pivoted to the lever is provided with an arm which, when the switch is in position, fits in slots on the upper part of the frame, and is held in position by a pin.

Claim.—In combination with the switch lever C, the bell crank G, with the weight *h* and pin *i*, arranged substantially as described, for the purposes set forth.

83,243.—WILLIAM BOLD, Sheboygan Falls, Wis.—*Machine for Dressing Millstones.*—October 20, 1868.—A number of pick plates are held in a hollow block, which latter slides vertically in a holder. A cap fitting over the pick plates and secured to the hollow block is struck by a mallet when dressing while the holder is pushed along on the guide.

Claim.—The combination of the pick-block holder E and pick block D, having the adjustable pick plates H and removable cap G, with each other, and with the adjustable frame A B, substantially as described, for the purpose specified.

83,244.—GEORGE C. BOVEY, Cincinnati, Ohio.—*Brick Machine.*—October 20, 1868.—An improvement on his patent of February 29, 1867. The molds are provided with plungers which have rollers on their ends in contact with a fixed cam, which latter imparts a proper motion to the plungers. The clay is forced into the molds by the wallowers, and pressure is applied by the solid portions of one wheel coming in contact with the clay contained in the other. The final pressure is given to the clay by rollers which revolve in weighted bell cranks.

Claim.—1. The arrangement of the pulverizers M and M' and screen N, in combination with the mold wheels B C of a brick machine, in the manner and for the purposes described.

2. The arrangement of the fixed cam I, having wings I' I'', and flanges J J', in combination with a series of plungers, E, having rollers H, and outwardly-projecting shafts *h*, for the object herein stated.

3. In combination with the mold wheels, having radial compartments D, and shoulders *d*, the gravitating and weighted rollers P and bell cranks *p*, substantially as herein set forth.

83,245.—R. J. BOWMAN, Mansfield, La.—*Wheel for Vehicles.*—October 20, 1868.—One part of the rim has parallel sides and a V-shaped inner face. The other part fits over the first part and has a face at right angles to its sides. The tire, spokes, and the two parts are held together by the same bolts.

Claim.—1. The tubular rim A, composed of two parts, constructed and fitted together in the manner substantially as and for the purpose set forth.

2. The flat spokes C, secured to the hollow rim A by means of the bent ends *e*, angle plates *f*, bolts dx , and grooved blocks *g*, and to the hub ring D by means of the cylindrical keys *i* and chambers h^x , substantially as herein shown and described.

3. The combination of the rim A, tire B, spokes C, and the hub, composed of the ring D and box E, all constructed and arranged substantially as and for the purpose specified.

83,246.—NATHANIEL L. BRADLEY and JOHN A. EVARTS, West Meriden, Conn., assignors to BRADLEY and HUBBARD, same place.—*Gas Fixture.*—October 20, 1868.

Claim.—As an article of manufacture, gas fixtures, the shell or ornamental part of which is formed of two parts of cast metal, one part being provided with a lip or lips, *a*, to cover the joint and form a rib, substantially as and for the purpose specified.

83,247.—RICHARD A. BRIGHT, Jr., Providence, R. I.—*Cigar Machine.*—October 20, 1868.—Two non-elastic rollers revolve in a stationary frame and three in a swinging frame. A follower prevents the cigar from being formed too long. The header is prevented from turning by lips fitting under plates

which protect the rollers. A cutter trims the end of the cigar.

Claim.—1. A cigar machine, consisting of the stationary frame A, carrying rollers B C; of the swinging frame E, carrying the rollers F G H; of the header J, follower L, and cutter O, all made and operating substantially as and for the purpose herein shown and described.

2. The sliding follower L, fitted to the end of the spindle D, and made yielding by means of the spring *t*, substantially as described, and operating for the purpose specified.

3. The header J, formed on a pin, *p*, and having the lips *r*, as set forth, for the purpose specified.

4. The cutter O, formed on the swinging weighted lever N, substantially as set forth, the same being adjustable on the frame E, as described, for the purpose specified.

83,248.—WILLIAM E. BROOKE, Trenton, N. J.—*Shutter and Blind Operator.*—October 20, 1868.—A worm wheel attached to the sill actuates a toothed wheel which is secured to an arm, the end of the latter being fastened to a bar which slides on a dovetail plate secured to the shutter.

Claim.—The worm gear C D, arm E, slide F, and slide bar G, dovetail *b b*, or their equivalents, when constructed, arranged, and combined substantially as and for the purposes herein described.

83,249.—CONRAD BROWN, New Albany, Ind.—*Compound for the Cure of Dropsy.*—October 20, 1868.—Composed of crab cider, horse radish, sea onions, parsley root, garden radish, huckleberries, watermelon seed, green and black tea, and lungwort.

Claim.—A compound, or medicine, composed of the above-mentioned ingredients, and used substantially as and for the purposes herein set forth.

83,250.—H. BUCHTER, Louisville, Ky.—*Chair Seat.*—October 20, 1868.—The canes are closely interwoven and the ends inserted in grooves formed in the upper surface of the frame and are held by strips attached to the frame so as to overlap and bend the canes into the grooves.

Claim.—The combination of the bent canes B, grooved seat A, and strip C, as herein described, for the purpose specified.

83,251.—JOHN H. BURTIS, Brooklyn, N. Y.—*Wash Boiler.*—October 20, 1868.—Removable division plates are applied on the inside of the boiler to support the clothes and to form circulating water ways beneath them and the wash boiler.

Claim.—The removable plates *e f*, applied to a wash boiler, substantially as and for the purposes specified.

83,252.—WILLARD E. BUSII, Damascus, Pa.—*Car Coupling.*—October 20, 1868.—Two springs, with shoulders, are attached to the coupling pin, in the hole of which is a recess with a lip. As the pin is pushed down, the springs are compressed, but having passed the shoulders, expand and catch under the lip.

Claim.—The springs *d d*, with their shoulders *f f*, and the lip *h*, on the draw head, substantially as and for the purposes herein shown and described, in combination with a draw head of a car coupling.

83,253.—NATHANIEL L. CHAMBERLAIN, Boston, Mass.—*Hand Stamp.*—October 20, 1868.—The saddle which carries the type wheels marking the year, month, and day, has a handle for turning them, and flanges, with screw holes, by which the die plate is secured; the hollow plunger being upheld in a sleeve by a spring, and the wheels kept in place by spring pins.

Claim.—1. The combination, with a die in a hand stamp, of three type wheels of equal diameter, each provided with exposed figures or letters upon their sides, substantially as and for the purpose set forth.

2. Securing the saddle or type wheel holder to the plunger by means of a screw bolt, substantially as and for the purpose specified.

3. Constructing the saddle or type holder with flanges *i i*, as and for the purpose described.

4. The type wheel *n*, provided with figures upon

its side, when the said wheel is constructed and arranged between two wheels of equal diameter, as and for the purpose set forth.

5. The type wheels *m* and *n*, when the same are constructed and combined together, as and for the purpose described.

6. The arrangement whereby one detent serves to secure in position two of the type wheels, as specified.

83,254.—CHARLES F. CHAMBERS, Hutsonville, Ill.—*Washing Machine.*—October 20, 1868.—A series of concave, corrugated, and yielding fingers, each having a pin encircled by a spiral spring, is hinged by a bolt to the yielding frame, the front edge of which is upheld by spiral springs, its rear edge resting on the tank bottom. Arms and a pin of vibrating rubbers are hung to a frame, and the pressure is adjusted as required.

Claim.—1. The peculiar construction of the said board, namely, the inclined and yielding frame D, supported in front on springs E, and at back on or near the tub bottom, and having hinged to its front and upper edge the series of concave, corrugated, and yielding fingers G, whose lower ends are supported on springs I, in combination with a vibrating rubber.

2. The yielding and swinging frame K, having the double rubber L L', and handle P, in combination with a yielding, concave board, substantially as set forth.

83,255.—LEWIS S. CHICHESTER, Brooklyn, N. Y.—*Grain Drier.*—October 20, 1868.—Vertical air tubes, passing through the grain, and their upper ends being a little above it, have their lower ends near the bottom of the grain spaces, the warm air blowing it through the tubes to the upper part and drying it.

Claim.—A grain drier, formed with air tubes running through the grain space, and open at both ends, substantially as specified, whereby a current of air causes a circulation of the mass of grain during the drying operation, substantially as set forth.

83,256.—T. M. CLUXTON, Rising Sun, assignor to himself and GEORGE B. GARLINGHOUSE, of North Madison, Ind.—*Head Block for Carriages.*—October 20, 1868.—In a groove in a shank of the T-shaped head block is imbedded the front end of a reach having a supporting plate, on which reach, and in the recesses of the shank, side braces are secured by bolts.

Claim.—In the T-shaped head block A B for carriages, the combination of the recessed extension arm B with the supporting plate D, and braces E E, arranged as herein described and set forth.

83,257.—A. V. CONKLIN, Bennington, Ohio.—*Beehive.*—October 20, 1868.—The hive is placed obliquely to the platform of a frame, its upper sides being hinged to the case, the vertex of which coincides with that of the comb frames, the honey boxes being placed upon and in connection with them by bee passages cut in their sides.

Claim.—1. The square or angular case B, folding roof or doors D, when said case is elevated upon the vertex of the angle of its sides, in the manner as and for the purpose specified.

2. The angular frames F, when arranged within the case B, so that the vertex of the angles of said frames shall coincide with the vertex of the angles of the case, in the manner and for the purpose set forth.

3. The honey boxes G G', frames F, doors D, and case B, combined and arranged, in relation to each other, in the manner and for the purpose substantially as described.

83,258.—WILLIAM CONWAY, Rushville, N. Y.—*Seat Lock for Carriages.*—October 20, 1868.—A bolt, rigidly attached to the seat, is connected to, or disconnected from, the socket fixed to the body, by means of a sliding key, so that the seat may be put on or off at pleasure.

Claim.—The bolt *b'*, provided with the tongue *b''*, in combination with the sliding key *c* and the socket *a*, as and for the purpose set forth.

83,259.—WILLIAM CUSTER, Shannondale, Ind.—*Cultivator*.—October 20, 1868.—Three or more fingers, joined at one end to a long crooked bar, fastened to the plow beam by a bolt, nut, screw, and head, form a shield to catch clods or stones thrown out by the plow, and prevent them from falling on the plants.

Claim.—A shield or fender attachment to a plow, constructed and operating substantially as herein specified, and for the purposes mentioned.

83,260.—G. A. DABNEY, San José, Cal.—*Washing Machine*.—October 20, 1868.—To the swinging bars are pivoted the rear ends of the side bars, with which the grooved rubber is so arranged that it may turn freely. Rollers are attached to a removable frame in the tub, and are arranged in a curve corresponding with that of the rubber block.

Claim.—The reversible rubber G, constructed as described, in combination with the side bars F, swing bars D, and removable rubbing platform K L, substantially as herein shown and described, and for the purpose set forth.

83,261.—BENJAMIN DARLING, Bridgewater, Mass.—*Bit Stock*.—October 20, 1868.—The sliding jaws inclose the socket shank of the stock, pass below it, and are loosely attached to a lever, the fulcrum of which is on an arm of the stock, and while they have full sliding play, all lateral movement is prevented by a band on the socket end of the stock.

Claim.—In combination with a bit stock, the sliding jaws B B, whereby a bit or anger is fastened to the stock, substantially in the manner herein shown and described.

83,262.—REUBEN B. DE BARE, Philadelphia, Pa.—*Sawing Machine*.—October 20, 1868.—A series of cross-cut saws are so arranged and combined with a series of racks, pinions, guide plates, lever, and grooved frame, as to operate with a reciprocating motion, the wood being held in a V-shaped rack.

Claim.—The arrangement of the half-pinion U with its reciprocating double rack V, guide Y, with its adjustable lever G, grooved frame C, guide plates D D, and wood racks K K, with their curved rack lever L, when combined and operating with the adjustable cross-cut saws B B, as herein described, and for the purposes set forth.

83,263.—CHARLES DECKER, New Michigan, Ill.—*Bee House*.—October 20, 1868.

Claim.—The bee house, constructed as described, and divided into compartments *a b* by the central partition *c*, each compartment adapted to receive in its lower part the suspended comb frames B E, above which the ordinary hive D is placed, supported on slats *h*, and communicating with the entrance *g* by means of the board *h'*, as herein shown and described.

83,264.—IRA DIMOCK, Florence, Mass.—*Apparatus for Boiling Eggs*.—October 20, 1868.—An inside cylinder, closed at its lower end, and containing an expanding fluid, rests on a larger cylinder, leaving an air space between the two, the upper end of the smaller cylinder being closed by a rubber diaphragm, secured by a cap screwed on the outer case.

Claim.—1. The use, in an apparatus for boiling eggs, of a fluid, surrounded by a slow heat-conducting material or air cavity, substantially as described, in combination with a bell or other sonorous annunciator, the striking hammer of which is actuated to strike the same, from the expansion of the said fluid, all as set forth.

2. The use of a fluid in a case arranged to act, by expansion, on a piston or diaphragm, which will transmit movement, so as to release a catch and ring a bell, all substantially as shown and described, and for the purpose set forth.

3. An egg-boiling apparatus, when constructed substantially as herein shown and described.

4. The combination, in an egg-boiling apparatus, of an egg receptacle, *a*¹, of any suitable form, with a case, *b*, inclosed by another case, *c*, to retard the penetration of heat to a fluid within the inner case, substantially as described.

83,265.—JAMES DOOLING, Boston, Mass.—*Ice-cream Freezer*.—October 20, 1868.

Claim.—1. The means, herein described, of coupling the cream holders and beaters to the operative mechanism, and uncoupling the same, by giving to the sleeve shafts O O and the spindles S S a vertical motion up or down, by means of the lifting bar P and the levers Q, or their equivalents, substantially as described.

2. The within-described arrangement of mechanism, or its mechanical equivalent, for controlling the operation of the cream holders and beaters, so that the cream holders may be made to rotate while the beaters remain inoperative, or the beaters may be rotated while the cream holders remain inoperative, or both the cream holders and the beaters may be rotated at the same time in opposite directions, substantially as described.

3. The combination, with the two separate trains of gearing for transmitting the motion of the vertical driving shaft G to the cream holders and beaters, of a locking device for each, substantially as described.

4. Forming the interior of the ice tank so that its surface shall be approximately concentric to the exterior of a group of cream holders, substantially as described.

5. Mounting the ice tank and contents upon a carriage moving on rails, in combination with stationary driving mechanism, operating substantially as described.

6. The guides Z Z and the locking bolt Y, in combination with an ice tank mounted on a carriage, substantially as described.

7. The central beater wings *h h*, attached to either side of the beater shaft, and curved partially around said shaft, parallel to its axis, when so constructed and applied that a free passage for the cream is left between its edge and the walls of the cream holder, substantially as described.

83,266.—JOHN H. DOUGLASS, Meriden, Conn.—*Sash Fastener*.—October 20, 1868.—Within the case is a bolt, with a spring that forces it out, connected with a follower which receives a spindle, and also operates a lever forced down by a spring. The case is inserted into the window jamb, so that the face plate will be inclined to it, on and between which and the sash is a roll raised by the lever.

Claim.—The follower F, bolt E, and lever I, combined with the roller L and incline C, when constructed and arranged to operate in the manner and for the purpose substantially as described.

83,267.—WILLIAM G. DUCE, Baltic, Conn., and ALBERT C. EDDY, Providence, R. I.—*Filling Forks for Looms*.—October 20, 1868.—A portion of the fork, made of India-rubber, is attached to the metal portion by a socket in which it is screwed, the prongs being covered near their tips with shields of thin sheet metal.

Claim.—The combination, with the filling fork, having tines of India-rubber, or other flexible and elastic material, of the protecting metallic shields *c c*, substantially as described.

83,268.—THOMAS DUTTON and THOMAS MA-GUIRE, Port Jervis, N. Y.—*Water Charger for Pumps*.—October 20, 1868.—The charger has two channels close to and in line with each other, the upper one having a coupling seat for the pump, and the lower one with another for the well pipe. The sand is removed through a hole at the top.

Claim.—1. The arrangement of the channels *b* and *c* in relation to the body of the charger, as herein recited.

2. The charger *a*, with its channels *b* and *c*, and port or hole *f*, all substantially as shown and described.

83,269.—DANIEL S. EARLY, Hummelstown, Pa.—*Buggy Top Fastening*.—October 20, 1868.—The jointed bars, when depressed so as to occupy a horizontal position, prevent the disengagement of the parts which secure the buggy top frame to the seat. When the joint of said bars is thrown upward, the relative positions of the parts are so altered as to permit the ready removal of the top frame.

Claim.—The jointed bars M, in combination with

the arm *n n* and sockets *o o*, as and for the purpose described.

83,270.—JOHN S. FENNER, Warren, R. I., assignor to INMAN MANUFACTURING COMPANY.—*Reel*.—October 20, 1868.—Designed for winding silk braid and other threads. By removing a pin, the hinged arm can be turned inward and the reel contracted so as to admit of the removal from, or application to, it of a hawk of thread. The pulley answers the purpose of a frame for carrying the reel arms.

Claim.—The hinged arm *C'*, applied and retained in position, as described, in combination with the immovable arms *C*, and the pulley *A*, all constructed in the manner and for the purpose described.

83,271.—A. M. FRANKLIN, W. J. HASTINGS, and J. A. HOLFORD, Rising Sun, Ind.—*Combined Corn Planter and Shovel Plow*.—October 20, 1868.—By the revolution of the wheel the lever is vibrated and the box thereby raised above the bottom of the hopper, so as to be filled with grain, and then carried below the hopper where the grain is discharged.

Claim.—1. The combination of the hopper *K*, wheel *O*, lever *N*, bar *S*, and box *T*, all constructed as described, and supported by the cross bar *H* and bar *I*, substantially as and for the purposes herein set forth.

2. A double shovel plow, in combination with a movable corn planter, when both are constructed substantially as herein described, and operating as and for the purposes set forth.

83,272.—JESSE P. FREEMAN, Dalton, Ga.—*Car Coupling*.—October 20, 1868.—The lower hook usually holds the link, but the upper one catches and holds it if it jumps out of place. In coupling, the link may be thrown down from an upright position by means of the rock shaft, or by the concussion of the colliding cars, it being held in the upright position by the serrated arm, in which its toe catches.

Claim.—1. The arrangement of two beaks or hooks *b b'*, upon a single draw head, in the position relatively with each other, substantially as shown and described, and for the purpose specified.

2. The combination of a link, *D*, having the toe *n*, and operating as described, with a rock shaft, *E*, supported by the end of the car above the draw head, and having attached to it a curved serrated arm, *I*, and a rope or crank for moving it, the whole operating together in the manner substantially as described, and for the purpose set forth.

83,273.—FRANK FULLERTON, Williamsport, Pa.—*Tonic Bitters*.—October 20, 1868.—Wild cherry bark, gentian root, sweet marjoram, angelica seed, calamus root, galangal, cloves, nutmegs, cardamom seed, orange peel, green paradise, caraway seed, cinnamon, coriander seed, lavender flowers, Virginia snake root, ginger root, juniper berries, simple sirup, and spirits of wine.

Claim.—The within-described compound for tonic bitters, made of the ingredients and in the proportions as above set forth.

83,274.—MORGAN GALE, San Antonio, Mexico.—*Construction of Pick Axes*.—October 20, 1868.—Designed to prevent the pick from becoming loose upon the handle.

Claim.—The detachable socket *C*, constructed with a base, *c¹*, with or without the side or brace flanges *c²*, in combination with the pick head *B*, substantially as herein shown and described, and for the purpose set forth.

83,275.—GEORGE GIRTY, Rainier, Oregon.—*Lubricator for Steam Engines*.—October 20, 1868.—When the inlet pipe and the two connected valves are held down by the lever and spring catch, the upper valve is closed, cutting off communication between the oil chamber and admission tube, and the lower valve is open, permitting the oil to flow from the oil chamber to the cylinder. Upon releasing the lever the lower valve is closed by steam pressure, and then the lever may be raised by hand to open the upper valve and permit the oil chamber to be replenished.

Claim.—The two valves *L I*, pipes *B E*, oil cham-

ber *D*, and lever *F*, all constructed and arranged to operate in the manner substantially as and for the purpose set forth.

83,276.—JOHN H. GLEIM, St. Louis, Mo.—*Binding Mercantile Books*.—October 20, 1868.—Consists in connecting together the copying, bill, or sales-book and journal, and an arrangement of entry columns and blank pages in the journal, with a view to simplify the record of the business and lessen the number of books.

Claim.—The combination of a journal or entry book, *B*, with the press copying book *A*, into one volume, substantially as herein shown and described, and for the purposes set forth.

82,277.—S. A. GOODWIN, Buffalo, N. Y.—*Wash Boiler*.—October 20, 1868.—The washing solution, being heated, is forced upward through the central tube and then percolates through the clothes to the bottom. The dirt which separates itself from the washing solution by deposition is retained in the upper and lower pans.

Claim.—1. In a wash boiler, the separation and collection from the washing solution of the dirt discharged from the articles washed, automatically, by subsidence or deposition, by means of an elevated pan or pans *E*, or their equivalents, placed at some point or points on the line of circulation, as set forth.

2. The plate *B*, with its two rims and the settling pan *E* combined, substantially as and for the purposes described.

82,278.—S. A. GOODWIN, Buffalo, N. Y.—*Wash Boiler*.—October 20, 1868.—The washing solution is carried up by the force of heat or steam from a chamber under the clothes, through the tubes to the top of the boiler, and, being discharged upon the top of the clothes, percolates to the bottom. The solution circulates through filtering chambers which retain the dirt.

Claim.—1. In connection with wash boilers of the class above mentioned, the filtration of the washing water automatically, as herein set forth.

2. The inclined imperforated plates *D*, bars *b'*, plates *B*, and rim *g*, combined together, and arranged with the boiler *A* and pipe or pipes *C*, substantially as and for the purpose described.

83,279.—H. A. GRAEF, Brooklyn, N. Y.—*Method of Destroying Insects in Trees and Plants*.—October 20, 1868.

Claim.—The described process of exterminating caterpillars and measure worms, consisting in forcing a stream of water, containing chloride of lime, against the tree in which the insects are found, as herein shown and described.

83,280.—MARTIN HAAS, New York, N. Y.—*Compound for Destroying Insects*.—October 20, 1868.—Consists of benzine, sulphurous ether, camphor, and *oleum sinapis*.

Claim.—The compound admixture in the proportions specified, and for the purpose set forth.

83,281.—F. R. HARBAUGH, Philadelphia, Pa.—*Egg Holder*.—October 20, 1868.—The instrument is designed for conveniently grasping and holding hot boiled eggs.

Claim.—The within-described egg holder, composed of a base, *A*, two elastic arms, *B* and *B'*, and two sections, *D D*, of a cup, or the equivalent to the same, the whole being constructed and arranged substantially as and for the purpose herein set forth.

83,282.—SAMUEL HOKE, Mount Pleasant, Md.—*Chimney*.—October 20, 1868.—The vane, revolved by the wind, communicates motion to the wire cleaners, which prevent soot from collecting against the sides of the chimney.

Claim.—1. The combination of the self-acting cleaners *M*, with the guides *K*, when constructed with and operated by means of the vane *N*, as herein described, and for the purpose set forth.

2. An iron tubular chimney, in sections, with a fire-place *A*, radiator *B*, reel *P*, cleaners *M*, and vane *N*, when constructed, combined, and operated as herein described, and for the purposes set forth.

83,283.—H. R. HUIE, Hayward's, Cal.—*Gang Plow*.—October 20, 1868.—The frame of the plow is connected to the crank-axle through the medium of the plate, which is cast with the ears and boxes. The axle is used for raising and lowering the plow frame, and means are provided for adapting one wheel to the furrow, and for adjusting the tongue.

Claim.—1. Securing the arm *e* of the axle *f* to the axle-tree *a* by means of the eye bolt *i*, as shown and described.

2. The crank bolt *g*, in combination with the eye-bolt *r*, for adjusting the tongue, as herein set forth.

3. The arrangement and construction of the plate *l*, ears *m*, and boxes *n*, which allows of their being cast as one piece, as herein described.

83,284.—ARTHUR JAMES, Redditch, England.—*Envelope for Needles*.—October 20, 1868.—A flat tube, open at both ends, is formed of paper, and provided with a flap at one end. The tube is folded at about its middle, and a paper, in which the needles are stuck, is inserted within the flap end of the tube.

Claim.—A needle case or wrapper, made from a blank, formed and folded as herein described, and illustrated in the accompanying drawings.

83,285.—GEORGE B. JENKINSON, Newark, N. J.—*Trunk Handle*.—October 20, 1868.—The clasps freely slide back and forth on the attaching plates, permitting the handle to adjust itself to the hand when grasped, and resume its extended position when released.

Claim.—1. The sockets or plates *C C*, constructed with the hollow shoulders or elevations *a a*, with an aperture or opening between them, arranged and operated substantially as and for the purpose set forth.

2. The clasps or plates *D D*, provided with projections *d d*, working in the sockets or plates *C C*, as and for the purpose set forth.

83,286.—WILLIAM JOHNSTON, Cincinnati, Ohio.—*Window Blind*.—October 20, 1868.—The bushings relieve the slats of friction upon their axial rods, and prevent attrition at the ends.

Claim.—1. The through cylindrical rod *B*, fixed rigidly in the stiles, as an axle for a slat in window blinds, shutters, doors, and lower windows or openings to turn upon, substantially as herein described.

2. The metallic slat, when formed with a tubular or hollow spine running longitudinally through the same, and made to turn on the said cylindrical rods.

3. The bushings *D*, when provided with the annular flange *d*, adapted to form a washer at the end of the slat, for the purpose specified.

83,287.—JOHN JULIEN, Christiansburg, assignor to himself and JOHN F. HERR, Springfield, Ohio.—*Whip Socket*.—October 20, 1868.—The whip is secured in the socket, and requires a key to release it.

Claim.—A whip socket, constructed with a lock, *D*, having a spring bolt, *D'*, and flexible chain *C*, notched curved piece *C'*, and spring *C''*, arranged to operate in combination, substantially as set forth.

83,288.—SAMUEL C. KENAGA, Kankakee, Ill.—*Dumping Platform*.—October 20, 1868.—The wagon is anchored to the platform so that it cannot back while the load is being dumped. The main lever may have its long arm depressed by a "shaft" which is held down by a hasp when the lever is in a position to support the platform flush with the floor.

Claim.—The arrangement and construction of the floor *B*, dumping platform *C*, rods *X*, and hub rings *y'*, lever *K*, shaft *S*, hasp *p'*, dogs *M*, lever *O*, and trap-door *Q*, in combination with posts *A*, *G*, and *I*, axle *D*, caps *F*, friction roller *S'*, fulcrum *L*, rest *N*, spout *T*, and bin *t'*, substantially in the manner and for the purposes herein shown and described.

83,289.—JOSHUA KIDD, New York, N. Y.—*Apparatus for Carbureting Gas*.—October 20, 1868.—An improvement on his patent of March 12, 1867. An annular projecting lip on the lower part of the carbureting vessel reflects the heat against the lower part of the vessel.

Claim.—1. The combination of interceptors, as *H I*, or any other suitable form or construction, inter-

posed between the carbureting vessel *A B* and the burners of the same, to screen the heat from the lower part of the said vessel, and deflect it so as to act on or near the surface of the contained oil or carbureting fluid, all substantially as shown and described, and for the purpose set forth.

2. The reflecting lip *d*, substantially as described, in combination with the carbureting vessel *A B* and interceptor *H I*, all as set forth.

83,290.—LEWIS KING, Oriskany Falls, N. Y.—*Weeding Hoe*.—October 20, 1868.—The hoe and shank are formed in one piece and the form is adapted for working around delicate plants.

Claim.—The weeding hoe, substantially as herein shown and described, as a new article of manufacture.

83,291.—M. C. LONGACRE, Cleveland, Ohio.—*Step Ladder*.—October 20, 1868.—A brace is hinged at one end to legs and is provided with a slotted metallic plate at the other end which is secured to the ladder by a button. When not in use the brace is folded back and held by a button on the legs.

Claim.—The slotted metallic plate *b c*, in combination with the hinged brace *D*, and buttons *d e*, when used in connection with a step ladder, substantially as and for the purpose described.

83,292.—SAMUEL L. LOOMIS, Byron, N. Y., assignor to himself and CHARLES E. WALTER, same place.—*Sash Holder*.—October 20, 1868.—When the sash is raised the rollers descend to the bottom of the recess; but when the sash is lowered the rollers move up the incline by the traversing of the slide, and, being compressed into a narrower space, press the slide against the side of the frame.

Claim.—The traversing slide *B*, arranged in a groove in the side or edge of the sash, with the mortises *D* in said groove, with inclined bottoms, and the rubber or elastic rollers, arranged in the mortises as described.

83,293.—A. J. LITTLE, West Union, Ohio.—*Button-hole Cutter*.—October 20, 1868.—A brass plate secured to the upper part of the lower jaw, by a bolt sliding in a slot in the jaw, acts as a gauge for the position of the button-hole.

Claim.—The slotted plate *E*, in combination with the slotted jaw *B*, of a button-hole cutter, as herein described, for the purpose specified.

83,294.—JOHN A. MACKINNON, Cleveland, Ohio.—*Holdback for Carriages*.—October 20, 1868.—On reversing the position of the yoke the tongue is thrown down and the yoke can be released. The hook is attached to the shaft by a continuous band which is held by a key.

Claim.—1. The loop *F* and yoke *D*, arranged at right angles to each other, or nearly so, the latter passing around hook *B*, and provided with the bar, having arms *E*, substantially as and for the purposes set forth.

2. The continuous band *I*, attached to the hook, in combination with the key *J* and shaft *A*, substantially as and for the purpose set forth.

3. The loop *F* and yoke *D*, provided with the cross bar and arms *E*, in combination with the hook *B* and tongue *C*, substantially as and for the purpose set forth.

83,295.—WILLIAM R. MALONE, Mason City, West Virginia.—*Safety Valve*.—October 20, 1868.—The fire is checked when the pressure of the steam in the boiler is greater than desired by the escaping steam from the safety valve being conducted into the fire.

Claim.—The arrangement of the safety valve *B*, exhaust pipe *D*, provided with pipe connections, communicating with the furnace, the extension tube *C*, and boiler *A*, substantially as described.

83,296.—JOHN MARSH, Seneca, Ill.—*Ditching Machine*.—October 20, 1868; antedated September 28, 1868.—A shaft provided with a toothed roller which actuates the slotted apron, receives motion from gearing on the wheel. By means of a lever the plow and apron can be raised from the ground. *A*

shoe prevents the apron from rubbing on the ground. A double brace sliding on a guide regulates the inclination of the plow.

Claim.—1. The combination of the lever G, shaft F, roller H, and apron I, with the lever L, plow K, apron frame J, and shoe M, substantially as and for the purpose described.

2. The combination of the wheels C C', frame A, beam K, double brace N, guide O, and brace P, substantially as and for the purpose described.

83,297.—HENRY MARTIN, Keyport, N. J., assignor to JAMES H. RENICK, New York, N. Y.—*Brick Machine.*—October 20, 1868.—The end plates are pressed against the end surfaces of the press box by the clay acting against the underlapping edges of said bar, thus preventing the escape of clay up past the end of the plunger. The turn buckle increases or diminishes the throw of the pusher.

Claim.—1. The plunger I, constructed in sections, essentially as described, by combining, with the main plate or body of the plunger, loose end bars, *rr*, and a front plate or bar *u*, adjustable, relatively to the main body, substantially as and for the purpose or purposes herein set forth.

2. The application to the rod O, to which the spring hook is attached, of the turn buckle U, in the manner and for the purpose set forth.

83,298.—F. S. McWHORTER, St. George's, Del.—*Grain Weighing and Tallying Machine.*—October 20, 1868.—The bag rests on a support pivoted to one end of a steel rod, which latter is secured to plates to which the choking plate is attached. When a proper quantity of grain has entered the bag its weight causes the support to drop and the choking plate obstructs the further passage of the grain.

Claim.—1. The sleeve V and choking plate W, or the equivalent thereof, in combination with the steelyard J, weight K, sack holder L L T, and spout A, all substantially as shown and described, and for the purpose set forth.

2. The steelyard arm J, having a rigid connection with the choking plate W, and loose connection with the sack holder L L T, or its equivalent, all substantially as and for the purpose shown and described.

3. The sack holder L L T, or its equivalent, in combination with the steelyard arm J, weight K, and spout A, for the purpose of thrusting in a plate, W, to shut off the flow of grain, substantially as shown and described, and for the general purpose set forth.

4. The band Q and clips *ff*, substantially as shown and described, in combination with the plates L, all as and for the purpose set forth.

5. The catch lever *b* and spur wheel *d*, constructed and operating as shown and described, in combination with the choking plate W and any tallying mechanism, all as and for the purpose set forth.

6. The arrangement of the tallying mechanism, consisting of the shaft *k*, bearing the worm *l*, gear *h*, and pointer *a'*, the shaft *i*, provided with the worm *j* and spur wheel *d*, the pinion *g* and pointer *a*, on shaft *m*, all combined to operate as set forth, in connection with the weighing mechanism.

83,299.—JOSIAH MUNFORD, Clarksburg, Ohio.—*Process of Preserving Potatoes.*—October 20, 1868.

Claim.—The above-described process of preserving potatoes, viz., by dusting or sprinkling them with lime, and then packing them away in a composition of lime and loam or sand, as herein described and represented.

83,300.—FREDERICK G. NIEDRINGHAUS, St. Louis, Mo.—*Construction of Metallic Spoons.*—October 20, 1868.

Claim.—1. A metallic spoon, fork, or similar utensil, provided with a handle, concaved or dished longitudinally on the upper side thereof, being curved from edge to edge, substantially as herein set forth.

2. Folding over or bending outwardly the edges of a fork, spoon, or similar utensil, at the juncture of the handle with the head or bowl thereof, substantially as herein set forth.

83,301.—FREDERICK G. NIEDRINGHAUS and WILLIAM F. NIEDRINGHAUS, St. Louis, Mo.—*Coal Hod.*—October 20, 1868.

Claim.—A coal-hod bottom, stamped up out of an unbroken piece of sheet metal, when provided with an upwardly-projecting flange, formed to receive, encircle, and embrace the lower edge of the body of the hod, substantially in the manner and for the purpose herein set forth.

83,302.—JOHN A. NICHOLS, Paterson, N. J.—*Valve for Pump.*—October 20, 1868.—One part of the valve case is an outer cylindrical shell provided with perforations at the bottom which form the seat for the valve. The other consists of a perforated plate covering the top of the shell from which depends an annulus with a rubber packing on its under side, which forms a stop for the upward movement of the valve, the latter being perforated and provided with a rubber face.

Claim.—The valve case A A', in combination with the valve B, constructed and arranged to operate as described.

83,303.—GEORGE PALMER, Littlestown, Pa.—*Railway Rail Joint.*—October 20, 1868.—The fish piece is high enough to support the car wheel when passing over the butt end of the rails and prevents their being battered.

Claim.—1. The fish piece C, lapping the rail joint B, its upper surface as high as the level of the top of the rail, in length sufficient to rest upon two or more ties, and secured to said ties, independent of the fastenings of the rail.

2. A wooden fish piece, provided with a metallic plate on its upper surface, lapping the rail joint B, substantially as and for the purpose set forth.

3. A fish piece, lapping the rail joint B, and constructed with the grooved ends as shown and described, for the purpose of enabling cars to regain the track, after having been thrown therefrom, as set forth.

83,304.—ISAAC H. PALMER, Lodi, Wis.—*Harvester.*—October 20, 1868.—The platform on which the grain is delivered is placed behind the cutter and is tilted at every revolution of the reel by a cross bar on the latter coming in contact with an arm secured to the inner end of the pivoted part of the platform so as to deliver the sheaf upon the ground.

Claim.—The combination of a reel, having the cross bar N, as described, with the tilting platform, operated by the cross bar at every revolution of the reel, substantially in the manner described and shown.

83,305.—GEORGE PANCHOT, Hastings, Minn.—*Carriage Step.*—October 20, 1868.—A platform attached to the lower edge of the carriage body is provided with eyes at its inner edge into which the hooks on the end of the right-angled removable step fits.

Claim.—The attachable and removable carriage step, constructed substantially as above described.

83,306.—FRANCIS PARKER, Petaluma, Cal., assignor to himself and C. W. ORMSBY, same place.—*Mortising Machine.*—October 20, 1868.—The construction of the gauge rod obviates the necessity of marking off the mortises.

Claim.—The gauge rod B, with the slides D E F G, or their equivalents, together with the stops R S T U V W, when constructed substantially in the manner and used for the purpose above described.

83,307.—W. N. PEIRCE, West Boylston, Mass.—*Wash Boiler.*—October 20, 1868.—The water and suds, after passing through the clothes, descend through the continuous space and is re-heated and thrown up again through the tube.

Claim.—The combination, with the boiler, of the inclined and perforated base F, and its central tube, supported upon legs or standards above the bottom of the boiler, in the manner described, so that a continuous space, *c*, shall intervene between the periphery of the base and the sides of the boiler, as and for the purposes set forth.

83,308.—JOHN G. PERRY, Kingston, R. I.—*Meat Cutter.*—October 20, 1868.—A curved plate provided with grooves to hold the knives is fitted in the bottom of the case.

Claim.—The curved or hollow plate D, with openings, made substantially as described, for the purpose of holding the knives of a meat cutter.

83,309.—WILLIAM PHELAN, Peoria, Ill.—*Condenser.*—October 20, 1868.—Designed for condensing the exhaust steam and at the same time employing it as a means for heating water to be supplied to steam boilers.

Claim.—1. A central crowning cone, C, applied within the cones J F, so as to form a condensing chamber B, surrounded by a cool-water chamber F, substantially as described.

2. Cones C F, connected by a concavo-convex bottom, E, when these cones are arranged substantially as and for the purposes described.

3. The jacket J and its concavo-convex bottom G, with the cones C F, constructed and arranged substantially as described.

4. The valve T, arranged with relation to the internal extension of feed pipe D, substantially as described.

5. The deflecting pipe U, applied over the condenser, in combination with outlets a through the feed pipe D, substantially as described and for the purposes set forth.

6. The arrangement of outlet pipes O with relation to chamber F' and the outer jacket J G, substantially as described.

7. The arrangement of the valve R with relation to chamber B¹ and passage S, substantially as described.

8. The valve T, arranged with relation to the internal extension of feed pipe D, substantially as and for the purposes described.

9. The deflecting plate U, applied over the condenser, in combination with the outlets d through the feed pipe D, substantially as and for the purposes described.

83,310.—JAMES T. PIERCY, Martinsburg, Ohio.—*Ironing Table.*—October 20, 1868.—Standards placed diagonally with each other are pivoted at the center to a bar and secured at their ends by cross braces, to one of which is fixed one end of the table, and on another rests its other end, one end of a rod beneath it being fastened to its lower side and the other to one of the braces.

Claim.—The supporting frame F, bar or support e, standards A A, and ironing board d, all constructed and arranged substantially as set forth.

83,311.—FREDERICK POST, Plano, Ill.—*Pulverizing Land Roller.*—October 20, 1868.—The roller is made with grooves, into which the teeth of the scraper fit. The markers are made adjustable in height, to be used or not, as required.

Claim.—The roller A, in combination with the scraper B, markers C, sills K K, cross bars L L, bearings G, and tongue E, all constructed and operating substantially as described.

83,312.—JAMES P. PRESTON, Monroe, Wis.—*Fanning Mill.*—October 20, 1868.

Claim.—1. The frame M, hung to the faces A A by the metallic strips, as described, in combination with the spiral springs, substantially as described.

2. The combination of the spout Z and screens K and L, the latter being provided with the door a and button a', as and for the purposes set forth.

83,313.—J. WALTER PYNE, Danville, Ill.—*Fruit Drier.*—October 20, 1868.—The dry house is made with alternate steam spaces and those in which are fruit drawers, both arranged vertically, the steam spaces communicating at each end by pipes.

Claim.—The combination of the perforated drawers with the surrounding steam spaces, each one of which spaces is provided with an induction pipe, substantially as shown and described.

83,314.—JOSHUA S. RACKHAM, Waterport, N. Y.—*Corn Shelling Machine.*—October 20, 1868.—A vertical, cylindrical shell made in sections divided into segments, hinged at one end, the other, swing-

ing outwardly against springs, has within it a vertical cylinder provided with teeth. In the inside of the shell are also teeth.

Claim.—1. A hollow toothed corn-shelling cylinder, composed of yielding segmental sections, substantially as and for the purpose described.

2. The combination, with the same, of the cylinder H, substantially as and for the purpose described.

3. The combination, with the cylinder H and shell B, of the screen and fan blower, substantially as and for the purpose described.

83,315.—ELLERY P. RALPH and JAMES HAMAN, Gallipolis, Ohio.—*Straw Cutter.*—October 20, 1868.—The knife has at its front end a collar attached to an eccentric wheel, the rear end being fixed to jointed levers attached to the shaft, and also to a guide. A crank on the shaft passes through a slot in the end of a connecting lever fastened to a bell crank lever.

Claim.—1. The eccentric cam wheel E, collar and lever e and d, and guide b, to which the knife F is attached in combination with the frame D, constructed substantially as described, and operating as and for the purposes set forth.

2. The shaft e, crank f, lever g, crank lever h, rod g', lever i, and pawls i' and j, in combination with wheels k' and k and rollers m m, substantially as described, and operating as and for the purposes set forth.

83,316.—THOMAS L. RANKIN, New Richmond, Ohio.—*Refrigerating House.*—October 20, 1868.—Under the ice floor are freezing pans for reducing the temperature, and above the ice is an air tight wooden follower lined with galvanized sheet iron, and having a lip of rubber.

Claim.—1. Ice follower h, constructed and operating substantially as and for the purposes described.

2. The combination of ice floor e and pans e' e', operating together, for the purposes explained.

3. The combination of ice floor e and follower h, operating together, substantially as and for the purposes explained.

83,317.—ISAAC RANNEY, Delaware, Ohio.—*Varnish.*—October 20, 1868.—Rosin is thoroughly melted at a high heat and then reduced in temperature, and benzine or benzole heated to the boiling point is then added.

Claim.—1. The varnish, compounded substantially as above described.

2. The process herein set forth of making the above-described varnish.

83,318.—EMANUEL RAU, New York, N. Y.—*Fastener for Collars and Neck Ties.*—October 20, 1868.

Claim.—The stud A, having an inclined side slot g, as described, in combination with the pointed arm d e, doubled or jointed at f, and having both a forward and lateral spring, when the parts are constructed to operate substantially as described.

83,319.—JOHN JAY REA, Cadiz, Ohio.—*Elevator.*—October 20, 1868.—A forked truck runs upon a beam which is provided with hooks for suspending it in any desired place. A trigger retains the truck in place until tripped, when the load is carried along and dropped in the proper place by the automatic tripping of the hook which holds the weight.

Claim.—The beam A, hooks B B, forked truck C, provided with wheels D D and E, trigger L, pulley E, cords G K I, and weight H, all combined and operating substantially as herein set forth.

83,320.—GEORGE W. RICHARDSON, Troy, and HENRY WATERMAN, Hudson, N. Y.—*Steam Safety Valve.*—October 20, 1868.—The valve is held down by a spring resting upon the plate of a spindle, the pressure of the spring being varied by a spider screwed into the case. The spider is held in place by a flange on the cover, which latter is secured by bolts, the nuts of which are inclosed and concealed within ends of an arched lock-up bar. The lock-up bar is fastened by a padlock and staple passing through a hole in the center.

Claim.—1. The lock-up bar or arch J J, constructed substantially as shown and described.

2. The construction of the branch or escape passage N, substantially in the manner shown and described, it being so arranged as to prevent tampering with the valve or its adjustments.

3. The combination of the valve A, spring C, spider D D, cap I', and lock-up bar J J, substantially as shown and described.

4. The arrangement of the branch escape passage N, with reference to the valve A and spring C.

5. The arrangement of the lock-up bar J J; with reference to bolts I I, substantially as shown and described.

6. The arrangement of the spider D D, with reference to the spring C, substantially as shown.

7. The combination of the overhanging valve A, spring C, spindle E, and spider D D, or its equivalent, substantially as shown and described.

83,321.—MARTIN HENRY RUMPF, Paris, France.—*Railway-car Brake.*—October 20, 1868; patented in France October 17, 1867.—The brake block is attached to a lever, which is suspended from an axis eccentric to the axis of the wheel, and adapted to instantaneously stop the wheel when it comes in contact therewith.

Claim.—The combination, with a brake suspended, as described, of a sliding or rotating shaft, or a chain for raising and lowering the brake, either the shaft or chain being operated by any suitable mechanism, substantially as herein set forth and shown.

83,322.—GELSTON SANFORD, Bergen Point, N. J.—*Machine for Sharpening the Cutters of Mowing Machines.*—October 20, 1868.—An angular-faced, reciprocating grindstone is arranged to work over a transversely-adjustable bed, in which the cutter bar is so supported that the stone, working in the angle between two adjacent cutters, sharpens them both at the same time.

Claim.—1. The combination, with a holding bed, I, of a reciprocating grinder, arranged for adjustment relative to one another, substantially as and for the purpose set forth.

2. The combination, with the holding bed I, of the adjustable arms L, substantially as and for the purpose described.

3. The combination with the bed A of the holding bed I and reciprocating stone D, substantially as and for the purpose set forth.

4. The bed B, provided with the ways C, trough B, and sponges Q, substantially as and for the purpose set forth.

5. The arrangement of the sliding stone D, connecting rod G, crank shaft H, and stone P, substantially as and for the purpose set forth.

6. The combination with the reciprocating stone D, of the presser wheel O, substantially as and for the purpose set forth.

83,323.—MORITZ SAULSON, Troy, N. Y.—*Dinner Pail.*—October 20, 1868.—The arrangement of the inner vessel and pan divides the pail into several compartments for containing different articles of food, the vessels being used for culinary purposes, or as dishes when removed. The wire spring supports the vessel at any desired height within the pail. The spring bail, engaging with the notches, prevents the bail from swinging within the pail.

Claim.—1. The combination of the pail A, inner vessel B, arranged in the upper part of the pail, pan C, in the upper part of the inner vessel, and cover D, extended down outside of the pan, inner vessel, and pail, as herein described.

2. The combination, with the pail A and inner vessel B, of the removable wire spring K and groove or grooves L, formed and arranged substantially as and for the purpose herein set forth.

3. The combination, with the pail A and outside surrounding cover D, of the notches r r and wire-like spring bail N u, formed and arranged substantially as and for the purposes herein shown and described.

83,324.—F. M. SCHAEFFER, Blooming Grove, Kansas.—*Sawing Machine.*—October 20, 1868.—The lazy tongs connect the saw guide to a pivoted plate, which is adjustable, so as to adapt the saw to work in any desired plane. The guides are pivoted, so

that one alone may be thrown to the side of the saw by its spring while the other is resting upon the log. The swinging block supports the end of the log and throws it away from the log when severed.

Claim.—1. The arrangement of the guides M M and springs m m with relation to the guides G and the saw, whereby said guides M move independently of each other, to press upon the log being sawed, as herein described, for the purpose specified.

2. The guides of a reciprocating saw, supported on an adjustable, oscillating plate or support, K, substantially as and for the purpose described.

3. The combination, with the plate K and the saw guides, of the lazy tongs I, for the purpose of connecting the guides to the oscillating plate, and admitting of the rising and falling motion required by the saw in its passage through the log, substantially as and for the purpose described.

4. The swinging-block support Q, arranged as described, in combination with the log bed, substantially as and for the purpose described.

83,325.—JEROME SCOTT, Charleston, Pa.—*Washing Machine.*—October 20, 1868.—The bucket and press board are made to approach and recede from each other by the up-and-down movement of the handle. At every upward movement of the handle the clothes turn over in the bucket, and at every downward movement they are pressed.

Claim.—The swinging bucket D, as arranged and connected, by means of the arms K, with the press board H, and operated by the levers F and handle E, substantially in the manner and for the purposes herein shown and described.

83,326.—NICHOLAS SELBY, Flora, Ill.—*Horse Rake.*—October 20, 1868.—The rake frame is free to rise and fall with the surface over which the rake is drawn. When the rake is released by the depression of the forward end of the trip stick, it revolves so as to discharge the gathered hay and reverse the position of the two sets of teeth. The hinged frame and rake are raised and sustained by a lever and links.

Claim.—1. The arrangement of the hinged frame e, carrying the revolving rake within the rectangular, balanced frame a a a a, all constructed and combined to operate substantially as and for the purpose herein shown and described.

2. The notched trip stick u r, when hinged to the front cross-bar of the frame a, and combined with a spring w, whereby said stick a is actuated downward and held in contact with the rake head, as herein shown and described.

3. The described arrangement of the pivoted lever k, link l, and stirrup link n, with relation to the rectangular, balanced frame a and hinged rake frame e, as herein shown, for the purpose set forth.

83,327.—NANCY M. SELDEN, Chatham, Conn.—*Pie Tube.*—October 20, 1868.—The tube tends to draw the juice toward the center, preventing it from escaping at the edge of the pie while baking.

Claim.—As an article of manufacture, the cone-shaped tube A, provided near its lower edge with a series of holes, a a, substantially as and for the purposes herein set forth.

83,328.—WILLIAM G. SHATTUCK, Boston, Mass.—*Inkstand.*—October 20, 1868.—The inkstand is so secured as to require the aid of a wrench in removing it from the desk.

Claim.—The combination, with the ink well and its metallic case and cover, applied to a desk or like article, in the manner described, of a nut, E, arranged to hold said ink well and case in place, substantially as herein set forth.

83,329.—ALLEN SHERWOOD, Auburn, N. Y.—*Wash Boiler.*—October 20, 1868.—Soap and soda are put in the cylinder, and as the water boils it rises in the cylinder is discharged upon the clothes, through which it percolates to the chamber below the float; there the sediment remains while the water again passes upward through the tube.

Claim.—In a clothes washer, the wooden perforated float B, provided with a metal flange, C, tubes I I, and, at its center, with a circular hole,

covered with wire gauze, over which hole is placed a tapering cylinder, D, provided at its upper end with a circular perforated box, E, all constructed and operating substantially as and for the purposes herein set forth.

83,330.—J. SIEGRIST, New York, N. Y.—*Stop-motion for Warping Machine.*—October 20, 1868.—When the yarn breaks or runs out, one or more of the weights drop upon the board of the balanced frame, the lower bar of which is consequently moved to a position to be acted upon by the lifter of the drum. This action frees a mechanism so that it may respond to the draught of a spring and, by shifting a belt, stop the machinery.

Claim.—In combination with the weights G, suspended on or from the yarns, the balanced frames H, I, J, and K, arranged for operation by said weights, revolving shaft or drum L, provided with a lifter, f, and belt shifter, for throwing the yarn beam out of gear, all for action together, substantially as specified.

83,331.—CHARLES E. SMITH, Lowell, Mass., assignor to himself, JOHN S. JAQUES, and FRANK T. JAQUES, same place.—*Spindle for Shuttles.*—October 20, 1868.—The object to retain the cop on the spindle and prevent the same from being upset or separated by the sudden blows of the shuttle.

Claim.—A split shuttle spindle, notched or serrated on both sides, or on its entire circumference, substantially as and for the purposes set forth.

83,332.—P. W. SMITH, Chicopee Falls, Mass.—*Device for Fastening Shirt Collars.*—October 20, 1868.—An outer flange corresponds with the shape of the button holes in the ends of the collar, so that in connecting the same it serves to cover and conceal the button holes. The pin, entering one of the collar button holes, prevents the stud from turning.

Claim.—The combination of the plate A, necks a and b, with oblong and circular flanges, B and C, and pin D, the parts being constructed and arranged substantially in the manner and for the purpose set forth.

83,333.—B. L. SOUTHACK, New York, N. Y.—*Sefa Bedstead.*—October 20, 1868.—The projecting ends of the back serve as stops to arrest the bottom in the proper position when it is being slid in.

Claim.—The seat D, sliding in grooves a of the arm-rests B, and hinged at its rear edge to the back, E, which back is held up to the arm rests B by the catches e and projections f, all operating as described, whereby the back is turned down into a horizontal position, and then drawn forward into the grooves a with the seat D, until arrested by the projection f, whereby a continuous bed bottom is formed, as herein shown and described.

83,334.—LUCAS STADLER, Bowen, Ill.—*Combined Seeder and Cultivator.*—October 20, 1868.—Revolving knives serve to cut into small fragments the stalks, roots, &c., that may be in their path.

Claim.—1. The knives G, constructed and operating substantially as and for purposes set forth.

2. Combining in one machine the knives G, the seed-sowing box D, the sod breakers F, cultivator-plows K, and harrow O, substantially as specified.

3. A seed-sowing, cultivating, and harrowing machine, having seed box D, cylinder E, cranks a a, pitmen b b, cranks d, sod-breakers F, knives G, roller H, pins n, plows K, lever S, and harrow O, constructed and arranged substantially as specified.

83,335.—UPTON STANSBURY, Plymouth, Ind.—*Beehive.*—October 20, 1868.—When the honey boxes are removed, as is the case in winter, the openings in the upper partition are covered by a fine wire screen and the space above filled with straw.

Claim.—1. The breeding boxes C C, closed at their sides and ends, and slotted at the top and bottom, and provided with small glass windows and entrances, and connected to the cleats c c of box A, by means of their grooved sides, as herein set forth.

2. The arrangement of the outside box A with the breeding boxes C C, honey boxes D D, and side screens a and n, substantially as and for the purposes herein set forth.

83,336.—WILLIAM M. STEVENSON, Sharon, Pa.—*Balance Slide Valve.*—October 20, 1868.—Steam, admitted to the interior of the valve, exerts a sufficient downward pressure to counterbalance the upward pressure upon the walls which close the ports in the bottom.

Claim.—A steam valve, constructed as described, with a cavity, d, between the walls a a, and with packing strips e e, in grooves on the top of the walls, steam being admitted through holes i i, under said strips, pressing them up against the cap of the steam chest, substantially as and for the purposes herein set forth.

83,337.—WORDEN E. STODDARD, Fort Edward, N. Y.—*Weatherboard Gauges.*—October 20, 1868.—Improvement on his patent of May 17, 1859. The instrument is used for scribing and adjusting the boards so that their exposed surfaces may all be of the same width.

Claim.—The combined weather-board gauge and scribe, consisting of arms A B, slide E, the spur pivoted block H, hinged bar I, and sliding block J, and slotted knife K, all constructed and arranged to operate as herein shown and described.

83,338.—DANIEL F. TAFT, New Bedford, Mass.—*Corn Planter.*—October 20, 1868.

Claim.—1. The rock shaft J, levers g, I, and disk e, in combination with the cords h i, section M, angular lever H, and cam L, attached by a rod to the disk e, all operating as described, whereby the partial rotation of the rock shaft throws the seeding device out of gear, and folds back the discharge spout simultaneously, substantially as herein shown and described.

2. The hinged section M of the jointed spout, in combination with the pin l, notched bar P, and spring R, all made and operating so that the section will be yielding, even if in the working position, as set forth.

3. The cam D, levers I, H, and springs K all operating as set forth, so as to move the seed slide F back and forth, the cam being connected with a revolving ratchet wheel, a, by means of a pawl, b, so that it will be out of gear when the machine moves backward, as specified.

4. The wedge L, connected with a crank or disk on the rock shaft J, substantially as described, and operating so as to throw the lever I off the cam D when the machine is to cease dropping seed, as set forth.

83,339.—F. T. THURSTON, Providence, R. I.—*Attachment for Skates.*—October 20, 1868.—Strips of elastic material are interposed between the bottom of the skate runner and the flat strip of metal which is secured to the runner and forms the snow shoe.

Claim.—The shoe A, or B, with the protecting strip a, constructed substantially in the manner described, for the purpose specified, irrespective of the method employed to secure its attachment to the skate.

83,340.—R. T. TAYLOR, Everton, Ind.—*Shield for Corn Planter.*—October 20, 1868.—An adjustable shield allows the corn to be plowed as close as desired without injuring or covering it up.

Claim.—1. The adjustable shield B, constructed and attached to the plow in the manner described, and operated by means of the slotted arms on the stay c, and the lever D, substantially as and for the purposes herein set forth.

2. The ratch bar g, in combination with the bent spring h, for the purpose of holding the lever D at any point desired, thereby adjusting the shield B, substantially as and for the purposes herein set forth.

83,341.—JOSEPHUS SMITH TOWNDROW, Moline, Ill., assignor to W. P. HUMPHREY, Davenport, Iowa.—*Pocket Drinking Cup.*—The cup is provided with a screw hole at its bottom into which a screw on the top of the stand fits.

Claim.—A pocket goblet, consisting of the cup A and stand B, constructed so that they may be detached, and the cup connected to the stand in a reversed position, substantially as herein described.

83,342.—ENOCH B. TURNER, Providence, R. I.—*Horseshoe Machine.*—October 20, 1868.—The mark in the center part of the forward blank is moved up to the gauge and the surplus end of the blank is trimmed off by the knives. The bar is then moved across the machine until it strikes the butting gauge, when the knife makes a counter movement and cuts the blank from the bar. The forming rolls then bend it around the dies and the squeezing rollers come in contact with the cam of the squeezing lever and press the blank against the die and complete the shoe.

Claim.—1. The arrangement and combination of the adjustable gauge L, knife-holder M, adjustable knives T and S, adjustable butting gauge N, spring t, and slotted bar K, as herein set forth and for the purposes described.

2. The combination of the anvil F, mandrels I I, pads J J, squeezing cam levers E E, forks k k, and springs j j, all arranged as herein set forth and for the purposes described.

3. The combination of the above devices with the cranks b b, adjustable shafts B B, saddles A A, saddle bars A' A', spurs m m m m, axle g g, adjustable connecting rods P P, rollers D D, slotted cam formers G G, former rollers H H, and adjustable rollers i i, as herein set forth, all arranged and combined so as to form a complete machine for making horse-shoes, as described.

83,343.—JAMES D. VAN HOEVENBERGH, Kingston, N. Y.—*Spring Adjuster.*—October 20, 1868.—A lever has its fulcrum on a shackle link which is secured to a block on the spring. A movable block, placed on the lever near the fulcrum, bears against the part of the spring to be adjusted. The other end of the lever is attached to a block which slides over a screw rod attached to the spring.

Claim.—The improved spring adjuster above described, its several parts being arranged and operating together, substantially as herein specified.

83,344.—HUGH WAIN, Ravenna, Ohio.—*Gas Machine.*—The space surrounding the oil tank is filled with ashes instead of water, so that the temperature of the oil will not be affected by the vicissitudes of the weather.

Claim.—The arrangement of the cylinder A, tank C, provided with induction and exhaust pipes, and having the space H filled with a poor conducting material, in combination with the perforated bottom and gasometer D, as and for the purpose substantially as described.

83,345.—FRANK B. WELLS, Fishkill on the Hudson, N. Y.—*Binding Mathematical Books.*—October 20, 1868.

Claim.—The insertion of these silicated leaves in the aforementioned works, in which they may be used, said leaves to be bound in the book firmly, inserting any number desired, according to the nature and the size of the volume, or they may be simply fastened in any way, that they may be removed, changed, or replaced, or new ones inserted, at pleasure, if so thought to be more practicable.

83,346.—J. C. WHARTON, Nashville, Tenn.—*Jet Attachment for Soda Fountains.*—October 20, 1868.—A jet of water is made to play on each of the nozzles of the sirup-fount coeks and cleanses them from any adherent drops of sirup to prevent the obstruction of the nozzles.

Claim.—An attachment for soda-water fountains, when constructed of a plane surface, A, having a border pipe, B, provided with jet tubes, a a a, &c., drain pipe b, and supply pipe d, all substantially as and for the purpose set forth.

83,347.—A. W. WHITNEY and P. A. WHITNEY, Woodstock, Vt.—*Machine for Bending Sheet Metal.*—October 20, 1868.—The folding bar is secured to shafts which rotate in adjustable bearings on bars attached to a cam shaft. When the folding bar is rotated the cams cause the folding knife to hold the metal while being bent, and the folding bar is prevented from being raised too high by slotted straps. A gauge is arranged beneath the folding blade to regulate the width of the lock.

Claim.—1. The folding bar H, in combination with the bars J J, arms P P', and connecting rods Q, all arranged to operate in the manner substantially as and for the purpose set forth.

2. The straps M, in combination with the folding bar H, adjustable bearings I, and screws O, all arranged to operate in the manner substantially as shown and described.

3. Holding the folding blade C upon the work on bed piece B, through the media of the cams l, friction rollers L, and bars D e, all arranged to operate substantially as set forth.

4. The gauge E, arranged and applied in connection with the screw F, substantially in the manner as and for the purpose set forth.

83,348.—P. A. WHITNEY, Woodstock, Vt.—*Counter Sink.*—October 20, 1868; antedated October 16, 1868.—The cutter, made of a flat piece of steel, is held within a hollow stock by semicircular clamping jaws, having the lower end tapering to agree with the cutter. A feed screw in the upper part of the stock forces the cutter down when the cutting edge has worn away.

Claim.—The herein-described improved counter sink, when constructed substantially as and for the purpose described.

83,349.—D. E. WHITON, West Stafford, Conn.—*Lathe Chuck.*—October 20, 1868.—The pinion is secured to the shank of a wrench and is kept in place when meshing with the rack in the chuck, by projections beyond it fitting in sockets in the back of the chuck.

Claim.—The construction and arrangement of the back plate P, with openings b b b, and projection E, with sockets a a a, when connected with the rack B of a geared chuck, substantially as and for the purpose herein shown.

83,350.—FRANCIS R. WOLFINGER and JOSEPH BARRETT, Chicago, Ill.—*Extension Table.*—October 20, 1868.

Claim.—An extension table, consisting of a central frame, A, having the side rails cut away to form recesses, F, to receive the attachable top boards G, and having the extension frames connected thereto by the hinged bars H, all constructed and arranged to operate as set forth.

83,351.—GEORGE M. WOODWARD, New York, N. Y.—*Steam Heater.*—October 20, 1868.—A pipe fitting in the upper part of the vessel is provided with a cap in which a perforated plate is secured, so as to form an upper compartment. A tube is suspended from this plate and reaches nearly to the bottom of the base. The steam enters the compartment and flows down the tube to the base and then escapes.

Claim.—The cap C, secured upon the pipe B, and provided with a perforated diaphragm, b, from which the tube D is suspended, substantially as herein shown and described.

83,352.—HENRY W. YERINGTON, Jersey City, N. J.—*Hydrocarbon Burner.*—October 20, 1868.—A current of cold air augmented by a steam jet pipe, passes through an air jacket on its way to admixture with the gas prior to its entry within the burners, which latter are formed of parallel horizontal tubes with oblique slots in their sides which cause the air to pass up from beneath and between the flame. The gas is generated and mixed with the air in a pipe connecting with the air pipe.

Claim.—1. The combination, with the oil tank A, of the air jacket B, having inlets and outlets, d and C, for operation in connection with the burners of a liquid fuel apparatus, substantially as specified.

2. The combination of the oil tank A, air jacket B, suction pipe C, and steam jet pipe or nozzle g, essentially as herein set forth.

3. The combination of the pipe or pipes I, mixing and distributing boxes F, air pipes C and G, and burners E, for operation together as specified.

4. The intermediate connecting pipe J, in combination with the gas pipes I and air pipe C, substantially as shown and described.

5. The tubular burners E E, arranged essentially

as specified, and provided with oblique jet orifices or slots, *e*, as herein set forth.

83,353.—JOHN W. MURRELL, Seaford, Del., assignor to himself, SAMUEL PERRY, and EDWARD R. JACOBS.—*Attachment to Spools for Cutting Thread.*—October 20, 1868.—A metal plate with a clamp in the center to attach it to the spool, is provided with notches on its ends for the purpose of breaking the thread.

Claim.—As an article of manufacture, the within-described thread breaker, formed from sheet metal, its retaining parts, *a a*, being cut from its center, and bent at right angles thereto, substantially as and for the purposes herein set forth.

83,354.—THOMAS L. LUDERS, Olney, Ill.—*Bobbin and Thread Holder for Spinning Machines.*—October 20, 1868.—The thread or yarn is attached to curved arms of the holder which grasps the bobbin and causes it to rotate with the spindle.

Claim.—The coiled wire holder *A*, having outwardly-curved arms *a a*, constructed as described, combined with the spindle and the bobbin, and serving as a holder for the bobbin and for the thread, as set forth.

83,355.—PHILIP AMMERMAN, Cynthiaana, Ky.—*Harvester Rake.*—October 27, 1868.—The guide bar fastened to the platform is curved, so as to encircle both ends, and extends the whole length of the endless chain, which, as the grain is cut, carries the rake along, sliding up and around the bar, the beveled cap aiding in tipping it over.

Claim.—The guide bar *k* and beveled block or cap *t*, in combination with rake *A* and endless chain *C*, substantially as and for the purpose described.

83,356.—JOSEPH D. AYERS, East Greensborough, assignor to J. O. CUTTER and WILLIAM WALLACE GOSS, Greensborough, Vt.—*Sugar Pan Derrick.*—October 27, 1868.—The derrick beam is upheld by guide beams mortised into an upright, and with mortises for a vertical guide post, which slides in the mortises of the guide beams; and it is also braced by iron rods, connecting the guide post with the frame fixed on the derrick beam, and having hooks, for hanging the pans, adjusted by bolts passing through cross bars and slots in the frame.

Claim.—1. The combination, in a sugar pan derrick, of the guide beams *B B'*, guide post *G*, rotating upright *A*, pulley *k*, cords *a b*, derrick beam *C*, drum and crank handle *l*, all constructed and operating substantially as shown and described, and for the purpose set forth.

2. The frame *m m*, *o o*, hook rods *h h h h*, and braces *g g*, with the parts specified in clause first of the claim, all substantially as shown and described, and for the purpose set forth.

83,357.—NATHAN BARTLETT, Centreville, N. J., assignor to himself and FRANKLIN OSGOOD, Richmond County, N. Y.—*Manufacture of Pigments from the Sulphurets of Zinc and Lead.*—October 27, 1868.—The ore is pulverized, passed through a desulphurating oven, and then treated in the ordinary oxidizing furnace and the flowers collected, the zinc and lead in combination passing off together to the receiving chamber.

Claim.—1. The manufacturing of pigments from the sulphurets of zinc and lead combined in the manner and by the means substantially as herein described.

2. The pigment, made from the sulphurets of zinc and lead, as a new article of manufacture.

83,358.—WILSON BRAGG, Connersville, Ind.—*Automatic Car Coupling.*—October 27, 1868.—The pin and sliding block are connected with a chain, and when the pin is raised the block will be drawn out toward the mouth of the draw head, and as soon as it is pressed in the chain forces down the pin.

Claim.—The combination of the chain *E*, sliding block *C*, and coupling pin *F*, substantially as and for the purposes specified.

83,359.—THOMAS W. BROWN, Reading, Pa.—*Hot Air Register.*—October 27, 1868.—Three slats

are pivoted to the register frame and also at one end to a connection bar, a sectoral lever being fixed upon the journal of the middle one.

Claim.—The improvement of having the sectoral lever fixed directly to the slat journal, when the slats are pivoted to the frame, and to a connection bar having no pivoted connection with the sectoral lever, as set forth, the whole being substantially as described and represented.

83,360.—FREDERICK CAJAR, New York, N. Y., assignor to himself and JAMES ANDERSON, same place.—*Spring.*—October 27, 1868.—The plates or strips of metal for the springs are corrugated, and riveted or pivoted together, being so arranged as to take the strain in the direction of their breadth.

Claim.—Elliptical or arched springs, made of corrugated sheets or plates, arranged as herein shown and described, substantially as and for the purpose set forth.

83,361.—GEORGE CARNELL, SAMUEL WILLIAMS, and WILLIAM ELLIS, Philadelphia, Pa.—*Mill for Tempering Clay.*—October 27, 1868.—The rack with two straight sides is connected at each end with semicircular racks, and in the center of the cap on which they are cast is the web, reaching nearly to each end, and against which bears the pinion which operates the wheel.

Claim.—The inverted double rack *H*, cast with a cover, *h²*, and internal web, *h³*, in combination with saddle *M* and pinion *E*, for operating the wheel *B* of a clay mill, in the manner substantially as shown and described.

83,362.—JOSEPH E. CHAMBERLIN, Wilmington, Del.—*Jig-Saw.*—October 27, 1868.—The saw is arranged between two sliding head blocks, to the upper one of which is attached an index to mark the bevel, a vernier plate being fixed to the circular iron-banded timber to which the blocks are secured by braces. It is moved by a segment of a cog wheel under the carriage, gearing and working into pinions, and by a pulley band over a pulley.

Claim.—The circular timber *b*, with its vernier plate and index, iron band *d d*, sliding head blocks *c c*, braces *e e*, and saw *s*, in combination with the semicircular ways *y y*, carriage *5*, segment *i*, pinions *g g*, *h h*, pulley *6*, and their connecting or reciprocating appliances, constructed, arranged, and operating substantially as and for the purposes set forth.

83,363.—ANDREW CHRISTIAN, New York, N. Y.—*Folding Perambulator.*—October 27, 1868.—The front and back upright arms extend so as to support the front wheel and handle, the jointed arm supports, made of two pieces, the under fitting in a groove of the upper one, being connected with the bars, and pivoted to them, thus dispensing with hinges.

Claim.—1. Extending the front uprights *D* of a folding perambulator downward, to form supports for the front axle *J*, as set forth.

2. Extending the rear uprights *E* of a folding perambulator upward, to form supports for the handle *I*, as set forth.

3. Contracting the jointed arm supports *H*, of a folding perambulator, of two parts, *a b*, which are pivoted together, as set forth, the narrow part, *b*, fitting into a groove in the under side of the main part *a*, as shown.

83,364.—N. A. CLOPTON and JOHN S. CLOPTON, Fauquier County, Va.—*Seeding Machine.*—October 27, 1868.—To four uprights in the frame are pivoted arms, the lower ends of one being connected by links to the upper ends of vibrating arms, and to their upper and lower ends are fixed elbowed slides, moving forward and back under a hopper, having two parts, one for seed, and the other for the fertilizer.

Claim.—The combination and arrangement of the reciprocating slides *k l*, vibrating arms or levers *h*, connecting pieces or links *j*, pivoted arms *g f*, and springs *i* or their equivalents, constructed and operated in the manner substantially as shown and described, and for the purpose set forth.

83,365.—WILLIAM CROSSLEY, Chicago, Ill.—*Machine for Edging Metals.*—October 27, 1868.—The

slotted guide moves the clamp to and from the grindstone, and forms a track for the double carriage, to which slides are fixed to run on and carry the clamp parallel with the stone cross pieces sliding in the slot between the pieces of the guide, while the metal in the clamp is moved against the stone by means of a screw.

Claim.—The combination of the slotted guide C C', carriage B E, clamp A, track G G, slides M M, crank screw and slides F F', constructed as and for the purpose set forth.

83,366.—JOHN M. CULLEN and ANDREW J. BAIRD, Pittsburg, Pa.—*Drill Press.*—October 27, 1868.—The parts are so constructed that the feed and drill may be operated by a continuous circular motion of the lever and pawl in one direction.

Claim.—Not any of the specified parts in severalty, but the improved tool, consisting of the several parts specified, all combined, constructed, and arranged as described.

83,367.—EDWARD M. DAVIS, Pittsburg, Pa., assignor to HENRY H. COLLINS, BENJAMIN F. COLLINS, and HOMER WRIGHT, same place.—*Fruit Jar.*—October 27, 1868.—The names of the fruits, chemicals, &c., are stamped or permanently fixed on the cover of the vessel so as to radiate from the center, an index pointing to any one and so applied that on closing it, by sealing, the labeling is effected.

Claim.—1. The method, substantially as described, of labeling preserve cans and other similar vessels, in the act of sealing the covers of such vessels upon them.

2. The cover B, constructed with names radiating from its center, and adapted for use upon a preserve vessel, having an index of a suitable description upon it, substantially as and for the purposes described.

83,368.—BENJAMIN L. DENNISON, Boston, Mass.—*Attaching Strings to Tags.*—October 27, 1868.—The clasp is made by cutting away or bending down the lips of one end, to the center, into a point, before applying it to the string, and then clasping the lips of the other end over the string, thus bringing the pointed end toward the label.

Claim.—1. The combination of the metallic clasp *a*, with the string and label card, substantially as and for the purposes described.

2. The metallic clasp *a*, Figs. 2 and 5, constructed so as to operate as a clasp, a needle, and a bar, at the same time, substantially as and for the purposes described.

83,369.—LEONARD FELKER, Tewkesbury, Mass.—*Combined Hinge and Fastener.*—October 27, 1868.—Projecting from the support stand are chambered wings which form sockets for the stile, and through the said wings are openings through which catches pass to receive the latches, by which the blind is securely fastened from within.

Claim.—The combination and arrangement of the support *e*, with its stem *e* and pintle *d*, latches *h* and *i*, and catches *b* and *b'*, and wings *f f*, with or without the plate *a*, when arranged to operate as and for the purpose described and set forth.

83,370.—R. R. FENNER, Urbana, Ill., assignor to himself and ELI HALBERSTADT, same place.—*Feed Water Heater for Steam Generators.*—October 27, 1868.—Water is supplied to the vessel at the upper part and falls through and between pieces of iron in an upper vessel to a filter below, steam being forced into the said vessel through the bottom.

Claim.—The arrangement of the supply pipe E, exhaust pipe C, ingress pipe B, water delivery pipe G, filter I, and vessel A, substantially as herein set forth.

83,371.—WALTER K. FOSTER, Cambridgeport, Mass.—*Screw Tap.*—October 27, 1868.—An oil passage through the upper portion of the screw tap communicates by a lateral passage with a groove made in one of the ranges of the screw cutters.

Claim.—The arrangement of the main and lateral oiling passages *a b*, and the groove *d*, in one of the ranges of screw cutters, the whole being substantially as described.

83,372.—JULES FOUGERAT and LUCIEN A. TARTIERE, Quogue, N. Y., assignors to "THE ALGA CHEMICAL WORKS," New York, N. Y.—*Process for the Manufacture of Iodine.*—October 27, 1868.—An improvement on his patent of May 19, 1868. The calcinized and pulverized mussels are boiled in water for a few minutes, the mixture filtered, put into a retort and heated with sulphuric acid and peroxide of manganese, then distilled and the iodine drawn off.

Claim.—1. Filtering the calcinized and boiled mussels, preparatory to their distillation, as set forth.

2. The application of peroxide of manganese to the making of iodine from mussels, as set forth.

3. The process herein specified of producing iodine from mussels.

83,373.—THOMAS J. GAFFNEY and CHARLES H. DUNKS, Detroit, Mich.—*Spring Bed Bottom.*—October 27, 1868.—The slats are secured to the ends of the steel spring bars or strips, and kept in position by strips of leather, or other flexible material, extending along their upper sides, the ends being elamped between the bars and slats.

Claim.—The leather strips H, in combination with the longitudinal top slats G, and transverse steel bars E, whereby the slats are secured to the bars, as herein shown and described.

83,374.—DENNIS C. GATELY, Newtown, Conn., assignor to NEW YORK BELTING AND PACKING COMPANY.—*Vulcanized India-rubber Belting.*—October 27, 1868; antedated October 2, 1868.

Claim.—1. Belting or banding for driving machinery, composed of paper or other pulped and calendered material, combined with India-rubber or other vulcanizable material, substantially as herein set forth.

2. The use, in combination with paper or other pulped and calendered material, of a vulcanizable cement, applied either externally as a coating, or both internally, as a cement between several layers of paper, and externally, substantially as and for the purposes set forth.

3. The vulcanizing of paper belting, with rubber or other material or compound capable of vulcanization, between metal plates or otherwise, as herein indicated, so as to produce a smooth surface on the belts, substantially as set forth.

83,375.—JOHN GOULDING, Worcester, Mass.—*Spinning Machine.*—October 27, 1868.

Claim.—1. The combination of the segment cam *k*, in two parts, elastic roller *j*, brake lever *s*, with its pin *u* and disk *v*, or their equivalents, for giving an intermittent feed to the roving, and so that the quantity of roving given out for each revolution of segment cam *k* can be regulated, substantially as set forth.

2. The segment cam *k*, in two parts, elastic roller *j*, brake lever *S*, with its pin *u*, disk *v*, drum *G*, rollers *J I*, and spool *e*, in combination with the twisting tube *K*, provided with a staple, *b'*, or their equivalents, to produce a counter twist to the roving, substantially as set forth.

3. The segment cam *k*, in two parts, elastic roller *j*, brake lever *S*, with its pin *u*, disk *v*, drum *G*, rollers *J I*, spool *e*, twisting tube *K*, with a staple, *b'*, in combination with drawing rollers *c' e' d'*, flier *F*, spindle *F'*, bobbin *g'*, or their equivalents to produce yarn from roving, substantially as set forth.

4. The conical cam *R*, or its equivalent, mounted on the traversing shaft *N*, in combination with the tappet arm *j'*, lever *k'*, sliding wedge *n'*, chain wheels *T*, and chain *l'*, which support the spindle rails *M*, substantially as set forth.

83,376.—ROBERT GRACEY, Pittsburg, Pa.—*Bolt Heading Machine.*—October 27, 1868.—A weighted drop beam is, through various devices, operated by steam, and by means of a toggle, actuates the heading die of a bolt machine, an adjustable bumper head so regulating the length of the stroke, as to need no other adjustment for bolts of different sizes.

Claim.—1. The weighted lever *F*, link *G*, and toggle arms *K K*, in combination with the header *N*, and steam cylinder *A*, arranged and operating substantially as described.

2. An adjustable spring bumper head, *J*, arranged

in relation to the weighted drop beam F, toggles K K', and piston in steam cylinder A, for regulating the throw of bolt heading dies, substantially as and for the purposes hereinbefore set forth.

83,377.—ROBERT GRACEY, Pittsburg, Pa.—*Die for Bolt Making Machines.*—October 27, 1868.—A groove is made in the faces of the dies to gripe the bolt rods, give the shank its shape, and hold it for heading. A header, sliding in a socket, is attached to a shaft to work between the faces of the blocks, when the dies are closed; and to prevent their being too much heated, cold water is forced in and out of the apertures, so as to fill the groove.

Claim.—1. The combination of the dies *a a'*, die blocks *b b'*, and plunger *f*, with or without the socket *o*, said parts being arranged substantially as described.

2. The gripping dies *a a'*, with raised projection *d*, in combination with the die blocks *b b'*, having water passages *n n'*, when so arranged, substantially as hereinbefore described, as to form an inclosed space for the passage of water around the raised portion of the dies whenever the heading tool is withdrawn.

83,378.—HENRY H. HALL, Boston, Mass.—*Index.*—October 27, 1868.—Principally intended to indicate the location, in an index, of any given name among an indefinite number of names. The first letter of the name being found in the left-hand vertical column of letters, the other letters of the name are noted in the same horizontal column in which said first letter stands. The figures, which are the exponents of the letters thus traced, are taken consecutively to form the index number.

Claim.—The within-described index or tabular guide to indexes, consisting of the combination of letters and figures, substantially as and for the purposes set forth.

83,379.—L. HARRINGTON, Saugatuck, Mich.—*Ironing Table.*—October 27, 1868.—The top of the table is made in three parts, hinged and doweled together, one part being stationary, the others folding. A hinged leg upholds a bearer pivoted to a post to be turned crosswise, and a holder, with a flange for a flat iron, slides under the table top.

Claim.—A folding table, made with a three-part top, A B C, in combination with flat-iron holder H I, hinged leg G, supporting a pivoted bearer S, and bearer T, constructed and arranged to operate substantially as and for the purpose set forth.

83,380.—JOEL HAYDEN, Jr., Haydenville, Mass.—*Check Valve for Steam and other Machinery.*—October 27, 1868.—The valve is opened by outside pressure upon the rod, and when such pressure is removed the cup, which is attached to the rod, is forced down by the pressure of the entering fluid, thus closing the valve.

Claim.—The combination of the valve J, cup F, connecting rod G, outlet D, and inlet C, with the partition A and valve seat B between them, whereby the fluid or liquid is enabled to close the valve by its pressure against the cup, when the valve is relieved from outside force, substantially as herein described and shown.

83,381.—HENRY HERBERT, Jersey City, N. J.—*Buckle.*—October 27, 1868.—The frame has oblong slots at the ends, into which are slipped the bent ends of slides which fasten on the inside portion.

Claim.—The self-fastening buckle, consisting of a frame and two slotted slides, for the purpose substantially as described.

83,382.—P. HOOP, Jr. and R. HOOP, Berlin Cross-roads, Ohio.—*Hot Blast Apparatus for Puddling and other Furnaces.*—October 27, 1868.—The air to be heated is passed through a series of hollow rings, one above the other, from which project lugs, and through which the products of combustion rise, circulating in them successively, they being also connected with the pipes for transmitting the air from one to another.

Claim.—1. The rings C, provided with the lugs *e*, in combination with the foundation plates *c*, as and for the purpose described.

2. The rings C, in combination with the pipes D, made in three or more sections, and having their middle portions outside the chimney, as and for the purpose specified.

83,383.—DAVID HUFFMAN, Luray, Va.—*Device for Sharpening Saws.*—October 27, 1868.—The circular saw is inserted in a slot in the block, on each side of which, and opening into it, are transverse recesses for the jaws, to which screws pass from each side of the block.

Claim.—The block A, jaws B B, and screws *c c*, when constructed and arranged as described, and for the purpose set forth.

83,384.—R. W. HUMPHREYS, Clarksville, Tenn.—*Steam Generator.*—October 27, 1868.—The boiler consists of a hollow annular cylindrical ring, and on its side is attached a cylindrical fire box having its annular space filled with water from the boiler, while the products of combustion pass through tubes in the water space of the boiler to the smoke stack.

Claim.—A steam boiler, in the form of a hollow cylindrical annular ring, with fire box, and fire flues, and smoke stack attached, substantially in the manner herein shown and described.

83,385.—AMOS B. HUNT, Matteson, Mich.—*Elevator.*—October 27, 1868.

Claim.—1. The crane B, crane post A, sheaves or pulleys, arranged at the points *d, f, u*, and *i*, rope or cord C, arranged on the sheaves, and passing down through the axis of the crane, in combination with a sweep bar, G, all substantially as set forth.

2. The swivel hook *l*, and its accessory parts, *m, j, n*, in combination with the pin *o* and tripping device *r q*, all substantially as herein set forth.

3. The crane B, when constructed of planks and parts *a a, g g, e, b, d*, substantially as described, in combination with the crane post A, bearing blocks *h h*, sweep bar G, cord or rope C, and pulleys at the points *d, f, u*, and *i*, all as set forth.

83,386.—J. M. HURT, Blacks and Whites, Va.—*Plant Protector.*—October 27, 1868.

Claim.—As a new article of manufacture, the plant protector, consisting of the cylinder A, adapted to rest upon the ground over the plant, perforated circumferentially near its top, at B, and provided with the horizontal glass top C, as herein described, for the purpose specified.

83,387.—EBENEZER JENNINGS, Jr., New York, N. Y.—*Shoulder Brace and Suspender.*—October 27, 1868.—An improvement on his patent of October 6, 1868. The double slide is made of a square piece of metal with holes cut out at the corners, and two side wings are formed by slitting the plate, leaving a center bar in the shape of an hour glass, and by bending the edges of the plate the wings lie so as to give room for the straps.

Claim.—1. A combined shoulder brace and suspender, consisting of two straps crossing each other at both ends in adjustable slides, substantially as described, either with or without an adjustable slide at the back crossing.

2. The adjustable double slide, cut from a single piece of sheet metal, or other suitable material, substantially as described.

83,388.—ALFRED S. JOHNSON, Waupun, Wis., assignor to himself and LYMAN B. BALCON, same place.—*Beehive Protector.*—October 27, 1868.

Claim.—1. The casing or box A, composed of paper or *papier-maché* for encasing a beehive, substantially as herein shown and described.

2. The shield or projection *a*, attached to the case, covering, or box, substantially as and for the purpose specified.

83,389.—THOMAS W. JOHNSON, New York, N. Y.—*Apparatus for Making Extracts from Tan Bark.*—October 27, 1868.—An improvement on his patent of September 15, 1868. An additional or secondary tank and two sets of squeezing rollers are combined with the crushing rollers, saturating tank, and elevator, so that the astringent qualities will be

disengaged and the pulp left finally in a condition to be used as fuel.

Claim.—The arrangement of a secondary saturating tank, J, and two sets of squeezing rollers, G M, in combination with the crushing rollers A, saturating tank C, and elevators E K, all substantially in the manner herein shown and described.

83,390.—DANIEL KIDDER, Franklin, N. H.—*Knitting Machine.*—October 27, 1868.

Claim.—1. The detachable stock D, adapted and employed for the reception of the cams and yarn feeder, substantially as set forth.

2. The yarn feeder G, elevating cam F, and slotted depressing cam E, secured to the stock D, substantially as and for the purpose described.

83,391.—MICHAEL J. LOURENTZ, Leavenworth, Kansas, assignor to himself and JOHN MYERS, Jr., same place.—*Lamp Chimney Cleaner.*—October 27, 1868; antedated October 17, 1868.

Claim.—As a new article of manufacture, the holder for lamp-chimney cleaners, consisting of the two rods A A', each double-headed, the rod A passing through the button at the inner end of rod A', and *vice versa*, whereby the cleansing material is held between the inner head of one rod and the outer head of the other, as herein shown and described.

83,392.—STEPHEN N. MANNING, Kankakee, Ill.—*Apparatus for Illustrating Spherical Trigonometry.*—October 27, 1868.—By adjusting the different parts and applying the several sections, the several points, lines, arcs, and angles of spheric triangles are shown in their true relative positions and proportions.

Claim.—The combination and arrangement of the hinged sector, plates, and wires, constructed substantially as described, for the purpose of illustrating and demonstrating the problems of spherical geometry and trigonometry, by forming the diagrams so as to show all the parts in their true relative positions and proportions.

83,393.—LORENZ MASCHAUER and WILLIAM FRANKFURTH, Milwaukee, Wis.—*Pintle of Butt Hinge.*—October 27, 1868.—The pintle and eyes of the hinge are so constructed as to admit of the pintle being withdrawn far enough to detach the leaves of the hinges, but not far enough to be wholly withdrawn from the butt.

Claim.—The pintle B, made of uniform diameter in its middle and upper part, and provided with a tapering, expanded lower end, c, in combination with the tapering, internal diameter of the upper eye a, substantially as and for the purpose set forth.

83,394.—JOHN McDONALD, New York, N. Y.—*Brick Kiln.*—October 27, 1868.—An improvement on his patent of November 27, 1866.

Claim.—The tunnel or kiln, provided with a door at each end, and with a chimney, and with apertures through the side walls for the management of the fires, substantially as described, in combination with movable platforms, on which the bricks to be burned are to be stacked, with archways in which the fires are to be made for burning the bricks, substantially as and for the purpose described.

83,395.—PETER McEWEN, Jersey City, and WILLIAM MCKENZIE, Hudson City, N. J.—*Singeing Machine for Fabrics.*—October 27, 1868.—The fabric passes from the roll over tightening bars and is singed by a series of gas jets placed between the tightening bars.

Claim.—The arrangement of the rollers b c f, stretching bars c e g g, and rows of burners l m, for presenting both sides of the fabric to be singed, as and for the purposes set forth.

83,396.—R. L. MCGOWAN and WALTER FLETCHER, Alliance, Ohio.—*Railway-switch Stand.*—October 27, 1868.—A longitudinal slot is made in the top of the switch stand, in which latter recesses are provided on one side of the slot, to receive the elastic switch lever, which is held by a dropping key.

Claim.—The lever c, in combination with the

sliding key b, slot a, and recesses a', substantially as described.

83,397.—J. N. McINTIRE, New York, N. Y.—*Billiard Cue.*—October 27, 1868; antedated October 6, 1868.

Claim.—A telescopic billiard cue, having a false or spring butt so constructed as to yield to any pressure, and again resuming its natural position, substantially as described, for the purpose set forth.

83,398.—NICHOLAS MEYERS, Buffalo, N. Y., assignor to EDWARD L. CHAMBERLAYNE and EMERSON C. POMEROY, same place.—*Swing Machine.*—October 27, 1868.—The pivoted arm, to which the feed plate is secured, receives a reciprocating and vertical motion from cams on the driving shaft.

Claim.—The feed plate c', in combination with the shank c, arm a a' a'', spring bar c'', and eccentric b, as and for the purpose described.

83,399.—Canceled.

83,400.—RUFUS MOODY, Monmouth, Me.—*Holdback.*—October 27, 1868.—The breeching strap keeps the right-angled, pivoted plate down on the shaft, thus closing the loop.

Claim.—The loop b c d, in conjunction with the plate e, piece f, plate k, and hinge h, to be operated by the breeching strap of the harness, as herein described, when attached to a carriage shaft, as and for the purposes set forth.

83,401.—HIRAM B. MORRISON, Le Roy, N. Y.—*Elbow Joint for Stovepipes.*—October 27, 1868.—An angular joint is made by a tongue on one part and a groove on the other, which overlap to make a close fit. Lugs on one part fit and turn into grooves on the other which holds them in position.

Claim.—1. A cast-iron elbow, for stove and hot-air pipes, made entire, with a suitable connecting and disconnecting joint, substantially as set forth.

2. An elbow, for stove and hot-air pipes, in which the joint is so formed and connected that the arms or ends of said elbow may be turned to any position, from a right angle to a straight length, as described.

3. The combination and arrangement of the lugs F, notches g, groove h, and tongue and groove c d, the whole constituting the joint, as herein described.

83,402.—WILLIAM NASH and MONTGOMERY KENFIELD, Malden, Mich.—*Machine for Preparing Husks for Mattresses.*—October 27, 1868.—The cutting knives sitting spirally in rows, rotate between a series of springs secured to the bottom of the box.

Claim.—The arrangement and combination of the feed rollers E and F, the spiral cutting cylinder D, and the series of slitted springs a a a, as constructed, and operating substantially in the manner as and for the purposes herein set forth.

83,403.—CHARLES N. NICKERSON, Gloucester, Mass., assignor to himself and WILLIAM HODGKINS, 3d, same place.—*Button.*—October 27, 1868.—Designed as an improvement on patent of J. Palmer, March 27, 1866. The stud is made smaller and is surrounded by a flanged sleeve to hold it in the cloth. A portion of the sleeve enters with the stud into the button head and the spring catches in a notch in the head.

Claim.—The combination of the sleeve E, stud A, and spring C, substantially as described.

83,404.—JOHNSON ORR and HENRY H. MARTIN, Oxford, Ohio.—*Convertible Plow and Cultivator.*—October 27, 1868.

Claim.—1. The combination and arrangement, substantially as described, of the frame A C, c c', swinging hangers D d and D' d', adjustable bars E e and E' e', nuts G G', ring bolts F f and F' f', pins H, apertures i, plow beams J J', pivoted sheths K k, ties M, pins N, handles O, braces R r and R' r', and catch S, for the object stated.

2. The construction of the brace T, with depressed portions t t, to serve as steps, and an elevated central portion, t', to which the seat P is attached, all as herein described.

83,405.—JOHN L. OTIS, Leeds, Mass.—*Grinding Machine.*—October 27, 1868.

Claim.—1. In a grinding machine, in which the article to be ground is moved past the face of the grinding wheel or stone, the hanging of either the stone or wheel, or of the clamp frame that carries the thing to the ground, in arms or a swinging frame, whose center of motion is remote from the center of motion of the wheel or stone, for the purpose of grinding the tool or implement on a concave from a greater radius than that of the stone or wheel, substantially as described.

2. The feeding along of the tool or article to be ground, past the face of the wheel or grindstone, by means of the vibrating frame, reversible pawl, and its spring arm or support, and the ratchet plate, acting together in the manner and for the purpose described.

83,406.—D'ARCY PORTER, Cleveland, Ohio, assignor to himself and THOMAS H. WHITE, same place.—*Tension Device for Sewing Machine.*—October 27, 1868.—The thread passes over a grooved wheel which is secured to a shaft having bearings in a standard attached to the fixed arm, and also through the ends of a stay which fits under and partly surrounds the wheel. A spring on one side of the stay presses on the thread as it passes through. The tension is regulated by a spring and screw on the standard pressing on the shaft to which the wheel is secured.

Claim.—The tension device, consisting of the grooved wheel C', shaft B', cap or box e', spring I', screw H', stay D', and spring G', all arranged upon standard A', and with relation to each other and to the thread E', and so as to operate substantially in the manner and for the purpose described.

83,407.—JULIUS F. QUIMBY, Troy, N. Y.—*Reservoir Cooking Stove.*—October 27, 1868.

Claim.—1. Combining the chamber or flue e of a water reservoir or tank, C, when constructed and arranged with a cooking stove, substantially as herein described, with the diving or descending flue e thereof, so as to divert a portion of the unspent currents of heat going therefrom, and making them pass directly into and horizontally through said flue e, without first passing under the stove's oven, as formerly, thus making said reservoir flue e a branch flue of the diving flue e, in manner substantially as and for the purposes hereinbefore set forth and shown.

2. Connecting each end of said branch flue e, when extending or passing in horizontal direction around the end sides and rear side of said water reservoir or tank C, as arranged at the rear-end side of a cooking stove, respectively, with the diving and rising flues e and f thereof, by means of apertures a and a' in the stove, opposite to the ends of said flue e, in manner substantially as described and shown, for the purposes set forth.

3. The combination with each other of the extended or branch flue e, passing in horizontal direction around the end sides and back side of a water reservoir or tank C, the cross flue b, as passing in a horizontal direction, and connected at each end with said flue e and the diving and rising flues e and f, as connected with the respective ends of said extended flue e by apertures a and a', when all of a water reservoir cooking stove, and relatively arranged in manner substantially as herein described and shown for the purpose set forth.

4. In combination with the damper G, branch flue e aforesaid, and the aperture a in the diving flue e, the employment of a damper, d, to close the opening to said flue e, to shut off all currents of heat therefrom, and thus make of said flue an air chamber, for the purposes as hereinbefore set forth.

83,408.—FITCH RAYMOND and AUGUST MILLER, Cleveland, Ohio.—*Compound for Preserving Cheese.*—October 27, 1868.—Composed of sulphuric acid, nitro-muriatic acid mixed with water, and used as a disinfective compound.

Claim.—The herein-described compound for the purpose set forth.

83,409.—EDWIN T. RICE, New York, N. Y.—*Mode of Preventing Mildew or Injury to Fibrous*

Materials during their Manufacture.—October 27, 1868.—A solution of carbolic acid and water is used to moisten the fibers.

Claim.—Moistening flax or other fibers with the material specified, so as to prevent mildew or other injury to the same while being manufactured, substantially as set forth.

83,410.—GEORGE RICHARDS, Richland Centre, Wis., assignor to himself and DEXTER E. PEASE, same place.—*Bit Stock.*—October 27, 1868.—The handle is extensible both from the bit holder and rest.

Claim.—The handle A, provided with the sockets B B, to receive adjustably both the shank b of the rest D and the shank a of the tool holder C, whereby the leverage of the handle is adjusted equally from the rest and tool holder, as herein shown and described.

83,411.—PETER RODIER, Detroit, Mich.—*Stop Device.*—October 27, 1868.—The device is arranged to impinge forcibly against the belt if the latter moves in the wrong direction.

Claim.—A lever, resting in suitable bearings, and operating automatically, both to stop a belt, by compressing it between the end of said lever and another rigid body, upon the opposite side of the belt, and also to release its hold upon the belt, both operations being performed by the action or movement of said belt itself, substantially as herein described and set forth.

83,412.—WILLIAM H. ROGERS, New York, N. Y.—*Match Composition.*—October 27, 1868.—A composition of saltpeter, orris root, minium, phosphorons, and dissolved caoutchouc is used to make the match flexible, self-igniting, and combustible throughout its length.

Claim.—The use of caoutchouc, (or India rubber,) or of gutta percha, in a composition for the manufacture of matches, substantially as and for the purposes described.

83,413.—E. A. SAWYER, Portland, Me.—*Dish Rack.*—The curved edges of the plates are placed between pairs of parallel horizontal coils of wire which are secured to the bottom of the pan.

Claim.—The dish rack, as described, having the pan or base, a, with the horizontal parallel pairs of helices, all combined and arranged as and for the purposes set forth.

83,414.—WILLIAM C. SELDEN, Brooklyn, and CHARLTON B. KID, New York, N. Y.—*Fabric for Covering Steam Boilers, &c.*—October 27, 1868.—A sheet of wire cloth is covered with asbestos in a broken state and the latter is covered with wire cloth or wool felt.

Claim.—The non-conducting coating herein described, composed of fibrous mineral, secured between layers of strong material, substantially as and for the purposes herein set forth.

83,415.—ELI SLATER and ANSON H. PLATT, Philadelphia, Pa.—*Hot-air Furnace.*—October 27, 1868.—The descending draught is intended to effect the combustion of the smoke and gases.

Claim.—The combination of the inner combustion cylinder or chamber a, outer radiating cylinder or chamber o, surrounding the same, and the close base b, all constructed and arranged so that the draught and products of combustion pass down from the first through the fire grate g, into the base, and thence up through the space between the two cylinders, substantially as and for the purposes herein specified.

83,416.—DANIEL SNELL, Springfield, Ohio, assignor to himself and J. H. GANO, same place.—*Wood Sawing Machine.*—October 27, 1868; antedated May 28, 1868.—The machine is moved from point to point along the log to saw it into sections, an immovable relation being maintained between the two, while the saw is operating, by means of the cant hook and spurs.

Claim.—The combination of the spikes or spur points C C in the forward ends of the bed timbers, to pierce the log to be sawed, and the grab or cant hook B in addition thereto, hinged or fastened to the

forward cross beam, the whole constructed substantially as described, as and for the purpose specified.

83,417.—PETER SPENCE, Newton Heath, Manchester, England.—*Purifying Illuminating Gas.*—October 27, 1868.

Claim.—The use of protosilicates and protoearbonates of iron, specially the slags before mentioned, for purifying gas, for lighting, from sulphureted hydrogen, and also the use of these substances, as specified, for the product of "dry copperas," or the copperas of commerce, and the use of said "dry copperas" for purifying gas from ammonia.

83,418.—JOSEPH STEGER, New York, N. Y.—*Car Brake.*—October 27, 1868.—The movable bar or plate is pinched between the axle and the roller on the end of the lever when the brakes are to be applied, the consequent friction of the axle upon and the movement of said bar or plate effecting the desired object.

Claim.—The combination of the roller G, lever E, friction bar or plate L, and axle B, substantially as described, for actuating the brakes of a car.

83,419.—M. C. STEBBINS, Springfield, Mass.—*Portable Gas Apparatus.*—October 27, 1868.—Forced air before entering the gasometer passes first through a body of water and then through a body of oil, the two liquids being contained in separate vessels. In passing through the oil the air is converted into gas. The water vessel prevents the escape of gas from the oil vessel.

Claim.—The combination of the vessels C and D, and the gasometer B, with their pipes and connections, all arranged and operating substantially in the manner and for the purposes herein specified.

83,420.—JOHN B. STONER, LEOPOLD MENDELSON, and THEODORE CROMMELIN, New York, N. Y.—*Ballasting Vessels.*—October 27, 1868.—This device is designed to prevent undue lateral rolling of the vessel without materially retarding the progressive movement of the same.

Claim.—1. So applying a ballasting weight, B, to a casing, D D', or its equivalent, that such weight can be raised or depressed bodily, and at the same time it is free to swing in a direction with the keel of a vessel, substantially as and for the purposes described.

2. The arms *b*, of weight B, provided with a pin, C, whose ends are fitted to slide up and down, and to oscillate in grooves *c c*, formed in the case D D', substantially as described.

83,421.—LEVI W. SWAFFORD, EDWARD BUTLER, and JOHN R. HESS, Muscatine, Iowa.—*Blind Slat Operator.*—October 27, 1868.—The bent arm is secured to the lower movable slat of the blind, and the end of the lever may be placed over or under the projection on said arm in order to adjust the slats.

Claim.—The bent arm G and slotted lever E, arranged, with relation to the blind slats and window casing, in such a manner that their combined action shall adjust said blind slats in any required position, as herein shown and described.

83,422.—BENJAMIN TATHAM and JOSEPH STEGER, New York, N. Y.—*Car Brake.*—October 27, 1868.—A reversing arrangement causes the brakes to be brought in contact with the wheels, whatever may be the direction in which the cars are moving.

Claim.—1. The reversing arrangement, as herein substantially described, by which the brakes of a car may be brought into alternate action by the motion of the plate and axle.

2. The means, as herein substantially described, of applying the brakes simultaneously upon the wheels of a series of cars by the combined operation of a connecting rope, chain, or rod, upon a series of levers, one on each car, the levers having friction rollers, and acting, by the revolution of the axles on the brakes, as set forth.

83,423.—HENRY A. TILDEN, New Lebanon, N. Y.—*Manufacture of Vinegar.*—October 27, 1868.—The temperature of the air in the acidifying vat is regulated by the steam coil in the jacket, to which

air is admitted from the exterior and from which it passes into the vat.

Claim.—The jacket *f* around the vat *a*, with the openings 2 and 3, in combination with the heating coil *g*, as and for the purposes set forth.

83,424.—J. B. TUNSTALL, Boydton, Va.—*Hydraulic Press.*—October 27, 1868.—The levers connected with the cross head serve to actuate, through the medium of toothed segmental extremities, a press platen, and the shaft of a weight elevator.

Claim.—The arrangement, herein described, of cross head D, attached to levers E E', by link connection *x*, segment gearing *o o*, rack *g*, press head G, shaft F, pulley *f*, with its cord and weight, all constructed and operated as set forth.

83,425.—GEORGE WALTERS and THOMAS SHAFER, Phoenixville, Pa.—*Method of Constructing Wrought-iron Columns.*—October 27, 1868.

Claim.—An improved column, formed by the combination of the segmental bars C, skewback bars A, and interior rings or bands B, with each other, substantially as herein shown and described, and for the purpose set forth.

83,426.—JOSEPH W. WATTLES, Canton, Mass.—*Ring for Spinning Machine.*—October 27, 1868.—

Upon a stoppage of the frame so as to sufficiently lessen the draught of the yarn on the traveler, the latter descends into the oil in the trough; hence when the traveler is again put in operation it lubricates the flange of the ring.

Claim.—The improved ring, as made with the traveler supporter or rail *a*, and the oiling trough *b*, arranged as represented in the accompanying drawings, and as hereinbefore described, such being so as to cause the traveler, on ceasing to revolve on the supporter, to dip its lower part into such groove, as and for the purpose specified, when such groove may be supplied with a lubricating fluid.

83,427.—JAMES D. WHELPLEY, Boston, Mass.—*Rotary Steam Engine.*—October 27, 1868.—

The axes of the steam cylinder and abutment ring are parallel, but eccentric; the axis of the piston chamber and the motion of the reciprocating piston are at right angles to the axis of rotation of the cylinder, and the piston rod acts directly upon the abutment ring, causing it to rotate upon the friction cradle and impart a rotary motion to the cylinder through the medium of the interior ring. The valves are situated at the ends of the cylinder and operated by means of eccentrics.

Claim.—1. The friction cradle, consisting of exterior-bearing rolls *b* and interior ring *a*, in combination with abutment ring, G, substantially as described.

2. The arrangement of the interior friction ring *a*, whereby its axis of revolution coincides with the axis of revolution of cylinder A, substantially as described.

3. The arrangement of the steam cylinder D, revolving on its axis, perpendicular to the axis of its piston cavity, and carrying the reciprocating piston E, combined with rod F, abutment ring G, and friction roll *a*, substantially as described.

4. The arrangement of the steam cylinder D, the reciprocating piston E, rod F, abutment ring G, and friction rolls *b*, substantially as described.

5. The combination of the eccentric *m*, gib *l*, eccentric *k*, gib *i*, and valve plate *h*, with reference to the rod *n*, and ears on the induction pipe H, substantially as described.

6. The arrangement of the valve chest C, valve plate *o*, with the packing *p*, and adjustable eccentric *r*, substantially as described.

7. The arrangement of the cylinder A, with the trunnion K revolving with it, abutment ring G, and its friction cradle *b* and *a*, and the neck B of the steam chest revolving with cylinder A, with reference to the fixed steam pipe H, substantially as described.

8. The arrangement of the valve plate *h*, revolving about a ring, *k*, held from revolution by ears on pipe H, thereby allowing linear motion when combined with the adjustable interior eccentric *m*, pivoted on the axis of revolution of cylinder A, substantially as described.

83,428.—WILLIAM S. WIDGER and WILLIAM M. READ, Fairfield, Iowa.—*Apparatus for Tolling Grain.*—October 27, 1868.—The grist passes through the funnel and gives it a rotary motion, so that the spout, at each rotation, receives a portion of the passing grain and conducts it out of the regular channel. The spout may be adjusted so as to embrace a fractional part of the area of the funnel's mouth, which shall correspond with the amount to be tolled.

Claim.—The rotary funnel A, having a spout provided with the movable part C', adjusted by means of the slot and set screw, all arranged and operating substantially as herein set forth.

83,429.—WILLIAM S. WILCOX, Wellington, Ohio.—*Trap Net.*—October 27, 1868.—The object is to afford better security at the point where the funnel enters the trap net or "pound." The cover is used when the net is set entirely under water. Weights are substituted for stakes.

Claim.—1. The supplementary funnel G, and cover C', as arranged, in combination with the funnel C and pound A, in the manner as and for the purpose set forth.

2. The use of weights, J, for sinking and anchoring the net, in combination with buoys, in the manner substantially as described.

83,430.—WILLIAM LOUIS WINANS, Clarges Street, England, and THOMAS WINANS, Baltimore, Md.—*Condenser.*—October 27, 1868; patented in England March 23, 1866.—The pipe which conducts the water to the pump from the condenser-reservoir is surrounded at top by a tube, which always projects somewhat above as well as below the surface of the condensed liquid. The mouth of the pipe stands below said surface so that the water which passes into said pipe must be taken from a point sufficiently below the surface to preclude the passage of the greasy, floating matter to the pumps.

Claim.—The means herein set forth of constructing the condensers of steam engines, and providing for the drawing off therefrom of the greasy water or scum that may accumulate therein.

83,431.—GEORGE WINTER, Buffalo, N. Y.—*Beer Cooler.*—October 27, 1868.—Tanks within the reservoir are so connected that as soon as one tank is filled with beer, the surplus is discharged into the next, and so on, until all are filled. A reservoir receives the warm water from the surface, and subjects it to further use, by contact with the tank containing the warmest beer, before the water is discharged.

Claim.—1. The tanks A, in combination with the reservoir B and conducting pipes D, all parts being constructed, arranged, and operating substantially as herein described.

2. Supporting the tanks A, within the reservoir B, by means of the upright posts or rods B' and cross-bars or tie rods C, substantially as set forth.

3. The reservoir F, in combination with the tanks A, for the purposes and substantially as herein described.

83,432.—ALBERT A. YOUNG, Boston, Mass., assignor to himself, HELEN J. DALTON, and GEORGE W. ARMSTRONG, same place.—*Wardrobe Bedstead.*—October 27, 1868.—The bed frame is supported upon legs, the center ones being detachable, and serve to fortify the hinges. The pillow rest is hinged to the bed frame, and has suspensory, yielding support.

Claim.—The combination and arrangement of the several parts of the wardrobe bedstead, to wit, the case A, with its drawers B B, the two parts of the bed frame *d d'*, joined by the hinges *i i*, with its pillow rest *e*, its cord *p*, with its spring *s*, the intermediate legs *k k*, having supports *q q*, and the turn-down legs *j j*, and the sacking *g*, all combined and arranged, substantially in the manner and for the purpose set forth.

83,433.—G. ZIPPE, New York, N. Y., assignor to himself and WERNER WERNER, same place.—*Process and Composition for Tanning Leather.*—October 27, 1868.—The hides are, after being unhaired, steeped

in a solution of sugar of lead. They are then treated with a compound of alcohol, water, sulphate of iron, sulphuric acid, manganese, sirup, salt, and chlorochromic acid. Finally they are steeped in a soaping compound, of linseed, tallow soap, tallow, water, and alcohol.

Claim.—1. The composition herein set forth for impregnating hides during the tanning process.

2. The process herein set forth of tanning hides.

3. The soaping compound herein described for insolubly binding the metallic contents of the tanning compound.

83,434.—JOHN ABRAHAM and THOMAS RICHARD BAYLISS, Birmingham, England.—*Cartridge.*—October 27, 1868; patented in England, March 20, 1868. By reason of the incisions, the cartridge shell expands and prevents the escape of gas when the explosion takes place, and afterward contracts to admit of its ready withdrawal.

Claim.—1. Making a series of longitudinal, oblique, or helical incisions in the metallic cases or shells of the said cartridges, for the purpose and substantially as hereinbefore described, and illustrated in the accompanying drawing.

2. The construction, substantially as herein described, of the percussion chamber, by forming the same, as shown and set forth, of a blank, independent from the cartridge case, and securing it in the rim of the case, as herein described.

3. The combination, with a cartridge case, provided with a percussion chamber constructed as described, of a primed percussion pin, enlarged at its base, so as to close tightly the said chamber, substantially as herein set forth.

83,435.—ANSON T. ADAMS, Indianapolis, Ind.—*Washing Machine.*—October 27, 1868.—The clothes in boiling are situated between the two "bottoms," the upper of which constitutes a presser operated by the lever. The end of the lever is fitted upon a journal or lug, and is held against any sliding movement thereon by a hook which engages in a groove in the lug.

Claim.—1. The application of the lever A B, and the perforated bottoms F G and H I, to an ordinary wash boiler, for the purpose and in the way substantially as herein set forth.

2. The combination of the hook *g h* and the lug *a e* with a common wash boiler, with perforated bottoms, constructed as aforesaid, and used in the way and for the purpose herein set forth.

83,436.—JOHN H. ALDRICH, Northbridge, Mass. assignor to himself and JOHN C. WHITIN, same place.—*Flier for Speeders.*—October 27, 1868.

Claim.—The flier, substantially as described, having the arm of the flier and the detachable presser connected by a spiral guide and worm so that when turning one way, the presser detaches from the flier when there is no bobbin or spindle for it to press against, and turning the other way, it stops by the presser arm itself coming in contact with the end of the flier arm, thus forming a more direct passage for the roving to the presser arm, substantially as described.

83,437.—PRUDDEN ALLING, Norwalk, Ohio.—*Vine Cutter and Garden Cultivator Combined.*—October 27, 1868.—The cutter serves to lop off the runners of the vines, and the cultivator shovel stirs the soil.

Claim.—The wheel B, cutter C, cultivator D, and beam A, combined and arranged to operate in the manner as and for the purpose set forth.

83,438.—JOHN E. ANDERSON, Boiling Spring, Pa.—*Grain Cleaner.*—October 27, 1868.—The scouring wheel consists of two disks set apart from each other upon a central hub and connected by groups of rods and strips of metal.

Claim.—1. The scouring wheel, substantially as described, when forming part of a grain cleaner, all as set forth.

2. The arrangement of the scouring wheel above the fan wheel, with the chute board K, inclined screen L, and chaff box B, all substantially as set forth.

83,439.—DANIEL ARMSTRONG, Chicago, Ill.—*Sash Fastener.*—October 27, 1868.—The two parts of the bolts are supported at their inner ends by a thimble or socket which incloses the single spring that forces outward both parts of the bolts.

Claim.—The arrangement of the thimble B and coil spring *m*, the latter fitting into the ends of the bolts A A', and operating both of them at the same time, in combination with thimbles G G, pins *d d*, and thumb pieces *c c*, as and for the purpose set forth.

83,440.—BENJAMIN F. ATWOOD, New York, N. Y.—*Compound to be Applied to the Hair.*—October 27, 1868.

Claim.—1. A hair-stimulating compound, consisting chiefly of a decoction of quince seed and smart weed, substantially as herein described, as a new article of manufacture.

2. The addition, to the said quince seed and smart weed, of sage, sweet fern, and hemlock bark, to form a modification of the compound, substantially as described, the whole being softened with glycerine, all as set forth.

83,441.—N. AUBIN, Plattsburg, N. Y.—*Peat Machine.*—October 27, 1868.—The shaft and cutters act to grind and work the peat as it is propelled through the cylinder. The ribs on the removable bottom of the mold form corresponding indentations in the molded peat, which, in drying, break up into bricks or blocks, the indentations being at the lines of separation.

Claim.—The cylinder A, provided with the stationary shear-bladed cutters E, shaft C, with trough-shaped revolving knives F, and mold D, with its removable bottom *d*, having annular projections *d*¹, all arranged together, and operating substantially as and for the purposes herein set forth.

83,442.—WILLIAM W. BABCOCK, Harmar, assignor to himself, A. W. McCORMICK, and SAMUEL S. McNAUGHTON, Marietta, Ohio.—*Car Brake.*—October 27, 1868.—The combination of the screw and toggle-joint levers is designed to constitute a powerful brake to insure the instantaneous stopping of the wheels.

Claim.—1. The combination of the screw spindle C, cross bar G, lever H, and brake head I, when said parts are constructed to operate substantially as described.

2. The combination of the screw spindle C, cross bar G, lever H, arm J, and wedge-shaped brake head K, when constructed to operate in the manner set forth.

3. The arrangement of the brake heads I K M, wheels B B, levers H L, cross bar G, and screw spindle C, as described and shown.

83,443.—JOHN G. BAKER, Philadelphia, Pa., assignor to HENRY DISSTON, same place.—*Saw-grinding Machine.*—October 27, 1868.—The object of this arrangement of the stones is to allow the saw blade to yield to any slight irregularity of either stone. The guide bars prevent the tilting of the blade.

Claim.—1. A saw-grinding machine, in which two stones are so arranged that a line drawn through their centers shall be at an angle with the blade of the saw, as and for the purpose herein set forth.

2. The combination of the above with the guides E and E'.

83,444.—WILLIAM BAXTER, Newark, N. J.—*Steam Engine Valve Device.*—October 27, 1868.—The throw of the valve is controlled by interposing between the moving cam and the valve a resisting medium, the action of which on the valve increases or decreases, according to the speed of the engine, in such a manner that the speed of the engine is regulated by the valve itself without the use of a governor.

Claim.—1. The piston K and barrel J, in combination with the valve H, substantially as herein described.

2. The regulating valve *g*, in combination with the barrel J, piston K, and valve H, substantially as herein set forth.

83,445.—WILLIAM BAXTER, Newark, N. J.—*Steam Generator.*—October 27, 1868.—The fire box is provided with descending flues passing through the water space and communicating with a jacket surrounding the water space and extending up to the water line of the boiler, so as to leave the dome uncovered.

Claim.—The arrangement of the fire box A, flues D, jacket F, pipe K, and steam dome G, substantially as set forth.

83,446.—SIDNEY A. BEERS, Brooklyn, N. Y.—*Splice for Railroad Rails.*—October 27, 1868.—A flat bolt fits in a mortise formed by slots in the end of each rail. The nut attached to such bolt is prevented from working loose by a key resting in a slot in the joint of the bolt and corresponding slots across the face of the nut.

Claim.—1. The combination and arrangement of the flat bolt and nut with fishing plates, as illustrated by letter *e*, Fig. 1", and letter *c*, Fig. 3, when applied to any form of rail.

2. The device for preventing the nut from working loose, as illustrated by letters *c* and *d*, in Fig. 1", whether used separately or in combination, for the purposes above set forth.

83,447.—ERASTUS S. BENNETT, Brooklyn, N. Y., assignor to himself and JUSTUS SMITH, same place.—*Shirt and Drawers Combined.*—October 27, 1868; antedated October 7, 1868.—The shirt and drawers are made in one with buttons down the front. The back portion covering the lumbar region of the spinal column, is re-enforced. A drawing string is applied above the hips to take the weight of the drawers from the shoulders.

Claim.—1. The combination of the shirt or body E E, drawers or legs F, and the re-enforced portion B and C C, all substantially as described, and for the purposes set forth.

2. In combination therewith, the drawing string or adjuster *a a*, applied and operating substantially as described.

83,448.—BENJAMIN S. BENSON, Baltimore, Md.—*Mold Blacking Machine.*—October 27, 1868.—The hub of the gear wheel is elongated below the bearing and is provided with a spool which, by means of a latch, may be locked so as not to revolve. A cord attached to the sleeve and extending over two pulleys is secured to the brush, and by locking the sleeve the cord is wound round the shaft and the brush is raised.

Claim.—1. Supplying the brush and mold with blackwash, or facing, for coating the inner surface of pipe molds, through a hollow shaft or tube, while the brush is spreading and smoothing it.

2. The reservoir D, communicating pipes E F, valves *e' c*, and hollow revolving shaft, in combination with a revolving reciprocating brush.

3. The spool H and pawl or latch *h*, in combination with the cord I and pulleys *i i*.

4. A revolving reciprocating brush, in combination with a force pump, so arranged that it will supply the brush with the blackwash at the time of its being rotated.

83,449.—ALFRED BERNEY, Jersey City, N. J.—*Tea-kettle Boiler.*—October 27, 1868.—The body of the boiler is made tapering to enable it to be fitted to any tea kettle. It is graduated so as to be read on the inside or outside.

Claim.—A combined tea-kettle boiler, pitcher, and measure, made of tapering form, as described, and provided with a handle, lid, and spout, also graduated into quantities, essentially as herein shown and described.

83,450.—JOHN BOND, Versailles, Ill.—*Stirrup.*—October 27, 1868.—An oscillating bottom pivoted in flexible prongs opens and disengages the foot in case the rider is thrown from the horse.

Claim.—As a new article of manufacture, the riding stirrup, consisting of the elastic pendent prongs, A, between which the oscillating foot piece B is pivoted in such a manner as to fall out when the elastic prongs are spread apart, as herein described, for the purpose specified.

83,451.—PATRICK B. BONNER, New York, N. Y.—*Mode of Soldering Galvanized Iron.*—October 27, 1868.—The seam in the iron to be soldered is first coated with muriatic acid, which, when the copper is applied, wholly removes the galvanizing.

Claim.—The process of soldering galvanized iron, substantially as herein described and set forth.

83,452.—S. C. BRINSER, Middletown, Pa.—*Horse Rake.*—October 27, 1868.—The head is locked and prevented from rotating in raking over even ground, and is readily unlocked to trip the rake head to avoid stones and uneven surfaces.

Claim.—The combination and arrangement of the lever H, curved, as described, and shown with the connecting rod F, having a series of holes in its rear end; the frame K, having the series of holes *k'*; the arm E, and the rake teeth B B, when the said parts are so constructed and combined together as to operate in connection with a pin in the frame K, substantially in the manner described.

83,453.—SARAH H. BRISBANE, Fordham, N. Y.—*Scissors.*—October 27, 1868.—The gauge fits in a beveled slot in the back of the upper blade, and is held by a beveled wedge or a thumb screw.

Claim.—1. The combination, with a pair of scissors, of a gauge or measure, B, substantially as and for the purposes set forth.

2. A pair of scissors, one blade of which is provided with a slot at right angles to the line of its cutting edge, in combination with a gauge or measure, B, substantially as and for the purposes set forth.

83,454.—JAMES BROWN, Matteawan, N. Y.—*Trace Fastening.*—October 27, 1868.

Claim.—1. The socket A, having a tapering dovetailed groove formed in its outer end, the strap or bar B, having its rear part dovetailed and tapering, and having a crosshead *b'*, formed upon its rear end, and the spring C, or equivalent, in combination with each other, substantially as herein shown and described, and for the purpose set forth.

2. Forming an inclined recess *a'*, in the bottom of the forward end of the dovetailed groove in the end of the socket A, to receive the end of the spring C, in detaching the fastening, substantially as herein shown and described, and for the purpose set forth.

83,455.—HENRY C. BULL and SAMUEL T. SHELLEY, Louisville, Ky.—*Hose Coupling.*—October 27, 1868.—A slotted eccentric ring bears against the projections protruding through grooves in the female portion of the coupling, and on being turned the eccentric portions press the male portion toward the shoulder, and tighten the joint.

Claim.—A hose coupling, consisting of the following elements: The female portion E, with its concave shoulder *f*, the male portion F, having the elastic ring or tube secured therein, and the eccentric ring D, all constructed and combined substantially as herein described.

83,456.—FRANCIS L. CAGWIN, Joliet, Ill.—*Automatic Spading Plow.*—October 27, 1868.

Claim.—1. The spades *a*, when operating in the manner and by the devices described, so as to enter the ground on the cycloid line, as set forth.

2. The maintaining of the parallel between the spades *a*, from the time of their entry into the ground until the heel of the spades comes to a rest up against the drum or disk *b*, to any given point, either before or past the hinge line, by means of the traction and weight of the machine, causing them to turn on their hinge, as described.

3. The backward turn of the spades *a* from the cycloid entry line to their original position, as described, by means of the upright lever *e*, and spring *i*, as set forth, regulated to stop at any given cycloid point by means of the device shown in Fig. 5, or its equivalent.

4. The spades *a*, constructed with a crank and hinge, when attached, as set forth, to the periphery of the drum or disk *b*, in combination with the upright lever *e* and spring *i*.

5. A rotary spader or plow, constructed with spades *a*, hinged to the drum or disk *b*, as shown in combi-

nation with a frame, constructed and operating substantially as set forth.

6. The mode of leverage, substantially as described, to force the spades into the ground, and to raise them out of the ground when desired, as set forth.

7. The combination of all the parts described, when arranged and operating as set forth.

83,457.—CHARLES W. CAHOON, Portland, Me.—*Steam Generator.*—October 27, 1868; an improvement on his patent of November 5, 1867.—The water heated to a proper temperature is conveyed from the boiler into the tanks on the carriage, through flexible pipes which are connected by a coupling with the carriage pipes. When the temperature of the water in the carriage has fallen below the necessary temperature for producing power, it is conveyed through a flexible pipe into the boiler tank to be reheated.

Claim.—1. The boiler A, with the pipe B, flexible by means of the joints D D, having the coupling E, and valves, substantially as herein set forth and described.

2. The combination of boiler tank F with the boiler A, and with reference to the carriage C, substantially as herein described.

3. The combination of pipe G, flexible, as described, and having the coupling, whereby to convey the residuum of the carriage reservoirs into the boiler tank F, as described.

4. In combination with the boiler A, having a supply pipe, B, for connecting with the carriage C, to supply the tanks therein, as described, the relief pipe *b*, with its valve *c*, substantially as described.

83,458.—EDWARD CARD, Providence, R. I.—*Double Oven Cooking Stove.*—October 27, 1868.—A division plate under the hinged oven serves to throw an equal amount of heat over the bottom, the heat being again brought toward the center of the stove by the division plates at the back of the front oven, and then entering a branch of the return flue which extends under the back oven.

Claim.—1. Placing the forward oven, with its accompanying flue, upon joints or hinges, substantially as described.

2. The division plate *h*, in combination with either of the division plates *i* or *i'* and plate *a*, substantially as described.

83,459.—HENRY CARPENTER, Brooklyn, E. D., N. Y.—*Peach Basket.*—October 27, 1868; antedated October 17, 1868.

Claim.—Securing the raised bottom of the peach basket upon the inner hoop D by means of the central batten *a* let into said hoop at each end, beneath the bottom, and by the wires *c* and screws *b*, all arranged as described, whereby the bottom and batten are raised above the lower edge of the hoop D, and prevented from being knocked into the basket, when the latter is inverted and used as a seat, as herein shown and described.

83,460.—PATRICK P. CARROLL, Washington, D. C.—*Ironing Table.*—October 27, 1868.—The top of the table is provided with sliding sections of different widths, which, when drawn out and supported by supplemental legs, serve as ironing boards.

Claim.—A combined ironing and work table, consisting of the sliding parts C C C, and supplementary legs D D, in combination with a table of the usual form and construction, substantially as herein shown and described.

83,461.—DEXTER H. CHAMBERLAIN, West Roxbury, Mass.—*Elevator for Buildings.*—October 27, 1868.—In the event of the rope breaking, the pin is forced down by the spring, which causes the levers to raise the wedges until they impinge on the rods.

Claim.—The rods *c c*, or their equivalents, in combination with the wedges *d d*, or their equivalents, and the cross head C, substantially as and for the purpose set forth.

2. The levers H H, spring *h*, and pin G, in combination with the wedges *d d* and the rods *c c*, for the purpose described.

83,462.—THEODORE CLOUGH, Dobb's Ferry, N. Y.—*Lamp.*—October 27, 1868; improvement on his

patent of November 26, 1867.—Designed to prevent the accumulation of the solid products of combustion in the burning of heavy oils.

Claim.—The two opposite segmental wick tubes, in combination with the air jet pipe, having a gas burner nozzle, when arranged in combination, substantially as described.

83,463.—T. S. COFFIN, Harrington, Me.—*Hammer.*—October 27, 1868.

Claim.—The hatchet D, adapted to be removably attached to the hammer head A, having the short claws B, by means of the screw E, and held in any desired position by the spring-catch *a b d*, as herein described, for the purpose specified.

83,464.—FRANKLIN COFFRIN, Claremont, N. H.—*Car Coupling.*—October 27, 1868.—Designed to be self-connecting, and also to be automatically disconnected in case any car should run off the track.

Claim.—The levers or keepers *f*, the pins *h*, the spindles *g*, the springs *i*, the staple *l*, the hooks *e*, and link D, all arranged and combined substantially as and to operate for the purposes specified and set forth.

83,465.—J. COLLIER, Morenci, Mich.—*Machine for Twisting Jack Bands.*—October 27, 1868.—Rotating hooks, and a stationary hook for twisting the yarn, are arranged with the devices for operating them, and are automatically thrown out of gear when the yarn has been sufficiently twisted.

Claim.—The combination of the hook H, levers I and L, sliding wheel C, hooks F, and springs G K, substantially as and for the purpose described.

83,466.—WILLIAM S. COLWELL, Allegheny City, Pa.—*Stave Machine.*—October 27, 1868.—Into the rack which is secured to the back part of the ram are two wheels, one of them having teeth on only a part of its periphery, and above them, on a shaft, are placed corresponding wheels which gear into each other.

Claim.—The combination of the wheels *f, g, h*, and *i*, with the rack *e*, for imparting a reciprocating motion to the ram B, substantially as herein described and set forth.

83,467.—LEVI RICHARDSON, Comstock, and JAMES N. CHERRY, Keokuk, Iowa.—*Refrigerator and Cooler.*—October 27, 1868.—A removable tube, with a perforated cap at one end and a diaphragm at the other, is fitted in the ice chamber, which, with the refrigerator chamber, has a removable top of two lids hinged together. Two dead spaces, one inside of the other, surround the sides of the cylinder and the reciprocating space, and a trough with discharge pipes runs around the outside wall at the bottom.

Claim.—1. The combination of the ice chamber K with the horizontal detachable strainer L, and chamber I, and hinged lids C C', as and for the purpose specified.

2. The combination of the non-conducting chambers A P, and the trough O, and pipes N and M, as and for the purposes specified.

83,468.—EZRA G. CONE, East Hampton, Conn.—*Call Bell.*—October 27, 1868.—Two gong-shaped bells are secured to the arms of a bifurcated shank which passes through the handle, and a two-headed hammer, the rod of which is held at one end by a pin passing through its eye and the arms, after striking the gongs, is brought back and held by a loop in the rod which strikes against the shank on both sides.

Claim.—The combination, with a suitable handle, of two gong-shaped or open-mouthed bells, provided with a suitable clapper or clappers, substantially as arranged and as herein specified.

83,469.—HORACE I. CRANDALL, New Bedford, Mass.—*Cog Wheels for Gearing.*—October 27, 1868.

Claim.—1. The teeth of cog wheels, for gearing, constructed as hereinbefore described.

2. The thickness of the teeth spaced at right angles from the center line of the same, substantially as set forth.

3. The meeting point of the root and point face circles inside of the pitch circle, in accordance with the rules, as specified.

4. The radii, for sweeping the faces of the teeth, obtained from the wheel containing the least number of teeth in a set, as so described.

83,470.—F. A. CRANE, Zanesville, Ohio.—*Hay Elevator.*—October 27, 1868.—A plank is provided with lateral rails on each side of its lower edge, on which the hanging truck with pulleys, rollers, and a catch lever travels to and fro, the arrangement being such that the truck will be held until the hay is at the proper height, and, on raising the catch lever, it will be free to move to the position for discharge.

Claim.—1. The combination of the plank A, having lashings B, side rails C, with the truck D E E, rollers G, catch lever H, having a shoulder, *h*, and stirrup plate I, shoulder cleat J, expanding pulley *a a*, having shoulders *k*, with India-rubber block interposed between them, rope K, and pulley L, all constructed and operating together, substantially as shown and described.

2. The pulley, constructed as described, of the circular plates *a a*, having radial shoulders *k*, clamping between them the India-rubber disk *b*, in such a manner that the width of the disk and the distance between the plates are made adjustable, for the purpose specified.

83,471.—ROYAL CUMMINGS, Newport, Vt.—*Printing Press.*—October 27, 1868.—The type beds, one above the other, have each at one side a rack gearing into the toothed wheels of the pressure cylinder. The upper bed has also a rack which gears into the wheel of the lower cylinder, motion being thus given from the shaft through the upper bed to the lower one, and to both the cylinders, while the paper passes over and under a succession of large and small rollers at both sides of the two cylinders, respectively, to the shears.

Claim.—1. The pressure cylinders C C' in connection with the reciprocating type beds B B', and the paper feed rollers I I', J J', all arranged to operate in the manner substantially as and for the purpose set forth.

2. The combination of the two impression cylinders C C', revolving in opposite directions above the reciprocating beds B B', with the paper-carrying cylinders I I', J J', substantially as described, for the purpose specified.

83,472.—JOHN CUSTER, Corsica, Ohio.—*Subsoil Plow.*—October 27, 1868.—The share bar is fixed to the plow beam and to the lower end of the rear beam by which it passes through a slot in the bar, and also through the end of the beam, while through a slot in the flattened end of the bar, and another in the plow beam, passes a cutter.

Claim.—1. The share bar D I K, with slots *d* and *h*, when constructed and used in combination with the plow beam A and rear beam B, substantially as and for the purpose herein specified.

2. The peculiar arrangement and combination of the share and shoe F G, bolts *f f*, and share bar D I K, the several parts being arranged substantially as and for the purpose specified.

3. The peculiar arrangement and combination of the share and shoe F G with common point *g*, the cutter E, share bar D I K, and plow beam A, the several parts being arranged substantially as and for the purpose specified.

83,473.—JOHN DARE, Liberty, Ind.—*Washing Machine.*—October 27, 1868.

Claim.—The arrangement of the roller D, pawl *j*, and ratchet *f*, for allowing the same to move without revolving one way, and to revolve the other, when suspended from the arms C, and exterior adjustable springs B, and operated by the double lever H, all as herein shown and described.

83,474.—JOHN DAVIS, Allegheny City, Pa.—*Tellurium.*—October 27, 1868.

Claim.—1. Pivoting one pole of the earth to the disk 8, and pivoting it to the crank 7, and operating said disk and crank through the medium of disk 6, wheels *t, x*¹, 5, and endless screw 15, the whole being

constructed, arranged and operating in the manner substantially as herein described, and for the purpose set forth.

2. The inclined disk B', in combination with disk a^1 , stem 18, and arm 11, provided with friction wheel 12, said disks being constructed, arranged, and made operative through the medium of the mechanism herein described, and for the purpose set forth.

83,475.—LESTER DAY, Buffalo, N. Y., assignor to himself, HENRY F. BRIGGS, and EDWARD BELDING, of same place.—*Apparatus for Transporting, Extending, and Elevating Pipes and Hose.*—October 27, 1868.

Claim.—1. The reservoir M, swivel G, windlass I, and the extension pipe C E, in combination with the platforms A and B, as and for the purpose described.

2. Pipes E and F, the latter having a spring cover, u , guide rope f , annular coupling g , and belt v , in combination with case C, socket D, raising and lowering devices $i j k l n$, and guides $r s$, as herein set forth.

3. The hollow axle N, with bars and supports J, as specified.

83,476.—F. W. DEAN, Tremont, Ill.—*Trace Fastener.*—October 27, 1868.—A loop hinged to the singletree holds the trace from slipping off the pin in the singletree, and may also be moved away from the pin when the trace is slipped over it.

Claim.—The loop B, hinged to the rear of the singletree A, and adapted to rest against the front side of the pin a , outside the trace, and the equivalent of the hoop B, as shown at D d and $e e$, all operating as described, for the purpose specified.

83,477.—THOMAS DEPP, San Marcos, Texas.—*Stitching Horse.*—October 27, 1868.—To the forward part of a lever, which is connected with the seat, is attached a strap, which passes through a hole in the bench and in the stationary jaw, and is fixed to the movable jaw of the clamps.

Claim.—1. The combination of the seat D, lever F, and strap or cord H, with each other and with the bench B and clamps C, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the foot lever K, and strap or cord I with the lever F and bench B, substantially as herein shown and described, and for the purpose set forth.

3. An arrangement of mechanism by means of which the jaws of the clamps of a stitching horse may be closed to hold the work by the weight of the workman when sitting upon his seat, substantially as herein shown and described.

83,478.—CHARLES DYER, Coal Run, Ohio.—*Combined Corn Planter and Cultivator.*—October 27, 1868.

Claim.—The described arrangement of the flexible tubes G, rigid tubes H, standards I, furrow shares J, seed covers L^x , pivoted braces J^x , standard N, shares M, pivoted brace O, connecting rod f , crank shaft g , and lever K^x , as herein set forth for the purpose specified.

83,479.—DUNCAN EDGE, St. Mary's, Ill.—*Beehive.*—October 27, 1868.

Claim.—A beehive, having the stationary central chamber, with the glass, D, at one end, and the removable piece a at the opposite end, with the drawers B, and doors C, arranged on opposite sides thereof, all constructed as described.

83,480.—SIMEON F. EMERSON, Seville, Ohio.—*Wringing Machine.*—October 27, 1868.—Upon the axis of the bearing plate revolve intermediate gears, and a curved slot in it receives the journal of the lower roller at the gear end, while the plate extends partly over the roller like a hook, and thus prevents its rising when operating.

Claim.—1. The bearing plate C², furnished with axes C and C¹, substantially as and for the purpose set forth.

2. The bearing plate C², furnished with axes C and C¹, slot d , and hook d' , substantially as and for the purposes set forth.

3. The curved slot d and hook d' , in combination with the gears $c c^1$, $b b'$, rollers B B¹, slotted plate G, wedge-shaped bearings h , and plate C², with the axes C C¹, substantially as and for the purposes set forth.

83,481.—WILLIAM B. EVANS, Bracken County, Ky.—*Shovel Plow.*—October 27, 1868.

Claim.—The circular conformation of the rear portion of the beam, the front or inner part of which is formed of steel, and reduced to a sharp cutting edge, and bent downward, at its lower end, for the reception of the plowshare.

83,482.—JOHN GILMORE, Phoenixville, Pa.—*Horse Hay Fork.*—October 27, 1868.—The knives have on each side an elevation, a little distance from their edges and points, to keep them from cutting the hay when it is raised.

Claim.—The turning knives C C, provided with the projecting pieces $d d$, to prevent the knives from cutting through the hay when the latter is being elevated, substantially as set forth.

83,483.—LEVI F. GOBEN, Spring Hill, Mo.—*Rotary Steam Engine.*—October 27, 1868.—The central cylinder has two longitudinal cavities diametrically opposite each other in its outer surface. Four cylinders in their respective chambers rotate in contact with this cylinder, and the pistons on each pair work in the cavities alternately, thus rotating the central cylinder.

Claim.—1. The construction of the central cylinder A, with longitudinal channels adapted to receive the pistons C of the cylinders B, substantially as herein shown and described.

2. The steam chambers d , having ports $e f$, and adapted to receive the cylinders B, provided with pistons C, substantially as herein shown and described.

3. The combination of the central cylinder, having longitudinal grooves, the cylinders B, provided with pistons C, and the steam chambers D, with ports $e f$, all arranged within the case A, to operate substantially as described.

4. The means for operating the cut off valve, consisting of the arms $n n$ and crank g , all arranged to operate substantially as herein shown and described.

83,484.—GEORGE W. GOODWYN, Petersburg, Va.—*Rotary Steam Engine.*—October 27, 1868.—

The rotary valve is fixed to a short spindle, revolving and working in the steam chest, and covering the steam port during most of its revolution, apertures in the valve at certain points coming over it to permit the passage of the steam, while an equal number of arms are attached to the spindle, outside of the steam chest, and as many more also are fixed to the shaft, so that as it rotates these arms strike the others, and partially rotate them with the valve.

Claim.—1. The combination of the rotary valve H with the arms $t t t$, R R R, when so constructed and operating that, by the rotation of the main shaft, the arms R R shall be caused to strike and turn the valve H, substantially as described.

2. The arrangement of the shaft B with the arms R R R, $t t t$, the rotary valve H, and the induction port G, substantially as described.

83,485.—WILLIAM GRAFF, Philadelphia, Pa.—*Bottle Stopper.*—October 27, 1868.—The ribbon is passed round the bottle and its end fastened above the stopper by a strip of metal, the opposite ends of which are bent down into grooves formed in the sides of the stopper.

Claim.—The ribbon C, or its equivalent, passing around the bottle and over the stopper, in combination with a flexible strip, D, adapted to the ends of the ribbon, and to grooves in the said stopper, all substantially as herein described.

83,486.—HENRY C. GRIGGS, Waterbury, Conn.—*Campaign Badge.*—October 27, 1868.—A ring formed with lips and with an annular flange fitting over the plate upon which the portrait is represented, is secured to the raised base plate by means of the

lips entering perforations in the plate and then being turned over.

Claim.—1. The combination of the base plate, constructed with the raised surface A, and provided with perforations α , with the ring B, constructed so as to be applied to the plate, and secured through the perforations, substantially as described.

2. The arrangement of a common pin upon the plate, so as to be secured and held by a notch in the said plate, and so as to secure the badge, substantially in the manner herein set forth.

83,487.—A. M. GRISWOLD, Mokenca, Ill.—*Cultivator.*—October 27, 1868.—An improvement on his patent of July 30, 1867. An extra shovel is secured to a bar on the beams, to be used when preparing the ground for the seed and can be removed when cultivating the growing crops.

Claim.—1. The trucks B, the slides F, one or both, when arranged with relation to the rod D and beams E, and to operate as and for the purposes set forth.

2. The extra shovel A, when arranged upon the beams E, substantially as described and set forth.

83,488.—JOHN R. GUY, Springfield, Ohio, assignor to RICE & GUY, same place.—*Coupling for Railroad Train Heaters.*—October 27, 1868.

Claim.—In combination with the permanent pipes G and elongated, open sockets H, constructed with flaring mouths, the tubular coupling formed by a single rigid pipe, I, terminating with balls I', fitting said sockets, substantially as and for the purpose set forth.

83,489.—CHARLES HACKER, Euphemia, Ohio.—*Spring Bed Bottom.*—October 27, 1868.—One series of spiral springs being shorter than the other, are only brought into action when the longer springs are compressed to a level with the shorter ones and by further compression the weight would rest upon the cushioned middle rail, thus adapting the bed to persons of different weight.

Claim.—The combination of the slats H K, the spiral springs A D, the cushioned rail B, the cords E F, in the manner shown and described, and for the purpose specified.

83,490.—JOHN HALL, Marshfield, Mass.—*Device for Scuttling Vessels.*—October 27, 1868.—The gate slides in guides in a metal bed and is opened and closed by a screw attached thereto and protruding through the deck.

Claim.—The device above described, consisting essentially of the metallic piece C, having the flanges $c c'$, the former expanded sufficiently to form a bed, for the gate to slide upon, and having the guide flanges $e e$, the gate G, the rod R, swivel joint F, and screw rod M, all combined in the manner and for the purpose set forth.

83,491.—W. N. HAMILTON, Odessa, Del.—*Grain Drill.*—October 27, 1868.

Claim.—1. The employment, in the fertilizer hopper or receptacle, of an adjustable bottom, capable of being moved from or toward the distributing wheels, so as to increase or diminish, at pleasure, the size of the openings from which the fertilizing compound in the hopper is discharged, substantially as and for the purposes set forth.

2. The combination, with the fertilizer receptacle and distributing wheel or wheels, arranged beneath and relatively to the receptacle, as described, of an adjustable bottom, hinged to the front of said receptacle, and actuated by a set screw, united to said bottom, and mounted in bearings attached to the frame of the machine, under the arrangement and for operation substantially as set forth.

3. Forming the adjustable bottom of the hopper, and the saddles attached to the same, of metal, cast in one piece, as and for the purposes specified.

4. The employment, in machines such as described, of distributing wheels formed of glass, porcelain, or other silicate, or of metal enameled or coated with a silicate, substantially in the manner and for the purposes shown and set forth.

83,492.—HENRY J. HANCOCK, New York, N. Y.—*Sewing Machine.*—October 27, 1868.—The needle bar

slide is provided with wings which slide in inclined guides so as to cause the needle to move horizontally while in the cloth, thus acting as a feeding device.

Claim.—The combination of the needle bar slide I, with its wings $x x$, inclined guides or ways J J', presser foot K, made capable of independent lift from the cloth, but reciprocating in direction of the feed together with the needle bar, from or through a rock shaft or center i , common to both, substantially as specified.

83,493.—SMITH HARPER, Leipersville, Pa.—*Fishing Net.*—October 27, 1868.—The bottom line is made small so that on coming in contact with an obstruction the line will break and release the net.

Claim.—A fishing-net, constructed as described, longer at the bottom than at the top, and the bottom line small and weak, and provided with balls, substantially as and for the purposes herein set forth.

83,494.—JOHN M. HASSAM, Mount Vernon, Me.—*Apple Corer and Quarterer.*—October 27, 1868.—A spring plunger forces the apple against a series of quartering and coring knives. A tube conveys the core to one receptacle while the quarters drop in a box beneath the corer.

Claim.—The combination, with the spring plunger F, cross bar G, knives K or Q, and corer J, of the conveyer L, and the extended conveyer or spout N, whereby the cores and the quarters or slices are conducted to separate places of deposit, substantially as described.

83,495.—J. R. HATHAWAY, Westfield, N. Y.—*Composition for the Manufacture of Burial Cases.*—October 27, 1868.—Composed of paper pulp, glue, resin, oil, silicate of soda, and whiting.

Claim.—1. The compound herein described, substantially as and for the purpose described.

2. Burial cases, made either wholly of the compound herein described, or in part of the same, and wood, or other suitable material, as a new article of manufacture, substantially as and for the purpose set forth.

83,496.—GEORGE B. HEAD, Albany, N. Y.—*Artificial Leg.*—October 27, 1868.

Claim.—1. The bar J, in combination with the stand A, connected with the foot by one or more rods, and operated for unlocking the knee joint, substantially as shown and described.

2. The combination of the bar A, and the disk joint h , and its square pivot, with the coiled spring i , whereby the leg is thrown forward, substantially as described, for the purpose specified.

3. The stop N, in combination with the bar J, substantially as and for the purposes set forth.

4. The combination of the bar J and rods B B' with the stand A, knee joint and foot, whereby the pressure of the toe or ball of the foot upon the ground, in the act of walking, relieves or unlocks the knee joint, substantially as described, for the purpose specified.

83,497.—PHILIP HICKS, Chicago, Ill.—*Truck and Wagon Reach.*—October 27, 1868.—This construction allows the front wheels of the truck at the sharp turns to pass freely under the casting.

Claim.—1. The reach, made of two wooden parts, A B, connected by a metallic curved splice, consisting of separate plates, P P, or of solid metallic piece K, the whole arranged substantially as and in the manner herein set forth and specified.

2. The metallic block K, constructed and secured to the curved part of the reach or splice, substantially as and for the purpose set forth.

83,498.—AUSTIN D. HOFFMAN, Minneapolis, assignor to himself and FRANK BREWSTER, Austin, Minn.—*Till Alarm.*—October 27, 1868.—On attempting to move the drawer a projection on the counter forces out a pin on the disk, and on turning the knob again this pin strikes against the end of a spring lever which strikes the bell.

Claim.—1. In combination with the drawer A, a revolving knob C, ring C', rod D, notched disk E, and projection I, the pins F, lever G, and bell H, arranged to operate substantially as described.

2. The disk E, constructed with pins F, substantially as and for the purpose set forth.

3. The combination of the knob, the adjustable ring C', shaft D, and notched wheel E, with the projection I, substantially as and for the purpose set forth.

4. The disk E and pins F, so arranged, in relation to the lever and bell, that the bell shall be struck when the disk is turned, after a pin has been projected behind it, substantially as and for the purpose set forth.

83,499.—LEONARD HOLTSCHEITER, Philadelphia, Pa., assignor to A. B. SHIPLEY, same place.—*Box Opener.*—October 27, 1868.—The blade is pivoted in the handle and folds up like a knife blade when not in use.

Claim.—The within-described instrument, composed of the handle A, blade D, and head C, constructed and arranged as set forth, for the purpose specified.

83,500.—M. G. IMBACH, Hartford, Conn.—*Hasp Lock.*—October 27, 1868.—Consists of an arrangement of parts which the device can be used as a common latch lock or as a hasp lock.

Claim.—The arrangement of the casing I, sliding plate E, spring bolt D, escutcheon H, latch A, and staple C, all constructed and operating substantially as and for the purposes herein set forth.

83,501.—SAMUEL IVERS, New Bedford, Mass.—*Needle.*—October 27, 1868.—The needle can be threaded without passing the thread endwise into and through the eye.

Claim.—My improved needle, made substantially as described and represented, that is, with an opening leading out of one side, rather than one end of the eye, and also with an inelastic head at the upper end of the eye, and with an elastic hook, and either an elastic or inelastic abutment, constructed and arranged together, substantially in manner and so as to form the eye, as hereinbefore explained, the whole being to operate as set forth.

83,502.—I. O. IVERSEN, Madison, Wis.—*Dyeing Textile Fabrics with Aniline Colors.*—October 27, 1868.—The aniline color is moistened with hot water and then spread on a smooth non-metallic surface to dry in the open air. After being dried it is mixed with a compound of bichromate of potash, alum, and soda ash.

Claim.—1. The herein-described mode of treating aniline colors before they are dissolved in the dyeing compound.

2. The herein-described compound of bichromate of potash, alum, and soda ash, with an aniline color, substantially as and for the purpose set forth.

83,503.—THOMAS R. JAMES, St. Louis, Mo.—*Tram for Gauging Millstones.*—October 27, 1868.

Claim.—The tram bush C, constructed as described, bearing the vertical mandrel D, adjustable arm E, and screw gauge pins F, when secured to the runner by being wedged into the recess provided for the driver, in such a manner as to step the spindle D in the bail B of said runner, as herein shown and described.

83,504.—T. B. JONES, Radnor, Ohio.—*Fruit Box.*—October 27, 1868.—The fruit may be discharged from the bottom instead of the top.

Claim.—A box or basket, constructed with a hinged bottom, (which bottom is provided with a bail for dropping and closing the same,) for handling fruit and other articles, constructed, arranged, and operating substantially as and for the purposes set forth.

83,505.—THOMAS B. JORDAN, South Lambeth, England, assignor to B. H. BARTOL, Philadelphia, Pa.—*Steam Generator.*—October 27, 1868; patented in England October 28, 1865.—The horizontal pipes, and sockets in which the vertical tubes fit, are imbedded in brick work to protect them from the direct action of the heat. A horizontal pipe, at the upper part of the generator, acts as a steam receiver and distributor and communicates with the vertical tubes by small pipes.

Claim.—1. The combination of the upright pipes E, horizontal pipes B, and a steam chest or reservoir E, substantially as described.

2. A generator, constructed substantially as described, and having its lower portion imbedded in the brick work, substantially as set forth.

3. The combination, with a chamber containing a steam generator, of two or more flues having independent dampers, substantially as set forth.

83,506.—J. A. W. JUSTI, Savannah, Ga.—*Smoke Stack for Locomotives.*—October 27, 1868.—A series of detaining devices in connection with an annular grate to prevent cinders, sparks, &c., from passing out with the escaping smoke.

Claim.—1. The grate formed by the rings K, K¹, &c., or their equivalent, arranged in the ring G, and under the plate H, substantially as described, and fitted into the smoke stack of a locomotive, for the purpose of arresting sparks, ashes, &c., as set forth.

2. The combination, within the smoke stack of a locomotive engine, of the pipe B, having an enlarged upper end, of the cap C, ring D, deflector E, cap F, ring G, and plates K, K¹, &c., or their equivalents, plate H, and ring p, all arranged substantially as herein shown and described.

3. The caps C and F, and the ring E, constructed with inward and downward bent inner edges, substantially as herein shown and described.

83,507.—JAMES KAY, Salem, Ind.—*Wheel Plow.*—October 27, 1868.

Claim.—1. A two-wheel single-riding plow, having the plow E and its standard C' secured to a hinged frame, C, as described, in combination with lateral, front, and rear braces arranged for sustaining said standard, substantially as described.

2. The brace bar j, connected to the bar n of the plow E, passed through the standard C' and secured to the frame C, substantially as described.

3. The combination of levers or treadles e f with a plow which is applied to a hinged frame, C, upon a two-wheel carriage, one of which levers or treadles is adapted for raising the plow and its frame, while the other is adapted for depressing said parts, substantially as described.

4. The brace g, connected to the bracket d', and the seat standards e', substantially as and for the purposes described.

5. The adjusting screw rods c c, applied to the hinged frame C, and supporting this frame upon the axle A' of a single riding plow, substantially as and for the purpose described.

6. In a machine which is constructed as described, the three holdback rods or chains p p s, attached to the doubletree, substantially as and for the purposes described.

83,508.—PETER KEFFER, Reading, Pa., assignor to himself and E. G. FISHBURN, same place.—*Car Brake.*—October 27, 1868.

Claim.—A railroad car brake, consisting of a yielding wedge-shaped frame, C, constructed and operating substantially as herein described, in combination with brake shoes B and B', hung to the car or truck, substantially as set forth.

83,509.—JACOB H. B. KELLER, Chambersburg, Pa.—*Cultivator.*—October 27, 1868.—The machine is so constructed as to enable it to be used on rough and stony ground without liability of being broken or injured.

Claim.—1. The pivoted standards G, arranged in connection with the rods J, India-rubber springs I, and beams E, all arranged in the manner substantially as and for the purpose set forth.

2. The levers K, attached to the beams E, and arranged in relation with the driver's seat D, substantially as and for the purpose specified.

83,510.—MICHAEL KELLEY, St. Charles, Mo.—*Railroad Switch.*—October 27, 1868.—Lugs are attached to the outsides of the switch rails, on which the flanges of the wheels climb and mount over the rail should the switch be misplaced. It is designed for wheels having a central flange.

Claim.—The lugs C C and guard rails E E, when arranged relatively to each other, as set forth, in

combination with switch rails A, as shown, for the purpose explained.

83,511.—WILSON W. KNOWLES, Plantsville, Conn.—*Thill Coupling*.—October 27, 1868; antedated October 17, 1868.—Between the ears of the ear piece is an eye piece, in a hole of which is inserted a center piece, a bolt being fitted into the holes in the ear piece, and fastened by a nut on its screw-threaded end.

Claim.—The combination and arrangement of the center piece C with the eared piece A, eye piece B, bolt E, and nut F, all arranged, combined, and operating as described.

83,512.—PERLEY LAFLIN, Warren, Mass., assignor to himself and JOHN J. SPRAGUE, Providence, R. I.—*Automatic Car Coupling*.—October 27, 1868.—An arm extends from one side of the draw piece, and has an upward projection, slotted to receive the rear of another arm pivoted in it, and has also two slotted projections, one to raise the toggle and the other the prop bar, the pivoted arm having a spring, bearing on a screw inserted in the under side of the slotted arm, and a rod striking against it raises it, allowing the prop bar to swing forward.

Claim.—1. The combination, with the draw piece B, the projecting arm C, and its slotted standard or upright piece *b* of the hinged or pivoted arm D, and the prop G and toggle pin E, attached to said arm, substantially in the manner described, the whole being arranged to operate as set forth.

2. In combination with the parts named in the preceding clause, the rod H, constructed and arranged to operate in connection with the swinging arm D, substantially as described.

3. The combination and arrangement, with the arms C and D, of spring *g* and screw *h*, substantially in the manner and for the purposes set forth.

83,513.—HERVEY LAW, Chatham, N. J.—*Machine for Cutting Paper*.—October 27, 1868.

Claim.—1. In machines for trimming books, the turning of the bed S, on which the paper is cut, by the receding movement of the bed from the knife, after the completion of each cut, so as to present an uncut side of the pile of paper or books to the knife at each upward movement of the bed, substantially as set forth.

2. Giving the bed S, and consequently the paper to be cut, a lateral, horizontal movement at the termination of its upward, oblique movement, in order to effect a clean cut, substantially as shown and described.

3. The automatic mechanism, substantially as shown and described, for operating the clutch lever H and stopping the machine at the completion of the cutting of the four sides of the paper or piles of books on bed S, as set forth.

4. The pendent projections *r r' r'' r'''* at the under side of the bed S, in connection with the projections *s s'*, on the upper surface of the fixed bed J, for the purpose of holding the bed S in proper position relatively with the knife C, when the paper is being cut, and also when receding from the knife, and at the same time admit of the bed being turned at the proper moment, substantially as set forth.

5. The trip, on the fixed bed J, composed of the fixed part *t*, the pivoted part *t'*, and the spring *u*, when used in connection with the projections on the beds S J, and arranged to operate in connection therewith, substantially as and for the purpose set forth.

83,514.—BENJAMIN LECKRONE, Somerset, Ohio.—*Beehive*.—October 27, 1868.—In a removable cleaning box, which has a feed rack, is a slot for entrance, opposite to which is a hinged door, extending the whole height of the hive, and when open showing the comb boxes, between which are sliding boards, the boxes each having a glass window and a perforated ventilating plate, and their frames being hung from rods, which have a hook to catch in the flattened parts, and to be slid along them.

Claim.—1. The device for hanging the frames J J, so that they are independently attachable to or removable from the sliding boxes which support

them, such device consisting essentially of the rods *m m*, flattened at *o*, and operating, in connection with the hook *n* and the perforated lug *r*, substantially as described.

2. The combination and arrangement of the feed rack D and cleaning box C, substantially as described.

3. The boxes F F¹ F², when constructed with the front doors hinged at *a a*, and latched at *a'*, having the catches or hooks *d d*, by which the slide boards can be attached to them at pleasure, and containing the comb frames J J, substantially as described.

4. The arrangement and combination of the ventilating aperture and bee entrance *c*, the foraminated slides I I, the foraminated plates H H, and the space K, between the front of the comb boxes and the wall of the hive, for the purpose of affording a free ventilation to all parts of the hive, whether the bees are confined or free.

5. The arrangement of the entrance *c*, cleaning box C, feed rack D, boxes F F¹ F², comb frames J J, windows G G, ventilators H H, and door E, substantially as and for the purpose set forth.

83,515.—A. W. LOOMIS, Atwater, Ohio.—*Gauge for Stone Ware*.—October 27, 1868.—The gauge is designed to finish the inside of stone ware smoothly and of a uniform size.

Claim.—The adjustable gauges G and F, in combination with the handles D E, when arranged in relation to a potter's wheel, in the manner as and for the purpose specified.

83,516.—JOSEPH THEODOR LOSSEN, Würzburg, Bavaria.—*Governor for Steam and other Enginery*.—October 27, 1868.—A spur wheel gears into a pinion fixed to a shaft which has its bearings in a weighted lever bearing a bucket or shell immersed in a vessel containing fluid, and having its connection with the outside air regulated by a stop cock. The pinion shaft also carries arms which move the throttle valve of the engine and check its speed.

Claim.—1. The arrangement of the spur wheel F, pinion G, weighted lever I, and vane arms L, substantially as shown and described.

2. The inverted bucket or air shell M, having an air cock, *b*, and vessel N, in combination with the spur wheel F, pinion G, weighted lever I, and vane arms L, substantially as herein set forth.

83,517.—JOHN T. LYMAN, Jeffersonville, Ind.—*Grain Drill*.—October 27, 1868.—The cutters are attached to springs secured to the front cross bar, and to the rear end of each cutter is attached a tube, which latter receive the ends of fixed tubes.

Claim.—The combination and arrangement of the cutters F, springs E, and the tubes D G, all applied to a seed-drilling machine, to operate in the manner substantially as and for the purpose set forth.

83,518.—ALLEN MAGOWAN, Boston, Mass.—*Wringer Roller*.—October 27, 1868.

Claim.—The elastic roller, having its core formed by winding the square mandrel A, having radial arms D, with a string or cord steeped in liquid raw India-rubber, an outer rounding filling, composed of longitudinal strips E, being interposed between the winding string and mandrel, as herein described, for the purpose specified.

83,519.—JAMES MALLON, Lockport, Ill.—*Cultivator*.—October 27, 1868.—Handles are combined with an oscillating frame and the braces which support the shovels, so that the hands and feet may be used to guide the shovels.

Claim.—1. The handles E, brace Q in combination with the bar 5, pivoted to the under side of the tongue, reciprocating bar *g*, braces P, rods *f*, and braces G', for giving a lateral motion to the shovels, as set forth.

2. The braces G G', in combination with bars F F', shanks J J', and stirrups *d*, substantially as set forth.

3. The combination of the draft rod 1 1, spools T, bars F F', cams V, and lever X, substantially as set forth.

4. The hill protector K, pivoted to the brace G', and arranged substantially as set forth.

83,520.—LEANDER J. McCORMICK, WILLIAM R. BAKER, and LAMBERT ERPELDING, Chicago, Ill., assignors to C. H. McCORMICK & BROTHER, same place.—*Harvester*.—October 27, 1868.—Behind the finger beam is pivoted a shoe, the rear end of which terminates in an arched recess which forms a shield or covering for an oval roller turning in bearings in the shoe.

Claim.—1. The combination, substantially as set forth, in a two-wheeled harvester, of a tongue, with its rear end pivoted so that the tongue can play laterally in a socket over the main axle, a corrugated laterally-slotted bracket on the front of the main frame, a correspondingly-corrugated socket on the tongue, and a vertical clamping bolt connecting the socket and bracket, whereby the angle of the tongue to the line of draft can be varied at pleasure.

2. The shields S, constructed as described, attached to the main frame, and inclosing the countershaft, the pinions which drive it, and the backing ratchets, for the purpose set forth.

3. The arrangement, as set forth, for joint operation, of the countershaft, the adjustable bevel gear O, and its sliding clutch, with the nut and removable pinion on the front end of the crank shaft, whereby we vary the speed of the cutters, by using a single gear wheel on the countershaft without moving either shaft.

4. The arrangement as described, for joint operation, of the finger beam, the shoe, and the stirrup, with the horn *l*, and dog L, whereby we lift the divider end of the finger beam first in raising the cutters.

5. The combination, as set forth, of the shoe H and arched shield *i*, with the roller, provided with wooden bushing.

83,521.—JOHN MEALEY, Fairville, New Brunswick.—*School Desk*.—October 27, 1868.—The back is hinged to the rear part of the seat, and is secured by drop pawls pivoted to it and catching upon notched brackets. The desk is attached to arms, and so arranged that it may be turned down to serve as a table, or as a back to the seat.

Claim.—1. The adjustable desk G H, in combination with the seat C and its supports, said desk adapted to be folded back, to form a back rest for the seat, substantially as shown and described.

2. In combination with the adjustable desk G H, the seat C, and its supports, the hinged back C, as herein described, for the purpose specified.

83,522.—JACOB MILLER, Washington, Pa.—*Machine for Forming the Hook or Eye on Pot Bails, &c.*—October 27, 1868.—A disk with a mandrel and guide is placed above the lever, which has a measuring guide and a grooved roller for forming "hook" and eyes of the bail while being bent around the mandrel.

Claim.—The disk *e*, provided with the mandrel *e* and pin *f*, combined with the lever B, furnished with a forming roller, *e*, and guide J, constructed, arranged, and operating as herein described, and for the purpose set forth.

83,523.—JACOB MILLER, Washington, Pa.—*Machine for Bending Oval Handles for Tin Ware*.—October 27, 1868.—The wire being cut the proper length is placed between the guide pin and the forms. The levers are then forced around and cause the rollers to bend the wire around the forms.

Claim.—The frame A, provided with the slots B and *e*, pin J, forms C, and brace *l*, and used in combination with levers D, provided with rollers *f*, constructed, arranged, and operating as herein described, and for the purpose set forth.

83,524.—WARREN P. MILLER, New York, N. Y.—*Gauge for Circular Saws*.—October 27, 1868.—A tube is provided with forked arms at its lower end, which fit in and rotate on a grooved collar secured to the saw mandrel. A gauge rod slides in this tube, and, when adjusted properly to ascertain the relative position of the teeth of the saw, is held by a thumb screw on the tube.

Claim.—The gauge for rounding circular saws, consisting of gauge point *h*, gauge rod *g*, nut *k*, tube *f*, plug *e*, and curved arms or forks *m m*, in connec-

tion with grooved collar *l*, all constructed, combined, and arranged substantially as and for the purpose specified.

83,525.—THOMAS W. MOORE, Richmond, Ind.—*Bolt Cutter*.—October 27, 1868.—The bolt is passed through the perforations in the shears. By opening the levers the movable shear blade is drawn forward, thus cutting off the superfluous end of the carriage bolt.

Claim.—The arrangement of the shear blades, levers, and swivel pivot pins, in the manner described and for the purpose set forth.

83,526.—CHARLES F. MORRISON, Rifton Glen, N. Y.—*Waste Saver for Carding Engine*.—October 27, 1868.—The horizontal waste carriers catch the fiber dropped from the main card cylinder doffer and feeding rollers, and present it to the stripping roller, which latter transfers it again to the main cylinder. The under currents of air act less on the fiber when the belts are horizontal than when inclined.

Claim.—1. The described arrangement of the horizontal waste carriers E F with relation to the doffer D, cylinder C, feed rollers B B', and stripping roller G, as herein described, for the purpose specified.

2. The horizontal waste carriers E F, constructed as described, of small wire ribs, widely spaced upon the belts, and adapted to be shaken, in the manner described, for the purpose specified.

83,527.—E. P. MOSMAN, deceased, (ALBERT S. BOLLES and SARAH E. MOSMAN, administrators,) Norwich, Conn.—*Steam Generator*.—October 27, 1868; antedated October 24, 1868.—The diaphragm of the evaporizer is of less diameter than the case so as to leave an annular space around it for the ascent of the steam and water admitted below said plate. The flues in one boiler section are small near the outer edge and gradually increase toward the center of the shell, and in the alternate section increase in the opposite direction. The water is conducted from the feed-water chamber into the lower short flue section; it then passes down beneath the grate into a vertical pipe which rises through the fire chamber, the center of the short flue section and the bottom of the evaporizer.

Claim.—1. An evaporizer for a steam boiler, consisting of a case or shell, H, with an inclosed diaphragm, I, arranged within it, substantially as described.

2. The combination of short-flue boiler sections and evaporizers, constructed, arranged, and communicating with each other substantially as described.

3. A feed-water heating chamber, combined with a short-flue boiler section or sections, substantially as described.

4. The manner, substantially as shown and described, of conducting the water from a chamber, *j*, horizontally over the fire chamber, and thence vertically through said fire chamber.

83,528.—T. H. MÜLLER, New York, N. Y.—*Steam Generator*.—October 27, 1868.—The openings are placed eccentrically in the heads so that the water and steam discharging from the elevated end of the pipes will strike the top and side plates of the head before going through the apertures. A brace is placed between the inner plate and the head which enables the bolt connecting the chambers and heads to throw the pressure caused by the nut directly to the joint between the plate and head. The pipes are surrounded by a water jacket composed of four chambers which form the side walls of the boiler and furnace.

Claim.—1. The heads E, provided with openings, *a*, in their sides, and openings, *b*, in their tops, placed eccentrically toward the center lines of the pipes D, substantially as shown and described.

2. The perforated tubular brackets *n*, through which bolts *m* pass, arranged, with relation to water jacket F and heads E, substantially as set forth.

3. The water chambers *e d e f*, communicating with the heads E, and inclosing the pipes D, substantially as shown and described.

83,529.—JOSEPH NEUBRAND, Green Point, N. Y.—*Composition for Forming Tiles, Floors, and for*

other Purposes.—October 27, 1868.—Composed of white clay, kaolin, flint, feldspar, and heavy spar, and colored by suitable pigments.

Claim.—The combination of the within-described articles for the purpose specified.

83,530.—O. G. NEWTON, Edinburg, Mo.—*Tuyere.*—October 27, 1868.—A ball valve provided with cavities to receive the cinder is arranged on a rotary shaft which has a vertically-adjustable bearing so as to be raised or lowered, to be rotated for the discharge of the cinders.

Claim.—The combination of those parts with the adjustable bearing for the shaft G, as arranged and described.

83,531.—BARUH NEY and HENRY HOFHEIMER, Alexandria, Va.—*Paper File.*—October 27, 1868.—Around a part of the frame to which the papers are secured is a marginal casing or series of card holders for displaying a number of business cards.

Claim.—The paper file A, provided with an outer supporting edge A', counterbalanced by the advertising frames E, arranged and combined substantially as shown.

83,532.—ABNER NIEBEL, Tiffin, Ohio.—*Beehive.*—October 27, 1868.—On removing the dirt drawers for cleaning, the slides cover the space left and prevent the ingress and egress of the bees. The bee boxes or chamber rest on the wire top of the feed box; the honey boxes are placed on the top of these boxes and are covered with a cap which rests upon the top of the feed box.

Claim.—1. The feed box A, constructed as described, in compartments, with wire-cloth top, door, and ventilating holes, and provided with dirt drawers B B, and slides e e, and with blocks c c, covering the openings b b, substantially as and for the purposes herein set forth.

2. The combination of the feed box A, chambers D D, honey boxes E E, and cap H, all constructed as described, and operating substantially as and for the purposes herein set forth.

83,533.—PHILIP NUNAN, Sandusky, Ohio.—*Apparatus for Preserving and Freezing Fish, Meats, &c.*—October 27, 1868.—The compartments are constructed with two walls and a space filled with a non-conducting substance. A vessel filled with a material to produce intense cold is suspended from the center of the roof in each compartment, and is provided with pipes leading downward connecting with horizontal pipes which receive any liquid that may escape from the vessel.

Claim.—In a meat and fish-preserving house, having compartments B B, with walls, as herein described, the combination of the vessel C, pipes D and E, and vessels F F F F, all suspended in the house, so as to allow a space below them for the articles, substantially as herein shown and described.

83,534.—CHARLES H. NYE, Vineland, N. J.—*Bag Fastener.*—October 27, 1868.—A handle is secured to the buckle to facilitate the unbuckling of the straps.

Claim.—The described arrangement of the handle D, buckle B, and strap A, secured to the bag for the purpose specified.

83,535.—E. F. O'NEILL, Prairie du Chien, Wis.—*Washing Machine.*—October 27, 1868.—Corrugated rollers are journaled in a bow lever, which is kept in proper form by a board on the end, and is provided by a downwardly-projecting flange, which prevents the water from splashing out.

Claim.—The combination of the bow lever D, board I, apron or flange J, arms or bars G, and three or more corrugated rollers H, with each other, and with the tub A and cylinder B, substantially as herein shown and described, and for the purpose set forth.

83,536.—W. H. PAIGE, Springfield, Mass., assignor to himself, JOHN SWEENEY, and JAMES W. RUSSELL, same place.—*Seat Back.*—October 27, 1868.—The back is so constructed as to conform to the shape of the back of the person using it.

Claim.—The metallic springs b b, attached to the body or frame A, the ends of said springs having a bearing in the channels n or n', with the screws a a or other protuberances therein, the whole, when covered and stuffed, forming a seat back, all constructed and operating substantially as herein described and set forth.

83,537.—CLINTON J. PAINE, Young America, assignor to himself and HENRY CRESWELL, Warren County, Ill.—*Corn Plow.*—October 27, 1868.—The ends of the plow beams are forked and secured to plates which are pivoted to the drag bar by pins, thus forming a hinge.

Claim.—1. The curved draft bar B, running from the inside of the center of the wheels forward and upward, substantially as and for the purposes herein set forth.

2. The arrangement of the curved plow beams F F, coupled to the curved draft bar B, as and for the purposes herein set forth.

3. The bar E, running from the outside of the center of the wheels, and across the top, as and for the purposes herein set forth.

4. The combination of the forked ends a a of the plow beams, and the pins b b, and plates c c, forming a hinged coupling, substantially as and for the purposes herein set forth.

83,538.—JOHN W. PATTEN, North Greenbush, N. Y.—*Knife and Fork Holder.*—October 27, 1868.—A shelf for receiving the knife and fork is mounted on posts which are provided with clasping fingers and means for adjusting the shelf in a horizontal position when applied to any plate.

Claim.—1. The longitudinally-supporting device A, mounted on a standard or standards, B B, which extend up from a rod, C, substantially in the manner and for the purpose described.

2. The combination of the longitudinal-supporting device A, standards B B, rod C, and spring clamp or clamps D D, substantially in the manner described.

3. The rod C, with clamp screws a fitted to the standards of supporting device A, substantially as described.

83,539.—MICHAEL PINNER, Buffalo, N. Y.—*Roofing Compound.*—October 27, 1868.—Composed of asphaltum, slaked lime, sulphur, sand, and baryta.

Claim.—A cement composed of the ingredients above specified, in substantially the proportions and for the purposes set forth.

83,540.—HONORÉ ETIENNE PIQUET, Sartrouville, France.—*Apparatus for Shuffling and Dealing Cards.*—October 27, 1868.—A box, containing the cards, is divided transversely in the center by wires which separate or shuffle the cards when a longitudinal movement is given to the box. After being shuffled the box is inclined and the cards slide forward against a roller which receives a rotary motion from clock work and which pushes the cards out, one at a time, through an opening in the end of the box.

Claim.—1. The transverse metal wires H, in combination with the box A, substantially as and for the purpose set forth.

2. The combination of the clock movement with the distributing roller J, the spring D, the platform D', and the pin F G, constructed and operating substantially as and for the purpose described.

3. The platform D', in combination with the spring D', the pin F G, and distributing roller J, constructed and operating as and for the purpose set forth.

83,541.—CORNELIUS PLATT, New Haven, Conn.—*Chair Seat.*—October 27, 1868.—The bottom of the body is formed by a sheet of canvas and pasteboard glued together, then covered loosely with a suitable fabric, and stuffed between the covering and the bottom.

Claim.—The chair seating herein described, as an article of manufacture, consisting of the compound foundation a and b, covered, and so as to be applied to the chair frame, substantially in the manner herein set forth.

83,542.—AUGUSTE PONSARD, Paris, France.—*Furnace for the Manufacture of Iron and Steel.*—October 27, 1868.—Vertical tubes on the hearth of an ordinary puddling furnace are filled with pure carbon, flux, and ore, and heated by the reverberating flame. As the ore is reduced it melts and runs into a hollow portion of the hearth.

Claim.—A furnace for the manufacture of iron and steel, constructed substantially as specified, and provided or fitted with tubes or ore, carbon, and flux receptacles B B, in communication at their base with the basin D of the furnace, essentially as shown and described.

83,543.—LOUIS B. POWELSON, Pittsburg, Pa.—*Feed-Water Heater.*—October 27, 1868.—A "Giffard injector" is inclosed in an air-tight steam cylinder and leads the water into a large conical cap, from whence it is conveyed into the boiler. If the injector is not in order the water is forced directly into the cylinder through an opening in the elbow of the supply pipe.

Claim.—Not any of the specified parts in severalty, but an improved feed-water apparatus, consisting of the several parts specified, all combined, constructed, and arranged as described.

83,544.—JAMES D. PRATT, Cleveland, Ohio.—*Bed Lounge.*—October 27, 1868.—Designed as an improvement on his patent of July 16, 1868.

Claim.—So arranging the springs E and F on the flat horizontal bars C and D that the middle of the entire space of the bed shall present a soft and elastic surface, substantially as shown and described.

83,545.—GEORGE K. PROCTOR, Salem, Mass.—*Photographic Room.*—October 27, 1868.

Claim.—1. For photographing purposes, an apartment or room having its interior of such a curved form as to reflect and concentrate the rays from a lamp, or other light, upon the person or object to be photographed, substantially as shown and described.

2. The opening *c*, in the room or apartment A, for the purpose of adjusting the camera outside of the room in proper position with the person or object to be photographed within the room or apartment, substantially as set forth.

3. The employment of magnesium, when used for illuminating purposes, in connection with a room or apartment A, constructed in the manner or form as shown, and for the purpose specified.

83,546.—ROBERT PYLE, Wilmington, Del.—*Thill Coupling.*—October 27, 1868.—The die, when fastened in place between the jaws of the clip by means of a screw bolt, presses firmly against the eye of the thill iron, prevents the pin from turning and rattling.

Claim.—1. The die, as constructed, in combination with the bolt and washers, as shown and described.

2. The combination of the die *a* and screw bolt *c* with the clip iron *b*, tie iron *f*, and thill iron, with an eye or hooked end, constructed and operating in the manner and for the purpose substantially as herein shown and described.

83,547.—JAMES M. RAGSDALE, McCoy's Station, Ind.—*Road Grader.*—October 27, 1868.—As the machine is drawn forward the plow breaks the earth and throws it upon the revolving wheel, upon which the earth is carried to the opposite side of the machine to be there discharged by the revolving arms.

Claim.—1. The arrangement of the wheel E, plow R, and revolving arms H H, when connected with the frame A, and constructed and operating substantially as specified.

2. The combination of the hinged axle B' and lever K with the frame A, provided with the wheel E, plow R, and arms H H, and connected to operate as set forth.

83,548.—BYRON REED, Kokomo, Ind.—*Photographic Printing Frames.*—October 27, 1868.—The follower is pressed toward the negative by a spring, and admits of the interposition of any desired number of papers for printing.

Claim.—1. Placing an indefinite number of papers, prepared for receiving photograph impressions from a negative, in a frame at one time, substantially in the manner herein shown and described.

2. The frame A, constructed substantially as described, and arranged for receiving a large or a small number of papers, substantially as set forth.

83,549.—ANDREW J. REYNOLDS, Chicago, Ill.—*Steam Pump.*—October 27, 1868.—The water is discharged from the pump by gravity, and its descent is expedited by the steam. When the upper cylinder is emptied the floating piston descends and depresses the vertical rod, which closes the steam valve and exposes the escape valve. The steam in the upper cylinder is condensed by the water in the lower one, and creates in the upper cylinder a vacuum which causes the piston to rise and draw water into the pump from the reservoir.

Claim.—1. A water-elevating engine, having two cylinders, arranged one upon the other, the upper one for receiving the steam, which aids in expelling the water therefrom, and which, by means of its condensation, causes a vacuum to be created therein, and another, into which the steam from the latter is caused to flow by the discharge of the water from the former, and in which the steam from the upper cylinder is condensed, substantially as described.

2. The combination of cylinders A and B and float or piston M, with its apertures or passages O, substantially as described.

3. The combination of the float or piston M and valve P, substantially as set forth.

4. The combination of the rod E, float M, valves P, Q, and X, substantially as described.

5. The combination and arrangement of valves Q and X on rod E, and valve W in the head of cylinder A, substantially as set forth.

6. The arrangement of valve H in relation and with reference to valves X and W, substantially as set forth.

83,550.—JOHN F. RODGERS, South Bend, Ind.—*Gate.*—October 27, 1868.—The lower bar and the short posts serve as guides and prevent the gate from swinging laterally.

Claim.—A gate, constructed as described, having the rail *a*, for sustaining the lateral pressure, placed at the bottom of the gate, in combination with the short post D, the rollers A, their supporting posts E, and connecting bar A', and posts E', all constructed and arranged as and for the purpose set forth.

83,551.—HENDERSON ROSS, Pittsburg, Pa.—*Furnace for the Manufacture of Iron and for Other Purposes.*—October 27, 1868; antedated September 30, 1868.

Claim.—So constructing the fire chamber of furnaces used in the manufacture of iron and steel, that the interior walls of said chamber shall consist of iron, which are surrounded with water, substantially as herein described, and for the purpose set forth.

83,552.—JOHN C. RYAN, Chicago, Ill.—*Water Heating Apparatus.*—October 27, 1868.—The water in the coil being heated passes upward into the boiler, while the water from the tank enters the coil from below, thus causing a rapid circulation of the water and keeping the main body of it hot.

Claim.—The combination of the pipes E D L C with the boiler A, stove S, and coil B, whereby the circulation of water is effected as above described, and at the same time the steam is taken from the pipe D or vessel A, and conveyed to the heater M, as herein set forth, for the purpose specified.

83,553.—GEORGE H. SELLERS, Phoenixville, Pa.—*Hot Water Heater.*—October 28, 1868.—The form of this heater is designed to concentrate the heat upon the walls of the water chamber and induce a free circulation of water in the latter.

Claim.—1. In combination with the external water chamber C, the cylindro-conical fire chamber A, as and for the purpose substantially as described.

2. In a hot water heater, the immediate connection of the water chamber with the street mains, so as to

avoid the necessity of a reservoir, substantially as described.

83,554.—HENRY F. SHAW, West Roxbury, Mass.—*Screw-cutting Lathe*.—October 27, 1868.—The lever is connected with the tool carriage and operated by a nut running on the actuating screw of the lathe. The effective length of the lever may be changed at will to regulate the speed of the tool carriage and the pitch of the screw.

Claim.—The arrangement, substantially as described, of the lever L, pivoted at L', the nut N having a slotted shank, N', thereon, the adjustable connecting button K, carriage G', provided with the swiveled and slotted disk H, and the screw F, or their equivalents, for the purpose described.

83,555.—EPHRAIM SHEPARD, New York, N. Y.—*Fastening for Carriage Curtains*.—October 27, 1868.—The eye is retained on the tube by a spring, the tube being fastened to the carriage frame by the screw.

Claim.—The tube B, slotted substantially as shown, to form a spring, b, in combination with the eye E in the curtain D, all constructed and arranged to form a new and improved curtain fastening, as set forth.

83,556.—DAVID B. SHIRK, Brunnerville, Pa.—*Railway Cattle Guard*.—October 27, 1868.—The crank shaft is weighted and provided with pickets to form the gate or barrier. The cranks are depressed by hinged levers, acted upon by the flanges of the wheels, the effect being to prostrate the gate until the cars have passed over. The weight then restores the gate to its upright position.

Claim.—The arrangement of the crank c c', when not in the same plane, on the top of a shaft, which shaft is provided with pickets P, and a central weight, w, appended below, and when operated by a hinged lever, L, with its open jaws J, the lever being pivoted at one end, all combined and operating substantially in the manner and for the purpose specified.

83,557.—A. W. SILVIS, Birmingham, Iowa, assignor to himself and SAMUEL B. SHOTT, same place.—*Loom*.—October 27, 1868.—The spring hooks are hinged to a stationary bar of the frame, and actuate the picker staff by reason of their up-and-down movement relatively to the pivot of the staff as the lay vibrates, the picker staff being pivoted on a bar carried by the lay. The pivoted pawl effects the alternate engagement of the spring hooks with the notches in the opposite sides of the picker staff, and the picker staff is thus thrown to one side or the other at each backward movement of the lay. The bridge retains the parts in their operative positions.

Claim.—1. The arrangement of the picker staff a, with its enlarged lower end notched at a², the swinging reversing pawl a¹, provided at its enlarged lower end with double inclines, the hinged spring hooks a³, and the bridge a⁵, all operating as described, for the purpose specified.

2. The arrangement of the pawl b⁴, bracket b¹, secured to the lay, the pattern cylinder b², catch pawl b³, and pivoted right-angular harness levers b⁵, all constructed as herein described, for the purpose specified.

3. The combination of the right-angled harness levers b⁵ with the harness frames and pattern cylinder, substantially as and for the purpose set forth.

83,558.—ALFRED SIMS, Brooklyn, N. Y.—*Jack for Turning Shafting*.—October 27, 1868.

Claim.—The lever pawl C D and jack E, in combination with the ratchet wheel B, mounted on the shaft A, substantially as and for the purpose described.

83,559.—CHARLES E. SMITH and FRANK T. JACQUES, Lowell, Mass.—*Shuttle for Looms*.—October 27, 1868.—The shank, remaining fixed in the wood, enables the tip to be applied or detached without liability of injuring the body of the shuttle.

Claim.—The twisted shank C, provided with the removable tip B, constructed substantially as shown and described, in combination with a shuttle.

83,560.—JOHN PATERSON SMITH, Glasgow, Scotland.—*Tool for Turning and Planing*.—October 27, 1868.—This device consists of a straight rectangular trough of metal with sides unequal in height, together with a cap piece of somewhat less length than the trough and a straight tool which fills the trough, the upper surface of the tool and that part of the cap which lies upon it being curved or molded.

Claim.—The within-described formation and adaptation of the under surface of the part c, to fit tightly and firmly to the properly-curved surface of the tool b, the curvature of each being uniform through the whole length, by rolling, molding, or otherwise, the part c, and the tool being used, in combination with the part a, substantially as and for the purposes herein set forth.

83,561.—WILSON SMITH, Tod Township, Ohio.—*Hay Rack*.—October 27, 1868.—This device compels the animal to take but a moderate quantity from the manger at a time, each mouthful being drawn through the bars of the rack.

Claim.—1. The rack, composed of side pieces a and d, and the rungs or cross pieces b b b, when applied to mangers, by hinging or attaching it to the top of said manger, and at the side next to the animal that feeds therefrom, substantially as shown and described.

2. The combination of manger g, the rack a b b d, and feed trough or troughs f f, all as shown and described.

83,562.—CHARLES L. SPENCER, Providence, R. I.—*Hat Hook*.—October 27, 1868.—The rim of the hat is introduced between the jaws of the tongs, and the hook is then opened so as to suspend the hat from any convenient support. In opening the hook it acts like a cam, to close the jaws tightly.

Claim.—The combination of the hook, strap, and tongs, when constructed to operate substantially as set forth and for the purpose specified.

83,563.—ELIHU SPENCER, Ottawa, Canada.—*Station Indicator*.—October 27, 1868.—An improvement on his patent of December 31, 1867. A bell is provided which is sounded as often as the device is operated to exhibit the name of the station; a stop prevents the device from being casually turned in the wrong direction by the attendant; a lamp illuminates the names of the stations, and a mode of applying cards to the front of the device, notifies passengers where to change cars, &c.

Claim.—1. The cutting out or otherwise constructing the plates c, so as to form frames, over or on which a transparent or semi-transparent fabric, d, is secured, having the names of the stations upon them, in combination with a candle, lamp, or other light D, placed at one side of the box A, and arranged so as to throw the rays of light within the same, substantially as and for the purpose specified.

2. The adjustable, or sliding bar or stop E, arranged and applied in the manner substantially as and for the purpose set forth.

3. The bell operating mechanism, composed of the lever K', spring I, right angular plates H H, and hammers G G, all arranged to operate by the turning of the heads B, substantially as and for the purpose specified.

4. The flaps L, when applied to the box A, and used in connection with the drop catch M, substantially as and for the purpose specified.

83,564.—WILLIAM H. STARTZMAN, Big Lick, Va.—*Cultivator*.—October 27, 1868.—The stay rods or the adjusting keepers of the pivoted shanks are attached to the respective ends of the oblique bar.

Claim.—The arrangement of the standards B B, oblique bar C, rack bar I, and keeper E, with nuts g and plows D, all as herein set forth.

83,565.—L. M. STOOPS, Grand View, Ind.—*Beehive*.—October 27, 1868.—The only entrance to the hive leads into the tube at the bottom, and while the entering moths do not have access therefrom to the interior of the hive, they are likely to be destroyed by the bees in passing in and out.

Claim.—1. The perforated tube E, placed in the bottom of the hive, at its front side, and provided

with the entrance F, all substantially as shown and described.

2. The ventilating tube G, provided with openings to admit air through the sides of the hive, and other openings leading into the brood chambers and honey boxes, substantially as herein set forth.

3. The arrangement of the brood chambers C C, ventilating tube G, feed box H, and honey boxes I I, all constructed substantially as and for the purposes herein set forth.

83,566.—JEROME B. SWEETLAND, Pontiac, Mich.—*Wash Boiler*—October 27, 1868.—As the water is heated it rises in the central tube, and is discharged from the spouts of the horizontal, surmounting tube, the latter being whirled around by the reaction of the outflowing water. A valve closes communication between the filling side of the chamber and the ascending tube, so that the water in the other side may have no other mode of egress than that afforded by the upright tube.

Claim.—1. The reversed bottom B, provided with a rim C, projecting downward, and said rim provided with openings, covered on the inside with valves D D, substantially as and for the purposes herein set forth.

2. The removable cone-shaped tube E, secured to the reversed bottom B, by means of the notched flange c, and keys d d, or its equivalents, and provided at the top with a grooved flange, e, on which is placed the cap F, with its lugs f f, forming a loose joint, substantially as and for the purposes herein set forth.

3. The reversed bottom B, provided with a partition or wall, J, and hinged pallet or valve L, the latter extending up into the tube E, substantially as and for the purposes herein set forth.

83,567.—C. W. THIESSEN, Effingham, Ill.—*Corn Planter*—October 27, 1868.—The seed box and the dropping mechanism are contained in, or applied directly to, the main or supporting wheels. The seed slides work in boxes projecting from the face of the wheel, and communicate with the seed box, and seed may be dropped in the ground and imbedded at each revolution or partial revolution of the wheel.

Claim.—1. The drop box, constructed as described, of the parallel ribs d d, one of which is provided within the seed receptacles i m, as herein set forth and shown.

2. The circular seed receptacle E, constructed as described, and secured to the inner face of the wheel B, within the flange c, as herein set forth and shown.

3. Pivoting the connecting rods j of the slides g, by means of a common pin, K, to the stationary axle of the revolving wheel, so that, by the revolution of the wheel, the slides will receive reciprocating motion in the drop boxes, substantially as set forth.

4. The arrangement of the circular seed receptacle E and slides g upon opposite sides of the wheel B, as herein described, for the purpose specified.

83,568.—JAMES TOAY, Mineral Point, Wis.—*Harvester*—October 27, 1868.—Relates to sprocket wheels and their attachment, for the purpose of driving harvester rakes. The object is to prevent the straw from winding upon the shaft of the wheels.

Claim.—1. The wheel A, constructed substantially as shown and described.

2. The plate B, constructed substantially as shown and described.

3. The combination of wheel A, plate B, and the framework of a harvesting machine, substantially as shown and described.

83,569.—P. R. TOTTEN, Adams, Ill.—*Cultivator*—October 27, 1868.—The plows are connected to the bow-shaped lever, and the latter to the treadle, so that by depressing the treadle all the plow beams may be raised simultaneously.

Claim.—1. The bow-shaped lever K, in connection with the treadle L, combined and arranged substantially as and for the purpose specified.

2. The connecting of the beams G G of the inner plows H by means of staples passing through oblong slots e, to admit of the lateral movement of said plows, substantially as set forth.

83,570.—LEONHARDT UTTING, Philadelphia, Pa., assignor to himself, G. MASSA, CH. AMMLUNG, and H. ZIMMERMAN, same place.—*Hasp for Trunk Locks*—October 27, 1868.

Claim.—Hinging the swinging hasp B to the upper edge of its plate b''', so that it can be freely turned sufficiently upward to allow the plate b''' to be fastened to the trunk lid by rivets b⁵, which will be covered by the said hasp when the trunk is closed and locked, substantially as and for the purpose set forth and described.

83,571.—ELIAS F. VARNER, Harveysburg, Ohio.—*Fodder Cutter*—October 27, 1868.—The slotted shank adapts the knife to have its position reversed upon the shaft, so that either its hook or its cimeter-edge may be made to operate. The feed hands which actuate the rollers are pivoted to a cross head reciprocating with a bar which is forced toward the front of the machine by a spring and retracted by a cam, the latter being adjustable, to regulate the feed.

Claim.—1. The provision, in a fodder cutter, of the knife N, having one cimeter cutting edge, n, and one hooked cutting edge, n', and being furnished with a slotted shank, O o, or its equivalent, for attachment to a driving shaft, in the manner herein described.

2. The combination and arrangement, substantially as described herein, of the feed rollers C C', springs D, ratchet wheels c c', pivoted feed hands E E' e c', cross head F, reciprocating bar G, spring H, adjustable cam I i, driving shaft J, and fly wheel K, for the object explained.

3. The combination of the knife N n n', driving shaft J, nut L, and washer l, for the purpose described.

83,572.—ANTON W. WALTER, Canton, Ohio.—*Door Hinge*—October 27, 1868.—The lips at the sides of the leaves are drilled, to receive the hinge pin. The leaves may be U-shaped, in which case the lips are at the inner edges.

Claim.—1. A hinge, composed of two leaves, having eyes or lips turned up at their outer or inner edges, and combined with a hinge pin, substantially in the manner and for the purpose herein specified.

2. In combination with a hinge, constructed as herein specified, a spiral spring, F, arranged and used substantially in the manner and for the purpose specified.

83,573.—WILLIAM H. WHITLOCK, Rising Sun, Ind.—*Turning Tool*—October 27, 1868.—A cylindrical block, provided with a handle, has an axial hole through it of larger diameter than the stick to be turned and is made flaring at the end. A side excavation receives the bit, which is secured by bolts passing through slots in the bit.

Claim.—The hand tool for turning, herein described, composed of the stock A a a' a'', bit or cutter B b b' b'', set screws C C', and handle D.

83,574.—BENNET WHITNEY, New Brunswick, N. J.—*Grist Mill*—October 27, 1868.—An elastic hose or band is placed between the curb and the upper stone, which has two projecting pins, in a line with each other, fitted into the lower ends of two vertical, adjustable bars, which pass through openings in a plate, and are hung from a bar, with a horizontal slot, and a nut working on a screw, around which also the bar is fitted and swings upon it.

Claim.—1. The arrangement of the elastic packing H, interposed between the upper stone E and the curb C, substantially as and for the purpose set forth.

2. In combination with the stone E, the pins h, slotted sliding bars i, slotted plate g, adjustable plate L, stationary screw i, and nut j, all operating as described, for the purpose of adjustably suspending the stone E, in the framing, as herein shown and described.

3. The reversible Z-shaped bars M, when provided with hooks l, arranged to support the hopper and shoe of the grist mill, as herein described.

83,575.—JAY J. WIGGIN, Syracuse, N. Y.—*Preparation of Roofing Fabrics*—October 27, 1868.—Upon a bed formed of side and end pieces of

wood, and filled with sand on a clay packing, are placed three iron rollers, in a frame, holes being made in their interior through nuts screwed into their ends, for admitting steam or hot water to heat them.

Claim.—1. The box or bed C, constructed as and for the purpose described.

2. The three rollers B B B, constructed and arranged substantially as and for the purpose described.

3. The rolling apparatus, composed of the three rollers B B B, the frame A A, and the parts contained in the same, constructed and arranged substantially as and for the purposes set forth and described.

4. The heating and keeping hot the rollers B B B, by the introduction into them of either hot water or steam, substantially in the manner set forth.

5. The process, herein described, of coating felt, paper, and other roofing fabrics, the same consisting in the use of heated rollers acting over a clay bed, or its equivalents, constructed substantially as described.

83,576.—JAY J. WIGGIN, Syracuse, N. Y.—*Roofing Composition for Houses, Boats, Barns, &c.*—October 27, 1868.—Clay and air-slaked lime are mixed together and boiled with coal or gas tar.

Claim.—The compound made of the ingredients before described, in the proportions above set forth, substantially as and for the purpose described.

83,577.—JOHN D. WILKINSON and E. O. BOYLE, Plattsburg, N. Y.—*Combined Tool.*—October 27, 1868.

Claim.—Combining and securing or pivoting the wire gauge A, dividers C, rule D, square E, and calipers F and H together, when made to correspond in dimensions with each other, as and for the purpose set forth.

83,578.—MILETUS J. WINE, Long Glade, Va.—*Harvester.*—October 27, 1868.—An endless apron receives and deposits the grain on a chute between it and the right-hand draught wheel, the hub of which actuates one of the apron rollers by means of a belt connected with a shaft rocked in one or the other direction by a treadle, an arm being fixed to it, which at its outer end supports an idle pulley for tightening the belt.

Claim.—1. The chute M, having its rear end left open, and attached only to the finger bar at its front end, when arranged between the grain wheel W and the apron A, and below the level of the latter, in the manner and for the purpose specified.

2. In connection with the belt C, for moving the apron A, and the chute M, for receiving the grain from said apron, the rock shaft G, the rake J, the idle pulley N, and the treadle t or arm z, when combined and arranged to operate in the manner and for the purposes substantially as specified.

83,579.—A. N. WOLF, Sheridan, and JOEL HAAG, Bernville, Pa.—*Water Wheel.*—October 27, 1868.—Six chutes are fixed between the ring and the inner periphery of the lower casing, to which the gates are pivoted in a groove near the inner ends of the chutes, and are hinged at their outer ends to the ring, so that by turning the latter all the gates are opened at the same time.

Claim.—The combination of the casing A, wheel E, chutes B B, hinged gates C C, and ring a, all constructed, arranged, and operated, substantially as set forth.

83,580.—DAVID WOLF, Easton, Kansas.—*Registering Scale.*—October 27, 1868.—By the fall of a scale beam on a shaft, which has a wheel with a wrist pin set into it, a crank is made to lift a hammer shaft, and work a pawl fixed to it by a pin on the other side of the wheel, a hammer striking a bell when the required quantity is secured.

Claim.—The arrangement of the dial plate E, pawl f, shaft C, wheel D, with its pin g and wrist pin d, the hammer j, and bell k, as constructed, in combination with the beam A, to be operated by a platform or weighing scale, substantially in the manner as described, for the purposes herein set forth.

83,581.—JOSEPH WRIGHT, Philadelphia, Pa.—*Stop for Umbrella Runner.*—October 27, 1868.

Claim.—A stop for umbrella runners, consisting of a staple, having legs a^1 , of different lengths, and a shoulder, a^2 , substantially as described.

83,582.—JOHN W. KIDWELL, Washington, D. C.—*Extracting Gold and Silver from their Ores.*—October 27, 1868.—Sulphurets of iron containing precious metals, being concentrated and roasted,

yield oxide of iron mixed with metallic gold and oxide of silver, which is mixed with a carbonaceous substance and heated for six hours in Bischoff's oven. This gives finely-divided iron mixed with gold, which, after being cooled, is amalgamated, to secure the gold.

Claim.—The use of finely-divided iron, prepared according to Bischoff's patent process, in connection with the amalgamation of gold and silver ores, as herein described and set forth.

83,583.—WILLIAM H. ABEL, Greenville, R. I.—*Knitting Machine.*—November 3, 1868.—The knocking-over bar is provided with a lip notched vertically and longitudinally to receive the knocking-over points which are secured to the bar by a clamp.

Claim.—1. The knocking-over points, constructed substantially as described, for the purpose specified.

2. The combination of the separately removable knocking-over points, substantially such as described, with the bar B, having the notched lip g, clamp A, and screws a, or equivalent.

83,584.—WILLIAM H. ABEL, Greenville, R. I.—*Knitting Machine.*—November 3, 1868; antedated October 22, 1868.—A series of vertical sliding jacks on the slide bar are provided with loop sinkers and dividing sinkers, which are secured to the lower end of said jacks, the latter being held up by small friction springs. A plate is secured to the face of the leads and sinkers and draws the old loops over the newly-formed loops. The vertical shaft is rotated by a segment wheel oscillated by cords fastened to said segment and the top bracket.

Claim.—1. The sinkers c^6 and c^7 , constructed as described, combined with the jacks c, and operating in combination with the needles, in the manner and for the purpose set forth.

2. In combination with the jacks c, which have sinkers c^6 and c^7 , constructed, combined, and operating as set forth, the springs g^6 , arranged to operate as and for the purpose specified.

3. The plate f f, applied to the face of the knocking-over bar, in the manner and for the purpose substantially as specified.

4. The combination of the vertical shaft 19, operating as set forth, the crank arm 17, connecting rod 15, the segment, with its arm A^2 , cords 24, pulleys 27 and 28, and the top bracket, the whole arranged to operate substantially in the manner and for the purpose specified.

5. The combination of the friction slide and slide box with the parts last above claimed, as and for the purpose set forth.

6. The lever M, for operating the presser bar, when provided with a pin or stud, m, and a rotary sliding roller n, and with a shipping device, substantially as and for the purpose specified.

7. The combination of all the operative parts herein described, arranged to operate substantially in the manner and for the purpose set forth.

83,585.—MAX ADLER, Buffalo, N. Y., assignor to himself and HENRY BREITWIESER, same place.—*Blind Hinge.*—November 3, 1868.—A bearing cushion is interposed between the leaves of the lower hinge to prevent jarring, when the blind is turned.

Claim.—The combination of the interposed bearing cushion k l with the geared hinge leaves a d, arranged as described, and operating in the manner and for the purpose specified.

83,586.—T. G. ARNOLD, New York, N. Y.—*Die and Punch.*—November 3, 1868; antedated October 24, 1868.—The plate holding the die is detachable.

The punch holder bar is beveled on its edges to slide in a groove in the lower face of the cross head,

and is provided with tubes in which the punches are secured.

Claim.—1. The combination of the die plate A, series of removable dies C, and spring die clearer L, arranged substantially as described.

2. The combination of the plate H, series of punch-supporting tubes K, and punches E, arranged substantially as described.

83,587.—E. H. ASHCROFT, Lynn, Mass.—*Steam Engine Oil Cup.*—November 3, 1868.—Two cups are arranged one within the other, the inner one being open at the top and provided with a valve which, when open, allows the melted tallow to run into the outer cup, which latter is provided with a valve to regulate the amount of oil to be fed to the steam cylinder.

Claim.—The combination and arrangement of the outer cup G, inner open-mouthed cup A, stem B, and valve C, operated in the manner as shown and described, and for the purpose set forth.

83,588.—E. H. ASHCROFT, Lynn, Mass.—*Steam and Water Check Valve.*—November 3, 1868.—The part forming a seat for the valve is provided with a conical end which is held in a correspondingly-shaped seat in the other part by a union joint piece.

Claim.—The construction of the piece E, and its arrangement in relation to the valve piece e, piece C, and union joint piece D, substantially as shown and described.

83,589.—WILLIAM ANHEUSER, St. Louis, Mo.—*Extracting Saccharine Matters from Malt.*—November 3, 1868; antedated October 28, 1868.

Claim.—1. The process of forcing a direct current of steam, water, or compressed air into a tight compartment containing the malt, for the purpose of pressing the saccharine juice from the malt.

2. The application of a suction apparatus to secure a ready issue of the saccharine liquid, either separate, or in combination with the device specified in first claim.

83,590.—JAMES A. BALL and PETER B. LAWSON, Cold Spring, N. Y.—*Machine for Blocking Hats.*—November 3, 1868.—The brim portion of the hat is stretched by the conical ribs. The cone has a horizontal surface which serves as a bearing for the lower edge of the lower portion of the chamber.

Claim.—1. The perforated cone H, having recessed surface f, in combination with the hollow chamber mold or former C, arranged so as to pinch and hold fast the hat body, substantially in the manner set forth.

2. In combination therewith, the conical ribs e e e, applied to and forming part of the horizontal upper surface of the chamber d of the box mold or former C, substantially in the manner and for the purpose specified.

3. The combination of the recessed perforated cone H, flexible covering I, plate B, and steam pipes K and L, with the box mold C, arranged and operating substantially as specified, so as to force a felt hat body into the said mold C, by applying the pressure of steam internally.

83,591.—ROBERT M. BARTHELMESS and CHAS. C. MILLAR, Savannah, Ga.—*Car Coupling.*—November 3, 1868.—A curved slotted latch vibrating on a pivot in the slotted draw head and abutting against the curved ends of the slot in the draw head, operates as a self copier and can be raised or lowered by the hand.

Claim.—The application, within a longitudinal slot b, through a buffer head, B, of a slotted segmental latch, D, of described construction, guided and kept in place by means of a pin, g, and curved abutment h, substantially as described, and for the purposes set forth.

83,592.—WALKER B. BARTRAM, Danbury, Conn.—*Gathering Attachment for Sewing Machine.*—November 3, 1868.—The upper blade is riveted to a lower plate provided with two tongues. The upper strip of cloth is passed underneath the riveted blade while the lower strip is passed between the two blades, and is less retarded in its movement toward

the needle than the upper one, consequently the lower strip will be sewed to the upper one in a gathered condition.

Claim.—The within-described gathering attachment for sewing machines, composed of three elastic blades or plates, B b a, all arranged relatively to each other, as shown, and constructed to guide and give the required pressure to the strips of material to be gathered, as described and specified.

83,593.—W. W. BATCHELDER, New York, N. Y.—*Lighting Gas.*—November 3, 1868.—The friction fuse is saturated in a bath of phosphorus which is held in solution by bisulphide of carbon, then drawn through collodion, and afterward dried and coated with shellac varnish. It is wound around a spool fitting over a tube which forms part of the cup.

Claim.—1. The friction fuse or cord, saturated and coated with the ingredients and in the manner herein set forth.

2. The method of effecting the feed of the fuse by means of two racks or pinions, constructed and arranged so as to admit of the passage of the fuse between them, the said pinions being operated by a spindle and endless screw, or equivalent device, substantially as set forth.

3. The combination, with the feed pinions or racks and fuse, and the spindle for operating the racks, and effecting the combustion of the fuse, of the hollow standard case, in which the said spindle and racks are supported and inclosed, substantially as and for the purposes set forth.

4. The combination, with the rotary spindle for operating the feed racks, of a thumb-piece, mounted upon the spindle, substantially as herein described, so as to prevent the retraction of the fuse from between the said racks.

5. The fuse receptacle, constructed as described, in combination with the gas burner, under the arrangement herein shown and specified.

83,594.—ALMA BEDFORD, Coldwater, Mich.—*Check Hook.*—November 3, 1868.—A ball, sliding vertically on a pin secured to the rear end of the check hook, can be raised high enough to permit the check rein to pass under it, and, when dropped, prevents the check rein from being withdrawn.

Claim.—A harness check hook, B, provided with a vertical pin C, and ball D, all constructed and arranged to operate substantially as herein described.

83,595.—GEORGE BEISNER, Chicago, Ill.—*Churn.*—November 3, 1868.—The beater is provided with the movable paddles in shape of troughs for producing a greater agitation in the cream. The pinion driving the beater is held in place by a spring, and is taken off to remove the beater when the churning is done.

Claim.—1. The movable paddles b b, arranged and operating substantially as set forth.

2. The spring d, as and for the purpose set forth.

83,596.—CHARLES P. BENEDICT, Hoboken, N. J.—*Sewing Machine.*—November 3, 1868.—A slotted lever, pivoted to the frame and actuated by a cam, gives the horizontal reciprocating motion to the feed. The presser foot is provided with a thin spring plate on its under side to prevent any noise when the feeding bar strikes the under side of the presser foot.

Claim.—1. The slotted lever B C, having one of its jaws so constructed that it shall always hold and keep the pin g, on the arm E, in contact with the other jaw, by a spring pressure, substantially as set forth and specified.

2. The frame A, and vibrating slotted lever B C, constructed substantially as described, so that it may be readily attached to a four-motion-feed sewing machine, in co-operative relation with the feeder thereof, substantially as and for the purposes set forth and specified.

3. The combination, with a reciprocating feeder, of the vibrating slotted lever B C, constructed as described, so that said lever shall always be in contact with the ordinary feed cam of a four-motion-feed sewing machine, without making or breaking contact therewith, substantially as described and set forth.

4. The supplementary presser foot or spring h, in

combination with a reciprocating feeder H, and vibrating slotted lever B C, constructed and operating substantially as described and specified.

83,597.—LORENZ BOMMER, New York, N. Y.—*Block and Die for Forming Hats.*—November 3, 1868.—The hat blocks, molds, and dies are composed of a material described in letters-patent granted to T. C. Krause, on the 17th of February, 1863, which allows the dampness or steam to pass off through the pores by filtration and evaporation.

Claim.—Making porous hat blocks, molds, and dies, substantially as described, as distinguished from molds made porous by perforations or woven meshes.

83,598.—B. S. BURGAN, Congress, Ohio.—*Horse Hay Fork.*—November 3, 1868.—The fork is constructed with two tines, each of which have pivoted points, which allow a small quantity of hay or short hay to be removed from the load.

Claim.—The links E, bow F, lever G, and cross bar C, as arranged to operate in combination with the feet D and limbs A, substantially as and for the purpose described.

83,599.—CHARLES THOMAS BURGESS, Brentwood, England.—*Harvester Rake.*—November 3, 1868; patented in England September 8, 1866.—A number of arms are secured together in pairs, forming obtuse angles, through the vertex of which passes the reel shaft, so as to permit each pair of arms, when revolved, to vibrate in its plane, their inclination being controlled by a cam. To the extremity of each of these arms is hinged an arm carrying a rake, and connected by a jointed link to the reel shaft, each rake being rotated while sweeping over the platform.

Claim.—1. The combination, as herein described, of the reel shaft, the rake arms, and the cam for carrying the delivery rake or rakes of the reel or fly by the arm or arms which are inclined to the shaft of the reel, and which are caused to vary their angle to the shaft, substantially as described.

2. The arrangement of mechanism, herein described, for causing the delivery rake of the reel or fly, as it is moved back over the platform, not only to move endwise toward the draught side of the machine, but also to turn into a position inclined to the line of the knife, substantially as hereinbefore described.

83,600.—JAMES W. BURNS, Medway, Ohio.—*Letter Package.*—November 3, 1868.—The labels, showing the destination of the bundle of letters, are fastened to the upper one of the plates holding the letters, by a narrow strip of metal firmly secured at one side and passed through a slot and bent on the other side.

Claim.—The direction papers E, when attached, as described, by the fastening e, or the band x, and combined with the parts A B, as and for the purpose set forth.

83,601.—WILLIAM BURTIS, New York, N. Y.—*Propeller Shaft.*—November 3, 1868.—A gear wheel on the crank shaft actuates two counter shafts, (one on each side of the crank shaft,) which operate the propeller shaft.

Claim.—The application of the double counter shafts C C with their gear wheels F, in combination with the gear wheel E on the crank shaft, and the gear wheel D on the wheel shaft, as herein described.

83,602.—JAMES E. CARTER, Portland, Me.—*Non-freezing Hydrant.*—November 3, 1868.—A gas pipe ascends from the main with the water pipe, and both are protected by the hydrant case. The gas burner is arranged beneath the gooseneck termination of the water discharge pipe.

Claim.—The improved hydrant, having the gas and water pipes combined and arranged within the shell or stock of the same, from their respective mains upward, as and for the purposes set forth.

83,603.—CHARLES B. CLARK, Buffalo, N. Y.—*Blind Hinge.*—November 3, 1868.—A movable knuckle sliding down the incline of a stationary

knuckle, causes a slight lateral movement of the blind sufficient to bring the angular side of the axial pin of the male portion in contact with the angle of the socket in the female portion, thus locking the parts together.

Claim.—The angular socket g and pin n, in combination with the inclines m m', constructed and operating as described.

83,604.—MARK J. COLBOURN, Karthaus, Pa.—*Water Wheel.*—November 3, 1868.—The radial buckets are each provided with hoods so shaped as to prevent the water, after acting on the buckets, from rebounding against the surfaces of the succeeding buckets. The wheel is supported in a metallic frame secured to a wooden frame. The removable box, adapted to receive a wooden step block for supporting the shaft, is supported in the standard, and held by a hook.

Claim.—1. The hoods or shields D, constructed of the form substantially as described, upon the backs of radial floats m, substantially in the manner and for the purposes described.

2. The shields D, constructed with interlocking segments S' and shoulders l, in combination with the float plates m, flanches H, and a locking key k', substantially as described.

3. The convolute case, inclosing the water wheel, of two sections, C C', constructed and connected together by the devices as shown, so as to be detachable, substantially as described.

4. The combination of the sectional frames A A', the sectional water wheel case, and the tongue-and-groove and bolt fastenings, all constructed and arranged substantially in the manner and for the purpose described.

5. The removable box d, provided with hooked fastening d', adapted for use with a standard, C³, substantially as and for the purpose described.

83,605.—WILLIAM J. COCHRAN, Baltimore, Md., assignor to himself and JOHN COCHRANE, Farmingdale, N. J.—*Annealing Pit for Annealing Car Wheels.*—November 3, 1868.—A chamber formed beneath the molding floor, of a larger diameter than the clear of the wheels, has arranged within it three vertical guide strips which keep the wheels in the center of the pit, the top of which latter is closed by an iron plate, on which sand is placed and kept from spreading by a cope-ring. A vent tube is provided to relieve the pressure within the chamber.

Claim.—1. The cooling or annealing pit herein described, with a top covering and bottom vent, arranged for the purpose set forth.

2. The arrangement of the cope ring with the top plate, substantially as described.

3. The cooling or annealing pit, in combination with the guide strips, or their equivalents, arranged and operating substantially as described.

83,606.—JOHN F. CORY, New York, N. Y.—*Noiseless Bell-pull.*—November 3, 1868.—The rubber on the end of the slide prevents any noise when the slide is released after pulling the bell. It is intended particularly for pilot houses on steamboats.

Claim.—The carrying of the rubber D on the slide B, attached to the wire C, leading to the bell, so that it is raised and lowered therewith, substantially as and for the purposes herein set forth.

83,607.—PATRICK H. COYLE, Newark, N. J.—*Boiler Flue Brush.*—November 3, 1868.

Claim.—1. A boiler flue brush, the flexible or brush portion of which is composed of strips or pieces of steel or other metal, inserted in the hub, substantially as set forth.

2. The combination of a metallic lined tubular hub or base, with a steel or metallic brush, substantially as set forth.

3. The combination, with a boiler flue brush, of removable end pieces or heads, and a removable center rod or handle, substantially as set forth.

83,608.—JOB A. DAVIS, Watertown, N. Y.—*Steam Generator.*—November 3, 1868.—As fast as the water in the generator is vaporized, the water in the supply reservoir flows in, thus causing a small quantity of water to be heated at a time.

Claim.—The combination of the generator A, and the water supply reservoir F, whereby to generate low pressure of steam, and to supply heated water to the boiler, substantially as herein set forth.

83,609.—CHARLES DE ST. CHARLES, Jalapa, Mexico.—*Coffee Huller and Polisher.*—November 3, 1868.—The coffee is discharged from the hopper upon the rim of a cylinder, covered with elastic material, and carried between the crushing plate or rubber and knobbed belt. The crushing plate is hinged and held in position by an elastic belt, the end of which is secured to an adjustable stretcher.

Claim.—The combination of the cylinder A, rubber *b*, belt *e*, and adjustable stretcher *h*, when constructed and operating in the manner herein described.

83,610.—JOSEPH DICK, Jr., of Oshawa, Ontario, assignor to himself and EUGENE GLEN, Rochester, N. Y.—*Harvester Rake.*—November 3, 1868; patented in Canada, June 25, 1868.—An improvement on his patent of January 28, 1868. The movement of the rake arm backward and forward produces the necessary rising and falling motion of the rake. A catch holds the rake in position on its return stroke, and is thrown up and allows the rake to drop when in position to move forward again, by means of an adjustable trip roller on the main standard.

Claim.—1. The bed plate B, provided with bearings for the driving and crank wheel shafts and rake pivot, and for the adjustable stops and rake latch, arranged substantially as described.

2. The latch *f*, attached to the rake-carrying arm, and operating in connection with the sector arms, substantially as described.

3. The adjustable roller arm, in combination with the latch *f*, for releasing the same, in the manner set forth.

4. The pivoted latch lever *i*, operating in combination with the sector and rake-carrying arms, substantially as described.

5. The pivoted latch lever *i*, provided with the adjustable latch or hook, for the purpose set forth.

6. The pitman J and boxes I and K, in combination with the adjustable washers or jam nuts *k*, arranged and operating substantially as described.

7. The vibrating rake arm, provided with the heel extension or counter-arms *D'*, in combination with the crank wheel shaft, arranged and operating in relation thereto, substantially as described.

83,611.—JOHN B. DRAPER, Salem, Ill.—*Post Auger.*—November 3, 1868.—A screw shaft provided with a point and auger at the bottom and a wheel at the top rotates in a nut and feeds the auger into the ground. On retracting the auger the shaft remains stationary and the nut is rotated.

Claim.—The arrangement of the screw shaft G, with its wheel I, and the nut D, with its wheel F, and restraining plates E, operating respectively for the rotation and insertion of the auger, and for its upward withdrawal, substantially as described and represented.

83,612.—JAMES W. EARDLY, Grand Rapids, Mich.—*Corn Marker.*—November 3, 1868.—The corn marker bar is hinged at the center so that one-half of the frame may be raised by the handle to pass over obstructions. It is also provided with adjustable guide arms to keep the machine at a proper distance from the rows previously marked. The markers swinging on bolts can be set at an angle with the marker bar.

Claim.—1. The adjustable hinged bars A A, in combination with the arms *a a a a* and slotted arms *b b*, arranged and operated substantially in the manner shown and described, for the purpose set forth.

2. The manner of adjusting the marker *a*, Fig. 2, substantially as and for the purpose described.

83,613.—DEXTER ESTES, Stockholm, N. Y.—*Washing Machine.*—November 3, 1868.

Claim.—The corrugated roller A, moving in the curved box B, by means of the lever *d*, pivoted to a projection extending from one side of the box, and furnished with the handle C.

83,614.—AMOS FASSETT, Sterling, Ill.—*Wagon Stake.*—November 3, 1868; antedated October 17, 1868.—A flange around the center plate rests upon the bolster. The part of the plate below the flange passing through the bolster is formed thicker than the body of the plate and terminates in a screw, by which it is fastened. On each side of this plate are secured plates which hold the entire stake securely to the bolster.

Claim.—1. The plate B, when provided with the flange *b'*, and the enlargements *e e*, projecting below said plate, substantially in the manner and for the purposes herein set forth.

2. In combination with the above, I claim the side plates C D, arranged and operating in the manner specified.

83,615.—H. D. FLOWER, Chicago, Ill.—*Compound for Killing Insects on Trees.*—November 3, 1868.—Composed of iron filings, tartaric acid, and calomel.

Claim.—The ingredients herein named, compounded and applied substantially as and for the purpose set forth.

83,616.—ELIAS T. FORD, Stillwater, N. Y.—*Manufacture of Paper.*—November 3, 1868.—The water from the pulp is drawn from the suction box through tubular bearings of the forming cylinder. The slice bars secured to the side of the reservoir support the blades which regulate the flow of pulp forming the sheet of paper and permit the suction to assist in the formation of the paper and suck the water from the paper before coming to the couch roll.

Claim.—1. The perforated cylinder A, with the interior suction box B, both constructed and arranged to operate substantially as herein described.

2. In combination with the perforated cylinder A, the suction box B, when constructed and arranged to operate substantially as herein described, and for the purpose set forth.

3. The reservoir D, with a packing roll, G, or its equivalent, for preventing drip, in combination with the forming cylinder A, when constructed and arranged to operate substantially as herein described.

4. In combination with the perforated cylinder A and sucking box B, the slice bars *r r* and blades H H, when constructed and arranged to operate substantially as herein described, and for the purpose set forth.

5. Providing the forming cylinder A, and its attachment as herein described, with a reciprocating movement, for the purpose of interweaving the fiber of the pulp, as set forth.

83,617.—ELIAS T. FORD, Stillwater, N. Y.—*Machinery for the Manufacture of Paper.*—November 3, 1868.—The wire cloth passes over and is supported by a perforated cylinder rotated in a box which is open at the top and provided with packing plates, the open edges of which hold rubber packing strips that support the wire cloth. The cylinder is provided with plungers which extract the water from the pulp as the wire cloth progresses, and with concave plungers between the cylinders and the box for preventing the passage of air or water.

Claim.—1. In the manufacture of paper, the method of sucking the surplus water from the pulp formed into a sheet on the wire cloth as it passes to the couch roll, substantially as herein described.

2. The perforated cylinder B, when constructed and arranged to operate substantially as herein described, for the purpose of avoiding the wear of the wire cloth in the manufacture of paper.

3. The water box A, perforated cylinder B, circular plungers C, concave plungers J Q, packing plates I, and packing Z, when constructed and arranged substantially as herein described, and for the purpose set forth.

4. In combination with the perforated cylinder B, the sucking box W, with its plungers C, when constructed and arranged substantially as herein described.

83,618.—ELIAS T. FORD, Stillwater, N. Y.—*Wrench.*—November 3, 1868.—The jaws embracing the nut are secured to a lever which is provided

with an adjustable slide made to embrace the spokes of the wheel, and, on rotating the latter, the nut is unscrewed without greasing the bands.

Claim.—The above-described wrench for axle-nuts of carriages, the whole constructed and operated substantially as and for the purpose specified.

83,619.—ELIAS T. FORD, Stillwater, N. Y.—*Finger Bar for Harvesters.*—November 3, 1868.—The finger bar is composed of two oval plates riveted together and perforated on one side to receive square lugs on the guard finger, and on the other side with circular apertures for the insertion of a screw which secures the guard fingers to the bar. A metal plug is inserted in the extremity of the bar and affords greater solidity at the point of attachment.

Claim.—The oval plates A B, provided with apertures F and r, in combination with the guard fingers C, provided with shanks e, screws a a, and metal plug J, all constructed and arranged substantially as described.

83,620.—JOHN FRAZEE, St. Louis, Mo., assignor to HIRAM PROBASCO, of same place.—*Windmill.*—November 3, 1868.—Cams are fixed on the wing shaft, and are guided by cam plates. The governor devices, supported by the upper rotating frame, are connected by a pulley on the governor shaft, with the main power shaft to control the action of the vanes.

Claim.—1. The vanes G and G', respectively, combined with the frame B, cam plate B², cams f and f', and fan shafts E, substantially as and for the purposes set forth.

2. The governor device h H h¹, acting upon the vanes G and G', to cause them to turn the frame B, substantially as and for the purpose set forth.

83,621.—JOHN G. GARRETSON, Cincinnati, Ohio.—*Loom.*—November 3, 1868; antedated October 22, 1868.—The web is shed by the action of the batten in its backward vibration upon the pendants of the harness, by means of a finger, without the intervention of treadles. Guide pins are inserted in the hand rail to guide the shuttle through the web, the same being propelled by an endless cord, in the hand of the operator, the guides transferring the shuttle from one to the other as they meet in the middle of the web.

Claim.—1. The combination of the batten, the finger b, the pendants d, the cord f, the pulley e, and the case e c, for the purpose of operating the harness, as above described.

2. The cords w and x, in combination with the lever y and finger b, for the purpose of operating the pendants, as above described.

3. The combination of the guide pins n n n, with the hand rail or batten cap, and with the sliding guides o o, in the manner and for the purpose above set forth.

4. The endless cord a a a, arranged with the batten and its guiding pulleys, in combination with the shuttle-working or carrying guides o o, for the purpose above shown and described.

5. The combination of the pawl k, the fly m, the dog i, and the lever h, acting on the rag wheel of the cloth beam, and making a take-up motion, as above set forth and described.

83,622.—JAMES GARVEY and MATTHEW H. KIMBALL, San Francisco, Cal.—*Bell-pull.*—November 3, 1868.—The striking hammer has an arm resting on the pull-bar at the inner end of which is fastened a lug, on which is hung the lifting wedge.

Claim.—The application of the lifting wedge H, combined with the lug I, which, being attached to the pull-bar G, operates, with it, directly on the hammer E, in the manner herein described, and for the purpose before mentioned.

83,623.—JAMES GARVEY and MATTHEW H. KIMBALL, San Francisco, Cal.—*Bell-pull.*—November 3, 1868.—On one end of the lever is pivoted the lifting wedge connected by a wire with the pull-bar, and its lower end is connected with the hammer by a spring which actuates the hammer, and, when the bell is struck, restores the lever and pull-bar.

Claim.—1. The lever D, as constructed, and the attachment of the wedge piece G, thereto.

2. The attachment of the handle or pull-bar H directly to the lifting wedge G.

3. Connecting the lever D and hammer K by the spiral spring P, or its equivalent, the whole constructed in the manner substantially as herein described, and for the purposes as set forth.

83,624.—HENRY A. GASTON, Stockton Cal.—*Seeding Machine.*—November 3, 1868.—A valve slide with a projecting spur works under the bottom of the bin, which is provided with valves and has within it stationary fingers, a shaft with fingers being so arranged that when it is rotated, one set of the fingers pass on one side of the valve while the next follow on the opposite side.

Claim.—1. The rotating fingers d, when constructed to operate between fixed fingers f, of a grain-sowing machine, substantially as above described.

2. The combination and arrangement of the rotating shaft D, and its fingers d, with the stationary fingers f, and the further combination and arrangement of the relief board H with the remaining internal machinery of a grain-sowing machine, substantially as above described.

3. The spur c', in combination with the slide C', substantially as above described.

83,625.—JOSEPH GATCHELL, Rahway, N. J.—*Machine for Bending Elliptic Springs.*—November 3, 1868.—Upon the rollers, which move on a spring conforming to the curve of the templet, rests the weight of the cross-head. The rollers are fixed to the ends of two levers and have a curvilinear motion from those centers.

Claim.—1. The combination, substantially as described, of the templet, rolls, bending levers, and weight.

2. The combination of the series of rolls with the bending levers and templet, arranged substantially as described.

83,626.—H. C. GOODSPEED, New York, N. Y.—*Sash Supporter.*—November 3, 1868.—Two cords are fixed to the upper and lower corners of the sash, the upper one being carried through between double and single sheaves, over the single and through the second groove of the double, while the lower one passes over a single pulley. Both cords are connected by a spring of coiled wire.

Claim.—The construction and arrangement of the grooved single pulleys or sheaves a a, double sheave b, cords C C, and spring D, when applied to a window sash and frame, substantially as described, and for the purpose set forth.

83,627.—MARTIN HALLENBECK, Albany, N. Y., assignor to ALFRED BLAKER, Newtown, Pa.—*Harvester.*—November 3, 1868.—The tongue is bolted on the foot board, to which is secured the standard, for the driver's seat, and on the grain side of which is pivoted a lifting lever. Two down-hangers support a pin, on which fits a tubular socket, and which passes through the eye of a lever bearing against the under side of the foot board, a flanged plate, with a socket for a screw in the finger beam, keeping the pitman head from flying out of its socket in the cutter bar.

Claim.—1. The arrangement, as described, for joint operation, of the tongue, the driver's seat, and the lifting lever on the foot board, pivoted to the main frame behind the main axle, for the purpose specified.

2. The arrangement, for joint operation, as described, of the main frame, the down-hangers h h¹, the lever H, the socket I, and the cutting apparatus.

3. The combination, as described, with the sickle eye and pitman, of the flanged, slotted guard-plate N, for the purpose specified.

83,628.—MARTIN HALLENBECK, Albany, N. Y., assignor to ALFRED BLAKER, Newtown, Pa.—*Cutting Apparatus for Harvesters.*—November 3, 1868.—A divider is pivoted to play vertically on the finger beam, its upward movement being limited by a spring. The vibration of the divider is limited by a stop.

Claim.—1. The combination, with the cutting ap-

paratus of a harvester, of a vertically-moving divider and a depressing spring, for the purpose set forth.

2. The combination, substantially as set forth, of a vertically-yielding divider, a depressing spring, and a stop to limit the vibration of the divider.

3. In a harvester cutting apparatus, the construction and arrangement, for joint operation, substantially as set forth, of the finger beam, the guard fingers, and their ledges *e*, the brackets, and their ledges *b*, with the cutter bar and cutters, for the purposes specified.

83,629.—WARNER HATCH, Plainfield, Ill.—*Furnace for Heating Soldering Irons.*—November 3, 1868.—The throat connected with the fuel chamber has a slide, by pulling up which the fuel is let into the fire box, which has a circular partition, partly covered by a lid around the grate.

Claim.—1. The combination of the fuel chamber *a* with the throat *d* and slide *m*, when applied to a furnace for heating soldering irons, all constructed and arranged as and for the purpose set forth.

2. The throat *d* and slide *m*, in combination with the fire box *b*, when constructed with a circular partition, *o*, and lid *s*, all arranged and operating as and for the purposes set forth.

83,630.—DEXTER HATHAWAY, Wyoming, Wis.—*Grain Separator.*—November 3, 1868.

Claim.—1. The two short screens C and D, as described.

2. Attaching the spout G to the lower edge of the shoe, as specified.

3. The movable tail board H, as shown and described.

83,631.—GEORGE HAVELL, Newark, N. J.—*Skate.*—November 3, 1868.—An angular bar slides in a box under the heel of the foot plate, its bent ends being in the rear and corrugated, forming clamps, both bar and clamps being moved by the screw rod.

Claim.—The angular sliding bar G, encased in the box F, and provided with clamps, H H, and operated by means of the screw rod I, substantially as and for the purposes herein set forth.

83,632.—ORION R. HIGHT, Dowagiac, Mich.—*Window Sash and Frame.*—November 3, 1868.

Claim.—The arrangement of pin J K, loosely in stop G, for the purpose of rigidly fastening the sash when desired, substantially as and for the purposes described.

83,633.—THOMAS M. HILL, Richmond, Ind.—*Animal Trap.*—November 3, 1868.—A gate, working between parallel guides, is operated by arms which form part of the rocking platform inside, the trigger having a hook for bait at its lower end, being pivoted to a central post, and is connected at the other end by a rod to the head block, which is held by a spiral spring, and has a pin for keeping up the gate.

Claim.—The arrangement and combination of the vibrating platform I with its levers J J, the door B working in guides *i i*, the head block K, spring H, connecting rod G, post E, and trigger F, with the box A, when provided with the hinged lid C and opening D, for the purpose and in the manner substantially as herein set forth and described.

83,634.—HATFIELD HOPPER and JOHN G. HETZELL, Newark, N. J.—*Slate Cutter.*—November 3, 1868.—The gauges regulate the angle for cutting the slate, and the pin prevents the slate from moving too far under the cutter.

Claim.—1. The combination of fixed knife R with beveled cutter A, when the latter is operated by means of an up-and-down motion, in the manner substantially as described.

2. The gauges O O and the center pin P, substantially as described, and for the purpose named.

3. The frame B, hinged at C, carrying the beveled cutter A, when operated by means of the treadle E, through the media of the connecting rods F K, and crank shaft H, carrying fly wheel L, all constructed and arranged to operate in the manner and for the purpose substantially as described.

83,635.—HORACE J. HUBBARD, Chicopee, Mass.—*Bobbin.*—November 3, 1868.—The catch is formed of a ring with arms, having each a pin at right angles from them, and driven in the bottom of the bobbin outside of the edge of a groove, so that the arms cross it.

Claim.—The combination, with the bobbin, of the fly catch, consisting of the ring A, with one or more arms B, with pins C, constructed and arranged substantially as herein described, and for the purpose specified.

83,636.—AARON P. M. JEFFERS, Allegan, Mich.—*Tool Holder for Grinding.*—November 3, 1868.—The apparatus is designed to be attached to a grindstone of any size. It is made adjustable, so as to hold the tool upon a true bevel firmly in place.

Claim.—The construction of a tool holder, with the rock shaft C, standard D, set screw E, rest E', provided with slots F and H, thumb nut G, standard I, pin J, bolts K M, and O, rest L, ratchet N, jaw P, bail R, springs S, screw M, and nut U, or their equivalents, when arranged and operating substantially as and for the purposes herein set forth.

83,637.—NATHANIEL JENKINS, Boston, Mass.—*Composition for the Soles and Heels of Boots and Shoes.*—November 3, 1868.—Upon sliced India-rubber is spread raw hide, reduced to as fine a powder as possible, and rolled into and thoroughly incorporated with it.

Claim.—1. A combination of caoutchouc, or India-rubber, and raw hide, in suitable proportions, for the purposes before explained.

2. The addition, to a compound of caoutchouc and raw hide, of a less expensive and heavier substance or substances, to produce results before described.

83,638.—ELIZA JOYCE, New York, N. Y.—*Low Water Indicator.*—November 3, 1868.—A valve is affixed to a spindle which passes through a screw, connected by a crank to the float, and an elastic arm of a hammer, reaching above a bell, is fixed to the opposite end of the spindle.

Claim.—The arrangement, in connection with the boiler, of the float C and alarm E, directly connected together by the crank spindle B, substantially as described, so that the ebullition of the water, when at a determined level in the boiler, will effect the vibration of the float, and the consequent sounding of the alarm, as set forth.

83,639.—EDWARD H. KENT, Portland, Oregon.—*Rotary Spading Machine.*—November 3, 1868.—When the spades are ready to enter the ground, by the rotation of the cylinders they are in nearly a vertical position, and are held down by one of the latches, remaining in the same position until the cylinder has passed over them, causing the earth to be broken up and overturned.

Claim.—The spade bars E, moving in slots O, operated by pawls H and lever L; also, fastening the spade bars E, when extended outward in the slots O of the cylinder B, by the latches D, falling in and out behind the collars G, with the groove M, on the shaft N, and the concentric segment I and bars J, and combination of the various parts as herein described, and for the purposes set forth.

83,640.—ALBERT J. KLETZKER, St. Louis, Mo.—*Paper Fastener.*—November 3, 1868.—A lever is pivoted to a stand, and also connected by a link to the follower, the bottom of which is perforated to receive the pins affixed to the plate, as the follower descends.

Claim.—The stand A, lever B, follower C, and perforators D, when arranged and operated as described and set forth.

83,641.—JOHN D. KNEEDLER, Collinsville, Ill., assignor to himself and THOMAS S. DAVIS.—*Gang Plow.*—November 3, 1868.—Inside of the bearing frame is pivoted a frame so that the front end of the latter will vibrate up and down, being held up by a spring pressing against the bottom of the loop which is attached to its front beam, from the central beam of the outer frame, to the front end of which

latter is fixed a treadle resting on top of the loop and ending in a foot piece for the driver.

Claim.—The frame A and vibrating frame A', the spring a^1 , loop a^2 , and treadle a^3 , all operated and combined substantially as set forth.

83,642.—JOHN A. LEE, Chattanooga, Tenn.—*Animal Trap.*—November 3, 1868.—As the animal pulls upon the bait the entrance is closed by the turning of one of the concentric drums; at the same time a lighted entrance to the cage is opened, into which the animal passes, and which is closed by a wire grating, when the trap is again automatically set.

Claim.—1. The two concentric drums A and A', one stationary and the other rotating by means of a coiled spring upon the upright axis b , when in combination with the platform c , spring trigger o , and bait hooks q , as and for the purposes set forth.

2. The combination and arrangement of the glass gate I and wire grating J and pawl f' with the lugs f upon the outside drum A, as and for the purposes set forth.

83,643.—DAVID LEES, Blair County, Pa.—*Manufacture of Oxide of Zinc from Sulphureted Ores.*—November 3, 1868.—The intensity of the blast maintains a constant oxidizing atmosphere above the charge. This is effected by means of a supply pipe with valves, and with slots inclined in a pipe filled with water and kept hot, and the perfect distribution of the air over the whole surface of the furnace.

Claim.—The application of a hot blast, substantially in the manner and by the process above described, to the manufacture of oxide of zinc, whereby the oxide is always formed in an oxidizing atmosphere, and at a temperature sufficiently elevated to decompose all injurious products.

83,644.—MICHAEL LEIDECKER and PHILIP CRON, Rochester, N. Y.—*Barber and Dental Chair.*—November 3, 1868.—Toggles, acted upon by a screw for inclining the chair back and forward, are arranged together, with a worm and screw for elevating the loose seat.

Claim.—The combined arrangement of the screw D, nuts $b b$, and toggles $c c$, for producing the backward and forward adjustment of the chair, and the worm h , nut g , and screw f , for producing the vertical adjustment of the seat, independent of the chair, as herein set forth.

83,645.—ROBERT F. LEIGHTON and SOLOMON SEVERY, Melrose, Mass.—*Writing Slate.*—November 3, 1868.

Claim.—The improved manufacture of elastic-frame slate or writing tablet, as made with the India-rubber, or material of the frame, not only molded upon the tablet about its edges, but through holes made through the tablet and near to such edges, as set forth, such extensions of the rubber through the tablet serving to effectually prevent detachment of the frame from the tablet.

83,646.—JOHN L. LITTLE, Atkinson, N. H.—*Stove-pipe Thimble.*—November 3, 1868.—A collar is secured in a cylinder by means of slots in its rim, which allow the passage of the projections on the cylinder.

Claim.—A stove-pipe thimble, composed of cylinder A, having the inward projections P, removable collar C, with rim R and slot S, all constructed and operating in the manner and for the purpose described.

83,647.—ORRIN LUCE, Cortland, N. Y., assignor to himself and MARTIN LUCE, of same place.—*Trunk Hinge.*—November 3, 1868.—The hinge is intended to be applied to the corners of a trunk, and is fastened both to the end and back of the same.

Claim.—The construction and arrangement herein described of the parts $a, s, b, t, g g, p, d, e$, and c , for the purpose set forth.

83,648.—GEORGE H. MALLARY, Poughkeepsie, N. Y., assignor to himself, ALEXANDER L. VAN BUREN, HERBERT REED, WILLIAM H. CLARK, and

JOHN A. STANDISH.—*Paper-Bag Machine.*—November 3, 1868; antedated October 17, 1868.—One edge of the sheet is pasted by means of a roller as it passes into the machine; then one of its sides is folded over a former, and over it is folded the pasted side. The bag so far formed is drawn off by rollers, by which it is passed into an inclosure made with a bottom of a series of rollers, which carry it forward. One roller applies paste across the bag near the bottom, while another forms a fold for the bottom lap. It then passes out between another pair of rollers, which press the bottom fold of the bag into place.

Claim.—1. The combination of the moving bed f and the rollers $d e$ and the folders $h h$, actuated substantially as set forth, so that the feeding of the sheet of paper and folding the same are effected at the right time, as set forth.

2. The rollers $k k'$ and $l l'$, in combination with the moving bed f and the folders $h h$, for the purposes and as set forth.

3. The pasting and creasing mechanism applied on the axis of the roller o , as and for the purposes set forth.

83,649.—JOHN MALLORY, Penn Yan, N. Y.—*Broiler.*—November 3, 1868.—A gridiron is made in two parts, hinged together, and so that it may revolve and expose both sides of the meat, which can be examined during the cooking process by means of a transparently-covered opening in the top of the case.

Claim.—1. The gridiron B, when made as specified, and used in combination with the case A, substantially as set forth.

2. The opening in the case, when made as and for the purpose herein specified.

83,650.—WILLIAM MAY, Binghamton, N. Y.—*Door Stop.*—November 3, 1868.—A plate attached to the door is provided with a slide, to which is attached a cam. By pressing down the slide with the foot the door is held open in any desired position. A spring holds the slide in place.

Claim.—The cam F and spring D, in combination with the slide B and plate A, as arranged and shown, for the purpose set forth.

83,651.—HENRY E. MEAD, Centreville, Mich.—*Stump Extractor.*—November 3, 1868.—A capstan is mounted on a frame and is provided with a self-acting clutch by means of which when the draught on the sweep secured to a cup on a journal ceases, the cylinder will be thrown out of gear and the rope slackened automatically.

Claim.—The combination and arrangement of the capstan head H, provided with recesses L, clutch plates M, and the yoke O, with the cylinder E, provided with a journal, F, and clutch G, sills A, center plate B, standard C, cross-tie D, sweep I, evener J, guide yoke K, lever N, and cord P, when constructed and operating substantially as herein described, and for the purposes specified.

83,652.—W. T. MUNGER, Branford, assignor to P. CORBIN and F. CORBIN, New Britain, Conn.—*Knob Latch.*—November 3, 1868.—A lever arm extends from the hub of the spindle, and a suspending link connected with the inner end of the latch, has on it pins, against which the lever operates.

Claim.—The swinging link f , jointed to the latch e , in combination with the projections 2 and 3, and lever arm h , from the spindle hub k , substantially as and for the purposes specified.

83,653.—HENRY A. NEWHALL, Providence, R. I.—*Ventilating Attachment for Ash Sifters.*—November 3, 1868.—A current of air from the chimney fine flows through the sifting box during the process of sifting and causes the dust to be carried into the stove.

Claim.—1. A funnel, to connect the inclosing case of a coal-sifting apparatus with a flue, constructed substantially in the manner herein described.

2. The sifting box t , provided with pipes $w v$, constructed in the manner and for the purpose herein set forth.

83,654.—FRANK L. OLIVER, Scarborough, Me.—*Wrench.*—November 3, 1868.—The handle of the

wrench is curved, and after loosening the nut another wrench is applied which allows the handle to be turned like a bit stock.

Claim.—The improved wrench for carriages, made in the manner and combining the parts herein specified.

83,655.—ELIPHALET H. PARKER, Bucksport, Me.—*Steam Governor.*—November 3, 1868.—When the speed of the piston is greater than the friction between it and the hub of the fan the action of the truck on the screw flange carries the fan upward and raises the end of the rod connecting with the throttle valve.

Claim.—A steam governor, constructed with fan G, spindle *a*, spiral flange *e*, truck *e*, or other suitable bearing for the fan upon the flange, pulley *f*, or its equivalent device, for imparting motion, and the rod *g*, or its equivalent, for connecting the governor with the valve, all arranged substantially as described and shown.

83,656.—ANDREW PATTERSON, Birmingham, Pa.—*Harrow Teeth.*—November 3, 1868.—The tooth is held by a wedge fitting the inner angle of the tooth and the adjacent edges of the hole.

Claim.—An angular iron or steel harrow tooth, made substantially as shown and described.

83,657.—HENRY PEASE, Broekport, N. Y., assignor to himself and H. W. SEYMOUR, same place.—*Cooking Stove.*—November 3, 1868.—The oven is made open and unobstructed and a downward passage is made for the air from the top. Apertures in the fire pot form a communication between the air jacket and the interior of the fire chamber. A false bottom is made to revolve in the oven to bring the articles in a convenient position to be handled. The arms sweep over the bottom of the stove and remove the fallen ashes.

Claim.—1. The arrangement of a fire pot, E, concentrically within a circular oven space, B, substantially as shown.

2. In a central independent fire pot, E, suspended concentrically within the circular oven space, the air jacket *i i*, induction orifices *k k*, and ventilating dampers *p p*, communicating externally through the top of the stove, combined and arranged substantially as set forth.

3. The combination of the revolving false bottom P and sweeping arms *s s*, arranged as described, and operating as herein set forth.

83,658.—C. T. PHILLIPS, Jordan, N. Y.—*Smut Mill.*—November 3, 1868.—The several devices and their combination are disclaimed.

Claim.—The arrangement, herein described, of the scouring cylinder D *d e*, annular chamber *h*, blast wheels L I, screen B R *r*, chamber J K, conduits *k*, and spouts F G, all operated as shown, and for the purpose specified.

83,659.—BENJAMIN CHARLES POLE, Richmond, Va., assignor to himself and GEORGE F. McLELLAN, of Washington, D. C.—*Butt Hinge.*—November 3, 1868.—When the door or lid is closed the hinge is concealed from view, leaving a smooth, unbroken surface.

Claim.—The bed plate A, the spring B, the hinge plate C, with slot D, the hinged lever E, rod I, plate K, hinge plate F, all constructed, combined, and operating substantially in the manner and for the purpose herein set forth.

83,660.—JOHN POLLOCK and THEODORE J. DIEDRICK, Philadelphia, Pa.—*Manufacture of Metal Cans.*—November 3, 1868.—The edges of the metal which form the sides of the can are joined together by means of tongues interlocking and fastening into each other.

Claim.—1. Table T, levers L L¹ L² and L³, plates P and P², lug *l*, standards S and S', rods *r* and *r*¹, springs *s s*¹ *s*² *s*³ and *s*⁴, block B, and its beveled punches *b*, saddle E, and its hammers *h*, cylinder C, flexible tongue *f*, flat bar F and F', arm *a*, rod R, vibrating guide G, and treadle D, all arranged, constructed, and operating in the manner and for the purpose set forth.

2. The combination of the sliding plates P and P',

rods *r* and *r*¹, and springs *s* and *s*¹, with the cylinder C and flexible tongue *f*, for the purpose of interlocking the tongues, and bringing the edges of the can together, as herein set forth.

83,661.—WARREN PORTLOCK and J. R. DODDS, New London, Iowa.—*Railway Car Brake.*—November 3, 1868.—A longitudinally-sliding frame is attached to the tender of a locomotive, and pressed forward by a spring, and is connected with a system of levers, rods, and chains, arranged beneath the cars, so that the engineer can operate the brakes of each car in the train.

Claim.—1. The arrangement of the rod D², links S R *g*, chain *h h'*, rocking bar J, brake bars N, suitable connections and rod D¹, substantially in the manner and for the purpose described.

2. The arrangement of the chain or cord *b* and brake shaft *a*, in combination with the sliding self-retracting frame D D, in the manner shown and described.

3. The rods D¹ D², arranged on opposite ends of a car, and connected to the brake bars as described and shown, in combination with the right-and-left arms of the sliding self-retracting frame D D, substantially as and for the purpose described.

83,662.—DAVID QUINN, Chicago, Ill.—*Raft.*—November 3, 1868.—The light being excluded, the workmen are placed in a medium darker than the water below them, thus enabling them to see down into the water.

Claim.—A raft or boat, having an interior opening in combination with a house, box, or cabin over it, whereby wind and waves are excluded from the surface of the water in the opening, and light excluded from the interior of the cabin, substantially as herein set forth.

83,663.—JOSEPH READ, Philadelphia, Pa.—*Gutter in Foot Pavement.*—November 3, 1868.—The sides of the metallic drain are formed with flanges to support the blocks or bricks of the foot pavement.

Claim.—In combination with the foot pavement of a city or town, the iron drain C, having the side flanges *e''' e'''*, and the detachable covering plate *e'*, constructed and applied, substantially as and for the purposes described.

83,664.—E. P. RUSSELL, Manlius, N. Y.—*Churn.*—November 3, 1868.—The dash is turned a portion of a revolution at the termination of its upward and downward movement to prevent a continuous flow of the cream in one direction.

Claim.—The link I, pin J, adjustable sleeve *f*, and loose band *d*, all constructed and arranged as described, for the purpose specified.

83,665.—R. J. RUSSELL, Moundsville, W. Va.—*Skate.*—November 3, 1868.—The toe slide is beveled on the ends and fits tightly in the beveled sides of the front bar secured to the runner. The heel slide beveled on one end and slotted at the other, fits in the back bar and is held by a washer, grooved to fit against the beveled end of the heel slide, and a nut in the bar.

Claim.—The combination of the slides A and B with the bars C and E, and the washers H and nut F, substantially as described, the whole constructed and operating as herein set forth and shown.

83,666.—THOMAS COOKE SILLIMAN, Chester, Conn.—*Trap for Destroying Insects.*—November 3, 1868; antedated October 24, 1868.—The driving shaft is placed out of the axial line of the sweep so that as the arms on the shaft rotate they gradually recede from the sweep and allow it to return while they still continue to rotate.

Claim.—1. The regulator, substantially as described, to insure silence, and to simplify the mechanical combination and movement.

2. The flat or elliptical form of the driving shaft S, to economize power.

3. The placing of the driving shaft, or the arm or arms for driving the sweep, out of the axial line of the sweep, for the purpose specified.

4. The sweep R, to convey the insects to the drowning box, or its substitute.

5. The arch A, as located relatively to the sweep, to increase the trapping surface.

6. The strainer F, to remove the insects from the liquid.

83,667.—GEORGE SMITH, Providence, R. I., assignor to himself and JOHN C. DE LANY, Detroit, Mich.—*Device for Unloading Hay.*—November 3, 1868.

Claim.—The combination and arrangement of the hook C, latch D, cords E and A, pulley *p*, for latch cord E, sling *a e*, and rings *b b*, all constructed and operating substantially in the manner described.

83,668.—WILLIAM SMITH, Allegheny City, Pa.—*Pipe Molding Machine.*—November 3, 1868.—The packer shaft is made to rotate by means of a shaft, with which it is connected by bevel gearing, and which is actuated by a pinion working in a rack on the frame and rotates as the carriage descends. The flask is held in position on the carriage by pivoted clamps having rollers which press on the flange at the bottom of the flask.

Claim.—1. A packer shaft, mounted in bearings on a vertically-moving carriage, arranged and operating so as to communicate rotation to the packer shaft during its vertical movements, substantially in the manner described.

2. The carriage G and racks $G^3 G^4$, in combination with the pinions $D^1 D^2$, counter shafts D C, gear wheel D^d , pinion Cc, loose pulleys $C^1 C^2$, clutch $C^c D^d$, and driving shaft A^b , arranged and operating substantially as described, and for the purposes set forth.

3. The pivoted clamps L^2 , having friction rollers upon their ends, in combination with the car K and flask B, as set forth.

83,669.—DANIEL M. SOMERS, and WALTER S. ATWOOD, Brooklyn, N. Y.—*Instrument for Attaching Buttons to Fabrics.*—November 3, 1868.—The blades are constructed to lap over each other so as to compress the shank all around, equally without leaving a burr.

Claim.—1. The bed piece A, lever E, friction roller F, sliding die plate C, attached to and operated by sliding piece H, having an inclined face, and a stationary die plate, B, combined and arranged substantially as herein described, and for the purposes set forth.

2. The die plates B and C, so constructed, with removed surfaces *t t'* and *v v'*, that they may overlap, and their dies provided with inclined sides *i i'* and *e e'*, combined and operated substantially as herein described.

83,670.—JOHN STEWART, Jackson, Mich.—*Potato Digger.*—November 3, 1868.—The triangular frame can be easily detached when the apparatus is to be used simply as a plow.

Claim.—1. The extension of the mold boards B by means of the curved bars or wings C, when the latter are held and rendered yielding by means of braces D, constructed and operating substantially as herein set forth.

2. The triangular frame E, with its attachments, in connection with plow A, when constructed, arranged, and operating substantially as and for the purposes specified.

83,671.—HENRY D. STOVER, New York, N. Y.—*Mortising and Tenoning Machine.*—November 3, 1868.—The cutter heads are mounted on arms attached to the driving shaft in a bed on which, upon an adjustable bracket, is a cutter at right angles to the others which, after they have done their work, forms the double tenon. The "throw" of the mortising tool is effected by friction disks operating alternately by means of a rack and a pinion on a shaft moved back and forth by a lever. The disks are also connected with a friction wheel, with a bevel pinion on its axle operating a screw working through a slide, carrying the crank pin. Gains or notches may also be formed in heavy timber by using only one of the cutter heads.

Claim.—1. The bed plate A and A', when so constructed that the cutter heads may be worked back and forth, or to and from the work, substantially as described.

2. Varying the throw or motion of the chisel in mortising machines, by means of the friction disks C and C', when arranged substantially as described.

3. The cutter heads, attached to levers N and N', in combination with cutter head *x*, when constructed and arranged as described, for the purpose set forth.

4. Mounting a cutter head upon the adjustable lever N, attached to the sliding bed L, so that gains or notches may be readily formed in heavy timbers, substantially as described, and for the purpose set forth.

83,672.—JOSEPH T. STYER, Richwood, assignor to himself and EBER BRADLEY, Whitehouse, Ohio.—*Sheep-shearing Table.*—November 3, 1868.—The table is formed with hinged, folding legs on its under side, held in place by rods which pass through eyes on the sections of the legs. On the top of the table are revolving concave disks.

Claim.—The construction of a sheep-shearing table, A, provided with folding legs or standards B, and revolving concave disks E, when operating substantially as and for the purposes herein set forth.

83,673.—HORACE TARBOX, Warwick, R. I.—*Automatic Car Coupling.*—November 3, 1868.—To a shaft inside the box is fastened one end of a lever, the other end being fitted in a slot in the coupling pin. This pin has a guide plate, and the short arm of a bent, sliding staple also rests against it near the slot, the longer arm passing through the front of the box, while a lever, having a coiled spring at its lower end, presses against the bend.

Claim.—A car coupling, composed of the box A, with a shaft, *b*, and spring *e*, which has a lever, *d*, connected to the slotted coupling pin, with a guide plate, *e*, when combined with a projecting staple, *f*, and lever *i*, all constructed and operated substantially as described, and for the purpose specified.

83,674.—BJARNE O. THOMPSON, Chicago, Ill.—*Railway Car Brake.*—November 3, 1868.—Designed to operate the brakes of a whole train of cars from the locomotive.

Claim.—1. The combination and arrangement of the arms B, when connected to the driving wheels of a locomotive, and to disk C, thereby giving motion to bevel wheel D, keyed on the same shaft C' as the disk C, when the driving wheels are in motion.

2. The combination of the vertical brake shaft S', slotted plate *e*, pin *e*, shaft *h*, pinion or serrated flange *d*, pawl *f*, spring *g*, bevel pinions E and G, cog wheel H, shaft I, projection I', and chain L, substantially as and for the purpose set forth.

83,675.—STERLING C. THORNTON, Macomb, Texas.—*Combined Cultivator, Plow, Harrow, and Roller.*—November 3, 1868.—A cultivator, plow, harrow, and an adjustable frame are arranged in such a manner that the several parts can be used together or independently, the adjustment of the plows, draught pole, and clearing of the harrow being also secured.

Claim.—1. The combination and arrangement of the fixed frame C, movable frame E, parallel ruler joints *d d d d*, lever G, rod *g*, rack H, and spring catch lever *g'*, the whole being constructed to operate in the manner and for the purposes set forth.

2. The joint plates *d d*, when constructed in the triangular-shape described and shown, and provided with notches *v v* in their under edge, and used in connection with the pin *v¹*, and series of holes *v² v² v²* in the fixed frame, for the purpose of adjusting the depth to which the plows, &c., can work.

3. The pivot *a*, in combination with the lugs *a¹ a¹* and bolts *e* and *e'*, passing through the rear end of the draught pole, the whole being constructed to operate in the manner and for the purpose specified.

4. The use of the standards L L, in combination with the springs *l l*, and middle beams J J, for the purposes and operating in the manner described.

5. The rocking frame M, when pivoted to the drag bars or arms R R, as described, and provided with the lever *s* and adjusting bar *r²*, by which the whole frame can be raised or depressed at pleasure, in combination with the cleaning device *u u*, when made to operate substantially as described.

6. The described method of attaching the tooth or plow K to the frame of the machine, namely, the em-

ployment of a bifurcated standard, so constructed as to brace the tooth laterally, and, if necessary, provided also with braces to brace it longitudinally with the machine, substantially as shown and specified.

83,676.—PETER VANDE SANDE, Rochester, N. Y., assignor to himself and STEPHEN COLEMAN, same place.—*Machine for Cutting Meat and other Articles.*—November 3, 1868.—The knives and clearers are arranged adjustably to different positions by means of a vertical gate on which the knives are pivoted. A flexible rack, with clearers pivoted at their opposite ends to straps and angular corners, is adjusted to set them at corresponding angles with the knives. The meat box is moved back and forth by means of a divided screw, cams, and thread plate, and adjustable collars having threads of different coarseness on the crank shaft.

Claim.—1. The combination of the knives *a a* and clearers *i i*, having an angular adjustment, and otherwise arranged as described, and operating in the manner and for the purpose specified.

2. Constructing the rack *II* in such a manner as to have a degree of flexibility, as herein described.

3. The arrangement of the divided screw threads, *q q*, upon the collar *I*, in such a manner as to alternate in position when combined with the thread plate *K*, in the manner and for the purpose specified.

4. The combination of the cams *r r* with the screw threads *q q* and thread plate *K*, operating in the manner and for the purpose specified.

5. The arrangement of a series of the collars, *III*, upon the same shaft, and having screw threads of different degrees of coarseness, whereby one may be substituted for another, as described.

6. The arrangement, as a whole, consisting of knives *a a*, rack *II*, box *C*, thread plate *K*, and screw collars *I*, operating as described.

83,677.—JAMES F. WALKER, Murrayville, Ill.—*Corn Planter.*—November 3, 1868.—The seed slides of two hoppers are operated by compound levers applied to the vibrating hopper frame, and controlled by hand levers, so that two hills may be dropped into at one time, the dropper raising or lowering the frame and also clearing the rear transporting wheels by means of the same lever.

Claim.—1. The construction of the tread of each covering and transporting wheel *E*, of three tires or rings, *a a a'*, so applied to forked ends, *b*, of the spokes of the wheel as to leave spaces for the escape of earth, substantially as described and shown.

2. The lifting lever *F*, in combination with the looped lever *c* and scrapers *m*, when these parts are constructed and arranged so as to operate as herein described.

3. The looped lever *c*, the longitudinally movable and vibrating lever *F*, and the vibrating hopper frame, when these parts are arranged, combined, and constructed, substantially in the manner described.

4. The levers *H, J J*, connected to the seed slides *s s'*, and operated by means of one or two hand levers *G²*, substantially as described.

5. Removable perforated cut-off plates *d*, applied to hoppers above the seed slides, substantially as described.

6. While not claiming broadly anti-friction casters, I do claim providing the transverse beam *C* with channeled blocks *P*, having supporting wheels *P²*, and swiveling standards, *P¹*, applied to said blocks, with anti-friction balls, *p'*, interposed between said blocks and standards, as described.

83,678.—JAMES W. WESTON, New York, N. Y.—*Fruit Carrier.*—November 3, 1868; antedated October 17, 1868.—A cylindrical fruit carrier is formed with perforated sides for ventilation, and with a removable cover, and a series of these cylinders is strung together by wires or cords so as to allow of their being hung or packed in a frame.

Claim.—A fruit carrier, formed of a perforated cylinder, fitted with heads that are retained in place by the cords that suspend the carrier horizontally, as and for the purposes set forth.

83,679.—STEPHEN WILKS, Chicago, Ill.—*Cooking Range.*—November 3, 1868; antedated October

17, 1868.—Designed for use in sleeping cars and other places where the space allowed for cooking is limited.

Claim.—The arrangement of the several parts constituting my said range, as above specified and shown.

83,680.—WILLIAM H. YOUNG and L. YOUNG, Boston, Mass.—*Curtain Fixture.*—November 3, 1868.—The slide is self fastening, and with its connected tassel is made to slip upon the lower part or stick of the curtain.

Claim.—The slide *C*, constructed as described, and for the purpose specified.

83,681.—SEWALL ALBEE, Wiscasset, Me.—*Fishing Jig.*—November 3, 1868.—The hook passes through a tube into the aperture in the center piece, and is held firmly by the open parts of the lower end of the center piece, being closely compressed when the tube is screwed on.

Claim.—The method of forming the body of the jig of three adjustable parts, substantially as described, and especially the method of adjusting, securing, and holding the hook, by means of an adjustable tube or cap, in combination with a center piece, containing a screw, fitting the cap, and an aperture, for the admission of the stem of the hook, all substantially as above described.

83,682.—JULIUS AMBRUN, Leavenworth City, Kansas.—*Straw Cutter.*—November 3, 1868.—Reciprocating oblique cutters are arranged in frames, moving in opposite directions, by means of racks, into which meshes a pinion and a lever pivoted to and swinging around on an elastic support, so as to cause the frames to move up and down, while the straw is fed and regulated by means of an arm connected with a ratchet wheel, belt, and pressor roller.

Claim.—1. The frames *C* and *D*, which hold the two cutters, *E* and *F* respectively, when connected with each other by means of a pinion, *b*, and racks, operated by a lever, *G*, substantially as herein shown and described.

2. The reciprocating frames *C D*, carrying the cutters *E F*, in combination with the pawl, *f*, ratchet wheel *g*, belt *h*, feed wheel *K*, and presser wheel *L*, all arranged on a straw box, *A*, substantially as herein shown and described.

83,683.—WILLIAM AUSTIN, London, England.—*Composition for the Manufacture of Safety and other Friction Matches.*—November 3, 1868.—Phosphorus, spirits of tar, black sulphuret of antimony, red ochre, and emery, wherewith to produce the match-igniting surface, are mixed with Japan or other varnish, or resinous, oleaginous, or other "anti-hydro" matter, instead of being mixed with size or other watery preparations.

Claim.—1. The manufacture of match-igniting chemicals and ingredients with anti-hydro matter, so as to render the same, and the igniting surfaces and matches prepared therewith, wet and damp-proof.

2. The manufacture of friction-igniting chemicals and ingredients for safety matches and their igniting surfaces, with the anti-hydro matter or compound herein mentioned, and applying the same directly to or upon the natural surface of the material of boxes, match-containers, or match-igniters, of metal, china, stone, or earthenware, or other similar materials.

3. The manufacture of other match-igniting chemicals, with the anti-hydro matter or compound herein mentioned, and applying the same to matches.

83,684.—EZRA BAILY, Cincinnati, Ohio, assignor to himself and JOSEPH PARKER, Covington, Ky.—*Plank and Timber Dresser.*—November 3, 1868.—The stuff to be dressed is supported upon a carriage which simply rests upon the single stationary rail, and which is held to the hinged guide rails by jaws fastened to the under side of the carriage near its ends.

Claim.—The adjustable hinged rails *C D*, jaws *I I'*, carriage *II*, and adjustable heads *J J'*, herein described, arranged to operate for the purposes set forth.

83,685.—ALFRED BICKNELL, South Reading, Mass.—*Sash Guide Block*.—November 3, 1868.—The blocks are set in the easing in the same position in which the cord pulleys are usually placed. The blocks are kept in place by the shoulders. The cords run in the grooves of the block.

Claim.—The anti-friction grooved guide blocks A, constructed substantially as herein shown and described, that is to say, with grooves upon their semicircular upper edges, and with shoulders or notches upon either or both their sides and lower edge, or upon their lower edge only, as and for the purpose set forth.

83,686.—E. BLUNT, JR., New York, N. Y., assignor to HENRY P. NICHOLS, trustee.—*Coffee Pot*.—November 3, 1868.—As soon as the rapid generation of steam in the lower vessel occurs, as indicated by the steam whistle, water is introduced to the lower from the upper vessel by raising the valve.

Claim.—The combination of the vessels A and C, double partition *c c'*, valve and rod G, and whistle D, all constructed and operating substantially as herein shown and described.

83,687.—JOHN A. BORGOT, Hudson City, N. J.—*Pile Driver*.—November 3, 1868.—The piles are inserted in the ground by a continuous steady draught applied by means of the grappling hook, instead of being subjected to the injurious blows of a hammer.

Claim.—The combination and arrangement of a grappling hook, H, pulleys K and L, with the frame, composed of the uprights B and C, and base A, substantially as herein shown and described, and for the purposes set forth.

83,688.—HARVEY BROWN, Harlem, N. Y.—*Cooking Stove*.—November 3, 1868.—This invention has reference principally to the method of connecting together the main parts of the stove. In using the oven the rack is first placed upon the top of the stove with the article to be cooked upon it, and is then covered by the box.

Claim.—1. The cleats *a b*, attached respectively to the sides *c c* of the body of the stove, and the base, A, for the purpose of securing the body of the stove to its base, substantially as shown and described.

2. The combination of the hooked cleats *f k* with the lugs *g* and bolts *h*, for the purpose of securing together the plates *c c*, *c e*, *i i*, *j j*, of the stove, substantially as set forth.

3. The pins *d*, or their equivalents, in combination with the cleats *a b*, arranged substantially as and for the purpose specified.

4. The oven, placed upon the top of the stove, consisting of elevated rack E, covered with the closed box F, whereby the article to be cooked is raised above the stove, to receive the heat from the plate D, and that radiated from the top of the box, in about equal proportions, as herein shown and described.

5. The combination of the upper flaring or inclined plates *i i*, *j j*, of the stove, with the upright plates *c c*, *e e*, of the lower part of the same, when used in connection with the rack E and cover F, substantially as and for the purpose set forth.

83,689.—WILLIAM COLBORNE, Cambridge, Bristol, Great Britain, assignor to himself and J. T. GRIFFIN, New York City.—*Grate Bar for Furnace*.—November 3, 1868.—The ribs, projecting above the surface of the web, prevent the fuel, in a measure, from resting upon the web, thus leaving a space for the circulation of air.

Claim.—A fire bar, constructed with vertical side ribs A A, having raised ledges *a a*, in combination with the depressed web B, and oblique opening *c*, substantially as and for the purposes set forth.

83,690.—ANDREW CHAMBERS, Providence, R. I.—*Machine for Drying Cloth*.—November 3, 1868.—Air is forced through the meshes of the cylinders and through the fabric which is made to traverse the peripherics thereof.

Claim.—The arrangement of the perforated cylinders B B, geared as described, independent fans C C, guide rollers L L¹ L² L³ L⁴, feed and take-up

rolls M N, presser roll O', shaft H, and belts G I K, all operating as described for the purpose specified.

83,691.—THOMAS CHAMBERS, St. Louis, Mo.—*Pump*.—November 3, 1868.—Power is applied to operate the pump, through a modification of a hydraulic press, the platen of which moves in the cylinder, and constitutes the piston of the pump.

Claim.—A large forcing cylinder, A or B, a vacuum or air cylinder, D or E, and a small forcing cylinder, F¹, when combined substantially in the manner and for the purposes set forth.

83,692.—ANGELOS McCLARA, Whitney's Point, N. Y.—*Post Driver*.—November 3, 1868.—The secondary tongue enables the ram to be elevated by the team. The elevated ram is sustained by a spring latch, and may be dropped at any time by pulling the tripping line.

Claim.—The combination of the secondary sliding tongue *m* with the ram C B F and wagon A, as and for the purpose set forth.

83,693.—A. W. CLARK and GEORGE W. MARBLE, Charlestown, N. H.—*Bow Iron for Carriages*.—November 3, 1868.—The pointed clasps on the bow iron are bent around and driven into the bow, thus securing the two parts together without the use of nails or rivets.

Claim.—The bow iron C, constructed as described, with holding points or clasps, for attachment to the bows of a baby cab or other carriage, substantially as and for the purpose herein set forth.

83,694.—SAMUEL T. COTTERILL, Dayton, Ohio, assignor to COTTERILL, FENNER AND COMPANY, same place.—*Tobacco Drier*.—November 3, 1868.—The tobacco is placed upon racks or trays having perforated bottoms, and inserted in the upper end of a drying chamber, through which a continuous and evenly distributed current of air is forced, said air having no other means of egress than through the trays and their contents.

Claim.—1. A drying chamber, consisting of the frame C, having cleats E, and an open end, D, provided with stops L, in combination with the nest or series of gravitating trays F, for the purpose of allowing the withdrawal of said trays, in the manner described for the purpose specified.

2. The combination, with the upwardly flaring trunk B, and drying chamber C, arranged as described, of the series of branch pipes or goose necks K K, having downwardly projecting nozzles, for the purpose of distributing the blast of air forced through said drying chamber, as set forth.

3. The arrangement, substantially as described, of the flaring trunk B, drying chamber C, removable and porous-bottomed trays F G, blast pipe H, and goose necks K, for the object stated.

83,695.—M. Z. CRANE, New York, N. Y.—*Receptacle for Watch Keys and other Articles*.—November 3, 1868.—By bringing the aperture in line with any one of the marks or names on the head, the contents of the compartment, appropriated to the articles indicated, will be displayed and rendered accessible.

Claim.—The cover D, provided with an aperture, *b*, of the same size as one of the compartments in the stationary box A, and adapted to be rotated around the fixed pin C, whose enlarged head is marked or numbered to correspond with the number of compartments in the box, all arranged and operating as described, for the purpose specified.

83,696.—C. N. CUTTER, Worcester, Mass.—*Velocipede*.—November 3, 1868.—The crank shaft is turned and the velocipede propelled by the hand levers, which, being moved back and forth, alternately raise and depress the elbow connections.

Claim.—1. The combination, with the frame A, cross piece I, and crank shaft B, of the elbow connections G H, or either, and right-angle levers K L, or either, substantially as and for the purposes set forth.

2. The combination, with the crank shaft of a velocipede, and main frame thereof, of one or more sets of elbow connections G, connected to a right-angle

lever, K, by means of a swing piece M, substantially as and for the purpose set forth.

83,697.—ADDISON DAVIS, Boston, Mass.—*Sash Supporter*.—November 3, 1868.

Claim.—The window-sash fastener, consisting of a spring lever, *e*, having at its top a wedge-shaped bolt, formed and applied as shown, so as to perform the double function of locking the sash securely in position, and also of wedging or pressing back the sash against the bead *d*, the lever having a slide rod or other provision for releasing the bolt, substantially as set forth.

83,698.—JASPER N. DAVISON and NAAMAN SPENCER, Jr., Buffalo, Ill.—*Gang Plow*.—November 3, 1868.—The lever is pivoted to the tongue, and has upon its lower end a cam which rests upon the platform. When the lever is drawn back a rigid connection is formed between the tongue and platform, and the plows are raised. The seat may be slidden backward to cause the driver's weight to press the plows into the ground.

Claim.—1. The combination of the plows, the beams, the adjustable platform, the lever E, and the tongue, so arranged that the tongue shall be flexible when the plows are at work, and only stiff when used to carry the plows above the ground, the depth of the cut being independently regulated, substantially in the manner set forth.

2. The combination of the plows, the beams, the platform, and axle, with the braces N and sliding seat O, arranged to operate substantially as and for the purpose set forth.

83,699.—ALPHEUS C. DUNN and ISAAC L. DUNN, New York, N. Y., assignors to PHILIP DUNN and JAMES YATES, Trenton, N. J.—*Spike with Screw Threads*.—November 3, 1868.—The bolt or nail is driven into the wood, and a spiral rib thereon forms for itself a spiral bed or groove.

Claim.—The construction of the bolt, to conform to the form shown, and in the manner described.

83,700.—JOHN DURAND, Cincinnati, Ohio, assignor to PERKINS, LIVINGSTON, and POST, same place.—*Railroad Signal Box*.—November 3, 1868.—Designed as a receptacle for the customary signaling apparatus, such as flags, torpedoes, and the like.

Claim.—The railroad signal-box arrangement, consisting of the portable case, provided with a flag on a jointed and folding staff, and with pockets containing torpedoes, substantially as described and represented.

83,701.—JOHN ERVIN, Sr., Princeton, Ind.—*Fireplace*.—November 3, 1868.—Air is supplied from beneath the fire gate or hearth, and air flues and orifices are formed in the jambs.

Claim.—The flues H and J, with the orifices *l*, *m*, *i*, *k*, and *o*, arranged substantially as and for the purposes described.

83,702.—JAMES FALLOWS, Philadelphia, Pa., assignor to himself and JOHN PFEIFER.—*Beer Cooler*.—November 3, 1868.—This device is hung upon the facet of a beer keg, so that the beer may be drawn off through the cooling chamber, it being cooled during the short period of its transit by reason of the extended surface presented by the cold pebbles.

Claim.—A portable cooler, consisting of a vessel, C D, filled with pebbles, coarse gravel stones, or their equivalents, in combination with an ice-holding case, A B, the same being constructed and arranged to operate together, substantially as and for the purpose described.

83,703.—LEVI FOSDICK, Tiskilwa, Ill., assignor to DAVID REIGEL, same place.—*Plow*.—November 3, 1868.—This plow belongs to a peculiar class employed for breaking up new ground, and the rods constitute the mold board. Set screws, bearing against the back of the handle, are made to produce a pressure of the stirrups against the bolts, and thereby firmly retain the rods and bolts in place.

Claim.—The securing of the rods G to the handle B, by means of bolts *b* and stirrups H, substantially as shown and described.

83,704.—L. H. GANO, New York, N. H.—*Hand Stamp*.—November 3, 1868.—The stamp head revolving in elastic bearings, which permit the faces of the die to come in contact with the ink pad, is held in position by a ratchet and spring pawl. The conical stem valve, regulating the flow of ink to the pad, is opened by one of the faces of the stamp head coming in contact with it, and closed by a spiral spring. The pad is held in place by the cam ears fitting in recesses in the standards, and by a set screw.

Claim.—1. The combination of the revolving stamp head B with ink pad *c'* and ratchet *k*, substantially as and for the purpose set forth.

2. Disclaiming the use of an inking ribbon in a postal and canceling stamp, an apparatus for automatically inking the die, substantially as described.

3. The conical stem valve *d*, provided with the spiral spring *e*, when said stem is applied to the fountain of a self-inking stamp, and used in combination with the perforated pad *c'*, as and for the purpose set forth.

4. The standards *a*, in combination with arms *h* and springs *h''*, in the manner and for the purpose described.

5. The pad holder *c*, provided with the cam ears *c'* *c''*, in combination with recessed standards *a* and thumb screw *a''*, in the manner and for the purpose described.

83,705.—WILLIAM M. GILLAN, Mount Parnell, Pa.—*Horse Hay Fork*.—November 3, 1868.—The lower end of the fork is provided with two opening and shutting blades, which are capable of being locked in position or unlocked, by means of two levers pivoted to the center bar and connecting with the blades by two rods, said levers being operated by another arm.

Claim.—The center bar A, side rods D D', levers C C', arm E, with the notch *e*, and blades B B', all in combination, and arranged as and for the purposes set forth.

83,706.—HENRY GIROUD, Paris, France.—*Gas Regulator*.—November 3, 1868.—The gas passes to the burner through an annular chamber containing water, which is opened and closed by a conical plug suspended from a pulley, from which plungers are also suspended, which latter are operated by the return of the excess of gas supplied to the burners.

Claim.—1. The method, herein described, of regulating the flow of gas, by the employment, in combination with a regulator or regulating apparatus and valves, of a return pipe, in which the pressure of the gas supplied to the burner or burners, in excess of combustion, acts upon said regulator, so as to control the flow of gas therefrom, in the manner shown and set forth.

2. The improved regulating or equilibrium valves or regulators herein described, arranged and operating as shown and set forth.

83,707.—THOMAS GRAY, of London, England.—*Preparing Resin Size for Use in Paper-making*.—November 3, 1868.—Patented in France, June 30, 1868.

Claim.—1. The improved process for making size, by first bleaching the resin in a solution of warm water and salt of soda, or other alkaline salt, and mixing the same with a solution of chloride of sodium, under the conditions substantially as and for the purpose specified.

2. Size prepared by the herein described process, as a new article of manufacture, substantially as and for the purpose specified.

83,708.—JOHN C. GUERRANT and BENTON J. FIELD, Leaksville, N. C.—*Engraving Machine*.—November 3, 1868.—Designed as an improvement on their patents of December 18, 1866, and November 5, 1867. This machine is intended to operate on flat surfaces, on the inside and outside of cylinders, &c., and for regular and irregular ornamental figures.

Claim.—1. The combination, with the graving tool, of an adjustable presser, substantially as and for the purpose described.

2. The stock C⁵ of the graving tool, provided with the pulley C⁶, for communicating rotary motion

thereto, substantially as and for the purpose described.

3. The disk F^2 , provided with the recess and set screw F^{14} , for tightening the belt F^{13} , substantially as and for the purpose described.

4. The combination, with the slotted holder G^6 and the slotted disk F^5 , of the chuck G^7 , provided with the shank G^{12} , substantially as and for the purpose described.

5. The combination, with the holder G^6 , of the toothed rack, and the pinion G^8 , on the shank of the chuck, or the equivalent thereof, substantially as and for the purpose described.

6. The chuck G^7 , adjustable in a horizontal plane, coincident with the vertical axis of the graver support, substantially as and for the purpose described.

7. The chuck G^7 , provided with means for giving it rotary motion on its own axis, while it is adjusted in the horizontal plane of the vertical support of the graving tool, substantially as and for the purpose described.

8. The combination, with the weighted graver supporting frame, of the yoke H and treadle H^5 , suitably connected thereto, substantially as and for the purpose described.

9. The combination, with the presser support C , of the screwed rod D and the rod D^3 , adjustably connected to the said end D , substantially as and for the purpose described.

10. The combination, with the rod D^3 , of the rollers L^9 and L^{10} , and the frame L^6 , or its equivalent, for actuating the said rollers, substantially as and for the purpose described.

11. The combination, with the staff B , of the slide L^1 , provided with a vertical guide connected to the staff, substantially as and for the purpose described.

12. The combination, with the staff B , of a vertically adjustable rest, I^2 , substantially as and for the purpose described.

13. The combination, with the staff B , of a counterpoised frame, I^4 , substantially as and for the purpose described.

14. The combination, with the staff B and adjustable rest I^2 , of the adjustable gauge, for producing wave lines, substantially as and for the purpose described.

15. The combination, with the staff B and slide L^1 , of the adjustable gauge O , substantially as and for the purpose described.

16. The combination, with the staff B and adjustable rest I^2 , of the gauge P , substantially as and for the purpose described.

17. The combination, with the staff B , and adjustable rest I^2 , of the mechanism, substantially as described, for producing circles and ellipses, as and for the purpose specified.

18. The combination, with ring R^5 , of the ring R^{16} , yoke R^6 , and crank shaft R^{12} , connected to the screw R^{17} , by a universal joint, substantially as and for the purpose described.

19. The combination, with the crank shaft R^{12} , of the rings R^8 and R^9 , slotted plate R^{12} , shaft R^{13} , and pinions R^{15} and R^{16} , substantially as and for the purpose described.

20. The mechanism for actuating the staff, for producing circles, arranged for adjustment in a horizontal plane, substantially as and for the purpose described.

21. The combination with the rings R^5 and R^{16} , of the spring snap R^{20} , substantially as and for the purpose described.

22. The combination with the crank shaft R^{12} and yoke R^6 , of the adjustable slotted plate R^{12} and rings R^8 and R^9 , for effecting the adjustment of the ring R^{16} , substantially as and for the purpose described.

23. The combination of the adjustable copy-holding plate with adjustable pointer, and with the graving tool, substantially as and for the purpose described.

24. The pointer F^3 , provided with the presser gauge E^4 , substantially as and for the purpose described.

25. The arrangement of the pointer support, for adjusting it axially, with reference to the staff B , and vertically, substantially as and for the purpose described.

83,709.—WARREN H. GUTHRIE, Brooklyn, N. Y.—*Machine for Trimming Wall Paper.*—November 3, 1868; antedated October 24, 1868.—The under

one of two feed rolls rotates in a paste box which distributes paste upon the paper as it passes through the rollers. A circular knife rotating on the shaft of the upper roller, and driven by gearing from the lower roll, trims the edge of the paper as it passes through the rolls.

Claim.—1. An automatic machine for pasting and trimming wall paper, substantially as shown and described.

2. A circular rotating cutter a^1 , in combination with the rollers A and B , substantially as shown and described, and for the purposes set forth.

3. The pasting roller B , in combination with the roller A and paste cup C , substantially as shown and described, and for the purposes set forth.

4. The lifting lid D , in combination with the frame M , substantially as shown and described.

5. The roller e' , in combination with the binding roller R , and frame M , and rollers A and B , substantially as shown and described, and for the purpose set forth.

83,710.—PATRICK J. HOGAN, Cincinnati, Ohio.—*Attaching Handles to Picks.*—November 3, 1868.—The ferrule is provided with a threaded aperture, into which the screw stem of the rectangular eye, which surround the pick head, fits. The pick head fits in a groove across the face of a socket which is swiveled on the face of the ferrule of the handle to adapt the letter to turn.

Claim.—The combination of the handle A , rectangular eye B , screw stem b , ferrule nut $E e'$, socket F , pick head D , and notches c and f , all constructed, arranged, and employed in the manner and for the purposes described.

83,711.—THOMAS A. HUNTER and JOHN BLEWITT, New York, N. Y.—*Lamp.*—November 3, 1868.

Claim.—1. The fountain a , provided with the plug b in the bottom, for filling, in combination with the cylinder e , that is tightly attached at its upper end to the fountain a , and provided with a foraminous bottom as and for the purposes specified.

2. The fountain a , formed with a depression in its upper surface, for receiving the collar of the burner, as and for the purposes specified.

3. The handle, formed so as to set upon the bracket h , and support the lamp, or be removable therefrom, as set forth.

83,712.—S. H. KENNEDY, Hydetown, Pa.—*Machine for Forming Sheet Metal Pans.*—November 3, 1868.—The bending bar is provided with a series of grooves which have beveled surfaces arranged to operate in connection with the forming surface on the detachable end former, which latter is cast on the end of the bed plates.

Claim.—1. In combination with the bed plate A , the detachable end former a' , arranged to operate in connection with the forming surfaces $c' c'$, upon the bending bar, substantially as and for the purposes set forth.

2. In the construction of the bending bar B , the described arrangement of the forming surfaces $c' c'$, (one or more, as may be required,) to operate in connection with the detachable end former a' upon the bed plate, substantially as and for the purposes set forth.

3. The general arrangement and combination of the bed plate A , provided with its detachable end former a' , the bending bar B , with its channels $d d$, and forming surfaces $c' c'$, skeleton clamp bars $C C'$, and bending lever D , all arranged to co-operate substantially in the manner and for the purposes set forth.

83,713.—HENRY C. KNOWLTON, Gardner, Mass.—*Chair Seat.*—November 3, 1868.

Claim.—The arrangement of the bearing faces of the seat frame and each of the confining bars at an acute angle with the upper surface of the seat frame, in combination with the arrangement of each of the clamping screws, so as to incline upward at an obtuse angle with the said bearing faces, the screw hole in the confining bar being made so as to admit of the upward movement of the bar while it may be in the act of being forced against the bottoming to confine it to the frame, the same serving to effect

not only the fixation of the bottoming to the frame, but the straining or tightening of the said bottoming, and the setting of it up so as to be flush or even with or in its proper position with respect to the upper surface of the seat frame.

83,714.—CHARLES ERNEST KRÜGER, New York, N. Y.—*Photographic Rest.*—November 3, 1868.—The rest allows any movement for the proper adjustment and fixing of the desired position of the person to be photographed.

Claim.—1. The combination of the foot part or its equivalent with the main body of a photographic rest, in the manner as described, and for the purpose set forth.

2. The head part of a photographic rest, consisting of jointed pieces, or their equivalents, in connection with the movable rod of the rest, as herein fully described and for the purpose set forth.

83,715.—J. K. LANDIS, Palmyra, Pa.—*Car Coupling.*—November 3, 1868.—When the cars are brought together the links push back the vertically-vibrating pins until the latter pass the swinging plates, which allow said pins to fall into slots in the link.

Claim.—1. The pin *e*, and the rock shaft *f*, in combination with the swinging plate *h*, all being applied to operate substantially in the manner and for the purpose set forth.

2. The link *C*, constructed as shown, and secured to the draw head by a screw bolt, *D*, occupying slots *a* in the draw head, as and for the purpose set forth.

83,716.—E. B. LATCH, General Wayne, Pa., assignor to himself and EDMUND LINCOLN, Cleveland, Ohio.—*Steam Engine Slide Valve.*—November 3, 1868.—The upper face of the valve is provided with a plate which is made to bear against the packing plate, by means of springs interposed between it and the face of the valve. A thin metal strip covers the joint between the face of the valve and the plate.

Claim.—1. The combination of the valve *E*, plate *F*, and intervening springs or elastic packing with the packing plate *G*, the whole being constructed and arranged substantially as herein set forth.

2. The thin metal strip *j*, adapted to the valve *E* and plate *F*, substantially as specified.

83,717.—E. T. LIGON, Demopolis, Ala.—*Railway Car.*—November 3, 1868.—If the car wheels get off the track the stringers act as flanges with the sides of the rails and keep the car on the rails.

Claim.—The body of a railroad car, having its bottom extended down between the trucks, as described, and provided at its bottom side with V-shaped metallic stringers, *a*, as herein set forth, for the purpose specified.

83,718.—ROBERT MARSDEN, Sheffield, England.—*Apparatus for Rolling Metals.*—November 3, 1868; patented in England March 13, 1865.—Friction rollers on each of the four shafts, in connection with toothed wheels, prevent the cogs of the pinions from meshing too deeply, whatever the distance the die rolls may be separated.

Claim.—The mode described of combining the two shafts by means of the toothed wheels and rollers and countershafts, connected by loops or rods, substantially as specified.

83,719.—DON CARLOS MATTESON and TRUMAN PANE WILLIAMSON, Stockton, Cal.—*Horse Hoe.*—November 3, 1868.—The cutter is secured in the ends of curved bars, which are pivoted to the beam and held by adjustable braces, by means of which latter a greater or less "rake" may be given to the cutter.

Claim.—The combination of the reversible double-edged cutter *D*, the pivoted bars *C C* and adjustable braces *E*, with a beam *A*, substantially as described.

83,720.—GEORGE MCALEER, Worcester, Mass., assignor to E. W. VAILL, same place.—*Folding Chair.*—November 3, 1868.—The chair can be folded into a compact form for transportation.

Claim.—A chair, composed essentially of the crossed pivoted legs *A A*, *B B*, seat *C*, rod *E*, connected to the seat, as described, and bearing in slots or sock-

ets *e e* in the legs *B B*, back *G*, straps *J J*, round *R*, slat *s*, and cross bar *o*, the whole being constructed to operate in the manner and for the purpose substantially as set forth.

83,721.—JOSHUA B. MOORE and ERWIN G. MOORE, McDonough, N. Y.—*Apparatus for Unloading Stone.*—November 3, 1868.—The box is hinged to either side by a removable bolt, and is raised by means of a tackle attached to the frame and box and operated by a windlass.

Claim.—The movable platform *A*, so attached to a wagon or sled that it may tilt from either side, in combination with frame *F*, tackle *C*, and windlass *D*, all constructed, arranged, and operated substantially as and for the purpose described.

83,722.—GUSTAVUS NATORP, New York, N. Y.—*Car Wheel.*—November 3, 1868.—The wheel is constructed without any metallic confining band and with dovetailed recesses which interlock the web tie and grooved wooden blocks without the aid of bolts or other securing devices.

Claim.—A compound wheel, in which the wooden and metallic portions are interlocked and bound together, substantially as described.

83,723.—JOHN NICHOLS, Paterson, N. J.—*Machine for Burring Wool.*—November 3, 1868.—The burrs caught by the notched blade are knocked off by the reel and the wool is removed from the teeth by the brush.

Claim.—A burring machine, consisting of the combination with each other of the drum *B*, having the toothed triangular band *F*, of the notched blade *I*, rotating reel *G*, and brush *H*, all made and operating substantially as herein shown and described.

83,724.—O. J. NUTTING, Warwick, N. Y.—*Milk Can.*—November 3, 1868.

Claim.—The described construction of the milk can, consisting of the body *A*, provided at top and bottom with internal grooves *b a*, for receiving the edges of the top *C* and bottom, the latter being supported by the bruise hoop *B*, secured within the body below the bottom, as herein shown and described.

83,725.—CHARLES R. OTIS and NORTON P. OTIS, Yonkers, N. Y.—*Hoisting Apparatus.*—The object of the interposed springs and ratchet attachment is to divide the strain on the two screws.

Claim.—The combination, with the hoisting drum, of screws operated through pulleys, by a belt or band coupling the same, said screws gearing with worm wheels arranged at opposite ends of the drum, and connected with the latter by interposed spring and ratchet attachments, or either, substantially as specified.

83,726.—GEORGE N. PALMER, Greene, N. Y.—*Stone Drag.*—November 3, 1868.—The rope for raising the boat passes over two pulleys rotating in standards on the front part of the runners, and is secured to a slide on the tongue.

Claim.—A low sled, having a boat or body, *B*, secured to the rear ends of the runners *A A*, as described, so that the body *B* may be lifted at the front end for discharging the load by the arrangement of mechanism, constructed and operated substantially in the manner as and for the purposes herein set forth.

83,727.—W. E. PHELPS, Elmwood, Ill.—*Combined Seeder and Harrow.*—November 3, 1868.—The adjustable harrow is suspended from the frame, between two seed boxes, one placed on the front and the other on the rear end of said frame.

Claim.—The arrangement, upon the frame *A*, of the adjustable harrow *I* and the seed boxes *H H*, all operated in the manner described, for the purpose specified.

83,728.—STEPHEN RANDALL, Centreville, R. I.—*Railway Car Brake.*—November 3, 1868.—A sleeve sliding on and allowing one of the axles to turn in it is provided a grooved eccentric, to the end of which is fastened the brake chain, by which means the leverage is increased, while a shoulder on the

same axle has a face so shaped that the end of the sleeve fits tightly into it, and whenever the sleeve is moved toward the disk it will, by friction, be carried around the axle.

Claim.—The combination of the grooved eccentric *F'* with the sleeve *F*, shoulder *G*, and brake chain or chains, as herein described, for the purpose specified.

83,729.—G. W. REED, Brooklyn, N. Y., assignor to himself, REUBEN S. MIDDLETON, and HENRY ROTHFELDER.—*Watch.*—November 3, 1868.—The winding pin passes through the arbor of the spring barrel, and is so connected with two ratchet wheels that when it is wound one way the teeth of the winding ratchet wheel pass beneath the end of a pawl, and the other wheel is stationary, but when wound the other way the winding wheel and pawl turn the other ratchet wheel and wind up the spring, and thus the key can be held firmly during the whole operation.

Claim.—A winding pin, applied at the arbor of the spring barrel, in combination with the double ratchets, acting in opposite directions, as and for the purposes set forth.

83,730.—JOSEPH RICHARD, New York, N. Y., assignor to himself and G. W. BAKER, same place.—*Apparatus for Carbureting Air.*—November 3, 1868; antedated October 28, 1868.—The inclined shelves are covered with sheets of absorbent material, which dip into troughs under their highest ends, and conduct the hydrocarbon liquid in the troughs down over the shelves in a zigzag course. Vertically-adjustable rods are connected to the suction ends of the sheets and the lowest ends of the shelves, by which they may be lowered or raised and the flow of the liquid regulated or stopped at pleasure.

Claim.—1. The arrangement and combination of the inclined shelves $e^1 e^2 e^3$ and absorbing sheets $i^1 i^2 i^3$, the upper edges of which dip into the troughs $d^1 d^2 d^3$, substantially as and for the purpose described.

2. The vertically-adjustable rods $g g'$, in combination with the shelves $e^1 e^2 e^3$, absorbing sheets $i^1 i^2 i^3$, and troughs $d^1 d^2 d^3$, constructed and operating substantially as and for the purpose set forth.

3. The vertically-adjustable rod g , in combination with the sheets $i^1 i^2$ and troughs $d^1 d^2$, substantially as and for the purpose described.

83,731.—EDWARD Y. ROBBINS, Cincinnati, Ohio.—*Passenger Railway Car.*—November 3, 1868.—Hollow ribs are attached to the body, which consists of a cylinder of plates of iron, riveted or bolted together, as stiffeners, and also to receive and discharge fresh air through different apertures; further stiffening being likewise effected by a semi-tube of sheet iron, and the floor made of wrought iron. Attached to the roof plate, to support it, are angle irons, while an elastic platform serves to break the violence of collisions.

Claim.—1. The body of a passenger railway car, made of wrought iron, steel, or other metal, the different parts or sheets being riveted or otherwise firmly fastened together, the whole forming one continuous shell, of a cylindrical or approximately equivalent shape, the shape itself being such, together with the thickness of the metal, as to give the requisite strength and stiffness without the necessity of a general framework of bars and rods, or hoops, &c.

2. The yielding platform *X*, constructed and employed as and for the purposes herein specified.

3. The hollow, annular ribs *F*, extending completely around the interior of the cylindrical shell, in the manner and for the purposes specified.

83,732.—ADOLPH SCHLINGMAN, DETERICK GLANDER, and JAMES CAMPBELL, West Alexandria, Ohio.—*Churn.*—November 3, 1868.—Between two cross-bars, secured at their center to each end of a bar fastened to the lower end of a rod fixed to the lever handle, are pivoted the dashers, which consist of rollers with a twisted core through their entire length.

Claim.—The churn dashers *I I*, consisting of rollers, constructed substantially as herein described,

and pivoted in a frame, as and for the purposes herein set forth.

83,733.—CARL DIETRICH JULIUS SEITZ, Bury, England, assignor to himself and CHARLES EDMUND BAILLIÈRE, New York, N. Y.—*Recovering Waste Alkalies from Paper Stock and Other Fibers.*—November 3, 1868.—The liquors obtained by the pressure of the fibrous substances are run into pans and evaporated to one-fourth their bulk, after which they are treated with soda, caustic soda, soda ash, and quicklime, and the mixture, now in a dry state, is subjected to the action of a furnace or kiln.

Claim.—1. The general system or mode of treating the waste liquors resulting from the preparation of bamboo, cane, Esparto grass, alfa, straw, or other similar fibrous substances, as and for the purposes herein set forth.

2. The system or mode of mixing the concentrated waste liquors with a certain proportion of soda, (caustic soda, soda ash, recovered ash, or sulphate of soda,) and with quicklime, in the manner herein set forth.

83,734.—N. B. SHERWOOD, New York, N. Y., assignor to himself and W. H. WILLSON, same place.—*Piano Forte Tuning Key.*—November 3, 1868.—By means of the movable frame, the endless screw may be thrown out of gear, enabling the handle to be applied directly to the keys. The adjustable base allows the endless screw to stand in any direction most convenient for manipulation.

Claim.—A tuning key, so constructed that the wrench may be applied directly to the pipe, or through the medium of the worm wheel and endless screw, and provided with an adjustable base, substantially as shown and described.

83,735.—ANDREW H. SHREFFLER, Joliet, Ill.—*Dropping Platform for Harvesters.*—November 3, 1868.—A narrow platform rests upon the finger-beam, and hinged to its rear edge is an extension, which may be set at any desired angle to the platform by means of curved, slotted arms and set screws. Underneath the platform is a spring which assists in returning the platform to a position for receiving another gavel.

Claim.—1. The combination of the stop *b* with the tilting floor *a*, arranged, operating, and constructed substantially as and for the purposes set forth.

2. The use of the spring *i* to start the dropping device back past the center, after letting go of the lever *e*, substantially as described.

3. The combination, of the platform *a*, slotted extension *b e*, curved slotted plates *d*, spring *i*, and lever *e*, arranged in rear of the finger-bar, and operating substantially as described.

4. The circular slotted plate *d*, for the purpose of regulating the stop *b*, substantially as and for the purposes set forth.

83,736.—ALVAN A. SIMONDS and GEORGE F. SIMONDS, Fitchburg, assignors to THE SIMONDS MANUFACTURING COMPANY, West Fitchburg, Mass.—*Machine for Serrating Sickle Sections.*—November 3, 1868.

Claim.—The arrangement, with the anvil block *b*, upon which the sickle section or blank is supported and clamped, of the two cutter carriages, at an angle to each other corresponding to the angle of the cutting edges of the blank, each carriage having a feed-movement imparted to it, and carrying a cutter having blow-giving movements imparted to it, in such manner that the two edges of the blank may be simultaneously or alternately serrated, without movement of the blank, the mechanism being arranged to operate substantially as described.

83,737.—GEORGE W. SPOTS, Jacksonville, Ill.—*Compound for Destroying Insects on Trees, Plants, &c.*—November 3, 1868.—A wash, consisting of a decoction of tobacco, unslacked lime, and sulphur.

Claim.—The composition, substantially as and for the purpose above set forth.

83,738.—WILBUR F. STANLEY, Cazenovia, N. Y.—*Manger.*—November 3, 1868.—The necks of the cattle are placed between pivoted bars, which permit

the cattle to reach all parts of the manger without interfering with each other.

Claim.—The suspended pivoted neck bars D, constructed, arranged, and operating substantially in the manner herein shown and described, and for the purposes set forth.

83,739.—M. C. STEBBINS, Springfield, Mass.—*Piston Valve.*—November 3, 1868.—Projecting downward from the disk valve is an axial tubular guide, which receives a projection on the bar, the effect being to retain the valve in proper position with reference to its seat. The valve is held against its seat by a spring between said disk and bar.

Claim.—The combination and arrangement of the piston D, having the beveled seat or chamber *m'* therein, the disk *n* having the chambered projection *d* thereon, with its spring *s*, and the bar *a'* with the projection *n* thereon, operating within said chambered projection *d*, the whole constituting an improved piston valve, and constructed and operating substantially as herein described and set forth.

83,740.—JOHN STETSON, West Harwich, Mass.—*Fishing Apparatus.*—November 3, 1868.—The clamp is designed to be secured to the gunwale of a boat, and it has a swiveled pulley-guide attachment for the fishing line, and a rest for the hand.

Claim.—The combination of the clamp, thumb screw, guard pin, pivot joint, hand rest, or their equivalents, with the pulley.

83,741.—S. STEVENSON, Dansville, N. Y.—*Carpet Stretcher.*—November 3, 1868.—The head piece is fitted to slide between the side pieces of the frame, and is gradually moved up to the wall by the action of the hand lever, alternately, upon the two rack bars. The head piece, together with the toothed plate and edge of the carpet being thus forced up to the washboard, the tacks, guided through openings of the head piece, are driven by the handle end of the lever.

Claim.—1. The head-piece B, having the toothed plate C attached, and provided with the rack bars E E, in connection with the pawls F F, on the framing of the device, all arranged substantially as and for the purpose set forth.

2. Providing the head piece B with a series of holes *e*, with or without the clamps *f*, for the purpose of facilitating the tacking down of the carpet, as described.

3. The bar G, when constructed to be used in combination with the racks E, pawls F, and perforated head piece B, as herein described, for the purpose specified.

83,742.—WILLIAM M. STODDARD, San Francisco, Cal.—*Binder for Sewing Machine.*—November 3, 1868.

Claim.—The two pieces, A B, shaped, bent, and otherwise constructed and arranged substantially in the manner and for the purposes described.

83,743.—WILLIAM MONT STORM, New York, N. Y., and GEORGE H. ENNIS, Hudson County, N. J.—*Machine for Furling and Felting Hat Bodies.*—November 3, 1868.—The rollers carry around the apron, which, by contact, rotates the "form," and acts upon every portion of the perimeter of the hat body, the latter being saturated with water which may be conducted through the tubular support of the form, and be diffused between the walls of the form, so as to escape onward. Owing to the eccentricity of one of the rollers, the apron is repeatedly stretched and relaxed, laterally, and in the act of drawing narrower the apron produces a greater pressure upon the hat body, and has the effect to interlock and compact the fibers.

Claim.—1. The apron or aprons of netting or sheet rubber, one or both, so arranged that, while moving in contact with the body to be furred, they shall be alternately stretched and relaxed, by means substantially as described, and for the purpose specified.

2. The hollow double-shelled form E, its outer shell perforated, and its inner shell whole, mounted and operating substantially in the manner and for the purpose described.

3. In combination with the above, the water cock *c* and conduit standard *d*, arranged and operating

substantially in the manner and for the purpose described.

4. In combination with the perforated form E, the external sprinkler Q, arranged and operating substantially in the manner and for the purpose described.

5. The rolls G G¹ G², mounted upon movable standards, so that they shall be adjustable in position relative to the form E, substantially as and for the purpose set forth.

6. In combination with the above, the supplemental roll or rolls *p*, located and operating substantially in the manner and for the purpose described.

7. The latching bar K, in combination with the swinging standard *d*, for the purpose set forth.

83,744.—E. W. VAILL, Worcester, Mass.—*Folding Chair.*—November 3, 1868.—An improvement on the patent of David Howarth, April 16, 1867. The invention has reference to the attachment of a flexible back and an upholstered seat, and to a different arrangement for effecting the co-operation of the short legs and seat.

Claim.—1. The improvement in the Howarth chair, consisting essentially in placing the legs B B outside of the legs A A, and pivoting them to the sides of the seat frame, which is provided at its rear end with pins, adapted to slide in grooves in the legs A A, in closing the chair, substantially as shown and described.

2. A chair, constructed of the legs A A, B B, pivoted upon short pins or bolts *e e*, the stuffed upholstered seat C, jointed to the legs B B by means of short pivots *cc*, behind the front edge of the seat, and connected with the legs A A by a pin working in a slot or groove, the upholstered back D, and the flexible arms O O, the whole being constructed and operating substantially as and for the purpose above set forth.

83,745.—SAMUEL VANSTONE, Providence, R. I.—*Machine for Making Nuts.*—November 3, 1868.—A bar is indented on its opposite sides by compression in dies, a series of united nut blanks being thus formed. Separate pairs of jaws hold the bar during the operations of punching the eyes of the nuts, and cutting them apart from each other. The dies are in a drop press, and the jaws are forced together by wedges which project downward from the hammer die plate.

Claim.—1. The combination of the crimping jaws D D', pressing jaws K K, and punches E E, with the plunger plate A' and bed plate B, all constructed and arranged substantially as described.

2. In combination with the subject-matter of the foregoing clause of claim, the jaws I, studs G, and punches G, arranged substantially as described.

3. In combination with the bed plate B, plunger plate A', and jaws I I and K K, the tapering studs N N, arranged and operating substantially as set forth.

83,746.—L. M. WHITMAN, Sterling, Ill., assignor to himself and A. B. ENDERTON, same place.—*Invalid Chair.*—November 3, 1868.—When the chair is converted into a couch, the standards serve as supports and prevent rocking. The truck may be attached to the front standard to facilitate the moving of the invalid, and the occupant may change the position of the several parts by turning the crank wheels.

Claim.—1. The combination of the pivoted slotted bar J, cord L, pulleys *on*, rocker E, shaft and crank wheels H, and the standards T U, with the back A, seat B, front C, and foot piece D, substantially as described, for the purpose specified.

2. In combination with an invalid's chair, the adjustable stands T and U, arranged substantially as shown and described for the purposes set forth.

3. In combination with an invalid's chair and the stands T and U, the truck W, substantially as and for the purposes set forth.

83,747.—DENNIS C. WILCOX, Meriden, assignor to MERIDEN BRITANNIA COMPANY, West Meriden, Conn.—*Manufacture of Double Wall Ice Pitchers.*—November 3, 1868.—The upper edge of the inner wall is electrotyped to prevent that portion of the

metal from corroding, and also to prepare the surface to be tinned to facilitate soldering.

Claim.—Electrotyping the upper end or unprotected surface of a glazed coated or enameled vessel, substantially as and for the purpose described.

83,748.—CYRUS M. WILLIAMS, New York, N. Y., assignor to HENRI L. STUART, same place.—*Charging Gas with Vapor of Hydrocarbon Liquid.*—November 3, 1868.

Claim.—1. A gas holder, in which is suspended or retained any suitable absorbent or capillary material, saturated with hydrocarbon liquid, through which air or gases are passed for carbureting.

2. A carbureting chamber, placed in the gas holder tank, arranged to receive and distribute hydrocarbon liquid, through which air and gases are forced, for the purpose set forth.

83,749.—ISAIAH M. WILLIAMS, Blanchester, Ohio, assignor to himself and HARVEY SMITH, same place.—*Self-loading Hay Cart.*—November 3, 1868.—The hay is prevented from falling back by the shifting board which pushes it to the back part of the bed. Knives are attached to the under side of the fingers to sever any stalks of hay that would otherwise clog the forward progress of the machine.

Claim.—1. A self-loading hay or grain cart, capable of being depressed for raking and loading, and elevated for conveying, when provided with the ground wheels D D' on bent axle C, and driving wheels E E', for operating the board M N O, or equivalent shifting mechanism, substantially as herein explained.

2. The shifting board M N O, arranged and operated substantially as set forth.

3. The arrangement of depressible bed A, bent axle C, lever G, and cross piece I, for the purposes designated.

4. The provision of one or more severing knives R, or their equivalent, beneath the fingers B.

83,750.—WILLIAM C. WILLMARTH and C. N. FARR, Philadelphia, Pa., assignors to B. W. LACY, same place.—*Sewing Machine.*—November 3, 1868.—By means of the adjustable plate, on the end of the lever, a lock or chain stitch can be formed. An opening in a plate, which is secured to the fixed arm so as to be adjustable diagonally, serves as a fulcrum on which the needle vibrates, and by adjusting the plate the fulcrum of the needle is moved to and from the fabric, thus altering the size of the stitch.

Claim.—1. The combination of the plate R, its thread carrier *i*, lever P, needle *b*, and an adjustable plate S, the whole being arranged and operating substantially as and for the purpose specified.

2. The vibrating needle arm I, with its needle *b*, in combination with the plate J, and its projection and opening for the passage of the needle, when the said plate is adjustable diagonally on the arm C, as and for the purpose described.

83,751.—JOHN ZIEGLER, Dayton, Ohio.—*Casting Hollow Ware.*—November 3, 1868.

Claim.—1. The sprue pattern herein described, constructed with wings *c c c*, and downward projections D D D, so arranged as to correspond in position with the feet of the vessel to be cast, as and for the purposes stated.

2. The process of casting hollow ware, by introducing the metal through the part or parts of the mold which are to form the feet of the vessel, substantially as and for the purposes set forth.

83,752.—REUBEN S. ZILAR, Cincinnati, Ohio.—*Ice Elevator.*—November 3, 1868.—An inclined plane is made in sections hinged together so as to permit either of the upper sections to be placed at different angles to discharge the ice at different elevations. The frame supporting the driving wheel of the endless chain has a spring bar which sets the hooks in a position to engage with the eakes of ice.

Claim.—1. An ice elevator, consisting of the frame A A' *a*, B *b*, adjusting devices D F V W *w*, toothed wheels J *j*, T *t*, endless chain N, hooks R, notched bar U *u w*, and inclined plane E G *g* H, having one or more flexible upper sections, E E', for the purpose specified.

2. In combination with the wheels J T, inclined plane E, endless chain N, and hooks R, the spring bar X, for the purposes set forth.

83,753.—CHARLES ALDEN, Newburg, N. Y.—*Treating and Storing Grain.*—November 3, 1868.

Claim.—The chamber A, adapted to be closed, and provided with false bottom *a*, side walls *b*, columns *c*, and supply and exhaust pipes *e f*, when said bottom, side walls, and columns are perforated, and communicate with each other, whereby the contents of the chamber are not exposed to the ordinary action of the atmosphere, but adapted to be subjected to a forced current of hot or cold air, substantially as described.

83,754.—J. K. ALWOOD, near Delta, Ohio.—*Fleeceing Cradle.*—November 3, 1868.—The cradle on which the sheep are placed is pivoted to the flanges of a plate which is pivoted to the top of the shaft and held by means of a lug. Arms, pivoted to the outer bars of the cradle, are provided with sliding clasps, to which the spring loops, by which the feet of the sheep are held, are secured.

Claim.—1. The arms H, lugs *h*, and springs *f*, constructed and operating substantially as and for the purposes described.

2. A table for sheep shearing purposes, having pedestal A, shaft B, cradle E, plate C, arms H, lugs C and *h*, nuts *d*, and springs *f*, constructed and arranged substantially as specified.

83,755.—STERLING BASS, M. D., Savannah, Ga.—*Medical Compound.*—November 3, 1868.—Composed of purified chinodine, soluble citrate of iron, extract of taraxicum, fluid extract of columbo and alcohol.

Claim.—The specific for cure of chills, made up of the ingredients or medicines herein named, or their equivalents, in or about the proportions specified.

83,756.—EDWARD BRADY, Philadelphia, Pa.—*Skate Fastening.*—November 3, 1868.

Claim.—A heel piece of metal, or other hard substance, surrounded at one end by a similar thin plate, which may be enlarged to the size of and to be fastened by screws, &c., to the heel of a boot, having a hollow cylinder sunk into the heel, containing any common spring, operating against a cap covering a stud hole to prevent dirt, &c., from entering the cylinder, and thus to enable the stud of a skate to be adjusted to the heel of a boot without the stud hole in the cylinder being obstructed by dirt, &c., substantially as set forth.

83,757.—CHARLES B. BRISTOL, New Haven, Conn.—*Curry Comb.*—November 3, 1868.—The shank and teeth are cast in one piece and secured to the metal plate, which has its edges turned down, and cut, as in the ordinary curry comb.

Claim.—As an article of manufacture, a curry comb, in which the bar C, teeth *a*, and shank B, are formed in one and the same piece, and united to the plate D, the whole constructed substantially in the manner herein set forth.

83,758.—CHARLES BROWN, Albemarle County Va.—*Process of Preserving Timber from Decay.*—November 3, 1868.—Sandstone, reduced to a very fine powder and mixed with caustic lime or carbonate of iron, is fed into an exhausted receiver containing the wood.

Claim.—Preserving or "lapidifying" wood, in the manner and with the material or materials substantially as described.

83,759.—ALBERT G. BUZBY, Philadelphia, Pa.—*Substitute for a Billiard Table.*—November 3, 1868.—The ends of the strips are rounded, and the side strips are placed at a short distance apart from the end strips and are connected together by angular corner pieces, the spaces within which serve as substitutes for pockets.

Claim.—1. A substitute for a billiard table, consisting of cushioned strips, connected together and to the floor, substantially as described, for the purpose specified.

2. The rounded ends of the strips, in combination with the plates *a*, for the purpose specified.

83,760.—JAMES H. CARKEET, Montgomery, Ala. *Butt Hinge.*—November 3, 1868.—Alternating plates, in conjunction with a hinge, allow the door, when closed or open, to assume a position parallel with the door frame.

Claim.—The double-acting butt hinge, constructed and arranged as described.

83,761.—SAMUEL K. CHRISTY, Noblesville, Ind. —*Car Coupler.*—November 3, 1868.—The hook is kept in position by a spring bearing against a shoulder, the end of which is pivoted to the draw head.

Claim.—The combination of the hollow-sided draw head B, with its hook D pivoted thereto, when said hook has a rounded end, *d*, and shoulder, and operates on a spring, E, connected to said shoulder, and in a recess in the side of the draw head, all substantially as shown and described.

83,762.—WALTER CLIFFORD, Holly Springs, Miss.—*Mode of Carrying Knapsacks.*—November 3, 1868.—The knapsack is secured by straps to padded shoulder-springs, which latter are held in position by a back brace and secured by thongs to slides on the waist belt.

Claim.—A device for carrying knapsacks, composed of the padded shoulder springs A, back brace *e*, belt B, slides *b b*, and thongs *d d*, when combined, constructed, and applied as herein shown and described.

83,763.—ANDREW JAMES CONNELL, New York, N. Y.—*Method of Manufacturing Show Cards, Labels, &c.*—November 3, 1868.—The paper, coated with a composition of glue solution, white lead, sulphate of zinc, and finished by calendering, is printed upon by aniline colors, ground with glue water, piping, Spanish whiting, and gum, said colors being secured thereon by a coating of spirit varnish.

Claim.—The method, substantially as herein described, of preparing cards and paper, and printing or otherwise impressing and fixing thereon prepared aniline colors, substantially as set forth.

83,764.—WILLIAM COOPER, Galesburg, Ill.—*Washing Machine.*—November 3, 1868.—Cleats are secured radially around the center of the bottom of the box. A circular board, with cleats corresponding to the bottom ones, is attached to a shaft which is rotated by a segmental rack receiving motion from a crank.

Claim.—The arrangement of the box A, its bottom ribs, *a*, the board C, with ribs *b*, shaft *c*, spring *d*, cog H, segment E, pitman I, plate F, and balance wheel G, all constructed and operated as herein set forth.

83,765.—C. O. CROSBY, New Haven, Conn.—*Tatting.*—November 3, 1868.—The filling thread is knotted around one or more warps or a different number of knots around different warps, and when the requisite number of knots has been made upon the thread they are beaten up, sliding on the warp thread, so as to bring the work into a regular figure.

Claim.—The herein-described tatting, fabricated substantially as set forth, as a new article of manufacture.

83,766.—DANIEL CURRIE, St. Charles, Mo.—*Rotary Steam Engine.*—November 3, 1868.—The steam chest, divided by a partition into two chambers, is placed on top of the two cylinders. The pistons, a portion of their peripheries between certain points being cut away to let them come in contact, in that interval, with the sides of the cylinders, have their heads, each, attached to a sliding rod, which rods are coupled by links with the working beam.

Claim.—1. The arrangement of the steam chest E with the chambers *e*¹ *e*² and the cylinders A A', as herein set forth.

2. The arrangement of the cylinders A A', piston wheels B B', with their periphery eurtailed on one side, as shown at *x x'*, together with the sliding heads D D', rods *d d*¹, links *d*² *d*³, and beam D², all constructed as herein shown and described.

83,767.—WILLIAM B. DEUEL, Ithaca, N. Y.—*Mower and Reaper Knife Sharpener.*—November 3, 1868.—The device is for the purpose of holding at the proper angle or inclination the knives of a mower or reaper upon the plain ordinary face of a common grindstone of any size.

Claim.—1. The arrangement and application, to the sides of an ordinary grindstone, of the plate or plates C, made with holes or mortises to receive the pins or hooks E, for the purposes of holding and adjusting the described mower and reaper-knife holder to the face of an ordinary grindstone, substantially as set forth.

2. The arrangement of the arm or projecting piece F, with the pins or hooks E fitted to two or more of the holes in the plate C, and adjustable anywhere in the series of holes in the same, and sustaining the bolt G in its slot in the arm, and the cutter-bar holder, as set forth.

3. The cutter-bar holder I, when made with the deep and hollowed V-shaped bottom cavity, substantially as set forth.

4. The bolt G, when held in place in the arm F by the set screw H, and adjustable for the holder I by the set screw J, and the collar or collars N, bevel or obliquely, as described.

5. The clamps L, so arranged as to hold the cutter bar M in the cavity of the holder I, by the edges of the cutter bar, and on the rear of the knives, thereby leaving the face of the knives free, and open to the stone, as described.

6. The combination of the plates C, arm F, bolt G, and holder I with the frame of an ordinary grindstone, constructed and arranged to operate as set forth.

83,768.—JOHN H. ELWARD, Polo, Ill.—*Plow.*—November 3, 1868.—The coulter is attached to the beam by a rounded shank arranged nearly vertically between its edge and the beam. A roller is made to turn freely on the shank, and another is placed on the outer end of its extension.

Claim.—The combination of the coulter D, the rounded shank or rod D', and rollers attached thereto, substantially as and for the purpose set forth.

83,769.—EDWARD FARON, New York, N. Y.—*Brick Machine.*—November 3, 1868.—A system of toggle bars operate plungers and press the brick against a head block with holes for the escape of water bubbles, and revolve the mold carrier. Connected with them are also a plate directly over the molds which can be removed for planing, and a pushing block.

Claim.—1. The combination and arrangement of the toggle bars *e e'* and *f f'*, pitman *j*, crank and plunger *k*, with the mold carriage H, operating substantially as and for the purposes herein specified.

2. The head block N provided with slots *q*, in combination with plate P, provided with perforations *r r*, substantially as and for the purposes herein specified.

3. The combination of the pusher block O, lever V, pin *x*, cam R, shaft D, and mold carriage H, arranged and operating substantially as and for the purpose herein specified.

4. The arm L', in combination with the mold carriage H, and plungers J, substantially as and for the purposes herein specified.

83,770.—MAURICE FITZGIBBONS, New York, N. Y.—*Wooden Box.*—November 3, 1868.

Claim.—As an article of manufacture, a box, A, constructed of a material consisting of two sheets of wood, with one sheet of paper between them, the sheets of wood and paper being glued together, substantially as herein described.

83,771.—MORDECAI H. FLETCHER, Richmond, Ind.—*Compound Adjustable Garden Hoe.*—November 3, 1868.—To an arm forming an angle is attached one of the shovels, the other being fixed to a shank, which, at its upper end, has an eye into which the shorter arm is inserted and held by a thumb screw thus allowing the shovel to be moved back and forth.

Claim.—The combination of the arms *b* and *c*, shovels *b'* and *c'*, and shank *d*, when the latter is made adjustable on arm *b*, and the whole is con-

structed in the manner described, and for the purpose set forth.

83,772.—OTTO GSANTNER, East Orange, N. J.—*Elevated Railway.*—November 3, 1868.—Two transverse rails are secured to columns on each side of the street, and upon them are placed slides provided with hangers, on which at their lower parts are fixed rails which may be brought in line with either track by moving the slides.

Claim.—The carriage K, fitted to move on the transverse bars J, provided with hangers L and rails M, when adapted to be operated as shown, for shifting the suspended ears from one track to the other, as represented and described.

83,773.—HENRY L. HAMMOND, Providence, R. I.—*Carriage Jack.*—November 3, 1868.—Flanged plates, supported in one of the holes in the standard, slide up and down in a slot, and between them lies a lever transversely extending on either side, on one end of which is a toggle joint formed by means of a stirrup which also forms a projection on the working lever.

Claim.—The flange plates C and C' in combination with the levers E and F, and the standard A, substantially as described and for the purposes set forth.

83,774.—JOHN HUMPHREYS, Chicopee, Mass.—*Adjustable Gearing for Lathes.*—November 3, 1868.

Claim.—1. The combination of the shaft A, having the gear *x x* arranged upon it, the shaft E, with traveler G, and the rack L, the parts being arranged and constructed substantially in the manner shown and for the purpose set forth.

2. In combination with the rest of my device, as herein shown, the arrangement of the lever O, with gear P and Q, substantially as here described and for the purpose set forth.

3. In combination with the gear *x x* and traveler G, the dial plate or index W, with the different sizes of gear numbered upon it, substantially as herein described.

83,775.—WILLIAM C. KELLUM, San Francisco, Cal.—*Clock Escapement.*—November 3, 1868.—A detent with two arms, having locking serews in their ends, is raised by a beveled screw, and a set screw in a slide adjusts its fall. This lever is also connected with two pallets on a roller and two sets of escape teeth turning in parallel planes, and attached to the same axis, so as to allow the roller to turn between them, and receive alternate impulses from them.

Claim.—1. The detent lever D, with the locking serews *c e'*, the adjusting screw *i*, and the screw *m*, combined and arranged substantially as and for the purpose described.

2. In combination with the pallets *a a'* and the locking serews or heads *e e'*, the two parallel and symmetrical sets of escape teeth E E', arranged and operating substantially as described.

83,776.—WILLIAM C. KELLUM, San Francisco, Cal.—*Clock Escapement.*—November 3, 1868.—Two sets of escape teeth move about the same axis, one of which gives impulse directly to the impulse roller, while the other is so constructed that as the teeth pass the impulse roller or pin, they cause it to move in an opposite direction from their own.

Claim.—1. The impulse wheel D' on the same shaft with the escape wheel D, and having teeth arranged to give an impulse in a direction the reverse of that given by the wheel D, substantially as described.

2. In combination with the impulse and escape wheel D, and the reverse impulse wheel D', the double-headed screw detent, substantially as described.

83,777.—THOMAS H. LINDLEY, Taunton, Mass.—*Machine for Milking Cows.*—November 3, 1868.—As the lever is raised, the movable frames are drawn inward and the rollers on the frames, passing over the vessels, operate to squeeze the teats while the milk passes into the vessels, and thence by a tube into the pail.

Claim.—1. The stationary and movable frames

I I, provided with rollers *c c*, and connected by means of cords, or their equivalent, to the lever N, for the purpose of milking cows, substantially as herein set forth.

2. The funnel-shaped vessels K K, or their equivalent, in combination with the tube L, for the purpose of receiving and conducting the milk to the milk-pail, substantially as herein set forth.

3. A cow-milker, constructed substantially as described, and adjusted and operating in the manner and by the means herein set forth.

83,778.—HENRY W. LONG, Council Bluffs, Iowa.—*Wagon Jack.*—November 3, 1868.

Claim.—The movable clasp A, with the hooked fulera upon said clasp, in combination with the jack for raising weights, the whole arranged as described in the accompanying specification.

83,779.—DAVID LOWN, Poughkeepsie, N. Y.—*Churn.*—November 3, 1868.—A cup or air chamber is placed on the staff above the dasher, which is made of two bars laid across each other and perforated with holes, by which means the air is forced in through the milk.

Claim.—The combination of the cross-arms B B, perforated near their outer ends, with the cup D, secured under the shoulder on the shaft A, as and for the purposes set forth.

83,780.—GEORGE T. MARSHALL, Unadilla, Mich.—*Salting Trough for Stock.*—November 3, 1868.—A sloping board connected with the foot board, beam, and lever, which have a partial rotation, prevents the cattle from stepping beyond the foot board and thus causing the lid to fall, while they have their heads in the trough, which is uncovered as they step upon the foot board.

Claim.—The inclined board L, in combination with the trough A and foot board C, upon the lever *h*, whereby the cattle are prevented from stepping beyond the foot board, inside the fulcrum of the lever *h*, as as herein described, for the purpose specified.

83,781.—GEORGE MCKENZIE, Zanesville, Ohio.—*Wagon Brake.*—November 3, 1868.—The brake bar is provided with a rack operated by a pinion which receives motion from the hand lever.

Claim.—1. The adjustable connecting parts *c e*, in combination with the rack bar G and pinion J of a wagon brake, substantially as described.

2. The scrapers O, applied to the brake bar F, substantially as and for the purpose herein set forth and shown.

3. The plate E, provided with guides *a*, and secured to the reach, when used in connection with the parts set forth in the first clause of claim, substantially as shown and described, and forming a surface on which the brake bar F moves, as set forth.

4. The easing H, bolted to the reach, when inclosing the pinion J, and forming, at the same time, a bearing for the rock shaft I, and a space in which the rack bar G may be moved back and forth, as set forth.

83,782.—GERRY MORGAN, Newport, N. H.—*Wind Elevators of Grain.*—November 3, 1868.—A current of air is forced through the tube and deflected by means of the adjustable wind guide, which creates a vacuum near a lateral opening in the tube through which the grain enters in the direction of the air current.

Claim.—The deflected lip C, and the wind guide I, with its regulating pin E, in combination with the aperture B in the elevating tube A, as and for the purposes herein described.

83,783.—EDMUND L. MORSE, St. Louis, Mo.—*Cotton Compress.*—November 3, 1868.—Designed as an improvement on his patent of April 16, 1868.

Claim.—The combination of the sector A with the vertical screw E, and its step upon the upper platen *b*, thereby counterbalancing in whole or in part, by the thrust of said screw, the upward pressure of the compressed bales, substantially as set forth.

83,784.—JOHN W. NEWTON, Geneva, Wis.—*Bog Cutter and Drag.*—November 3, 1868.—The cutting

blade rests on the ground and shears off the irregularities. The teeth drag the sod and loose bodies out of the way of the plow.

Claim.—1. The cutting blade A, removably secured to the L-shaped straps C, attached to the stock B, and adapted for use either with or without the drag teeth, substantially as and for the purpose herein set forth.

2. The plate E, provided with removable teeth, and detachably secured to the hangers depending from stock B, when used either with or without the cutter A, for which it can be substituted, substantially as herein described, for the purposes specified.

3. The L-shaped hangers C, secured to the stock B, and adapted for the attachment of the toothed bar E, and cutter A, either separately or combined, substantially as described.

4. The combined bog cutter and drag, consisting of the cutter A, toothed bar I, hangers C, and a stock, all operating substantially as herein described.

83,785.—JOHN W. NEWTON, Geneva, Wis.—*Potato Digger and Vine Puller.*—November 3, 1868.—The frame to which the teeth are secured by means of an adjustable plate, is hinged to the draught pole so that the frame may be raised to allow the teeth to clear obstructions.

Claim.—1. The frame A, handles D, and draught pole B, in combination with the teeth G or H, substantially as and for the purpose described.

2. The series of curved tapering teeth G, arranged upon the adjustable plates F, as described, for the purposes of a potato digger, substantially as described.

83,786.—JOSEPH H. OSGOOD, Peabody, Mass.—*Process of Recovering the Materials of Wornout Printer's Rollers.*—November 3, 1868.—The discarded material is soaked in cold water and the sirup is recovered by evaporation and solidified by being placed in a tank with a false bottom through which the saccharine matter percolates while the glue remains and is solidified by evaporation.

Claim.—The process of utilizing the ingredients of discarded roller composition, substantially as described and specified.

83,787.—CHARLES B. PAYNE, Clinton, Ill.—*Gag Swivel.*—November 3, 1868.

Claim.—The gag swivel, formed of one piece of metal, and composed of two bars *a a*, and outwardly curved bar *b*, with a buckle at one end, and with a rivet plate at the other, all substantially as herein set forth.

83,788.—EUGENE PAULUS, Philadelphia, Pa.—*Watch-winding Click.*—November 3, 1868.—The crescent-shaped pawl of the winding shaft is pivoted centrally, and fitted within a recess so as to present its entire outer surface as a bearing to resist the strain of the main-spring.

Claim.—1. The improved watch-winding click, made in a round shape, cut so as to catch the teeth of the ratchet wheel, and adjusted in a recess of the top plate, to resist, by its full size, the power of the main-spring, in the manner substantially as described.

2. The combination of the winding click E, bridge L, spring M, and pin screw P, arranged and operating substantially as described.

83,789.—WILLIAM PHELPS, Jr., Salem, Mass.—*Blind Fastener.*—November 3, 1868.—The two plates are fastened to the under side of the blind, and the spring, which is fitted in a recess of the blind, acts to hold the latch plate in contact with the two projections on the confining plate.

Claim.—The combination and arrangement of the plates E and F with the spring *s*, all constructed and applied substantially in the manner and for the purpose specified.

83,790.—GEORGE H. PHILLIPS, Troy, N. Y.—*Reservoir Cooking Stove.*—November 3, 1868.—The upper front part of the hot-water tank forms the rear wall of the heating chambers.

Claim.—1. Extending the rear-end vertical flues of

a cooking stove upward above the horizontal plane of the boiler-hole top plate A and the top edge of the rear end plate C thereof, which is in the same horizontal plane, by curving or raising upward and backward, above its horizontal plane, the rear end part of the said top plate, thereby extending said flues upward, so as to form, at and above their upper ends, and above the horizontal plane of the stove top A, hot-air or heating chambers H H H, open at their rear side, in manner substantially as herein shown and described, for the purpose set forth.

2. The combination of the upward extension of the rear flues of a cooking stove, over the horizontal plane of the top plane, and the elevation of the rear part of the top plate, whereby hot-air chambers H are formed, with the shelf F and boiler E, substantially as and for the purposes described.

83,791.—WILLIAM POTTS, Handsworth, England.—*Molding Screw.*—November 3, 1868.

Claim.—The method of producing molds for casting screws, by first making a plain, cylindrical mold, and afterward molding the thread by screwing a pattern screw through the said cylindrical mold, substantially in the manner and by the means herein shown and set forth.

83,792.—JOHN J. REICHARD, Canton, Ill.—*Saw-Set.*—November 3, 1868.—The position of the set screws determines the degree to which the teeth shall be bent upon the bevel of the anvil by the action of the punch.

Claim.—A saw set, composed of jaws *a b*, anvil *h*, punch *f*, spring *g*, and set screws *c d*, constructed and arranged as described, and for the purposes set forth.

83,793.—JOHN J. REICHARD, Canton, Ill.—*Saw-Set.*—November 3, 1868.—Two hammers are respectively adapted for setting the oppositely-deflected teeth of the saw, one hammer being swung back out of the way while the other is in use. The gauge, against which the points of the teeth rest, graduates the position of the saw in accordance with the length of the teeth, and in relation to the hammer.

Claim.—As an improvement in a saw set, the adjustable gauge D, with its tenon E, set screw G, hammers B and C, when constructed and arranged as described.

83,794.—ELIAS RHODES, Jr., Clyde, Ohio.—*Horse Hay Fork.*—November 3, 1868.—The shoulder on the lever engages a shoulder on the central shaft, and thus locks the latter when in position for lifting the load. The lever also enters a notch in the top of said shaft when the fork is ready to be thrust into the hay, thereby holding the tines against the sides of the shaft.

Claim.—The lever B, formed with the shoulder *b*, in combination with the central sliding shaft *c*, formed with the shoulder *b*¹, shank or body A, consisting of two bars, connected together at their upper ends, and supplied with prongs *a' a'*, passing through shaft *c*, and cords *b*², *g*, and *g'*, all constructed and operated substantially as and for the purpose set forth.

83,795.—CONSTANT S. ROUSE, Dowagiac, Mich.—*Step Ladder.*—November 3, 1868.—By means of holes in the hangers, together with the shifting pin, the blocks and the platform on the ladders may be supported at any desired elevation, and when one continuous ladder is formed, it is braced by passing the pin through the uppermost holes of the hangers.

Claim.—The guide blocks D D, the pin H, and rounds E E, when combined with the platform braces and ladders, as and for the purposes set forth.

83,796.—HIBBARD SABIN, Philadelphia, Pa.—*Water Heater.*—November 3, 1868.—Both the inner and outer tubes are exposed to steam, and the water, in taking its course through the annular, intervening spaces, is in contact with two heating surfaces, against which the entire volume of steam impinges.

Claim.—The arrangement of chambers or pass

ages B, B', E, E', F, and *i*, in respect to internal and external tubes *h* and *f*, so that the steam shall pass first within and then around the tubes, as described.

83,797.—JOSEPH THEODOR SCHMITT, Brooklyn, N. Y.—*Picture Frame*.—November 3, 1868.

Claim.—The hollow, continuous shell A, made of glass or other transparent material, and leaving a hollow space, *c*, for the reception of flowers or other ornaments, substantially as described.

83,798.—DAVID STUART and LEWIS BRIDGE, Philadelphia, Pa., assignors to STUART, PETERSON AND CO., same place.—*Cooking Stove*.—November 3, 1868.

Claim.—The arrangement of the ovens D E, fireplace A, plates *h* and *p*, flues *c f j k m*, and the damper *x*, as herein described.

83,799.—NATHAN THOMPSON, Brooklyn, E. D., N. Y.—*Lantern*.—November 3, 1868.—The sectional wire guard permits the insertion of the glass from the side. The platform and its back facilitate the sliding in of the glass. A front cheek for the glass is on the bottom rim of the hinged side of the guard.

Claim.—1. The combination of the hinged portion G' F' with the fixed or stationary portion G, arranged to connect the middle rim B with the head piece F, substantially as shown and described.

2. The middle rim B, formed or provided with a raised interior upper surface or platform, H, and back I, substantially as and for the purposes herein set forth.

3. The sectional rim or flange K, to the lower end of the portion G' of the guard, provided with a raised front rim or cheek, L, to the glass.

83,800.—GEORGE TOPPING, Chicago, Ill.—*Mittens*.—November 3, 1868.

Claim.—Cutting the whole of a mitten, back, front, and thumb out of one and the same piece of material, substantially as described and shown.

83,801.—A. N. TOWNE, Chicago, Ill.—*Music Stool and Rack*.—November 3, 1868.—A combined piano stool and receptacle for book or sheet music.

Claim.—The arrangement of the seat D, in combination with the base or music rack A, substantially as and for the purpose set forth.

83,802.—MICHAEL TROMLY, Mount Vernon, Ill.—*Clock Movement*.—November 3, 1868.—Instead of a winged fly wheel for regulating the striking movement, a balance wheel is used, which receives motion through a rack bar connecting with the pallet, which is operated by the scape wheel. Dogs on the hand spindle cause the balance wheel to move before the scape wheel does, and thus commence the movement of the scape-wheel pallet.

Claim.—1. The arrangement of the escapement wheel D, the pallet I, with its rollers *i i*, oscillating on the rod P, and connected by the link H with the pendulum rod, substantially as shown and described.

2. The combination of the balance wheel W, spring *v*, rack bar *w'*, rod *u*, pallet T, and scape-wheel C, when employed to regulate and control the action of a striking apparatus for clocks, substantially as described.

3. The arrangement of the dogs *x' x'*, arms S' T', rock shafts X *t*, stop S', and pallet T, substantially as set forth.

83,803.—WILLIAM TUTTLE, Boston, Mass.—*Street Railway Switch*.—November 3, 1868.—The shoe, suspended by rods which pass through a steadying tube, has both a lateral and vertical motion and can be lowered to bring it into contact with the switch, which is provided with suitable grooves and inclined planes to cause the car to pass from one track to another.

Claim.—1. The combination of the shoe with the car body, by means of the links or rods *a* and *h*, when these links are connected to the said shoe and body in such manner as to permit of the shoe oscillating or moving laterally as well as vertically, so as to accommodate itself to the surfaces over, on, or against which it may pass, substantially as described.

2. The combination of the steadying tube *m* with the car body, and the shoe applied thereto, substantially as described.

3. The arrangement and combination of the inclined planes or chutes *p* and *q*, with the rails S T T', the flange groove *n*, and the deflector *r'*.

4. The combination and arrangement of the inclined plane *o*, the groove *n*, the inclined planes or chutes *p q*, the rails S T T', and the deflector *r'*.

83,804.—P. SHELTON TYLER, Boston, Mass.—*Paper Boat*.—November 3, 1868.—Longitudinal strips of paper or thin wood, of gradual decreasing length or width, are attached to those portions of the side and bottom of the boat most subjected to wear and strain. Transverse strips placed across the bottom and sides of the inner surface of the boat serve as braces to strengthen the same under and at the rower's seat.

Claim.—1. The combination, with a paper boat, of the sheets or strips *c¹*, *c²*, &c., as and for the purpose specified.

2. In combination with the strips *c¹*, *c²*, &c., the pieces *d¹* *d²*, as and for the purpose set forth.

83,805.—RICHARD W. TYLER, Wayne, Mich.—*Saw-Set*.—November 3, 1868.—An adjustable saw holder is provided with a rack, with which a pinion engages, which latter is actuated by an adjustable pawl on the lever actuating the die. The saw is fed along each time the die is raised by the lever.

Claim.—1. The pinion G, provided with concentric series of notches in its upper face, when arranged, as described, with relation to the toothed bar F, and operated simultaneously with the die, by means of the adjustable pawl H applied to lever D, substantially as herein set forth, for the purpose of feeding the saw along automatically, and with a regular, graduated motion.

2. The arrangement of the frame A, die B, lever D, adjustable pawl H, pinion G, and toothed bar F, substantially as herein shown and described.

3. The adjustable sliding elamps J, consisting of jaws *w w'*, and the hinged, slotted block *y*, arranged as described.

83,806.—WILLIAM S. VAN HOESEN, Saugerties, N. Y.—*Combined Mop Head and Scrubbing Brush*.—November 3, 1868.

Claim.—The combination of the scrubbing brush A, held by the clamping plate and set-screw handle C, mop head D, and elamp E, all constructed substantially as described, and operating as and for the purposes herein set forth.

83,807.—T. VAN KANNEL, Cincinnati, Ohio.—*Ticket Case*.—November 3, 1868.—A projection rises from the lower edge of the slot in the end of the case to within a sufficient distance from the top of the case to allow one card to be pushed out at a time.

Claim.—The card or ticket case A, provided with the projection *h* in the slot *g*, and constructed in the manner as and for the purposes described.

83,808.—JACOB VAN NORMAN and WILLIAM YOUNG, Easton, Pa.—*Rain-water Cut-off*.—November 3, 1868.—One of the semicircular plates is painted a different color from the outside of the drum, and the same side of the drum is provided with two holes, so that the painted portion shall come opposite one of the said holes when the valve is opened to its full extent, the object being to ascertain at a glance the position of the cut-off.

Claim.—The drum A, provided with exit pipes B B', and induction pipe C, in combination with the cut-off *c*, and semicircular plate *d*, the drum A being provided with holes *i i*, and one of the plates *d* being stained, on its outer surface, a different color from the drum, as and for the purpose set forth.

83,809.—ANDREW WEST, Burlington, Iowa.—*Bed Bottom*.—November 3, 1868.—Each slat resting on the Z-shaped springs is hinged to the head part, which rests on two upright pieces attached to each side of the bed, and can be adjusted at any height by means of the braces.

Claim.—The Z-shaped springs D D, braces I I,

uprights G G, and slats E E, all constructed and arranged substantially as herein set forth.

83,810.—WILLIAM F. WHITNEY, Milton, N. Y.—*Carriage Spring*.—November 3, 1868.—The weight of the wagon body and load exerts a downward force against the outer ends of the extended arms which act upon the springs, causing a torsional resistance.

Claim.—The combination of the torsion springs B and their attached arms *g*, arranged for operation in connection with the body and running gear of a wagon or other vehicle, substantially as described, and for the purpose herein set forth.

83,811.—CHARLES WHITTIER, Boston, Mass., assignor to himself and BENJAMIN F. CAMPBELL, same place.—*Steam Generator*.—November 3, 1868.—The generator is made of two shells so connected with each other, the water tubes, and with the bridge piece as to allow a free circulation of water and to give an increased heating surface.

Claim.—1. A bridge piece, having water and steam connections with a double shell, in combination with such double shell and water tubes, constructed and arranged substantially as herein described.

2. The arrangement of the flues with reference to the double shell and bridge piece, substantially as described.

3. The bridge piece *d*, when constructed substantially as described, and placed in the rear of the fire box, to increase the heating surface of the generator.

83,812.—JOHN W. WILCOX, New York, N. Y.—*Box*.—November 3, 1868.—The parts are so cut and folded as to secure great strength and small amount in weight of stock. The box is intended for containing articles to be carried in the mail.

Claim.—1. The supplemental lappets *i*, in connection with the lappet D and strengthening folds *h*, substantially as described and set forth.

2. The above, in combination with the pocket E, as and for the purposes specified and set forth.

83,813.—JAMES WIXTED, Port Carbon, Pa.—*Railway Rail Splice*.—November 3, 1868.—A steel bar is inserted in the upper part of one of the fish pieces so as to be flush with the tread of the rails, and overlap the ends of the contiguous rails.

Claim.—The steel bar D, adapted to the rails and to the splicing bar B', substantially in the manner and for the purpose herein set forth.

83,814.—JAMES T. WALKER, Albany, N. Y.—*Collar Machine*.—November 3, 1868.—The collars or cuffs are bent in the act of cutting them out, so as to fit the contour of the neck or wrist. The paper is fed through and guided by the tube to the cutting dies.

Claim.—1. A collar or cuff die, whose face is inclined downward from its longitudinal center, or point corresponding with the folding line, substantially as herein specified.

2. The female die, or its movable bed, constructed to conform to the face of the male die, by being inclined downward from the folding line, substantially as set forth.

3. The female or counter die B², constructed as described, and arranged upon the bed A, with one end elevated above the other, presenting an inclined face, substantially as described.

4. In combination with the slotted follower C², the knife Y, so arranged that it shall indent the collar upon its folding line at each descent of the male die, substantially as and for the purposes set forth.

5. The slotted folder Z, in combination with the vertically reciprocating knife Y, substantially as herein set forth.

6. Forming or bending the collar in the line of the fold, as it is cut, in contradistinction to creasing the same, substantially as and for the purposes herein set forth.

7. A flat guide tube, *u*, made adjustable to suit the width of the paper, and arranged with the feeding rollers *q* and *r*, for the purposes set forth.

8. The arrangement of the levers V and W, and cams R and Q, all constructed as shown, and operating to alternately cause the upward and downward motion of the knife Y, substantially as shown and described.

9. A movable collar-shaped bed, C², in combination with the dies B² and A², substantially as and for the purposes set forth.

83,815.—SCHUYLER S. CASE, Marion, N. Y.—*Churn*.—November 3, 1868.—A chamber, formed by a false bottom and real bottom of the churn, communicates with the pump, from which latter air is forced through a valve in the false bottom into the churn, to facilitate the separating of the butter.

Claim.—1. The false bottom B, constructed substantially as described, and provided with a valve, *f*, when used in connection with a plunger, F, also provided with a valve, *m*, all constructed and arranged to operate substantially as herein set forth and shown.

2. The removable stock C, to which the barrel E and false bottom B are attached, when constructed and arranged as herein shown and described, so as to form part of the sides of the churn A, as set forth, for the purpose specified.

83,816.—GEORGE U. RELYEA, Watkins, N. Y.—*Machine for Spreading Plaster, Lime, &c.*—November 3, 1868.—The receptacle or sifter may be worked independently of the corresponding parts on the other side. The perforated sifters are provided with longitudinal bars and vertical division plates for thoroughly stirring the plaster, before it falls through the meshes.

Claim.—1. The combination, in the same machine, of two independent sets of mechanism for sifting plaster, &c., situated end to end, the said sets consisting of revolving sifters D D', with the inner ends fixed, but the outer ones resting in slide boxes *g g'*, to throw out of gear, by means of connections *f f'*, G G', and the axle of the driving wheels, and the shaft of the sifters, made in halves, the whole arranged as described, and operating in the manner and for the purpose specified.

2. The combination, with the perforated sifters D D', of the angular bars *i i* and division plates *h h*, the whole arranged as described, and operating in the manner and for the purpose specified.

83,817.—SAMUEL S. ALLEN, Richmond, Ind., assignor to himself and JOHN B. MORRIS, same place.—*Oil Blacking for Leather*.—November 10, 1868.—Composed of neats-foot oil, tar, ivory-black, linseed oil, tallow, lampblack and turpentine.

Claim.—The within specified composition, as an oil blacking for leather, mixed in the proportions substantially as set forth.

83,818.—WILLIAM W. ANDREW, Grand Rapids, Mich.—*Field Roller*.—November 10, 1868.—The roller is divided in the center, and each half is provided with a shaft, the outer end of which is provided with a ball fitting in a socket, and the inner end slides up and down in grooves in the plates, thus allowing the rollers to operate on uneven ground.

Claim.—1. The dividing board B, provided with plates F F and grooves H H, and extended forward of the frame A, under the pole J, where it is perforated (*e e e*) to receive the elevs, all constructed to operate as specified.

2. The combination of the frame A, box D, rollers C C, rods G G, and grooved board B, when constructed and operating substantially as set forth.

83,819.—LEWIS J. ATWOOD, Waterbury, Conn.—*Pin Cushion*.—November 10, 1868.

Claim.—A pin cushion, formed of a ring or disk of fibrous material, confined between two metallic plates that are connected together by rivets or other metallic connections, as set forth.

83,820.—E. J. BALCEAR, Martinez, Cal.—*Hair Restorative*.—November 10, 1868; antedated November 7, 1868.—Composed of the juice of common soap root "*Saponis radix*."

Claim.—The within-described ingredient or root, treated and prepared in about the manner herein specified, for the purposes set forth.

83,821.—HORACE J. BEEMER, Honesdale, Pa.—*Horse Hay Fork*.—November 10, 1868; antedated August 21, 1868.—The tripping lever is composed of

two parts halved into each other, and so arranged that when the pivoted arm is extended the jointed parts lock the lever in place.

Claim.—The hay harpoon, constructed as described, and consisting of the shanks A B, pivoted arm *c*, lever L, made in two parts, *m m*, and jointed at *g*, pivots *x z*, cross bar E, and grooved pulleys P P', all constructed, arranged, and operating as set forth, and for the purpose specified.

83,822.—ERASTUS S. BENNETT, New York, N. Y., assignor to himself and JUSTUS SMITH, same place. —*Stirrup.*—November 10, 1868; antedated October 24, 1868.—The end of the foot support at the open side is provided with a spring, which prevents the foot from slipping forward.

Claim.—A stirrup made with one side entirely open, with a device for preventing its slipping, substantially as and for the purpose set forth.

83,823.—EPHRAIM M. BERRY and LARKIN M. BERRY, Saltville, Ind.—*Medical Compound.*—November 10, 1868.—Composed of persulphate ferri, stramonium, stilingia, valerian, oil of sassafras, and alcohol.

Claim.—The compound above described, substantially as and for the purposes herein set forth.

83,824.—JOHN VREELAND BOGERT, New York, N. Y., and MICHAEL R. PERKINS, Portsmouth, N. H., assignors to themselves and JOHN F. LOWELL, Boston, Mass.—*Sash Fastener.*—November 10, 1868.—When the window is closed, a spring operated by a projection on the sliding sash releases a spring bolt, which slides over the movable sash, and prevents its being raised.

Claim.—The sliding bolt and its spring, when arranged as shown, with the projecting catch spring, substantially as and for the purpose specified.

83,825.—W. E. BOORAEM, New York, N. Y.—*Apparatus for Pasting Labels.*—November 10, 1868.

Claim.—1. Preparing (or pasting) and presenting the labels, ready to be affixed to the bottles, in the manner described; that is to say, by applying the paste to a plane or board, adapted to transfer the paste to the back side of the label, over its entire surface, and pick it up and present it for transfer by hand to the bottle.

2. An apparatus, composed of a suitable supporting surface, and yielding retaining arms, for holding a supply of labels, and provided with a movable pasting board, for applying the paste to and picking up the labels, one at a time, as and for the purpose described.

3. The adjustable and yielding retaining arms, in combination with the label-supporting table, whereby the apparatus may be adapted to the use of labels of different sizes and proportions, as hereinbefore set forth.

83,826.—JAMES T. BOYD, M. D., Indianapolis, Ind.—*Uterine Supporter.*—November 10, 1868; antedated October 31, 1868.—By means of the curved wires the pad can be raised or lowered to adjust it to the person. The instrument can be enlarged by uncoiling the springs in the back pads to suit the size of the person.

Claim.—1. The curved wires M M and B, and their corresponding grooves in the pad A A, with their fastenings and attachments, in the manner and for the purpose substantially as set forth.

2. The coiled springs or wires on the back of the pads C C, arranged and attached in the manner and for the purpose substantially as set forth.

83,827.—HORATIO N. BROOKS, Bloomington, Ill.—*Combined Water Elevator and Dairy.*—November 10, 1868.—A cooling apartment is provided with a series of water tanks, and placed at the side of a structure over a well, which structure contains a water-elevating apparatus operated by springs or weights, by which means water is supplied to the several tanks in succession.

Claim.—The arrangement of a cooling apartment, C, constructed and furnished substantially as described, and an automatic water-elevating apparatus, substantially as set forth.

83,828.—DAVID BRUCE, Brooklyn, N. Y.—*Type Casting Machine.*—November 10, 1868.—The propelling shaft is connected with a face cam wheel of a form to operate by three successive movements upon a vertical cam lever, so as to throw the shaft out of connection with a loose driving pulley, which has on its side a spring pawl for locking automatically with the wheel. The cam lever has also a wedge-shaped tappet for operating the wheel, and with its frame is connected with a gutter, and a lever which has two type-registering plates on its end, with holes, so arranged that they are opened only when the lever is raised to its full height.

Claim.—1. The loose pulley G, having a pawl, F, attached thereto, in combination with the cam wheel D, having a notch, E, in its periphery, substantially as hereinbefore set forth.

2. In combination with the driving shaft C, the cam wheel D, having a cavity, J, in its face, and planes K and L, substantially as described, and for the purposes hereinbefore set forth.

3. The combination of the upright cam lever I, having the tappet H attached thereto, with the said cam wheel D, when formed as hereinbefore described.

4. The combination of the said upright cam lever I and frame B with the horizontal registering lever P, substantially as hereinbefore described, and for the purposes set forth.

5. In combination with the frame B, the inclined gutter N, made and arranged substantially as hereinbefore set forth.

6. In combination with the horizontal registering lever P, the registering plates R¹ and R², substantially as hereinbefore described, and for the purposes set forth.

7. In combination with the inclined gutter N and registering plate R¹, the type M, arranged and operating in the manner described and for the purposes set forth.

83,829.—ROBERT I. BURBANK, Boston, Mass.—*Vegetable Cutter for Animal Food.*—November 10, 1868.—A series of rotating carriers operate to bring the vegetables up to the circular saws, which run between them, their motion, on account of their larger gear, being slower than that of the saws, between which latter are clearers to let them spring laterally without injuring their teeth, annular grooves being also provided between the hubs of the carriers to secure the positive action of the saws.

Claim.—1. A series of rotating carriers, A or B, constructed as shown and described, and operating in connection with a series of rotating circular saws, in the manner and for the purpose specified.

2. A series of notched clearers, N, constructed, applied, and arranged for operation, as and for the purpose set forth.

3. The combination of all the operative parts specified, when arranged to operate substantially as and for the purpose set forth.

83,830.—C. R. BUSHNELL, St. Anthony's Falls, Minn.—*Head Block.*—November 10, 1868.—Two ratchet wheels are attached, one on the end and the other on the middle part of a shaft, their teeth resting on pawls, of which each succeeding one is shorter than its preceding one, the wheel fixed at the middle part being also attached to a lever. A semicircle, with its end fixed to the carriage frame, has two rows of square holes into which fits a pyramidal-headed pin, and a set screw passes through an eye attached to the semicircle. The pin and screw being adjusted the timber may be set by a single movement of the lever, and lumber may be sawed of any thickness.

Claim.—1. The graduated semicircle, I, resting upon the carriage, and provided with two rows of square holes; the set screw K, armed lever H, receding pawls G, ratchet wheels F D, and shaft C, all arranged to operate in the described manner, for the purpose specified.

2. The graduated semicircle I, when provided with two rows of square holes and the set screw K, as herein described, for the purpose specified.

83,831.—W. T. CLEMENT, Northampton, Mass.—*Cutlery.*—November 10, 1868; antedated October 28, 1868.

Claim.—The within-described method of the manufacture of cutlery, consisting in bending the wrought iron B, and beveling its ends, as represented, and afterward compressing it together upon the steel, and welding and drawing it, substantially in the manner and for the purposes herein set forth.

83,832.—D. CODD, Ottawa, Canada.—*Corn Sheller.*—November 10, 1868.—A toothed cylinder, connected with a corrugated belt, has its upper part inclosed in a casing, leaving an opening from one end to the other, and an apron is placed between bars for inserting the ears, which are caused by the belt to pass through the machine.

Claim.—1. The toothed cylinder B, and the corrugated or grooved endless belt F, in combination with each other, the toothed surface of said cylinder moving at right angles to the direction of said endless belt, substantially as herein shown and described and for the purpose set forth.

2. The combination of the fan blower S with the toothed cylinder B and endless belt F, substantially as herein shown and described, and for the purpose set forth.

3. Operating the endless belt F and fans S from the toothed cylinder B, substantially in the manner herein shown and described.

83,833.—VIRGIL P. CORBETT, Alexandria Co., Va.—*Potato Digger.*—November 10, 1868; antedated October 31, 1868.

Claim.—The arrangement and combination of the revolving-toothed cylinder or bar C, scoop A, with pronged front spring bars s s, and wings W W, constructed and operating substantially as and for the purpose set forth.

83,834.—HARRY C. COTTER and GEORGE G. GREENE, Fort Wayne, Ind.—*Safety Switch Lock.*—November 10, 1868.—A laterally-moving bar is provided with catches projecting through openings in a guard and actuated by means of eccentric levers pivoted to a bar. A reciprocating bar in the rear, in connection with recesses and rods, serves to lock the bar and catches in position.

Claim.—The stop bar A, carrying stops a' a'' a''', and eccentric levers C C, in combination with the stop bar H, having recesses m n, the whole being constructed in the manner and for the purpose substantially as set forth and described.

83,835.—GUSTAV CRAMER and JULIUS GROSS, St. Louis, Mo.—*Posing Apparatus for Photographers.*—November 10, 1868.

Claim.—1. The body rest A, when provided with flexor joints, m, and extension torsion joints, n, constructed substantially as herein described and set forth.

2. The leg rests B, when constructed so as to be able to follow all the movements of the human leg, and be adjustable thereto, as and for the purpose set forth.

3. The arm rest C, when constructed so as to be able to follow all the movements of the human arm, substantially in the manner and for the purpose herein shown and described.

83,836.—WILLIAM D. CUTLER, Philadelphia, Pa.—*Article of Food Prepared from Fish and Potatoes.*—November 10, 1868.

Claim.—The within-described mixture of desiccated potato and fish, as a new commercial article.

83,837.—CHARLES B. DAVIES, Dayton Ohio.—*Key-hole Guard.*—November 10, 1868.—A metal cap provided with an arm, to which is attached a spring, is inserted in the outside key-hole of a lock and held in position by a screw bolt from the inside.

Claim.—Cap A, provided with projecting arm B and spring C, when used in connection with bolt D, perforation as described, and thumb screw E, substantially as described, and for the purposes set forth.

83,838.—SAMUEL DAY, Delavan, Ill.—*Cultivator.*—November 10, 1868.—An elbow lever or crank is pivoted to the $\frac{1}{2}$ and provided at one end with a slot through which passes a pin on a pivoted tongue. The other end of the said crank is connected to a le-

ver by which the direction of the machine may be instantly changed.

Claim.—In a corn cultivator the mode of guiding the machine and shovels by means of the crank D and connections, with the lever o, as and for the purposes above described.

83,839.—JAMES F. EARL, San Francisco, Cal.—*Harvester.*—November 10, 1868.—The cutter frame is so arranged that it can be raised or lowered without hindering the working of the gearing, and the rake and platform are so constructed that the gavel may be discharged at either end, the machine entering back and forth on the same side of the field, while the guiding wheel, by various devices, is always maintained in a vertical position when used on a side hill.

Claim.—1. The vertical adjustment of the cutter frame, relative to the main frame, upon a pivot or shaft, in advance of the main axle, by means and substantially in the manner described.

2. The arrangement of the driving gear, in combination with the vertically-adjustable cutter frame, substantially as described, whereby the height of said frame may be adjusted without disturbing the working relation of the gear shafts.

3. The rake head, constructed as described, in combination with teeth applied thereto, and operating substantially as described.

4. The manner of actuating the rakes by means of the straps or belts, and drums or rollers, and shifting clutches, operating as described.

5. Operating the shifting clutches, by means of the rake head acting alternately thereon through the clutch levers, as described.

6. The slotted plate, to which the middle fingers are attached, forming the box inclosing the springs, and permitting the withdrawal of the lever staple and the removal of the sickle, as described.

7. The arrangement of the fulcrum of the reel frame in rear of and above the pivot or axis around which the sickle frame is adjusted, in combination with means for simultaneously adjusting said frames, whereby the relation of reel and sickle is varied when the height of cut is varied, as described.

8. The hollow reel shaft, provided with the end hubs and with the central stiffening sleeve and central hub, as described.

9. The adjustment of the steering wheel upon a horizontal axis or pivot, for the purpose of maintaining the same in a vertical position, irrespective of the position of the main frame and cutters.

10. The attachment of the driver's stand or seat and the sickle-adjusting mechanism to the horizontal axis upon which the steering wheel is adjusted, substantially as and for the purpose set forth.

11. The combination, with the grain platform, of a reciprocating rake, adapted to deliver the grain at either end of the platform, as set forth.

83,840.—JOHN ELLIOTT and WILLIAM LEE, Chippewa, Ohio.—*Sheep Rack.*—November 10, 1868.

Claim.—The hinged covers C D, so arranged and combined with the rack A as to form a roof when folded up, and grain trough when turned down, in the manner as described.

83,841.—SAMUEL S. FERRIS, New York, N. Y., assignor to himself and WILLIAM O. ROBBINS, same place.—*Machine for Making Sheet Glass.*—November 10, 1868.—The melted glass is poured on a table on which are side pieces to regulate the opening through which it passes, and, consequently, the thickness of the layer. The platform is made of hinged plates with slides, and is inclosed by a casing, which has openings with slides to regulate its temperature, and also an adjustable roller to press the glass upon it, and straighten any bend.

Claim.—1. A pair of rollers, formed hollow, and provided with means, substantially as specified, for regulating their temperature, in combination with the inclined table g and movable side pieces h, for regulating the width of the melted glass passing to said rollers, substantially as set forth.

2. The platform k, formed of a series of plates hinged together, in combination with the rollers b and c, and straightening roller s, for the purposes and substantially as set forth.

83,842.—EDWARD FORD, San Francisco, Cal.—*Quartz Crusher*.—November 10, 1868.—A series of dies are placed one above another, and also a series of stamps acting against the dies by means of springs operated by cams and tappets, so that, as the ore is fed to one stamp, it is reduced enough to pass through a screen to the second one, where it is made still finer.

Claim.—The horizontally acting batteries A and B, when placed one above the other, and acting against the vertical dies E E, with the screen M, and feeding the ore from one to the other, the whole constructed and operating substantially as and for the purpose herein described.

83,843.—NORMAN N. GORDON, Rochester, N. Y., assignor to himself and ROBERT BOYD, same place.—*Thill Coupling*.—November 10, 1868.—The jack is formed with two journals projecting inwardly, having a space between them, and connected with a thill iron which has an eye with a narrow neck entering the space to couple the parts, the eye being held forward by packing adjusted by screws in the rear.

Claim.—1. The combination of the closed eye *d*, provided with narrow neck *f*, with the jaws *a a*, provided with the separated bearings or journals *b b*, the whole arranged as described, and operating in the manner and for the purpose specified.

2. In combination with the above, the sliding pressure plate *h*, provided with lugs, *i i*, which rest upon the jaws, the said plate serving to apply the rubber block to the bearing, through media of screws *k k*, as herein described.

83,844.—H. B. GOUCHER, Peconica, Ill.—*Wine or Cider Mill*.—November 10, 1868.—An improvement on S. A. Hebard's patent of September 1, 1863. The apron is held distended to its fullest width by means of continuous ropes placed by its sides in connection with elastic bands fixed to its edges and the ropes.

Claim.—The apron C, ropes C', and elastic bands D, when arranged and employed substantially as and for the purpose set forth and described.

83,845.—ANDREW J. GOVE, San Francisco, Cal.—*Dredging Machine*.—November 10, 1868.

Claim.—The beam E, turning about the axis *c*, and the governing chain G G' moving about the drum H, together with the excavator B, and its lever D, pivoted to the beam E at the point F; also the regulating chain I; the whole constructed and arranged substantially as and for the purpose described.

2. The beam E, and the lever D, with its excavator B, working in the well or opening *a*, substantially as and for the purpose herein described.

83,846.—WILLIAM C. GRIMES, Philadelphia, Pa.—*Pressure Blower*.—November 10, 1868.—Upon the coupled ends of two shafts are fixed two disks, to which are attached bellows, the inflexible sides of which are secured to each disk, and, as they revolve, the opposite sides of the bellows approach and recede. The air passes into and from the bellows through apertures in the disk, then into a semicircular chamber, and thence through a tube to the place required.

Claim.—1. A series of rotative bellows, *c c c*, in combination with the angled shafts B B, arranged to operate substantially as hereinbefore described, and for the purpose set forth.

2. The arrangement of a series of valveless bellows between two rotative disks or obtuse cones that revolve in planes inclined, the one to the other, as hereinbefore described, and for the purpose set forth.

3. The semicircular air chamber E, in combination with the disks D D' and the bellows C C, arranged to operate as hereinbefore described, and for the purposes set forth.

83,847.—ANDREW M. HALL, Falmouth, Me.—*Potato Digger*.—November 10, 1868.—A screen is hung on swinging arms pivoted to the rear end of the carriage frame, a vibrating screener being set in motion by a diagonal arm. An adjustable plate connected with the arms and screener is raised and

lowered by a lever. The forward end of the screener is held by bent rods, the bent parts passing through holes in the screener so as to vibrate it.

Claim.—1. The combination of arms *h*, pivoted at *i* and *y*, plate *j*, clamps *k*, hand or lever piece *l*, to adjust the screener E, when desired, support the rear end of it, and still to allow of its vibrating motion, as herein set forth.

2. The bent rods *o*, when used to sustain the screen E, allow of its vibrating motion on the parts *p*, and also to aid in supporting the rear end of the plow D, as herein set forth.

3. The adjustable wings of the rotating fans F, as herein set forth.

4. Moving the fan F, and imparting a vibratory motion to the screen E, simultaneously, by means of the revolving axle *b*, by the devices and as herein set forth.

83,848.—J. R. HAMILTON, M. D., Dexter, Me.—*Valve at the Ends of Tubes*.—November 10, 1868.—The valve is composed of an India-rubber tube in which is made an incision a little below the inside of the closed end, leaving one-third of the inner surface uncut. The valve holder has a cylindrical end to receive the open end of the valve, and below is made larger, and has a screw cut on its outer surface.

Claim.—1. The valve C, formed by the partial excision of the closed end of a hollow cylinder, substantially as described, and for the purposes herein set forth.

2. The valve holder, combined and arranged with the foregoing, as and for the purposes specified.

83,849.—E. B. HAMLIN, St. Louis, Mo.—*Paint Can*.—November 10, 1868.—The lip of the reinforcing band is to be hammered down upon the can when put on. The cover is secured by wires attached at their lower ends to car pieces and bent over the top.

Claim.—1. The reinforcing band B, when constructed with a lip, *b*, at its top edge, and attached to the can A, in the manner and for the purpose herein described and set forth.

2. The locking pieces E, when constructed and employed as and for the purpose herein shown and described.

83,850.—GEORGE HAMMER, Philadelphia, Pa., assignor to himself and ALFRED BUTZ, same place.—*Cork-cutting Machine*.—November 10, 1868.—The live spindle for rotating the cork presented to the knife is driven by means of a chain passing over pulleys, one of which is the driver, and receives motion through bevel wheels and a belt from the main shaft, and has a clutch actuated by a lever and arm. A rocking arm, actuated by an inclined plane and a spiral spring on a spindle, gives the sliding movements to the spindle for alternately grasping or releasing the corks.

Claim.—1. The sliding spindle frame D, when its live spindle J is actuated by the clutched chain pulley *j*², and clutch lever *k*, substantially as and for the purpose specified.

2. Operating the sliding spindle J', by means of the double lever K, spring *i*², and inclined plane *i*¹, substantially in the manner and for the purpose described.

3. In combination with the cutting disk C, the sliding saddle P, when its vibrating head piece Q is, respectively to the stops *q q* and gauge O', arranged substantially in the manner and for the purpose set forth.

4. The described combination of the mechanism for slicing the cork, and for tapered and cylindrical cutting, when the same are so arranged as to be simultaneously operated from one driving shaft, A, substantially as specified.

83,851.—E. K. HARVEY, Quincy, Ohio.—*Corn Harvester*.—November 10, 1868.—The stalks are pressed down upon and cut by a saw by means of a reel, and, when cut, they are carried to the rear platform in a standing position by means of belts and guides.

Claim.—The belt F, guides *n n*, belts E E, and saw D, combined, arranged, and operating as set forth.

83,852.—HENRY HAVELL, Newark, N. J.—*Machine for Bending Carpet-bag Frames.*—November 10, 1868; antedated October 24, 1868.—Ductile metal is wrapped around a former by means of a roller worked by rack wheels rotating around the former, bending and shaping the metal correspondingly.

Claim.—An improved machine for making traveling-bag frames, consisting of its several parts, herein described, combined and arranged substantially as described, and for the purposes set forth.

83,853.—SILAS HEWIT Seneca Falls, N. Y.—*Churn.*—November 10, 1868; antedated October 31, 1868.—Fixed to the inside of the churn are four V-shaped breakers. The dasher, made in the form of a frustum of a pyramid, has wings on its sides set obliquely to the shaft.

Claim.—1. The dasher A A', when constructed substantially in the manner and for the purpose set forth.

2. The dasher, when constructed as described, in combination with the breakers *a a a a*, as specified.

3. The combination of the body, the frame B, the dasher A A', and the breakers *a a a a*, as and for the purposes set forth.

83,854.—SAMUEL HOLMES, 180 High Holboru, England.—*Vapor Burner.*—November 10, 1868; patented in England March 23, 1868.—A tube is connected with the lower end of the wick tube, thus forming a casing, which insulates the wick tube from the fluid, while a gas-tight joint between the wick tube and the sliding tube around it prevents the escape of the vapor.

Claim.—1. The combination of the insulating casing, the packed, gas-tight joint, and the valve, constructed to operate substantially as before described.

2. The combination, with the insulating casing, the packed, gas-tight joint, and the valve, of the lever *ix* and screw *vi*, substantially as shown in Fig. 2.

83,855.—EDWIN J. HORNER, Wilmington, Del.—*Car Spring.*—November 10, 1868.

Claim.—In combination with a suitable box, A, provided with an overlapping lid D, with inner pins I, the arrangement of the concentric springs *a, b,* and *d*, the three being graduated, and extending one above the other, as shown, and held in position by the pins I, for the purpose of suiting the light, medium, and heavy weight of a railroad ear, all as shown and described.

83,856.—SAMUEL HUNTER, Andrew Co., Mo.—*Sawing Machine.*—November 10, 1868.—Semicircular notches are cut at different points along the bottom of the upper plate and top of the lower plate. The upper plate is hinged, so that the driving shaft of the horse power may be introduced between the two plates, which afford a bearing for said shaft, the notches serving to accommodate the shaft, from whatever direction it may be presented.

Claim.—The plates *a a'*, the lower rigid, the upper pivoted, provided with the orifices *e e'*, adapted to varying the direction of the driving shaft, substantially as described.

83,857.—WILLIAM W. JEFFERY, Greenview, and CYRUS SNYDER, Middletown, Ill.—*Automatic Car Coupling.*—November 10, 1868.—Consists of two hooks, having backward projecting ends, and so arranged that both hooks may be uncoupled by one movement of a double cam.

Claim.—The links A' B', constructed and arranged as described, with the pins C C, and double cam D in the draw heads, as and for the purpose set forth.

83,858.—JACOB O. JOYCE, Dayton, Ohio.—*Pump.*—November 10, 1868.—At one side of the connection between the valve chamber and the air and piston cylinders the water flows into the bottom of the piston cylinder, and at the other side into the upper end through an elongation of the passage. A third passage connects the valve chamber directly with the air chamber. It is a combined suction and force pump.

Claim.—1. The combination and arrangement of the valves N, N', and M' with the openings U, V,

and R, substantially as and for the purposes specified.

2. The combination and arrangement of the piston chamber B, piston or plunger D, tube or cylinder E, and discharge pipe G, with the flues or passages R, U, and V, substantially as specified.

3. The combination and arrangement of the air chamber A, piston cylinder B, piston or plunger D, tube or passage E, and pipe G, with the passages R, U, and V, valves N, N', and M, with their opening T, substantially as and for the purposes specified.

83,859.—BENJAMIN D. KAY and HENRY E. KAY, Fall River, Mass.—*Adjustable Box for Arbor, &c.*—November 10, 1868.—When, by use, the axis of the arbor is made to deviate from the center of the casing, it can be readjusted by turning the side screws, and thus setting the brasses.

Claim.—The brasses B¹, B², &c., hinged in the casing A, and arranged relatively to the arbor M, the hinge screws C, and adjusting screws D¹ D², or their equivalents, substantially as and for the purposes herein set forth.

83,860.—RICHARD A. KENDALL and THOMAS KENDALL, Mineral Point, Wis.—*Railway-track Cleaner.*—Consists of tilting boards, tipping to each side, and operated by cams and rods, together with a hinged scraper at one end of the car, and a head-board similarly hinged at the other, all being connected and operating together to load and unload.

Claim.—A railroad-track clearer, composed of the shovel A, attached to the check board E by levers C C and rods D D, in combination with the hinged and divided platform, operated by the rods L, substantially as described, as and for the purposes specified.

83,861.—ISAAC KING, Germantown, Ohio.—*Beehive.*—November 10, 1868.—The lower two chambers, as well as the interior case of the upper one, have comb frames. The case is used in summer for rearing queens, and in the winter the bees room therein, the middle chamber being in the latter case removed, and the upper chamber mounted directly upon the lower.

Claim.—The combination of chamber A with removable chamber B and the interior box D and chamber C, without the interposition of a diaphragm, when the parts are constructed, ventilated, and arranged in the manner and for the purpose substantially as described.

83,862.—RICHARD KNOTT, Suisun, Cal.—*Horse-power Fastener.*—November 10, 1868.

Claim.—The arrangement of the frame A, with arms E E, attached to the timbers C C, the hooks G G, and adjusting screws I I for fastening the horse-power to the ground, retaining it in position, and leveling it, substantially as herein described.

83,863.—WILLIAM H. LAUBACH, Philadelphia, Pa.—*Steam Generator.*—November 10, 1868.—Each series of vertical heating tubes constitutes one of the sections of which a boiler is made up. A single transverse pipe supplies the upper, horizontal feed tubes of all the sections, and each of said tubes supplies feed water to a series of vertical feed tubes inclosed within the tubes which are exposed to the fire. By this arrangement the water may be conveyed from the source of supply to the point where it is heated without being brought in contact with the steam.

Claim.—1. The combination of the transverse pipe *a*, the horizontal pipes *b*, and the inner vertical feed pipes *b c*, constructed substantially as described.

2. The feed pipes *b c*, in combination with the steam pipes *d*, and the outer tubes *e*, as set forth.

3. The construction of the horizontal water pipes *b*, and the horizontal steam pipes *d*, combined as herein described.

83,864.—JACOB LAUX, Cleveland, Ohio.—*Sleigh Runner.*—November 10, 1868.—Designed for ready attachment to the body of a carriage. The plates, which join together the rail and standards of the runner, form seats or bearings for the axles of the

carriage body, the axles being clamped thereto by a cap.

Claim.—1. The semi-disks or plates F, radial arms H H', in combination with the sleigh runner, in the manner as and for the purpose specified.

2. The cap J', provided with a groove, K', as arranged, in combination with the plates J, for the purpose and in the manner set forth.

3. The center E, when constructed in two sections, in the manner substantially as set forth.

83,865.—DAVID H. LOWE, Boston, Mass.—*Vapor Burner.*—November 10, 1868.—A tube conveys naphtha from the reservoir to the burner, and a non-conducting substance is applied to the tube near the base of the burner, in order that the heat shall not be communicated to the naphtha until it arrives at the mouth of the burner. The cap may be applied to the ordinary burner for the purpose of varying the form and number of jets.

Claim.—The reservoir A, burner C, perforated cap G, and non-conducting material D, when all are constructed and arranged to operate as shown and described.

83,866.—ALFRED E. LYMAN, Northampton, Mass.—*Weeding Hoe.*—November 10, 1868.—The blades are held by a bolt passing through the standard, and are prevented from moving by a pin on the lower flange fitting in one of the series of holes in the blades and holding them when properly adjusted. By means of an eccentric collar on the bolt the cutting point of the blade can be raised or lowered to cut deeper or shallower.

Claim.—The graduating expansive weeding hoe, (or weed cutter,) as substantially described and herein set forth.

83,867.—PETER MCCOLLUM, Fayette, Mo.—*Gate.*—November 10, 1868.—The gate is counterpoised, and raised or opened in a vertical plane. The lower part is hinged to the upper, so that it may be opened upward, to permit small stock to pass under the gate.

Claim.—The gate A A', when arranged in two parts, hinged together, so as to allow the bottom part to be folded up or thrown open, as described.

83,868.—JAMES T. MCDUGALL, San Francisco, Cal.—*Apparatus for Collecting Precious Metals.*—November 10, 1868.—Improvement on his patent of January 7, 1868. The invention relates to the construction of the sluices for quartz mills, placer mining, &c.

Claim.—1. Vertical or inclining iron standards C C, with stems or bars D D, resting on a plate or plates of copper, B, or plates of some other metal having affinity for mercury, when used for collecting the precious metals, substantially as described.

2. Iron standards, with a supporting horizontal base, on the edge of which there are projections, E E, so that, when placed side by side, open spaces, F F, will be formed between the said standards, having one or more stems or bars projecting upward, all of which serve as riffles when placed in running water, substantially as and for the purpose specified.

3. Iron stands, with hollow projecting stems, H, containing bars, slips, or tubes of copper, H', or other metal having affinity for mercury, communicating with the water outside through slits or openings, I I, substantially as described.

4. Copper resting on iron, the iron resting on copper, the copper having amalgamated, silvered, or mercurialized surfaces when placed in sluice boxes, or other apparatus, or equivalent device, designed to intercept and collect the precious metals moving with the water, in the manner and for the purposes herein specified.

5. The metallic obstructing and collecting surfaces, or equivalent device, separately or in combination, whether placed in sluice boxes, concentrators, or other apparatus for collecting the precious metals moving in running water, substantially as described.

83,869.—WILLIAM MCKEE and CHARLES H. JORDAN, Washington, D. C.—*Blind Hinge.*—No-

vember 10, 1868.—The latch is pivoted at one end to the window frame, and its other end carries a forked or notched head, which, by engagement with the shutter leaf of the hinge, renders the two parts of the hinge rigid in relation to each other, and thus holds the shutter firmly.

Claim.—The arrangement and combination of the latch D with its forked head H, when operated as herein described, and for the purpose set forth.

83,870.—W. A. McLAUGHLIN, New York, N. Y.—*Machine for Cutting out Garments.*—November 10, 1868.—A feeding clamp is combined with a reciprocating cutter and with rollers, for presenting several thicknesses of material to the action of the cutter, so that pieces of cloth or muslin to be used in the manufacture of shirts, &c., may be cut accurately from the smoothly presented fabric.

Claim.—The slider *u* and clamping lever *t*, constructed as set forth, and actuated by the arms and rock shaft *q*, in combination with the follower *e'* and toggles *f*, actuated as specified, to operate the cutters when the feeding device is not acting upon the cloth, as set forth.

83,871.—E. G. McMILLAN, Norwalk, Ohio.—*Farm Fence.*—November 10, 1868.—The fence is sustained by the stakes and band, the former affording the requisite lateral support, and the latter binding the fence down. The ends of the band are secured to the stakes.

Claim.—The band C, cap I, and stakes D, as arranged in combination with the posts G and rails A, for the purpose and in the manner substantially as set forth.

83,872.—S. I. MERRILL, Falmouth, Me., assignor to D. U. YOUNG and M. C. MERRILL, same place.—*Medical Plaster.*—November 10, 1868.—Resin, mutton tallow, beeswax, fir balsam, alcohol, and fir oil.

Claim.—The above-described compound of ingredients, in the named proportion, for the purposes set forth.

83,873.—ALEXANDER MONCRIEFF, Woolwich, England.—*Gun Carriage.*—November 10, 1868; patented in England, June 4, 1866.—By the shifting of the fulcrum the statical momentum of the balance weight is made to preponderate so greatly over that of the gun that it will, when allowed free action, after the loading of the gun, raise the same into its original position.

Claim.—The before-described system of mounting and working ordnance, whereby the gun is supported upon a moving fulcrum, which, on the firing of the gun, is caused to shift nearer to the gun, and farther from a counter weight, spring, or other force, while at the same time the gun is brought into a lowered position for reloading, and is then automatically raised into position for firing.

83,874.—SAMUEL C. MOORE, Boston, Mass.—*Lamp.*—November 10, 1868.—By traversing the upper section of the wick tube, the cap or cone may be set at a greater or less elevation, to adapt the cap to the size of the blaze and prevent smoking.

Claim.—1. The combination and arrangement of the cap H, cup G, hangers I, slide F, and tube B, all constructed and operating in the manner described.

2. So arranging the chimney supporters that the lower edge of the chimney shall extend below the level of the rim of the base plate, substantially as described and shown.

3. The hangers or supporters I, whether depending from the base plate or rising from the screw cup, when so arranged as to support the lower edge of the chimney below the rim of the base plate, as and for the purpose set forth.

83,875.—L. H. MORRILL, West Cumberland, Me.—*Horse Rake.*—November 10, 1868.—The spring has a tendency to hold the clutch away from the pin on the axle, but by means of the lever the clutch may be forced into engagement with the pin, so that the clutch shall be rotated by the axle, and operate through the medium of the chain, &c., to elevate the rake teeth. An automatic device is employed

to release the clutch and drop the teeth as soon as the windrow has been passed.

Claim.—The sliding clutch *c* on the axle *b*, together with its spring *f*, chain *i*, lever *g*, and pin *d*, set in the axle *b*, all as and for the purposes set forth, the clutch being attached to the axle at the center, to make the draught upon the cattle even when the rake head is being lifted.

83,876.—HENRY B. MYER, Philadelphia, Pa.—*Gas Burner.*—November 10, 1868.—The lower tip has a side aperture through which the gas is allowed to flow when the tip is slightly raised or loosened in its socket; in this way an increased supply may be allowed to flow upward when desired. The internal valves are designed to prevent “blowing” under a strong head of gas.

Claim.—The combination of the upper tip *J*, metallic crown *C*, glass body *A*, valve *K* or *K'*, a lower tip with side aperture or apertures *E''*, therein, and base *B*, all constructed substantially as shown and described.

83,877.—BENJAMIN NOTT, Albany, N. Y.—*Illuminator for Stoves, Grates, &c.*—November 10, 1868.—The metallic frame or case, constituting the door, is closed at front by a glass plate, behind which the glass cylinders are arranged. The case is opened to the fire, but may be closed, at its rear, by doors or dampers. The cylinders are designed to reflect the light and diffuse it throughout the room.

Claim.—1. The within-described illuminator, hinged to a stove or other heater in the manner and answering the purpose of a door, as set forth.

2. The hollow glass cylinders *F*, having currents of air circulating through them, substantially as and for the purpose as set forth.

3. Using glass cylinders to transmit the light from a stove or heater, when protected by adjustable doors or dampers in rear thereof, as set forth.

4. The cylinders *F*, in combination with the plates *D* and *E*, or either of them, substantially as and for the purpose set forth.

5. The cylinders *F*, in combination with the doors *C* and *C'*, or either of them, substantially as set forth.

6. The combination of the cylinders *F*, plates *D* and *E*, or either of them, with the doors *C* and *C'*, or either of them, substantially as set forth.

7. The combination of the cylinders *F*, plates *D* and *E*, or either of them, doors *C* and *C'* or either of them, with a stove, or door of a stove, substantially as set forth.

83,878.—WILLIAM F. OSBORN, Mount Pleasant, Pa.—*Harrow.*—November 10, 1868.—When the harrow is raised bodily, the lever handles interlock and hold the harrow teeth slightly above the ground. In turning up the sections of the harrow so as to make them rest upon the frame, for transportation, the lifting is done partly by the hands of the driver and partly by the levers. The tongue may be freed from a catch and allowed to swing round so that it shall act directly, and not by side strain, upon the harrow in turning it around.

Claim.—1. The combination substantially as set forth, with a harrow, of a supporting carriage, inclosed within the harrow, and carrying devices for lifting the harrow at the will of the driver.

2. The combination, substantially as set forth, with a supporting carriage and hinged harrow frame, of the interlocking lifting levers, for the purpose specified.

3. The combination, as set forth, with the supporting wheeled carriage carrying a seat for the driver, of the centrally hinged sectional harrow frame, arranged to fold upon the carriage for transportation, without interfering with the driver.

4. The combination, substantially as set forth, with the supporting carriage, of the pivoted tongue and locking catch, for the purpose specified.

83,879.—JOSEPH J. PIERCE, Maquoketa, Iowa.—*Wagon Brake.*—November 10, 1868.—The brakes are applied by the partial rotation of a rock shaft which is mounted, parallel with the axle, upon the hounds, and connected to the brake bar by arms and rods. Springs retract the brakes and collars serve as stops.

Claim.—The combination of the lever *K*, arm *F*, slot and bolt *H*, and rack *L*, the rock shaft *D*, arms *M M*, rods *N N*, collars *O O*, springs *R R*, and bar *P*, the whole combined, arranged and operating as described.

83,880.—JAMES POTTER, Portland, Me.—*Railway Rail.*—November 10, 1868; antedated October 28, 1868.

Claim.—1. The chairs *d*, when secured to the sleepers *e*, as described, by bolts *f* and braces *i i'*, as and for the purposes set forth.

2. The base *e*, in combination with braces *i i'*, part *m*, and screw bolt *n*, as and for the purposes set forth.

3. The construction of the brace *i i'*, with projection *m* and slotted base *j j'*, operating as described, on the rail and chair.

4. The method of attaching the whole rail *a* to the chair, by means of base *e*, braces *i i'*, and clamps *s r t*, constructed and combined as herein set forth.

5. The combination of the divided rail *b* with the base *e*, chair *d*, clamps *v w*, and braces *i i'*, as and for the purposes set forth.

83,881.—FITCH RAYMOND and AUGUST MILLER, Cleveland, Ohio.—*Gate.*—November 10, 1868.—The spring is so applied that in opening the gate it rises and thus passes over objects that might otherwise create obstruction.

Claim.—The spring *F* and hinges *C*, as constructed and arranged, in combination with the gate, for the purpose and in the manner specified.

83,882.—ROBERT REILLY, Baltimore, Md.—*Hydrant.*—November 10, 1868; antedated October 27, 1868.—The valve is unseated by depressing the plunger, bearing down upon the discharge nozzle. The cylinder steadies the plunger during its vertical movements, and the packing excludes water from the upper part of the main chamber. The entire hydrant, save the bottom section and pipe, may be readily unscrewed and withdrawn from its casing.

Claim.—1. The combination of the parts *C D E*, the two former capable of being firmly attached together, by the screw *N*, with the tubular plunger *I*, having the discharge pipe *J*, when so arranged as to enable the operator to detach and remove the hydrant from the pipe, by simply turning the handle of the plunger, substantially as described.

2. The combination of the packing *L*, and cylinder *K*, with the plunger *I*, walls *C C*, valve *F*, spring *G*, and stem *H*, substantially as and for the purpose described.

83,883.—NATHAN P. RYDER, Boston, Mass.—*Hasp for Trunk Locks.*—November 10, 1868.—The eye, through which the lock bolt passes, is connected to the hasp in such a manner as to admit of its turning in the same, so that the cover of the trunk may be moved or shifted without danger of breaking the eye.

Claim.—The eye *E*, so attached to the hasp *D* as to allow a motion of the latter independently of the eye, as and for the purpose specified.

83,884.—MRS. MARY ANN H. SAURMAN, Philadelphia, Pa.—*Bath-room Rack.*—November 10, 1868.—The receptacles are designed to hold articles for the toilet used in a bath-room.

Claim.—A series of receptacles, for the purpose described, arranged and applied, so that the water dripping from them will be conducted to a place of discharge, substantially as set forth.

83,885.—FREDERICK W. SCHULTZ and JOHN A. WILSON, Baltimore, Md.—*Steam Heater.*—November 10, 1868.—Heated water passes from the water back of a kitchen range into a boiler, and thence into the coils, from which it flows, when cooled, back to the boiler, to be again delivered to the range and heated. Air, supplied from a draught flue, is warmed by contact with the coils.

Claim.—1. In combination with the elevated water back, the boiler and steam-coils, made and arranged to operate substantially as and for the purpose set forth.

2. The screw-thread form of the coil pipes, when so arranged in series that the threads of the adjacent

pipes shall nearly or quite touch each other, and leave openings between them for the air to pass through and become heated, by impinging upon the extended surface, substantially as described.

3. In combination with a hot-water heater, the introduction of the cold air from the top or upper part of the house, by means of a turn cap, air flue, and valve, substantially as described.

4. The supplemental air flue and valve to furnish air momentarily, while the turn cap may be veering, substantially as described.

83,886.—FREDERICK SHALLER, Hudson, N. Y.—*Gas Burner Attachment.*—November 10, 1868.—The flame being ramified in passing through the wire cone, is increased in volume, and thus made to answer the requirements of jewelers, dentists, and others who employ the blow-pipe for soldering.

Claim.—The wire cone or cap, A, in combination with the support *b* and spring *c*, constructed and employed substantially as and for the purpose set forth.

83,887.—JAMES B. STEVENSON, Bloomington, Ill.—*Return Drips for Pumps.*—November 10, 1868.—The return pipe, placed alongside of the pump stock, has hinged to it a funnel, which latter is held in position to catch the waste water by means of a spring, and is easily forced back by the bucket when water is wanted from the well.

Claim.—The combination of the funnel, conductor, pipe, hinge, guide, and spring, all arranged as described, and for the use specified.

83,888.—JOHN TAGGART, Boston, Mass.—*Machine for Splitting Leather.*—November 10, 1868.

Claim.—1. The combination of a set of feeding rollers, (provided with mechanism for operating them,) a series of rotary cutters, B, carrying frame, D, therefor, and mechanism for revolving such cutters, and imparting to the carrying frame a reciprocating rectilinear movement in order to cause such cutters to cut a sheet of leather into separate pieces or sheets, when it is forced against them by the action of the feeding rollers.

2. In such a combination, the employment or combination of a mechanism with the cutters, such as will cause those of them on one side of the medial vertical line of their sustaining frame to revolve in directions opposite to those in which the remainder of such cutters are made to revolve, the same being for the purpose of stretching the leather in opposite ways while the cutters may be in action on it to cut it.

3. The combination and arrangement of sharpening devices, *s s t*, or mechanism, with the feed rollers, and the series of rotary knives or cutters, their supporting carriage or frame, and mechanism for operating it and them, so as to cause them to revolve, and at the same time to move together back and forth in a manner to separate, when presented to them, a sheet of leather into two sheets, as described, the said sharpening devices or mechanism being made to effect the sharpening of the cutters while they may be in action, as stated.

4. In combination with the feed rollers, a series of rotary cutters, and their carrying frame or carriage, as explained, devices for moving such frame toward the feed rollers, from time to time, as the wear of the cutters may require.

5. In combination with the feed rollers, a series of rotary cutters and their carrying frame or carriage, as explained, the series of tapering deflectors, *i*, arranged with the cutters and their shafts, as set forth.

6. The arrangement and combination of the steadying and guide plate F, with the feed rollers, and series of rotary cutters, provided with mechanism for operating them, as described.

83,889.—O. H. TAYLOR, Brooklyn, N. Y., assignor to himself, JOHN A. PARKS, and DARIUS ALLEN, same place.—*Apparatus and Process for Roasting Coffee.*—November 10, 1868.—The coffee rests over a steam chamber, in which is placed a coiled pipe through which air is forced and escapes at the center into and through the coffee. A safety valve allows superabundant vapors to escape into a condenser, from whence they are carried to a receiver,

whence the air passes off, and the condensed vapor is sprinkled over the mass of burnt coffee.

Claim.—1. The hot air pipe B, located in the steam chamber D, in connection with the coffee chamber A, substantially as shown and described, and for the purpose set forth.

2. The coffee chamber A, provided with a discharge or escape pipe, W, in which is a safety valve, H, the condensing pipe I, and condenser O, in connection with the receiver P, for the purpose herein set forth, and substantially as described.

3. Roasting coffee, in the manner substantially as herein described, and for the purposes set forth.

83,890.—JOHN S. THOMPSON and KELLY GIRVIN, Brooklyn, N. Y.—*Machine for Sizing Yarn.*—November 10, 1868; antedated October 22, 1868.—The machine is moved over the yarn when stretched in the hand spinner's walk, the lower roller being forced against the upper one by a spring. A brush at the end of the box removes the surplus size from the yarn.

Claim.—The combination of rollers B and C, wedges *c*, spring D, brush E, and box A, provided with handles F, or their equivalents, when constructed arranged and operating substantially as and for the purpose set forth.

83,891.—ROBERT F. TOMPKINS and HUGH T. WILLIAMS, New York, N. Y.—*Mitering Machine.*—November 10, 1868.—Designed as an improvement on ROBERT F. TOMPKINS'S patent of October 1, 1867.

Claim.—1. The knives or cutters N, arranged in pairs, each pair fitted on a vertical shaft, D, in such manner that they may turn, rise, and fall thereon, as described, and for the purposes herein set forth.

2. The guides M, attached to the arm K and knives N, so as to move in connection with the knives, as described, and for the purpose desired.

83,892.—CHARLES N. TYLER and AUGUSTA C. TYLER, Buffalo, N. Y.—*Crimping Pin.*—November 10, 1868.—The double tongue is secured in the object in which it is inserted by a slide.

Claim.—1. In combination with a hair pin, H, formed with a loop at its head, the double tongue *b*, substantially as described, and for purposes set forth.

2. In combination therewith, the clasp or slide 'a', substantially as described, and for the purposes set forth.

3. The double tongue *b*, formed with the clasp or slide 'a', substantially as described, and for the purposes set forth.

83,893.—S. W. H. WARD, New York, N. Y.—*Coating and Water-proofing Collars, Cuffs, and other Articles of Wearing Apparel.*—November 10, 1868.—The articles are coated with a composition of glue dissolved in milk and mixed with any pure white pigment.

Claim.—The described means of rendering collars, bosoms, cuffs, and other articles of wearing apparel composed of paper, or compounded of cloth and paper, water-proof.

83,894.—FREDERICK WILLIG, Joliet, Ill.—*Tenter Bar for Cloth.*—November 10, 1868.—The cloth is secured by hooks to a stationary strip on the end of the frame and to a movable strip on the other end, which latter connects with a pawl and ratchet attachment, by which the cloth is stretched longitudinally. It is then fastened to hooks on the side bar, and stretched in the same manner.

Claim.—The combination of the movable horizontal bars *a*, pawls *n*, ratchets *m*, pulleys *e*, and weights *d*, with cords attached, as described, perpendicular bars *f* and *g*, and windlass *i*, as described, constructed and arranged as and for the purposes set forth.

83,895.—JOHN B. WOOD, Jersey City, N. J., and JOHN T. CHAPMAN, Brooklyn, N. Y.—*Mode of Filling Marshes.*—November 10, 1868.—A flexible track supported by adjustable caps on the top of the piles, allows the track to be shifted for convenience in filling up the marsh.

Claim.—The removable and adjustable caps B, secured to piles A, in combination with the adjustable flexible track C, all constructed and arranged to

operate in the manner substantially as and for the purpose herein set forth.

83,896.—WILLIAM S. WOOTON, Richmond, Ind.—*School Desk.*—November 10, 1868.

Claim.—1. A combined school desk and seat, when the seat and desk are made to turn on separate pivots, and are so connected together that, by raising the seat, the upper angle of the desk is made to fold into the angle of the seat, in the manner and for the purposes substantially as herein shown and described.

2. The combination of desk B, seat C, and the devices connecting them together, with the standards A and brace D, when said parts are constructed and arranged to operate in the manner substantially as herein set forth and shown.

83,897.—WILLIAM ZIMMERMAN, Quincy, Ill.—*Hammer.*—November 10, 1868.—Holes are made in the front and side of the hammer to insert the heads of nails, when they are to be driven in places higher than can be reached by hand. The various tools fit in a slit in the end of the handle and are held by a ring fitting over the tapering end of said handle.

Claim.—The above-described hammer or instrument, when adapted to the different uses and purposes described, and constructed to operate in the manner substantially as set forth.

83,898.—T. W. AKIN, Patterson, N. Y.—*Milk Can.*—November 10, 1868.

Claim.—The bottom B, having a downward-projecting flange, when secured upon the inside of the milk can, above its lower edge, by the rivets *a*, the portion below said flange being strengthened by the interior ring riveted to the body of the can, as herein described, for the purpose specified.

83,899.—JAMES ALLISON, Cincinnati, Ohio.—*Hydrant.*—November 10, 1868.—The lower portion of the discharge pipe carries a flexible valve on its end and has lateral openings to permit the ascent of water. Two packing rings have a waste opening between them which is coincident with an opening in the external pipe when the inlet valve is closed.

Claim.—The hollow perforated pipe H, provided with the elastic disk I, waste passage *d*, and elastic packing rings *e e'*, arranged to operate in connection with the cylinder F, having the waste passage *d*, as herein described, for the purpose specified.

83,900.—JOSEPH F. APPLGATE, New Albany, Ind.—*Wagon.*—November 10, 1868.—When the spring bolts are withdrawn from the perch pole, and the back wheels moved forward until the rollers supporting the bed are beneath the yoke on the coupling rod, the bed can be tilted and the load discharged.

Claim.—1. The arrangement of the coupling rod F, made in two pieces, connected by a screw swivel, *h*, and attached at the front end, either to the sand board or to the king bolt, and at the rear end provided with a yoke, *g*, which moves freely around the roller or shaft *f*, in boxes *i i*, on the inner sides of the two middle rails of the frame A, as and for the purposes herein set forth.

2. The tail gate G, provided with a strap, *k*, across its upper end, and with slides H H, extending below the wagon, which work on pieces I I, on the inner side of the frame A, substantially as and for the purposes herein set forth.

3. The arrangement of the spring bolts *e e'*, in combination with the perch pole C, sheath D, and hounds E E, all constructed and operating substantially as and for the purposes herein set forth.

83,901.—JOHN S. ARMSTRONG, Delaware, Ohio.—*Drive Well.*—November 10, 1868.—The well tube does not rotate while being forced down.

Claim.—The point C, having helical threads or feathers *b*, and fitted to rotate independently on the perforated end of the tube A, substantially as described, and for the purpose set forth.

83,902.—E. H. ASHCROFT, Boston, Mass.—*Globe Valve for Steam and other Machinery.*—November 10, 1868.—The end of the valve in which

tubing is inserted is bushed with composition to prevent said end from being split by the fitter in connecting the pipes.

Claim.—The construction of the bodies of globe, angle, check, and other valves, with bushing made of the ordinary composition of tin and copper, in their ends, substantially as herein described.

83,903.—LEONARD ATWOOD, Norwich, Conn.—*Valve for Steam Engine.*—November 10, 1868.—The under side of the steam valve is cut away between its two parts, so that the steam in the steam chest will act upon the under side of said valve to counterbalance the downward pressure on its upper surface.

Claim.—1. Intermediate valves, between the steam chest and cylinder, to reverse the action of the engine, by changing the course of the steam after it has passed the main or induction and eduction valve, substantially as described.

2. The tumblers C and C', in combination with the steam passages *e, e', f, and f'*, substantially as and for the purpose described.

3. The steam counterbalanced valve V, constructed as described, when arranged and operating in relation to plate D, substantially as described.

83,904.—GUSTAV BERNARD BACHMANN, Brooklyn, E. D., N. Y.—*Bottle-filling Apparatus.*—November 10, 1868.—The bottle is supported by its neck engaging with a bracket on the side of the receptacle, and its body resting on the long leg of a siphon which is hinged to the side of the receptacle and weighted to cause its short arm to come in contact with a seat, and prevent the flow of liquid when the bottle is removed.

Claim.—1. The arrangement of one or more hinged siphons, B, loaded by weight C, in combination with the brackets E and reservoir A, substantially as and for the purpose described.

2. The seats D, in combination with the hinged siphons B B, and reservoir A, substantially as and for the purpose set forth.

83,905.—ELIAS BARTO, Tiffin, Ohio.—*Machine for Marking and Covering Corn.*—November 10, 1868.—Arms, provided with adjustable spades on one side and shovels on the other side, are placed on the outer ends of the axle and can be taken off and reversed.

Claim.—The reversible and adjustable arms C C, provided on one side with blocks D and shovel E, and on the other with cross bar L, on which are the adjustable blocks M M and spades N N, all constructed and operating substantially as and for the purposes herein set forth.

83,906.—WILLIAM BISBEE and FLEMING G. HEARN, Yreka, Cal.—*Self-adjusting Hook.*—November 10, 1868.—Improvement on his patent of December 31, 1867. A notch on the inner side of the head of the hook receives the staple in which the hook engages, and by moving the hook forward the staple is released from the notch.

Claim.—Forming a notch *b'*, upon the inner side of the head or heads of the hook B, substantially as herein shown and described, and for the purpose set forth.

83,907.—TIMOTHY B. BLACKSTONE, Chicago, Ill.—*Car Coupling.*—November 10, 1868.—The hollow buffers are provided with right and left hand screws for adjusting the distance between the ears. Beams applied to the end of the platforms to hold the latter on the same level and strengthen them.

Claim.—1. The hollow buffer E, constructed as described, in combination with the draw head F and heel G, connected by the right and left screw J, or other suitable device for drawing the head F back, substantially as specified.

2. The combination and arrangement of the hollow buffer E, the movably-connected draw head F, and heel G, with the springs H and H', substantially as specified.

3. The combination and arrangement of the beams D, applied to the platform or end of a car, with any suitable close-drawn coupling, substantially as and for the purposes specified.

83,908.—C. W. BOND, Biddeford, Me., assignor to himself and JOHN A. GOULD, same place.—*Bill File.*—November 10 1868.—The cards are numbered and lettered for indexes, and are designed to hold bills alphabetically arranged between the cards.

Claim.—The arrangement of the separate cards A, covers B, and elastic straps *a*, in the manner described, substantially as and for the purpose specified.

83,909.—ANTOINE BONNAZ, Paris, France, assignor to EMILE CORNELLY, same place.—*Sewing Machine for Embroidering.*—November 10, 1868.—Designed to obviate the necessity of constantly turning the entire cloth in embroidering rounds or other intricate designs, by means of a universal feed motion which causes the cloth to move in any direction desired, the hooks or needles moving with the said feed motion so as not to change their relative position.

Claim.—1. The combination of a hook or needle with an oscillating looper B, and the universal-jointed feed bar *e*, when said three elements are connected to each other by a mechanism, substantially as described, which permits of turning one or the other of said devices, without changing the relative positions of said parts to each other, for the purposes described.

2. The universal-jointed feed bar O², in combination with the collar *n*, sleeve R, and the operating parts which constitute the universal feed motion above described, constructed and arranged substantially as and for the purposes set forth.

3. The combination and arrangement of parts, by which the needle-bar carrier G is connected with the feed bar O², the looper B, and the crank S, for imparting the movements to the several parts of the machine.

4. The coupling and uncoupling device, substantially as herein described, for the purpose of disconnecting the parts and suddenly changing the feed, when used in combination with an embroidery machine, as described.

83,910.—ANTOINE BONNAZ, Paris, France, assignor to EMILE CORNELLY, same place.—*Sewing Machine for Embroidering.*—November 10, 1868.—A universal feed motion causes the cloth to move in any direction desired, and connected with this motion, the hooks or needles, which make the stitch, move, so as not to change their relative positions, and thus the most intricate embroidery can be made at any speed desired without turning the cloth.

Claim.—1. The needle-bar carrier G, the universal-jointed feed bar O², as herein shown and described, and the horizontal looper shaft B, connected by means of the gearings Z Y, shaft W, gearing V U, shaft *z*, gearings *y x*, shaft N, and endless screws *l k*, substantially in the manner and for the purposes described.

2. The mechanism herein described, for connecting the shafts E D, consisting substantially of disk F, cam-grooved disk K', lever G', spring pawl F, rod D', and lever B', substantially as and for the purposes described.

83,911.—LOUIS W. BOSART, St. Marie, Ill.—*Portable Fence.*—November 10, 1868.—Wedges are driven through mortises in the post, and with the spaces between the rails of the panels between battens on their ends.

Claim.—The combination of the post B', panels A, and wedges or keys F, substantially as shown and described.

83,912.—JAMES HENRY BRADFORD, Westborough, Mass.—*Stencil Plate for Numbering Barrels, &c.*—November 10, 1868.—A series of sectoral plates are pivoted to a common center pin, the upper one being provided with holes and the others with the nine digits at the curved outer end.

Claim.—The combination of two or more concentric curves of the nine digits, for marking numbers in horizontal or other right lines, substantially as described.

83,913.—B. H. BRADLEY, Waterbury, Conn.—*Picture Nail.*—November 10, 1868.—The outer end of the nail is bent at right angles to form a hook on which the socket of the head slips.

Claim.—A picture nail, having formed upon its end the hook C, and combined with the head D, constructed so as to be attached to the end, B, of the hook, substantially in the manner herein set forth.

83,914.—CHARLES C. BRADLEY, Brodhead, Wis.—*Draught Equalizer for Wagons.*—November 10, 1868.—Designed for three animals harnessed abreast.

Claim.—The combination and arrangement of the power equalizer, consisting of the duplicate poles, and the two whiffletrees, and two neck yokes, each with a long and a short arm, and the pulleys attached to the whiffletrees and poles, for the purposes herein set forth, or substantially the same.

83,915.—JAMES BRAMBLE and ALBERT H. NIRDLINGER, Fort Wayne, Ind.—*Ticket Holder.*—November 10, 1868.—A metallic plate is formed with its edges turned over on three sides for holding a ticket, and having at the back a pointed spiral spring for fastening it to the dress.

Claim.—The ticket holder as constructed of a single metallic plate, provided with a fastening device, C, the edges of the said plate being bent over on three sides to form grooves *a*, adapted to receive the ticket, and the upper edge of the plate being cut out at *d d*, leaving a central tongue, *e*, which is bent over, substantially as herein shown and described, for the purpose specified.

83,916.—H. G. BROOKS, New York, N. Y.—*Steam Generator.*—November 10, 1868.

Claim.—1. A boiler, in which the ends of the inner sheets of the laps or seams are prolonged beyond the fastening rivets, and chamfered or beveled, in the manner and for the purposes set forth.

2. The offset, flanged outwardly, in the manner described, on the end of the forward course of the cylinder portion of the boiler, in combination with the smoke arch or box, substantially as and for the purposes set forth.

83,917.—CHARLES BROWN, Adrian, Mich., assignor to himself and AARON G. SALMON, same place.—*Carriage.*—November 10, 1868.—Two side straps are connected near their upper ends with the corner irons of the stake and bolster by horizontal portions of metal cast in one piece.

Claim.—The use and manufacture of the side straps A and C, combined with the corner iron B by means of the portions *a* and *b*, substantially as set forth and described.

83,918.—C. D. BROWN, Bainbridge, N. Y.—*Machine for Dressing Hop Poles.*—November 10, 1868.—The first tapering or sharpening cutter wheel has two ordinary and two beveled arms; the middle one has four cutter-bearing arms, the bevel of each being in an opposite direction from the adjacent ones, and the third has two beveled and two plain arms.

Claim.—The construction of the three wheels A, B, and C, and their combination with and arrangement on the shaft E, substantially as herein shown and described.

83,919.—WALTER BUCHANAN, JR., Main Prairie, Cal.—*Fastening Horse Powers to the Ground.*—November 10, 1868.—Iron straps, on the under side of the beams, on each side of the machine, are bent at their ends to hook into the turned-up ends of an iron strap fixed on the bottom of the frame, which is cut away at the other side to rest on a beam, from the center of which rises a link keyed to the cross beam.

Claim.—The straps C and *bb*, and the beams D D and G, together with the links *g g* and *m*, with their keys, the whole constructed and operating substantially as and for the purpose herein described.

83,920.—WILLIAM S. BULLOCK and HUGH HANIGAN, Wilmington, Del.—*Dumping Wagon.*—November 10, 1868.—A heavy spring attached to the frame supporting the body curves outward toward the rear of the cart, and is fastened to the hind axle over which the load is dumped when the body tilts.

Claim.—The combination of the curved springs *s*, bed frame *a*, applied and operating in connection with the hind axle *d*, and body *m*, as herein shown and described, for the purposes specified.

83,921.—E. S. BURNS, La Crosse, Wis.—*Tatting Shuttle Winder*.—November 10, 1868.—The driving wheel is connected with a pulley to which is attached a disk, on the opposite side of which latter is a light wire staple and a wire hook placed at the opposite ends of a diagonal line, so made as to project only far enough from its face to receive and hold the ends of one side of a shuttle.

Claim.—A machine for filing tatting shuttles, consisting of the rotating disk F, operated by the wheel C, and having the stationary loop e, and the pivoted loop or hook d, arranged thereon, all substantially as shown and described.

83,922.—EDWARD E. BURROUGH, Baltimore, Md.—*Apparatus for Making Extracts and Essences*.—November 10, 1868.—The apparatus consists of a stove, coiled water pipe, reservoir, heater, retort, and condenser, provided with supply and exhaust cocks, so that by means of plates and flanges the hot water may be applied to the bottom and walls of the vessel containing the materials for the extracts.

Claim.—1. The vessel D, constructed with the coneave bottom d, plug d', flanges e e' e, and cocks J K, all arranged to operate in the manner and for the purpose set forth.

2. The arrangement of said vessel with the vessels I and B, substantially as described.

3. The arrangement of said vessels D I B with the casing G, substantially as described.

4. The arrangement of the vessels D I B with the pipe E, substantially as described.

5. The arrangement of said vessels D I B and pipe E with the reservoir F and pipe f, substantially as described.

The arrangement of stove A, pipe E, vessels F G B I D, cocks J K L, plug d', and flanges e' e, substantially as described and for the purposes specified.

83,923.—W. W. BURSON, Rockford, Ill.—*Automatic Gate*.—November 10, 1868; antedated October 31, 1868.—So constructed as to enable the gate to be opened and closed by a person on horseback or in a carriage, without dismounting.

Claim.—1. The combination and arrangement of levers F F', pendants H H', connecting pieces I I', arm K, and ways D D', when the whole are constructed and operated substantially as and for the purpose set forth.

2. Constructing the way D or D' with suitable curve to overcome the gravity of swinging arm K, substantially as specified.

3. The combination and arrangement of the pendants H H', wire m, and posts E E', operating substantially as and for the purpose set forth.

83,924.—S. G. CABELL, Quincy, Ill., assignor to FLORA B. CABELL, same place.—*Fluting Machine*.—November 10, 1868.—Relates to an arrangement of devices for supporting and adjusting the fluted hollow cylinders, the mode of covering their front ends, and providing flutes of a peculiar shape.

Claim.—1. The cap plate F, when constructed and arranged substantially as herein described, for the purpose of furnishing a support and bearing for the cylinders I, as set forth.

2. The combination of the lever C, bolt D, cross bar E, frame G, and cap plate F, when constructed and arranged to operate substantially as described and for the purpose set forth.

3. The cap L and bolt g when constructed and arranged to operate substantially as herein described and for the purpose set forth.

4. In combination with the cylinder H the cap M, on the end of the crank N, constructed substantially as herein described and for the purpose set forth.

5. In combination with the cylinders I the covers O and thimbles P, when constructed and arranged substantially as described and for the purpose set forth.

6. The fluting rolls for fluting machines, constructed with ogee fluting, of the form herein described, and shown in Figs. 4 and 5.

83,925.—M. S. CAHILL, Boston, Mass.—*Bronze Dressing for Leather*.—November 10, 1868.

Claim.—A bronze dressing for leather, composed

of spirit varnish and aniline fushine, substantially as herein set forth, either with or without the addition of aniline blue or bronzed powder, all as described, as a new article of manufacture.

83,926.—STEPHEN Q. CAREY, Waxahatchie, Texas.—*Hay and Cotton Press*.—November 10, 1868.—The ends of the cord are fastened to tapering spirally-grooved pulleys on the ends of a shaft having at its middle a large pulley connected by a cord to a capstan.

Claim.—The arrangement, herein described, of the shaft J, pulleys I I', cord G, pulleys H H', platen P, press box B, capstan L, cord or chain N, and large flanged pulley K, all constructed and operating substantially as set forth.

83,927.—H. F. CARY, Boston, Mass.—*Machine for Applying Reinforcing Patches to Button-holes of Collars*.—November 10, 1868.

Claim.—1. The process herein described, of applying to paper, before or after its conversion into collars, reinforcing button-hole patches, automatically cut from gummed strips, continuously moistened in their passage through the machine, substantially as described.

2. In a machine for applying strengthening patches to button-holes of collars, a trough and guides, for moistening the cement-applied surface of the ribbon.

83,928.—CHANDLER P. CHAPMAN, Madison, Wis.—*Wind Wheel*.—November 10, 1868.—Two steering vanes present surfaces of different area, turning loosely on axles arranged at right angles with each other, and so joined that when one is vertical, the other is horizontal, and connected and operated by a governor, by which the feathering of either, throwing the wheel to or from the wind, will regulate its power.

Claim.—The combination of the pivoted main vane F, connected to the governor by the rod a, with the pivoted auxiliary vane G, connected by rod d to the vane F, for the purpose of changing the position of the wheel to the wind, substantially as described.

83,929.—E. M. CHUMARD, Pittston, Pa.—*Brake for Vehicles*.—November 10, 1868.—The brake bar is secured to the hounds of the vehicle, and the brake blocks are operated by a lever attached to a crank shaft connected to the blocks at each end by short rods and arms. The brake blocks are retracted by means of a coiled spring on the crank shaft.

Claim.—The arrangement of the crank shaft D, rods g g, arms x x, slotted guides m, loops h h, and brake blocks I, with the brake bar C, and operated by the lever K and spring l, all constructed substantially as set forth.

83,930.—GILBERT H. CLEMENS, New York, N. Y.—*Elastic Calk for Boots and Shoes*.—November 10, 1868.

Claim.—1. A rubber heel calk, molded or made to fit on to a boot or shoe heel, in combination with the metallic disks C in the bottom of the same, all as and for the purpose specified.

2. A rubber heel calk, molded or made to fit on to a boot or shoe heel, in combination with a band or bands, strap or straps, to pass around the instep of the boot or shoe, for the purpose of holding the heel calk on the heel of the same, all as shown and described, and for the purpose set forth.

3. A rubber heel calk, molded or made to fit on to a boot or shoe heel, the bottom of which is made with a series of corrugations, constructed substantially as shown and described, and for the purpose specified.

4. The combination of a rubber heel calk, made to fit on the heel of a boot or shoe, with the strap or straps to hold it thereon, the metallic disk C, and the corrugations on the bottom of the calk, all substantially as shown and described, and for the purpose specified.

83,931.—LEANDER CLIFTON, Barry, Ill.—*Cultivator*.—November 10, 1868.—A safety spring clevis, which acts automatically, is formed on the forward

part of the body. The handles may be adjusted to suit persons of different height and size.

Claim.—1. The safety detaching device for a cultivator plow, consisting of the curved piece B and spring piece H, substantially as and for the purposes described.

2. The cultivator, constructed of the iron bow A A', curved piece B, spring piece H, ring I, pieces F F', standards C C', having bent and slotted ends *a a'*, rod D, nuts *b c*, brace K, and plows G G', all combined, arranged, and operating as and for the purposes described.

83,932.—A. E. COLMAN, New York, N. Y.—*Scrubbing Brush.*—November 10, 1868.—The brush is made of rows of bristles and strips of India-rubber or gutta pereha, alternating with each other, the strips being attached by glue to strips of wood in the bottom slab of the brush.

Claim.—As a new article of manufacture, the brush, made up of bristles and rubber, substantially as herein recited, and for the purposes set forth.

83,933.—EDWARD COOGAN and HOWARD MILLER, Washington, D. C.—*Tip for Chair Leg.*—November 10, 1868.—A tip of glass or polished steel is secured in a concavity in the leg, and fastened thereto by a shank passing through the eye of a bolt, and also entering a recess made in the leg. The shank also passes through a piece of rubber or other elastic material between the lower concave surface of the leg and upper convex surface of the tip.

Claim.—1. A tip for chairs and other articles of furniture, constructed substantially as shown and described.

2. The combination of the tips B, the elastic dividing plate F, and the leg or post A, substantially as and for the purpose shown and described.

3. The within-described method of securing the tips to the legs or posts of furniture, it being by means of the shank D, and recess or chamber E, and a suitable cement.

83,934.—WARREN COOK, Arsenal, Pa.—*Rolling Pin.*—November 10, 1868.—The hollow part of the roller may be filled with flour and covered with a perforated cap and without the handle at that end it becomes a dredging box, and by removal of the handle at the other end a potato masher.

Claim.—The kitchen utensil, consisting of the cylinder A, having a cavity, B, the removable perforated cap *a*, and the detachable handles C D, provided respectively with bands *b d*, substantially as herein set forth and shown, for the purposes specified.

83,935.—PH. COURVOISIER, Paris, France.—*Fastener for Gloves.*—November 10, 1868.—A cap provided with a series of points has inside a bolt which catches in the neck of a button, also having points. The button moves in a slot, and is subjected to the action of a spring so as to fasten or release the cap.

Claim.—The cap A, provided with points *a*, and containing the spring bolt *b*, in combination with the button B, provided with points *c*, and with a neck *f*, substantially as and for the purpose described.

83,936.—MARK CROSBY, Boston, Mass.—*Parlor Bedstead.*—November 10, 1868.—The sides and ends of the bedstead when closed form the ends and top of a case resembling a commode.

Claim.—1. In combination with the side pieces A and B, the hinged pieces F F', when attached to the front part K, in such a manner as, when closed, to form a finish around the corner and across the side piece A, and underneath the projecting end of the top D, substantially in the manner shown and described, as and for the purposes set forth.

2. The combination with the base G, the end pieces A and B, having their ends rounded off so as to allow them to turn down into the base G, when closed, and when open to form a continuous side piece at the bottom, without the addition of intermediate pieces, substantially in the manner described, as and for the purposes set forth.

83,937.—SAMUEL L. DENNEY, Christiana, and JOHN N. CHALFANT, Chester County, Pa.—*Horse*

Rake.—November 10, 1868.—A rod, connecting with a lever pivoted to the axle, slides in an arm which is also secured to the axle and is made to engage with serrations on a circular rim which is secured to the rake wheel, thus causing the rake teeth to be raised and discharge the hay. A curved stand causes the rod to be disengaged from the wheel when the said arm has been carried forward far enough to discharge the hay.

Claim.—1. The lever D, rod E, arm F, spring G, and curved stand H, when arranged to operate in the manner and for the purpose described.

2. The combination of the serrated rim I, rod E, lever D, arm F, spring G, and curved stand H, when operating in the manner and for the purpose set forth.

3. The combined tooth guard, guide, and pressure bearer, when constructed as here shown and described.

83,938.—J. B. DRAKE and WILLIAM H. HUTTON, Montoursville, Pa., assignors to themselves and J. SILL, same place.—*Derrick.*—November 10, 1868.—A supplemental rope secured to the main rope and to the inner end of the arm causes said arm to be raised, and is rotated by means of a spiral rod on the part over which it passes.

Claim.—1. The guide E, in combination with the arm D and the hoisting device, when operating substantially as set forth.

2. The combination of the rope J, having the two parts *j j'*, with the crane D, when operating substantially as described.

3. The arrangement of the sled-shaped base A with the above-described derrick, substantially as and for the purpose set forth.

4. The combination and arrangement of the sled A, mast C, crane D, rope J, *j j'*, guide F, pulleys G H I, and braces *c c c*, substantially as shown and described.

83,939.—THOMAS R. DRUMMOND, Hartford, Conn.—*Machine for Cutting Slate.*—November 10, 1868.—A cushion within the box knife, pressed downward by springs below the knife, first comes in contact with the slate on the cushioned bed and rises as the knife descends, allowing the slate to be adjusted between the beds so as not to be broken.

Claim.—1. A box knife, or a box with any number of knives attached, whereby a slate may be cut at one blow or descent of such knife or knives, substantially as herein described.

2. The elastic cushion K, pressed upon by either a weight or by springs, arranged substantially as and for the purposes set forth.

3. The elastic cushioned bed C, in combination with the shell *a*, arranged and operating substantially as and for the purpose specified.

4. The arrangement of the cutter box with two or more knives combined, so that a piece of slate may be cut at one blow, and either with or without punches at the corners.

83,940.—FREDERICK B. DUNTON, Center Lincolnville, Me.—*Reefing and Furling Sails.*—November 10, 1868.—The sail may be furled or reefed from the deck.

Claim.—The arrangement of the setting ropes *i*, the center reefing brails, having reefing loops *l*, and passing through the eyelets *m n o*, the swiveled brailing rod, and the outer furling brails passing through the eyelets *j*, with reference to the sail A, yards B C, and jack stays *d e*, the hauling parts of each gear being united in sets, and arranged upon different sides of the mast, whereby the sail may be spread, furled, or reefed by hauling on any one set, as herein shown and described.

83,941.—ALFRED DUVAL, Baltimore, Md.—*Rotary Steam Engine.*—November 10, 1868.—Oil chambers are formed within the material composing the outer walls of the piston at its greatest diameter, rendering said walls elastic, so as to be forced in contact with the cylinder by means of set screws and springs. The end packing is adjusted by means of a spring and set screws bearing against the packing rings.

Claim.—1. An elliptical piston, constructed with

elastic or yielding surfaces upon its points of greatest diameter, substantially as shown and described.

2. The chambers D D, formed within the piston, substantially as shown and described.

3. The combination of the elliptical piston B, the chambers D D, and the set screw H, bars G, and springs F, substantially as shown and described.

4. The arrangement of the packing rings K and I, rubber or elastic packing J, spring L, and set screw M, substantially as shown and described.

83,942.—JAMES B. EADS, St. Louis, Mo.—*Bridge*.—November 10, 1868.

Claim.—The levers D, forming a compensating expansion joint, with the horizontal members C, for the purpose of preventing the horizontal movement of the arch under the effect of a moving load on the bridge, when constructed and arranged as herein described.

83,943.—ALFRED EDMISTER, Westfield, Ohio.—*Corn Planter and Cultivator*.—November 10, 1868.

—The plows are held in any position by means of one of the bars, from which the plows are suspended, resting in notches on a plate, which is pivoted to the frame.

Claim.—1. The combination and arrangement of the plows P and T, draught rods R V, and rods or bars Q U W S, with each other and with the frame A, to enable the machine to be conveniently adjusted for use as a planter or cultivator, substantially as herein shown and described, and for the purpose set forth.

2. The combination and arrangement of the seed box N, guard plate O, gauge wheel L, tube and valve plate k, disk J, vertical shaft H, operated from the axle B by means of the bevel-gear wheels F and G, and the conductor or spout M, with each other, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the pivoted notched bars Y, connecting rod Z and lever or handle X, with the bars or rods U Q W, from which the plows P and T are suspended, substantially as herein shown and described, and for the purpose set forth.

83,944.—WILLIAM H. EDWARDS, Moline, Ill.—*Joint and Coupling for Cultivators*.—November 10, 1868.

—The shovel beams are provided with a coupling and joint, which permit them to move horizontally or vertically, so as to cultivate rows either shallow or deep, and of different widths.

Claim.—1. The joint and coupling for cultivators, consisting of the side plates G, the clasping plates g, and vertical rod H, all constructed and arranged substantially as herein described, and for the purpose set forth.

2. The method of connecting the vertical rod H to the frame of the cultivator by means of the eye bolt I and plate J, or their equivalents, substantially as herein described, for vertically and laterally adjusting the shovel beams, as set forth.

83,945.—JOHN ELBERTSON, Kirksville, Mo., assignor to himself and JESSE L. CONNOR, same place.—*Car Coupling*.—November 10, 1868.

—Sliding bars are made to disconnect the cars, in case the latter run off the track, by pressing against each other, so as to crowd the levers backward, and thereby release the hook from the link. The cars are coupled by adjusting the respective bumpers to each other by means of a lever, which raises a hook that drops into the connecting link.

Claim.—1. The sliding bars P, with their springs r and pins s, in combination with the spring G, lever K and its attachments, herein described and shown, substantially as and for the purposes specified.

2. In combination with a bumper, having springs E attached thereto, as described, the plate D, lever F, guide c, bar H, springs h, and link n, constructed and arranged substantially as specified.

3. The lever L, with its ratchet and pawl, as described, bar m, and link n, when constructed, arranged and operating substantially as and for the purposes herein set forth.

83,946.—STEPHEN A. EMERY, Boston, Mass.—*Arithmetical Game*.—November 10, 1868.—Each

player commences with a capital of 12. The balls are shot by means of a cue, and on striking the index of a subtraction, multiplication, or division circle it is thrown around to a number which is to be subtracted from, multiplied, or divided by a previous number remaining.

Claim.—The arrangement and construction, and mode of operation, as above described, by which instruction in the science of arithmetic is secured, in combination with an entertaining amusement.

83,947.—DANIEL FASIG, Rowsburg, Ohio.—*Lifting Jack and Cant Hook*.—November 10, 1868.

—A hook, formed at the base of the front of the standard, is used for canting timber.

Claim.—The combination of the hook G, on the lower part of the forward edge or side of the standard B, with the slotted, adjustable lever C, substantially as herein shown and described, and for the purpose set forth.

83,948.—MICHAEL FLERSCHEIM, New York, N. Y., assignor to HENRY WHITTEMORE, Passaic, N. J.—*Fabric for Floor Covering, Wainscoting, &c.*

—November 10, 1868.—Narrow strips of different kinds of wood are glued upon cloth. After the glue is dry the surface of the wood is planed down and finished.

Claim.—As a new article of manufacture, the herein-described portable wainscoting or floor covering, composed of narrow strips of wood, secured upon cloth or its equivalent, as described.

83,949.—DUNCAN FORBES, Chicago, Ill.—*Folding Lounge*.—November 10, 1868.

—A two-part bolster is attached at the foot of a folding lounge and arranged to be folded between the mattresses when the lounge is closed.

Claim.—The combination of the two-part bolster D D, body H, and folding part A, the whole being arranged substantially as and for the purpose set forth.

83,950.—H. W. FULLER, Brooklyn, N. Y.—*Tuck Creaser for Sewing Machines*.—November 10, 1868; antedated May 11, 1868.

—As a modification of the lever and base plate, formed of one piece, the lever is formed of wire, and at its point of attachment with the base plate is formed into a horizontal scroll spring, which is supported by a bolster on the base plate, to the front end of which latter a tongue plate is secured, on which the nipper points play. A scale is marked on the base plate to expedite the measurement for the width of the tuck.

Claim.—1. The lever which carries the nipping points, the spring, and the base plate, all formed of or from the same piece of metal, substantially as described.

2. The adjustable tongue plate and tongue, combined with its supporting plate, as specified.

3. The combination, with the base plate and supporting bolster, of the scroll spring, constructed as described, and for the purpose set forth.

4. The combination, with the adjustable tongue plate and tongue, of the graduated scale, whether on the cloth smoother or the base plate.

5. The combination, with the adjustable tongue plate and tongue and the graduated scale, of the nipping points D D'.

6. The gauge G, in combination with the clamping block and the tucker proper, constructed substantially as described, and all separately adjustable with respect to the needle of the sewing machine, and for the purposes set forth.

83,951.—JOHN GARSEED and CLAYTON DENN, Frankford, Pa., assignors to JOHN GARSEED.—*Machine for Packing Tea, Coffee, &c.*

—November 10, 1868.—The substance to be packed is weighed and put into a box, to which a paper bag is attached, and which is placed in another box, and the treadle being forced down causes the plunger to turn directly over the box, and to descend and pack the article. The fork then forces up the inner box, feed from the bag, and contents, which are left in the outer box, after which the plunger is raised and swung round, and the inner box removed, and then, after further packing, folding, and sealing, the

package is left on the fixed bottom, ready for removal.

Claim.—1. The plunger N, attached to or connected with a rising and falling shaft, I, placed within a tube, J, connected with a treadle, G, and arranged substantially as shown, so that the plunger will have a rising-and-falling and also a turning movement communicated to it, for the purpose herein set forth.

2. The rising and falling box B, with the fixed bottom plate F, in combination with the plunger N, all arranged to operate substantially in the manner as and for the purpose specified.

3. The box P, in combination with the fork Q, rising-and-falling box B, and plunger N, all arranged substantially in the manner as and for the purpose set forth.

83,952.—J. C. GASTON, Cincinnati, Ohio.—*Beehive*.—November 10, 1868.—A vertical passage surrounded by a water receptacle has, at right angles at its lower end, a wire-gauze passage, extending out from the body of the hive.

Claim.—In combination with a beehive, the angular passage way *a d*, and receptacle *c*, arranged and used in the manner described.

83,953.—JOSEPH GECMEN, Chicago, Ill., assignor to himself and LEOPOLD J. KADISH, same place.—*Beer Cooler*.—November 10, 1868.—A trough, extending across one end of the apparatus, is divided lengthwise by a strainer, through which the beer, flowing in the shallow channels of corrugated plates passes and goes out at holes below, while a current of cold air, entering at an opening in the inclosure, passes in an opposite direction through the plate and cools it.

Claim.—1. A series of corrugated pans, constructed and arranged substantially in the manner and for the purpose shown and described.

2. In combination with a series of pans, arranged as specified, a trough, B, provided with a strainer, *b*, and outlets *a*, arranged substantially in the manner and for the purposes described and set forth.

3. The opening L in the inclosure A, below the series of cooling pans, for the purposes specified.

83,954.—JASON C. GILLET, Holly, Mich.—*Sawing Machine*.—November 10, 1868.—As the disk revolves to the right it carries the crank, which, pressing on the side of the slot, impels the cross-head to the right, and after a half revolution, also in the opposite direction, gives a rapid motion to the slide and the saw, which is lifted from the cut by bearing on the hand lever, by which means the tilting lever is operated.

Claim.—1. The arrangement of the driving pulley A with reference to the platform upon which the operator stands, and to the levers H H¹ and connecting link H², substantially as shown and described.

2. The arrangement of the driving pulley A, crank shaft, with its disk C, crank D, and cross-head E, for giving motion to the saw, substantially as shown and described.

83,955.—EDWARD L. GILMAN and THEOPHILUS S. SMITH, Somerville, Mass.—*Tobacco Cutter*.—November 10, 1868.—The cutter is held up by springs and worked up and down in grooves in the box, by rods passing through the cover and united at top by a bar or cap.

Claim.—A tobacco cutter, constructed and operating substantially as shown and described, that is to say, with the knife D, the rods *e*, springs *g*, cap F, and tray C, in combination with the box A, and either with or without the match box J.

83,956.—HENRY H. GRIDLEY, Auburn, N. Y.—*Swage for Saws*.—November 10, 1868.—A triangular piece is cut out where the two lips meet, so that the cutting edge of the saw tooth, when upset, shall be a very little higher relatively to the periphery line of the tooth than it was before it was worn, and, when upset and filed to a sharp edge, shall be as high as that line.

Claim.—1. The raising of the cutting edge of the saw tooth by means of the swage *c*, herein described, and for the purpose set forth.

2. The swage for up-setting saw teeth, having the triangle *c* formed thereon, as described, and for the purpose set forth.

83,957.—BENJAMIN HANDFORTH, Chicago, Ill.—*Curtain Fixture*.—November 10, 1868.

Claim.—Providing one end of a curtain roller with an angular spindle, to operate in connection with an angular bearing, or with pins, to operate in connection with stops, upon the support for the roller, so that said roller can be locked or unlocked by a longitudinal movement thereof, substantially as herein described.

83,958.—CYRUS H. HARDY, Bath, Me., assignor to himself and B. L. WHITE, same place.—*Saw Horse*.—November 10, 1868.—A curved clamp or jaw is pivoted and slides on the upper round and between the frames of a saw horse, its lower bifurcated end fitting over the upper round or brace of a frame or lever, which is pivoted on the brace as its center, and has at its lower end a round for the foot to operate the clamp.

Claim.—The clamp C, herein described, sliding longitudinally between the frames A B of a saw horse, in combination with the frame or lever D by which it is operated.

83,959.—CHARLES HAYDEN, Collinsville, Conn.—*Nut Cracker*.—November 10, 1868.—One of the jaws is provided with a clamp to attach the device to a table, and between the jaws are two different points of application for nuts of different sizes.

Claim.—The nut cracker, consisting of the stationary jaw A and pivoted lever B, when the former is made with extensions *a b* D, and provided with the clamping screw C, substantially as herein shown and described.

83,960.—JULIUS S. HEATOR, Ovid, Mich.—*Revolving Table*.—November 10, 1868.—A circular table top is fixed on a table and arranged with a metal box having a conical recess, tube, screw thread, and adjustable cone nut, so that it can be raised or lowered to allow dishes to be placed under it, while a caster is placed in the center with similar devices, and can be raised, lowered, or turned independently of the table.

Claim.—The arrangement of the metal box socket B, the tube C, cone nut *c*, and rotating table D, in combination with the caster E, as constructed, operating substantially as and for the purposes herein set forth.

83,961.—GEORGE H. HENFIELD, San Francisco, Cal.—*Journal Box*.—November 10, 1868.—To prevent endwise and lateral movement of the frame, and keep it firmly in place, the ends are dovetailed in recesses in the shell, the outer projecting end of which is strengthened by corner pieces connecting the sides and top, to prevent its breaking from excessive pressure.

Claim.—1. The frame C, having a center bar, *b*, secured to the shell A by pins *d d*, and dovetailed ends in the recesses *h h*, in combination with the soft metal bearings B B, separated by the single longitudinal bar *b'*, substantially as described.

2. The frame C, surrounding and separating longitudinally the soft metal bearings B B, the latter secured to the shell A by pins *e*, and the former by pins *d*, and dovetail recesses *h h*, protected and strengthened by the corner pieces *k k*, cast upon the shell, as herein shown and described.

83,962.—H. M. HICKMAN and B. G. DEVOE, Vandalia, Ill.—*Harrow*.—November 10, 1868.—The beams that hold the teeth are attached at their inner ends to a hexagonal central hub of iron, provided with mortises in each of the six sides. A curved metallic rod attached to the teeth bars is covered with rubber to prevent injury to the young trees.

Claim.—1. The central hub A, constructed substantially as described and set forth.

2. The combination of the hub A, and the beams B, substantially as illustrated.

3. The hub A, the standard C, the draw bar D, the brace F, and the spring brace E, all arranged substantially as described and set forth.

4. The covering I, of rubber or other suitable substance, upon the rod G, as and for the purposes set forth.

83,963.—W. O. HICKOK and GEORGE W. REISINGER, Harrisburg, Pa.—*Tool Holder for Lathes.*—November 10, 1868.

Claim.—The employment, in combination with the improved tool holder, herein described, and a screw cutting tool, narrowing from the top downward, of a tapered wedge, *e*, for adjusting the tool to cut threads of a right or left pitch, substantially as and for the purpose described.

83,964.—FRANCIS H. HILL, Chicago, Ill.—*Coffin.*—November 10, 1868.—A separate movable frame for the glass, in the opening in the top of the coffin, can be depressed and moved back in a groove in the lid, or the frame may be opened upward on a hinge, the object being to gain access to the face of the corpse without removing the glass.

Claim.—1. So connecting and arranging a movable glass frame, B, in a coffin lid that the same may be depressed and moved down beneath the lid, and restored to place again, substantially as herein described.

2. So hinging or connecting said movable frame B with and in the coffin lid, that the same may be opened upward and closed again, substantially as specified and set forth.

3. So connecting and arranging the movable frame B with and in the coffin lid, that it may be moved back beneath the lid, or opened upward, substantially as and for the purposes shown and described.

83,965.—TIMOTHY HOLLAND, New York, N. Y.—*Lubricator.*—November 10, 1868.—A projecting glass rib on the neck of the oil holder prevents the metallic collar fitting over it from turning when screwed into the oiler cup.

Claim.—The combination of the rib *j* on the neck of the oil holder D and the collar *g*, formed and applied as described, substantially as and for the purposes set forth.

83,966.—D. D. HOWE, Beaver Dam, Wis.—*Railway Car Coupling.*—November 10, 1868.—The upper part of the buffer head, together with a plunger to push up the hook when the cars are to be uncoupled, receive a vertical motion from a lever suspended from the framing and a spring, which latter causes the movable part of the buffer head to descend after admitting or releasing the coupling hooks.

Claim.—The buffer B, constructed, as described, of the fixed part C and the movable part D, operated by the spring bolt H, yoke E, and lever F, whereby the mouth of said buffer is expanded or contracted, substantially as described, for the purpose specified.

83,967.—LEVI T. HOWELL, Camden, N. J., assignor to himself, WILLIAM SHARP, and SMITH FISHER, same place.—*Retaining Device for Doors, &c.*—November 10, 1868.—The ends of the bent plate bear upon the plates of the hinge, while the leg on the projection rests against the inner side of the hinge and retains the fastening.

Claim.—A retaining device, consisting of a curved plate, A, its projection *a* and lug *b* extending from the projection parallel to the plate, all substantially as and for the purpose described.

83,968.—CHARLES JARECKI, Erie, Pa., assignor to H. JARECKI & Co., same place.—*Piston for Deep Well Pump.*—November 10, 1868.

Claim.—The steel valve seat D, provided with the concentric collar, *e*, adapted to be clamped between the shoulder *f* of the detachable crown A, and the top of the section B, whereby the valve is held rigidly in place, as herein shown and described, for the purpose specified.

83,969.—GODFREY JEPSON, Chelsea, Mass., assignor to himself and THOMAS F. BRYAN, same place.—*Double-walled Pitcher.*—November 10, 1868.—A hollow screw at the spout is suitably packed and secures the sides of the walls together.

Claim.—The arrangement of the hollow flanged screw E, hollow flanged nut F, and washer W, with the outer and inner walls of a double-walled pitcher, substantially as and for the purpose specified.

83,970.—JAMES L. JOHNSON and J. WILSON FOUST, Evansburg, Pa.—*Hand Spinning Machine.*—November 10, 1868.—The tension pulley is supported in a vibrating frame, which is secured to a shaft provided with a ratchet wheel and pawl for regulating the tension.

Claim.—The combination of pulley C, having a vibrating support, the ratchet *a*, pawl *b*, and the pulley D, having an adjustable support, all constructed, arranged, and operating substantially as and for the purpose described.

83,971.—EDGAR A. JONES and JULIUS A. BIDEWELL, Sturgis, Mich.—*Valve for Melodeons.*—November 10, 1868.—The valve is pressed against the seat by a spring provided with a wedge-shaped bearer which is slotted to fit over a staple on the valve which prevents lateral movement. The rear end of this spring is secured, and can be adjusted to give greater pressure, by means of a screw.

Claim.—1. The bearer C, constructed as described, with its lower edge slotted to fit over and play upon the staple *h* in the under side of the valve, whereby the lateral movement of the bearer is prevented, as herein described, for the purpose specified.

2. The spring D, when formed as described, together with the regulating screw E, when employed for the purposes and uses set forth.

83,972.—GILBERT D. JONES, Brooklyn, E. D., N. Y.—*Machine for Cutting Sugar into Blocks.*—November 10, 1868.—After the sheet has been pierced by the projections on the two plates, the lower plate is released from the wiper operating it, and drops, thus allowing the sugar to fall. A hammer descends and, stripping the upper plate, disengages what remains on that plate.

Claim.—1. The combination of the dividers or pins *b* and *e*, arranged to project at suitable distances apart from surfaces or tables, in lines corresponding to the desired profile of the blocks to be produced, and made to approach and recede from each other at intervals, to effect splitting of the slab into blocks of uniform size, substantially as herein set forth.

2. The table D, provided with dividers or cutters on its face, and hinged or arranged to swing relatively to a table, E, also provided with dividers or cutters for operation in concert therewith, essentially as specified.

3. The combination, with the table E, provided with dividers or cutters, and arranged to have up and down play or motion, of a hammer, I, operating at intervals to strike and depress said table, essentially as specified.

4. The combination, with the hammer I, of a spring, N, arranged to give impetus to the hammer at starting, for action in concert with or on the table E, substantially as described.

83,973.—SIMON KAUFMAN, Fairburg, Ill.—*Stay for Collars.*—November 10, 1868.—A flexible, detachable stay and fastening band supports the collar and prevents it from being injured by perspiration.

Claim.—The detachable inner stay or lining B, and the narrow detachable band C, applied to the collar A as described and shown, for the purposes specified.

83,974.—WALTER KNAGGS, Clarendon, Jamaica.—*Manufacture of Sugar.*—November 10, 1868; antedated November 7, 1868.—The cane juice is treated with sulphurous acid as it leaves the mill; it is then boiled, and has carbonate of lime and manganic acid added to it. After the boiling has ceased the cane juice is drawn into a subsiding vessel, and milk of lime is added. The clear liquid is then evaporated. The double cover and its appendages enable the evaporation to be conducted without subjecting the juice to contact with the air.

Claim.—1. The combined process for manufacturing sugar herein shown and described.

2. The application of a combination of manganese and oxygen, (combined or uncombined with a base.)

3. The double cover to the evaporating tray, composed of the curved outer case J and the inner inclined plates B, constructed and arranged as described, for the purpose specified.

83,975.—JACOB M. KNEPLEY, Jersey Shore, Pa.—*Harvester*.—November 10, 1868.—This contrivance keeps taut the chain that drives the reel, but permits the reel to rise and fall with the movements of the platform without breaking the chain.

Claim.—The independent spring arms *l* and *l'*, having the pulleys *e* attached thereto, and arranged to operate in connection with the chain that drives the reel of a harvester, substantially as described.

83,976.—H. T. LA ROY, Richmond, Ill.—*Machine for Bundling Wool*.—November 10, 1868.—The operator, by applying his foot to the lever, can fold the movable sections into a position to compress the wool into a compact bundle. Then, by means of the yoke, which is provided with a hasp, he can secure the sections in that position until the binding cord is tied.

Claim.—The arrangement, herein described, of the hinged sections *c d*, the fixed sections *a b*, connecting rods E, four-armed frame B, guide rods D, the belt F, lever G, and yoke H, all operating as shown, for the purpose specified.

83,977.—JACOB LATTA and LEWIS SNYDER, Bethlehem Center, N. Y.—*Sled Brake*.—November 10, 1868.—The draught tongue is fixed to the center of a bar which has at its ends loops whereby the tongue is attached to the sled. Hence the tongue and its cross bar have a limited forward and backward movement independently of the sled, and this movement is made available in applying the brakes in descending a slope, said movable cross bar being connected to the brakes by rods.

Claim.—The curved levers I^x I^x, in combination with the sliding bar F and fixed rod D, whereby, as the longer lever is raised, the curved ends of both levers are forced between the bars F D to hold them in a fixed position, and under the levers H II, inoperative, as herein shown and described.

83,978.—JOSEPH LAUBEREAU, Paris, France, assignor to JOSEPH DE SUSINI, same place.—*Toy Watch*.—November 10, 1868.—A toy watch, moved by the tension of an elastic string, governed by a self-acting brake.

Claim.—The combination of the pulleys *f g*, elastic string *d*, and friction lever *a e*, with each other and with the watch case, substantially as described, for the purpose specified.

83,979.—E. B. LAWRENCE and C. QUICK, Lakeville, Ohio.—*Corn Planter*.—November 10, 1868.—The seed slide is actuated by one of the wheels, but sometimes, after turning the machine, the wheel is not in position to give an impulse to the slide when the proper moment for dropping has arrived; hence levers and a connecting rod are employed to enable the slide to be operated by hand when desired.

Claim.—1. The seed slide G, provided with the arm *g*, arranged to be operated by the cams *b* upon the wheels C, substantially as described.

2. The stops or lugs *d*, secured to the wheel C, in combination with the lock bar K, arranged to operate as described.

3. The combination of the slide G and the levers H and I, arranged as shown and described.

83,980.—JAMES S. LEVER, Philadelphia, Pa., assignor to ROSS C. BROWNING, Orange, N. J.—*Book-binding*.—November 10, 1868.—The pressure is applied by India-rubber rollers instead of the usual hand smooth surface tool.

Claim.—The within-described means or method for cementing the muslin or other surface material upon the boards of book covers.

83,981.—WARREN LYON, New York, N. Y.—*Punching Machine*.—November 10, 1868.—Designed as a more advantageous instrumentality, for operating the sliding punch, than the usual cam or eccentric, "it being possible, for a given stroke, to

work much closer to the working center," (*i e*, the pivotal center of the sector,) and secure a more powerful action.

Claim.—The construction and arrangement, herebefore described, of the lever J and pinion I, slotted toothed sector H, pitman G, punch stock E, guide F, and frame A, for the purpose set forth.

83,982.—ALEXANDER C. MARTIN and WILLIAM RITCHIE, Hamilton, Ohio.—*Head Block*.—November 10, 1868.—The beveled rings on the rotary shaft actuate the block in which the pawls are jointed, and the pawls (being released from the shifting mechanism) act in regular succession against the teeth of racks, and thus give motion to the knee of the feeding mechanism.

Claim.—1. The arrangement of the block L, loosely on the shaft G, between the beveled rings N O, to produce a traversing or feeding movement, substantially as and for the purpose described.

2. The combination of the four segmental portions *m* and the portion *l* of block L with the shaft G, substantially as and for the purpose specified.

3. One or more pawls, with an oscillating block, in combination with the rotary shaft G, substantially as and for the purpose described.

4. The pawl-shifting mechanism, consisting of the ferrule *e* and plate *g*, in combination with the pawls *z*, operating in the manner and for the purpose described.

5. The ring or ferrule *e*, springs *x*, and plate *g*, in combination with pawls *z*, in the manner and for the purpose described.

83,983.—WALTER K. MARVIN, New York, N. Y.—*Sash Fastener*.—November 10, 1868.—The two plates are let into the jamb and are adapted to slide one upon the other. The plates may be simultaneously actuated by the cams so as to cause their jaws to bind the respective sashes against the dividing strip at the meeting rails. One sash only may be thus held, in which case one of the jaws is dispensed with.

Claim.—1. A sash fastener, composed of one or more sliding jaws, or equivalent compressing and holding devices, in combination with a double cam or eccentric, shaft, and handle for actuating said jaw or jaws, substantially as and for the purposes set forth.

2. The herein-described construction and arrangement of the two jawed sash-fastening plates, placed together and recessed to receive the double cam or eccentric, in the manner specified, the under or lower plate being slotted to receive the end of the cam shaft, and to admit of the movement of the same in the direction of the length of the said plate, as and for the purposes set forth.

83,984.—NORMAN MCLEOD, Clio, S. C.—*Feed Cutter*.—November 10, 1868.—The straw, as it falls from the cutters, is caught in the circular screen, and, being swept around by the arms, is delivered in a compact heap through the spout, thus preventing the grain from being wasted.

Claim.—1. The knives L L, when made in the shape described, and attached to the arms M M, in the manner set forth.

2. The circular screen B, composed of two parts, the upper one of which is provided with a spout P, and hinged to the lower portion, which is rigidly secured to the frame A, all constructed in the manner and for the purpose set forth.

3. The combination of the arm I with the ratchet wheel J, pawl K, feed roll E, and knives L L, whereby the said parts are made to operate together, substantially as and for the purpose set forth.

4. The arrangement and combination of the shafts C C, cutters M L, screen B, feed table F, rolls E G, ratchet J, pawl K, and arm I, substantially as described and shown.

83,985.—WILLIAM MERRELL, Kent, Ohio.—*Iron Fence Post*.—November 10, 1868.—A flat metallic fence post, with groups of studs to receive and support the rails.

Claim.—The fence post A, formed with groups of studs *a a a a*, holes *c*, and wings C, all substantially as and for the purpose set forth.

83,986.—ISAAC T. MEYER and JAMES F. J. GUNING, New York, N. Y.—*Hoop Skirt*.—November 10, 1868.

Claim.—1. The combination, with the hoop skirt, of an adjustable bustle, made up of springs so hinged, pivoted, or connected at their ends to the skirt, and provided with straps uniting them to the waistband at points or in lines intermediate of the ends of the springs, as that said bustle, by letting out or taking in said straps, may be readily raised or lowered, substantially as and for the purpose herein set forth.

2. The trail C, made up of springs hinged, pivoted, or otherwise connected, at their ends, to the skirt, in such manner as that said trail may, at pleasure, be let down, or thrown up and back out of the way, essentially as shown and described.

83,987.—CHARLES MORGAN, Waumandee, Wis.—*Hames Fastening*.—November 10, 1868.—The hames are locked by inserting the metal bar within he socket and the recess, thus setting the slide.

Claim.—The hames fastener, constructed as described of the bar A, provided with a socket, C, to receive the end of the bar F, carrying the hook B, which bar is held in place by the slide D, all operating as described, whereby, when the bar F is released by the slide, the hooks are detached from each other, as herein shown and described.

83,988.—ISSACHER MORRIS, Clinton, Ill.—*Fire Kindler*.—November 10, 1868.—A small quantity of benzole or other inflammable liquid, is poured into the cup, which spreads through the pumice stone, and a match being applied to the top of the burner, it is held close to the grate bars or draught bar of a stove.

Claim.—The burner B, made conical, or tapering toward its orifice, for the purpose described, in combination with the cup C, sack c, containing pumice stone, or other porous substances, and handle A, substantially as described.

83,989.—LOUIS MULLER and CORNELIUS HOOD, Hartford, Conn.—*Shutter Worker*.—November 10, 1868.—Parts of the hinge of the window blind are so arranged as to enable the blind to be opened and closed by a handle on the inside, and also secured in either position. The slats may also be operated from the inside.

Claim.—1. The combination of the box or easing f with the wheels d and e and the pivot g, all arranged as described.

2. The combination and arrangement of the button or arm l, having the connecting rod and handle k, with the lever m, for the purpose of securing the blind or shutter when closed, and for operating the slats, substantially as described.

83,990.—HENRY B. MEYER, Philadelphia, Pa.—*Regulating Gas Burner*.—November 10, 1868.

Claim.—1. The glass body B, Fig. 2, having a small aperture in its bottom, in the manner and for the purposes set forth.

2. The glass body B, with its small aperture at the bottom, for gauging the gas, in combination with the metallic base A, and lava or other non-metallic tip C, all constructed and arranged as and for the purpose specified.

2. In combination with the above-described burner, the wire gauze or other fibrous valve, resting upon the small aperture, at the base of the glass body B, as and for the purpose set forth.

83,991.—J. K. NELSON, Green Point, N. Y.—*Divided Car Axle*.—November 10, 1868.—The axle divided crosswise has its inner ends supported in a lubricating box which clasps firmly one of the ends and revolves with it; the other end turns loosely in the box, arranged within which are removable collars, and fitted in a groove cut within it is a collar of yielding material.

Claim.—The divided ear axle A, constructed as described, with the revolving self-lubricating box C, removable collars e, and flexible collar f, substantially as and for the purpose herein set forth.

83,992.—CHARLES F. NOFTZ, Toledo, Ohio.—*Potato and Corn Plow*.—November 10, 1868.

Claim.—1. The combination of the screw K, nut

b, and jointed levers J J, for adjusting the position of the wings I I, substantially as and for the purpose herein shown and described.

2. A plow, consisting of the combination of the beam A, handle D, standard F, arrow-head share H, adjustable wings I I, adjustable coulter B, and adjustable draught chain C, that works in the up-and-down adjustable notched plate L, all made, arranged, and operating substantially as and for the purpose herein shown and described.

83,993.—JAMES K. P. NOURSE, West Medway, Mass.—*Boiler Feed-water Regulator*.—November 10, 1868.

Claim.—1. The combination, with the vessel C and float F, of the pump P, the bent pipe d and its gate g, contained within the said vessel, and connected to the said float, the whole being arranged substantially as herein shown and specified.

2. In combination with the arrangement of parts claimed in the preceding clause, the steam whistle H, pipe a, and lever h, connected with the float F, as specified, the whole being arranged substantially as herein shown and set forth.

83,994.—FRANK ODENBAUGH, Middletown, Pa.—*Scaffold*.—November 10, 1868.—The platform is formed with side rails pivoted to side pieces and resting on cross bars. At the lower ends of the side pieces are wheels, above which are a crank and shaft, to which are attached a ratchet and pawl.

Claim.—A portable platform or scaffold, having end pieces A, platform B, ladder rounds a, pin b, axle and wheels c, crank and shaft d, ratchet and pawl f, cross bars g and h, ropes r p r and u, and staples, as described and shown, constructed and arranged substantially as herein specified.

83,995.—T. G. PALMER, Shultzville, N. Y.—*Horse Power*.—November 10, 1868.—The brake arm rests its weight on a support, and if the belt slips from the pulley the trigger is released and brings the rubber into contact with the periphery of the wheel and stops the motion of the power.

Claim.—The herein-described brake combination, consisting of the levers C, rubber D, support E, and trigger F, or their equivalents, all constructed and arranged as and for the purpose specified.

83,996.—HENRY A. PEASE, Hartford, Conn.—*Manufacture of Soap*.—November 10, 1868.—The ingredients used are flour of wheat, rye, or other grain, caustic soda, stearine, tallow, or other stock, which are subjected to various processes of boiling, stirring, and mixing.

Claim.—The manufacture by cold and hot process, and the combination of these two processes, above described, together, thereby obtaining a soap which will harden in two hours, when, by the old process, it requires about five days.

83,997.—WILLIAM K. RAIRIGH, Rural Valley, Pa.—*Implement*.—November 10, 1868.—Within the central portion of a hatchet is placed a lock, and hatchet blades, a cold chisel, plane tongues, vise or wrench are fitted and secured by means of tongues.

Claim.—The implement herein described, constructed and arranged in the manner and for the purpose set forth.

83,998.—ADRIAN RAIS, Waterbury, Conn.—*Machine for Spinning Sheet Metal*.—November 10, 1868.

Claim.—1. The combination, with the metal-holding clamp or dies, the one being fixed upon a stationary arbor, and the other upon an arbor capable of sliding longitudinally, of a plunger or sliding bolt, to force the movable clamp against the stationary one, and a toggle-jointed lever for operating said plunger, substantially as shown and set forth.

2. Dividing the bearing or journal box of the sliding arbor longitudinally, and hinging the two parts together, substantially in the manner and for the purposes set forth.

3. The combination of the sliding carriage F, the spinning rollers, their transverse slide rests, and the screws for regulating the position of said rests, so as to adjust the spinning rollers with relation both to

each other and to the metal to be operated on, substantially as herein shown and set forth.

4. The arrangement of the plates upon which the spinning rollers are mounted, the same being pivoted to and adjustable upon the transverse slide rests of the carriage F, as and for the purposes specified.

5. The method of automatically spinning to a pattern, by the employment, in connection with the spinning rollers, their sliding carriage, and the hinged or vibratory frame, on which said carriage moves, of a pattern plate, a guide pin for following said pattern, and a weight, or its equivalent, operating upon the free end of the vibratory frame, so as to hold at all times the guide pin against the pattern, under the arrangement herein set forth.

6. The combination with the sliding carriage, its actuating screw shaft, and the vibratory frame on which it moves, of an adjustable plate, H, to which the frame is hinged, as described, the said plate carrying a pulley and shaft, connected with the driving shaft of the machine, and communicating motion to the screw shaft, substantially in the manner and by the means herein shown and set forth.

7. The movable half nut, in combination with the sliding carriage, and its actuating screw shaft, under the arrangement and for operation as set forth.

S3,999.—SAMUEL J. REED, Middletown, Ohio.—*Plow Fender*—November 10, 1868.—Designed to form a receptacle for the earth and clods thrown up by the share, and is slotted to allow the pulverized earth to pass through.

Claim.—The curved fender *e g*, in combination with lever *f*, constructed, arranged, and connected with a plow, in the manner and for the purpose substantially as described.

S4,000.—OTIS ROOT, Wendell, Mass.—*Mop Head*.—November 10, 1868.—A cast-iron collar has a screw thread inside and a frame of wire attached to it which incloses a cast-iron cross bar with a socket in which the small end of the handle turns.

Claim.—A mop head, consisting of the frame A B, with the sleeve C, secured to the handle I, by means of the spurs *e*, and having the end of the handle protruding through the sleeve, and turning in a socket in the cross head D, as herein shown and described.

S4,001.—F. WILLIAM RUST, Umatilla, Oregon, assignor to himself, A. E. ROGERS, and A. C. GIBBS.—*Machine for Scouring, Blacking, and Finishing Leather*.—November 10, 1868.—The rubbing blocks are provided with brushes for removing light obstructions and for spreading the blacking, and also with a scouring stone or glass.

Claim.—1. The scouring blocks H, hinged to the pendulum rod, and held in place by rods, G, working through the cross heads F, and provided with springs, substantially as described.

2. The hinged levers I, attached to the swinging frame, and arranged to operate or adjust the scouring block H, substantially as set forth.

3. Suspending the scouring apparatus upon a yielding support, and providing it with a lever and weight, arranged substantially as described, for the purpose of adjusting the scourers to the thickness of the leather operated upon, and also to regulate the pressure of scouring devices, as described.

4. The hollow pendulum, or its equivalent, for holding the blacking, and feeding it upon the leather while in operation, substantially as set forth.

5. The perforated cross pipe T, or its equivalent, when arranged to move with the scouring or smoothing devices, for distributing the blacking evenly over the surface of the leather, as described.

6. The platform B, provided with a series of balls, C, secured loosely in its under side, substantially as set forth, for the purpose of enabling it to be moved in any desired direction while the machine is in operation.

S4,002.—BENJAMIN L. RYDER, Chambersburg, Pa.—*Potting and Packing Plants*.—November 10, 1868.—The plants, surrounded by earth, are placed in thin boxes, which latter are packed side by side in the large box. The thin boxes can easily be removed when the plant is to be set in the ground.

Claim.—1. The above-described mode of potting and planting plants with rectangular masses of earth about the roots, such masses fitting closely against each other and against the sides of the crate or large box in packing, substantially in the manner and for the purposes set forth.

2. The above-described, close-jointed, sectional box, or its equivalent, for the purpose of forming the rectangular masses of earth, and for potting and packing plants, substantially in the manner above described.

S4,003.—CARL SCHAEFFER, Elizabeth, N. J.—*Manufacture of Artificial Stone*.—November 10, 1868.—Composed of cement, sand, and sulphuric acid molded into blocks, subjected to a heavy pressure, and are then dried and introduced into a bath of sulphuric acid.

Claim.—Artificial stone, formed of the ingredients herein specified, and treated repeatedly with sulphuric acid, substantially in the manner set forth.

S4,004.—WILHELM SCHARRATH, Bielefeld, Prussia.—*Railroad Car Ventilator*.—November 10, 1868.

Claim.—Forming the walls, ceilings, or partitions of permanent or temporary habitations wholly or in part of porous material, covered wholly or in part with fibrous or textile fabric, leaving a space between said walls and the fibrous material, as herein set forth, for the purpose of ventilation.

S4,005.—OSCAR SCHIMMEL, Chemnitz, Saxony.—*Washing Machine*.—November 10, 1868.—Flexible aprons are so arranged on the beaters as to prevent the clothes, while being washed, from lodging on the beaters. The wrists of a double crank work in sliding boxes on the beaters, and cause the latter to oscillate.

Claim.—1. The aprons *d*, in combination with the beaters B and tub A, substantially as and for the purpose described.

2. The double crank E and sliding boxes *a*, in combination with the suspended beaters B, substantially as and for the purpose described.

S4,006.—JACOB SEIBEL, Manlius, Ill.—*Harvester*.—November 10, 1868.

Claim.—1. In the construction of harvesters, connecting or coupling the frame supporting the binding platform to the main frame A by means of hinges or joints P, arranged at or near the center of said main frame, so that it may oscillate upon said hinges to admit of the raising and lowering of the cutter bar without tipping the binding platform, substantially in the manner and for the purposes specified and shown.

2. In combination with said binding platform and main frame A, hinged as described, the lever L, so connected and arranged that the driver, from his seat on the main frame, can operate the machine, in the manner and for the purposes set forth.

3. In combination with a harvesting machine having a raking platform with a rear delivery, a binding platform, arranged close behind the raking platform, and hinged to the main frame at or near its center, substantially as described, so that the grain can be raked directly from the raking to the binding platform, and otherwise operating substantially as specified.

S4,007.—J. A. SHANNER, Plainview, Ill.—*Mechanical Movement*.—November 10, 1868.—The pump is operated by means of segmental racks on the gear wheels engaging alternately with a rack on the pump rod.

Claim.—The combination, with the wheels F and G, of the segments H and I, and the rack E, arranged to operate substantially as and for the purpose described.

S4,008.—HENRY F. SHEPHERD, Framingham, Mass.—*Vencer*.—November 10, 1868; antedated October 31, 1868.—Can be used as a vincer or as a substitute for paper hangings.

Claim.—A compressed and burnished vincer, applicable as wood hangings, and for other purposes, substantially as specified.

84,009.—SILAS SHIRLEY, Rockford, Ill.—*Wagon Wheel*.—November 10, 1868.—Beveled blocks, provided with circular flanges fitting over the box, extend upward between the spokes, and are arranged to be forced between said spokes to cause them to expand and tighten the tire when it is loose.

Claim.—The wheel described, consisting of the box A, beveling blocks B, with curving flanges *b b*, friction plates D, rods *e*, and caps E, the whole being combined and operated in connection with the spokes of an ordinary wheel, substantially in the manner and for the purpose described.

84,010.—SIMON SHROCK, New Philadelphia, Ohio.—*Beehive*.—November 10, 1868.—The exterior case is provided with a slanting bottom for the ingress of the bees to the central tube leading to the central hive; above and on each side of the latter are honey boxes which are ventilated by boxes with openings covered with wire gauze.

Claim.—1. The combination and arrangement of the central hive C, provided with comb frames H H, sliding face G, feed box D, slant board S, and central tube *b*, all constructed and operated in the manner and for the purpose set forth.

2. The combination of the central hive C, slant board S, central tube *b*, openings K, honey boxes I I, provided with corresponding openings, and ventilating boxes L L, all constructed, arranged, and operated substantially as described.

3. The combination of the drawers *a' a'*, tubes *a a*, and slant board S, all constructed, arranged, and operated as set forth.

4. The arrangement of the central hive C, slant board S, central tube *b*, honey boxes I I, ventilating boxes L L, feed box D, drawers *a' a'*, and tubes *a a*, all constructed and operated as set forth.

84,011.—J. H. SMITH and GEORGE O. SMITH, Chicago, Ill.—*Paint for Buildings, Roofs, &c.*—November 10, 1868.—Composed of leached ashes, coal tar, hydraulic cement, and benzine.

Claim.—A paint, composed of the ingredients herein named, and compounded substantially as herein set forth.

84,012.—EZRA SPRINGER, Davis, Ill.—*Railway Car Mover*.—November 10, 1868.—The driving wheel, provided with teeth to gripe the rail, is actuated by an arrangement of gearing communicating with the power, and so connected as to increase or diminish the speed of the car.

Claim.—1. The driving wheel D, in combination with the driving gears, arranged and operating conjointly, as and for the purpose substantially as specified.

2. The lever Q, rod R, and stay P, in combination with the arm N, feather keys, and shifting gears, applied to the purpose set forth.

3. The racks *A'*, sliding dog *C'*, in combination, arranged in the manner and for the purpose set forth.

84,013.—WILLIAM A. STACK, Hillsborough, Md.—*Animal Trap*.—November 10, 1868.—The animal steps upon one of the arms to reach the bait, which is placed on a wire connecting with a spring bolt supporting the arm. When the bait is pulled the bolt is drawn back and the arm swings down, precipitating the animal into a water receptacle placed beneath.

Claim.—The arrangement of the box B, the rotating wheel, having the trap-door arms *e e' e² e³*, the stop *m*, pivoted bait-holder *h*, spring *o*, wall D, and metallic bait-box E, when the said parts are constructed and arranged to operate in the manner described.

84,014.—WILLIAM STAMP, Susquehanna Depot, Pa.—*Steam-engine Steam Chest*.—November 10, 1868.—The copper wire is hammered into grooves in the cover of the steam chest, and then faced off to produce a tight joint.

Claim.—The construction of the wire packing, inserted in both surfaces of the joint to be made, substantially as herein described.

84,015.—CHARLES H. STOCKBRIDGE, Northampton, Mass., assignor to himself and OSMORE O.

ROBERTS, same place.—*Bit Holder*.—November 10, 1868.—Improvement on his patent of February 19, 1867. A spring is applied to the rear end of the clamping jaws to open them as the sleeve is screwed forward to release the outer ends from the bit.

Claim.—The bit stock, formed of the clamping jaws *e*, set in grooves having curved bottoms, in combination with the contractile spring *i* and sleeve *d*, substantially as set forth.

84,016.—ALFRED F. STONER, West Unity, Ohio.—*Cultivator*.—November 10, 1868.—A toothed bar, under the spiked roller, is provided with a spring which allows the teeth to yield to such strain as would break the cultivator. A hiller is placed nearly under the roller, and a share in the middle of the machine in front of the roller.

Claim.—1. The spiked roller B, in combination with the spring, concave, or toothed bar M, arranged and operated substantially as set forth.

2. The arrangement of the hiller E, in combination with the share C in the front part of the frame, and the pulverizing roller and concave, substantially as described.

84,017.—OLE O. STORLE, Norway, assignor to himself and J. B. SMITH, Milwaukee, Wis.—*Horse Hay Fork*.—November 10, 1868.—The lock fits and revolves on a screw on the center shaft. A trigger secured to the slide catches in notches on the lock and holds it in any position.

Claim.—The parts B, F, and G, in combination with the screw on shaft A, substantially as described.

84,018.—R. STRICKLAND, Albany, N. Y.—*Coffee and Tea Pot*.—November 10, 1868.

Claim.—1. A coffee or tea pot, having a strainer hinged to it inside, and applied over the orifice at the base of the spout, substantially as described.

2. The hinged strainer C, provided with a weight, *b*, operating substantially as described.

84,019.—JOHN E. TENCATE, Pittsburg, Pa.—*Machine for Welding Tubing*.—November 10, 1868.

—Two sets of grooved rollers are arranged, the one set in a horizontal, and the other in a perpendicular position. Two levers are each provided with a notch fitted to grooves in the mandrel, to hold the latter in a fixed position. Enlargements on the mandrel serve to obtain and retain the desired bore of the pipe in welding.

Claim.—1. The arrangement of the rolls A and B, guides *e*, levers C and D, and mandrel F, provided with enlargements *x* and *x'*, the whole being constructed, arranged, and operating as herein described, and for the purpose set forth.

2. The scrapers *y*, in combination with the rock shaft P, provided with oblique slots, *4*, constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

84,020.—HERMANN THAL and GUSTAV SCHLOTTMANN, New Haven, Conn.—*Coffee-pot*.—November 10, 1868.

—The upper edge of the vessel has around it a gutter, the overflowing water in which runs into the vessel, while the inner edge of the gutter fits into the flange of a bell-shaped mouth piece fixed to a tubular neck, to the bottom of which is geared a strainer, and its upper edge extends beyond the bottom of the mouth piece, forming a seat for a safety cap, from the center of which is suspended a perforated disk.

Claim.—The arrangement and combination of the strainer C, tubular neck *g*, flanged mouth piece *f*, gutter *d*, cap *h*, perforated disk *i*, and vessel A, all constructed and operating substantially as and for the purpose shown and described.

84,021.—WILLIAM THOMPSON, Cleveland, Ohio, assignor to H. B. MYER, same place.—*Gas Machine*.—November 10, 1868.—A double bellows is arranged with a flexible air holder, an upper and lower carbureter, and a purifier.

Claim.—1. The bellows B B, for forcing air into the receiving bag, as described, in combination with the carbureters and purifiers.

2. The combination of receiving bag C and bellows

B B, substantially as set forth, with the upper and lower carbureters.

3. The arrangement of the bellows B B, the large air bag C, the passage pipe D, and the perforated coil pipe D', substantially as set forth.

4. The coil partitions G G G, filled with sponge or other equivalent material, forming a lower carbureting chamber, substantially as set forth, in combination with the purifier.

5. The combination of the purifying chamber S and the upper carbureting chamber, substantially as described.

6. The pipe T and cock T', for conveying residue or surplus oil from the carbureting cylinders, substantially as described.

7. The combination of the bellows B B, the receiving bag C, the passage pipe D, the coil partitions G G G, the chamber S, the pipe T, and cock T', when the said parts are arranged, combined, and operating as and for the purpose herein set forth.

84,022.—WILLIAM J. TOWNE, Newtonville, Mass., assignor to SILVER LAKE MANUFACTURING COMPANY, same place.—*Packing for Joints of Steam Engines.*—November 10, 1868.—To the exterior surface of a braided or twisted packing of cotton or other fibrous material is applied a glazing of a glutinous substance, with which may be mixed asbestos, soapstone, or other mineral powders.

Claim.—The application of a glazing or coating to the exterior surface of a packing, substantially as and for the purpose described.

84,023.—AARON VAN GUYSLING, West Albany, N. Y.—*Railway Chair and Support.*—November 10, 1868.—A fixed and a movable lip are secured to the chair by a key bolt, held in place by a wooden key, having a rubber cushion, and a device for connecting the chairs to each other, the hollow supports being connected by a tube.

Claim.—1. The railroad chair support, consisting of the hollow supports A, connected by the tube B, the chairs C having the fixed lip c^1 and the detachable lip c^2 , the key bolt D, the rubber block G, the wooden block F, and the connecting bar E, said chairs being slotted to receive the bent ends of the connecting bar, and for the passage of the wooden blocks, all arranged as described, for the purpose specified.

2. The chair C, fitting over the hollow supports A, and constructed as described, having the fixed lip c^1 detachable lip c^2 , and the key bolt D, and provided with an opening in its side for the introduction of the rubber block G, which is kept in place by the sliding door H, as herein set forth, for the purpose specified.

3. The combination of the horizontal metallic bar or tie, B, with the vertical hollow supports A, substantially as herein shown and described, and for the purpose set forth.

84,024.—JASPER VAN WORMER and MICHAEL MCGARVEY, Albany, N. Y.—*Magazine in Base-burning Stoves.*—November 10, 1868.—The lower portion of the reservoir consists of a flaring mouth piece, attached to which and forming the lower part of the feeder is a neck, enlarged at its lower end to give free discharge to the coal and prevent clogging.

Claim.—1. Attaching to the ordinary contracted reservoir a neck, having its lower end enlarged, substantially as and for the purpose described.

2. The method of attaching the neck to the reservoir, substantially as set forth.

84,025.—FRANCIS J. VITUM, Newburyport, Mass., assignor to WILLIAM N. ELY.—*Hand Pegging Machine.*—November 10, 1868.—An improvement on E. M. Stevens's patent, August 6, 1861.

Claim.—1. A hand pegging machine, so constructed, arranged, and adapted as to its several parts, that, while the machine is held to the work, as it passes over it, with one hand, the movements of the awl and peg driver, and of the feeding devices, shall be actuated or managed with or by means of the other, substantially as described.

2. So constructing, arranging, and adapting the parts of a hand pegging machine, as to operate the

same by means of a crank, turned by the hand of the operator, substantially as described.

3. Arranging and adapting a crank handle, cam, and spring in a hand pegging machine, in combination with the awl and peg-driver bars, or either of them, substantially as and for the purposes described.

4. Arranging and adapting a crank handle and cam, in a hand pegging machine, in combination with an awl or piercing or pointed instrument, as a feeding device, substantially as described.

5. The ratchet bar and pinion, in combination with the awl or peg driver bar in a hand pegging machine, substantially as and for the purposes described.

6. Constructing the bar C in connection with the dog G, so that the latter may operate without the aid of a spring, substantially as described.

7. The combination of the portable frame with crank handle, cam, spring, and piston, all constructed to operate substantially as described.

84,026.—FRANZ VOEGTLI, Montgomery City, Mo., assignor to ANTONIO VOEGTLI, same place.—*Reel for Yarn, &c.*—November 10, 1868.—On the shaft which carries the reel is a single finger which gears into the cogged counter wheel, on the axle of which is another finger gearing into a cogged wheel placed on the index shaft, so that the reel is adjustable to the size of the skeins, and the number of strands in a skein may be automatically indicated.

Claim.—The reel C and its shaft B, to operate the finger d , pinion D, finger d^1 , pinion D', and indicators d^2 d^3 , substantially as set forth.

84,027.—WILLIAM VOGEL, Norwich, Conn., assignor to EZRA DURAND.—*Musical Instrument.*—November 10, 1868.—The iron bridges on which the strings rest are connected by cross bars passing under and below the sound board, stiffening and strengthening them to resist the strain of the strings, while the brace bars on the under side of the board leave an open communication for the escape of sound.

Claim.—1. The arrangement of the diagonal dampers L with relation to the bridges F, sound board c , and strings G, of the dulcimer, as herein shown and described.

2. The construction of the bridges F, stiffening end bars and central frame E, and the curved braces H beneath the sound board c , all arranged as described, for the purpose specified.

84,028.—J. E. VOILES, Madison, Ind., assignor to himself and JOHN W. HUTCHINS, same place.—*Horse Rake.*—November 10, 1868.—One end of a coiled spring is fastened to a roller, the other end being secured to the vibrating cross head which rests on the points of the two center teeth of the rake.

Claim.—A releasing device for the teeth of revolving horse rakes, composed of the coil spring A, roller C, and vibrating cross head D, when arranged and operated substantially as shown and described.

84,029.—JOSEPH VOWLES, Milford, Mich.—*Cultivator.*—November 10, 1868.—The mold boards are bolted to the hangers, which are supported by braces, the side hangers being furnished with reversible mold boards, while the rear hangers are attached to a cross beam from which extends a sub-tongue, between which latter and the tongue is a wedge piece for raising its outward end. The teeth or plows are held in any desired position by a sector.

Claim.—1. The mold board L, constructed substantially as shown and described.

2. The combination of the mold board L with a cultivator.

3. The construction of the wedge N, and its arrangement with reference to the tongue of a cultivator, or for any equivalent purpose, substantially as shown and described.

4. The arrangement of the hangers H H with their teeth M M, with reference to the wheels of the machine, substantially as shown and described.

5. The arrangement of the sub-tongue F, frame E, sector D, lever C, hangers H and K, and braces I, substantially as shown and described.

84,030.—C. W. WAILEY, New Orleans, La., assignor to NEW ORLEANS PNEUMATIC PROPELLING COMPANY.—*Pump for Compressing Air.*—Novem-

ber 10, 1868.—An improvement on J. H. Johnson's English patent, No. 890, of April 1860. The induction valves, in the concave heads, are held up to their seats by spiral springs, the vertical sections of a pump, connected with the heads, being alternately filled with water.

Claim.—The combination of the concave heads G and G', with the vertical sections, A A', of a pump, through which flows a continuous stream of water, when the valves of the induction ports are placed in said heads, and are operated by the springs *d* and *d'*, substantially as set forth.

84,031.—FELIX WALKER, New Orleans, La.—*Sash Stop and Holder.*—November 10, 1868.—The plate, with two flanges, fixed to the side of the window frame, has two notches in which engages one arm of a pivoted catch, the other arm being weighted, thus holding the sash down, or at any desired point.

Claim.—The combination of the double flanged plate A, with notches *n n*, and secured to the inner side of the window frame, with the pivoted catch C, having two arms, one being weighted, as shown, all operating as set forth.

84,032.—BENJAMIN D. WASHBURN, Boston, Mass.—*Shutter Fastener.*—November 10, 1868.—An elongated tooth or projection is formed centrally between the jaws of a fastening, so that when one of the jaws passes over into the catch, the tooth will prevent the fastening from slipping over the catch.

Claim.—The construction and arrangement of the piece A with the projections *a a* and *b*, the latter extending below the former, when formed in one piece, as and for the purposes herein set forth.

84,033.—GEORGE WELLHOUSE, Akron, Ohio.—*Dropping Platform for Harvesters.*—November 10, 1868.—This platform is pivoted at its rear end. Across its front lies a roller, whose bearings are in the sides of the platform, and on one end of which is keyed a pinion, working in a curved rack. The cut-off is an apron, one end of which is fastened to the rear of the finger beam, and the other to the roller, so that, by elevating the platform, the apron is unwound, and by depressing the platform the apron is rolled up.

Claim.—The arrangement and combination of the roller H, pinion I, segment J, and platform D, in the manner substantially as set forth.

84,034.—GEORGE WELLS and S. A. HAYNES, Island Pond, Vt.—*Mop Wringer.*—November 10, 1868.—By raising the bail the rollers are made to recede from each other to admit of the insertion of the mop. One of the rollers has a crank handle.

Claim.—The bail B, arranged with relation to the pail A, uprights D, plates E, G, H, I, J, and rollers C C, as herein described, and operating in the manner and for the purpose specified.

84,035.—GEORGE W. WESLEY, Troy, Pa.—*Water Wheel.*—November 10, 1868.

Claim.—A water wheel having buckets of a concave or depressed outer surface, and with a corresponding convex or raised inner surface, in combination with the side issues or escapes, for the purpose and in the manner set forth and described.

84,036.—ALBERT WETHERBEE, Waltham, Mass.—*Composition Tip for Billiard Cues.*—November 10, 1868.

Claim.—A tip of a billiard cue, made of vulcanized rubber, one part, and pulverized chalk, more than one part, intimately mixed, and baked in combination, all substantially as and for the purpose described.

84,037.—CHARLES WHITTIER, Boston, Mass., assignor to himself and BENJAMIN F. CAMPBELL, same place.—*Steam Radiator.*—November 10, 1868.—The openings in each section are so cast that the steam may pass from one to the other in as rapid a manner as it goes through the body itself, thus preserving the effectiveness of the steam within a larger extent of radiating surface.

Claim.—1. Constructing each section on opposite sides, near the ends, with an aperture, *a*, of same shape as aperture *d* of body of radiator, substantially as and for the purposes described.

2. Connecting the alternate ends of the radiator, by means of lugs, *b b b b*, &c., and bolts, *e*, &c., constructed substantially as described.

84,038.—WILHELM WIESMANN, Bonn, Prussia.—*Preserving Meat.*—November 10, 1868.

Claim.—1. The within-described process of preserving meat, by first coating the pieces of meat with powdered saltpeter and olive oil, and then storing them away in a hermetically closed vessel, with intermediate layers of charcoal filled in bags, as herein set forth.

2. The vessel A, provided with perforated movable shelves *a*, and closed by a disk, *e*, and lid, *c*, leaving an oil space, which is filled through stop-cocks *h i*, all as shown and described.

84,039.—GEORGE C. WILDER, Lawrence, Kas.—*Punch.*—November 10, 1868.—The follower is forced upward against the washer or nut, after the same has been punched, by the face of the spring, which frees the nut from the punch.

Claim.—Combining with said combination the spring E, as and for the purpose described.

84,040.—S. R. WILMOT, Bridgeport, Conn.—*Apparatus for Sizing Glass Cylinders.*—November 10, 1868.—The fingers expand or contract the base of the hot chimney to the size required.

Claim.—The arrangement of the several fingers *a*, operated so as to size the cylinders, by opening the said fingers upon the inside, or closing them upon the outside of the said cylinder, substantially as set forth.

84,041.—HENRY M. WOODWARD, St. Louis, Mo.—*Treating Cast Iron for the Manufacture of Car Wheels.*—November 10, 1868.—The iron is melted in a reverberatory furnace and is free from contact with the fuel during the process. It is maintained in a molten condition, subject to the oxidizing or decarbonizing action of the atmosphere which passes over the surface of the molten mass, until the iron is found, by test samples, to be in that condition which will produce the desired thickness of drill on the face and flange of the wheel.

Claim.—1. The herein-described improved process for producing cast metal car wheels, substantially as and for the purpose described.

2. Car wheels produced by the herein-described improved process, as a new article of manufacture, substantially as and for the purpose specified.

84,042.—WENDELL WRIGHT, Bloomfield, N. J.—*Suspender Fastening.*—November 10, 1868.—It is designed to let the clamps remain on the pants or drawers, and slip them off from the snap hooks when the wearer wishes to take off the garment.

Claim.—The double clamps B, having teeth on their inner faces, and provided with slides *h*, said clamps being hinged together by the collar *f*, and removably attached to the buckle A by means of a snap hook, *a C b*, formed on the latter, all constructed and arranged substantially as herein shown and described.

84,043.—JACOB ZEPF, Troy, assignor to JAMES T. WALKER, Albany, N. Y.—*Machine for Making Horseshoes.*—November 10, 1868.—The movements of the several parts of this machine are so timed that the following operations occur consecutively, namely: A heated bar is fed forward a limited distance by feeding wheels; a plunger, with its cutter, then descends to sever a blank from the bar; a forked bender is then advanced, bending the blank around a male die, and the shoe is completed by the action of dies and creasers.

Claim.—1. The arrangement of the sliding arm *e* and its corrugated wheel *d*, with the vertical shaft *a*, and wheels *c* and *b*, operated by the shaft E and shaft K, with its cam Z, all substantially as shown and described.

2. The horizontal notched clutch V and sliding dies U U, in combination with the vertically reciprocating

roccating male die and former *i*, substantially as herein specified.

3. The vertically reciprocating male die *i*, provided with a pressing and creasing shoulder, and with a projecting guide, all as herein shown, in combination with the dies U U, substantially as herein specified.

84,044.—WILLIAM AUGUSTUS BERKEY, Grand Rapids, Mich.—*Construction of Fire-proof Houses.*—November 17, 1868.—Consists in such a construction of the floors or partitions that there shall always be between the inner and outer wood-work of the floor or partition an interposed stratum of plaster or cement. It also consists of a certain peculiar arrangement of metallic strips for holding together the double floor or wall.

Claim.—1. The combination of the iron straps C and furring D with the joists B and lath E, for the purpose substantially as described.

2. The floor strips L, when attached to the deafening partition K, in the manner described, for allowing the mortar M to be interposed, in the manner and for the purpose substantially as described.

3. The combination of the construction for suspending the ceiling and the construction for sustaining the floor, as described, with the interposed mortar, for preventing the burning of the timbers in such construction, and the passing of water or sound, as set forth.

84,045.—JOSEPH BELL ALEXANDER, Washington, D. C.—*Device for Raising and Adjusting Wicks in Lamps.*—November 17, 1868.—The wick is held by a metal clasp that slides easily in the wick tube, which clasp is raised and lowered by a pinion working in a rack attached to the clasp.

Claim.—1. The making of the rack, with the guides H and H' and the stops L and L', by striking it up of one piece of sheet metal, substantially as described and for the purpose set forth.

2. The combination, with any lamp, of the imperforate wick tube A, the sliding wick holder B, the rack C, the pinion D, and the bow spring S, when arranged together substantially as described and for the purpose set forth.

84,046.—LEVI BLACK and MILTON GAFFNEY, Logan, Ohio.—*Device for Saw Carriages.*—November 17, 1868.—Combined with a clamp and gauge are adjustable holders, for squaring and sizing the unturned part of bed posts, table legs, &c., the holders at one end being two sliding plates provided with flanges flaring in opposite directions.

Claim.—Adjustable plates *a* and *b*, holders F and H, sliding stop or clamp E, and plate D, herein described, constructed, combined, and arranged to operate in the manner and for the purpose set forth.

84,047.—J. H. BODINE and T. A. HILL, Mount Morris, N. Y.—*Water Wheel.*—November 17, 1868.—The curb is provided with an elongated rim or flange around its lower edge, which encircles the upper part of the vertical discharge wheel, so as to prevent the escape of water as the wheel drops from the wear of the step. Openings in the gate are made to open or close the chutes to any required degree.

Claim.—1. The arrangement of the top feed vertical discharge wheel B, in connection with the flanges *a a*, upon the lower edge of a curb, which has the gate at its top, its side walls being water-tight, substantially as and for the purpose herein set forth.

2. The gate I, when cast with recesses or concaves, *e e*, on its under surface, substantially as specified.

3. The arrangement of wheel B, gate I, arm *v*, screw shaft T, block R, working upon the screw shaft, and spindle S, operating the screw shaft by means of cog gearing W, when said parts are constructed to operate in connection with each other in the manner and for the purposes above described.

84,048.—JOHN B. BOLINGER, Detroit, Mich., assignor to himself and L. R. FITCH, same place.—*Portable Forge.*—November 17, 1868.—The pulley on the face shaft and an intermediate pulley are formed of rubber, so as to render them elastic, and are pro-

vided with metal rims. A double lever has a slotted arm in which the wrist of the driving pulley crank shaft works.

Claim.—1. The pulleys *o* and *q*, formed of rubber, with metallic faces or peripheries, substantially as described, in combination with the pulleys C and *p*.

2. In combination with a portable fan blast forge, the air chambers S, the double lever D, and the slotted arm F, operating in the crank G, all constructed and arranged substantially as and for the purposes described.

84,049.—JOHN H. CHADWICK, Bristol, assignor to himself and GEORGE B. PECK, Warren, R. I.—*Car Coupling.*—November 17, 1868.—A pivoted weighted lever is provided with two arms arranged so as to lock the hook when the cars are coupled, and release it when the end of the lever is raised.

Claim.—The arrangement and combination of the arms *b c*, and part or abutment, *m*, with the lever D, the draw bar chamber B, and its mouth C, substantially as described, the whole being to operate in manner and for the purpose specified, with a connection bar, E, made as set forth.

84,050.—WESLEY CORNELL and THOMAS L. BLAKLEY, Buchanan, Mich.—*Washing Machine.*—November 17, 1868.—The pivoted guide ways of the rubber board are adjusted by means of a cam having a number of square faces.

Claim.—1. The eccentric cams K, adjustable ways G, and guide blocks M, when constructed substantially as set forth.

2. In combination with all the above named parts, the box A, slide bars C, rollers E, and rubber board L, all operating substantially as specified.

84,051.—ALEXANDER G. DONNELLY, Breesport, N. Y.—*Harvester.*—November 17, 1868.—When the speed of the cutters is to be increased, the spur wheel shaft is removed from its bearings and placed in another pair of journal boxes, so that the flanged, toothed disk, which is screwed upon the spur wheel, will mesh with the pinion driving the cutter bar.

Claim.—The wheel D, constructed and operating as herein described, and for the purposes set forth.

84,052.—BENJAMIN DOUTHETT, Pittsburg, Pa.—*Beehive.*—November 17, 1868.

Claim.—A hive for bees, having all of the herein-described characteristics; that is to say, a box divided on a vertical line, so as to form two equal and distinct parts, A A, and with an India-rubber packing, T, between the two, each part or half of the hive being provided with a horizontal partition E, inclined bottom, and perforated plate, F, and a wire gauze, *m*, extending from the partition to the bottom, and a narrow horizontal box, P, beneath the hive, open at both ends, and provided at each end with a metallic curtain, N, as a passage way, common to each half of the hive; the whole being constructed, arranged, combined and operating substantially as and for the purposes hereinbefore set forth.

84,053.—FRANCIS ELLERSHAUSEN, Ellershausen, and AUGUSTUS E. STAYNER, Halifax, Nova Scotia, and ADOLPH GUZMAN, New York, N. Y.—*Manufacture of Iron and Steel.*—November 17, 1868.

Claim.—1. As a new article of manufacture, pig-bloom, or pig-scrap, being a conglomerate of cast iron, oxides, wrought iron, and particles of matter more or less nearly approaching one or other of those substances, produced by admixing, and bringing in contact with fluid cast iron oxidizing substances in a solid state, in such a manner and in such quantity as to produce a solid condition of the mass.

2. The mixing of cast iron with an oxidizing agent, one or other of which is rendered fluid by heat applied previously to such mixing.

3. The production of wrought iron from cast iron, by mixing with the latter, while fluid, a sufficient amount of oxidizing material to produce a solid condition of the mass.

4. The production of wrought iron from oxides of iron, by mixing the latter with molten cast iron to such an extent as to produce a solid conglomerate of the two.

5. The employment of deterrent agents and useful

alloys, by mingling them, or either of them, with the oxides used in the process hereinbefore described, so that they shall become part of the conglomerate, and have such intimate contact and connection with the mass as to produce their proper chemical effects when it is afterward subjected to the action of heat.

84,054.—JOHN S. EVERITT and OSSIAN COOK, Oshkosh, Wis. — *Steam-engine Slide Valve.*—November 17, 1868.—A hollow slide valve is constructed with holes on opposite sides, so that the pressure on either side balances the pressure on the other. They are adjustably connected with arms on the valve stem, which latter is provided with cams, by which the valves are adjusted to fit the valve chest when worn. A four-way cock or throttle valve reverses the flow and exhaust of the steam, thereby reversing the engines.

Claim.—1. The valve bores S S, of the valve H, with lugs r r, constructed and arranged relatively to the cams n n, arms m m, provided with slots x x, and the valve stem C, as a means of adjustment in compensating for wear of valves and valve seats.

2. The valve case A A, when constructed substantially as described, and arranged relatively to the slide balance valve H, as herein set forth.

3. The arrangement of the hollow balance slide valve H, throttle valve F, with the valve case A A, injection and ejection pipes I I', supply pipe K, and exhaust pipe K', substantially as herein set forth.

84,055. — DAN P. FOSTER, Waltham, assignor to himself and N. M. LOWE, Boston, Mass.—*Suspending Clamp.*—November 17, 1868.—The cams are united by a link, so that they may be moved together.

Claim.—A suspending clamp, formed of two segment cams, B B', pivoted to the supporting frame A, and connected by a link, C, substantially as described, and for the purpose set forth.

84,056.—HAMILTON FRANCE, Hinmansville, N. Y.—*Potato Digger.*—November 17, 1868.—The bar to which the scoop is secured is operated by a lever pivoted to the front of the machine. The grate is raised or lowered by a lever pivoted to the operator's seat.

Claim.—1. The geared wheel E, shaft F, pinion G, and arms H, in connection with the axle A, frames C and I, connecting rods J, for the purpose of giving a vertical vibratory motion to the grate K, substantially as herein described.

2. The frames C and I, hinged together at their front ends, in connection with the axle A and lever Z, when constructed and operating substantially as herein specified.

3. The bar N, arms R and U, lever Q, fulcrum S, and pin T, in connection with guides and standards O, axle P, and tongue V, when combined, arranged, and operating substantially as and for the purposes herein described.

4. The combination of the above-named parts with the wheels B and X, bails M, and seat Y, when constructed, arranged, and operating substantially as herein set forth and shown.

84,057.—CHARLES F. HADLEY, Chicopee, Mass., assignor to CLIFFORD ARRICK, Belmont County, Ohio.—*Chuck.*—November 17, 1868.—The bevel gear is fitted on the adjustable nut by means of the annular groove, dividing ring, and securing pins, so that it may revolve freely, and still allow the nut to turn independently on its axis, to allow the bevel gear to be thrown in or out of gear with the bevel pinions, the object being to allow a concentric or eccentric adjustment of the jaws for circular or irregular-shaped work.

Claim.—1. The arrangement of the adjustable nut E, bevel gear F, divided ring G, and securing pins h h, or their equivalents, constructed substantially as described, and for the purpose set forth.

2. The arrangement of the adjustable nut E, bevel gear F, divided ring G, annular groove d, and securing pins h h, or their equivalents, in combination with the bevel pinions D, constructed and operated substantially as and for the purpose set forth.

84,058.—MORTIMER S. HARSHA, Batavia, Ill., assignor to himself and EDWIN MEREDETH, same place.—*Washing Machine.*—November 17, 1868.

Claim.—The combination of the bars F F, pivoted at their centers to the frame B, the two rollers D D, having bearings in opposite ends of said oscillating bars F F, the roller C, arranged beneath and between said rollers D D, and the cam wheels A A, all arranged and operating so as to give the rollers D D a rotating, a longitudinal, and an oscillating motion with respect to the roller C, substantially as herein shown and set forth.

84,059.—ADAM HERBIG, Corry, Pa., assignor to himself and THOMAS BLACKBURN, same place.—*Tuyere.*—November 17, 1868.—The fire pot has a denticulated vertical margin which fits over a similarly denticulated flange projecting downward from the inner edge of the annular cap piece; by rotating the fire pot the spaces between the teeth may be made to coincide and give a full blast or be partially or wholly closed, giving little or no blast.

Claim.—The circular duck's nest A, provided with the inlet pipe d and the outlet pipe d', placed opposite each other, and with the damper e', all arranged and operating substantially as described.

84,060.—JULIUS HIETEL, JOHN WENZEL HIETEL, and JOHN LOOMIS GEISSLER, Philadelphia, Pa.—*Watch Escapement.*—November 17, 1868.—A spring branch on the detached lever embracing the pallet staff, permits the balance wheel to turn freely under irregular movements or disturbances without injury to the impulse pin of the said balance.

Claim.—1. The described construction of the self-regulating lever C, for watch escapements, consisting of the arm b, fitting around the staff D, and provided with a shoulder, e, against which rests the end of the shorter arm d, said arms being connected by the spring f, as herein set forth.

2. The combination and arrangement, in a watch escapement, of the balance wheel A, spring lever C, partly flattened or grooved staff D, pallets F, banking pin h, and ruby pin a, all made and operating substantially as herein shown and described.

84,061.—ISAAC HULL, Stamford, Conn., assignor to himself and J. FERGUSON MORSELL.—*Rein Holder.*—November 17, 1868.—One of the jaws of the clamp embracing the dash board is provided with a spring, between which latter and the jaw to which it is fastened, the reins are held.

Claim.—The device for holding driving reins, composed of the clamp A and spring B, constructed and operating substantially as herein specified.

84,062.—MICHAEL KELLY, New York, N. Y., assignor to himself, WILLIAM LALOR, and JAMES SLAMMON, same place.—*Metallic Fence.*—November 17, 1868.—Designed as an improvement on his patent of February 11, 1868.

Claim.—The construction of thorny fence by fixing the thorns B in holes in the wire A, in the manner and for the purposes herein set forth.

84,063.—HENRY KINSEY, F. W. KISSELL, J. E. SMITH, and J. M. SMITH, Ligonier, Pa.—*Hay Cutter.*—November 17, 1868.—The knives are pivoted at their outer ends to the front end of the feed box and their inner ends are slotted to receive an arm on a vertical rod, which latter is operated by a double crank and bent pitman. The vertical rod is connected to a rock shaft which actuates a pawl operating the feed rollers.

Claim.—1. The knives H, constructed and operating substantially as herein shown and described, and for the purpose set forth.

2. The combination and arrangement of the double crank f' of the shaft F, bent pitman J, and vertical sliding rod or bar I, having arms i¹ i² formed upon it, with each other and with the slotted knives H, substantially as herein shown and described, and for the purpose set forth.

3. The combination and arrangement of the ratchet wheels L, sliding pawls P, short arms Q, rock shaft R, long arm S, and pitman T, with each other and with the feed rollers K L, and sliding rod or bar I, for the purpose of operating the said feed roller from the said sliding bar I, substantially as herein shown and described.

84,064.—RALPH R. LEE and GEORGE H. WREN, Mahanoy City, Pa., assignors to themselves and JOHN C. NORTALL, same place.—*Valve for Steam Engine.*—November 17, 1868.—The action of the piston upon tappets gives motion to the induction and eduction valves. The valve is cylindrical, has a central vertical partition, and moves upon fixed heads within the chest. The steam ports pass through the fixed heads, and discharge steam against the valve partition, thereby giving the valve its reciprocating motion, and opening and closing the ports of the main cylinder.

Claim.—1. The main valve C, constructed substantially as herein shown and described.

2. The combination of the valve C with the stationary heads F G of the steam chest, substantially as herein shown and described.

3. The arrangement of the valve C and heads F G with relation to the steam ports *p*, substantially as herein shown and described.

84,065.—SYLVANUS D. LOCKE, Janesville, Wis.—*Reel for Grain Binders.*—November 17, 1868.—The friction of the brake is the measure of the tension with which the binding material is paid out; and when the binding material slackens, the spring, driving the reel backward, causes it to take up the slack material.

Claim.—The combination of the reel A, spring D, and brake E, either with or without the pins I, or with or without the cylinder B, substantially as and for the purpose set forth.

84,066.—JAMES OSMAN and JOHN F. POTTER, Linden Hall, Pa.—*Car Coupling.*—November 17, 1868.—The circular heads of the coupling bolt are turned horizontally when they have entered the vertical slots of the draw head, and are turned up vertically before they can be withdrawn.

Claim.—The pivoted plate I, having the guides *e e*, or their equivalent, when employed in connection with a draw head, substantially in the manner and for the purposes described.

84,067.—U. H. READ, JEREMY LAKE, and LUTHER Sisson, North Easton, Mass.—*Anti-Friction Washer.*—November 17, 1868.—When the washer is under the action of a nut which is being screwed down on a bolt or on a vise screw, between the bearing and the shoulder of the screw, the pressure will be taken by the balls between the two parts, and one of said parts allowed to turn with the nut or screw, thereby reducing friction.

Claim.—The combination of the parts A, B, and D, and the spherical balls, substantially as and for the purpose described.

84,068.—FRANK A. REIHER, Cincinnati, Ohio, assignor to FRANK A. REIHER AND COMPANY.—*Window Shutter.*—November 17, 1868.—An upper and a lower set of metallic slats meet at the center of the window when closed. The lower slat of the upper set and the upper slat of the lower set are attached to sliding racks at the sides of the window frame, and the respective racks are geared together by fixed pinions. Hence by raising or lowering the upper slat of the lower set a corresponding movement may be given to all or any desired number of the other slats in that set, as well as a simultaneous, but opposite, movement to the slats of the upper set.

Claim.—The arrangement of the two series of lipped or flanged slats I II III IV, I' II' III' IV', racks D D', pinions E, and guiding grooves 1, 2, 3, 4, 1', 2', 3', 4', substantially as set forth.

84,069.—GUSTAVUS RENEKY and SAMUEL KEISS, Edgerton, Ohio.—*Spring Bed Bottom.*—November 17, 1868.

Claim.—The arrangement, herein described, of the longitudinal slats A, blocks C, transverse slats B D G, double looped springs E, grooved and slotted blocks F, metallic loops I, and straps H, as and for the purpose specified.

84,070.—GELSTON SANFORD, Bergen, N. J., assignor to the MALLORY AND SANFORD FLAX and HEMP MACHINE DRESSING COMPANY, New York,

N. Y.—*Machine for Separating the Pulp from Fibrous Substances.*—November 17, 1868.—The rotary wheel has radial combs and scrapers upon its sides that operate between vertically-suspended planks, for holding the material to be operated upon and pressing it against the combs or scrapers as the thickness of the mass varies. The position of the opening in the holding planks enables a favorable disposition of the fibrous leaves to be made in submitting them to the action of the wheel.

Claim.—1. The holding planks F, suspended vertically upon each side of the rotary scraper disk, when the feed openings therein are arranged above the horizontal plane of the axis of said disk, as herein described, for the purpose specified.

2. The vertical holding planks F, suspended above the disk A, free from contact with the combs E, and adapted to be operated by the cam levers G, to press the material to be operated upon against the radial combs from opposite sides, as herein shown and described.

3. The described arrangement of the rotating disk A, the radial combs E, upon opposite sides of said disk, the suspended planks F, having the feed openings and the spouts I, the side rails H, and cam levers G, all operating as described, for the purpose specified.

84,071.—WILLIAM A. SHARP and JOHN A. SHANNON, Tama City, Iowa.—*Harness-tree Pad.*—November 17, 1868.

Claim.—The pad F, made heart-shaped, or triangular, to increase its bearing surface parallel with the animal's back, and having formed upon its outer and small end the loop G, for the passage of the tug-buckle strap, whose upper end is secured by a rivet passing through the hole H, and also provided with the two lugs C, between which the tenon of the terret D is secured by the bolt E, all arranged and operating as described, for the purpose specified.

84,072.—AMOS SHEPARD, New Britain, Conn., assignor to "UNION MANUFACTURING COMPANY," same place.—*Venting Metallic Cores.*—November 17, 1868.—The metal to be inclosed by the molten metal is provided with creases, flutes, or acute angles, so fine that the molten metal will not close solidly over them, small apertures being thus left, through which the air or gas may escape to the pores in the sand.

Claim.—Venting the interior surface of the molten metal which comes in contact with the solid metal, by means of grooves *d*, formed in the solid metal, substantially as described, and for the purpose herein specified.

84,073.—H. P. WETMORE, Elizabeth, N. J., and J. G. HITCHCOCK, New York, N. Y.—*Cloth Drawers.*—November 18, 1868.

Claim.—As a new article of manufacture, cloth drawers, formed in pieces A and B, having the joining seam extended across the back of the leg at or near the knee joint, substantially as and for the purposes herein set forth.

84,074.—JOHN W. WHEELER, Cleveland, Ohio, assignor to H. H. WHEELER, New York, N. Y.—*Machine for Spreading Paint or Mastic.*—November 17, 1868.—The paint or mastic is thrown upon the paper or cloth when the latter is adjusted upon the apron. The paper is fed beneath the spreading roller by the apron, the roller and apron turning in opposite directions. The spring guards prevent the cement from being spread upon the margin of the fabric.

Claim.—1. The spreader or roller B, in combination with the apron E and rollers F F', when operating conjointly and reversely in relation to each other, for the purpose specified.

2. The guards J, springs K, as arranged, in combination with the apron E, and in relation to the frame A and spreader B, in the manner as and for the purpose set forth.

84,075.—LORENZO D. WYATT, Castleton, Ind., assignor to himself, SAMUEL FARLEY and EDWARD MCMANAMA.—*Corn Planter.*—November 17, 1868.—By depressing the lever, pivoted upon one of the

handles, a weight is raised and a jointed-rod connection actuated, so as to turn the seeding wheel and discharge the contents of its pocket; the weight, gravitating, turns the wheel back to its first position. The agitator is attached to the wheel.

Claim.—The arrangement A, B, C, D, E, F, and G, and the agitator N, all arranged and operating substantially as described, for that purpose.

84,076.—CHRISTOPHER AMAZEEN, New York, N. Y.—*Paper-Bag Machine.*—November 17, 1868.—The paper in passing into the machine from a mounted roll has paste applied to its margin at one side, and is fed forward to toothed knives, which cut off a piece large enough to form a bag. The pasted and detached piece is then made to pass on beneath a plate or former, around which it is deflected, into tubular form, by bent guide plates. The paper, being delivered from this forming device, has its pasted side pressed down upon the adjoining edge. One side of the paper tube is now longer than the other, (a result due to the shape of the knives,) and the mechanism, which finally comes into play, applies paste to the projecting end, folds it over to finish the bag, and discharges the latter from the machine.

Claim.—1. The arrangement of the knives G and H with the collars I I and the spring forwarders J J, substantially as and for the purposes herein set forth.

2. The arrangement of the cog wheel *w'*, on the main shaft *h*, and gear wheels *v' v'* secured in slots to the frame A, so that the former may be changed, and the latter are movable, for the purpose of adapting the machine to making bags of different sizes, substantially as herein set forth.

3. The bag former K, constructed as described, in combination with the pressing roller *d'*, for the purpose of forming the bag, and pressing down the pasted side of the same, substantially as herein set forth.

4. The arrangement of the rollers *r* and *w*, one placed under the rear end of the bag former K and the other under the pressing roller *d'*, the rubber carriers *p p*, and the rollers *b' b'*, which latter are provided with rings to hold the carriers in proper position, all constructed as described and operating substantially as and for the purposes herein set forth.

84,077.—WILLIAM WALLACE ANDERSON, Camden, N. J.—*Thill Coupling.*—November 17, 1868.—As the segments do not touch each other, they must bear constantly and snugly upon the coupling bolt, thereby avoiding rattling or looseness at the joints.

Claim.—The steel spring *b*, in combination with the segments or arches *d* and *E*, which bear upon the shaft pin *g*, but do not touch each other, and with the screw bolt *a*, the whole arranged and operated substantially as and for the purposes herein set forth.

84,078.—CEPHAS APPLEBEE, Lyndon, Vt.—*Safety Apparatus for Lamps.*—November 17, 1868.—This device is to be secured upon the foot of the burner and into the neck of a kerosene lamp. The small pipe supplies air for displacing the gas, which, being generated in the reservoir, is discharged through the small openings to prevent explosion.

Claim.—1. My improved arrangement of the air pipe *d'* with the annular body A, and its series, *d*, of gas-discharging holes.

2. The combination and arrangement of the neck *c*, and the male and female connection screws *a b*, with the annular body A, the air-entrance tube *d'*, and the gas educts or series, *d*, of discharging holes, arranged in such body, as hereinbefore specified.

84,079.—WILLIAM C. BAKER, New York, N. Y.—*Flue Cleaner for Boilers.*—November 17, 1868.—The device consists of a tube scraper and a movable partition, which may be allowed to stand in any desired position, for the purpose of serving as a bridge wall, to direct the heat and prevent it from passing directly into the chimney.

Claim.—The tube scraper, constructed and arranged as specified, so as to form a partition for directing the products of combustion, except during the operation of scraping the tubes, as specified.

84,080.—CHARLES H. BASSETT, Derby, Conn.—*Check Hook for Harness.*—November 17, 1868.—The depression of the spindle is effected in the act of forcing the rein into or out of the hook, in consequence of the inclined surface presented by the conical head.

Claim.—The arrangement of the conical-headed spindle F through the bolt or base of the hook, and provided with a spring, arranged within the body of the bolt and spindle, so as to operate in the manner herein set forth.

84,081.—SANFORD O. BLANDING, Smithfield, R. I.—*Debris Check for Pump.*—November 17, 1868.—The pipe leading upward to the pump barrel is guarded by netting to prevent the upward passage of detritus and other extraneous matter, such matter being deposited in, and occasionally cleaned out from, the air chamber.

Claim.—A debris check or strainer *c*, water charging pipes D E, and air chamber A, arranged and combined substantially as described, for the purposes specified.

84,082.—ALMENA R. BOYLSON, Chicago, Ill.—*Waist-belt.*—November 17, 1868.

Claim.—A metallic belt supporter, made in sections, with an elastic or flexible piece *b*, interposed between the sections *a*, substantially as and for the purposes specified.

84,083.—GEORGE E. BRINCKERHOFF, Brooklyn, N. Y.—*Catamenial Sac.*—November 17, 1868.

Claim.—A catamenial sac, with four elastic straps, two of which are longer than the other two, and all attached to the sac, so that the latter may be adjusted on the body of the wearer in such manner that it will not interfere with the performing of the ordinary functions of nature, substantially as shown and described.

84,084.—JOSEPH H. BRINTON, Thornbury, Pa.—*Horse Hay Fork.*—November 17, 1868.—When the fork has nearly reached the height at which the hay is to be discharged, the ball on the main rope acts through the hinged arm upon one jaw and through the cord upon the other, thereby opening the fork and discharging the hay.

Claim.—1. The use of an adjustable ball or other enlargement upon the operating rope of a hay elevator, for automatically unloading the same, substantially as herein set forth.

2. The combination of the adjustable ball H with an arm, F, jointed to one of the jaws of a hay elevator, connected to the other by a cord, *h*, and having an opening, *e*, for the passage of the operating rope, the whole being constructed, arranged, and operated substantially as and for the purpose described.

84,085.—HENRY L. BROWN, Adrian, Mich.—*Horse Rake.*—November 17, 1868.—To discharge the rake, the operator presses his foot upon the stop and disengages it from the lever, which is then drawn backward by hand to raise the teeth.

Claim.—The segmental gears G and K, lever L, quadrant M, stop N, and spring O, substantially as herein described, and for the purposes specified.

84,086.—WILLIAM BROWN, Smethwick, England.—*Rolling Mill.*—November 17, 1868.

Claim.—1. The combination and arrangement, in rolling machinery such as described, of two sets of rolls, having parallel axes, the one set consisting of two rolls, and the other of three rolls, driven at different speeds, substantially in the manner and for the purposes herein set forth.

2. In conjunction with two sets of billeting or reducing rolls, the one consisting of two and the other of three rolls, driven at different speeds, and combined as herein specified, the arrangement of the flattening and edging grooves formed in said rolls, as described and shown, for preventing the necessity for turning the bar on passing from one set to another.

84,087.—J. M. BURDICK, Ilion, N. Y.—*Hay Spreader.*—November 17, 1868.—The bars carrying the tedder teeth are connected by cranks to a revol-

ing ring which is confined between two rollers, and so arranged as to cause the teeth to point in the same direction, during their entire revolution with the tedder frame. Serew clamps secure the teeth upon the tedder bars.

Claim.—1. The combination and arrangement of the tedder teeth F F, bars E E, with cranks H H, and revolving ring I, constructed and arranged to operate substantially as described.

2. In combination with the teeth F F, the loop b and clamp a, for fastening said teeth upon the bars E E, substantially as described.

3. In combination with the tedding devices above claimed, hinging the shafts to the main frame A, and making their direction, relatively to said frame, adjustable by means of the link M, rock shaft N, and hand lever O, to raise and lower the tedder frame as required, substantially as described.

84,088.—ROBERT M. CAMPBELL, Cambridgeport, Mass.—*Sash Supporter.*—November 17, 1868.—The serew, acting against the plate causes the journalled roller to bear against the window frame, with sufficient force to retain the sash at any degree of elevation. The sash, when closed, is locked in place by turning the serew, causing a projection on the plate to enter a notch in the side of the window.

Claim.—The within-described sash supporter and lock, consisting of the plate C, with its friction roll D, in combination with the serew E, and a projection e, for locking the sash when closed, operating substantially as described.

84,089.—WILLIAM B. CHOATE, Galt, Canada West.—*Heat Radiator.*—November 17, 1868.—Consists of a flattened tube whose end pieces may be of cast-iron, while the remainder is of sheet iron, the parts being joined together by flanges.

Claim.—1. In combination with a radiator of serpentine form, the method of placing the flanges d and f on the end plates, substantially as shown and described.

2. Depressing the flue of the radiator after the curves or turns, so as to form a series of diving flues, substantially as and for the purpose set forth.

84,090.—LYMAN CLINTON, North Haven, Conn.—*Horse Rake.*—November 17, 1868.—Improvement on the rake patented by CLINTON and MUNSON, May 22, 1866. Consists in combining with the foot treadle, which bears down the rake teeth, a second treadle, attached directly to the axle and serving to raise the teeth.

Claim.—The combination and arrangement of the two treadles D and E with the axle A, the one fixed directly to the axle, and both in relative position to each other, so as to be operated in the manner specified.

84,091.—JOHN E. COFFIN, Portland, Me.—*Machine for Folding and Cording the Edge of Paper.*—November 17, 1868.—The paper passes through three sets of rolls. By the first set the edges of the paper are turned up at a right angle. By the second set and its accessories the cord is guided into place and the paste applied near the upturned edges, and the latter are then folded down so as to inclose the cord. By the third set the folded and corded edges are smoothed.

Claim.—1. The creasing rolls e d, chutes b b' of guards z, pasting disks 1, 2, 3, grooved as shown, pressing roll m, and finishing rolls p q, all arranged and combined substantially as and for the purposes set forth.

2. The pasting disks 1, 2, 3, provided with grooved edges to receive the cord e', substantially as shown

84,092.—Z. S. CRACRAFT, Lacon, Ill.—*Means for Securing Springs to Slats of Bed Bottoms.*—November 17, 1868.

Claim.—Securing the semi-elliptic spring b to the slat d, by means of the coupling piece e, provided with the bent lips e' e', passing through slots in the slats, substantially as described.

84,093.—WILLIAM J. DE GRUMMOND, Cincinnati, Ohio.—*Sash Fastener.*—November 17, 1868.—Spiral springs, arranged on one side of the window

frame, press a strip against the side of the sash, and thus force a projection on the opposite side into cavities in the window frame.

Claim.—The series of springs marked F or F', and the pieces D or D', or the equivalent of said devices, in combination with the catch E and the series of cavities or notches K, as and for the purpose described.

84,094.—THOMAS DILLON, Highland, Ohio.—*Corn Plow.*—November 17, 1868.—The plow blade is adapted to any kind of a plow, single or double shovel, sulky plow, or subsoiler.

Claim.—1. The tenoned plow beam E, pivoted in the beam A, and provided with a bent arm, F, by which it is adjusted at any height desired, substantially as herein set forth.

2. The curved plow blade H, provided with an ear or lug, I, for the purpose of attaching it to the plow beam E, substantially as herein set forth.

84,095.—SAMUEL DISSTON, Philadelphia, Pa.—*Attaching Handles to Cross-cut Saws.*—November 17, 1868.—The wooden handle is serewed into the tapering socket on the end of the slotted stem for holding the saw, which latter fits in a grooved washer covering the end of the ferrule.

Claim.—The socket B, forming a part of the slotted stem b, and having an internal serew thread for the end of the handle D, in combination with the grooved washer e and a ferrule E, having an internal serew thread adapted to a thread on the socket, the whole being constructed and arranged substantially as and for the purpose set forth.

84,096.—AUGUST DOEPP, Newark, N. J.—*Compound for Treating Leather.*—November 17, 1868.—Composed of oleate of glyceryl, oil of tar, and nitrobenzene.

Claim.—A compound for treating leather, the chief ingredient of which is oleate of glyceryl, as set forth.

84,097.—V. C. DUCLOS, New Harmony, Ind.—*Plow.*—November 17, 1868.—An arm for raising and lowering the plow beam, pivoted to the rear end of the beam, extends upward between two uprights on the rear end of the hounds, and is held by a pin fitting in notches in the posts.

Claim.—1. The arrangement of the notched standards J J, arm K, and pin d, for the purpose of regulating the plow, substantially as herein set forth.

2. The combination of the hounds C C, hinged beam F, arm K, standards J J, and lever L, all constructed and operating substantially as and for the purposes herein set forth.

84,098.—WILLIAM EDSON, Boston, Mass.—*Sash Fastener.*—November 17, 1868.—A leaf, hinged to a plate secured to the window frame, is provided with a horn which rests against a segmental wedge on a lever pivoted to said plate. By pressing the lever down the leaf is pressed against the sash and holds it in position.

Claim.—The segment wedge F, horn H, and leaf A, operating in combination with the plate B, substantially as described and for the purpose set forth.

84,099.—JOHN V. D. ELDRIDGE, Detroit, Mich.—*Take-up for Sewing Machine.*—November 17, 1868.—The pin on the needle bar, engaging with the curve in the lever, causes the projection on the end of the lever to engage with the spring take-up, thereby slackening the thread so that the shuttle will only have to draw the thread through the stuff operated upon.

Claim.—The combination and arrangement of the needle bar F, provided with pin G, face plate B, provided with slot I, take-up spring E, and spring lever A, with the curve H, and projection D, all constructed as described and shown.

84,100.—JOSEPH ELLENBERGER, Easton, Ohio.—*Post Driver.*—November 17, 1868; antedated November 13, 1868.—A windlass is used to elevate the weight, sliding in guides, adjustable vertically.

Claim.—The arrangement of the adjustable guides K K, grooved weight R, slotted beam H, pulley g,

cord *f*, and windlass I, with the frame constructed as specified, with its various parts, for operating as herein set forth.

S4,101.—JAMES ENGLISH, Syracuse, N. Y.—*Shielding Arches for Evaporating Kettles.*—November 17, 1868.—The connecting ends of the two sections of the arch are corrugated so that they will engage when the supporting walls expand or contract. A cap covers the joint, and clasps and holds the sides of the arch.

Claim.—The combination of the inclosing shield C with the cogs *a a*, in the ends of the sections forming the joint, the whole arranged as described, and operating in the manner and for the purpose specified.

S4,102.—CAROLINE F. FLEMING, Belleville, Ill.—*Washing Machine.*—November 17, 1868; antedated October 28, 1868.—The apertures between the sections of the roller allow the water to pass through the clothes.

Claim.—The roller B, when formed of the sector pieces *b*, and combined with the shaft C by the washer plates *c*, substantially as set forth.

S4,103.—JAMES H. FOOTE, Pittsfield, Mass.—*Candle Cap.*—November 17, 1868.—The candle cap is provided with an annular flange rest to prevent the uneven melting and wasting of the candle.

Claim.—A candle cap, *a*, when provided with an annular flange rest, *b*, in the form and manner described, as a new article of manufacture.

S4,104.—CHARLES E. FRAZIER, Baltimore, Md.—*Hydrant.*—November 17, 1868.—The hollow piston, in the chamber, is connected with the hollow screw in which the valve stem is fastened, and is rotated to open and close the valve by a handle pivoted to a rotating tube on the cap. The hollow piston can be raised or lowered to limit the space in the chamber to allow a space for receiving the water from the discharge pipe when the hydrant is closed to prevent freezing.

Claim.—1. The cap or top B C, constructed and operated in the manner substantially as shown and described, and for the purpose set forth.

2. The combination of the hollow screw H, and the valve stem I, arranged, constructed, and operated in the manner substantially as shown and described, and for the purpose set forth.

3. The combination of chamber F, screw H, rod I, and hollow piston *b*, arranged, constructed, and operated in the manner substantially as shown and described, and for the purpose set forth.

S4,105.—PETER GEISER and DANIEL GEISER, Waynesborough, Pa.—*Threshing Machine.*—November 17, 1868.—A hook, extending from the tie through the wind case, is provided with a regulating weight so that the action of the register may be regulated according to the degree of strength designed to be given to the blast.

Claim.—1. A threshing machine and separator, combining in its construction the following elements, viz: An adjustable feed board, a cylinder and concave, two sets of reciprocating rakes, and a series of spur wheels and intermediate pinions for driving both rakes from the fan shaft, substantially as set forth.

2. The combination of the fan shaft, the two sets of reciprocating rakes, and the pinions U², X¹, X², and X³, and arm, with wrists supporting the intermediate pinions X and X², substantially as set forth.

3. The arrangement of the shields in relation to the gearing for driving the rakes, substantially as and for the purpose set forth.

4. In combination with the reciprocating rakes, the intermediate notched bars, the slides and guides, the cranks, and the system of driving gearing, substantially as set forth.

5. So arranging the parts of the driving mechanism that the motion of the several parts shall be communicated from one to another at a regularly reduced speed from the cylinder to which the power is first applied, substantially in the manner set forth.

6. The cast shoe, side plates, with pivot or joint bearings, shelf or apron recesses, adjustable slide-board flanges, and with notched recesses to receive the second roller shaft, substantially as set forth.

7. The shoe, when constructed with combined metallic and wooden sides, and so arranged, in relation to the case of the separator, that blasts of air may pass between the shoe and the case, substantially as and for the purpose set forth.

8. In combination with the fixed register plates, the oscillating inner plates V¹, connected by a tie, V², and having one side loaded so as to open the register by gravity, and a regulating weight attached to the hook V³, said parts being so arranged in relation to the blast as to operate substantially as and for the purpose set forth.

9. The dividing apron O, in combination with the graduating rib O², substantially as and for the purpose set forth.

10. The chaff board *g* for separating the tailings and the chaff, when constructed and arranged so as to be applicable, also for the purpose of closing the rear end of the winnower, substantially as set forth.

S4,106.—CHARLES V. GENUNG, Duquoin, Ill.—*Rotary Pump.*—November 17, 1868.—A slotted V-shaped projection on the piston depresses an abutment connecting with the induction valve, and closes the latter. An opening in the abutment allows the water to enter the hollow cylinder from whence it is discharged through the center of piston and case.

Claim.—1. The hollow cylindrical piston A, having the slotted V-formed projection V, when used in combination with the follower B and vane C, as herein specified.

2. The hollow piston A, provided with the opening H, forming an eduction passage, substantially as described.

3. The vane C, having an enlarged head, forming the follower B, as specified, as arranged in relation to the trip D and valve E, as herein described and for the purpose specified.

S4,107.—JOSEPH U. GEROW, Brooklyn, N. Y.—*Sash Lock.*—November 17, 1868.—The slotted bolt, provided with a sharp projection, is pivoted to the lock plate, and operated by an eccentric having a weighted handle, so that, when the projection on the bolt is forced into the window frame by the cam, the weighted handle tends to keep it in place.

Claim.—The arrangement and construction of the slotted and suspended plate A, to which is attached the projecting fastener D, with the weighted handle C', in combination with the cam B and lock plate or case E, as shown and described.

S4,108.—SAMUEL D. GILSON, Oswego Falls, N. Y.—*Propeller for Canal Boats.*—November 17, 1868.—A number of small propellers are used instead of large ones, so that they may be placed lower down in the hull to operate when the boat is loaded or unloaded. Two boilers are employed, one of which is reserved, in case of accident to the other.

Claim.—1. The canal-boat, with pairs of shafts, *a a*, carrying propellers B, of small diameter, and applied on each side of the center of the boat, at its stern, upon said shafts, which are all on the same or nearly the same horizontal plane, and driven substantially as described.

2. The combination and arrangement of two small steam boilers, depressed engine, and boiler room E, and shafts *a a*, with small propellers, B, in pairs, on each side of the center of the boat, substantially in the manner and for the purposes described.

S4,109.—JAMES GRAY, Albany, N. Y.—*Magazine Stove.*—November 17, 1868.

Claim.—1. In a base-burning stove, having a fuel magazine suspended free from the grate, and having an unobstructed free space around and below it, and having an illuminated casing surrounding the same, the construction of descending flues N N, passing from the brim of the fire pot C, and outside the base A', and near the front of the stove, into annular flue K, in combination with ascending flues L and O, chamber R, and descending flue T', substantially as shown and described.

2. The construction of hooded chute I, with a flue opening, T, upon the top thereof, for the purpose of causing the products of combustion from flue O to pass through the said hooded chute on their passage

to exit flue M, substantially as and for the purpose set forth.

3. The combination of the intermediate air chamber J, the descending flues N N, the annular flue K, and the ascending flue L, substantially as shown and described.

4. The combination of the combustion chamber E, flue O, and hooded chute I with its top flue opening T, substantially as herein set forth.

5. The revolving cover or valve Q, in combination with the coal reservoir H, and the hooded chute I, substantially as and for the purposes herein set forth.

6. In a coal stove or furnace, having a depressed fire pot, and a supplying reservoir sustained free from the grate and fire pot, and so arranged that the inflated gases may burn in a free space, so constructing and arranging such stove or furnace, that a portion of the products of combustion arising from the fire will be conducted up, around, and above the reservoir H and hooded chute I to the top of the stove, and at the same time another portion of said products of combustion will be carried down outside the fire pot C, to and around the bottom of the stove, thereby producing an equal degree of heat over the entire surface of the stove, substantially in the manner herein described.

84,110.—JOHN GRAY, San Francisco, Cal.—*Hydrocarbon Burner*.—November 17, 1868.—The gas flows from the retort through openings in the bottom of the tube, and escapes around the metal plug, which can be raised or lowered to increase or diminish the size of the flame.

Claim.—The above-described adjustable burner, consisting of the cylinder B, plug E, adjusting stem D, and openings *a a*, constructed and arranged substantially as described.

84,111.—A. C. GRETH, Reading, Pa.—*Wrench*.—November 17, 1868.—A roller, having bearings in slots in a case placed over the jaw of the ordinary monkey-wrench, causes the jaws to gripe the pipe more firmly as the pressure of turning increases.

Claim.—1. The roller B, moving in the slides *e e*, when applied to the jaw of a wrench in the manner described, for the purpose set forth.

2. The shell or case, of substantially described construction, when carrying the roller B, and fitted to be placed over the jaw of an ordinary monkey or key wrench, in effect as and for the purpose set forth.

84,112.—ALBERT HALLOWELL, Lowell, Mass.—*Gas and Steam Fittings*.—November 17, 1868.—The screw core is passed upward through the center of the mold, thus bringing the top side of a disk on the core against the bottom of the mold, which latter is made in two pieces clamped together. The metal is poured in at the flaring annular gate around the top of the screw ease, and after cooling the screw core is withdrawn, the mold unclamped, and the casting withdrawn from the die.

Claim.—The mold or molds, constructed and arranged substantially as described, for the purpose of forming finished fittings, or parts of fittings, as and for the purpose specified.

84,113.—ALEXANDER HAMAR, New York, N. Y.—*Roasting Iron Ores by Waste Gases*.—November 17, 1868.—The ore is fed continuously through the furnace and roasted by the waste gases from the blast furnace.

Claim.—The combination, as set forth, with the kiln, of the open top for charging the raw ore, the open bottom for discharging the roasted ores, the flue, encircling the roasting chamber, and communicating with it by the slits *d*, and a fan, for forcing in the heated waste gases escaping from the blast furnace.

84,114.—A. HAMMON, Paris, France.—*Machine for Forming Tin-lined Lead Pipe*.—November 17, 1868.

Claim.—1. The combination and arrangement of the sliding cross-head F', vertically slotted nuts and screws *f H*, or their equivalents, and pillars C C', for the purpose of adjusting the die *e* to the mouth of the mold, in the manner described.

2. The combination and arrangement of the lifting apparatus, consisting of a cylinder, G, and the parts thereto attached, with the slotted nuts and screws H *f*, or their equivalents, and pillars C C', for the purpose of confining, releasing, and moving the cross head F', at the times specified and for the purposes set forth.

84,115.—WILLIAM S. HARRISON, Germantown, Tenn.—*Washing Machine*.—November 17, 1868.—The connecting lever between the operating levers of the upper of two semi-cylindrical wash boards is adjustable.

Claim.—The frame F, hinged at one end of the stationary tub, and provided with levers G, connecting the board A, and with an adjustable lever for operating the interior board B, with slotted arms *m*, all as herein shown and described.

84,116.—HENRY HAUER, Philadelphia, Pa.—*Padding or Stuffing for Harness*.—November 17, 1868.

Claim.—The stuffing of collars, saddles, and other parts of harness, with granulated cork, combined with a gum-elastic or other equivalent cement, as and for the purpose herein set forth.

84,117.—B. R. HAWLEY, Normal, Ill.—*Drying Kiln*.—November 17, 1868.—The cold air enters the kiln through a chamber in the bottom of the house surrounding the fire box, and is heated by the plates of said box, and ascends into the hot air chamber through which the smoke tubes from the fire box pass.

Claim.—1. The dry house or kiln A, when provided with an inlet, *b*, surrounding the fire box, at or near the base of the house, and with the heating chamber B', which is to be so arranged as to conduct the heated air to the top of the building, and the up-cast shafts or chimneys D, when the latter are arranged to take the vitiated or spent air from the bottoms of the chambers A', substantially as described and for the purpose shown.

2. The fire box B, the smoke tubes C, and the hot air chambers *b* and B', when constructed and employed as and for the purpose set forth.

84,118.—DAVID B. HEDDEN, Newark, N. J.—*Chair*.—November 17, 1868; antedated November 5, 1868.—Pins running across the grain of the wood through the seat serve to strengthen it. Holes bored in the seat to lighten it are closed at their outer ends by plugs. The legs are made in one piece, and bent to the desired shape. The back is provided with metal pieces which fit in grooves on the bottom of the seat.

Claim.—1. The seat C, constructed with one or more pins *d*, and the holes E with the plugs F, substantially as and for the purposes set forth.

2. In combination with the said seat, the legs A B, constructed and secured as described.

3. In combination with the said seat, the back G, constructed and secured in the manner described.

84,119.—CLEMENT F. HINMAN, Chicago, Ill.—*Composition Roofing*.—November 17, 1868.

Claim.—A roofing composition, composed of coal tar, clay, (or other similar suitable substance,) glycerine, and dissolved India-rubber, either with or without animal oil, substantially as and for the purposes specified.

84,120.—DWIGHT HITCHCOCK, Syracuse, N. Y.—*Roofing Compound*.—November 17, 1868.—Composed of calcareous tufa, marl, sand, and coal tar.

Claim.—A roofing compound, composed of the within ingredients, in about the proportions mentioned.

84,121.—SIDNEY S. HOGLE, Berea, Ohio.—*Seeding Machine and Cultivator Combined*.—November 17, 1868.—The machine is constructed so that the ground will be cultivated, harrowed, seeded, and rolled at one continuous and simultaneous operation.

Claim.—1. The revolving cultivators E, as arranged in combination with the jointed frame A, for the purpose and in the manner substantially as set forth.

2. The combination of the revolving cultivators E and rollers B B', in the manner as and for the purpose specified.

3. The combination of the revolving cultivator E rollers B B', and seeding boxes, substantially as and for the purpose specified.

4. The special construction and arrangement of the drill box A', when operated in the manner as and in combination with the cultivators E and rollers B B', for the purpose described.

5. The slotted standards *i*, revolving cutters or disks F', in combination with the box D, in the manner as and for the purpose set forth.

6. The windings, wings, or ribs *d*, as arranged in combination with the wings *c* and roller I, for the purpose set forth.

7. The combinations of the toothed wheels K, rollers B B', agitator I, and chain J, for the purpose specified.

84,122.—GUY C. HUMPHRIES, Washington, D. C.—*Can Opener*.—November 17, 1868.—The knife has its fulcrum between the two outside edges of the bearing block, which latter edges prevent any slipping of the block while the knife is cutting.

Claim.—The bearing block C, hinged or pivoted to the knife A A', substantially as and for the purpose set forth and described.

84,123.—DANIEL HUSSEY, Nashua, N. H.—*Differential Gear Elevator*.—November 17, 1868.—The pulley over which the belt passes rotates on a stationary internally-toothed wheel. A differential gear revolving on a stud secured to the side of the pulley, is composed of two gear wheels, one of which meshes into the stationary toothed wheel and has one more tooth than the other one which gears into the toothed wheel secured to the pinion shaft. The pulley must make as many revolutions as there are teeth in the smaller gear wheel to cause the pinion shaft to be turned over.

Claim.—The combination of the racks *c c*, pinions *d d*, internal gears *j* and *l*, and differential gear *k*, when constructed and operating substantially as and for the purposes described.

84,124.—BENJAMIN A. JENKINS, La Crosse, Wis.—*Iron Window Shutter*.—November 17, 1868.—The ends of the pins supporting the slats are bent and prevented from being withdrawn by a retaining strip.

Claim.—1. Metal slats *a*, which, in transverse section, are of a form very similar to the letter U inverted, the leaves of each slat being pressed together, so as to leave an air space between them, and form an eye just below the arch of the U, to receive and confine the pivot on which the slat is hung, all as herein described and shown.

2. As a new article of manufacture, the metal window shutter, with its hinging sides, made of U-iron, and its closing sides, of a similar shaped iron, lapping at the closing edges, said shutter having its slats double, and pivoted to the arch of the U-iron, and also having its bar, which adjusts the slats, made of U-iron, and connected to the slats by iron brackets, all as described.

3. The arrangement of the U-sheet metal hinging facing strips G G, in combination with the double slats and U-metal frame, all in the manner described and shown.

4. The pins *c*, carrying slats *a*, with bent ends, in combination with the retaining strip *b*, as herein described.

84,125.—JOHN KLEPZIG, San Francisco, Cal.—*Lemon Squeezer*.—November 17, 1868.—A movable button supported by a spiral spring is placed in an opening in one of the levers. The juice from the lemon is expressed through a hole in the button into a receptacle while the rind is pressed closely against the face of the button.

Claim.—The movable button E, with its opening H, the spiral spring F, in combination with the two levers A and B, operating substantially as and for the purpose specified.

84,126.—CHARLES LEWANDO, Boston, Mass.—*Caster*.—November 17, 1868.—The sphere rests

against concave friction rollers which are set diagonally in the caster frame.

Claim.—In a ball caster, the concave friction rollers D D' D'', said rollers running on inclined axles, made substantially as described, and for the purpose set forth.

84,127.—WILLIAM LOUDEN, Cedar Township, Iowa.—*Elevator*.—November 17, 1868.—Designed as an improvement on his patents of September 24, 1867, and March 17, 1868.—The track is so attached to the ridge pole as to be suspended without ascending into the barn peak. A keeper or guide prevents the lateral play of the lever over which the rope from the latch passes.

Claim.—1. The within-described arrangement of the bar N, for suspending the track or railway A, substantially as set forth.

2. The manner of attaching the pulley E to the track or railway A, substantially as shown and described.

3. The adjustable stop P, when provided with a projecting pin or hook, around which the hoisting rope is fastened, substantially as shown.

4. The lever L, so arranged and operated that it can be used both as a latch and as a brake, substantially as shown and set forth.

5. The combination of the levers L L', having a flexible or sliding connection, substantially as and for the purpose set forth.

6. The levers L L', having a flexible connection, in combination with a weight for producing, and a stop, F, for releasing the pressure on the hoisting rope, substantially as and for the purpose set forth.

7. So arranging the latching apparatus that the hoisting rope will pass by, instead of through it or around it, and the latch be released by one edge of the plate S coming in contact with it, substantially as set forth.

8. The guide or keeper K, for the purpose specified.

84,128.—JOHN MAGOFFIN, St. Louis, Mo.—*Womb Supporter*.—November 17, 1868.—The plate on the inferior rod is curved to fit the posterior side of the anterior lip of the uterus. The superior rod is armed with teeth which shut down on the plate and grasp the uterus, which can then be moved about for proper adjustment.

Claim.—1. The instrument herein described, consisting of the curved rods A B, having their forward ends provided with the plate *b* and claws *a'*, and pivoted together by means of the pin *a*, substantially in the manner and for the purpose described and set forth.

2. The instrument A B, in combination with the external supporter C, as described and shown.

3. The arrangement of the adjusting screw D, by pivoting it to the rod B, and sliding it in a slot in the end of the rod A, as described and set forth.

84,129.—JABEZ F. MASON, Brooklyn, N. Y.—*Scrubbing Brush and Mop*.—November 17, 1868; antedated November 2, 1868.—A ring on the end of a metal socket of the handle is placed over a circular flange on the center of the plate and is secured thereto by the flange of the mop handle and a screw on the stem passing through the metal plate on the brush. The thumb screw secures the handle in any position.

Claim.—1. A handle attachment for a scrubbing brush, formed of the ring *c*, flange *i*, stem *e*, and screw, in combination with the plate *b* and thumb screw *g*, substantially as and for the purposes specified.

2. The mop frame on the stem *e*, in combination with said handle attachment for a scrubbing brush, substantially as specified.

84,130.—SILAS MERRICK, New Brighton, Pa.—*Coffin*.—November 17, 1868.—The sheet metal sides and bottom are held together by angle iron. Strips of wood secured to and even with the top edge of the sheet metal sides are provided with rubber packing on which the cast-iron lid rests.

Claim.—In the construction of coffins, burial cases, or caskets, the sheet metal bottom A, the angle iron B, the sheet metal sides and end plates C C, the strip of wood D, the rubber packing E, in combination

with the cast metal top F, arranged substantially as and for the purposes herein described and set forth.

84,131.—ADOLPH MILLOCHAU, New York, N. Y., assignor to himself, JULES MARCELIN, LOUIS A. GEYER, and EDWIN D. BARNES.—*Manufacture of Lampblack.*—November 17, 1868.

Claim.—The use of lampblack as a porous material, to supply oil to the flame in the manufacture of lampblack.

84,132.—CHARLES NIVERT, Paris, France.—*Steam Device for Washing Buildings.*—November 17, 1868.—A water reservoir and steam generator secured to the truck are connected with injectors which discharge the water in a heated state against the building to be cleaned.

Claim.—The combination of the injectors A A, their delivery pipes f, tank C, communicating through pipes a a, with the injectors, and steam generators G, communicating with the injectors through pipes d, the whole being arranged and constructed as herein set forth.

84,133.—A. L. PETERS and G. M. PETERS, Lancaster, Ohio.—*Dropper for Harvesters.*—November 17, 1868.—The tilting platform is supported by two parallel bars pivoted to the platform at one end and to the finger bar at the other so as to have a motion like a parallel rule. By this device the platform is swung to the rear of the machine, where, being hinged to a supporting platform, it is tilted in a line at right angles to the path of the machine.

Claim.—1. A dumping platform, which is adapted to be swung or vibrated, in the arc of a circle, to a position behind the frame, for discharging the gavel, while, at the same time, it preserves the parallelism with the finger bar.

2. The tilting or dumping platform, in combination with means for operating the same, whereby said platform is adapted to be swung to a position behind the main frame, and there tilted upon a pivot or hinge parallel with the platform, and at right angles to the path of the machine, as set forth.

3. The parallel arms or links C C', or their equivalent, for supporting and operating the platform, as described.

4. The combination of the parallel arms or links, platform bar, and tilting platform, hinged or pivoted thereto.

5. The retaining teeth, in combination with the platform bar and tilting platform.

6. The arrangement of the fulcrum of the cut-off in rear of the cutting apparatus, and above the same, so that said cut-off, in being operated to intercept the falling grain, shall be moved downward and forward in the arc of a circle, the center of which is in rear of and below said cut-off, as described.

7. The inclined way or cam, on the heel of the shoe or drag bar, for raising the platform as it is swung to the rear of the frame for the discharge of the gavel, substantially as described.

8. The angular extension of the platform arm C', or its equivalent, operating in combination with the platform, substantially as described.

9. The forked lever or its equivalent, for operating the cut-off, in combination with the vibrating cam or cam rod on the platform arm C' or platform, substantially as described.

10. The combination of the swinging and tilting platform, cut-off, and means for operating the same, substantially as described.

84,134.—S. A. POCHÉ, St. James Parish, La.—*Apparatus for Evaporating Cane Juice.*—November 17, 1868.—The kettles are secured to the top of the boiler and heated by means of steam.

Claim.—The boiler A, when constructed substantially as described, and combined with a set of sugar kettles, as and for the purpose set forth.

84,135.—WILLIAM M. RENNYSON, Pottsville, Pa.—*Lubricator.*—November 17, 1868.—The neck is provided with a shoulder to hold the rubber gasket. The oil cup is steadied by a strap embracing the cup and attached to the rubber gasket.

Claim.—The combination of the reservoir A, neck B, shoulder a, rubber gasket C, and strap D, all con-

structed and operating substantially as and for the purposes herein set forth.

84,136.—LEONARD RICKARD, Danville, Ill.—*Ditching Machine.*—November 17, 1868.—The wings are adjustable, so that the ditch can be made of any width desired.

Claim.—The arrangement of the point I, mold boards H H and B B, adjustable wings D D, and braces C C, all constructed and operating substantially as herein set forth.

84,137.—WILLIAM C. ROGERS, Newark, N. J.—*Reefing Fore-and-aft Sails.*—November 17, 1868.—The roller to which the lower part of the sail is secured has bearings on the boom, and is rotated by an endless screw engaging with a pinion on its end.

Claim.—The combination and arrangement of the pinion K, endless screw L, and crank M, attached to the upper side of the jaws P, and operating the roller at its inner end, as herein described and for the purposes set forth.

84,138.—JOHN L. ROHRER, Upper Leacock, Pa.—*Harvester Reel.*—November 17, 1868.—An adjustable plate secured to the reel standard is provided with a pin eccentric to the reel axis, on which a triangular plate rotates. Wires extend from the several corners of the rakes and connect with the arms of the triangular plate, so that the rakes will be retracted from the grain and be covered by the reel blades just after passing the cutters.

Claim.—1. A rake, F, arranged upon the beater of a harvesting machine, and adjustable thereon, so that its teeth may be projected beyond, or withdrawn from the edge of the beater, substantially as and for the purpose described.

2. The revolving beaters or blades D, and their adjustable rakes F, in combination with a pin i, arranged eccentric to the axis round which the blades revolve, and connected to the rakes, substantially as and for the purpose specified.

84,139.—JAMES S. SHIELDS, Medora, Ind.—*Fruit Box.*—November 17, 1868.—Springs secured in grooves on the inner surface of the end pieces press against the cleats on the top and sides.

Claim.—1. A box or crate, having its ends secured therein by means of cleats on the end pieces, and grooves on the sides, top, and bottom of the box, substantially as shown and for the purpose described.

2. In combination with the ends of the box, the secret springs F, substantially as shown and described.

84,140.—JAMES Y. SIMONS, Troy, N. Y.—*Shoemaker's Shave.*—November 17, 1868.—The knife rests upon bars cast on the stock of the shave, and is held by a cap sliding under lugs on the stock, and a screw.

Claim.—1. The combination of the bars B and C, and lugs I I, the knife D, cap G, and screw H, substantially as and to the effect hereinbefore set forth.

2. The formation of the handles A, in such a manner as to give space for the fingers below them, and with downward projections at their ends, substantially as set forth.

84,141.—THOMAS J. SMITH, Jackson, Mich.—*Apparatus for Raising Fenees.*—November 17, 1868.—A hook is attached to the end of the lever of a carriage jack for the purpose of raising fenees.

Claim.—The combination, with the lever of a carriage jack, of a hook, H, substantially as and for the purpose described.

84,142.—WILLIAM SYDNEY SMOOT, Washington, D. C.—*Wrench.*—November 17, 1868.—The head is provided with a claw and a V-shaped depression and the sliding jaw with teeth, so as to be used as a pipe wrench. The end of the handle forms a screw driver.

Claim.—A wrench, constructed with a head, A, handle B, and sliding jaw C, when arranged substantially as and for the purpose set forth.

84,143.—ROBERT SPENCER, New York, N. Y.—*Fire Proof Compound.*—November 17, 1868.—Composed of silicate of soda, plumbago, and fire clay.

Claim.—A fire-proof molding compound or paint, composed of the within-described ingredients, mixed together in about the proportions set forth.

84,144—GREENLEAF STACKPOLE, New York, N. Y.—*Lever Power for Sewing and Knitting Machines.*—November 17, 1868.—On each side of the friction wheels are friction rings which are alternately forced in contact with the wheel by levers on the grooved wheels, which latter are rotated by means of a cord secured to the frame and to the thumb nut. The brake is hinged to the lower side of the table and is kept out of contact with the balance wheel by a spring.

Claim.—1. The application to the sewing machine and knitting machine of an auxiliary lever power, consisting of the friction wheel E, or its equivalent, when used to produce continuous motion by the alternate application of friction to its opposite sides, substantially as and for the purpose set forth.

2. The cord I, frame j, and thumb nut L, substantially as and for the purpose set forth.

3. The brake P, as and for the purpose set forth.

84,145.—JOHN STITT, St. Johns, Mich.—*Log Cart.*—November 17, 1868.—One end of the log chain is attached to the rear of the hounds; the other end is secured to a windlass shaft, which is rotated by a weighted lever provided with a pawl engaging with a ratchet wheel on the windlass shaft.

Claim.—The arm E, cast with hollow axle F, when constructed and operating substantially as herein described.

2. The weighted lever T, pawl S, and ratchet wheel R, in combination with windlass O, rope M, block N, and chain U, when arranged and operating substantially as described.

3. The combination of the above-mentioned parts with the cross ties H, hounds I, pole J, braces K, hook L, bearing Q, evener X, and connecting rods Y, when constructed, arranged, and operating substantially as herein described.

84,146.—WORDEN E. STODDARD, Fort Edward, N. Y.—*Scrubbing Machine.*—November 17, 1868.—Water and soap are placed in the tub and the slot in the hollow shaft is closed by a rod. The movable collar is made to engage with the fixed collar, and the shaft, being rotated, the arms are revolved and the soap and water mixed. The arms are then dropped and the soapy water passes through the hollow shaft to the brush.

Claim.—1. The arrangement of the hollow shaft D, pinion F, cog wheel G, shaft H, crank J, bottom B, and cross bar E, all substantially as and for the purposes herein set forth.

2. The combination of the hollow shaft D and stationary collar M with the movable collar N, plate O, arms P P, rods R R, collar S, arm T, and screw V, all arranged and operating substantially as and for the purposes herein set forth.

3. The arrangement of the hollow shaft D, provided with a slot, a, and the rod b, substantially as and for the purposes herein set forth.

4. The combination of the hollow shaft D and tub A, with a circular brush, seourer, or drier, when arranged and operating substantially as and for the purposes herein set forth.

84,147.—CHARLES STREIT, Indianapolis, Ind.—*Extension Lounge.*—November 17, 1868.—The bottom of the lounge is made of tongued and grooved boards, every alternate one of which is attached to the movable front rail, so that they may be drawn out to widen the lounge.

Claim.—The slats B, attached to the movable front rail A, movable pieces I and J, and to the strip C, in combination with the slats E, attached to the strip F, and the slats D, attached to the front and rear rails of the principal frame, when constructed and arranged to operate substantially as herein described.

84,148.—EDWARD W. TAYLOR, Norristown, Pa.—*Hydrocarbon Burner.*—November 17, 1868.

Claim.—1. The improved process of producing intensity, and at small expense, heat and other effects of combustion by burning petroleum and other liquid

and liquecent fuel on the surface of an open plate, surmounted and combined with an incombustible covering, without the intervention of sand or other materials, the combustion being facilitated and the effects intensified by the employment of a current of steam passing into the fire chamber, substantially as shown and described.

2. The blast apparatus assisting in said process, being the arrangement described, of the air passage D, in combination with the steam receptacle E, arranged to move up and down, and the method of bringing heated steam into union with the air at a point and in a mode as described, so as to form a most intimate union, and at the same time creating a powerful blast, conveying the mixture into combination with the burning fuel.

3. The combination of a fuel plate with a blast apparatus, assisting in the combustion of liquid and liquecent fuel, substantially as shown and described.

4. The slide P, as a device for the purpose of accommodating hydrocarbon burners to fire boxes and other spaces of varying sizes, without requiring the burners in such cases to be constructed on different scales.

84,149.—WILLIAM H. TOWERS, Boston, Mass.—*Hoop Skirt.*—November 17, 1868.—Steel wires are substituted for cords, by which the hoops are ordinarily suspended, thus decreasing the number of hoops and the weight of the whole skirt.

Claim.—As a new article of manufacture, a hoop skirt, consisting of the bustle hoops a a, flounce hoops b b, and suspending wires D D, arranged substantially as herein described.

84,150.—WESLEY WESTFALL, Chelsea, Mich.—*Field Roller.*—November 17, 1868.—The rollers have bearings on pivoted frames so as to adapt themselves to any inequalities of the ground.

Claim.—The frames B B B and C C C, when constructed as described, and secured by the pins F, to bear the rollers A' A', all arranged, constructed, and operating as described and shown.

84,151.—CYRENUS WHEELER, Jr., Auburn, N. Y.—*Harvester.*—November 17, 1868.—The main frame has a hollow cylindrical projection on one side for holding the box of the bevel wheel shaft, and to serve as a hinge for connecting the tongue and crank frame, and having an axle for the driving wheel on the other side, which is adjustable, so as to be set at different heights on the main frame. Devices are employed for locking the tongue and crank frame to the main frame when adjusted at different heights.

Claim.—1. A main frame, having a tubular projection on one side, for supporting the bevel wheel shaft, in combination with an axle for the driving wheel, bolted to the other side, substantially as described.

2. A main frame, having a tubular projection on one side, for supporting the bevel wheel shaft, in combination with an adjustable axle on the other side, for receiving the driving wheel, substantially as and for the purposes described.

3. In combination with a main frame and an adjustable crank frame, an adjustable axle, as and for the purposes set forth.

4. In combination with a main frame, an adjustable crank frame, an adjustable tongue frame, and an adjustable axle, substantially as set forth.

5. So uniting the platform with the finger bar as to compensate for the sag of the platform, or its tendency to spring or bend when in use in reaping.

84,152.—JOHN T. WILSON, Pittsburg, Pa., assignor to himself, FRANK RAHM, and THOMAS J. LOUIS, same place.—*Railway Rail Coupling.*—November 17, 1868.—The joint plate has a flange formed on it which fits over the ends of the rails, and its tongue extends through the splice brace and is held by a wedge.

Claim.—1. Strengthening the joints between contiguous rails by means of the chairs c and the inclined wrought iron splice piece E, having horizontal flanges d struck up upon it, and connected together

and supporting the ends of said rails, in the manner and for the purpose described.

2. In combination with the chairs, splice piece, and ends, or joint between the rails, the joint plate F, held to the base of the rails and to the splice piece, substantially as and for the purpose described.

84,153.—HERMAN JOHN WALTERS, Chester, Mass.—*Burglar Alarm*.—November 17, 1868.—The horizontal sliding rods, connecting with the door, act against a bar on the pendulous tripper which releases the vibrating match carrier, thus igniting the lamp. Each rod is provided with an index hand which apprises the sleeper of the point at which entrance is being effected.

Claim.—1. The combination, with the horizontal sliding rods *t*, for actuating the bar *s*, of the upright posts *a'*, and their pointers *c'*, moving in slots formed in the case A, and arranged, with relation to the numerical figures or letters attached to the said case, as herein shown and specified.

2. The combination, with the vibrating bar *s*, operated by the rods *t*, as described, and the tripper *m*, to which said bar is attached, of the vibrating match carrier, and its actuating spring, arranged to operate in connection with the friction plate *k* and lamp *a*, as herein shown and specified.

3. The herein-described construction and arrangement of the friction plate supporter *h*, so that it may be adjusted to any desired distance and angle, with respect to the swinging match carrier, as and for the purposes set forth.

84,154.—T. G. YEOMANS, Walworth, N. Y.—*Grape and Vine Trellis*.—November 17, 1868.—A short lever is attached to each of the wire bars for the purpose of tightening or loosening them.

Claim.—The combination, with the independent wires C C', of the lever B, having openings at different points, whereby said wires are connected thereto, and thereby tightened, and a sliding ring, *d*, for holding the wires when so tightened, substantially as described.

84,155.—BENJAMIN F. ZINN, Mount Rock, Pa.—*Open or Middle Ring*.—November 17, 1868.—This ring can be used to connect the single and double-tree of the wagon, or as a substitute for broken links of chains.

Claim.—The oval or circular parts A A and B B, with the trapezoidal extension C and D, and the trapezoidal apertures C and D, and the rivet or bolt and screw E, connecting the parts A A and B B, all combined and operating in the manner and for the purpose herein set forth.

84,156.—ELIJAH BAKER, Lorraine, assignor to himself and AUGUSTUS L. BAKER, Mannsville, N. Y.—*Reel*.—November 17, 1868.—The movable arm, provided with hooks, which fit in a groove on the nut, is advanced or retracted with the nut when being secured to or disengaged from the other arm. One of the pins holding the skein is adjustable toward and from the center of the reel.

Claim.—1. The screw *b*, nut D, and hooks *a a*, in combination with the arms A A', by means of which said arms may be secured together or disconnected, for the purpose herein specified.

2. In combination with the above, the pins E E' E'' E''', the latter made adjustable by means of the screw F, substantially as and for the purpose herein shown and described.

84,157.—PETER H. BAKER, Virginia City, Nevada.—*Mode of Fastening Straps to Boots*.—November 17, 1868.

Claim.—The plate A, constructed as described, provided upon its outer edges with the long teeth *a*, and upon its inner edges, opposite to each other, with the short teeth *a'*, said plate secured to the boot and strap by inserting the teeth, and lapping the outer rows *a* over the inner rows *a'* upon each side of the frame, as herein described, for the purpose specified.

84,158.—VINCENT M. BAKER, Preston, Minn.—*Water Wheel*.—November 17, 1868.—The water first acts on the concave and convex parts of the bucket

by impact, and then descends and exerts a reactive force against the lower part. The rods secured to the gates pass through oblong slots in an annular rim, which latter, on being turned, opens and closes the gates.

Claim.—1. The buckets C, composed of the three parts *a a' b*, constructed and arranged as described, to be acted upon by the water, as herein set forth.

2. The gates D, composed each of two plates, *e f*, arranged as shown, and connected to the rim *h* by rods *g*, in combination with the tangential plates *d*, between the rims A B, all being constructed, arranged, and made to operate substantially in the manner as and for the purpose set forth.

84,159.—WARREN S. BARLOW, Paterson, N. J.—*Door Spring*.—November 17, 1868.—When the door is opened so that a line drawn from the center of the stud to the hinge will be perpendicular to the face of the spring the door will be held, but if pushed on either side of that point of contact the door will be acted upon by the spring and opened or closed.

Claim.—The within-described combination and arrangement, with a door or blind, A, and casement B, of a spring, C, and stud D, in such manner as that the opening of the door or blind shall draw or extend the spring, substantially as herein set forth.

84,160.—MANFRED C. BATTEY, Washington, D. C.—*Awning for Horse Cars*.—November 17, 1868.—The awning is attached to the ridge pole and to the hinged arms, and can be folded up or opened out by means of the ropes within reach of the driver.

Claim.—1. The combination of the pole A and hinged arms B C with a system of ropes and pulleys capable of folding or expanding said hinged arms, in the manner described.

2. The arrangement of pole A, hinged arms B C, fixed arms D F, and ropes G I, substantially as described and shown.

84,161.—A. BIGELOW, Hamilton, Canada.—*Shaft Coupling*.—November 17, 1868.—The purpose is to provide for free rotation when the shafts are out of line with each other.

Claim.—The shells B B on shaft A, in combination with the rings D, and sockets F F', which receive the shafts G G, the rings and sockets being connected together, and the shells, respectively, by the bolts E H, with the bolts E passing through the bolts H, all being constructed and arranged substantially as and for the purpose set forth.

84,162.—AMOS S. BLAKE, Waterbury, Conn.—*Padlock*.—November 17, 1868.—The cup and cone are capable of sliding longitudinally upon the spindle. When the cone and lock frame are in contact, the latch preserves the relative position of the parts, and the device may be said to be locked. When the device is to be unlocked the key is introduced, the latch turned, and the cup and cone slid upon the spindle so as to carry the recessed end of the cone away from the engaging extremity of the frame.

Claim.—The frame A, provided with the spindle B, in combination with the cup C, provided with the catch or bar D, or its equivalent, and the cone E, attached to the cup, all being constructed and arranged substantially as and for the purpose specified.

84,163.—E. K. W. BLAKE, Chicago, Ill.—*Velocipede*.—November 17, 1868.—Springs, connected by belts to small drums projecting from the loose pulleys, retract the pulleys to wind on the propelling belts.

Claim.—1. The combination with the driving axles, having the fixed ratchets C, of the loose pulleys B, actuating pawls, and propelling belts, the latter passing over guide pulleys at or near the front of the machine, substantially as and for the purpose described.

2. The combination with the axle of the guiding wheel, of the slotted guide brackets I, swinging bearings K, adjustable foot rests L, and retracting springs M, all substantially as and for the purpose described.

84,164.—D. C. BREWSTER, Kent, Ohio.—*Extension Spoke*.—November 17, 1868.—The threaded thimble nut is adjustable upon the screw, so that the spoke is practically extensible, the object being to tighten the tire.

Claim.—The socket F, tenon C, screw D, and thimble nut E, all constructed and arranged as shown and described, in combination with the spoke A and felloe B, substantially as and for the purpose set forth.

84,165.—HORACE C. BRIGGS, West Auburn, Me.—*Hoeying Machine*.—November 17, 1868.—The clevises or draught irons are adjustably attached to the forward upward-curving ends of the runners, to which the hoes are attached, and by this means the working depth of the hoes is made variable. The position of a slide governs the vertical play of the tongue.

Claim.—1. The combination of the cross bars A and B, longitudinal bars C, runners D, curved parts or pieces G, and plows or hoes I with each other, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the inwardly-projecting, adjustable hoes J with the rear ends of the runners D, substantially as herein shown and described, and for the purpose set forth.

3. The draught irons H, constructed as desired, in combination with the curved parts G of the runners D, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the adjustable bar or slide L with the hinged tongue K, and front cross bar A, substantially as herein shown and described and for the purpose set forth.

84,166.—AMOS W. BROWN, Lansingburg, N. Y.—*Brush*.—November 17, 1868.—A flexible brush, designed chiefly for "rubbing down" horses.

Claim.—As a new article of manufacture, the horse brush, having its parts A A B connected together by the transverse leather hinges *ee*, and by the longitudinal metallic spring *d*, covered with strips of veneering, *b*, as herein described, for the purpose specified.

84,167.—JAMES B. BROWN, Peekskill, N. Y.—*Garden Roller*.—November 17, 1868.—The weights, which impart the requisite heaviness to the roller, are provided with hooked shanks, whereby they are suspended from the axle, so as to enable them to be readily detached.

Claim.—The combination of the weight D and shank *a* with the shaft B, squared portions *bb*, handles C, and roller A, as herein shown and described.

84,168.—JOSEPH BUCHEL, Portland, Oregon.—*Contact Pad for Photographie Printing*.—November 17, 1868.—One end of the pad can be raised without destroying the pressure on the other.

Claim.—The use of the elastic pad *a*, filled with fluid, air, or gas, and also the eyelets *b*, with the attendant screws, together with the diaphragm *e*, substantially as set forth and for the purpose described.

84,169.—C. J. BUGH, Eau Claire, Wis.—*Tanning Process*.—November 17, 1868.—The specification describes several processes and compositions, and cannot be briefly described.

Claim.—The improved tanning process, substantially as herein shown and described.

84,170.—WILBUR F. CLARK, Hagaman's Mills, N. Y.—*Bridle*.—November 17, 1868.—The arrangement of the gag runner, martingale, and driving rein is designed to produce the same effect as a curb. When the gag runner is taken up short, the rein is allowed to play upon the pulleys, and thereby revolve the bit; but when the gag runner is let out so that the junction between the same, the martingale and the rein shall come down to the bit, the latter does not revolve when the reins are drawn, but acts in the usual manner.

Claim.—1. The revolving bit A, having pulleys *a b*, and working in the plates B, substantially as herein described.

2. The combination of the gag runner D, rein C, and martingales E, with the bit A, B B, *a b*, *a b*, substantially as herein described.

84,171.—W. F. CORNELL, Adrian, Mich., assignor to himself and SILAS HURLBUT, same place.—*Skate*.—November 17, 1868; antedated November 7, 1868.

Claim.—A skate, having the following characteristics: Arched brackets B, sliding ball flanges M, adjustable sectional heel flanges E, padded, hinged, metallic straps P F; bands H, with yokes I, hinged baud K, and hinged ankle-support G, constructed, arranged, and operating as herein represented and described.

84,172.—E. H. CRAIGE, Brooklyn, N. Y.—*Paper File*.—November 17, 1868.—A plurality of holes may be made in the weight, so that it may be set upon the impaling wire at random, or without exercising the particular care which would be requisite in the case of a single socket.

Claim.—1. The combination of a base plate, A, having an upright pin or pointed wire, *a*, with a weight, C, having one or more holes, *b*, the whole constituting a paper file, substantially as and for the purpose herein shown and described, as a new article of manufacture.

2. The angular base plate A B, having a pin or pointed wire, *a*, in combination with a weight, C, having one or more holes, *b*, the whole constituting a paper file, substantially as and for the purpose herein shown and described, as a new article of manufacture.

84,173.—ELIHU DOUD, Oshkosh, Wis.—*Corn Sheller*.—November 17, 1868.—The grain is chiefly detached from the cob as the ear passes between the toothed roller and the first segment; the second segment affords egress to the husked corn, and permits the cob to be advanced in a horizontal position to the third segment, which, in conjunction with the roller, strips off whatever corn may remain upon the cob. The spring adapts the shell to conform to the size of the ears.

Claim.—An outer half-cylindrical shell, constructed in segments, *d e f*, in the manner described, when used in combination with the toothed roller *i*, spring S, plate C, and hopper C', as and for the purposes described.

84,174.—DESSO DUDUIT, New York, N. Y.—*Process for Ageing and Rectifying Copal Varnish*.—November 17, 1868.—The process consists in, first, boiling the crude varnish; second, passing it through charcoal, brimstone, and oxalic acid, successively; and, third, in showering it down in streams for aeration.

Claim.—The process for rectifying and ageing copal varnish, substantially as herein described.

84,175.—O. P. DUNBAR, Norwalk, Ohio, and H. D. DUNBAR, Hartland, Vt.—*Steam Valve*.—November 17, 1868.—Each of the two heads has a packing ring fitted between it and a follower, the rings being held in position by a projecting nib working within the chambered head, and the joint of said ring working steam-tight upon the supporting bridge.

Claim.—1. The herein-described steam valve, consisting of the heads G, flange M, ring N, and nib *a*, when constructed substantially as set forth.

2. The bridge O, as arranged in relation to the valve, for the purpose specified.

84,176.—CHARLES E. EMERY, Brooklyn, N. Y.—*Pumping Engine*.—November 17, 1868.—Two auxiliary pistons are combined to operate the main valve of the engine. The invention has reference to the mechanical details whereby to produce positive action without the aid of cams, levers, or tappets, operated by the main piston; and the construction is such that either of the systems used in combination may also be used separately.

Claim.—1. The combination, with cylinder A, main piston J, and the equal heads M and N of auxiliary piston E, of the ports *e f g h* in a valve face operated by E, and *e', f', g', and h'*, in the valve

seat, when arranged substantially in the manner specified.

2. The arrangement of the exhaust passages f' and g' with reference to the ports B and B', substantially as described, to accomplish the results specified.

3. The combination of two auxiliary pistons, the first to operate the valve of the second in both directions, without the assistance of tappets, and the second to operate the main valve in the usual manner, to accomplish the results specified.

4. The connection of a moving piston or cylinder with the seat of its slide valve, in such manner that the motion of the piston or cylinder causes the valve seat to follow the initial movement of the valve, and close (and, if necessary, reverse) the ports, and thus bring the moving piston or cylinder to rest, substantially in the manner described, to secure the results specified.

5. The passages r' and s' , so arranged, in combination with r and s , as to admit steam to the auxiliary piston E, after the valve P has moved the desired distance.

6. The extra exhaust ports Z Z, when arranged as shown, in the face of the valve, substantially as described.

7. The particular arrangement of the valve-seat piece Q with the valve chamber R, and the face of the pump cylinder at w .

84,177.—WILLIAM F. ENSIGN, New York, N. Y.—*Permutation Lock.*—November 17, 1868.—The set wheels and locking gear connected therewith, the traveler connected with the hub, and the series of annular guides for the traveler, are arranged in such a manner in relation to the tumblers that the latter may be brought into positions to admit the stump into their gateways, in order to throw back the bolt.

Claim.—1. The slide H, bars J K, with stump L attached to the latter, in connection with the bolt-locking mechanism, composed of the bar O, wheel N, pivoted bolt P, arm M, and spring l , all arranged to operate in connection with bolt I, in the manner substantially as and for the purpose set forth.

2. The step-like projections k , at the free or disengaged end of bar K, when used in connection with the wheel N, for the purpose specified.

3. The annular plates R R' R'' R''', provided with the internal annular grooves, connected by passages g' , in connection with the traveler W, all arranged for operating the tumblers, substantially as set forth.

4. The toothed rims T T' T'', in connection with the pinions $e' e'$, attached to the slides V V, having springs f' bearing against them, all arranged in connection with the tumblers U U' U'', substantially as and for the purpose specified.

5. The combination of the tumblers U U' U'', toothed rims T T' T'', plates R R' R'' R''', traveler W, and hub F, all arranged to operate in the manner substantially as and for the purpose set forth.

84,178.—SNYDER FILSON and WILLIAM E. KINERT, Bluffton, Ind.—*Corn Planter.*—November 17, 1868.—The movable notched collar is provided with an arm which engages in its rotation with an arm on the bar connecting with, and operating, the slides. Said collar can be thrown in and out of gear with a lug on the shaft by means of a lever pivoted to the top of the box and actuating a bar connecting with the collar.

Claim.—1. The movable notched collar o , provided with arm or arms k , in combination with the lug n on the shaft a , when operated by means of one of the wheels M, which is firmly secured to said shaft, substantially as and for the purposes herein set forth.

2. The cross-bar g , provided with the arms h and i , in combination with the movable notched collar o and arm k , for the purpose of moving the slides H H, substantially as herein set forth.

3. The lever l , arranged as described, on top of the box D, in combination with the bar m and movable notched collar o , for the purpose of throwing said collar in and out of gear with the lug n , substantially as and for the purposes herein set forth.

84,179.—RUFUS A. FISH, Worcester, Mass.—*Milking Pail.*—November 17, 1868.—Said springs are made of steel, and tempered, and firmly fastened to

the pail, the lower portion of which projects above the rim of the pail, with an aperture in them, through which the bail passes. Said springs can be attached either in front or rear of the ears of any ordinary pail in use, and can also be fastened to a hoop, and firmly secured to the pail in the usual manner of hooping. These springs can also be constructed of iron, or other metal, or of wood, or their equivalents, arranged substantially in the manner described, and for the purpose set forth.

Claim.—The manner of securing the pail while milking, by allowing its weight to rest upon the knees, on the curved springs A A.

84,180.—GEORGE FLETCHER, Sr., Greensburg, Ind.—*Mode of Making Combined Wood and Wire Fence.*—November 17, 1868.—The batten is suspended by rods which have bearings in notches in the frame; it can be suspended parallel to the heddles or in an oblique position to enable the fence to be constructed so as to set on uneven ground. A knife is attached to the frame of the loom to sever the superfluous ends of the poles.

Claim.—1. The mode of constructing a wood and wire fence, by means of a stationary crab or anchor, U, and a loom, adapted to be drawn over the ground, in manner substantially as set forth.

2. In the described combination, the suspended and detachable batten R and notches S S, as and for the purpose stated.

3. In this connection, the gauge or knife V upon the frame K.

84,181.—EDWIN GIBBS, Painsville, Ohio.—*Device for Bending Scrolls.*—November 17, 1868.—The end of the bar is placed in a notch in the former and bent until it forms a circle; it is then bent over the spiral former to complete the form of the scroll.

Claim.—The finishing scroll former B, and the scroll former A, constructed and combined as and for the purpose set forth.

84,182.—CHARLES GOODWIN, Beardstown, Ill.—*Windmill.*—November 17, 1868.—Springs arranged on the narrow side of the pivoted wings allow them to open when the wind blows hard and close them when the wind subsides.

Claim.—1. The arrangement of the vane F, in an inclined position upon the shaft D, and operating in connection with the wheel G, as herein described, for the purpose specified.

2. The arrangement of the wings H, shafts i , straight springs K, and ring d , operating as described, for the purpose specified.

84,183.—EDWARD M. GRANT, J. B. VAN DYNE, and T. R. PUGH, Nashville, Tenn.—*Railroad Car Stove.*—November 17, 1868.—The bottom of the stove, placed above the water line of the tank base, is provided with openings which are closed by lids in such a manner, that when the car upsets, the lids fall off and the water from the tank flows into the stove and extinguishes the fire.

Claim.—1. In combination with the base tank A, the bottom b , with its apertures and lids or valves, d , made and arranged in the manner and for the purposes set forth and described.

2. The arrangement of the bottom b , in the stove, forming, between it and the water line in the tank, the space C, as shown, and for the purposes described.

84,184.—ABRAM A. HARMON, Olney, Ill.—*Cultivator.*—November 17, 1868.—The foot bar can be slipped forward in its holders so that the pins in the rear of the plow standards may rest thereon when the plows are unemployed.

Claim.—1. The plows H H, attached by elevises to the front bar of the diagonally-braced open frame A B D E F, and connected by a cross bar, I, which admits their adjustment as to relative distance, and causes them to swing by a parallel motion as they are deflected laterally, substantially as described.

2. In combination with the said plows, thus attached and connected, the sliding foot-bar K, arranged as described, and adapted to hold them in elevated position, for the purposes described.

84,185.—EDWARD P. HASKELL, New Bedford, Mass., assignor to the HALE PATENT WASHER CO., same place.—*Axle Box.*—November 17, 1868.—The internally-projecting ring on the hub plate embraces the periphery of the plate washer and confines it in place.

Claim.—For employment with axle boxes and washers, the hub plate *g*, constructed with the internally-projecting ring or flange *h*, substantially as and for the purpose described.

84,186.—GEORGE H. HAYDEN, New Market, Ala.—*Saddle.*—November 17, 1868.—The pommel is provided with a tobacco pipe, match safe, and looking-glass. The cantle has an adjustable back piece which may be elevated to support the back of the rider.

Claim.—1. A saddle, provided with a tobacco pipe, A, and a case, C, having a looking-glass secured therein, and otherwise arranged substantially as and for the purpose described.

2. The combination, with the cantle of a saddle, of an adjustable back piece, I, substantially as and for the purpose described.

3. The back piece I, provided with the lugs K, arranged to slide on the rods L, and with the jointed braces M, substantially as and for the purpose set forth.

84,187.—CHARLES HENRY, Brooklyn, JOHN McLOUGHLIN, Morrisania, and EDMUND McLOUGHLIN, New York, N. Y.—*Method of Etching Relief Plates for Surface Printing.*—November 17, 1868.—The zinc plate having been etched and cleaned, is covered with a coat of varnish. The varnish is scraped from the surface when dry, and the etched surface cleaned and dipped in a solution of water and sulphuric acid and allowed to remain until the plane surface is bitten away nearly to the depth of the etched lines. The edges of the lines are then covered with a protective powder and again immersed in the corroding solution, the operation being repeated until the bottom of the etched lines is raised in relief. The plate is then ground down to render the comparatively rough surfaces smooth enough for press-work.

Claim.—1. The transforming of etched plates into relief plates, in which the relief lines shall be of the same continuous material as that composing the body of the plates, by the process and in the manner substantially as herein described.

2. The filling of the etched lines upon the plate with varnish or other protecting gum or compound, in the manner and for the purpose specified.

3. As a new article of manufacture, relief plates, of metal or stone, for printing and similar purposes, prepared direct from etching, and in which the raised surfaces shall be of the same continuous material as that composing the body of the plate.

84,188.—C. W. HERMAN, Schnylerville, assignor to W. P. OSTRANDER, A. H. PEARSALL, B. G. SHULTS, and A. L. FINNE, all of the State of New York.—*Stone-drilling Machine.*—November 17, 1868.—The devices for compressing the spring are so arranged that the operator can regulate the desired force of stroke.

Claim.—1. The arrangement of one or more flanges or cams, or their equivalents, on the side of a wheel, for the purpose of operating a machine, by raising a certain part thereof and letting it fall again when said flanges or cams operate from the periphery to the axle of the wheel; that is, commence the raising at or near the periphery, and letting go near the axle, substantially as herein set forth.

2. The tube H, having its sides slotted and notched as described, in combination with the movable collar *b*, and pins *e e*, for the purpose of compressing the spring J, thereby regulating the force of the drill operated by said spring, substantially as shown and described.

84,189.—CYRUS D. HUNT, Fairhaven, Mass.—*Nail-cutting Machine.*—November 17, 1868.—The tubular shaft to which the plate holder is secured is rotated to reverse the blank plate, by means of a segmental rack receiving motion through miter gearing from a rocker shaft connecting with one of the gear

wheels. The arm to which the tubular shaft is attached receives a vibratory motion so as to remove the nail plate away from the bed plate in order that it may be revolved.

Claim.—The arrangement, as well as the combination, of the gears *i k*, their crank pins *h r*, the connecting rods *g p*, the arm *f*, rocker shaft *e*, toothed sectors *c d*, shaft I, toothed sector H, and gear G, as applied to the vibratory arm F, and the tubular shaft E, the whole being for effecting the vibratory motions of the said arm, and the reciprocating semi rotary movements of the nail-plate carrier, as set forth.

84,190.—SILAS HOSMER, Concord, Mass.—*Tanning Apparatus.*—November 17, 1868.—The agitating mechanism produces and maintains currents in the liquor bath containing the skins, and prevents the tanning matter held in solution, from depositing in the vat.

Claim.—The combination, with a vessel arranged for tanning *in vacuo*, of an agitating wheel, B, or its equivalent, substantially as and for the purpose described.

84,191.—D. W. JAMESON, Warren, Ohio.—*Machine for Holding the Cutters of Mowing Machines while being Ground.*—November 17, 1868.—The knife while being sharpened is held firmly to the bar. It may be moved to the right or left by means of the sliding joint, so as to bring the teeth successively to the action of the stone.

Claim.—1. The flanged rod C, grooved bar D, forming the sliding joint E, as described.

2. The flanged rod C, grooved bar D, in combination with the bar D', uprights A', cross bars B B'', and foot pieces B', all constructed and arranged to operate as and for the purpose described.

84,192.—WILLIAM JOHNSON, Milwaukee, Wis.—*Permutation Lock.*—November 17, 1868.—The guard prevents the fences from touching the revolving tumblers when the latter and disk are not in position for locking or unlocking the bolt, the plate to which said guard is secured preventing the bolt from being withdrawn.

Claim.—1. Guard I and fence *h*, in combination with plate L, substantially as described.

2. The stop O held in slot P by shaft T, in combination with tumbler U, substantially as and for the purpose set forth.

3. Key bit Y, socket Z, rubber ring *a*, and nut *b*, in combination with key stem X, substantially as described.

84,193.—WILLIAM JOHNSTON and JOHN D. FLANSBURGH, Philadelphia, Pa.—*Apparatus for Roasting Coffee.*—November 17, 1868.—The aroma which passes off in the form of vapor during the roasting process is conducted to a condenser; as soon as the roasting is completed, the condensation is allowed to flow through the valve and reunite with the coffee. The roasting vessel may be slid out of the furnace to cool the coffee, and when thus situated its rotation is resumed by reason of the engagement of an extra feather on the hollow draught, with the driving pulley.

Claim.—The elevated condenser C, with its valve *c'*, the tube D, and the tube E, in combination with the hollow perforated sliding shaft *a'*, the roasting vessel A, and the furnace B, the said parts being constructed and arranged to operate together as and for the purpose set forth and described.

84,194.—A. C. KASSON, Milwaukee, Wis., assignor to himself and NELSON C. GRIDLEY, same place.—*Culinary Vessel.*—November 17, 1868.—A vessel for cooking food by steam, whereby several varieties may be cooked at once, each article being incapable of imparting flavor to or receiving it from any of the other articles.

Claim.—1. The vessel B, provided with its central steam chamber or tube I, with its openings and slides, and a series of compartments C, constructed and arranged to operate substantially as described.

2. The vessel A, provided with the compartment F and the drip chamber G, substantially as and for the purpose set forth.

3. The combination of the vessels A and B, the

latter having the annular flange *t* fitting into the drip chamber *G* of the former, when said parts are constructed and arranged for joint operation, substantially as set forth.

84,195.—EDWARD G. KELLEY, New York, N. Y.—*Petroleum Still*.—November 17, 1868.—Improvement on his patent of August 20, 1867.—The indicator shows the height of the liquid in the main still.

Claim.—1. The gate *F*, arranged in combination with the two vessels *B C*, to regulate the gravity of the products of distillation, substantially as and for the purpose herein shown and described.

2. The petroleum still, consisting of the cylinders *B C*, the latter having the shells *D*, and the former being provided with the automatic indicator *I J*, all made and operating substantially as herein shown and described.

84,196.—THEODORE DWIGHT KELLOGG, New York, N. Y.—*Refrigerator*.—November 17, 1868.—Improvement on the subject of his patent of February 11, 1868.—The present object is a more thorough ventilation, currents of air being allowed to pass through the bottom, center, and upper part of the refrigerator.

Claim.—The combination of the casing *A*, lining *B*, ice chamber *G n*, grating *g*, strips *b b, b' b'*, openings *c c*, boxes *C C*, and wire cloth *W W*, all constructed, arranged, and operated in the manner and for the purpose set forth.

84,197.—GEORGE W. KING, Georgetown, D. C.—*Telegraph Instrument*.—November 17, 1868.—This contrivance obviates readjustments of the armature, inasmuch as the amount of attraction in the stationary magnet, in excess of the attraction in the core, will remain equable under all disturbances in the strength of the current.

Claim.—The core *D*, acting as an armature, and oscillating in the helix *B*, when pivoted to the supporting spring *I*, in the manner and for the purpose herein described.

84,198.—GILES D. A. KRIGBAUM, Zanesville, Ohio.—*Apparatus for Holding Sheep*.—November 17, 1868.—An apparatus for holding a sheep while its feet are being pared or otherwise treated.

Claim.—The sheep-holding table *A*, provided with the holes *a*, and legs *B*, and pivoted levers *b*, notched to coincide with the holes in the table, all arranged and operating as described, whereby the sheep is suspended beneath the table, with its feet clamped in the holes *a* by the levers *b*, as herein set forth, and for the purpose specified.

84,199.—S. C. LA HALT, P. LISTEMAN, and C. HADLEY, Collinsville, Ill.—*Wagon-top Bow*.—November 17, 1868; antedated November 9, 1868.

Claim.—Arranging the central hoop *A* in hinged parts, *a, a¹*, and *a²*, and the end hoops *B* in hinged parts *b, b¹*, *b²*, and *b³*, so that said parts may be folded together into small compass, substantially as set forth.

84,200.—JOSEPH J. LEIGHTON, Boston, Mass.—*Box*.—November 17, 1868.

Claim.—A round or cylindrical wooden box, composed of two or more layers of wood, wound spirally around in opposite directions, and glued or otherwise secured together, substantially as herein specified.

84,201.—EDGAR W. MANDEVILLE, Ithaca, N. Y., assignor to himself and CHARLES D. JOHNSON, same place.—*Low Water Alarm for Boilers*.—November 17, 1868.—When the water is sufficiently high in the boiler, the globe is occupied by water, and its weight preponderating over the weight on the other end of its suspending lever, closes the faucet; but when the water gets low, the globe is emptied, and the weight being then the heavier, the lever moves, and the faucet with it, and steam escapes through and blows the whistle.

Claim.—1. The faucet *B*, as arranged and constructed, whereby the opposite ends of the same receive the two pipes, *G* and *H*, one from the upper and the other from the lower part of the globe *E*, as set forth.

2. The construction of the faucet *B*, with reference to the pipes *G* and *H*, and the arrangement of the steam passage in the faucet leading to the whistle, whereby, when the globe *E* is full of water, no steam can pass to the whistle, but, when empty, the turning of the faucet opens the passage, and the whistle gives the alarm.

3. The arrangement of the direct connection between the globe *F* and faucet *B* by the lever *C*, whereby to operate these several parts in combination, through the three parted passage in the faucet, as set forth.

84,202.—JOSEPH W. MARSHALL, Williamsburg, N. Y.—*Hydrant*.—November 17, 1868.

Claim.—The plug *D*, with openings of supply, *L*, and waste discharge *M*, in combination with the plug seat *C*, spiral spring *E*, and hand lever *N*, operating together in manner substantially as and for the purposes described and set forth.

84,203.—ALBERT M. MAYNARD, Savoy, Mass.—*Water Wheel*.—November 17, 1868.—A turbine wheel

revolves, without contact within an external barrel, which serves as a scroll. The gates are connected by rods to a collar working freely on a sleeve, and operated so as to open and close the gates, by means of a toothed segment and a pinion on an upright shaft, to be turned by hand. The water, after acting upon the upper part of the bucket by impact, exerts an additional impelling force upon the wheel as it descends in contact with the lower, deflected part of the bucket.

Claim.—1. The chutes *C*, gates *D*, diaphragm *B*, and external barrel *A A*, in combination with the turbine wheel, all constructed and arranged to operate substantially as described.

2. The combination and arrangement of the V-shaped buckets *b*, within the box *a*, diaphragm *d*, hoop *e*, external band *A*, diaphragm *B*, carrying the sleeve *n*, the collar *m*, rods *l*, chutes *C*, and gates *D*, as herein described for the purpose specified.

84,204.—ANTOINE MICHEL, St. Louis, Mo., assignor to himself, JAMES S. HANNAN, and NAPOLEON MOISAU, same place.—*Wash Boiler*.—November 17, 1868.—Heat is applied at the bottom of the boiler, and the products of combustion ascend through the central flue. The heated water ascends in the conducting pipe and is discharged through the perforated head upon the articles to be washed.

Claim.—1. The arrangement of a heating flue, *B*, within each conducting pipe *C*, for the purpose of accelerating and directing the flow of fluid.

2. The combination of the vessel *A*, its flues *B*, duct *C*, perforated at *c*, and discharging head *D*, perforated at *d*, substantially as and for the purposes set forth.

84,205.—EZEKIEL MILLS, Baltimore, Md.—*Sheet-metal Roofing*.—November 17, 1868.—The ends of sheets or strips of metal are interlocked, and the metal then passed between rollers to close the seams, and then through a bath of molten tin or other soft metal, which coats the surface and closes and covers the seams, so as to form continuous pieces, of indefinite length, without appreciable or pervious joints.

Claim.—The continuous metallic strips, jointed and coated by the process herein described.

84,206.—FRANK MILLWARD, Cincinnati, Ohio., assignor to himself, DEXTER D. HARDY and HENRY C. DART, same place.—*Oscillating Steam Engine*.—November 17, 1868.—This arrangement admits of locating the valve between the joint upon which the engine vibrates and the cylinder, the ports being opened and closed by the movements of the cylinder. The steam and exhaust pipes terminate at said joint, and may be connected to the usual stationary pipes by the flexible interior tubes.

Claim.—1. The combination and arrangement of the frame *J*, cylinder *A*, and V-shaped joint or hinge, substantially as shown and described.

2. The arrangement of the pivots *K* and *L*, by which the wear between the parts thereof may at any time be taken up, substantially as shown and described.

3. The arrangement of the adjusting screws *M N*,

with reference to the V-shaped pieces K and L, for the purpose of taking up lost motion and preserving the pivots in line.

4. The oscillating side pipes E G, and flexible tubes I, for the purpose specified.

5. The arrangement of the independent valve motion P Q R S, or its mechanical equivalent, for the purpose of reciprocating the valve the short distance equal only to the "lap" of the valve, and the slight additional distance necessary to give a proper "lead" to the engine, substantially as described.

84,207.—CHARLES MOORE, Stratford, Conn.—*Fruit Basket*.—November 17, 1868.

Claim.—A fruit basket, constructed out of a single piece of sheet metal, cut and swaged up in the desired shape, substantially as shown and described.

84,208.—JOEL MOULTON, Boston, Mass.—*Machine for the Manufacture of Elastic Rolls and Tubes*.

—November 17, 1868.—More especially intended for manufacturing elastic rolls, such as are described in letters-patent granted to the same inventor March 10, 1868; and May 5, 1868. The elastic machine is wound about a rotating, metallic shaft, combined with which is a series of bunters or hammers for driving the coils in close contact with each other, as they are wound. Means are provided for folding the strips of rubber previous to winding, and for introducing a metallic wire into the fold.

Claim.—1. A machine, so constructed and operating as to hold and rotate the roll shaft, and to cause the elastic material and its accompaniments to be wound about such shaft, and condensed or tightly driven thereon, for the purpose substantially as before explained.

2. As an appurtenance or a part of the above-described machine, a device for folding and maintaining, in an upright position, the elastic material as it is fed to the shaft, and also for introducing into the fold of the elastic material a metallic wire or string, for the purpose as before premised and described.

3. For the purpose of condensing the folds of elastic material about the shaft, and for supporting one end of it in position while winding, the combination and arrangement of the case *e* with its cam groove *i*, and the circular carrier *f* with its bunters *g g*, &c., the whole being arranged and operating essentially as herein shown and described.

4. In combination with the last-described arrangement of parts, the sliding carriage *p*, with its shaft, supporting chuck or bearing *o*, such chuck being applied and operating as before referred to and described.

5. Applying the auxiliary frame *e* to the main frame, at an angle to its longitudinal axis, in manner and for the purpose as herein shown and explained.

6. The combination and arrangement of the endless bands *b³ b³* and the rollers *v v*, &c., or their equivalents, for producing the same result, in combination with suitable supporting and feeding rollers, as and for the purpose before set forth and exhibited.

7. The general combination and arrangement of the bunters *g g*, &c., and the shaft-supporting and operating adjuncts, the sliding carriage *p*, and the mechanism for folding and "wiring" the elastic material or strips, the whole operating together to produce results before set forth and explained.

84,209.—JOEL MOULTON, Boston, Mass.—*Method of Detaching Rubber Articles from the Molds in which they are Vulcanized*.—November 17, 1868.—The clearing rods inserted between the article and side of the mold loosen the rubber, and, being revolved and made to approach each other at the same time, they cause the mold to revolve in its bearings on the crutches, thus releasing the article around the whole inner circumference of the mold.

Claim.—1. As a machine for loosening the adhesion of vulcanized articles to their molds, the employment of the clearing rods *e e'*, so arranged and operated as to produce this effect by their combined rotary motion and longitudinal movements

2. Supporting the clearing rods *e e'* within or by means of the dually-arranged sliding head stocks *a a'* and mandrels *b b*, or their equivalents, the head stock and mandrels being actuated by the pinions *d d'* and pinions *l l'*, or other equivalent mechanical devices, and the whole operating together as described.

3. The general combination and arrangement of the dually-arranged head stocks *a a'*, supported substantially as described, with the mandrels and clearers connected, as explained, the twin or dually-arranged pinions *d d'* and *l l'*, and gears *g g'* and *p p'* and *q q'*, the shafts *h*, *r*, *m*, and *m'*, the posts *f f'*, the cradle or clutches *u u'*, being adjuncts or important details of the machine, the operation and general arrangement of the above described combination being as hereinbefore shown and elucidated.

84,210.—DAVID MUNSON, Indianapolis, Ind.—*Lightning Rod*.—November 17, 1868.—The sections

are lapped over each other at their ends, and secured together by cutting into the edges to form ears, which are turned down, and the points on said ears receive the electricity. The rod forms a gutter for conducting the rain or dew to the ground.

Claim.—The lightning conductor, composed of the sections A, formed and secured together as and for the purpose set forth.

84,211.—FRANCIS S. PEASE, Buffalo, N. Y.—*Steam Valve*.—November 17, 1868.—The valve is

constructed in two parts, the face vibrating against the ports, and the back vibrating in contact with a packing ring acted on by the steam. A rectangular shaft passes through an oblique slot in the valve, having spaces on its side which allow the valve to adjust itself to its seat.

Claim.—1. The oscillating steam valve, consisting of two segments, V and V', constructed and operating as and for the purposes described.

2. The combination and arrangement of the packing L, and the slots *v v* in the valve V V', substantially as and for the purposes explained.

84,212.—LEVI PENTZ, Canton, Ohio.—*Thill Coupling*.—November 17, 1868.—The rear face of

the rubber block sets against the end of the strap with its upper flange resting on the upper edge of the strap, and its lower flanges setting under the lip of the thill iron, the latter being secured to the slip arm by the elliptical pin which is inserted through a slot in said arm when the thills are raised.

Claim.—1. The rubber block G, when constructed with concave front face *d*, upper rear flange *a*, and lower side and rear flanges *e b c*, and used in combination with the thill iron H F H and clip arm B, constructed as specified, substantially as and for the purpose specified.

2. The combination of the rubber block G, constructed as specified in first claim, the thill iron H F H, with elliptical pin E, and the clip A, with arm B, provided with the slot D, hole C, and curved wedge part *n*, the several parts being arranged in the manner and for the purpose herein specified.

84,213.—GEORGE W. PUTNAM, Peterborough, (town of Smithfield,) N. Y.—*Pocket Lantern*.—November 17, 1868; antedated November 7, 1868.—

Claim.—The lantern, constructed as described, adapted to receive the case H, containing the candle and match chamber M, in such a manner as to leave an air chamber, U, containing the sliding handle P between said case and lantern, to prevent the heat generated in the latter from communicating with the chambers M, as herein described, for the purpose specified.

84,214.—NAT RAYMER, New Sterling, N. C.—*Fruit Jar*.—November 17, 1868.

Claim.—As an article of manufacture a stopper or cork for fruit jars, made as described, viz., furnished with a short, metallic tube, through which the air may be readily drawn, and by the pressing together of which the jar is hermetically sealed.

84,215.—J. W. RHOADES, Clyde, Ohio.—*Oil Box*.—November 17, 1868.—The exit passage is opened

or closed by a rubber disk on the end of a rod connecting with a handle on the outside of the oil box. The under side of the box is cut out to fit the shoulder of the axles.

Claim.—The combination of the oil box A, cut-off C, tubes c^2 and d , and shoulder f , all constructed, arranged, and operated substantially as and for the purpose set forth.

84,216.—C. K. RICE, Marlborough, Mass.—*Coal Sifter.*—November 17, 1868.—The main sieve is pivoted to the side of the box and vibrated to release the ashes, while the cinders fall through one side into an inclined sieve resting on the projection and secured to the main sieve by a strap.

Claim.—1. The combination with the ash box A and coal box B, of the sieves C E and D H, substantially as and for the purposes set forth.

2. The combination and special arrangement of the sieves and frames C and D, in respect to each other and the box B, substantially as shown and described.

3. The combination of the projection b and pin a , with the box B and sieves C and D, as shown and described.

84,217.—Canceled.

84,218.—JACOB SANDS, Waterloo, N. Y.—*Spinning Jack.*—November 17, 1868.—When the carriage is backing off, the vibrating catch thereon comes against the square part of the sliding block, drawing the cord attached to the trigger, and thereby pushing the slotted catch away from its connection behind the post, so as to allow the spring to shift the belt, through the medium of the bar, on to the tight pulley. The adjustable weight on the weighted lever varies the resilient power of the spring and consequently the distance the belt will be forced onto the tight pulley. The projection on the carriage striking the lever shifts the belt back onto the loose pulley.

Claim.—The combination, with the sliding block A, trigger f , spring catch i , and belt shifter k , of the vibrating catch d , on the carriage, when arranged substantially as and for the purpose described.

2. The combination, with the spring latch i , and belt shifter k , of the weighted lever n , when arranged substantially as and for the purpose described.

3. The combination, with the sliding catch i and belt shifting slide k , of the lever m and the projection r on the carriage, when arranged substantially as and for the purpose described.

84,219.—CHARLES A. SEELY, New York, N. Y.—*Manufacture of Gas from Volatile Liquids.*—November 17, 1868.—The volatile liquid, contained in a closed receptacle, is subjected to the heat of hot water, causing the liquid to be converted into vapor which is led off to the burner by pipes covered with a non-conducting material to prevent condensation.

Claim.—1. The process of generating a gas or vapor of high tension, for lighting and heating purposes, as described.

2. The combination of the generator and the pipes or other receptacles containing hot water, as described.

3. The combination of the generator with the escape pipe and stop cock, as described.

4. The prevention of condensation in the gas conducting pipes, substantially as described.

84,220.—THOMAS SHAW, Philadelphia, Pa.—*Generating and Applying Carbonic Oxide for Treating Metals.*—November 17, 1868.—The air blast is prevented from oxidizing the fluid metals by converting the oxygen into carbonic oxide by means of hydrocarbon fluid introduced into the blast pipe and furnace.

Claim.—The employment of hydrocarbon fluids for the purpose of generating carbonic oxide, for operating on heated metals, as described.

84,221.—THOMAS SHAW, Philadelphia, Pa., assignor to himself and PHILLIP S. JUSTICE.—*Power Hammer.*—November 17, 1868.—The spring, secured to one end of the walking beam, is connected to the flexible straps by means of metallic links. The fric-

tion belt, passing around the fly wheel, is attached to a pulley on the shaft from which the tightening pulley is suspended, so that, on raising the tightening pulley and loosening the driving belt, the friction belt is drawn against the fly wheel and stops the machine. On reversing the movement of the tightening pulley, the friction belt is slackened and the fly wheel released.

Claim.—1. The combination of the hammer, flexible strap, links, spring, walking beam, connecting rod, and crank shaft, substantially as herein described.

2. The method, substantially as herein described, of simultaneously tightening the driving belt and releasing the friction or clutch belt, so as to suddenly start the machine, and by a reverse movement to as quickly stop the machine.

84,222.—FREDERICK SHICKLE, St. Louis, Mo., assignor to SHICKLE, HARRISON & Co., same place.—*Hydrant and Gas-pipe Stop.*—November 17, 1868.—The cap is provided with a pivot pin, which has vertical play, so that the cap can be raised from its seat and swung around to gain access to the hydrant pipe.

Claim.—The stop box A, cap B, and their lug A' , and pivot pin b^1 , when constructed and arranged as and for the purpose herein set forth and described.

84,223.—C. B. SILL, Wilkins, assignor to himself and JOHN GOLDSBOROUGH, Philadelphia, Pa.—*Instrument for Affixing Stamps.*—November 17, 1868.—The descent of the affixer causes the spring connecting with the feed wheel to be tightened, and by releasing the spring pawl holding the feed wheel, the latter is rotated by means of the resilient power of the spring, and feeds a stamp forward ready to be cut off and affixed on the descent of the latter.

Claim.—The combination of the cutter and affixer D, sponge a , a spring feed, and the within-described devices, or their equivalents, through the medium of which the spring feed is "set" on the downward movement of the affixer, as and for the purpose described.

84,224.—CHARLES SLOTTERBEK, San Francisco, Cal.—*Fire-arm.*—November 17, 1868; antedated May 18, 1868.—When the trigger is in its forward position the pin on the spring, bearing on the trigger, is on the rear side of the point in the curved slot, so that the slightest pull back on the trigger will bring the point on the front side of the pin, and cause the spring to press the trigger forward and bring its head to bear upon the sear, and thus discharge the hammer.

Claim.—The combination and arrangement of plate B, springs d , i , and l , trigger k , sear g , and hammer f , when operated in the manner substantially as shown and described, and for the purpose set forth.

84,225.—HIRAM F. SMART, Worcester, Mass.—*Process for Printing in Colors.*—November 17, 1868.—An impression can be taken from an engraving or plate in as many different colors as is desired by overlaying the different parts of the impression or print on the sheet, supported by the tympan, and cutting out corresponding parts of the sheet attached to the frisket frame.

Claim.—The mode of printing in colors from a single plate or engraving, substantially as and for the purposes described.

84,226.—KILBURN SMITH, Lowell, Mass.—*Register for Time and Price.*—November 17, 1868.—The face of the dial has three circles of figures or numbers marked upon it with radial division lines beyond each circle of such numbers. The pointer stand on the inner flange indicates the time employed in performing certain labor. If the labor is suspended for a time, the pointer stand on the outside flange is set to the corresponding number on the stationary circle of figures between the outer and inner flanges. A small dial on a pivoted arm is actuated by pins on the dial, and indicates hours.

Claim.—1. The circular flange F, in combination with the moving dial A, in the manner and for the purpose set forth.

2. The outer flange H, in combination with the

stationary circle of figures and indicating lines, for the purpose and substantially as described.

3. The pointer stands E, having each a point, *d*, when used in combination with the flanges F or H, and the moving dial A, or the stationary figured circle between said flanges, for the purposes and in the manner substantially as described.

4. The pivoted arm J, in combination with the dial I, for the purpose and substantially as described.

84,227.—ALBERT SPANGLER, Philadelphia, Pa.—*Latch*.—November 17, 1868.—The spring bolt, operated by the sliding face plate, is locked by means of a projection on a loose collar turning on a stationary knob shank, which engages in the curved recess in the face plate.

Claim.—The sliding face plate E, with its slots *e'* and *e''*, in combination with the loose collar D, the fixed shank C, and the sliding spring bolt F, the said parts being constructed and arranged so as to operate as and for the purpose described.

84,228.—WILLIAM STEIN, Camden, N. J.—*Target*.—November 17, 1868.—Plates representing animals are hinged near the periphery of a revolving frame, and drop when struck, and are turned up by coming in contact with an inclined bar. A screen is placed in front of the target, with an aperture large enough to expose the object as it revolves; another screen is placed behind the target to arrest the balls.

Claim.—1. The swinging plates or aims C C, hinged or pivoted to the rotating frame or disk B, substantially as herein shown and described, to form a target in which the aim will automatically indicate when it is hit, as set forth.

2. The rotating disk or frame B carrying the hinged or pivoted plates C, in combination with the incline D, for automatically resetting the plates C, substantially as herein shown and described.

3. The screen E, having the aperture *g*, in combination with the rotating frame B, and with the plate C hinged or pivoted thereto, as set forth.

4. An automatically-adjusting target, consisting of the rotating frame or disk B, of the hinged or pivoted plates or aims C, of the stationary incline D, perforated screen E, and ball arrester F, all arranged in combination with each other, and made and operating substantially as herein shown and described.

84,229.—A. R. STEWART, Douglas Harbor, New Brunswick.—*Machine for Sharpening Saws*.—November 17, 1868.—The table supporting the laterally-adjustable saw holder is adjustable so as to set the teeth in the right position for grinding on their opposite sides at the desired angle of inclination. A guide rest is so arranged as to keep the teeth true when they are ground, and to regulate their advance.

Claim.—1. The combination and arrangement of the table *b*, adjustable saw rest *n*, pivoted arm *c*, vertical shaft *d*, slotted segment *h*, segment *k*, and sector slide *m*, all constructed and operating as herein described, for the purpose specified.

2. The adjustable guides *r r*, and the wedges *t t*, connected with the saw rest *n*, combined with the stud *s*, on the table *b*, constructed, arranged, and operating as described.

84,230.—BARNA T. STOWELL, Quincy, Ill.—*Excavator*.—November 17, 1868.—The cutting cylinder, composed of two disks united together by bars on which the sinuous cutters are secured, is actuated by suitable power, and while revolving, draws the machine forward. Scraping blades secured to the periphery of the disks throw the dirt separated by the cutters on to the endless apron.

Claim.—1. The cutters *m m*, when constructed in the sinuous form described and shown, and attached to the rotary cylinder G, in the manner specified.

2. The arrangement of the disk J J', connecting bars M M, scraping blades N N, and sinuous cutters *m m*, when the several parts are constructed in the manner described.

3. In that class of excavators in which the rotary cutting cylinder operates to move the machine forward in the manner herein described, the arrange-

ment of such cylinder horizontally across the machine, in front of an inclined apron C, so that the cylinder shall cut the dirt and throw it back upon the apron, while, at the same time, it draws the machine forward, substantially as described.

4. The arrangement of the horizontal rotary cylinder G, apron C, wheels D D, frame E, lever F, and side cutters P P, substantially as described.

84,231.—HENRY THACKER, Oneida, N. Y.—*Combined Rake and Hoe*.—November 17, 1868.

Claim.—As a new article of manufacture, the combined rake and hoe, cast in one piece, the cross head A being sharpened between the tines B, to form a straight cutting edge, as herein described, for the purpose specified.

84,232.—J. H. THURSTON, Rainsborough, Ohio.—*Bee-hive*.—November 17, 1868.

Claim.—The slide *n* and lever *o*, pivoted in recesses cut in the partition *e*, between the same and the spare honey boxes C C, said lever extending to the outside of the hive, whereby the capacity of the opening *l m* is regulated, or communication closed between the boxes C and chamber *a*, as herein shown and described, for the purpose specified.

84,233.—MICHAEL TROMLY, Washington, D. C.—*Gun Lock*.—November 17, 1868.—The upper part of the hammer containing the head slides on the lower part so that when the hammer is at "fall cock" and sprung, centrifugal force throws the head out far enough to explode the cap, but when the hammer is sprung from less than "half cock," it is not thrown out far enough to explode the cap, but falls on the guard.

Claim.—1. A hammer constructed with the parts A and B, operating together, substantially as described.

2. The combination of said hammer with the nipple *n* and guard G, in the manner set forth.

3. A hammer constructed with the depression *m*, shoulders *i i*, and lip or projecting plate *o*, substantially as described.

84,234.—LOUIS VERSTRAET, Paris, France.—*Hydrocarbon Burner*.—November 17, 1868.

Claim.—1. The reservoir A constructed with a double casing or wall, and filled in with the absorbent C, substantially as and for the purposes described.

2. Withdrawing the vapor which rises from the petroleum, or other mineral oil or liquid, from the reservoir, preventing thereby its escape into the atmosphere, and the accumulation thereof in the reservoir, substantially as described and for the purposes set forth.

3. Collecting and using in the boiler the water produced by the condensation of the vapors in the smoke flues, substantially as described.

4. Discharging into the furnace, and utilizing as fuel, the vapors rising from the oil in the reservoir, substantially as shown and described.

5. Producing a current of air through the reservoir, in contact with the oil therein, substantially as and for the purposes described.

6. The filling C, in combination with an oil reservoir, substantially as and for the purposes described.

7. The air-discharge tube E', closed at its base, having a conical end, perforated at *e*, and surrounding the closed conical-ended tube E'', in such a manner as to leave an annular space, *m*, between them, and arranged, with relation to the air-supply pipe F and the gas pipe N, as herein described, for the purpose specified.

84,235.—JAMES VINEY, Manchester, N. H.—*Paper-making Machine*.—November 17, 1868.—A vacuum or partial vacuum, produced in the boxes over which the apron bearing the paper pulp passes, extracts the water or moisture from the pulp. These vacuum boxes can be adjusted to the width of the paper to be made.

Claim.—1. Extracting the water or moisture, to a greater or lesser extent, from the pulp on the wire cloth or felt apron, on its way to the pressing rollers,

by the removal of atmospheric pressure, as described, or in any equivalent manner.

2. The adjustable slides E on the boxes A, by which the aperture in the top of the box is made to correspond with the width of the paper, substantially as described.

84,236.—WILLIAM WARDSWORTH and E. H. SEMPLE, St. Louis, Mo.—*Machine for Picking Wool.*—November 17, 1868.—The journal boxes of the roller have a lateral adjustment so as to set the revolving brushes in such a position as to sweep the edges of the revolving blades on the cleansing cylinder and clear them of adhering particles of wool. The floor is slotted to permit the dirt separated from the wool to pass down into the apartment below.

Claim.—The combination of the cleansing cylinder B, roller C, arranged in adjustable bearing boxes c^3 , and having radial arms C and brushes c^1 c^2 , the slide F, and slotted floor F', all constructed, arranged, and operating as and for the purposes set forth.

84,237.—R. WAITE, Blue Earth City, Minn.—*Wind Wheel.*—November 17, 1868.—The horizontal wheel, having a spirally-tapering vane of varying twist, is inclosed in a bell-mouthed case, which latter is provided with a regulator at its receiving end to govern the quantity of air to be admitted.

Claim.—The wind wheel constructed as described, of the case A, having the flanges B C, the draught-regulator D, horizontal shaft G, and the spiral wind wheel E, having a variable diameter and pitch, all arranged and operating as described for the purpose specified.

84,238.—THOMAS WAITE, Plymouth, Ohio.—*Cultivator.*—November 17, 1868.—The shares can be adjusted for plowing furrows of different widths.

Claim.—The side beams C, when provided with slots D for the insertion and adjustment of the standards E, in combination with the beam A, for the purpose set forth.

84,239.—BERNHARD WEINMANN, Cincinnati, Ohio.—*Steam Whistle.*—November 17, 1868.—A piston fitting in the tube can be raised or lowered to increase or decrease the height of the column of steam vibrating therein, and thus produce a sonorous or shrill sound. The plug at the lower end of the tube has an upwardly-projecting stem which is provided with a head around which the steam passes on its way to the tube.

Claim.—1. The adjustable piston E, arranged in the upper end of a steam whistle, substantially as herein shown and described.

2. A steam whistle, consisting of the tube A, plug B, which has the stem d , head e , and the adjustable piston E, all constructed substantially as herein shown and described.

84,240.—WILLIAM WELLS, Ashtabula, Ohio.—*Spring Butt.*—November 17, 1868.—A pawl slides in a recess in one leaf of the hinge, and can be made to engage with, or be disengaged from, teeth on the end of the spiral spring, and thus cause the latter to operate in closing the door, or be inoperative, as desired.

Claim.—The pawl i and the ratchet teeth h , when arranged substantially as and for the purposes herein shown and described.

84,241.—GILES B. WILLIAMS, New York, N. Y., assignor to ELISHA M. ALLEN, same place.—*Desiccated Cocomanut.*—November 17, 1868.—An alkali is added to the grated cocomanut to prevent acidification.

Claim.—An improved article of confection, consisting of desiccated cocomanut meat combined with sugar and the bicarbonate of soda, substantially as set forth.

84,242.—JOHANN WINKLER, Hudson City, N. J.—*Froth Arrester for Beer Glasses.*—November 17, 1868.—An oval plate, hinged to the edge of the glass, is notched at its free end to permit the liquid to escape and arrest the foam.

Claim.—The oval froth arrester A, provided with a notch, b , and arranged substantially as and for the purpose described.

84,243.—JUSTIN P. WOODWORTH, Brooklyn, N. Y.—*Electro-plating.*—November 17, 1868.—The articles are so held by the rack as to prevent a deposit mark being left.

Claim.—1. The method, substantially as set forth, of depositing different thicknesses of plating or metallic coating on different portions of an article at one operation, by obstructing and deflecting the electric current in the bath in its passage between the two poles, substantially as described.

2. The rack or holder, Fig. 1, or its equivalent, for holding the articles to be plated properly, and for receiving and adjusting, by suitable means, the said obstructing device, substantially in the manner described.

84,244.—JOHN YATES and EDGAR DEUEL, Brooklyn, N. Y.—*Beer Cooler.*—November 17, 1868.—The ends of the pipes are so connected as to prevent leakage. The beer is prevented from coming in contact with the external air when flowing down over the series of pipes, by means of doors hinged to the connecting boxes.

Claim.—1. Connecting the ends of the pipes or tubes A by means of boxes, C, divided into compartments by means of partitions a , the ends of the pipes or tubes passing through suitable standards or plates, B, into the compartments of said boxes, substantially as shown and described.

2. Inclosing the series of pipes or tubes A by means of doors, E' E', hinged to one of the boxes C, substantially as and for the purpose herein set forth.

84,245.—AUGUST DESTOUY, New York, N. Y.—*Manufacturing Boots and Shoes.*—November 17, 1868.—The twist of the thread fills up the awl holes and prevents the entrance of water through the same.

Claim.—The within-described method of manufacturing boots and shoes, that is to say, securing the insole by a stitch whose parts are twisted and crossed in or at each awl hole, substantially as and for the purpose herein described and represented.

84,246.—RICHARD SMITH, Sherbrooke, Canada.—*Machine for the Manufacture of Paper Boxes.*—November 17, 1868.

Claim.—1. A plunger, so constructed as automatically to admit air beneath its lower end just previous to its withdrawal from the cavity of the completed box or other hollow article, substantially in the manner and for the purpose set forth.

2. The formation of the sides of the box by the sudden displacement of the pulp in the mold, by the introduction of the plunger into it by a quick motion, substantially in the manner described.

3. The combination and arrangement of the piston, packing r , air passage c , and valve v , in the manner and for the purpose specified.

4. Discharging the completed box or other hollow article from the bottom of the mold, substantially as set forth.

5. The molds H; made with removable bottoms and permanent perforated linings, as distinguished from removable linings, substantially in the manner specified.

6. The ways W, in combination with the common bed plate of the molds H H', for the purpose of allowing the latter to have a reciprocating movement to bring the molds alternately beneath the plunger, in the manner and for the purpose described.

7. Forming a box or other hollow article from pulp, by forcing a plunger down into the mold containing the pulp, of which the box or other article is to be made, as set forth.

84,247.—SAMUEL L. ALLEN, Cinnaminson, N. J.—*Planting Machine.*—November 24, 1868.—The carrying wheel, the hopper, and chambers revolve together upon the axle, and the chambers discharge the grain successively into the continuous channel, from which it flows into the furrow made by the carrying wheel.

Claim.—1. In combination with the carrying

wheel A, a central hopper, B, having chambers C constructed and arranged around in the said hopper, substantially as and for the purpose described.

2. In combination with the said hopper and chambers, arranged and combined as described, the slides *c'*, constructed and operating substantially as and for the purpose described.

3. In combination with the hopper B and the perforated rim or tread *a'* of the wheel A, the continuous intervening channel *a''*, as and for the purpose described.

84,248.—HENRY E. ANDERSON, Ripon, Wis.—*Swaging Attachment for Sheet-metal-working Machines.*—November 24, 1868.—The rollers are placed upon the revolving arms of a tinner's or iron worker's beading machine for the purpose of swaging screws on stove pipes. The nut and the mandrel of the attachment run out or in according to the direction in which the arms are turned. The guide is set by the index hand to agree with the size of the pipe.

Claim.—1. The screw F, nut G, swaging rollers H and I, acting in combination, substantially as described.

2. Frame C, guide standard D, guide E, nut L, and index hand P, substantially as and for the purpose described.

84,249.—EARLE C. BACON, New York, N. Y.—*Steam Engine.*—November 24, 1868.—The trunk presents an oblong cross-section, with its greatest diameter lying in the same direction as the path of the piston rod's vibration; the object being to increase the effective area of the piston head.

Claim.—The construction of the oblong hollow trunk D, and its arrangement with reference to the piston head B, cylinder A, and cylinder head F, substantially as described.

84,250.—HAYDN M. BAKER, New York, N. Y.—*Manufacture of Carbonate of Soda.*—November 24, 1868.

Claim.—The use of bicarbonate of soda for the purpose of decomposing soluble silicate of soda, to produce pure carbonate of soda and silica, (silicic acid.)

84,251.—JOHN S. BARDEN, Providence, R. I., assignor to himself and DANIEL N. PICKERING, Boston, Mass.—*Steam Pump.*—November 24, 1868.—The stationary block or cylinder in the pump case contains the passages which afford communication between the space below one piston and that above the other, and said block is employed in order that the passages may be larger than it would be practicable to have them in an extension of the main shaft.

Claim.—1. The combination of the stationary cylinder K, and its passages *b*² *c*², with the pump pistons *i'* *k'* connected with the shaft B, and arranged in the pump case, provided with valves and partitions, and induction and eduction conduits, as explained.

2. The arrangement of the steam engine and the pump, and their connection by the neck I and the shaft B, as described.

84,252.—EDWARD D. BENJAMIN, Old Town, Ill.—*Plow.*—November 24, 1868.—The arrangement of the whiffletrees is designed to equalize the work of the horses. The levers, short axles, and sway bar are arranged to vibrate upon the ends of the axletree, for the purpose of raising and lowering the plow frame. When the machine is at work the sway bar rests upon the folding frame, but when it is desirable to depress the plows the folding frame is drawn from beneath the sway bar, which then assumes a lower position and rests upon the plow frame.

Claim.—1. The combination of the whiffletrees with the plow, when the same are constructed and arranged in connection therewith, in the manner herein shown and described.

2. The levers D D', pivoted to the ends of the axletree, and bearing wheel axles E E at the ends of their short arms, and having their long arms connected by the adjustable sway bar G, the whole ar-

ranged and operating substantially as herein set forth and specified.

3. The folding frame K, arranged and operating as described, and for the purpose specified.

84,253.—THOMAS BOOTH and CHARLES CARROLL SANDERSON, Norway, Me.—*Let-off Mechanism for Looms.*—November 24, 1868.—It is the design of this mechanism that when once set to a certain number of picks to the inch on the web, the weaver shall have no power to change the standard to accelerate the weaving and change the texture of the cloth.

Claim.—The combination of standard *d*, arms *g g*, rods *i i*, weights *j j*, arms *k k*, and bands *n n*, with the beam *b*, as and for the purposes herein set forth.

84,254.—LEWIS S. BORTREE, Grand Rapids, Mich.—*Horse Rake.*—November 24, 1868.—The bell-crank lever engages a notched segment to hold the arms and teeth in their depressed position. By throwing forward the foot lever, the rake teeth are made to assume a nearly vertical position, and when this has been done the rake is tilted upward at the rear by giving a forward movement to the crank lever. The teeth work very near the ground, but the rollers prevent them from touching.

Claim.—1.—The vibrating frame E, bell-crank lever F, arms G, slotted double-pronged teeth I, provided with rollers K, and the spiral springs J, when constructed, arranged, and operating substantially as herein described, and for the purposes specified.

2. The standards L, rock shaft N, provided with arms X, the wires P, foot lever O, and bell-crank lever F, substantially as and for the purposes set forth.

84,255.—ANSON R. BROWN, M. D., Albion, Mich.—*Bandage for Preternatural Enlargements.*—November 24, 1868.

Claim.—An elastic bandage, having numerous perforations or interstices, *e*, in its structure, to admit air to the surface of a diseased portion of the human body while under compression, substantially as and for the purpose herein set forth.

84,256.—EDWARD BROWN, New York, N. Y.—*Hinge Machine.*—November 24, 1868.—The hinges are pressed between dies, so that the pipe of the hinge shall be rendered truly cylindrical, and the leaves flattened and bent, and made to lie in the proper plane relative to the axis.

Claim.—The combination, with the bed A, posts B, shaft D, and gate F, with their connections, constituting the frame and moving parts of a press, of the die H, the yielding dies K I, the levers T, T¹, T², T³, and N, and their corresponding springs, substantially as and for the purpose set forth.

84,257.—GEORGE E. BURT and EDWIN A. HILDRETH, Harvard, Mass.—*Hay Spreader.*—November 24, 1868.

Claim.—1. The forks *j j*, when so arranged as to revolve horizontally over the ground, turning the hay, substantially as described, and for the purpose set forth.

2. The forks *j j*, when so arranged as to revolve horizontally over the ground and sweep the hay from before the wheels, in order to give them a path clear from grass or hay, substantially as described and set forth.

3. The arms *g* and *h*, in combination with the fork handle *i*, when so arranged as to revolve the forks *j j* horizontally over the surface of the ground, gathering and discharging or turning the hay, substantially as described and set forth.

4. The forks *j j*, when actuated by mechanism so constructed that there shall be imparted to the forks, in addition to their horizontal rotary motion a dipping and rising motion, to collect and discharge the hay, substantially as described.

5. The forks *j j*, when hung from hinges *l* and *m*, (one or both,) and so arranged that the forks can freely rise, and pass over rising ground or obstacles, substantially as described, and for the purpose set forth.

6. The shaft *f*, disk *u*, and eccentric wrist *s*, in combination with the driving arm *g* and operating

arm *h*, arranged to operate the forks *j j*, substantially as described.

7. The gear *c*, pinion *d*, tube *e*, shaft *f*, disk *u*, and wrist *s*, when used in combination to operate the arms and forks of a hay tedder or rake, substantially as described.

8. The flexible joints *l* and *m* in the arms *g* and *h*, to allow the forks to follow over rising ground or obstacles, substantially as described, and for the purpose set forth.

9. The combination of the forks *j j*, the pivots *q*, pins *p*, staves *i*, and pivots *k* and *n*, with the driving arm *g* and operating arm *h*, operating as and for the purposes set forth.

10. The springs *v v*, when so arranged as to lift a portion of the weight of the forks *j j* and their connections, substantially as described, and for the purpose set forth.

84,258.—ERASTUS T. BUSSELL, Indianapolis, Ind.—*Car Spring*.—November 24, 1868.—The annular air spaces communicate with an air chamber in the base cup, upon which the rubber tubes and spiral springs rest, and into which air may be pumped to replenish any leakage.

Claim.—1. The formation of a rubber, spiral, and air spring, by the arrangement and combination of two or more concentric, hollow tubes of vulcanized India-rubber, $R^1 R^2 R^3$, and four or more spiral springs $S^1 S^2 S^3 S^4$, in such manner that the spirals support the rubber tubes externally as well as internally, and so as to form annular air spaces for the confinement of atmospheric air between said rubber tubes, substantially as described and shown.

2. The chambered base C^2 , with induction openings *i*, furnished with valves *V*, and eduction openings *J*, between and in combination with the tubular and spiral spring, composed of the rubber tubes *R* and spirals *S*, arranged to operate in conjunction, as shown and described.

84,259.—JOHN BUTLER, Brooklyn, N. Y.—*Method of Generating Fixed Gases from Hydrocarbon Vapors*.—November 24, 1868.—The vapors generated in the vaporizer by steam from the boiler pass to the roasting chamber. The vapor traverses the longitudinal perforations in the charcoal block, and is thus divided into streams, to be more effectively acted upon by the heat. It then passes to the condenser.

Claim.—1. An arrangement of mechanism for roasting hydrocarbon vapors or changing them into permanent gases, by exposing them to heat while minutely divided or separated into small streams, substantially as herein shown and described.

2. The combination and arrangement of the furnace or fire chamber *A*, boiler *B*, vaporizer *E*, roasting chamber *H*, and perforated charcoal block *I*, or its equivalent, with each other, substantially as herein shown and described, and for the purpose set forth.

3. The perforated charcoal block *I*, prepared and operating substantially as herein shown and described, in combination with the roasting chamber *H*, as and for the purpose set forth.

84,260.—JOSEPH CHARLEVILLE, St. Louis Co., Mo.—*Step Ladder*.—November 24, 1868.—This mode of applying the top seat or foot board renders it readily removable.

Claim.—The rail *a*, its tenon *f*, in combination with the mortise *g* of the seat board *B* and the brace *G* and step or round *b*, substantially as and for the purposes set forth.

84,261.—CHARLES L. COLE, Richmond, Mich., assignor to himself and THOMAS JOHNSON, same place.—*Spinning Wheel*.—November 24, 1868.—The depression of the respective treadles causes the spindle to approach and recede from the operator.

Claim.—The rock shaft *M*, wheel *L*, friction wheels *H*, *S*, and *T*, arms *Q* and *R*, belts *N*, *U*, and *V*, and treadles *O* and *P*, when arranged relatively to each other, as herein described, in connection with any hand spinning wheel, and operating as and for the purposes substantially as set forth.

84,262.—HUGH H. CRAIGIE, New York, N. Y.—*Water Closet*.—November 24, 1868.—The piston is

depressed by a connection with the seat of the water closet, and when free to rise its valve is opened by the upward pressure of the water. Thus water flows upward through the piston, while the latter is rising in the act of closing, under the conjoint upward pressure of the water and a spring.

Claim.—1. The piston *l*, moving in the cylinder *b*, between the inlet and outlet pipes, in combination with the valve *n* and seat *f*, the parts being arranged and operating substantially as and for the purposes set forth.

2. The rod *m*, piston *s*, and valve-controlling chamber *a*, in combination with the water way *8*, and valve *n*, to the water closet, substantially as specified, so that the end movement given to the piston rod shall open or close the water way *8*, for the purposes specified.

3. The valve *r*, applied at the piston rod *m*, in combination with the valve controlling chamber *a*, and a piston, moving in said chamber, to regulate the closing of a water-closet valve, substantially as set forth.

84,263.—JAMES B. CRANE, Dalton, Mass.—*Manufacture of Paper Belting*.—November 24, 1868.—The pulp is carried through the first press rollers by means of a felt; it is then carried over other rollers, and the first formed end is brought back to the first press rollers, run through again, and made to perform the same journey over the other rollers as before, carrying with it the continued stock as the felt delivers it.

Claim.—The process herein described for manufacturing paper fabric, substantially in the manner and for the purposes herein set forth and described.

84,264.—DANIEL M. CUMMINGS, WYMAN PATTEE, and ALBERT M. SHAW, Enfield, N. H.—*Divided Axle for Railways*.—November 24, 1868.—One part of the sleeve is fixed to one half of the divided axle, and the other part permits the other half of the axle to revolve within it, and the parts of the sleeve are rigidly connected, so that, while either axle section can be rotated independently of the other, neither can be oscillated within its coupling.

Claim.—1. Uniting the axle section *b* with the coupling section *d*, by fitting a tapering portion of the former into the tapering bore of the latter, and then employing a screw nut or nuts on the inwardly-projecting end of said axle section, when the said coupling section *d* is combined with its matching coupling section *c*, substantially in the manner herein set forth.

2. The arrangement of a properly proportioned disk or washer, *e*, within the coupling box of our improved car axle, in such a position as to prevent any lateral action that may be exerted upon the car wheels or axle from injuriously jamming the tapering portion of the axle section *b* within the coupling section *d*, substantially as herein set forth.

84,265.—WILLIAM H. CURTIS, Painesville, Ohio.—*Thill Coupling*.—November 24, 1868.—The diameter of the eye of the hook equals that of the joint bolt, but the mouth of the hook is contracted by the feather to an extent equal to the depth of the notch in the joint bolt. In order to couple or uncouple the hook and bolt, the thills must be raised to such a position as will bring the feather and notch into coincidence.

Claim.—The combination of the hook *B* and its key *B'* with the rigid joint bolt *E* and its notch *e'*, when arranged and operating in the manner and for the purpose set forth.

84,266.—CHARLES B. DAVIS, Dayton, Ohio.—*Device for Hanging Picture and other Frames*.—November 24, 1868.—Designed to sustain the frame at any inclination from the wall.

Claim.—The method of hanging frames herein described, with the eyes *B*, *C*, and *C'*, ring *D*, cord *E*, and slip *F*, when arranged with relation to the frame *A*, substantially as and for the purposes set forth.

84,267.—JOB A. DAVIS, Watertown, N. Y.—*Clog*.—November 24, 1868.—The clog is held upon the foot by the force of the springs, tending to draw the front and rear parts of the clog together, the heel

support and toe piece serving as adjuncts of the springs.

Claim.—1. A clog formed in two separate parts, so connected that, while drawn toward each other by force of a spring or springs, they may be stretched further apart from each other, substantially as and for the purpose described.

2. A heel piece for a clog, mounted with a heel support and with a flexible shank, substantially as and for the purpose described.

3. The sole piece, having therein a cavity and a yielding spring or springs, substantially as and for the purpose described.

4. The combination of the cavity and spring or springs in the sole of the clog, with the elastic shank piece secured to the heel piece, substantially as shown and described.

84,268.—PAUL DEHLINGER, Buffalo, N. Y.—*Hod Elevator.*—November 24, 1868.—The bodies of the hods rest in the angular notches of the frame, and are retained in place by a cleat on the bottom of each, and by a cross piece beneath, against which the handles rest. The open ends of the hods rest against a guard board, which prevents the accidental discharge of their contents. The hinged step admits of the hook of the hoisting tackle being reached.

Claim.—1. A frame, provided with angular notches, when used in combination with hods, provided with cleats *j* for elevating the latter, substantially as set forth.

2. The arrangement of the guard board *M* between the hod racks, as described.

3. In an elevating apparatus, the combination and arrangement of the platform *C* with hod racks *E*, substantially as set forth.

4. The arrangement therewith of a hinged step, *Q*, as herein set forth.

5. The construction of the hod rack *E* with double row of angular notches, *e e'*, in the manner described.

6. The arrangement of the brace and elevating bars *g g g g* and eye *h* with the hod racks *M*, constructed as herein set forth.

84,269.—WILLIAM E. DERRICK, Jordan, N. Y.—*Horse Hay Fork.*—November 24, 1868.—The slides being forced together so as to open the prongs, the central shaft is thrust into the hay, and the upper slide then clamped to said shaft by the cam lever. The foot is placed upon a projection of the lower slide, and the prongs close as the instrument is raised.

Claim.—The caliper-shaped prongs *B*, in combination with the straight piercing shaft *C*, for the purpose herein described.

84,270.—OSSIAN E. DODGE, St. Paul, Minn.—*Reflector for Public Halls, &c.*—November 24, 1868.—The reflector may be adjusted upon its horizontal axis so as to cast the light fully in any particular place or direction, or wholly or partially exclude it.

Claim.—The double reflector *E*, as arranged and operated by the cord *H*, in combination with the pipe *A* and burners, for the purpose specified.

84,271.—GEORGE H. DOW, Freeport, Ill.—*Horse Hay Fork.*—November 24, 1868.—The prong is sustained in a raised position away from the point of the tine by a lever catching in a notch near the lower end of the prong, and in this condition the fork is thrust into the hay; the prong is then released and forced downward until the lower end reaches the point of the tine, it being locked in this position by the engagement of the lever with an upper notch.

Claim.—The curvilinear tine *A*, in combination with the prong *B*, in the manner as and for the purpose set forth.

84,272.—GUSTAVE DUBELLÉ, Boston, Mass.—*Composition for Pavements.*—November 24, 1868.—Asphaltum, coal tar, yellow wax, iron slag, sand or silica, caustic lime, and clay.

Claim.—The new pavement composition, as made of the several materials and in the manner as herein first described.

84,273.—F. G. FOSTER, Eagle Rock, N. C.—*Type-setting Machine.*—November 24, 1868.—The

type is pressed from the box into a slot in the vertical plate by means of a coiled spring, so that on operating the keys the arms are caused to rotate, thus forcing the types into a groove which directs them to the central channel, from whence they fall through a curved groove on to a setting rule which slides in a pivoted composing stick. When one line is completed the composing stick is turned over, the type justified, and the setting rule slidden back, while a slide moves the type into the galley far enough to permit the rule to be again placed alongside of the stick.

Claim.—1. The arrangement of the removable vertical plate *I*, when provided with recesses *x x*, and grooves *x' x'*, as described, and entirely covered with a glass or other transparent plate, with the type boxes *D D* and fingers *f f* acting in the recesses *x x*, substantially as and for the purposes herein set forth.

2. The type box *D*, constructed as described, and provided with a spring, *g*, to press the type forward, substantially as herein set forth.

3. The arrangement of the fingers *f f*, placed in the recesses on the plate *I*, in combination with the journal *e*, lever *d*, rod *b*, and the key *C*, all constructed as described, and the fingers operating so as to force the type down in the grooves, substantially as herein set forth.

4. The guide *E*, constructed as described, with a curved groove to guide the type properly into the composing stick, as herein set forth.

5. The combination of the setting rule *G*, composing stick *h*, slide *i*, and galley *F*, all constructed as described, and operating as and for the purposes herein set forth.

6. The setting rule *G*, constructed and working in the manner and for the purposes herein set forth.

84,274.—EARL J. HALL, Indianapolis, Ind., assignor to himself and JACOB ELDRIDGE, same place.—*Pump.*—November 24, 1868.—The induction pipes are reciprocated simultaneously, in the same direction, upon the pipes of the water box, and the valve chambers are alternately charged with water.

Claim.—The arrangement and combination of water box *A*, horizontal induction pipes *V*, valve chambers *B*, and the means used for operating the same, all as shown.

84,275.—EVERETT C. HAMMOND, Oswego, N. Y., assignor to himself, O. H. PENNOCK, and IRA G. W. PENNOCK, same place.—*Center-board Winch.*—November 24, 1868.—The worm and worm wheel give the men more complete control of the cranks, and obviate the injury to which they are liable in suddenly starting a heavy center board by the common means, namely, a spur wheel and pinion. The arrangement is such that the operating cranks do not interfere with a lumber deck load.

Claim.—1. The barrel *A*, worm wheel *B*, endless screw *C*, and gears *E f*, combined and operated substantially as herein described and for the purpose set forth.

2. The arrangement of the operating shaft or shafts *c e*, when placed at right angles to the barrel *A*, for the purpose herein described.

84,276.—ANNE B. HANCOCK, Suspension Bridge, N. Y.—*Fan.*—November 24, 1868.

Claim.—The combination of the whalebone frame *A E* and buckram plates *C*, to form an elastic foundation to receive the covering of feathers, *D*, substantially as described.

84,277.—JAMES HARRIS, Janesville, Wis.—*Evaporator.*—November 24, 1868.—The apparatus is divided into several compartments, so arranged and connected with each other and the flue passage as to regulate the draught and prevent the apartments from being emptied unless so desired, and their contents from burning.

Claim.—1. So constructing the opening in the partition between finishing apartment *b'''* and the others, that the bottom of this opening, being above the bottom of these latter, they cannot get empty and burn.

2. Dropping the finishing apartment *b'''* lower than the others.

3. The combination and arrangement of dampers *e* and *f* with the pan *C*, constructed with its several apartments, as set forth.

4. The combination of pan *C*, damper *f*, cold-air passage *g'*, and flue *d*.

5. The evaporator constructed, arranged, and operated in the manner substantially as shown and described, for the purpose set forth.

84,278.—THOMAS M. HERRIOTT and SAMUEL MYERS, South Pittsburg, Pa.—*Balance Slide Valve*.—November 24, 1868.—The upper ring is held in easy contact with the cap of the steam chest by the elastic force of a beveled ring, but when steam is admitted to the chest, its pressure upon the outside of the spring ring tends to close the latter concentrically, and thus force the top ring into steam-tight contact with the cap of the chest.

Claim.—The combination of the rings *C* and *B*, with the projection *S*; the whole constructed substantially as shown and described.

84,279.—WILLIAM T. HORROBIN, Bennington, Vt.—*Molding Machinery*.—November 24, 1868.—The mold may be easily separated from the pattern, for inspection and repair, and the parts again united and caused to register truly.

Claim.—1. The combination, substantially as described, of the reversible follow board with the sliding carriage *C*, for the purposes set forth.

2. The combination of the flask with the reversible follow board and the clamping screws *J*, as and for the purpose set forth.

84,280.—CHARLES KAISER, New York, N. Y.—*Rotary Steam Engine*.—November 24, 1868.—The fly valves fitted into the circumference of the revolving piston, are provided with semicircular self-adjusting packing pieces having their ends presented to the pressure of the steam. Spring levers connecting with the inner surfaces of the fly valves form a parallelogram, the action of which is to keep the fly valves in contact with the cylinder.

Claim.—1. The arrangement of the circular piston *H* in an oblong or oval cylinder *A*, when said piston is provided with fly valves *N N' N'' N'''*, constructed and fitted into the circumference of the piston, substantially as described.

2. The construction and arrangement of the fly valves *N N' N'' N'''* in the circumference of the piston *H*, with circular packing pieces *c* near the outer ends of said valves, substantially as herein set forth.

3. In combination with a circular piston *H*, provided with fly valves, constructed as above described, and working in an oval cylinder, the arrangement of two induction passages *n n*, and of two eduction passages *m m*, directly opposite each other, whereby to admit and exhaust the steam simultaneously at the opposite sides of the revolving piston, substantially as described.

4. Rods or levers *s s' s'' s'''*, forming a parallelogram, in combination with the fly valves, said levers being provided with springs, substantially as set forth.

84,281.—R. H. KENT, Middlebury, Ohio.—*Cloth-measuring Apparatus*.—November 24, 1868.—The standards in which the winding shaft is journaled are adjustable on the slides so that any width of goods can be measured. By means of the slides the uneven winding of the cloth is obviated, thereby preventing wrinkles.

Claim.—The combination of the slide *O* and adjustable standard *R*, as arranged in relation to and combined to cooperate with the rollers *H J*, winding shaft *F*, all in the manner as and for the purpose set forth.

84,282.—CHESTER KING, East Cleveland, Ohio.—*Water Elevator*.—November 24, 1868.—The bucket on being drawn up is caught between guide arms which prevent it from swinging about and striking the curb, and tilted by arms coming in contact with lugs on the centrally pivoted bucket.

Claim.—The guide arms *F*, hinged at *a*, and tilting arms *H*, when arranged in relation to the curb *A* and spout *I*, all constructed in the manner and for the purposes substantially as described.

84,283.—GEORGE H. KITCHEN, New York, and SCOTTO C. NASH, Brooklyn, N. Y.—*Portable Gas Apparatus*.—November 24, 1868.

Claim.—1. A diaphragm *h*, introduced in the lower part of the vessel containing the liquid hydrocarbon, so that said liquid shall freely pass into and fill the space below said diaphragm, in combination with a pipe supplying air below said diaphragm, and a pipe conveying away said carbureted air, substantially as set forth, whereby said diaphragm directs the bubbles of air, as they pass through the lower part only of the liquid hydrocarbon, and they do not disturb or vaporize the upper portion of the same, as set forth.

2. The diaphragm *h*, and spiral flange, forming a channel in which the bubbles of air travel, in combination with the pipes *2* and *k*, and diaphragm *f*, within the gasoline vessel *l*, substantially as and for the purposes set forth.

3. A gas holder, provided with perforated distributing pipes in the lower part, in combination with the carbureting vessel, pump, and pipes arranged substantially as specified, so that the air that is forced directly into the gas holder, to dilute the gaseous hydrocarbon, will enter by the same distributing pipes that have supplied the carbureted air, in order that the contents of the gas holder may be mixed together with uniformity, substantially as set forth.

4. The combination of a gas holder, formed of a flexible bag, with a pump and carbureting vessel, substantially as and for the purposes specified.

84,284.—J. KLINKHARDT and W. KIBURZ, St. Louis, Mo., assignors to themselves and PAUL OEHLER, same place.—*Brick Machine*.—November 24, 1868.—Plungers operate on two sides of the brick in the mold at one operation, while a cutter detaches any swelling on the lower face, thus producing a true-faced brick.

Claim.—1. The arrangement and combination of the pug mill *A*, its screw *b*, and passage *a'*, with the mold chamber *C*, and plungers *D* and *E* and slide *F*, substantially as set forth.

2. The knife *f*, when combined and operated with the slide *F*, substantially as and for the purpose set forth.

85,285.—FRANCIS KRICK, Fidelity, Ohio, assignor to himself and ELI SINKS.—*Lifting Jack*.—November 24, 1868.—A stirrup on the end of the lever which is pivoted to the notched standard fits into the notches on the movable rod, and on lowering the lever the rod is raised and held in position by a spring catch.

Claim.—The combination and arrangement of the bars *A B*, the lever *C*, stirrup *K*, guides *E D*, and spring-catch *G*, constructed substantially as and for the purpose specified.

84,286.—J. C. LANDER and R. R. LANDER, Mazo Manie, Wis.—*Beehive*.—November 24, 1868.

Claim.—The sections *A B*, movable sides *H*, dividing boards *C'*, and frames *C*, when said frames are so arranged in the cases that a space is left between them and the walls, all constructed, combined, and arranged in relation to each other, in the manner as and for the purpose set forth.

84,287.—CHARLES LEAVITT and W. H. BURRIDGE, Cleveland, Ohio.—*Cotton Gin*.—November 24, 1868.—The vibrating comb prevents the edge of the plate and the rollers from being gummed.

Claim.—1. The rollers *D* and *G*, vibrating comb *J*, and plate *K*, combined and operating as set forth.

2. In combination with the above, the rotating brush *I*, or its equivalent, operating substantially as described.

84,288.—J. H. LINVILLE, Philadelphia, Pa.—*Bridge*.—November 24, 1868.—The struts are stayed at one or more intermediate points in their length, by means of diagonal ties which act in a twofold capacity of suspension ties and trussing rods, without the use of auxiliary truss rods for that purpose.

Claim.—The construction and arrangement of tension bars and struts for giving initial tensile stress to the bars, and rigidity to the struts, substantially as herein set forth.

84,289.—EDWARD A. LOCKE and WILLIAM N. WEEDEN, Boston, Mass.—*Mode of Packing Lamp Shades.*—November 24, 1868.—The blanks may be packed in a small compass for transportation, and readily formed in shape by joining the edges.

Claim.—A compact encased package of two or more paper lamp shade blanks, having a single margin prepared with a dried gum or cement, and with the margins or ends left unnnited, substantially as and for the purposes described.

84,290.—SAMUEL B. LUCKETT, Corydon, Ind.—*Cloth Measuring Apparatus.*—November 24, 1868.—A rod arranged within the winding cylinder is provided with hooks which are thrust into or withdrawn from the cloth by the rotation of the rod.

Claim.—The cylinder B, arranged as described, cylinder C, with rod c^1 , and hooks c^2 , and the rod D, the whole being combined and operated substantially in the manner and for the purpose set forth.

84,291.—HARMON F. LUSHBAUGH and OSCAR Z' HURD, Mount Pulaski, Ill.—*Animal Trap.*—November 24, 1868.—The animal depresses the platform on reaching for the bait, thus disengaging a pawl which allows the shaft to rotate and push the animal onto a platform operating a series of pointed rods which, on the animal passing into the end of the box, prevent it from returning.

Claim.—1. The combination of the shaft B, coil-spring h , rods $m m^1 m^2 m^3 m^4$, and n and $o o^1 o^2 o^3$, platform p , with its springs q , link f , and pawl r , as and for the purpose specified.

2. The combination of the platform t , links v and x , levers w and z , rock shafts E and F, with their lance heads and weight, as and for the purpose specified.

3. An animal trap, formed by the combination of the parts hereinbefore described, as and for the purpose specified.

84,292.—THEODORE W. MAHLER, Rome, N. Y.—*Water Wheel.*—November 24, 1868; antedated November 9, 1868.—The water passes onto the wheel by a double scroll, and a separate radially moving gate provided for each guide is constructed in two parts, so that an obstruction of one gate will not prevent the closing of the others.

Claim.—1. The double scroll, constructed and arranged in relation to the wheel, substantially as described.

2. The extension gate F F², constructed and arranged to operate as described.

84,293.—CORNELIUS W. L. MARTINE, Scotch Plains, N. J.—*Water Elevator.*—November 24, 1868.—The links of the chain fit in grooves in the sides of the buckets. The ratchet wheel, pawl, grooved wheel, and weight are so arranged as to prevent the rapid descent of the full buckets when the operator releases the crank.

Claim.—1. The chain P, and buckets or cups O, when combined, constructed, and operated, substantially as described, for the purposes specified.

2. The combination of the chain P, buckets or cups O, ratchet wheel I, pawl J, grooved wheel F, and weight H, constructed and operated substantially as shown, for the purposes indicated.

3. In combination with the subject-matter of the second claim, the shaft C, box A, and crank N, for the purposes set forth.

84,294.—SAMUEL MASON, Newark, N. J.—*Horse Shoe.*—November 24, 1868.—The calks are provided with ribs which fit in grooves or indentations in the shoe, and are held together by pins.

Claim.—The rib b , indentation c , the pin d , and the corresponding groove e , when combined in the manner and for the purpose specified.

84,295.—WILLIAM C. MCGILL and WILLIAM KNOX, Cincinnati, Ohio.—*Safety Stove for Railroad Cars.*—November 24, 1868.—The upper reservoir is provided with a spherical valve, and the lower reservoir, which forms the base of the stove, with a cap, so that a collision of the ear would cause the spherical valve and the cap to be removed, allowing the water to extinguish the fire.

Claim.—In combination with the fire chamber, the upper and lower water reservoirs H and A, substantially as set forth.

84,296.—LYNFRED MOOD, Ithaca, N. Y., assignor to TITUS and BOSTWICK, same place.—*Seeding Machine.*—November 24, 1868.

Claim.—1. The arrangement and construction of the bars P P fast to a cross-bar, anterior of and extending to the rear of the carriage axle, but are not fixed to it, for the purpose of obviating the jar of the seed box A by the carriage wheels, as set forth.

2. Moving the sliding bars H and I in opposite directions at the same time, when made and used substantially as described, thereby giving great motion to the sowing bars, as set forth.

3. The arrangement of the double crank C, over and transverse to the center of its motion, for the purpose of moving the sliding bars H and I in opposite directions, as set forth.

4. Attaching the agitators G to the bar H, when said bar H is used for the twofold purpose of agitating the grain, &c., and for forming part of the throat, as set forth.

5. The arrangement of the hinged leaf J, so as by the described means to regulate the throat made by the leaf and the sliding bar H, as described.

6. The construction and use of the lever K and its set-screw clamp, for the purpose of setting the throat by the leaf J, as set forth.

7. The arrangement, on the ends of the leaf J, of one or more springs, M, for the purpose of evening the sowing, as set forth.

8. The combined whole, made and arranged of the carriage B, the seed box A, bars H and I, and double crank C, substantially as described.

84,297.—F. A. MORLEY, Syracuse, N. Y.—*Potato Digger.*—November 24, 1868.—The riddling cylinder is supported by a single set of arms, located somewhat in rear of the cylinder, so as to have free action. The screen is driven by means of pinions on the driving shaft and internal gears on the driving wheels.

Claim.—1. A rotating cylinder, I F, sustained wholly by a central spindle, f , with arms $i i$, only, which are projected from the said spindle considerably in the rear of the screen F, when combined with the shovel H, as herein shown, and for the purpose described.

2. A crank axle, C c , having a driving shaft, E, working through the center of its crank wrists $e e$, as shown in Fig. 4, in connection with the driving wheels B B, frame A g , and screen F, all constructed and operating substantially as and for the purpose set forth.

84,298.—ADOLPHUS F. W. NEYNABER, Philadelphia, Pa.—*Water Indicator for Steam Boilers.*—November 24, 1868.—Improvement on his patent of June 4, 1867. The float in a pipe on the water line of the boiler is connected by a rod with the whistle valve, which is placed above the water line of the boiler to prevent water from being blown through the whistle.

Claim.—The construction and arrangement of rod B, bracket E, and pipe F, substantially in the manner described.

84,299.—GARRET J. OLENDORF, Middlefield, N. Y.—*Mode of Poling Hops.*—November 24, 1868.—The cords are secured to stakes in the hills and to poles placed between the hills, instead of using a pole for each hill without cord.

Claim.—The poles A, hill stakes B, and cords C, when arranged as and for the purposes herein set forth.

84,300.—HENRY H. PALMER, Rockford, Ill.—*Spring Bed Bottom.*—November 24, 1868.—End play is prevented by the straps, and side play by the band.

Claim.—The bed bottom described, consisting of the frame A with cross pieces E, slats c with straps B and projections G, springs F and band D, the whole being combined and arranged as and for the purpose set forth.

84,301.—WILLIAM G. PERRY, Manchester, N. H.—*Machine for Producing Weavers' Cut Marks.*—November 24, 1868.—Beneath the shaft is a wire which takes up and transfers color from the trough, in contact with one or more tiers of threads in the web.

Claim.—The shaft *b*, with the wire *a'*, or its substitute, attached, and the trough *a*, and the disk and sweep by which the wire is brought from its state of immersion in the color trough into contact with the web of yarn, all substantially as and for the purpose set forth.

84,302.—CHARLES C. POST, Hinesburg, Vt.—*Sap Spile.*—November 24, 1868.

Claim.—The sap spile, constructed with the longitudinal fins *B*, whereby it may be held or retained in the tap or hole in the tree without materially interfering with the flow of the sap, substantially as herein set forth.

84,303.—ELI RICE, West Northfield, assignor to himself and N. H. RICHARDSON, Fitchburg, Mass.—*Device for Preventing Hens from Scratching.*—November 24, 1868.—A plate or elog, through one end of which is passed the leg of the hen, extends to the rear and terminates in a point, so that the forward movement of the leg will draw the point forward and prevent the hen from scratching.

Claim.—The within-described device for preventing fowls from scratching.

84,304.—CARL WILHELM ROEDEN, San Francisco, Cal.—*Anchor.*—November 24, 1868.—The fluke arms consist of two parts, divided longitudinally through the center, and secured together by rivets or bolts. The arms are pivoted to the stock by means of steel balls working in recesses in the shank and arms.

Claim.—1. An anchor, constructed with its fluke arms *B* divided in two pieces, and attached to the shank *A*, as described.

2. The use of metal balls *G*, as a means of pivoting the arms on the shank, the whole as herein described, and for the purposes as set forth.

84,305.—WARREN ROWELL, New York, N. Y., assignor to himself and JOHN HECK, same place.—*Molding Gear Wheels.*—November 24, 1868.

Claim.—1. Molding the double gear wheel *A* with the groove between the two series of teeth, by, in effect, dividing the core into parts or steps, and mounting the parts alternately in the opposite flasks, and forming them of greensand at the same time the main parts are formed, substantially as and for the purposes herein set forth.

2. The introduction of an elastic substance between the pattern and plate, as described.

84,306.—GEORGE H. SANBORN, New York, N. Y.—*Paper-cutting Machine.*—November 24, 1868.—The knife bar is hung eccentrically to two gears pivoted to a frame and operated simultaneously by two worms on one shaft.

Claim.—The combination of the knife bar *H*, gears *F F'*, and worm wheels *D D'*, constructed and operating in the manner and for the purpose specified.

84,307.—GEORGE H. SANBORN, New York, N. Y.—*Paper-cutting Machine.*—November 24, 1868.—The swinging arms, to which the knife is suspended, are not parallel to each other, which has the effect of lifting the knife a little higher at one end than the other, thus giving an inclined and gradual cut.

Claim.—1. The combination of the knife *c* and the swinging arms *b b'*, when the latter are arranged relatively to each other, in the manner described, for the purpose specified.

2. The arrangement and combination of the rod *p*, arm *h*, rock shaft *e*, and lever *g*, as and for the purpose described.

3. The rubber *r*, attached and adjusted as described, for the purpose of arresting the motion of the knife, as set forth.

84,308.—ETHEL SANGER, Alton, Ill.—*Car-heating Stove.*—November 24, 1868.—A water reservoir attached to the stove is so connected with the

fire box that should the stove be overturned, the fire will be at once extinguished. A float in the reservoir is so connected with a damper in the smoke pipe as to turn the same and obstruct combustion of the fuel.

Claim.—1. The stove *A*, tubes *C*, and reservoir *D*, when arranged as herein described, and for the purpose set forth.

2. The arrangement of the float *E*, valve or damper *b*, and the connecting devices *e e'* *e''*, as and for the purpose set forth.

84,309.—NORMAN B. SHERWOOD, Millville, N. Y.—*Potato Planter.*—November 24, 1868.—A series of cups attached to an endless chain is made to pass through a curved tube attached to a hopper containing the potatoes to be planted, and convey the same to a distributing cultivator tooth.

Claim.—1. The tube *A*, in combination with the carrying chain *B*, or its equivalent, and elevating cups *C*, or their equivalent, arranged substantially as and for the purpose set forth.

2. In combination with the above, the hopper *D*, constructed and operating as herein shown, and for the purpose described.

84,310.—LOUIS SHMETZER, Chicago, Ill.—*Sleigh and Baby Carriage.*—November 24, 1868.—The carriage body is mounted on a frame formed by two sled runners, which frame has attached to it two detachable axles having wheels. The runners are made in two sections, hinged together near the front end, the forward end being turned back when used as a carriage.

Claim.—The combination of the removable carriage body *A* and wheels *D C* with the sled runners *B*, when constructed and arranged as herein described, for the purpose of easy conversion into a child's carriage or sled, at will.

84,311.—JOHN SIDDONS, Rochester, N. Y.—*Ring-ferruling Machine.*—November 24, 1868; antedated November 7, 1868.—Upon the top of an upright slide, which is pivoted to a slotted lever, is fastened an arm, extending over the top of the standard, and having on its under face a half-round rib. On the top of the standard is a steel die provided with a raised edge and a groove, and between two arms is pivoted a bent lever, to which is bolted a steel die.

Claim.—1. The lever *O*, upright slide *W*, and arm *y*, with its swaging rib *e'*, in combination with the grooved die *C*, all constructed and arranged as and for the purpose set forth.

2. The combination of the cutting and forming dies *C*, *e'*, and *K*, constructed and operating substantially as shown and described.

84,312.—JAMES SPEAR, Philadelphia, Pa.—*Railroad-car Stove.*—November 24, 1868.—Self-acting valves are so arranged on the top plate of the stove, and in relation to the pipe, as to obviate the necessity of separate holes for the air and smoke pipes.

Claim.—The arrangement of the valves *A A* on the top plate of the stove, in such a manner as to allow the stove pipe to extend through the cold-air pipe, substantially as and for the purposes set forth.

84,313.—NORMAN C. STILES, Middletown, Conn.—*Adjustable Press.*—November 24, 1868.—A rocking lever, fitted between cheeks in a punch or die carrier, is supported indirectly upon an axis which passes eccentrically through a wheel fitted to be easily turned in a corresponding hole in the lever, the said wheel being provided with diagonal screw threads to receive an endless screw, by which it is operated.

Claim.—The method herein described, or its equivalent, of adjusting and fastening the eccentric to the lever or working part, and allowing to the supporting or crank pin freedom to rotate in the body of the eccentric, or in its own bearings, substantially as described.

84,314.—JOHN STOKES, Springfield, Mass., assignor to WESSON FIRE-ARMS COMPANY, same place.—*Gun Lock.*—November 24, 1868.—The end of the

short arm of the main spring, instead of resting in a fixed position against a rigid support, is elongated so as to bear upon the upper edge of the tumbler during a part of the rotation of the latter.

Claim.—The construction and arrangement, relatively to each other, of the main spring and tumbler in the locks of fire-arms, whereby the hammer, after delivering its blow, is made, by the action of the main spring, to rise or return sufficiently to relieve the nipple, firing pin, or cartridge, substantially as and for the purpose set forth.

84,315.—OLE O. STORLE and LORENS SWENSON, Norway, Wis.—*Horse Rake.*—November 24, 1868.—The teeth are attached to the bolster by means of a hinge or "cap," which is held open by a spring. A bolt, through which the teeth pass, enters the upper part of the hinge, and, with a nut, holds the teeth firmly against the hinge.

Claim.—1. Hinged cap I and bolt M, in combination with spring K, substantially as described.
2. Tooth F, passing through bolt M, with its end passing up through hinge I, substantially as and for the purpose specified.

84,316.—ANSON C. STOWE, San José, Cal.—*Carriage Spring.*—November 24, 1868.—Two shafts extend across from one reach to the other, each having three bent cranks, the middle ones being joined by a connecting rod, and attached to bars, so as to cause the weight to be equally distributed on both sides.

Claim.—The shafts E E, with their cranks or bent arms *d* and *g*, and the connecting rod *c*, together with the links *e e* and rods *b*, the whole operating on the springs D as an equalizing device, substantially as herein described.

84,317.—EDWARD STROTHMAN and JOHN STROTHMAN, Milwaukee, Wis.—*Straw Cutter.*—November 24, 1868.—Rollers attached to the knife frame bear upon the back of the knife, to which latter is imparted a drawing motion by means of a lever. A spring throws back the lever which moves the feed rollers, a knob on the fly wheel throwing the lever forward.

Claim.—1. Pitman H, shaft I, frame K, rollers L L, knife M, lever N, arranged and combined substantially as described.

2. Wheels C C', hands D, feed lever E, spring F, and knob G, all combined and arranged substantially as described.

84,318.—ANDREW TERRY, Waterbury, Conn.—*Iron Fence.*—November 24, 1868.—The collars are made double, one portion fitting upon the posts and the other receiving the tube rails. The posts are inserted in cast metal stumps.

Claim.—The combination of the posts and stumps *a a'*, with the collars *d d'*, tube rail *c*, and pickets *e*, substantially as shown and described, and for the purpose set forth.

84,319.—WILLIAM THOMPSON, Dublin, Ireland.—*Car Window Ventilator.*—November 24, 1868; patented in England November 11, 1867.—Two or more rows of semi-tubes are so arranged that the centers of those in a rear row will cover the interstices of those in front.

Claim.—A dust blind and ventilator, consisting of two or more rows of troughs or trough-shaped tubes, *m'*, set in a suitable frame-work, constructed and arranged substantially as and for the purposes hereinbefore set forth.

84,320.—CHARLES W. TREMAIN, Chicago, Ill.—*Boiler Tube Scraper.*—November 24, 1868.—Two semicircular disks, the front one of which is provided with a chamber inclosing a spring to expand the disk, are attached to a rod by which they are drawn through the boiler flue.

Claim.—The boiler tube scraper, consisting of the opening disks A' A'', chamber D, spring C, guides E, and lips E, connected to rod I, arranged substantially as set forth.

84,321.—NEWELL TUPPER, Grand Blanc, Mich.—*Adjustable Flood Gate.*—November 24, 1868.—The gate is a continuation of a fence across streams, and

hangs loosely from suspending arms, so as to allow floating objects to pass. When the water is high and ice drifting, the rails may be sustained in an elevated position.

Claim.—The combination of the parts C D E G H I J, in a water gate, substantially as and for the purposes set forth.

84,322.—WILLIAM H. VANCE, New Corydon, Ind.—*Compound for Treating Ring Bone, Spavin, &c., in Horses.*—November 24, 1868.—Venice turpentine, corrosive sublimate, mercury, and iodine.

Claim.—The composition of matter herein described, when the same is prepared and used in manner and form substantially as herein set forth.

84,323.—WILLIAM F. WARBURTON, Philadelphia, Pa.—*Hat Ventilator.*—November 24, 1868.—Improvement on his patent of December 11, 1860; reissued September 8, 1863. The outer strip is secured to the hat by stitching or otherwise, while the inner strip adapts itself to the forehead.

Claim.—The within-described ventilator, composed of the non-elastic flexible strips A and B, secured together, so as to leave a crescent-shaped opening, *a*, substantially in the manner and for the purpose described.

84,324.—A. F. WARD and J. H. BEAN, Marietta, Ohio.—*Cane and Willow Stripper.*—November 24, 1868.—The plates form a casing in which the scrapers are mounted in sets, each set forming an opening through which the canes are thrust to be stripped. Springs are attached to the "standards" to adapt the knives to canes of different sizes. The catches and adjustable clamp secure the stripper to a cane mill.

Claim.—1. The cane stripper described, consisting of the plates A B, standards *c*, scrapers D, and springs *e*, all being constructed and operated substantially as and for the purpose set forth.

2. The plate B with catches *b*, in combination with the adjustable catch B', when operated in connection with a mill frame, as described.

84,325.—JOHN T. WARING, Yonkers, N. Y.—*Felted Tufted Fabric.*—November 24, 1868.—The tufts of yarn or rovings are introduced through the cloth by means of a suitable needle and a perforated board or "tuft holder." The object of the felting is to prevent the tufts from being pulled out of the fabric; hence either the back of the fabric, or the tufts, or both, must have sufficient felting properties to unite with the bat or sliver or with each other by the process of felting.

Claim.—1. The new and improved manufacture of tufted fabrics, consisting of tufts secured in a previously manufactured back of felt or woven cloth by the process of felting, substantially as hereinbefore described.

2. The tufting needles, or either of them, in combination with the tuft holders.

84,326.—ISAAC P. WENDELL, Philadelphia, Pa., assignor to EBERT J. WENDELL, same place.—*Journal Bearing for Railroad Cars.*—November 24, 1868; antedated May 25, 1868.—For supplying the journal with oil by capillary attraction.

Claim.—The journal bearing A, constructed with an oil chamber, B, and tubes or openings, C, which are provided with a cord, D, or other fibrous material, substantially in the manner and for the purpose set forth.

84,327.—DARIUS WHITE, Portland, Me.—*Paint Brush.*—November 24, 1868.—The handle is driven through the leather disk, so as to expand it into the creases of the binding wire. Being thus applied, the handle continues intact, and aids in securing the bristles.

Claim.—The disk *d*, when made of leather, or any equivalent substance, when used in the manufacture of brushes, in the manner as and for the purposes specified.

84,328.—CHARLES WHITTAKER, Milwaukee, Wis.—*Rein Holder.*—November 24, 1868.—This device is secured to the dash board of a vehicle, and

has a pivoted bar which is raised to enable the reins to be hitched thereto, and is then thrown down by a spring, so as to hold the reins securely.

Claim.—A rein holder, consisting of the parts A, B, and C, substantially as described.

84,329.—GEORGE F. WILSON, East Providence, R. I.—*Method of Inserting India-rubber in Hubs of Carriages.*—November 24, 1868.—The metallic lining is introduced as a strengthening appliance whereby to preserve the hub against splitting, when said hub has India-rubber applied to it as described in patent granted to James M. Whiting, March 30, 1858.

Claim.—1. The employment, in the hubs of carriage wheels, such as described, of a metallic lining, interposed between the India-rubber, or other elastic substance, and that portion of the hub in which said elastic substance is held, substantially as and for the purposes set forth.

2. The combination, with the rubber or other elastic bearing and chambered hub, of a metallic lining, constructed as herein specified, so that while its larger end will line the sides and end of the chamber in which the rubber is held, its smaller end will extend back more or less into the interior of the hub, as and for the purposes set forth.

84,330.—JAMES F. WINCHELL, Springfield, Ohio, assignor to himself, GEORGE C. STEELE, and L. A. SIMONS.—*Road Scraper.*—November 24, 1868.—The scoop, after being filled, is released from the lock bar, and turns upside down to dump the load. The lever automatically engages the several stops which detain the scoop in its different positions.

Claim.—1. The pivoted lever D, in combination with the frame, arranged to lock against the stops *m*, *n*, and *i*, and provided with the chain E for operating it, substantially as described.

2. The stops *m*, *n*, and *i*, arranged to operate as described, for the purpose of holding the scraper in the different positions, as set forth.

3. Providing the scraper with the adjustable stops for adjusting the hauld at various angles or heights, substantially as and for the purposes set forth.

4. The manner of securing the frame to the scraper by means of the notch in the corner of the bars C and metal strap *a*, arranged as described.

84,331.—JESSE WINECOFF, Berlin, Pa.—*Hand Plow.*—November 24, 1868.—The plow is pushed along by means of the wheels and beam, and a downward pressure is exerted upon it by a long, wooden spring.

Claim.—The combination of two wheels, 1, going before, and a single plow, 10, together with a pivoted and adjustable beam, 3, and spring, 5, arranged in the manner described, and for the purpose set forth.

84,332.—JOSEPH S. WOOD, Philadelphia, Pa.—*Apparatus for Carbureting Air.*—November 24, 1868.—The object is to improve the apparatus for which the same inventor has heretofore obtained letters-patent, No. 66,545. The carbureter is suspended in the volatile liquid in such a manner that it may rise and descend by the pressure of the inflowing air, and thus agitate the liquid while the air is passing from one of the chambers of the carbureter to another.

Claim.—1. A carbureter E, which is composed of an inverted cup and a number of independent concentric chambers formed by concentric rings projecting from its bottom, and which is suspended from the case A of the apparatus by means of an adjustable spring, substantially in the manner and for the purposes described.

2. The construction of a carbureter, E, having a number of independent carbureting chambers or cups in its bottom, with a central guide tube, *e*, and side tubes *e'*, leading therefrom into the central chamber *e*, substantially as described.

3. The condenser G, air inlet pipe C, draw-off cock W, and central guide pipe *d*, in combination with a suspended agitator and carbureter, substantially as described.

4. While not claiming broadly a floating carbureter, I do claim a cupped carbureter, which is sus-

ended and balanced in the volatile liquid by means of a spring arm, T, substantially as described.

5. The condensing chamber S interposed between the chamber in which the receiver O works and the chamber in which the air is carbureted, said chamber S being in communication with the receiver O, and also with the service pipe R, substantially as and for the purposes described.

6. The discharge tube V, leading from the condenser S into the tank D, substantially as and for the purposes described.

7. The combination of the receiver and its valve, operating substantially as described, in a chamber, L, with an agitator and carbureter, which is constructed and suspended so as to operate substantially as described.

8. A combined carbureter, regulator, and condenser, constructed and operating substantially as described.

84,333.—JOHN ABSTERDAM, New York, N. Y.—*Apparatus for Refining Iron and Making Steel.*—November 24, 1868.—Improvement upon his patent of January 23, 1866. A current of steam passes through the nozzle and thereby produces a partial vacuum in the converter. By adjusting the nozzle in relation to the discharge spout, the degree of exhaustion may be varied to suit the requirements of the process.

Claim.—The combination of the nozzle F and conical spout E, either one or both of which may be made movable toward or from each other, with the suction pipe C and converter A, substantially as and for the purpose herein shown and described.

84,334.—JOHN ABSTERDAM, New York, N. Y.—*Process for Refining Iron and Making Steel.*—November 24, 1868.—Improvement upon his patent of January 23, 1866. When the forced current of air is required, plugs are withdrawn from small openings in the bottom of the converter. A movable chamber, situated beneath the converter and communicating with the air-supply pipe, is then elevated until its openings match with those of the converter bottom.

Claim.—The within described process of refining iron and making steel by exposing the molten metal in the converter to the combined action of a current of air produced by suction, and of a current of air produced by force, substantially as and for the purpose set forth.

84,335.—JOHN ABSTERDAM, New York, N. Y.—*Apparatus for Making Steel and Refining Iron.*—November 24, 1868.—Improvement upon his patent of January 23, 1866. The spark arrester and the exhauster may be swung back or raised from the mouth of the converter without breaking the connection of the steam-supply pipe. Hydrocarbon gas or air is supplied under pressure, it being injected into the converter through the perforated chamber when the latter is pressed up against the bottom of the converter. The adaptation of plugs to the nipples of the chamber renders the latter, when elevated, serviceable in plugging up the converter.

Claim.—1. The spark arrester B in combination with the converter A, substantially as and for the purpose set forth,

2. The tubular pivot *b*, in combination with the spark arrester B, steam pipe *d*, and exhauster C, substantially as and for the purpose described.

3. The chamber D, having a rising and falling motion in its socket *m*, in combination with an air or gas-supply pipe, one or both, and with the converter A, substantially as and for the purpose set forth.

4. The arrangement of nipples *s* in the chamber D, substantially as and for the purpose described.

5. The moveable plugs *t*, in combination with rising and falling chamber D, substantially as and for the purpose set forth.

6. The pipe *r*, connecting with an air-forcing apparatus, in combination with the converter A and exhauster C, substantially as and for the purpose described.

84,336.—JOHN ABSTERDAM, New York, N. Y.—*Process for Introducing Gas Fuel into a Converter*

for Making Steel and Refining Iron.—November 24, 1868.—The metal may be treated in *vacuo*, after the manner described in patent granted to the same inventor January 23, 1866. The materials which are introduced during the process of conversion, to produce fuel, are carbonaceous gases, or ground or powdered solid carbonaceous substances, which are drawn into the converter by the suction involved in the general process.

Claim.—The process herein described, of introducing fuel into the molten metal in a converter by suction.

S4,337.—CALVIN P. ALLING, Jr., Sylvan, Wis.—*Folding Bedstead.*—November 24, 1868.—The bedstead can be compactly folded up for storage and transportation, and in such a manner that the frame of the bedstead may be protected, while folded, by the slat frames which form the bed bottom.

Claim.—An improved folding bedstead, formed by the combination of the hinged posts A, hinged side bars C, cross slats D, jointed longitudinal bars or slats E, hinged or pivoted elbow straps F, and hooks G, with each other, said parts being constructed and arranged substantially as herein shown and described, and for the purpose set forth.

S4,338.—THEOPHILUS ARNDT, Mount Joy, Pa., assignor to himself and E. L. FLOWERS, same place.—*Cultivator.*—November 24, 1868.—The plowbeams extend backward through slots in the bolts which pass downward through the curved slotted bar, and through binding clips and nuts at the under side thereof. This mode of attachment, in connection with that at the forward end of the beams, admits of the ready lateral adjustment of the beams together with the shovels.

Claim.—1. The ring or ring plate D, in combination with the central or main beam A of the cultivator, and with the hooked forward ends of the side or adjustable beams E, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the curved and slotted bar H, slotted bolts I, clips J, and nuts K, with the central beam A, and with the adjustable side beams E, substantially as herein shown and described, and for the purpose set forth.

S4,339.—MOSES ATWOOD, New Sharon, Iowa.—*Harrow.*—November 24, 1868.—By raising the free end of the lever the hinged bar will be lifted away from the "cams," so as to allow the shafts to revolve and thus clear the teeth. The supplemental arms or teeth act against the ground to keep up the rotation of the shafts while the harrow teeth are not performing the same function.

Claim.—1. The pivoted or hinged bar E, having notches or catches *e'* formed upon its lower side, and the cams F, in combination with each other and with the frame A and toothed shafts B, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the arms or teeth D with the shafts B and teeth C, substantially as herein shown and described, and for the purpose set forth.

3. An improved harrow, formed by the combination of the frame A, shafts B, teeth C, arms or teeth D, pivoted or hinged bar E, having notches or catches *e'* upon its lower side, cams F, and lever G, with each other, substantially as herein shown and described, and for the purpose set forth.

S4,340.—JOHN BLUE, Trumansburg, N. Y.—*Harvester.*—November 24, 1868.—This contrivance enables the attendant to alter the position of the reel while the machine is cutting, and thus adapt it to the various requirements of the grain in the different parts of the field. The arrangement of the pulleys produces a uniform tension of the driving band in all positions of the reel.

Claim.—1. The combination of the lock, consisting of the curved plate C, bolt *h*, and spring *d*, or their equivalents, with the staff B, joint *i*, shaft K, and pulleys *f* and I, when these several parts are arranged for operation, substantially in the manner described, for the purpose specified.

2. The combination of the toggle joint F with the slide E, and pulleys *f*, I, and *g*, when these several

parts are arranged for operation, substantially in the manner described, for the purpose specified.

3. The combination of the lock, consisting of the curved plate H, bolt *k*, and spring *e*, or their equivalents, with the toggle joint F, slide E, and pulleys *f*, I, and *g*, when these several parts are arranged for operation, substantially in the manner described, for the purpose specified.

S4,341.—GEORGE W. CASILEAR, Washington, D. C.—*Method of Preventing the Alteration of Numbers on Bonds, &c.*—November 24, 1868.—The numbers are printed between brackets or other peculiar marks, leaving no room for an additional number, and on a finely-engraved background, in fugitive colors.

Claim.—Printing numbers in parentheses, or between any other marks or forms, on a fugitive ground or background, tint or color, thus effectually preventing alteration of the figures or numbers, as substantially set forth.

S4,342.—JOHN CHASE, Farmington, Pa.—*Harrow.*—November 24, 1868.—The harrow is composed of four parts, consisting of triangular and square frames, connected together by hook and eye joints.

Claim.—The arrangement and combination of the several parts B D E E, substantially as herein shown and described.

S4,343.—SARAH M. CLARK, Beaver Dam, Wis.—*Reservoir Cook Stove.*—November 24, 1868.—The separate devices, as well as their combination, are disclaimed.

Claim.—The arrangement, with reference to the stove A, of the flanged top frame B, rotating top C, whose upper surface is a plane, the stove hearth M, extending along both sides of the stove body, at both ends of the fire box, the concavo-convex reservoir J, and the oven L, as herein described, for the purpose specified.

S4,344.—ADAM COLLIGNON, Closter, N. J.—*Folding Chair.*—November 24, 1868.—The upper ends of the legs are connected with the arms by straps which form swinging joints, and allow the arms and front to separate, so that the chair can be compactly folded.

Claim.—1. In combination with a folding chair, the straps *i*, connecting the arms with two of the legs of the chair in such a manner as to allow the chair to be folded, substantially as described.

2. The arms G, hinged to the back, and connected with the legs B, substantially as specified.

S4,345.—JOHN J. CRIDER, Greenfield, Ind.—*Grain Screen.*—November 24, 1868.—A spiral conveyer at one end of a rotating cylinder feeds the grain at about the axis thereof. The grain is raised at the discharge end by means of slats, and discharged into pockets on one of the screw heads, and thence into a delivery tube.

Claim.—1. The head *e'*, provided with cups H and apertures *h*, adapted to collect and deliver the grain, substantially in the manner shown and described.

2. The worm or spiral conveyer *i*, in its application to the feed end of a rotating grain screen, and adapted to feed the grain in regular quantity, substantially as described.

S4,346.—ROBERT CUSHMAN, Pawtucket, and JOHN R. DENNIS, Central Falls, R. I.—*Pounce Holder.*—November 24, 1868.—A small bag containing powdered rosin and chalk is fastened to a handle.

Claim.—As a new article of manufacture, a paper smoothen, consisting of the handle and bag, substantially as herein shown and described.

S4,047.—SAMUEL DANKS, Cincinnati, Ohio.—*Revolving Puddling Furnaces for Treating Iron and Steel.*—November 24, 1868.—A section of the flue in front of the cylinder is suspended by hangers, and made to close the mouth of the cylinder for puddling or balling, or open the same for removing the ball. Under an opening in front of the fire chamber is a bridge within which is a coil of cold-water pipes.

Claim.—1. The hollow ribs L and protuberances M (either or both) in the metal shell of the rotary

refining cylinder I, forming, on the outside, troughs or pockets for the reception of water, in the manner and for the purposes set forth.

2. The shiftable piece P, employed, in combination with a rotary refinery, for the double purpose of a door and a flue, as described.

3. The arrangement and adaptation, substantially as described, of the water bridge G H, in combination with the fire chamber A and rotary puddling chamber I, for the purpose set forth.

84,348.—MILTON FISK, Sparta, Tenn.—*Horse Power.*—November 24, 1868.—A rotating table carries a counter shaft and gearing which derive motion from a wheel secured to a fixed bed, and communicate it to a central spindle, which latter may serve for a set of stones on the top of the movable table, or as a shaft for communicating motion to other machinery when the upper stone is removed and a socketed shaft is employed.

Claim.—1. The table C C', arranged as shown, and provided with the adjustable spindles D and G, and the operating shaft F, and its wheels, in combination with the wheel B and bed A, all substantially as and for the purpose described.

2. The combination, with the movable table C C' and spindle G, of bed stone H, substantially as and for the purpose described.

3. The combination, with the spindle G, of the socketed shaft I, substantially as and for the purpose described.

84,349.—JAMES W. GAINES, Clarksville, Texas.—*Millstone Dress.*—November 24, 1868.

Claim.—The millstone dress, formed by the annular beveled furrow *a*, the leading furrows *b*, passing through the annular furrow, the radial furrows *c*, connecting with the leading furrows at an angle, and the secondary furrows *d*, all laid out in the manner herein shown and described.

84,350.—WILLIAM GILMORE, Hudson City, N. J.—*Tenoning Machine.*—November 24, 1868.—Motion is communicated from a vertically-sliding rod to a pawl arm which carries a feeding and a holding pawl working in a rack on the top of the carriage.

Claim.—The combination of the pawl arm *d*, vertically sliding rod *a*, and pawls *d*¹ *d*², with the vertical carriage C, all arranged and operating as described, for the purpose specified.

84,351.—RANSOM W. GREEN, Bradford, Pa.—*Combined Hammer and Nail Holder.*—November 24, 1868.—Underneath the handle are attached a fixed and a sliding clamping jaw, the latter being provided with a spring and a thumb piece.

Claim.—The jaws A and C, secured to the hammer handle by the plate D, constructed and arranged to operate as and for purpose set forth.

84,352.—WILLIAM W. GREEN, Jr., Janesville, Wis., assignor to himself and E. BROWN, same place.—*Device for Holding Doors Open.*—November 24, 1868.—A spring catch passes through a knob affixed to the washboard or wall, and catches into a socket plate secured to the bottom of the door.

Claim.—The holder, having the bifurcated end *d* *d*, adapted to fit within the plate *e* attached to the door, and with a shoulder at the inner end of the bifurcation, by which the knob A is held to the washboard B, as constructed and shown.

84,353.—EDWARD GUILLOD, Titusville, Pa., assignor to BRYAN, DILLINGHAM & COMPANY.—*Drilling Jars.*—November 24, 1868.—The wearing and striking surfaces of the bolt head, and the wearing surface of the bolt are of steel, the remainder of each being of wrought iron.

Claim.—The within-described drilling jars, consisting of a single link and bolt, constructed of wrought iron and steel, combined and applied substantially in the manner represented, and for the purpose set forth.

84,354.—A. W. HAGER and JOHN H. S. GROVE, Waverly, Iowa.—*Dog Power.*—November 24, 1868.—The working beam is made extensible in order to adjust its length to the desired throw of the part of

the machine to be driven. A sliding weight adjusts the brake to the power of the dog.

Claim.—The combination of the extensible working beam I J, weight H, connecting rod K, crank L, drums C C', rollers D, adjustable bearings S, and the endless belts, consisting of the transverse slats O and the pivoted buttons *e*, arranged to break joints with each other, all operating as described, for the purpose specified.

84,355.—THOMAS HANSBROW, deceased, Sacramento, Cal., (LUCY A. HANSBROW and B. B. REDDING, executors.)—*Pump.*—November 24, 1868.—The vertical play of the valve pivots enables the valves to be always readily adjusted to their seats. The water chest is connected directly with the barrel at the bottom, and with the air chamber through valve chambers at the top.

Claim.—1. The valves F, when their pivots *a* are adapted to fit in recesses formed in the walls of the valve chamber, whereby the heel of said valves has a vertical play while swinging upon said pivots, as herein described, for the purpose specified.

2. The pump barrel A, water chest B, and valve chest, all cast in one piece, and arranged as described, for the purpose specified.

84,356.—S. J. HARE, Louisville, Ky.—*Hot-air Furnace.*—November 24, 1868.—An arrangement of cylinders, pipes, and chambers for securing a large heat-radiating surface.

Claim.—The described arrangement of the annular outer drum H, formed by the cylinders I J, and supported above the combustion chamber C by the short pipes *k*, the central chamber L containing the perforated plate *m*, the air pipe N and pipe O connecting the chamber L and drum H, the damper S, combustion chamber C, and fire chamber B, all constructed and operating as described, for the purpose specified.

84,357.—HIRAM HARRIS, Circleville, Ohio.—*Snow Plow.*—November 24, 1868.—The lower parts of the moldboard are inclined, so as to pass beneath the snow and raise it from the track, and the upper parts are curved upward and forward.

Claim.—The snow plow B, the moldboards *b'* of which are constructed substantially in the form and manner herein shown and described, and which is detachably secured to the pilot A by the bar or plate C, shackle bar D, and side arms or bars E, substantially as and for the purpose herein set forth.

84,358.—JOHN ADAM HUSS, Louisville, Ky.—*Machine for Cleaning Entrails.*—November 24, 1868.—Two rollers, revolving in opposite directions and armed with scraping edges, are surmounted by elastic feed rollers, and provided each with an adjustable curved surface for pressing the entrails against the scraping edges.

Claim.—1. The counter revolving rollers A B, armed with scraping edges *a a a*, or their equivalents thereof, all substantially as shown and described, in combination with any curved surface or surfaces, D E, all as set forth.

2. The feed rollers H H, in combination with the scraping rollers A B, substantially as described, and for the purpose set forth.

3. The gear wheels J K *d* L, and crank wheel M, substantially as described, in combination with the rollers A B, scraping edges *a a a*, and surfaces D E, all as and for the purposes set forth.

84,359.—J. GEORGE JUNG, Newark, N. J.—*Method of Constructing Chains.*—November 24, 1868.—Designed as an ornamental chain for jewelry.

Claim.—As a new article of manufacture, a chain, constructed of links having two heads and two apertures, in the above described location to each other, and the links being interlinked, substantially as specified.

84,360.—LUCIEN H. KELLOGG, Monroe, Ohio.—*Horseshoe.*—November 24, 1868.—The flange prevents the toe calk from being forced out of the dovetailed guides. The heel calks are arranged lengthwise with the side of the curve.

Claim.—The described construction of the horse-

shoe, having the flange B extending entirely around its under side, forming a rest for the front end of the toe calk C, and adapted to receive the dovetailed heel calks in such a manner that they shall rest upon the flange, longitudinally of the same, as herein shown and described.

84,361.—WILLIAM A. L. KIRK, Hamilton, Ohio, assignor to OWENS, LANE, DYER and Co., same place.—*Swage for Saws.*—November 24, 1868.—The die is slid into position in the jaws of the swage, and a portion of one of the saw teeth is embraced by the guides and swaged by a blow on the shank.

Claim.—The swage, consisting of jaws *d* and *f*, and angular or movable die E, all constructed and arranged as shown and described, for the purpose set forth.

84,362.—A. F. KITCHEN, Shelton Depot, S. C.—*Door Fastening and Alarm.*—November 24, 1868.—A lever is arranged to trip the trigger of a fire-arm by connecting with the fastening of a door, in case an improper attempt is made on the latter.

Claim.—An improved door fastening and alarm, formed by the combination of the hinged plate F, bar or plate E, chain G, or equivalent, lever I, and spring K, with each other, and with the hasp C, attached to the door frame B, and staple D attached to the door of the onthouse to be protected, and with the gun or pistol J, placed in the dwelling, substantially as herein shown and described, and for the purpose set forth.

84,363.—JOHN KLINE, Rochester, N. Y.—*Cover for Circular Vessels.*—November 24, 1868.

Claim.—A rotating semicircular cover for pails, &c., moving in a groove, and pivoted to a fixed semicircular cover, substantially as described, for the purpose specified.

84,364.—SAMUEL LAGOWITZ, Newark, N. J.—*Frame for Traveling Bags.*—November 24, 1868.

Claim.—A traveling-bag frame, made of sheet metal, each jaw having one edge doubled up, and the other provided with a wire, the ends of which form the joints on which the jaws open and close, substantially as shown and described.

84,365.—JOHN LOUGH, Buckingham Village, Quebec.—*Dressing Saw Teeth.*—November 24, 1868.—In place of treating each tooth separately by a hammer and file, a "dressing-machine," extending over a considerable number of teeth, is employed, by which uniformity is obtained. The cutting side of each tooth is formed by passing the saw through a peculiar apparatus, the unformed point of each tooth passing into a steel die, and pressure being applied by a powerful lever.

Claim.—1. Widening the saw tooth at its under side in such a manner that the expanded cutting face thereby produced is parallel-sided, or in the form substantially as shown in Fig. 10, and as hereinabove described, for the purpose set forth.

2. The plates *ee*, when united by the bolts *dd*, and provided with the projections *ee* and the arm *h*², and having between them the space *f* and the space for the compression bar, substantially as described.

3. In combination with said plates *ee*, constructed as above described, the lever *h*, pivoted at *h*¹, the strap *h*³, the compression-bar *i*, and the die *k*, all operating together in the manner and for the purpose set forth.

4. In combination with said plates *ee*, constructed as above described, the wedge *g*¹, lever *g*², strap *g*³, key or equivalent *g*⁴, eccentrics *g*⁵, and pivots *g*⁶, *g*⁷, *g*⁸, all operating together substantially as and for the purpose set forth.

5. The improved saw-dressing machine herein described, consisting of the bed plate *o*, top plate *p*, clamp *q*, plane *r*, iron strap or file-holder *s*, adjustable screws *t*, file *u*, adjustable strip *v*, and adjusting screws *v*', all arranged and working together substantially in the manner and for the purpose described.

84,366.—SAMUEL MACFERRAN, Philadelphia, Pa.—*Removable Head for Boxes, &c.*—November

24, 1868.—For securing the removable heads of round or elliptical boxes in their places.

Claim.—The combination of the lever D, having an elliptical or wedge-shaped projection *e*, with one end of the tightening strap C, and the slotted piece F with the other end of the strap, substantially in the manner above described, and for the purpose specified.

84,367.—JACOB MILLER, Canton, Ohio.—*Threshing and Grain-separating Machine.*—November 24, 1868.

Claim.—1. In combination with the straw carrier, the toothed beater D, revolving in a direction contrary to that of the motion of the straw carrier, so as to lift up and throw over the straw, substantially as and for the purpose described.

2. In combination with the straw carrier and the cylinder D, for throwing over the straw, the perforated board *e* to prevent the straw from driving into or between the slats of the carrier, and to carry and deliver the grain to the screens, substantially as described.

3. In combination with the straw carrier, the double pickers or beaters *hi*, at the upper end thereof, as and for the purpose substantially as described.

4. The construction of the picker or beater *i*, viz., of the central shaft, the heads, and the rods or wires, as described and represented.

5. Supporting the lower end of the straw carrier upon adjustable journals, and without a cross shaft, as and for the purpose described and represented.

84,368.—JACOB MILLER, Canton, Ohio.—*Dropping Platform for Harvesters.*—November 24, 1868.

—The platform is arranged to be dumped to drop the grain upon it, and the apron at the same time is raised up to catch the falling grain.

Claim.—The combination of the pivoted platform, the flexible apron, and the traveling belts, united to each other, as herein described, so that the tipping of the platform shall bring the holding apron into action, and the returning of the platform into its receiving position move the apron out of action, substantially as herein described.

84,369.—J. B. NEWBROUGH, New York, N. Y.—*Compound of Rubber or Gutta-Percha.*—November 24, 1868.

Claim.—As a new composition, gutta-percha, or India-rubber, combined with clay, iodine, and wolfram or tungsten-oxide, substantially as described.

84,370.—JOHN SANDERS, Harrisburg, Pa., administrator of the estate of RICHARD NORRIS, deceased.—*Exhaust Nozzle for Steam Engines.*—November 24, 1868.—The valves of the nozzle are alternately opened by the exhaust steam, and immediately closed by the spiral springs, the exhaust steam passing off through the smoke stack.

Claim.—The arrangement of the valves *ee*, rods *dd*, springs *ee*, partition *h*, and exhaust pipes *bb*, constructed as described.

84,371.—FERRIS OGDEN, Meadville, Pa.—*Rotary Steam Engine.*—November 24, 1868.—The two halves inclose the steam space through which the piston passes, and power is transmitted to the main shaft by an arm which passes through a hole in the ring up into the piston, the space through which the said arm passes in revolving being closed by the ring; the latter has a bearing with the abutment and rotates with it.

Claim.—1. The two halves A A, the ring *m*, the arm *j*, and the piston C, constructed as described.

2. The abutment D, constructed as described.

3. The thimble *h* and the plug valve G, constructed as described.

4. The steam chest I, constructed as described.

5. The arrangement of the parts designated in the foregoing clauses of the claims, constructed as described.

84,372.—ENOCH HAILE PAINE, Louisville, Ky.—*Baggage Check.*—November 24, 1868.

Claim.—The baggage check attached to the ticket, and corresponding in number with the number of the ticket, as herein set forth.

84,373.—WILLIAM ROCHESTER PAPE, Newcastle-upon-Tyne, England.—*Breech-loading Fire-arm.*—November 24, 1868.—Flanges on the cartridge fit in rabbets in the extractor, so that as the breech is opened the cartridges are drawn out by means of a beaded tongue moving in a flange in connection with guide rods.

Claim.—The cartridge extractor *a*, provided with rabbets *a'*, guide rods *d d'*, and beaded or flanged tongue *b*, substantially as and for the purpose described.

84,374.—G. S. PERFATER, Camp Point, Ill.—*Root Cutter.*—November 24, 1868.—Designed to be attached to a plow. A revolving cutter works in the rear of, and above, a fixed cutting point, and also in a slit in a curved shank that supports the fixed cutter.

Claim.—1. The revolving cutter *A* and fixed cutter *G*, when constructed and operating substantially as described.

2. The pivoted plate *E* and curved shank *H*, having a slit *d*, in combination with the revolving cutter *A* and fixed cutter *G*, substantially as described.

84,375.—GOTTFRIED RANK, Greenleaf, Minn.—*Seed Sower.*—November 24, 1868.—Within the seed-cylinder is a flanged rod moved by a lever for adjusting the cavities in the rod in relation to the holes in the cylinder. The discharged seed passes through an inclined narrow box, having a series of transverse rods or pins.

Claim.—1. The seed or wind protector and scatterer *K*, in combination with the cylinder *G*, flanged rod *H*, and hopper *D*, substantially as described for the purpose specified.

2. The combination and arrangement of the perforated slides *E h*, cylinder *G*, and rotating rod *H*, provided with cavities *d*, substantially as and for the purpose set forth.

84,376.—W. W. REXFORD, Loch Sheldrake, N. Y.—*Extension Pole and Holdback for Carriages.*—November 24, 1868.—The holdback is arranged to be moved backward or forward on the pole, so as to be adjusted to different kinds of harness, and to horses of different sizes.

Claim.—The sliding tube *C*, holdback *D*, and spring-catch *E b*, in combination with the perforated tube *B*, affixed to the end of the pole, said tubes being prevented from turning one upon the other by means of the feather *a*, all constructed and operating as described, for the purpose specified.

84,377.—J. C. RICHARDSON, Ilion, N. Y.—*Fork Blank.*—November 24, 1868.—The fork is finished by turning up the end tines at right angles to the shank, and then drawing them out by rolling or hammering, and then turning them down. The central tines and shank are also drawn out in a similar manner.

Claim.—The blank *A*, formed by punching or otherwise severing it from a bar of suitable width, with the space *e e'*, slits *c*, and shoulders *f*, substantially as and for the purpose described.

84,378.—BENJAMIN H. ROBERTS, Fall River, Mass.—*Carriage Spring.*—November 24, 1868.—One part of each spring passes over, and the other passes beneath the axle, and the rocker is secured between two parts of the spring, thus dispensing with a reach pole.

Claim.—1. In combination with the elliptic springs *B B*, the *C*-springs *F F*, formed by an extension of the ends of the elliptic springs, substantially as described.

2. In combination with the *C*-springs *F F* formed by an extension of the elliptic springs, the braces or brackets *G G* for connecting the *C*-springs to the body of the carriage, substantially as described.

3. The arrangement of the axle and rocker between two parts of the elliptic springs, substantially as described, and for the purposes set forth.

84,379.—MILTON SATTERLEE, Richland Centre, Wis.—*Sleigh Brake.*—November 24, 1868.—A spur-wheel is supported between two arm plates, which are operated to raise or depress the wheel by connections with a lever under control of the driver.

Claim.—The combination of the arm-plates *e e* with the spur wheel *w*, and the means for raising or depressing it, when used as a brake in connection with a sleigh or sled, in the manner described.

84,380.—MARSHALL SATTLEY, Taylorsville, Ill.—*Revolving Coulter for Plows.*—November 24, 1868.—The lower portion of the upright is bent at right angles and slotted to receive the swivel bolt, and is inserted in a slot in the swiveled arm attached to the wheel.

Claim.—1. The slotted upright *D*, constructed substantially as herein shown and described, and for the purpose set forth.

2. The wrist or swivel bolt *C*, constructed substantially as herein shown and described, and washers *E*, in combination with the slotted upright *D*, and slotted end of the swiveled arm *B*, as and for the purpose set forth.

84,381.—CHARLES B. SEAMAN, Honesdale, Pa.—*Insect Net.*—November 24, 1868.—This device is placed upon the bed so as to cover the body.

Claim.—The frame *A*, having bows *a*, or rods *d*, and provided with a netting, which is secured by rods *c* and eye bolts *b*, all substantially as described, as a new article of manufacture.

84,382.—GEORGE H. SEAVER, New York, N. Y.—*Reversible Latch.*—November 24, 1868.—The piece which connects the latch with the followers is flexible, so that when the spindle is removed the followers can be pressed inward and forward sufficiently to admit of the reversal of the latch.

Claim.—1. The flexible tail piece *c*, constructed and arranged substantially as described, and for the purpose specified.

2. In combination with a reversible latch and flexible tail piece, the application of the spring *e*, for the return of movable followers to their proper position.

84,383.—THOMAS SHAW, Philadelphia, Pa.—*Pile Driver.*—November 24, 1868.—The hammer falls upon a cartridge in the chamber of the cylinder, and the consequent explosion forces the hammer up the guide tube and drives the pile into the ground. The descent of the hammer automatically releases the pawl from the spring, and the pawl engages with the rack to sustain the hammer when it reaches its elevated position.

Claim.—1. A suitably-guided hammer, *G*, in combination with a cylinder, *R*, all constructed, arranged, and operating in the manner and by the means described, and for the purpose set forth.

2. The rack *C*, pawl *K*, and spring *L*, in combination with the hammer *G*, all constructed and arranged as described, and for the purpose specified.

84,384.—PETER M. SHERWOOD, New York, N. Y.—*Bottle-filling Apparatus.*—November 24, 1868.—A siphon straddles the side of a reservoir, and is so hinged thereon as to permit the alternation of its lower and higher extremities, the inside valve being opened by the act of elevating that end. An adjustable staging on the outside sustains the bottle.

Claim.—1. The valves, as arranged on the interior and exterior ends of the siphon *E*, said siphon being combined with a reservoir, substantially as described.

2. The valve *l*, arranged as described, on the delivery end of the siphon *H*, with the collars *m o*, spring *p*, and yoke *n*, substantially as and for the purpose specified.

3. The bayonet fastening *z*, in combination and arranged with the tapering valve *v'*, the spiral spring, and the sleeve *w*, having the enlarged portion *y*, and the flange *x* adapted to fit upon the mouth of the bottle, all operating as described, whereby, as the bayonet catch is released, the sleeve *w* is thrown outward, to close the orifice *i* in the valve *v'*, as and for the purpose specified.

4. The valve, arranged on the interior end of the siphon *J*, in such a manner that the operation of the siphon moves its end from the packing *v*, affixed to the reservoir, and allows the liquid to flow, substantially as described.

5. The adjustable bar *a* and shelf *B*, constructed

and arranged substantially as shown and described, in combination with the reservoir A, for the purposes specified.

6. The faucet *y'*, embracing the tapering valve *v'*, sleeve *w*, and the bayonet fastening *z*, substantially as described, and for the purposes set forth.

84,385.—THOMAS B. SIMONTON, New York, N. Y.—*Elevator.*—November 24, 1868.—A crank may be applied to the extended journal of one of the lower pulleys, from which motion is transmitted to the scroll wheels on the platform shaft, which wheels, by engagement with the racks, and connection with the upper pulleys, cause the entire power multiplying apparatus to move up and down with the platform.

Claim.—1. The combination of the scroll wheels J K, the platform shaft G, inclined plates H, and racks L, substantially as herein shown and described, and for the purpose set forth.

2. The combination and arrangement of the racks L, inclined plates H, flanged or scroll wheels or pulleys J K, shaft G, platform N, band or chains M, pulleys E and F, shaft D, sliding guide bars C, ways B, endless bands T, and guide pulleys P Q, pulleys S, and band R, with each other, substantially as herein shown and described, and for the purpose set forth.

3. The arrangement of the mechanism, by means of which all the operating parts of the hoisting apparatus may be raised and lowered with the platform, substantially as herein shown and described.

84,386.—JOHN SIMPSON, Charleston, Ill.—*Combined Crusher, Harrow, and Roller.*—November 24, 1868.—This device admits of a longitudinal separation or division of the implement, so that it may be converted from a double to a single horse machine.

Claim.—The rollers E, fitted in the frames D, attached to the frame A, as shown, in combination with the toothed cylinders C C, all arranged substantially as and for the purpose specified.

84,387.—JAMES D. SINCLAIR, Brooklyn, N. Y.—*Hatchway.*—November 24, 1868.—The object is to admit of any one or all of the hatches in a storehouse or other building to be conveniently opened or closed by a person standing on one of the floors, thus obviating the common necessity of proceeding to the several floors to control their respective hatches.

Claim.—1. The arrangement of the pulleys *a b*, the cord or chain H, and the hatches B D F, whereby the latter are opened successively, substantially as described, for the purpose specified.

2. In combination with the pulleys *a b*, cord or chain H, and hatches B D F, the hooks *d* and cord *e*, whereby the hatches are released simultaneously, substantially as described, for the purpose specified.

84,388.—WILLIAM BORTHWICK SMITH, Coventry, England.—*Frame for Protecting Watch Works.*—November 24, 1868.—An improved construction of lever watch frame, together with the application thereto of a T-lever escapement, having the same action as in the ordinary construction, but being so applied as to admit of its complete and ready detachment.

Claim.—1. The means employed for facilitating the separate detachment of the escapement, to wit, the bars L L' M', arranged and applied in the manner substantially as set forth.

2. The bow A^x, applied to the bar M', and in relation with the balance staff, substantially as and for the purpose set forth.

3. The protecting cap B^x, when arranged and applied, in relation to the pillar plates and regulator, substantially as shown and described.

84,389.—M. R. SMITH, Armonk, N. Y.—*Sewing Machine.*—November 24, 1868.—If a seam or knot occur in the cloth, the block will press the seam against the wheel with one of its ends, and will rock on its pivot until the other end touches the presser roller or foot, when the feed of the cloth will proceed without delay.

Claim.—The pivoted self-adjusting block H, in

combination with the lever D and the presser roller C, substantially as described, for the purpose specified.

84,390.—WILLIAM C. SMITH, Brooklyn, N. Y., assignor to HENRY SUTCLIFF and JOHN E. TUCKER.—*Paper Ruling Machinery.*—November 24, 1868.—The smoothing plate presses upon the paper in front of the pens, and may be adjusted to suit the thickness of the paper. Provision is also made for setting the smoothing plate nearer to or further from the pens.

Claim.—1. The combination of the blocks I, supports J, and bars M, with the smoothing plate H and frame A of the machine, substantially as herein shown and described, and for the purpose set forth.

2. Smoothing the paper as it passes beneath the ruling pens, by means of a smoothing plate H, adjustably attached to the frame of the machine, substantially as herein shown and described.

84,391.—ARNOLD SPRAGUE, Poland, N. Y.—*Combined Latch and Lock.*—November 24, 1868.—The rotary latch is locked by the eccentric when the latter occupies its recess. The movement of the latch is limited in either direction by a stop projecting from the case into the curved groove of the latch. The tumblers are operated by a key and serve to hold the eccentric into or out of gear with the latch.

Claim.—1. The combination of the slotted, vibrating latch A, *a*², provided with a stop, *b*¹, and the eccentric B, with stops D E, arranged and operating substantially as described.

2. In combination with the said eccentric, the spring tumblers C and stops D E, arranged and operating substantially as described.

84,392.—WILLIAM SUTTON, Washington, Ga.—*Saw Cotton Gin.*—November 24, 1868.—Designed to render the outer saws of the gang more effective in operation. By giving obliquity to the sides of the hopper, the spaces between the same and the outer saws become gradually larger from the top downward so that the cotton may be readily drawn downward in said spaces.

Claim.—The hopper A, constructed as described, with its sides inclined, for the purpose of supplying the cotton to all the saws equally, as herein shown and described.

84,393.—WILLIAM E. TATE, Cambridgeport, Mass.—*Water Wheel.*—November 24, 1868.—The top plate is provided with a tangential water passage or guide, in continuation of the induction pipe. Said passage is curved downward and directs the water at right angles against the buckets. The space between the top of the abutment and the under surface of the top plate is just sufficient to allow the buckets to pass through edgewise.

Claim.—The top plate E, with its channel or passage, in combination with the suspended or pivoted pendent buckets *e* of the wheel B, the groove *d*^x in the case A, the abutment *e*, within said groove, and the induction and eduction pipes C D, all arranged to operate in the manner substantially as and for the purpose set forth.

84,394.—S. J. THOMAS, Dawson, Ga.—*Water Wheel.*—November 24, 1868.—The wheel is composed of a series of segments, each having a spiral bucket. Projections and recesses formed on the front end of each segment match with corresponding recesses and projections in the rear of the preceding one.

Claim.—The wheel composed of sections or segments A, with buckets B, the segments joined by means of the projections *a e c* fitting into the recesses *b f d*, all constructed and arranged in the manner set forth.

84,395.—C. ARTHUR TOTTEN, Hudson, N. J.—*Wash Boiler.*—November 24, 1868.—The water, after it has passed through the clothing, goes up the corner conduits, and is discharged, and, falling on the porous partition, is strained of impurities before going through the clothes again. The sides of the partition are sustained in slots or grooves.

Claim.—1. The braces B, when arranged to

strengthen the corners, and provide a channel for the rising water also, substantially as and for the purposes specified.

2. The flange D, the brace B, and short tube E, in combination with the boiler sides, substantially as described and set forth.

3. The porons cover L, when provided with the hinges at its center, in connection with the grooves M, substantially as and for the purposes specified.

84,396.—SAMUEL TRUMBORE, Easton, Pa.—*Governor for Steam Engines.*—November 24, 1868.—The float is provided with a tubular extension, into which the tube conveying the gas extends, said extension being provided with guide rollers acting against the interior walls of the water vessel to steady the float.

Claim.—The float D, provided with the tubular extension F and guide rollers G, and arranged with reference to the vessel E and the tube H, substantially as described.

84,397.—A. VAN PATTEN, Weyauwega, Wis.—*Book-cover Protector.*—November 24, 1868.—The ordinary binding of books is covered with tin or suitable metal, for the purpose of protecting and preserving the binding.

Claim.—A metallic protector for book covers, hinged and constructed substantially as and for the purpose herein described.

84,398.—EDWARD WEISSENBORN, Hudson City, N. J.—*Construction of School Globes.*—November 24, 1868.

Claim.—1. A school globe made of two layers, A, of pasteboard, cut out to form arms, *a*, and placed together and united by the aid of the mold B, all as shown and described.

2. The strip *f*, pasted to the inner surface of one hemisphere, and serving to fasten and retain the second hemisphere, substantially as set forth.

84,399.—WILLIAM N. WHITELEY, Springfield, Ohio.—*Harvester.*—November 24, 1868.—The wedge-shaped lever throws the bevel gear on the driving shaft in contact with the pinion on the shaft driving the cutters. The angle of the tongue may be changed by means of the lever and notched bar.

Claim.—1. The double-pivoted crank wrist box, moving upon axes at right angles to each other, as set forth, so that the wrist pin will not be cramped in its box by any irregular movement of the pitman, as set forth.

2. The pitman joint at the heel of the cutter bar, formed by the conical or conoidal points and the plates *o o*, secured by the bolts *p q* and stay plate *s*, in the manner set forth.

3. Jointing the inner shoe of a harvester's cutting apparatus to a rocking shaft, located transversely to and extending across the main frame, so that by moving said shaft upon its axis the points of the guard fingers and cutters may be "set" high or low, as desired, substantially as shown and described.

4. In combination with the shoe R and rocking shaft Q, the lever *q'*, and the standard rack *x*, for the purpose of permitting the adjustment and retention of said shoe and shaft in the desired position, as set forth.

5. Mounting the driver's seat upon two notched rails *w w*, so that said seat may be shifted forward or backward when slightly raised at the back, substantially as set forth.

6. Pivoting the platform U at the tops of the posts *u u*, and adjusting its forward end at any desired height by the adjusting bar V.

7. Arranging the two unequal-sized driving wheels C and F, with their axles about in the same vertical plane, so that neither wheel will drag when the machine is being turned, as at the field corners.

8. The wedge-ended clutch lever M, constructed and operating as set forth.

9. The notched bar *z* and lever *y*, constructed and operated as set forth.

84,400.—C. F. WIELAND, Darmstadt, Ill.—*Ice Spur.*—November 24, 1868.—A U-shaped plate incloses the wearer's heel, while a similarly-shaped plate is pivoted to the heel plate in such a manner as

to fold back and forward under the sole of the shoe, and is held in position by a spiral spring.

Claim.—The combination in a spur or creeper, of the two U-shaped plates A and B, pivoted together by pintles *d d'*, and actuated by a spring within a case, C, with the spring catch E, and pin *b*, all arranged and operating substantially as shown and described, and for the purpose set forth.

84,401.—HENRY ZAHM, Toledo, Ohio.—*Railway Rail.*—November 24, 1868.

Claim.—The hollow elastic base B, having inwardly-inclined sides, terminating in the vertical parts *a a*, between which the tongue *b* of the rail A is bolted, whereby the rail B is depressed by the weight of the passing train, causing the parts *a a* to pinch the tongue *b*, thereby lessening the effect of percussion and vibration in proportion to the downward pressure of the rail, as herein shown and described.

84,402.—OLIVER M. ADAMS, Milford, Mass.—*Boot Crimper.*—November 24, 1868.

Claim.—The jaws *b b*, with serrated or segmental rows of teeth, in straight lines, at right angles to the jaws, as described, and in combination with plate *d*, and clamp *a*, screw *c*, and screw nut *e*, constructed and operating as and for the purpose set forth.

84,403.—SAMUEL J. BAIRD, Stannton, Va.—*Printing Press.*—November 24, 1868.—The frisket frame is made of flexible material, so that it may be bent when used with a cylinder press, to avoid contact with the ink rollers.

Claim.—1. A flexible frisket, to be used in combination with a flat form and cylinder impression press, substantially as and for the purposes set forth.

2. The roller, smooth or grooved, for protecting the frisket from the ink rollers, and directing its ascent, as above described.

3. The grooved frame above described, whether fixed or made movable, so as to be adjusted to any desired breadth of frisket, holding it firmly extended, as above described, and for the purpose specified.

84,404.—HAYDN M. BAKER, New York, N. Y.—*Process of Recovering Pigments, Oils, and Gums from Cloths Used by Engravers.*—November 24, 1868; antedated November 7, 1868.—The invention consists in treating engravers' wiping tools with any substance capable of dissolving the oils and resinous or gummy portion of the ink, and forming a solution of the same, which solution, together with the coloring matter, is submitted to distillation.

Claim.—1. The manufactures of paints from the material contained in cloths or fibrous substances, (used by engravers for wiping their plates,) in the manner or by the process herein described.

2. Also, the use of the solvents herein enumerated, or their equivalents, for the purpose set forth in the specification, *i. e.*, the manufacture of paint.

3. Furthermore, the process, herein described, for the separation and recovery of oils, and gums, or resinous matter.

84,405.—B. F. BARNES, Boston, Mass.—*Oil Can.*—November 24, 1868.—The wire is designed to clear the oil passage of dirt or other obstruction.

Claim.—The nose C, made in two parts or sections, D and E, in combination with the wire J, secured at one end in section D, and extending by its other therefrom into the oil passage, through part E, substantially as and for the purpose specified.

84,406.—ALFRED BLISS, New York, N. Y.—*Lamp Burner.*—November 24, 1868.—The chimney is made with an inward projection which rests upon a ring forming a part of the lower edge or flange of the cone or deflector.

Claim.—The combination with the burner of a kerosene or other lamp, of a removable cone or deflector, so constructed, that when the chimney and cone or deflector are in position for use, the chimney will rest upon the bead or ring and retain the cone in place, substantially as described.

S4,407.—W. P. BOYD, Thorntown, Ind.—*Gauge for Mortising Window Sash.*—November 24, 1868.—A grooved bar is provided with a series of blocks, each having a spring stop or bolt, to be placed in a common mortising machine, for determining the position of the mortise to be cut.

Claim.—The combination of the adjustable blocks B B, stops or bars C C, and slotted or grooved bar A, all arranged as described, and operating substantially as and for the purposes herein set forth.

S4,408.—JONATHAN S. BUELL, Buffalo, and WIL-LARD B. BUELL, Pompey, N. Y.—*Screw Press.*—November 24, 1868.—A continuous circular motion of the crank imparts a vibratory motion to the lever and an intermittent rotary motion to the screw to operate the follower.

Claim.—1. The ratchet wheel, lever, pitman, and crank, in combination with the press screw, when arranged and operated substantially as and for the purpose set forth.

2. The combination of the diagonal brace M with the oscillating lever F and screw D, arranged so as to support the former, and permit the necessary movement of the parts, as set forth.

3. The combination of the triangular-pointed spring pin *i* and arm *h* with the double-pointed pawl G, arranged to operate substantially as and for the purpose set forth.

S4,409.—WILLIAM H. BUTTERWORTH, Trenton, N. J.—*Hay Spreader.*—November 24, 1868.—The angle which the forks are to assume in moving is adjusted by an eccentric, provided with a slot so as to be fastened to the side of the frame. The fork bars are connected to cranks pivoted to the periphery of a ring arranged to rotate about the eccentric.

Claim.—1. Eccentric H, provided with a slot *e*, so as to be adjusted as desired, substantially as herein described, and for the purpose set forth.

2. The combination of the adjustable eccentric H, the rotating ring G, and the reel, having its rake bars journaled therein, and connected by cranks *b* to the ring G, all arranged to operate as and for the purpose described.

S4,410.—JOHN T. CAMPBELL, Altoona, Pa.—*Nut Planer.*—November 24, 1868.—A series of nuts of different sizes are screwed to the mandrel, and one side of the latter is a sliding tool rest, to which are screwed a series of tools, having each two cutting edges, by which a number of nuts can be simultaneously faced and beveled.

Claim.—1. The combination of one or more tools, *m m'*, and a revolving mandrel, G, all constructed, arranged, and operating together, substantially as and for the purpose set forth.

2. The combination and arrangement of the revolving mandrel G, sliding tool rest E, edge-planing tool *n*, and the double edged tools *m m'*, all constructed and operating substantially in the manner described.

S4,411.—SAMUEL J. MILLS CLARK, Brookline, and JOHN L. FARRELL, Boston, Mass.—*Screw Tap.*—November 24, 1868.—The tap is formed of a series of cutting surfaces of different diameters, so arranged as to perform the work for which three distinct taps are usually required.

Claim.—The improved compound tap, made as before described, that is, having its cutting surface or series of teeth disposed in graduated sections, substantially in the manner and for the purposes shown and specified.

S4,412.—E. W. COOPER, Williamstown, assignor to himself and LUKENS COOPER, Blackwoodtown, N. J.—*Glass Mold.*—November 24, 1868.—A detachable ring is used so that when the screw thread has become worn or broken, the ring may be removed and replaced by a new one.

Claim.—In a mold for forming glass vessels with screw tops, a detachable ring, D, having screw threads on its inner edge, and being applied to the mold, substantially in the manner described.

S4,413.—WILLIAM F. COULTER, G. F. TRABUE, and W. A. LOWREY, Hardinsburg, Ind.—*Cultivator.*

—November 24, 1868.—Beneath the axle and hounds are two shovel-carrying beams pivoted to V-shaped pendants, so arranged as to vibrate in vertical planes and be adjusted vertically.

Claim.—1. The V-shaped brace pendants S S, adjustable beams G G, stiff pendants H H, and staple guides *p p*, arranged together in a cultivator, substantially as herein described.

2. The hooked-spring goose necks F, applied to axle B, and adapted to serve for holding up the shovel-carrying beams out of action, substantially as described.

S4,414.—JOHN CRANDELL, Chicopee, Mass., assignor to LAMB KNITTING MACHINE MANUFACTURING COMPANY.—*Gathering Attachment for Sewing Machines.*—November 24, 1868.—Two plates of sheet metal fastened together at one end, in connection with a screw for regulating the distance of the upper plate from the lower, so operate as to cause the lower one of two pieces of cloth, being sewed, to be at the same time gathered, the amount of gathering being readily adjusted.

Claim.—The within-described gathering attachment, consisting of the plates *a b*, constructed in the manner explained and represented, provided with the screw *d* and projection *f*, and adapted for operation in conjunction with the feed and presser foot of a sewing machine, as and for the purpose set forth.

S4,415.—SAMUEL CUPLIN, Iowa Falls, Iowa.—*Beehive.*—November 24, 1868.—The comb frames are pointed at their lower ends and braced at the center by vertical bars.

Claim.—1. The removable boards F F, held in place by the strips *f f'*, and used for the purpose of retaining firmly in position the comb frames, and facilitating the removing of the same.

2. The comb frames E E, constructed, arranged, and operated substantially as described.

3. Casing A, cover B, honey boxes G G, ventilating lid I, comb frames E E, removable or adjustable boards F F, strips *f* and *f'*, horizontal and inclined bottom C, inclined board D, and door J, all constructed and arranged substantially as and for the purpose set forth.

S4,416.—PAUL DISMUKES, Gallatin, Tenn.—*Clover Harvester.*—November 24, 1868.—A reel in front of the machine carries the blades of grass against adjustable stationary fingers, by which they are held, and the heads are cut off by revolving blades.

Claim.—1. A machine for gathering clover or grass seed, having the adjustable fingers C, reel E, and cutter D, all constructed and combined substantially as set forth.

2. The combination of the adjustable fingers C and the rotating cutter D, when said parts are constructed and arranged to operate as herein described.

S4,417.—ALFRED DUVALL, Baltimore, Md.—*Universal Joint.*—November 24, 1868.—The device is particularly adapted for communicating motion to hollow, revolving dredging pipes. Two sections of hollow spheres are arranged one within the other, the outer driving the inner by gearing, and by means of two pins fastened into and revolving with the outer section, the latter revolving within three stationary bearings, or on friction rollers.

Claim.—The combination of devices, substantially as shown in the drawings, and set forth in the foregoing specification.

S4,418.—GUSTAV JULIUS GÜNTHER, London, England.—*Armor Plating for Vessels.*—November 24, 1868; patented in England, October 25, 1867.—The plates are so constructed and connected as not to exhibit any bolt holes or other source of weakness in those parts of the armor which are exposed to the enemy's fire. The plates may be secured to the back structure by T-shaped plates, the T portion fitting in grooves in the vertical end edges of two adjoining plates.

Claim.—1. The combination of two or more armor plates with each other by back flanges and bolts, substantially as described.

2. The combination of two or more armor plates

with each other, by means of back flanges and bolts, and tongues and grooves, substantially as described; and this I claim both when the said tongues are attached to and separate from the plates, as described.

3. The method, substantially as described and represented, of fastening armor plates, which are combined with each other by flanges and bolts, to a backing structure by means of T-shaped plates, substantially as specified.

84,419.—FRIEDRICH HÄFELFINGER and ROBERT N. EAGLE, Washington, D. C.—*Corn Husker, Sheller, and Stripper*.—November 24, 1868.—Two or more sectional bars are each provided with side bars and transverse serrated bars, and are so arranged as to assume a curved form when the hand of the operator is closed, the sections being allowed to swing loosely upon each other.

Claim.—1. The sectional bars B B, connected by transverse bars C C, substantially as and for purposes set forth.

2. In combination with the aforesaid bars B B and C C, the spring D, for the purpose stated.

3. The hood E F G G', in combination with the sectional frame B B C C, substantially as set forth.

4. The loops K, for the attachment of the straps or bands of any suitable form.

84,420.—WILLIAM HOWELL and N. W. BROWNING, Webster City, Iowa.—*Compound for Hardening and Uniting Iron and Steel in the Manufacture of Plows, &c.*—November 24, 1868.—Composed of alum, saltpetre, chloride of sodium, borax, and prussiate of potash dissolved in soft water.

Claim.—The solution herein described, or its equivalent when used for the purposes specified.

84,421.—NATHANIEL IRISH, Rochester, Minn.—*Compound for Roofing and Painting*.—November 24, 1868.—Composed of boiled linseed oil, plaster of Paris, white or colored lead, Venice turpentine, and water.

Claim.—A compound, consisting of the above-mentioned ingredients, and used substantially as and for the purposes herein set forth.

84,422.—EBEN JAMES, Tyngsborough, Mass., assignor to himself and W. B. BRINLEY, same place.—*Machine for Making Boxes*.—November 25, 1868.—The arrangement of the adjustable cutters allows the manufacture of boxes of various sizes. The lumber is secured to the table, which latter can be raised or lowered to bring the wood in or out of contact with cutters, square tenons being cut on both edges of the board simultaneously.

Claim.—The combined arrangement of the two gangs of cutters, *h h* and *i i*, one being adjustable toward and from the other, and the table *q* movable between the said gangs of cutters by means of the crank *t*, pinions *v v*, and racks *w w*, all substantially as and for the purpose herein specified.

84,423.—BARTON H. JENKS, Bridesburg, Pa.—*Loom*.—November 24, 1868.—The cords, which pass over blocks attached to the lower end of the heddle frames are secured to a flanged drum, which is toothed at one end to form a ratchet wheel, and provided with a pawl, whereby the tension of said cords can be regulated. The cam hubs and cams are sustained and guided during their laterally-sliding movements by means of feathers fitting into corresponding matrices, and arranged diametrically opposite each other in such relation to the switch that the hubs and cams will be firmly sustained against any twisting action, and be guided freely while changing.

Claim.—1. The combination of the tension device G, arranged and operating substantially as described, with heddles, which are either held down or suspended by means of a cord and a system of sheaves, substantially as and for the purposes described.

2. The combination of the twilling cam K, hub L, which is grooved circumferentially, and as described, diametrically opposing feathers *y y*, on the cam shaft, and the swivel *n*, substantially as and for the purpose described.

3. The combination and arrangement of the system of loom treadles, the twilling cam, the circumfer-

entially-grooved hub, which is grooved as described, and slides, the cam shaft with two feathers, *y y*, and the swivel *n*, substantially as and for the purpose described.

84,424.—BARTON H. JENKS, Bridesburg, Pa.—*Reeling Machinery*.—November 24, 1868; antedated November 14, 1868.—The arms and parallel bars can be folded to permit the ready removal of the hanks. By means of the circular, movable bearing the yarn can be carried beneath the ends of the reel shaft and thrown off without lifting said shaft or changing its axial line.

Claim.—1. The combination of the folding reel bars G G, shaft E, circular bearing J, with a brake, P, in its rim, and groove or flanges *i i*, substantially in the manner and for the purpose described.

2. The bearing J P, *pp*, constructed in the manner shown and described, in combination with the groove or flanges *i i* and pin *s*, for the purpose set forth.

3. The arrangement, consisting of the oscillating bearing J P, reel E G, groove or flanges *i i*, intermittent, longitudinally, reciprocating bar C, sizing box B, and gearing, shown, for operating the bar and reel, all substantially in the manner and for the purpose set forth.

84,425.—WILLIAM ASHLEY JONES, Dubuque, Iowa, and JAMES L. SHERMAN, Cassville, Wis.—*Steam-engine Water Heater*.—November 24, 1868.—Relief valves are attached to each section of the worm or coil to relieve the latter from shocks occasioned by the back action of the water passing through on its way to be forced by the pumps into the boiler.

Claim.—A valve or valves, E, applied to the several sections, D¹, of a worm or coil of pipe, which is arranged within a heater, A, substantially in the manner and for the purposes herein described.

84,426.—C. A. KELLOGG, Elyria, Ohio.—*Corn Planter*.—November 24, 1868.—A pair of chutes is secured to the front side of the box and a third one is attached to a lever pivoted to the case, and so arranged that when the slide, which is kept in contact with the lever by a coiled spring, is brought into a position to feed the grain, the jaw closes and prevents the grain from being discharged into the ground until the motion of the lever is reversed to force the slide back into the box.

Claim.—1. The slide L and spring M, as arranged in combination with the lever D, for the purposes set forth.

2. The lug E, as arranged in combination with the chutes I, F, and G, and operated in the manner as and for the purpose described.

84,427.—JOHN C. KILGORE, Philadelphia, Pa.—*Steam Generator*.—November 24, 1868.—A foam cap attached to the curved part of the siphon breaks the foam and prevents the water from being drawn into the steam pipe.

Claim.—The foam cap *e*, combined with the siphon H and tubes C, substantially as herein specified.

84,428.—ALEXANDER CARNEGIE KIRK, Glasgow, Great Britain.—*Blowing Engine*.—November 24, 1868.—The cylinder provided with openings and valves supports a hollow piston rod or trunk, which is provided with piston disks and valves which draw the air or gas in through the piston and expel it through the cylinder valves.

Claim.—The cylinder 1, with its openings and valves, in combination with easings 7 7, and with a hollow piston rod or trunk extending through both heads of the cylinder, open at each end, and communicating with a hollow piston, A, having openings and valves arranged as described, the whole being constructed and operating as set forth.

84,429.—DAVID H. LOWE, Boston, Mass.—*Sad-iron Heater*.—November 24, 1868.—The interior of the sad iron is divided into three compartments, in the center one of which the gas is generated and spread over the bottom by a conical deflector, through which the flame passes from the burner, and through

apertures in the other compartments to heat the sides.

Claim.—A sad-iron, heated substantially in the manner described by gas from naphtha.

84,430.—THOMAS E. McDONALD, New Brunswick, N. J., assignor to P. P. RUNYON, JOHNSON-LESTER and GEORGE J. JANEWAY, same place.—*Cultivator*.—November 24, 1868.—The teeth are secured in rebates in the faces of radial arms on the hub by bolts.

Claim.—1. A machine, having a series of cultivator teeth arranged on a rotary shaft, in combination with a swinging or hinged frame, pivoted in rear of the cultivator, when the latter is operated by its progressing over and in contact with the ground, substantially as described.

2. The employment, in combination with the cultivator hinged frame, of the chains, or their equivalent, and a suitable moving and holding mechanism for retaining the adjustable frame while the cultivator is at work, substantially as and for the purpose set forth.

3. Arranging the teeth on each hub, or each set of teeth, spirally, as and for the purpose specified.

4. Method, shown and described, of constructing and combining the teeth and their retaining arms and hubs.

5. A divided cultivator shaft, whereby the machine is rendered capable of straddling a row of plants, and cultivating each side, as hereinbefore set forth.

84,431.—CHARLES MESSENGER, Cleveland, Ohio.—*Dish Washer*.—November 24, 1868.—The plates are laid on the coarse wire netting or grate secured in the case. The spindle, provided with triangular arms, is then rotated by means of the bow, thus throwing the water against the dishes and cleansing them.

Claim.—The grate I, radial angular arms C, as arranged, in combination with the spindle D, bow G, and case A, and operated in the manner as and for the purpose set forth.

84,432.—LEWIS MILLER, Akron, Ohio.—*Harvester*.—November 24, 1868.

Claim.—1. The combination of the changeable gears with the adjustable crank wrist, so that a fast motion and short stroke, or a slow motion and a long stroke, may be given to the cutters, as the work to be done may require, substantially as described.

2. The arrangement of the gear pinion *j* with regard to the pinion *k* and rake driving gear H, so that a long coupling may be used, and a change of gear and change of speed attained or given to the rake, as and for the purpose described.

3. In combination with the device by which the tongue may be made fast or loose, the double hook 1 2, or its equivalent, by which the coupling bar may be suspended to the main frame, and to the lifting lever by the same or another chain, *x*, as and for the purpose described.

4. In combination with a detachable platform, the rearward projecting arms O P on the main frame, for connecting said platform to, and carrying it upon, when the machine is being transported to or from the field or elsewhere, substantially as described.

5. Hanging the rake and beaters or reel, and operating them upon or from two centers, remote from each other, and to which they are connected, so that the beaters shall have their rising and falling and horizontal position without the use of guides, ways, or cam ledges, substantially as described.

6. In combination with a combined rake and reel or beaters, having the motions herein described, the incased spring for raising the rake after it has cleared the platform, substantially as described.

84,433.—LEWIS MILLER, Akron, Ohio.—*Making Harvester Guard Fingers*.—November 24, 1868.—The roller dies for shaping the parts of which the guards are made, fit on the projecting necks of the rolls and can be readily removed to substitute a different set of rollers. The two pieces composing the finger guard are held together and shaped while being welded by a pair of die tongs.

Claim.—1. In combination with the rolls B C, projecting beyond one of their housings, the pairs

of changeable die rollers, with their dies for rolling out irregular, shouldered pieces, F I, as and for the purpose set forth.

2. In combination with a pair of rolls projecting beyond one of their housings, a pair of welding and shaping rolls and dies, and a pair of clamping and shaping tongs or holders, operating together to hold, weld, and shape a guard or finger, substantially as described.

84,434.—SIMON B. MINNICH, Landisville, Pa.—*Windlass and Horse Power*.—November 24, 1868.—

The upper toothed flange of the cylinder or drum is provided with a locking device, and the lower flange with chambers for the insertion of radial arms provided with adjustable hooks, over which a chain is wound, when the whole is operated by a horse attached to the sweep. A trunk, through which the chain passes, is employed when used to drive a corn sheller.

Claim.—1. The construction of the hub or drum C, with its lower flange and open chamber Y, when the upper flange is provided with cog-like stops *n* on its upper face, arranged and operated substantially in the manner and for the purpose specified.

2. Independent rings D M, provided with cog-like stops *n*, in combination with the drum C, arranged in the manner and for the purpose set forth.

3. The adjustable sliding hooks L on the radiating arms K, in combination with the chambered hub or drum C, when operated in the manner and for the purpose described.

4. The arrangement of the sweep head E, when provided with slots 1, 2, and 3, for the reception of the rod J, eliek bolt I, and hook bolt G, in the manner and for the purpose specified.

5. A loose, wooden click bolt, I, bevelod, and operating, in combination with the cog-like stops *n*, in the manner and for the purpose set forth.

6. In combination with the hub or drum C, radiating arms K, and hooks L, the arrangement of the trunk Q, with its vertical roller S and horizontal pulleys *t u r v*, all arranged in the manner and for the purpose specified.

84,435.—JOHN H. MORRIS and THOMAS B. HARRISON, Maquoketa, Iowa.—*Hand Corn Planter*.—November 24, 1868; antedated November 18, 1868.—

On lowering the plunger the chamber or mortise is filled with seed which is deposited in the cast-iron box at the same time that the end of the plunger comes in contact with and forces the springs apart, thus allowing the seed to be deposited in the ground. The brushes prevent any seed from dropping except from the chamber.

Claim.—1. The seed box A, of sheet metal, cast box B, blocks C' C'', springs E E, plunger D, in combination with the chamber or mortise H, regulating slide R, and brushes T T, constructed, arranged, and operating as and for the purpose set forth.

2. The seed box A, in combination with the opening and glass sliding door X, the strap L, screws M and N, and plunger D, constructed, arranged, and operating as described.

3. The combination of the stop block O, plunger D, blocks C' C'', and seed box A, constructed substantially as and for the purpose specified.

84,436.—LEWIS Y. MYERS, Roanoke, Ind., assignor to himself and EMANUEL RABER, same place.—*Elevator and Conveyer*.—November 24, 1868.—

The article to be raised is attached to a block and pulley which slides on a rope attached at one end to the conveyer frame, the other end passing over a pulley, to be grasped by the band. The block on being raised comes in contact with a latch, which allows the conveyer to be carried forward with its load. A weight and cords carry the conveyer back when the load is removed.

Claim.—The rail A, conveyer frame D, latch *b*², catch *b*³, pulley *g*, cord *h*, weight *h'*, cord *c*¹, pulley *d* and block and pulley *f*, all combined, arranged, and operated substantially as set forth.

84,437.—WALTER NOTMAN, Deerfield, Ohio.—*Corn and Potato Plow*.—November 24, 1868.

Claim.—The moldboards G, of the twisted and

bent form, as shown, combined and arranged with the V-shaped frame A, cross-pieces H, uprights D, and braces C L I, which parts are firmly secured to each other, as herein represented and described, and for the purpose specified.

84,438.—JOHN OWEN, Dayton, Ohio, assignor to himself, HENRY L. BROWN, and A. BARR IRWIN, same place.—*Patterns for Stoves and Hollow Ware.*—November 24, 1868.—The object of this invention is to obviate the warping or change of shape incident to the use of wooden patterns.

Claim.—Patterns for casting stove plates and hollow ware, made of paper, substantially as set forth.

84,439.—A. D. PUFFER, Somerville, Mass.—*Beer Cooler.*—November 24, 1868.—The cooler occupies the space beneath the drip plate, which latter can be removed to insert the ice charge. The opening through the case board is covered by a back protecting plate, which can be removed when the couplings of the beer pipes with the delivery faucets are to be examined. The water from the cooler is withdrawn by a pipe surrounding the waste pipe.

Claim.—1. The arrangement of the cooler, with respect to the movable drip plate, as and for the purposes specified.

2. The opening *e*, protected by the plate *f*, as and for the specified purpose.

3. A base draught waste, constructed and arranged substantially as described.

84,440.—LEOLF REESE and HARRY REESE, Philadelphia, Pa., assignors to themselves and WILLIAM MCHENRY, same place.—*Printing Press.*—November 24, 1868.—The rods to which the lid is hinged are provided with spiral springs and nuts to regulate their tension, so that the yielding plate on the lid will rest evenly on the type when pressure is applied.

Claim.—1. The box A, having a recess in the top for the reception of type, and to which is jointed, by yielding hinges, a lid, F, containing a movable plate, H, faced with rubber, or its equivalent, and bearing on springs *l*, all substantially as and for the purpose described.

2. The arrangement of the springs *k* on the rods *h*, between nuts on the latter and the projections *i*, through which the rods slide, as and for the purpose specified.

84,441.—MARTIN RHINEHART, Lockport, Ill.—*Compound for Treating Piles.*—November 24, 1868.—Composed of tannic acid, flowers of sulphur, pulverized nutmeg, lard, and goose oil.

Claim.—The medical compound, consisting of the ingredients substantially as herein described, as a remedy for the piles, as set forth.

84,442.—ADAM C. SMITH, Philadelphia, Pa.—*Construction of Waste Water Pipes.*—November 24, 1868.—This construction allows the pipe to expand when ice is formed, thus preventing bursting.

Claim.—A water pipe, consisting of a strip of metal coiled spirally, and so that one edge shall overlap the other, as set forth.

84,443.—LEWIS SMITH and SAMUEL FOSTER, JR., Des Moines, Iowa.—*Curtain Fixture.*—November 24, 1868.

Claim.—In combination with the roller D and its reel F, the elongated journal *a*, provided with an indentation, *i*, within which the bend in the curved spring rod I is rested, all as herein shown and described.

84,444.—L. F. SMITH, Philadelphia, Pa.—*Low-Water and High-Steam Indicator.*—November 24, 1868.—Water from the steam boiler enters the outer cylinder and passes through openings at the upper end of the inner cylinder, thus filling the latter. When the water in the boiler becomes so low that the outer cylinder is emptied, the inner cylinder, being filled with water, acts as a weight to operate the valve, through a system of levers, steam taking the place of water in the outer valve, and sounding the whistle.

Claim.—1. The combination of the cylinder A, tube B, and cylinder E, the latter provided with

openings, *a a*, and suspended by means of levers G H and rods *b c d*, from the valve J of the steam-whistle D, all substantially as herein set forth.

2. In combination with the valve *e*, the circular cap *f*, fitting in the groove *i* on the valve-seat *h*, substantially as herein set forth.

3. The arrangement of the levers U W, weight T, and rod V, as set forth.

4. The arrangement of the cylinder A and the inner vessel E, with its perforations *a a*, with the steam generator C and whistle D, all substantially as specified.

84,445.—E. M. STIGALE, Philadelphia, Pa.—*Case for Preserving Flowers, &c.*—November 24, 1868.

Claim.—The rubber band *e*, applied to the edge of the glass, fitting a recess in the base, and protected by a flange, *i*, on the glass, all as set forth.

84,446.—WILLIAM F. VERNIER, Philadelphia, Pa.—*Carriage Spring.*—November 24, 1868.—The axle is secured to the under side of levers attached to two hangers near the front end of the frame, and between each of the levers and the frame is a spring, consisting of a perforated gum-elastic cylinder held between two disks.

Claim.—1. In combination with the axle and frame of a carriage, the lever D, having its fulcrum at *a*, and the gum-elastic spring G.

2. In combination with the above, the cross levers D', with their gum-elastic springs, arranged substantially as and for the purposes set forth.

84,447.—C. W. WAILEY, New Orleans, La., assignor to NEW ORLEANS PNEUMATIC PROPELLING COMPANY, same place.—*Pneumatic Street Railway Car.*—November 24, 1868.

Claim.—The combination of a street railroad car with a pneumatic engine, when the latter is operated by compressed air, that is contained in tanks, composed of paper or its equivalent, and which are carried on the car, substantially as herein described, for the purpose set forth.

84,448.—B. F. WATSON and ALBERT SHEPARD, Bridgeport, Ill.—*Curtain Clasp.*—November 24, 1868.—The clasp is placed upon the rolled portion of the curtain, and holds the latter at any desired height.

Claim.—The metallic band *a*, open at the top, forming small rolls, C C, from which project the handles *c c*, for operating it, all as herein shown and described.

84,449.—SETH WAY, La Porte, Ind.—*Cultivator.*—November 24, 1868.—The swiveling joint permits lateral motion to the rear end of the plow beams, a two-armed lever is secured to the tongue, and serves to raise the plows, a portion of the weight of the plows, when raised, resting on the long arm of the lever to prevent displacement when the machine is transported from place to place. The divergence of the plow beams is regulated by metal clasps or stirrups.

Claim.—1. The swiveling joint 2 8, secured to the tongue of the carriage, substantially as and for the purpose described.

2. The construction of the lever 1, and its combination with the plow beams, substantially as shown and described.

3. The arrangement of the stirrups 4, with reference to the two diverging portions of the plow beams, substantially as and for the purpose described.

4. The socket 3, and its combination with the axle 7 and tongue A, substantially as shown and described.

84,450.—THEOPHILUS WEAVER, Harrisburg, Pa.—*Safety Horse Hitch.*—November 24, 1868; ante-dated September 23, 1868.—The base or bed plate consists of a flat bar provided with a cavity on its under side, in which is a trunnion which, in connection with two cylindrical bars in a holder, causes a strap to be firmly clamped.

Claim.—1. The base R R', substantially as herein set forth.

2. The holder F, with tread *h l*, and bars *s t u*, substantially as shown and described.

3. The arrangement of the base R R' and holder F, for the purposes specified.

4. Inserting a hitching strap, pliated to form a release hiteh, substantially in the manner herein set forth.

84,451.—MILO WEBB, Cheango Forks, N. Y.—*Mechanical Movement.*—November 24, 1868.—In the upper part of a frame is a eylinder near one end of which is attached a chain which is wound around a eylinder in the lower part of the frame. A spring is secured to the said shaft and to the frame so that when the upper shaft is turned the spring is wound up and by its own force unwinds the chain from one eylinder and rewinds it on the other.

Claim.—The arrangement of the frame A with the eylinder C, chain D, eylinder E, spring H, wheels F I, shaft G, dogs *o o*, bar *h*, shaft *i*, spring *m*, regulator R and its screw S, wheel N, bar L, and rod O, all, with their various parts, constructed and operating substantially as herein set forth.

84,452.—HENRY W. WEISS, Quakertown, Pa.—*Dung Drag and Hook.*—November 24, 1868.—To the rear end of a V-shaped frame is hinged a transverse bar, provided with teeth, which may be raised from the ground and held in an elevated position as required.

Claim.—The improved dung drag, consisting of the rolling bar D, with teeth *a*, and standard E, the pivoted stop bar F, lever G, guard *d*, frame A B B' C C', and swiveled roller H *f*, all constructed and arranged to operate substantially as herein described.

84,453.—E. R. WHITNEY, Plattsburg, N. Y.—*Cover for Hay and Grain Cocks.*—November 24, 1868.

Claim.—As a new article of manufacture, the herein described cover for grain and hay stacks and cocks, when the same is constructed of water-proof paper, and provided with holes for the guys, substantially as and for the purposes herein set forth.

84,454.—ELIHU WILDER and JOHN CRANDELL, Chicopee, Mass.—*Hemmer for Sewing Machine.*—November 24, 1868.—An upper plate slides on a lower one so that a part of the curved surfaces which turn and form the hem are formed upon one plate, and a part upon the other, so as to make a hem of any desired width. An adjustable guide on the hemmer is fastened to the work plate by the same binding screw with hemmer, so that the cloth is automatically and accurately guided to the hemmer.

Claim.—1. A hemming attachment for sewing machines, composed of the stationary plate B and the slotted sliding plate A, having the curved surfaces *b* and *c'* for forming the folds, substantially as described, and the whole constituting an adjustable hemmer, as set forth.

2. The movable plate A of an adjustable hemmer, having thereon lips *b c'* and the elongated loop *a*, constructed and applied substantially as set forth.

3. The slotted and jointed guide G G', in combination with a hemming attachment for sewing machines, and constructed substantially as set forth.

84,455.—JOSEPH S. WILLIAMS, Cinnaminson, N. J.—*Manufacture of Alcoholic Spirits from Tomatoes.*—November 24, 1868.

Claim.—The process, herein described, of producing spirits by first separating the juice of tomatoes from the pulp, then mixing molasses or other saccharine matter, and yeast, and afterward fermenting and distilling the compound liquid thus obtained.

84,456.—WILLIAM M. WILLIAMS, St. Louis, Mo.—*Coffee Pot.*—November 24, 1868.—Conically-shaped chambers open at the bottom, and extending up into the vessel, serve to increase the heating surface. The lid forms a receptacle for cold water, the bottom acting as a condensing surface for the ascending vapor.

Claim.—The vessel A, with tubes *a'*, strainer B, and condenser lid C, the strainer being located cen-

trally in regard to the tubes, and the whole being combined and arranged as and for the purpose set forth.

84,457.—GEORGE L. WITSIL, Philadelphia, Pa.—*Umbrella.*—November 24, 1868.—A tip of rubber is attached to the end of a curved handle so as to retain the same in position when suspended upon a smooth surface.

Claim.—An elastic tip, in combination with the handle of an umbrella or cane, substantially as shown and described.

84,458.—WILLIAM C. WOOD, Washington, D. C.—*Construction of Ice Pitchers.*—November 24, 1868.—A weighted valve is arranged to close an air vent when the pitcher is in an upright position, but when the pitcher is turned the vent is opened and at the same time a bolt is operated to fasten the cover.

Claim.—1. A self-operating vent valve, substantially as shown and described, for the purpose specified.

2. A self-operating bolt, arranged and operating substantially as described, for the purpose specified.

3. The combination of a self-operating vent valve and sliding bolt or latch, arranged and operating substantially as described, for the purposes specified.

84,459.—ANDREW WYLEY, Birmingham, England.—*Breech-loading Fire-arm.*—November 24, 1868; patented in England, March 25, 1867.—The plunger is made to carry a transverse bolt capable of sliding vertically in the plunger, which also carries a pin or striker, to explode the cartridge. The plunger is locked by the bolt, the stem being slit and retained in place by the striker.

Claim.—The combination of a longitudinal plunger with a locking bolt of T-form, which, when raised, acts as a handle for manipulating the said plunger, while performing its various functions of ramming and drawing the cartridge, (where the cartridge requires to be drawn,) and of locking the lock, the whole constructed and operating substantially as herein set forth.

84,460.—E. HALL COVEL, and WILLIAM H. COVEL, New York, N. Y.—*Gas Machine.*—November 24, 1868.—Two meter drums are mounted on the same shaft, one driven by the gas and causing the other to revolve so as to draw in air. Devices are employed for increasing and diminishing the relative amount of air and gas, and also for heating the entering air.

Claim.—1. Mixing atmospheric air and any of the inflammable gases, and then adding to the mixture certain further proportions of the gas, before passing the same over or through the carbon-supplying materials.

2. Mixing atmospheric air and any of the inflammable gases, and then adding to the mixture certain further proportions of the gas, after the said mixture has been passed over or through the carbon-supplying materials.

3. Pumps A and B, in combination with an inclosed space or carbonizer, I, fluid or chemical tank L, and feed pipe or opening N, or their equivalents, when used to add new constituents to the mixture of air and gas produced by the action of pumps A and B, and to keep up the supply of such new constituents.

4. Pump A, pump B, tank L, feed pipe N, ventilating pipe or pipes O, and inclosed space I, or their equivalents, with the usual couplings and connections known in the business, when combined for the purpose of mixing air and gas, supplying new constituents to such mixture, and keeping up, automatically, the supply of such new constituents.

5. The combination of filling pipe M, feed pipe N, ventilating pipe or pipes O, and tank L, with inclosed space I, constructed and operating substantially as and for the purpose hereinbefore described.

6. Pump A, pipe E, and carbonizer or inclosed space I, or their equivalents, in combination with a lamp, or any other heating device, operating substantially as and for the purpose described.

7. The pumps A and B, in case C, tank L, and an inclosed space or carbonizer, as arranged.

8. Pump A, pump B, pipe H, and an inclosed

space or carbonizer, combined with a regulator, valve, cock, or other device for checking or regulating pressure, or their equivalents, operating substantially as and for the purpose hereinbefore described.

9. Pump A and pipe E, or their equivalents, combined with a regulator, valve, cock, or other device, placed in or upon pipe E, when so constructed that, either automatically or otherwise, pipe E shall or may be closed, when the pump A is not in action, for the purposes hereinbefore described.

10. Pump A and pipe E, or their equivalents, and lamp W, or other heating device, combined with a regulator, valve, cock, or other closing device, placed in or upon pipe E, when so constructed that, either automatically or otherwise, pipe E shall or may be closed, when the pump A is not in action, and the hot air generated by the heating device W, or its equivalent, instead of passing up pipe E, shall be forced to discharge itself into the air.

11. Pump A and pipe E, or their equivalents, in combination with a heating device, operating substantially as and for the purpose hereinbefore set forth.

12. Gas-service pipe X, pump A, pump B, pipe D, and their equivalents, in combination with a regulator, valve, cock, or other device for checking or regulating pressure, and space G, for the purpose of adding a further supply of gas to that already furnished by pump B, and controlling proportions of gas and air in space G.

13. Gas-service pipe X, having in or upon it a regulator, valve, cock or other device for checking or regulating pressure, in combination with pipe H, and carbonizer or inclosed space I, for the purpose of controlling proportions of gas and air caused to enter the inclosed space or carbonizer I.

14. The combination of gas-service pipe D, gas-supply pipe K, and cross-pipe R, having in or upon it a regulator, cock, valve, or other device for checking or controlling pressure, or their equivalents, when substantially constructed and arranged as described, and for the purpose set forth.

15. Forming channels and bisecting the same, within the carbonizer or inclosed space I, by means of partitions and sheets of porous substance, when constructed and arranged substantially as shown and described, and for the purpose set forth.

16. The combination of the pumps A and B, pipe H, tank L, pipe N, pipe O, heating device W, pipe E, and a carbonizer or inclosed space, or their equivalents, when arranged to substantially operate in the manner and for the purpose hereinbefore described and set forth.

17. The improvement in combination gas machines, constructed and operating substantially as hereinbefore described and set forth.

84,461.—GEORGE F. FESSENDEN, Arlington, Mass.—*Toy Target.*—November 24, 1868.—A small ball is attached to a miniature target by an elastic cord, so that by drawing the ball back and releasing it, it will be driven against the target.

Claim.—A toy target, constructed to operate substantially as described.

84,462.—WILLIAM C. WHITMORE, Mason City, Mo., assignor to ABILAH RICHARDSON, Boston, Mass.—*Horseshoe.*—November 24, 1868.—On the under surface of the shoe is a groove with a rib around it projecting from the groove, and formed on its inner side with a concave slope or bevel. The rib serves as a calk, causing the hoof to take an even bearing upon the shoe.

Claim.—1. An improved horseshoe, constructed with the single continuous rib *e*, one or more bevels or inclined inner faces, *d e*, a continuous groove *b*, and nail holes *a*, arranged as described, the rib *e*, under such arrangement, being made to project down below the groove *b*, or the part in which such groove is made, the whole being substantially as specified.

2. Further, a horseshoe having a continuous groove, in which are the nailholes, and surrounding a single continuous rib or calk, when constructed in the manner substantially as described.

84,463.—HENRY ANDERSON, Shepherdstown, Pa.—*Wagon Brake.*—December 1, 1868.—A series

of devices so arranged as to be readily changed from a rear to a side brake and *vice versa*.

Claim.—The metallic semicircular ratchet D D, the bar E, and the lever F joined thereto by the pin G, the small upright post H H, passing through the end and forming the fulcrum of the lever F, the bar I, the rubber blocks J J, the part K, the rubber bar L L, and the bar M, all constructed and combined, in the manner and for the purpose herein set forth.

84,464.—EMERY ANDREWS and WILLIAM TUCKER, Portland, Maine, assignors to STAR MATCH CORPORATION, same place.—*Match Machine.*—December 1, 1868.—Designed for cutting veneers, or match cards, in the usual way, and then stacking the same in form for handling, instead of scattering them on the floor, as is usually done.

Claim.—1. The combination of the eams *d d* with the receivers and conductors *m m*, in the receiving box H, as and for the purposes specified.

2. The combination and arrangement of the slides *o* and grooves *i*, on the wheel B, and the spring *h*, in connection with the receivers and conductors *m m*, in the receiving box H, substantially as and for the described purposes.

84,465.—J. D. M. ARMBRUST, Apolloborough, Pa.—*Car Coupling.*—December 1, 1868.—Within an ordinary drawhead is arranged a series of springs so as to grasp the link and hold it in a horizontal position. An additional spring is also connected with the bearing plate, which spring operates the keeper plate that retains the pin in an elevated position when required.

Claim.—1. Arranging within a drawhead, A, a series of springs, C and C', D and D', when the same are secured by a single bolt, H, at the rear of the same, thus leaving their forward opening or mouth entirely free, substantially as described, as and for the purpose specified.

2. The combination of the keeper F, spring G, plate B, and bolt H, when the former is secured to and works upon the spring C, substantially as described, as and for the purpose specified.

84,466.—DERK ARNAUD, Boston, Mass.—*Bureau Bedstead.*—December 1, 1868.—The bedstead is attached to the case so as to be swung out like a door, and the case is provided with drawers and boxes for holding wash bowl, &c., and with a sliding mirror.

Claim.—1. A folding bedstead, hinged to the bottom of the door of a case, when the side of the door is hinged to the case, so that the bedstead can be swung out to any angle, substantially as described.

2. The arrangement of the wash stand G and box E with a bureau bedstead, substantially as described.

3. The arrangement of the several parts, A, B, C, D, E, G, S, and M, in one piece of furniture, substantially as described.

84,467.—DAVID ARTER, Ashland, Ohio, assignor to himself and J. J. KAUFFMAN, same place.—*Eaves-trough Hanger.*—December 1, 1868.—A button is attached to the cross piece that sustains the upright part of the hauger, so that the troughs can be readily taken down.

Claim.—The button E, in combination with the cross piece D and trough A, in the manner as and for the purpose set forth.

84,468.—PHINEAS E. AUSTIN, New Haven, Conn.—*Method of Holding and Adjusting Dies and Punches.*—December 1, 1868.—Two or more dies are acted upon separately by a series of clamps and wedges, so that the dies may be nicely adjusted in any direction. The dies are held together by means of a connecting block, which is dovetailed into each.

Claim.—1. The arrangement of the several dies, clamps, wedges, and screws with the frame, as described, and for the purpose specified.

2. The spring gauge pin F, in combination with the dies, in the manner and for the purpose specified.

3. Arranging the punches in the punch stock, and confining them to one another by means of the block H, and the stock by means of the dovetailed tenons fitting into the dovetailed groove in the stock, and the wedge, all substantially as described.

4. The connecting block H, placed between the two punches or male dies, for the purpose of holding them together, substantially in the manner and for the purpose specified.

84,469.—A. P. BALDWIN, Newark, N. J.—*Bridle Bit.*—December 1, 1868; antedated November 21, 1868.—The two mouth pieces are so connected with the cheek pieces as to vibrate endwise one upon or in the other, and cause a vicious horse to release the bit, when seized by the teeth.

Claim.—Pivoting the two mouth pieces *a* and *b* to the cheek pieces C, the pivots of the one being at a distance from the other greater than that of the mouth pieces, substantially as described and shown.

84,470.—RUFUS P. BURNETT, CHARLES P. PURINGTON, and NICHOLAS SEIBERT, Nevada, Cal.—*Anti-friction Bearing for Vertical Shafts.*—December 1, 1868.—The end of the shaft rests upon three or more hard, metallic balls, which rest in turn upon a self-adjusting plate, so constructed as to keep them all in contact with the shaft.

Claim.—1. In combination with the balls H, and their guide I, the universal joint formed by the convex surface G, and the upper concave surface of D, substantially as described.

2. In combination with the balls H and the above-claimed joint, the screw E, to adjust the same to the required elevation beneath the shaft.

84,471.—SIGISMUND BEER, New York, N. Y.—*Process of Recovering and Reworking Borax from Solutions Used in Treating Wood.*—December 1, 1868.—The liquor drawn off after the lumber has been impregnated with a solution of borax is mixed with a solution of alum, when the albuminous matter will settle, and the clear liquid is alkalized with soda.

Claim.—Utilizing the liquids employed in the process of Beerizing, seasoning, or preserving wood by precipitation, substantially as and for the purposes specified.

84,472.—DANA BICKFORD, Boston, Mass.—*Needle for Knitting Machine.*—December 1, 1868.—

Claim.—1. A knitting machine latch needle made from a wire, and having a swell, *b*, thereon, as and for the purpose set forth, formed by giving a bend to the wire, and without cutting away or reducing the same.

2. A knitting machine latch needle, having a swell, *a*, thereon, located between the latch and the end projection, and whose elevation is on the same side with the hook, as and for the purpose set forth.

84,473.—DANA BICKFORD, Boston, Mass.—*Process of Knitting Pile Fabric.*—December 1, 1868.—

Claim.—1. The process herein described of knitting tufted or piled fabric, the same consisting in laying between the regular courses of stitches, after a course has first been knitted, a course of loose loops, formed from a continuous yarn, and then binding this last course in place by a succeeding course of regular stitches.

2. As a new article of manufacture, a knitted fabric, in which, after a course of stitches is knitted, a course of loops, formed from a continuous yarn, is next deposited upon this row of stitches, and then another course of stitches, knitted over the same, to bind and hold to place the loops or tufts.

84,474.—J. S. BIRCH, New York, N. Y.—*Annunciator.*—December 1, 1868; antedated November 14, 1868.—The combination of two indicators, formed of an inclosing case, movable tablet, or check table, and weighted sliding rod, placed, one at or near a billiard or other table, and the other at the cashier's desk, and connected by a cord, or other flexible connection, so as to communicate the amount of indebtedness of the players.

Claim.—The arrangement of the table boxes A, having doors, *a'*, the sliding tablets C, operated by the weighted rods B, the cashier's box A, having a series of tablets, C, operated by the weighted rod, extended to connect with the bell hammer H, each of said table tablets connected with the cashier's tablet by means of the cords D, and all operating in the manner described for the purpose specified.

84,475.—GEORGE E. BURT and STANLEY B. HILDRETH, Harvard, Massachusetts.—*Ratchet Attachment for Harvesters.*—December 1, 1868; antedated June 2, 1868.—As the machine moves in a curve, one of the propelling wheels will revolve faster than the other, and the link which connects the pawl with the friction band is silently disengaged from the teeth of the outside case. When the machine turns a curve in the opposite direction, the pawl is made to engage with the teeth in a quiet but positive manner.

Claim.—1. A loose collar or ring, in combination with the pawl, when the pawl is connected to the collar or ring in such a manner as to be operated in and out of the surrounding or covering internal ratchet gear, by the resistance arising from the inertia or friction of the collar or ring, operating substantially as described, for the purpose set forth.

2. The bolt *e* and tightening nut *f*, in combination with the friction band I and hub *d*, when said friction band is used to operate the pawl in and out of cog, substantially as described.

3. The combination of the pawl A, the pivot ears *i i'*, the link *n*, and the friction band I, substantially as described, for the purpose set forth.

84,476.—EDMUND AUGUSTIN CHAMEROY, Paris, France.—*Fluid Meter.*—December 1, 1868.—Designed to be so constructed as to dispense with ordinary mechanisms, such as pistons, cork, turbines, and wheels, and to determine by means of a varied movement, arising from the uniform oscillation of a pendulum or other motor, the different changes in the size of the opening through which the fluid passes.

Claim.—The combination, with the tapering valve chamber, the weighted valve, and valve rod, connected with the counter weight O, as described, and the pinion M and disk P, mounted upon the shaft I of said counter weight, of the registering mechanism and the rotary plate R, actuated by clock-work, under the arrangement and for operation as herein shown and set forth.

84,477.—ALONZO M. CHENEY and HANDLEY B. KIMBALL, Charlotte, Mich.—*Horse Hay Fork.*—December 1, 1868.—The tines are fastened to the foot of the bent fork shank by a corrugated clamping bar having rectangular grooves, and by steady pins; the clamping bar being held over the ends of the tines by eye bolts, and the forks of the stay bar.

Claim.—1. The bent fork shank B, broadened at its lower extremity, *b*, for the connection of the bail, stay bar C, and overlapping detachable tines A A A, substantially as described.

2. The pivoting of the bail D to the bent fork shank B, so that the axis of revolution of the fork within the bail shall be underneath the load, substantially as described.

3. The attachment of the detachable bent fork tines A A A to the bent fork shank B, at the foot *b*, by the corrugated clamping bar H, fastened by the shouldered, threaded, and united eye bolts *n n*, and forks of the stay bar *f f*, substantially as described.

84,478.—JAMES CHITTOCK, Chicago, Ill.—*Rein Holder.*—December 1, 1868.—The device consists of two jaws which form a clamp, joined together by a spring at the lower end, and attached to the vehicle by a spur or pin on the lower part of the inner jaw.

Claim.—A clamp, for fastening lines, consisting of the parts A A', spring C, hook B, and pin H, as and for the purpose set forth.

84,479.—HENRY G. DAYTON, Maysville, and JAMES CHRISTIE, Atlanta, Ill.—*Apparatus for Condensing, in Distilling Spirits and other Liquids.*—December 1, 1868.—This invention consists in the substitution, for the ordinary worm used in the refrigeratory or tub in distillation, of two or more vapor chambers of copper, so constructed as to present a greater amount of surface for the action of cold water upon the said chambers.

Claim.—1. The alternate chambers for water and vapor, which may be continued or repeated indefinitely, thus securing much greater surface for the action of water in cooling.

2. The concave surface of the bottom of the outer vapor chamber, which permits the flow of water,

striking it at or near the center, to spread in every direction from the point of contact, thus cooling the entire bottom of said vapor chamber.

3. The creation of a partial vacuum in the vapor chamber by our superior means of cooling, which causes the vapor from the retort to flow promptly and readily into the vapor chambers, substantially as described.

4. The tubes H H, I I, K K, L L, M, &c., for their various purposes and uses, in the manner substantially as set forth.

84,480.—HENRY JAMES DICKERSON, Appleton, Wis.—*Method of Working Steel and Iron.*—December 1, 1868.—The steel is first heated and subjected successively to the compounds as follows: The first compound consists of borax, table salt, copperas, sal-ammoniac, prussiate of potash, resin, and rain-water, to be dried and then pulverized. The second compound consists of prussiate of potash, tallow, resin, sal-ammoniac and bone dust. The third is composed of rain-water, saltpeter, alum. sulphate of iron, oxalic acid, and prussiate of potash.

Claim.—1. The working of steel and similar substances, more readily and with better results, by the assistance of the above first-described compound, applied for the purpose substantially as described.

2. The refinement of steel and similar substances, by the application of the second compound, in the manner and substantially as described.

3. The refinement and hardening of steel and similar substances, by the application of the third compound, in the manner, and for the purpose, and substantially as described.

4. The accurate attainment of the desired quality in many articles at once, by the use of the receptacle and instruments above described, in the manner and substantially as set forth.

84,481.—JULIUS EDMUND DOTCH, M. D., Washington, D. C.—*Preserving Meat.*—December 1, 1868.

Claim.—The preserving of the body of animals, or parts thereof, by the use of aldehyde, in the gaseous or liquid state, or mixtures of aldehyde in glycerine and phospho-glyceric acid, or acetate of soda and glycerine, or simply phospho-glyceric acid.

84,482.—NICHOLAS DOWNES, Syracuse, N. Y.—*Filter and Cooler.*—December 1, 1868.—The ice-chamber is surrounded by the filtered water, and the unfiltered water passes from an upper tank, through a pipe, to the bottom of the case, and upward through a filtering medium.

Claim.—As an improved article of manufacture, the combined water cooler and filter, consisting of the ice chamber B, with the rack G and separate cover e, the perforated chamber D, connected with the chamber B by pipe C, and having an outlet, h, and the casing A, having covers f f and cock H, when said parts are all constructed and arranged to operate as herein shown and described.

84,483.—JOHN EARNSHAW, East Greenwich, R. I.—*Machine for Finishing Cloth.*—December 1, 1868.—Consists in a means for automatically raising or turning the nap of fabrics, so as to form varied designs of raised figures upon their surface, and also in coloring, fitting, and napping or shearing the said portions.

Claim.—1. An endless flexible stencil belt, in combination with a nap-raising device, substantially as and for the purpose set forth.

2. A nap-raising device, convex supporting bed, and continuous stencil plate substantially as described, arranged for conjoint operation, as and for the purpose set forth.

3. The combination of a heated work-supporting surface, a stencil plate, and a nap-raising mechanism, substantially as and for the purpose set forth.

4. The combination of a supporting bed, a stencil plate, and a shearing device, substantially as herein described.

5. Devices, substantially as described, for applying moisture, in combination with a continuous stencil plate, arranged and operating substantially as set forth.

6. Devices for applying coloring matter to the cloth, in combination with mechanism for working

and teasing the same, substantially as herein set forth.

7. The devices for applying the coloring matter, combined with the device for steaming or moistening the same, as herein set forth.

8. The combination of the supporting bed, stencil plate, and nap-raising device, with the shearing device, as herein described.

9. The adjustable tension rollers, in combination with the stencil belt and the supporting bed, substantially as described.

84,484.—MONROE B. FOOTE, Northampton, assignor to himself, WILLIAM M. GAYLORD, and E. N. FOOTE, New England Village, Mass.—*Door Lock.*—December 1, 1868.—A cylindrical case contains a slotted bolt, having a rib and a triangular-shaped stop, against which latter a spring catch bears from the rear, and pivoted to the stop is a lever for depressing the catch.

Claim.—The combination and arrangement of the lever l with the cam and stop f, the spring catch k, and with the slotted bolt and its case, substantially as described.

84,485.—GEORGE A. FREAR, Chicago, Ill., as signor to CHARLES HOLLAND, same place.—*Brick and Concrete Press.*—December 1, 1868.—An arrangement of devices for exerting a strong pressure upon clay or concrete in forming bricks. The separate devices are disclaimed.

Claim.—The combination and arrangement of the knee-jointed levers e e, plunger d, cam g, the segments and ratchets f e and w x, the bed piece i, and partitions k k of the mold box, all constructed as described, and to operate substantially in the manner and for the purpose set forth.

84,486.—LEVI K. FULLER and HENRY K. WHITE, Brattleborough, Vt., assignors to J. ESTEY & Co., same place.—*Reed Musical Instrument.*—December 1, 1868.—The back valve is hinged along the lower edge of one side of the base of the chamber, by which means a quicker sound is produced. The front valve is connected with the back valve operative lever by means of a strip of cloth.

Claim.—1. The improved arrangement of the valve hinge, viz. along the side of the valve, instead of at one end of it, as heretofore practiced.

2. The combination of the strip of leather L, with the front valve C, its spring C', the back valve G, and its lever D.

84,487.—LEWIS GRANGER, Memphis, Mich.—*Wash Boiler.*—December 1, 1868.—Slides provided with vertical ribs are fitted in the ends of a boiler, and in the bottom of the boiler is a slotted grate, which supports the clothes. The boiling water passes up through the spaces between the ribs and upon and through the clothes.

Claim.—1. The slides C, provided with ribs D, or their equivalents, when constructed and operating substantially as and for the purposes herein set forth.

2. The combination of the slides C, slotted grate F, and hooks I, in connection with any suitable boiler, and the flanged projection H, in connection with any suitable cover, when arranged and operating substantially as and for the purposes herein described.

84,488.—THOMAS M. HART, New Bedford, Mass.—*Wooden Washer for Carriages.*—December 1, 1868.

Claim.—A wooden washer, made of two or more thicknesses of board fastened together by glue or any adhesive compound, in such manner that the grain of one shall cross the grain of the other, to prevent splitting, as herein specified.

84,489.—GEORGE HAWKHURST, Somersville, Cal.—*Mode of Preventing Corrosion of Boiler Tubes in Sea-going Vessels.*—December 1, 1868.—A solution of lime in water.

Claim.—A protection from corrosion, for the boilers of steamers using surface condensers, consisting of the solution herein described, and used substantially as set forth.

84,490.—JOHN HIRST, Jamaica, N. Y. assignor to himself and HENRY A. DIRKES, New York City.—*Car Brake*.—December 1, 1868; antedated November 13, 1868.—A vertically adjustable block is suspended from an oscillating horizontal shaft, so as to be forced down upon the rails. Brake shoes are also arranged on both sides of the wheel, so as to be drawn simultaneously toward the axis of the wheel.

Claim.—1. The rail brake shoe H, attached by the connecting bar *e* to the crank *d* of the weighted shaft D, hung in spring bearings *a*, said shoe being supported in a horizontal position, by means of the cords *f*, all constructed, arranged, and operating as described, for the purpose specified.

2. The combination of the brakes G G, heads F F', crank shaft D, weight I, cords or chains *b c*, rail brake shoe H, connecting bar *e*, and supporting cords or chains *f*, all constructed and arranged to operate as herein described, for the purpose specified.

84,491.—L. H. HUBBARD, Canton, Ohio.—*Washing Machine*.—December 1, 1868.—For raising the frame of the rollers and rubber, together with the rollers and rubbers themselves, in the wash-box, so as to maintain the same in proper position with respect to the suds in the wash-box.

Claim.—The peculiar arrangement and combination of the sliding boxes I I, with ratchet dials *k k* secured thereto, the lifting levers J J, with spring pawls *j j* and geared heads *g g* thereon, and the frame standards H H, with cog pins *q q*, the several parts being constructed, arranged and operating substantially in the manner and for the purpose herein specified.

84,492.—JOHN INGRAHAM, New York, N. Y., assignor to himself and CHARLES E. L. HOLMES, same place, assignors to CHARLES E. L. HOLMES.—*Clasp for Hoop Skirts*.—December 1, 1868.—The clasp is cut out of a compound sheet of metal formed of alternate layers of tin and zinc.

Claim.—A clasp for skeleton skirts, cut out of a compound sheet of metal, formed of zinc and tin, in the manner described.

84,493.—WILLIAM F. JENKINS, Indianapolis, Ind., assignor to himself and JAMES M. MYERS.—*Wash Boiler*.—December 1, 1868.—An adjustable interior bottom for wash boilers, consisting of four pieces held together by rivets in one part which slip in adjusting slots in a corresponding part.

Claim.—The rivets *a', b', c', d', f', g',* and *h'*, and the adjusting slots *a, b, c, d, e, f,* and *h*, when constructed and used in the manner and for the purpose substantially as set forth.

84,494.—EDWARD KAYLOR, Perrysville, Pa.—*Machine for Making Nuts*.—December 1, 1868.

Claim.—In a machine for making nuts from hot bars of iron, a die box, either solid or made in separate pieces, with apertures and grooves for the admission and flow of water along the inner or working face of the die box, or of the separate dies of which it may be composed, substantially as hereinbefore set forth.

84,495.—ROBERT C. KELLY, West Meriden, Conn.—*Coat Support*.—December 1, 1868.—Two arms of wire bent to a proper shape are connected together at their inner ends by a slotted support, into which they are slipped.

Claim.—The within described coat supporter, as a new article of manufacture, consisting of the arms A and B, and the slotted connection C.

84,496.—JOHN KENNEDY, Chicago, Ill.—*Hoisting Machine*.—December 1, 1868.—A two-part spring band passes over a wheel on the main drum, and is operated by a rack lever, which is held in place when the band is braking the wheel, by a weighted pawl, the said lever being operated by ropes or cords passing over pulleys pivoted to a cross-tree.

Claim.—The combination of the weighted pawl P, cross tree B, pulleys D, rack lever N, weighted rope W, ropes *b Z*, friction wheel E, and band H J, the whole being arranged as and for the purpose set forth.

84,497.—GUIDO KUSTEL, San Francisco, Cal.—*Mode of Working Gold and Silver Ores*.—December 1868.—The ore is charged in a wooden box having a false bottom provided with a cork. After the ore has been charged, hot water, containing sulphuric acid, is conveyed into the box; the cork is then opened and sufficient water is admitted to keep the ore covered by it.

Claim.—The ingredients or agents above enumerated, added to the ores in the manner and in about the proportions herein specified, for the purpose set forth.

84,498.—J. R. LITTLE, West Roxbury, Mass.—*Stay for Shirt Bosom*.—December 1, 1868.—The hook is formed with an oblong eye having an opening between the extremity and one end of the eye piece, so as to admit of its ready attachment to a shirt bosom.

Claim.—1. The new article of manufacture, or shirt bosom stay, as composed of the button-holed strap A and the hook or attachment C, as specified, the whole being substantially as and for the purpose set forth.

2. The double hook attachment C, made as and for the purpose above explained.

84,499.—CALVIN LOBDELL, Fort Hill, Ill.—*Cultivator and Seeder*.—December 1, 1868.—An adjustable leveler is arranged to run between the shovels of an adjustable cultivator, so as to smooth the surface of the soil, and gauge the depths of the shovels in the ground.

Claim.—1. The leveler K K L, arranged to operate substantially as and for the purpose herein specified.

2. The combination of the leveler K K L, arms I, wings B, rods M G, and curved plate R, the whole being constructed and arranged substantially as and for the purpose set forth.

84,500.—JOHN MALEY, Middletown, Ohio, assignor to himself and MARTIN DOWD, same place.—*Machine for Crozing Barrels*.—December 1, 1868.—The front of the machine is curved to fit the inner surface of the barrel at its chine, so that the latter will come in contact with a feed and guide roll, and a planing tool.

Claim.—The curved frame A B D, and vertical guide rolls *o l*, in combination with the feed rolls *i j*, and tools *e f g*, for planing, crozing, and chamfering barrels, arranged and operating conjointly by means of the system of gearing, substantially as and for the purpose described.

84,501.—GEORGE HUMPHRYS MATHEWS, New York, N. Y.—*Envelope*.—December 1, 1868; antedated November 16, 1868.—Melted sealing wax is placed over the mark, and the flap of the envelope is pressed down, a portion of the wax filling up the opening in the flap, upon which a seal or stamp is then pressed.

Claim.—An envelope or wrapper having one or more openings cut in the flap, and having marks on that portion of the body of the envelope beneath the flap, substantially as and for the purpose set forth.

84,502.—HENRY MCGANN, Cleveland, Ohio.—*Float for Boilers*.—December 1, 1868.—A globular frame is placed on the inside of the shell of the float, so as to prevent the latter from collapsing from the pressure of the steam.

Claim.—The globular frame C, in combination with the shell A, substantially as herein specified.

84,503.—JASPER P. MOORE, Boston, Mass., assignor to ANDREW B. ULINE, and said ULINE assignor to himself and GARDENIR G. KIDDER.—*Seal Bolt for Railway Cars*.—December 1, 1868.—The bolt is made with a slotted shank, and at its end is pivoted a pointed tongue, which closes within the shank. After insertion in the staple, the tongue is turned out and has a leaden seal inserted in a hole in the same.

Claim.—1. The combination of a bolt, and a tongue pivoted to such bolt, the same having one or more holes to receive a seal for the purpose of holding the tongue at any angle with the bolt.

2. The combination and arrangement of the shouldered head with the bolt and tongue pivoted to-

gether, and having one or more holes, as described, to receive a seal for the purpose as set forth.

84,504.—JOHN OBREITER, Lancaster, Pa., assignor to himself and ANDREW LEIBLY, same place.—*Sash-holder*.—December 1, 1868.—Within a slotted bearing plate, of peculiar form, is pivoted a drop latch, which serves as a sash supporter and lock.

Claim.—The construction and arrangement of the sash-holder plate A , with its open slot b , and curved bearings c , in combination with the drop latch B , bifid head e , fulcrum arms d , and side lever f , substantially in the manner and for the purpose specified.

84,505.—LEVERETT H. OLSTED, Brooklyn, N. Y.—*Paper File*.—December 1, 1868.—Two clamps, made of wire, are attached to a plate and are actuated by springs to hold the papers in place.

Claim.—The combination of plate A with the clamps B , which said clamps are actuated by means of springs, substantially as shown and described, and for the purpose set forth.

84,506.—WILLIAM H. PALMER, Jr., Middletown, Conn.—*Cord-covering Machine*.—December 1, 1868.—Designed more especially for the manufacture of picture cord, or ornamental cord, in which the strands are wound or served with silk or worsted, to impart an ornamental finish.

Claim.—1. The within-described arrangement of the belts M and N , so as to turn the several bobbins G^4 and H^4 , or their equivalents, by pulleys carried on the shaft B , from pulleys mounted concentrically within the mechanism, substantially as and for the purpose herein set forth.

2. The covering bobbins H^4 , mounted on horizontal axes, the revolving ears H^3 , or their equivalents, and the open-based eyes D^2 , carried on the frame D , all combined and arranged substantially as and for the purposes herein specified.

3. The bevel gears B^1 C^1 D^1 , the revolving frame D , and guides D^2 , the twisting spindles G , and covering devices H^4 , in combination with the concentric shaft B , revolving in the direction opposite to the revolutions of the frame D , and arranged to impart opposite motions to the twisting and covering mechanism, all substantially as and for the purposes herein set forth.

84,507.—L. F. PARKER, Davenport, Iowa.—*Harvester*.—December 1, 1868.—By means of cords secured to opposite sides of the main frame, and attached to a windlass near the operator, the machine can be more readily turned, the pole being so attached as to have a lateral movement. The pole is allowed to slide vertically within a yoke, so as to admit of adjustment of the sickle to cut higher or lower. The rake is mounted in rear of the sickle in a frame composed of two endless chains. A grain-receiving reel projects from the right hand corner of the machine.

Claim.—1. The pole C , pivoted at the rear end of the main frame, and having its front end arranged to move laterally in a guide bar, D , located in front of the wheels, in combination with the cords n o , pulley s , and windlass n , substantially as described.

2. The yoke J , attached to the main frame A , and having the pole C , provided with the sliding bolt f , working therein, and operated by the cord p , arranged substantially as set forth.

3. The rake R , carried by the chains K , and having the arm w working in the groove x , and against the guides k and l , when said parts are arranged as shown and described.

4. The combination of the grain-receiving reel I , the rock shaft b' , with its arm b'' , to be operated by the rake R and the locking bar a'' , all constructed and arranged to operate as herein described.

5. So arranging the rake R as to impart to it a lateral movement from the sickle as it passes from the upper side of the platform, and a return movement toward the sickle as it rises to the top of the platform, substantially as described.

84,508.—JAMES PICKERING, New Hope, Pa.—*Bench Vise*.—December 1, 1868.—The upper one of two inclined planes or slides is attached to the

movable jaw of the vise, and passes through the fixed jaw, and also through a connecting bar or slide, to which the lower inclined plane is attached, so as to maintain the parallelism of the jaws.

Claim.—The two inclined planes or slides, when combined and arranged in the manner and for the purpose substantially as herein described and set forth.

84,509.—OWEN REDMOND, Rochester, N. Y.—*Machine for Rounding Barrel Heads*.—December 1, 1868; antedated November 19, 1868.—An arrangement of mechanism for retaining the wood to be cut against the saw until the wood has performed more than a complete revolution, and afterwards withdrawing it from the saw, so that the parts will be in proper position for the adjustment of a new head.

Claim.—The combination of the loop or staple c^3 and lever c^4 with the spring latch F , when arranged and operating substantially as described, for the purpose of causing more than a complete revolution of the clamps c c^1 to be made during the time that each barrel head is being sawed.

84,510.—E. J. RIKER, Lewiston, Me.—*Grappling Hook*.—December 1, 1868.—A holding rod passes loosely through a cross bar and has pivoted at its lower end two cross arms, which are also pivoted to curved or hooked arms, so that as the latter grasp an article, the rod and cross arms form a toggle and at once securely hold the article.

Claim.—The grappling hook, as described, combining the rod c , cross bar a , arms h h , hooked arms f f , all arranged to operate as described.

84,511.—ISAAC N. ROSS, Worcester, Mass.—*Heating Stove*.—December 1, 1868.—To the lower end of the magazine is affixed a hollow annulus, perforated on its under side, and concentrically with the same is another annulus attached to the top of the fire-pot, and provided with an air induction pipe, and a series of holes to discharge air into a concentric annular chamber, on the inner side of which is a ring of foraminous fire-brick.

Claim.—1. In a stove, in which the magazine is arranged with relation to the fire-pot, and combined with an annulus surrounding its lower end, and one or more air-supply pipes, leading from the top of the stove as described, the formation of the air-discharge apertures or perforations in the bottom, in contradistinction to the sides, of said annulus, substantially in the manner and for the purposes shown and set forth.

2. The combination and arrangement of the auxiliary annulus N , and its air-supply pipe, and discharge holes, with the fire-pot, the magazine, and the annulus L , and its air-supply pipe and discharge holes, the whole being in the case as specified.

3. The combination of the inner annular air-chamber P , and its foraminous fire-proof side, R , with the fire-pot and the hollow annulus L applied thereto, as and for the purpose specified.

84,512.—O. E. SEYMOUR, Madison, Ind.—*Farm Gate*.—December 1, 1868; antedated September 18, 1868.—A series of levers is so arranged, in connection with a bell crank, that the gate may be opened by sliding it at right angles with the road-way, by a person on horseback or in a vehicle.

Claim.—The above described combination, consisting of the hand levers G G' , rods s s' , bars a and e , and lever b , used in connection with the triangular bell crank F , or its equivalent, substantially in the manner and for the purposes as set forth.

84,513.—BENJAMIN N. SHELLEY, Newark, N. J.—*Fastening for Whip Sockets*.—December 1, 1868.—The ring of the socket is provided with a hook which fits against the outer surface of the end of the dasher frame, and is secured to the same by means of screws.

Claim.—A whip socket, having connected with it a fastening consisting of the hook a and the screw d , constructed and operating substantially as and for the purpose specified.

84,514.—A. R. SILVER, Salem, Ohio, assignor to himself and JOHN DEMING, same place.—*Saw*

Gummer.—December 1, 1868.—Upon one end of a sliding bar is formed a die-holding head, having a tapering socket adapted to receive and retain firmly in place a tapering die for gumming saws.

Claim.—The saw-gummer bar B, herein described, constructed with the head D, in which is a die socket *e*.

84,515.—T. S. SMITH, Charlestown, assignor to ALFRED B. ELY, Newton, Mass.—*Let-off Mechanism for Looms.*—December 1, 1868.—Upon the crank shaft is a projecting lug or finger having a set screw to adjust its position on the shaft circumferentially, and also having an adjustable plate with a set screw to regulate the length of its stroke. The lug or finger, as the shaft revolves, is made to actuate two lever arms that raise the brake from the wheel so as to allow the requisite delivery of yarn from the yarn beam.

Claim.—1. The combination of the brake or pawl J with the shaft and finger H, when the parts are constructed and arranged to operate together, substantially as described.

2. The adjustable lug or finger H *h* when arranged and operating in connection with the brake or pawl J, as a positive let-off to the yarn, substantially in the manner described.

3. The whip roll D, supported by sliding arms *d*, in combination with the spring *e* and adjustable collar *b*, constructed and arranged substantially as and for the purposes described.

4. The whip roll, supported in spring bearings, in combination, and arranged and operating in connection, with the brake or pawl J, so as to relieve the same, and let off the yarn by means of the tension thereof, substantially as described.

5. The whip roll supported in spring bearings, in combination or connection with the shaft and finger H, when the latter are arranged to operate with the pawl or brake J, substantially as described.

84,516.—MICHAEL C. TAYLOR, Grass Valley, Cal.—*Pump-valve Chamber.*—December 1, 1868.—The valve chamber is divided by a diaphragm at its center, on each side of which is a valve, operated by levers on the outside of the pump, so that in case of accident either valve can be closed to cut off the water from that direction, and force it through the other valves.

Claim.—1. The diaphragm B, in a valve chamber, and the valves C C', operated by the levers D D', substantially as and for the purposes described.

2. A double valve chamber, having one ingress and egress pipe, constructed substantially as and for the purposes herein described.

84,517.—SILAS B. TERRY, Waterbury, Conn.—*Clock.*—December 1, 1868.—The pallets of a combined recoil and dead beat anchor escapement are so constructed that one is turned outward and the other inward, so as to allow the motive power of the wheel to aid the weight of the pendulum to overcome its momentum.

Claim.—The anchor escapement, constructed as described, with one pallet D, having a flange *d*, and the other pallet E bent out, whereby one pallet is made dead beat and the other recoil, for the purpose of equalizing the vibrations of larger or smaller pendulums, produced by unequal motive power, as herein shown and described.

84,518.—P. J. TORNEY, Washington, D. C.—*Machine for Sawing Marble.*—December 1, 1868.—The saw frame is suspended upon endless chains, so as to prevent it from jumping when moving back. The saw is fed gradually downward by means of a shaft provided with a cog wheel, and a movable arm provided with a pivoted pawl.

Claim.—1. The shafts *a a*, with cog wheels B B and pulleys *b b*, in combination with the endless chains D D and pulleys *d d*, all constructed and arranged substantially as herein set forth.

2. The arrangement of the shaft I with pulleys J and L L, and pinion H, operating in combination with the pinion G and screw threads on the shaft C to raise or lower the saw frame, substantially as herein set forth.

3. The combination of the shaft I, cog wheel M,

and arm N, the latter provided with a dog or pawl, O, and connected in a suitable manner with an engine for the purpose of feeding the saw while the machine is in operation, substantially as herein set forth.

84,519.—EDWARD P. UNDERHILL, New York, N. Y.—*Device for Attaching Vines to Trellises.*—December 1, 1868.—The device is formed with a base piece provided with two arms or hooks, by which the vine may be readily attached to a wire.

Claim.—The vine lock herein described, as a new article of manufacture, the same being adapted to be applied upon the vine and the trellis wire, and to be secured by a simple movement thereon, substantially in the manner and for the purposes herein set forth.

84,520.—CHARLES H. WATERS, Groton, Mass.—*Machine for Painting Wire Cloth.*—December 1, 1868.—The wire cloth is passed through a trough containing paint, between pressure rollers, and under a rotating brush.

Claim.—1. The combined arrangement of wire cloth and mechanism, herein described, for painting wire cloth, consisting of a trough of paint in which the wire cloth is immersed, and adjustable pressure rollers, between which it is passed, and a mechanism, by which the cloth, after being painted, is drawn from the adjustable pressure rollers, substantially in the manner and for the purpose specified.

2. In connection with the combined arrangement of wire cloth and mechanism just described, the employment of a drying room, in which the cloth is suspended vertically while being dried, substantially as herein specified.

3. In combination with the adjustable rollers, which determine the quantity of paint applied to the wire cloth, the employment of a brush, by which the meshes are cleared, substantially as described.

84,521.—CHARLES H. WATERS, Groton, Mass.—*Machine for Printing Figures on Wire Cloth.*—December 1, 1868.

Claim.—The combined arrangement of wire cloth and mechanism, herein described, for printing figures upon wire cloth, consisting of a roller having the figures to be painted engraved thereon, and a pressure roll, between which rollers the wire cloth is passed, a trough of paint, and the rolls by which the paint is applied to the engraved roll, and the mechanism by which the cloth is drawn away from said rollers after the figures are painted thereon, substantially as herein described and set forth.

84,522.—C. JOSEPH WIRTH, Dansville, N. Y.—*Slate Frame.*—December 1, 1868; antedated November 25, 1868.—A rectangular box is attached to the edge of the slate frame, for the purpose of holding pencils, pens, rulers, &c.

Claim.—An attachment for school slate frames, consisting of a narrow oblong metallic box, C, the top of which, D, is hinged to the lower section, forming a cover therefor, said box being provided with narrow flanges for attaching the same to the outer edge of the slate frame, for the purposes set forth.

84,523.—FREDERICK A. WOOD, Jersey City, N. J.—*Bit Brace.*—December 1, 1868; antedated November 19, 1868.—The thimble-shaped clamp is provided with a spiral slot, and connected with a ring outside by means of a pin or screw made fast to the inside of the outer ring.

Claim.—The thimble-shaped ring or clamp D, when provided with the spiral slot C and the longitudinal slot E, in combination with the ring H, for giving to it a longitudinal motion, when constructed and arranged substantially as and for the purpose set forth.

84,524.—JOHN K. WOOD, Alleghany City, and DAVID H. SPEER, Pittsburg, Pa.—*Churn.*—December 1, 1868.—To the upper portion of the hollow helical dasher is affixed a pipe, which projects through the lid, and at the lower end is an enlarged outlet, by which atmospheric air is forced into the cream.

Claim.—The vertical shaft C, with its operative mechanisms B, B¹, and B², and hollow helical dasher

C¹, of the form described, with its inlet pipe C² and outlet C³, in combination with the frame D, when connected to the lid A¹, as described, when constructed, combined, arranged, and operating substantially as herein described and for the purpose set forth.

84,525.—ONOFRIO ABBRUZZO, New York, N. Y.—*Ordnance and other Fire-arms.*—December 1, 1868; antedated November 20, 1868.—The explosive force of the charge is caused to act upon a piston sliding upon the barrel, and connected with and imparting its motion to a device moving within the barrel, and serving, in connection with the gas that acts directly upon the main portion of the base, to project the ball with increased power.

Claim.—1. The provision, in a fire-arm, of a piston, C, confined within a gun, which shall afford increased surface for the expanding gases to act upon, and which shall impel the projectile when the discharge takes place, substantially as described.

2. The combination of the connected piston C and tube C' with the slit barrel A', substantially as and for the purpose set forth.

3. The apertures a a', in combination with the piston C and a projectile, F, constructed and operating in the manner and for the purpose explained.

4. The springs D, in combination with the piston C, substantially as and for the purpose explained.

84,526.—JAMES M. ACKERSON, La Fayette, N. J.—*Sled Brake.*—December 1, 1868.—A lever dog is pivoted to the sled and operated through a connecting rod by a lever attached to the tongue.

Claim.—The combination of the lever dog A, connecting rod D, and operating lever E, said parts being constructed, arranged, and operating substantially as herein shown and described, and for the purpose set forth.

84,527.—ALBERT B. BEAN, New Haven, Conn., assignor to himself and J. H. BOOTH, same place.—*Reversible Ratchet Feed.*—December 1, 1868.—A cam bears upon the head of the double pawl so that as the lever is turned in one direction, one end of the pawl will operate upon the ratchet, and, upon reversing the lever, the pawl will be reversed.

Claim.—The double-ended pawl, constructed with the head F, in combination with the lever G, having the cam H arranged therein, so as to operate to reverse the action of the pawl, substantially in the manner herein set forth.

84,528.—RICHARD BEAUMONT and WILLIAM CLARKE, JR., Albany, N. Y.—*Apparatus for Grooming Horses, &c.*—December 1, 1868.—A handled gas burner is connected by a flexible tube to a gas pipe, and is provided with a perforated cross-head pipe, and also with a comb, between which and the cross head is a space for the passage of a current of cool air.

Claim.—In combination with a handled-encased conduct pipe, A, the cross-head pipe F, perforated with the escape holes a a, placed as described, and combined with the comb G, in such a manner as to leave the air space c between the said cross head F and the comb G, and all constructed and arranged in the manner specified, for the purposes set forth.

84,529.—BYRON BOARDMAN, Norwich, Conn.—*Handle for Files.*—December 1, 1868.—A metallic socket or ferrule projects from the end of the handle, into which socket a "plug" of wood is inserted, for securing the shank of the instrument.

Claim.—The cylindrical ferrule B, handle A, and plug C, when each part is constructed and arranged, with relation to the others, to operate in the manner and for the purpose substantially as described.

84,530.—JAMES BOYD, Mamaroneck, N. Y., assignor to himself and N. C. GARRETSON, New York City.—*Window-blind Slat Holder.*—December 1, 1868.—A crank arbor is connected with the slatrod, and provided with a lever pressed against the edge of a notched or corrugated plate, so that both the arbor and slats will be locked in the desired position.

Claim.—The slat-fastening device, consisting of

the sliding-crank arbor G, held in the ears E and F, and combined with the lever H, spring I, and notched ridge e, all made and operating substantially as herein shown and described.

84,531.—FREDERICK BREMERMAN, Indianapolis, Ind.—*Coupling for the Hounds and Poles of Wagons.*—December 1, 1868.—The segment-shaped piece supports the weight of the hounds and tongue, which latter is received by a hinged bed or chamber, for the purpose of relieving the animal's neck of the weight.

Claim.—The device composed of the segment E, bed or chamber F, with flanges H, when constructed and arranged substantially in the manner and for the purposes set forth.

84,532.—A. P. BRYSON, Prospect, Pa.—*Churn.*—December 1, 1868.—The dasher is concave on its under side. Its base is of polygonal form, and is provided with a series of oblique wings for imparting a rotary, reciprocating motion to the dasher.

Claim.—The combination and arrangement of the oblique wings a a, and concave, perforated revolving dasher, A, substantially as and for the purpose herein specified.

84,533.—ISAAC CAREY, Warwick, N. Y.—*Water Meter.*—December 1, 1868.—A tilting measure is so arranged in connection with valves and a water supply and discharge tubes, as to be operated by the gravity of the water as the latter passes through it.

Claim.—1. The tilting box B, divided into two compartments, D D', with the boxes F F', fitted within said compartments, and provided with valves G G, the boxes F F' communicating with the tube C by the pipes d d', in connection with the tilting bars or valves I I', arranged in relation with the discharge pipes c c', to operate in the manner substantially as and for the purpose set forth.

2. The mercury tubes J J', applied to the tilting bars or valves I I', substantially as and for the purpose specified.

84,534.—ALANSON CAREY, New York, N. Y.—*Furnace for Desulphurizing Steel and other Wire.*—December 1, 1868.—The desulphurizing chamber is placed directly above the combustion chamber, and the two communicate by means of valves. The door to the oven is raised and lowered by chains, so that when partially raised it may be turned back to a horizontal position.

Claim.—1. A furnace for desulphurizing wire or other articles or substances, constructed with valve openings between the combustion and desulphurizing chambers, whereby the heat of the fuel has direct access to the wire or article to be desulphurized, substantially as described.

2. The chambers A and B, with valve openings between them, substantially as described.

3. The door H, when the same is hung and operated substantially as described.

84,535.—O. CASE and D. B. EVANS, Columbus, Ohio.—*Street Lamp.*—December 1, 1868.—Designed for burning benzine. A reservoir is arranged in the frame of the lamp and surrounded by a perforated casing, into which cold air is introduced by suitably arranged pipes.

Claim.—1. The arrangement of the reservoir B and perforated shield B, in the frame of the lamp, substantially as and for the purpose described.

2. The combination, with the reservoir B, arranged within an air chamber, of the pipes F, communicating with the exterior of the lamp, substantially as and for the purpose described.

84,536.—JOHN Q. CROSBY, Northborough, Mass.—*Lifting Jack.*—December 1, 1868.—The lever is provided with rollers forming a movable fulcrum, so as to maintain the slide or lifting bar in a vertical position.

Claim.—The rollers G, in combination with the lever F, substantially as described for the purpose specified.

84,537.—STEPHEN CULVER, Newark, N. J.—*Base-burning Stove.*—December 1, 1868.—A current

of air is supplied to the lower end of the magazine for the purpose of cooling the same, and also to more perfectly consume the fuel.

Claim.—1. The air chamber *f*, in shape of a frustum of a cone, surrounding the magazine, and provided with air inlet passages from the base of the stove, and a narrow throat between its lower end and the mouth of the magazine, substantially as and for the purposes set forth.

2. Operating the cover of the hopper, through which the magazine is supplied, by means of the concealed hinge, herein described, constructed and arranged substantially as specified.

3. Communicating to the fire grate both a rotary and horizontal movement, by means of the divided axle, herein described, constructed and operated as specified.

84,538.—HENRY THOMAS DAVIS, New Cross, Great Britain.—*Damping Trough.*—December 1, 1868.—Consists of a trough or receptacle to hold a damping brush, combined with an atmospheric reservoir.

Claim.—An apparatus for supporting and moistening the damper or brush of a letter-copying press, when constructed and arranged substantially as herein set forth.

84,539.—J. G. DREHER, M. D., Pine Grove, Pa.—*Cheese Cutter.*—December 1, 1868.—The cheese rests upon rollers so that it may be easily turned, and is cut by a hinged knife passing through a radial slot in the table.

Claim.—1. A cheese-cutting apparatus, consisting of a circular or other formed table, *A*, provided with the slots and rollers and a knife *H*, substantially as and for the purpose described.

2. The combination with the table of the pins *D* or *O*, guides *P*, and vibrating hand pawl *E*, all substantially as and for the purpose described.

3. The arrangement, with the knife, pivoted on the stud *K*, of the guide *M*, substantially as and for the purpose described.

4. The combination, with the table *A* and the knife, of the stop *N*, when all arranged substantially as and for the purpose specified.

84,540.—ROLAND S. FRAME, Washington, Ohio.—*Horse Hay Fork.*—December 1, 1868.—The lifting blades are connected to a rod which is pivoted at its upper end to a cross lever attached to a tripping lever.

Claim.—The levers *E D*, in combination with the plates *A* and connecting rod *B*, arranged and operating as described, for the purpose specified.

84,541.—DANIEL FULLER and DELOSS SWAIN, Oakwood, Mich.—*Land Roller.*—December 1, 1868.—The central roller is journaled in the ends of two levers, and independently of the outer rollers, so as to be elevated when desirable, and allow the machine to be easily turned.

Claim.—The arrangement of the rollers *C E D*, lever *e*, arms *f* and *i*, levers *b b*, and brake *h*, in the manner set forth, and constructed and operating substantially as specified.

84,542.—FRANK H. FULLER and OREN S. SEVERANCE, South Boston, Mass.—*Lamp-wick Tube.*—December 1, 1868.—The wick tube is lined with isinglass, as being a non-conductor of heat, and is designed to prevent the generation of gas.

Claim.—The combination, with the lamp-wick tube, of isinglass lining, substantially as and for the purpose described.

84,543.—ROBERT GIDLY, Freedom Plains, N. Y.—*Rock-drilling Machine.*—December 1, 1868.—The frame is so constructed as to admit of adjustment to bring the drill into any desired position. The drill has a reciprocating and also an intermittent rotary motion.

Claim.—1. The frame *C D E F* of a rock-drilling machine, when such frame is made adjustable around the axis of the beam *C*, and around the pivot *g*, substantially as herein shown and described.

2. The legs *B*, pivoted by the pin *b* to the side of the frame *A*, the outer end of said pin having an

eye, *a*, in which the legs are adjusted vertically, as herein described, for the purpose specified.

3. The combination of the winged wheel *I* with the up-and-down as well as with the laterally-movable bar *M*, from which latter the pins *l* and *m* project, as set forth.

4. The up-and-down as well as the sideways-moving bar *M*, in combination with the lever *J*, spring *L*, rod *N*, rack *o*, and ratchet wheel *p*, all made and operating substantially as herein shown and described.

5. Imparting an intermittent, rotary motion to the drill shaft *N*, by means of the sliding pinion *p*, horizontal rack *o*, and vibrating bar *M*, arranged and operating as herein shown and described.

84,544.—J. A. GLENN, West Middlesex, Pa.—*Horse Hay Fork.*—December 1, 1868.—The elevating cutter is pivoted to two bars, one of which slides, so that by moving one of the bars the cutter will be in proper position for raising the hay.

Claim.—1. The arrangement of the elongated draught bar *A* and its hook *B*, bar *E* and hook *D*, with lever *G*, bar *F* and rope *H*, all constructed and operating as herein shown and described.

2. The arrangement of the lever *G*, rope *H*, handle *C*, pulley *d*, and slotted and curved bar *F*, all substantially as herein set forth.

84,545.—ALBERT W. HAM, Stockport, N. Y.—*Shifting Jack for Carriage Thills.*—December 1, 1868.—A projecting bar is attached to the axletree by clips, and is slotted to receive the jack, so that shafts or tongues of different widths may be readily fitted to the vehicle.

Claim.—The forwardly-projecting holders *D D'*, supporting the single-shank jacks *C C'*, as arranged with the separated clips *B B'*, as and for the purpose described.

84,546.—HUGH HANNA, Pittsburg, Pa.—*Threshing Machine.*—December 1, 1868.—The cylinder is so arranged as to be made reversible in position, to adapt it to threshing either grain or clover, timothy, &c. The concave is also made adjustable toward or from the cylinder, and the sections composing the concave are adapted for detachment, so that their number may be increased or diminished in order to admit of sections bearing projections suited for special kinds of work.

Claim.—1. A cylinder or threshing reel, *B*, having beaters *b b'* arranged transversely in pairs, and one beater of a pair to project beyond its partner, substantially as and for the purpose set forth.

2. The adjustable concave *C*, constructed of sections or bars *C'*, bent plates *N*, removable blocks *n*, projection *c*, plates *c'*, wires *c'*, rod *J*, and bolts *K K'*, combined and adapted to operate as and for the purpose set forth.

3. The retarding and separating roller *H h*, applied and operating substantially as described.

4. The combination of the cylinder *B*, the adjustable concave *C*, the retarding roller *H h*, and the feed roller *F f*, all arranged within the frame or casing *A*, as herein described and represented.

84,547.—C. HANSON, Owatonna, Me.—*Harrow.*—December 1, 1868.—The side beams are curved and connected together by cross bars and braces, in which are set teeth of peculiar form.

Claim.—An improved harrow frame, formed by the combination of the curved side bars *A*, brace straps *B*, cross bars *C*, teeth *E*, and brace straps *D*, with each other, substantially as herein shown and described and for the purpose set forth.

84,548.—CHARLES H. HOLDREDGE, Westerly, R. I.—*Box for Carriage Wheels.*—December 1, 1868.—The box is constructed with transverse notches or grooves near its outer end, to receive keys or wedges, so as to secure the box against longitudinal movement. On the inner flange is a series of wedge-shaped projections adapted to enter corresponding recesses in the end of the wooden hub, to prevent the latter from turning upon the box.

Claim.—1. The box *C*, of uniform exterior diameter, provided with the transverse notches or grooves *a*, and the radial wedge-shaped projections *G*, formed

upon the flange E, substantially as described, for the purpose specified.

2. The box C, secured within the hub A by means of the transverse notches *a* and keys *b*, and prevented from turning therein by means of the wedge-shaped projections G, fitting within recesses in the end of said hub, substantially as herein shown and described.

3. The combination of the box C, wedge-shaped projections G, and the transverse keys *b* with the hub A, substantially as described, for the purpose specified.

84,549.—OPIELIA C. HOTCHKISS, Cortlandville, N. Y.—*Ironing Table*.—December 1, 1868.—The bed of the table is formed of two tapering pieces joined together by dowels, so that one piece can readily be detached from the other, and from the frame.

Claim.—The combination of the beds *a* and B with the frame *c c'* and dowels *d d*, arranged and operating as and for the purposes specified.

84,550.—J. S. HOUGHTON, Philadelphia, Pa.—*Compound for Coating the Outside Walls of Buildings*.—December 1, 1868.—Composed of scarlet calcareous paint, brown calcareous paint, oxide of iron, mineral black, hydraulic lime, and water.

Claim.—The chemical compound, consisting of the above-mentioned ingredients, and variable proportions of the same ingredients, to be applied with a brush, for coating and coloring the exterior brick, stone, and mortar walls of buildings, substantially as above described.

84,551.—A. B. JOHNSON, Washington, Ind.—*Horse Rake*.—December 1, 1868.—Adjustable stirrups enable the frame to be adapted to wagon wheels of different sizes. A toothed wheel and a hooked pawl serve to turn the rake head over, in connection with a lever.

Claim.—1. Hanging the wheels B B to adjustable stirrups, *a a*, fastened on the middle of the side framing A, arranged as and for the purpose specified.

2. The combination of the toothed wheel *d*, the pawl *h*, and the lever *g*, arranged substantially as and for the purpose herein described.

3. The rod *h*, combined with the side *k* and the spring *m*, arranged and operating as and for the purpose set forth.

84,552.—A. C. KAISER, Vienna, Mo.—*Knife Cleaner*.—December 1, 1868.—The handles of the knives are secured to a reciprocating bed-plate, so as to throw the blades forward and backward, between a set of cushioned rollers coated with some scouring substance.

Claim.—1. The combination of the bed-plate B, its seats *b*, with cushioned rollers D, when arranged and operated substantially as described and set forth.

2. The bed plate B, in combination with the driving shaft C, resting in adjustable pillar blocks A¹, and connecting-rod attachments B² *b*¹ *b*², substantially as and for the purpose set forth.

84,553.—HENRY KIME, Marshalltown, Iowa.—*Calk Sharpener*.—December 1, 1868.—A nib plate is pivoted within the recess of one of the handles of the instrument, and so arranged in relation to the other handle that the heel of the latter will actuate the lever extension of the nib plate, so as to cut the calk with a tapering cut.

Claim.—An instrument for cutting off the points of horseshoe calks, constructed substantially as shown and described, consisting of the nib plate E, having the lever extension *d*, and point *f*, in combination with the recessed handle B, and operated upon by the lever D, substantially as set forth.

84,554.—MARTIN V. B. KNOWLES, Wakefield, R. I.—*Chalk-line Reel*.—December 1, 1868.—A spring is made to wind up the chalk line when the latter has been drawn out, and it is also made to pass through a chalk receptacle for the purpose of chalking it.

Claim.—1. The combination of the spring *a*, reel *x*, chalk line *z*, and chalk box D, through which the

line passes, substantially as and for the purpose set forth.

2. The hook, composed of the forked bar *f*, tongue *g*, and spring *v*, substantially as described, and for the purpose set forth.

84,555.—JOSEPH KOBERLE, St. Louis, Mo.—*Button*.—December 1, 1868.—Folding wings, operated by suitable mechanism within the head of the button or stud, are folded so that the button shaft will easily pass into the button hole or other slot, and then spread so as to prevent the return of the wings, or release of the button, except upon proper operation by the wearer.

Claim.—1. Unfolding and folding the wings G, by a thumb piece B or pressure slide *c*, from the outer button surface, substantially as set forth.

2. The lever C, operating in the lock slot *e* of the plate E by the tappet *e*², substantially as and for the purpose set forth.

3. The plate E, its tappet *e*², the plate *f*, its slots *f*¹, and shaft F, operating the teeth *f*² and wings G, substantially as set forth.

84,556.—THOMAS LANGSTON, Brooklyn, N. Y.—*Lantern*.—December 1, 1868.

Claim.—Fastening the upper and lower parts of a lantern together by means of clasps D D, pivoted to the flange *a* on the base, and working over said flange, and over the ring *d* on the upper part, said ring having the guards *c c* attached thereto, and setting inside the rim *b* on the flange *a*, substantially as herein set forth.

84,557.—ELIJAH LINDSLEY, Neenah, Wis.—*Threshing Machine*.—December 1, 1868.—The sieve is open at both ends, and is provided on the inside with a number of bent teeth. Under the sieve is an inclined board upon which the separated grain falls. A spout, to which a reciprocating motion is imparted, carries off the shuck, &c.

Claim.—1. The cylindrical sieve D, provided with bent teeth *i i* along its ribs, and resting on four rollers C C, which are placed one near each end of the two shafts B B, and one of said shafts being turned, imparts the necessary rotary motion to the sieve, substantially as herein set forth.

2. The arrangement of the frame A, sieve D, and inclined board J, as and for the purposes set forth.

3. The wind boards H H, arranged as described, between the fan and the sieve, for the purpose of regulating the draught to the latter, substantially as herein set forth.

4. The arrangement of the spout K, rod *f*, and wheel L, constructed and operating substantially as and for the purposes herein set forth.

84,558.—WILLIAM LINDON, New Haven, Conn.—*Watch Key*.—December 1, 1868.—A spring or plate is arranged outside of the key barrel so as to keep it closed when not in use.

Claim.—In combination with the key A, the plate B, pivoted to the key, and bent so as to cover the barrel, and arranged thereon so as to be turned to and from the barrel, as and for the purpose specified.

84,559.—ABRAHAM W. LOZIER, New York, N. Y.—*Horse Hay Fork*.—December 1, 1868.—To the main bar are secured two curved tines of different lengths, and a straight tine, which latter is retained in place while the fork is being elevated by a spring catch; and is also provided with slots and a plate, which act as a gauge to regulate the quantity of hay to be taken up, according to the power used.

Claim.—1. The combination and arrangement, with the bar A and rigid tine B, of the movable tine C and tripping lever E, the whole constructed and operating substantially as described, and for the purpose set forth.

2. The horizontal bar A, rigid tine B, movable tine C, and tripping lever E, in combination with the lever handle F, the whole constructed and operating substantially as described.

3. The combination of the bar A and tines B and C with the supplementary tine D, for holding the load of hay with greater security, substantially as described, and for the purpose specified.

4. So constructing the supplementary tine D that it may be used as a gauge for taking up the desired quantity of hay, substantially as described and specified.

5. The projecting pivot *f*, in combination with the tine C and bar A, substantially as described, and for the purpose set forth.

84,560.—ABRAHAM W. LOZIER, New York, N. Y.—*Hay Loader*.—December 1, 1868.—The crane is secured to an upright, and has attached to it a hinged arm, on the under side of which is secured a plate which turns on a pivot, and is held between two catches, by detaching one of which latter, the crane is allowed to swing around.

Claim.—1. The combination, with the upright standard A, of the arm B, connecting arm C, and the hook F, the whole constructed and operating substantially as described.

2. The combination, with the upright standard A and arm B, provided with the arm C, of the mechanism for holding the arm in place on and releasing it from the upright while loading and discharging the load, substantially as described and specified.

3. The combination, with the upright A, and the arms, constructed substantially as described, of the pin-lewis wheel, for elevating the load, substantially as described and specified.

84,561.—LOUIS F. LANNAY, Indianapolis, Ind., and WILLIAM F. PARKS, Baltimore, Md.—*Combined Bristle Washing and Combing Machine*.—December 1, 1868.—Relates to an improvement upon a machine patented to L. F. Lannay, May 19, 1868, and consists in combining therewith a combing apparatus, whereby the two operations of combing and washing may be accomplished at once.

Claim.—1. The combination, with the washing apparatus A C, of the combs E, substantially as and for the purpose described.

2. The combination of the same, when the combs are arranged to have the longitudinal and oscillatory movements, or either separately, substantially as and for the purpose described.

3. The combination, with the reciprocating frame A, of the pawl lever O, pawl N, wheel M, levers H G, and the combs, all substantially as and for the purpose described.

4. The combination, with the combs E, of the arms S, and springs R, substantially as and for the purpose described.

84,562.—WESLEY MALICK, Tidioute, Pa.—*Machine for Pointing Hooks, Staples, &c.*—December 1, 1868.—The rollers are provided respectively with a male and female die. The unfinished staples are placed in the hopper so that the bow end shall pass through the same first, when they are drawn between the rollers and finished.

Claim.—The frames M M and F, the sliding boxes L L, and the set screws N N, in combination with the wheels E and C, the rollers D¹ and D², the adjustable hopper A, and the male and female dies H and P, when the same are constructed and arranged as described, and in the aforesaid combination.

84,563.—GEORGE W. MARSH, Clinton, N. C.—*Plow*.—December 1, 1868.—The upper portion of the moldboard is dispensed with so as to admit of the application of a harrow attachment.

Claim.—The combination, with a plow A, of a harrow attachment, arranged and operating substantially as herein described and represented.

84,564.—LUCIENE G. MATTHEWS, New Albany, Ind.—*Book Binding*.—December 1, 1868.—To one side of the back is attached a paper tuck to receive blank paper or pages of a book.

Claim.—The combination of the book A with the cover B, when the same are connected together by one or more pockets and tucks, substantially as and for the purpose described.

84,565.—EDMOND P. MCCARTHY and JAMES JOHNSTON, San Francisco, Cal.—*Anchor*.—December 1, 1868.—Two sets of arms and flukes are arranged at right angles to each other, and in the center of one of the arms is formed a cam, operated

by the other arms, so that when the strain is applied to the cable, and one of the flukes enters the bottom, it causes the others to enter also.

Claim.—The arm G, having the cam I, in combination with the arm D, with its flukes J J, and the projections *c e*, or an equivalent device, operating the arm G by means of the cam, the whole constructed and arranged substantially as herein described.

84,566.—ISAAC M. MILBANK, Greenfield Hill, Conn.—*Breech-loading Fire-arm*.—December 1, 1868.—The object is to cock the hammer as a preliminary operation in opening the breech, and to effect the opening of the breech by a continuation of the motion that cocked the hammer. The trigger is locked so that the piece cannot be accidentally discharged, and the hammer is used as a means for locking the breech block in place.

Claim.—1. The lever *g*, actuating the firing pin as the breech is opened, in combination with the sliding hammer and bolt, substantially as and for the purposes set forth.

2. The movable block *m*, in combination with the hammer *h*, bolt *h'*, and spring *k*, as and for the purposes set forth.

3. The trigger lock, formed of the spring *t'*, swinging block *t*, and projection *u*, in combination with the trigger *d*, for the purposes and as set forth.

84,567.—JAMES MOODY, Harwich, Mass.—*Wagon Jack*.—December 1, 1868.

Claim.—The wagon-jack, constructed as described, of the base block *a*², parallel side bars *a*¹, provided with vertical slots, and carrying the notched block *b'*, the intermediate parallel bars B, slotted vertically, the interior parallel bars C, having the curved slots, the fixed pin E, sliding pin F, and lever D, all operating as described, whereby, as the bars B C and pin F are raised by the depression of the lever, the bars C are thrown rearward, locking the lever D in position, for the purpose specified.

84,568.—Q. R. MOOR, PETER MOOR, and E. L. PATRICK, Forest Hill, Ind.—*Corn Planter*.—December 1, 1868.—The parts are so arranged as that two rows of corn can be planted at the same time, and the machine is easily adjusted to suit any kind of ground or depth of plowing desired.

Claim.—1. The arrangement of the boxes E E, grain boxes F F, and the slides G G, all constructed as described, and operating substantially as and for the purposes set forth.

2. The wheels H H, constructed as described and held on the driving wheels B B by means of the slotted blocks I I, and provided with a series of rounded blocks, J J, on their inner sides, for the purpose of operating the slides G G, substantially as herein set forth.

3. The arrangement of the lever *n*, rods *m m*, and springs *l l*, for the purpose of throwing the slides G G in and out of gear, to be operated or not by the wheels H H, as may be desired, substantially as herein set forth.

84,569.—THOMAS J. MURPHY, Rochester, N. Y.—*Automatic Gate*.—December 1, 1868; antedated November 18, 1868.—The gates are opened and closed by the weight of a vehicle, the front wheels of which pass over levers operating to raise and lower slides on which the gates are hung.

Claim.—1. The swinging lever E, in combination with the slide D, elbow levers C, rod B, and lever A, substantially as and for the purpose described.

2. The swinging lever E, in combination with loops F H, elbow levers G I N, rods K M, and levers L O, substantially as and for the purpose described.

84,570.—DANIEL NEFF, Amsterdam, N. Y.—*Road Scraper*.—December 1, 1868.—The edge of the scraper is made to conform to the surface of the ground over which it is moving without regard to the position of the carriage or axle by which the scraper is drawn.

Claim.—The self-adjusting reach, having a swivelled metal bolt embedded horizontally therein, to be used as a connection for and in combination with a scraper, *d d d*, and carriage *a a a*, constructed

substantially the same as described in the foregoing specification.

84,571.—JAMES NEVISON, Morgan, Ohio.—*Corn Dropper*.—December 1, 1868.—The case is attached to a sack which is secured to the waist by the operator, and by pushing the slide a certain number of seeds will drop into the hand.

Claim.—The case A, slide C, springs G, as arranged in combination with the sack or bag I, as and for the purpose specified.

84,572.—SOLOMON OPPENHEIMER, Peru, Ind.—*Milk Pail*.—December 1, 1868; antedated November 30, 1868.—A valve on the lower part of the hopper is kept open by a lever operated by a rod as the latter rests on the ground. In case the pail is upset, the valve is automatically closed so that no milk can escape.

Claim.—1. The lever C, having movable swivel hinges, as shown at L, for the purpose specified.

2. The rod O, when constructed as shown, having shoulder *z* and cap *x*, for the purpose shown and explained.

3. A handle on the milk pail, for the rod to pass through, having a pipe connected with it, in a manner as shown.

4. The combination of all the above described parts, when constructed as shown, and used and applied on a milk pail.

84,573.—WILLIAM B. PARDEE, New Haven, Conn.—*Top Prop for Carriages*.—December 1, 1868.—A sleeve is placed over the bolt, and over this the brace, so as to bind the parts firmly together. The form of the head prevents the bolt from turning while the nut is being screwed down.

Claim.—1. A top-prop bolt, constructed with the T-shaped head D, so as to be secured upon the bow by the ends of the said T, substantially as set forth.

2. In a top-prop, in which a sleeve, E, is passed over the bolt, the nut F, arranged so as to secure the parts substantially in the manner and for the purpose specified.

84,574.—EDWARD PAYNE, London, England, assignor to himself, and EDWARD CHAPLIN, Montreal, Canada.—*Composition for Cattle Food*.—December 1, 1868.

Claim.—1. The improved composition for cattle food, by mixing refuse of grain, either before or after distillation, or other pulp, the residuum of analogous processes, with linseed meal, pease meal, bran, or other farinaceous and aromatic substances, substantially in the manner and proportions described.

2. The use of the refuse matter, when treated in the same manner, but without the addition of the other substances.

84,575.—S. G. PEABODY, Champaign, Ill.—*Cultivator*.—December 1, 1868.—To a swiveled shaft or arm, near one wheel, is attached a geared segment which meshes with a similar segment upon another swiveled shaft, so arranged that by moving the rear ends of the beam in either direction the direction of the wheels will be instantly changed.

Claim.—1. An arrangement of mechanism by means of which the direction of the wheels F may be changed by the lateral movement of the plow beams H, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the bushes or tubes C, swiveled shaft or axle E, gear wheels or segments of gear wheels J K, and swiveled shaft G, with each other, and with the wheel F, cross-bar B, and plow beams H, substantially as herein shown and described, and for the purpose set forth.

84,576.—GEORGE PHILLIPS, Cadet, Mo.—*Rock Drill*.—December 1, 1868.—The drill is actuated by a cylinder and piston in which steam or compressed air is employed, in combination with devices for controlling and regulating the operation of the drill.

Claim.—1. The slide bar H, with its diagonal slot *a*, and the lever V, with a slotted head, P, both constructed and operated substantially as shown and described, in combination with the stud *n*, for the

purpose of operating the valve of a drilling machine by the piston rod of the same, all as set forth.

2. The ratchet pinion O, in combination with the ratchet rod M, slide plate H, lever V, and piston rod F, of a drilling machine, all operating substantially as shown and described, to rotate the drill G of a drilling machine, in the manner set forth.

3. The projections *h* and *g*, of the plates I and N, substantially as shown and described, and for the purpose of forming guides for the guide rod L', all as set forth.

4. The plate I and uprights U U of a drilling machine, in combination with the cylinder A of the same, substantially as and for the purpose shown and described.

84,577.—JONATHAN PICKERING, Stockton-on-Tees, England.—*Apparatus for Raising Weights*.—December 1, 1868.—On one side of a chain pulley is fixed a crank pin or eccentric having a toothed wheel which revolves loosely upon the said crank pin, and is made to revolve with the chain pulley also. The toothed wheel is surrounded by two internal-toothed wheels of the size of the orbit of the former, and provided with one or more teeth different in number. One of the said orbit wheels is fixed to the framework and the other is loose upon the axle.

Claim.—1. An apparatus for raising weights and for other purposes, consisting of a frame, *h*, having mounted therein, on an axle or shaft, *i*, a chain pulley, *c*, provided with an eccentric or pin, *e*, having a planet wheel, *d*, thereon, gearing into and rotated by a stationary wheel, *f*, and also gearing into and turning a loose wheel, *g*, the stationary wheel acting as a fulcrum for the planet wheel in giving motion to the loose wheel, all constructed and arranged to operate as herein described.

2. The chain pulley *c*, with its eccentric, *e*, having mounted thereon a planet wheel, *d*, in combination with a fixed wheel, *f*, or their equivalents, for giving motion to a loose wheel, *g*, or its equivalent, when constructed and arranged to operate as herein described, and for the purposes set forth.

84,578.—JOSEPH H. RAYNARD, Lynn, Mass.—*Machine for Manufacturing Parceling*.—December 1, 1868.—The tank is divided at or near its center by a transverse movable partition or slide, so as to be raised or lowered as occasion requires.

Claim.—1. In the manufacture of parceling or tarred-canvas covering for ropes, seams, &c., in vessels, the employment of a machine, substantially as herein described; that is to say, consisting of cutting and drawing and pressure rolls, in combination with an interposed tank for the tar in which the material is immersed, and bobbins or spools upon which the prepared canvas is wound in rolls, the said parts being constructed and arranged for joint operation, as shown and set forth.

2. The combination of the tank *c* and slide *n*, constructed as described, with the pressure and cutting rolls, in the manner and for the purposes specified.

84,579.—L. G. RICE, Montague, Mass.—*Device for Measuring Skirts*.—December 1, 1868.—A skeleton frame is enveloped with a covering in the form of a skirt, and adjusted to a position corresponding to the height of the waist of a person to be fitted.

Claim.—The combination of the cords I, or equivalent, the spring F, and hoop H, with the base B, frame A, and cover G, whereby, as the waist E is adjusted upon the frame, the tension of the cover is preserved, substantially as described, for the purpose specified.

84,580.—SARAH RUEGER, Kansas City, Mo.—*Mammalian Liniment*.—December 1, 1868.—Composed of tea and whisky boiled in water, and after being strained the decoction is again boiled down.

Claim.—The combination of the materials in the proportions and in the manner herein described, and for the purpose set forth.

84,581.—HIRAM RUSSELL and MYRON S. FULLER, Nashville, Mich.—*Spring Bed Bottom*.—December 1, 1868.—The bed-bottom slats are hung on

elastic bands, so that they may be free to turn, the bands being fastened by serews or nails.

Claim.—The journal slats A supported in bearing blocks *b*, in combination with the elastic webbing *w*, and recesses and keys D in the cross-bars C, substantially as and for the purpose specified.

84,582.—WILLIAM H. SALISBURY, Lawrence, Mass.—*Process for the Preparation of Woolen Cloths for Dyeing.*—December 1, 1868.—The cloth is wound upon two eylinders, plaeced at a short distance apart and covered with water heated to the proper temperature, or exposed to steam.

Claim.—In the preparation of cloth for dyeing by boiling, the exposure of both surfaces of the cloth, while in a state of tension and submerged in a suitable vessel, freely and equally to the action of boiling water or steam, in the manner above described, or by any equivalent means of producing that result.

84,583.—ROBERT SAYLOR and ELI T. RHODES, Marshall, Mich. — *Anvil for Forming Horseshoe Calks.*—December 1, 1868.—In a steel-faced plate is sunk a vertieal groove, and the faces on each side of the groove are inclined, so as to give the proper taper to the inner sides of the calk when the horse-shoe is placed within the groove.

Claim.—The double-inclined anvil plate A, having a transverse groove and slot, *e*, in combination with the standard B, substautially as and for the purpose set forth.

84,584.—THOMAS SARGEANT, Williamsburg, N. Y.—*Stair Rod.*—December 1, 1868.—The rod is held in hollow soekets by a movable knob and bayonet fastening.

Claim.—The fastening device, consisting of the slotted socket C and the movable knob G, having its pin *h*, in combination with the stair rod A and soeket B, all arranged as described, for the purpose specified.

84,585.—J. B. SARGENT, New Haven, Conn.—*Blind Staple.*—December 1, 1868.

Claim.—As an improved article of manufacture, the herein-described staple, constructed with the corrugations extending from or near the base of the point *f*, and increasing in depth, and so as to spread the metal from the point, and with or without the indentation *d*, as set forth and described.

84,586.—JOSEPH SHACKLETON, Rahway, N. J.—*Steam Exhaust Regulator.*—December 1, 1868.—The valve is adjusted to the pressure of the steam by compressing or relaxing the spring held within the tube, by means of a disk seured to the end of the spindle, the object being to utilize the exhaust steam.

Claim.—The arrangement of the valve D with its conical enp-seat C, the stem E, cap F, projection G, tube H, spring I, disk J, screw K, and check-nut L, snbstantially as herein set forth.

84,587.—GEORGE V. SLOAT, Morrisania, N. Y.—*Boiler-flue Cleaner.*—December 1, 1868.—Consists of a set of tools adapted by their particular shape to operate on the scale deposited on different parts of the flue, and on flues in different situations.

Claim.—The chipping head A, with one or more cutting edges B, on either side of head B, when arranged in referenee to the shank C and cross-piece D, substantially as described.

84,588.—A. B. SPIES, Sterling, Ill., assignor to JOHN K. JOURNEY, same place.—*Cultivator.*—December 1, 1868.—An arrangement of devecs for facilitating the lateral movement of the plow beams, and raising them from the ground.

Claim.—1. Connecting the frame E to the axle A by means of the roller I, link H, yoke J, and clevis *e*, all arranged as and for the purpose set forth.

2. The lever K, applied to the frame E and axle A, in the manner substantially as and for the purpose set forth.

3. The curved bar L, attached to the axle A, swivel pulley M, clevis *e*, rope or chain N, and bar O, all combined and arranged to operate in the manner substantially as and for the purpose set forth.

84,589.—JONATHAN SPRAGUE, Ann Arbor, and ALVA T. HILL, Pontiae, Mich.—*Sewing Machine.*—December 1, 1868.—The needle holder is so arranged as to be vibrated automatically, to change the position of the needle at each downward motion, in order to adapt the machine to bntton-hole stitching, felling, &c.

Claim.—1. The combination, with the sliding holder *b*, of the vibrating lever *e*, slide *l*, and cam-grooved plate *f*, provided with the spring K, substantially as and for the purpose described.

2. The combination, with the cam-grooved plate *f*, of the elliptical spring K, substantially as and for the purpose described.

84,590.—THOMAS STARR, New Lisbon, Ohio.—*Animal Power.*—December 1, 1868.—Designed for operating churns, grindstones, and for similar domestic purposes, and is made adjustable to adapt it for animals of different weights and sizes.

Claim.—1. The web C, consisting of the strips or belts *r*, having the slats *b*, and beveled blocks *m* connected thereto, and arranged as described.

2. Adjusting the rear end of the frame B vertically, by changing the position of its supporting pin in the holes C of the frame A, substantially as herein described, for the purpose of giving any desired ineline to the web C, as set forth.

3. The adjustable roller *h*, and notches *o*, of the frame B, when constructed and arranged substantially as described, to compensate for the stretching of the web C, as set forth.

84,591.—Canceled.

84,592.—WILLIAM TELL STREET, Frankford, Pa.—*Life Line for Sea Bathing.*—December 1, 1868.—A series of lines is suspended from stays attached at one end to masts and at the other end to anchors, for the use and safety of bathers.

Claim.—The combination of the masts A, gaffs D, stays G, life lines J, piles H, and anehors and buoys I K, either or both, and cork lines L M, with each other, substantially as herein shown and described, and for the purpose set forth.

84,593.—ROBERT TAYLOR and FREDERICK STROW, Philadelphia, Pa.—*Apparatus for Molding Pots and Crucibles.*—December 1, 1868.—The vertical bar to which the former is attached is made to slide in guides, to which latter a horizontal motion is imparted by means of a rack and lever. The motion of the sliding bar and horizontal slides is limited by means of adjustable collars.

Claim.—The arrangement, herein described, of the rack and pinion with the vertical and horizontal slides, and their adjustable collars, all in relative connection with the rotating mold, substantially as shown and set forth.

84,594.—FRANCIS VAN DOREN, Adrian, Mich.—*Corn Planter.*—December 1, 1868.—An adjustable slide in the seed chamber enables the latter to be made larger or smaller to accommodate a greater or less quantity of seed to be dropped from the hopper of a hand seed planter when it is deposited in the ground by a plunger.

Claim.—The recessed shuttle E, in combination with the adjustable slide *a*, seed chamber C, and plunger A, all constructed in the manner substantially as set forth and described.

84,595.—FRANCIS VAN DOREN, Adrian, Mich.—*Shingle Stool.*—December 1, 1868.—Four wheels provided with sharp teeth are attached to bars of unequal length for each two wheels, and provided with a seat, to form a wheeled stool for a workman to sit upon while laying shingles upon a roof.

Claim.—The combination of the seat S, the metallic bars *m n*, bent to form legs of unequal length, and the four serrated wheels *a a' b b'*, all constructed, arranged, and employed in the manner and for the purpose herein specified.

84,596.—WILLIAM M. WARREN and CHARLES A. WARREN, Watertown, Conn., assignors to the WARREN MANUFACTURING COMPANY, same place.—*Sash Fastener.*—December 1, 1868.—A toothed

pinion in the window case meshes in a rack secured to the window sash, and is fastened by a pin provided with trunnions, which work in helical slots in a tube through which the locking pin passes. A detachable winding apparatus is also used when necessary to set the pinions in balancing the sash.

Claim.—1. The combination, with the locking pinion C, of the locking pin F, arranged to be withdrawn, and held by means of inclined grooves K and L, when a rotary movement is communicated to it, as arranged and shown, and for the purpose described.

2. The combination, with a spring-actuated balancing pinion for sash fastening, of a detachable winding apparatus, with its hook D, pin Q, and frame, arranged as and for the purpose described.

84,597.—LE ROY B. WHEELER, Madison, Wis.—*Washing Machine.*—December 1, 1868.—The surface of the cylinder is composed of a series of triangular pieces or stops, with one side smaller than the other, and is used in connection with a set of rollers in a hinged band resting on the cylinder, and provided with a string and button for holding and alternating the clothes.

Claim.—The cylinder P, with the stops or triangular pieces *a b*, constructed as described, and provided with a string and button, for holding and alternating the clothes, so as to wash them on both sides, in combination with the concave or rollers E E, all constructed, arranged, and operated in the manner and for the purpose set forth.

84,598.—LUKE WHEELOCK, New Haven, Conn., assignor to WINCHESTER REPEATING ARMS COMPANY, same place.—*Magazine Fire-arm.*—December 1, 1868.—An auxiliary sear is so arranged that when the trigger guard is depressed, it will catch the hammer when at full cock, and be thrown out from the hammer when the guard is returned to its place; but while the same is supporting the hammer, the principal sear cannot release the hammer, and can only do so when the auxiliary sear is removed by the return of the guard.

Claim.—The auxiliary sear *d*, combined with the hammer and trigger guard, and principal sear, so as to operate substantially in the manner herein set forth.

84,599.—MILTON D. WHIPPLE, Cambridge, Mass.—*Felting Hats.*—December 1, 1868.—A flat circular piece of felting material is shaped into a hat form by means of a former, which is gradually forced into a mold, while the rim is at the same time properly formed by being passed between two condensing rollers and two manipulators, so as to lubricate and compact together the felting fibers.

Claim.—1. The process herein described of forming hats, by felting the same into proper shape from a flat circular piece of suitable material, by a continuous automatic operation, substantially as set forth.

2. The combination of the manipulators *r r'* with the conical rollers, as and for the purpose described.

3. The combination, with the conical rollers, of the mold *b* and movable disk *c*, substantially as and for the purpose set forth.

4. The combination of the disk *c*, rod *e*, and spring *e'* with the cam *f*, substantially as and for the purpose described.

84,600.—AUGUST WILHELMS, St. Petersburg, Russia.—*Chimney.*—December 1, 1868.—The "rectifier" consists of a central portion of cylindrical form with an upper and lower part of a double conical form, and inclosing the upper end of a tube provided with curved arms which support a biconical deflector; the object being to cause the consumption of smoke in furnaces and fire chambers.

Claim.—The rectifier A, with the biconical deflector C at the lower part of the chimney, in connection with the deflector F and spherical frame E, covered with an iron grating *d* on the top of the chimney, all constructed and arranged substantially as and for the purpose set forth.

84,601.—ALONZO S. WOODWARD, Pepperell, Mass.—*Wagon Hub.*—December 1, 1868.—The hub

is made of cast metal, in three parts, held together by longitudinal bolts.

Claim.—1. The hollow cast metal hub, composed of the parts A, C, and B, the latter having the box cast thereon, and the whole fitted together as described, and held by bolts *a*, all as set forth.

2. The packing rings *c* and *f*, and packing strips *k*, substantially as described, in combination with the hollow cast metal hub, as above set forth.

3. The part B of the hub, provided with the inclined lubricating hole *n*, when said hole is closed by the perforated cap *p* and the elastic packing disk *q*, as herein described, for the purpose specified.

84,602.—ALBERT F. YARDELL, San Francisco, Cal.—*Propulsion of Vessels.*—December 1, 1868.—A box or tank loaded with freight or ballast is suspended above the keelson, so that the action of the ship as it is pitched by the sea will impart motion to the box and actuate a propeller suitably attached to the stern of the vessel.

Claim.—1. The bar or tank C, capable of containing cargo, arranged and operating substantially as described, for the purpose of communicating motion to the propeller of a vessel.

2. In combination with the tank C, the rod I, segment J, pinion K, gears L L¹ L², ratchets P, and pawls P', arranged and operating substantially as described, to give a rotary motion to the shaft M.

3. Interposing a coiled spring, S, between the power shaft and the propeller shaft, for the purpose of equalizing or continuing the action of the power upon the propeller, substantially as described.

84,603.—CHARLES W. AIKEN, Decatur, Ill.—*Wagon Seat.*—December 1, 1868.—The springs incline toward and meet at the center, their inner ends being formed of wedge-shaped blocks, which are secured to slotted beams by means of bolts, so as to be readily adjusted to wagons of different sizes.

Claim.—1. The springs C, with triangular blocks *c* formed at their lower ends, in combination with a wagon seat, substantially as and for the purposes described.

2. The device for adjusting a wagon seat to any sized wagon, consisting of the slotted beams D, bolts *b*, nuts *c*, and side pieces E, substantially as and for the purposes set forth.

84,604.—J. M. ALLISON, Crauberry, Pa.—*Corn Planter.*—December 1, 1868.—The machine is so constructed as to plant three or four rows of corn at the same time.

Claim.—A corn planter having marking plows A, rollers B, D, and E, with pins *a*, covering plows *b*, castors *c*, lever *d*, rods *e* and *g*, and their duplicates, as described, and springs and pins *h*, operating with slides at the bottoms of the seed-boxes, all constructed, arranged, and operating substantially as herein specified.

84,605.—WILLIAM BAXTER, Newark, N. J., assignor to himself and WILLIAM D. RUSSELL, same place.—*Wrench.*—December 1, 1868.

Claim.—1. An adjustable S-wrench, composed of two parts, mortised and tenoned together in the manner and for the purposes described.

2. The combination, with the two mortised and tenoned parts of the S-wrench, of a right and left-hand serew, and thumb-piece to operate it, substantially as and for the purposes set forth.

3. The construction and combination of the two parts composing the S-wrench, each being provided with a tenon and mortise, arranged on opposite ends, so that the plane of movement of the two parts shall be in the direction of the length of the wrench, and at right angles or transversely to the jaws, as set forth.

4. The combination, in an adjustable S-wrench, as described, of scales upon the divided wrench shank, with the right and left-hand screw and thumb-piece, arranged within a recess formed in the two parts of the said shank, as and for the purposes set forth.

5. The tenons formed upon and at right angles to the inner jaws, in combination with the corresponding mortises in the heads of the outer jaws, substan-

tially as and for the purposes herein shown and set forth.

6. The construction and arrangement of the larger and smaller jaws of the wrench, so that, when the smaller jaws are completely closed, the larger will be open to the maximum extent of the former, as and for the purposes set forth.

7. The formation of the mortise and tenon in the body of the divided shank of an adjustable wrench, and upon that side of the division line between the two parts of the shank nearest the jaws, substantially as and for the purposes set forth.

S4,606.—SIGISMUND BEER, New York, N. Y.—*Mode of Preventing the Counterfeiting of Bank Notes, &c.*—December 1, 1868.—The material is first made inimitable by the use of surface plates on which designs have been, in whole or in part, produced by nature, in the structural formation of the fiber of plants, as a piece of grained walnut, ash, &c., cut of the size of the note wanted.

Claim.—Making a bank note or other printed article inimitable, substantially in the manner and by the means described.

S4,607.—GEORGE W. BLAKE, New York, N. Y.—*Steam Generator.*—December 1, 1868.—At the end of a series of tubes, which are bent at a right angle, or nearly so, are arranged chambers, by which intermediate joints are dispensed with and increased facility afforded for the contraction and expansion of the tubes.

Claim.—1. The arrangement of the hollow headers G and F with the pipes M, bent as described.

2. The hollow headers G and F, of corrugated construction on their sides, to admit of the alternate triangular arrangement of the pipes, and to form a close joint with the adjacent header, as shown and described.

S4,608.—GEORGE W. BLAKE, New York, N. Y.—*Ventilation.*—December 1, 1868.—Each of the separate room flues is provided with a radiator, so that each room shall have an independent supply of heated air separately heated.

Claim.—1. The arrangement of radiators within the room flues, substantially as and for the purpose or purposes herein set forth.

2. The combination, with the fresh air shaft, and radiators arranged within the room flues, as described, of a valve, operating automatically, to prevent an upward current being established through said shaft, but freely admitting of a downward one through the same, essentially as specified.

S4,609.—LOUIS BRAUER, Washington, D. C.—*Apparatus for Making Extracts and Decoctions from Coffee and other Substances.*—December 1, 1868.—Water is introduced into the outer chamber through a funnel-shaped tube, and, as it becomes heated, passes up through a central tube upon the coffee or other substance in the upper chamber, and thence into the lower chamber.

Claim.—1. The apparatus herein described, composed of the two vessels *a* and *b*, the outer vessel *a*, surrounding the bottom and sides, or lower portion, of the vessel *b*, substantially as described.

2. The vessels *a* and *b*, united by means of flanges or their equivalent, so as to be united or detached at will, substantially as described.

3. The funnel-shaped mouth piece *h*, with closely fitting stopper, in combination with the vessels *a* and *b*, substantially as described.

S4,610.—JAMES A. CALDWELL, Horseheads, N. Y.—*Corn Sheller.*—December 1, 1868.—A toothed drum with a convex surface is arranged within a toothed concave sectional shell, below which is suspended a vibrating sieve. Springs are placed between portions of the concave, to admit of their yielding to large-sized ears of corn.

Claim.—The corn sheller, as composed of the drum F, with convex surface and armed with teeth; the concave sectional shell K¹, K², K¹⁰, also armed with teeth, and perforated between the teeth; the springs *s s*; the sieve T T, with the attachment for shaking the same; the fan P; all constructed for the purpose as specified.

S4,611.—ISAAC H. CHAPPELL and JAMES MONTGOMERY, Decatur, Ill.—*Cultivator.*—December 1, 1868.—The draught pole is pivoted laterally on a pin passing through a slot in the seat bar, so as to allow of a lateral movement of the plow frame, while a horizontal movement is also given to it by the said slot.

Claim.—1. A cultivator, the draught pole and plow frame of which are pivoted on the seat bar, substantially as and for the purposes set forth.

2. The attachment of the draught pole to the seat bar by means of the pin *a* pivoted in slot *c* and nut *d*, substantially as and for the purposes set forth.

S4,612.—FELIX CHILLINGWORTH, Springfield, Mass.—*Scabbard for Trowel Bayonet.*—December 1, 1868.—The scabbard is provided with a spring for closing its mouth, to exclude rain and snow.

Claim.—A scabbard for trowel-shaped bayonets, constructed and arranged as described.

S4,613.—ISAAC H. CLARK, Boston, Mass.—*Application of Carbonic Acid in Fire Engines.*—December 1, 1868; antedated November 27, 1868.

Claim.—1. Combining with the discharge water of a force pump or fire engine a stream, jet, or flowage of carbonic acid gas, for the purpose and to produce results before stated.

2. As one mode of producing and applying the said gas, the employment of the furnace constructed as before explained, and combined with the air pump and discharge water of the engine, essentially as herein shown and described.

3. The combination with a force pump or engine, otherwise of ordinary or well-known construction, of an air pump for introducing or ejecting carbonic acid gas into the discharge water of such engine after such water may have left the pump cylinders, or the purposes substantially as before explained.

S4,614.—SAMUEL H. HALSTEAD, Godfrey, Ill., administrator of the estate of JESSE R. CLOUGH, deceased.—*Windmill.*—December 1, 1868.—The vanes are so constructed as to cause the wing to act twice upon each one, first upon impact against the outer faces, and then upon the inner faces on the side of the wheel opposite the place of entrance.

Claim.—The triangular vanes L, arranged substantially as described, so that their narrow faces, P, are exposed to the direct action of the wind on entering the wheel, and the adjoining faces, Q, are exposed to its action when leaving the wheel.

S4,615.—JOSEPH CRAMPTON, New York, N. Y.—*Steam Engine Valve Gear.*—December 1, 1868.—The valve gear is attached to a reversing arm or lever, arranged, in swinging it, to cross to opposite sides of the cylinder trunnions, so that, as the said lever is thrown to one side or the other, the valve is shifted to reverse the action of the engine.

Claim.—The combination of the reversing lever G, link F, and valve-operating beam E, the whole arranged relatively to each other, and to the cylinder trunnion and valve, substantially as and for the purpose herein specified.

S4,616.—SILAS CRISPIN, New York, N. Y.—*Cartridge Box.*—December 1, 1868.—The carrier block is detachable, and perforated above and below for the reception of cartridges, so as to be inverted when the first tier of cartridges is exhausted, and is provided with a leather flap to hold the cartridges in place. The ends of the block are supported upon ledges or battens in the corners of the box.

Claim.—1. The removable carrier block B, when provided with its own flap, and adapted to fit an outer case or cartridge box, substantially as and for the purposes described.

2. In combination with the cartridge-carrier block B and the outer case or cartridge box, the ledges or battens *a'*, applied in the manner and for the purpose described.

S4,617.—W. H. DE VALIN, Sacramento, Cal.—*Steam, Gas, and Water Stop Cock.*—December 1, 1868.—Designed to allow the valve and other working parts to accommodate themselves to the wear in

the direction of the pressure, without cramping or interfering with each other.

Claim.—1. In a stop-cock, in which the valve or plug is arranged within the case, in the manner described, the combination of the valve with a disconnected flanged valve stem, having its seat or bearing against the cap by which the valve chamber is closed, and held in place by means of a handle, arranged and operating substantially as herein described.

2. The combination and arrangement of the valve stem and cap for closing the valve chamber, with the handle for operating the stem, and the cap and spring for retaining the handle in place, and holding said stem up in its seat, substantially as herein specified.

3. A stop cock, such as described, having the valve stem, formed in two parts, hinged together above the point where the stem bears or fits against the cap, for closing the valve chamber.

4. The recessed and grooved handle and knob, and the flanged or winged cap, in combination with the valve-operating stem, said parts being constructed and arranged to operate, as herein shown and specified.

84,618.—JEAN CHARLES DROUHARD and ADOLPHE LEWIS ROYÉ, New York, N. Y.—*Table.*—December 1, 1868.—The table is so constructed as to be made convertible at pleasure into a center table, two console tables, or two card tables.

Claim.—1. The divided center pillar C, so constructed and combined with the legs *a* as to form the central support of a center table, one of the three legs of two console tables, and two of the four legs of two card tables, substantially as herein described.

2. The combination of the jointed brace G, hinged arms *d'*, fixed legs *a a*, and movable legs or divisions *c c*, of the divided center pillar, substantially as and for the purpose herein set forth.

84,619.—SAMUEL S. ELDER, Springfield, Ill.—*Churn.*—December 1, 1868.—The agitators are so placed upon the arms as to cause their greatest surface to strike forcibly upon the cream.

Claim.—1. The within-described construction and arrangement of agitators F.

2. The combination of the driving mechanism, arranged as described, with the agitators F and C.

84,620.—W. L. EPPERSON, Louisville, Ky.—*Mortising Machine.*—December 1, 1868.—An increased leverage, when it is principally needed, is given to the short arm of the treadle by the addition of a toothed segment, moving in the slotted cross piece, in connection with a cogged lever. The tool carrier is attached to a rod connected with the treadle, and the chisel is secured in place by means of a screw.

Claim.—1. A treadle, or lever, for operating a mortising machine, the short arm of which is lengthened automatically as the lever is moved to operate the machine.

2. The combination of the cogged lever F, and the segment E, and connecting rod H, substantially as shown and described.

3. The arrangement of the adjustable tool carrier A⁴, screw O, and connecting rod H, substantially as shown and described.

84,621.—MAX EYTH, New York, N. Y.—*Rope Bearing Attachment in Machines for Steam Culture.*—December 1, 1868.—Projecting from the sides of the cultivator are two arms curved upward, and extending to such a height above the ground as to pass over the growing crops.

Claim.—Curving the arms or "outstrippers" *a a'* upward, so that the same will clear the growing crops, as herein shown and described.

84,622.—JOSHUA GARSEED, Frankford, Pa.—*Steam-engine Register.*—December 1, 1868.—For regulating the speed and indicating the number of revolutions of a steam engine, and is especially adapted to cotton or woolen mills, to indicate the amount of work done in a given time.

Claim.—1. The disk M D, cross piece C P, arms A and A', shaft S, and worm W, flange F L, wheel T W, cap C, and its boss R B, lever L and its pawl

P, shaft U S, wheel T W' and worm W', shaft S', and worm W'', wheel T W'', and hand H, all arranged, constructed, and combined, in the manner and for the purposes herein set forth.

2. A register for steam engines, or other purposes, arranged and operating substantially in the manner herein specified.

84,623.—JOHN GIBBS, Brooklyn, E. D., N. Y.—*Lamp.*—December 1, 1868.—A movable roller is furnished with an operating sliding stem, and so combined with a wick tube and the feed roller as to more readily raise the wick.

Claim.—The pressure roller or rollers *d*, supported in slots *c'*, when operated by the sliding stem *e*, in combination with the feed roller C, substantially as shown and described.

84,624.—HENRY H. GRAY, Haverstraw, N. Y., assignor to himself and MOSES B. PARDEE, Norwalk, Conn.—*Brick Machine.*—December 1, 1868.—By adjusting the stops, the throw of the plunger can be changed, and a positive unyielding motion is imparted to the plunger in whatever position the said stops may be brought. A yielding bar is made to impart motion to the pusher bar of the mold, so that in case of obstruction the pitman will be automatically disengaged.

Claim.—1. The stair-shaped stops *j*, in combination with standard *l*, cross bar *e*, and plunger F, substantially as and for the purpose set forth.

2. The yielding latch *b'*, in combination with the pusher bar *r*, substantially as and for the purpose described.

84,625.—W. D. GRIMSHAW, Newark, N. J.—*Stamp and Die for Sheet Metal.*—December 1, 1868.—Consists in arranging and adapting several cylinders with pistons, to give varied pressures upon the sheet, required for the production of sunken work, which shall be as smooth and perfect on the sides as on the bottom.

Claim.—1. The employment of four cylinders, *y*¹ *y*² *y*³ *y*⁴, combined with the main cylinder F, to equalize the pressure upon the four corners of the guide plate H, Fig. 4, when descending on the four guide posts *z*¹ *z*² *z*³ *z*⁴, constructed, adapted and arranged substantially as set forth.

2. The top plate C, with circular passages *x*, *w*, and *v*, in combination with the five cylinders, as specified and shown.

3. The levers *o m n l*, and the treadles *p* and *q*, when combined with the five cylinders for graduating the pressure upon the plate H, Fig. 4.

84,626.—ELIZABETH HAWKS, Vineland, N. J.—*Heating Stove.*—December 1, 1868.—The base is provided with a double bottom, and the upper part is divided into two chambers, in the partition between which are holes provided with slides, by opening or closing which, the base can be heated or not, at will.

Claim.—1. The base, A, constructed as described, with a partition B, dividing it into two chambers, and which partition is provided with holes *b b*, and slides L L, substantially as and for the purposes herein set forth.

2. The arrangement of the cylinders D and E, and upright plates F F, forming a flue for the passage of the smoke, &c., and leaving the balance of the chamber between said cylinders for hot air, substantially as herein set forth.

84,627.—RICHARD M. HOE and STEPHEN D. TUCKER, New York, N. Y.—*Printing Press.*—December 1, 1868.—The sheets, as they come from the printing mechanism, are directed alternately on opposite sides, so as to be delivered in two piles, either by two separate "fly" frames or a double-acting "fly" frame. The plates are clamped directly to the surface of the type cylinder, so as to dispense with the use of blocks and iron frames commonly used.

Claim.—1. The combination of two feeding tables with the means described, or the equivalent thereof, for taking the sheets of paper alternately from the opposite feeding tables, and conducting them to the impression cylinder, substantially as and for the purpose described.

2. Separating the sheets by mechanism, substantially as described, so that they will be delivered in files, substantially as set forth and specified.

3. The means, substantially as herein described, for clamping stereotype or other printing plates directly to the surface of a type cylinder, as set forth.

84,628.—ROBERT HUNTER, New York, N. Y.—*Toy Fish.*—December 1, 1868.—A vibrating tail is made of thin elastic material, and operated by a coil spring and ordinary gearing.

Claim.—The application of the vibrating tail as a propeller for mechanical fish, toy boats, &c., substantially as and for the purpose stated.

84,629.—F. C. JACKSON, Peru, Ind.—*Boot Crimper.*—December 1, 1868.—When the slide is lowered the frames are made to close upon the outer edges of the crimping board.

Claim.—The slide B, provided with two triangular frames, projecting inward, and operated as specified, to cause an equal pressure on the board D, as herein shown and described.

84,630.—GEORGE A. JENKS, Chicago, Ill., assignor to himself and JAMES MAGUIRE, same place.—*Butt Hinge.*—December 1, 1868.—When the wing is applied to a door, it may be lifted without detachment, and still be detachable by stopping in the proper position.

Claim.—The arrangement and construction of the two wings of the butt, with their pivots, on the upper and lower bowl, pointing toward the center, with a recess for the other bowl e, by which the hinge or butt can be adjusted, substantially as shown and described.

84,631.—WILLIAM C. JOSLIN, Putnam, Conn.—*Machine for Reducing Leather.*—December 1, 1868.—Relates to a machine described in a patent to the same inventor of September 24, 1867, and consists in combining with the receiving and delivering rolls and bed in the said machine, a flat reciprocating knife, instead of a cylindrical and rotating one.

Claim.—The combination, with the receiving and delivering rolls B B, C C, bed D, and reciprocating knife or reducer E, of the sliding blocks I I, and cranks or eccentrics, with their pitmen or rods H H, arranged for operation together, essentially as specified.

84,632.—MORITZ LAEMMEL, Bay Ridge, N. Y.—*Mechanical Movement.*—December 1, 1868.—By adjusting the shaft nearer to or further from the peripheries of the lever segments, the leverage of the segments may be increased or diminished at pleasure. The lever segment may be turned in one direction or the other by a dog and friction strap, so as to bind or release the pulley.

Claim.—The arrangement of an adjustable shaft B, in combination with the lever segments C, operated alternately by treadles or hand levers, and connected to the shaft B by clutch pulleys, or other equivalent mechanism, substantially in the manner and for the purpose shown and described.

2. The arrangement of a dog E, and friction strap i, in combination with a pulley, b, lever segment C, and shaft B, substantially as and for the purpose set forth.

84,633.—P. A. LA FRANCE, Elmira, N. Y., assignor to himself and OLIVER B. GRAY, New York City.—*Wash Pounder.*—December 1, 1868.—To the under side of an ordinary pounder for cleansing clothing is secured a rubber bottom or pad to render it less injurious in operation.

Claim.—A rubber shield or pad attachment to a wash pounder, in general form and device substantially as and for the purposes described.

84,634.—JAMES B. LOGAN, Richview, Ill.—*Gang Plow.*—December 1, 1868.—The plows are arranged to be raised and lowered in a vertical, instead of a curved line.

Claim.—The combination and arrangement of the beams H, swinging beams O and G, the hangers F, and lever E, the arrangement being such that the plows are drawn by the levers O, which are attached

to the forward ends of the levers thereof, substantially as shown and described.

84,635.—JACOB LONG, Shaver's Creek, Pa.—*Explosive Projectile.*—December 1, 1868.—A shell is loaded with a number of bands or tubes, each containing five musket charges of powder and balls, and provided with fuses, which shall ignite from the explosion of the shell.

Claim.—The combination of a loaded shell with the barrels A, each containing several charges of powder and ball, arranged so as to discharge their contents in succession after the bursting of the shell, substantially as described.

84,636.—CHARLES B. LOVELESS, Syracuse, N. Y.—*Manufacture of Illuminating Gas.*—December 1, 1868.—Hydrogen gas is carbureted with the light oils of petroleum for illuminating purposes. Oxygen gas is used in connection with hydrogen gas, for manufacturing purposes, by the aid of the oxy-hydrogen blowpipe.

Claim.—1. The combination of the battery h as constructed with the oil reservoir a' containing perforated lead pipe n, and gasometer a, and float b, for generating hydrocarbon gas, as herein set forth.

2. The combination of the pipe k', lead pipe n, with perforations, pipes l, and t, and o, with gasometer, and descending gas pipe r with gasometer, and pipe d with gas burner, also the rod q q' with pipe g, for guiding the float in the gasometer.

3. The perforated lead pipe n, with oil reservoir a', as described and for the purposes set forth.

4. The heater g, constructed substantially as described, and operating as and for the purposes set forth.

5. The combination of the pipes k and k'', as described, and for the purposes of an oxy-hydrogen blowpipe, as set forth.

84,637.—JOHN N. LYMAN, New York, N. Y.—*Revolving Stay Log for Cutting Veneers.*—December 1, 1868.—The stay log is adjustable relatively to its journals, so that the peripheral surface of the log or section of timber may revolve at a more uniform distance from the knife or cutting edge.

Claim.—A revolving stay log, constructed as described, and for the purpose herein set forth.

84,638.—E. V. MACHETTE, Jr., and E. M. CRARY, Philadelphia, Pa.—*Cement.*—December 1, 1868.—To be used in place of putty. Consists of whitening, and china, porcelain, or kaolin clay, incorporated with linseed oil.

Claim.—A cement, composed of the above-named ingredients in or about the proportions aforesaid, for the purpose specified.

84,639.—JOHN MALTPRESS, Edgerton, Wis.—*Grate for Brick Kilns.*—December 1, 1868.—There are as many dampers and levers as there are sections of the grate; the draught is controlled at each section irrespective of the others, and the sections may be sifted from one kiln to another.

Claim.—The movable grates B B, constructed as described, in sections, and provided with dampers a a, said dampers being operated by levers b b, for the purpose of increasing or diminishing the heat in the whole or part of a brick kiln, substantially as and for the purposes herein set forth.

84,640.—HENRY MARX, Pikesville, Md.—*Apparatus for Reducing Wood to Paper Pulp.*—December 1, 1868.—The blocks of wood are held against the grindstone by a chain, partially surrounding the chain and blocks and kept tense by a pendent weight. After being coarsely ground, the wood particles pass between the lower surface of the same grindstone and a stationary stone, and are thus comminuted.

Claim.—1. The stone, O, employed for regrinding fragments separated from the blocks by the stone, B, substantially as and for the purpose explained.

2. The chain E, employed to hold or press the blocks to the surface of the stone B, substantially as explained.

3. The counter chain H, for retracting the chain D, for the insertion of fresh blocks.

84,641.—L. H. MAUDELBAUM, New York, N. Y.—*Fluted Trimming.*—December 1, 1868.—The row or rows of large flutes are bounded on either side by parallel rows of small flutes which have marginal, flattened borders.

Claim.—The within described compound fluting, made of muslin or other suitable material, and composed of large, regularly formed flutes *c c*, divided by straight-line depressions *e e*, and bounded on either side by more numerous and smaller flutes *b b* having flattened borders *a a* exterior to them, substantially as shown and described.

84,642.—HENRY MCGANN, Cleveland, Ohio.—*Automatic Boiler Feeder.*—December 1, 1868.—The water in the shell rises and falls with that in the boiler, and owing to the consequent ascent and descent of the float therein, the arm is vibrated and the valve shifted so as to shut off and admit the feed water.

Claim.—1. The combination of the slide valve F with the arm D, shaft *a*, float B, case A, and chest C, substantially as specified.

2. The supplementary chest C, in combination with the shell A, as set forth.

84,643.—PATRICK J. MCGUINNESS, New York, N. Y.—*Martingale.*—December 1, 1868.—The martingale consists of a leather strap and a rubber strap riveted together, and having loops at their free ends. These ends are respectively attached to the surcingle, and a fancy chain hooked to the bit ring, the horse's head being allowed free motion while the martingale preserves its standing character.

Claim.—As a new article of manufacture, an ornamental elastic standing martingale, consisting of the leather loop A, rubber-elastic strap D, metallic flat-tube chains H, and swiveled snap hooks I, all constructed and arranged as herein described.

84,644.—JAMES MYERS, JR., Brooklyn, N. Y., assignor to BARRON'S STEEL MANUFACTURING COMPANY.—*Mode of Producing Steel.*—December 1, 1868.—The carbon of refuse cast iron is eliminated by heat, to convert the material into malleable cast iron, which, together with additional malleable cast iron, is subjected to a high degree of heat, while carbon, in the form of gas, or liquid hydrocarbon, is applied. The heat being properly maintained, the iron is gradually converted into steel.

Claim.—1. The conversion of cast iron into steel, by the combination of the two processes of decarburization and recarburization above described, in the manner and for the purpose substantially as above stated.

2. The conversion of articles of malleable cast iron, produced by any known process, into steel, by the application of gases produced from any solid or liquid carbonaceous substances, in the manner substantially as described.

3. The production of cast steel, by remelting steel formed from malleable cast iron, when made in the manner above described.

84,645.—WILLIAM POTTS, Handsworth, England.—*Hook and Cornice for Suspending Pictures.*—December 1, 1868.

Claim.—A metallic picture rail, that is to say, a metallic strip or bar, whose lower or inner edge is turned upward, so as to constitute a rail upon which the picture-supporting hooks can freely slide, provided with an ornamental covering or casing of a metallic or non-metallic substance, as described, and attached to the wall of the room by means of screws or staples, in the manner shown and set forth.

84,646.—JOHN W. RICHARDS, Newark, N. J.—*Low-water Indicator.*—December 1, 1868.—The tube in which the valve is seated communicates with the boiler, and is occupied by water so long as the water does not fall too low; but in that event steam takes the place of water in the tube, and, by reason of the consequent expansion thereof, the valve is opened, and steam is conducted through its hollow stem to a whistle.

Claim.—The fixed valve E, constructed of a tubular character, as described, and hung so as to be capable of expansion away from its seat, for action

in concert with the tube D, substantially as described.

84,647.—SEELYE RICHMOND, Annapolis, Md.—*Last-block Elevator and Instep Stretcher.*—December 1, 1868.—The nut, through which the operating screw passes, plays freely in the recess of the last block. The block may be elevated by a short screw taking into a nut in the last, or by a long screw resting upon a bearing screwed into said nut.

Claim.—1. The inclining slot *b*, in the rear part of the last block B, in combination with the nut D, substantially as and for the purpose set forth.

2. The combination of the slot *b*, nut D, short screw C, and nut F, when operating as a last-block elevator, substantially as described.

3. The screw socket H, when constructed as described and shown, and operating in a last, substantially as and for the purpose set forth.

84,648.—EPHRAIM RUSSELL, Waynesburg, assignor to himself and REYNARD YOST, Honey Brook, Pa.—*Car Coupling.*—December 1, 1868.—The entire coupling may be detached and carried away for safe-keeping. When the device is held up by the handle the ends of the link can be dropped into the respective slots of the adjacent draw-heads, and the link may be as readily lifted to effect the disengagement.

Claim.—The open link A, and the sliding handle B, in combination with a slotted draw-head, all constructed and operating together, substantially as and for the purpose described.

84,649.—ROGER SANDIFORD, Joliet, Ill.—*Cultivator.*—December 1, 1868.—Provision is made for the vertical and lateral adjustment of the plow-beam; for relieving from draught strain the pin that couples the beam to the clevis; for uniting the ends of the frame timbers without using mortise and tenon joints, and for supporting the plows when the machine is traveling, but not operating.

Claim.—1. The segmental oscillating coupling-clevis, shown in Figs. 1 and 2, consisting of the parts *a d n*, and the part *o*, shown in Fig. 3, when applied to a cultivator in the manner and for the purposes set forth.

3. The metal cross-piece A, in combination with the post or frame *c* and supporting arms B B, constructed and arranged in the manner described.

84,650.—FREDERICK M. SHEPARD, New York, N. Y.—*Water-proof Shoe.*—December 1, 1868.—Consists in inserting within an India-rubber sole a plate of metal, or other material, which will resist the vulcanizing heat, and to which, after vulcanization, is applied an outer sole of leather or other material suitable to resist the cutting action of sharp stones, shells, &c., when the shoes are in use.

Claim.—A boot, shoe, or other such like article, made of vulcanized India-rubber or allied gum, with a plate, or sections of a plate, or the equivalent thereof, made of metal or equivalent material, imbedded in the India-rubber sole while in the green or plastic state, to which, after vulcanization, an outer sole can be secured, substantially as and for the purpose specified.

84,651.—JAMES S. SMITH, Brooklyn, N. Y.—*Cartridge Holder.*—December 1, 1868.—The cartridges are retained in holes, corresponding approximately to the diameters of the cartridges, the holding springs being part of the top and bottom pieces, which are formed of reed metal, or the brass made for the tongues of reed instruments.

Claim.—The casing or holder herein described, adapted to receive cartridges, and to support them with firmness by the springs *n*, formed of the same metal as the respective pieces B and C, substantially as and for the purposes herein set forth.

84,652.—ANDREW SMITH, Portland, Oregon, assignor to T. J. CARTER and W. P. WATSON, same place.—*Gang Plow.*—December 1, 1868.—Relates to the mode of attaching the plow to the beam, attaching and supporting the forward end of the plow beams; also to the construction of the supporting frame, and a novel ratchet apparatus for elevating the plows.

Claim.—1. The combination of the lever O, having the offset *o*, with the ratchet P, rod R, having the tooth or shoulder *r*, and lever T, the whole operating substantially as and for the purpose described.

2. The arrangement of such frame, when constructed as herein described, in combination with a downward-bent axle D, the box strap *e*, the braces H H, the draught pole G, and the wheels F F.

3. The arrangement of the clevis K, braces H H', king bolt C, cross bar A³, and axle D, the axle being behind the king bolt, and the latter being supported by the braces and the cross bar, substantially as herein described.

4. The braces *u* and *v*, attached at their lower ends, respectively, to the moldboard and standard, and at their upper ends provided with screw threads, upon which are fitted, above and below the plow beam, through which the braces pass, adjusting screw nuts, substantially as and for the purpose specified.

84,653.—BYRON SNYDER, Clinton, Wis.—*Farm Gate.*—December 1, 1868.—The outer end of the latch bar is pivoted to the vibrating end of the eccentric lever, so that when the endless band is put in motion, by rotating the pulleys in opening the gate, the latch bar is drawn backward, so as to disengage from the latch, the gate being opened by said motion, and held open by a self-acting latch provided for the purpose.

Claim.—The rigid lever E, eccentric lever D, and latch bar F, in combination with the pulleys I I, cranks *i i*, endless band or chain K K, clasps *a a*, gate A A, posts B C *c''* H H, and latches *f* and *g*, when constructed substantially as described, to operate as specified.

84,654.—DANIEL E. SOMES, Washington, D. C.—*Construction of Rubber and other Elastic Springs.*—December 1, 1868.—The effective elasticity of the spring increases in proportion to the pressure or weight it is called upon to sustain.

Claim.—1. A spring, composed of a series of elastic tubes, one within another, substantially as set forth.

2. A spring, composed of a series of elastic spheres, one within another, and either air-tight or perforated, substantially as set forth.

3. A spring, composed of elastic tubes or spheres, surrounded by elastic bands or rings, substantially as set forth.

84,655.—NATHAN THOMPSON, Brooklyn, E. D., N. Y.—*Box to contain Cigars, Money, &c.*—December 1, 1868.—The mouth or opening of the box is formed by the removal of a peripheral portion, covered by the lid, and concentric with the pivots upon which the lid turns.

Claim.—The combination, with the box or shell A, of the lid or cover B, pivoted, by or through side arms *b b*, to the sides of the box, for operation in relation to the mouth thereof, substantially as shown and described.

84,656.—WILLIAM R. TOBY, Nunda, and BYRON J. BARCALO, Mount Morris, N. Y.—*Revolving Harrow.*—December 1, 1868.—The revolving motion of the harrow is produced by a weighty roller resting upon one side. This roller is journaled upon an arm attached to the beam by a universal joint, and is held in any desired position by the attachment of said arm to a slack chain, which admits of the free, vertical movement of the roller passing over the rough ground. The roller may be shifted from side to side. The draught rod has a point of attachment behind as well as in front of the center, and is adjustable, to avoid undue friction upon the roller at the rear.

Claim.—1. The combination of the slack chain *d* with the weighted rollers D, arm *b*, and beam B, arranged as described, and operating substantially as and for the purpose described.

2. The draught rod *g* and gauge bearing *h*, in combination with the beam B and friction roller *i*, arranged and operating substantially as and for the purpose herein set forth.

84,657.—CHARLES L. TUCKER, Chicago, Ill.—*Box for Lard, Butter, and Similar Substances.*—De-

ember 1, 1868.—The coating composition is impervious to and insoluble in the oleaginous substances which the boxes contain. It is proposed to add to the compound such substances as terra-alba, kaoline, or gypsum.

Claim.—1. As a new article of manufacture, a box for packing lard, butter, and other similar substances, made by coating wood, pasteboard, or other suitable material, with a stiffening cement of glue and starch, with or without earthy materials, substantially as described.

2. A cement for preparing boxes composed of glue or gelatine, combined with starch or its equivalent, with or without the addition of earthy materials, as described.

84,658.—WILLIAM B. TUCKER, Columbus, Ohio.—*Churn.*—December 1, 1868.—The vertical bars of the dasher are diamond-shaped in transverse section.

Claim.—A churn dasher of a diamond form, as herein shown and described, as an improvement on my letters-patent bearing date March 12, 1868.

84,659.—A. B. VANDEMARK, Phelps, N. Y.—*Combination Lock.*—December 1, 1868.—The tumblers have spring bearings cut out of and struck up from the surface. The arrangement of cams on the spindle is such that when the spindle is pressed out, the cams engage with two of the tumblers, by turning in opposite directions, and when drawn in they engage with the other two in the same manner.

Claim.—The combination and arrangement, with the disk tumblers E E¹ E² E³, provided with spring bearings *k k* of the cams D D on the spindle, having an end motion to engage in one position with two of the tumblers, and in opposite position, with the other two, said tumblers, by twos, being set by the reverse turns of the spindle, as herein set forth.

84,660.—W. W. VANDERBILT, New York, N. Y.—*Operating Capstan.*—December 1, 1868.—The connections between the pumping engines and the pumps may be readily uncoupled, and the capstan thrown into gear with said engines. A regulating screw is combined with the friction clutch, which throws the capstan into gear with the engines, so that the effect of said clutch, respecting the power or speed of the capstan, may be varied.

Claim.—1. The arrangement and combination of the engines A A, couplings *a a*, pumps C C, gear-wheels *f g i*, capstan E, and friction cone *j*, all constructed and operating substantially as and for the purpose herein set forth.

2. The regulating screw *s*, in combination with the lever *q*, friction cone *j*, cog wheels *f g*, and capstan E, substantially as and for the purpose described.

3. The arrangement of the back gear *m o*, in combination with the cog wheel *l*, bevel wheels *f g*, capstan E, crank shaft D, and engines A A, all as and for the purpose shown and described.

84,661.—FREDERIC VEAZIE, Worcester, Mass.—*Blind Fastener.*—December 1, 1868.—The cavity in the bed plate receives the spring, and the raised portion being sunk into the bottom of the shutter, the top plate, to which the levers are attached, protects the spring from moisture, and the shoulders on the same having raised points, curved so as to receive the catch pin on the sill, the shutter is prevented from striking said pin.

Claim.—The construction and arrangement of the blind fastener, having the raised surface *d*, the shoulder *g*, and cavity B, to hold the spring E and notches and shoulders on the bed piece, when constructed and operating in the manner and for the purposes above set forth and described.

84,662.—WILLIAM T. WARD, Indianapolis, Ind.—*Wagon Brake.*—December 1, 1868.—The weights are on the ends of arms projecting rearward from the cross bar, which carries cam-shaped brakes at its ends, said brakes being applied to the wheels by the partial rotation of the cross bar produced by the unrestrained gravitation of the weights. A chain attached to the sliding draught evener is drawn tense to rotate the brake bar, and take off the brakes when the wagon starts. The slack condition of the

chain may be maintained by means of a pin, to prevent the brakes from being taken off by the forward movement of the wagon when the team is unattended.

Claim.—1. The application of one or more weights H, by whose specific gravity the cams or rubbers F are kept to the periphery of the wheels, substantially in the manner and for the purposes specified.

2. The strap L, provided with the holes *n n*, and bolt or pin O, as and for the purposes set forth.

84,663.—F. WASHBOURNE, New York, N. Y.—*Screw.*—December 1, 1868.—In turning the screw with the screwdriver, the instrument takes hold of the slot in the shank, avoiding the liability of wrenching off the head.

Claim.—In a screw, the head and shank of which are made in separate pieces, extending the slot D in the head of the screw downward into the shank, substantially as described.

84,664.—JARVIS B. WHITE, Detroit, Mich.—*Combination Lock.*—December 1, 1868.—The positions of the dials on the drawer must be made to correspond with the known positions in which the disks on the frame or easing are fixed, in order to admit of the passage of the projections on the rods through, and their withdrawal from, the slots in said disks, the locking and unlocking being thereby effected.

Claim.—1. The projections *d d'* on the rods C C', in combination with the series of holes and the slots *e e'* on disks *f f'*, substantially as and for the purposes set forth.

2. The combination lock, consisting of the rods C C', provided with projections *e e'* and *d d'*, and with dials *a a'*, and knobs *b b'*, attached to and passing through the drawer, and engaging with the slotted revolving disks *f f'* secured by rims *h h'*, over recesses *j*, in the back wall of the easing, all arranged constructed, and operating substantially as and for the purposes set forth.

84,665.—JARVIS B. WHITE, Detroit, Mich.—*Carriage Jack.*—December 1, 1868.—When the lever is depressed, the strap is wound upon its circular end and made to act on the lifting bar.

Claim.—The carriage jack, consisting of the side pieces A A', lifting-bar C, straps D, arranged and operating substantially as described.

84,666.—ALBERT WINDECK, Peoria, Ill.—*Corn Planter.*—December 1, 1868.—The sliding parts are guided on the ribs, and hence they are not liable to bind or jam. The corn falls through the holes in the slides and is retained upon the plate below till the slide makes a succeeding movement, when it falls into the tube and is retained therein by the valve; a reverse movement of the valve liberates it and it then falls to the ground. The form of the cut-off teeth gives them a free, unobstructed movement among the corn.

Claim.—1. The slides *a a*, with forks *m*, for operating the valves *k*, in combination with plates R, having ribs *j j*, fitting the grooves, and gauges *b*, substantially in the manner and for the purpose as herein set forth.

2. The valves *k*, in combination with the slides *a a*, when constructed and operated substantially as set forth.

3. The construction of the valves *k*, curved straight across at their bottom ends outwardly, and divided in the middle, at their upper ends, and curved outwardly in reverse directions, substantially as and for the purpose set forth.

4. The construction of the plate *d*, with diamond-shaped teeth, for cut-offs, in the bottom of the seed boxes, substantially in the manner and for the purpose as set forth.

84,667.—J. L. WINSLOW, Portland, Me.—*Lubricating Axle.*—December 1, 1868.—The journal may belong to either a rotating shaft, or a carriage axle. In the one case the rotary motion, and in the other the jar of travel, causes the movable pins to slide forth and back in their holes, and the lubricating material is consequently allowed to ooze or work its way out of the journal to the inner side of the box.

The collar, in conjunction with the cavities of the journal, forms the oil reservoir.

Claim.—The hollow journal, having the parts *d h*, collar *k*, and sliding pieces *e e*, as and for the purposes set forth.

84,668.—FREDERICK WHITTON, South Carrollton, Ky.—*Churn.*—December 1, 1868.—The notched and perforated wings are fixed to the dasher rod so as to slightly decline; and the upper pair is fixed sufficiently above the lower pair to permit the milk to pass freely between them.

Claim.—The churn dasher, composed of the piston A and the four pieces B B B B, arranged together, and constructed as and for the purpose set forth as described.

84,669.—SAMUEL WARREN HENLON, Selma, Ala.—*Suspender.*—December 1, 1868; antedated June 1, 1868.—Each suspender has two straps united at the ends by pieces of leather (called attaching straps) having the button holes in them. The object is to more comfortably support the garment, and give the suspenders the function of shoulder braces.

Claim.—The suspender, or shoulder brace, composed of two single straps C C, each passing from its attaching strap at the one side, over the shoulder, to the attaching strap on the other side of the body, substantially as herein stated.

84,670.—JOHN ANNEAR, Philadelphia, Pa.—*Punching Machine for Tin and Sheet Metal.*—December 8, 1868.—A horizontal rotary bed plate carries and supports the dies, and is combined with a punch and a "former," so constructed and arranged as to punch out and turn the edge, and discharge the finished disk of sheet metal during each rotary motion of the actuating shaft.

Claim.—The rotary bed plate C, the punch D *d'*, and the "former" E *e'*, the same being constructed and arranged to be operated together, in any suitable frame, A B, substantially as and for the purpose described.

84,671.—ROBERT BRECKENRIDGE BAKER and CHARLES JAMES ADOLPHUS DICK, Paris, France, assignors to the American Anti-Incrustation Company.—*Device for Preventing Incrustation in Steam Generators.*—December 8, 1868.—Designed as an improvement upon patents granted to A. F. Porter and to G. T. Parry, October 31, 1865. In this invention carbon is substituted in place of magnetic points in the instruments used.

Claim.—An insulated mass or block of carbonaceous matter, suspended within a boiler, near one end of the same, but connected by a wire to the shell of the boiler, near the opposite end of the latter, all substantially as set forth.

84,672.—CHARLES BENNITT, Bristol Station, Ill.—*Shaft Coupling.*—December 8, 1868.—Consists in the application of rollers or "pulleys" to the inner periphery of the coupling band, to relieve the friction of the jaws of the tumbling rods.

Claim.—The combination of the band H, journal G, pulleys E E, jaws C and D, with the rods B B, as and for the purpose herein specified and shown.

84,673.—GEORGE B. BRAYTON, Providence, R. I.—*Machine for Cutting Eyelets.*—December 8, 1868.—Pressing against the edges of a series of revolving cutters is a metallic tube, which lies in a groove made upon a slightly spiral line in a jacket or easing which surrounds the cutters, so that each tube is brought to bear in succession against the surface of a pressure cylinder revolving in a contrary direction to the cutters.

Claim.—1. An apparatus for cutting tubing into sections, for eyelet blanks or other purposes, consisting of a series of revolving cutters, *a a*, a surrounding revolving jacket B, for holding and conveying the tubing, and a pressure cylinder, C, all in combination, substantially as described, for the purposes specified.

2. Making the openings D in the jacket or easing B, for holding and conveying the tubing inclined to the axis of the series of cutters *a a*, as herein set forth, for the purposes specified.

84,674.—MOSES P. BRECKENRIDGE, Meriden, Conn.—*Self-regulating Air Valve for Steam Heaters.*—December 8, 1868.—The cylinder is cast in one piece and cored in the center for the reception of a frame, in which a spring is securely held at one end.

Claim.—Inserting the frame B, which holds the spring C, into the case or cylinder A, by this means allowing the said cylinder to be constructed in one piece, and thereby doing away entirely with the use of packing.

84,675.—JULIUS BRÖNNER, Frankfort on the Main, Prussia.—*Gas Burner.*—December 8, 1868.—The burner head is made concave or sunken, and is provided with a slit by which the gas is made to flow from both ends of the slit toward the middle, so as to produce a flame at a right angle to the slit.

Claim.—1. The use of a slit, as aperture to a gas-burner, the top exterior surface of the head of which is concave or funnel-shaped, substantially as and for the purposes set forth.

2. The combination of two gas-burners thus made, in other words, of two fish-tail-slit burners, to form a compound economic or double burner, or of one such fish-tail-slit burner, with an ordinary burner, substantially as described.

3. The use of the fish-tail-slit burner head or insertion *e*, constructed and applied substantially as herein set forth.

84,676.—REUBEN BROOKS, JR., and WILLIAM N. MANNING, Rockport, Mass.—*Ruffling Device for Sewing Machines.*—December 8, 1868.—To the tension-bar, which is attached to the bed of the machine, is pivoted a slotted plate, by turning which the presser is relieved from contact with the tension-plate. A spring guide secured to the under side of the tension plate, permits the adjustment of the latter, so as to bear upon the cloth at any angle required.

Claim.—1. The combination of the bar B, slotted plate H, and screw G, all constructed substantially as described, and for the purpose set forth.

2. The rubber presser D, combined with the bar B and tension plate E, substantially as specified.

3. The adjustable spring guide F, in combination with the tension plate E and presser D, as specified.

84,677.—HIRAM BROWN, Burton, Ohio.—*Fastener for Lasts.*—December 8, 1868.—For securing the instep block to the last without nailing, as in the usual way.

Claim.—The slide D, so arranged in such relation to the last, B', that the lower end of said slide is received directly into the last, in the manner as and for the purpose set forth.

84,678.—A. R. BUFFINGTON, United States Army.—*Mechanical Movement.*—December 8, 1868.

Claim.—The improved mechanical movement, consisting of devices herein described, by means of which angular motion may be transmitted from one body to another, increased in velocity to twice, or reduced to one-half, the power varying, but the motion uniform, according as the one from which the initial motion proceeds acts upon the other, by means of surfaces on which slide or roll parts connected with this other body, or through the intervention of projections, axles, hubs, or pins simply, or these with blocks or wheels fitted on them, sliding, rolling, or moving in contact with surfaces of said other body, as substantially herein described.

84,679.—MILLS L. CALLENDER, New York, assignor to himself and SIDNEY L. HOLDREDGE, Greenburg, N. Y.—*Gas Retort.*—December 8, 1868.—The retort is divided by a partition into two chambers used in connection one with the other, whereby one chamber may be charged at different intervals from the other, so that the high temperature of the partially spent charge may be used to communicate with the adjoining chamber, and the vapors and gases of the first chamber be conducted through the second chamber, and vice versa, alternately.

Claim.—A double retort, made, arranged, and operated in the manner and for the purposes substantially as described.

84,680.—ELIJAH CARPENTER, Carbondale, Pa.—*Weather Strip.*—December 8, 1868.—A metallic plate is secured in a rebate in the threshold, and is provided with projections fitting in recesses, and operated by levers to raise or lower one edge of the plate or strip as the door opens and closes.

Claim.—1. The arrangement of the weather strip A, having the two projections *a a'*, with the slots *e e'* in the plates E E, attached to the jamb, or in the jamb itself, substantially as herein described and shown.

2. The combination of the strip A, levers B D, and door, when the several parts are constructed and arranged to operate in the manner described and shown, and for the purposes specified.

84,681.—ANDREW B. CLEMONS, Ansonia, Conn.—*Friction Clutch Pulley.*—December 8, 1868.—Upon the friction plate are placed two levers which are opened and closed by means of a slide, their jaws fitting upon a corresponding screw upon the hub of the pulley, so that the two parts may be forcibly drawn together by the revolution of the pulley.

Claim.—1. The screw-threaded levers E and E', in combination with the friction plate D and threaded hub C, of the pulley, for the purpose of drawing the two parts together, substantially in the manner and for the purpose specified.

2. The slide F, in combination with the levers E and E', and pins *a a*, for the purpose of operating the said levers upon the hub C of the pulley, substantially as herein set forth.

84,682.—N. A. DE LONG, New Scotland, N. Y.—*Wagon Tongue Support.*—December 8, 1868.—Underneath the axle and bolted to the king bolt is a plate spring, extending upward over the tongue, and slotted at its forward end, through which slot passes a standard having a series of holes, in one of which is placed a pin to regulate the tension of the spring.

Claim.—The combination of the tongue and axle with the slotted adjustable plate spring, embracing the standard F, and having four points of support, as and for the purpose set forth.

84,683.—EDWIN B. DEWEY, Pontiac, Mich.—*Lever Grapple.*—December 8, 1868.—A bearing lever provided with a hook, to which the tackle is hitched, is attached to the extended shorter arm of one of the main levers, so as to bear forcibly upon the other lever in raising the weight.

Claim.—The bearing lever F, provided with suitable hook G, when connected with curved and pointed levers A and B, and constructed and operating substantially as and for the purposes herein set forth and described.

84,684.—FORDICE W. EDISON, Port Huron, Mich.—*Horseshoe.*—December 8, 1868.—The shoe is made in two sections, hinged to the toe-piece, to which latter are attached springs which are designed to lie between the frog of the foot and the shell of the hoof.

Claim.—The arrangement of the expanding springs C C on the toe piece B, to which the wings A A are pivoted, substantially as and for the purposes set forth.

84,685.—WARREN R. EVANS, Thomaston, Me.—*Magazine Gun.*—December 8, 1868.—A fluted shaft rests upon the inner edge of a spiral thread or partition attached to the inside of the tube in the gun stock, to facilitate the passage of the cartridge.

Claim.—The combination of the fluted shaft D, which contains one or more flutes, with the fixed spiral thread or partition B, substantially as specified.

84,686.—HENRY S. FIRMAN, New York, N. Y.—*Apparatus for Deodorizing, Desiccating and Mixing Manures.*—December 8, 1868.—The apparatus consists of a furnace set within a brick chamber, and over which is an air-tight vessel forming a desiccating and mixing pan. Surmounting the mixing pan is a hopper fitted with sloping bottoms provided with valves. Connected with the mixing pan by a tube is a box provided with a false bottom, charged

with some suitable absorbent and into which the unabsorbed gases are conducted.

Claim.—1. Arranging a close desiccating and mixing pan, constructed substantially in the manner described, and provided with mixers, as set forth, in a close heating chamber, over a furnace or heating flue fitted with dampers, and constructed substantially as described.

2. The combination of the supply hopper, constructed substantially as described, with a close desiccating pan, for the purpose of introducing the material to be treated in the pan, as set forth.

3. Combining, with a close desiccating and mixing pan, a deodorizing or absorbing chamber, for the purpose of utilizing the offensive gases, and avoiding the nuisance occasioned by their escape from the pan.

4. Creating a circulation of the air and gas in the desiccating pan by means of an air pump affixed thereto, through the agency of pipes arranged substantially as described.

84,687.—JAMES P. FORCE and JOHN E. FORCE, Constantine, Mich.—*Fastening for Horse Collars.*—December 8, 1868; antedated November 21, 1868.—A flexible metallic strap or latch, and a catch, of sheet metal, are attached to the respective ends of a horse collar.

Claim.—The combination, with the collar A A' A'', of the flexible straps or latches B and catches C, constructed and employed as and for the purpose described.

84,688.—PERRY G. GARDINER, New York, N. Y.—*Car Spring.*—December 8, 1868.—A solid India-rubber spring is surrounded by one or more flat steel springs, against the outside of which latter three or more India-rubber solid springs are placed, the whole being inclosed in a suitable casing, a plunger acting on the central spring.

Claim.—The arrangement of an India-rubber spring, H, surrounded by steel spring rings, *n*, *m* and *w*, and India-rubber springs J, inclosed in a suitable casing, E, in combination with a plunger, P, acting upon the central India-rubber spring H, the whole being combined and operating together, in the manner and for the purpose substantially as described.

84,689.—E. P. GLEASON, New York, N. Y.—*Gas-lighting Device.*—December 8, 1868.—An elastic receptacle is placed within a metallic case, and filled with gas, which latter is expelled, as desired, through an exit pipe, by the contraction of a spring acting on the elastic receptacle.

Claim.—1. Charging or filling an elastic gas-tight receptacle with gas, and then supplying the same to a burner connected thereto, for lighting purposes, whether the same shall be accomplished in the precise manner shown, or in an equivalent manner.

2. The combination, with an elastic gas-tight reservoir, B, of a suitable case, A, and an exit-pipe, D, constructed and operating substantially as described, for the purposes specified.

3. The combination of an elastic gas-tight reservoir or receptacle, B, case A, and exit-pipe D, with a spring, G, placed either within or beneath the receptacle B, for the purposes fully described.

4. The combination of the case A, receptacle B, exit pipe D, and spring G, with the cord E, for the purposes set forth.

84,690.—WILLIAM C. GRISWOLD, Brooklyn, N. Y.—*Machine for Stretching Hat Bodies.*—December 8, 1868.—Above the upper cross-bar is an adjustable ring containing in its interior six or more curved arms, and to the lower side of the said cross-bar is secured a ring provided with a number of inclined radiating bars. On a vertical sliding rod is a circular plate provided with radiating expanding arms. On the upper end of the said vertical rod is a stud which carries a star, the arms of which intervene with the above named curved arms, when the rod is raised.

Claim.—The combination of the tip-stretching mechanism, consisting of the spokes *c'* and star *m*, with the brim-stretching mechanism, consisting of the inclined stationary arms *d'*, and the expansible or spreading arms *i*, all constructed, arranged, and operating substantially as herein specified.

84,691.—MICHAEL STOLL and HENRY GROSS, Middletown, Pa., assignors to HENRY GROSS.—*Manure Hook.*—December 8, 1868.—As the machine is drawn across a stable floor the manure is gathered and carried off. By disengaging the lever and raising the handles the rake is relieved of its load.

Claim.—1. The handles A, provided with the slots *i i*, and the stops *p p*, in combination with the beam B and hook C, substantially as described, and for the purposes set forth.

2. The lever *e*, to act in conjunction with the slot *j*, as and for the purposes specified.

84,692.—W. H. HALLECK, Ann Arbor, Mich.—*Implement for Trenching around Plants, to Prevent the approach of Worms.*—December 8, 1868.—A circular stamp made of metal having a sharp lower edge, having its interior surface inclining toward the center, and with a flaring exterior, so that when pressed into the earth and drawn out, it will leave a wedge-shaped circular trench.

Claim.—The invention of an implement to prevent the cut or wire worm from destroying corn and plants, using for that purpose the aforesaid stamp, (circular, rolling, square, sliding,) or any shape substantially the same, for the same purpose as herein set forth.

84,693.—VIRGIL HAYES, CAMPBELL G. WALDO, and HARLAN A. MAIN, Tekonsha, Mich.—*Grain Binder.*—December 8, 1868.—The grain is carried by an endless belt to a rack which feeds the binding attachment, the latter consisting of a hollow arm through which the wire is run, and as the arm passes around the grain, the wire is drawn by a small hook to the twisting device and then to the cutter, after which the hook is brought to the proper position to receive the wire for binding another sheaf. The sheaf, when bound, is dropped by a rack attached to the rear of the binding attachment.

Claim.—1. The stationary apron J and the tilting rack K, with its disengaging lever T, the bracket M, and stationary rod N, provided with rests O, spool pulley P, with its spool Q, pin X, and hollow arm R, with its opening S, or their equivalents, when arranged and operating substantially as and for the purposes specified.

2. The clutch pulley V, provided with inclined plane 2, clutch lever W, shifter Y, clutch 1, shaft 3, the pulley Z, provided with wrist pin 7, and hook 8, spur wheel 4, pinion 5, ratchet wheel 6, hinged binding apron U, spring latch 10, closing spring 12, provided with wire or rod 11, and the knife 9, or their equivalents, when arranged and operating substantially as and for the purposes set forth.

84,694.—ISRAEL HOGELAND, Indianapolis, Ind.—*Clothes Rack.*—December 8, 1868.—So constructed as to render the parts readily detachable, and capable of being compactly folded.

Claim.—In a rectangular clothes frame, the two rigid stays or cross-bars B B, pivoted, at one end, to one of the side pieces A A, and having the end which is not pivoted attached to the opposite side piece, in such a manner that it is easily detachable, substantially as described, and for the purpose specified.

84,695.—SAMUEL W. HUNTINGDON, Augusta, Me.—*Shearing Machine.*—December 8, 1868.—A movable blade is pivoted to a stationary blade, and operated by a lever which, in turn, is pivoted at its front end to a standard or goose neck making a part of the stationary blade. The two blades are also provided with short auxiliary jaws or blades for cutting wire, &c.

Claim.—1. The construction and arrangement of the fixed blade *a*, the post *c*, and goose neck *e*, the lever *i*, attached to and moving in the slot formed in said goose neck, and the movable shear blade, connected with both the post *c* and lever *i*, as herein shown and set forth.

2. In conjunction with the fixed and movable blades *a* and *f*, and the lever *i*, arranged as specified, the auxiliary cutting blades *d* and *g*, formed in rear of the pivotal point *a'*, the one upon the post *c*, and the other upon the prolongation of the shear *f*, as herein shown and described.

S4,696.—ANTHONY ISKE, Lancaster, Pa., assignor to himself and BENJAMIN MISHLER, same place.—*Burglar Alarm and Table Bell.*—December 8, 1868.—An ordinary call bell is combined with a portable burglar alarm, which may be connected by a pin and thread with any door or window, so that if either be opened an alarm will be sounded.

Claim.—The combination and arrangement of the base V, with its chambers for the affixed key U, and the spiral spring T, gearing, and bell attachment, all constructed and operating substantially in the manner and for the purpose specified.

S4,697.—JACOB O. JOYCE, Dayton, Ohio.—*Device for Cutting Out Sections of Annular Cylinders.*—December 8, 1868.—The tool post, which is set in the circular outer end of the bed, is provided with an adjustable cutter, and also with a gear wheel which engages with a worm gear on a horizontal shaft attached to the head of the bed, by which the cutter is turned slowly around to plane out the interior of an annular semi-cylinder.

Claim.—The combination and arrangement of the bed plate A, tool post G, and cutter I, with the gear wheel C, shaft E, and worm D, all substantially as and for the purposes specified.

S4,698.—ANSON JUDSON, Brooklyn, N. Y.—*Lathe Chuck.*—December 8, 1868.—The nuts by which the screws operate the jaws are made in separate pieces, which interlock with the jaws by dovetailed tenons arranged at right angles to the axes of the screws, so that as the inclined surfaces on the tenons slide upon the inclined grooves in the jaws the latter will be more closely drawn against the face plate.

Claim.—Making the jaw C and the nut B, or its equivalent, in two or more parts, instead of in a single piece, as has formerly been done, and so combining these parts that the action of the part B upon the part C shall draw the latter snugly to the face-plate or bed, substantially as hereinbefore set forth.

S4,699.—HANDLY B. KIMBALL, Charlotte, Mich.—*Mode of Applying Crystal Frosting to Glass.*—December 8, 1868.

Claim.—As a new article of manufacture, the “crystal frosting” on window glass, produced by flowing one side with any suitable efflorescing solution, and protecting the efflorescence, when fully dry, with copal or other suitable varnish, substantially in the manner and for the purpose herein specified.

S4,700.—CHARLES KOHLER, Galena, Ill.—*Car Coupling.*—December 8, 1868.—The coupling pin is pivoted to a lever, so as to have a vertical movement to engage with the coupling link, and is thrown back to its place by means of a spring.

Claim.—The combination of the lever *a*, pivoted pin *h*, with a buffer head, which has cavities *i* and *j* therein, when constructed and arranged to operate in connection with a spring *k*, substantially as described, as and for the purpose specified.

S4,701.—G. W. LEWIS, Dansville, N. Y.—*Bolt Trimmer.*—December 8, 1868.—An adjustable fulcrum is combined with the cutter so as to compensate for the wear of the cutting edge. The cutter is thrown forward by means of a cam, and the reaction is produced by a spring.

Claim.—1. The curved handle *d*, cast with the stock A, in combination with the independent screw *l*, the cam lever *g d'*, fulcrum *i*, and the cutters *b c*, substantially as described, for the purpose specified.

2. In combination with the above, the spring *h*, substantially as and for the purpose described.

S4,702.—JOHN A. MOFFITT, Boston, Mass.—*Water-proof Paint.*—December 8, 1868; antedated November 25, 1868.

Claim.—1. The combination of either India-rubber, gutta percha, or balatta, with benzine or naphtha, and either arsenic, arsenic acid, or the “universal deodorizing powder,” as driers, in manner and for the purposes hereinbefore described.

2. The combination of either India-rubber, gutta-

percha, or balatta, with benzine or naphtha, and either of said driers, arsenic, arsenic acid, or the “universal deodorizing powder,” with oils and pigments, in the manner and for the purposes hereinbefore described.

3. The application of arsenic, arsenic acid, or the “universal deodorizing powder,” as driers for India-rubber, gutta percha, or balatta.

S4,703.—MARY A. MOORE, Lisbon, Ill.—*Child's Diaper.*—December 8, 1868; antedated November 23, 1868.—The diaper is secured to the body by elastic straps passing over the shoulders and across the hips.

Claim.—The combination of the diaper A with the elastic straps B C D, constructed and arranged substantially as set forth.

S4,704.—W. T. MUNGER, Branford, assignor to P. and F. CORBIN, New Britain, Conn.—*Reversible Latch.*—December 8, 1868.—The lever stop is so constructed as to hold the shank of the latch in its recess in the swinging link, to prevent the latch from being withdrawn, and also to allow of the removal of the shank from the swinging link, in order to reverse the position of the inclination at the end, to make a right or left hand lock.

Claim.—The lever *a*, acting as a stop, and also retaining the reversible latch, substantially as specified.

S4,705.—S. E. OVIATT, Richfield, Ohio.—*Grain Separator.*—December 8, 1868.—To an endless apron are attached a series of cross bars provided with fingers, which are moved by an arm as they pass over rollers, to agitate the straw.

Claim.—1. The finger bar D and conveyer C, in combination with the roller H or its equivalent, to operate substantially as set forth, for the purpose specified.

2. So hanging the finger bar D of the conveyer to the endless belt, chain, or apron, as to allow the said finger bar to receive a turning or tipping motion, to throw or agitate the straw when it is being conveyed from the threshing cylinder, substantially as and for the purpose described.

S4,706.—S. E. OVIATT, Richfield, Ohio.—*Threshing Machine.*—December 8, 1868.—Attached to the lower end of the stacker are brackets provided with hollow journals, which form bearings for the shaft of the carrier rollers. Attached to the shoe is a hinged tail board and screen.

Claim.—1. The metallic bracket C, when attached to and forming a support for the lower end of the stacker B, and having its pivot or journal hollow, forming a box or bearing for the carrier shaft E.

2. The metallic bracket C, so connected with the stacker B and frame of the thresher as to form a pivot and support for the lower end of the stacker, substantially as set forth.

3. The hinged tail board H and tail screen I, in combination with the shoe G of the thresher, substantially as and for the purpose set forth.

4. The hinged chute K, cut-off L, and shoe G, arranged in the manner and for the purpose as set forth.

S4,707.—CYRUS PEABODY and PATRICK H. DELANEY, Detroit, Mich.—*Advertising Device.*—December 8, 1868.—The clock work is made to operate a bell, which is continuously rung to call the attention of passers by to the advertising board.

Claim.—The combination, with an advertising board or frame, of a bell-striking clock work, substantially as and for the purposes set forth.

S4,708.—CULLEN W. REED, Chagrin Falls, Ohio.—*Horse Hay Fork.*—December 8, 1868.—In a slotted cross head is arranged a hinged dog, so adjusted as to catch the free end of an independent tine pivoted at the end of the cross head, the tine being connected with an arm or lever, which enters the snap catch of the dog.

Claim.—The cross head A, when the same is slotted its entire length, the pivoted hinged tines B and C, when the former is provided with a lever arm, B¹, in combination with a dog, E, and the whole

is so arranged as to operate substantially as described, and for the purpose specified.

84,709.—C. W. ROBERTS, Austin, Ill.—*Repeating Clock*.—December 8, 1868; antedated November 21, 1868.—The parts are so arranged as to cause the clock to strike, at certain intervals, the same number as the previous hour.

Claim.—1. The combination of the bell spring J, bell I, and standards *a*, *b*, *c*, &c., substantially as set forth.

2. The combination of bell I, spring J, slide G, cams M, N, and levers D, B, as and for the purpose set forth.

84,710.—WILLIAM ASPLEY ROBINSON, Auburn, N. Y.—*Steam Graduator*.—December 8, 1868.—To the reversing lever is attached an additional lever or graduator, supplied with a graduating quadrant, and so connected with the reversing lever and its connecting rod that the smallest movement of connecting rod can be very minutely adjusted.

Claim.—The arrangement of the graduating lever B with the reversing lever A, quadrant C, and joint E, as shown and described.

84,711.—JOHN C. ROGERS, Alden, N. Y.—*Gate Latch*.—December 8, 1868.—An armed catch is hinged to the gate post so as to oscillate laterally in the direction in which the gate swings, and is provided with a notch which engages with a rigid bolt in the end of the gate.

Claim.—The oscillating catch C, hinged to the gate post, and provided with notch *e* and socket *f*, in combination with the rigid pin *g* and bolt *i*, operating substantially in the manner and for the purpose set forth.

84,712.—E. G. DORCHESTER and URI SCOTT, Geneva, N. Y.—*Hay Fork*.—December 8, 1868.—The tines are secured in a ferrule by a wedge held in place by a screw, so that a new tine may be inserted at any time when necessary.

Claim.—The tines A, when constructed as herein shown and described, and wedge B, and screw *e*, or its equivalents, in combination with the ferrule C, all acting conjointly, as and for the purpose set forth.

84,713.—EDWIN SEELY, Elkhart, Ind.—*Machine for Sacking Potatoes*.—December 8, 1868; antedated November 23, 1868.—On one side of the bin is arranged a slide provided with pointed teeth below. The slide is opened to let out the potatoes.

Claim.—The hetchel slides C and D, bin B, the whole constructed, arranged, and operated substantially as and for the purpose set forth.

84,714.—AMOS SHEPARD, New Britain, Conn.—*Machine for Bending Sheet Metal*.—December 8, 1868.—A thin plate is suspended over the edges of two folding bars which are hinged at each end in such a manner that their inner edges are in the center of motion. The under side of each bar is provided with a stationary support, near its outer edge, while an opening is left under them, so that when the plate and center of the bars descend, the supports cause the bars to fold up either side of the plate.

Claim.—1. The combination of the plate C, bars A A, and supports L L, the whole connected and operating substantially as and for the purpose described.

2. The combination of the plate C, bars A A, slides B B, and set screws *c c*, the whole connected and operating substantially as and for the purpose described.

3. The combination of the plate C, bars A A, gauge *a*, and table K, arranged and operating substantially as and for the purpose described.

4. Hinging the plate C at one end so that the other end of plate C can be raised, substantially as and for the purpose described.

5. The combination of the bars A A and plate C, when arranged so that at each operation of the machine the plate C shall move edgewise toward the bars A A, and gripe the metal previous to any action or movement of the bars A A, substantially as and for the purpose described.

84,715.—M. W. STAPLES, Catskill, N. Y., assignor to himself and JOHN H. BURFIS, New York City.—*Wash Boiler*.—December 8, 1868.—A conical tube is affixed to a movable bottom, and water is ejected upon the clothes from perforations in the upper portion of the tube. The movable bottom is supported upon hollow legs having openings in their sides.

Claim.—The tubular legs *d*, supporting the removable bottom *c*, and provided with openings in their sides, near the lower ends, in combination with a tube, rising above the bottom *c*, through which the rising water circulates, substantially as set forth.

84,716.—O. S. ST. JOHN, Willoughby, Ohio.—*Car Coupling*.—December 8, 1868.—The coupling links are each provided with a hook pointing inwardly by which they are automatically locked together. The links are uncoupled by means of a cam acting on the under side of the draw bar.

Claim.—1. The link G, made with hook *b*, and guide shoulders C thereon, operating in the manner and for the purpose described.

2. In combination with the above, the cams K and L, chain N, and shaft I, arranged as described, and operated by the means, and in the manner, and for the purpose substantially as specified.

84,717.—J. E. STURDY, Augusta, Maine.—*Tack Holder and Carpet Stretcher*.—December 8, 1868.

Claim.—As a new article of manufacture, a combined carpet stretcher and tack holder, composed of two hinged jaws, notched upon either or both of their contiguous edges, so as to receive and hold the tack, and having their carpet-stretching teeth turned inwardly or toward the center, as set forth, either without or in combination with a spring of vulcanized rubber, or its equivalent, for holding said jaws together, substantially as and for the purposes described.

84,718.—DEWITT C. THOMPSON, Isehua, N. Y.—*Beef-steak Cutter and Mangler*.—December 8, 1868.—Two upright forks are secured to a platform upon which the steak is placed to be cut, after which, the cut pieces are passed between two rollers provided with knives or cutters.

Claim.—The combination of the forks A with the platform D, and rollers B, and sharp knives C, as above described, for the purpose specified.

84,719.—JOHN FINDLEY THOMPSON, Greenborough, Pa.—*Hydraulic Apparatus*.—December 8, 1868.

Claim.—1. A pair of upright stationary cylinders, having ports for the admission of water from the forebay, in combination with valves *a a'*, which open and close such ports, and pistons *e e'*, which operate inside the cylinders, and are attached to the opposite arms of a walking beam, substantially as and for the purposes above set forth.

2. A reciprocating shaft *l*, when used for actuating the valves of water-power cylinders *b b'*, and constructed with adjustable connections, *h* and *l'*, for securing an adjustable or variable cut-off, and giving any desirable lift to the valves, substantially as above set forth.

3. Imparting to the reciprocating shaft *l* a greater or less length of throw, by raising or lowering in a slot, *o'*, the forward or operating end of an eccentric rod, *f''*, the devices being constructed and operated substantially in the manner and for the purposes hereinbefore set forth.

4. The slotted levers *m m'*, when connected by supports *u u'* with the valve lifters *n n'*, in such way that the open port of one cylinder may be closed before the completion of the downward stroke of its piston, without opening the ports of the other cylinder till the upward stroke of its piston shall be nearly or quite complete, substantially as and for the purposes hereinbefore expressed.

5. The slotted arm *x*, on the walking beam C of a water power, and the slotted circular head *y'*, or its equivalent, connected together by a pitman, *x'*, adjustable at each end, the parts being arranged and operating substantially as and for the purposes hereinbefore set forth.

6. The upright cylinders *b b'*, with valves, ports, and pistons, as a fluid meter, constructed and operated substantially as and for the purposes hereinafore set forth.

S4,720.—G. G. TOWNSEND, Rochester, N. Y.—*Metal Last*.—December 8, 1868.—A metallic last is mounted on a standard so that it can be turned around, and is designed for clinching the nails when driven in.

Claim.—The revolving metallic last B, when made as shown, so as to withstand a blow from the hammer on any portion or point of the face or sole, in combination with the conical-pointed standard A, for the purposes set forth.

S4,721.—STEPHEN D. TUCKER, New York, N. Y.—*Machine for Grinding Circular Saws*.—December 8, 1868.—The carriage that supports the saw is made to move automatically in both directions. The circular arbor or bearing for the saw is so constructed as to permit the center of the saw to advance to the edge of the grindstone.

Claim.—1. Making the head adjustable on the carriage K, in combination with the rollers E' F', for driving the saw, whereby the machine can be readily adjusted to grind saws of any diameter, substantially as described and specified.

2. The movable rest *h*, for holding the saw at the point of grinding, whereby the saw may be automatically ground of a concave, convex, or plane surface, substantially as described and specified.

3. The rest *h*, screw *l*, provided with its arm M', and the grooved and slotted guide L', pivoted to the carriage, substantially as described and for the purpose specified.

4. The combination and arrangement of the clutch *p'*, pulleys C' C', the worm V' on the shaft W', upright shaft N', with its spring *y*, and the adjustable stops *d d* on the carriage, for operating the carriage in both directions automatically, substantially as described and specified.

5. The rod N', provided with arm *v* and pin *w*, clutch *p'*, and adjustable stops *d d* on the carriage, for reversing the travel of the carriage, substantially as described and specified.

6. The scroll gear G' and inclined rack I', on the carriage, for giving a differential movement to the carriage, substantially as described and specified.

7. The arbor or bearing *q*, center pin *p*, and cap *o*, substantially as described and specified.

S4,722.—JOHN L. WARREN, Detroit, Mich.—*Saw*.—December 8, 1868.—For the purpose of cutting dovetails or other similar work.

Claim.—The construction of a saw, substantially as described, with two cutting edges, the one operating at any desired angle relative to the other.

S4,723.—WARREN WRIGHT, St. Louis, Mo.—*Hominy and Smut Mill*.—December 8, 1868.—The mill consists of a double case, the inner shell of which is provided with semiannular plates or partitions. Within the said case is a revolving hollow scouring and blowing shaft, having an air-gathering cup or scoop upon one of its ends, and at the opposite end is a discharge spout and a blast passage. Roughened scouring and smooth conveying blades are set spirally around the hollow blowing shaft.

Claim.—1. The "double case," consisting of the divided end plates A B, A' B', the divided cylindrical shell C D, and the divided perforated scouring cylinder E F within and concentric with said shell C D, all said parts being arranged to operate substantially as herein described, for the purposes set forth.

2. In combination with the partitions H, the wedge-formed wings or cut-offs S, arranged upon a rotating shaft, in the manner set forth.

3. The longitudinally-adjustable scouring and blowing shaft O, constructed with the air-gathering cup or scoop P, and air discharges *o*, and armed with roughened blades R, wedge-formed wings or cut-offs S, and spiral discharge blades S', in combination with a horizontal, partitioned, and perforated cylinder, substantially as herein described, for the purposes specified.

4. The combined arrangement, with the descending grain-discharge spout T of the laterally-travers-

ing and upturned blast passage U *u u'*, substantially as described, for the purpose specified.

S4,724.—JACOB H. BALLARD and EDWARD P. BOND, New Antioch, Ohio.—*Brick Machine*.—December 8, 1868.—The clay is forced into chambers, and then out of openings in the same upon rollers forming long slabs, and is afterward cut in proper lengths by wires.

Claim.—The frame A, shaft B, with wheel *b*, pug mill C, with openings *c²*, and shaft C', having the wheel *c¹*, plungers D, shaft *d'*, wheel E, chambers F, with openings G and wires H, the whole being combined, arranged, and operated in the manner described and for the purposes set forth.

S4,725.—A. B. BARNARD, Worcester, Mass., assignor to THOMAS C. CRAVEN, Albany, N. Y.—*Hay Spreader*.—December 8, 1868.—Fixed to the hills are bent or curved screws, provided with coiled springs, and which extend upward and pass through openings in the cross piece of the reel frame, so as to allow the spreading device to yield to obstructions on the ground.

Claim.—The combination with the screw standard or standards I', provided with nuts, as shown, of coiled spring or springs K, substantially as and for the purposes set forth.

S4,726.—P. G. BIGGS, H. A. BUTLER and H. GRANGER, Macou, Mo.—*Combined Band Cutter and Feeder for Thrashing Machines*.—December 8, 1868.—A series of disks, set at an angle on a rotating shaft, spread the bundles as they are carried forward, and the bands are cut by circular knives on a pivoted shaft arranged at one end of an inclined platform.

Claim.—The spreader H I, constructed as described, in combination with the band cutter E G, carrier C D, and frame or box A, substantially as herein shown and described and for the purpose set forth.

S4,727.—ELI S. BITNER, Lock Haven, Pa.—*Brick Machine*.—December 8, 1868.—The molds upon the endless chain are each hinged on one side, and provided with a crank pin, which is operated by an inclined plane to open the hinged side and deliver the clay upon a board, which is moved by contact with a corrugated roller. The end of the spiral screw is deflected and provided with a disk, so as to prevent the clay from choking the screw.

Claim.—1. The pressure rollers D D¹ in the movable frame A⁵, chain of molds C, plank H, and corrugated feed roller E, constructed and arranged substantially as and for the purposes herein set forth.

2. The mold C, when provided with the movable side *c*, and crank pin *c¹*, operated by contact with the inclined planes I, and pressure roller D, substantially as and for the purposes herein described.

3. The combination of the feed screw F, when deflected at *f*, with the disk *f¹* and feed box F¹, all constructed and operating substantially as and for the purposes set forth.

S4,728.—JOHANN BONGARDT, New York, N. Y., assignor to himself and L. H. COHN, same place.—*Process and Composition for Printing the Grain of Wood*.—December 8, 1868.—The wood is soaked in variable proportions of linsed oil, brown japan, lithrage, white soap, and water, and the impression is made as in ordinary surface printing.

Claim.—1. The method, herein described, of preparing wood to cause it to print its veneer or grain on paper or other material, as set forth.

2. The composition herein described for treating wood, for the purpose set forth.

S4,729.—EDWARD BUCKMAN and ALEXANDER BUCKMAN, Greenbush, N. Y.—*Gate*.—December 8, 1868.—Two stops upon the gate are so arranged that when the gate is brought to a closed position, two latches on the supporting posts will drop at the inner ends of the stops, and prevent longitudinal movement of the gate, and lock the same.

Claim.—The combination and arrangement of the latches with the supporting posts and the stops upon the gate, substantially as and for the purpose specified.

84,730.—ORRIN H. BURDICK, Auburn, N. Y., assignor to himself and DAVID M. OSBORNE, same place.—*Harvester Rake*.—December 8, 1868.—The invention relates to the manner of driving and controlling a series of revolving and rising, and falling arms, one of which is a rake, and the others beaters for drawing in the grain to the cutters of a harvesting machine, while the rake delivers it, after it is cut, in a gavel on the ground.

Claim.—1. The adjustable camway *h*, in combination with the permanent camway *g*, for the purpose of raising the rake over the grain that may be on the platform, when it is desired to use the rake as a beater only, substantially as described.

2. The combination of the two adjustable camways *G h*, for controlling the action of the rake, substantially as herein described.

3. In combination with the fixed or permanent camways for guiding and controlling a series of rake and beater arms, in their rotation, the lever *F*, and movable camways, dog, and trigger, for allowing the driver from his seat to control the rake and throw it out of raking action, while the rake itself sets the parts for allowing it to go into raking action, substantially as described.

4. In combination with the rake and beater heads, the auxiliary arms *P*, and the three adjustable fastenings *u*, *v*, and *v'*, for giving such heads and arms the requisite inclinations upon their arms *B*, substantially as described.

84,731.—MAXIMILIAN LOUIS J. CHOLLET and CELESTE H. E. HAMILTON, Paris, France.—*Poultice Cloth*.—December 8, 1868.—The mucilaginous substances consist of decoctions of marsh mallow, flax seed, bran, or starch.

Claim.—An article of manufacture, consisting of a poultice, composed of leaves of canvas or muslin, impregnated with mucilaginous substances, substantially as herein described.

84,732.—Suspended.

84,733.—EBEN L. COWLING, Boston, Mass., assignor to JAMES P. BRIDGE.—*Preserving Wood*.—December 8, 1868.

Claim.—The employment of dry superheated steam, in combination with vaporized chemicals, for the preservation of wood, as set forth, the natural moisture of the wood being first absorbed by the use of the dry superheated steam without the chemicals, and the air expelled, substantially as described.

84,734.—NEEDHAM COX, Salem, Ill., assignor to himself, CHRISTOPHER M. HOUTS, and J. S. MOORE, same place.—*Tanning Composition*.—December 8, 1868.—The ingredients consist of tan bark, salt, sulphuric acid, salix root, terra japonica, and soap, in various proportions.

Claim.—The use of all of said ingredients, when applied in the proportions heretofore given, or their equivalents, substantially as and for the purposes set forth.

84,735.—ARNOLD DAVIDSOHN, St. Louis, Mo.—*Railroad Car Heater*.—December 8, 1868.—A box to be filled with hot sand is attached to the floor of a car, and is provided with an influent and an effluent hopper, for the reception of hot sand and discharge of the cooled sand, at suitable stations on the road.

Claim.—The car-heating device, composed of box *D*, slide *d'*, influent hopper *E*, valve *e*, and effluent hopper *F*, and discharge valve *f*, when constructed to operate as described and arranged, with relation to the vehicle, substantially as set forth.

84,736.—JOHN FAINT, Columbus, Canada.—*Stove Pipe Joint*.—December 8, 1868.—An annular rib is formed around and at a given distance from each, and of each length of pipe, and combined with open lap portions of the seam at each end thereof.

Claim.—A section of stove pipe, seamed longitudinally, except that portion lapping the adjoining section, such portion being lapped the width of the seam, or thereabouts, as shown and described, for the purpose set forth.

84,737.—CHARLES FLEISCHEL and WILLIAM C. BUSSEY, San Francisco, Cal.—*Door Lock*.—December 8, 1868.—Passing through a hole in the lock case and the door is a cylinder, having attached to its inner end a disk, from the upper side of which rise two rigid plates having tumblers between them, consisting of elongated metal plates. Within the case is a flat bar having fastened to it a steel plate with wards on its edge corresponding to the number of the tumblers.

Claim.—The plate *K*, fastened upon the bolt of the lock, and provided with the wards *c. c. &c.*, in combination with the cylinder *B*, disk *C*, and revolving tumblers *F F*, substantially as described, and for the purposes set forth.

84,738.—J. M. D. FRANCE, Washington, D. C.—*Paper File*.—December 8, 1868.—Two notched uprights are attached to a base, and in the notches fits a bar placed upon a movable board under which the papers to be filed are placed.

Claim.—A device for filing papers, consisting of a frame, *A A*, notched as described, in combination with bar *B*, base *C*, sliding board *D*, and pin *E*, combined and operated in the manner substantially as hereinbefore described, for the purpose specified.

84,739.—JOHN FRIESE and GEORGE DANIEL FRIESE, Baltimore, Md., assignors to JOHN FRIESE, same place.—*Conductors' Punch*.—December 8, 1868.—To the inner side of one of the jaws is attached a steel plate, extending beyond the tooth, and bending over the extremity of the other jaw, to facilitate the entrance of the article to be punched.

Claim.—In connection with the eyelet-cutting instrument, having the two jaws *A* and *B*, the tooth *a*, the opening *e*, and the spring *C*, the rigid plate *M*, when attached to the jaw *B*, upon a raised bed, *s*, and provided with the opening to receive the tooth *a*, and bent so as to hook over the end of jaw *A*, the several parts being constructed to operate together, in the manner and for the purposes herein set forth.

84,740.—ABRAM J. GIBSON, Cincinnati, Ohio, assignor to himself, BENJAMIN J. THURSTON, and THOMAS A. HARROW, all of same place.—*Mode of Constructing the Heating and Lighting Apparatus on Railway Cars*.—December 8, 1868.—A separate fire-proof room for heating and lighting is provided at one end of the car, so that in case of the destruction of the car by accident, that portion occupied by the passengers would escape the danger from fire. A sash or window is made of sufficient size to allow the furnace to be thrown out from the same.

Claim.—1. A perforated metallic partition, enclosing and constituting a fire-proof lighting and heating chamber, in one end of a railway car, constructed in the manner and for the purpose substantially as herein set forth.

2. One or more lenses, in the perforated metallic partition of a fire-proof lighting and heating chamber of a railway car, as and for the purpose above specified.

3. The safety sash or window, when so constructed as to constitute the outer side of a lighting and heating chamber in a railway car, as hereinbefore described and set forth.

84,741.—JOEL E. GILES and WILLARD FERRY, Mead's Mills, Mich.—*Potato Digger*.—December 8, 1868.

Claim.—1. Arranging the shares *S S* on the landsides in such a position that the landsides will gather the vines together before the shares enter the hill, substantially as shown and described, and for the purpose set forth.

2. The construction and arrangement of the two shares *S S*, as shown and described, viz, by making their front edges recede to the rear, and leaving an opening there between them, when said shares are combined with the landsides, substantially as and for the purpose set forth.

3. The arrangement of the tines *N N*, &c., in a double curve, as shown and described, and for the purpose set forth.

4. The combination of the brace *E* (applied to prevent the spreading of the landsides) with the bow *D*, when said bow is arranged in position to

prevent its engaging with the vines, substantially as and for the purpose set forth.

5. The brace A, when arranged as shown and described, for the purpose set forth.

84,742.—SETH GILL, San Pablo, and DAVID C. WOODS, San Francisco, Cal.—*Ships' Davits.*—December 8, 1868.—The davit arms are jointed so as to be turned at right angles and not project from the ship's side. The boat is suspended by a tackle from travelers which move in and out of the davit arm, being operated by an inhaul and outhaul tackle.

Claim.—1. The jointed davit arms E E, with their tackle, or an equivalent device, the whole constructed and operated substantially as and for the purpose herein described.

2. In combination with the jointed arms E, the traveler L, with its inhaul and outhaul tackles M and N, substantially as described.

3. In combination with the davit arms E, the uprights D, with the lifts H, and stanchion I, the whole connected by rods with the davits on the opposite side, substantially as and for the purpose herein described.

84,743.—WILLIAM B. GLEASON, Conneautville, Pa.—*Boot Crimper.*—December 8, 1868.—Consists of an arrangement of devices by which the necessity of first braking the boot front and then removing it from the brake, and drawing and tacking it on to the crimping board by hand, is dispensed with.

Claim.—1. The grab bars S S, spring block M, the movable spring grabs O O O O, all constructed substantially as set forth.

2. The crimping board L, combined with the grab bars S S, spring block M, and movable spring grabs O O O O, for the purposes as set forth.

84,744.—JOSIAH E. HOLLISTER, Calais, Vt.—*Elevator.*—December 8, 1868.—The parts are so arranged as to retain the load at any elevated position until it can be moved, by transferring the carriage, arranged on an elevated truck, to any place of deposit beneath.

Claim.—1. Combining the brake A and the pulley G with the car, as and for the purpose specified.

2. The hoisting rope c and tackle block J, in combination with the brake A and pulley G, for the purpose and substantially as described.

3. The tripping rope I, applied to the hook end N of the brake, as and for the purpose specified.

4. The draw rope H, in combination with the car E and eye k, as and for the purpose specified.

5. The adjustable and movable cam h, constructed as described, and applied to the rail C, for the purpose and substantially as described.

6. The rod f, in combination with the brake A and the cam h, for the purpose and substantially as described.

7. The plate e or holding device, in combination with the hook end of the brake A, for the purpose and substantially as described.

8. The combination of all the operative parts specified, when arranged to operate substantially as and for the purposes set forth.

84,745.—ROBERT G. JAMESON and WILLIAM H. CHAMBERLAIN, Bristol, N. H.—*Horseshoe.*—December 8, 1868.—A curved bar, having calks formed upon it, is attached to the shoe by means of hooks which pass through slots in the heel of the shoe, and a screw at the toe.

Claim.—The bar C, of the form herein shown, and provided with heel and toe calks, when fastened to the shoe by means of the hooks f f and slots b b at the heel, and screw i at the toe, substantially as described for the purpose specified.

84,746.—CATHARINE MAXWELL and I. NEWTON PEIRCE, Philadelphia, Pa.—*Preparation of Steel for Corsets, Hoop Skirts, &c.*—December 8, 1868.—Composition consists of varnish, pulverized quartz and benzine.

Claim.—Coating steel with this composition, for use in female apparel, as herein described, or any other substantially the same, and which will produce the intended effects.

84,747.—C. MCINTURFF, Greenville, Tenn.—*Car Coupling.*—December 8, 1868.—The coupling bar is pivoted at its rear end and provided with a hook or projection, below which enters a slot in the opposite coupling bar. In connecting the cars the coupling bar pushes back a sliding block to allow the hook to drop into the slotted bar.

Claim.—A car coupler, composed of the bars A, with hooks B and springs H, and sliding blocks C with springs D, when used in connection with the levers G, all constructed and arranged substantially as described, and for the purposes specified.

84,748.—FRANCIS MCTARNAHAN, Santa Clara, Cal.—*Gang Plow.*—December 8, 1868.—Under the axletree is a block to which the evener is attached, and, in connection with the curved serew slides, serves to regulate the depth of the furrow. As the team turns, the plows are automatically raised to clear the ground.

Claim.—1. The frame or groundwork of the gang plow.

2. The combination and arrangement of the beam R, to which the plows are fastened, the beam to which said plow beam is fastened by hinges, the semicircular hinges, as constructed, and the manner of fastening the plows in the beam, all as shown.

3. The serew slides A, in combination with the frame.

4. The combination and arrangement of the beam L, to which the lever is fastened, the post on which it works, the chain, the pulley on which it works, the evener, and the guard, all as described.

5. The square block D under the axletree, for regulating the amount of land, in combination with the evener.

6. The construction, combination, and arrangement of the several parts, as shown and described.

84,749.—HENRY MERRIMAN, Bloomington, Ill.—*Coal Chute.*—December 8, 1868.—The device is designed to be used in discharging coal into boats, cars, &c. The hinged doors are balanced by weights so arranged that the swinging downward of the outer door unfastens the inner and permits it to fall.

Claim.—The inner weighted apron C, having the loose catch rods g, and pivoted at its lower edge to the chute, and the outer weighted apron D, also pivoted at its lower edge, and provided with the lugs o o, all operating as described, whereby as the outer apron is swung down to form a spout, the lugs o o release the rods g from the catches e, and permit the inner apron to open the chute for the discharge of coal, substantially as herein shown and described.

84,750.—L. E. MOREY, Vandalia, Ill.—*Plow Attachment, (Doubletree.)*—December 8, 1868.—Three bars are connected together in a triangular shape, and provided with loops or hooks, whereby three horses may be attached to a plow.

Claim.—A plow attachment, having four connecting points, a, b, b, and b', arranged substantially as herein described, for the purpose set forth.

84,751.—JAMES MUSGRAVE, New Cumberland, West Virginia.—*Seed Planter.*—December 8, 1868.—The buckets are detachable, so as to be readily removed and replaced by buckets having cavities of different sizes, according to the kind and amount of seed to be planted.

Claim.—1. Detachably securing the buckets H to the belts F, by means of the brackets G, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the tube J with the hopper I and buckets H, substantially as herein shown and described, and for the purpose set forth.

84,752.—GEORGE NELSON, Boston, Mass.—*Lamp Burner.*—December 8, 1868.—The chimney is supported upon an annular plate and fits within a flange, and is held in position by springs which bear against its interior surface, and have their upper ends secured upon a hoop or ring.

Claim.—1. The combination, with the cone and cone-supporting cylinder, of the chimney rest, chim-

ney, and spring device, by which the latter is supported and steadied, under the arrangement and for operation as herein shown and specified.

2. The combination, with the chimney and chimney rest, of the springs and hoop or ring for holding the upper ends of said springs, in the manner and for the purposes herein shown and described.

84,753.—FREDERICK W. NEWTON, South Orange, N. J.—*Lappet or Embroidering Loom.*—December 8, 1868.—This machine is designed for weaving large and flowing figures, such as are suitable for the borders of gored skirts or dresses, either woven on the body of the garment, or separately, and attached afterward.

Claim.—1. The combination of the pattern mechanism with the stitch mechanism, when the two are actuated by different powers, or are connected with the same power by intermediate gearing or attachment, so as to give to each mechanism a motion distinct from the other, substantially as described.

2. The friction rollers or cylinders, one or more, for the purpose of giving a definite, yet adjustable, quantity of whip yarn to the needles without tension, substantially as described.

3. The roller *j*, of irregular or cam shape, in combination with the pin and needle bars, for the purpose of giving them an irregular motion, substantially as described.

4. The combined ratchet and pinion wheel *G*, in combination with the rack *H*, substantially as and for the purpose described.

5. The double wedge bar *I*, for the purpose of regulating the quantity of whip yarn to be furnished to the needles, substantially as described.

6. The lever *n*, in combination with the bar *O*, and its pin for raising the double wedge bar, substantially as described.

7. The traverse bar *M*, in combination with the needle bar and friction rollers, substantially as described.

8. The combined pinion and friction wheel *N*, in combination with the friction wire, substantially as described and for the purpose set forth.

9. The lever *e*, with adjustable fulcrum, in combination with the traverse bar *M*, and needle bar for regulating its movements, substantially as described.

10. The friction sleeve, having an upright stand, in combination with the pattern and stitch wheels and traverse lever *e*, substantially as described.

11. The combination, with the stitching mechanism, of the adjustable pawl *Q*, constructed and operating substantially as described.

12. The combination of the mechanism which makes the stitch with the mechanism which gives the whip yarn to the needles, arranged and connected substantially as described, so that the motion of the mechanism which gives off the whip yarn to the needles may be regulated and controlled by the stitching mechanism.

84,754.—ALONZO PALMER, Hudson, Mich., assignor to himself and N. H. MELCHER.—*Pump.*—December 8, 1868.—To a tubular bolt upon a rod extending through the center of the cylinder are secured two metallic valve plates, above and below which are two metallic disks attached to the central rod, one of each of the said disks being perforated. Between each of the two upper and lower disks are placed rings which serve as seats for the solid valves.

Claim.—The disks *J K* and *J' K'*, in combination with the rings *G G'*, bolt *H*, rod *I*, and plates *E E*, with their valves, arranged and used as and for the purposes set forth.

84,755.—G. W. PERRY and J. D. BILLINGS, Wilmington, Del.—*Seat for Railway Cars.*—December 8, 1868.—A chair car seat is provided with a reversible back, which may be readily adjusted and secured on either side of the seat, and at any desired inclination.

Claim.—1. A seat, *B*, capable of longitudinal adjustment between side frames *A A'*, in combination with a reversible back, which is connected by arms *H* to the side frames, turns on an adjustable fulcrum on said arms, and which may be jointed to either edge

of the seat, all substantially as and for the purpose described.

2. The back *J*, with its slots *z*, and pins *s*, sliding in the said slots, in combination with arms *H*, jointed to the side frames and to the pins, substantially as and for the purpose specified.

3. The bent rods *E*, having pins *m* at the ends, and sliding and turning at the sides of the seat *B*, in combination with a reversible back, *J*, having openings, *t*, for the reception of the pins *m*, substantially as described.

4. The rods *E*, with their pins *m* and arms *n*, in combination with the box *B'*, the slotted plates *h*, and the traversing plate *F*, connected to the arms *n*, the whole being arranged and operating substantially as set forth.

5. The sliding seat *B*, with its ratchets *o o*, in combination with the shaft *G*, pinions *k* and *q*, and a worm for operating the said shaft, substantially as set forth.

6. The frame *K*, which is hung between the side frames *A A'*, and to which are hinged arms *u u*, connected by cross strips *w w*, substantially as and for the purpose described.

84,756.—G. W. PERRY and J. D. BILLINGS, Wilmington, Del.—*Door Retainer.*—December 8, 1868.—A yielding block, fitted in a recess in the floor, receives and holds the under edge of the door, in a cavity provided for the purpose.

Claim.—A plate, *a*, having an opening for the reception of a block, *E*, which rests upon springs, *d*, below the plate, the whole being constructed and operating substantially as and for the purpose described.

84,757.—H. W. PERSING, Centralia, Ill.—*Wagon Box.*—December 8, 1868.—Movable staples, passing through side boards just behind the end gates, are attached to hooked rods passing longitudinally through the box, and are held in place by eccentrics pivoted to the outer ends of the staples.

Claim.—The combination and arrangement of the eccentrics *e e*, the staples *f f*, and the swivel *d* attached to the rods *c c*, substantially in the manner described and for the purposes set forth.

84,758.—EDWARD B. PHELPS, New York, N. Y.—*Gridiron.*—December 8, 1868.—The gridiron is composed of two flat frames, and provided with a central axle, upon which it vibrates, and the whole is inclosed in a metal box. A trough is suspended on the hinged edge of one of the frames, and arranged so as to adapt itself to the vibrations of the gridiron.

Claim.—1. The combined frames *F* and *F'*, with the central axle *E*, in connection with the trough *K* and stop *N*, operated and vibrated in the manner and for the purpose substantially as herein shown.

2. Providing reversible gridirons with a trough, *K*, to operate and to be used for the purpose herein described.

84,759.—D. A. PORTERFIELD, New Paris, Ohio.—*Wash Boiler.*—December 8, 1868.

Claim.—In combination with the boiler, the conical or pyramidal spouts, as described, *i. e.*, their bases resting in the bottom of the boiler, without the intervention of a horizontal partition, and so arranged as to admit the supply of water by spanning the sunken pit, or by means of an opening at the bottom, as set forth.

84,760.—ADAM R. REESE, Phillipsburg, N. J.—*Horse Rake.*—December 8, 1868.—The teeth are formed with a return arm made parallel to the teeth, to serve as springs to keep the teeth down upon the ground. The various parts are so constructed and connected as to enable them to be readily taken apart for transportation.

Claim.—1. The teeth *N*, provided with the return arm, arranged relatively to and operating in connection with the rake head, substantially as described.

2. The shafts *E E*, when provided with the gains or notches, as set forth.

3. The standard *I*, in combination with the transverse bars *H H*, arranged upon opposite sides of the shafts *E E*, said bars being provided with gains, and operating as set forth.

4. The bars H H, when provided with the gains, as set forth.

5. The combination of the notched shafts E E, plates G G, axle B, and bolts F F, substantially as set forth.

6. The combination of the notched bars H H, shafts E E, and bolts K K, all arranged and operating as set forth.

7. The removable cleaners, adapted to be secured to the axle by means of screws or pins, and removable for transportation, as set forth.

8. The spurs on the cleaner rods, for the purpose and substantially as set forth.

84,761.—HUGH REID, St. Louis, Mo.—*Steam Engine Valve Gear.*—December 8, 1868.—A double piston valve is enclosed in a cylinder which communicates with the exhaust passage, the exhaust steam being admitted alternately into the atmosphere and condenser by the motion of the valve, which latter is operated by means of a toggle joint connected to a rock shaft.

Claim.—1. The arrangement of the balanced piston valves D¹ D² with reference to the exhaust cylinder C, steam port *a*, and exhaust ports E and F, substantially as set forth.

2. The arrangement of the piston valves D¹ D² with reference to the rod *d*, toggles G G', pin *g*, slot *h*, and rod H, substantially as described.

84,762.—ISAAC REXFORD, Malone, N. Y.—*Seed Planter.*—December 8, 1868.—The rear wheels are connected to the forward wheels by bars, from which rise vertical rods supporting the seed hopper, beneath which latter is the seeding cylinder. Coverers, formed of two side bars secured together at an angle in the rear, are connected to the seed box by draught bars or chains. The rear part of the machine is elevated by means of levers under control of the driver, by which the seeding operation is stopped, and the machine easily turned.

Claim.—1. The combination of the side bars D, bars or supports G, seed box H, dropping cylinder E, and wheels F, with each other and with the forward axle B, said parts being constructed and operating substantially as herein shown and described, and for the purposes set forth.

2. The coverers J, constructed as described, and draught bars or chains K, in combination with the seed box H, substantially as and for the purpose specified.

3. The combination of the levers L, cross bar M, standard N, lever O, and standard P, with each other, with the cross bar of the tills A, forward axle B, dropping cylinder E, and seed box H, substantially as herein shown and described, and for the purpose set forth.

84,763.—W. C. RHINEHART and ROBERT GASTON, Oskaloosa, Iowa.—*Corn Plow.*—December 8, 1868.—The bar of the frame to which the tongue is attached is supplied at each end with a fender extending directly over the wheels.

Claim.—The inclined fenders *b b*, for protecting the reins of the driver from the action of the wheels, in combination with the inclined frame B, substantially as set forth.

84,764.—GEORGE RICHARDSON, Lowell, Mass.—*Reverse Motion for Winding on Bobbins.*—December 8, 1868.—Upon the shaft which imparts the traverse motion to the wind is fixed a spiral cam, which in turn imparts motion to a sliding yoke. When the yoke has passed over the extent of its traverse, a detent is raised by a cam on the shaft, which releases a catch and allows a spring to react so as to force the reverse rod in the opposite direction, and bring the actuating gears into contact.

Claim.—The cam B, yoke C, reverse rod E, springs I I', detent G, and reverse catch M, all combined, substantially as and for the purpose set forth.

84,765.—C. M. REID, Greensborough, Ala.—*Lubricator for Journals.*—December 8, 1868.—A screw, provided with a flange, is made to propel a cog wheel having its bearings in a hanging frame, and also having a rock shaft connecting with two cranks. Each crank has a pitman connecting with spring

arms, which carry a dipper that distributes the lubricant upon the axle.

Claim.—The screw *c*, with its flange C, frame E, cog wheel D, cranks G, pitmen *g*, spring arms H, dipper I, in combination with the "housing" or "grease box," when constructed and operating substantially in the manner and for the purposes set forth.

84,766.—CYRUS ROBERTS and JOHN A. THROP, Three Rivers, Mich.—*Combined Horse Power and Truck.*—December 8, 1868.—The beveled wheel that actuates the mechanism extends downward, so as to enable the power to be used at a point near the ground, and immediately over the working shaft, to which it is geared. The horse power is permanently attached to a truck.

Claim.—1. The beveled wheel G, extending downward to the point, and in the manner represented, for the purposes specified.

2. A horse power, having cogged wheels A, D, E, and G, staples B, disk C, friction rollers *c*, and shaft H, in combination with a truck, constructed and operating as herein specified, substantially as described.

3. A truck, having V-shaped bottom, as described, bolsters O, P, and Q, and rear V-shaped frame, as described, in combination with the horse power here in described and shown, substantially as specified.

84,767.—WILLIAM J. ROSS, Worcester, Mass.—*Door Fastener.*—December 8, 1868.—A slotted metal bar is provided at one end with an adjustable bar or catch, formed so as to fit in between the door and the door frame. The slotted portion is supplied with a sliding bar provided with a set screw and hooked at its inner end.

Claim.—The slotted bar A, in combination with the catch B and hooked sliding bar D, provided with the thumb or set screw *b*², all constructed, arranged, and operated substantially as and for the purpose set forth.

84,768.—EDWIN P. RUSSELL, Manlius, N. Y.—*Gas Burner.*—December 8, 1868.—The body of the main cock is made conical, so as to form a chamber for the gas to be distributed to the main burner and the jet burner. Between the tubes for the main burner is a hollow cylindrical chamber for the protection of the jet burner, so that a small jet can be kept constantly burning and easily regulated by a small cock.

Claim.—1. The hollow cylindrical gas cock B, constructed substantially as described, and operating as and for the purposes set forth.

2. The combination of pipes *h* and *h'*, pipe or hole *z*, and small cock *g*, chamber *p*, all as constructed, with the gas cock B, substantially as described, and for the purpose set forth.

3. The sway bar C, in combination with rods W W', arms *f f'*, for operating the cock B, constructed substantially as described, and for the purposes set forth.

84,769.—WOODBURY SANBORN, Chelsea, assignor to himself and BAILEY WEST, Chicopee, Mass.—*Truss.*—December 8, 1868.—A metallic spider, having flanges on the ends of the arms, is applied within the shell to prevent its warping. A T-shaped piece is pivoted to the spider, and provided with buttons to which the supporting straps are attached.

Claim.—1. The shell A, having a metallic frame or spider attached to the inner side thereof, and provided with knobs attached to said spider, either with or without the cover C, the whole constituting a truss pad, and constructed of the material and substantially in the manner set forth.

2. The combination of the shell A, the metallic frame or spider rigidly attached to said shell, and the T-shaped piece F, pivoted to said spider, and mounted with knobs or buttons, the whole constructed substantially as specified.

3. The construction and arrangement, in combination with a truss pad, substantially of the kind herein described, of the flexible body strap D and thigh strap E, applied to said pad substantially as set forth and shown.

84,770.—ANDREW SCHMITT, California, Mo.—*Salve for Burns and Scalds.*—December 8, 1868.—Composed of disintegrated lint and fish oil, charred or burned together.

Claim.—The formation of a salve for the cure of burns, &c., in the manner and of the materials herein described.

84,771.—WILLIAM SHANNON, Allegheny City, assignor to himself and JOSEPH GRAFF, Pittsburg, Pa.—*Hinge.*—December 8, 1868.—The hinge is provided with a pintle, made in two parts and secured in a knuckle joint.

Claim.—Providing a hinge with a pintle, consisting of parts C and D, the inner ends of which are upset, in the manner herein described, and for the purpose set forth.

84,772.—WILLIAM SHANNON, Allegheny City, assignor to himself and JOSEPH GRAFF, Pittsburg, Pa.—*Hinge.*—December 8, 1868.—The two parts are each provided with a hooked end, so that they will lock when forced together in the knuckled joint of the hinge.

Claim.—Providing hinges with a pintle, C and D, made in two parts, the inner ends of which are beveled off at *f*, and provided with hooks *i*, substantially as herein described, and for the purpose set forth.

84,773.—JOSEPH SHIRT and CHARLES BRIGGS, Tamworth, Great Britain.—*Steam Engine Condenser.*—December 8, 1868.—The device is constructed with steam and water spaces for the ingress of water and steam, so that a partial vacuum will be formed, thus dispensing with the air-pump mechanism for discharging the heated water.

Claim.—A condenser, constructed and operating as herein described.

84,774.—JOHN SHOE, Pleasant Hill, Ohio.—*Beehive.*—December 8, 1868.—The hinged bottom projects a short distance beyond the side of the hive and can be placed at any desired inclination.

Claim.—1. The adjusting, hinged, inclined bottom C, operating substantially as set forth.

2. The top B, provided with supports or strips *h h*, to which are attached hooks, catching into staples on the hive, for the purpose of removing the said top, substantially as described.

84,775.—A. G. SMITH, Jersey City, N. J.—*Lamp Burner.*—December 8, 1868; antedated November 27, 1868.—The burner is attached to the lamp by means of a plate, in connection with a ring of some elastic substance, so as to dispense with the use of a screw collar and to insulate the burner.

Claim.—1. In combination with the burner A and the cylinder C, the ribs or projections H H, substantially as and for the purpose set forth.

2. The insulating ring C, constructed with the flange I, substantially as and for the purpose set forth.

3. In combination with the burner A and elastic ring C, the detachable plate E, or its equivalent, for the purpose of rendering the ring C easily removable.

4. The plate E, secured to the wick tube F by a detachable device, substantially as set forth.

5. Keeping the plate E always in contact with its detachable fastenings, by means of the elasticity of the material of the ring C, as set forth.

84,776.—GARLAND B. ST. JOHN, Brooklyn, Mich.—*Cultivator.*—December 8, 1868.—To both plow beams is attached a standard, which carries a plow by means of a bolt passing through arms and through both beams. The standard is braced by rods so arranged as to admit of adjustment of the same to a greater or less angle of inclination.

Claim.—The securing of the standard G between the two beams C C, by means of the bolt *m*, arms *n n*, and braces H H, all arranged substantially as and for the purpose set forth.

84,777.—GEORGE E. SUTPHEN, Louisiana, Mo.—*Horse Rake.*—December 8, 1868.—An adjustable prop is arranged to fall upon the rear teeth and hold

the rake from revolving until required, and is withdrawn from the teeth by a connecting rod and lever.

Claim.—The connecting rod D, with seat *d*², when used in connection with spring *d*¹ upon rod *d*³, as shown and described, and combined with the prop C, having the foot piece *c*, and lever D', the whole being operated, in connection with the handle B and rake A, as and for the purposes described.

84,778.—JAMES TAMBLYN, Virginia City, Nevada.—*Automatic Stop for Mining Cars.*—December 8, 1868.—Curved projections or stops attached to a lever, arranged below the track, are caused to rise and prevent the car from moving forward when the cage is not in a position to receive the same. As the cage reaches the mouth of the shaft the stops are automatically withdrawn.

Claim.—The projections or stops E E, arranged with the levers C F, and spring H, connected with the chain G, and all applied to operate in the manner substantially as and for the purpose herein set forth.

84,779.—THOMAS R. TAYLOR, Broadhead, Wis.—*Pile for Railroad Rails.*—December 8, 1868.—A T-shaped bar of steel is combined with a rolled iron bar, one of the surfaces of the latter being made to conform to the side of vertical web of the steel bar, and the whole doubled around one end and upon the two sides of the steel bar.

Claim.—1. The improved pile for forming railroad rails, when constructed and arranged as herein described.

2. As a new article of manufacture, railroad rails, when produced from the improved pile herein described, as and for the purpose set forth.

84,780.—MOSES N. WARD, Bangor, Me., assignor to himself, BENJAMIN S. GRANT, and THOMAS HERSEY, same place.—*Timber Grapple.*—December 8, 1868.—Two curved pronged arms are pivoted to an oval plate provided with a hole above and below the junctions of the said arms. At such junction the plate is provided with shoulders to prevent the ends from overlapping.

Claim.—The combination and arrangement of the double-eyed and shouldered plate B, made substantially as described, with the two pronged arms A A pivoted to such plate, as set forth.

84,781.—FRANCIS WATKINS, Birmingham, England.—*Nut Machine.*—December 8, 1868; antedated November 28, 1868.—The machine consists of two working parts, acting alternately, so that a nut is cut, shaped and punched on one side, while a finished nut is being ejected from the other side, thus utilizing the power required for one machine to operate two.

Claim.—The combination, with each other, of the reciprocating frames D and E, stationary die I, punches F, J, and K, slide G, punch H, and stop L, all made, arranged, and operating substantially as and for the purpose herein shown and described.

84,782.—FRANCIS WATKINS, Birmingham, England.—*Bolt-making Machine.*—December 8, 1868; patented in England, December 8, 1866.—Two rotating disks are mounted at the ends of a shaft, which latter also carries a feed wheel worked by a slotted rod, which is pin-jointed to a lever acted on by a cam on another shaft. In the periphery of each of the disks are placed dies for receiving the shanks of the rivets, bolts, &c., to be headed. Inside the dies are sliding bolts for holding the blanks, and for discharging them when finished.

Claim.—The arrangement, herein shown and described, of two bolt heading machines constructed substantially as described, and so as to operate alternately, as set forth.

84,783.—JAMES WENSLEY, New Brunswick, N. J.—*Guiding Attachment for Sewing Machines.*—A sliding and adjustable gauge is made in two parts, so that one part may be swung out of the way for gauging around abrupt inner angles. An adjustable presser is also so arranged as to swing out of the way when not required for use.

Claim.—1. The pivoted gauge E and pivoted

transparent presser G, in combination with the attachment B, arranged and operating as described, for the purposes specified.

2. The arrangement of the spring I and the notched bent arm K, by which the presser plate is jointed to its support, whereby the spring is adjusted to the several notches in the bent arm, for regulating the pressure of the plate, as herein shown and described.

3. The gauge E, provided with the stud *a* and adjustable part *b*, substantially as and for the purpose described.

4. The transparent presser, constructed as described, and hinged to the support by the rod K, arranged, with reference to the guide, as herein described, for the purpose specified.

84,784.—AMOS WESTCOTT, Syracuse, N. Y.—*Churn.*—December 8, 1868.—The staves of the churn are held together by a segment hoop having trunnions on each side, the said hoop also having a plate on its under-side extending down between standards on a socket that receives the legs composing the stand.

Claim.—1. The combination and arrangement of the segment hoop *e*, socket *h h*, with its projecting arms *k k*, and the vessel for the reception of the material to be operated upon, substantially as shown and described.

2. The combination of the segment hoop *e* and segment *b'*, substantially as shown and described.

84,785.—SIMEON WHEAT, Middletown, and DAVID B. WHEAT, New York, assignors to FRANCIS M. WHEAT and ELLEN A. WHEAT, Middletown, N. Y.—*Refrigerator.*—December 8, 1868.

Claim.—An improved refrigerator, formed by the combination of the double-walled case or body A, detachable ice box B, waste pipe C, cup D, drip pan E, hinged shelf F, middle shelf G, having its middle part cut away, and plaster of Paris lining, K, with each other, substantially as herein shown and described, and for the purpose set forth.

84,786.—GEORGE W. N. YOST, Cory, Pa., assignor to THE CORY MACHINE COMPANY.—*Track-Clearer for Harvesters.*—December 8, 1868.—The arc or bend of the track clearer is within a vertical mortise through the shoe, and laps around or incloses a segment of the shoe next the mortise, so as to avoid all separate pivoting, and attaching the clearer to the shoe by rivets, bolts, &c.

Claim.—The combination of the track clearer V and the finger-bar shoe W, a curved or bent part of the track clearer lying within a vertical mortise in and encircling a part of the shoe, made and used as described, for grass and grain cutting machines.

84,787.—ALEXANDER ADAMSON, Washington, D. C.—*Shoulder Brace.*—December 8, 1868.

Claim.—The shoulder brace, consisting of a single elastic strap crossing its center, (where it is fastened,) and forming the double loops B B, as herein described, and for the purpose set forth.

84,788.—THOMAS R. ALLEN, Syracuse, N. Y.—*Beehive.*—December 8, 1868.—Secured to the sills are frame holders provided with notches on the top to receive the main beams of the comb frames. The outside covering is fitted with a top covering.

Claim.—1. The frame holders F F, separately, and also in combination with the sills *a a*, substantially as and for the purposes described.

2. The same parts, in combination with the comb frames *c c*, substantially as described, and independent of and detached from the outside covering C D.

3. The frame holder F, constructed as described, in combination with the outer covering C and top D, as set forth.

84,789.—FORTUNE L. BAILEY, Freeport, Ind.—*Car Mover.*—December 8, 1868.—By an upward and downward movement of the lever, the rods which carry the gripping devices alternately slide and step forward to move the car.

Claim.—The arrangement of lever A, bars I I, and clamp B, when combined with the gripping de-

vices on the lower ends of the rods I I, as and for the purpose set forth.

84,790.—L. D. BIDWELL, Birmingham, Conn.—*Mowing Machine.*—December 8, 1868.—Each of the circular cutters has a revolution upon its own axis, and also one in an opposite direction about their common center of motion. The number of cutters is such that each will operate once while the fingers are moving each one length.

Claim.—1. The arrangement of the revolving cutters *d* in a revolving head, so as to give to the said cutters a double movement, substantially as herein described.

2. In combination with the above, the finger bar P, constructed and arranged so as to operate in conjunction with the said cutters, substantially in the manner set forth.

84,791.—CLARK E. BILLINGS, Warren, Vt.^l—*Apple Quarterer.*—December 8, 1868.—A wooden plunger is pressed down upon the apple placed on a central point, and forces it between the four knives.

Claim.—The arrangement herein described of the fixed knives F, placed at right angles to each other, and having the central point *g*, the plunger B, hollowed out upon its under side, the plunger rod C, guides *h*, slotted lever D, pin *i*, spring E, and stand A, as herein set forth, for the purpose specified.

84,792.—G. E. BOISSILIER, St. Louis, Mo.—*Compression Cock.*—December 8, 1868.—A socket valve within the shell of the cock is operated by revolving the stem which is secured beneath the cap.

Claim.—The valve D, having a screw thread cut upon its outer surface, and furnished with a smooth socket J, in which the squared end of the valve stem C is fitted, said stem having a disk *i*, bearing against the under surface of the packing placed in the recess of the cap B, and resting upon the lower packing disk, secured to the shell A by the screw cap, all arranged and operating as described, for the purpose specified.

84,793.—W. H. BOYDEN, Rockland, R. I.—*"Dresser Copper" for Warp Dressing Machines.*—December 8, 1868.—Behind the rack are arranged wires over which the yarn or threads pass without danger of being cut, and which may be easily moved or replaced when worn or injured.

Claim.—1. The combination of the rack B and wires *m m*, in a frame A, substantially as and for the purposes specified.

2. The arrangement of the rack B, frame A, wires *m m m m*, thumb screws *n n*, and clamp T, substantially as shown and described.

84,794.—WILLIAM D. BROOKS, Bethany, Pa.—*Elevator.*—December 8, 1868.—Designed as an improvement upon a patent granted to Cramer and Brooks, September 17, 1867. Over the rafter which sustains the pulley block is placed a metal cap, through which and the rafter is passed a hook secured by a nut, shoulder or pin, that rests upon the cap.

Claim.—The cap *b* and rod *a*, for sustaining the swiveled pulley C, and a series of hooks D, in combination with and arranged with relation to the adjustable flexible gravity track, as herein set forth and shown, for the purpose specified.

84,795.—HENRY CARSE, Pittsburg, Pa.—*Bottling Machine.*—December 8, 1868.—The opening of the bottle screen is controlled by means of the corking piston, so that the screen continues closed until the said piston is lifted from its work, thus affording the desired protection until the completion of the work.

Claim.—The screen I, when the closing thereof is controlled by the downward motion of the filling head, and its opening by the reeding motion of the corking piston or its carrying frame, through suitable mechanism, substantially as herein set forth.

84,796.—M. CARY, Racine, Wis.—*Medicine.*—December 8, 1868.—The ingredients consist of ground bark of the root of wahoo, ground gulber root,

ground root of iron plant, ground bark of the root of white pine, ground bark of the root of wild cherry, pulverized root of sanguinaria, sugar, and flour.

Claim.—The ingredients herein named, compounded and pressed substantially as and for the purpose specified.

84,797.—MICHAEL CONNOLLY, Newark, N. J.—*Spade.*—December 8, 1868.

Claim.—The described construction of the spade, consisting of the blade A, bent at its center, so that the two parts *a b* shall form an obtuse angle with each other, and provided upon its upper end, next the handle, with the widened foot rest C, as herein described for the purpose specified.

84,798.—GEORGE W. COOPER, Ogeechee, Ga.—*Plowshare.*—December 8, 1868.—The usual landside plate is dispensed with, and the front cutting edge is made concave on the under side, thereby causing the plow to rest on the left-hand edge.

Claim.—A cast iron plowshare A, made as described, without a landside plate, and with a concave front edge, substantially as and for the purpose set forth.

84,799.—WILLIAM D. CORRISTER, New York, N. Y.—*Fluting Machine.*—December 8, 1868.—By turning the operating serew, the bent bar, and with it the upper roller, can be adjusted up or down at will to regulate the distance between the two rollers.

Claim.—The described arrangement of the operating serew C, spring *i*, nut *h*, and bent bar D, as herein set forth, for the purpose specified.

84,800.—THOMAS C. CRAVEN, Albany, N. Y.—*Hay Spreader.*—December 8, 1868.—As the machine moves forward the reel is caused to revolve in a direction opposite to the movement of the wheels, so that the hay is taken from the ground, carried over the top of the reel and thrown back of the machine.

Claim.—1. The combination, with the ends of the central support M and caps *m*, of the bars N, substantially as and for the purpose set forth.

2. The combination of the bars N, having irregular shaped ends, with the heads or disks L and central support M, substantially as and for the purposes set forth.

3. The combination of the caps *m* with the central support M, substantially as and for the purposes set forth.

4. The combination, with the frame or bearings which support the reel shaft, of the eccentrics E', substantially as and for the purposes set forth.

5. The combination, with the eccentrics E' and side rail A, or their equivalents, of the arms *p*, springs *s*, and pins *r*, substantially as and for the purposes set forth.

6. The combination of the driving gears K with the wheels F, substantially as and for the purposes set forth.

7. The combination, with the frame which supports the reel and the frame which connects the journals of the wheels F, of adjusting serew R and nuts *v v'*, substantially as and for the purposes set forth.

8. The combination, with the frame of the machine and the driver's seat, of a metallic or other suitable guard or shield W, arranged substantially as and for the purposes set forth.

9. The combination, in a hay tedder, of a triangular or three-barred reel, with caps *m*, constructed substantially as shown and described.

84,801.—ELISHA CROWELL, New York, N. Y.—*Article of Prepared Codfish.*—December 8, 1868.—The bones and skin are removed from the fish, which is cut into long, narrow strips, and then exposed to a current of air.

Claim.—A new article of prepared codfish, made substantially as described.

84,802.—JOHN CURTIS, Cincinnati, Ohio.—*Step Cover and Wheel Fender for Carriages.*—December 8, 1868.—When the carriage door is opened a hinged flap hangs down and protects the clothes of a person entering the carriage from being soiled by contact with the rear wheel.

Claim.—The bracket F, depending rigidly from the carriage door, in combination with the hinged flap G, arranged and adapted to operate in conjunction with a carriage step, in the manner and for the purposes set forth.

84,803.—THOMAS B. DAVIS, New York, N. Y.—*Scoop.*—December 8, 1868.—The scoop is so constructed that when resting on a plane surface the bottom is slightly inclined from front to rear, so as to prevent any substance in the scoop from falling out.

Claim.—A scoop, having its body A constructed out of a single piece of sheet metal B, cut and bent in the form, and soldered, substantially as herein shown and described.

84,804.—CHAUNCEY A. DICKERMAN, New Haven, Conn.—*Label Holder.*—December 8, 1868; antedated November 30, 1868.—Designed for attachment to trunks, boxes, &c., and so constructed that a card may be readily withdrawn and replaced by a new one.

Claim.—The frame A, through which is formed an opening, B, and upon the under surface, upon three sides of the opening, a rabbet, *a*, is formed, and so as to leave an opening through the end, C, for the insertion of the card, and having combined therewith a convex plate, D, the whole constructed and arranged so as to be applied and operate in the manner set forth.

84,805.—A. P. DURANT, Athens, Ohio.—*Beehive.*—December 8, 1868.—The hive is so constructed as to admit of its being easily enlarged or diminished in size, to suit a large or small swarm of bees.

Claim.—The combination of the base or bottom, A, bars B B, frames C D, side pieces E F, connecting bars G G, frame H, and cap I, all constructed and arranged substantially as herein set forth.

84,806.—CHARLES DURANT, Jersey City, N. J.—*Electro-magnetic Relay Instrument.*—December 8, 1868.—Improvement on a device patented to the same inventor on May 19, 1868, and is designed to prevent the oscillating movement of the bolt by reason of the movement of the armature, incident to the varying strength of the electric current, and which is sufficient to throw the machine out of adjustment, as in the original device. A graduating friction is also produced on the sliding bolt by means of a spring fastened to the bolt, or fastened, and the pressure on the bolt graduated for the purpose of shutting out "induction."

Claim.—1. The curving of the shifting or sliding bolt L, and also the curving of the opening in the armature or armature lever, through which opening said bolt moves and operates, substantially as and for the purpose herein shown and described.

2. The spring U, in combination with the adjustable lever V, or its equivalent, applied to the shifting or sliding bolt L, moving through and upon the armature or armature lever, substantially as and for the purpose set forth.

84,807.—O. W. EDMUNDS, Bluffdale, Ill.—*Harrow.*—December 8, 1868.—To the beam which connects the shafts of two rotating harrows is attached a spring so as to admit of a yielding motion of the said shafts. The said shafts are fitted in adjustable bushes, provided with inclined openings, by which the harrows are caused to rotate in opposite directions.

Claim.—1. The combination, with the beam C and shafts B of the harrow, of the spring F, substantially as and for the purpose described.

2. The combination of the bushes E, beam C, shafts B, and spring F, as herein described, for the purpose specified.

84,808.—ALBERT J. ELDER, Kansas City, Mo.—*Safety Bridge for Railway Cars.*—December 8, 1868.—The plates are attached respectively to either end of a car, and are connected by a headed bolt in one, passing through a slot in the other, so as to conform to the motion of the cars.

Claim.—1. Two plates, B B', one provided with a

headed bolt, D, and the other with a slot, when hooked to the opposite ends of two railroad cars, substantially as and for the purposes herein set forth.

2. The pivoted hooks E E, held in place by the stirrups I I, and secured to the platform A' by the eyes F F, in combination with the slotted plate B' and plate B, to operate substantially as herein set forth.

3. The combination of the plates B B' with the headed bolt D passing through the slotted plate B', hooks E and C, stirrups I, and eyes F, all substantially as shown and described.

84,809.—WILLIAM H. ELLIOTT, New York, N. Y.—*Feather Renovator*.—December 8, 1868.—Warm or cold air is forced from a chimney through conducting passages in such connection with a boiler and steam pipes, that the air may be moistened more or less with steam, as required. Hollow bearings for the renovating cylinder serve as couplings between the central pipe and the draught pipe.

Claim.—1. The arrangement and combination of the draught pipe *f''*, steam pipe *e*, central perforated shaft *f*, and diaphragm *g*, as specified.

2. The combination of hollow bearings *k*, diaphragm *g*, and draught pipe *f''*, substantially as herein described.

3. The combination of heater *e*, central pipe *f* with its tubes *r*, diaphragm *g*, and draught pipe *f''*, substantially as set forth.

84,810.—GEORGE WILLIAM ENSMINGER, Richland, Iowa.—*Wire Fence*.—December 8, 1868.

Claim.—1. A portable wire fence, formed in sections, composed of the wires A, movable posts A¹ A², slats B, supports C, and corner posts D D¹, constructed as herein described.

2. The rods K and plates *k*, and the screws E and nuts *e*, in combination with the movable posts A¹ A² and corner posts D D¹, arranged and operating in the manner herein described and for the purpose specified.

3. The wires H, and the screws G, and nuts *g*, in combination with the movable posts A¹ A² and corner posts D D¹, arranged and operating in the manner and for the purpose herein described.

84,811.—W. B. FARRAR, Greensborough, N. C.—*Shutter and Blind Fastener*.—December 8, 1868.—For securing the bolt by which the shutter bar is confined, and is so constructed as to prevent it from being removed by a person outside the building, but can be fastened at any time from the outside.

Claim.—1. The tumbler E, in combination with the stop G, both operating in connection with the bolt B, as and for the purpose specified.

2. The combination and arrangement of the springs F and G, plate E, shoulder *n*, pins *m m*, knob *e*, and bolt B having the notch *b*, when constructed to operate substantially as and for the purpose set forth.

84,812.—JAMES T. FIFE, Tyrer City, Ind.—*Beehive*.—December 8, 1868.—The chamber in the main hive is made with a circular bottom, having an opening extending its whole length. The side boxes are so arranged that the honey boxes at the ends can be slipped into them, and between the lid and the main chamber are two more honey boxes.

Claim.—1. The lid C, when so arranged as to cover the main hive A, as well as the side boxes B B, and to lock the door to the main hive and the end doors to the wings, substantially as and for the purposes herein set forth.

2. The chamber F, constructed as described, and provided with the entrance *k* for the bees to enter the chamber when hiving them, and with entrances *a* and *b*, for the passage of the bees from said chamber to the different honey boxes, substantially as and for the purposes herein set forth.

3. The combination of the side boxes B B, chamber F, honey boxes D D and E E, ventilating chamber *o*, frames *f, f*, and robber catcher J, to make and constitute a complete beehive, substantially as and for the purposes herein set forth.

4. The arrangement of the case A, and its wings B B, with the chamber F, honey boxes E E and D

D, and cover C, all constructed and combined in the manner specified.

84,813.—JAMES FINLAY, New York, N. Y.—*Knee Boot for Horses*.—December 8, 1868.—The boot is provided on its inner surface with pads for preventing the boot from touching the leg. Upon transverse straps are placed adjustable pads, to suit legs of different sizes.

Claim.—1. The knee boot A, constructed and provided, as described, with fixed pads *a a'*, and adjustable pads *c c'*, to slide upon fixed or sliding straps *b b'*, substantially as herein specified.

2. A knee boot, constructed with upward projection A' for protection of the knee, and the leg above the knee, substantially as herein described.

84,814.—WILLIAM FOSTER, JR., and GEORGE P. GANSTER, New York, N. Y.—*Apparatus for Illuminating Railroad Cars, Steamers, &c.*—December 8, 1868.—The perforated tubes prevent the sponges from clogging the holes at the bases of the tubes. The movable platforms serve to express, with great force, the refuse material of the sponges, without opening the apparatus. By means of an upright and cam, a powerful compressive force is applied within all the chambers.

Claim.—1. Holding the gasoline in sponge, or equivalent absorbent material, on movable plates, substantially as and for the purposes herein set forth.

2. Receiving the gasoline in sponges, and exposing it to evaporation therefrom, by holding the sponges in layers in the several chambers F G H, as and for the purposes herein set forth.

3. The perforated tubes N M, arranged as represented, in the chambers F G, and to the absorbent material, arranged as and for the purposes herein specified.

4. The movable platforms *f g*, &c., in combination with the absorbent material, chambers F G, &c., and provisions for conducting the air back and forward through the same, and adapted to be moved vertically by suitable means, as herein specified.

5. The upright K, and cam *j*, in combination with the movable platforms *f g*, &c., and arranged to operate therewith, in the manner and for the purposes set forth.

6. The reinforcing chamber E, containing a fresh supply of volatile fluid, arranged relatively to the evaporating chambers F G, &c., and their connections, substantially as and for the purposes herein set forth.

7. The wicking *e²*, arranged as represented, relatively to the reinforcing chamber E, cock *e¹*, and evaporating devices below, substantially as and for the purposes herein set forth.

8. The combination of a spring power or blowing mechanism, evaporating space, and absorbent material therein, forming an organized machine, adapted for use in railroad cars, and analogous moving structures, with the advantages and for the purposes herein specified.

9. The method, herein described, of illuminating moving structures by means of a portable gas apparatus, holding volatile fluid in capillary tubes, and operating by a force independent of gravity, and without disturbance from inertia, all constructed, combined, and arranged, substantially in the manner and for the purposes herein set forth.

84,815.—EDWARD F. GARVIN, M. D., New York, N. Y.—*Instrument for Treating Fistula, &c.*—December 8, 1868.—The instrument consists of a hollow, conical, slotted tube, in which is an expander for enlarging the tube. Below the tube is a supplementary chamber, from which the material to be used is forced by a plunger into and through the conical tube to the parts of the body affected.

Claim.—1. The hollow conical slotted tube *a*, with two or more slots, substantially as and for the purposes described.

2. The cap *c*, having the chamber *f* below tube *a*, substantially as and for the purposes described.

3. The plunger *g*, operating in the supplementary chamber *f*, also expander *h*, both operating with or without screws, substantially as and for the purposes described.

4. An expander, *h*, of equal diameter, operating in

a conical tube of unequal diameter, as and for the purposes substantially as represented.

5. All the parts of the described instrument, singly or in combination, as and for the purposes described.

84,816.—EVANS GEARY, Harrisburg, Pa.—*Brick Machine*.—December 8, 1868.—Upon the front end of a sliding box is a sliding gate, operated by a lever, for cutting off the necessary quantity of clay. In front of the pug mill is a table mounted on a supporting frame, and has pivoted to its front end a flanged tilting plate for holding the mold.

Claim.—The arrangement herein described of the tempering tub A, compressing plunger B, adjustable feeding box C, cut-off *f*, tilting plate *o*, open-bottom molds *r*, and sliding table B, all operated as herein set forth.

84,817.—D. L. GIBBS, Worcester, Mass.—*Mortising Machine*.—December 8, 1868.—Upon the base, at each side of the treadle, are projections, on which are standards that support a shaft, having upon it two pinions which mesh into racks, by which the table is elevated and depressed. The chisel arbor is turned by means of a lever, to reverse the position of the chisel, and is retained in position by a spring fastened to the back of a slide and having its lower end resting on a cam secured to the arbor. To the side of the main frame is fastened a guide frame upon which slides a carriage furnished with a rack, and in front of which are bearings carrying an upright spindle to which an auger is attached.

Claim.—1. The employment, with the treadle D of a mortising machine, of a catch or stop mechanism adapted to retain said treadle in its depressed position without the aid of the foot, substantially as set forth.

2. The combination of the arm J, spring *g*, beak *i*, and lever K, in the manner described, the whole constituting a catch mechanism, arranged to operate in connection with the treadle D, substantially as herein set forth.

3. The arrangement, with the main frame A, of the treadle device herein described, and the devices for elevating and depressing the table, as shown and described.

4. The combination, with the chisel arbor O, of the hand lever P, spring S, and cam T, having projection *o*, as shown and described.

5. The arrangement, with the guide frame U, of the rack carriage V, lever 3, connecting rod 4, standard 15, stop 11, weight and cord 6, 7, stud S, pinion S', and hand wheel W, as and for the purposes set forth.

6. The arrangement, in connection with the treadle rod D', of the weight D'', and double-grooved pulley Z, and cords or chains *z z'*, as shown and described.

84,818.—MASON GIBBS, Homer, Mich.—*Harvester Rake*.—December 8, 1868.—To the reel shaft is rigidly attached a pinion, two opposite fourths of whose periphery are toothed, and the other two fourths covered by projecting plates provided with notches. A vibrating sector-shaped frame is fitted loosely on the reel shaft, and carries the rake arms. This frame has a toothed portion into which the toothed portion of the pinion and head alternately mesh.

Claim.—The pinion and head G, placed on the reel shaft B, in connection with the sleeve C, sector D, with the teeth R, levers H L, and the cam M, all arranged for joint operation, substantially in the manner as and for the purpose set forth.

84,819.—WILLIAM GOODWIN, Boston, Mass.—*Steam Engine*.—December 8, 1868.—Each of the several pistons is jointed to one of a series of cranks projected from a series of shafts having their bearings in the two heads of the frame, the boxes of which bearings may be adjusted radially relatively to the main shaft. Each of the heads is provided with a tubular annulus, one for the supply of steam to the several cylinders, and the other to receive the exhausted steam.

Claim.—1. The combination and arrangement of the steam cylinders E E, their pistons, and cranked

shafts *g g*, with the driving shaft B, gears *h i*, and several cranked shafts, as described.

2. The combination and arrangement of the two hollow or tubular annuli D D, with the series of steam engines, and their cranked and main shafts *g B*, gears *h i*, and frame C, as set forth.

84,820.—MARION GOULD, Chicago, Ill.—*Roofing Composition*.—December 8, 1868.—Composed of fine sand, pine tar, whale oil, and Japan varnish, boiled together and spread on felt.

Claim.—The combination of the ingredients herein named, compounded substantially as and for the purpose specified.

84,821.—GUSTAV GRAETZ, Alexandria, Va.—*Match for Lighting Cigars, and for other Purposes*.—December 8, 1868.—Through a disk of tinder or fire sponge is inserted a stem of wood or other suitable material. The outer face of the disk is then dipped in phosphorus or equivalent fulminate.

Claim.—A match, constructed substantially as described.

84,822.—THOMAS F. HAMILTON, New Haven, Conn.—*Imitation Stone for Building Purposes*.—December 8, 1868.—A block or bar of wood is inclosed in a casing of hydraulic cement and sand.

Claim.—The herein-described process for forming blocks with a wood foundation and cement covering, substantially as herein set forth.

84,823.—C. A. HARPER, Wheeling, Ind.—*Cultivator*.—December 8, 1868.—An improvement on his patent of January 7, 1868. The forward part of the frame is hinged or jointed so that the wheel may have a vertical movement and adjust itself to the unevenness of the ground. The flanged shaft or clodder is formed at its end with a ball which works in a slot in the lower part of a swinging arm, the upper end of which is pivoted to the frame.

Claim.—1. Connecting the wheel D to the cultivator beams or frame A, by means of the hinged or jointed slotted plate or frame E, substantially as herein shown and described, and for the purposes set forth.

2. Securing the flanged shaft H or clodder in its bearings, by means of balls or heads formed upon the ends of said shaft, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the swinging arm J with the rear end of the flanged shaft or clodder H, and with the frame of the cultivator, substantially as herein shown and described, and for the purpose set forth.

84,824.—H. N. HEMINGWAY, Rochester, N. Y.—*Bed Spring*.—December 8, 1868.

Claim.—The metallic holder *h*, having double open sockets, *c*, (for holding the ends of the elastic loops *g*,) and a projecting shank, *s*, with a lip, *a*, when constructed substantially as herein set forth, for the purpose specified.

84,825.—JAMES HOOVER, Gratis, Ohio.—*Fly Trap*.—December 8, 1868.—A revolving circular plate upon which is an S-shaped elevation, is furnished with a casing, and is combined with a spring trap door fitting over an opening in a reservoir, into which the flies are precipitated by the said door after being caught beneath the casing.

Claim.—1. The revolving circular plate or disk B, constructed on its upper side with the S-shaped shoulder or elevation C, arranged and operating substantially as and for the purpose set forth.

2. The employment of the trap door F, provided with the spring bar *f*, attached to bar *f'* and spring *g*, secured to bar *g'*, constructed, arranged, and operated substantially as and for the purpose described.

3. Platform or easing A, plate or disk B, elevation or shoulder C, easing or covering D, flange or partition *d*, trap door F, spring bar *f*, bar *f'*, spring *g*, bar *g'*, and reservoir E, provided with opening *e*, all combined, constructed, arranged, and operated substantially as and for the purpose set forth.

84,826.—HENRY O. HUGHES, Judson, Mo.—*Beehive*.—December 8, 1868.—The bottom of the hive

is formed of inclined hinged and sliding doors, and is provided with ventilating cut-offs, constructed so as to change the draught in the different parts of the hive.

Claim.—1. The lower or bottom part of the hive A, constructed as described, in combination with the hinged and sliding inclined doors *c c'*, and cone-like-shaped piece or bottom, *e*, operated substantially as and for the purpose set forth.

2. The employment of the cut-offs D D', constructed or grooved so as to change the draught, or cut it off from one part of the hive to the other, arranged and operated substantially as described.

3. Frame B, outer and inner casings or walls A A', doors *c c'*, bottom *e*, comb frame C, partition or floor *g*, honey boxes *g¹ g²*, doors *h* and *a*, and ventilating cut-offs D D', all constructed, arranged, and combined, substantially as described.

84,827.—THEODORE G. HULETT, Niagara, N. Y.—*Cable Shackle for Bridges.*—December 8, 1868.—The shackle is made of ox-bow form, its outer edge being provided with a groove, in which the cable lies. In its end are two holes, one for entering the cable, and the other to fasten it, a slot or hole being provided to adjust the length or take up the slack of the cable by means of slotted bars, pin gibs, and keys.

Claim.—The adjustable cable shackle, constructed and operating substantially as described.

84,828.—MARION JACOBS, Sturgis, Mich.—*Potato Digger.*—December 8, 1868.—In the rear of two separated parallel plows is arranged a coulter, from the center of the sides of which project radial rods. At the lower end of the coulter are two angular shares, which constitute the digger.

Claim.—The arrangement of the plows A, with the devices D, F, and G, forming the digger, all as shown, and for the purposes described.

84,829.—NICHOLAS JENNY, Jr., Pittsburg, Pa.—*Carriage Loop and Billet Cover.*—December 8, 1868.—A metal socket provided with ears or flanges, through which are inserted rivets, passing through the flap of leather on a horse collar, and entering a metal plate placed between the two parts of the flap.

Claim.—The metal sockets or receptacles into which the straps B B are inserted, and provided with flanges *b b* and rivets *b' b'*, in combination with the straps D D and metal plates C C, all constructed, arranged, and operated as and for the purpose set forth.

84,830.—GEORGE JONES, New Haven, Conn.—*Coffee Urn.*—December 8, 1868.—Improvement on patents granted to T. Bishop, November 1, 1859, and G. Jones, April 16, 1867.—A flanged cover sets into an annular chamber in the upper part of the urn, which chamber is partially filled with water to form a tight joint.

Claim.—In combination with the perforated cylinder C, within the body A of the urn, the arrangement of the annular chamber B and flange *a* of the cover, without communication from the chamber B to the urn below, substantially as and for the purpose set forth.

84,831.—HENRY P. JUDSON, Bethlehem, Conn.—*Ox-bow Pin.*—December 8, 1868.—Carved springs extend around the cross-head, and are secured at their rear ends by means of clips or hooks bent down over the wire of the spring when in position.

Claim.—1. The self-acting wire side springs D D, when constructed and arranged as described, in combination with the pin C and cross-head B, substantially in the manner and for the purpose set forth.

2. The peculiar method, herein described, of attaching and supporting the side springs D, consisting of the pipes F and hooks *a*, in combination with the cross-head B and loops E, as and for the purpose specified.

84,832.—DANIEL KELLOGG, Ypsilanti, Mich.—*Clothes Boiler.*—December 8, 1868.—Upon the pipes, which arise from the bottom plate, are fitted to slide

easily caps provided with curved pipes, so as to adjust the apparatus to boilers of different heights.

Claim.—The removable caps D, with their branch spouts *f*, when combined with the perforated and slotted plates *a b*, as herein shown and described.

84,833.—WILLIAM A. KIRBY, Auburn, N. Y.—*Harvester Rake.*—December 8, 1868.

Claim.—1. A combined rake and reel, the arms of which are capable of having a rolling motion on their axes, and in which any arm, acting at the time being as a beater, or all of the beaters, can be raised or lowered, while acting as such, by the operator riding on the machine, so that it or they may pass over the grain on the platform at any desired height, substantially as described.

2. In a combined rake and reel, in which any arm thereof may be a rake or a beater, at the will of the operator, the so constructing or arranging the cam ways as that the arm that acts as a rake shall pass over the platform at a uniform fixed height, while the arms that act as beaters may be raised or lowered in parallel lines, to pass over the grain on the platform at such height as the operator may desire, substantially as described.

3. Hanging the arms of a combined rake and reel at points remote from the center of motion of the wheel or head that carries them, so that, in dropping or rolling the rake and beater arms into their working position, they shall do so in a direction contrary to that in which the wheel, frame, or head that carries them is moving, and so that they may roll into a position to reach the adjustable-hinged lifting and lowering cam way, when used as beaters, and pass beyond or outside of it when used as a rake, substantially as described.

4. Uniting a series of rakes and beaters to their journals, respectively, by curved or bent axles crossing each other, one bent upward and the other downward, for the purpose of getting the centers of motion of the beaters or arms all in the same plane, so that they may all receive a uniform motion from the cam ways that guide or influence them, substantially as described.

5. The combination of the sleeve with its hinged dogs, the forked latch *k*, and the cam way *l*, for the purpose of enabling the operator on the machine to throw the arm that has been acting as a rake out, and hold it out, or to allow it or any other arm of the series to run into action as a rake, while the remaining arms of the series act as beaters, substantially as described.

6. In combination with a series of arms that have a revolving, rising, and falling, and a rolling motion on their journals, a hinged cam way, that may be raised or lowered, to raise or lower the beaters by means of a lever extending therefrom, so as to be within reach of the driver upon the machine, substantially as described.

7. In combination with a series of arms, one of which acts as a rake, and the others as beaters, a series of hinged dogs *g*, one of which shall serve to adapt an arm specially to raking, while the others shall adapt the other arms specially to reeling in the grain, substantially as described.

84,834.—RUDOLPH L'APORTA, New York, N. Y.—*Horse Shoe.*—December 8, 1868.—A screw bar is made to fit at its forward end, the inner edge of the shoe, and at its rear end screws into a nut placed into a hole in a cross bar provided with calks, and fitting in the rear inner edges of the screw. By screwing the nut to fasten the device, the heel of the shoe tends to expand.

Claim.—The combination of the screw bar C with calk I', nut E, cross-bar H, having calks I I, with the shoe A, when constructed and arranged to operate together substantially in the manner and for the purpose described.

84,835.—FRANCOIS LECLÈRE, Boston, Mass.—*Apparatus for Making Paper Boxes.*—December 8, 1868.—Designed for the formation of hollow paper articles from paper pulp, and the invention consists mainly in employing over a previous former, a column of thin pulp, which in height several times exceeds the height of the article to be made.

Claim.—1. For the purpose specified, the described

process of using thin pulp in high columns over pervious formers, substantially as set forth.

2. The combination of the wheel *b* with cylinders *r*, arranged to rise and fall over the formers *m*, substantially as and for the purpose set forth.

3. The combination of the wheel *b* and slides conveying the formers *m*, with inclines to move the slides outward and inward, as the wheel revolves, substantially as and for the purpose set forth.

4. The combination, with the cylinders *r* and their conveyer *b*, of the valves *o*, and the incline *c*¹ operative thereon, substantially as and for the purpose set forth.

5. The process of condensing the pulp on the former, and expelling the water therefrom against atmospheric pressure by covering the pulp-covered former with a close vessel, *d*¹, and admitting therein air under pressure, substantially as and for the purpose set forth.

6. The process for removing the paper from the pervious former, by covering the pulp on the former with a cap fitting thereon, and admitting an air blast within the former, substantially as and for the purpose set forth.

7. The process for removing the paper from the cap which received it from the former, and for transferring the paper to a receiving block, by covering the receiver block with the cap, and admitting an air blast into the cap, substantially as and for the purpose set forth.

84,836.—JOHN MATTHEWS, JR., New York, N. Y.—*Bottle-filling Apparatus*.—December 8, 1868.—Designed for bottling gaseous liquids under pressure, and at the same time charging the bottles with sirup or other flavoring mixtures while under the filling head of the machine.

Claim.—1. The combination of a sirup pump or charging device with the filling head or corking plunger of a bottling machine, in such manner that said pump or charging device is operated automatically by the filling head or its corking plunger, to admit sirup or other flavoring mixture to the bottle, while the aerated water, or other liquid to be sweetened or flavored, is separately supplied to said bottle as it remains under the filling head, substantially as specified.

2. The arrangement, essentially as described, of the sirup pump or charging device, made adjustable, to regulate its charge, as specified, with the filling head or corking plunger, for operation together, substantially as herein set forth.

84,837.—W. W. MCKAY, Ossian, Iowa.—*Rotary Horse Brush*.—December 8, 1868.—The parts are so arranged as to admit of the ready substitution of one brush or comb for another.

Claim.—1. The combination, in a frame, of a rotary brush, and a slide arranged for communicating rotary motion to the brush, alternately in one direction and the other, as and for the purpose described.

2. The brush *D*, arranged in combination with the frame *A*, so as to be readily attached to and detached therefrom, substantially as and for the purpose described.

3. The combination, with the brush *D*, of the adjustable scraper *F*, substantially as and for the purpose described.

4. The arrangement of the brush *D*, frame *A*, pulleys *E*, cords *D*¹, and slide *C*, all substantially as and for the purpose described.

84,838.—JOHN MCKIBBEN, Lima, Ohio.—*Bridle*.—December 8, 1868; antedated December 1, 1868.—The reins serve as check and driving reins combined, being made to pass through rings at the lower ends of the side bars of the bit.

Claim.—The reins *E*, provided with the stops *h*, in combination with the bit, having its side bars *g* provided with the guides *f f* for the reins to pass through, and the tubes *e*, at the rear edges of the blinders, through which the reins also pass, all arranged substantially as and for the purpose set forth.

84,839.—WARREN MOREHEAD, Parkersburg, W. Va.—*Extension Ladder*.—December 8, 1868.—An improvement on his patent of March 14, 1865, and consists in providing the latch with a regulating

slide, and in constructing the ladder with two beams of single thickness, instead of one with double thickness.

Claim.—The arrangement of the sliding ladder *B*, constructed as described, triangular ladder *A*, with its guides *d d*, and the latch *D* and slide *e*, all constructed and operating as shown and described.

84,840.—CHARLES R. M. POHLÉ, Richmond, Va.—*Envelope*.—December 8, 1868; antedated November 30, 1868.—The two extremities of the end flaps are each provided with a half seal, both of which are put through the cut in the closing flap and covered by the seal flap.

Claim.—The closing of the envelope by the action of the double seal, substantially as described.

84,841.—LIBERTY RAYMOND, Green, Ohio.—*Water Elevator*.—December 8, 1868.—To a swing or trapeze are suspended inclined guides extending nearly to the bottom of the well, so as to prevent the buckets from interfering with each other in passing.

Claim.—The combination of the swing or trapeze *F*, the inclined guide *G*, and the cords and pendants *D E*, all substantially as and for the purpose set forth.

84,842.—JOSEPH S. REYNOLDS, Wauconda, Ill.—*Flour Cooler*.—December 8, 1868.—In a series of pans, placed one above the other, are arranged agitators secured upon a common shaft. Screw conveyers are arranged to convey the flour from the spouts to a point near the center of each pan below, whence it is carried to the peripheries of the pans.

Claim.—The arrangement, herein described, of the shaft *B* and agitators *D D*, with the cooling pans *A A*, provided with spouts *a' a'*, near their peripheries, and screw conveyers *C*, as and for the purpose set forth.

84,843.—WILLIAM S. ROBBINS, New Bedford, Mass.—*Bridle Bit*.—December 8, 1868.—Designed as a safety bit in addition to an ordinary bit, so that if the horse takes the bit in his teeth, a bit will still remain in his mouth by which he may be managed.

Claim.—1. The inner bit *B*, attached to the outer concave bit *A* by means of the curved end springs *h*, whereby the inner bit is adapted to be drawn out of the bit *A* its entire length, and parallel with said outer bit as herein described, for the purpose specified.

2. Attaching the bridle to the outer bit *A*, and the driving reins to the inner bit *B*, as herein described, for the purpose specified.

84,844.—CHARLES SANGALLI, New York, N. Y.—*Hand Supporter for Pianos, &c.*—December 8, 1868.—The invention consists in providing a piano or organ with a hand supporter, which can at any time be readily attached to or detached from the instrument.

Claim.—The apparatus hereinabove described, or its equivalent, suspending the hands or resting the wrists, without hindering the free movements of the fingers, and keeping thereby the hand or wrist, and, in consequence thereof, the fingers upon the keyboard, in the position desired, at the same time unhindering all the motions required to be made to use the same, and to play upon an instrument, as above described.

84,845.—W. W. SIMMONS, Birmingham, Conn., assignor to himself, R. M. BASSETT, and T. S. BASSETT.—*Dies for Making Carriage Axles*.—December 8, 1868.—The invention consists in the employment of dies for welding on the collar, shaping the journal and collar, and swaging or upsetting the stock in rear of the collar, all at one operation.

Claim.—The dies *E*, constructed as shown and described, for the purpose hereinbefore set forth.

84,846.—OSCAR SNELL, Williamsburg, Ohio.—*Pump*.—December 8, 1868.—At the side of the pump barrel is a chest which contains a slide valve that covers two ports communicating respectively with the pump barrel and the suction pipe. A tube projecting from the top of the valve chest causes the

latter to serve as an air vessel, so as to discharge the water in a continuous stream.

Claim.—In combination with the pump proper, A, the valve chest F, constituting, also, an air chamber, the slide valve G, tube K, and discharge pipe L, when constructed and arranged to operate in the manner and for the purposes herein set forth.

84,847.—HENRY D. STOVER, New York, N. Y.—*Planing Machine.*—December 8, 1868.—The invention consists mainly of a combination of the two well known planing devices, as the arm of Daniels's planer, with the cylinder of Woodworth's, so that they may be used either separately or in conjunction, as desired.

Claim.—The frame of a planing machine, constructed in the manner described, so that the arm-cutters F F may operate simultaneously with the cylinder D, substantially as and for the purpose set forth.

2. The oscillating clamp R', when constructed in the manner and for the purpose described.

3. The adjustable brackets N, in combination with the frame E, for supporting the driving shaft O, and tighteners, when constructed and arranged as described.

4. The clamp R, when provided with a single hook at each end, to take hold of pins inserted in the sides of the carriage, as described.

5. The iron uprights E, in combination with a bed, A, when such bed is used for the support of the vertical and horizontal cutters D and F F, in the manner and for the purpose set forth.

84,848.—SOLOMON TICE, Cincinnati, Ohio.—*Hydrant.*—December 8, 1868.—The operating parts are so arranged that the valve shall close very gradually when the hydrant is shut off, by means of the gradual escape of water below the plug.

Claim.—The combination, substantially as described, of the open-ended and perforated cylinder A a, chamber B b, inlet pipe C, discharge pipe D, collar E, valve seat F, packing G, stem K, plunger M m, valve O, and contracted passage P, all substantially as described, and for the object explained.

84,849.—JARVIS B. WHITE, Detroit, Mich.—*Clothes Drier.*—December 8, 1868.—The standard of the clothes reel is hinged to an upright, and elevated and depressed by means of a rope and windlass.

Claim.—The clothes drier, consisting of the standard A, part C hinged near the foot of standard A, and carrying the clothes rack D E F, straps G, and windlass H, all arranged and operating substantially as and for the purposes set forth.

84,850.—GEORGE L. WITSIL, St. Louis, Mo., assignor to himself and T. L. BATES, Philadelphia, Pa.—*Apparatus for Cleaning Rags.*—December 8, 1868.—By the alternate exhaustion of air from each of two cisterns, a current of water is caused to flow through rags, pulp, clothes, &c., subjected to the treatment for cleansing.

Claim.—An apparatus for the uses specified, consisting of the cisterns, pipes, stop cocks, and air pumps, arranged for operation, substantially as set forth.

84,851.—ASHBEL P. BARLOW, St. John, Canada, *Slide for Hanging Upright Saws.*—December 15, 1868.—The slides are so constructed as to control the relative positions of the saw with the log being sawed, at all points of the reciprocation of the saw.

Claim.—The slides g g of a muley block for a saw mill, when constructed with a straight inclined or straight perpendicular surface, and a curved surface, in the manner and for the purpose substantially as described.

84,852.—ELIAS BEACH, Titusville, Pa.—*Side Scraper for Wells.*—December 15, 1868.—Metallic scrapers are pivoted at their upper ends to a socket secured upon a central rod connected to the pump rod of the well. The feet of the said scrapers are united by springs to a collar sliding upon the central rod, which collar is pressed upward by a spiral spring and forces the feet of the scrapers outward against the walls of the well.

Claim.—1. The pivoted scrapers C and plate springs C', in combination with the collar E and spiral spring F, arranged and operating substantially as described.

2. The sliding carriage D and friction rollers d, in combination with the springs C' and scrapers C, as set forth.

3. The sliding carriage D and lifting rod D', in combination with the spiral spring G and collar E, arranged and operating as and for the purposes set forth.

84,853.—ROBERT BRAYTON, Fremont, Ohio.—*Oil Injector for Steam and other Enginery.*—December 15, 1868.—A plunger is used to force the oil into steam chests, cylinders, &c., subject to a pressure of steam.

Claim.—The piston E, pipe or barrel A, oil cup and cock C B, and discharging cock D, when arranged and operating conjointly, substantially as set forth.

84,854.—ANSON R. BROWN, M. D., Albion, Mich.—*Instrument for Acupuncture.*—December 15, 1868; improvement on his patent of January 1, 1867.—The elastic disk controls the passage of the fluid to the lancet points. A concave-shaped cap and a shoe are screwed on to the ends of the casing, so as to form an air-tight chamber which contains the inoculation matter. By means of the screw the penetration of the lancets can be regulated.

Claim.—1. The disk J, of felt or other suitable yielding or elastic material, when used in combination with one or more inelastic disks, I, through which the lancets e may pass, substantially as and for the purpose herein specified.

2. The arrangement and combination of the concave-headed cap C and adjusting screw F, with the plunger and shank A a, and casing B, of an acupuncture instrument, substantially in the manner and for the uses set forth.

84,855.—EDWARD E. BURNHAM, Gloucester, Mass., assignor to himself and GEORGE BROWN, same place.—*Mode of Preserving Bait for Fishing.*—December 15, 1868.—The bait is treated with a saturated solution of lime, the water serving, with the excess of lime, to preserve the bait.

Claim.—1. The treatment of fish or bait by the employment of the saturated solution, as and in manner as hereinbefore specified.

2. The improved fish bait, as made by exposure of fish or fish flesh to the action of the saturated solution, as and in the manner as hereinbefore explained.

84,856.—BORK CAPRON, Loc Center, N. Y.—*Roofing Composition.*—December 15, 1868.

Claim.—A composition for coating the external surfaces of roofs of buildings, made by compounding coal tar, asphaltum, plaster of Paris, sugar of lead, japan varnish, raw India-rubber, gum shellac, soapstone, boiled linseed oil, spirits of turpentine, and alcohol, or other substances substantially the same, and boiling the mixture as herein described, in greater or less proportions, partially or wholly in combination, and with or without the addition of any other substance, as set forth.

84,857.—R. CARKHUFF, Lewisburg, Pa., assignor to himself and T. H. WILSON, same place.—*Harvester Rake.*—December 15, 1868; antedated December 3, 1868.—The rake teeth are turned down parallel to the plane of the platform at the termination of the backward stroke of the rake so as to occupy very little vertical space beneath the platform.

Claim.—1. The combination of a vibrating and rocking rake head, vertical crank shaft, independently moving cam plates, segment platform frame, and an overhanging grain receiver, with or without the hinged front section D, substantially as described.

2. The slotted plates J K, constructed and pivoted substantially as shown and described, so as to vibrate and rock the rake head, as set forth.

3. The arm d, for lifting the section D of the grain receiver, arranged on the rake head, substantially as described.

4. The spring g^2 , sustaining the overhanging segmental grain receiver A, forward of its rear point of attachment, without interfering with the passage of the rake beneath the said receiver, substantially as described.

5. The combination of the overhanging standard G of plate G', crank shaft F, and slotted cam plates J K, substantially as described.

6. Rocking the rake head by means of a movement in the plate J, independent of the moving plate K, through the agency of the tongue g^1 and slot h , substantially as described.

7. The guard E, constructed and applied substantially as described, in combination with standard and platform for protecting the rake-moving devices, substantially as described.

8. The construction of the support G' G' P, for the rake-moving devices, and for the finger beam, and inner side beam, substantially as described, so that the raking attachment may be applied to the inner front corner of the platform, as set forth.

9. A rocking rake head, applied to and operated by independently movable vibrating cam plates, controlled and operated by a crank shaft, F, substantially as described.

84,858.—JAMES CARLTON, Walla-Walla, Washington Territory.—*Churn*.—December 15, 1868.—The dasher is provided with hollow arms, communicating with the hollow spindle, for the purpose of conveying air to the cream.

Claim.—In combination with the partially-cogged gear wheels F F and hollow pinion H, the agitator, composed of the hollow spindle J, hollow arms $b b$, and floats $a a$, substantially as and for the purpose herein described.

84,859.—JOHN C. CLARK, La Grange, Mich.—*Fire Shield*.—December 15, 1868.—The shield is designed to be erected in front of or between burning buildings to prevent the flames from spreading, and afford a shelter for the firemen, who may approach much nearer to extinguish the same.

Claim.—A portable fire-shield, composed of columns A, pinions H, cranks I, sectional columns J, with their grooves B, pins E, collars K, hooks M, and hook braces N, the racks C, provided with springs D, the shields G, with their hooks F and doors O, and the hooked poles L, when arranged relatively to each other, and operating substantially as herein described, and for the purposes set forth.

84,860.—LEE D. CRAIG, Nevada City, Cal.—*Hair Cutting Shears*.—December 15, 1868.—The sliding slotted plate to which the comb is attached can be moved up and down at right angles with the blade of the shears and held at any point by a set screw, so as to regulate the length of the hair to be cut.

Claim.—In combination with the blades A and B, the comb F, adjusting plate E, set screw D, and lug C, the whole forming a hair-cutting shears, substantially as described.

84,861.—ALBERT O. CRANE, Boston, Mass.—*Heel for Boots and Shoes*.—December 15, 1868.—The heel revolves on a tapering stud, which latter is held by a screw and prevented from turning when the heel is revolved, by projections on its inner end fitting into the leather.

Claim.—1. Heels, made substantially as described, and so constructed that they may be revolved upon the stud by which they are fastened upon the boot or shoe.

2. A stud, so formed that it will hold the heel upon the boot or shoe, and remain in its place while the heel is revolved.

3. The combination of the heel and stud, made substantially as and for the purposes described.

84,862.—JOSEPH DARDEN, Washington, D. C.—*Boot Jack*.—December 15, 1868.—The boot jack can be secured to the floor by means of the pintles.

Claim.—Combining with a boot jack, the body of which is cast in one homogeneous piece, the side supports E E, provided with pintles i , the whole being constructed substantially in the manner and for the purpose described.

84,863.—JAMES C. DEAN, Chicago, Ill.—*Brick Machine*.—December 15, 1868.—By means of the double cams or inclined ways the bricks are expelled from the revolving mold wheel, and the followers retracted after such expulsion, so as to leave the mold cells open to receive fresh charges of clay.

Claim.—1. The combination of a vertical pug mill, having a lateral branch, a molding wheel revolving in a vertical plane and having horizontal mold cells, and a pressure plate, b , constructed, operated, and arranged substantially as and for the purpose described.

2. The revolving pressure plate b , applied above the axis of the mold wheel, which revolves in a vertical plane, in combination with a stop, R, arranged below said axis of the mold wheel, and with a rotary plunger, J s, a mold wheel and followers, substantially in the manner and for the purpose described.

3. The combination of the rotary pressure plate b , rollers $m m$, and the mold wheel, substantially as and for the purpose described.

4. The arrangement of an endless chain of right-angled tables $g g^1$, which are open at both sides and at one end, so as to pass under bricks as they are extruded laterally from the mold cells, and also support them while they are being separated from the followers by the vertical portions of the tables, in combination with a vertically-revolving mold wheel, substantially in the manner and for the purpose described.

5. A toothed disk or wheel, J, or its equivalent, for acting upon the followers and producing the pressure upon the clay, in combination with a molding wheel or drum, substantially as and for the purposes described.

6. Constructing the molding wheel with recesses, w , for receiving the propelling teeth of a disk, J, between which teeth are plungers, s , for producing the pressure upon the clay while in the mold cells, substantially as described.

7. The rotary pressing plunger or plungers s , substantially as and for the purpose described.

8. The combination of a rotary disk, or shaft, or hub, J, with a plunger or plungers, s , attached to it, and a revolving plate, b , and a mold wheel and followers, substantially as and for the purpose described.

9. The combination of the vertical pug mill, vertically-revolving mold wheel, with its followers, vertical pressure plate, and the chain of angular carrying-off tables, constructed, arranged, and operated substantially as described.

10. The double cams or inclined ways H I, applied to frame B¹, and adapted to serve the purposes described, in combination with followers and the vertically-arranged revolving mold-wheel C, substantially as described.

11. The construction of the frame, with the portion B⁵, of such a form that it constitutes a lateral branch of the pug mill, such lateral branch being cast with and on the side of the frame, substantially in the manner shown and described.

12. The construction of the frame so as to admit of the arrangement of the several parts of the press or molding and pressing contrivances upon it, in the manner shown and described, such frame having the tying cap and bearing plate B² applied to its part B¹ and to its part B³, all substantially as and for the purpose set forth.

84,864.—BYRON DENSMORE, New York, N. Y.—*Gasket Packing for Steam and other Machinery*.—December 15, 1868.—The gaskets are V-shaped in a section through their diameter, and grooved to yield to the pressure of the couplings or the steam in the pipes.

Claim.—Metallic spring gaskets, made as specified.

84,865.—CHARLES H. DOUGLAS, Hartford, Conn.—*Game of Colors*.—December 15, 1868.—A series of colors are marked upon the board, and a series of correspondingly colored tops are spun. A card accompanies the game and indicates the harmony between the color of the top and the color of which it is spun; the object being to familiarize children with the names and harmony of colors.

Claim.—The game herein specified, as a new article of manufacture.

84,866.—JAMES S. EVANS, Irondale, Mo.—*Process of Screening Charcoal.*—December 15, 1868.—The charcoal falls from the wagon on to a chute leading to the screen, from which the coarser portion falls into a receptacle, and the "braze" through the screen into the trough.

Claim.—1. The method or process of screening charcoal, substantially as herein specified.

2. The apparatus herein described as being adapted for carrying out the said process, that is to say, the combination of the sliding platforms, the screens, "chutes," and troughs, substantially as herein specified.

3. In a charcoal screening apparatus, the combination with a screen of a platform so constructed, adapted, and arranged as to receive upon it, in a position directly, or nearly so, over the screen, a wagon containing the charcoal, whereby the charcoal may be delivered directly to the screen, without manipulating the same, substantially as herein specified.

84,867.—WILLIAM R. FAIRBAIRN, Ridotte Township, Ill.—*Compound for Destroying Insects.*—December 15, 1868.—Composed of stone sulphur, black sulphide of mercury, red precipitate, French green paint, and quicksilver.

Claim.—The described compound, of the ingredients and proportions specified, and for the purpose set forth.

84,868.—WILLIAM A. FENN, Wolcott, N. Y.—*Method of Attaching Knobs to their Spindles.*—December 15, 1868.—The surfaces of the spindle and its adjustable knob are serrated, and the knob is provided with an inclined-plane-bearing surface for the end of the screw by which it is secured.

Claim.—The jamming set-screw C, in connection with the serrated contact surface or surfaces *a*, when the knob socket is formed with a slot *b*, and inclined surface *d*, substantially as herein shown and described, for the purpose set forth.

84,869.—HERMAN FISCHER, Chicago, Ill.—*Blank Book.*—December 15, 1868.

Claim.—The method of imitating ornamental leather strips pasted on the buff leather cover of blank books, by painting and burnishing upon the buff leather itself with suitable colors, in places corresponding to those where said strips are now produced by pasting on separate pieces of colored leather, and in pressing dark borders or other ornaments on their tanned-leather covers, substantially as herein described.

84,870.—JOHN F. FISHER, Greencastle, Pa., assignor to himself and DANIEL BREED, Washington, D. C.—*Machine for Distributing Fertilizers.*—December 15, 1868.—Feeding fingers placed over orifices in the bottom of a box containing a fertilizing material, are attached to shafts passing up through the boxes and secured to arms attached to a connecting bar, by which they are operated.

Claim.—1. The combination of the coupling bar *c*, arms *d*, working beneath the hopper, and shafts *e*, substantially as and for the purposes described.

2. The combination of the above with the fingers *i*, as and for the purpose set forth.

3. The fingers *i*, when so arranged that their acute angles are presented to the floor of the hopper, for the purpose specified.

84,871.—DAVID FISK and JOHN M. BLODGETT, Clyde, N. Y.—*Shoemakers' Bench.*—December 15, 1868.

Claim.—As an improved article of manufacture, the shoemakers' bench *A a*, with rotating seat *B*, and also the detachable and adjustable legs *D f d*, substantially as set forth.

84,872.—WILLIAM T. FLINN, Bridesburg, Pa., assignor to BARTON H. JENKS, same place.—*Loom.*—December 15, 1868.—The sliding and rotary cam hubs are circumferentially grooved, and the shaft which receives such cam hubs are so constructed that the cams and hubs shall be supported at different points around the axis of the said shaft, so that the resistance of the swivel dogs in sliding the cams laterally shall not cause undue friction or binding.

Claim.—1. The circumferentially-grooved removable segments *D D*, constructed and applied to the hub *e* of the treadle cam *B*, substantially as described, and for the purposes set forth.

2. An angular cam shaft, carrying a sliding cam, having a grooved and removable shell, the shell being constructed and combined with the cam and its hub, substantially as described, and for the purpose of changing from one twill to another.

3. The combination of longitudinally-adjustable dogs *C*, which actuate the pick motion of looms, an angular shaft *A*, and a longitudinally-reciprocating treadle cam, and a circumferentially-grooved hub cam, all constructed substantially as and for the purpose described.

4. A treadle cam *B*, with a circumferentially-grooved sectional shell *D D*, which is wholly removable, independently of the cam *B*, from the cam shaft, and without disturbing said shaft, substantially as described.

84,873.—CHARLES S. H. FOSTER, Deer Isle, Me.—*Belaying Cleat.*—December 15, 1868.—A central recess is formed in the cleat in which the standing part of the sheet is secured in order to prevent the fouling of the sheet attendant upon tacking.

Claim.—A cleat, formed with the usual horns *B B*, and recesses *b b*, and the central recess or seat *c*, substantially in manner as and for the purposes specified.

84,874.—THEODORE A. GAMAGE, Boston, Mass.—*Menstrual Receiver.*—December 15, 1868.

Claim.—1. The improved menstrual receiver or guard, before described, consisting of the impervious bag or cup *b*, to contain sponge or other absorbent material, and connected to the belt *j*, by pendent straps *h h h'*, in manner and for the purpose as before described.

2. The combination and arrangement of the front strap *h'*, the belt *j*, the slotted plate *k*, and buckles *m m*, as and for the purposes herein specified.

84,875.—HACHADOOR P. GARABEDIAN, Philadelphia, Pa.—*Pipe Coupling.*—December 15, 1868.—The collar has a conical screw formed upon it and a number of inclined slots, the edges of which are pressed together by the nut so as to compress the hose firmly upon an inner tube.

Claim.—The collar *C*, with its conical screw *a*, and the inclined slots *b b'*, in combination with the nut *D* and the tube *B*, substantially as shown and described.

84,876.—J. IRVING GORTON, Sing Sing, N. Y.—*Corn Husker.*—December 15, 1868; antedated December 11, 1868.—A metal bar is provided on one side with a ring for the finger, and on the other side with a spring bar, by which the husk is grasped, torn off, and cut.

Claim.—Combining the parts *A B C D E*, substantially as described and for the purpose mentioned.

84,877.—JOHN GRAY, San Francisco, Cal.—*Tile for Floors, Sidewalks, &c.*—December 15, 1868.—Composed of sand and sulphur, and pressed in molds to form slabs or tiles.

Claim.—The above-described composition tile as a new article of manufacture.

84,878.—J. ASHTON GREENE, Brooklyn, N. Y.—*Mode of Fastening India-rubber Tires on Carriage Wheels.*—December 15, 1868.—A rubber tire is so attached to an ordinary metal tire as to admit of its ready attachment and removal, so that the wheel may be adapted for use either with or without the rubber tire.

Claim.—1. The method of attaching an India-rubber tire to the ordinary flat metal tire of a wheel, by means of detachable and removable fastening devices, substantially as and for the purposes herein described.

2. The herein-described bolts, nuts, and springs for holding together the rubber and metal tires, the same being arranged and applied to the wheel, substantially as shown and set forth.

84,879.—E. W. HEWITT, Peconica, Ill.—*Sulky Harrow.*—December 15, 1868.—A harrow is

suspended in a frame mounted on wheels, so as to be readily raised and lowered by means of levers under control of an operator seated on the frame.

Claim.—1. The harrow W, suspended by ropes or chains, R, S, and T, and held in place by chains *d d* and P, and drawn by a chain Y, substantially as and for the purpose set forth.

2. The combination, with the harrow W, of chains S, R, and T, hooks V V, pulleys *n n*, and levers F F, the latter being used to raise and lower said harrow, substantially as described and shown.

84,880.—COLLINS F. HILL, Hamilton, Ohio.—*Spirit Level.*—December 15, 1868; antedated December 8, 1868.—The cylinder, which holds the spirit vessel, is capable of a rotating movement on its axis, and also longitudinally within a graduated circular chamber, so that the device applied to a rule may be used as a level or a plumb, and also to determine a line at any angle between the vertical and horizontal.

Claim.—1. The chamber B, provided with the scales *m m*, and quadrantal slot *i*, in combination with the rotary adjustable cylinder D, spirit vessel *b*, and rule A, substantially as and for the purpose described.

2. The combination of the stem C, arbor *s*, plate *u*, packing *z*, and washer *y*, connected, arranged, and operating in the manner and for the purpose described.

84,881.—ISAAC V. HOLMES, New York, N. Y.—*Metallic Lath.*—December 15, 1868.

Claim.—1. The metallic sheet lath described, when provided with rectangular openings, made by slitting the lath and bending back the edges *e e*, substantially as and for the purpose described.

2. A lath, when constructed of sheet metal, with its edges bent back, so as to present the beaded corners *a a a a*, and applied substantially as and for the purpose described.

3. The construction of the described metallic sheet lath, when made with a tapered form at one end, with a view to splicing or jointing, substantially as described.

4. The metallic plates, slitted as described, when used for studs or supports for metallic sheet laths, substantially as shown and for the purpose described.

5. The arrangement and fastening of sheet metal laths upon metallic plates, used for studs, substantially in the manner and for the purpose described.

84,882.—EDMUND S. HUNT, Weymouth, Mass.—*Manufacture of Fans.*—December 15, 1868.

Claim.—1. The method, hereinbefore described, of connecting and compressing together the layers of a fan body, so as to form them with recesses or pockets, to receive the fan sticks, as set forth, the same consisting in arranging the layers one on the other, with dextrine or a liquid cement between them, and compressing them together by heated dies, having one or more grooves arranged in either or each of them, so as to prevent adhesion of the layers where it may be desirable, the whole being substantially as described.

2. The above-described method of connecting and compressing together the layers of a fan body, so as not only to form them with recesses or pockets between them, to receive the sticks of a fan frame, but, at the same time, to crimp or corrugate such body, as and for the purpose substantially as specified.

3. Either or both the dies, as formed with grooves, or with grooves and corrugating ridges or projections, for the purpose or purposes and to operate with respect to the layers of a fan body, under circumstances and in manner as hereinbefore explained.

84,883.—MICHAEL KEEFER, Millstone Point, Md.—*Rock Drill.*—December 15, 1868.—The drill shaft is operated by a spring attached to an adjustable rod, and oblique holes in the cross pieces admit of the shaft being operated obliquely to the frame.

Claim.—1. The combination of the adjustable rod I, spring J, and drill shaft E, with suitable guides for the drill, substantially in the manner and for the purpose described.

2. The cross pieces D and F, with the oblique

holes, in combination with the drill and spring, thus operating substantially as shown and described.

84,884.—CHARLES F. KUHNLE, Washington, D. C.—*Dovetailing Machine.*—December 15, 1868.—By means of levers and a bevel gear the slotted wheel is turned to a position to move the saws to the proper angle for cutting the sides of a tenon; and in cutting the sides of the mortises the saws are set on line with the center of the machine, and the slots in the bevel-gear wheel in the same direction.

Claim.—1. The combination of carriage and the slotted gear wheel P, substantially in the manner and for the purpose specified.

2. The combination of the adjustment plates N and the slotted gear wheel P, substantially in the manner and for the purpose specified.

3. The combination of the adjustment plates E', the levers *j*, rods *h*, connecting bars *i*, and stirrups *c*, substantially in the manner and for the purpose specified.

4. The combination of the carriage H, in which both an oblique and straight feed can be obtained, and the chisels G, when operated substantially in the manner and for the purpose specified.

5. The construction and arrangement of the rocking adjustable carriage H, and carriage G, which moves transversely, and the carriage F, moving lengthwise of the machine, all as and for the purpose set forth.

84,885.—J. D. LEACH and SABIN HUTCHINGS, Penobscot, Me.—*Fishing Tackle.*—December 15, 1868.—The elastic section is designed to facilitate the hooking of the fish when biting, and to prevent tearing the hook from the gills when hauling the fish in.

Claim.—1. Inserting in the line, near the hook, an elastic section, substantially as described, and shown at *b*, Fig. 1.

2. An elastic cord, interposed between the sinker and hook, in manner substantially as described, and shown at *i*, Fig. 4.

3. Combining with fishing tackle an elastic spring or section of rubber, so arranged near the hook as to produce the results and accomplish the objects herein set forth.

84,886.—J. D. LEACH and SABIN HUTCHINGS, Penobscot, Me.—*Revolving Pile Hook.*—December 15, 1868.—Upon one side of a metallic collar, which rotates loosely on a pile, is a hollow projection, in which are inserted springs, to which is attached the shank of a hook that holds a hawser.

Claim.—1. A revolving pile hook, formed with a collar, C, to receive the pile, and a hook E, for attaching the hawser, substantially as described and shown.

2. Combining with collar C and hook E the elastic buffers *c c*, substantially in manner as and for the purposes specified.

84,887.—SAMUEL K. LIGHTER and JOSEPH CURTIS, Hamilton, Ohio.—*Harvester.*—December 15, 1868; antedated December 3, 1868.—Ratchet teeth on the inner sides of the driving wheels, in connection with loose ratcheted rings recessed in the hubs and projections, cause a continuous motion to be given to the main shaft when the machine moves forward, but in a backward movement the ratchet teeth reverse their relative motion, and produce no motion on the shaft.

Claim.—1. The arrangement, within the hubs H on the shaft F, of the ratcheted rings *I i i'*, the lugs or projections *h*, cast on the heads of said hubs H, the ratchet teeth *d* on the ground wheels D, and the coiled spring J, as and for the purpose specified.

2. The finger bar, supporting caster O P, adjustable by means of the serrated or toothed head *p* and pawl R, or its described equivalent, substantially as set forth.

84,888.—JOSEPH LINK, United States Army.—*Apparatus for Cooling Liquids on Draught.*—December 15, 1868.—From the sides of a vertical cylindrical vessel extend a series of inclined radial tubes, connected at their lower ends with a hollow annulus, from which latter extends upward a dis-

charge pipe, the whole to be arranged within a vessel containing ice.

Claim.—The combination and arrangement of the cylinder or hollow vessel A, the series of radial pipes B, the hollow annulus C, and its discharge pipe D, the whole being for use with a tank, substantially in manner and for the purpose as specified.

84,889.—DAVID H. LOWE, Boston, Mass.—*Gas Heater.*—December 15, 1868.—Relates to improvements on his patent of August 11, 1868. A burner is arranged to point downward into a fire pot, from the bottom of which the flame is deflected under and around the kettle or utensil to be heated. A conical tube, provided with perforations, is used with the fire pot when a quantity of naphtha has been carelessly allowed to accumulate in the said pot.

Claim.—1. A tube or deflector *j*, which is either of a conical form, and open at the top, or of other form, and provided with a perforated top, and having openings *kk* at the bottom, in combination with a fire pot L, substantially as and for the purpose specified.

2. The burner H, for heating the nurse lamp, in combination with one or more burners, 17, 18, for illuminating the apartment, all arranged and operating substantially as set forth.

3. A conical tube, O, provided with a series of perforations at its bottom, in combination with a fire pot, L, substantially as and for the purpose described.

4. The conical sleeve P, and cap or cover Q, in combination with a conical tube O, provided with perforations for extinguishing the flame of the naphtha contained in the fire pot L, substantially as described.

84,890.—EGBERT MACY, New York, N. Y., assignor to JOHN H. KEYSER, New York, N. Y.—*Cover for Fuel Magazine in Base Burning Stoves.*—December 15, 1868.—The cover is rendered self-acting by being made heavier on one side than the other.

Claim.—1. The combination of a self-acting cover with a fuel reservoir, substantially as described.

2. The inclined self-acting cover C, applied to a rim, A, constructed substantially as described.

3. The construction of rim A with abutments *c g* and recesses *a a*, adapted for receiving a self-acting cover C, substantially as described.

84,891.—PETER H. MANN and GRIFFITH P. TERRY, Albany, N. Y., assignors to ANDREW B. ULIN and G. G. KIDDER.—*Seal Bolt for Railway Cars.*—December 15, 1868.—The tongue is provided with a slot to receive the pivot pin and with a recess at its lower end into which a projection on the locking pin enters when the tongue is wholly inclosed in the socket.

Claim.—The combination and arrangement of the slot *c*, the recess *i*, and the projection *k* with the bolt A, the tongue B, and their pivot or pin *d*.

84,892.—THOMAS M. MARCY, Windham, Ohio.—*Wagon Box.*—December 15, 1868.—The sides and ends of the wagon box are hinged to the bottom, so that the box can be converted into a platform for a hay rack or a wagon truck.

Claim.—The sides B B, ends C C, hinged to the bottom or center piece A, each and all being constructed, arranged, combined, and operating together in the manner and for the purpose as specified and set forth.

84,893.—OLIVER M. MARTIN, Ann Arbor, Michigan.—*Process of Curing Hams, Beef, and other Meats.*—December 15, 1868.

Claim.—The process, herein described, of preserving meat, by steaming it in salt and saltpeter, after brine has been injected into the meat, substantially as and for the purposes described.

84,894.—H. McMANUS and JOHN B. HATTING New York, N. Y.—*Plate or Salver.*—December 15 1868.—The specification describes a mode of casting the plate.

Claim.—The chased or ornamented plate or salver, herein described.

84,895.—DANIEL E. MCSHERRY, Dayton, Ohio.—*Wheat Drill.*—December 15, 1868.—An adjustable arm allows the use of different-sized spur wheels to vary the speed of the seeding apparatus.

Claim.—The adjustable arm E, and its arrangement with reference to the shaft B, the frame A, the spur wheels C and D, bolt *n*, and axle *s*, substantially as described and for the purpose specified.

84,896.—I. FERGUSON MORSELL, Stamford, Conn.—*Railway-switch Signal.*—December 15, 1868.—The lever, when liberated by the breaking of the main line of track, or the opening of the switch, assumes a vertical position and causes the colored plate on its end to come opposite an opening in the vertical board, thus giving a signal of danger.

Claim.—A railroad-switch signal, consisting of the combination of a suitable frame or stand, A, supporting or show board, B, a perpendicularly-arranged vibrating lever, D, provided with a weight, *b*, or its equivalent, and a colored plate, *b*, and a detached rod, connecting said lever D with the rails of a railroad, arranged and operating substantially as and for the purposes herein specified.

84,897.—CHARLES MURDOCK, Hartford, Conn.—*Stave Machine.*—December 15, 1868.—The reciprocating, vibratory table, with its head block, is pivoted at such a point as to cause the saw to cut a transverse circle on the outside of the stave to conform to the outside diameter of the barrel when completed. The cams and flanges act against rollers on the arms of the feeding table, causing the same to have the necessary vibration.

Claim.—1. Hinging or pivoting the vibrating feeding table H in the manner described, and with relation to the saw, so that the staves may be sawed in the manner substantially as set forth.

2. The combination of cams Q, flanges R, and shaft O, with the table H, when constructed and arranged to operate in the manner and for the purpose set forth.

3. In combination with the flanged cams Q, table H, and stops *w w*, the adjustable stand *k*, for determining the thickness of the staves to be cut, substantially in the manner described.

84,898.—DANIEL F. MYERS, New York, N. Y.—*Waiter Machine.*—December 15, 1868.—The dishes are placed on an endless belt, which is actuated by suitable mechanism in the kitchen. A plate in close contact with the belt receives the soiled plates and allows them to slide on to the receiver. The pillars supporting the chutes are adjustable vertically.

Claim.—1. The combination, with the endless belt B, working in the chute D of the receiver H', having the plate S as and for the purpose described.

2. In combination with the above, the pillars D and adjustable hangers D''.

3. The machine above described, constructed, arranged, and operating as set forth.

84,899.—PETER H. NILES and FRANK W. MARSTON, Boston, Mass.—*Fastening for Corsets.*—December 15, 1868; antedated December 2, 1868.—The eye of each clasp is so made that it may be thrown out of engagement with the pin to which it fastens by the end movement of one spring relatively to the other.

Claim.—A corset spring, made with clasps or fastening plates, each of which has a vertical slot opening from a lateral slot and out from the plate, substantially as and for the purpose set forth.

84,900.—JOSEPH W. NORCROSS, Boston, Mass.—*Grommet.*—December 15, 1868; antedated November 30, 1868.—When the grommet is clinched, one of the eyelets is inclosed between the flange of the other eyelet and an additional flange, thus protecting it from the influence of air or water, and allowing an iron eyelet to be used.

Claim.—The arrangement and combination of the eyelets *a b'* and additional flange or cap *c*, substantially as and for the purpose set forth.

84,901.—JOHN W. PEASE, Belmont, N. Y., assignor to himself, LEONARD WILLETS, and ISAAC WILLETS, same place.—*Brick Machine.*—December

15, 1868.—The water or steam is introduced to the clay through the hollow shaft and spirally-arranged hollow arms. The gathering-in edge of the feeding blades is adjustable by means of set screws to regulate the feeding capacity of the blades.

Claim.—1. The combination of the hollow, perforated, and spirally-set taper arms D, with hollow shaft C, and with the feeding blades G G, substantially as described.

2. Adjustable feeding blades G G, applied to the shaft of the pug mill, for the purpose of regulating the feed of the clay to brick-making machinery, substantially as described.

84,902.—WILLIAM S. PORTER, Boston, Mass.—*Button-hole Cutter.*—December 15, 1868.—The cutting blade can be adjusted on one of the jaws, so as to cut larger or smaller-sized holes. The stop can be adjusted to vary the distance of the button-hole from the edge of the material.

Claim.—1. The combination and arrangement, with the jaws A and stop *h*, of the knife *f*, held in one of said jaws, and made adjustable, so as to project a greater or less distance therefrom, in the manner and for the purposes set forth.

2. Providing the jaws A with slotted or recessed heads *a a'*, constructed and arranged with relation to each other and the knife *f*, substantially as and for the purposes shown and specified.

84,903.—JOHN EDWIN RACE and AARON SMITH, Chicago, Ill.—*Cloth-measuring Apparatus.*—December 15, 1868.—Designed to roll the cloth on any required shaped roller board, and at the same time measure and register the number of yards or fractional parts of yards.

Claim.—The cloth-measuring apparatus, consisting of the board or roller I, plates J F', screws C D, hand wheel E, shaft F, winches H G, wheels M N, pinion P, wheel Q, bars L, and indicator S, when arranged to operate substantially as and for the purposes set forth.

84,904.—O. H. REED and ASA L. CARRIER, Washington, D. C.—*Machine for Washing Printers' Ink Rollers.*—December 15, 1868.—The inking rollers are fed by rubber feed rollers through a cylinder provided with brushes on its inner circumference, which revolve in a cleansing solution, and remove the dirt, which falls into a box, through an aperture closed by a spring valve, when the box is removed to be cleaned. The inking rollers are then fed through similar brushes revolving in clean water, and then wiped by being passed through disks of rubber.

Claim.—1. The double box B C, for containing a cleansing solvent and clear water, in combination with the brushes G, constructed and operating substantially as and for the purposes set forth.

2. Two or more brushes G, constructed and operating substantially as and for the purposes set forth.

3. The boxes D D, constructed and operating in combination with boxes B C, substantially as and for the purposes set forth.

4. The dirt box O, provided with rod *o*, valve V, and spring *v'*, constructed and operating substantially as described.

5. The reels E, provided with disks *e*, substantially as and for the purposes set forth.

6. The elastic wipers W, constructed and operating substantially as and for the purposes set forth.

7. The elastic feed rollers R, constructed and operating substantially as and for the purposes set forth.

84,905.—HIRAM A. REID, Beaver Dam, Wis.—*Apparatus for Shearing Sheep.*—December 15, 1868.—The comb plate is constructed with plain, straight teeth, without any cutting or scissor-blade edges. The blade is secured to the slotted plate, which is vibrated on a fixed pin by the crank, so as to give a variable movement to the point of the blade.

Claim.—1. The manner of constructing and arranging the comb plate *i i i*, substantially as described.

2. The operative combination of the cutting blade *m* with the comb *i i i*, as described and for the purposes set forth.

3. The combination of the blade *m* with the slotted bar H, substantially in the manner and for the purposes described.

84,906.—SELDEN N. RISLEY, Brooklyn, N. Y.—*Cigar Case.*—December 15, 1868.—The ring around the open case prevents the spreading of the openings.

Claim.—A cigar case, made of paper tubes, with longitudinal ribs and a retaining ring, substantially as described.

84,907.—HENRY M. RITTER, Covington, Ky.—*Machine for Riveting Hinges.*—December 15, 1868.—Peculiarly-shaped revolving milling tools spread the pintle on being forced against it, and form the head.

Claim.—1. A riveting tool, composed of a rod having V-shaped grooves and intervening rounded projecting spurs on the end thereof, said grooves crossing one another at and in a direction at right angles to the longitudinal axis of said rod, substantially as described.

2. A pair of riveting tools, constructed as specified in the foregoing claim, in combination with mechanism for operating the same, arranged substantially as described.

84,908.—SULLIVAN W. ROGERS, Harwich, Mass.—*Baking Pan.*—December 15, 1868.—The bottom of the pan is removable to allow the ready withdrawal of the loaf without the pan having been previously greased.

Claim.—False-bottom baking pans, as herein described, of any size or shape.

84,909.—EDWIN H. SAMPSON, Boston, Mass.—*Clamp for Suspending Pasteboard and Other Fabrics.*—December 15, 1868.—The pasteboard is held between the stationary and movable jaw, the latter of which is so pivoted that the weight of the board causes it to be grasped firmly by the jaw.

Claim.—The jaws B C and frame A, when combined and arranged substantially as and for the purposes described.

84,910.—JOHN SCHEIBLEIN and JOHN HEITZMAN, Philadelphia, Pa.—*Hand Cultivator.*—December 15, 1868.—The coulters and plows are secured to a transverse plate on the frame. The coulters sever the roots between the rows to prevent the plows from tearing up the plants.

Claim.—1. The coulters *e*, plows *f*, and transverse plate E, when combined and arranged as shown and described.

2. The frame A, stilts B, transverse plate E, standards D D, pin *c*, wheels C, clearers F, coulters *e*, and the plows *f*, when combined and arranged as shown and described.

84,911.—SAMUEL F. SEELY, Whiteford, Mich.—*Cultivator and Plow.*—December 15, 1868; antedated December 11, 1868.—An improvement on his patent of August 6, 1867.—A slotted arm attached to the cross rod, which secures the handles together, slides in a mortise on the end of the plow beam, and is held by a cam lever. The plow standard is attached to the plow beam in such a manner as to readily change the direction of the plows.

Claim.—1. The tenon B', the cam lever C', the slotted arm F, in connection with the cross rod E, when operating substantially as and for the purposes set forth.

2. The share O, wings P, and braces R, in connection with the standard I, when operating substantially as and for the purposes herein described.

3. The adjustability of the standard I, for the purpose described, in combination with the share O, wings P, and tenoned beam A, substantially as set forth.

4. The combination of the beam A, the tenons B' and B'', the cam levers C' and C'', the handles D, the cross rod E, the slotted arm F, the slot G in the same, the slotted slide H, the standard I, the bolt and nut J, the eye and ring K, the draught rod L, the hook M, the bolt N, the share O, the wings P, and the braces R, when arranged, constructed, and operating substantially as and for the purposes herein shown, set forth, and described.

84,912.—THOMAS SHAW, Philadelphia, Pa., assignor to himself and PHILIP S. JUSTICE.—*Pumping*

Engine.—December 15, 1868.—The chamber is divided into two compartments by a flexible diaphragm. The water admitted into the upper compartment is forced out by the steam admitted into the lower compartment, raising the diaphragm. By a suitable arrangement of valves the steam is cut off when the water has been ejected, the exhaust is opened, and a spray of water is forced into the steam chest, a vacuum being thus formed, which causes the diaphragm to descend to allow water to be again admitted.

Claim.—1. Operating valve F in the manner set forth.

2. The arrangement of valve L with steam chest E for starting the engine, as described.

3. The combination of valves V and U with well W, as specified.

4. Controlling the injector in the manner specified.

84,913.—S. M. SHERMAN, Fort Dodge, Iowa.—*Window Shutter.*—December 15, 1868.—The slats are hung by means of clamps on pins secured rigidly to the frame of the blind and are operated by bars connecting with cams in connection with keys.

Claim.—1. The slats A', provided with clamps a a', as and for the purpose described.

2. The slats A', having the clamps a a', in combination with rod B, bar c, and cam d, the whole being constructed and operated in the manner described, for the purpose set forth.

3. The cam c and bar c³, with or without the intermediate connections e¹ e², when arranged as described, in connection, either with the rod of a blind of the usual construction, or a rod attached to the slats by the clamps h', as set forth.

84,914.—GEORGE E. SMITH, San Francisco, Cal.—*Automatic Stop-cock for Gas Burners.*—December 15, 1868.—A compensation curb, supported so as to encircle the gas flame, is so connected by a lever with a detent holding the cock open, that when the flame is extinguished the curb contracts and liberates the detent, which allows the cock to be closed by means of a spring.

Claim.—1. The compensating curb or rod, composed of two or more metals, b and c, together with the lever K, detent M, arm D, and spring E, substantially as and for the purpose described.

2. The lever K, connected with the curb, the two detents G and M, and the catch a, on the arm D, constructed and operated substantially as herein described.

84,915.—GEORGE W. STOUT and JOHN C. RICHARDSON, Newark, N. J., assignors to themselves, JAMES DAVIS, Jr., and Samuel R. HAWLEY, assignors to said STOUT, JAMES H. PRENTICE, said DAVIS, Jr., and HAWLEY.—*Hat Ironing Machine.*—December 15, 1868.—A curved hollow box has its broadest side to the face plate, and its lower or concave side beveled at its inner edge, so as to iron the brim close up to the crown of the hat. The box is secured to a piston rod that allows it to turn freely, to press equally on the brim.

Claim.—1. The swinging arm F, supporting a platform, carrying a revolving iron and its driving mechanism, when the platform is arranged to be adjusted for ironing the sides of hat crowns, substantially as set forth.

2. The hollow face plate H, constructed with teeth on its periphery, and arranged to be swung into or out of gear with its driving mechanism, substantially as described.

3. The hollow box iron No. 3, constructed with an acute angled face on its concave side, combined with the hollow face plate H.

4. The combination of the hollow face plate H and hollow box iron No. 3, when the latter is arranged with its shank or piston playing in a cylinder and under spring pressure.

5. The combination of the slides which carry the boxes or bearings for the irons with the slotted adjustable plates which support the irons.

84,916.—ELIAS STRANGE, ELIAS W. STRANGE, and EMERSON C. STRANGE, Taunton, Mass.—*Saw Grinder.*—December 15, 1868.

Claim.—1. Applying the grinding or polishing

wheels to the cylindrical saws or other cylinders, with or by a yielding pressure of a spring or weight, substantially as described.

2. Applying the stone or wheel on the inside of the cylinder, against a point at some distance from the point opposite to the stone or wheel, on the outside, to avoid heating the cylinder by the grinding stones or polishing wheels.

3. Applying the grinding stones or polishing wheels to the inside and outside of the saw or other cylinder at the same time, so as to grind or polish the inside and outside at one operation.

4. In combination with the swinging arms and grinding stones or wheels, pressed against the cylinder by a yielding pressure, the adjustable stops Y Y, arranged to limit the vibration of the arms, substantially as described.

84,917.—EDWIN J. TOOF, Fort Madison, Iowa.—*Horse Rake.*—December 15, 1868.—The lifting forward of the handle of the rake is accomplished by the combined action of the gate trip stick and hounds of the rake, so that the front parts of the rake fingers will pass under the hay and gather it up cleanly.

Claim.—1. A stop, to arrest the gate in its forward movement, formed by the rod g, or its equivalent, substantially as described, for the purpose specified.

2. The yielding connection e, substantially as shown and described, in combination with the trip stick d, hounds B, and the handle A, of a revolving horse rake, all as and for the purpose set forth.

84,918.—CHARLES N. TYLER, New York, N. Y.—*Wash Boiler.*—December 15, 1868.—The boiling and steam space is formed by a close arched plate curved down at both sides and secured to a band which fits the sides of the boiler at the bottom, openings being left at the ends of the curved plate.

Claim.—The close concave plate B, provided with the band B' and openings G, at the ends, and capped tube C, substantially in the manner and for the purposes set forth.

84,919.—JOHN VALENTINE and HENRY B. STEVENS, Buffalo, N. Y.—*Clothes-line Reel.*—A reel is inclosed in a metallic casing, and the end of a cord is secured in a cavity in the end of the journal, passing through a hole in the same, to the winding portion. A pin passing through the handle into holes in one end of the casing serves to hold the reel in position.

Claim.—1. The perforated spool journal h, substantially as and for the purpose herein specified.

2. A reel, composed substantially of the following parts: The periphery A, heads B B, bars a a, serving both to connect the other parts and to receive the oblong mouth f, and loop or staple m, and the locking pin E, in the crank handle, and holding in the concentric holes b b, as herein specified.

84,920.—HENRY B. VAN BENTHUYSEN, Emporium, Pa.—*Base-burning Stove.*—December 15, 1868.—Designed for burning bituminous coal. An inner rotating cylinder of conical form, the large end being downward, is arranged within the external casing. On the inner surface of the casing are placed spiral segments to force the coal downward. The grate is made to rotate, and is of conical form with a spear-like projection in the center.

Claim.—1. A rotating inside cylinder magazine, with or without projections on the inner surface, substantially as described.

2. The ratchet, dog, and lever, or other equivalent device, in combination with the rotary magazine, substantially as and for the purposes described.

3. A cone-like rotary grate, provided with vertical projections on its surface, as above described.

4. The projecting ribs on the inner surface of the fire space, in combination with the vertical projections on the rotating grate, substantially as and for the purpose set forth in the foregoing specification.

84,921.—H. M. VIETS, Carlisle, Ohio.—*Milk Can.*—December 15, 1868.—One or more ice vessels are placed within a milk can, and are attached to a

shank which is hung to a hook on the inside of the cover.

Claim.—The ice vessels E E, with the shank C and arms a a, hook B, on the lid of can A, and eye D, all constructed and adapted to the uses and purposes in the manner substantially as described.

84,922.—ERNEST VON JEINSEN, New York, N. Y.—*Breech-loading Fire-arm.*—December 15, 1868.—A limb is formed on the body of the extractor, in front of the hook, to shut off access to the extractor space, in order to prevent the entrance of dust and dirt. A covering plate in the bottom of the receiver serves to prevent the latter from becoming foul. On the side of the plunger is a slot, in which plays a roller pin, which prevents any motion from being imparted to the extractor while the said pin is in that part of the slot, where it will be until after the full-cock notch has passed the sear.

Claim.—1. The limb l, on the body of the shell extractor, so arranged as to close the place left vacant by the hook j, when extracting a shell, substantially as described.

2. The covering plate p, over the bottom of the receiver, arranged substantially as and for the purpose set forth.

3. The slot n, on the tumbler, in combination with the extractor k, and a pin, which works in said slot, substantially as described.

84,923.—J. B. WARING, Brooklyn, N. Y., assignor to HIRAM DURYEA, New York, N. Y., assignor to W. E. DICKSON, Chelsea, Vt.—*Hydraulic Wash Boiler.*—December 15, 1868.—The central tapering tube is surmounted by an inverted flaring cap or deflector.

Claim.—1. As a means for guiding and showering over the clothes an ascending column of water, the employment of one or more inverted conical flaring caps C, constructed substantially as described.

2. Such a cap, combined and arranged as shown and described, relatively to the open top of a vertical tube of a wash boiler.

3. Such a cap or caps, when combined each with a vertical tube, and with a perforated false bottom, substantially as and for the purpose described.

84,924.—ARETUS A. WILDER and JOHN WILDER, Detroit, Mich.—*Washing Machine.*—December 15, 1868.—The journal is made hollow, to allow of free access of air to the interior chamber, in order to avoid resistance to the movement of the clothes and water. A drip pipe serves to convey off water which may enter the shaft. Wedge-shaped ribs on the interior of the case, which is made to turn eccentrically on the journals, cause the clothes to travel from end to end of the case.

Claim.—1. In a rotating washing machine, the hollow journal F, connecting with interior of case A and drip pipe H, substantially as and for the purposes set forth.

2. The combination, in a washing machine, of the cylindrical case A, with door E, turning eccentrically upon journals, and provided with wedge-shaped ribs I, hollow journal F, drip pipe H, and handle G, all arranged and operating as herein described.

84,925.—F. GREENLEAF WILSON, Nashua, N. H.—*Belt Fastener.*—December 15, 1868.

Claim.—A single plate belt hook, with one or more rows of teeth, spurs, or pins on or near the edges of the concave side of the plate, as shown and described.

84,926.—JOHN C. WILSON, ADAM WALKER, and JOHN FOSTER, New York, N. Y.—*Clipping Shears.*—December 15, 1868.—The device is designed to adjust and hold the cutters steadily in position, so as to produce an even clip, and prevent the entrance of dust, &c., between the cutters.

Claim.—The spring plate K, and adjusting thumb set screw L, in combination with the serrated cutters A B, substantially as and for the purposes described and set forth.

84,927.—GEORGE W. N. YOST, Corry, Pa., assignor to THE CORRY MACHINE COMPANY.—*Harvester.*—December 15, 1868.—The pinion shaft is

passed through an aperture in the bolt, and serves to unite the two halves of the main frame, and also as a bearing for the crank shaft.

Claim.—The bolt I, made and used as a gudgeon box for the pinion shaft N, and as a fastening bolt for the cases A and A', as described, for grass and grain cutting machines.

84,928.—WILLIAM H. ACKER, Tarrytown, N. Y.—*Clothes Drier.*—December 15, 1868.

Claim.—The levers B, pivoted to the upright posts A, and provided at their upper ends with the cross-bars C, carrying the slotted plates D, and at their lower ends with the chains F, all operating as described, whereby a series of parallel clothes lines is adapted to be raised, lowered, and tightened between the posts, at the same time preserving their parallelism, as herein shown and described.

84,929.—ETHAN ALLEN, Worcester, Mass.—*Breech-loading Fire-arm.*—December 15, 1868.—The

metal which forms the barrel extends down and back, to form receiving chambers for the cartridge cases, and to effect secure connection between the barrels and the breech iron. Combined with one or both shot barrels is an auxiliary rifled barrel.

Claim.—1.—The combination of the downwardly and backwardly projecting barrel extension and connection part E, made in one piece, as described, with the barrel or barrels, and metal breech piece D, as and for the purposes set forth.

2. The combination, with the metal breech piece D, and forwardly projecting arm M, of the barrel extension or connection part E, and dovetail projection L, inserted laterally into a correspondingly-shaped recess in the breech piece, substantially as and for the purposes set forth.

3. The combination, with the hinged lifting and locking lever N, of a breech-locking device, separate from said lever, but so combined therewith as to be operated thereby, for the purposes set forth.

4. The combination, with the hinged breech piece G, and hinged lever N, of the locking bolt O, and connection d, substantially as and for the purposes set forth.

5. The combination, with the locking bolt O, of the spring P and friction roll e, substantially as and for the purposes set forth.

6. The combination, with the hinged breech piece G and locking bolt O, of a holding spring, P, substantially as and for the purposes set forth.

7. The combination of a yielding roll, e, with the rear concave or recessed end of the locking bolt O, substantially as and for the purposes set forth.

8. An auxiliary flanged rifle barrel, R, applied to the main barrel of the gun, so as to be operated or withdrawn by the cartridge extractor, substantially as and for the purposes set forth.

9. The auxiliary rifled barrel R, when made with the tapering or contracted end R', substantially as shown and described, and for the purposes set forth.

10. The combination and relative arrangement of the combined hinged extractor, lever, and trigger guard J, and hinged breech piece G' with the cartridge shell or case extractor Q, substantially as and for the purpose set forth.

84,930.—LEVI O. ALLEN, Gardiner, Me.—*Stove Pipe Damper.*—December 15, 1868.—The two plates,

when closing the pipe, form an angle of 90° to each other, and are operated by a shaft provided with pintles passing through inclined slots in a socket of each plate.

Claim.—1. The combination and arrangement of the two semi-ovate plates A and A', hinged together upon and operated by a common shaft, B, put through the pipe or flue horizontally, substantially as herein shown and described.

2. The arrangement of the slots D and D', in combination with the pintles E and E' upon the shaft B, substantially as shown.

3. In combination with the shaft B, the key F, and washer H, arranged and constructed as described and shown.

84,931.—CLARK ALVORD, Westford, Wis.—*Cultivator.*—December 15, 1868.—The invention relates to a method of attaching the teeth; to a device

for holding them in the ground; to an apparatus for cleaning them; and to devices for raising and lowering the teeth and fixing them in the ground or at any required elevation.

Claim.—1. Clamping the teeth to the side of the drag bars by means of the independent plate *o*, and the two screw bolts, when the several parts are constructed and arranged to operate in the manner described.

2. The arrangement of the slotted cross bar *J*, drag bars *I I*, headed bolts *b*, fixed to the drag bars and extending through the slots of the beam *J*, and springs *i i*, substantially as shown and described.

3. The employment of cleaning bars *r r*, arranged in relation to the teeth, substantially as described, and operating to clean the teeth when the latter are raised or when the bars are depressed, as herein set forth.

4. The combination of the cleaning bars *r r*, beam *N*, spring *s*, and hinge *n*, when employed on a cultivator, for the purpose specified.

5. The combination of the frame *C*, rocking with the axle, as described, with the draught pole *E* pivoted to the front beam of the frame, the plow beams *I I*, the cleaning bars *r r*, and the springs *s*, substantially as and for the purposes herein described.

6. In combination with the rocking beams *F* and *N*, cleaning bars *r r*, and drag beams *I I*, the hasp *h* and staple *h'*, arranged, as described, on the two beams, and operating in the manner and for the purposes herein described.

84,932.—FORDYCE BEALS, New Haven, Conn.—*Mode of Plating Scales with Hard Rubber, for the Manufacture of Cutlery, and for other Purposes.*—December 15, 1868.—Hard rubber is heated and pressed upon a perforated scale by means of a die.

Claim.—1. As a new article of manufacture, a scale, plated with hard rubber, substantially as herein set forth.

2. The method of uniting the vulcanite or hard-rubber plate and metal scale, substantially in the manner and for the purposes described.

84,933.—W. G. BELL, Pittsburg, Pa.—*Car Coupling.*—December 15, 1868.—Behind the tapering aperture of the coupling head are pivoted two vertical jaws bent and arranged to cross each other near their upper ends, and pressed together by springs, to hold the coupling rod. In rear of the jaws is a spring buffer plate, which assists in keeping the rod in a horizontal position.

Claim.—1. The beveled vertical jaws *a a*, constructed and arranged as described, with reference to the mouth piece *A*, with or without the springs *e e*, and the coupling rod *C*, as herein set forth, for the purpose specified.

2. The vertical bar *D* and spring *E*, in combination with the vertical jaws *a a*, coupling *C*, and mouth piece *A*, as herein described, for the purpose specified.

84,934.—FREDERICK BIHN and WILLIAM SCHRAEDER, Frankford, Pa.—*Mode of Recovering Useful Products from the Waste Liquor of Gelatine Factories.*—December 15, 1868.—Designed to separate the ingredients of waste liquor when gelatine is made by treating certain bones with diluted muriatic acid, which is effected by evaporation and subsequent condensation of the muriatic acid, or by the combined action of sulphuric acid and distillation, whereby the phosphate of lime remains as a residuum.

Claim.—The process herein described of separating the ingredients of the herein specified waste liquor, for the purpose of utilizing the same, as set forth.

84,935.—JOSEPH H. BRINTON, Thornburg Township, Pa.—*Cultivator.*—December 15, 1868.—By means of a transverse adjusting bar moving in inclined slots at the sides of the framing, double levers are operated to regulate the depth of the plows in the soil, each plow being pressed also by a spring.

Claim.—1. A transverse adjusting bar moving in inclined slots, or their equivalents, for the purpose shown.

2. A yielding pressure applied to the arms or

levers *a*, together with a transverse bar moving in inclined, whereby to regulate the depth the plows enter the soil, and to accommodate them to any unevenness of the ground.

84,936.—JOHN D. CHAMBERS, Carthage, Mo., assignor to himself and ERASMUS D. ROWLAND, same place.—*Corn Planter.*—December 15, 1868.—The dropper chute consists of two uprights rising from the heel of the cutter, and united by a central partition, making two compartments. Strips or vanes, forming the sides of the chutes, have a vibrating motion given them by an oscillating shaft under control of the operator. The gauge wheel has a reversible axle, so as to bring it on either side of the frame.

Claim.—1. The arrangement in a corn-planting machine of the several parts *e e*, *m*, *h*, *f*, *e e*, *M*, *K*, *I I*, *b*, all arranged and operated substantially as shown and described.

2. The arrangement in a corn-planting machine of the frame *A A E D*, and the U-shaped shafts *B*, with the cross brace *C*, substantially as herein described.

3. The arrangement in a corn-planting machine of the diagonal axle bar *P*, brace *Q*, in combination with the gauge wheel *O*, substantially as shown and described.

84,937.—JOHN F. COOK, Baltimore, Md., assignor to GEORGE F. PAGE, JOSEPH ROBERTS, and GEORGE L. MCCAHAN, same place.—*Head Block.*—December 15, 1868.—The lever which operates the shaft is so adjusted as to produce the simultaneous movement of both elbows, by which means the elbows may be moved a greater or smaller distance, as may be desired, at each throw of the lever. Mechanism is so arranged that one elbow shall operate as check upon the other.

Claim.—1. The shaft *D*, so arranged on the rear side of the carriage as that, while it propels the knee, it acts as a fulcrum to facilitate the lateral adjustment of the head block.

2. The shaft *D*, with the arm *a* rigidly attached, and the levers *e e* loosely attached, in combination with the wheels *b b*, also loosely attached, and the arms *e e*, also rigidly attached, each arm having the pawl *e'*, and each lever having the pawl *e'*, all arranged to communicate an independent motion to each elbow *C*, or a simultaneous motion to both, substantially as described.

3. The graduated vibrating rod *k*, pivoted to the carriage at its lower end, provided with a fixed stop, and also an adjustable stop *k''*, arranged as described and shown, when constructed to operate in connection with the arm *a*, substantially in the manner and for the purpose specified.

84,938.—JOSEPH ROCK COOPER, Birmingham, England.—*Breech-loading Fire-arm.*—December 15, 1868.

Claim.—1. In breech-loading fire-arms, such as described, the combination, with the breech block, cartridge extractor, and hammer, of an independent vibratory or pivoted lever, having an independent return movement for locking the breech block, and connected with said parts in the manner set forth, so that by the action of said lever the opening of the breech, the withdrawal of the cartridge, and the cocking of the hammer may be effected at one operation, as specified.

2. The combination, with the hammer and breech block and shoe, of the lever *l*, and its actuating spring, in the manner described, so that while the lever, in its backward movement, carries with it and cocks the hammer, it will be caused by its spring to return, independently of the hammer, in position to effect the locking of the breech block, as set forth.

3. Lifting the hinged blocks of breech loading fire-arms from the breech chambers, or shoes of the said fire-arms, and supporting the said blocks in their raised position by means of a spring or spring lever, arranged and operating upon the joint of the block, substantially in the manner hereinbefore described, and illustrated in the accompanying drawings.

4. In connection with the breech chamber and hinged block, the combination and arrangement of

parts described, and illustrated in the accompanying drawings, for starting the breech block from the breech chamber, or shoe, on releasing the said block.

5. The spring stud for retaining the cartridge in the barrel, constructed and arranged in the breech chamber, as hereinbefore described, and illustrated in the accompanying drawings, so that the said gun may be loaded, with the muzzle end of the barrel raised higher than the breech end.

6. The improvement or improvements hereinbefore described, and illustrated in the accompanying drawings, in preventing the accidental discharge of breech-loading and other fire-arms, that is to say, by means of a detachable or removable bolt or pin, made to pass, from the exterior of the gun, transversely through, or bear against such part or parts of the fire-arm as will cause the said bolt or pin to fix the hammer, or fix such other part of the fire-arm as will prevent the discharge of the fire-arm.

84,939.—W. B. CULVER, Scranton, Pa.—*Hoisting and Dumping Apparatus.*—December 15, 1868.—Stationary and moving dumping projections are attached, respectively, to the frame and platform for effecting the dumping of the latter. Upon the moving parts of the apparatus is a locking bolt operated by a stationary guide for locking and unlocking the platform by the sliding of the same. A series of springs, levers, connecting rods, and wedges are so connected with the hoisting rope that in case of the latter being broken, the fall of the platform will be arrested.

Claim.—1. The sliding rod *e*, springs *s*, levers *d*, connecting rods *c*, and wedges *a*, with rollers *i* arranged therein, all arranged, with relation to each other and to the hoisting apparatus, substantially as described and for the purpose herein set forth.

2. The stationary and moving dumping projections *E* and *F*, in combination with the hoisting and dumping apparatus, all arranged and operating in the manner substantially as herein described.

3. The locking bolt *g*, projection *m*, and grooved block *H*, in combination with each other and with a hoisting apparatus, substantially as described and for the purpose herein set forth.

84,940.—EDWARD FINN, Berlin, Wis.—*Axle.*—December 15, 1868.—In place of the usual screw threads of the nut and axle, a series of projections are formed on the reduced end of the axle, and a series of annular slots in the eye of the nut, communicating with each other by short longitudinal slots or entrances.

Claim.—The combination of the nut *B*, having annular slots *b b* and entrances *d d*, with the axle *C A*, having projections *a a*, arranged substantially as described and for the purpose set forth.

84,941.—WILLIAM FOSTER, Jr., and GEORGE P. GANSTER, New York, N. Y.—*Portable Gas Apparatus.*—December 15, 1868.—By means of valves, which are opened and closed alternately, the supply of gasoline from the tank may be regulated. An equalizing pipe leading from the vaporizer to the top of the reservoir insures an absolute uniformity of pressure on the surface in the reservoir with that on the surface in the vaporizing apparatus.

Claim.—1. Supplying the vaporizing apparatus with gasoline only as fast as it is evaporated through small pipes from a reservoir at a distance and preferably outside the building, substantially as and for the purposes herein set forth.

2. The measuring vessel *J*, and valves *j i*, in combination with the gas apparatus *A B*, and its adjuncts, and with a suitable reservoir for the volatile fluid, and arranged to operate relatively thereto, substantially as and for the purposes herein set forth.

3. In combination with the separation of the reservoir from the evaporating apparatus, as described, the measuring of the requisite quantity of volatile fluid for the manufacture of gas, as it is consumed at the burners, by means of an intermediate measuring device, substantially as and for the purposes herein set forth.

4. The equalizing pipe *l*, transmitting the pressure of the gas to the surface of the gasoline in the dis-

tant reservoir, as and for the purposes herein set forth.

5. The vent pipe, arranged as represented, relatively to the measuring chamber *J* and reservoir *G*, for the purposes herein set forth.

6. The spiral evaporator *U*, in a chamber adjoining that containing the meter wheel, constructed and operating as and with the advantages herein set forth.

7. The spiral chamber *Q q*, the receiving and discharging passages for the gasoline, and the receiving and discharging passages for the air, arranged, relatively to each other and to the other parts of the apparatus, so as to spread the gasoline, and present the gas thereto after its manufacture in the revolving vaporizer, and immediately before its discharge from the apparatus, all substantially as and for the purposes herein set forth.

8. Dipping out and removing the remains of the gasoline, and the water of condensation, and preventing it from accumulating, or in anywise mingling with the freshly-received gasoline, substantially in the manner and for the purposes herein set forth.

84,942.—JOHN FRY, Latrobe, Pa.—*Muzzle for Shot Guns.*—December 15, 1868.—An adjustable section of a barrel is attached by a catch and spring to the outer end of the muzzle, for the purpose of concentrating the shot in its flight from the guns.

Claim.—1. The muzzle piece *A'*, having a tapering bore, as described, in combination with the barrel *A* of a shot gun, substantially as and for the purpose specified.

2. The combination of the catch *m*, snap-spring catch *h*, and the thumb lever *g*, substantially as and for the purpose specified.

84,943.—CHARLES FURBER, London, England.—*Dressing-glass Reflector.*—December 15, 1868.—For facilitating the inspection of the back part of the head or other portion of the body.

Claim.—The bent rod *F*, jointed to the center of the back of the reflector *E*, whereby the latter is adjustable to any desired angle, with reference to said rod, which is adapted to slide within the tube *D*, adjustably connected to the short tube *B*, upon the glass frame, as herein shown and described.

84,944.—WILLIAM H. GRAY, New York, N. Y.—*Looking-glass Support.*—December 15, 1868; antedated December 8, 1868.

Claim.—1. A portable mirror or looking-glass, having combined with it a divided or bow-like frame, acting as a support to the glass, of such character that it may be attached as an appendage to the person, leaving both hands at liberty for other purpose or purposes, substantially as specified.

2. The frame *A*, having an opening, as at *a*, and provided with adjustable or shifting legs *b*, for use in connection with a glass, either as an appendage to the person or otherwise, as herein set forth.

3. The combination, with the frame *A*, constructed to fit the person, essentially as described, of the reversible wire or rod *B*, socket *c*, and glass-holding rod *C*, for operation as specified.

4. In combination with the frame *A*, the rods *B* and *C*, jointed together for operation, in connection with the glass, as herein set forth.

5. The combination, with the frame *A* and rod *B*, of the socket *c*, made adjustable up or down, essentially as herein set forth.

84,945.—BENJAMIN HENDRICKSON, Huntington, N. Y.—*Gate Latch.*—December 15, 1868.—A double incline on the latch plate, with a recess in the center and a roller attached to the gate, serves to support the gate and allow it to be opened either way.

Claim.—The combination of the double inclined part *b*, of the latch plate, with the parts *a c* and the roller *d*, all arranged as set forth, whereby the gate is permitted to swing in either direction, as herein shown and described.

84,946.—W. UPTON HOOVER, Daysville, Ky.—*Plow.*—December 15, 1868.—The two side plows admit of a reversal of position so as to turn the furrows to the right or left, and the implement is designed to be used for plowing, planting, and cultivating.

Claim.—The combination of the three turn plows

f. when arranged in relation to each other, and for adjustment, in the manner shown and described.

84,947.—ALFRED HUTCHINSON, Philadelphia, Pa., assignor to himself and STEPHEN H. MARKLEY, same place.—*School Desk and Seat.*—December 15, 1868.

Claim.—The combination, with a double desk, A, of separate seats, C C', each folding up to the front of the desk independently of the other, substantially as and for the purpose herein specified.

84,948.—JOHN JOHNSON, Saco, Me.—*Device for Pumping, &c.*—December 15, 1868.—A cylindrical vessel is provided with a pipe below, leading to a source of water supply, and one above leading to a tank, each pipe having a valve. To the said vessel are secured the two ends of a bent pipe, the bent portion being placed within a heating apparatus. In the higher portion of the bent tube steam is generated by which the water is forced into the upper pipe. The steam is then condensed in the pipe, the upper valve closes, and water ascends from below into the vessel, and the action is repeated.

Claim.—The automatic or self-acting steam pump or motor, herein set forth and described.

84,949.—WILLIAM JOHNSTON, Appleton, Wis.—*Bedstead Fastening.*—December 15, 1868.—A curved fastening attached to the post is provided with lugs and recesses into which engage corresponding lugs on a piece attached to the rail.

Claim.—An improved bedstead fastener, C c¹ c², D d¹ d², constructed and operating substantially in the manner herein shown and described.

84,950.—J. M. KENNEDY, Vicksburg, Miss.—*Revolving Inkstand.*—December 15, 1868.—A revolving easter is provided with cells for inks of different colors and for mangle, and on the inner side of the case is a rotating galender.

Claim.—The construction and arrangement of the ink easter and case, as herein shown and described.

84,951.—J. H. KUTTNER, Hempstead, Texas.—*Suspender for Scissors.*—December 15, 1868.—The scissors are suspended to a cord which passes over pulleys in a movable frame and is attached to a weight, which holds the scissors in an elevated position when not in use.

Claim.—Suspending scissors from a horizontal wire by means of the movable frame B, weight D, and cord E, arranged and operating as shown and described.

84,952.—FREDERICK LANGE, Chicago, Ill., assignor to himself and EDMOND LICHTENBERGER, same place.—*Street Lamp.*—December 15, 1868.—The glasses are held in place by metal frames provided with flanges fitting over the edges of the glass at top and bottom on the outside and held on the inside by springs.

Claim.—1. A lamp, having the side glasses A held in position by means of the metal frames C and D, and the rods *d*, arranged as described.

2. The springs *e*, arranged to bear against the glasses, and hold them in position, and, at the same time, permit their ready removal and replacement, substantially as shown and described.

3. The combination of the gauge-cock *a*, located within the lamp, and the supply-cock *b*, located below the lamp, all arranged to operate as described.

84,953.—ELI H. LORD and WILLARD THOMSON, Homer, N. Y.—*Churn Dasher.*—December 15, 1868.—A series of dash boards are secured to a shaft at right angles to each other and formed with serrated edges and diagonal openings or slots.

Claim.—The peculiar form of the dasher, consisting of the shaft B, wings C C', having their longitudinal and diagonal slots *c c*², and angular and curved serrated ends, as specified.

84,954.—PHILO MALTBY, Cleveland, Ohio.—*Wrist-pin Turner.*—December 15, 1868.—Designed for turning wrist pins while remaining in their place in locomotives or other engines, or the turning of journals on the end of a shaft when the machine can

be applied for dressing and turning the said pins when worn, or requiring renewing, without the necessity of removing them from the engine.

Claim.—1. The cutting head D, provided with the adjustable tool holder and feeding device, in combination with pipes B B, substantially as and for the purpose specified.

2. The feeding serews *b b*, wheels K K, pinion O, and weighted lever P, combined and arranged substantially as shown.

3. The adjustable cross head C, center shaft N, adjustable hooks S S, spring *t*, and set serews *x x*, arranged and operating substantially as and for the purpose set forth.

84,955.—ALBERT D. MANCIESTER, Westport, Mass.—*Propagating Box.*—December 15, 1868.—A series of boxes formed with two sides of wood and two of metal, and resting on metallic strips that form the bottoms, are arranged within a crate having a detachable side.

Claim.—1. The packing box or crate A, constructed substantially as and for the purpose described.

2. The boxes F, constructed as described, and provided with the crate or box A, substantially as and for the purpose described.

84,956.—B. T. MARTIN, Charlotte, Mich.—*Harrow.*—December 15, 1868.—A series of toothed arms are arranged at an angle with, and hinged to, each side of a central shaft. A brace on one arm, with a curved extension on its inner end, serves to govern the action of the opposite arm.

Claim.—1. The arms B, in combination with the central shaft A, when hinged thereto, as described, whereby each arm is capable of oscillating on the said shaft independently of the other, substantially as and for the purpose described.

2. The brace *b*², provided with the curved extension, in combination with the shaft A and the brace upon the opposite side of said shaft, as and for the purpose described.

84,957.—THOMAS J. MASON, Harmony, Me.—*Plowing Hoe.*—December 15, 1868.—The top frame is composed of two slotted cross bars of unequal length, secured at their center to the ends of a plank, and the side frames consist of two bars bolted together at their center and connected at their upper ends by a bar. The tongue is hinged to the forward part of the upper frame and is adjusted at the rear by a wedge-shaped block.

Claim.—1. The top frame A B C and the side frames D E F, constructed and adjustably combined with each other, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the adjusting lever braces J with the side frames D E F and pivoted scrapers I, substantially as herein shown and described, and for the purpose set forth.

3. The combination and arrangement of the hinged tongue K, loop or keeper L, adjustable wedge block M, and braces N with each other and with the frame A B C, substantially as herein shown and described, and for the purpose set forth.

84,958.—J. J. MERVES, New York, N. Y.—*Horseshoe.*—December 15, 1868.—The calk is attached to the shoe by pressing the "crank" of the wedge into a recess in the body of the calk, and inserting both in a tapering socket, in the shoe, after which the wedge is riveted.

Claim.—1. A horseshoe, with or without a steel lining, in combination with a detachable calk, the shank of which is tapering and ribbed, in combination with the wedge, as shown at *g*, Fig. 1.

2. Securing calks to horseshoes by means of the part *n* of the wedge *g*, engaging with a recess in the under side of the shoe, and the part *p* bent over the calk, substantially as described.

3. Securing calks to horseshoes by means of the crank *h* of the wedge *f* entering a groove or recess in the body of the calk B, and the rivet or burr raised on its lower end, substantially as described.

4. Securing calks to horseshoes by riveting the end of the tapering shank of the calk E, as seen at *m*, substantially in the manner and for the purpose herein specified.

84,959.—NICHOLAS MEYERS, Buffalo, N. Y., assignor to EDWARD L. CHAMBERLAYNE and EMERSON C. POMEROY.—*Sewing Machine.*—December 15, 1868.—The object of this invention is to make the double loop stitch on a machine using a shuttle. The looper is pivoted to the under side of the removable plate of the machine and is operated to lay its thread in the well-known manner, by means of pins on the top of the shuttle carrier. The shuttle is removed when the loop stitch is to be made.

Claim.—The above-described loop-stitch attachment to a shuttle-sewing machine, consisting essentially of the shuttle carrier *b*, provided with the pins *b'* *b''*, the pivoted thread carrier *c*, provided with the spur *i*, and the spring bar *h*, when constructed as described, arranged in a shuttle race, *a*, and combined to operate in the manner and for the purposes described.

84,960.—WILLIAM MILLER, Chicopee, Mass.—*Knife Cleaner.*—December 15, 1868.—Upright leather plates are inclosed between two horizontal plates, the lower one being perforated, and are pressed together by means of a screw. Above is a hopper, in which is placed pumice stone or other cleaning material.

Claim.—The cleaning plates *F E*, when arranged in an upright position between the plate *B*, having the hopper or hoppers *D*, and between the perforated plate *C*, and when adjusted by means of a screw, *G*, as herein described, for the purpose specified.

84,961.—GEORGE MOONEY, Providence, R. I., assignor to MOONEY, ARNOLD, and SHAW, same place.—*Gas Socket.*—December 15, 1868.—The base of the socket extends below the rubber, and, by contact with the burner, prevents any lateral movement.

Claim.—A gas socket, constructed of one piece of metal, possessing the recess, fitted with a packing, consisting of a piece of the ordinary elastic rubber tubing, and the extension of the metal below the packing, in the manner and for the purposes described.

84,962.—AMOS KNIGHTS NOYES, Lynn, Mass.—*Apparatus for Turning the Leaves of Music Books.*—December 15, 1868.—The arms which turn the leaves of the music are provided with lugs and are actuated by dogs on a screw shaft which is rotated by a pinion rack, which latter is operated through links and levers by the musician's foot.

Claim.—1. In combination with the lugs *Q Q* and bars *L L*, which carry the arms *N*, the screw shaft *H*, with its dogs *R R*, arranged to turn the bars and arms, substantially as described.

2. In combination with the devices above claimed, the pinion *S*, rack *T*, levers *V* and *X*, and links *U* and *W*, constructed and arranged substantially as described, for the purpose set forth.

3. The clamping stand described, for holding the music book or leaves, substantially as described.

84,963.—D. J. PARMELE, San Francisco, Cal., assignor to himself and J. H. CURRIER, Springfield, Ill.—*Railway Car Brake.*—December 15, 1868.—On releasing the hooked trigger by means of the cord, the lever in which one end of a friction roller shaft is journaled is released, and the roller, coming in contact with a roller on the axle, is rotated, thus winding up a cord attached to a lever that operates the brakes.

Claim.—The combination, with the lever *e*, of the hooked rod *g*, hooked trigger *i*, and cord *k*, provided with rings, substantially as and for the purpose described.

84,964.—D. W. PERRY, Wilkesbarre, Pa., assignor to himself and O. K. MOORE, same place.—*Tool for Cutting Moldings.*—December 15, 1868.—The bits are held by screws on the side and top, by which means a wide or narrow bit can be used.

Claim.—The beveled molding cutter *B*, adjustably attached to the head *A* by means of the recess *g*, cap *C*, screws *d*, set screws *e* in the cap *C*, and the set screw *h* in the side of the head, all arranged to operate in the manner herein shown and described.

84,965.—F. PINCKARD, New Orleans, La.—*Sanitary Brace to Keep the Mouth Closed During Sleep.*—December 15, 1868.—Bands, connected by rubber straps fitting over the upper part of the head and under the chin, keep the mouth closed.

Claim.—The sanitary brace, constructed, arranged, and operating as herein described, for the purpose specified.

84,966.—WM. F. REDDING, Saratoga Springs, N. Y.—*Stove Door Handle.*—December 15, 1868.

Claim.—1. A handle, for attachment to stove doors, consisting of the handle *E*, made of wood or other suitable non-conducting material, fastened upon the wire *G*, bent so as to form an eye, *A*, shank *B*, and guard and fender *C*, substantially as herein described.

2. Providing a stove door handle with a curved guard and fender, *C*, substantially as herein described, and for the purpose set forth.

84,967.—PETER SALMON, London, England.—*Manufacture and Application of Gas for Various Useful Purposes.*—December 15, 1868.—In combination with the self-acting shut-off valves, are used scrubbers, consisting of vessels through which the gas passes, filled with sponge, tanners' bark, asbestos or charcoal, and driers, consisting of heated vessels, through which the gas is made to pass. The "Giffard" injector is used.

Claim.—1. The construction and arrangement of gas generators, combined with the before-mentioned self-acting shut-off valves, scrubbers, and driers, and the use of the feed injectors, substantially as hereinbefore set forth and described, or any mere modifications thereof.

2. The combination and arrangement of apparatus for the application, and the methods of treatment of gas for the purposes aforesaid, substantially as hereinbefore set forth and described, or any mere modifications thereof.

84,968.—CHARLES G. SARGENT, Graniteville, Mass.—*Belt Hook.*—December 15, 1868.

Claim.—A belt fastener, consisting of a single strip or piece of sheet metal, *H* or *K*, having a series of V-shaped hooks, *e*, punched through and out of it, or cut on its ends, with spaces between, and all bent at right angles with it, in the same direction, for the purpose of being passed through the adjoining ends of the belt, and clasped on their under sides, as herein shown and described.

84,969.—ELIHU SPENCER, Elizabeth, N. J.—*Railroad Car Heating Apparatus.*—December 15, 1868.—By discharging the heated air at a higher level than that at which the cold air enters, a constant current is produced.

Claim.—The combined car heating apparatus herein described, consisting of the hollow grate bars *A*, depressed induction openings *b*, and elevated discharge ports *D*, adapted to supply air constantly to the cars, whether moving or not, and provided with one or more elevated bell-mouthed supplementary pipes, *B*, for use when the track is obstructed with snow, and the train under motion, as explained.

84,970.—J. L. STEARNS, Mahomet, Ill.—*Plow.*—December 15, 1868.—The sulky plow is adaptable as a gang breaking plow, or a subsoil plow, by the attachment of the proper plows to the sulky.

Claim.—The combination of the axletree *A*, wheels *Q* and *R*, guide standards *L*, upright *H*, lever *G*, chain *I*, and brace *J*, with the adjustable plow beams *D* and *E*, all arranged as set forth for the purpose specified.

84,971.—BENJAMIN C. STEPHENS, Houston, Mo.—*Millstone Dress.*—December 15, 1868.

Claim.—The forming or laying out of a millstone dress by means of a stencil plate or pattern, made in the manner substantially as herein shown and described.

84,972.—BENJAMIN F. STEPHENS, Brooklyn, N. Y.—*Box for Pills, &c.*—December 15, 1868.—Confections and pills are prevented from adhering by being placed in separate compartments.

Claim.—A box, pressed or formed of plastic material, with cavities in it, forming separate compartments for the pills, or similar articles, substantially as specified.

84,973.—L. A. SUNDERLAND, Chagrin Falls, Ohio.—*Milk Can.*—December 15, 1868.—An improvement on his patent of August 6, 1867. The supplementary wooden bottom supporting the metal bottom is secured to the can by means of rings and screws.

Claim.—The supplementary bottom G, in combination with the flanged ring or base E, screws *b*, and can A, arranged as described, and for the purpose set forth.

84,974.—DENNIS H. TIERNEY, Waterbury, Conn.—*Fastening for Neck Ties.*—December 15, 1868.—When the tie is secured to the collar, the loop is drawn into the socket formed in the plate and thus prevents the tie from being detached.

Claim.—The arrangement of the elastic loop B within the socket A, and secured therein in such manner that that portion within the socket, as well as the outer portion, may be capable of extension and retraction, substantially as set forth.

84,975.—JAMES F. TRAVIS, New York, N. Y.—*Chandelier.*—December 15, 1868.—On raising the pendant or extension frame, a flexible tubing is made to coil itself within an enlarged hollow portion of an upper chamber.

Claim.—The chandelier or gasolier, provided with a chamber H, connecting the inlet pipe A, and guide tube E, in combination with the flexible tube G, pendant C, and its counterbalance F, all constructed and arranged to operate substantially as shown and described, as a new article of manufacture.

84,976.—FRANK WESSON, Worcester, Mass.—*Revolving Fire-arm.*—December 15, 1868.—The barrels are locked and unlocked by means of a spring placed so as to be operated by the finger which operates the trigger. A slide is arranged to prevent the hammer, when down, from moving.

Claim.—1. The spring catch *c*, arranged for operation by the trigger finger, and in the frame C, and with reference to the two rotating barrels and the trigger, substantially as and for the purpose specified.

2. The slide *f*, arranged upon the upper side of the frame C, and in relation with the notched rear portion of the hammer D, substantially as and for the purpose specified.

84,977.—PHINEAS D. WESSON, Providence, R. I.—*Steam Heater.*—December 15, 1868.—The steam enters the inner chamber, and courses through a series of pipes into the radiating pipes, from whence it passes downward into the radiating chamber, which latter allows it to escape.

Claim.—A steam heater, composed of the outer and inner chambers A and B, the radiating chambers A A, and the pipes B B, relatively arranged and operating substantially as shown and described, for the purposes specified.

84,978.—STEPHEN WILKS, Chicago, Ill.—*Water Back for Stoves and Ranges.*—December 15, 1868; antedated December 9, 1868.—The partition at the cold water inlet causes the water to pass in close contact with the bottom of the water back, which prevents the jarring incident to the ordinary water back.

Claim.—The partition A, when placed in a water back for cooking stoves or ranges, as and for the purposes specified and shown.

84,979.—JAMES WILLIS, Mifflin, Wis.—*Sled Brake.*—December 15, 1868.

Claim.—The brakes B, formed upon the ends of the shaft C, arranged at the rear of both runners, and connected upon both sides of the sled to the transverse crank shaft D, by means of the connecting rods H H, all operating as described, for the purpose specified.

84,980.—E. L. YANCY, Batavia, N. Y.—*Cheese Table.*—December 15, 1868.—The leaves supporting

the cheeses are hinged to a rotating center bar which has bearings and is supported by removable braces. A rod secured to the lower rail prevents the table from turning when in position.

Claim.—The combination of the leaves D D', center bar C, standards A, and rail B, substantially as and for the purpose set forth.

84,981.—JOHN ABSTERDAM, New York, N. Y.—*Manufacture of Illuminating Gas, with other Products.*—December 15, 1868.—The hydrocarbon fluids are passed through red-hot metallic ore in the retort. A portion of the surplus carbon combines with the ore and converts it into a sponge, while the other portions of the carbon combine with the oxygen of the ore, thus forming illuminating gas.

Claim.—The within-described process of manufacturing illuminating gas, by passing hydrocarbon fluids through a retort charged with metallic ore, as set forth.

84,982.—JAMES M. ALBERTSON, New London, Conn.—*Baling Press.*—December 15, 1868.—The pedestal is so shaped as to prevent the segmental screw from turning when raised or lowered by the nut.

Claim.—The pedestal C, formed of two plates, connected together, and provided with spaces for the segmental screw A to pass through, the whole surrounded by the revolving nut B, all arranged and operating substantially as herein set forth.

84,983.—JABEZ ALEXANDER, Nashua, N. H.—*Device for Singeing Horses.*—December 15, 1868.—The burner, constructed to produce a wide flame, is connected with a gas pipe by rubber tubing which allows the burner to be carried to any portion of the animal.

Claim.—The metallic gas burner when substantially arranged as and for the purpose described.

84,984.—JOSEPH AUSER, Mount Vernon, N. Y.—*Door and Shutter Fastener.*—December 15, 1868; antedated December 12, 1868.—The slotted pivoted latch can be swung around when the nut on the hook is loosened, so as to allow the hook to be withdrawn from the locking bar with only a few turns of the nut.

Claim.—The latch D, in combination with the hook C, nut E, and locking bar A, substantially as and for the purpose set forth.

84,985.—WILLIAM N. BARTHOLOMEW, Newton Centre, Mass., assignor to JOSEPH RECKENDORFER, New York City.—*Rubber Eraser.*—December 15, 1868.—The object of this form of rubber is to make erasures near or between contiguous lines.

Claim.—Rubber erasers, made with acute angles, substantially as and for the purposes herein set forth.

84,986.—F. G. BEACH, Hartford, Conn.—*Ash Sifter.*—December 15, 1868.

Claim.—1. Suspending a sieve, C, within a suitably inclosed reservoir, A, by means of the links E E, or their equivalent, so that a reciprocating motion applied to said sieve shall cause an alternate upheaving motion of each of its ends, substantially as and for the purpose herein shown and described.

2. An ash sifter, consisting of the reservoir A, cover B, sieve C, links E E, and rod F, when constructed in the manner and for the purpose substantially as herein described.

84,987.—ALMA BEDFORD, Coldwater, Mich.—*Sash Fastener and Adjuster.*—December 15, 1868.—The sashes are raised and lowered by means of the cord and pulleys, and are held in position by stops forced into recesses in the sashes by springs.

Claim.—The combination of the cord B, pulleys *a*, *b*, and *c*, stop F, bolt *i*, and spring *j*, when constructed and arranged to operate substantially as herein described, and for the purpose set forth.

84,988.—CHARLES P. BELLOWS, Gloversville, N. Y.—*Dentists' Flask.*—December 15, 1868.—The cope being placed on the bed plate, the nut is slipped over the cope and its screw thread made to engage

with the thread on the bed plate. The cap is unscrewed to allow the plastic material to be inserted in the cup-like aperture in the cope. The cap being screwed on, presses the material into the mold.

Claim.—A flask for molding and pressing vulcanite and other substances, consisting of the bed plate D, cope B, nut C, and cap A, or their equivalents, all constructed and combined, substantially as shown and described.

84,989.—EDWARD S. BLAKE, Pittsburg, Pa.—*Radiator.*—December 15, 1868.—Three hollow columns, connecting the upper and lower chamber, are so arranged that the chambers and columns can be readily cleaned. A drawer in the lower chamber receives the soot which falls or is forced from the columns.

Claim.—1. The columns C, D, and *e*, combined with the chambers A and B, or their equivalent, constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

2. The drawer *x*, when used in connection with heating flues of stoves, substantially as herein described, and for the purpose set forth.

84,990.—STERLING BONSALE and LOUIS HILLEBRAND, Philadelphia, Pa.—*Bell Pull.*—December 15, 1868.—An improvement on their patent of March 9, 1868. A spring bearing against the lower end of the plate throws the handle back to release the wire after being pulled.

Claim.—The plate A', to which the handle is attached, with its journals *e* fitted into depressions in the plate A, as shown, in combination with the spring C, as arranged, and operating for the purpose set forth.

84,991.—J. F. BRICKLEY, Winchester, Ind.—*Pump.*—December 15, 1868.—By means of the regulating rods the valves in the pistons can be screwed onto their seats.

Claim.—1. The combination and arrangement of pump stocks A C and delivery pipe E, substantially as and for the purpose described.

2. The arrangement of the stocks A and C and the delivery pipe E, connecting pipes *a*, *b*, and *c*, with reference to the valve-regulating rod K, by which the pump may be converted from a lifting pump only into a lifting and forcing pump, substantially as described.

84,992.—HENRY C. BULL and SAMUEL T. SHELLY, Louisville, Ky.—*Steam-engine Throttle Valve.*—December 15, 1868.—A piston is substituted for one of the disks and accompanying seat of the ordinary balance valve.

Claim.—The combination and arrangement of the casing F, valve A B C, and lever G, substantially as shown and described.

84,993.—CHARLES W. CAHOON, Portland Me.—*Lamp Burner.*—December 15, 1868.—The chimney is held by means of a spiral spring on the periphery of the deflector, fitting into and against a groove in the chimney.

Claim.—The combination of a chimney, having interior chimney fastenings, with a horizontal joint, substantially as and for the purposes set forth.

84,994.—W. CARTER, St. Louis, Mo.—*Bee House.*—December 15, 1868.—The shelves on which the honey is deposited are made of slats and arranged so as to allow the tender to enter and remove the moths.

Claim.—The combination of the bee house A with the slats, so as to obviate the necessity of a gum; the injury caused by the bee moth; the swarming of the bees; and to secure easy access to the honey.

84,995.—C. CLIFFORD, Fulton, N. Y.—*Vapor and Steam Condenser, to be Applied to Brewers' Boilers and Like Apparatus.*—December 15, 1868.

Claim.—A steam condenser, constructed as described, with a dome-shaped bottom, and having a tortuous pipe leading from the center of the bottom to the outside, and also with suitable apertures for the admission of cold water and the exit of the hot water, substantially as herein set forth.

84,996.—WILLIAM A. COLSTEN, Great Bend, Pa.—*Liquid Cooler.*—December 15, 1868.

Claim.—The arrangement of the two parallel plates *c c*, so as to form a thin, narrow channel or duct for cooling liquids, said channel being connected with a supply pipe *s*, and discharge pipe *d*, the whole constructed and operating substantially as set forth.

84,997.—JESSE COULSON, Oskaloosa, Iowa.—*Fire Alarm.*—December 15, 1868.—The plungers, actuated by springs, are discharged against the cartridges, by the bifurcated end of the lever raising and releasing the triggers, when heat is communicated to the fusible composition through the roughened cylinder on the end of the lever.

Claim.—1. The combination of the composition block H, the roughened cylinder G¹, lever G, spring G², and triggers F, for discharging the plungers, arranged substantially as set forth.

2. The bifurcated lever G, triggers F, and roughened cylinder G¹, in combination with a fusible support H, when so arranged as to act upon the triggers successively, with the melting of the support, substantially as set forth.

84,998.—DAVID DICK and OLIVER W. PRESTON, Jr., Corning, N. Y.—*Bag Tie.*—December 15, 1868; antedated December 9, 1868.—A clamp on one end of the chain fits over toes on the end of a slotted lever pivoted to a clamp on the other end of the chain, said lever being locked by a snap hook fitting through one of the links.

Claim.—The arrangement of the curved slotted lever C, with chain A, clamp E, and spring snap D, all combined and operated as and for the purpose described.

84,999.—A. T. DUNBAR, Alba, Pa.—*Horse Hay Rake.*—December 15, 1868.

Claim.—The runners A A, so constructed as to form raves, the ends of the raves extending beyond the ends of the runners, arranged in combination with the rake B, operating substantially as and for the purpose set forth.

85,000.—FRANCIS B. DUNN, New York, N. Y.—*Steam Generator.*—December 15, 1868.—A core sustained in position in the tube by pins, allows a thin stratum of water to be presented to the heated surface of the tube, causing a rapid evaporation.

Claim.—1. The core C, constructed with a series of supporting pins *a*, and arranged in the tube A, substantially as shown and described.

2. The arrangement of the core C eccentrically within the tubes A, by means of the pins *a* around its periphery, whereby to displace a portion of the water, as herein set forth.

85,001.—GEORGE M. DWIGHT, Oregon, Ill.—*Cultivator.*—December 15, 1868.—The parallel beams from which the cultivators are suspended can be raised or lowered, and are held in position by spring catches fitting in notches on the arch-plate.

Claim.—1. The combination of the body platform C, with the draft bar D, the tongue E, and the guiding lever F, in such a manner that, when the said body platform is combined with the bent axle A, the said draft bar will be in the proper relative position for the combination therewith of the parallel beams G G, and the notched arch plates *k k*, all substantially in the manner and for the purpose herein set forth.

2. When the parallel beams G G are combined with the draft bar D, substantially in the manner herein set forth, the combination therewith of the cultivating points *i i*, the notched arch plates *k k*, and the spring catches *ll*, substantially in the manner herein set forth.

85,002.—F. EICHLER, New Lisbon, Wis.—*Portable Pump.*—December 15, 1868.—The chambers in the valve chest communicate with each other; the water is drawn through two of them and discharged into and forced from the third one. The valve chest is hinged to allow a lateral movement equal to that of the piston rod, which moves in the arc of a circle.

Claim.—A portable force pump, consisting of a

reservoir or box A, having hinged therein by lugs *h* to a rod C a valve chest with three separate chambers B¹, B², and B³, connected by three valves *e*, *e*, and *d*, all constructed as described, and arranged to be operated as set forth.

85,003.—VALENTINE FATH, PHILIP FATH, and JULIUS FRIELINGS DORF, St. Louis, Mo.—*Soldering Machine*.—December 15, 1868.—The sections of the gutter are held on the trough, while being soldered, by spring clamps. The stops prevent the trough from tipping over too far when it is turned over, to facilitate the soldering operation.

Claim.—The trough A, supported by trunnions *a* and the stops *a'*, and in combination with the clamps D D¹ D² D³, substantially as and for the purpose set forth.

85,004.—JOHN GRAHAM, Grafton, W. Va.—*Signal Lantern*.—December 15, 1868.

Claim.—A signal lantern, provided with sockets on the blank sides, covered or otherwise, to receive and hold the spare glasses, substantially as described.

85,005.—FREDERIC GUTZKOW, San Francisco, Cal.—*Preparation of Sulphates and the Manufacture of Fine Silver therefrom*.—December 15, 1868.—The sulphuric-acid bath, into which the sulphate of silver is to be poured, should have a specific gravity of 58° Baumé, and be heated to a temperature of 200° to 400° Fahrenheit.

Claim.—The preparation of crystals, consisting principally of sulphate of silver, by separating them from their solution in a sulphuric acid, in the manner as described above, the volume, the specific gravity, and the temperature of such acid to be within the limits as stated in my specification, for the purpose of converting such crystals into what is called in commerce fine silver.

85,006.—CHARLES HARRISON, New York, N. Y.—*Slow-closing Valve for Water Closets*.—December 15, 1868.—A grooved way or notch is formed in the edge of the metallic piston, so that a leakage is produced that allows the water to pass from one side to the other of the piston as the valve is opened or closed, to prevent a concussive action.

Claim.—The metallic piston *m*, formed hollow, and provided with the notch *o*, in combination with the valve *f*, seat *d*, cylinder *a*, and chamber *n*, as and for the purposes specified.

85,007.—HENRY HENLEY, Shoals, and JOHN J. REINHART, Loogootee, Ind.—*Grain Drier*.—December 15, 1868.—An interior-revolving steam cylinder is provided with hollow journals hung in an outer casing, in one of which is formed an elbow, extending to the inner surface of the steam cylinder, so as to scoop up water in the same and carry it off through the discharge pipe. Flanges on the cylinder serve to stir the grain.

Claim.—1. The revolving cylinder E, provided with the tubular journal G, for the introduction of steam, in combination with the journal H and elbow-shaped tube *m*, substantially as set forth.

2. The revolving cylinder E, provided with the flanges *a a*, journals G and H, elbow-shaped tube *m*, and casing A, substantially as set forth.

3. The hollow journal H, in combination with elbow-shaped tube *m*, substantially as described.

85,008.—FRANK A. HUNTINGTON, San Francisco, Cal.—*Carriage Spring*.—December 15, 1868.—The body of the carriage rests upon springs of rubber or other elastic material, placed at each end of the adjustable cross bars.

Claim.—The rigid levers C C and springs G G, in combination with the adjustable bars F F, the whole arranged substantially in the manner and for the purposes described.

85,009.—ANTHONY WILLIAM JACKSON, La Crosse, Wis.—*Machine for Cutting and Splitting Wood*.—December 15, 1868.—The movable cutter is forced toward the stationary knife, and the cut pieces of wood fall upon an inclined plane below. On the opposite end of the follower are four cutting knives for splitting the wood.

Claim.—1. The follower F, provided at one end with a cutting knife, D, and at the other end with a four-bladed splitting knife, E, all constructed and operating substantially as and for the purposes herein set forth.

2. The arrangement of standards A A, rails B B, stationary knife D', platform *e*, and inclined plane *f*, all constructed as described, and operating in combination with the follower F and knives D and E, substantially as and for the purposes herein set forth.

85,010.—LEWIS JONES, Funk's Grove, Ill.—*Pulverizer, Leveler, and Marker*.—December 15, 1868.—Two parallel beams are connected together by cross bars, to one of which beams is attached a seraper, and to the other shovel teeth.

Claim.—1. The combination of the parallel beams A B, provided respectively with shovel teeth *a* and metallic plate *b*, and connected together by bars *d*, all constructed, arranged, and operating substantially as herein described.

2. The combined pulverizer, leveler, and marker, as herein described.

85,011.—JOSEPH R. JORDAN and JAMES CAMPBELL, West Alexandria, Ohio.—*Combined Corn Crib and Thrashing Floor*.—December 15, 1868.—Upon a solid floor rests a slatted or grated floor, provided with legs and hinged at the lower edge of the crib.

Claim.—The combination of the crib E, grated floor G, and supporting base F, all arranged and used as specified.

85,012.—JAMES M. KING, Quiney, Minn.—*Apparatus for Tightening Belts*.—December 15, 1868.

Claim.—The belt-tightening device, consisting of the loose pulley C, mounted on a stud, D, attached to the plate E, arranged to slide in the frame F, and adjusted by the set screw G, or its equivalent, all substantially as herein described.

85,013.—GEORGE W. LAWBAUGH, Geneseo, Ill.—*Harness-pad Press*.—December 15, 1868.—Improvement on his patent of February 25, 1868. The pad holder consists of a thin shell of cast iron, having on its bottom two ribs to form a support for the holder when clamped on the stifehing horse.

Claim.—1. The harness-pad press, in which the dies are so constructed as to give the necessary curvature to the under side of the pad, to enable it to conform to the shape of the horse's back, substantially as herein shown and described.

2. The pad holder E, when curved in the manner described, and provided with the ribs *e e*, substantially as and for the purpose specified.

85,014.—LEMUEL W. LEARY, Norfolk, Va.—*Portable and Stationary Lantern*.—December 15, 1868.—Upon the top of the lamp and near the wick is secured an igniting plate, and a narrow vertical slot is cut in the inner and outer casings of the base, through which a match can be inserted to light the lamp without removing the latter.

Claim.—1. Lighting the match and wick within the base without removing the same, or opening any door, substantially as described.

2. The vertical friction plate E, secured upon the top of the lamp, in combination with the sections B¹ B², slots *b b*, and burner F, or an ordinary wick tube, as set forth.

3. The lugs D¹ D², and springs *d d*, in combination with the flange C, openings *e e'*, sections B¹ B², and slots *b² b³*, the whole constructed and operating substantially as and for the purposes described.

85,015.—KARL LIEBER, Charlottenburg, near Berlin, Prussia, assignor to E. J. KEFERSTEIN, Washington, D. C.—*Mode of Preparing Carbonated and Caustic Alkalies, &c.*—December 15, 1868.—Consists in heating together soda or potassa, saltpeter, and carbonate of lime, or chalk.

Claim.—1. The manufacture of caustic and carbonated alkalies, in the manner substantially above described and set forth.

2. The production and collection of nitrous acid and oxygen, useful for the manufacture of nitric acid by the process described and set forth.

85,016.—ALBERT LOVIE, Philadelphia, Pa., assignor one half to CHARLES F. STEINBACH.—*Curtain Fixture.*—December 15, 1868.—From the upper to the lower end of the frame is a vertical slot, having a cross slot at top, in which fits the shank of a button secured to a screw spindle. On the spindle is a nut, by which the pulley cord is tightened.

Claim.—The shouldered button *c*, cast or formed with the screw spindle *B*, in combination with the slotted frame *A* and nut *D*, when the parts are constructed and adapted to operate as herein represented and described.

85,017.—THOMAS E. MARABLE, Petersburg, Va.—*Toy Pistol.*—December 15, 1868.—A spring acts as an adjustable stop, to prevent the ball from accidentally falling out. The ball is forced out by a short cross rod fitted in a slot in the barrel, and operated by elastic cords.

Claim.—1. The spring *N*, when employed in a toy pistol or gun, substantially as and for the purpose described.

2. As an article of manufacture, a toy gun or pistol, having a barrel *A*, slotted at *b m*, a stock *B*, a trigger *D*, elastic cords *C C*, connected with a short rod *E*, operating in the slot *b*, and a spring *N*, operating in the slot *m*, the whole being constructed to operate substantially as and for the purposes specified.

85,018.—JOHN MUDGE MERRICK, Jr., Boston, Mass., assignor to NEW ENGLAND VULCANITE HIDE COMPANY.—*Material for the Manufacture of Boxes, Picture Frames, Buttons, Insulators, Inkstands, and other Articles.*—December 15, 1868.

Claim.—1. The new material for being molded into useful or ornamental forms, consisting of a combination of a powder of silica, chemically prepared, or occurring in the form of diatomaceous deposits or infusorial earth, with gum shellac, or other similar gums.

2. The molding of the aforesaid material into useful or ornamental articles by rollers and dies, substantially in the manner above described.

85,019.—LORING MOODY, Malden, Mass.—*Spading Machine.*—December 15, 1868.—The crank shafts are held in place by passing through sliding blocks, and are elevated or depressed by means of a lever.

Claim.—1. Hanging, upon cranks, spades, with handles passing through the axle, which serves as their fulcrum, operating substantially as and for the purposes described.

2. Connecting the spade handles with the crank by means of the sockets and screws, in order to lengthen or shorten them at pleasure, substantially as and for the purposes described.

3. The combination of the lever *H* with the axle, whereby the spades may be inclined at any angle with the earth, or thrown out of it, when desired, substantially as and for the purposes described.

4. The combination of the lever *I*, the rotating bar *J*, and the arm *K*, with the crank *C*, for throwing the machine out of or into gear, at pleasure, substantially as and for the purposes described.

5. The combination of the movable blocks *M* with the cranks *C* and the posts *N*, substantially as and for the purposes described.

85,020.—CHARLES A. MOORE, Westbrook, Conn.—*Manufacture of Knives and Forks.*—December 15, 1868.—A slit or opening is made in the butt end of the blade, and provided with a screw thread, over which is slipped a bolster. Through the bolster is screwed the tang.

Claim.—The blade *A*, with the opening *a a*, bolster *C*, with projections *b b*, and screw tang *D*, all arranged to operate as and for the purpose described.

85,021.—CHARLES MURDOCH, Hartford, Conn.—*Cylindrical Saw.*—December 15, 1868.—The saw is so constructed as to form a stave, with a transverse convex curvature on the outside, to correspond to the circle of the barrel at the bilge, and the inside concave to correspond to the inner circle of the barrel.

Claim.—1. A cylindrical or circle saw, composed of sections *B B*, having teeth *C*, and a longitudinal and transverse curvature, and secured together, and to flange *A'*, in the manner and for the purpose substantially as described.

2. A cylindrical or circle saw, with insertible teeth *C*, having two curvatures, one longitudinal and the other transverse to the blade of the saw, when constructed substantially in the manner as set forth.

85,022.—MICHAEL NECKERMANN, Pittsburg, Pa.—*Machine for Grinding Glass Fruit Jars.*—December 15, 1868.—The jars to be ground are placed in notches provided in the rotating wheel, when they are carried over the grinding plate by means of a belt, and gradually pressed down by an inclined plate under an adjustable cross piece.

Claim.—1. The adjustable cross piece *L*, provided with a semicircular inclined plate *O*, and arranged substantially as and for the purposes herein set forth.

2. The wheel *F*, constructed as described, of a cast-iron center piece *a*, and wooden frame *b*, the latter provided with semicircular notches *d d*, all substantially as herein set forth.

3. The combination of the inclined shaft *E*, wheel *F*, and inclined plate *O*, all arranged and operating substantially as and for the purposes herein set forth.

4. The arrangement of the grinding plate *B* and wheel *F* on the table *A*, so that another wheel may be added, if desired, substantially as herein set forth.

5. The arrangement of the sliding pulley *J*, operating on the belt *G* by means of a weight *K*, or its equivalent, for the purpose of holding the jars tightly in their places, substantially as herein set forth.

85,023.—GERRIT NIERMANN, Cincinnati, Ohio.—*Portable Wardrobe.*—December 15, 1868.—The separable parts of the wardrobe are connected by means of dowels, wedges, clamps, and a detachable cornice.

Claim.—The combination with the separable parts *A B* of the tapering dovetail cleafs *E H I*, clamps *F J*, cornice *L*, dowels *O*, and sockets *P*, all constructed and arranged substantially as represented and described, for the purposes specified.

85,024.—BENJAMIN J. F. OWEN, Memphis, Tenn.—*Machine for Cleaning Cotton.*—December 15, 1868.—The arms of the fan are provided with prongs which pass between prongs in the sides of the box. A riddle at the discharge opening is made adjustable in inclination so as to project the cotton at a greater or less distance in separating the same from the burrs.

Claim.—1. A fan armed with spikes or prongs *c c*, arranged as described, and applied to and operating in a cotton cleaning machine, substantially as set forth.

2. An adjustable riddle or deflector, *K*, arranged, in relation to the discharge opening *I*, substantially as and for the purpose set forth.

3. The cotton box, composed of the detachable parts *A A¹ A²*, substantially as and for the purpose explained.

85,025.—D. J. OWEN, Springville, Pa.—*Wagon Brake.*—December 15, 1868.—The brake or "support" is fixed to the hounds and to the reach, and is provided with a groove in which is a shaft having cranks at the outer ends carrying wedge-shaped brake blocks, which are forced down between the brake beam and the wheels.

Claim.—1. The combination of the fixed support *I* with the shaft *K*, cranks *L L'*, and brake blocks *M*, substantially as shown and described.

2. The arrangement of hand lever *P*, connecting rod *O*, and vertical arm *N*, with reference to the shaft *K* and crank *L L'*, substantially as shown and described.

85,026.—S. R. OWEN, Stewartsville, Mo.—*Churn.*—December 15, 1868.—Arms on the shaft revolve between inwardly projecting arms secured

to a drum which has outwardly projecting arms that rotate between projecting arms fitting in sockets in the churn case. The shaft and drum are revolved in opposite directions by suitable gearing.

Claim.—The shaft A, sleeve B, and frame E, with their respective arms or beaters, herein described and shown, in combination with the racks H and sockets G, when constructed and operating substantially as herein specified.

85,027.—S. C. RICHARDS, St. Louis, Mo.—*Steering Apparatus.*—December 15, 1868.—Surplus steam is applied directly or through force pumps, at the opposite ends and on different sides of the vessel against the water without, to steer the vessel.

Claim.—The combination of the steam cylinder or drum B with pipes D, stop valves d^5 d^6 , end-nozzles d , d^1 , d^2 and d^3 , when constructed and arranged to operate substantially in the manner and for the purpose specified.

85,028.—WILLIAM H. ROUNDS, North Bridgewater, Mass.—*Machine for Trimming Weltsed Seams.*—December 15, 1868.—The welt passes between a concave and convex finishing roll, pressure being applied to the lower roll to finish the welt. The shank of the upper forked cutter is secured to a spring to yield vertically to the irregular width of the seam.

Claim.—1. In combination with a mechanism for feeding a stitched welted seam, cutters for trimming the edges of such welt and seam, such cutters being each provided with prongs for straddling the welt or seam, and guiding it to the action of the cutter, substantially as described.

2. In combination with the feed and trimming mechanism, the edge-finishing rolls, substantially as shown and described.

3. Hanging the upper knife and the lower finishing roll, with provision for yielding, substantially as described.

85,029.—M. SAMUELS, New York, N. Y.—*Fountain Lamp.*—December 15, 1868.—A pear-shaped channel provided with an inclined bottom directs the oil from the fountain to the neck of the burner.

Claim.—The pear-shaped channel D, with its inclined bottom E, and provided with a top, B, which supports the fountain A and the neck C of the burner, substantially as herein shown and described.

85,030.—CHRISTIAN SCHMITZ, Philadelphia, Pa.—*Mode of Shaving and Polishing Skins.*—December 15, 1868.

Claim.—The mode of shaving and polishing skins, by subjecting them to the action of a rotating wheel, having a grinding composition applied to its periphery, substantially as described.

85,031.—EDWARD SEELEY, Scranton, Pa.—*Wash Boiler.*—December 15, 1868.—Steam is generated beneath the deflecting plate and rushes rapidly past its curved ends, compelling the water to ascend the passages formed by the plates with the side of the boiler.

Claim.—1. The dome-shaped deflecting plate, with its upwardly inclined edges, substantially as shown and described.

2. The arrangement of the deflecting plate B, with reference to the plates C C', and to the plates forming the walls of the boiler, as a consequence of which, only a small amount of water is allowed to pass below such deflecting plate when the boiler is in use, substantially as shown and described.

3. The within-described construction of the passages for the ascending water.

85,032.—CLARK R. SHELTON, New Haven, Conn.—*Repairing Whips.*—December 15, 1868.—An improvement on his patent of February 11, 1868. The broken ends of the whip to be joined are first covered with ferrules, to prevent the covering from slipping off the stock; they are then joined by the tube.

Claim.—Preparing the ends of whips to be joined by the tube A, by securing thereon the ferrule d , substantially in the manner herein set forth.

85,033.—DANIEL SHOCKEY, Waynesborough, Pa.—*Farm Gate.*—December 15, 1868.—On pulling one of the cords, the spring bolt is withdrawn from the socket in the post so as to allow the gate to rise until the bolt strikes and is held by a pivoted dog. A guide on the end of the gate prevents it from swinging out too far when opened.

Claim.—1. The spring bolt I, in combination with the main arm or tilting lever of a gate, substantially as described.

2. The guide N, attached to the lower arm of a gate, substantially as described.

3. The combination of the spring bolt with the dog C, cam lever K, and cords, substantially as described.

4. The guide N, in combination with a circular flange on the post, substantially as described.

85,034.—L. S. SISON, West Edmeston, N. Y.—*Car Brake.*—December 15, 1868; antedated December 5, 1868.—The cam rod having bearings in a pivoted hanger, is connected with a ratchet wheel on the rod operating the brake, and actuates the same when thrown in contact with the cam by the operating lever, which is raised and held in position by means of the fingers and spring on the guide. A lever, connecting with the plate to which the pawls are secured, can be raised to release the ratchet wheel and thus loosen the brakes.

Claim.—1. The combination of the pivoted hanger e , lever D, and springs e' and d , with the cam rod C, for the purpose of throwing the same into and out of gear, as set forth.

2. The guide E¹ and catch e , for governing the position and movements of the lever E, as set forth.

3. The guide D', with its fingers d^2 and d^3 , and spring d^4 , arranged and operating as and for the purpose described.

85,035.—J. P. SMITH, Hummelstown, Pa.—*Corn Sheller.*—December 15, 1868.—The teeth near the shaft of the shelling wheel feed the ears forward. The notches on the concave plate remove the corn from the tips of the ears.

Claim.—1. The teeth n n , near the shaft of the shelling wheel, arranged and operating, in combination with the concave plate, substantially as set forth.

2. The notches h h on the concave plate, arranged and operating, in combination with the shelling wheel, substantially as and for the purpose herein specified.

85,036.—W. S. SMOOT, Washington, D. C., assignor to himself and JAMES D. BACON, *Neck Tie.*—December 15, 1868.—The two parts, each secured to one end of the collar, overlap and form a neck tie when the collar is fastened to the shirt band.

Claim.—As a new article of manufacture, a neck tie, consisting of two parts A, formed without button holes, and adapted to be attached to a collar, substantially as described.

85,037.—CHARLES SPOFFORD and CHARLES H. MONTAGUE, Boston, Mass.—*Machine for Making Paper Collars.*—December 15, 1868.—Two reciprocating heads arranged parallel with each other are operated by levers on both sides of the machine, to which they are connected at different points by arms, one actuating the embossing and button-hole dies, and the other the cutting dies. The paper is fed through two rolls arranged between the two heads.

Claim.—1. The arrangement of the dies e e , with relation to each other, substantially as shown, and for the purpose set forth.

2. The heads B C, arranged as set forth, and operated by the lever G, to which they are attached at different points by the arms D E, one actuating the cutting die or dies, and the other the embossing dies, substantially as and for the purpose described.

3. The feed rolls g h , when arranged as described, in combination with the heads B, C, substantially as and for the purpose set forth.

85,038.—LEANDER R. STREETER, Chelsea, Mass.—*Plate for Artificial Teeth.*—December 15, 1868.—Tortoise shell or horn are disintegrated and subjected to the action of boiling water, then placed in the mold and subjected to heat and pressure.

Claim.—The use of tortoise shell, turtle shell,

horn, and similar bodies, or those of similar composition, in making dental plates or bases for artificial teeth, substantially as described.

85,039.—RICHARD WALKER and GEORGE TRUMBULL, Batavia, N. Y.—*Draft Equalizer*.—December 15, 1868.—The slotted bar is provided with teeth which fit in serrations on the draught bar; the latter is perforated and can be adjusted to suit the draft of the horse.

Claim.—1. The bar A, constructed and formed substantially as and for the purpose described.

2. In combination with the above, the slotted bar B, operating as and for the purpose set forth.

85,040.—ALBIN WORTH, Stapleton, N. Y., as signor to himself and EBERHARD FABER.—*Shuttle for Sewing Machines*.—December 15, 1868.—The flange and shoulder on the back of the shuttle prevent the shuttle thread from being caught by the needle on its descent.

Claim.—The combination with the shuttle, of the projecting flange *b* and shoulder *a*, arranged and operating substantially as set forth.

85,041.—E. Z. WEBSTER, Norwich, Conn.—*Hat Conformer*.—December 15, 1868.

Claim.—1. The flexible ribs B and elastic band C, hinged or otherwise secured to a disk or tip, A, of suitable form, so that when placed upon the head, the band, with the ends of the ribs attached thereto, shall expand or contract, so as to conform to the size and shape of the head, substantially as and for the purpose set forth.

2. In combination with the tip disk A and supporting tablet E, the stud *a*, which rigidly attaches said parts together, and forms an axis for the slide F, substantially as shown and described.

3. The supporting tablet E, made detachable from the spindle *a*, substantially as and for the purpose herein specified.

4. In combination with the supporting tablet E, the springs I, for holding the paper thereon, substantially as shown and described.

5. The slide F, provided with a suitable tracing point, in combination with the arm G, provided with a guide finger or wheel resting upon the band C, by means of which, when pressed lightly against and caused to revolve around said band, a diagram of its contour is traced upon the surface of the tablet E, as and for the purpose specified.

6. The sliding piece *f*, rod *f'*, and spiral spring *o*, in combination with the slide F, for the purpose herein specified.

7. The tube *i*, bolt *k*, spring *l* and slot *s*, in the slide F, by means of which the pencil may be adjusted to any desired distance from the stud *a*, and caused to press against the tablet E, substantially as herein shown and described.

85,042.—GUSTAV A. WEDEKIND and HELMUTH DUEBERG, New York, N. Y.—*Burning Kiln*.—December 15, 1868.—Designed as an improvement on the patent of F. E. Hoffman, June 13, 1865.

Claim.—The arrangement, within a progressive kiln, of the permanent perforated walls C C, one at each side of the fire chamber, whereby heated air is permitted to pass from one chamber to another, while, at the same time, the material being burned is protected from the direct action of the fire, as set forth.

85,043.—GEORGE A. WELLS, Oskaloosa, Iowa.—*Riddle for Grain Separators*.—December 15, 1868.—Transverse elliptical openings allow the grains to pass through, while oats will pass over, the same.

Claim.—1. A riddle for a grain separator, formed from a single sheet of metal, swaged into flat channels A, separated by parallel ribs B, substantially as set forth.

2. A riddle for a grain separator, constructed with transverse elliptical openings C, placed across the channels A, substantially as and for the purpose set forth.

85,044.—CYRENUS WHEELER, Jr., Auburn, N. Y.—*Harvester Rake*.—December 15, 1868.—The tripper is adjustable in the arc of a circle, so as to re-

lease the rake at any desired point in its sweep over the platform, and is turned out of the way to allow the rake to sweep the platform when a gavel is formed. An adjustable arm carrying a friction roller upon the cam guide turns the rakes into gathering position before they descend into the uncut grain, and a button fastens them in such position when it is desired that they should act continually as rakes.

Claim.—1. In a combined rake and reel, the several arms of which may, at the option of the attendant, be made to act either as rake and reel arms, or as reel arms only, an adjustable device whereby the rake teeth may be made to rise out of the grain on the platform, at any desired point in their passage over said platform, without varying the point where said arms enter the grain for reeling it into the cutters.

2. A tripping device, adapted to release the rake, and permit it to roll up on its longitudinal axis at any desired point in its passage over the platform.

3. A rake, moving over the platform in the arc of a circle, and adapted to turn or roll upon a longitudinal axis, in combination with means for releasing the rake, and causing it to roll up at any desired point, for the purpose set forth.

4. An adjustable tripping device, operating to release the rake, for permitting its rotation on its longitudinal axis, as described, in combination with means controlled by the driver for moving said tripping device out of the path of the rake latch.

5. A button, or equivalent device, for preventing the rake head from rocking up when released by the tripping device, whereby any one or all the rakes may be made automatic when desired.

6. The friction roller, or its equivalent, on the cam track, for returning the rake to its proper position for gathering and discharging the grain, as set forth.

7. The retracting friction roller J, or its equivalent, made adjustable, as set forth.

85,045.—WILLIAM N. WHITELEY, Springfield, Ohio.—*Harvester*.—December 15, 1868.

Claim.—1. The main frame A, cast in a single piece, with the disk P and tool box D, all as shown and described.

2. Making the bearing of the pinion shaft B through the center of the hub of the sector plate R, and the bearing of the latter through the center of the hub A', and securing these parts in place, in the manner shown.

3. The driver's seat *e*, and foot board *f*, mounted at the upper end of the standard *d*, said standard being rigidly secured to the main frame, and its upper end curved outward over the main wheel, as and for the purpose set forth.

4. The bevel wheel C, provided with the hollow hub, as shown, in connection with the bearing hub A', projecting from the main frame A, and the hub of the sector plate R, substantially as shown and described, and for the purpose set forth.

5. The lever V, provided with latches W and Y, in connection with the disk P and sector plate R, substantially as described.

6. The combination of the hemispherical or conoidal wrist pin with the corresponding socketed pitman head and the socketed washer, as shown and described.

7. The reel shaft *k*, made in two parts, as shown, and mounted in bearings in the post *p*, as shown, the two parts connected by a universal coupling, *k'*, the lower part perpendicular to the surface of the platform, and the upper part inclined thereto, and always held in the same relative position, as and for the purpose shown and described.

8. The combination of the rake and reel, when constructed to operate substantially in the manner shown; *i. e.*, the reel, moving around the axis of the inclined shaft in fixed planes; a collar, which moves around the axis of the vertical shaft, in a plane at right angles thereto; and the rake, jointed to said collar in such a manner that it may rise and fall in a plane parallel with the axis of said vertical shaft, and all actuated by the same mechanism.

9. Making the guide way in two parts, C' D', C' being fixed, and D' jointed thereto, substantially as shown, so that the position of the part D' may be changed, at the will of the attendant, as regards the

fixed part C', and the path of the rake be thereby raised from the platform, as and for the purpose set forth.

10. Elongating one end of the movable part D', to form the lever E', which extends to a position convenient to the hand of the driver, and acts directly upon said movable part, in the manner and to the effect shown and described.

11. The independent rake head t, provided with the arm v, jointed to the collar w, or its equivalent, hung around the reel shaft, and operated by a pendent arm, jointed to the reel head, substantially as and for the purpose set forth.

12. The combination of the driving arm r and rake head t, connected by the stationary ring u, and operating as shown and described.

13. The stops s' s', on the driving arm r, to limit the movement of said arm and the rake head upon each other.

85,046.—WILLIAM WILMINGTON, Toledo, Ohio.—*Chill for Casting Car Wheels.*—December 15, 1868.—The chill is formed with a groove in the angle, or curve thereof, between the inner periphery and the outer horizontal face of the said chill, which groove is filled with clay or sand preparatory to casting the car wheel.

Claim.—The within described improvement in the annular metallic portion, or chill, of a car wheel mold.

85,047.—S. R. WILMOT, Bridgeport, Conn.—*Lamp Chimney.*—December 15, 1868.

Claim.—As an article of manufacture, lamp chimneys, fluted or corrugated at the base, substantially in the manner and for the purpose herein set forth.

85,048.—JOHN S. WILSON, Harveysburg, Ohio.—*Sluice Gate.*—December 15, 1868.—An arrangement of devices for automatically shutting off the flow of water through a mill race whenever the stream from which the race is supplied becomes unusually high. Flood gates are also arranged to open automatically, so as to drain the mill race, to prevent the embankments from bursting by the excessive pressure of water.

Claim.—1. The head gate D d', shaft E, arm e, bolt G, levers H H' and K k, supporting shoulder j, connecting rod l, arm L, and regulating valve M m, all combined and arranged to operate substantially as and for the purposes specified.

2. The combination of the stop valve O o with the gravitating lever H H' and tripping apparatus j, K, l, L, M, for the object stated.

3. The combination of the flood gate P, releasing devices R, S, H, tripping devices K k, j, rod l, arm L, and valve M m, all arranged to operate in the manner and for the purposes explained.

85,049.—HENRY E. ANTHONY, Providence, R. I.—*Wrench.*—December 22, 1868.—The jaws are constructed with grooves extending from the side of the shank, the widest part of the latter being at right angles to such grooves.

Claim.—The combination of the grooved or angular jaws C D, wide shank B, and screw E, or its equivalent, for adjusting the jaws, all arranged substantially as described.

85,050.—J. H. APEL, Boston, Mass.—*Chair for Children.*—December 22, 1868.—For preventing the chair from upsetting.

Claim.—The combined chains and screw clamps for fastening children's chairs to tables, substantially as and for the purpose herein shown and described.

85,051.—JOHN BAIRD, New York, N. Y.—*Composite Vessel.*—December 22, 1868.

Claim.—1. A vessel, composed of a double planking, and an iron frame, in which the outside planking is secured to the inner planking only with wooden fastenings, whereby a composite ship may be coppered without serious risk of galvanic action, the combination of planking and frame being substantially such as described.

2. In combination with an iron frame, a planking, partly fore and aft, and partly diagonal, the latter drooping both ways from amidships, and being se-

cured amidships, or nearly so, upon an iron plate, the whole construction being substantially such as specified.

3. In combination with an iron frame, having metallic chords secured to the outside thereof, fore and aft planking partly covering the chords, and diagonal planking abutting thereon, and covering the remainder of the chords, whereby the chords serve as lapping plates, and the frame and both sets of planking are all intimately and firmly secured together, substantially as described.

4. A diagonal planking, drooping both ways from about amidships, in combination with an outer fore-and-aft planking covering the diagonal planking, as described, the two sets occupying substantially such relative positions to each other as are described herein.

85,052.—JOSEPH BARKER, Champlain, N. Y.—*Horseshoe.*—December 22, 1868.—Designed to prevent "overreaching."

Claim.—Constructing horseshoes of a gradually decreasing thickness, the front shoes decreasing in thickness from their rear to their front ends, and the rear shoes gradually decreasing in thickness from their front to their rear ends, substantially as and for the purpose set forth.

85,053.—THOMAS S. BLAIR, Pittsburg, Pa.—*Manufacture of Steel.*—December 22, 1868.—The invention consists in preparing so-called "pig bloom" or "pig scrap," composed of oxides of iron or ores, and of cast iron. The melted pieces are then treated as a substitute for blistered steel or wrought iron in the manufacture of cast steel, the process being conducted in a furnace or crucible, as practiced in making crucible steel. The invention is designed as an improvement on patent No. 84,053.

Claim.—1. The manufacture of cast steel in the crucible, from "pig bloom" or "pig scrap," substantially as hereinbefore described.

2. The manufacture of steel by melting down, in an open furnace, "pig bloom" or "pig scrap," composed of a mixture of cast iron and an oxide or oxides, in such relative proportion of metal and oxide as to give the necessary ratio between the oxygen, carbon, and iron, to produce the desired result, substantially as hereinbefore described.

3. The manufacture of steel from cast iron, by adding to the cast iron, in a melted state, a conglomerate composed of cast iron and oxides of iron, substantially as hereinbefore described.

4. The production of steel from cast iron and malleable iron, by melting the cast iron and fusing in it a sponge of wrought iron obtained from "pig bloom" in the manner hereinbefore described.

85,054.—N. O. BOND, Hyannis, Mass.—*Summer Attachment for Stoves and Ranges.*—December 22, 1868.

Claim.—A summer attachment, A, formed to fit in the top plate of a stove or range, and to receive the stove plate C of the opening, in which it fits, and provided with a hollow extension, D, leading from the bottom of the attachment to any suitable air passage formed in the side, door, or front of the stove or range, and provided with an exit passage, e, all substantially as shown and described, and for the purpose set forth.

85,055.—CHARLES E. BONNET, Philadelphia, Pa., assignor to J. P. WILKINSON & SONS, same place.—*Composition for Ornamental Moldings.*—December 22, 1868.—Composed of glue dissolved in boiling water, to which paper pulp is added, and afterward zinc white and oil, and then whiting.

Claim.—A composition, formed substantially as herein described, for the manufacture of ornamental moldings.

85,056.—LEOPOLD BRANDEIS, Brooklyn, N. Y.—*Method of Making Cores for Molding Articles of Lead and Other Metals.*—December 22, 1868.

Claim.—The production and use of cores (fire-proof or not) made of wire, paper, pasteboard, paper pulp, mushin, felt, and linen cloth, or of any textile fabric, or of oil-cloth, silk, or India-rubber, for casting of plumbers' traps or other curved articles made

of lead, tin, zinc, bismuth, antimony, cadmium, and their respective and mutual alloys, and the application of paper or other materials, as described, for forming cores to be used in making castings from any metal or alloy.

85,057.—LEOPOLD BRANDEIS, Brooklyn, N. Y.—*Solder*.—December 22, 1868.

Claim.—The production of laminated solder, cut into pieces of desirable shape and weight by means of rollers and revolving shears, for the purposes of producing pieces of regular weight, so as to insure a perfect control over the workmen.

85,058.—JOSEPH BRAUN, Rochester, Pa.—*Apparatus for Drying and Pressing Coats*.—December 22, 1868; antedated December 11, 1868.—A metallic core is so formed that the several parts can be readily adjusted to coats and vests of different forms and sizes.

Claim.—The combination of the parts A, B, C, and *g*, adjusting screws 1, coupling 4, pipes 2, 3, *n*, *o'*, and *y*, constructed, arranged, and operating as herein described, and for the purpose set forth.

85,059.—JOSEPH BRAUN, Rochester, Pa.—*Apparatus for Drying and Pressing Pantaloons*.—December 22, 1868; antedated December 11, 1868.—A metallic core for pantaloons is formed in two parts and provided with pipes, couplings, and adjusting screws, by which the pantaloons can be cleansed, steamed, and pressed.

Claim.—The combination of the part B, concave part B', adjusting screws 1, couplings 4, pipes A, C, 2, 3, and 5, constructed, arranged, and operating as herein described, and for the purpose set forth.

85,060.—JOSEPH BRAUN, Rochester, Pa.—*Apparatus for Cleansing Clothes*.—December 22, 1868; antedated December 8, 1868.

Claim.—The use of a hollow metallic core, the form of which corresponds to the form of the human body and its wearing apparel, said metallic core being provided with perforations and used with steam, substantially as herein described, and for the purpose set forth.

85,061.—JOHN BRETZ, WILLIAM SANGSTER, and JOHN F. BRETZ, Springfield, Ill.—*Brick Machine*.—December 22, 1868.—Pins extending downward from the sweep of the shaft of the pug mill strike against and operate a twisted lever, to which is attached a bar to push the molds under the pugging apparatus. The lever is retracted by a spring.

Claim.—The arrangement and combination of the sweep C and pins I I, with the lever K, (said lever being constructed as described,) with the twisted iron rod *f*, connecting bar L, stick M, and pivot *a*, and spring N, all operated as and for the purposes herein set forth.

85,062.—WILLIS S. BRONSON, Hartford, Conn.—*Base-burning Stove*.—December 22, 1868.

Claim.—1. A fire pot, made in two parts, so that one part, the inner one, can be removed and replaced at pleasure, having air space between the two, provided with orifices in the upper edge or side of the walls thereof, substantially as and for the purpose described.

2. Perforating the edge or sides of the fire pot, when said pot is made in two distinct parts, for the purpose of protecting the wall of the pot and facilitating combustion, substantially as described.

3. Air tubes *e*, in combination with a pot, constructed as described, and for the purpose set forth.

4. Forming the reservoir, below the cover, of two parts, having space between its inner and outer walls, substantially as and for the purpose described.

5. The combination of a two-plate cover, and a double or two-plate coal receiver, below said cover, whereby I am enabled to introduce air to the fire surface, upon the principle of the siphon, substantially as and for the purpose described.

6. The combination of air-conducting spaces *e n*, whereby I am enabled to bring two heated currents of air from opposite directions and discharge them at the fire surface, substantially as described.

84,063.—BENJAMIN F. BROWN, Woburn, Mass.—*Submerged Pump*.—December 22, 1868.

Claim.—The valves *a, b, c, d*, constructed as described, in combination with openings F and *g*, ports S and S', cylinders Q, Q', and Q'', piston B, piston rod D, air chamber C, eduction pipe E, cog-faced arm *m*, cogged holder P, sockets K and M, and lever H, all arranged and operating, relatively to each other, substantially as and for the purpose herein described.

85,064.—SAMUEL BROWN, Philadelphia, Pa., assignor to himself and C. R. CARVER, same place.—*Feed Attachment for Machinery*.—December 22, 1868.—For moving the fingers of a feed attachment for rotary cutters for cutting paper, sheet metal, rubber, &c. The fingers are actuated to move forward, in feeding the material to the machine, in a horizontal manner, and at the completion of the forward movement to withdraw below the surface of the feed board, return beneath the same, and again rise and repeat the movement.

Claim.—1. The combination of the finger plate *m*, guide plate *h*, upright *g*, projection *p*, grooved plate D, shaft *e*, connecting rod *f*, rod *b*, crank *d*, and cam shaft *a*, all arranged to operate as herein described, for the purpose specified.

2. The guide board *g*, substantially as described, in combination with the apron E, fingers *i*, and their actuating mechanism, all substantially as described, for the purpose set forth.

3. The guide plate *h*, carrying the fingers *i*, operated, as described, by the cam *n*, upon the shaft *a*, through the medium of the crank *d*, connecting rod *f*, shaft *e*, and upright *g*, sliding in the grooved plate D, as herein described, for the purpose specified.

85,065.—WILLIAM G. BROWN, Canton, N. Y.—*Reel*.—December 22, 1868.—The bent ends of the arms are inserted in holes in the reel head, and secured by a set screw. The inclination of the reels can be varied, to adjust them to skeins of different length. Prolongations in the heads admit of two skeins being reeled at the same time.

Claim.—The combination of the right-angled arms, having their heads provided with the prolongation *e*, with the reel head, provided with the sets of holes *a* and *a'*, and the set screw B, all constructed substantially as and for the purpose set forth.

85,066.—ISAAC N. BUCK, Elgin, Ill.—*Burglar Alarm*.—December 22, 1866.—A sliding bolt rests against the back edge of the door, and is so connected with the striking mechanism as to set it in motion in case the door is opened at night. During the day the striking bolt is held back by a key bolt, so as not to sound an alarm.

Claim.—1. The sliding bolt E, with its studs E E and D D, arranged and operating in connection with the vibrating or pallet rod D, substantially as described.

2. The key bolt F, arranged and operating substantially as described.

3. The key bolt F, spring H, sliding bolt E, and the striking mechanism, arranged substantially as described, for the purposes specified.

85,067.—ROBERT I. BURBANK, Boston, Mass.—*Machine for Cutting Hay, Straw, and Vegetables*.—December 22, 1868.—The teeth of the larger saws are designed to split or divide the stalks, and are aided by the smaller saws to crush the articles to be cut. Notched and forked plates pass between the saws, to clear the same.

Claim.—1. One or more series of K-tooth saws D, constructed and operating in connection with another, as described, and each or either in connection with a series of small saws, E, arranged at each side of the former, on an opposite shaft, the teeth of the latter pointing upward and outward while rotating inward and downward toward the other, and all arranged to operate substantially in the manner and for the purpose specified.

2. The notched and forked clearers N, constructed as described, in combination with the saws D and E, as and for the purpose specified.

3. The combination of all the operative parts speci-

fied, when arranged to operate substantially as and for the purpose set forth.

85,068.—R. B. CARSLY, New York, N. Y.—*Alarm Rug.*—December 22, 1868.—The spring plate is secured to the floor or sill, and is connected with an alarm gong, so as to sound the latter when a person enters the door.

Claim.—The movable spring plate C, when covered with or forming part of a rug, and used in connection with a door or window, and connected with an ordinary gong, D, by the connecting wire E, arranged as shown and described, for the purpose specified.

85,069.—CHARLES E. CHASE and BENJAMIN F. DEVENDORFF, Wyoming Township, Mich., assignors to themselves and JOSEPH S. RANDALL.—*Grubbing Machine.*—December 22, 1868.—A curved hook is provided with notches, which engage with a bolt passed through the lever.

Claim.—The adjustable hook I, Fig. 3, when used in combination with the lever A and wheels B B, Fig. 1, substantially in the manner and for the purpose above set forth.

85,070.—WILLIAM JUBY COLEMAN, Bury St. Edmunds, and ALFRED COLEMAN, London, England.—*Article of Food.*—December 22, 1868; patented in England November 19, 1867.

Claim.—The manufacture of biscuits, lozenges, and similar articles of food, by compounding Liebig's extract of meat with farinaceous materials, then rolling or pressing the mixture together, so as to form sheets or thin pieces, and drying or baking the same.

85,071.—O. B. COLLINS, Carthage Landing, N. Y.—*Furniture Tip.*—December 22, 1868.

Claim.—The furniture tip, constructed, as described, of the grooved button *a*, around which the India-rubber block *b* is cast, whereby, when said rubber becomes worn off, a smooth, even bearing surface is presented, to avoid injury to carpets and floors, as herein shown and described.

85,072.—WILLIAM H. COWLEY, Cleveland, Ohio.—*Gate.*—December 22, 1868.—By means of the plates, levers, and connections in combination with the double-acting hinge, the gate is raised at its outer or swinging end, thus throwing it out of a vertical line and causing it to open.

Claim.—The combination of the plate D, attached to the inner end of the gate, and provided with curved slots *n*, with the plates *f h*, the former having pins *g*, the double-acting hinge *a b d*, levers *l v v' i*, and connections *r r' k*, all constructed and arranged to operate substantially as herein set forth.

85,073.—SAMUEL G. DARE, New York, N. Y.—*Chuck.*—December 22, 1868.—The case is made in two pieces and a ring is interposed which is provided with notches on its face in which projections on the semicircular jaws fit. The ring is turned by a screw on the side of the case, and projects the jaws toward, or withdraws them from, the center of the chuck.

Claim.—The combination, with the case A and operating ring D of my improved chuck, of the semicircular or crescent-shaped jaws E E E, moving in counterpart recesses or slots formed (about independent centers) in said case A, upon circles intersecting at the center of the chuck, all substantially as herein set forth.

85,074.—D. H. DOTTERER, Philadelphia, Pa.—*Car Brake.*—December 22, 1868; antedated December 5, 1868.—The brake beams are placed above the beams of the truck, and so connected thereto by means of links as to dispense with the ordinary suspension of the brakes.

Claim.—1. The brake beams F and F', arranged above the beams of the truck, and connected thereto by links, substantially in the manner described.

2. The brake beam, composed of two bars, *d d'*, and intervening packing piece, and provided at the ends with blocks *f*, to which are hinged the shoes *f'*, all substantially as set forth.

3. The horizontal lever H, hung to a pin on the truck, but having a lateral play thereon, in combination with the system of levers and rods herein described, or their equivalents, by which the movement of the said lever H is imparted simultaneously to both brake beams, as set forth.

85,075.—JOHN DUNLAP, Madison Township, Pa.—*Horse Blinder.*—December 22, 1868.—Springs on the outside of the blind prevent the eyes from being injured and leave sufficient light for the animal to see to walk and graze.

Claim.—The application of a blind (constructed in such a manner as is more fully described in the accompanying specification) to a halter, to prevent breachy horses and cattle from breaking or jumping fences.

85,076.—ROBERT FRANCIS FAIRLIE, London, England.—*Locomotive Steam Engine.*—December 22, 1868; patented in England, November 14, 1867.—The bogie frames of locomotive engines are combined with a carrying frame, and these frames with stowage compartments, to enable passengers and commodities to be transported upon the locomotive and thus increase its tractive power.

Claim.—1. The rigid carrier or eradle frame A, supported on the bogies or swivel frames B, to which the engines are attached, the said frames being constructed substantially in manner herein described and shown.

2. The combination of the rigid frame, bogie frames, and a coupling frame between the bogies, as and for the purpose herein described.

3. The combination, with the rigid frame A and bogies B, of the boiler C, which is dropped into its place and bolted only at the center of the fire box, free scope for expansion and contraction being thus permitted, substantially as herein described and shown.

4. The combination, with the rigid frame A, bogies B, and boiler C, of the fuel carrier D, substantially as herein described and shown.

5. The combination, with the rigid frame A, bogies B, and engines mounted thereon, and boiler C, of the luggage or merchandise compartment F, substantially as herein described and shown.

6. The combination, with the rigid frame A, bogies B supporting the engines, and boiler C, of the passenger carriages G H, substantially as herein described and shown.

7. The combination, with the rigid frame A, bogies B, and boilers C, of the water spaces I I, substantially as herein described and shown.

8. The combination, with the rigid frame A and bogies B, supporting the engines, of the springs *a* and *b*, substantially as herein described and shown.

9. The combination, with the rigid frame A and bogies B, of a double barreled boiler, the fire-boxes of which are fed through apertures O O in the dome, substantially as herein described and shown.

85,077.—L. H. FARNSWORTH, Hudson, Mass., assignor to himself and H. J. WATKINS, of same place.—*Boot and Shoe Shave.*—December 22, 1868.—The face of the handle is recessed to receive the blade with its projections, in the latter of which the adjusting screws fit. By means of a central screw the guard can be raised or lowered to cut thick or thin shavings.

Claim.—1. The combination, with the handle A and guard C, of the screws *g g* and *k*, substantially as and for the purposes set forth.

2. The combination, with the handle A and blade B, of the blade seats D D, having slotted projections *b e*, substantially as and for the purposes set forth.

3. The combination, with the wooden handle A of the peculiarly constructed blade seats D D, blade B, guard piece C, and adjusting and holding screws *g g* and *k*, substantially as and for the purposes set forth.

85,078.—JAMES D. FIELD, Wataga, Ill.—*Paper File.*—December 22, 1868.—The bills are secured in an open frame by a plate pressed against them by a spring.

Claim.—A bill holder, constructed of the parts A B C, plate D, with the hinged flap E, guides *f*, and

spring G, arranged substantially as described, for the purposes set forth.

85,079.—C. C. FITZGERALD, Phoenix, N. Y.—*Paper Pulp.*—December 22, 1868.—The wood is passed through pressure rollers to extract the acids, and then reduced to pulp in the ordinary manner.

Claim.—Paper pulp, prepared from the fibers of the plantain tree, either in the manner herein set forth, or otherwise, as specified.

85,080.—C. W. FLINT, Washington, D. C.—*Ice Cutter.*—December 22, 1868; antedated December 19, 1868.—A knife is arranged on the vertical rotating cylinder to cut or shave the ice placed on the shelf, and a scraper is arranged on the inside of the cylinder to remove the cut ice.

Claim.—An improved ice cutter formed by the combination of the plate A, shelf or flange B, two-armed brackets C, crank gear wheel G, small gear wheel F, vertical shaft D, vertical hollow cylinder E, adjustable knife or knives I, and scraper J, with each other, substantially as herein shown and described, and for the purpose set forth.

85,081.—JOSEPH FLINT, Rochester, N. Y.—*Grinding Machine.*—December 22, 1868.—The saw is fed by the rollers between the grindstone and the cross bar, and then passed between rollers which carry it to an inclined apron. The apron is pulled up by a rope until the saw is caught between upper rollers which return it to the operator. The frame in which the rollers are journaled can be adjusted by means of screws to grind one side of the saw thinner than the other.

Claim.—1. The feed rollers F and F¹, cross bar H², in combination with the grinding stone C, for the purpose herein shown and described.

2. The vertically movable frame B¹, in combination with the grinding stone C, as and for the purpose herein set forth.

3. The arrangement of the platform F³, slide L, and rope o, in combination with the rollers G and F, for the purpose of returning the saw to the operator, substantially as herein shown and described.

85,082.—BENJAMIN FLOWERS, Jerusalem, Ohio.—*Shingling Roofs.*—December 22, 1868.

Claim.—The angular metallic sections D, connecting the gutters or "valleys" of two roofs together, when applied as described, by having one wing of each of the sections laid up with the shingles on one roof, and the other wings of the same resting upon each other, and covered by the shingles on the other roof, as herein shown and described.

85,083.—JOHN GARDNER, Philadelphia, Pa.—*Machine for Making Confectionery.*—December 22, 1868.—A figure is formed in the mold made by the cavities on the two rollers coming opposite each other, and is pushed in an upright position upon a reciprocating plate which delivers it to a revolving belt.

Claim.—1. The forming of figures (either solid or hollow) in confectionery, by revolving rollers or cylinders, in an upright position, so that the figures formed by the revolution of the rollers or cylinders will stand in an upright position, substantially as and for the purposes described.

2. The movable plate J, or its equivalent, in combination with the rollers A B for carrying off or removing from the rollers the figures thus formed, in an upright position, substantially as described.

85,084.—WASHINGTON L. GILROY, Philadelphia, Pa.—*Blacking Box.*—December 22, 1868.—A perforated disk fits over the face of the blacking in the box, and on being pressed down forces the blacking up through the perforations. Oiled paper fits under the disk and protects the blacking from the air until it is to be used.

Claim.—1. The application to a blacking box of the perforated plate or disk D, substantially as and for the purpose described.

2. The employment of the oiled paper E, in combination with the perforated plate or disk D, when the same are applied to a filled box of blacking, substantially as and for the purpose described.

85,085.—JAMES H. GOLDING, Liverpool, England, assignor to himself and PATRICK MARTIN, same place.—*Cylindrical Cutter for Leather and other Materials.*—December 22, 1868.—The end plane or base of each cylinder wears itself and fellow to a true plane.

Claim.—A cutting machine, in which are combined hollow cylindrical cutters, so arranged that their flat faces will wear each other in planes, substantially as described.

85,086.—GEORGE B. GOODWIN and SAMUEL McCORD Milwaukee, Wis.—*Dumping Car.*—December 22, 1868.—The car is supported on a tilting cradle which is held in a horizontal position by swing braces. The car is held, when tilted, by braces pivoted to the track way.

Claim.—1. A carriage or cradle, constructed in the roadway and resting upon trucks or shoes, and traveling upon a segmental track, substantially as described, and for the purpose set forth.

2. The arrangement of the cradle, trucks E and F, and segmental track G H, when constructed as described.

3. The swing braces a a and K K, or their equivalents, as and for the purpose set forth, in combination with the tilting cradle and segmental track, as set forth.

85,087.—J. S. GRIFFITH, Philadelphia, Pa.—*Toy entitled Sibyl's Cave.*—December 22, 1868; antedated December 8, 1868.—The figure representing a sibyl is connected with the door and attached to a pendulum, so that on vibrating the latter the door opens and one of a series of lettered balls is allowed to escape from a tube.

Claim.—The toy, consisting of the elevated rock and temple A B, sibyl C, pendulum H, tube F, valve f', and the numbered balls K K, the said parts being constructed and arranged to operate substantially as and for the purpose described.

85,088.—V. M. GRISWOLD, Peekskill, N. Y.—*Filtering and Pouring Bottle.*—December 22, 1868.—The liquid is filtered by passing from the bottle into a filtering tube from which it is poured. With volatile liquids, a pipe connects the upper end of this tube with the bottle, so that an equilibrium will be constantly maintained.

Claim.—1. A combined filtering and pouring bottle, consisting of the bottle A and tube C, both arranged and combined, as set forth.

2. The pipe D, connecting the upper ends of the bottle A, and tube C, substantially as and for the purpose herein shown and described.

85,089.—WILLIAM G. HAMILTON, New York, N. Y.—*Metal for and Mode of Manufacturing Car Wheels.*—December 22, 1868.

Claim.—A car wheel composed of mixed steel, low steel, or steel sponge, and cast iron, with chilled tread, substantially as described.

85,090.—EDWARD HAMLIN, Delanco, N. J.—*Swage for Saw Teeth.*—December 22, 1868.—The swage upsets the points of the saw teeth, and determines their width.

Claim.—A sleeve, having recesses y y, and fitted to a stem, and to a detachable die, substantially as and for the purpose described.

85,091.—HENRY P. HASKIN, Roscoe, Ill., assignor to himself and JOSEPH L. BRENTON, Beloit, Wis.—*Gate.*—December 22, 1868.—The gate is made in two parts, one of which, operated by a rack and pinion, is attached to the endless belt, and when operated, causes the other part, which is also attached to the belt, to be opened in the opposite direction.

Claim.—1. Broadly, the employment of the endless band or chain J' J', in combination with the rack C, and pinion D, shaft d and cranks d d.

2. The inverted guide track a a, when the whole is constructed and arranged substantially as herein set forth, to operate as specified.

85,092.—NEHEMIAH L. HATCH, Cape Elizabeth, Me.—*Hay Loader.*—December 22, 1868.—The cord to which the fork is attached runs over blocks on the

arms of a swinging derrick, and is then secured to a grooved wheel on a pinion shaft, which is journaled in the horizontal arm, by which latter the pinion can be thrown in and out of connection with a gear wheel on the hub of the cart wheel.

Claim.—The combination of the gear *a*, on the wheel hub, gear *g* on the arm *e*, arm *e*, wheel *h*, cord *r*, blocks *k* and *j*, arms *m* *n*, and blocks *o* *o*, as and for the purposes set forth.

85,093.—NEHEMIAH L. HATCH, Cape Elizabeth, Me., assignor to himself and CHARLES DYER, same place.—*Carriage.*—December 22, 1868.—A stud on one of the perches fits in a slot in the other, which slot regulates the extent to which the wheels can be turned inwardly toward the perch. The jointed bolt gives a free vertical motion to the shafts.

Claim.—The combination, with the perches *b b b b*, rigidly connected to the axles *e f*, and united to each other by the sliding joint *c d*, of the rigid draw bar *m* and jointed bolt *A*, all as and for the purposes set forth.

85,094.—WILLIAM HEUPECKE, Black Creek, Pa.—*Water Wheel.*—December 22, 1868.—An air chamber is constructed to buoy up a part of the weight of the wheel. One side of the floats is curved so that the water, escaping from the wheel, may leave it in a backwardly direction to the motion of the wheel, and in the direction of a tangent to the circumference.

Claim.—1. The air chamber *E*, above the wheel, so that, when the water is higher around the wheel than the floats, it will tend to lift the wheel, and lighten the pressure on the step of the shaft.

2. The hollow or box-form buckets *D*, having two curved sides, and one plane, or nearly so, substantially in the manner and for the purposes described.

85,095.—JAMES HINDS and JAMES GEE, Conologue, Ill.—*Cultivator.*—December 22, 1868.—The plow beams are connected by means of a belt with a lever for raising and lowering them. The plow-supporting arms are pivoted to the beam, and elevated or depressed by adjustable supporting arms.

Claim.—1. The arrangement of the belts *D D'*, pulleys *F F'*, and lever *G*, substantially as and for the purpose specified.

2. The combination, with plow-supporting arms *L*, pivoted to the beams *A*, of the adjustable supporting arms *N*, when provided with a loop which slides upon the arms *L*, substantially as and for the purpose described.

85,096.—AMOS A. HOTCHKISS, Hannibal, Mo.—*Fastening for Wagon Bodies.*—December 22, 1868.—Eye bolts fitting over the ends of rods on the tail-board secure the latter in position when the nuts are screwed up.

Claim.—The fastening for wagon bodies above described, consisting of hooks *g g'*, &c., *o o'*, &c., bolts *c c'*, &c., screws *d d'*, &c., and rods, all arranged and operating substantially as and for the purpose shown and specified.

85,097.—HENRY E. HULL and BURLIN T. MERRITT, Sag Harbor, N. Y.—*Window Frame.*—December 22, 1868.

Claim.—1. The eccentric levers *D*, pivoted within the case *E*, or within the window jamb at *G*, and adapted to fit over the pin *i*, in the slot *g* of the stop or bead, all operating as described, whereby the depression of the lever draws the bead firmly within the casing, as herein shown and described, for the purpose specified.

2. The combination of the eccentric lever *D* and pin *i* with the window casing and the slotted bead *C*, whereby an increasing pressure is produced by the eccentric movement of the lever, substantially as described, for the purpose specified.

85,098.—WILLIAM INGLIS, Manchester, England.—*Steam Cylinder.*—December 22, 1868.—The inner cylindrical shell is cast separately from the steam jacket, and a secure steam joint is formed by casting, in separate pieces, the ends containing the valve chambers.

Claim.—The construction of the four valve cham-

bers, the easing *B*, and the inner steam cylinder, arranged with reference to each other, and the ingress and egress ports, substantially as set forth.

85,099.—W. W. JACOBS, Hagerstown, Md.—*Lamp.*—December 22, 1868.—The lower burner, which is designed to force an ascending current of air to the upper burner, is supplied with oil from the main reservoir by means of a pipe in which is a regulating stop-cock.

Claim.—The metallic tube or pipe *K* and the stop-cock for the purpose of supplying the lower burner *N* from the fountain or reservoir *G* of the lamp, as set forth.

85,100.—NATHAN JOHNSON, Decatur, Mich.—*Water Wheel.*—December 22, 1868.—The wheel is to be placed where a current of water strikes the lower part of the casing, so as to be rotated.

Claim.—The arrangement of the horizontal wheel *A'*, and cylindrical case *a b*, provided with a single inlet, *c*, and a single outlet, *d*, both orifices being arranged in the lower side of the case, opposite to each other, and the inlet being provided with a slide or other gate *c'*, substantially as and for the purposes herein described.

85,101.—EDWIN R. KERR, Kewanee, Ill., assignor to himself and JAMES L. PLATT, same place.—*Wood and Coal Dumping Apparatus.*—December 22, 1868.

—Improvement upon the patent of KERR & PLATT, October 2, 1866. The inner doors are in two parts, hung, one on each side of the body of the chute, instead of at the top. An additional weight is used to aid in raising the gate at first, but ceases to act when the gate is partially closed.

Claim.—1. The inner doors *C C'*, forming, when open, a continuation of the sides of the chute, in combination with the chute *B* and the counterpoised outer door *E*, substantially as and for the purposes specified.

2. The compound weight *F K*, in combination with the chute *B*, chute door *E*, chain *G*, and stop *L*, when constructed and operating substantially as and for the purposes specified.

85,102.—SIMEON H. KING, Tunbridge, Vt.—*Leather-cutting Machine.*—December 22, 1868.—The swinging table is so arranged, in relation to a triangularly-shaped knife, as to be swung to one side or the other, to cut only one edge of a strip of leather. The two gear wheels are arranged to be simultaneously turned to raise or level the knife.

Claim.—1. The combination of the swinging table *B*, the knife *C*, the gear wheels *D D*, and the shafts *O O*, substantially as described, and for the purpose set forth.

2. The tumbling shaft *G*, lever *H*, notched bar *I*, and thumb-screw *M*, substantially as and for the purpose set forth.

3. The arrangement of the whole enumerated parts, substantially as and for the purpose described.

85,103.—CHARLES A. KINNEY and CHARLES PARKER, Corry, Pa.—*Shingle Machine.*—December 22, 1868.—Consists of a device for automatically operating an oscillating table, so as to form the two sides alternately of the shingles cut from four blocks secured in a rotating wheel.

Claim.—The automatic table *L*, when operated by shaft *M*, wheel *h*, cans *z* and *i*, and set screw *y*, and the revolving horizontal planer *k*, with knives *a' a'*, for dressing the entire face of the block, in combination with the saw *H*, revolving frame *A*, trips *b*, springs *e*, and brake *g*, substantially as described, and operating as and for the purposes set forth.

85,104.—P. H. LAWLER and WILLIAM H. GIBSON, Rochester, N. Y., assignors to themselves, G. SHELTON, and QUINCEY VAN VOORHIS same place.

—*Gas Machine.*—December 22, 1868.—A regulating float is suspended in a chamber separate from that in which the agitator operates, so as to secure steady action of the valve. Air passes from the outside into a chamber formed in one end of the agitator through spiral pipes into the fluid, and thence to the gasometer.

Claim.—1. The compartment *e*, in combination

with the float B, lever *c*, valve *d*, and supply pipe E, as and for the purpose herein shown and described.

2. The air-supply pipe P, chamber K, and spiral pipe, H, all acting conjointly, as and for the purpose shown and described.

85,105.—JOAH LAWSON, Allegheny City, Pa.—*Steam-engine Slide Valve.*—December 22, 1868.—On the valve seat of an ordinary steam cylinder is placed a covering or false chest, forming an oblong or square box, in which the valve is reciprocated, and is provided with ports or recesses of similar size with those on the valve seat, for insuring equality of pressure on all sides.

Claim.—1. The covering B over the slide valve C, with steam or induction ports A¹ A², and corresponding ports B¹ B², and eduction ports A³ and B³ passing through and over the same, constructed substantially as described.

2. The construction of the slide valve C, with its central opening or passage C', substantially as described.

3. The combination and arrangement of the covering B with its ports A¹ A² A³ and B¹ B² B³, with the valve C and its opening, C', when constructed and arranged as herein described and set forth.

85,106.—WILLIAM BRADSHAW LEACHMAN, Leeds, England.—*Rotary Steam Engine.*—December 22, 1868.

Claim.—1. The combination and arrangement, with the outer cylinder and its concentric double ring and the inner eccentric cylinder and shaft, of the slide blocks which move in the recess formed by said double ring, the bars, pivoted to said blocks, and the vanes or floats carried by said bar, in the manner described, whereby the vanes or floats are constantly retained in the desired position, not being allowed free action.

2. The arrangement, with the rotary engine, when constructed as described, of the rotating valve, provided with a number of ports, corresponding to the number of vanes or floats within the steam cylinder, so that steam may be admitted at any given point, and cut off, so as to work expansively, as set forth.

85,107.—C. W. LE COUNT, Norwalk, Conn.—*Drill.*—December 22, 1868.—The two sets of grooves are so placed that the ridges of one pair will be alternately cut out by the cutting edges between the grooves of the other cutting lip, thus preventing the drill from choking or clogging.

Claim.—1. Forming the two wings of the drill in parallel but different vanes, so that the cutting edge on each shall be in advance of the center of rotation, and that the portion intervening, or that which unites the said wings of substantially the same thickness of metal, shall present cutting edges at an angle of about forty-five degrees to the cutting edges of the wings, substantially as described.

2. The longitudinal grooves *a a* in the reëntering angles formed by the wing and intervening or central portion, substantially as described.

3. The longitudinal grooves *e e*, formed in the surface of the drill, as described.

85,108.—PHILANDER LEEK, Hartford, Conn.—*Door for Carriages, &c.*—December 22, 1868; antedated December 11, 1868.—Designed as a sash support, so that the sash may be easily raised and lowered and held firmly in position, and the door of the carriage be freely opened and closed.

Claim.—The combination of the two parts, *e* and *f*, with the catch or spring *h*, or its equivalent, and the frame work *a*, constructed and operated substantially as described.

85,109.—WINDSOR LELAND and VOLNEY E. RUSCO, Chicago, Ill.—*Device for Suspending Slaughtered Animals.*—December 22, 1868.—A bar, curved at its upper end, and provided with a slot for the insertion of the hoisting tackle.

Claim.—The suspending bar A, when constructed and operated substantially as and for the purposes herein specified.

85,110.—JOHN LIPPINCOTT, Pittsburg, Pa.—*Bar for Ax Bit Blanks.*—December 22, 1868.—De-

signed for blades or bits in which steel is made to overlap the iron on both sides.

Claim.—Grooved steel bars, made by rolling, substantially as described, as a step in the manufacture of bit blanks for axes.

85,111.—WILLIAM A. LUDDEN, Brooklyn, N. Y.—*Bottle Lock.*—December 22, 1868.—A spring catch is attached to the inner lower end of the cap, its free end catching under the flanged nut of the bottle. The catch is released by drawing it forward by a screw key.

Claim.—A bottle cap, provided with a lock or catch, in which the spring or bolt acts directly on the flanged neck of the bottle, substantially as described.

85,112.—ELLIS LUTHER, PLATT LYON, and WALTER EDWARDS, West Troy, N. Y.—*Finishing Loose Hinge Butts.*—December 22, 1868.—This invention consists in the employment of 3 sets of dies and suitable mechanism to operate them. The 1st set forces one wing from the butt, while the 2d expands the cylinder which receives it, and the 3d clamps and points it by means of a revolving burr cutter.

Claim.—1. The combination of the block F, constructed with the recess *f*, with the reciprocating shaft D and shaft head E, substantially in the manner and for the purposes herein described and specified.

2. The combination of the block I, constructed with the recess *g*, with the reciprocating shaft G and drift H, substantially as and for the purposes herein described and specified.

3. The tube K, in combination with the block I, reciprocating shaft G, and drift H, substantially as and for the purposes herein described and specified.

4. The revolving shaft L, burr M, wedge R, and treadle S, in combination with the groove N, clamp O, and lever P, all arranged and combined substantially in the manner and for the purposes herein described and specified.

85,113.—BENJAMIN MACKERLY, Paint, Ohio.—*Governor for Steam and other Machinery.*—December 22, 1868.—The cylinder is provided at each end with weighted valves, which govern the ingress and egress of air to the cylinder, and thereby the resistance of the piston to the machine by the force of the blast on the valves.

Claim.—1. The combination with the air cylinder A and plunger B, of the tubes D, having passages E and the weighted valves G, substantially as described.

2. The tubes D, provided with the gates F, adjustable plugs L, and pins K, substantially as described.

85,114.—H. R. MACOMBER, Shopiere, Wis.—*Windmill.*—December 22, 1868.—The outer ends of pivoted rings are attached by means of cords to a wheel turning freely on a main shaft provided with a brake and stops, so that by applying the brake the wings will collapse and thereby stop the mill.

Claim.—The pivoted wings *a*, *a*¹, *a*², &c., the cords *c*, the loose wheel C, provided with the pin *h*, the segmental piece D, provided with the sliding stops *f*, *f*¹, *f*² &c., and the brake P, when the whole are arranged and used substantially as and for the purpose described.

85,115.—WILLIAM R. MANLEY, New York, N. Y.—*Pillow Block.*—December 22, 1868.—The stock of the pillow is made in two parts, each having cheek plates which can be applied to opposite sides of the arm, and secured to each other and to the arm between them, so as to draw the two parts of the stock closely against the arm.

Claim.—1. The construction of the stock of a pillow block, with side pieces provided with cheek plates, substantially as before described.

2. The construction of the stock of the pillow block with a cylindrical cavity for the lining, embracing more than half the shaft, and with a mouth large enough to admit the said shaft, substantially as before set forth.

85,116.—D. F. MCKIM, Austin, Nevada.—*Feed Water Heater for Steam Generators.*—December 22, 1868.—The heads to which the tubes are attached are cut out, and a cavity formed between alternate pairs of tubes, so that communication is made between the tubes.

Claim.—The heads *f*, constructed with detachable covers, arranged upon the outside of the boiler, and with relation to the side and bottom pipes *e*, as herein shown and described.

85,117.—JOHN N. MERIAM, Cambridgeport, assignor to NORTH, MERIAM & Co., Boston, Mass.—*Apparatus for Stirring and Cooling Lard.*—December 22, 1868.—Four radial arms attached to a shaft compose, each, the upper part of a rectangular frame containing stirrers, arranged at an angle with each other and vibrating longitudinally on an axis. The lower bars of the rectangular frames are joined by a ring, thus dispensing with a central shaft.

Claim.—1. In the machine, as described, for treating lard, the arrangement of slats *K K'* of each series, with respect to each other, as set forth.

2. The combination and arrangement of the four slotted frames *H*, the connection ring *I*, and the shaft *D*.

85,118.—SAMUEL J. MILLER and LUNA WRIGHT, Economy, Ind.—*Corn Plow.*—December 22, 1868.—The rod which holds the fender passes through a slotted upright attached to a slotted bar, by which the fender is adjusted toward or from the plow, and is raised by a lever under control of the operator.

Claim.—The fender, with the rod *b*, lever *d*, slotted bar *i*, and slotted standard *t*, in combination with a corn plow, substantially as set forth.

85,119.—WILLIAM MOREHOUSE, Buffalo, N. Y.—*Making Horseshoes.*—December 22, 1868.—The former which carries the blank is rotated first between two friction rollers placed on and under a stationary bridge, then under a reducing roll, a guide roll, finishing bending device, and hammering rolls, the shoe being discharged by a pin thrown up by a cam.

Claim.—1. The arrangement of a series of removable horseshoe pattern beds *C C* around the central hub *a* of the horseshoe-bending table, and in the relation shown to the mechanism specified for bending and condensing horseshoe blanks, all substantially as set forth.

2. The arrangement of the cams *k k*, bending devices *j j*, horizontal bed *A*, horizontal rotary table *B*, and patterns *g g'*, substantially in the manner and for the purpose described.

3. The combination of the cams *k k*, bending devices *j j*, horizontal bed *A*, horizontal rotary table *B*, patterns *g g'*, and rollers *N' P*, substantially in the manner and for the purpose described.

4. The two rollers *N' P*, rotary table *B*, and bridge *U*, arranged and operating substantially as described.

5. The percussive or condensing finishing mechanism *G H*, or the equivalent thereof, in combination with the guiding and bending mechanism, substantially as described.

85,120.—PIERRE JULES JACOB NOËL, Paris, France.—*Breech-loading Fire-arm.*—December 22, 1868.—The engaging lugs form a firm fastening and enable the breech to resist recoil.

Claim.—The recessed breech block *D*, having the lugs *d* arranged upon its interior, adapted to interlock with the lugs *e*, arranged upon the reduced portion *b* of the body *A* of the gun, as herein described, for the purpose specified.

85,121.—GEORGE P. NUTTING, Chicago, Ill.—*Water-supply Regulator.*—December 22, 1868.—The steam pipe leading from the boiler terminates in a valve chest within the steam chamber, and has two valves opening in opposite directions. The said valves are connected by a system of levers with the whistle valve and the float.

Claim.—The arrangement of the chambers *A B*, pipes *H J*, valve chest *I*, valves *e e*, lever *b*, rod *d*, having adjustable pin *h*, lever *G*, float *F*, arm *L*, and whistle *K*, as herein set forth and shown.

85,122.—PETER PARADIS, Rochester, N. Y.—*Coal Stove.*—December 22, 1868.—In the bottom of the stove are division plates, connecting with plates between the outside shell and inner plates extending up within the stove. A circular chamber provided with a regulating damper is arranged below the door.

Claim.—1. The flue plates *c* and *e*, in combination with the plates *a*, arranged as herein shown, and for the purpose set forth.

2. The chamber *x*, in combination with the regulating damper *f*, when constructed and arranged as herein shown and described and for the purposes set forth.

85,123.—G. W. PARROTT, B. F. PARROTT, and E. H. TIMSON, Lynn, Mass.—*Machine for Folding and Cutting Material for Shoe Uppers, &c.*—December 22, 1868.—The table is arranged so as to be turned to a vertical position for convenience in folding and attaching the material. A series of pins in a movable bar hold the cloth while being folded.

Claim.—1. In a machine for folding and cutting material for shoe uppers, &c., a table folding down, and operating substantially as described and for the purpose set forth.

2. In combination with the same, the pin bar *P*, working substantially as described and for the purpose set forth.

85,124.—JOHN S. PERRY and JAMES EASTERLY, Albany, N. Y.—*Magazine Cook Stove.*—December 22, 1868.

Claim.—1. A cooking stove, having a fuel magazine arranged and supported wholly upon the top plate thereof, in combination with a deflecting plate, *D¹*, which will guide the coal into the fire pot, substantially as described.

2. The deflecting plate *D¹*, arranged over a fire pot so that it is removable, in combination with a fuel magazine, which is located on one side of the center of the fire pot, substantially as described.

3. In combination with a cooking stove which has its fuel magazine exterior to the body thereof, and which has a draught over and beneath the oven, a direct draught passage, *g¹*, leading from one side of the fire box into the main flue extension *F*, beneath the boiler, substantially as described.

4. An exposed fuel magazine, arranged over a fire pot, and provided with a conduit, *P*, which leads into a perforated pipe, *r*, above the combustion chamber, said conduit and pipe being adapted for conducting the gases rising above the coal in said magazine, together with air admitted through a register, *E*, into the combustion chamber, substantially as described.

5. The inlet register *E²*, applied to the conduit *P*, on that side of the fuel magazine *E* next the pot holes through the top of the stove, for the purpose of carrying off, through the flues of the stove, the vapors rising from the top of the stove while cooking, substantially as described.

6. A fuel magazine, which is located on top of the top plate of a cooking stove, between an extended flue space, *F*, and the boiler holes *D²*, substantially as described.

7. A base-burning cooking stove, which is so constructed that the products of combustion rising from the fire pot *D* shall circulate over and beneath the oven, beneath and up one side of the ash pit, and escape through a passage, *h*, which is made through the top plate in rear of the fuel magazine, substantially as described.

8. The relative arrangement of the fire pot *D*, flue extension *F*, water vessel *I*, and direct draught passage *g¹*, in a cooking stove, constructed substantially as described.

9. In a base-burning cooking stove having its flues *b* arranged around the oven and ash pit, as described, the dust-escape passage *g²*, substantially as described.

10. The relative arrangement of windows *e e*, fire pot *D*, magazine *E*, and oven, substantially as and for the purpose described.

11. The fuel magazine, fire pot, and flues of a cooking stove, arranged substantially as described, in combination with a warming closet, *H*, arranged substantially as set forth.

85,125.—**HERMAN PIETSCH**, New York, N. Y.—*Cooler for Water, Milk, and Other Liquids.*—December 22, 1868.—The cooler is composed of four compartments, the outer one containing a non-conducting material; the inner one, ice; and the intermediate chambers, which are connected at the bottom, the liquid to be cooled.

Claim.—1. The combination of the walls A B C, bottoms D, E, F, and H, flanges G, pipe I, pipes L M, provided with stop cocks, and ingress pipes J K, either or both with each other, said parts being constructed and arranged substantially as herein shown and described and for the purposes set forth.

2. The receiver N $n^1 n^2 n^3 n^4 n^5$, constructed substantially as herein shown and described, in combination with the cooler A B C D E F G H, and for the purposes set forth.

3. The ice receiver N, formed by the combination of the body n^2 , pipes n^3 , receptacle n^4 , and flanges n^5 with each other, substantially as herein shown and described and for the purpose set forth.

4. The formation, in a cooler, of a small space or chamber between the ice chamber and the waste water chamber, said space or chamber being provided with flanges G, substantially as herein shown and described, and for the purpose set forth.

85,126.—**WILLIAM H. PITT**, Philadelphia, Pa.—*Safety Bathing Apparatus.*—December 22, 1868.—To a hawser attached to two points on the shore is suspended a netting, and connected with the hawser are smaller lines, to which are suspended floats.

Claim.—The arrangement of netting, hawsers, or ropes, subtended from anchor buoys, substantially as above described, for the purpose of providing a means of support and safety to bathers at the sea and other shores.

85,127.—**N. M. PLATT**, North Fairfield, Ohio.—*Gate.*—December 22, 1868.—The gate rests upon rollers in slotted standards, which are pivoted in arms secured to the post.

Claim.—The deep-slotted standards A, as arranged in relation to each, and in combination with the rollers B and pivot, for the purpose specified.

85,128.—**A. A. PORTER**, Griffin, Ga.—*Cotton Gin.*—December 22, 1868.—The vibratory movement of the guiding strips causes the cotton to be brought more perfectly in contact with the saws.

Claim.—The combination with the saws of a cotton gin, of the guiding strips a , or their equivalent, and rod or bar b , arranged to have a vibrating motion imparted to them, substantially as and for the purpose described.

85,129.—**T. W. PORTER** and **H. K. PORTER**, Boston, Mass.—*Shawl and Blanket Strap.*—December 22, 1868.—The bail is riveted to the rigid bar. The straps pass between the bar and bail.

Claim.—In combination with bail D and straps C C, the rigid bar E, substantially as described and for the purposes specified.

85,130.—**ABRAM REESE**, McClure Township, Pa.—*Mode of Manufacturing Toe-calk Blanks.*—December 22, 1868.—A raised bead is first rolled along the edge of a bar, and this edge is then rolled down so as to leave standing the spurs by which to weld the calk to the horseshoe.

Claim.—The mode of making toe-calks, substantially as hereinbefore described.

85,131.—**JOHN RICHARDS**, Philadelphia, Pa.—*Expansive Gearing for Feeding Rolls.*—December 22, 1868.—The wheels fixed to the rolls rotate in different planes. The intermediate wheels are mounted on a pivoted radial arm having a cylindrical extension surrounding the axis of the second wheels, thereby holding the train of wheels rigidly in the plane of their rotation.

Claim.—The combination of wheels, in the manner described, with a pair of adjustable rolls, substantially as specified.

85,132.—**HORACE T. ROBBINS**, Boston, Mass.—*Locking Device for Umbrellas.*—December 22, 1868; antedated December 16, 1868.—A tube fits over the

slide to which the braces are attached, and, when slid over the catch, prevents the latter from being moved except by the key.

Claim.—1. The tube E, with or without the spring d , so arranged as to slide over and inclose the catch C, when the umbrella is locked, and to slide back from the catch when it is unlocked, substantially as described.

2. The arrangement of the runner B, the lock E, the catch C, the spring a , and key F.

85,133.—**DANIEL H. ROWE**, Pana, Ill.—*Attaching Card Clothing to Cylinders of Carding Engines.*—December 22, 1868.—The edges of the sheets of card clothing are sewn together and placed opposite longitudinal spaces on the periphery of the cylinder. The clothing is drawn into said spaces, and thereby tightened by screwing up nuts against bridge-pieces applied inside the cylinder and across the spaces, and through which pass screw bolts attached to tightening bars on the outside of the cylinder, and which have teeth on their edges for the purpose of taking firm hold of the edges of the clothing.

Claim.—1. Tightening bars C, applied by means of clamping devices to the card clothing opposite longitudinal spaces in the periphery of a cylinder, substantially as described.

2. The mechanism, substantially as described, or its equivalent, for tightening card clothing upon a carding-engine cylinder, and which will depress portions of such clothing toward the axis of such cylinder.

85,134.—**VOLNEY E. RUSCO**, Chicago, Ill.—*Gambrels and their Supports for Slaughtering Purposes.*—December 22, 1868.—The ways are provided with ribs which fit in the grooves on the ends of the gambrel, thus preventing the latter from assuming a diagonal position.

Claim.—The gambrel A and the supporting ways B, when constructed and operating substantially as herein set forth and shown.

85,135.—**JESSE RYDER**, Sing Sing, N. Y.—*Device for Extracting and Transporting Trees.*—December 22, 1868.—An adjustable bar is fitted to the draught pole to support the tree after it has been extracted.

Claim.—1. The device for taking up trees, consisting of the frame A, mounted upon wheels B, the axle of which supports the cushioned beam b , and receives the lever draught pole C, to which the adjustable bar E is attached, all arranged as described, for the purpose specified.

2. The cushion c , and adjustable bar E, in combination with the beam b , and lever C, as herein described, for the purpose specified.

85,136.—**WILLIAM H. SCANLAN**, Memphis, Tenn.—*Portable Service Heater.*—December 22, 1868; antedated December 9, 1868.—The compartments are adapted to receive the dishes to be warmed.

Claim.—1. The revolving dish or basin, having the inclosed chamber or reservoir, for containing hot water or steam, and one or more compartments, for the purpose described.

2. A portable revolving service heater or chafing dish, provided with any desired number of compartments, substantially as and for the purpose set forth.

85,137.—**HENRY SCHREINER**, Philadelphia, Pa.—*Car Replacer.*—December 22, 1868; antedated November 3, 1868.—A pair of sloping iron plates are each provided with two elevated ridges or bearings to guide the respective wheels of the car or locomotive to their proper positions on the track, with a groove and spike hole to keep them in their positions on the rails, and with an adjusting wedge to render them steady and firm on rails of different heights.

Claim.—A portable car replacer, consisting of the pair of sloping plates A B and C D, for the right and left rails, respectively, of a track, the plate A B having the elevated ridges or bearings a' and b' , and the plate C D having the elevated ridges or bearings c' and d' , and each plate having the rail groove H, and the adjusting wedge G, all the said parts being

constructed and arranged in relation to the slopes of the respective plates A B and C D, as shown and described for the purposes specified.

85,138.—LODVER SCHYE, Chicago, Ill.—*Boot Shank Machine.*—December 22, 1868.—The leather being placed over the last, is inserted between the jaws which are pivoted to the plate. The screw connecting with the jaws by arms, is then turned and causes the jaws to be brought together, thus stretching the leather.

Claim.—1. The jaws A B, in combination with the arms D D, plate C, and screw F, all constructed and operating substantially as and for the purposes specified.

2. The jaws A B, when provided with the openings *g*, substantially as and for the purposes specified.

85,139.—SAMUEL S. SHERMAN and JEREMIAH G. SHERMAN, McHenry, Ill.—*Harvester Rake.*—December 22, 1868.—One of the arms is so arranged on the rotating shaft which receives motion from the collar and arm, as to push the grain off the platform and thus dispense with the rake.

Claim.—1. The combination of the beater E, arm J, or its equivalent, and sliding and rotating rod K, and its bearings *m m*, arranged and operating substantially in the manner and for the purposes specified.

2. In combination with the movable beater E, rod K, and arm H, the fulcrumed beater G, arranged to operate substantially as and for the purposes set forth.

3. The combination of the collar Q, the arm M, with the bearings *m m*, the rotating rod K and beater E, arranged and operating substantially as described.

4. The combination of the lever L, or its equivalent, and the arm O, with the rod K, bearings *m m*, and beater E, arranged and operating substantially in the manner and for the purposes set forth.

5. The combination of the lever L with said arm O and the reel, when said lever is provided with a roller S, or its equivalent, moving in a groove or grooves T T', substantially as and for the purposes described.

6. The combination of the lever L, pins *a a*, and flange *y*, upon the bar M, operating in the manner herein specified.

85,140.—WILLIAM H. SINGER, Pittsburg, Pa.—*Method of Applying Cast Steel to Articles made of Iron.*—December 22, 1868.—The iron is cleaned in an acid bath, then taken out and placed in a lime bath to destroy any acid remaining on the iron. The iron is then placed in the mold in a cold state, and the melted steel is poured around it.

Claim.—The method of applying cast steel to iron, substantially as herein described.

85,141.—A. B. SMITH, Rochester, Pa.—*Grain Separator.*—December 22, 1868; antedated December 5, 1868.—The apron, made of inclined parallel slats, with guard strips of metal between to prevent the passage of straw to the sieve, is vibrated by means of knockers which are made of wood and held between metallic jaws on the adjustable flanch plate.

Claim.—1. The reciprocating knockers B B and C C, arranged and operating in combination with the stationary slatted or slotted apron D, substantially as and for the purpose herein specified.

2. Constructing the knockers of wooden quadrants, held between metallic jaws M N by bolts, substantially as specified.

3. Attaching the knockers by the flanch plate P, with its slot *t* and bolt *u*, so as to be adjustable on their shaft, substantially as set forth.

4. The inclined guard strips *d d* between the slats of the apron D, in combination with the knockers B B, C C, for the purpose specified.

85,142.—EDWIN SPRAGUE, Allegheny City, Pa.—*Brick Machine.*—December 22, 1868; antedated December 11, 1868.—A projection on the end of the automatic mold feeder catches on the mold and forces it under the opening on the hopper. The cut-

off operated by a cam on the shaft closes the aperture in the hopper, when the mold is full, and the delivering arm carries the mold along on the mold-way ready to be "carried off."

Claim.—The mold racks, automatic mold feeder *l*, cut-off S, delivering arm P, and mold-ways *h* and *h'*, constructed, arranged, and made operative through the medium of the shaft *e* and cams *f'* and *y*, in the manner substantially as herein described, and for the purpose set forth.

85,143.—W. C. STICKNEY and J. MCGEE, Steubenville, Ohio.—*Device to Open Railway Car Ventilators.*—December 22, 1868.—The valve of the ventilator is attached to the slotted head of a rod which slides in a thimble, and is held in position by a friction block and spring in said thimble.

Claim.—The thimble E, hollow shank *e'*, spring F, and friction block G, and the vertically-sliding rod D, having the slotted T-head *d'*, in combination with the pivoted sash B and frame A, arranged and operating as described, for the purpose specified.

85,144.—ANSON C. STOWE, San José, Cal.—*Carriage Spring.*—December 22, 1868.—The supporting bars are suspended from arms on the coiled spring shaft, to which latter are also attached shorter arms which are joined by rods to the equalizing lever.

Claim.—The combination, with the supporting device, consisting of bars H, links I, arms G, shafts E, and springs F, of the equalizing device, consisting of arms K, rods L, and lever M, the whole being constructed and arranged substantially as herein described.

85,145.—JOHN EDSON SWEET, Syracuse, and J. BOYD ELLIOTT, New York, N. Y., assignors to OLANDER B. POTTER and SOLOMON J. GORDON, New York City.—*Machine for Making Cut Nails.*—December 22, 1868.—On the forward movement of the punch a projection is made to come in contact with an inclined block on the spring, so as to force the latter against the blank while the punch is operating. The spring is held in position by a locking lever until the punch is withdrawn, when a reciprocating stud comes in contact with an arm on the locking lever and releases the spring. The fingers which push the blanks between the grippers are held in reciprocating boxes by springs, so as to slide if any undue resistance is met. The grippers hold the cut blanks in position with the large ends projecting far enough for the headers to form the heads.

Claim.—1. The spring E, and inclined block *a*, in combination with the punch D and guide C, constructed and operating substantially as and for the purpose described.

2. The locking lever *e*, in combination with the spring E, inclined block *a*, punch D, and guide C, constructed and operating substantially as and for the purpose set forth.

3. The unlocking mechanism, consisting of the arm *g*, and reciprocating stud *f*, in combination with the locking lever *e*, spring E, inclined block *a*, punch D, and guide C, all constructed and operating substantially as and for the purpose described.

4. The fingers *j j'*, acting in opposite directions, in combination with the punch D, and stationary cutters *i i'*, constructed and operating substantially as and for the purpose set forth.

5. The grippers *m m'* and headers H, in combination with the fingers *j j'*, punch D, and stationary cutters *i i'*, constructed and operating substantially as and for the purpose described.

6. The safety boxes *t*, in combination with the fingers *j j'*, punch D, and cutters *i i'*, constructed and operating substantially as and for the purpose set forth.

7. The combination, substantially as described, of the punch and cutters, (for cutting two nail blanks at a time,) with two sets of grippers and headers, for heading the two blanks so cut, so that each operation of the mechanism produces two headed nails.

85,146.—LEOPOLD THOMAS, Allegheny City, assignor to ANDREW KLOMAN, Pittsburg, Pa.—*Pointing Spikes.*—December 22, 1868.

Claim.—1. Tool posts *a* and pointing tools *e*, ar-

ranged on a reciprocating carriage, and in such relation to fixed guide posts or projections *s*, that, with the forward stroke of the carriage, the tool posts *a* or pointing tools *e* shall engage such guide posts, and the pointing tools shall thereby be made to engage the iron rod or bar fed in, and cut off and point a new spike, substantially as above described.

2. The pointing tools *e e*, mounted on a reciprocating carriage, in combination with fixed guide posts or projections *s* and square-faced dies *d d'*, above and below, such dies being either movable or stationary, the dies and tools being so arranged and operated, relatively to each other, that, while the pointing tools are cutting a spike from its bar, the upper and lower dies will prevent the spread of the iron in the point, substantially as above set forth.

3. The arms *f*, attached to or connected with the tool posts *a*, when so arranged, relatively to one or more fixed guide posts *g*, that, when the spike is severed from the rod or bar, and the carriage commences its return stroke, the pointing tools will be opened, substantially as above set forth.

85,147.—A. B. THOMPSON, Owego, N. Y.—*Railroad Car Coupling*.—December 22, 1868.—The pivoted hook is operated by means of a lever which is provided with a roller moving in a curved groove in the draw head, and is held in position by a coiled spring.

Claim.—The combination of the hook D and the lever O, with its spring and roller *e*, arranged to operate in the draw head A, substantially as and for the purpose herein specified.

85,148.—THOMAS URIE, Springfield, Iowa.—*Wagon Brake*.—December 22, 1868.—A projection on the lever comes in contact with the lower side of the segmental rack when the lever is raised, by the locking of the eccentric, and effectively secures it. By means of the adjustable slide a greater or less leverage can be exerted against the brake.

Claim.—1. The lever D, having end play in the socket L, as and for the purpose described.

2. In combination with the brake, the adjustable slide G, as and for the purpose described.

85,149.—GEORGE E. VAN AMRINGE, New York, N. Y.—*Tube for Steam Generators*.—December 22, 1868.—The tubes made in one piece are corrugated spirally or transversely.

Claim.—The construction of the tubes of steam generators, being composed of one piece, substantially as herein set forth.

85,150.—JOSEPH WADLEIGH, Chebanse, Ill.—*Tongue for Harvesters*.—December 22, 1868.—The play of the tongue and doubletree is limited by the chains.

Claim.—1. Forming a lateral joint in the draught pole or tongue A B, by means of a pivoted connection, when a slight longitudinal movement is permitted in B, substantially in the manner and for the purposes shown and set forth.

2. In combination with a draught pole, A B, jointed as described, provided with a suitable stop, *p*, the chain G, arranged and operating in the manner shown and described.

3. The combination of the doubletree C and chain H with jointed draught pole A B, arranged and operating in the manner set forth.

85,151.—GEORGE WESLEY WELSH and GEORGE WYLIE, Arlington, Wis.—*Wagon Brake*.—December 22, 1868.—The hold-back straps are attached to a rod which connects with a bent rod or lever operating the brakes; the rod, on which the latter rest, is provided with spiral springs which press the brakes toward the wheels.

Claim.—The arrangement of the bent rod G, having the pendent portion *a*, the arms I I, shaft J, shoes K, spiral springs *d* and rod D, with relation to the bolt E, the hounds and the wheels B, all operating as described, for the purpose specified.

85,152.—EDWARD WIARD, Louisville, Ky., assignor to himself and SAMUEL W. POPE, same place.—*Plow*.—December 22, 1868.—The handle is arranged between lugs on the moldboard and is held

by a bolt which fits in slotted hooks on the moldboard.

Claim.—The lugs *a a*, with their projecting points, in combination with the slotted hook or hooks *b*, the bolt *e*, handle B, and moldboard A, substantially as described, for the purpose specified.

85,153.—ESKRIDGE J. WILSON, Fair Play, Cal.—*Machine for Crushing Rock*.—December 22, 1868; antedated December 12, 1868.—The stampers receive intermittent rising and falling movements from the inclined surfaces and operate to strike the rock, and act as grinders in rising from the lowest to the highest points of said inclined surfaces.

Claim.—1. One or more rows of stamps, arranged in inclined positions, and in upper and lower guides, and acted upon by springs, in combination with an annular battery or batteries, formed with inclined step surfaces, and furnished with a screen or screens, substantially as described.

2. In combination with circularly-moving stampers, working upon annular stepped surfaces, providing for feeding the rock from the center of the machine outwardly, substantially as described.

3. The arrangement of the driving mechanism, circularly-moving frame and cylinder, stationary annular-grooved bed, with inclined steps at the base of the groove or grooves, and the stationary table E of stationary frame A A', substantially as and for the purpose described.

85,154.—A. WINTERS, Washington, Pa.—*Hand Rake*.—December 22, 1858.—The tang is bent upward to permit the rake teeth to act on the surface of the ground together. The curved head retains the leaves and other substances.

Claim.—As a new article of manufacture, the metal rake head, consisting of the curved head A, the straight teeth having the bent points *a*, and the bent bifurcated tang B, constructed and arranged to operate in the manner described, for the purpose specified.

85,155.—L. R. WITHERELL and E. A. WITHERELL, Galesburg, Ill.—*Machine for Washing Dishes*.—December 22, 1868.—The rack on which the dishes are placed is caused to revolve under a stream of hot water by means of a screw, on the end of the shaft operating the pump, engaging with a worm wheel on the rack shaft.

Claim.—1. The arrangement of disk R, rack T, shaft *m*, socket *n*, worm wheel J, shaft F, worm G, and bearings P and *v*, when used in dish-washing machines, substantially as described, and for the purpose set forth.

2. The combination and arrangement of the vessel A, pump B, pipe X, crank E, shaft F, worm G, pinion J, shaft *m*, disk R, and rack T, substantially as described, and for the purpose set forth.

85,156.—JOHN A. WOLFER, Rondout, N. Y.—*Automatic Ice Chute*.—December 22, 1868.—Guide rods are secured to the bottom and top of the chute on which a transverse bar slides which is connected by a rope with a chain or other weight so as to elevate the bar automatically when the ice is discharged.

Claim.—1. The chute B, provided with guide rods F, (or their equivalent,) so arranged that blocks of ice may be lowered thereon by a variable weight or chain, J, in combination with a bar, H, and chain or rope, I, substantially in the manner herein shown and described.

2. In combination with an ice chute, the bar H, rope or chain I, and variable weight or chain J, operating substantially as and for the purposes set forth.

85,157.—JAMES WRINKLE, Lee, Mass.—*Machine for Mixing Coloring Matter with Paper Pulp*.—December 22, 1868.—The object of this invention is to prevent lumps and blue spots being formed, as the pulp and coloring matter are kept well mixed, and the fibers of the pulp prevented from uniting.

Claim.—The drawing of paper pulp from the vat and ejecting it into the compartment, from which it passes upon the wire cloth by means of a pump, rotary or reciprocating, substantially as and for the purpose herein set forth.

85,158.—S. V. R. YORK, Antwerp, N. Y.—*Safety Bridle.*—December 22, 1868.—When the horse plunges, the straps tighten the bit. By pulling the reins the rings on the nose strap, fitting on the bit, produce the same effect as the straps.

Claim.—1. The straps D D and check straps E, branching from the nose piece *b*, and all acting on the sliding rings B, and combined and operating together for the purpose and in the manner as described.

2. The combination of the check strap E and connection *i* with the straps *b C C*, and loose rings B B, substantially as herein set forth.

85,159.—GEORGE W. N. YOST, Corry, Pa. assignor to CORRY MACHINE COMPANY.—*Harvester.*—December 22, 1868.—The sleeve, fitting in a hole in the frame, forms a bearing for the crank shaft, and is rigidly united to the yoke bolt which connects the two halves of the main frames.

Claim.—The combination of the sleeve R with the yoke bolt I and I', and the body A and A', provided with the hole R', made and used as described for grass and grain cutting machines.

85,160.—LAUREN B. ARNOLD, Lansing, N. Y.—*Milk Cooler.*—December 22, 1868.—The milk drops from the reservoir upon, and passes over, a vertical series of corrugated plates from which it is collected, as it falls, by a basin attached to the frame.

Claim.—1. The series of plates B B, one over the other, between the reservoir A and collecting basin C, made substantially as described, whereby the milk is spread in sheets, and falls in streamlets through the air, for the purpose of cooling milk and depriving it of its animal odor and deleterious gases, as set forth.

2. The combination of the reservoir and diffuser A, plates B, and collecting basin C, in the frame F, for the purposes as set forth.

85,161.—ADAM BAERLE, Chicago, Ill.—*Ice House.*—December 22, 1868.—The metallic sheets of the flooring are jointed so that the water can easily run down the sloping surfaces without being arrested by the joints.

Claim.—1. A floor for ice houses, covering a store room, when said floor is made of trusses and lateral braces in the manner herein described, so as to form a series of inclined surfaces with gutters at their point of junction, substantially as and for the purpose set forth.

2. In combination with the above, the flooring, of metallic sheets, arranged substantially as herein described and specified.

85,162.—HIRAM BERDAN, New York, N. Y., assignor to the BERDAN FIRE-ARMS MANUFACTURING COMPANY, same place.—*Breech-loading Fire-arm.*—December 22, 1868.—The extension of the shield serves as a stop to the breech piece while the latter is pushed forward when there is no cartridge in the gun.

Claim.—1. The extension of the extractor shield or projection C' on the breech piece forward beyond the face of the breech piece, substantially as and for the purpose herein set forth.

2. The tail piece F², constructed to assist in guiding the breech piece, and to serve as a means of transmitting the blow of the hammer to the firing pin, substantially as herein described.

85,163.—GARRET P. BERGEN, Brooklyn, N. Y.—*Combined Scissors Sharpener and Screwdriver.*—December 22, 1868.

Claim.—The combination, in the one instrument or implement, of a scissors sharpener, A and B, a screwdriver point or blade, D, and a handle, C, substantially as described.

85,164.—M. T. CARSON, Cleveland, Ohio.—*Lubricating Cup.*—December 22, 1868.—The journal is supplied with oil by capillary attraction while in motion, and none while at rest.

Claim.—The screw plug E, provided with the chamber F, openings or conduits H and G, in combination with an oil cup, substantially as set forth.

85,165.—JAMES M. CLARK, Lancaster, Pa.—*Door Fastener.*—December 22, 1868.—Two short

bars are hinged together to admit of being compactly folded, and are provided with teeth at the ends which are to be placed against the floor and door on the inside.

Claim.—The construction and arrangement of the flat turning latch C, in combination with the catch flange D, and toothed and beveled end of the hinged pieces A B, substantially as set forth and shown.

85,166.—G. F. J. COLBURN, Newark, N. J., assignor to JOHN DAVIDSON, same place.—*Dentifrice Paste.*—December 22, 1868.—Pulverized chalk, orris root, Castile soap and winter-green are mixed with glycerine.

Claim.—The mixing of the solids herein described, or their chemical equivalents, with glycerine, all substantially in the manner, and for the purpose hereinbefore described.

85,167.—MOSES DENNIS, Barton, N. Y.—*Horse Hay Fork.*—December 22, 1868.—The fork is tripped by pressing the upper end of the trip lever against the joint of "toggle bar" or brace.

Claim.—1. The arrangement of the jointed brace C, so that when flexed it holds the bail fast, and enables the bail to be used as a handle for entering the fork in loading, as set forth.

2. The arrangement of the ring L on the middle tooth before the rod B, and held by the tooth, in combination with the S-shaped trip lever I, as described.

3. The combination of the bail A, tines D E F, connecting toggle bar C, lever I, and trip rope, when constructed and arranged as described.

85,168.—JOHN A. DODGE, Auburn, N. Y.—*Harvester.*—December 22, 1868.—The sliding sleeve or collar is moved by a lever operated by the driver's foot, the clutch being outside the periphery of the bevel wheel. A spring pawl takes in a ratchet on the sector and is provided with an arm projecting inwardly, so that the driver can at any moment release the finger beam.

Claim.—1. The combination, as described, of the bevel wheel K, on the main axle, with the bevel pinion L, and sliding sleeve *m*, both mounted on the counter shaft, and connected by a feather, the sliding sleeve being arranged outside of the periphery of the bevel wheel, as set forth.

2. The combination of the bevel wheel K, the bevel pinion L, the sliding sleeve *m*, the counter shaft M, and the shipping lever R, when all these parts are constructed and arranged for joint operation, as described.

3. The combination of the bevel wheel, the bevel pinion, the sliding sleeve, the shipping lever, the counter shaft and its spur pinion, with the internal spur wheel N and longitudinal crank shaft O, when all these parts are constructed and arranged for joint operation, as described.

4. The combination of the sector T and ratchet *v* with the spring pawl and projecting arm *v'*, constructed, arranged, and operating as described.

5. The combination of the main frame, the tongue, the driving wheels, the gearing, the removable driver's seat, the projecting arm F, the removable arm U, the drag bar, the coupling arm, the finger beam, the cutting apparatus, and the lifting apparatus, all constructed and arranged as described, for joint operation.

85,169.—HENRY FISHER, Aurora, Ind., *Self-guarding Hook.*—December 22, 1868.—Attached to a tapering screw are two hooks, the upward turn of each of which is parallel with the downward turn of its fellow.

Claim.—The double hook A *a a*¹ *a*² *a*², constructed and arranged substantially as and for the purpose described.

85,170.—GUSTAV GRAETZ, Alexandria, Va.—*Combined Match and Cigar Box.*—December 22, 1868.—The holder is intended principally for the reception of a cigar which has been partially smoked, to be kept for future use.

Claim.—The combined match box, igniter, and cigar holder, composed of the compartment A, having one or more hinged covers, the cigar holder

F F' and the slotted chamber B B', *g*, with spring D, follower C *c' h*, lining E, and serrated spring holders *e'*, all substantially as herein described.

85,171.—EDWARD M. GRANT, Macon, Ga.—*Wrought Iron Bridge Pier.*—December 22, 1868.

Claim.—1. The lower section A, when constructed with the "Phoenix Patent" columns *d d*, the plates D M, the stays *s s*, the wrought-iron straps *n n*, the inclined column Q, the caps E E, and the east-iron plates *o o*, all constructed, arranged, and bolted together in the manner described.

2. The upper section B, when constructed with the columns *d d*, inclined as described and shown; the east-iron plates M M'; the stays *s s* and F F', the latter strengthened by the braces *e e*; the caps E E; and the east-iron plates *o o*; all constructed, arranged, and connected together in the manner described.

3. The intermediate sections C C, when constructed with the columns *d d*, plates M M, stays *s s* F F, braces *e e*, caps E E, plates *o o*, and trusses *m m'*, all constructed, arranged, and combined in the manner and for the purpose specified.

4. The described arrangement of sections A B C, when severally constructed and connected in the manner described, so as to form a single pier.

5. In any pier, the use of wrought-iron straps *n n*, and iron columns *d d* Q, arranged as described, and bolted together, the straps extending around the front and sides of the pier, for the purpose of protecting it from floating ice, drift-wood, &c.

6. The described method of attaching the stays to the columns, to wit, the arrangement and combination of the stays *s s*, columns *d d*, iron plates *o o*, and bolts *r r*, substantially as shown and specified.

85,172.—BENJAMIN IRVING, New York, assignor to H. A. TAYLOR, Malone, N. Y.—*Bark Crusher.*—December 22, 1868.—The different motions of the rollers are designed to prevent the bark from overworking or crowding the front and back rollers. The elevator consists of a series of buckets formed of sieve wire, which allows the escape of the liquid, and carries off the spent crushed bark.

Claim.—1. The combination of the rollers C and D, having a differential motion, with the roller E, having a uniform motion with the roller C, arranged and operated substantially as described, and for the purposes set forth.

2. In combination with the water bath and agitator wheel, the elevator P, substantially as described and for the purposes set forth.

85,173.—BENJAMIN IRVING, New York, assignor to H. A. TAYLOR, Malone, N. Y.—*Apparatus for Obtaining Extracts from Bark for Tanning, &c.*—December 22, 1868.—The bark, after being soaked in water, is placed on a table and fed in between two rollers rotating at a different speed, by which it is crushed and ground. The fibrous mass is then passed between two other rollers and reduced to a pulp, and then dropped into a water bath.

Claim.—The method or process of treating soaked slabs of bark, for obtaining the liquid extracts thereof, for tanning and other purposes, substantially as hereinbefore described.

85,174.—BENJAMIN IRVING, New York, assignor to H. A. TAYLOR, same place.—*Method of Concentrating the Extract of Bark for Tanning, &c.*—December 22, 1868.—The weak extract of the bark is passed in a thin stream through a trough divided by partitions, alternately from one end of the trough to near the other, and heated below by means of steam.

Claim.—The method or process of concentrating the liquid extract of bark for tanning and other purposes, by flowing it in a thin sheet continuously over the surface of an open evaporating pan, made and operating in combination with the steam and condensing chambers, or equivalents therefor, substantially as hereinbefore set forth.

85,175.—BENJAMIN IRVING, New York, assignor to H. A. TAYLOR, Malone, N. Y.—*Apparatus for Concentrating Extract of Tan Bark.*—December 22, 1868.—Over the evaporating box is a roof hinged to

the sides of the box so that an opening may be made at the peak for the escape of vapor. A condenser at the side of the box condenses the vapor when the roof is closed.

Claim.—1. The combination of the evaporating pan, made substantially as hereinbefore described, with the compartments D and E of the evaporating box A, for the purpose of concentrating the liquid extract of bark for tanning purposes, substantially as hereinbefore set forth.

2. The combination of the hinged wings H with the evaporating box A, substantially as described, and for the purposes set forth.

3. In combination with the evaporating chamber E, a condenser J, or other equivalent device, substantially as described, and for the purposes set forth.

85,176.—JOHN JOHNSON, Saco, Me., assignor to NEW ENGLAND STEAM-HEATING COMPANY, Boston, Mass.—*Steam Heater.*—December 22, 1868.—On the top of the steam-heating apparatus is placed a vessel containing a coil of pipe, the end of which is brought up and turned down in the form of a siphon. The heated water at the lower part of the vessel rises and replaces the cooler water at the top.

Claim.—The automatic condenser and regulator attached to steam-heating apparatus, constructed substantially as herein described, and for the purpose set forth.

85,177.—JOHN JOHNSON, Saco, Me., assignor to NEW ENGLAND STEAM-HEATING COMPANY, Boston, Mass.—*Steam Heater.*—December 22, 1868.—Two hollow boxes are connected together by a series of vertical pipes, within which latter are pipes of a smaller diameter, to allow of the passage of air between the two.

Claim.—The combination of the central pipe E, the outer pipe D, and the top and bottom chambers B and C, substantially as described, and for the purpose specified.

85,178.—ZALMON LUDINGTON, Uniontown, Pa.—*Peat Machine.*—December 22, 1868.—The mold blocks being driven back and forth, the molds are alternately filled with peat and pressed into solid, square blocks. Springs allow the molds to be forced back when the pressure becomes too great.

Claim.—1. The arrangement of the gate H, secured to the mold blocks K K' by metal plates I I', in combination with the molds O O', blocks P P', and springs S S', when operated, through shaft C, by crank F and connecting rod G, or their equivalents, substantially as and for the purpose set forth.

2. The blocks P P' and springs S S', in combination with the molds O O', blocks K K', and reciprocating gate H, as and for the purpose herein set forth.

85,179.—JOHN MARSHALL, Greenwich, assignor to JOHN CHRISTOPHER REES WEGUELIN, of London, England.—*Safety Gauge for Boilers.*—December 22, 1868; patented in England February 25, 1867.—A conical seating is formed in one end of the plug, in which is inserted a ball valve. At the other end is inserted a piece of metal bored out through its center, and through a reduced thickness are made apertures, forming a perforated seat.

Claim.—1. The ball valve E, or its equivalent, in combination with the conical seated plug A and the perforated seating C, the whole being constructed and arranged substantially as herein described.

2. The screw plug D, in combination with the valve E, the perforated seating C, and the conical seated plug A, the whole being constructed and arranged substantially as herein set forth.

85,180.—PALEMON POWELL, Cincinnati, Ohio.—*Cartridge Charger.*—December 22, 1868.—Between the shank of the stock and the outer shell is a space for the reception of the cartridge case, and on the end of the shank is a thimble provided with a groove, into which a spring crimping pin engages. In the upper part of the shell is arranged a small cylinder, into which is fitted a piston and spring for holding and inserting a cap into the cap cavity of the cartridge case.

Claim.—1. The arrangement of the stock A, shell

B, grooved plate *a'''*, and spring crimping device G *g'*, substantially as described.

2. The capping device D E, when constructed so as to be detachable, as described, and for the purpose specified.

3. In combination with the cartridge charger hereinbefore described, the thumb screw H *h'*, constructed as specified, and adapted for use in connection with the capper D E, and aperture *h*, and pin *e*, in the manner explained.

85,181.—LESTER REYNOLDS, Owatonna, Minn.—*Grain Weighing and Registering Machine.*—December 22, 1868.—Over two fixed measures are arranged rocking guide spouts, to which are attached rods and arms, connecting with valves at the lower ends of the measures, by which the measures are alternately and automatically filled and emptied.

Claim.—The arrangement of the measures M M', pivoted guide D D', hopper E, valves *n n'*, and arms I and J, for connecting the valves to the sides of the pivoted guides, substantially as shown and described.

85,182.—FRANCIS A. ROBERTS, North Vassalborough, Me.—*Potato Digger.*—December 22, 1868.—The scoop consists of two wings provided with a cutting tip, the part connecting the wings being provided with short fingers which project over the front end of a hinged riddle.

Claim.—1. The scoop A E, *e*, substantially as described, having a hinged riddle, *a a a*, &c., and fixed riddle *b b*, all as and for the purpose set forth.

2. The scoop A E, *e*, and a fixed riddle *b b*, substantially as shown and described, in combination with a plow beam, B, and handle D, all as and for the purpose set forth.

85,183.—FREEMAN K. SIBLEY, Auburndale, and LEVI C. WADE, Newton Upper Falls, Mass.—*Device for Receiving and Delivering Mails.*—December 22, 1868.—A hinged brace made to hook on to the edge of the scoop bears under springs which restrain the scoop from swinging out too far. The concussion of the mail bag as it is caught from the crane closes the scoop and releases the hinged brace from it, and the mail to be delivered is thrown from the hook upon the ear.

Claim.—1. The scoop D, arranged to swing on a vertical axis within or through an opening made in the side of the ear, and operating, in connection with devices for suspending the bags or packages to be received or delivered, substantially as specified.

2. The reversible swinging scoop D, operating in connection with catches for holding it in reverse positions, having an angular relationship to the side of the ear, essentially as herein set forth.

3. The combination of the hinged braces F F' and springs *e e'* with the scoop D, for operation as specified.

4. The arrangement, on the outside surface of the swinging scoop, of projections or formations G G, to direct delivery of the bag or package, as herein set forth.

85,184.—THOMAS SIM, Charleston, S. C.—*Process and Apparatus for Preserving Meat and other Perishable Articles.*—December 22, 1868.—Sulphur is introduced through a pipe into a well situated below a retort filled with incandescent charecoal into which the sulphur passes through a perforated plate, and is converted into bisulphide of carbon. The gas is forced in large quantities, by means of a pump, into the exhausted receiver.

Claim.—1. The employment or use, for preserving meat or animal matter, of any of the sulphides of carbon applied in gaseous form, and made to permeate the matter to be preserved, after the latter has been exhausted or partially exhausted of air.

2. The use, in connection with any of the sulphides of carbon, of phenic acid, methyl, or other product of the destructive distillation of wood or coal.

3. The apparatus, constructed and arranged to operate substantially as herein described.

85,185.—JACOB D. SPANG, Dayton, Ohio.—*Gas Machine.*—December 22, 1868.—Hydrocarbon passes

from the tank through the involutions of the pipe over the heated vessel and, being vaporized, enters the gasometer in the form of gas. The fire is now extinguished in the vessel and the burner under the pipes is lighted and heats the pipes. The quality of the gas is tried, and if found poor it is improved in the vessel, if rich, it is diluted by air from the pump.

Claim.—The arrangement of the tank A, coiled or involuted pipe B, gasometer E, burner F, vessel D, pipe I, vessels L and M, air-pump Q, and gasometer N, when the said parts are provided with suitable cocks, and constructed to operate in the manner and for the purpose indicated.

85,186.—P. J. STOLL, Marshallville, Ohio.—*Hitching Strap Buckle.*—December 22, 1868.—By means of the end and center tongues the hitching strap is prevented from being unfastened by the movements of the animal.

Claim.—The within described buckle, consisting of the frame A, with cross bars F and G and loop C, the front tongue E, center tongues D D, and rear retaining tongue B, the several parts being constructed, combined, and arranged as and for the purpose herein specified.

85,187.—CHARLES SWEENEY, East Bloomfield, N. Y.—*Churn.*—December 22, 1868.—By adjusting the pin in the holes on the rod, the resilient power of the spring is increased or diminished so as to lengthen or shorten the stroke of the dasher rod.

Claim.—The adjusting pin *a*, receiving holes *c* in the dasher rod B, in combination with the collar C, spring H, and head A, for the purposes set forth.

85,188.—GEORGE W. THOMPSON, Brooklyn, N. Y.—*Medicated Paper for the Water Closet.*—December 22, 1868.—Tar is introduced into the pulp in the vat; the paper when made retains the properties of the tar.

Claim.—1. The water closet paper, prepared in the manner specified, to impart the medicinal properties set forth.

2. The package of water closet paper, formed by the introduction of sheets into the wrapper, as set forth.

85,189.—DUDLEY W. TRAVIS, Enfield, N. Y.—*Corn Cultivator.*—December 22, 1868.—The plows are adjusted by means of slotted plates on the standards.

Claim.—The herein described mode of adjusting the plows and hoes, in combination with the posts or standards H and I, bars F G, and frames D, when the whole is constructed and arranged substantially in the manner shown and described, and for the purpose set forth.

85,190.—GEORGE B. TURRELL, New York, N. Y.—*Cooler for Beer and other Liquids.*—December 22, 1868.—The beer runs from a sprinkling trough over a series of flattened tubes, through which water circulates, and is cooled in its descent.

Claim.—A cooler, for beer and other liquids, formed of a series of flattened tubes, with their longest diameters horizontally, substantially as specified, so that the stratum of liquid passes in the manner described.

85,191.—JOSEPH EDWIN WARD, Bredbury, Great Britain, assignor to ANDREW DWIGHT CAMPBELL.—*Mold for Forming Hats.*—December 22, 1868.

Claim.—The mold F F', constructed perfect, or entire, with a reduction, *m*, where it is required to establish the joint, so as to form a jagged or ragged fracture when separating the mold into sections, essentially as and for the purpose herein set forth.

85,192.—DARIUS WELLINGTON, Boston, Mass.—*Water Closet.*—December 22, 1868.—The crank on the pan-supporting shaft is joined to a lever which is provided with a fulcrum slot having a vertical slot opening out of it into which the fulcrum pin slips when the pan closes, and locks the pan shaft in position. The cup is secured to the seat board by keys in the stirrup. The outwardly projecting flange

of the receiver supports the bowl, and the fingers serve as stops for the pan.

Claim.—1. In combination with the pan, the tongue *i*, entering the slot of the shaft *n*, after the shaft is thrust through the receiver, and confined in said slot, and to the shaft, by a screw, *l*, substantially as described.

2. For operating the pan, a lever having an end movement by means of the fulcrum slot, and also having the locking slot, by means of which, by locking the pan shaft from rotative movement, the pan is locked from tipping movement, substantially as described.

3. The weight hung loosely to the rod *u*, and slotted, to allow the lever *p* to run loosely through it, substantially as described.

4. In combination with the cup, the stirrup frame, provided with key slots, substantially as shown and described.

5. The receiver *a*, with an outwardly projecting flange *b'*, and inwardly projecting fingers *d*, substantially as shown and described.

85,193.—ALBERT M. WHITE, Thompsonville, assignor to the AMERICAN BRUSH COMPANY, New Haven, Conn.—*Brush Making Machine*.—December 22, 1868.—An improvement on his patent of April 4, 1865. The bristles are divided into knots or tufts and inserted and secured into the brush stock or back by the various devices automatically.

Claim.—1. In combination with the belt or other suitable feed of the bristles, a divider, *E*, of any suitable construction, operating to space the bristles into knots or tufts, substantially as described.

2. The fingers *F F*, so constructed and operating as to spread out laterally to effect or complete the separation of the bristles into knots or tufts, and afterwards to carry or push forward the same for insertion in the brush back or block, substantially as specified.

3. The combination of the divider *E* and fingers *F F*, for operation together, essentially as set forth, and whereby the fingers are made to lift and release the divider, to secure the spacing of the bristles, as specified.

4. The combination with the fingers *F F*, of the slide *G*, or their equivalents, for operation together, essentially as and for the purpose or purposes herein set forth.

5. The combination with the fingers *F F* of the slides *C* and *H*, slots *o o*, pins *n n*, inclined plane *r*, and arm *s*, or the equivalents of these devices, in such manner as that the fingers are first expanded, afterward moved forward, and, subsequently, in their back stroke, made to rise for the purpose of lifting the divider which spaces the bristles into knots or tufts.

6. The combination, in a brush making machine, of a wire cutter, *V*, and staple former *X*, for operation together, substantially as specified.

7. The jaws *j' j'*, having a reciprocating movement, and opening and closing, as described, in combination with a reciprocating punch, *B'*, for operation together, and on or relatively to the tuft, substantially as described.

8. The combination, with the recessed slide *G*, of the jaws *j' j'* and punch *B'*, for action together, as herein set forth.

9. The punch *B'*, constructed at its lower end of a concave form, in directions at right angles to each other, essentially as and for the purposes specified.

10. The combination of the jaws *j' j'*, punch *B'*, wire cutter *V*, and a staple former *X*, or their equivalents, for action together, or relatively to each other, essentially as and for the purposes specified.

11. In combination with devices for inserting and securing the bristles in tufts, the brush block carriage *D*, arranged to travel intermittently in the one direction, then crosswise of such motion for a distance corresponding to the width of the two adjacent rows of perforations apart, and subsequently to travel intermittently in a reverse direction to its first movement, substantially as described.

12. The combination of the slide *G'* with its pawls *h² h³*, notched wheel *H'*, pinion *O'*, rack *N'*, stops *M¹ M²*, and shifter *K'*, essentially as specified.

13. The combination of the cam *P'*, slide *Q'*, spring *m²*, spring catch *S¹*, and arm *R⁴* of the shifter

K', constructed to release the catch, substantially as herein set forth.

14. The combination, with the pawl shifter *K'*, of mechanism whereby the carriage-operating pawls are made first to be thrown out of gear with the notched wheel which they drive, afterward to be reciprocated independently of the same, and, subsequently, either one of said pawls made to gear with such wheel, for the purpose of establishing the adjustment of the carriage in a crosswise direction, and afterwards reversing its action at right angles thereto, as herein described.

15. A combination of mechanism for spacing or separating the bristles into tufts, and suitably locating them over a perforated brush back or block; also, serving automatically to insert and secure said tufts by staples within the back or block, essentially as herein set forth.

85,194.—RALPH C. WHITEHOUSE, Boothbay, Me.—*Stove Oven*.—December 22, 1868.—The revolving table is provided with a pivot which fits in a hole in the bottom of the oven, and with trucks, which prevent the table from tipping.

Claim.—The improvement in stove ovens herein set forth, consisting of the table *a*, with pivot *b*, and trucks *e*, together with the hole *c*, as and to operate for the purposes herein set forth and described.

85,195.—WESLEY YOUNG, Bloomington, Ill.—*Hedge Planter*.—December 22, 1868.—The coulter, hinged to the front of the shoe, has a lateral motion to change the direction of the shoe. An endless belt, carrying the hedge plants into the shoe, deposits them on the pins of the setting wheel, which sets the plants in the furrow.

Claim.—1. The shoe *A*, constructed as described, and provided with hinged coulter *C*, notched cut *A'*, and springs *h h*, substantially as and for the purpose set forth.

2. The setting wheel *D*, partially incased by the said shoe *A*, and provided with radially arranged pins *i i*, substantially as above described, and for the purpose specified.

3. In combination with the above, the endless belt *F*, rear coulter *k*, and roller *E*, the whole, arranged and operating substantially as herein set forth and specified.

85,196.—JOHN ADAMS, Findlay, Ohio.—*Stove Drum*.—December 22, 1868.—When the damper in the apex of the central cone is closed, the smoke and steam pass outside of that cone through the outer flues into the upper cone, then through the inner flues into the central cone to the escape pipe.

Claim.—1. The double flues *G*, when constructed and arranged substantially as shown and described.

2. The combination of the cones or chambers *B C* and the damper *D*, substantially as shown and described.

3. The combination of the cones or chambers *B F* and the flues *G*, substantially as shown and described.

85,197.—HENRY AIKIN, Pittsburg, Pa.—*Brick Machine*.—December 22, 1868.—The mold wheel receives an intermittent motion from the spur pinion. The segmental flange fits in recesses in the mold wheel and prevents any movement until the pinion again acts. A space is formed between the teeth in which the last tooth on the pinion operates. The plungers are operated by a toggle joint. The guides in which the plungers work are adjustable so as to be set up when worn.

Claim.—1. In combination with a pinion, *B³*, having teeth upon only part of its periphery, and the mold wheel *D*, the segmental flange *b³* and the recesses *d¹*, arranged to operate substantially as and for the purpose set forth.

2. The spur pinion *B³* and mold wheel *D*, having cogs, respectively, as set forth, when the respective cogs *b* and *d* are constructed with a pitch uniform with the other cogs of the respective wheels, and a space is formed in front of the tooth *d*, and between it and the next cog in the series, to receive said teeth *b*, substantially as set forth and shown in the drawings.

3. The knife *E¹*, when attached to a cast block in-

serted in the upper plate E, said block having also an inclined lip, *e'*, arranged in relation to the mold wheel and the knife, substantially as and for the purpose set forth.

4. In combination with the bed plate E and frame X of the brick machine, the auxiliary frame F, F³, F⁴, and F⁵, to which the press and press plate are so attached that the strain of the press shall be sustained upon said auxiliary frame, and not by the main frame or bed plate, substantially as herein described.

5. The combination of the toggle joint press, and the frame formed of the parts F, F³, and F⁴, and the shaft of the mold wheel, substantially as set forth.

6. The combination of two bed plates inclosing the mold wheel, and having the upper one supported by rods and double nuts, so as to be adjustable, substantially as and for the purpose set forth.

7. The combination of the sweep L¹, and rods and levers L, K, I³, I², and I, and the cam B¹, which operates the same, substantially as set forth.

8. The upper bed plate, with openings for knife E¹ and press plate F¹, as set forth.

9. In combination with the plungers, adjustable guides D¹, arranged in relation thereto, substantially as set forth.

85,198.—RICHARD ANTHONY, Scranton, Pa.—*Railway Rail.*—December 22, 1868.—A cap, placed over the head of the rails, is secured by means of a flange on the side bars fitting in the beveled lower edge of the cap, and when the spikes are inserted the cap is held perfectly tight.

Claim.—The combination of the rails A A, cap B, and side bars C C, the latter being provided with shoulder *e* and flange *a*, all substantially as and for the purposes herein set forth.

85,199.—E. B. BEACH, West Meriden, Conn.—*Fish Trap.*—December 22, 1868.—A central spindle is surrounded by a spiral spring which acts on a hooped stretcher covered with netting, operated by a trigger, on which the bait is affixed.

Claim.—1. The central spindle B, hollow, or partly hollow, at its lower end, and having the spring lever *a* inclosed therein, in combination with the toothed ring C, and its netted covering, and the plate A, substantially as described, for the purposes of a trap, as set forth.

2. The pivoted lever *a*, inclosed within the spindle B, on which the trap C has its sliding motion, substantially as and for the purpose described.

3. The combination and arrangement of the central spindle B, spring lever *a*, plate A, and the toothed ring C, substantially as and for the purpose described.

85,200.—LEVI A. BEARDSLEY, Fredericksburg, Va.—*Self-loading Cart.*—December 22, 1868.—The wheel is provided with elevating buckets working in a suitable channel way, which is attached to the body of the cart and is provided with a scraper to remove the soil adhering to the buckets, and a friction roller, against which the sides of the buckets strike before entering the channel-way.

Claim.—The inclined scraper F and friction roller *e*, in combination with the elevating wheel B¹ D, and channel-way E, substantially as and for the purpose set forth.

85,201.—ALVIN F. BENT, Antwerp, N. Y.—*Cheese Hoop.*—December 22, 1868; antedated December 11, 1868.

Claim.—The arrangement of the hoop A A', its strip C, flange E, movable bottom B, and follower D, with their cloths *b*, *d*, and *e*, all constructed and used substantially as herein specified.

85,202.—SOLOMON BEYL, Osborn, Ohio.—*Chalk Line Box.*—December 22, 1868.—The chalk line wound around a drum actuated by a coiled spring, passes through sponges and chalk in a tube attached to the sides of the cases. A measuring rule is attached to a swivel on the tube, to measure the line as it is withdrawn from the case.

Claim.—The arrangement of the sponge and cases F F, chalk receptacle G, measuring rule L,

and spring chalk line C, as herein described, and for the purposes set forth.

85,203.—T. G. BOGGS, Philadelphia, Pa.—*Medicine Glass.*—December 22, 1868.—The dose, and time of taking the same, defined by the prescription, can be written on the roughened glass covers.

Claim.—1. As a new article of manufacture, a vessel, A, to which is adapted a cover, B, prepared for the reception of memoranda, substantially as described.

2. A cover for medicine glasses, having a roughened surface, as herein described, and, upon the same surface, words and other markings, arranged substantially as and for the purpose specified.

85,204.—CHARLES F. BRIGHAM, Worcester, Mass.—*Runner Attachment for Carriages.*—December 22, 1868.—The journal boxes are attached above the raves and feneers in front, and below them in the rear, so that when the axles are inserted the body of the carriage will be level. The boxes may be shifted backward or forward at pleasure.

Claim.—1. The combination, with the long runners C, raves D, and fenders E, of the boxes H, arranged, in relation to each other, substantially as shown in the drawings for supporting the carriage-body in an even and proper manner, as described.

2. The combination, with the raves D, fenders E, and carriage body A, of the adjustable axle boxes H, substantially as and for the purposes set forth.

85,205.—CHARLES BRINCKERHOFF, Fishkill, N. Y.—*India-rubber Fender for Interfering Horses.*—December 22, 1868.—A number of India-rubber balls are strung on a strap, which is secured around the ankle or leg of the horse liable to be struck by the hoof of the opposite leg.

Claim.—The arrangement of a series of perforated, hollow, and flexible rubber balls, *a*, upon a leather strap, *b*, for forming a fender for interfering horses, all as herein shown and described.

85,206.—JOHN H. BROWN, Watertown, Mass., assignor to MOSES H. MOODY, New York City.—*Machine for Pegging Shoes.*—December 22, 1868.

Claim.—1. The combination of the traversing head, carrying both the awl and the driver, with the plunger, so that the awl and driver shall be alternately brought under the action of said plunger, and both driven by it, substantially as described.

2. In combination with an awl and driver, both arranged on and moving with a traversing head, and the plunger, the T-shaped grooves and terminus, so that said awl and driver can be connected to and detached from the plunger, as and for the purpose herein described and represented.

3. The arrangement of the feeding, clamping, and cutting mechanism, so that a wire may be properly fed up, cut into pegs or screws, and delivered, so as to be conveyed to the point where they are driven, substantially as described.

4. In combination with a machine for making and driving its pegs or screws, an intermittently rotating cylinder, with apartments or divisions in it, for receiving said pegs or screws where cut off, and carrying them to the place where they are driven, substantially as described.

5. Feeding the shoe along under the awl and driver, by means of a point that is forced into the sole, whilst or by the act of drawing out the awl, and then moved in the direction of the feed, substantially as described.

6. The combination of the screw socket and jam nut with the frame of the machine, for the purpose of adapting one and the same spring to the driving of pegs of variable lengths, substantially as described.

7. The driving of the pegs or screws through or from their chambers in the revolving carrier, and through the same hole in the foot piece of the machine that the awl passes through, substantially as described.

8. In combination with a pegging machine that is controlled and driven by hand, an arm-support that will carry or transfer a portion of the weight of the machine on to the arm of the operator, and thus very much relieve him from the burden of the machine, substantially as described.

85,207.—JOHN H. BROWN, Watertown, Mass., assignor to MOSES K. MOODY, New York City.—*Machine-made Channeled and Pierced Sole for Boots and Shoes.*—December 22, 1868.

Claim.—A boot or shoe sole, channeled and pierced, so as to facilitate its afterward being sewed to the upper by machinery, as herein described and represented.

85,208.—WALTER BURROW, Great Malvern, Great Britain.—*Rack for Bottles.*—December 22, 1868.—The rests are so arranged that a greater number of bottles may be stored within a given space. The hinged frame is for the purpose of securing the bottles in place during transportation.

Claim.—1. The frame, carrying a series of perforated or recessed bars, and a series of rods or rests arranged above the openings in the bars, but parallel to and on opposite sides of the latter, as and for the purpose described.

2. The combination, with the frame, of the movable wire guards *f*, hinged to the frame, substantially as specified.

85,209.—S. D. CARPENTER, Madison, Wis.—*Grain-Binder.*—December 22, 1868.—For holding and carrying the wire around a bundle of grain, and then twisting the wire and cutting it off. The device consists of a shuttle, within which are a twisting wheel, a cutter, and a stop which operates the cutter. The tension device of the spool permits a spring within the spool to take up the slack of the wire.

Claim.—1. A shuttle, consisting of the shell *A*, having the twister *B* and cutter *D* arranged therein, all constructed and arranged to operate substantially as described.

2. The twister, consisting of the flanged and toothed wheel *B*, having a slit for the entry of the wire, substantially as described.

3. The cutter, consisting of the axis *C*, blade *D*, and arm *E*, substantially as described.

4. The combination of the wheel *B*, and cutter *D*, constructed and arranged to operate substantially as and for the purpose set forth.

5. The combination of the wheel *B*, cutter *D*, with its arm *E*, and the stop *F*, all constructed and arranged to operate substantially as described.

6. In combination with a spool for holding the wire, the spring *a*, when arranged to operate as set forth, for taking up the slack.

7. The combination of the friction spring *O*, the loose shaft *d*, with the collar *y* attached rigidly thereto, and mounted in a support, *R*, with the adjustable nut *h*, all arranged to operate substantially as described.

85,210.—S. D. CARPENTER, Madison, Wis.—*Grain Binder.*—December 22, 1868.—Certain devices are employed for conveying the grain from the platform to the binding mechanism, and there compressing it into a bundle and binding the same automatically. Means are also provided for catching and saving the grain that may be dropped in the process of conveying and binding it.

Claim.—1. The combination in a grain-cutting and binding machine, of the horizontal apron *I*, with its guards or rods *d*, the inclined aprons *G* and *H*, the cut-off *J'*, the revolving rake *U*, and the rotating binder arm *O*, all constructed and arranged to operate substantially as and for the purpose herein described.

2. The slats *f*³, with the staples, or equivalent devices, applied to the apron *H*, as shown and described.

3. The revolving rake, when arranged to move at stated intervals, substantially as described, for the purpose of sweeping the grain from the cradle, and holding it under the compressor while being bound.

4. A rotating binder arm, constructed and arranged to operate substantially as described, for carrying the band around the bundle, and then removing the bundle, as set forth.

5. The combination of the arm *P*, having the sliding hook *t* attached, and the cam *B*³, when constructed and arranged to operate substantially as described, for the purpose of drawing the wire to the center of the twister, to insure the operation of the latter, as set forth.

6. The shuttle race or frame *M*, provided with the rack *m*, when arranged in relation to the binder arm, substantially as described.

7. The receptacle *F*, located under the binding mechanism, for receiving and saving the grain, as herein described.

8. The compressor *N*, constructed and arranged to operate as and for the purpose set forth.

9. The cut-off, consisting of the rock shaft *J*, provided with the curved arms *J'*, arranged to be operated by means of the cam *g*³ on the binder shaft *Q*, through the medium of the lever *g*², rod *g*¹, and arm *g*, substantially as described.

10. The swinging rollers *W*, arranged to operate in connection with the apron *G*, as set forth.

11. Changing the speed of the binder, independently of the cutting or carrying mechanism, by means of gear wheels *I*³, of varying sizes, applied to the shaft *E''*, as herein described.

12. The combination of the wheel *Y*, carrying the pivoted pawl *a*, the notched collar *b*, and wheel *Z*, with its cam *l*, when arranged to operate as and for the purpose set forth.

85,211.—JOHN CARREER, Southington, Conn.—*Pocket Cutlery.*—December 22, 1868.—One extremity of the spring is confined in a dovetail recess, while the other end is made fast in the act of attaching the blade, so as to avoid rivets in securing the spring.

Claim.—The spring *D*, constructed as described, and secured to the back by a dovetail projection, *C*, and resting upon a shoulder, *a'*, and combined and arranged with the blade, so as to operate in the manner specified.

85,212.—CHARLES H. CASSIDAY, Philadelphia, Pa., assignor to himself, WILSON JEWELL, and JOSEPH WHITE, same place.—*Toy.*—December 22, 1868.—Consists of a handle to hold a top while it is spun, and a trigger to disengage it at pleasure.

Claim.—The spring frame *D*, arranged for the reception and the retention or releasing of a top, substantially as specified.

85,213.—PATRICK CLARK, Rahway, N. J.—*Fan Blower.*—December 22, 1868.—As the air leaves the fan wheel its rotary motion is arrested by the deflectors, and hence the air is directed toward the center of the next fan chamber. The fan case is made to conform to the direction the air takes in passing through the machine.

Claim.—1. The stops or deflectors *G G*, in combination with the diaphragms or partitions *F F*, for the purpose named in the annexed specification.

2. The plano-convex ring *L L*, in combination with the compound hub *O K*, when so made that the journal box *I* will slip lengthwise through it, to facilitate the longitudinal adjustment of the shaft *C*.

3. The case or shell of the blower, substantially as described, in combination with the other parts of a multiplying fan blower.

85,214.—CHARLES J. CONVERSE, Boston, Mass.—*Bottle Stopper.*—December 22, 1868; antedated December 11, 1868.—The stopper may, by rotation, be made to admit of the influx or efflux of liquids, without being withdrawn from the bottle.

Claim.—1. A through-perforated, elastic, rotary bottle stopper, larger at the bottom than at the top, shaped to fit in the neck of a bottle, the opening at the bottom of said stopper being located upon one side of the center, in combination with an obstruction across the neck of the bottle, the same made with an opening upon one side, thus admitting or emitting the contents of the bottle on a partial rotation of the stopper.

2. In combination with a bottle stopper, with a through-longitudinal perforation, the through-perforated, removable neck piece *C*, (or lower part of the stopper,) whether the same be thick or thin, and of whatsoever substance it be made, when constructed and used substantially as and for the purpose described.

3. The bottle neck herein described, when used in combination with a rotary stopper, substantially as described.

85,215.—HIRAM CULVER, Dansville, N. Y.—*Upsetting Machine.*—December 22, 1868.—This machine has the form of a vise, and its jaws or posts carry pairs of eccentrics that hold the metal under action, a loose bar forming the bed upon which the article rests, and a follower attached to a hand lever holding the article down.

Claim.—1. The combination of the loose bar *g*, lever presser *kh*, eccentrics *d d d d*, and bed plate *e*, with the jaws *A A*, all arranged and operating substantially as herein described.

2. The upsetting machine, consisting of the jaws *A*, levers *a*, screw *b*, loose bar *g*, eccentrics *d*, lever presser *kh*, and bed plates *e*, all constructed and arranged to operate substantially as herein set forth.

85,216.—DANIEL M. CUMMINGS, Enfield, N. H., assignor to himself and WASHINGTON IRVING CONANT, same place.—*Composition for Water-proof Paint, &c.*—December 22, 1868.

Claim.—A water-proof coating or painting mixture, composed of clay, tar, oil, ashes, and oxide of iron, in about the proportions herein described.

85,217.—GEORGE L. CUMMINGS, New York, N. Y.—*Ice Cutter.*—December 22, 1868; antedated December 15, 1868.—The instrument is held in position by means of the pointed guide rod, while the weight is caused to rise and fall on said rod, in the act of cutting the ice.

Claim.—The combination of the guide rod *R*, the weight *S*, and the flat cutter *C*, attached to the weight, as and for the purpose specified.

85,218.—ALEXANDER M. DAMON and SIMEON G. LYFORD, Lowell, Mass.—*Combination of Name Plate and Letter Chute.*—December 22, 1868.—A letter slide or chute is combined with an ordinary name plate upon a door, so as to conceal the former when not in use. The arms which support the cover are pressed by spiral springs, to keep the same in place. A plate is fitted within a groove, so as to make a water-tight joint.

Claim.—1. The combined name plate and cover, by which a letter passage is concealed.

2. The depressed flange *I*, in Fig. 2, and the beveled projection of the cover, which serves as a guide to the letter passage in the door.

3. The arms *C*, and spiral springs *K*, together with their arrangement, when used for the purpose heretofore described.

4. The groove *P*, substantially as and for the purpose heretofore explained.

85,219.—RICHARD DEXTER and HAMOR GLEDHILL, Worcester, Mass.—*Wool Oiling Machine.*—December 22, 1868. For oiling or moistening wool for carding and spinning.

Claim.—1. The employment of a continuously-revolving driving shaft, *B*, to which, or to arms or disks on which, are secured pivoted arms *E*, provided with dripping devices, all so constructed that at each revolution of the driving shaft the pivoted arms will fall forward, and deliver the oil directly onto the wool, without the aid of intervening mechanism.

2. The combination of a dripping mechanism, delivering the lubricating material directly upon the wool, with loosely-pivoted arms carrying the same, substantially as above set forth and described.

3. The combination of the pivoted arms *E*, and the dripping devices *F F*, with the continuously revolving shaft *B* and the trough *A*, all constructed and operating substantially as described.

85,220.—Doctor ALOIS DRASCH, St. Egidii, Austria.—*Rotating Ball Motor.*—December 22, 1868.—By means of a hand lever the tray is continually tilted in advance of the rolling ball, so that said ball is kept in motion upon a constantly-changing inclined plane. As the ball progresses in its orbit, it acts on a lever, which transmits motion.

Claim.—1. The combination and arrangement of the tilting disk *A*, rolling ball *B*, lever *E*, tubular shaft *F*, concentric rim *c*, and its support, when the rolling ball is entirely disconnected, and actuates the lever *E* simply by pressure, as it rolls, as herein described.

2. In a rotating ball motor, the bent lever *E*, rig-

idly secured to the tubular shaft *F*, and actuated by contact with the freely-rolling ball, as it traverses its path on the tilting platform, as herein set forth.

3. The free rolling bail *B*, tubular shaft *F*, and rigid bent arm *E*, in combination with the tilting platform *A*, as and for the purpose herein set forth.

4. The application, to the tilting platform, of a rigid arm, *d*, moving in a vertical guide, *e*, attached to the supporting circle *C*, as and for the purpose herein set forth.

85,221.—GEORGE ESTERLY, Whitewater, Wis.—*Seeding Machine.*—December 22, 1868.—Especially applicable to the combined seeder and cultivator patented by the same inventor June 30, 1868.

Claim.—1. The arrangement of the rubber *e²*, or its equivalent, on a line with the seed cells, and in relation to the upwardly-flaring throat of the cap *E*, substantially as and for the purpose described.

2. The beveled collar or flange *r* on the distributor *F*, fitted into a beveled seat formed in the side of the cap *E* and bearing *E'*, substantially as described.

3. Gauge plate *O'*, gauge lever *O*, longitudinally-adjustable shaft *G*, carrying distributor *F*, and sleeve *c*, with cone or teat *d*, for connecting lever *O* to it, all combined and adapted to operate substantially as described.

4. Connecting the lever *M*, which operates clutch *T*, to a segment, *L*, on the shaft *I'* of hand lever *J*, in combination with cultivators, which are connected to segments *L*, for the purposes and in the manner substantially as described.

5. In a machine, constructed to operate substantially as described, the arrangement of the shafts *G* and *2* in the vertical plane of the axle *V*, substantially as and for the purposes described.

6. The thimble bearings *1*, secured to the drag bars *C*, substantially as described.

7. The suspension bar *H*, hung by flexible connections from lifting segments *L*, and connected by chains, or the equivalent thereof, to the drag bars *C*, substantially as described.

8. In combination with a cultivator tooth or standard, *D*, which passes through a drag bar, self-releasing clamp plates *D¹ D¹*, confined to said tooth, substantially as described.

9. In combination with the combined seeder and cultivator herein described, a grass seed sower, *N N'*, arranged and operated substantially as set forth.

85,222.—WILLIAM FISCHER, New York, N. Y.—*Wind Musical Instrument.*—December 22, 1868.—Relates to instruments made of wood, hard rubber, or other non-metallic substance. The object is to guard against splitting, and render the body cheaply renewable.

Claim.—1. The combination of an open band, *B*, having the keys permanently attached to it, with the body *A* of the instrument, substantially as herein shown and described, and for the purpose set forth.

2. Permanently attaching the keys *C* to the open removable band *B*, substantially as herein shown and described, and for the purpose set forth.

3. Cutting the band *B* away around the finger and key stops, either or both, substantially as herein shown and described, and for the purpose set forth.

85,223.—J. A. FREMON, Montgomery, Ala.—*Mortar.*—December 22, 1868.—This invention has reference to the connection of a mortar with a revolving disk, rotating on a circular rail, secured to a frame and operated by a belt and pulleys attached to a crank shaft, the bearings of which are supported by uprights. A sliding frame is furnished near its center with openings, and on its lower side with cleaners. The pestle is hinged to a rod that connects with the crank shaft.

Claim.—1. The circular grooved platform or disk *K*, rotated on a circular rail secured to the platform or table *N N'*, in combination with the mortar *A*, operated and arranged substantially as and for the purpose set forth.

2. The sliding frame or cap *C*, provided with the openings *D* and *P*, and cleaners *L L*, in combination with the uprights *M* and frame or boards *N N'*, all arranged and operated substantially as and for the purpose set forth.

3. The pestle *B*, hinged to the connecting rod *F* of

crank shaft E, arranged and operated substantially as described.

4. Frame or boards N N', uprights M, axle j, pulleys J J, cap or sliding frame C, revolving disk or platform K, mortar A, cleaners L L, pestle B, connecting rod F, pin G, crank shaft E, handle e, driving wheel or pulley H, and band or belt I, when combined, arranged, and operated substantially as and for the purpose set forth.

85,224.—A. J. FRENCH, Bridgeport, Conn.—*Feeding Percussion Cap.*—December 22, 1868.—The disk has hooks upon its periphery, so as to transfer the blanks to a tubular channel, and deliver them in the position and at the time desired.

Claim.—The arrangement of the hooked carrying wheel C, with a delivering tube H, and a hopper to supply the carrying wheel, the whole operating substantially in the manner herein set forth.

85,225.—A. J. GIBSON, Cincinnati, Ohio, assignor to himself and THOMAS A. HARROW, same place.—*Apparatus for Purifying and Aging Liquors.*—December 22, 1868.—The liquid is agitated by the arms of the revolving spindle, and air is simultaneously forced into the liquid near the bottom of the vessel. This air ascends and takes up the impurities of the spirits, and before escaping at top, passes through an alkali bath, which absorbs the valuable non-condensed gases that rise with the air.

Claim.—1. The spindle C, in an apparatus for ageing and purifying liquors, constructed and used substantially as and for the purpose described.

2. The introduction of a current of air into the vessel containing the liquor to be operated upon, in an apparatus for ageing and purifying liquors, in combination with the spindle C, and constructed and used substantially as and for the purpose described.

3. The vessel R, when used in the construction, in an apparatus for ageing and purifying liquors, constructed and used substantially as described.

4. The inverted cup Q, when used in an apparatus for ageing and refining liquors, in combination with the vessel R, substantially as and for the purpose described.

5. The described bath fluid, when used in an apparatus for ageing and purifying liquors, when composed and used substantially as described and set forth.

6. The vessel B, when used in combination with the spindle C, vessel R, and inverted cup Q, and constructed substantially as and for the purpose described.

85,226.—JACKSON GOLDER, Fort Recovery, Ohio.—*Poultry Coop.*—December 22, 1868.—The coop is folded in a condition convenient for transportation by pressing in spring catches, removing the top, and turning down the hinged ends and sides.

Claim.—A poultry coop, constructed substantially in the manner shown and described.

85,227.—ANSON HARDY, Boston, Mass.—*Indicator for Permutation Locks.*—December 22, 1868.—By making the indicator detachable and in separate parts, the said parts may be given to different persons intrusted with a knowledge of the combination, so that neither one can open the lock without the knowledge and consent of the others.

Claim.—The detachable indicator for combination locks, constructed in two or more parts, as and for the purpose described.

85,228.—FREDERIC HOWES, Boston, Mass.—*Anchor.*—December 22, 1868.—Upon the shank, above two rigidly fixed arms, are two other arms attached to a sleeve. Notches are made in the square portion of the shank to receive catches attached to the adjustable arms.

Claim.—1. The adjustable arms, when constructed substantially as shown, and for the purpose specified.

2. The combination of the shank, adjustable arms, and catch, substantially as and for the purpose specified.

85,229.—ALONZO JOHNSON, Springfield, Mass., assignor to SYLVESTER BISSELL and ANDREW B

WEST, Hartford, Conn.—*Calculating Apparatus.*—December 22, 1868.—Designed to ascertain and indicate, within certain defined limits, the sum or amount of numbers which are to be added together, and at the same time to indicate how many such numbers have been added.

Claim.—The combination and arrangement of the recessed base plate A, revolving dial plate B, perforated at h h, and both graduated as described, differential gears, index I and pointer P, the whole constructed and operating substantially as described.

85,230.—AMASA C. KASSON, Milwaukee, Wis., assignor to himself and NELSON C. GRIDLEY, same place.—*Bushing for Tool Handles.*—December 22, 1868.

Claim.—The packing or bushing D, composed of rubber or gutter pereha, either raw or vulcanized, when applied to a tool handle, substantially as and for the purpose described.

85,231.—JOHN LEFFLER, Rochester, N. Y.—*Building Block and Artificial Stone.*—December 22, 1868.—Composed of gravel, Rosendale cement, quicklime, and sea sand.

Claim.—1. Building blocks, of artificial stone, compounded of the materials and in the proportions substantially as herein set forth.

2. The method herein described, of producing blocks of artificial stone, by molding the same of the materials herein set forth, and subsequently kneading sea sand into the surface portion of said blocks, after they leave the molds, substantially as set forth.

85,232.—D. B. MAYNARD, Worcester, Mass.—*Folding Bureau Bedstead.*—December 22, 1868.—

Claim.—1. The combination, with the base, A, and folding eases B B', of the movable drop or bottom F, substantially as and for the purposes set forth.

2. The combination, with the folding eases B B', mattress K, and drop, of the springs M, substantially as set forth and described.

3. The combination, with the eases B B', and movable bottom or drop F, of hinged arms or connections, G, substantially as set forth.

4. The combination, with the folding bedstead, of a mattress, together with the devices for raising and supporting the center of the same, substantially as described, whereby, when the bedstead is folded up, the center of the mattress will be depressed, and when the bedstead is unfolded will be elevated or raised and supported, for the purposes stated.

5. The combination, with a folding bedstead, of a central base or receptacle, to receive the center of the mattress, and the supporting devices thereof, when the bedstead is folded up, substantially in the manner shown and described.

6. The combination, with the eases B B', of the hinged top C, and its holding pin and spring, together with the locking devices, arranged substantially as and for the purposes stated.

85,233.—L. D. McCLINTOCK, Glenwood, Iowa.—*Cultivator.*—December 22, 1868.—The machine is capable of being used by a person either walking or riding.

Claim.—The combination of the double plows a a, handles d d, shovels c c, frame A, wheels C, bent axles B, bars D D, lever g, chains e, bars m, and seat F, all constructed and used substantially as herein specified.

85,234.—WILLIAM MCKAY, Newburyport, Mass., assignor to himself and CHARLES E. BAYLEY, same place.—*Mast Hoop.*—December 22, 1868.—The hoop is composed partly of wood and partly of metal, the metallic portion being provided with friction rollers.

Claim.—The improved arrangement, as described and represented, of the parts a b, and the series of friction rollers d d, the same being productive of an improved manufacture of mast hoop provided with friction rollers.

85,235.—A. O. MORGAN, Nashville, Ohio, assignor to himself and WILLIAM B. LOLLER, same place.—*Tire Tightener.*—December 22, 1868.—Outside of the wooden felloe and opposite the center of

the metal felloe or "box." is an oblong slot in which is a projecting piece which holds the tire in the center. Apertures in the metal felloe or box are closed by dovetailed lids.

Claim.—The tire A, beveled at each end, as shown and provided with the oblong projection *d*, in combination with the metallic box C, having dovetailed tongues *a a*, and sliding door *b*, shielding the screw F, all substantially as set forth.

85,236.—GEORGE H. MYERS, Philadelphia, Pa., assignor to S. B. ROWLEY, same place.—*Fruit Jar*.—December 22, 1868.

Claim.—1. The annular nut or screw ring C, having a screw thread adapted to a similar thread on the neck of a vessel, and a flange, *a*, for confining a plate and packing to the said neck, all substantially as and for the purpose herein set forth.

2. An annular projection or projections on the neck or on the plate, for indenting the rubber packing, as set forth.

85,237.—WILLIAM LISTER NEWILL, Cincinnati, Ohio, assignor to himself and REDWAY & BURTON, same place.—*Mode of Attaching Stove Legs*.—December 22, 1868.—The notched shank forms a part of the leg, and fits over a projection cast on the bottom of the stove plate.

Claim.—The notched and beveled shank C, and dovetailed projection D, when constructed and combined as herein described, and for the purpose set forth.

85,238.—WILLIAM B. ODENATT, Philadelphia, Pa.—*Swing*.—December 22, 1868.—The suspension bars are hung on knife-edged projections to admit of easy oscillation. The back is made adjustable in inclination.

Claim.—1. The seat, with its rods *ff*, and slides H, in combination with the suspension bars *ee*, on which the slides are adjustable, and having openings to which are adapted detachable pins, all substantially as described.

2. The bars *e*, connected to the seat, and having knife-edge projections adapted to bearings *b*, as described.

3. The seat, with its adjustable back, in combination with the notched plate *i* and spring catch *b*, arranged and operating substantially as set forth.

85,239.—JAMES B. OLNEY, New York, N. Y.—*Gas Generating and Carbureting Apparatus*.—December 22, 1868.—Within the annular water chamber is a tank containing water and acids, above which is a supply of hydrocarbon liquid. A piece of zinc or other suitable metal is suspended from the roof of the gasometer and serves to decompose the water and liberate the hydrogen gas.

Claim.—1. Carbureting hydrogen gas by the process and in the manner herein specified.

2. A gas-generating and carbureting apparatus, having shells A and B, gasometer D, tank E, pipes H, I, J, and K, combined with the zinc or substance F, constructed and arranged substantially as herein described.

85,240.—JAMES T. PAGE, Rochester, N. Y., assignor to himself and WILLIAM H. BROWN, same place.—*Coal Scuttle*.—December 22, 1868.—The rear point or angle of the hod rests above the ground, the front being sustained by legs whose shank passes centrally back and turns up over the rear.

Claim.—1. A coal scuttle in which the angle *h* forms the base, and in which the incline *m* extends from said angle to the discharge point.

2. The combination of legs *i i* and shank *k* with the coal scuttle, as herein set forth.

85,241.—HIRAM E. PAINE, Troy, N. Y., assignor to HENRY H. PAINE, Rutland, Vt.—*Cartridge Box*.—December 22, 1868; antedated December 16, 1868.

Claim.—1. As a new article of manufacture, a cartridge box, constructed substantially in the manner and for the purposes herein described and set forth.

2. The metallic strip or brace B D, applied to the back and sides of the box, to strengthen the same,

substantially as hereinbefore specified and described.

* 3. A cartridge box, with the back and sides of thick, heavy leather, and the front of thin, soft leather, arranged and constructed in the manner and for the purposes substantially as hereinbefore specified and set forth.

85,242.—DARIUS C. RANDALL, Niles City, Mich.—*Liniment, or Medical Compound*.—December 22, 1868.—Composed of alcohol, oils of origanum, sassafras, and hemlock, aqua ammonia, and tincture of guaicum.

Claim.—The combination of the ingredients, substantially as herein described, as a new medical compound, for the purposes set forth.

85,243.—JOHN O. REHLEY, Baltimore, Md.—*Door Fastener*.—December 22, 1868.—A piece of metal formed with a shoulder and claw is fastened to the casing. The fastener consists of a dovetailed tenon and an eccentrically pivoted button.

Claim.—A door fastener, composed of the parts A, F, G, and H, made and combined substantially in the manner described.

85,244.—REUBEN ROWLEY, Rochester, N. Y.—*Training Grape Vines*.—December 22, 1868.—The object is to check the too rapid flow and concentration of sap at the top of the vines, as usually trained.

Claim.—The spiral training of grape vines around a circular trellis, first to the top and then back to the bottom, and entirely exposed to the light and air, as herein set forth.

85,245.—JAMES SARGENT, Rochester, N. Y.—*Permutation Lock*.—December 22, 1868.—The object is to connect with the dog that falls into the notches of the tumblers devices for elevating and retaining the dog from contact with the tumblers, in all positions of the lock.

Claim.—The combination of the pawl P, or its equivalent, and arm H, with the dog F, for the purpose of retaining the dog elevated in all positions of the lock, as herein set forth.

85,246.—JAMES SARGENT, Rochester, N. Y.—*Bolt for Safe Doors*.—December 22, 1868.

Claim.—So connecting the heavy bolt work of safe doors with the lock bolts, when two locks or sets of lock work are employed, that the bolt work may be set to open, either by the action of one lock or of both, by means of the lever C and rock arm D, arranged and operating substantially as set forth.

85,247.—JOHN A. SCOTT, Lexington, Va.—*Photographic Camera*.—December 22, 1868.—Above the magnetic needle is suspended a wire netting, which is dropped upon the compass plate at the instant the sensitized plate is exposed to the light, thus arresting the needle, and indicating the magnetic meridian of the place represented by the picture.

Claim.—1. The method, substantially as herein described, of producing pictures from considerable heights above the earth's surface, consisting in the employment of a balloon, or other analogous elevating apparatus, which has suspended from it a photographic instrument, provided with device for exposing and closing the image plate, and which is controlled by means substantially as described.

2. The combination of a magnetic compass with an instrument which is adapted for producing photographic pictures from considerable heights above the surface of the earth, substantially as described.

3. The netting V, or its equivalent, applied over the compass needle Y', so as to operate substantially as and for the purposes described.

4. Providing the photographic instrument with a contrivance which will automatically, or at the will of the operator, expose the image plate, substantially as described.

85,248.—CHARLES SEYMOUR, La Porte, Ind.—*Propelling Wheel*.—December 22, 1868.—So constructed and pivoted that when submerged in water the blades will assume a perpendicular position or nearly so.

Claim.—A pivoted paddle, the face of which is in

ogee form in cross section, or concave on one side of its longitudinal axis, and convex on the other, constructed to operate in the manner and for the purpose set forth.

85,249.—ALFRED J. SHIPLEY, Waterbury, Conn., assignor to the SCOVILLE MANUFACTURING COMPANY, same place.—*Feed Motion.*—December 22, 1868.—Additional ratchet wheels are so connected with the main operating parts as to effect an adjustable feed to enable combs to be readily cut from long strips of sheet metal.

Claim.—Combining, with the aforesaid combination of devices, an auxiliary set of devices, for imparting at intervals a feed movement of accelerated velocity, and of greater extent than that imparted by the aforesaid combination, constructed and arranged substantially as herein described.

85,250.—THOMAS SKELTON, Rockford, Ill.—*Hames Fastener.*—December 22, 1868.—Attached to the hames is a hook plate provided at one end with a spring catch, and at the other end with a bent lever which is held in position by a spring catch.

Claim.—In a hames fastener the combination of hook plate *a*, bent lever *b*, having stud *f*, and pivoted together as described; stud *c*, spring catch *d*, with the rings *h* and strap *i*, arranged with relation to each other, and to operate together, in the manner and for the purpose described.

85,251.—JOHN T. SLINGERLAND, New York, N. Y., assignor to ALDEN TYPE SETTING AND DISTRIBUTING MACHINE COMPANY, same place.—*Type Setting and Distributing Machine.*—December 22, 1868.—Relates to improvements on machines for which patents were granted to T. Alden, September 15, 1857, and Alden & Mackey, January 23, 1866.

Claim.—1. The arrangement of an adjustable manuscript supporter or desk C on the central arbor *a* of the carrier wheel B, substantially as and for the purpose set forth.

2. The adjustable rule and weight *e*, suspended from cords *f*, which wind on the friction arbor *g*, in combination with the desk C, substantially as described.

3. Constructing the carrier wheel B of two concentric rings *m* and *k*, substantially as and for the purpose described.

4. The protecting flange *r* on the central ring *m* of the carrier wheel, to prevent the fulcrum pins of the conveyers from working out, as described.

5. The friction steady rollers *u*, bearing on the inner edge of the lower ring *l* of the carrier wheel, substantially as and for the purpose set forth.

6. The gallery K, under the outer ends of the radiating type cases D, substantially as and for the purpose described.

7. The lever *d*¹² on the conveyers *p q*, in combination with the cams *d*¹⁴, to pull said conveyers back out of the excavations in the ring F, substantially as set forth.

8. The hook *z* projecting from the griper jaw *w* of the setting conveyers, and catching in the serrated rail *v*, to open the griper, substantially as described.

9. The projections *v*⁴¹ on the inner ends of the plates of the cases D, to act in connection with the distributing conveyers, substantially as and for the purpose set forth.

10. The cam *e*¹ on the rail H, acting on the rollers *b*¹ of the setting conveyers, substantially as and for the purpose set forth.

11. The segmental flange or projection *d*¹, cast solid with the foundation J of the radiating type cases D, and provided with recesses to sustain said cases, substantially as described.

12. The lip *t*¹ on the pusher *e*¹, to prevent the type in the type cases from rising, substantially as described.

13. The projections *f*² on the type cases, to prevent the pusher from rising, substantially as set forth.

14. The projections *e*² on the pusher *e*¹, to act on the levers *a*² *b*², substantially as and for the purpose described.

15. Giving to the tilting levers *u*, under the type cases D, a double fulcrum, substantially as and for the purpose described.

16. The latch *x*², at the inner end of the distributing galley gauge *g*², substantially as and for the purpose described.

17. The adjustable shield *z*² on the distributing type channel G, substantially as and for the purpose described.

18. The roller breaker *a*³, in combination with a cavity in the bottom of the type channel G, substantially as and for the purpose described.

19. Making the movable floor *p*² with a serrated, inclined, or curved edge, substantially as and for the purpose set forth.

20. The latch *w*², at the head of the distributing galley, substantially as and for the purpose set forth.

21. The alarm arrangement on the distributing galley, consisting of the pin *r*², spring arm *s*², rock shaft *t*², and alarm click *u*², or equivalent devices, as described.

22. The oscillating breaker *d*³, in one wall of the type channel, and opposite a cavity in the other wall, substantially as and for the purpose set forth.

23. The false yielding channel piece *f*³, in combination with the cavity opposite the breaker *d*³, substantially as and for the purpose described.

24. The oblique slot *m*³¹, for the purpose of adjusting the roller *m*³, in relation to the type channel G, substantially as described.

25. The method herein described of separating the first type in the distributing type channel from the line, consisting of the abutment *n*³ and lifter *a*⁴, substantially as set forth.

26. The spring detents *j*⁴, arranged in regular or zigzag position, near the mouth of the distributing type channel, to prevent more than one type being lifted on the abutment, substantially as described.

27. The self-adjusting gate *l*⁴, arranged to open freely, and then be locked by the lever *u*⁴ and bolt *p*⁴, substantially as set forth.

28. The latch *y*⁴, at the end of the gate *l*⁴, substantially as and for the purpose described.

29. The vibratory lifter *o*⁴, to take hold of the type and raise it on the abutment *n*³, substantially as set forth.

30. The additional spring *i*⁴, to carry the lifter back under the type, substantially as set forth.

31. The mechanism which I term "the governor," consisting of the rod *e*⁵, hook *e*⁵, latch *f*⁵, and spring arm *i*⁵, to stop the motion of the lifter, if the type on the abutment *n*³ is not pushed off, substantially as described.

32. The cam *v*³ and levers *u*³ *t*³, to throw the type levers *z*³ out of the nicks of the type by a positive action, substantially as set forth.

33. Giving to the composition type channel E a vibrating motion toward and from the carrier wheel B, substantially as and for the purpose described.

34. Ending the channel E directly over the center of its fulcrum pin, to allow the last type passing out with the least possible motion, as set forth.

35. The arrangement of the transfer channel N, in combination with the composition type channel E, substantially as and for the purpose described.

36. The flanged roller leveler O, in combination with the transfer channel N, substantially as and for the purpose set forth.

37. The revolving pressure shot *k*⁵ in the type channel E, substantially as and for the purpose described.

38. The combination of a movable jaw *y*⁵ with the vibrating type channel E, substantially as and for the purpose set forth.

39. The plunger *v*⁵, having both a vibrating and a reciprocating motion, independent of the vibrating motion of the channel E, and operating in combination with said channel, substantially as and for the purpose described.

40. The spring *d*⁵, in combination with spring *e*⁵, made to close the movable jaw *y*⁵ with the requisite force upon the type, and to release said jaw at the proper intervals.

85,252.—C. E. SNEIDER, Baltimore, Md.—*Breech-loading Arm.*—December 22, 1868.—A block arranged before the bridge, is provided with a hook or shoulder, which, when the breech of the barrels is thrown up, comes against the projecting head of a bolt attached to the breech piece, so as to prevent

injury to the pivot that connects the breech piece and barrels. Just above and behind the pivot is a spring catch so arranged that when the breech is open, the retractor can be slid into place, without coming into contact with the catch.

Claim.—1. In connection with the bolt I, locking the barrels down, as above described, the combination and arrangement of the two springs M and L, and pin *m*, with the projection *f*, when said parts are constructed to operate in such a manner as to hold the tongues of the bolt I out of the way of the barrel, when the latter is raised, until, as it is brought down again, it strikes the spring M, thereby releasing the bolt I, and allowing the spring L to turn the bolt and lock the breech, substantially as described.

2. The combination of the pivot *d'*, block F', and bolt G, having the eccentric head *a*, when constructed to operate in the manner described.

3. The combination of a cartridge retractor, R, with the spring catch *t* and the pivot *d'*, when the parts are constructed to operate together, substantially as described.

85,253.—GEORGE W. STARR, Washington, D. C.—*Envelope.*—December 22, 1868.—Designed to prevent letters from being opened and closed again by unauthorized persons.

Claim.—The cuts and perforations 1, 2, 3, 4, and 8, in combination with the flaps B, C, D, and E, of an envelope, all constructed and arranged substantially as and for the purpose set forth.

85,254.—GEORGE W. STEWART, Adairsville, assignor to himself and WARREN AKIN, Cartersville, Ga.—*Harvester.*—December 22, 1868.—An arrangement of devices whereby the apparatus may be raised or lowered without changing the angle of cut, while by the same movement the reel is raised or lowered, so as to preserve its distance from the cutters. The dropping platform is attached to a rod by means of lugs arranged in two parallel lines and bent inward to clasp the rod, by which means the dropper may be readily removed.

Claim.—1. The combination and arrangement of the devices, by means of which the cutting apparatus may be elevated or depressed, while preserving the horizontality of the plane of the cutters, consisting of the dragging frame J, block *e*, post *g*, bar *h*, rods *a* and Y, grain wheel Z, arm *d*, rod *e*, and post *f*, substantially as and for the purpose shown.

2. The arm *h*, jointed to the main frame at its forward end, and the dragging frame J, in combination with the block *e*, to which said arm and frame are jointed at the front and rear edges, so that as the rear end of the dragging frame J is raised up, the plane of the block *e* and cutting apparatus will in all positions be parallel with the ground, substantially as shown and described.

3. The arms *b* and *e*, jointed to portions of the main frame at their forward ends, in combination with the arm *d*, rods *a* and Y, grain wheel Z, and cutting apparatus of a harvester, so that as the inner end of said cutting apparatus is raised up, the outer end will be equally raised, substantially in the manner and for the purpose set forth.

4. The manner of suspending the reel, by means of the post *m*, sleeve *o*, collar *p*, and rod *r*, the latter being pivoted at its lower end to the head of the post *g*, substantially as shown and described.

5. Suspending the reel shaft *g* by means of the sleeve *o* (made to slide upon the reel post *m*) and the rod *r*, which connects said sleeve with the block *e*, and preserves a constant distance between the reel and cutting apparatus, substantially as herein specified.

6. The means used for attaching the dropper to the rod Y, consisting of the lugs *z' z' z'*, arranged substantially as herein shown and described.

85,255.—JOHN M. THATCHER, Bergen, N. J.—*Fireplace Heater.*—December 22, 1868.

Claim.—1. The double walled fire pot, in combination with the air passages, whereby air passes into and between its walls, and is supplied to the fire pot, in a heated state, below the grate, constituting the air supply or draught, for combustion in the heater, substantially as described.

2. In combination with the fire pot of a fireplace heater, the double walled vertical central feeder, placed centrally over the fire pot, and extending vertically upward through the heater, to and through the top thereof, so that coals may be filled within the feeder to the top of the fireplace heater, thereby giving the feeder the full capacity, in height, of the fireplace heater, for holding the coals, the double walls extending from the lower part of the feeder to the top of the heater, and serving as a passage-way for a current of air, admitted through suitable apertures at the top of the heater, to pass down to the fire for the purpose of cooling the lower part of the feeder, and aiding combustion, substantially as described.

3. In combination with the fire pot, a double-walled central feeder, which has the lower part of the outer wall extended downward below the lower part of the inner wall, and air outlets, substantially as described, whereby the air passing from the annular passage between the walls of the feeder, to the fire, is caused to impinge upon or come more closely in contact with the inclined surfaces of the burning coal next to the bottom of the feeder, as set forth.

4. In a fireplace heater, the combination and arrangement of the fire pot, combustion chamber, and the vertical air-heating tubes in the rear of and partly surrounding the fire pot, and connecting an air-receiving chamber, below the fire pot, with a hot air collecting chamber above the combustion chamber, substantially as hereinbefore described, the arrangement of the tubes, with reference to the fire pot, combustion chamber, and its outlet, being such that the products of combustion pass first in contact with the upper part of the tubes, and then downward, in contact with the lower part of the tubes, to the outlet.

5. In a fireplace heater, the arrangement of the outlet for products of combustion, at the lower part of the stationary concave, whereby the concave becomes an air-heating plate, when in operation, substantially as described.

6. In combination with the clinker-cleaning opening, the lip on the grate for opening and closing the same by turning the grate, substantially as described.

7. In combination with the stationary concave, having the slightly conical collar or outlet passage, the slides or guides, whereby the movable part is guided, so that the exit funnel will enter and fit said outlet passage, substantially as described.

85,256.—HENRY TORSTRICK, New York, N. Y.—*Bone Coal and other Filters.*—December 22, 1868.—The object is to utilize, for filtering purposes, bone dust that has been of little value, which is effected by mixing the same with fine anthracite coal or other similar insoluble substance.

Claim.—1. The use of a dividing agent substantially as described, in connection with the filtering material, for the purpose of filtration.

2. The use of a dividing agent, in reburning or otherwise restoring bone dust.

85,257.—JOHN E. TUCKER, Boston, assignor to himself and LEWIS BONNEY, same place, and JOSEPH C. SNOW, Mansfield, Mass.—*Faucet.*—December 22, 1868.—At the inner end of the screw plug is fitted a perforated, movable cap, which, as the faucet is screwed in the plug, is forced into the barrel far enough to uncover the holes.

Claim.—The combination of the plug A, provided with a perforated partition B, the headed screw-bolt C, inverted perforated cap D, and faucet E, all constructed and arranged substantially as and for the purposes herein set forth.

85,258.—JOHN TURNBRIDGE, Newark, N. J.—*Method of Extracting Gold and Silver from their Ores.*—December 22, 1868.

Claim.—1. The method of combining metallic mercury, salt, or chloride of soda, and sulphate of copper, substantially as and for the purpose set forth.

2. The application and use of sulphur and its salts, substantially as and for the purpose set forth.

3. The application and use of the cyanides, for the extraction of gold, substantially as and for the purpose set forth.

85,259.—S. W. H. WARD, New York, N. Y.—*Carriage Wheel*.—December 22, 1868.

Claim.—A carriage wheel, consisting of a rim B, of rubber, fitted on a hub A, having projections a, to prevent the rim slipping around, the lateral movement of the rim being prevented by metallic plates b, secured to the hub, in the manner herein described.

85,260.—GEORGE WEAVER and H. NELSON ALLEN, Boston, Mass., assignors to themselves and E. R. CHENEY, same place.—*Barrel Head and Tap*.—December 22, 1868.—The key is made detachable and is only used when it is desired to draw the contents from the cask, and obviates the necessity of a separate stop-cock. Together with a cap, a yoke and spring, it forms the tap.

Claim.—1. As a new article of manufacture, a cask head, as described, that is, composed of the disk A, of cast metal, and having a bung opening, with female screw molded and cast therewith, and corresponding bung, with male screw cast in the same way.

2. The keg g, constructed as described, and used in connection with the tap C, or tap C', and bung B', for the purposes specified.

3. The combination and arrangement of the tap C with and upon the disk A, substantially as set forth.

85,261.—EMANUEL WEISS, Basle, Switzerland.—*Treating Cereals for the Manufacture of Flour, Meal, &c.*—December 22, 1868.—For more perfectly separating the nutritious and indigestible portions of cereals.

Claim.—Subjecting cereals to the action of an alkaline solution, substantially as and for the purpose described.

85,262.—RICHARD MONTGOMERY, New York, N. Y.—*Machine for Corrugating Metal*.—December 22, 1868.—A series of parallel grooves, alternating with parallel elevations, is cut in the circumference of the central roll, and counterpart grooves and elevations are formed in the upper and lower roll, so that the iron is passed consecutively between the rolls in opposite directions.

Claim.—In a rolling mill, consisting of three high rolls, arranged in the same vertical plane, and used for corrugating metal by passing it through a series of gradually diminishing grooves alternately above and below the center roll, the construction of the grooves as and for the purpose specified.

85,263.—H. G. LUDLOW, Troy, N. Y.—*Stop Valve for Steam and other Enginery*.—December 22, 1868.—In opening the valve, the stem which raises it draws the wedge upward on the inclined planes, allowing the two parts of the valve to come together, and thus relieving them of all wedge pressure against the faces of the openings before any upward motion of the valve occurs.

Claim.—1. The valve box A, with its guides H H, constructed substantially as described.

2. The valve, composed of the parts B and B', constructed substantially as shown and described.

3. The combination of the strips or guides H H, the stops G G, and circular flanges d d, substantially as shown and described.

4. The arrangement of the rod or stem C, wedge D, with its projections a a and inclined planes E E, all substantially as set forth.

5. The combination and arrangement of the wedge D, inclined planes E E, projections a a, stops G G, and strips or guides H H, substantially as shown and described.

6. The arrangement of the wedge D, inclined planes and ways E E, F F, gates B B, stops G G, and stem C, substantially as set forth.

85,264.—WILBUR F. ARNOLD, New Britain, Conn.—*Lifting Jack*.—December 29, 1868.—A small pinion meshes into a rack on an upright, and is operated by a combined lever and pawl to raise a slide on said upright, which slide is held in position by another pawl meshing into the rack.

Claim.—The combination of the sleeve d with handle f, and projection e, rack c, pinion k, pawl h, and spring i, all combined and arranged substan-

tially as described, and for the purposes herein set forth.

85,265.—JAMES AYRES, Branchville, N. J.—*Device for Sharpening Rails*.—December 29, 1868.—The rail is clamped to a feeding table, so as to be fed obliquely to the saw, and thus have its corners cut off. The clamp is swiveled and may be released to change the position of the rail, so as to bring its corners successively under the action of the saw, without detaching the rail from the clamp.

Claim.—The swiveled holding and clamping block H, and the rock shaft G, arranged and operating as described.

85,266.—EARLE C. BACON, New York, N. Y.—*Pitman*.—December 29, 1868.—A rod is extended through the pitman, and so connected with the bearing brasses at both ends that when a key is driven in, or withdrawn, at one end, the brasses will be tightened or loosened at both ends.

Claim.—1. The rod F, or its equivalent, in combination with the bearing brasses to a pitman and connecting rod, &c., when the rod F, or its equivalents, is arranged within the pitman or connecting rod, &c., for operation upon one set of the bearing brasses thereof, substantially as and for the purpose described.

2. The rod F, or its equivalent, in combination with the bearing brasses, to a pitman and connecting rod, &c., and a gib, key, and strap, or their respective equivalents, when all arranged together for operation, substantially as and for the purpose described.

3. The plate N, interposed between bearing brasses and rod F, substantially as described, for the purpose specified.

85,267.—HARRY J. BAILEY, Pittsburg, Pa.—*Hydrant*.—December 29, 1868.

Claim.—1. A double-faced valve a, so made as to close down on the supply pipe, to cut off the flow of water, and upward against the stationary packing ring b, to close the waste, substantially as hereinbefore set forth.

2. The waste groove i of a hydrant, in the outer face of the outlet pipe, so arranged, relatively to the annular stationary packing ring b and valve a, as to be opened and closed by the closing and opening of the valve, and so as to be removable, substantially as and for the purposes hereinbefore expressed.

3. The outlet pipe B, working vertically through the stationary packing ring b, to open and close the valve, substantially as and for the purposes hereinbefore set forth.

85,268.—SALMON BELDEN and JOHN FRANKLING CRABTREE, Visalia, Cal.—*Breech-loading Fire-arm*.—December 29, 1868.—As the breech block rises by half cocking the gun, its two parts separate, and the empty shell is held at one side of the chamber, so that the entrance of a new cartridge will eject it, the entering cartridge being retained by a stop on the other side until the breech block has been returned to its place, and the two sides closed, which is done by fully cocking the gun.

Claim.—1. The double sliding breech block C, with chamber J, and the opening spring b, the whole constructed and operating substantially as and for the purpose herein described.

2. The lever B', and the two operating pins I and K, on the tumbler D, or an equivalent device for elevating and depressing the breech block at one motion, substantially as described.

3. The bent spring g, for holding the shell to one side, substantially as herein described.

4. In combination with the barrel A and magazine B, the double-sliding breech block C, the lever B' with its two operating pins I and K, and the shell-extracting spring g, the whole operating as a repeating arm, substantially as described.

85,269.—SALMON BELDEN, Visalia, and JOHN-SON P. FORD, Santa Clara, Cal.—*Expansion Wagon Wheel*.—December 29, 1868; antedated December 24, 1868.—The wedges are driven between the arms of the clamp, at each side of the wheel, to force together the sections of the felloe.

Claim.—The double clamp E E and wedges F F, for forcing the joints of the feloes together, substantially as described.

85,270.—SAMUEL BENSON, Allegheny City, Pa.—*Pump.*—December 29, 1868.—The grating protects the valve, and the valve box is applied in such a manner that it may be removed with facility when the valves are to be removed. The method of applying the valve box is designed to secure a more durable structure than the ordinary pump in which the box is fastened by screws.

Claim.—A valve box *d*, resting against and enclosing the lower end of a bilge-water pump, such box having a grated bottom *d'*, flap valves *o*, of India-rubber or other like material, and being secured to the pump tube *a* by screw bolts *m* and nuts *n*, substantially as and for the purposes hereinbefore set forth.

85,271.—DAVID P. BIRD, Richwood, Ohio.—*Flood Fence.*—December 29, 1868.—The force of the current or of floating drift wood during a freshet draws the braces from their moorings and prostrates the fence. The fence may be thus thrown down without injury, and set up again at will.

Claim.—The eye bolts B, to which the posts *a* of the panels are hinged, in combination with the braces D and their wedges, substantially as and for the purpose described.

85,272.—C. W. BREWER, Racine, Wis.—*Churn.*—December 29, 1868.—The churn has three compartments, the dasher operating in the central one, in such a manner as to force the cream through openings in the partitions into the outer compartments, whence the cream returns to the dash chamber.

Claim.—The combination of the circular box A and box H with movable T-shaped partitions B B, boards E E, and shaft F, with its arms G G, all constructed, arranged, and operating substantially as herein set forth.

85,273.—WILLIAM BUNTON, Pittsburg, and JOHN DAVIS, Birmingham, Pa.—*Method of Rolling Bars of Metal.*—December 29, 1868.—Round or oval and flat or square bars of iron are rolled from a flat bar, which is passed through on its edge between rolls grooved for forming the square and round parts successively, the thickness of the bar to be operated upon being somewhat less than the breadth of the grooves, to afford room for the spread of the iron, without its being forced into the "parb" of the rolls.

Claim.—The method, herein described, of rolling successively different sections of a bar of metal to different forms.

85,274.—GEORGE E. BURT, Harvard, Mass.—*Harvester.*—December 29, 1868.—The revolving cutter shaft is constructed with a series of thimbles or sleeves, so arranged that all the revolving shears are effectually held in their proper position by a single screw-nut on the end of the shaft. Two sets of guards are attached to the cutter bar, the upper set being so arranged as to cover the space between the lower set.

Claim.—1. The combination of the lower guard finger B, the upper guard finger A, the stationary cutter *a*, on the upper guard finger, and the vertically revolving cutter I, all arranged and operating substantially as described.

2. The combination of the revolving shaft F, the cutters I I, the collars N, held in position by the screw nut *m*, substantially as described.

3. The stationary cutters *a*, when attached to the guard finger by a bolt in such a manner that said cutters may be removed, ground, and replaced without disturbing the moving cutters, substantially as herein set forth.

4. The spring L, when so arranged and applied that it will tend to lift the outer end of the cutter bar, substantially as described, for the purpose set forth.

5. The rotary cutter I, so arranged that, if submitted to undue strain, it will yield to the pressure, and allow the shaft to turn without injury to the machine, substantially in the manner and for the purpose set forth.

85,275.—GEORGE E. BURT, Harvard, Mass.—*Horse Rake.*—December 29, 1868.—A lever and springs are so combined with the teeth as to enable the operator to hold the teeth down in heavy hay, and yet allow each tooth to spring upward, in order to override high abrupt obstacles.

Claim.—1. The tooth A, when pivoted to and held in position by two independent arms, B and C, substantially as described for the purpose set forth.

2. The arrangement of the tooth A, bars B and C, and springs *v*, the whole operating in the manner and for the purpose described.

85,276.—JOHN BURT, Fall River, Mass., assignor to himself, and WILLET M. SLOCUM, same place.—*Wrench.*—December 29, 1868.—The spring maintains a continuous pressure on the nut, so that when the nut is removed from the bolt the wrench holds it.

Claim.—Spring C¹, constructed, applied, and operating as herein set forth, for the purpose specified.

85,277.—THOMAS BUSHBY, Manchester, England.—*Pill-making Machine.*—December 29, 1868; antedated December 17, 1868.—The feeding mechanism and a knife deliver the material to the space between the roller and segmental plate in the form of bars or strips. The latter are caught by the roller and cut into pieces, which, in passing and being rolled between the roller and segmental plate, are shaped into pills.

Claim.—1. The combination, with grooved roller I, of the segmental grooved plate L, substantially as and for the purpose described.

2. The combination of the grooved rollers, segmental plate, and the reciprocating knife, substantially as and for the purpose described.

3. The feeding mechanism, constructed as described, in combination with a pill-forming mechanism, substantially as and for the purpose set forth.

85,278.—HAMPTON R. CAMFIELD, Susquehanna Depot, Pa., assignor to himself, JOHN H. FITZ SIMMONS, and GEORGE BOYD, same place.—*Steam Port of Steam Engine.*—December 29, 1868.—Has reference to valves for promptly releasing the inactive steam from the cylinder. These valves are inserted in the induction ports, and are opened by the escape of the exhaust steam and closed by the motion of the slide valve.

Claim.—1. The construction of releasing devices F, having two or more bearings or hinges, substantially as described.

2. The combination of the device F with the seat B and valve A, as set forth.

85,279.—ANGUS CAMPBELL, Downieville, Cal.—*Derrick.*—December 29, 1868.—The truck is made to slide on the boom, and the latter is braced by an endless rope without interfering with the motion of the truck. A safety hook is employed to adjust and suspend the tripping device.

Claim.—1. The truck D, consisting of the bow *a*, swinging frames *b c*, and concave rollers *d*, substantially as herein shown and described.

2. The rope G, when arranged as described, to brace the boom, by being fastened to the truck sliding thereon, for the purpose of relieving the top ping lift C, as specified.

3. The hook H, having the nut *x*, ring *w*, and link *v*, arranged substantially as and for the purpose herein shown and described.

4. The chain O, bar P, lever R, and arm *e'* in combination with the hook H, nut *x*, ring *w*, and link *v*, arranged as described for the purpose specified.

85,280.—DUNCAN McDUGALD CAMPBELL and JOHN STEVENS, Oswego, N. Y.—*Marble-sawing Machine.*—December 29, 1868.—Guide blocks are provided with rollers, over which the belts pass, are secured within slots on each side of the saw frame, by which the saws are readily adjusted to operate at various angles and at different distances from each other.

Claim.—The laterally adjustable guides *e e*, rollers *k k*, belts *f f*, and clamping loops *n n*, in connection with the saws G *g h* and feeding frame B, all con-

structed and operating as herein shown and described, and for the purpose set forth.

85,281.—JOHN CARLIN, New York, N. Y.—*Game called Vinco.*—December 29, 1868.—A board similar to a chess board, is divided in thirty-five squares, 5 by 7, of uniform color. A king, aided by his captains and guards, endeavors to capture a central castle defended by a general and his aid.

Claim.—The arrangement of a new game, as is fully explained in the above.

85,282.—S. D. CARPENTER, Madison, Wis.—*Revolving Harrow and Cultivator Combined.*—December 29, 1868.—When distended to the full length of the rear curved bars, the toothed bars rotate and act as harrows, but when contracted to pass between rows of corn they act as cultivators without rotating.

Claim.—1. The revolving bars F, in connection with the universal joint at G and h, as and substantially for the purpose set forth.

2. The combination of the block A, the revolving bars F, the stationary bar E, the adjustable curved bars H and I, the bearing pin h, and the slotted wrist bearing G, as and for the purposes herein set forth.

85,283.—THOMAS S. CLARK, Lena, Ill.—*Blacksmith's Forge.*—December 29, 1868.—The fire rests on a so-called "fire cup" located just below an orifice in the apex of a dome-shaped hearth, so arranged that it may be turned over to allow the ashes to fall through a tube which passes vertically through the air chamber. A second dome is placed inside of the outer or hearth dome, and the blast passes through the space between the two domes to the fire.

Claim.—The combination, substantially as set forth, in a blacksmith's forge, of the turning fire-cup, the two flanged domes, forming the air conduit, and the blast regulating valve, for the purposes specified.

85,284.—ELISHA H. COOK, Clarendon, Mich.—*Seed and Fertilizer Sower.*—December 29, 1868.—Two of the three horizontal arms are fixed in the shaft, and operate respectively the slides for depositing the seeds and the plaster. The other arm is connected to the crank shaft.

Claim.—1. The flaring notches f in the reciprocating feed bar D, in combination with the seed hopper B, having a perforated bottom, substantially as and for the use specified.

2. The mode of operating the reciprocating or vibrating feed devices of a plaster and seed hopper, by the arrangement and combination therewith of the three-armed rocking shaft J, connecting rods r, R' R'', and driving crank E, substantially in the manner as set forth.

85,285.—CHARLES S. COOLIDGE and JOSEPH A. ROLLINS, Jersey Mills, Pa.—*Portable Fence.*—December 29, 1868.—The notched ends of two of the panels fit into notches in the post, and the lower panels are secured in position by a button in the post.

Claim.—The post A, when provided with the upper notch a and side notch b b b b, in combination with the ends of the rails C D, and the button G, arranged as specified.

85,286.—WILLIAM CORFIELD, Philadelphia, Pa.—*Distilling Apparatus.*—December 29, 1868.—The material for distillation is heated by direct application of steam before the same is introduced into the distilling apparatus, so that the process of distillation is rendered continuous, and not liable to interruption.

Claim.—1. The combination, with a still, of an auxiliary closed vessel or vessels, B, with the valve e intermediate between the receiver into which the material is first pumped and an upper chamber of the still, M, for the purposes specified.

2. The introduction into the closed vessel B of the steam pipe m, terminating therein, for the purpose of agitating and heating the material contained in said closed vessel, preparatory to its introduction into an upper chamber of the still, the whole ar-

ranged substantially as and for the purposes specified.

3. The communicating pipe h, provided with the safety valve i, as and for the purposes specified.

4. Heating the mash, beer, or other substance by discharging steam in broken or continuous jets into the preparatory vessel or vessels before depositing said material in the still, or subjecting it to the distillatory process.

85,287.—WILLIAM CORFIELD, Philadelphia, Pa.—*Distilling Apparatus.*—December 29, 1868.—A combination of the well-known still, column, &c., with an auxiliary heating chamber, for securing a continuous process of distillation.

Claim.—1. The combination of the still A, the pipes a and b, and the column B, goose C, and worm D, with their usual respective connections and attachments, together with the auxiliary closed vessel E, and the pipe c, and pipe or valve d, as and for the purposes specified.

2. Heating the mash, beer, or other substance, before being used in the process of continuous distillation, in an apparatus composed of the ordinary whisky still, the ordinary alcohol column, and the goose, worm, and attachments, substantially as and for the purposes specified.

85,288.—JOSEPH H. DAVIS, Allegheny, Pa.—*Stop Valve for Steam and Other Machinery.*—December 29, 1868.—A slight bend is made in the coupling pipe by which the latter can be made of the same diameter with the valve chamber.

Claim.—The construction and combination of the valve chamber of a "valve cock" with a coupling pipe, whereby the bore of said pipe, chamber, and opening in the valve-seat shall, under all sizes of construction, be the same, substantially as herein described.

85,289.—THOMAS S. DAVIS, Jersey City, N. J.—*Steam Engine Exhaust Valve.*—December 29, 1868; antedated December 23, 1868.—The valve is so arranged as to freely open to allow the exhaust steam to escape from the cylinder and close the moment the pressure becomes equal to or less than that of the atmosphere within the smoke box, so as to prevent the entrance of cinders, &c., to the cylinder.

Claim.—The construction of the valve B, and its arrangement with the seat D, guide bar E, and exhaust passage A, substantially as herein set forth.

85,290.—LE GRAND DODGE, Syracuse, N. Y.—*Shutter Fastener.*—December 29, 1868.—The rod which opens the blind is held in position by the friction of the cam portion of the pivoted lever, so as to retain the blinds at any desired point of their swing.

Claim.—The lever, pivoted centrally at h, and provided with a cam-shaped end and a weighted handle, f, when used in connection with the pinion formed on the hinge and the plain bar E, to press the latter down in its seat, and, simply by friction therewith, preventing its movement, as herein set forth.

85,291.—LEWIS DODGE and LEWIS J. MAGNUSON, Chicago, Ill.—*Concrete-block Machine.*—December 29, 1868.—The follower is attached to the upper part of a knuckle-joint lever connected by a pitman to an eccentric shaft, so that the follower is operated twice at each revolution of the wheel. A double spout leads from the hopper and is divided into compartments by transverse slides.

Claim.—1. The combination of the eccentric O, pitman t, arms b and d, and the independently-movable follower C, operating in connection with the mold m and cover I, all constructed and arranged to operate as herein described.

2. The mixing tub or hopper F, provided with the gates k and spouts T, having the slides i and g, arranged therein, all substantially as set forth.

85,292.—WILLIAM A. DRYDEN, Monmouth, Ill., assignor to himself and JOHN M. TURNBULL, same place.—*Cultivator.*—December 29, 1868.—The axle is cast with a vertical spindle, on which and to which the plows may be hinged.

Claim.—The metal axle, with a vertical coupling spindle, F, cast thereon as a part of the same, substantially as described and for the purpose set forth.

85,293.—HENRY S. FAIRBANKS, Central Falls, R. I.—*Machine for Drilling and Boring Flanges of Pipes and Cylinders.*—December 29, 1868.—The drill stock is arranged horizontally in a radial slot passing through a vertically-rotating face plate, and is adjustable in relation to the center of the said face plate.

Claim.—In combination with the rotary head B, the drill arbor *k*, the driving shaft *p*, and the gears *m o*, arranged as set forth, the connection gear *n*, the movable box *e*, and their adjusting devices, substantially as described, applied to them and the head B, whereby the box *e* may be adjusted and fixed at different radial distances relatively to the axis of the head B, and the gear *n* may be adjusted and fixed so as to engage with the gears *m o*, after any such adjustment of the said arbor, the whole being for the purpose and to operate as explained.

85,294.—AMOS FELLKER, Bay City, Mich.—*Hanging Saws.*—December 29, 1868.—An oscillating motion is given to the saws by means of suitable connections at top and bottom of the frame, so that on their upward motion they will be thrown from the cut to allow the sawdust to fall.

Claim.—The arrangement of the horizontal pitman O, saw frame H, rock shaft F, having eccentric journals M, pitmen E and L, and stationary shafts J and P, all arranged to operate the saw frame H, substantially as and for the purposes set forth.

85,295.—HENRY FININLEY, New York, N. Y.—*Curtain Fixture.*—December 29, 1868.—Depending from the bracket is a stem provided with two friction rollers, between which and the upper pulley the cord is crossed. The weight of the curtain is sustained by lateral pressure exerted by an elastic ring upon the recessed surface of the pulley and upon the washer.

Claim.—1. The curved brackets *a* and *a'*, with the spur *g* and feet *f f*, attached to the casing, by means of the eye *h*, substantially as and for the purposes set forth.

2. The pendent stem *b*, (cast upon the bracket,) the friction rolls *o o*, guard *p*, cord *l*, and pulley *k*, all arranged to cooperate substantially in the manner and for the purposes set forth.

3. The general arrangement and combination of the pendent stem *b*, friction rolls *o o*, recessed pulley *k*, elastic ring *m*, washer *n*, and shaft *i*, the latter having its outer end riveted or upset, as shown, all arranged to cooperate substantially as and for the purposes set forth.

85,296.—R. H. FISHER, Beaver Falls, Pa., assignor to BEAVER FALLS CUTLERY COMPANY, same place.—*Knife.*—December 29, 1868.

Claim.—The knife A, provided with two slots *a a*, and handle B, cut with a tenon, which projects between said slots, in combination with the bolster C, all constructed substantially as herein set forth.

85,297.—WILLIAM HUTSON FORD and SAMUEL LOGAN, New Orleans, La., assignors to WHEELLOCK, FINLAY, AND COMPANY, same place.—*Disinfectant or Ozone Generator.*—December 29, 1868.

Claim.—The compound herein described; that is to say, the combination of acid sulphates, in the form of dry powder, with alkaline permanganate, substantially in the proportions herein given, with or without the admixture of a chloride or other deliquescent substance, as a joint disinfectant and ozone generator.

85,298.—DAN P. FOSTER, Waltham, assignor to himself and N. M. LOWE, Boston, Mass.—*Suspending Clamp.*—December 29, 1868.—The connecting link operates to raise both cams when one of the same is pushed up.

Claim.—A suspending clamp, formed of two segment cams B B', pivoted to the supporting frame A, and connected by a link, C, substantially as described, and for the purpose set forth.

85,299.—SAMUEL M. GAINES, Glasgow, Ky.—*Method of Teaching the Rudiments of Chemistry.*—December 29, 1868.—Simple elementary bodies are represented by cubes, hydrogen being taken for the base, and so increasing according to the relative weight of the bodies.

Claim.—1. The method of teaching the rudiments of chemistry by means of movable material bodies, varying in size, and marked with numbers, so as to represent the relative weight of the ultimate particles of matter of different chemical substances, known as simple or elementary bodies, substantially as described.

2. A series of movable material bodies, varying in size, and marked with numbers, so as to represent the weight of the ultimate particles of matter of different chemical substances known as simple bodies, substantially as and for the purpose set forth.

85,300.—ALFRED C. GARRATT, Boston, Mass.—*Voltaic Pile for Medical Purposes.*—December 29, 1868.—Plates of zinc and copper are soldered together and attached in pairs by a thread to a flexible non-conducting base, each pair being insulated from the next pair by a strip of rubber cloth.

Claim.—An electro-physiological battery, constructed by arranging a series of pairs of dissimilar metal plates, as elements completely insulated from each other, and from the base, as described, and the plates of each pair firmly connected, as shown, all arranged upon a flexible non-conducting base, as and for the purposes described in this specification.

85,301.—WILLIAM GATES and DAVID J. LLOYD, Frankfort, and SAMUEL MILLER, South Hammond, N. Y., assignors to WILLIAM GATES.—*Machine for Making Paper Boxes.*—December 29, 1868.—An adjustable stop prevents the plungers from casually moving too far back. The stationary cam causes the rear end of the plungers to be pressed toward the center of the plate in which they move. The springs allow the folding jaws to accommodate themselves to the different thicknesses of paper to be folded. The pressure roller comes in contact with and smooths the lapped surfaces of the paper on the plungers.

Claim.—1. The moistening of one edge, *e*, of the continuous paper roll E, by means of a wooden and a metal roller, D D', applied to a paper box, substantially as shown and described.

2. The elevated paste fountain F, arranged in connection with the paste boxes G G', substantially in the manner as and for the purpose set forth.

3. The plate M, provided with the radial recesses *j x*, block *k*, guide pins *l*, and springs *m*, all arranged as shown, for the purpose of balancing the plungers, as set forth.

4. The plate O, in combination with the plate M, for the purpose of keeping the plungers in place during their operation, or when forced down in the recesses *j x* of the plate M.

5. The adjustable stop P, arranged in relation with the plungers L, substantially in the manner as and for the purpose set forth.

6. The stationary cam R, placed relatively with the plate M, for the purpose of regulating the movement of the plungers, as set forth.

7. The adjustable stops *w*, in the hub *a'* of the plate M, for the purpose of limiting the inward movement of the plungers, as specified.

8. The application of the springs *p'* to the folding jaws *q*, substantially in the manner as and for the purpose set forth.

9. The finishing or pressure roller K', when arranged or applied in the manner substantially as and for the purpose set forth.

10. The discharging fork or slide N', provided with the rods *s' s'*, and operated in the manner substantially as and for the purpose set forth.

85,302.—JOSEPH G. GUTHRIE, Pittsburg, Pa.—*Railway Car Brake.*—December 29, 1868.—To the outer ends of the levers are pivoted the brakes, which are held in the desired position by pivoted guides.

Claim.—1. The arrangement of the levers D, provided with spring bearings, and used in connection

with guided shoes, hereinbefore described, and for the purpose set forth,

2. The pivoted guides 5, when used in connection with the brakes *l*, as herein described, for the purpose set forth.

85,303.—JOHN D. HADFIELD, M. D., Cincinnati, Ohio.—*Mode of Treating Diseases by Vacuum.*—December 29, 1868; antedated December 15, 1868.—By the arrangement of the tube and two-way cock the air pump can be used to exhaust two vessels at once. The rests can be adjusted without removing the limb or admitting air.

Claim.—1. The combination, with the chamber of an air pump, of the tube or tubes *B*, with the passage or hole *n*, and the cock *C*, having the passages *a* and *e*, arranged substantially as described.

2. The combination of the external adjustable rests *E* with the vacuum vessels *D*, substantially as described.

85,304.—JAMES E. HALSEY, New York, assignor to himself, MORRIS H. SMITH, and SAMUEL F. NOYES, Brooklyn, N. Y.—*Foundation for Railroad Tracks.*—December 29, 1868.—The cross ties are laid upon, or partially in, a bed of stone and earthy material, cemented together by asphaltum, coal tar, or other bituminous material.

Claim.—A foundation for railway ties, formed in the manner and for the purposes specified.

85,305.—E. B. HARDING, Northampton, Mass.—*Truss.*—December 29, 1868.—An improvement on his patent of August 20, 1868. The auxiliary pad rests above the hernia, and forms a fulcrum for the main pad.

Claim.—The construction and arrangement of the hinged auxiliary pad *C*, connected to the main pad of truss by means of the extension arm *B*, and to the belt by means of auxiliary straps *D* and *D*, substantially in the manner and for the purpose described.

85,306.—URIAH W. HARDY, Abingdon, Ill.—*Gate.*—December 29, 1868.—On pulling down the lever the latch bar is drawn back by the action of the pivot hinges and the rod. When the gate has been raised to an angle of 45 degrees the weight carries it to a vertical position.

Claim.—1. The manner of attaching the horizontal bars *b b b* to alternate sides of the post *A* and cross bars *k k*, with bolts and washers to prevent friction, in such a manner that they will fold closely together, and making the hinge post *A* supply the place of a cross bar to the gate, and the rod *R*, and guide bar, (Fig. 4,) all operating in combination, substantially as described and for the purpose set forth.

2. The combination and arrangement of the levers *D D*, the rods, ropes, or chains *f f*, the latch bar *L*, the hinges *h h h*, and the rod *R*, acting with a proper adjustment of the weight *e*, substantially as described and for the purposes set forth.

85,307.—FRANCIS P. HART, Strasburg, Pa., assignor to himself and SAMUEL KENEAGY, same place.—*Breaking the Surge on Harness or Vehicles.*—December 29, 1868.—A flat piece of rubber is inserted between the plates near that part of the trace attached to the singletree.

Claim.—The application of a flat piece of gum elastic *G*, introduced between the plates or straps *A B T*, when constructed substantially in the manner shown and described, for the purpose specified.

85,308.—RUSSEL P. HINDS, Chicago, Ill.—*Paint Composition.*—December 29, 1868.—Composed of asphaltum, litharge, gum shellac, hot residuum of coal tar, rice flour, naphtha of coal tar, naphtha of petroleum, unslaked lime, and china clay.

Claim.—1. The composition for paint, composed of the ingredients herein specified, or their equivalents, compounded substantially as herein described.

2. The application of unslaked lime, in connection with gasoline or naphtha, for the purpose of causing it to unite with other ingredients used to constitute a composition paint.

85,309.—WILLIAM JOHNSON, Philadelphia, Pa.—*Cock for Water Pipes.*—December 29, 1868.—When

the stem is depressed for drawing water the conical rubber valve is forced away from the main body, so as to allow water to pass through inlet holes in the packing box. When the valve is closed the water passes out of the stem through a waste hole above the packing.

Claim.—1. The hydrant water cock, made by the thick conical rubber valve *H* upon the sliding stem *K*, the said valve bearing against the interior of the conical body *A*, and being operated by the hollow stem *M*, through which the water passes, the parts being combined in the manner substantially as set forth.

2. The combination of the bottom cap *D*, body *A*, conical valve *H*, hollow stem *M*, and stuffing box *B*, arranged in relation to each other, substantially as shown and described.

85,310.—JOHN W. JORDAN, Lexington, Va.—*Butt Hinge.*—December 29, 1868.—The eye of one leaf screws on to a helical pintle on the other leaf, so that the shutter or door is raised as it is opened to clear the carpet or sill piece.

Claim.—Fitting the eye bracket *b* of the hinge leaf *B* upon the helical or screw pintle *C*, between the eye brackets *a a* of the leaf *A*, so that the eye bracket of leaf *B* is free to traverse up and down upon the pintle, between the eye brackets *a a*, substantially as and for the purpose described.

85,311.—WILLIAM KERR, Jr., and JOSEPH A. ROBBINS, Boston, Mass.—*Fountain Comb.*—December 29, 1868.

Claim.—1. As an improved article of manufacture, a comb whose teeth are hollow, and capable of containing liquid, for the purpose substantially as before explained.

2. A comb, having its body and teeth hollow, and with the latter foraminous or punctured, in order to allow of escape of liquid therefrom, in manner and to operate essentially as herein shown and described.

3. In combination with a comb, the body and teeth of which are hollow, an elastic bulb, or its equivalent, for the purpose of filling and emptying such comb of its liquid contents, substantially as hereinbefore explained.

85,312.—L. W. KIMBALL, Pittsford, Vt.—*Molding, Cornice, and the Like, from Paper.*—December 29, 1868.—An improvement on his patent of August 16, 1868. The hollow sections are braeed by internal stays.

Claim.—The molding or cornice *A*, when constructed of paper, provided with internal braces or stays *A'*, in the manner substantially as and for the purpose specified, as a new article of manufacture.

85,313.—JOSEPH S. KIRK, Pittsburg, Pa.—*Food for Animals.*—December 29, 1868.

Claim.—An improved article of food for animals, composed of hay, corn, oats, or barley, or all of them, ground and mixed together, in the proportions herein named, and pressed into suitable packages for transportation.

85,314.—J. E. LONG, Norway, Me.—*Staging.*—December 29, 1868.—The ends of the portable staging support are provided with toothed plates, which fit into the roof and prevent the scaffolding placed on said support from slipping.

Claim.—The improved portable and self-fastening staging, as described, and for the purposes set forth.

85,315.—JOHN LEBB, Akron, Ohio.—*Washing Machine.*—December 29, 1868.—The pressure on the rubber can be varied by adjusting the elastic notched arms on the collar.

Claim.—The peculiar arrangement and combination of the frame piece *H* with the elastic arms *I I*, having notches *k k* cut therein, the collar *K*, with beveled inner end faces, the spring *L*, presser *J*, and axle arm *N* of the rubber frame, the several parts being arranged and combined substantially as and for the purpose herein specified.

85,316.—JOHN LEWIS, New York, N. Y.—*Shingle.*—December 29, 1868.—Recesses are made

in the thick ends of the shingles, to prevent the water from being drawn by capillary action between the lower end of one shingle and the surface of the one below. A rib between the recesses covers the joint of the lower shingles.

Claim.—A shingle, formed with the recesses *b b* and rib *c* upon the under side, at the lower portion, for the purposes set forth.

85,317.—CURTIS O. LUCE and CYREL W. GREEN, Brandon, assignors to themselves and CYRENIUS M. WILLARD, Castleton, Vt.—*Stone-quarrying Machine.*—December 29, 1868.—A reciprocating saw, armed with diamond points, is so formed as to cut from the terminal holes formed by the drills, both saw and drills operating simultaneously.

Claim.—1. The reciprocating saw *F*, provided with diamond teeth *f** and *f*1*, arranged substantially in the manner described.

2. Constructing the saw blade *F1*, with rigid ends projecting beyond the end bars *f1* of the frame, substantially as represented.

3. The combination of a reciprocating saw, *F*, with a drill or drills, *P*, employed to free the ends of the saw kerf or channel, substantially as described.

4. The combination of the driving shaft *B*, mounted in an adjustable box or bearing, *b*, the crank *B'*, connecting rods *C E*, slides *E e*, and guide rod *G*, with the saw *F*, all constructed and operating substantially as described, for the purposes specified.

5. The combination of the saw *F f f1*, cross head *H h h'*, screws *H'*, vertical guide rods *I*, gear nuts *J*, idle wheel *K*, and ratchet lever *L l*, or its equivalent, substantially as and for the purpose described.

6. In combination with the drills *P*, the shafts *B N R*, bevel gearing *B2, N1, N3, R1 R2, P'*, and forks *S*, for the purpose of adapting said drills to receive a continuous rotary motion, or be separately stopped, substantially as set forth.

7. In combination with the revolving drills *P*, the cam bars *Q q*, operated by means of the saw *F* and presser bar *H*, in the manner described, to reciprocate and feed said drills.

85,318.—MORRIS MATTSON, New York, N. Y.—*Breast Pump.*—December 29, 1868.—An improvement on his patent of September 8, 1868. A loose floating valve, such as described in his patent of April 4, 1854, is employed.

Claim.—The combination, with a vacuum glass, of an exhausting mechanism or instrument, having or employing a single valve or valvular apparatus, substantially as and for the purposes set forth.

85,319.—ROBERT Y. MCCONNELL and GEORGE PRINGLE, Rochester, N. Y.—*Street Sweeper.*—December 29, 1868.—An improvement on their patent of December 10, 1867. The wings throw the dirt swept past their projections within reach of the brooms.

Claim.—1. The application of the projecting contracting wings *y3* to the plate *y2* of apron *H2* for the purposes herein shown and described.

2. The relative arrangement of apron *H2* with the broom shaft *L*, operating substantially as and for the purpose set forth.

85,320.—HUGH McDONALD, Pittsburg, Pa.—*Shield for Puddling Furnaces.*—December 29, 1868.—A hollow shield, through which water passes, is provided with a hollow sliding door for operating the furnace.

Claim.—Providing furnaces, used for the manufacture of iron or steel, with a shield, unattached to the furnace, and so constructed and arranged, with relation to the furnace, that a body of cold water will be between the workman and the furnace, as herein described, and for the purpose set forth.

85,321.—J. H. McELROY and JAMES H. HOLLY, Warwick, N. Y.—*Door Fastener.*—December 29, 1868.—The alarm mechanism, placed in one of the plates, operates, when the door is opened, by means of a catch sliding back and releasing the escape wheel.

Claim.—The combination of the door fastener *A B a* and the alarm mechanism, constructed substantially as shown and described, for the purpose specified.

85,322.—THEODORE J. MCGOWAN, Cincinnati, Ohio.—*Hydraulic Pressure Regulator.*—December 29, 1868.—The object of this invention is to allow the water to escape when pressure is in excess of the resistance, without stopping the pumps.

Claim.—1. In a hydraulic pressure regulator the piston *A*, provided with the means shown at Figs. 3 and 4, for the surplus water to escape, when the hydraulic pressure regulator contains more than sufficient water to produce the power required, as previously regulated by the weight on the lever *P*, substantially as and for the purpose specified.

2. An automatic hydraulic pressure regulator, containing the piston *A*, having the means of escape, *c c*, for the water, and aperture *I*, the nut *L*, having the space *X*, with the packing *B*, as and for the purpose specified.

85,323.—JOHN M. MILLER, Cincinnati, Ohio.—*Carriage Spring.*—December 29, 1868.—This device dispenses with perches and with inflexible connections between the axles.

Claim.—The rocking spring bars *D*, fulcrumed to the body sills, and connected at their outer parts to the axle or axle beds, and at their inner ends to central springs *B* attached to the body sills.

85,324.—JAMES W. MILROY, Galveston, Ind., assignor to himself and S. B. SHANER, Xenia, Ohio.—*Corn and Cotton Plow.*—December 29, 1868.—The right and left hand plows run in nearly the same track. The front plow throws the dirt from the row, and the rear plow throws the dirt thus pulverized back to the row.

Claim.—The combination of the right and left mold-board plows *A* and *B*, substantially in the manner and for the purpose as herein described.

85,325.—JOSEPH MONTGOMERY, Baltimore, Md.—*Grain Cleaner.*—December 29, 1868; antedated December 22, 1868.—The shoe has bearings on a shaft, one end of which receives a vertical motion and the other a vibratory motion when the shoe is reciprocated.

Claim.—1. Wheels *D*, in combination with plates *F* and shoe *P*, substantially in the manner and for the purpose as described.

2. The combination and arrangement of plates *A*, rods *B*, shafts *C*, wheels *D*, axles or shake rods *E*, and boxes *R*, plates *F*, bars or slides *L*, and supports *M*, substantially as described.

3. The adjustable curved or corrugated plates or bars *G* and *H*, separately, or in combination with stationary plates, for the purpose as described.

4. The combination and arrangement of the braces *K*, rod *C*, and shoe *P*, substantially as described.

85,326.—JOSEPH H. MOORE and JOSEPH E. GARY, Chicago, Ill.—*Car Brake.*—December 29, 1868.—An improvement on their patent of February 11, 1868. By means of the cord and lever the pressure of the friction wheel operating the brakes can be regulated.

Claim.—1. The friction wheel, composed of a disk *D*, and band *E*, and regulated by the friction clutch, substantially as and for the purposes specified.

2. The friction wheel *D E* and shaft *F*, in combination with the lever *G* and cord *H*, for bringing the friction wheel in contact with the sleeve *C* or axle, substantially as specified.

3. The cord *H*, lever *G*, wheel *D E*, and shaft *F*, with the chain *f*, and levers for operating the brake bars, substantially as specified.

85,327.—CESARE OSMANI, Tolentino, Italy.—*Tanning Hides and Skins.*—December 29, 1868; patented in England, January 23, 1868.

Claim.—The subjecting hides and skins to the action of a bath of mustard seed or oil of mustard, substantially as herein described, to open the pores of the skins, and thus render the process of tanning them by bark or other tanning material much more speedy than has heretofore been practicable.

85,328.—NANCY PATTON, Kansas, Ill.—*Composition for Preserving Eggs.*—December 29, 1868.—Composed of bituminous coal, charcoal, leached

ashes, lime, common salt, saltpeter, borax, cream tartar, and soda.

Claim.—The dry composition, compounded and prepared as herein described, for preserving eggs.

85,329.—CHARLES H. REID, Danbury, Conn.—*Tool Holder.*—December 29, 1868.—The turning tool is held in a dovetailed recess in one side of a split stock, forming two jaws, which are clamped together by a screw. The planing tool is inserted in a cylindrical socket in the other end, and there held by a gib and screw.

Claim.—1. The improved tool holder A, when constructed as set forth, to hold both the tools H and I, in the manner described.

2. The tools H b, in combination with a tool holder, A, all constructed substantially as set forth.

85,330.—CHARLES G. RIGGS, Turin, and HOMER C. MARKHAM, West Turin, N. Y.—*Milk Cooler.*—December 29, 1868.—Cool water is passed through the lower vat, and milk is made to flow over the bottom of the upper vat. Deflecting plates give a zig-zag course to the liquids in order to retard the transit sufficiently to insure the cooling of the milk.

Claim.—The combination of the vats A and B, constructed and operating substantially as described.

85,331.—THOMAS C. ROBINSON and GEORGE P. CLARK, Boston, Mass.—*Steam Street Car.*—December 29, 1868.—Consists in the mode of applying the boiler and certain accessories, whereby the truck is adapted to turn on curves and switches without interfering with the supply of steam from the boiler to the propelling cylinders.

Claim.—1. In locomotive cars, the use of the boiler as a transient bolt, when arranged and used substantially as described.

2. In locomotive cars, when the boiler is used as a transient bolt, the transient ring, and the rollers to diminish friction, whether with or without the inner ring, all substantially as described.

3. In locomotive cars, with the boiler, transient bolt, and friction rollers, and transient ring, above described, the use of trunnions on the transient ring, all substantially as and for the purpose described.

85,332.—ROBERT W. ROGERS, Pittsburg, Pa.—*Bridge.*—December 29, 1868.—The bridge consists of an arch constructed of subordinate arches whose lines of juncture converge to a common point, and which are connected in such a manner that they may be drawn tightly together.

Claim.—The construction and arrangement of bridges in sections, when supported, arranged, and connected together in the manner and for the purpose herein described.

85,333.—ROGER SANDIFORD, Joliet, Ill.—*Land Roller.*—December 29, 1868.—The land rollers are so coupled together that they may travel in different planes, and left free to pass over obstructions independently.

Claim.—1. The combination of the hinged cross bar *d*, the hub *i*, and the double-oscillating coupling box *e*, all arranged, constructed, and operating as described.

2. The device called a knuckle, shown in Figs. 6 and 7, for the purpose of allowing an oscillating motion to the inner section of the tongue, in the manner and for the purpose set forth.

3. The mode of hinging the main frame to the cross bar *d*, by means of hinges, such as are shown in Fig. 8.

4. The rollers, constructed as set forth, with metal heads, having the staves dovetailed into the same, as set forth, in combination with the frame *e*, double oscillating coupling box *e*, hub *i*, and cross bar *d*, all arranged and constructed as and for the purposes set forth.

85,334.—JEREMIAH L. SAYLES, Gloucester, R. I.—*Expanding Drill.*—December 29, 1868.—The slide has an inclined tongue on each side, which fits in a groove on the inner surface of the cutters, and is operated by a screw which expands or contracts the cutting edge, as may be desired.

Claim.—The combination of the tongued slide D with the screw *b* and cutters B and E', the whole constructed and arranged substantially as described, for the purposes specified.

85,335.—JOHN SIDDONS, Rochester, N. Y.—*Hot Air Furnace.*—December 29, 1868; antedated December 15, 1868.—An additional chamber is formed by placing connecting plates between the air tubes, by which the heat is longer kept in contact with the air tubes. The plates are provided with exit ports, made largest toward the front of the furnace, to equalize the draft.

Claim.—1. The plates *d*, in combination with the air flues C, for the purpose of adding an additional calorific chamber to ordinary hot air furnaces, as herein shown and described.

2. The plates *d*, having suitable openings at the top, the calorific flues K, air flues C, in combination with inner and outer shells B, acting conjointly, substantially as and for the purposes herein shown and described.

85,336.—JOHN SIDDONS, Rochester, N. Y.—*Machine for Making Rings.*—December 29, 1868; antedated December 17, 1868.—The wire is placed between the feed rollers and passed through a hole in the fixed cutting die. The forming die is then forced down by the eccentric, cuts off the wire and bends the ends. The forming dies, being brought together, the ends of the wire are joined together in the form of the bottom shaping iron.

Claim.—1. The forming dies F, and the forming and cutting die B, and the fixed cutting die *b*², in combination with the shaping iron *a*, all acting conjointly, for the purposes herein shown and described.

2. The eccentric cam wheel T, in combination with the die B, levers W, and forming dies F, as and for the purpose set forth.

3. The spring lever B², with its pin *h* and cam Y, in combination with the shaping iron *a* and reciprocating cutting die B, as and for the purposes herein shown and described.

4. The half-blank wheel R, pinion L, and shaft J, in combination with the feed rollers P² and P³, all arranged in relation to the cam T, lever W, and cutting die B, as described.

85,337.—SAMUEL M. SKIDMORE, Brooklyn, N. Y.—*Velocipede.*—December 29, 1868.—Two large wheels in front are driven by means of levers attached to a crank axle, and operated by hand. Steering wheels are arranged in the rear.

Claim.—A "velocipede," arranged, constructed, and to operate substantially as described.

85,338.—JOHN B. SMITH, Sunapee, N. H.—*Machine for Making Clothes Pins.*—December 29, 1868.—In this machine a square billet of wood, of proper length, is carried to the cutters, turned, headed and slotted, by successive automatic movements, and delivered from the machine a finished clothes pin.

Claim.—1. The lifting and depositing arms G, constructed and operated substantially as described, to carry the blanks to and deposit the same upon the seats or pin rests *i i*¹, to be clamped by the turning centers.

2. The combination of the lifting and depositing arms G with the curved spring guide N, for holding the pin blank to the arms while being carried over to the turning centers, substantially as described.

3. The fixed and movable seats or pin rests *i i*¹, with the turning centers, operating substantially as described.

4. The grasping and carrying arm or goose neck W, constructed and operated substantially as described, to carry the turned pin from the seats or pin rests *i i*¹ to the seat *y*, to be slotted.

5. The combination of the seat *y* and the releasing springs *y y'*, and their arrangement, in reference to the carrying arm W, the pushing arm X, and the clamping jaws *q q*, substantially as shown and described.

6. In combination with the seat *y* and spring holders *y' y'*, the piston rod X, operating substantially as described.

7. The clamping levers 7 and 8, or their equivalent, in combination with the seat *y*, the piston rod X,

and the slotting saw Z, operating substantially as described.

8. The transverse traversing cutter carriage D, connected with and operating the longitudinally-reciprocating cutter gouge, substantially as described.

9. The transverse cutter carriage D, connected with and operating the seizing and carrying arm or goose neck W, substantially as described.

85,339.—J. B. SMITH, Milwaukee, Wis., assignor to himself and GEORGE R. CHITTENDEN, Chicago, Ill.—*Coffee Pot*.—December 29, 1868.—The water receptacle and side reservoir are filled with water, into which latter steam is admitted to cause the water to boil. A float in the reservoir operates a valve, to regulate the height of the water.

Claim.—1. Water reservoir A, coffee pot S, and steam pipe E, substantially as described.

2. Reservoir D, with float M and cock N, in combination with reservoir A, substantially as described.

3. Reservoir A, strainer B, gauge F, and coffee pot S, combined, substantially as described.

85,340.—JOHN JOSEPH CHARLES SMITH, Philadelphia, Pa.—*Clay Mold for Casting Metals*.—December 29, 1868.

Claim.—A mold made of moist clay powder, under high but slowly applied pressure, for use in casting metals, substantially as described.

85,341.—HENRY F. SNYDER, GEORGE S. SNYDER, and WILLIAM N. JONES, Williamsport, Pa.—*Casting Bearings for Machinery*.—December 29, 1868.—Into a suitably prepared mold is introduced a stave of brass upon which is poured the iron. After a short time the brass assumes a liquid form, the iron becomes solid, and the liquid brass ultimately cools.

Claim.—The within-described mode of producing compound boxes, of iron and brass, united together, forming the brass with a sinking head projecting above the iron, so as to aid in compensating for the difference of contraction of the parts in cooling, substantially as herein set forth.

85,342.—P. H. STARKE, Richmond, Va.—*Plow*.—December 29, 1868.—The upper part of the standard extends forward in a line so as to form a fastening for a straight wooden beam.

Claim.—A plow standard, constructed and arranged so as to receive a straight wooden beam and handles, with suitable moldboard and landside, as shown and described.

85,343.—ADAM STERNBERG, Nettle Lake, Ohio, *Seeding Machine*.—December 29, 1868.—Valves over the holes in the seed box are opened by means of a lug as the shaft rotates, and are closed by springs. A reverse movement may be given to the shaft, so as to cause the lug to operate the valves at the proper time.

Claim.—1. The valves I, springs J, as constructed, arranged, and operated by the lug P, for the purpose substantially as set forth.

2. The arrangement of the cultivators K, spouts G, and forks L, for the purpose specified.

3. The levers C' D', pawl and lever B' and A', as arranged in combination with the roller D, for the purpose and in the manner as set forth.

85,344.—GEORGE STUDER, Richmond, Ind.—*Apparatus for Pressing Cigars*.—December 29, 1868.—A series of rods are arranged in a tubular form and secured together at one end, into which a newly made cigar is placed, and compressed by a ring on the other end.

Claim.—The combination of the rods or wires, and ring or rings, substantially in the manner described, and for the purpose set forth.

85,345.—W. H. SULLENBERGER, Harrisburg, Pa., assignor to himself and J. C. MARTIN, same place.—*Sash Stop and Lock*.—December 29, 1868.—The device is composed of a swiveled lever, a sliding wedge, an anti-friiction roller, and a shifting rod, all connectedly attached, and so arranged on the side rail of a window sash as to act as a lock and a stop when the sash is closed or opened.

Claim.—1. The swiveled lever A, provided with

the bolt O, the inclined arm H, and bearing a, the wedge C, provided with the flanges m n, bearings w' the rod B, provided with the catches b b, all constructed substantially as herein set forth.

2. The lever A H O, in combination with the wedge C, anti-friiction roller K, and rod B, when arranged to operate substantially in the manner as and for the purpose herein set forth.

85,346.—EMMA THRALL, (administratrix of the estate of GEORGE W. THRALL, deceased,) and WILLIAM L. RAYMENT, of Burlington, Mich.—*Corn Planter*.—December 29, 1868.—Cam disks are fitted to slide on the axle, and be clutched or unclutched by means of a lever, to operate the seed slides. The seed tubes are made with outside pivoted strips, to which are connected springs which act in opposite directions.

Claim.—1. The arrangement of the cam disks F, levers L¹ L², and the vibrating bars p, with the wheel axle E, seed slides a, and with the frame and hoppers of the machine, substantially as and for the purpose specified.

2. Constructing the seed-dropping tubes C, with vibrating sides h, when used, in combination with seed slides a and springs s¹ s², for the double dropping of the seed, substantially in the manner described.

3. The hinged marking rods R, in combination with the tubes C, substantially as and for the purpose set forth.

85,347.—WILLIAM VAN ANDEN, Poughkeepsie, N. Y.—*Railway Rail Chair*.—December 29, 1868.—Improvement upon his patent of September 18, 1866. The chair having corner bearing flanges, is provided with a perforated projecting base between them, by which the chair is prevented from rocking and cutting into the cross ties.

Claim.—The chair A, constructed as described, and having the bearing flanges a a, inclined sides J J, and perforations e e, all constructed and arranged as and for the purpose described.

85,348.—A. P. WINSLOW, Cleveland, Ohio.—*Stove for Railroad Cars*.—December 29, 1868.—Perforated pipes opening into the stove are connected with the tank, so that in case the stove is turned over the water in the tank will be thrown upon the fire.

Claim.—The tank, as specified and shown, which constitutes at the same time a base or bottom for a stove, and a tank for the purpose of carrying water to be utilized in extinguishing the fire in the stove in case of accident.

85,349.—GEORGE W. N. YOST, Corry, Pa., assignor to CORRY MACHINE COMPANY.—*Harvester*.—December 29, 1868.—A lever is pivoted to the tongue, and the tongue is pivoted to the main axle, thus making the latter, working within the tongue, the ultimate fulcrum of that lever, for raising and lowering the points of the cutting apparatus.

Claim.—The combination and arrangement of the lever Q with the axes e', the body A and A', the tongue Y, the tongue collar E' and the main axle G', made and used as described, for grass and grain-cutting machines.

85,350.—JOHN ADAMS, The Strand, England.—*Revolving Fire-arm*.—December 29, 1868; patented in England, July 28, 1866.—A thumb-piece, attached to the primary bolt which locks the ejector and cylinder rod, is held flat against the piece of metal through which the cylinder rod and ejector pass, by the secondary spring bolt when the rod and ejector are in their normal position. By turning the primary bolt, only one of the rods can be released at a time.

Claim.—1. A revolver, constructed as herein set forth, of a barrel and cylinder frame, forged in one piece, and combined with a back piece to support and contain the handle and lock, and with a lock, hammer, cylinder, and "ejector rod," all arranged and operating substantially as herein set forth.

2. The combination of the "primary" bolt U (or E) with the cylinder rod R (or C) and ejector O (or D) of my improved revolver, and with a "secondary" bolt, W, (or F,) substantially in the manner and for the purpose herein set forth.

85,351.—H. E. ALEXANDER, New York, N. Y.—*Railroad Ticket.*—December 29, 1868.—The conductor is required to tear off and hand one ticket to each person paying a fare, and to account to the company for as many fares as there are tickets separated from the stubs.

Claim.—The improved railroad or other tickets, riveted or otherwise secured in packages, and provided with the divisions, subdivisions, numbers, and names, substantially as and for the purpose herein described.

85,352.—WILLIAM ALLPORT, New Britain, Conn.—*Door Bell.*—December 29, 1868.—The pull-spindle is made to actuate the bell hammer at each inward and outward movement.

Claim.—The combination of the pull-spindle *e*, the spring *f*, the trip *m*, the lever *h*, and the spring *l* with the bell *b*, when adjusted and operating substantially as and for the purpose described.

85,353.—JOSEPH H. C. APPLGATE, Bridgeton, N. J.—*Dumping Cart.*—December 29, 1868.—The catch in front of the cart body is operated by means of a rod extending to the rear.

Claim.—The catch *A* (hinged to the front of the cart body) and the spring *C*, the fastening staple *g*, and the detaching rod *d*, arranged substantially as shown and described, in combination with a dumping cart, for the purposes specified.

85,354.—HOSEA BALL, New York, N. Y.—*Quartz Crusher.*—December 29, 1868.—The axis of the rollers is prolonged on both sides, so as to receive weighted wheels, to add to the force of the roller, and give it steadiness.

Claim.—1. The rocking pan *I*, supported from beneath, in combination with the reciprocating roller *K*, traversing said pan, and provided with weights *M*, substantially as described,

2. The combination and arrangement of the stationary rack *J*, the rocking pan *I*, with teeth or corrugations *m* on its bottom, and the reciprocating roller *K*, substantially as and for the purpose described.

3. The springs *N*, so arranged as by contact with the roller or wheels to arrest the motion of the roller, and assist its return movement, substantially as described.

85,355.—ELI BARTHOLOMEW, Cleveland, Ohio.—*Washing and Wringing Machine.*—December 29, 1868.—An interior basin or chamber to contain water, is surrounded by, and connected by, a pipe with a trough having a filtering bridge placed over a drain. In the trough a hollow wheel, to be filled with water, rotates.

Claim.—1. The interior chamber *F*, communicating with the exterior trough or chamber *G*, which is furnished with the filtering bridge *H*, and with the water receptacle or drain *I* beneath it, in combination with the rotating cylinder *K*, connected by one end of its shaft to a revolving post, all as and for the purposes set forth.

2. In a machine, as claimed above, making the revolving cylinder removable, together with the revolving post, so as to permit the cover to be placed over the machine when not in use, as and for the purposes set forth.

85,356.—FREDERICK BAUMGARTNER, Brooklyn, N. Y.—*Device for Operating Window Sash.*—December 29, 1868; antedated December 17, 1868.—A toothed wheel recessed in the sash is made to engage with a perforated strip or band secured to the window sash, a device being provided for holding the band closely to the wheel.

Claim.—The combination of the wheel *B*, band *A*, and device *h i i*, or its equivalent, arranged and operating substantially as and for the purposes herein set forth.

85,357.—G. W. R. BAYLEY, Algiers, La.—*Railway Chair.*—December 29, 1868.

Claim.—1. So constructing and arranging the lip of a railway-joint chair, that it shall fit snugly under the nuts *E* of a bolted railjoint, and thereby lock the nuts, so as to prevent their turning or becoming loose, substantially as described.

2. The combination of the lip *B* of a railway-joint chair, and the nuts *E* of the joint bolts, substantially as described.

85,358.—H. P. BEMISS, Milan, Ohio.—*Wash Boiler.*—December 29, 1868.—The lower ends of the tubes are secured to the upper face of the secondary bottom, so that, with the openings, circulation of the water will always be insured, irrespective of the quantity of clothes in the boiler.

Claim.—The false bottom *B*, rigidly affixed to the base of the tubes *D*, above the bottom of the boiler, perforated at its corners *F* only, and provided with the central hinged door *C*, as herein described, for the purpose specified.

85,359.—H. W. BOIFEUILLET, Savannah, Ga.—*Car Coupling.*—December 29, 1868.—A curved plate pivoted to the under side of the bumper, passes up through a slot in the same, and adjustably supports the link. The curved plate is held in place by means of an arm attached to a shaft on the same, and provided with a catch that engages with a rack in the bumper.

Claim.—The combination of the rack *I*, pawl or catch arm *H*, arm *G*, and square shaft *F*, with the bumper head *A* and curved plate *E*, substantially as herein shown and described, and for the purpose set forth.

85,360.—RICHARD E. BOWEN, Colden, N. Y.—*Fence Post.*—December 29, 1868.—The post is connected to a base of stone by means of metal clasps at the sides, secured together by screw bolts.

Claim.—The clasps *C*, in combination with the post *A* and base *B*, substantially as and for the purpose described.

85,361.—GEORGE F. BOYDEN, Providence, R. I.—*Furniture Protector.*—December 29, 1868.—A pad is attached to the outer end of a toothed bar which is adjustable in clips on the under side of the seat, and can be drawn in and out to protect the walls of the apartment and the furniture from being injured.

Claim.—An adjustable furniture protector, consisting of the ratchet toothed bar *A*, cushion *B*, clasps *C* and *C'*, and spring *D*, all operating substantially as herein shown and described, and for the purpose specified.

85,362.—PHILIP A. BROWN, Indianapolis, Ind.—*Mold for Forming Roofing Tiles.*—December 29, 1868.—One mold forms the lower tier, beginning at the eaves. The second mold forms the intermediate sections, and the third mold the top or ridge sections.

Claim.—The arrangement of a series of molds formed in the parts *A B*, and *B'*, for forming roofing tiles and caps, such as herein shown, all constructed in the manner as and for the purpose specified.

85,363.—GEORGE BUCKEL, Detroit, Mich.—*Chair Seat.*—December 29, 1868.—A semi-cylindrical seat is formed of bands crossed and interwoven to form a substantial fabric.

Claim.—The semi-cylindrical chair seat, when prepared of longitudinal bands *b*, and transverse bands *c*, substantially as described, for the purpose specified.

85,364.—WILLIAM CARPENTER, Fairbury, Ill.—*Cloth Guide for Sewing Machines.*—December 29, 1868.—The cloth-holding parts slide in the metallic plate and travel with the cloth as it is fed.

Claim.—The combination of slide *B B*, pincers *C C*, and metallic plate *A*, all constructed and operating substantially as and for the purpose described.

85,365.—M. D. CHEEK, Memphis, Tenn.—*Baling Press.*—December 29, 1868.—A removable head is hung by suitable rods to the *T*-head levers, which latter raise the head out of the packing chamber and move it to one side on the horizontal guide, to permit the cotton to be inserted. By releasing the latch that holds the tumbling bar, the straps can be removed and the door opened to remove the bale.

Claim.—1. The combination of the *T*-head lever *K*, packing head *F*, connecting rod *J*, or its

equivalent, and the guides *d* and *L*, substantially as set forth.

2. The tumbling bar *U*, with hooks *W W*, in combination with the latch *a* and straps *S S*, substantially as and for the purpose set forth.

3. The straps *S S*, attached permanently to the ends of one of the doors, and engaging with hooks *W W*, or equivalent devices, upon the other door, so as to relieve the press frame from lateral pressure, substantially as described.

85,366.—ASA H. CHURCH, Hubbardtown, Mass.—*Toy*.—December 29, 1868.—The figure is pivoted to the carriage and provided with a pinion which engages with a rack on the sliding handle, so as to reverse its position in conformity with the motion of the carriage.

Claim.—1. A toy, whose figure, *H*, will reverse its position in conformity with the motion of the carriage, substantially as described.

2. The sliding tongue *D*, rack *E*, and pinion *F*, or equivalents, in combination with the figure *H*, substantially as described.

3. The figure *H*, block *J*, platform *C*, gearing *E F*, sliding tongue *D*, and carriage *A B*, combined and operating substantially as described.

85,367.—J. A. M. COLLINS, Keokuk, Iowa.—*Bill Holder*.—December 29, 1868.—The pockets are curved so that the papers will form a section of a cylinder when standing, to prevent flapping over or bending down.

Claim.—The improved article of manufacture, made of such form as to hold papers in the form of part of a cylinder, substantially as and for the purpose specified.

85,368.—TOBIAS CRUMLING, Cross Roads, Pa.—*Separator for Thrashing Machines*.—December 29, 1868.—The straw carriers consist of a series of vibrating reciprocating beams which are operated by cranks. A series of suspended fingers prevent the escape of the straw under the roof of the shed.

Claim.—The straw carrier *b b'*, in combination with the winnower *B*, the fingers *d*, the connecting rod *k*, and shaft *i*, as and for the purpose specified.

85,369.—CHARLES D. CULVER, Mauch Chunk, Pa.—*Railway Car Brake*.—December 29, 1868.—A lever connecting with the brake wheel actuates an arm on the revolving brake bar, and causes the latter to force cams on its end in contact with one pair of brakes, and a rope to be wound up, which connects with the other pair.

Claim.—1. The combination of the arm *A*, revolving brake beam *B B*, cams *C* and *C'*, chains or wire-ropes *W R* and *W R'*, connecting with a second pair of brakes on the flat bar *F B*, substantially as specified.

2. In combination with the above, the lever *L* and stem or drum *D* of the brake wheel, to arm *A* on the brake beam *B B*, all arranged and operating as and for the purpose set forth.

85,370.—HENRY DEACON, Appleton House, Appleton, England.—*Manufacture of Chlorine*.—December 29, 1868.—The heated compounds are a mixture of oxide of copper and oxide of manganese, mixed with clay.

Claim.—1. The continuous production of chlorine, by passing a current of hydrochloric-acid gas and atmospheric air, by preference in a heated condition, over heated compounds, such as those hereinbefore referred to, which, or one of the elements of which, must have the power of absorbing oxygen, either before being heated or when heated, and must possess, when subsequently treated with hydrochloric acid, and heated, either alone or in the presence of oxygen, the power of decomposing such acid, and of ultimately yielding chlorine as one of the results of the decomposition.

2. The continuous production of chlorine, by passing, as above described, a current of hydrochloric acid gas and atmospheric air, by preference in a heated condition, over heated substances, porous or otherwise, which are impregnated or mixed with metallic compounds, such as are hereinbefore mentioned and described.

85,371.—THOMAS W. DRESSER, San Francisco, Cal.—*Quicksilver Furnace and Condenser*.—December 29, 1868.—The separating walls are pierced so that the heated vapor shall traverse as much space as possible in its passage. By means of inclined impervious plates, the escaping quicksilver is carried back into a receiver.

Claim.—1. The separating walls *L L* in the vapor chamber, with the upper connecting passages *M M*, and lower passages *N N*, together with the condensing troughs *o o*, the whole constructed and operated substantially as and for the purpose described.

2. The siphon water pipe *X*, and the pipe *b* from the vapor chamber, or equivalent device, for withdrawing the vapor by means of a vacuum, and condensing it in its passage, substantially as herein described.

3. The cylinder *e*, with the buckets *g*, operating as shown, for producing a vacuum and forcing the vapor beneath the water in the chamber *d*, and the vapor pipe *i*, constructed and operated substantially as and for the purpose described.

4. The two flues *m* and *n*, with the dampers *t t t*, for regulating the draft, or, by closing them entirely, to cause a draft through the siphon tube, and condensing chamber *j*, substantially as described.

5. Constructing the foundation with the inclined impervious plates *A A* and the channels *D* between the courses, together with the collecting channel *B*, substantially as and for the purpose described.

6. A draft, as created by the siphon tube *X*, the endless chain and its buckets *g g*, or equivalent device, for condensing the vapors and gases which escape from chemical works, for retorting gold and silver amalgams, and for withdrawing and condensing gold that would be lost in melting and refining, substantially as herein described.

85,372.—JAMES ELLIOTT, New York, N. Y.—*Pipe and Faucet Clamp*.—December 29, 1868.—Designed to facilitate the soldering of faucets to lead pipes.

Claim.—The curved bar *A*, provided with the fixed and sliding jaws *e e*, and the adjustable bearing *k*, all constructed and arranged substantially as shown and described, to form a pipe and faucet clamp for plumbers' use, as set forth.

85,373.—A. H. EMERY, New York, N. Y.—*Safety Lamp*.—December 29, 1868.—The inner tubes or rings are held in place by friction in the outer tubes, thus dispensing with the use of solder in securing the diaphragms.

Claim.—The method of fastening the diaphragms *G* in the tube *F*, by means of the inner tubes or rings *H*, substantially as and for the purposes herein described and set forth.

85,374.—J. M. ESTABROOK, Milford, Mass.—*Screw Peg for Boots and Shoes*.—December 29, 1868.

Claim.—The self-clinching metallic screw peg *A*, having a flattened wedge-shaped end, whereby, as it strikes the metal plate upon the last, in the act of driving, it is adapted to be bent down into the inner sole of the boot or shoe, as herein shown and described.

85,375.—ALBERT FONTAYNE, Cincinnati, Ohio.—*Treadle*.—December 29, 1868.—The foot plate has bearings on the treadle shaft, and is provided with adjustable caps with India-rubber washers attached, so that the lost motion caused by wear can be taken up by means of the screw. The connecting rod is slotted from the journal outward, so that wear may be compensated for.

Claim.—1. The movable pieces *C C*, in combination with the shaft *B*, collars *E E*, or their equivalents, screws *D D*, and India-rubber washers, or their equivalents, as and for the purposes described.

2. The combination of the pieces *C C*, shaft *B*, screws *D D*, India-rubber washers, and seats *F F*.

3. The piece *L* of the connecting rod *K*, extended as shown, for the purpose specified, and combining the screw *H*, journal box *M*, and curve surrounding the hole *N*, substantially as described.

85,376.—JOHN H. FRENCH, Albany, N. Y.—*Machine for Ruling School Slates.*—December 29, 1868.—Lines can be ruled longitudinally, transversely, or diagonally across the slate, which latter rests on spring bearings suspended from the disk. The adjustable stops arrest the motion of the slate at any point.

Claim.—1. Inserting the marking tools F in their heads, in such an angle that their broad faces shall stand at right angles to the line of motion, whereby oblique rulings are produced without changing the motion of the carriage, as herein shown and described.

2. The carriage C, carrying the adjustable disk D, in which the spring bearings *d d* are arranged, in combination with the tools F F, fitted in one head, substantially as set forth.

3. The adjustable stops *a*, in combination with the sliding carriage C, turning disk D, and tool head E, all made and operating substantially as herein shown and described.

85,377.—GEORGE A. FULLERTON, Lynn, Mass.—*Steam Pipe Coupling for Railroad Car Heaters.*—December 29, 1868.—A thick rubber band receiving the nozzle on the ends of the pipes, is held in place by a cylinder with inwardly-projecting flanges. A stiff spring provided with a wedge-shaped point is attached to each pipe; the wedge-shaped point of one spring enters a forked socket on the opposite pipe. The pressure of the springs holds the pipes together.

Claim.—1. The combination of the springs *s s'*, clutching the forks *g g'* of the opposite pipes *a b*, substantially in the manner and for the purpose specified.

2. The combination of the rubber band *u u* and coupling *c* with the conical muzzles of the pipes *a b*, in the manner and for the purpose described.

3. The mode of hanging the pipes *a b* to the cars, allowing them a free motion axially, or in a lateral direction, in the manner and for the purpose substantially as set forth.

4. The combination of springs *s* and *s'*, forked sockets *g* and *g'*, steam pipes *a b*, coupling *c*, having rubber lining *u*, lips *o o'*, bolts *f f'* and *m m'*, springs *q q'*, and valve *r*, when the whole are constructed and operate relatively to each other, substantially as and for the purpose described and set forth.

85,378.—FREDERICK A. GEISLER, Bristol, R. I.—*Mowing Machine.*—December 29, 1868.—The cutter bar is raised or lowered by means of the bell crank actuated by the drum, with which it is connected. The crank shaft is arranged in sliding bearings in a frame connected by links to arms pivoted to the frame, and supporting a shaft which is held by a spring catch, so as to be thrown in and out of gear with the driving wheel.

Claim.—1. The crank shaft E, drum D, and bell crank C, arranged and combined with the shoe A, substantially as and for the purpose described.

2. The crank shaft F, arranged in sliding bearings, and connected to the vibrating arms H' supporting the adjusting shaft I, combined with the spring catch K, all substantially as and for the purpose described.

85,379.—A. J. GOING, Clinton, La.—*Cotton Seed Planter.*—December 29, 1868.—The agitator keeps the seed in the upper part of the hopper in a light, loose state, and prevents the choking or clogging of the hopper.

Claim.—An agitator for a cotton seed planter, composed of a spring C, having an arbor or shaft D, attached, through which transverse rods or arms *b*, pass, the agitator being secured in the hopper, and arranged in relation with the seed-discharging device, to operate in the manner substantially as and for the purpose set forth.

85,380.—CHARLES E. GRIFFIN, Roseville, Ill.—*Scythe.*—December 29, 1868.—The weight serves as a counterpoise and obviates a side draft produced by the resistance of the grass to the action of the scythe.

Claim.—The application of a weight or counterpoise to a scythe swath, substantially as and for the purpose set forth.

85,381.—WILLIAM HAMILTON, Toronto, Canada.—*Lock Nut.*—December 29, 1868.—The object of this invention is to prevent the nuts from becoming loose when they are subjected to a vibratory motion, as in cars or other vehicles.

Claim.—The nut B, secured to the bolt, by providing a groove in the latter, and driving the key *b* into said groove, through the threads of the nut, at any point, substantially as herein shown and described.

85,382.—ELI HARBAUGH, Washington, Iowa.—*Fastening and Strengthening for Horse Collars.*—December 29, 1868.—A wire spring is attached to and extends entirely around the roll of the collar, and forms a hook at the top, by which it is fastened by a strap to the horse.

Claim.—The wire spring *a*, and hook on the upper end thereof, marked *b* in said drawing, for the purpose of securing the collar on the horse while in use.

85,383.—JAMES HOUSE, Turin, N. Y.—*Seed Sower.*—December 29, 1868.—By means of the adjustable perforated slides, the apertures in the hopper can be closed or regulated for the amount of grain to be fed. A second pair of slides, made adjustable for various sized seeds, receives a vibratory motion through a connecting rod from the cam.

Claim.—1. The use of the adjustable false bottom, consisting of the perforated slides C D.

2. The use of the adjustable slide I J, connecting rod N, and cam Q, as herein constructed and shown.

3. The construction and arrangement of the several parts, as herein set forth.

85,384.—CHARLES P. HOWELL, Covington, Ky.—*Hoe.*—December 29, 1868.—One end of the bent clamping bar embraces the blade of the hoe, and the other end fits in a recess in the handle. A ferrule slides over and secures the bars when inserted in the slots.

Claim.—1. The clamping-bars B, constructed substantially as herein described.

2. The clamping bars B, in combination with the brace piece E, blade D, ferrule C, and handle A, or their equivalent, when constructed and arranged in the manner and for the purpose shown and described.

85,385.—J. M. HUGHES, Menomonee, Wis.—*Medical Compound.*—December 29, 1868.—Composed of cider vinegar, molasses, spirits of turpentine, common salt, saltpeter, oil of vitriol and olive oil, for external use in diseases of the skin.

Claim.—The compound of matter composed substantially as herein described.

85,386.—DAVID HUNTER, North Bennington, Vt.—*Water Regulator for Paper Pulp Machines.*—December 29, 1868.—The pulp is prevented from rising in the vessel in which the float operates by the pressure of water from a small pipe leading from the upper vessel.

Claim.—1. The application to a paper pulp machine of a self-acting float, which regulates the water supply, for the purpose of preventing loss of pulp by the overflow of water, as set forth.

2. The combination of the float E, having the rod *h* and valve or valves *i*, with the vessel C, in which the chambers *e* and *f* are formed, by means of partitions *a a* and *b*, the apertures through which can be closed by means of the valves, as set forth.

3. The combination of the tank A, pipe B, box C, vessel D, float E, valves *i*, and pipe *g*, with each other, all made and operating substantially as herein shown and described.

85,387.—J. W. JESSOP, Harveysburg, Ohio.—*Cultivator.*—December 29, 1868.

Claim.—The provision in a cultivator of the adjustable long beams H, provided with mold plows, cross beams B and C, and standards D, also provided with plows, when the several parts, herein named, are constructed, combined, and arranged as herein set forth, for the purpose specified.

85,388.—J. E. JONES, Wiretown, N. J.—*Elastic Lanyard.*—December 29, 1868.—An elastic plate

is combined with a screw bolt and with the main packing and frame, so as to relieve the strain on the nut of the screw bolt caused by the straining of the rigging.

Claim.—The combination of the elastic washer *f* with the screw rod *E*, collar *e*, nut *H*, plate *D*, elastic packing *F*, and frames *A B*, as herein described, for the purpose specified.

85,389.—PAUL H. KENDRICKEN, Boston, Mass.—*Valve for Steam and other Machinery.*—December 29, 1868.—This invention is designed for effecting the simultaneous closure of the entrance and exit of a liquid, gas or steam, and it is especially applicable to steam radiators. Upon turning the valve stem, the two valves are caused to approach each other and close upon their seats. When the valves are closed the collar is in such a position as to allow a free circulation of steam throughout the entire device, and exclude return water from the radiator.

Claim.—1. The arrangement of the ports or passages *a a'*, *b b'*, *c c'*, and pipes *d d'*, when combined with the valves *C* and *C'*, and the valve chamber *B*, substantially as herein shown and described.

2. The arrangement of the valves *C* and *C'*, stems *f f'*, and valve seats *c c'*, substantially as shown and specified.

3. In combination with the ports or openings *a a'*, *b b'*, *c c'*, and *d d'*, and valve and valve seats *C C'* and *c c'*, the interposed collar or abutment *m*, substantially as shown and set forth.

85,390.—H. M. LONG, Williamsville, N. Y.—*Gate Attachment.*—December 29, 1868.—On pulling one of the levers, the swing arm draws back the longitudinally-sliding latch and causes the gate to open.

Claim.—The arrangement of the cross wires *c c'*, connecting with the levers *A A'*, the swing arm *C*, provided with forks *i i*, the button stop *h*, and the connecting rod *j*, when the said parts are combined with the longitudinally-sliding latch *m* and swinging gate *B*, in the manner and for the purpose specified.

85,391.—WILLIAM H. LOTZ, Chicago, Ill.—*Folding Lounge.*—December 29, 1868.—An upholstered body or shell is connected to the ordinary sofa by pivoted arms, so that when the apparatus is closed the shell covers the body of the sofa, and when opened forms a bed.

Claim.—1. A sofa-bed, consisting of a sofa, *A*, and a shell *B*, of corresponding form, combined and arranged to operate substantially as described.

2. A sofa-bed, consisting of the sofa *A* and the shell *B*, united, by means of the shaft *a*, with the arms *C*, attached rigidly thereto, and pivoted at their opposite ends to the shell *B*, all constructed and arranged to operate substantially as herein set forth.

85,392.—HENRY McCULLAUGH, Marietta, Pa.—*Collar for Pipes in Hot-blast Furnaces.*—December 29, 1868.—The collars are cast in two parts and connected by a knuckle joint, so that they can be removed from the pipes without being broken, or breaking the cement.

Claim.—The herein-described collar, for coupling or protecting hot-air pipes in blast furnaces.

85,393.—JEREMIAH McILVAIN, Churchville, Md.—*Anti-friction Box for Shafting.*—December 29, 1868.—The wings on the cover act as dusters to prevent the admission of dust between the two parts.

Claim.—1. The anti-friction box, composed of two parts *B D*, provided respectively with grooves *a d*, of the form shown, with balls *C* placed between them, the pendent shaft or arbor *E*, attached to *D*, fitting in the hole *c* in *B*, and the step *e* on *D*, for connecting a shaft to *D*, all constructed and arranged substantially as and for the purpose set forth.

2. The cover *F*, provided with the wings *f*, and applied to the upper box *D*, all constructed and arranged substantially as and for the purpose specified.

85,394.—SAMUEL MYERS, Hogestown, Pa.—*Window Frame.*—December 29, 1868.—This con-

struction obviates the necessity of removing the parting bead in removing the sashes.

Claim.—Constructing the window frame with the lower portion of one side of the casing of said frame *C*, and of the parting bead *D*, removable together, substantially as herein shown and described, and for the purpose set forth.

85,395.—EDWARD L. PERRY, New York, N. Y.—*Hose.*—December 29, 1868.—The end of the pipe that is coupled is made tapering and secured to the plug or coupling by a ring, which presses the rubber into the indentations of the screw threads.

Claim.—1. As a new article of manufacture, a continuous flexible India-rubber hose, terminating in a rigid nozzle of the same material, substantially as described, for the purpose specified.

2. The combination of the exteriorly-tapering end *D*, of the hose, with the tube *B*, having a screw thread on its exterior, the part *D* being pressed into the screw threads *B*, by means of a ring *A*, all substantially as shown and described.

85,396.—OZI M. PIKE, Leverett, Mass., assignor to himself, WENDELL T. DAVIS, and AUSTIN DE WOLF.—*Machine for Cutting Vitreous Substances.*—December 29, 1868.—The cutter is made of steel and turns on the friction wheels, and in a socket in the thumb screw. Guards are arranged to prevent the cutter from slipping.

Claim.—A tool for cutting glass or other vitreous substances, constructed to operate substantially as described.

85,397.—JAMES RESTIN, Philadelphia, Pa.—*Fabric for the Manufacture of Paper Collars, Cuffs, &c.*—December 29, 1868.—Plain white paper is pasted on one side of a fibrous hemp paper, and a white enameled linen imitation is pasted on the other side; the stock thus formed obviates the necessity of lining the button holes with muslin.

Claim.—A paper stock, for the manufacture of paper collars, shirt fronts, and cuffs, when the same is composed of the material and arranged substantially as herein specified.

85,398.—GEORGE REUBEN, San Francisco, Cal.—*Cover for Pots, Kettles, &c.*—December 29, 1868.—A hole in the lid is covered with wire gauze to permit the steam to escape, and prevent the admission of foreign substances.

Claim.—A cover for cooking and other vessels, having the opening *C* covered with wire gauze or perforated tin, surmounted by the flange *D*, the whole surmounted by the cover *E*, locking into the angular slots *c c*, arranged substantially as herein described.

85,399.—FERDINAND RHEYDT, Chicago, Ill.—*Making Screw Nuts.*—December 29, 1868.—Upon a longitudinally-sliding carriage is mounted a transversely-sliding carriage carrying a chisel, and also a longitudinally-sliding carriage carrying a stationary bit. A prismatic rod, from which the screw blanks are cut, passes through a hollow spindle in rear of the main carriage, and is supported in rolling rings at the rear end.

Claim.—1. The hollow spindle *C*, in combination with the adjustable cutting and boring tools, *H* and *J*, that are arranged on the carriage *B*, substantially as herein shown and described, all operating as set forth.

2. The combination of the hollow spindle *C*, ring *d*, and rings *g*, with the carriages *B*, *F*, and *I*, and tools *H* and *J*, all made, arranged, and operating substantially as herein shown and described.

85,400.—J. C. RICHARDSON, Ilion, N. Y.—*Fork Blank.*—December 29, 1868.—Improvement on his patent of November 14, 1868, and consists in reducing the length of, and giving a finished form to, the tang. A narrow slit is made between the space caused by the removal of the tang, and with that at the base of and between the two middle tines.

Claim.—Cutting out the shank *A*, and connecting the space caused by the removal of said shank, with the space caused by the removal of another portion of the metal, by the slit *b*, as described.

85,401.—S. L. RICHARDSON, Webster City, Iowa.—*Beehive*.—December 29, 1868.—Around the brood box, near the top, is a removable, inclined, rectangular frame or "portico" to afford shade and protection in warm or cold weather. In the spare honey chamber are boards with bearing pins in their upper edges, which may easily be removed.

Claim.—1. Pins of metal or wood for the bearings of the comb bars or frames, when constructed and arranged substantially as herein set forth.

2. The portico P, constructed and arranged substantially as set forth.

3. The hive, as herein described, when its several parts are constructed, combined, and arranged substantially as set forth.

4. The bearing boards *b b b*, in the spare honey chamber, substantially as described and for the purposes set forth.

5. The shallow space between the brood box and bottom board, in combination with narrow strips of wood, *n*, to act as a moth trap.

6. The projection E, of the end pieces D, to support the portico, and form bearings, upon which the hive is supported by the posts H.

7. The honey board *d*, in two pieces, lapping one upon the other, for the purposes specified.

85,402.—WILLIAM RILEY, Salem, Oregon, assignor to H. CARPENTER, same place.—*Shackle and Supporter*.—December 29, 1868.—Composed of two pieces of metal secured together around the leg of a prisoner and supported upon an iron ring attached to a strap passing under the foot.

Claim.—1. The improved shackle A B, with the tongue G and mode of fastening upon the ankle, substantially as herein described.

2. The supporter E, and the mode of fastening the same to the shoe, by means of the strap I and heel plate J, constructed and arranged substantially as herein set forth.

3. The mode of preventing the shackle from turning on the ankle, by means of the stops L L, as specified.

85,403.—HENRY F. ROBERTS, Pittsburg, Pa.—*Propeller*.—December 29, 1868.—The blade is attached to arms that travel in grooves, forming an elliptical track in the sides, by which the propeller is alternately plunged into, and lifted out of, the water. Pivoted V-shaped levers at each end of the track may be adjusted to cause the propeller arms to take either the upper or lower track, to reverse the motion of the blade.

Claim.—1. The combination of the blade I, having the arms *i i*, with the grooved track *c c* and pitman D, substantially as described.

2. The combination, with said blade and track, of the V-shaped reversing levers M M', and the arms N N', and connecting rod R, substantially as described.

85,404.—MATHIAS SCHLEGEL, St. Jacob, Ill.—*Hot-air Stove*.—December 29, 1868.

Claim.—1. The application, to a hot-air stove, of the cylinder I, around which the two spiral passages *l* and *m*, one for smoke and the other for hot air, are formed, substantially as herein shown and described, for the purpose specified.

2. The combination of the plate A, base C, shell D, and fire pot E, with the plate *f*, cylinder I, spiral channels *l m*, and covering plate *r*, all made and operating substantially as herein shown and described.

85,405.—L. B. SHERWIN, Hyde Park, Vt.—*Potato Washer*.—December 29, 1868.—The thin edges of the agitator arms run close upon the bottom of the vessel, so that the potatoes are raised up and dropped over the backs of the same.

Claim.—The vegetable washer, consisting of the agitator E, shaft D, crank *h*, cross bar C, and hinged perforated cover B, when the upper surfaces of the arms of the agitator are beveled in opposite directions, forming thin edges *f*, and thick backs *g*, all arranged within the pail A, to operate as herein set forth and shown.

85,406.—A. SIMIS, Brooklyn, E. D., N. Y.—*Operating Bridle Blind*.—December 29, 1868.—The

ends of the bifurcated portions of the rein cross each other, and pull the opposite edges of the blinders together.

Claim.—1. The rein line or cord E, with bifurcating parts *a a*, substantially as shown and described, or the equivalent thereof, for the purpose of pressing the blinds or blinkers, A, of a bridle upon and against the eyes of a horse, all as and for the purpose set forth.

2. Padding the blinds of a bridle, to form a cavity, B, in the same, substantially as shown and described and for the purpose specified.

3. Employing the blinds of a bridle to shut off the sight of an animal, substantially as shown, and for the purpose specified.

85,407.—JOSEPH STEGER, New York, N. Y.—*Car Starter*.—December 29, 1868.—By the action of the draw bar on the cam, a pawl is positively thrown into gear with a ratchet wheel on the car axle. A spring, connecting the arms that operate the pawls, serves to retract the latter from the ratchet wheel.

Claim.—1. The arrangement of a cam, which is actuated by the strain on the draw bar, and which acts on the pawl *b*, substantially in the manner and for the purpose described.

2. The spring *l*, situated under the middle of the car, and acting on the starting gear at the opposite ends of the car, substantially as set forth.

85,408.—JOSEPH STONEBANKS, College Point, N. Y.—*Attaching Wheels to Sleighs*.—December 29, 1868.—The runners are provided with pivoted spring holders, by means of which they are secured to the felloes and prevented from turning.

Claim.—The combination of the runners B with the spring holders C and the spring braces D, substantially as herein shown and described.

85,409.—HENRY M. STOW, San Francisco, Cal.—*Railroad Tickets and Punch for Cutting Coupons therefrom*.—December 29, 1868.—Each ticket is printed on one side of a small paper pouch, each of which latter contains an amount of money corresponding with some one of the small currency notes in use, less one fare, and each has a coupon printed in one corner, with figures representing the amount in the pouch, with one fare added.

Claim.—1. A pouch ticket, adapted to contain change, with a coupon printed thereon, or attached thereto, substantially as and for the purpose set forth.

2. In combination with an instrument for severing coupons, and automatically depositing them in a box, or other receptacle, substantially as described, a needle, so located in the box, or other receptacle, that it will perforate and retain upon it each coupon as it is deposited, and which, on being withdrawn, will draw a thread through all the said coupons, as set forth.

3. In combination with an instrument for severing coupons and automatically depositing them in a box or other receptacle, substantially as described, a sliding cover to such box or other receptacle, which will automatically slide over the box or other receptacle and close it, when the jaws of the instrument open, and recede from said box when the jaws close, the same being operated substantially as herein described.

4. In combination with an instrument for severing coupons from tickets, substantially as described, a needle, so located in relation to the cutting head, or other equivalent cutting device, that it will pierce and retain upon it each coupon as it is cut off, and so constructed and arranged that by withdrawing it from said coupons it will draw a thread through all of them, substantially as and for the purpose specified.

5. In combination with the cutting head and retaining box herein described, the case or shield D, substantially as and for the purpose set forth.

85,410.—ALOIS THOMA, New York, N. Y.—*Furnace for Melting and Refining Steel*.—December 29, 1868.—The open pan forms the bottom of the smelting oven, and is supported and made adjustable vertically by means of screws. The upper part of the fuel chamber is surrounded by an annular trough filled with sand or water.

Claim.—1. Smelting steel and other metals in an open pan, C, which is made of one piece, substantially as herein shown and described.

2. The oven B, when provided with an up-and-down adjustable and removable bottom, which is made in form of a pan, C, to contain the metal to be smelted, substantially as herein shown and described.

3. The pan C, when arranged of one piece, and in combination with the supporting pan D and screws *vv*, all arranged and operating substantially as herein shown and described.

4. The chamber *o*, arranged on the feeding apparatus, to leave the same clear of obstructions, substantially as herein shown and described.

5. The application of the inclined plane *r*, on the feeding apparatus, to facilitate the distribution of fuel, as specified.

6. The combination of the slide *i* with the cover *q* and endless trough *p*, all arranged to form a feeding apparatus for the fuel, as set forth.

85,411.—STEPHEN D. TUCKER, New York, N. Y.—*Machine for Coating the Surfaces of Electrotype Molds with Plumbago.*—December 29, 1868.

Claim.—1. The right-and-left-hand screw G, in combination with the carriage for carrying the mold to and fro, substantially as described and specified.

2. The combination, with the screw G, of the vibrating brush M, substantially as described and specified.

3. The combination of the screw G, worm H, shaft E, crank pin *c*, slotted lever K, brush M, and carriage N, constructed substantially as described and specified.

85,412.—FLAVIUS J. UNDERWOOD, Rock Island, Ill., assignor to B. D. BUFORD, same place,—*Cultivator.*—December 29, 1868.—Each shovel is provided with boxes secured to its back by bolts and a plate so arranged as to hold the shovel in any desired position. The plows are attached to the axles by joints or couplings, so constructed that the plows may be adjusted laterally and vertically.

Claim.—1. The cultivator frame, consisting of the bars A and the bent bar B, with the axles C attached, the part A being made adjustable, substantially as shown and described.

2. The manner of attaching the plows to the axle C, by means of the plates *h*, grooved boxes *g*, and studs or pins *i*, all constructed and arranged to operate as described.

3. The shovels F, provided with the boxes *b*, bolts *e*, and bar *c*, in combination with the rounded shank *a* of the plow beam, whereby the shovels are rendered capable of being adjusted and secured in place, substantially as herein described.

4. Connecting the handles of the two sets of cultivator shares by means of the bar I, when so arranged as to limit the distance to which said handles may move apart, and yet leave them free to approach each other, substantially as shown and described.

85,413.—H. V. VAN ETTEN, Auburn, N. Y.—*Device for Catching and Holding Domestic Animals.*—December 29, 1868.—Consists of two curved arms, one of which is fixed to a pole, while the other is pivoted and has a cord attached to it, so as to cause it to overlap the fixed arm, and hold the leg of a refractory animal.

Claim.—The device for catching animals, consisting of part A, cast with opening *d*, pole socket *b*, and the semicircular curve *a*, and the part *c*, cast with semicircular curve *a'*, when said curves form a complete circle, and have their ends bulbed and overlap each other, and arms A C bear against each other, and all parts are constructed and adapted to operate as herein represented and described.

85,414.—EDWIN WASSSELL, Pittsburg, Pa.—*Machine for Making Horseshoes.*—December 29, 1868.—A series of devices are used in connection with six rotating disks and two movable yokes, all operated at the appropriate time by one driving shaft.

Claim.—The former A and die B, when combined with the wheels C and D, friction rollers 1, 2, 3, 4, 5, and 6, cams *e*, *f*, *g*, and *h*, pivoted arms X and X',

cam *i*, cutter J, and guides *k* and *k'*, the whole being constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

85,415.—WILLIAM C. WILLIAMSON, Philadelphia, Pa.—*Hoisting Machine.*—December 29, 1868.—The friction wheel is caused, by the eccentric wheel operated by a lever, to come in contact with friction pulley for hoisting. When out of contact with the same, the load descends, and to stop the friction wheel it is brought in contact with a stationary shoe.

Claim.—The eccentric wheel H, when used in connection with the friction pulley C, the friction wheel D, and the shoes F, for the purpose shown.

85,416.—JOHN S. YINGER, Manchester Township, Pa.—*Horse Hay Fork.*—December 29, 1868.—The tines are locked in a closed position by drawing down a lever so attached to a connecting link that the joint will come below the fulcrum of the lever.

Claim.—The instrument above described, consisting essentially of the jaws A A', made in the form described, the plates C C', the link E, the lever D, connected to the link at *e*, the cord F, the link G, the arm *i*, and the pivot bolt B, all constructed, arranged, and combined so as to operate together in the manner and for the purpose specified.

85,417.—EMANUEL ANDREWS, Williamsport, Pa.—*Saw.*—December 29, 1868.—The saw is made with fine teeth at the lower and wider end of the saw, the space and depth of the teeth gradually increasing as they proceed upward.

Claim.—The saw A, herein described, as an article of manufacture.

85,418.—LEVI ANNIS, Quincy, Mich.—*Potato Digger.*—December 29, 1868.—This machine is designed, after digging the potatoes, to leave the ground in a fine pulverized state, clear of weeds, and ready for the reception of seeds.

Claim.—1. In combination with the forked digger, fixed in a rigid portion of the tongue or frame, the swinging controllable frame E, for carrying, behind the digger, the harrows F, substantially as and for the purpose described.

2. The vibrating digger N, for shaking up the potatoes and pulverizing the soil, when made controllable by the operator in his seat, and vibrated laterally of the path of the machine, by means substantially as described.

3. In combination with the laterally-vibrating digger for shaking up the potatoes and working the soil, the adjustable arms R', with their inwardly-inclined rakes for gathering the potatoes into a row, substantially as described.

85,419.—LEONARD ATWOOD, New York, N. Y.—*Hoisting Apparatus for Builders.*—December 29, 1868.—A series of parallel rack bars are attached centrally to a transverse beam on the platform, upon which bars hods may be readily attached.

Claim.—The parallel bars G G, attached to the transverse beam F, used in combination with the platform and frame of a hoisting apparatus, and arranged, in relation thereto, substantially in the manner and for the purpose set forth.

85,420.—ALLEN S. BALLARD, Mount Pleasant, Iowa.—*Ice-cream Freezer.*—December 29, 1868.—In this apparatus two freezing surfaces are presented to the cream, two ice cylinders being assisted to revolve quickly by rollers and scrapers on or against each cylinder. Stationary scrapers and rollers serve to mix the cream thoroughly.

Claim.—1. The outer cylinder A and inner cylinders B and G, forming two ice chambers, in combination with the revolving cream chamber H, and stationary scrapers *a a* and *a' a'*, rollers *b b*, springs *e e* and *e' e'*, and segmental collars *d'* and *d*, constructed substantially as described, and operating as and for the purpose set forth.

2. The collars *d* and *d'*, in combination with the springs *e e* and *e' e'*, scrapers *a a*, *a' a'*, and rollers *b b*, constructed as described and for the purposes set forth.

3. The points *g' g'* on collar *d*, slots in collar *e* of lid

f, segment collars *d' d'*, in combination with arms *i i'* on lid *f*, and sockets *j j'*, constructed as described, and operating as set forth.

85,421.—DAVID L. BARTLETT, Rockford, Ill.—*Water Wheel*.—December 29, 1868.—Each chute is prolonged to the periphery of the ring gate, and the gates, in opening, slide over the fixed walls of the chutes so as to brace them, and an extension rises at an angle to reinforce the projecting wall of said chute.

Claim.—In combination with a curb, in which the wall *a* of the chutes is prolonged beyond the wall *a³*, so as to form the projection *a⁴*, a ring gate, in which the slides that open and close the chutes are constructed with the two parts *m m'*, arranged, when open, to reinforce the parts *a³* and *a⁴*, all substantially as and for the purpose described.

85,422.—CHARLES BEAN, Ionia, Mich.—*Weather Strip*.—December 29, 1868.—A rubber strip is attached along the middle of the edge of the door or window by means of a clamping rod, which presses one edge of the rubber strip into a groove in the door or window prepared for the purpose. The projecting edge of the rubber folds back into a recess over the clamping rod when the door is closed.

Claim.—The arrangement of the rubber strip *E*, wooden strip or rod *F*, screws *e e e*, and door *A*, substantially as described.

85,423.—J. H. BEAUREGARD, Sandy Hill, N. Y.—*Hollow Auger*.—December 29, 1868.—The device is so constructed as to be readily adjusted to cut tenons of any desired size.

Claim.—An auger, consisting of the shank *F*, adjusting springs *E E*, adjustable jaws *A A*, with projections *A' A'* attached thereto, and slotted, so as to receive the adjustable slotted cutters *B B*, set screws *C C*, and right and left hand screws *D D*, all constructed, arranged, and operated as and for the purpose set forth.

85,424.—ROBERT S. BOYD, Smithland, Ky.—*Road Scraper*.—December 29, 1868.—An oblique scraping share is attached to a wheeled suspending frame, so that by raising the rear end of such frame the share will be brought clear of the ground.

Claim.—The combination of the frame *D*, hinged to the axle *A*, and carrying the oblique scraper *G*, with the lever *F*, standards *E*, cord *e*, and pulleys *a b*, all arranged and operating substantially as shown and described.

85,425.—JAMES F. BREWER, Plantsville, Conn.—*Poker*.—December 29, 1858.—The neck is cast upon the rod, and has a projection which is forced into the wooden handle when the latter is driven on. The end of the rod, being clenched, secures the handle.

Claim.—As an improved article of manufacture, the herein described poker, consisting of the wrought metal rod *A*, having the neck *B* cast thereon, and the said rod extending through the said neck, so as to receive and support the handle, all in the manner described.

85,426.—CHARLES K. BROWN, Troy, N. Y., assignor to himself, CHARLES A. BROWN, and F. FIELD, same place.—*Machine for Coloring Paper*.—December 29, 1868.—A reservoir for the coloring matter is placed above, and another below, the rollers, so that both sides of a sheet of paper may be colored at one operation.

Claim.—1. The rollers *d d*, in combination with the hopper *B* and brushes *e e*, substantially as described and specified.

2. The said rollers *d d*, in combination with the trough *C* and brushes *e e*, substantially as herein specified and set forth.

3. The hopper *B*, rollers *d d*, trough *C*, and brushes *e e*, all arranged and combined substantially in the manner and for the purposes herein described and set forth.

4. Distributing the coloring matter over the surface of both sides of a sheet of paper at one operation, by passing said sheet through a pair of brushes, *e e*, substantially as specified.

85,427.—JAMES BULL, Galesburg, Ill.—*Scissors*.—December 29, 1868; antedated December 19, 1868.—The handles are formed of springs riveted together at the ends, so as to keep the blades apart. The instrument is more especially designed for cutting off sewing machine threads.

Claim.—The combination of the curved blades *A A* with the spring handles *B B*, substantially as and for the purposes herein set forth.

85,428.—WILLIAM BURDITT and GEORGE H. BURDITT, Boston, Mass.—*Drive Well*.—December 29, 1868.—The concavo-convex screen is designed to prevent the filtering material from rising with the water.

Claim.—In combination with a pump tube, of the class that is driven into the ground without first digging or boring a hole, a perforated screen, containing some filtering material, and an elastic concavo-convex screen *F*, arranged to operate substantially as and for the purpose set forth.

85,429.—JABEZ BURNS, New York, N. Y.—*Kettle for Culinary Purposes*.—December 29, 1868.

Claim.—1. As a new article of manufacture, the bottom *B*, cast with water legs, *b*, and a bead, *a*, around which the lower edge of the body *A* is bent and secured simply by soldering, substantially as described and shown.

2. The kettle, constructed as described, of the bottom, *B*, cast with the water legs *b* and bead *a*, and the body *A*, of sheet metal, secured to the bottom by having its lower edge bent over the bead and soldered, as herein described.

85,430.—WILLIAM BURROWS, New York, N. Y.—*Combined Beam Compass and Calipers*.—December 29, 1868.—A pair of calipers, a gauge and a tram-mel are combined in one instrument.

Claim.—The combination, in the one instrument, with a stock or bar *A* and heads *C C*, of the trams or legs *D*, and transversely adjustable caliper blades or arms *E*, arranged to operate essentially as and for the purpose or purposes herein set forth.

85,431.—WILLIAM A. BUTLER, New York, N. Y.—*Automatically-operated Pan for Water Closets*.—December 29, 1868.

Claim.—1. A pan closet, in which the soil pan is automatically adjusted to its receiving and discharging positions, through pressure applied to and removed from the seat by means of the sliding bar *H* operating thereon through its jaws *J J'* and spur wheels *K L M*, substantially as specified.

2. The combination, in a water closet, of the tilting or tipping pans *F* and *G*, operating in a consecutive manner, the one as a fresh-water trap, and the other as a soil receptacle, essentially as herein set forth.

3. The combination, with the rising and falling seat *D*, of the fresh water pan *G* and soil pan *F*, in such manner as that weight applied to and removed from the seat will serve automatically to adjust the pans relatively to the bowl *B*, to make the one pan, *G*, act as a water trap when the closet is not in use, and the other pan, *F*, as a soil receptacle while or as the closet is being used, and afterward to tilt or tip to effect its discharge, substantially as described.

85,432.—GEORGE CROMPTON, Worcester, Mass.—*Loom*.—December 29, 1868.—The arrangement of parts admits of the ready removal of the shuttle boxes.

Claim.—1. The arrangement of the angular evener levers, pivoted in or near the cloth-making plane, with short lifter and depresser levers, connected to the evener levers by links, substantially as and for the purpose described.

2. The arrangement of short lifters and depressers, connected to eveners, pivoted as above described, with the slide rods, pattern chain or cylinder, and harness jacks, substantially as set forth.

85,433.—ALFRED S. DICKINSON, Washington, D. C.—*Curtain Fixture*.—December 29, 1868.—Arms pivoted on the inner surfaces of the window frame support a cross piece in which the curtain roller has its bearings, and project forward so as to fall when

the cord is released. The curtain is evenly balanced by attaching the cord to the center of the cross strip.

Claim.—1. The combination of the curtain roller, and the bearings therefor, attached to a strip, D, and said strip, and the rods E, attached thereto, and pivoted to the inner and opposite faces of the window casing, said parts being arranged, in relation to one another, to operate substantially in the manner set forth.

2. In combination with the oscillating arms, roller, and strip, the cord F, centrally attached to the strip, and passing through pulleys or eyes F', substantially as and for the purpose set forth.

85,434.—THOMAS DREW, Newton, assignor to himself and JAMES P. BRIDGE, Boston, Mass.—*Compound for Extinguishing Fires.*—December 29, 1868.

Claim.—The application of sulphite and hyposulphite of soda, either singly or mixed, and in solution with water, as extinguishers of fires.

85,435.—WILLIAM V. DEBOIS, Covington, Ind., assignor to himself, WILLIAM A. SANGSTER, and I. G. SANGSTER, same place.—*Water Indicator for Boilers.*—December 29, 1868.—A rotary movement is communicated from the float to the indicator shaft. The supply of water is regulated by connecting the indicating finger with the cock of the supply pipe, and the finger has a pin which strikes the stem of a wedge, when the water falls to a certain level, and forces a valve shaft inward, so as to admit steam to the whistle.

Claim.—1. The combination, with the cock E, of the whistle N, weighted wedge P, and valve shaft D, substantially as described.

2. The arrangement of the float B, arms C F, cock E, scale G, lever H, connecting rods I K, and the water cock L, substantially as described.

85,436.—GEORGE H. EDDLEMAN, Atlanta, Ga.—*Sawing Machine.*—December 29, 1868.—The inner end of the short shaft has a head in which the circular saw shaft may be secured by a set screw, said saw shaft extending thence to a bearing on the opposite side of the frame.

Claim.—The frame A, constructed as herein described, and provided with the eccentric pulley and shaft D, the short shaft L, one end of which is suitably centered, and the other end provided with a clutch, and the driving shaft V, whereby I am enabled to form a machine combining in one a circular saw, a jig saw, and a lathe, as herein set forth.

85,437.—JOHN T. ELLIOTT, Grand Rapids, Mich.—*Horse Hay Fork.*—December 29, 1868.—The disk is released from the lever by a trip cord, and is actuated by the spring, so as to give the initial backward revolution to the spiral, and thus insure the liberation of the hay from the fork.

Claim.—The construction and arrangement of the wheel or disk A and its pins *i i*, upon the upper portion of the spiral C, in combination with the spring T and lever D upon the head, having tines E E, all as herein set forth.

85,438.—HORACE EVERETT, Philadelphia, Pa.—*Fastening for Sheet Metal Joints.*—December 29, 1868.—Designed to form a tight joint, without the aid of solder, for boxes, tubes, and other articles of sheet metal.

Claim.—A fastening, composed of a lip, *b*, on one end of a strip of metal, and fitted to a pocket, formed by cutting and indenting another strip, or the opposite end of the same strip, all substantially as described.

85,439.—JEAN JOSEPH LÉON FARCOT, Saint Ouen, (Seine,) France.—*Device for Controlling Engines.*—December 29, 1868.—Relates to the arrangement of the valve rod of the engine in relation to the rock shaft, which is operated by a bell crank and connecting rod; said bell crank being attached to an oscillating arm, which is rigidly secured to the main shaft and derives motion from the piston rod.

Claim.—The arrangement of the bell crank I, pivoted to the main lever G, and of the rock shaft L, operated thereby to control the position of the valve

by levers and connections, substantially as shown and described.

85,440.—GEORGE H. GARRETT, St. Louis, Mo., assignor to RICHARD P. GARRETT, same place.—*Molding Pipe.*—December 29, 1868.—The molding apparatus consists of a roller and sweep, secured in a flask section by set screws. The roller has its bearings in radial arms made adjustable in length, so as to regulate the distance between the roller and shaft.

Claim.—1. The flask A, when provided with an adjustable framework, D, and a pressing roller, B, for molding and shaping the sand, in the manner herein shown and described.

2. The roller B, and its adjustable arms B', when arranged and operated as described and set forth.

85,441.—GEORGE W. GILLETT, Chicago, Ill.—*Combined Tank and Closet Attachment to Cooking Stoves.*—December 29, 1868.—The bottom of the water reservoir forms a top for the warming closet, and the water in the reservoir serves to keep the closet warm.

Claim.—1. A combined warming closet and water reservoir, when so constructed as not to form a part of the stove from which they are heated, but can be used in connection with any stove, being connected therewith simply by pipes, substantially as herein set forth.

2. A combined warming closet and water reservoir, constructed as herein described, when so arranged that a part of the water reservoir serves as a part of the warming closet, substantially as and for the purposes herein specified.

3. The combination of the pipes I with the warming closet and water reservoir, constructed as herein set forth, when so arranged that they serve to heat the warming closet and water reservoir, substantially as herein specified.

85,442.—EDWIN F. GUNN, Charleston, S. C.—*Breech-loading Fire-arm.*—December 29, 1868.—The breech block, operated by a pinion on the hammer, is provided with a spring, which comes in contact with the arm of a lever that operates the keeper and shell extractor when the hammer is thrown back or cocked.

Claim.—1. The cartridge keeper or retainer N, constructed for operation by the breech block, or by the hammer, in working the latter back, to effect lift of said keeper, substantially as specified.

2. The combination, with the breech block J and its spring Q, of the lever R, or its equivalent, keeper or retainer N, and shell extractor P, for operation together, essentially as herein set forth.

85,443.—ABSALOM HALLAM, Monmouth, Ill.—*Combined Seed Sower and Harrow.*—December 29, 1868.—Designed to be used as a seed sower, a harrow, a marker of corn ground, or a cultivator.

Claim.—The frame A, B, *v*, and M, of the seat F, harrow H and lever *f*, cords *g g* and chain G, and pulley X, when constructed and arranged in the manner described, and for the purpose set forth.

85,444.—EDWARD HARRISON, New Haven, Conn.—*Grinding Mill.*—December 29, 1868.—The meal, in passing from the stones, is thrown against the wire screen surrounding the stones, the flour passing through the screen to one exit and the hull being driven out at another exit.

Claim.—The arrangement, with the casing which incloses the stones, of one or more bolt cloths, so as to separate the finer from the coarser portion of meal, within the casing of the mill, substantially as set forth.

85,445.—M. R. HELIKER, Norwalk, Ohio.—*Churn Dasher.*—December 29, 1868.—Concentric coils of wire are attached to two pairs of radial arms, one above the other, a space being left for the passage of the butter and cream, and for the hand to be introduced in cleaning.

Claim.—A dasher, when constructed with two pairs of radial arms, B C, arranged in relation to each other, and in combination with the wires D, substantially as and for the purpose set forth.

85,446.—J. O. HOUCK, Iowa City, Iowa.—*Device for Supporting Wagon Tongues.*—December 29, 1868.—A spring is coiled around the pin on which the tongue is pivoted, one end of said spring being secured to the tongue and the other projecting beneath the axle, so as to support the tongue.

Claim.—The arrangement of the axle A, hounds B B, tongue C, pin *a*, and spring *b*, all constructed to operate substantially as and for the purposes herein set forth.

85,447.—ELIZA D. HUNT, New York, N. Y.—*Washing Machine.*—December 29, 1868.—Spiral blades are attached to cross bars on a shaft which has bearings in an inclined corrugated cylinder. The blades draw the water up through, and force the clothes against, the corrugations on the cylinder.

Claim.—The combination of the shaft C, cross bars E E, spiral blades I I, and perforated wheel F, all constructed and arranged to operate within the corrugated metal cylinder A, all substantially as and for the purposes herein set forth.

85,448.—ISAIAH ICKES, Massillon, Ohio.—*Music Book.*—December 29, 1868.

Claim.—So making a hymn book that there shall be a division, transversely, of the leaves of the said book, the notes being on the one half, and the words on the other, whereby any particular hymn may be sung to any desired tune, and the change of different hymns and different notes be accomplished readily, the whole having an exterior like a book of the ordinary make.

85,449.—CHARLES H. JACKSON, St. Louis, Mo.—*Filter.*—December 29, 1868; antedated December 17, 1868.—A central chamber for the filtered water is surrounded by an annular filtering chamber, through which the water filters downward and enters the central chamber at the bottom.

Claim.—The vessels A and B, B¹ B², when constructed with the filtering chambers *b* and *b*¹, and otherwise arranged, as herein shown and described.

85,450.—A. H. JOCELYN, New York, N. Y.—*Binding Books.*—December 29, 1868.—Slates are attached to books for the purpose of enabling the reader to make memorandums.

Claim.—The arrangement of hinged slated leaves *d*, when the same are attached to the cover or any other part of a printed book, so as to turn outward, for the purpose described.

85,451.—MOSES JOHNSON, Three Rivers, Mich.—*Plow.*—December 29, 1868.—The plowing is done by means of the sharp corrugated wheels revolving on pins in stirrups attached to the beam. The width of the furrow can be regulated by means of the hinged beams, which are held in position on the arm by pins.

Claim.—A plow, having wheels A, beams D, stirrups B, axles C, and punctured arm K, constructed, arranged, and operating substantially as described.

85,452.—WILLIAM E. KINERT, Bluffton, Ind.—*Churn.*—December 27, 1868.—The curved form of the dashers is designed to prevent the "slip" incident to the plane surface dasher.

Claim.—The dashers B B', when provided with curved paddles *c c*, wheels J J and K, and axles *e e*, the slotted boxes *g g*, and the slides *h h*, all substantially as herein shown and described.

85,453.—JOHN KIVETT and GEORGE KIVETT, Covington, Ky.—*Method of Laying and Spreading Composition Roofing, Pavement, &c.*—December 29, 1868.—The composition, formed of sand, asphaltum and brine, is smoothed by means of heated rollers.

Claim.—The within described process of spreading and smoothing the surface of concrete or composition for roofs, floors, walks, and streets, by the use of a heated roller or rollers, substantially in the manner described.

85,454.—JULIUS KRIEG, New York, N. Y.—*Piano Stool Screw.*—December 29, 1868.—The wound wire projects beyond the cylinder and forms a screw thread.

Claim.—1. A screw, formed by first spirally grooving a wooden cylinder, and then coiling a wire, C, in said groove, as herein described, as a new article of manufacture.

2. The piano stool screw, consisting of a wooden cylinder, A, spirally grooved, and having a wire thread, C, coiled in said groove, the screw being provided with a cross, D E, for the seat, secured to the upper end by pins G, as shown, whereby the wire C is held in place, as herein described.

85,455.—BENJAMIN KUHN, Dayton, Ohio.—*Seed Planter.*—December 29, 1868.—The pinions forming a cone revolve on a stud attached to an oscillating arm, which is raised or lowered to throw them in gear with a pinion on an axle made to slide by means of a bar, the end of which latter is attached to a sliding arm that moves over and is actuated by a revolving helical plate.

Claim.—1. The rollers D, constructed with pockets, formed by fixed heads, *d*², and intermediate partitions, formed by ribs, part spiral and part straight, substantially as set forth.

2. In combination with the spur wheel on the hub or axle, and the spur wheel on the seed roller, an intermediate set of pinions, cast in one piece, concentric with one another, so as to form a cone spur pinion, so arranged as to give a variable speed, by shifting the wheels in relation to one another, substantially as set forth.

3. The combination of the cone wheel, the oscillating arm, and sliding pinion, arranged in relation to one another, substantially as set forth.

4. The combination of the sliding pinion G, frame A, standard N, oscillating arm O, intermediate cone wheel F, and wheel E, substantially as and for the purpose set forth.

5. The combination of the lever, the sliding pinion and cone pinion, substantially as and for the purpose set forth.

6. The combination of the oscillating bar M, helical plate L, and sliding arm I, substantially as and for the purpose set forth.

7. So arranging the intermediate pinion and the stationary and sliding spur wheels, that while the intermediate pinion swings on an arm concentric with one of the wheels, it shall at the same time swing on a center common with the other, substantially as and for the purpose set forth.

85,456.—BENJAMIN B. LEWIS, Bristol, Conn.—*Calendar Clock.*—December 29, 1868.—Improvement on his patent of February 4, 1862.

Claim.—1. The combination and arrangement of the steps or notches in wheel A with spring *e* and hooked wire spring *m*, substantially as and for the purpose described.

2. Making the notch in wheel E straight and full from points 5 to 7, when said wheel is combined with wing *a* of lever *b*, and the other working parts of this calendar, substantially as and for the purpose described.

3. Making the lever *b*, Fig. 3, all of one piece of metal, substantially as and for the purpose described.

4. The arbor, Fig. 5, with its bearing 1, pivot 2, and tenon 3, in combination with and secured to lever *b*, substantially as and for the purpose described.

5. The combination of stud *d*, spring *e*, and slug *e*, all arranged and secured together, substantially as and for the purpose described.

6. The combination of plate *h*, pillars *g g g*, plate *f*, and wheels A B D E, socket C, and shaft F, substantially as and for the purpose described.

85,457.—LEWIS W. LEWIS, Sharpsburg, Pa.—*Metal Squeezer.*—December 29, 1868.—A hinged guard is so arranged as to bear loosely on the bottom, upset and receive, and throw out of the machine all the pieces or lumps of metal which fly off as the bloom emerges from the rolls.

Claim.—Hinging the guard, or hinging a bar to the guard of a squeezer, in the manner described, so that the bar or its guard, as the case may be, shall rest with its lower edge on the upper face of the bottom upset, substantially as and for the purposes hereinbefore set forth.

85,458.—JOHN S. LIPPS, New York, N. Y.—*Manufacture of Illuminating Gas.*—December 29, 1868.—Hydrogen, in its nascent state, is passed through liquid hydrocarbons, which is effected by means of an annular vessel containing water, and having inverted in it a vessel to which is attached a wire basket containing zinc or its equivalent.

Claim.—1. The manufacture of illuminating gas, by passing hydrogen, in its nascent state, through gasoline, substantially as herein described.

2. The manufacture of illuminating gas from hydrogen and gasoline, or other hydrocarbon liquid, by so placing the said liquid in the same vessel with the acid by or from which the hydrogen is generated that the said liquid floats upon the acid, and the hydrogen, as it rises from the acid, passes through the said liquid, substantially as herein described.

3. The combination and arrangement of the reservoir B, containing the acid and the gasoline, or other hydrocarbon liquid, the gas holder C, and the basket D, for containing the metal, whereby the production of the illuminating gas is made self-regulating, according to the demand or consumption, substantially as herein specified.

85,459.—ROBERT A. LUCAS and LOUIS S. LEHMAN, Wooster, Ohio.—*Fruit Drier.*—The dry house is constructed on the rear side of the furnace and provided with openings for the escape of smoke.

Claim.—1. The air chamber C, constructed on the rear side of furnace B, and communicating with the chamber *l* over said furnace, and operating substantially as set forth.

2. The employment, in a dry house, of the perforated inner double wall D, supplied with the air tubes *d*² *d*², and consisting of the inner house *d* and partition *d*¹, all constructed and operated substantially as and for the purpose set forth.

85,460.—D. D. MACKAY, Whitestone, N. Y.—*Egg Beater.*—December 29, 1868.—The spiral screw within the handle imparts an alternate rotary motion to the stirrers, by alternately pressing down and raising the handle, the spring acting to force up the handle.

Claim.—The combination of the spiral thread or screw B on the shaft or stem D, the nut *a*, the upper spindle bearing *e*, the spring C, and the stop *g*, all arranged within the handle A, substantially as herein specified.

85,461.—ROBERT B. MAGEE, Venango City, Pa.—*Temper Screw for Oil Wells.*—December 29, 1868.—The brace nut, through which the screw passes, is made in two pieces held together by a clamp, riveted or screwed to the said nut. A set screw passes through and bears against the nut, so that when the set screw is slackened the nut will spring open.

Claim.—The combination of the screw C, with its links C' and C', with the brace nut A, clamp B, rivet B¹, and set screw B², when constructed, combined, arranged, and operating substantially as herein described, and for the purpose set forth.

85,462.—LEONARD MANCY, St. Morgan, Ill.—*Whiffletree Attachment.*—December 29, 1868.—A singletree is so connected with levers that the draft of a single horse shall counterbalance the action of the draft of two or more horses upon the double or triple attachments.

Claim.—1. The combination of the singletree C, the adjustable staple bolt *c*, the lever B, adjustable bolt *d*, and link D, the lever E, adjustable staple bolt *g*, and doubletree G, substantially as set forth.

2. The pivot F on the fulcrum block *f*, attached at the side of the tongue A, substantially as set forth.

85,463.—WILLIAM MATTHEWS and JAMES MOORE, Philadelphia, Pa.—*Cover or Door for Gas Retorts, Furnaces, &c.*—December 29, 1868.—Designed to allow for expansion and contraction of the cover, and to prevent its breaking.

Claim.—A retort cover or furnace door, having the portion exposed to the fire of a concavo-convex form, and this portion waved or corrugated, all substantially as and for the purpose herein set forth.

85,464.—JOHN H. MCKINLEY, New York, N. Y.—*Hames Fastener.*—December 29, 1868.—A hook plate is secured to the hames, and has pivoted to it a hooked and bent lever, provided with a stud that fits in a hole in the hook plate when closed.

Claim.—The hook plate *a*, bent lever *b*, having stud F, hole *g*, and pivoted together as described, in combination with the curved bar C, with hook D at one end, the ordinary eye H at the other, and the movable loops *i*, all being constructed and arranged with relation to each other, and to operate together in the manner and for the purpose herein described.

85,465.—WILLIAM S. MCKINNEY, Cincinnati, Ohio.—*Shaft Coupling.*—December 29, 1868.

Claim.—In the described combination with the key-seated sleeve C and common key F, the double-draft key or gib G, constructed with opposing inclined faces *g g'*, to fit into match key seats H I in the shafts, substantially in the manner and for the purpose set forth.

85,466.—NOAH MENDENHALL, Greensburg, Ind.—*Corn and Seed Planter.*—December 29, 1868.—The seed distributors are connected by arms to a T-piece, which is reciprocated by means of a connecting rod attached to a crank on the axle.

Claim.—1. The combination of the crank C, connecting rod D, T-piece or cap arm E, and seed distributors I.

2. The combination of the within-described seed boxes with the distributors and the partitioned seed tubes, substantially as shown and described.

3. The arrangement of the T-piece E with reference to the seed distributors, by which they are both moved by one motion of the connecting rod.

85,467.—JOSEPH MILLARD, Winslow, Ind.—*Cultivator.*—December 29, 1868.—The side bars are connected at their front ends to the center bar by springs, and their rear ends are moved toward or from the center bar by means of connecting rods operated by a lever adjustably pivoted in a forked standard.

Claim.—The arrangement of the side bars B B, rods D D and E, standard F, bar G, lever H, and bent notched bar I, all as shown and described.

85,468.—ELIE MONEUSE and LOUIS DUPARQUET, New York, N. Y.—*Cooking Range.*—December 29, 1868.—The fire chambers, ovens, and flues are so arranged that the range has two fronts and an end, so that attendants can have ready access to all parts of the range. The products of combustion are utilized in heating ovens or spaces for warming plates and keeping the viands warm.

Claim.—1. A cooking range, in which two rows of fire spaces and ovens are arranged, substantially as set forth, so that the products of combustion pass away from the middle of the range, between said rows, as set forth.

2. The end fire space *k*, with ovens on each side, arranged substantially as shown, in connection with the two rows of fire spaces *h h*, and ovens *i i*, as set forth.

3. The warming ovens or closets *n n*, placed below or between the ovens *i i*, so as to be of a lower temperature than said ovens *i*, the respective ovens being arranged substantially as set forth.

4. The broiling spaces, arranged with the warming closets between them, and the racks or shelves *y* above, substantially as set forth.

85,469.—G. W. MORTER and EDWARD BERRY, Hartville, Ohio.—*Adjustable Shovel Plow.*—December 29, 1868.

Claim.—1. The second beam E, pivoted to the main beam A by parallel bars G G G G, and having attached to it the standard F, with brace rod N, substantially in the manner and for the purpose specified.

2. The rod I, with bent front end and plate K, with one or more holes therein, when used in combination with the beams A and E, pivoted to each other by the bars G G, substantially in the manner and for the purpose specified.

3. The double-shovel plow herein described, con-

sisting of the beam A, handles B B, cross bar C, standard D, second beam E, parallel bars G G, rod I, plate K, standard F, braces O N, and shovels M M, the several parts being constructed and combined substantially as and for the purpose specified.

4. So constricting a shovel plow as that it may be changed from a double-shovel plow to a single-shovel plow, without any change of parts, except the change of the two shovels for a single shovel, substantially in the manner herein specified.

5. So constructing an interchangeable double or single-shovel plow, as that, when used as a double-shovel plow, the distance between the two shovels may be changed as desired, the several parts being so arranged as that the only change of parts required in a change from a double to a single-shovel plow shall be the change of the two shovels for a single shovel, substantially in the manner herein specified.

85,470.—PETER MURRAY, Philadelphia, Pa.—*Grate*.—December 29, 1868.—The ends of the grate bars rest upon a horizontal ledge within a wedge-shaped groove or recess formed in the side pieces of the frame, the bars being prevented from rising vertically by the inclined shoulders of the recess.

Claim.—1. The combination, with a falling or hinged grate of detachable bars B, for the purpose specified.

2. The frame A of a falling grate, adapted for the reception and detention of detachable grate bars B, substantially as herein set forth.

85,471.—IRA A. PALMER, Monmouth, Ill.—*Cultivator*.—December 29, 1868.—The shovel is extended at its upper part, and is curved similarly to the moldboard of an ordinary plow, so as to carry a great portion of the soil raised in one certain direction. The beam plates embrace the journal spindle, to which they are adjusted by a bolt. Adjustable hooks attached to bars, secured to the doubletree, and resting on a spindle, are for attachment of the singletrees.

Claim.—1. The shovel *d*, constructed as described, and for the purpose set forth.

2. The slotted beam plates L and M, one of them being crooked, and bolt P and spindle T, arranged substantially as described and for the purpose set forth.

3. The arrangement of doubletree C, bar W, with holes *e e e*, and hook Y, combined with the frame A, E, F, and tongue B, substantially as described and for the purpose set forth.

85,472.—C. E. PATRIC, Macedon, N. Y.—*Grain Drill*.—December 29, 1868.—The machine is so constructed that the grass seeder can be used either in front or behind the grain seeder. The grain spouts are adapted to deliver the grain from each alternate one in the rear of the others.

Claim.—1. Connecting the lever for throwing the seed distributor into and out of action with the lifting roller, which raises the seed tubes in such manner that the said shipping lever shall be acted upon only while the seed tubes are in proper position to deliver the grain.

2. In seeding machines, in which the seed tubes are lifted by means of a traveling roller or equivalent, controlling the delivery of the seed through the motion of the roller or bar to which the seed tubes are connected.

3. The construction of the device for transmitting motion from the driving wheel to the distributor of a grain drill or seeding machine, in such manner that a limited or fixed throw of the shipping lever may be made to throw the distributors into and out of action, while provision is also made for varying the speed of the distributors relative to that of the driving wheel.

4. I do not claim, broadly, a travelling roller for raising the seed tubes, such device being embraced in a patent granted to me December 17, 1867; but I do claim the traveling roller or bar for raising the seed tubes out of the ground, when operated by means of the chains or cords, for the purpose set forth.

5. The grain spouts of a grain drill or seeding machine, made adjustable in such manner as to deliver

the grain to the drill teeth arranged in different positions.

6. The eccentric rotating bearing G, in combination with the arm G¹, shaft F, and shaft G², for throwing the pinion E into and out of gear.

85,473.—TIMOTHY PENDERGAST, St. Louis, Mo.—*Pole for Horse Cars*.—December 29, 1868.—A rubber cushion is placed within a protecting cylinder, at the rear end of which is a piston so connected with the doubletree and pole, as to avoid jars and produce a gradual propulsion of the vehicle. An adjustable brace, held by a bolt, is provided with a screw nut into which the rest fork passes for supporting the draught pole.

Claim.—1. The pole A, slotted at *g*, straps B and C, and slots *f*, doubletree E, hinge bolt F, rod G, piston G', cushion I, inclosing cylinder H *h*, when combined and arranged substantially as and for the purpose set forth.

2. The rest fork L, fitted at *l*¹, and having a screw end *l*², and combined with nut *l* of the brace K, substantially as and for the purposes set forth.

85,474.—ALBERT J. POTTER, Omaha, Nebraska.—*Farm Gate*.—December 29, 1868.—On the upper end of the rear gate post is a bevel cog wheel, into which gears a cogged segment, attached to a shaft passing through a cylinder, and operated by means of a lever actuated by cords. To the said lever is attached a cord connected with another lever that operates the gate bolt.

Claim.—The gate A, bolt *h*, lever F, bevel wheel D, cogged segment D', shaft *d*, cylindrical bar C, lever E, cords *e f g*, and posts B B¹ B² B³, all combined, constructed, arranged, and operated substantially as and for the purpose set forth.

85,475.—ELISHA O. POTTER, Pawtucket, R. I.—*Apparatus for Feeding Cloth to Printing Machinery*.—December 29, 1868.—The cloth passes over a roller which controls a yielding bar. The said bar is connected by a bell-crank lever with a long rod which is pivoted to a segmental disk plate set upon the axle that supports a bell-crank lever, upon whose periphery the lips of two pawls can rest, so as to be raised above the teeth of the ratchet wheel. Upon the same axis with the ratchet wheel is a drum bearing a cord which carries a movable weight placed upon a friction-brake lever applied to the delivery beam. Any increase or decrease of tension causes one or the other of the pawls to engage with the ratchet wheel to automatically operate the weighted lever.

Claim.—An apparatus or combination of devices for securing a uniform amount of tension upon cloth, or other material, during its delivery to other machinery, which consists of a friction brake, or like device, for varying the degree of friction upon the delivery beam, operated by a pawl and ratchet gear *g* I, and cord, *f*, or the equivalents thereof, in combination with a yielding bar, E, controlling, through the disk plate M, or like means, the action of the pawl and ratchet mechanism, such apparatus operating substantially as herein set forth.

85,476.—JOHN T. RAFTERY, Eldara, Ill.—*Water Elevator*.—December 29, 1868.—The motion of the chain can be reversed without reversing the motion of the crank, by means of a lever and loose pinions engaging with clutches on the shafts.

Claim.—A water elevator, having shafts D and H, chain B, cog wheels G and I, fast and loose pinions E and K, brace L, lever S, and hooks P, constructed, arranged, and operating substantially as specified.

85,477.—THOMAS L. RANKIN, New Richmond, Ohio, and CHARLES W. GRASSMUCK, Peru, Ill.—*Beer Cooler*.—December 29, 1868.—The ice is melted by the beer and flows down a vertical chamber into a cold water space over which the beer escapes from the cooler.

Claim.—1. An air-tight chamber for cooling beer, provided with a series of trays of galvanized metal, which extend obliquely beyond the vertical center, from one side of the chamber toward the other, in opposite directions, one above the other, and hav-

ing their ends perforated, all substantially as set forth.

2. In combination with the above, the inclined ice chamber *a*, over said trays, which communicates with a vertical chamber, *c*, leading into a cold water space, *f*, under the trays, and so formed that its narrowest part is near the chamber *c*, and with a conducting pipe, *b*, for the overflow, all substantially as shown and described.

85,478.—DANIEL REED, Birmingham, Conn.—*Nail-plate Feeder*.—December 29, 1868; antedated December 24, 1868.—One end of a clamp in the plate holder is secured to the plate; the other end is connected by a cord with the spring cylinder, which latter feeds the plate automatically against the guides when the cutters are withdrawn.

Claim.—1. The arrangement of the plate holder T, and the mechanism by which it is operated, substantially as described, by which the two ends of the plate are simultaneously moved in opposite directions, and different portions of it presented alternately to the cutters.

2. The subject-matter of the first clause of claim, in combination with the spring wheel W and clamp Y, as set forth.

3. The subject-matter of the second clause of claim, in combination with the guides *f*¹ and *f*², as and for the purpose set forth.

4. The subject-matter of the first clause of claim, combined with the cutters I and L, in the manner specified.

85,479.—NELSON RUE, Harrodsburg, Ky.—*Gate*.—December 29, 1868.—By means of the pivoted oblique braces and notched bars, the gate can be braced in any direction.

Claim.—The notched bars E, D, and E, and the pivoted oblique braces C C C C, arranged with the gate A, all as herein specified, and operating as set forth.

85,480.—M. SAMUELS, New York, N. Y.—*Hoop Skirt Clasp*.—December 29, 1868.—The bell-shaped tubes on the clasps connecting the hoops and tapes receive the hoops and prevent the abrasion of the covering.

Claim.—The bell-shaped guide tubes *e* on the clasps *d*, in combination with the hoops B and tapes C*, substantially as and for the purpose described.

85,481.—CHARLES C. SCHMITT, New York, N. Y.—*Spring Rocking Chair*.—December 29, 1868.—The back of the chair is hinged by means of loop hinges to permit it to be folded down close to the seat.

Claim.—1. A chair having its seat hinged to the base or lower portion, forward of the center, substantially as described, and sustained by springs, substantially as and for the purpose set forth.

2. The employment, in combination with a chair having a reclining back, of arms, which are both adjustable and removable in the manner and for the purposes as specified.

3. The employment, in combination with the seat and folding back, of the slotted hinge pieces, substantially as described, for the purpose set forth.

85,482.—WILHELM SCHMITZ, Philadelphia, Pa.—*Explosive Cartridge*.—December 29, 1868.—A composition of amorphous phosphorus, chlorate of potash, and gum arabic, is placed in paper covered with linen paper treated with a solution of brimstone, coal oil, and gutta percha.

Claim.—A combination of the articles above described, in and for the purposes set forth.

85,483.—I. D. SEELEY, Hudson, Wis.—*Wash Boiler*.—December 29, 1868.—The object of this invention is to convey the water which would otherwise run over the boiler onto the stove, back into the space below the cover.

Claim.—A tube or passage, the upper end of which communicates with the space above the cover of a wash boiler, while its lower end communicates with the interior of such boiler, below such cover, substantially as and for the purpose described.

85,484.—FREDERICK J. SEYMOUR, Meriden, Conn., assignor to himself and E. MILLER & COMPANY, same place.—*Tube for Oilers*.—December 29, 1868.

Claim.—As an article of manufacture, the conical metal tube, formed by drawing or spinning from a cylinder without seam or joint, substantially in the manner herein set forth.

85,485.—MERRELL B. SHERWOOD, Buffalo, N. Y.—*Process for Curing and Preserving Meat*.—December 29, 1868.—The blood and impurities are extracted from the meat in one tank and discharged into a second tank. A third tank containing the impregnating solution is filled with compressed air, and, on opening a cock in a pipe connecting this and the meat tank, the solution is forced in, and fills the pores of the meat.

Claim.—1. The combination of the tanks A, C, and F, all constructed as described and operating substantially as and for the purposes herein set forth.

2. The within-described process of preparing meat for curing, by subjecting the same to the suction of an air pump, whereby the blood and impurities are removed from the meat, and its pores opened, substantially as and for the purposes herein set forth.

85,486.—MICHAEL JOSEPH STEIN, New York, N. Y.—*Machine for Channeling Boot and Shoe Soles*.—December 29, 1868.

Claim.—1. The combination, with the channeling knives and with a guide to direct the edge of the sole, of a revolving table, and an upper feed roller or wheel arranged at right angles to the table, or thereabouts, substantially as specified.

2. The combination, with the channeling knife or knives, the revolving table, and the upper feed wheel, of a guide and pressing roller, arranged to work in close proximity to the feed wheel, and relatively to the knife or knives, essentially as herein set forth.

3. In combination with the channeling knife or knives, the guide H, made adjustable, by mechanism under the control of the operator, to gradually vary the distance of the channel or channels from the edge of the sole while the machine is running, and the sole being fed across or through it, substantially as specified.

85,487.—B. WILLIAM STESCHULT, Glandorf, Ohio.—*Dropper for Harvesters*.—December 29, 1868.

Claim.—1. The droppers, when formed by two boards or floats, attached to arms L², and so combined with the rod L¹ and lever L³, that the floats may alternately be used to support the stalks resting on the narrow platform, and to drop the gavel, substantially in the manner set forth.

2. The driving wheel B, when constructed with sockets B², to receive the levers when the driving mechanism is used as a horse power, substantially as described.

85,488.—WILLIAM L. STUART, Rushville, Ind.—*Cultivator*.—December 29, 1868.—A vertical series of holes made in the axle receive the eye bolts, to which the plow beams are hinged, and permit a vertical adjustment of the latter. The coulters are slotted so as to be adjustable horizontally, and are secured to vertically-adjustable shafts.

Claim.—1. The construction and arrangement of the axle B, by which means the front ends of the plow or shovel beams are raised or lowered for the purpose of controlling the depth to which the shovels shall enter the earth.

2. The within-described construction of the coulters H H, for the purpose set forth.

3. The arrangement of the coulters with reference to the shovels of the cultivator, that is to say, with vertical and longitudinal adjustment with reference thereto, substantially as shown and described.

85,489.—O. S. ST. JOHN, Willoughby, Ohio.—*Car Coupling*.—December 29, 1868.—To connect the cars, the forward tumbler is lowered by means of a rod until its pointed arm rests on the beveled front of the bar. The link, being forced against the arm

of the tumbler, pushes the latter back until it rests under the end of a second tumbler.

Claim.—A car coupler, having standards B and R, arms C and D, tumblers E, P, and T, bar K, and rod *a*, constructed, arranged, and operating substantially as described.

85,490.—CHRISTIAN STOTZ and GEORGE SMITH, Perth Amboy, N. J.—*Clay Pipe Machine.*—December 29, 1868.—As the pipe emanates from the forming die the collar die is pressed up by means of a lever pivoted to a swivel shaft. When the collar is formed the die is lowered and swung around out of the way of a yielding platform, which connects with, and is operated by, the swivel shaft.

Claim.—The combination, with the tubular extension die E, of the adjustable die F, swivel shaft *l*, arm *o*, rod *p*, and balanced platform H upon its shaft *m*, substantially as and for the purpose set forth.

85,491.—JOHN A. TERRELL, Bloomfield, Ky.—*Cannon.*—December 29, 1868.—The perforated reinforce affords great facility for the radiation of heat caused by the burning powder and friction of outgoing shot. The hinged breech piece is secured in position by a set screw working in a hinged nut, which is supported by stops on the slotted breech piece. By means of the double screws a quick or a very slow and accurate elevation or depression can be given to the cannon.

Claim.—1. A perforated reinforce for guns, substantially as shown and described.

2. The combination of the hinged breech piece D, hinged nut E, and set screw H, substantially as shown and described.

3. The arrangement of the elevating screws F F', substantially as shown and described.

85,492.—JULES CONSTANT TOUZET, Paris, France.—*Apparatus for Manufacturing Shoes.*—December 29, 1868.—Recessed plates hinged to a table are provided with guides and clamps to hold the vamp while the irons, receiving a vertical movement by means of treadles, turn up the edges of cloth and leather, and by a slight lateral movement folds down the projecting edges of the plates. The lever compresses the material between the plates and is secured while maintaining a pressure, by catches. The irons rest upon boxes which are heated by gas passing through the hollow shaft.

Claim.—1. A clamp, (consisting of recessed plates, adapted for the reception of the vamp or lining of a shoe,) in combination with an iron, corresponding in form to the recesses in the said plates, and so arranged as to be carried upward through the said openings, and laterally over the plates, all substantially as and for the purpose described.

2. Recessed plates D D', hinged to a table or platform, having openings *c c*, and adapted for the reception of guides H I and clamps E E', in combination with irons M M, corresponding to the openings in the platform, and operating to turn down the edges of the leather or fabric, all substantially as and for the purpose described.

3. The combination of the platform C, plates D D', E E', catches G, and the lever F, hung to a shed on the platform, substantially as and for the purpose described.

4. The boxes L, heated, as described, in combination with irons M, so secured to the said boxes as to have a limited lateral motion independently of the same, for the purpose described.

5. The hollow shaft J, with its enlargement *m*, openings *w*, and perforations at the upper end, in combination with the gas tube *n*, arranged substantially as set forth.

85,493.—STEPHEN D. TUCKER, New York, N. Y.—*Printing Press.*—December 29, 1868.

Claim.—1. The wrist pin N, slotted yoke L, rocking levers H H, arms I I, and rods J J, for operating the type bed, substantially as described and specified.

2. Giving the impression cylinder a reciprocating rotating movement, in coöperative relation with the type bed, so that the sheet to be printed shall come in contact with the form of type while the cylinder

and bed are traveling in one direction, and escape the form, and come in contact with the numbering wheels when traveling in the reverse direction, substantially as described and specified.

3. The feeding table, so constructed and operated that it shall approach to enter the sheet between the cords and the cylinder, and recede to allow the sheet to be delivered to the sheet flier, in combination with a reciprocating rotating cylinder and type bed, substantially as described and specified.

4. The combination of the sheet flier, constructed and operated substantially as described, with a reciprocating rotating impression cylinder, as described and specified.

5. The combination of the punneting rollers *c c* with a reciprocating rotating impression cylinder, substantially as described and specified.

6. The arrangement of cords *b b b*, pulleys G G G, and weight Z, for conducting the sheets to and holding them against the cylinder, and taking them from the form of type, substantially as described and specified.

7. The combination, with a reciprocating rotating impression cylinder and reciprocating type bed of the numbering wheels, substantially as described and specified.

8. The combination, with the numbering wheels, of the rod P' and inclined planes R' R', substantially as described and specified.

9. Operating the numbering wheels by the reciprocating movements of the type bed and the inclined planes, substantially as described and specified.

10. The combination, with the numbering wheels and reciprocating type bed, of the springs *h h h*, for forcing the pawls *i i i* into their respective notches, so as always to insure perfect rotation of the numbering wheels, substantially as described and specified.

85,494.—FREDERICK VETTERLIN, Newhausen, Switzerland.—*Magazine Fire-arm.*—December 29, 1868.—The sliding breech block is held in position to close the breech, by a collar provided with radial lugs which are brought in front of fixed shoulders on said collar. A dog and spring on the hammer prevent the firing of the cartridge if a slot in the collar is not in a position to receive said dog.

Claim.—1. The combination of the pivoted dog *u* and spring *w*, arranged upon the hammer, with the recess *r*, inclined plane *s*, shoulder *m*, and ledge *n*, provided at the rear end of the collar D* of the sliding breech bolt, whereby the accidental discharge of the arm is provided against, substantially as herein set forth.

2. The arrangement of the sliding extractor E* in the upper side of the breech bolt, and in relation with the locking collar D*, furnished with the lateral lever E** and the bore of the barrel, whereby provision is made for the withdrawal of the cartridge shell, by the backward movement of the collar and bolt, substantially as herein set forth.

85,495.—HENRY WANT and JOHN LUNDGREN, New Haven, Conn.—*Manufacture of Spectacle Bows.*—December 29, 1868.—The meeting ends of the continuous wire are secured by loops.

Claim.—Spectacle bows, constructed in the manner, and of a single continuous piece of wire, substantially as herein set forth.

85,496.—TIMOTHY U. WEBB, Springfield, Ill.—*Gang Plow.*—December 29, 1868; antedated December 22, 1868.—A series of ordinary plows can be placed in the bearers attached to the axle, so as to form a gang plow.

Claim.—In combination with a frame, A, the spreader and bearers, for the purpose of uniting and working as a gang a series of single plows, E E, constructed, arranged, and operating substantially in the manner and for the purposes described.

85,497.—ELI WHITNEY, New Haven, Conn.—*Reversible Latch.*—December 29, 1868.—The latch bolt is so connected with the "horseshoe" as to be forced into the case, and there reversed or set to the right or left, to accommodate it to different motions of the door.

Claim.—1. The arrangement of the latch bolt B,

in combination with the horseshoe E, so that the latch bolt must be forced within the ease so as to be reversed, substantially as set forth.

2. In a latch bolt pivoted to the horseshoe so as to be reversed, forming the flattened or square portion F', in combination with the annular groove d and lugs ff, so that the latch bolt may be reversed while within the ease, and secured by the said lugs when in any other position.

S5,498.—R. S. WILLARD, Franklin, Vt.—*Machine for Making Wire Hooks.*—December 29, 1868.—The wire is bent around a cylinder, and a movable pin, to form the ring at the upper end, and then inserted under a lever, to form the hook at the lower end; said wire hooks being used by sugar makers when tapping a sugar tree.

Claim.—1. The arrangement of the lever H, bars I I, and gauge K, with the spring d, rod G, and treadle F, all constructed as described and operating substantially as and for the purposes herein set forth.

2. In combination with the foregoing, the standard c, with cylinder a, stationary pin b, and a hole for the insertion of a movable shaft or pin, substantially as and for the purposes herein set forth.

S5,499.—DANIEL WITT, Hubbardston, Mass.—*Clothes Drier.*—December 29, 1868.—The construction of the hinge permits the arms to be folded up or detached without removing the leaf on the standard.

Claim.—In a clothes drier, constructed as above described, making the arms adjustable and removable, by means of the connecting devices C, arranged upon the drier, as and for the purpose described.

S5,500.—CHARLES WITTE, Brooklyn, N. Y.—*Hand Shears.*—December 29, 1868.—The flange receives the downward pressure of the palm of the hand in connection with the force exerted by the thumb.

Claim.—The flange C, when formed as shown, for the purposes herein set forth.

S5,501.—SYLVESTER A. WOOD, Manitowoc, Wis.—*Velocipede.*—December 29, 1868.

Claim.—1. The ratchet wheels B B, the pawls a, the pawl pulleys C C, the pins d d, the connecting rods c c, with their brace-linked chain extensions g, the levers e e, the cords n n, and the pulleys o o, or their equivalents, the foot pins p p, the treadles r r, and the foot straps s s, all arranged and acting in combination with the wheels A A, reach D, and wheel A², substantially as and for the purpose herein set forth.

2. The supplemental cross bar t², the pins y, the supporting rods v v, the circular plates w, the cross-bar connecting rods x x, and the forked lever z, all arranged and acting in combination with the forward cross bar t, for guiding the vehicle, substantially as herein shown and described.

3. The hub set screws ll, the reach boxes or couplings k k, with their set screws l² l², the chain guides m² m², the brake foot rod or bar c², and the packing or cushions for the ratchet wheels, substantially as and for the purposes herein set forth.

4. In combination with the first above-described arrangement, combination, and operation of parts, the runners A³ and A⁴, the supplemental guiding runner or knife o², the frame B², the slotted paddles n², the slotted plates t³, the springs r², the sliding rings v², the fulcrum eyes y², and the loops x², arranged and operating to propel the vehicle on snow or ice, substantially in the manner herein set forth and described.

5. A three-wheeled velocipede, the parts of which are constructed, arranged, and combined, substantially as and for the purposes herein shown and described.

S5,502.—EMMA C. WOOSTER, New York, N. Y.—*Ruffle Trimming.*—December 29, 1868.—The band ruffle and the double-frilled ruffle are so combined that one is made to strengthen or stiffen the other.

Claim.—A double ruffle, composed of a two-ply band ruffle, A, and two-ply double-frilled ruffle B, made and combined with each other, substantially in the manner described.

EXTENSIONS.

THOMAS D. BURRALL, Geneva, N. Y.—*Corn Sheller.*—Patented December 6, 1845, No. 4,300; extended seven years from December 6, 1849; reissued October 10, 1865, No. 2,083; again extended by act of Congress, (private No. 102,) approved March 2, 1867; again extended April 14, 1868.

Claim.—1. The opening d, in combination with the plate or disk c, and the sheller, substantially as and for the purpose described.

2. The open space between the lower edge of the sheller and the plate or disk c, in combination with said plate or disk, and the sheller, substantially as and for the purpose described.

STEPHEN MORSE, Springfield, Mass.—*Iron Car Brake.*—Patented September 6, 1853, No. 10,004; extended April 14, 1868.

Claim.—The spine B, having the point of suspension C, and socket D, with the open spaces c c, and brace plates b b, in combination with the rubber or friction surface plate A, substantially in the manner and for the purpose as is herein set forth.

OLIVER P. DRAKE, Boston, Mass.—*Apparatus for Combining Hydro-carbon Vapor with Air.*—Patented August 30, 1853, No. 9,967; reissued November 15, 1864, No. 1,819; extended April 14, 1868.

Claim.—1. The vaporizing chamber and rotary blowing apparatus, combined in the manner and for the purpose substantially as set forth.

2. The combination of the vaporizing chamber and rotary blowing apparatus, under the general arrangement described, with a weight, or its equivalent, acting with a uniform force, so that the pressure at the burner is uniform, whether a greater or less quantity of the mixed air and vapor is burned.

3. The combination of the vaporizing chamber with the mechanical agitator, for the purpose of agitating the liquid during the mixture of the vapor with air, substantially as set forth.

4. The combination of the heater and gas burner with the water vessel and vaporizing chamber, substantially as specified, so that by means of the said heater and gas burner and the pipes connecting them with the water vessel and the chamber the whole or a part of the mixture of air and benzole vapor produced by the apparatus may not only be used in any convenient place for the purpose of illumination, but also for heating the water of the vessel, substantially as set forth.

5. The combination of the closed vaporizing chamber, the rotary vaporizer or disseminator, (placed therein,) and the rotary meter wheel and its closed case, or air-foreing apparatus, so made as to force a stream of air into the hollow shaft of the vaporizer and through or against saturated portions of the disseminator and into the vaporizing chamber or regenerator, so as to vaporize the benzole or hydro-carbon and mix it with air, substantially as above specified.

6. In combination with the rotating meter wheel and its case, and the hot water vessel, the coiled induction air pipe, as made to pass through the water in the vessel, and thereby receive heat therefrom, so as to warm the air as it passes through the pipe, and to supply oxygen to the volatilized vapors, and for the purpose of facilitating the evaporation of the same.

7. In combination with the induction air pipe, the chamber and its regulator slide and orifice, applied for the purpose of supplying cold air to the warmed air, or to the meter wheel, in order to diminish or regulate the temperature of the air.

passage into the said wheel and forced into the vaporizing chamber.

8. The peculiar mode of making the rotary disseminator or vaporizer, viz., of two perforated heads or disks, a hollow perforated shaft, and strands of lamp wicking or other absorbent material, stretched from one head to the other, as specified.

HENRY RITCHIE, Newark, N. J., assignor to himself, SAMUEL C. THOMPSON, and GEORGE W. WESTERFIELD, of same place.—*Spring Padlock*.—Patented August 23, 1855, No. 9,963; extended April 14, 1868.

Claim.—The combination of the bolt C, guard E, and the double-toothed tumbler D, one tooth *n* of said tumbler fitting in the shackle *d*, and the other tooth *j* fitting in the notch at the back of the bolt; the bolt, guard, and tumbler operating as set forth in the body of the specification.

PHILO SYLLA, Elgin, and AUGUSTUS ADAMS, Sandwich, Ill.—*Grain and Grass Harvester*.—Patented September 20, 1853, No. 10,038; reissued May 17, 1859, to C. AULTMAN & CO., Canton, Ohio, in six divisions, division A, No. 721; extended April 14, 1868.

Claim.—1. An elevated binding table, in combination with the platform for receiving the grain as it is cut, substantially as set forth.

2. The combination with the binding table of one or more binders' stands, on a lower level than that of the table, substantially as set forth.

3. The combination of a binding table with a binders' stand, having an elevated side for the binder to rest his legs against, and thereby steady himself without the aid of his arms, both of which are thus left at liberty to do the binding, substantially as set forth.

4. The arrangement of the rakes and binders' stands, substantially as herein set forth, so that the grain may be raked from the platform and delivered upon the binders' table before the several binders' stands in the manner substantially as set forth.

5. The arrangement of the dumping tray, with the rakes and binders' stands, substantially as set forth.

Same; reissue, No. 722, division B; again reissued May 14, 1867, No. 2,608; extended April 14, 1868.

Claim.—1. The combination of a finger beam with slotted guard fingers, a reciprocating scalloped cutter, a double hinge connection between the finger beam and the main frame, and a driving shaft for the cutting apparatus, parallel, or nearly so, to the ground.

2. The combination of a double hinge floating finger beam with slotted guard fingers, a reciprocating scalloped cutter, and a removable platform for converting the machine from a mower to a reaper.

3. The combination of a finger beam with slotted fingers, a reciprocating scalloped cutter, a hinged connection to the main frame, a removable platform, and a reel.

4. The combination of a finger beam with slotted fingers, a reciprocating scalloped cutter, a hinged connection to the main frame, and arms or levers, or their equivalents, for adjusting the height of the cutting apparatus.

Same; reissue No. 723, division C; extended April 14, 1868.

Claim.—The short finger beam, in combination with the yielding connection with the main frame, or its equivalent, substantially as herein set forth.

Same; No. 724, division D; extended April 14, 1868.

Claim.—The combination of the finger beam with the hinges by which it is drawn, arranged above the plane of the cutter, substantially as herein set forth,

Same; No. 725, division E; extended April 14, 1868.

Claim.—1. The combination of a counterpoise weight, or the equivalent thereof, with that end of the finger beam next the main frame, to equalize

its pressure upon the ground, substantially as set forth.

2. The combination of a counterpoise weight, or the equivalent thereof, with each or either end of the finger beam, to diminish its pressure upon the ground, substantially as set forth.

Same; No. 726, division F; extended April 14, 1868.

Claim.—The combination of a stop with the mechanism for connecting the finger beam with the main frame, and allowing it to rise and fall, substantially as herein set forth.

EPHRAIM L. PRATT, Boston, assignor to JAMES SARGENT and DANIEL P. FOSTER, Shelburne, Mass.—*Machine for Paring Apples*.—Patented October 4, 1853, No. 10,078; extended April 14, 1868.

Claim.—Hanging or connecting the block S, which carries the knife to the rod which carries said block, so that the block and knife can vibrate in one or either direction, (by means substantially such as are herein described, or their equivalents,) so as to allow the knife to vibrate and accommodate itself to any irregularity on the surface of the apple or vegetable pared, substantially as described.

JOSHUA GIBBS, Canton, Ohio.—*Machine for Grinding Plow Castings*.—Patented October 4, 1853, No. 10,068; extended April 14, 1868.

Claim.—The carriage upon which the casting is fastened, with the weight and grooved stand upon which the carriage is moved, arranged and operated as described.

NATHANIEL GEAR, Marietta, Ohio.—*Machine for Turning or Cutting Irregular Forms*.—Patented November 8, 1853, No. 10,204; extended April 14, 1868.

Claim.—The combination of knives, in the manner described, with a rotary cutter head, so that said head shall serve as a guide or directrix to the form or pattern carrying the material to be dressed

NORMAN MILLINGTON and S. M. GEORGE, Shaftsbury, and ABRAHAM B. GARDINER, Bennington, Vt., and LELAND J. MATTISON, Cleveland, Ohio, executors of DENNIS J. GEORGE, deceased.—*Machine for Figuring Carpenters' Squares*.—Patented October 18, 1853, No. 10,136; extended April 14, 1868.

Claim.—The combination of the revolving chase wheel W with the lateral-moving anvil A, by which the relative position of the square to be stamped and the required chase is so regulated that the line of the square to receive the impression is brought under the chase containing the desired figures, substantially as herein set forth.

HARRY WHITAKER, Buffalo, N. Y.—*Application of High-pressure Engines to Screw Propellers*.—Patented October 18, 1853, No. 10,145; extended April 14, 1868.

Claim.—The direct application of the crank outside of the hull to side screw propellers, where such application is combined with or effected by a high-pressure engine, arranged also outside of the hull, substantially as hereinabove set forth.

DAVID M. SMITH, Springfield, Vt.—*Spring Clamp for Clothes Lines*.—Patented October 18, 1853, No. 10,163; extended April 14, 1868.

Claim.—The above-described improved clothes-pin, that is to say, the arrangement of the line opening D and the spring C, on opposite sides of the hinge *a* of the two levers A B, all substantially as hereinbefore specified, whereby by pressure of the longer legs of the levers between the thumb and fingers of the hand of a person the instrument is rendered very convenient of application, without danger during the same of tearing the clothes secured by it on a line.

BERNARD HUGHES, Rochester, N. Y.—*Trip Hammer*.—Patented May 16, 1854, No. 10,923; extended April 14, 1868.

Claim.—Adding to the stem or rod of the trip hammer a piston working in a cylinder, open on the upper end and closed at the bottom, and pro-

vided with regulating cock and valve, substantially as described, by which means I am enabled to add the whole or such part of the pressure of the atmosphere as may be desirable to the weight of the hammer in giving the blow.

SAMUEL PRATT, Hammonton, N. J.—*Screw Nail*.—Patented October 25, 1853, No. 10,171; extended April 14, 1868.

Claim.—1. A screw nail constructed with a thread, shaped substantially as herein described.

2. Shaping the head substantially as herein set forth, so that the battering caused by the driving will not obstruct the application of the turn-screw.

DANIEL NOYES, Abingdon, Mass.—*Machine Hammer*.—Patented October 25, 1853, No. 10,170; extended April 14, 1868.

Claim.—1. A machine for hammering iron, &c., having the distinguishing features hereinabove enumerated, viz., a hammer for giving the blow upon the upper surface of the iron, acting in conjunction with two hammers which simultaneously strike the sides of the iron, substantially as above set forth; in a machine for hammering iron, the use of these two side hammers, operating as specified, whether used in connection with the upper hammer or without it.

2. So arranging the relative position of the fulcra of the hammer beams, and the ends of the connecting rods attached to said beams and to the crankshaft and gears from which they derive their motion, as to bring the said fulcra and connecting rods in nearly a straight line at the time of giving the blow, for the purpose above specified, the opposite ends of the connecting rods just before giving the blow moving in opposite directions, so as to give a rapid and powerful blow.

3. Causing the anvil to descend from the iron just before the blow of the side hammers, and to ascend just before the blow of the upper hammer, by means of a rod attached at one end to the under side of the upper hammer beam, and at the other end to a tilting arm which embraces the anvil, substantially as above described.

ROBERT SINCLAIR, JR., and RICHARD F. MAYNARD, Baltimore, Md.—*Feed Roller of Straw Cutters*.—Patented November 15, 1853, No. 10,238; extended April 14, 1868.

Claim.—The employment thereon of alternate right-and-left pins, so arranged as to form a double spiral or screw, said pins being formed substantially as set forth, and operating together so as to prevent the straw from crowding to the right or left, and to compress the straw laterally as it is passed to the knives, and constituting, altogether, what we denominate the double-screw propeller for straw cutters.

CHARLOTTE B. THOMPSON, administratrix of JOHN H. THOMPSON, deceased, JAMES M. THOMPSON, and HOSEA Q. THOMPSON, Holderness, N. H.—*Machine for Trimming Soles of Boots and Shoes*.—Patented November 15, 1853, No. 10,239; extended April 14, 1868.

Claim.—A machine in which the sole is trimmed by revolving knives and guided, as fed along by the operator, by an adjustable gauge bar, against which the edge of the pattern plate abuts, substantially as hereinabove described.

LAURA S. WHITE, administratrix of JONATHAN WHITE, Antrim, N. H.—*Uniting Shovel Blades to Handle Straps*.—Patented November 15, 1853, No. 10,244; extended April 14, 1868.

Claim.—The uniting, by welding, of the iron handle straps to the sheet cast-steel blade, in the manner substantially as herein set forth.

ERASTUS T. BUSSELL, Indianapolis, Ind.—*Combined India-rubber and Steel Spring*.—Patented November 29, 1853, No. 10,280; extended April 14, 1868.

Claim.—The fluting a column of vulcanized India-rubber longitudinally, and then so surrounding it with the helical spring, mine being an improvement upon Ray's spring.

WILLIAM BUTTERFIELD, Boston, Mass.—*Sewing Machine*.—Patented July 4, 1854, No. 11,240; reissued to E. TOWNSEND January 5, 1864, No. 1,600; extended April 14, 1868.

Claim.—1. Separating into two instruments (a presser foot and a "rest cast-off," both operating on the surface of the material to be sewed) the "tube or holder" hereinbefore referred to, so that the "rest cast-off" can act independently of the presser foot, as respects its times and extent of motion, substantially in the manner specified.

2. Constructing the "rest cast-off" of such a form that it operates and is located in front of the barb of the needle, instead of surrounding it, by which construction it operates in an improved manner, especially when sewing in narrow channels.

3. Making the "rest cast-off" adjustable with reference to the needle, substantially as described.

4. The combination of a supporting surface, crochet needle, and presser foot with a "rest cast-off," operating substantially as described.

5. The improvement by which the "rest cast-off" is rendered capable of adapting itself to any ordinary thickness or variation of the thickness of the fabric or article to be sewed, such improvement consisting in the above-described mode of operating it by the spring F, applied to the carrier lever E, and made to operate on the lower end of the recess C, as stated.

6. The combination of the bobbin holder U with the spring V, the friction disk R, and the axle on which the holder turns, the same enabling an empty bobbin to be removed from the holder and a full one put in its place without disturbing the connection of the spring with the bobbin and friction plate or disk.

WILLIAM B. BATES, Mansfield, Mass., administrator of GEORGE WELLMAN, deceased.—*Stripping Top Flats in Carding Machines*.—Patented March 18, 1856, No. 14,481; antedated November 25, 1853; reissued July 30, 1867, No. 2,705; extended April 14, 1868.

Claim.—1. The combination of the segmental gear and its set rim or locking plate with a pinion and its locking plate or recess, as a device for imparting an intermittent rotation to mechanism from a continuous one, for the purpose of operating the stripping mechanism, or that which moves the cleansing frame from one top card to another, substantially as described.

2. The combination of the said device for producing intermittent rotation with the mechanism that lifts strips and lowers the top card, substantially as described.

3. The combination of the said device for producing intermittent rotation with the mechanism that moves the cleansing frame from one top card to another, substantially as described.

4. Combining and arranging the segmental gear and its set rim or locking plate with the two pinions, each with its locking plate or recess placed on opposite sides of said segmental gear, so as to operate the stripping apparatus and move the cleansing frame alternately, substantially as described.

5. The combination and arrangement of the mangle pins or teeth in the arc of a circle directly attached to the cleansing frame and concentric with its movement, for the purpose of avoiding intermediate gearing, substantially as described.

6. Mounting the stripper card upon radial arms that have their centers or axes below the stripper card and near the axes of the cleansing frame, substantially as described.

7. The combination of the cams X X with the levers Y Y, carrying and operating the stripper card, substantially as described.

8. The combination of the cams X X with the lifting rods Z Z and the levers Y Y, arranged to operate in connection, substantially as described.

9. The combination of the cams X X with the chain belts Q', the chain pulleys R', and shaft M, arranged and operating substantially as described.

10. The combination of the guide E' on the cleansing frame with the stationary guide D' on the frame of the machine, cooperating substantially as described.

11. The combination of the springs F' and the

pins *F'* and lifting rods *Z*, and their application to the frame *S*, substantially as described.

12. The mechanism for cleansing the stripper card, arranged and applied substantially as described.

WILLIAM B. BATES, Mansfield, Mass., administrator of GEORGE WELLMAN, deceased.—*Stripping Top Flats for Carding Machines*.—Patented December 6, 1853, No. 10,298; reissued July 30, 1867, No. 2,706; extended April 14, 1868.

Claim.—1. The combination and arrangement of a continuously revolving radial arm and pin, or crank pin, and a circular locking plate connected therewith, with a series of intermittently revolving radial working grooves to receive said pin, connected with a locking plate provided with segmental recesses corresponding to said grooves and to the other locking plate, substantially as described.

2. Combining with the cleansing frame a mangle gear and the mechanism herein described for imparting an intermittent motion to the same, suitably arranged, by which the cleansing frame is moved from one top card to another, in any order desired, in both directions, and held at rest while the cleansing operation is performed, substantially as described.

3. So combining and arranging the cleansing frame, the mangle gear, and pinion, and mechanism for giving it intermittent motion, when the motion of the cleansing frame is from one top card to the next but one, that when the pinion passes around the extremity of the series of pins or teeth of the mangle gear to the opposite side of the same, the distance of the point from where the pinion starts to where it stops on the mangle gear will correspond to the movement of the cleansing frame from one top card to that next to it, and thus shift the order of cleansing the top cards when the frame is moving in opposite directions, substantially as described.

4. Attaching the stripping card to radial arms, so arranged that by the oscillation of said arms the stripping card will be carried beneath the raised top card to cleanse the same, substantially as described.

5. Forming the working faces of the cams that raise the top cards in separate and detached segments, placed so as to act in succession in combination with a series of projections or working surfaces on the device that raises the top cards, substantially as described.

6. The combination and arrangement of the several correspondent parts of mechanism, both new and old, so as to form a complete apparatus by which the top cards of a carding machine may be automatically stripped or cleansed, substantially as described.

GEORGE W. LIVERMORE, Cambridgeport, Mass.—*Machine for Making Barrels*.—Patented March 21, 1854, No. 10,680; extended April 14, 1868.

Claim.—1. Forming or shaping the staves previous to jointing them, by passing them through a series of pairs of curved rollers, in the manner set forth and for the purpose described.

2. The peculiar construction of the carriage of the jointing machine, represented in Fig. 5, the bar *g* being made adjustable within the long slots or mortises, in the manner set forth and for the purpose described.

3. The combination of the cone *Q*¹ with the spring devices *g*¹, operating as described, for the purpose of guiding the hoop to the barrel and driving it into place, in the manner set forth.

JAMES WATT, Charlestown, Mass.—*Valve Arrangement for Steam Hammers*.—Patented December 6, 1853, No. 10,297; extended April 14, 1868.

Claim.—1. The revolving valve rod, the barrel *g*, and the adjustable screw top *l*, constructed, arranged, and operating in the manner substantially as described, by which I am enabled at any instant to admit the steam beneath the piston, during any portion of the fall of the hammer, without altering the effective force and length of the stroke.

2. In connection with the above, the arrangement for throttling the steam on its way from beneath

the piston, by which means I am enabled to regulate the intensity of the blow of the hammer to any degree of nicety, or to hold the same suspended above the anvil, in the manner and for the purpose substantially as set forth.

RICHARD A. TILGHMAN, Philadelphia, Pa.—*Process for Purifying Fatty Bodies*.—Patented October 3, 1854, No. 11,766; antedated January 9, 1854; extended April 14, 1868.

Claim.—The manufacturing of fat acids and glycerine from fatty bodies by the action of water at a high temperature and pressure.

LUCIAN B. FLANDERS, Philadelphia, Pa.—*Replacing Cars upon Railroad Tracks*.—Patented December 6, 1853, No. 10,301; extended April 14, 1868.

Claim.—Replacing railroad cars and locomotives upon the track, or replacing the car wheels upon the rails, in the manner substantially as herein described, viz., by means of flanges *C C'*, having inclined bottoms, and secured or attached to the rails, when designed to be used, by the lips or projections *b* on the sides *a* of the flanges, said lips or projections clasping or fitting over the rails, the flange *C'* being provided with a movable guide *E*, which directs or guides the wheels upon the rails, and which guide, by being movable, will act upon the wheels, the flange *C'* being adjusted to either side of the rails.

CHARLES J. WILSON, Cleveland, Ohio.—*Design for Stove Plate*.—Patented December 4, 1860, No. 1,349; extended April 14, 1868.

Claim.—The configuration and arrangement of said ornaments as herein designated and represented.

MELVIN JENKS, Dansville, N. Y.—*Turnkey*.—Patented December 13, 1853, No. 10,312; extended May 5, 1868.

Claim.—The adjustable claw *E*, constructed and arranged substantially as described, in combination with the claw *b*, and the rolling fulcrum, having a limited motion.

JOSEPH NOCK, Philadelphia, Pa.—*Hinge for Inkstand Covers*.—Patented December 13, 1853, No. 10,310; extended May 5, 1868.

Claim.—The application of the stamped round part, and the solid part, (or the moving lid or cover,) filled together as a hinge, which forms a rounded smooth-turned face, and the manner in which the pin is connected with both parts, as herein described, using for that purpose the aforesaid "two pieces to form a regular curvilinear or round-turned hinge," made of any materials which will produce the intended effect.

L. OTTO P. MEYER, Newton, Conn.—*Process of Vulcanizing Caoutchouc Compounds*.—Patented December 20, 1853, No. 10,339; extended May 5, 1868.

Claim.—The producing of smooth and glossy surfaces upon the hard compounds of caoutchouc and other vulcanizable gums, by means of the use of oil, or other equivalent substance, applied to the surface of the prepared gum, and between the gum and the plates of metal, or the molds, substantially as herein described.

WILLIAM WISDOM, Brooklyn, N. Y.—*Cleansing Hair and Feathers from Insects*.—Patented December 20, 1853, No. 10,347; extended May 5, 1868.

Claim.—Purifying hair and feathers by destroying all noxious insects or infectious matter contained therein, by subjecting the same to a vapor-bath of chlorine gas, after the material has been cleansed by a bath of sal soda, in the manner and for the purpose specified.

ROBERT P. WALKER, New York, N. Y.—*Machine for Hulling and Scouring Coffee*.—Patented December 20, 1853, No. 10,328; extended May 5, 1868.

Claim.—The combination of the springing-rubber flaps or scourers and polishers *c c c*, with the angularly-set hullers or beaters *c d*, the whole being constructed and arranged in any equivalent

manner to that herein described, and operating as set forth.

HARVEY LULL, Hoboken, N. J.—*Shutter Hinge*.—Patented January 31, 1854, No. 10,477; antedated January 2, 1854; extended May 5, 1868.

Claim.—The so forming of a self-locking shutter hinge, cast in two pieces, as that the blind or shutter hung thereon may swing open or shut on a horizontal plane, and lock when opened to its limit, and so that, also, when locked open, the strain shall be taken off from the spindle and thrown on to cam-arms, and thus effectually relieve the spindle from the weight or strain of the shutter, substantially as described.

EDWARD A. TUTTLE, Brooklyn, N. Y.—*Hot-air Register*.—Patented January 3, 1854, No. 10,371; reissued February 17, 1863, No. 1,412; extended May 5, 1868.

Claim.—So combining the connecting rod, or arrangement, which transmits motion to the fans, with the thumb piece or attachment by which it is actuated, and with the fans themselves, that it shall rest and ride upon anti-friction bearings *o o* formed on the fans, substantially as above described.

WILLIAM H. SWEET, Foxborough, Mass., administrator of HENRY L. SWEET, deceased.—*Guide for Sewing on Binding*.—Patented December 20, 1853, No. 10,344; extended May 5, 1868.

Claim.—The doubling guide, as not only made with a flat mouth, or one capable of receiving the ribbon, tape, or binding in a flattened state, but with a bent channel or sides, such as shall gradually bend or double it, and discharge it at the other end in a double state, ready to be applied to any article conveniently placed to receive it, and leave it sewed thereon, as stated.

MATHEW STEWART, Philadelphia, Pa.—*Floor Plate of Malt Kilns*.—Patented January 3, 1854, No. 10,370; extended May 5, 1868.

Claim.—1. The characteristic mode in which I construct the plates with downward edges at right angles with the surface of the plate, substantially and for the purpose herein described and illustrated.

2. The bearing and combining block, with the peculiar arrangement of the slots or grooves, or its equivalent, substantially and for the purpose as herein described.

3. The combination of the plates with the bearing and combining blocks, or their equivalents, and the peculiar manner of securing the plates and blocks down to the wrought-iron bars by means of the wire holes in the vertical edges of the plates, or their equivalents, substantially and for the purpose as herein described and illustrated.

WILLIAM WRIGHT, New York, N. Y.—*Operating Cut-off Valves of Steam Engines*.—Patented January 3, 1854, No. 10,398; extended May 5, 1868.

Claim.—1. The employment of a rotating concentric hub, on which the toes (or their equivalents) of the lifters rest when the valves are closed, substantially as specified, when this is combined with a cam connected therewith, and which turns eccentrically thereon, for the purpose of opening and closing the valve, and regulating the period of closing the same, substantially as specified.

2. Combining with the said hub and cam a slide within them, and acting on an oblique groove within the cam, and a straight slot in the hub, substantially as specified, to determine the period of closing the valve, while the period of opening remains the same as specified, and this I claim whether the said slide be operated by a governor or by other means.

HEZEKIAH B. SMITH, Smithville, N. Y.—*Mortising Machine*.—Patented January 10, 1854, No. 10,422; extended May 5, 1868.

Claim.—The afore-described combination for reversing the chisel by power, applied by friction, (with band or otherwise,) and stops, operated so as to stop the chisel when reversed, in the manner essentially as set forth.

JOSEPH NASON, New York, N. Y.—*Arrangement for Cutting Screws in Lathes*.—Patented January 3, 1854, No. 10,383; extended May 5, 1868.

Claim.—1. The mode of constructing and combining the stud, the tube, and the guide screw, by which guide screws of the various patterns used in screw cutting may be put on or taken off expeditiously.

2. The mode of constructing the tool bearer generally, particularly as regards placing the slide rest behind the work, whereby the cutting tool is brought into such relative position with the shaft and the mandrel, that the operation of raising the tool bearer from the rail removes the tool from the work.

3. The tool lifter, constructed substantially as described, and employed for the purposes and in the manner herein specified.

4. The combination of the guide screw, the threaded block, and the tool bearer, with the shaft, substantially as set forth, by which (1) the requisite traversing motion is imparted to the cutting tool, (2) the operations of releasing the block from the guide screw and removing the tool from the work are simultaneously performed, and (3) the tool bearer may be turned back out of the way when not in use.

AARON PALMER, Brockport, N. Y., and STEPHEN G. WILLIAMS, Janesville, Wis.—*Grain Harvester*.—Patented January 24, 1854, No. 10,459; extended May 5, 1868.

Claim.—1. The method of transferring motion to the rake on the platform from the driving wheel, by means of the double-curved rack and pinion on the axle of the driving wheel, the iron arm *c*, latch *p*, and spring *m*, as herein described.

2. The method of hanging the reel so as to dispense with any post or reel bearer next to the standing grain, as herein described, thereby preventing the grain from getting caught and being held fast between the divider and reel supporter.

CHARLES R. HARVEY, New York, N. Y.—*Air-heating Furnace*.—Patented January 24, 1854, No. 10,447; extended May 5, 1868.

Claim.—Constructing the bonnet or top of the fire chamber with a depression at the center, into which the smoke or exit pipe enters, so that the heat is equalized all around, and the expansion and contraction are made uniform, as above specified.

JAMES MCCARTY, Reading, Pa.—*Roller for Scarfing the Edges of Skelps for Lap-welded Tubes*.—Patented January 31, 1854, No. 10,478; extended May 5, 1868.

Claim.—A pair of rollers constructed, arranged, and adjusted substantially as herein described, so as to bevel the opposite edges of skelp plates of different widths on opposite sides of the same.

GEORGE E. BURT, Harvard, Mass.—*Machine for Cleaning and Assorting Bristles*.—Patented February 7, 1854, No. 10,498; extended May 5, 1868.

Claim.—1. The combination of machinery for combing or straightening the bristles and machinery for separating or assorting them, as specified.

2. The combination of the two movable combs or rakes *T U*, and the two lifter wheels *G O*, and their carrying endless belts *E*, and *L, F*, and *M*, so arranged as above described, the whole being for the purpose of first holding the mass of the bristles by one part or portion of it, and lifting and combing the remainder of it, and subsequently seizing and lifting it by such combed part or portion and combing the part previously seized, all as specified.

3. In combination with the machinery for combing or straightening the bristles and machinery for assorting or separating them, the endless guide belt *V*, the spring board *p'*, and rapping apparatus or hammer *r'*, as applied and made to operate substantially in manner as specified.

4. The combination and arrangement of the two endless brush belts *V W*, and two series of draft rollers, and their two sets of endless bands, as made to operate together and assort the bristles, substantially as hereinbefore specified.

5. The combination of the combs $u^2 v^2$ and their grooves $t^2 t^2$, &c., with the delivery rollers, so as to operate substantially in the manner and for the purpose as specified.

SAMUEL G. LEVIS, Kellyville, Pa.—*Making Thick Paper*.—Patented February 14, 1854, No. 10,519; reissued October 22, 1867, No. 2,789; extended May 5, 1868.

Claim.—1. Passing or carrying a sheet of paper pulp through or between the press rolls, and expressing the water therefrom between two endless felts, so arranged that the water may pass through the felts and run off freely in front of the rolls.

2. Running or operating two or more forming cylinders in connection with the press rolls, by means of, or in combination with, two endless felts, so arranged that the water passes through the felts and runs off at the end of the rolls.

3. The combination of the two forming cylinders C and D, the two endless felts E and H, and the two squeeze-rollers F F, arranged and operating substantially as described.

WILLIAM BURNETT, San Francisco, Cal., and JOHN ABSTERDAM, of New York, N. Y.—*Use of Fusible Disks in Steam Boilers*.—Patented February 28, 1854, No. 10,574; extended May 5, 1868.

Claim.—Placing in a pipe which is connected with a steam boiler, a fusible plug or disk, said plug or disk being so far removed from said boiler, but so connected with the water therein, that when the water is sufficiently high, the plug or disk will be in contact, or so surrounded with water cooler than that in the boiler as to prevent it from being fused, but when the water in the boiler shall fall below a proper height, the steam will enter and come in contact with said plug, or so surround it as to cause it to melt, the same being for the purpose specified.

L. OTTO P. MEYER, Newton, Conn.—*Vulcanizing India-rubber and other Gums*.—Patented February 28, 1854, No. 10,586; extended May 5, 1868.

Claim.—The heating or curing of the material commonly known as the hard compound of vulcanized caoutchouc or other vulcanizable gums by means of the immersion of the material in or under water or other suitable liquid during the process of heating or curing, substantially as herein described.

JAMES PITTS, Clinton, Mass.—*Cotton-picker Cylinder*.—Patented February 28, 1854, No. 10,578; extended May 5, 1868.

Claim.—1. The constructing the screw so that the periphery of the metal intervening between any two immediately adjacent orifices shall be of a length equal to or greater than that of the staple of cotton or other fibrous material to be picked, in order that the fiber shall not lap around the said periphery and become connected, attached, or tied by its ends, as stated.

2. The improvement of constructing the cylinder screw of a hollow perforated metal cylinder, without arms or ribs, and with open hollow cylindrical journals at its two ends, as stated, in order that the cotton may be drawn out of one journal by the suction draught, and any obstruction removed by a person's hand and arm introduced through the other journal, as specified.

JOHN B. HOLMES, New York, N. Y.—*Derrick*.—Patented February 21, 1868, No. 10,544; extended May 5, 1868.

Claim.—1. The combined arrangement of the collar upon the mast, the revolving platform supported upon it and clamped below it, and the tension rods from said platform to the revolving mast-head cap, in the manner and for the purposes described.

2. Pivoting the heel of the derrick boom upon the revolving platform in the locality substantially such as is herein represented and described, that is, upon that portion of the platform which is beyond the center of the platform when measuring from the point of suspension of the weight.

WARREN GALE, Peeksville, N. Y.—*Straw Cutter*.—Patented March 7, 1868, No. 10,592; reissued June 26, 1866, No. 2,293; extended May 5, 1868.

Claim.—1. The fixed pivot F, on which the moving knife works, provided with a flanch for fastening to the cutter box, and made adjustable thereon by means of slots and bolts, or their equivalent, substantially as and for the purpose herein specified.

2. I also claim the arrangement of the adjustable gauge-plate G, in front of the fixed knife, in such a manner that it shall be raised above the said fixed knife in proportion to the increased distance at which it is adjusted away from the knife, to give a longer cut, and *vice versa*, substantially as herein set forth.

CHAUNCEY D. WOODRUFF, Toledo, Ohio.—*Suspending Eaves Troughs*.—Patented March 7, 1854, No. 10,606; extended May 5, 1868.

Claim.—The mode of suspending and fastening eaves troughs as herein described.

A. M. SAWYER, Athol, Mass.—*Machine for Splitting Rattans*.—Patented March 7, 1854, No. 10,614; extended May 5, 1868.

Claim.—The employment of a tubular spurred cutter, or its equivalent, in combination with a guide for holding and guiding the stick thereto, substantially as hereinbefore described.

JAMES H. SWEET, Pittsburg, Pa.—*Hanging of the Gripping Jaw of Spike Machines in Weighted Levers*.—Patented March 14, 1854, No. 10,645; extended May 5, 1868.

Claim.—The so hanging of the gripping jaw in weighted levers, or their equivalents, as that when two spikes, or a spike and a blank, come in between the gripping jaws at one time, the said jaw may rise and yield to the excess of metal between the dies, and prevent the breaking of any of the parts, substantially as herein described.

LAVINIA L. BARTLETT, Bangor, Me., administratrix of RUSSELL D. BARTLETT, deceased.—*Machine for Making Shovel Handles*.—Patented March 14, 1854, No. 10,631; extended May 5, 1868.

Claim.—1. The combination and arrangement of the bed M, the rotary holder O, one or more vertical movable cutters, V W H, and one or more stationary cutters, I' K', as made to operate together and from the D or head part of the shovel handle, substantially as specified.

2. The combination of the curved knife *o*, and the arc knife *p*, so applied together as not only to allow them to be separated for the purpose of being ground, but to enable them to cut out the opening of the shovel handle, as specified.

3. The combination, applied to the shaft of the rotary holder and gear wheel A', for the purpose of operating the holder as specified, the said combination consisting of the cam blocks C' M', the arm L', the spring bolt N', its cam P', and the two studs *e'* and *h'*, the whole being constructed and made to operate together substantially as specified.

WILLIAM H. SEYMOUR, Brockport, N. Y.—*Harvester*.—Patented March 28, 1854, No. 10,707; extended May 5, 1868.

Claim.—1. The combination of the shaft E' for rotating the pinion, the shaft I for turning and carrying the rake, and connecting mechanism, constructed and arranged as described, whereby the rake is turned up and down and firmly held in either position in a simple and convenient manner, without producing an undue strain upon any part of the driving gear.

2. The adjustment of the rake at varying heights from the platform, in its elevated and depressed position, by means of the device herein described, or the equivalent thereof.

AMBROSE NICHOLSON, Poland, N. Y.—*Self-fastening Shutter Hinge*.—Patented March 21, 1854, No. 10,673; extended May 5, 1868.

Claim.—The eccentric extension *a'*, and recess E of the plate A, in combination with the pin *e'* of the plate C, by which, in connection with the elongated

eye *b'* and cylindric pin *d'*, one is enabled to move the shutter and catch it or release it, without giving it any upward or downward motion, as herein set forth.

CARMI HART, Bridgeport, Conn.—*Machine for Cutting Veneers*.—Patented April 4, 1854, No. 10,739; extended May 5, 1868.

Claim.—1. Cutting veneers, or other thin stuff, by giving to the shaving knife a rectilinear movement toward and through the log, at the same time that a rectilinear movement is given to the log either transversely or diagonally to the movement of the knife, so as to produce a long, continuous drawing cut, as described, whether the said movements of the knife and log are produced by the precise arrangement of mechanical means described or any other substantially the same.

2. Making the ways *N N*, upon which the log carriage moves, adjustable, as described, relatively to the ways in which the knife and cutting table move, for the purpose of giving more or less of a drawing action to the cut, as the nature of the stuff to be operated upon may require.

3. Attaching all the necessary appendages for holding the log and feeding it to the knife to a turn table, *L*, capable of being adjusted circularly within the main frame or part *K* of the log carriage, as described, for the purpose of presenting the grain of the stuff at any desired angle to the edge of the knife or direction of the cut.

4. Suspending the log or block above the knife, by gripping it with clamps *Y Y*, which form a part of a suspending head which supports the weight of said log or block, and prevents it dragging over the edge of the knife during the backward movement of the latter, and only allows it to be lowered under the control of suitable feeding mechanism.

5. Setting the lever handle *x*, which holds the clamps upon the log, free from the notched bar *12*, by which it is secured for that purpose by means of the bar *32* and the inclined block *35*, of which the former is attached to the suspending head and the latter to some fixed point on the turntable of the log carriage, and the former is made to slide, by coming at a proper time in contact with the latter, in such a way as to raise the lever handle, as herein described.

6. Making the slots in the clamps which receive the bar *m* and screw *n* of such length, that after the clamps are arrested by coming in contact with the proper part of the log carriage or turntable, the motion of the follower and the other parts of the feed motion may continue till it is desirable to stop them, as herein described.

7. The mechanism, herein described, for rendering the pawl of the feed motion inoperative, and thereby stopping the descent of the suspending-head and the feed of the log at the proper time, to wit, the bar *24*, pin *26*, spring *27*, rod *28*, arm *29*, shaft *30*, feather *31*, and angle piece *32*, the whole being combined and applied substantially as herein set forth.

HENRY WATERMAN, Hndson, N. Y.—*Safety Valve*.—Patented November 15, 1853, No. 10,243; reissued July 9, 1867, No. 2,675; extended May 5, 1868.

Claim.—1. The piston *F*, attached to the weighted end of the valve lever within the cylinder *G*, and immersed in the liquid in the cylinder, combined and operating in the manner and for the purposes herein described.

2. The concentric rim or ledge *ll* and the overhanging part of valve *kk*, constructed, combined, and operating in the manner and for the purpose herein set forth.

L. OTTO P. MEYER, Newton, Conn.—*Treating Caoutchouc and other Vulcanizable Gums*.—Patented April 4, 1854, No. 10,741; reissued August 16, 1859, No. 797; extended May 5, 1868.

Claim.—The mode of operation or mode of procedure, substantially such as herein described, which said mode of operation consists in the employment of a pliable or flexible envelope, substantially such as herein described, or the equivalent thereof, applied by pressure to the hard compound of vulcanizable gum, while in the green or plastic

state, so as to insure the contact of such covering with the surface of the compound, and while thus covered or protected subjecting it to the vulcanizing heat, and when vulcanized stripping off such covering, the whole process being substantially such as specified.

MORRIS MATTSON, New York, N. Y.—*Enema Syringes*.—Patented April 4, 1854, No. 10,742; extended May 5, 1868.

Claim.—1. The combination of the thumb or finger rest *d* with the barrel and piston, and for the purpose essentially as specified.

2. The upper ring-valve seat *i*, and the perforated tube *k*, in combination with the disk or valve *h*, and its seat and chamber, the same being made to operate substantially as described.

ELLSWORTH D. S. GOODYEAR, North Haven, Conn.—*Process for Treating India-rubber*.—Patented March 28, 1854, No. 10,689; extended May 5, 1868.

Claim.—The introduction of water or any other liquid into the interior of articles which require expansive force for their perfect formation to the interior surface of molds, said liquid to be converted into steam, substantially as described and for the purposes specified.

JAMES L. CATHCART, Georgetown, D. C.—*Attaching Propellers to the Driving Shaft*.—Patented April 13, 1854, No. 10,790; extended May 12, 1868.

Claim.—Attaching the propeller, secured to a short shaft, which passes through the rudder, to its main or driving shaft, by a universal joint placed between the sternpost and the rudder, by which attachment the propeller is moved laterally with the movement of the rudder.

WILLIS HUMISTON, Troy, N. Y.—*Apparatus for Molding Candles*.—Patented April 4, 1854, No. 10,730; reissued March 6, 1866, No. 2,190; extended May 12, 1868.

Claim.—1. The employment of the wick stretcher *E*, so arranged and combined with the machine, having vertical stationary candle molds therein, that the candle wick within such molds shall be uniformly stretched or strained before the material is run or poured into such molds, and the friction or strain be removed therefrom before the candles are drawn or ejected from such molds in a vertical direction, substantially as herein described and set forth.

2. The stretching or straining of the candle wick in each and every of the vertical stationary candle molds contained in the candle-mold machine, at and by one continued or simultaneous operation, when the said wick extends from spools or bobbins below said molds, upward, into, and through the center thereof, and from the lower or tip end of such molds to and into the candles suspended above such molds, substantially as herein described and set forth.

3. The employment of the candle-tip bar *F*, or any substantial equivalent therefor, which shall be so constructed and arranged as to be moved in a lateral direction, up to or against or under the tips of the candles drawn or ejected from the stationary candle molds below, and thereby come in contact with the tips of the said candles in such a manner as to center the candle wick in the said molds, and at the same time hold the said candles thus suspended during the operation of filling the said molds with melted material from which to mold candles, and during the cooling thereof, and until the wick is cut or severed between the said suspended and molded candles in said stationary candle molds, substantially as herein described and set forth.

4. A vertical stationary candle mold, constructed with an inner and annular shoulder *h'*, and with an outer surrounding shoulder *c*, and with a screw and nut *at* or near the lower end thereof, in the manner and for the purposes substantially as herein described and set forth.

5. The contraction of the lower end of the vertical stationary candle molds, so as to form an inner annular shoulder, in the manner and for the pur-

poses substantially as herein described and set forth.

6. The mode, substantially as herein described and set forth, for attaching to, and combining with, the lower end of the vertical stationary candle molds having an outer surrounding shoulder *c*, and the bottom plate *B''* of the surrounding water box, so as to make the same water-tight and firm therein, in the manner and for the purposes substantially as herein described and set forth.

7. The employment of the shovel-blade cutter *J*, or any equivalent therefor, and the passing of the same between two rows of the wicks of the vertically-suspended candles, so as to cut or sever the two rows of the said wicks, in manner and for the purposes substantially as herein described and set forth.

B. J. LA MOTH, New York, N. Y.—*Railroad Car*.—Patented April 4, 1854, No. 10,721; reissued March 18, 1856, No. 360; extended May 12, 1868.

Claim.—The construction of the frames of railroad cars substantially in the manner and for the purposes specified.

SAMUEL J. PARKER, Ithaca, N. Y.—*Sewing Machine*.—Patented April 11, 1854, No. 10,757; extended May 12, 1868.

Claim.—That combination that secures to me the relative position in which I place the needle's eye to the movement of the material or feed-motion and the position of the shuttle and its race resulting therefrom, when the needle is straight and the table on which the material to be sewed is horizontal, said relative position, meaning the longitudinal axis of the shuttle and its race at right angles to the feed motion, and the consequent position of the needle's eye therefrom, so that a line drawn through the center of the material sewed, shall coincide with the line of feed motion, not be at right angles therewith, and this for the purpose of rendering the stitch more nearly straight and perfect than it otherwise would be, the combination and purpose substantially as described.

JAMES McCARTY, Reading, Pa.—*Heating Skelps for the Manufacture of Wrought-iron Tubes*.—Patented April 3, 1854, No. 10,747; extended May 12, 1868.

Claim.—The new method of operating, as described, viz., heating the skelps in a furnace constructed substantially as herein set forth, with raw coal as fuel, whose combustion is maintained by a blast of air forced into the furnace under pressure, as set forth.

JULIA M. COLBURN, Baltimore, Md., administratrix of JAMES STIMPSON, deceased.—*Vessel for holding Liquids*.—Patented April 17, 1854, No. 11,819; extended May 12, 1868.

Claim.—The employment of a chain or string attached to the handle and lid of the pitcher, as described.

BENJAMIN A. LAVENDER, Halifax, N. C., and KATE LOWE, Baltimore, Md., administratrix of HENRY LOWE, deceased.—*Treating Cane Fiber for Paper and other Purposes*.—Patented April 4, 1854, No. 10,722; extended May 12, 1868.

Claim.—Breaking down woody fiber of cane and other like plants, and dissolving the gummy and other foreign matters therefrom by means of muriatic or sulphuric acid, of the strength of 10° Baume, or thereabout, preparatory to making hemp for bagging, rope, paper pulp, &c., in the manner substantially as set forth.

STEPHEN BAZIN and JAMES A. BAZIN, Canton, Mass.—*Machinery for Laying Rope*.—Patented April 25, 1854, No. 10,823; extended May 12, 1868.

Claim.—1. Adapting the machinery for forming both "hard" and "soft" cordage by means of the ring *g*, so actuated by the circular plate *i*, and its rollers made to revolve, or held stationary, as above set forth, as to form an extra twist in the rope when desirable, by giving an additional revolution to the bobbin frames, as above described.

2. Improvement in the movable crane, the same

consisting in forming it of a bent shape, with the right angular hinged arm, operating as above described, so as to feed the rope in a direction parallel with the axis of the winding reel.

3. Stretching the rope after it is laid, by means of the double pulley *r b*, with grooves of different diameters, as above set forth.

JAMES BUELL, New York, N. Y., executor of JAMES MACGREGOR, Jr., deceased.—*Coffee Pot*.—Patented April 11, 1854, No. 10,752; extended May 12, 1868.

Claim.—Having the pot where the tea or coffee is prepared air-tight, and so regulating the heat that is applied to the heating of the same, that a small pressure by the covers prevents it from boiling, and consequently from evaporation, while the tea or coffee is being prepared, in the manner and for the purpose substantially as above set forth.

PHILANDER SHAW, Boston, Mass.—*Air Engine*.—Patented May 2, 1854, No. 10,868; reissued July 17, 1860, No. 1,014; again reissued April 23, 1861, No. 71; extended May 12, 1868.

Claim.—1. The within-described auxiliary heater, constructed and arranged as set forth, the exhaust air and the products of combustion being passed through in one direction while the cold air from the force pump is passed through in the other, by which means the heat is extracted from the heated air and smoke and transferred to the cold air on its way to the engine, the latter being pumped in against a pressure much less than that at which it is worked off from the main heater, as explained.

2. Passing the exhaust air which has propelled the piston directly through the fire, for the purpose of economizing heat, as set forth.

3. In combination with a tight ash pit, into which the air for the support of combustion within the furnace is forced, a chamber *D*, communicating with the ash pit and surrounding the furnace for the passage of a portion of the air not required by the fire, which, combining with the products of combustion in the chamber *E*, passes off through the flue *G*, for the purpose of economizing heat, as set forth.

4. I do not claim refrigerating the cylinder or piston of hot air or other engines by means of cold water, but I do claim the arrangement herein described of the tubes within the piston rod, the reservoir *R*, and the India-rubber tubes *S S'*, for the purpose set forth.

HENRY CLARK, Cedar Keys, Fla.—*Machine for Feeding Sheets of Paper to Printing Presses*.—Patented April 25, 1854, No. 10,824; extended May 12, 1868.

Claim.—Loosening or detaching the top sheet of a layer of papers from those underneath it, by giving a part of said sheet a backward and forward motion, as herein shown, previously to its being operated upon by the pressure rollers or other device for conveying it to the printing-press or other machine to which the sheet of paper is fed, for the purpose of insuring the feed of only a single sheet of paper at a time, as set forth.

FREDERICK G. SCHAUM, Baltimore, Md., administrator of FREDERICK SCHAUM, deceased.—*Glass Furnace*.—Patented April 25, 1854, No. 10,830; extended May 12, 1868.

Claim.—Making the external and internal configuration of the breast work of the furnace wall with the re-entering portions, so as to partly embrace the pots and to furnish room for additional or extra teaze or ring holes, substantially in the manner described.

MAHLON LOOMIS, Washington, D. C.—*Plate for Artificial Teeth*.—Patented May 2, 1854, No. 10,847; extended May 12, 1854.

Claim.—The improved manufacture of whole or half sets of porcelain of mineral teeth, substantially as described.

CONRAD LIEBRICH, Philadelphia, Pa.—*Trunk Lock Hasp*.—Patented May 2, 1854, No. 10,862; extended June 16, 1868.

Claim.—1. The so combining of a spring with a hinged hasp as that the lower or hinged portion thereof shall stand off from the trunk, substantially in the manner and for the purpose described.

2. The placing of the hasp catch in a solid projection which enters the lock with a hasp catch, and takes all the strain incident upon the tendency of the lid to open, and thus protect the catch itself, substantially as described.

ALBERT FISK, Louisville Ky. — *Bridge.* — Patented May 9, 1854, No. 10,887; extended June 16, 1868.

Claim.—The method of combining the different systems of triangular bracings above described, so that a weight coming on one of the systems of the truss is not only transferred over one or more other systems before it is carried back to the abutments, but the foot of the post in each triangle being unconnected with the tension rods of the other triangular bracings can settle vertically, as well as move to the side, so that the tension rods of each system of the triangular bracings will be strained equally when the bridge settles under the superincumbent weight. This would not be the case if the foot of the post in the second system of triangular bracings rested on the tension chord of the post, in the first system, as heretofore used; and herein consists my improvement for which I ask letters patent.

NELSON GAVIT, Philadelphia, Pa. — *Machinery for Cutting Paper.* — Patented May 9, 1854, No. 10,889; extended June 16, 1868.

Claim.—The method, substantially as herein described, of adjusting the cutting of sheets from a web of paper, whereby the length of the sheets can be varied by any required proportionate amount of the whole range of variation to which the machine is adapted, however small or however large the same may be, thus rendering it possible, with a continuous feed of the web of paper under an intermittent cutter, to sever the sheets half way or thereabouts between water marks, nearer together at one part of the web than at another.

THOMAS A. STEADMAN, Lyons, Mich., administrator of THOMAS S. STEADMAN, deceased. — *Clover and Grass Seed Harvester.* — Patented May 23, 1854, No. 10,967; reissued June 19, 1860, No. 986; extended June 16, 1868.

Claim.—In combination with the main frame or box A, and arm or supplementary frame F, on which is formed or secured the master wheel axle, the employment of retaining arc H, or its equivalent, the whole constructed and arranged in such a manner that the main frame or box, and arm or supplementary frame, with its master wheel axle, will be held in parallel planes relatively to each other while they are moving up and down, substantially as and for the purposes herein set forth.

THOMAS A. STEADMAN, Lyons, Mich., administrator of THOMAS S. STEADMAN, deceased. — *Clover and Grass Seed Harvester.* — Patented May 23, 1854, No. 10,967; reissued June 19, 1860, No. 987; again reissued June 20, 1865, No. 2,209, extended June 16, 1868.

Claim.—1. The combination of the holding plate *c*, or its equivalent, with the shaft of the driving cog-wheel's pinion, and that end of the coupling arm or supplementary frame G, or its equivalent, which is hung and vibrated on said shaft.

2. The combination or arrangement of the following elements in a harvester, viz., a frame or box having the cutting apparatus connected to and drawn forward by it, the shaft of the main driving cog-wheel's pinion also connected to it, and about at right angles to its forward movement, a coupling arm or supplementary frame, or its equivalent, having one end hung and vibrated on said pinion shaft, and near the other end connected to the axle of the main driving cog-wheel, and holding devices whereby the attendant can have the inner end of the cutting apparatus held at different heights in respect to the axle of the main driving cog-wheel.

3. Connecting the main bearing and driving wheel of a harvester with a frame to which the cut-

ing apparatus is attached in such a manner that the attendant can, while riding on the machine, vary the height of the inner end of the cutting apparatus, while the outer end of said apparatus remains unchanged substantially as described.

4. The combination of the retaining and guiding arc g^2 , or its equivalent, with the axle end of the coupling arm or supplementary frame H, or its equivalent, the outer end of a harvester's cutting apparatus, and the wheel that carries this outer end or is nearest to it.

5. The combination of the axles *f* and *d*, the wheels C and D, the projecting ends of the shaft of the main driving cog-wheel's pinion, the frame or box carrying this shaft, the coupling arms or supplementary frames G and H, the holding plates *c c*, and the retaining and guiding arcs *g* and g^2 or their equivalents.

6. The combination or arrangement of the following parts or elements in a harvester, a frame or box which carries the shaft of the cutter's main driving cog-wheel's pinion; a coupling arm or supplementary frame, having the axle of the said cog-wheel connected to it, at or near its outer end, and the inner end hung upon said pinion shaft; a holding device by which it is properly held in that place; a guiding and retaining arc attached to the main frame of the machine, and maintaining the supplementary frame or coupling arm in place; cutters driven by a crank motion, and an automatic rake, which, as well as the cutters, receives its motion through the main driving cog-wheel's pinion shaft.

7. Connecting the axle of the cutter's first driving cog-wheel and said wheel's pinion shaft by the coupling arm or supplementary frame G, or an equivalent thereof, which has one end hung on the said pinion shaft, and therefore holds the said cog-wheel's axle always at the same distance therefrom, so that the connection of the said cog-wheel and its pinion will always remain the same.

8. The combination of the retaining and guiding arc *g*, or its equivalent, with the main frame or box of a harvester to which the cutting apparatus is secured, and the axle end of the coupling arm or supplementary frame G, or its equivalent, which has the other end hung on the pinion shaft connected to the main frame about parallel with the axle of the cutter's ground and driving wheel, so that the said axle and pinion shaft are always at the same distance apart and substantially parallel, and the axle end of said coupling arm free to rise and fall, vibrating on said pinion shaft while the machine is in motion.

THOMAS A. STEADMAN, Lyons, Mich., administrator of THOMAS S. STEADMAN, deceased. — *Clover and Grass Seed Harvester.* — Patented May 23, 1854, No. 10,967; reissued June 19, 1860, No. 985; again reissued June 5, 1866, No. 2,279; extended June 16, 1868.

Claim.—1. In combination with the main frame of a harvester, an axle upon which the cutter's driving wheel revolves that derives all its connection with the frame through one end, and which end does not cross a vertical plane parallel with and touching the side of this frame nearest to it, a plate from which this axle projects, and a holding-mechanism that holds this plate and frame together and prevents any essential variation in the distance between this axle and the cutter's driving pinion shaft, or in their parallelism, while the frame is being raised or lowered in respect to this axle, substantially as and for the purpose set forth.

2. In combination with the main frame of a harvester, an axle upon which the cutter's driving wheel revolves that derives all its connection with the main frame through one end, and which end does not cross a vertical plane parallel with and touching that side of this frame nearest to it, and a plate from which this axle projects, a holding mechanism that prevent any essential variation in the distance between this axle and the cutter's driving pinion shaft, or their parallelism, while the main frame is being raised or lowered in respect to this axle, and another holding mechanism by which the attendant is enabled to have this main frame held at different heights in respect to this axle, substantially as and for the purpose set forth.

3. In combination with the main frame of a harvester, an axle plate which is connected with one end of the axle of the cutter's driving wheel, said plate being wholly between the plane of said wheel and a plane parallel with and touching that part of said frame nearest to said wheel, a holding mechanism which prevents any movement of this plate other than its movement in the arc of a circle concentric to the axis of the shaft of the cutter's driving pinion, and a holding mechanism having one portion further forward than the axle of the cutter's driving wheel, and another portion further back than said axle, between each of which and the frame is a portion of said plate, and by which said plate is held to the frame while it is being raised or lowered in respect to said axle, substantially as and for the purpose set forth.

WILLIAM H. MITCHEL, New York, N. Y.—*Improvement in Machinery for Composing Type*.—Patented May 16, 1854, No. 10,929; extended June 16, 1868.

Claim.—1. The combination of the lip 51 with the lifting bar 52, and with the bar 50, as specified, the said lip 51 acting as a stopper against which the line of type lies in the inclined conductor, and over which the bar 52 lifts the bottom type so that it falls on the bed *m*, as specified, and the said bar 50 being so adjusted as only to admit of one type at a time being lifted, as specified.

2. Constructing the composing wheel of thin circular plates with teeth therein, so as to receive the type from the conductor *q*, in combination with the plates 58, which pass between the circular plates and receive the type, preventing their further descent, and passing them in line into the groove, as specified.

3. The tongue 57, to prevent the type jumping over the teeth in the composing wheel as they pass down the inclined conductor, as specified.

JOHN MEYERS and ROBERT G. EUNSON, New York, N. Y.—*Machine for Sawing Thin Boards, &c.*—Patented May 3, 1854, No. 10,965; extended June 16, 1868.

Claim.—1. The employment or use of the deflecting plates *E E'*, one or both placed at the sides of the saw, as herein shown, for the purpose of preventing the sawed stuff from bearing against the sides of the saw and expanding the saw kerf, and also for the purpose of allowing a thin veneer saw to be stiffened by plates *D*, one or two, as desired.

2. The employment or use of the clamps *I I*, arranged as herein shown, or in an equivalent way, so as to have a lateral elastic movement independent of the roller beds to which said clamps are attached, for the purpose of compensating for the varying thickness of different pieces of stuff, and keeping them in a proper relative position to the saw.

3. The knives or cutters *O O*, placed in the roller beds *F F*, and arranged substantially as herein shown and described, and for the purpose as set forth.

4. The employment of an adjustable bed *F*, with clamps as described, in combination with the saw *C*, when the saw has a stiffening plate *E*, in line with said bed, by which the stiffened or rounded side of the saw is made the "line side."

THOMAS T. JARRETT, Horsham, Pa.—*Hay-elevating Forks*.—Patented May 30, 1854, No. 10,989; reissued April 18, 1865, No. 1,939; extended June 16, 1868.

Claim.—1. The employment or use of a weight on the cord attached to the catch which shall operate to discharge the hay from the fork at any desired height, substantially as and in the manner described.

2. The combination of one or more pulleys with a hay-elevating fork, for the purpose described.

3. The pulley *J* at the back part of the head, operating as and for the purpose described.

4. Securing the handle or bail to the head by means of loop eyes, which are secured in the head and project therefrom.

5. Securing the tongue or brace lever to the handle or bail by means of a spring catch attached to the said handle or bail, for the purpose described.

6. A spring catch turning upon a pin or bearing, the functions of which are to keep the tines or body of the fork in position to retain the load and to discharge it whenever desired.

7. In hay-elevating forks, I claim the combination of the tines, the wooden head the tongue or brace-lever, and the spring catch.

8. The combination of a spring catch with a rigid tongue or brace lever, extending from the piece which receives the tines, for the purpose described.

EDWARD BROWN, Waterbury, Conn.—*Machine for making Hinges*.—Patented May 16, 1854, No. 10,943; extended June 16, 1868.

Claim.—1. The slides *G G'*, regulated by set screws substantially as described.

2. The eccentric rods *E E'*, sliding within the hollow rods *F F'*, and connected with the slides *G G'*.

3. The sliding punches *J J'*, with adjusting screws, arranged as set forth.

4. The sliding gauge *O*, with its longitudinal motion and set screws, for the purpose of securing the hinges while turning the knuckle, in the manner substantially as set forth.

5. The fast gauge *S* with the preventer *r*.

6. The slide *P* with the catchers *v* and the spring catchers *w w'*.

7. The gauge *U*, in combination with the preventer *r'*, for the purpose of preventing the hinge from returning with the feeding slide, the whole being arranged and combined in the manner set forth, or in any other manner substantially the same.

EDWARD HARRISON, New Haven, Conn.—*Grinding Mill*.—Patented June 6, 1854, No. 11,040; reissued November 6, 1858, No. 625; extended June 16, 1868.

Claim.—The improved method described of securing the runner stone on the driving spindle in a grinding mill, by means of a metallic band or its equivalent, embracing the periphery of the stone by combining said band with a hub, and a back plate of at least as great diameter as the runner, and rigidly attached to the spindle, such combination operating to secure the stone firmly in its place, in the manner and on the principle substantially as specified.

WILLIAM BAKER, Utica, N. Y.—*Clapboard Joint*.—Patented May 16, 1854, No. 10,903; reissued September 22, 1868, No. 1,541; extended June 16, 1868.

Claim.—1. The construction of the joint of clapboards, or jointed siding for houses, and other buildings, in such manner that the boards when laid on the frame shall lie flat and solid for their whole width against the frame of the building, and at the same time shall preserve the appearance and advantage of clapboarding in front by the outer lip of the upper board at each joint overlapping outside the board next below it for shedding the water, as described.

2. The combination of the lock *a*, in the rear of the joint for holding the board to the frame at the lower edge, as described, with the extended lip *C* (Fig. 1) in front for covering the head of the nail, as described, the whole being constructed, combined, and arranged substantially in the manner and for the purposes herein set forth.

GEORGE W. COATS and JAMES RUSSELL, Springfield, Mass.—*Machine for Sticking Card Teeth*.—Patented August 1, 1854, No. 11,434; extended June 16, 1868.

Claim.—1. The mode of imparting the intermittent motion to the main carriage for spacing the teeth, and reversing the same by means of the screw leader attached to the main carriage, and passing through a nut mounted in suitable boxes, and rotated by cog gearing, as described, when this is combined with a clutch operated by a cam, to clutch and unclutch the wheel which receives motion from the wheel or wheels on the main shaft, and imparts the required and measured intermittent motion to the nut, substantially as and for the purpose specified.

2. In combination with the mode described of

imparting the spacing motion to the main carriage, the employment of the cams on the main carriage, which, at the end of each traverse motion, act on a lever connected and combined with and operating the clutch to clutch and unclutch the wheel which receives motion from the main shaft to operate the shifting wheel which operates the double clutch on the main shaft, substantially as and for the purpose specified.

3. In combination with the mode described of operating the main carriage, the mode of operating the second carriage which holds the sheet of leather to determine the space between the rows of teeth by means of the shifting cam called the twill cam, and the shifting-sector cog-wheel which in turn imparts motion by the cog-wheels and shaft to the cog-wheel through which passes the feathered shaft mounted on the main carriage, and which in turn imparts the required motion to the drums for lifting the second carriage at the end of each complete motion of the main carriage.

4. In combination with this, making the nut on the screw leader in two parts, divided by a plane at right angles to the axis, when the two parts are attached together so that they can be turned on each other, substantially as described, so that the threads can be set to any wear of the threads, and thus avoid end play, as described.

5. Making the arbors of the two rollers with cylindrical bosses to determine their distance apart, in combination with the mode of mounting them between boxes and without interposed boxes, the said arbors being prevented from having end play by means of V-shaped or curved fillets on the arbors fitted to corresponding cavities in the boxes, substantially as and for the purpose specified.

6. Mounting the bending fingers in the sliding top plate independent of and below the slide or carrier of the former around which the teeth are bent, the said carrier being provided with an inclined plane or cam acted upon by a like inclined plane or cam on the top plate of the fingers, substantially as described, so that when the fingers are drawn back the former shall be lifted up preparatory to its back motion, as fully set forth.

JOHN BROWN, New York, N. Y.—*Hot-water Apparatus*.—Patented May 30, 1854, No. 10,982; reissued August 14, 1855, No. 321; extended June 16, 1868.

Claim.—1. Connecting the ends of the horizontal, or nearly horizontal, water pipes of hot water warming apparatus by means of return bends or elbows of less caliber, and entering within the end or ends of such pipe or pipes, substantially as and for the purpose specified.

2. Making each horizontal, or nearly horizontal, pipe having the bend or elbow at one end of reduced caliber, with the calibers at top in the same line, substantially as and for the purposes specified, whether made in one piece, or the bend or elbow separate, and then united, the said elbow being connected with the next pipe above it by entering the end thereof, substantially as and for the purposes specified.

3. The construction and arrangement of the apparatus for the purposes and substantially as specified.

JULIA M. COLBURN, Baltimore, Md., administratrix of James Stimpson, deceased.—*Vessel for Holding Liquids*.—Patented October 17, 1854, No. 11,819; antedated April 17, 1854; extended June 16, 1868.

Claim.—1. The double-wall pitcher, the same consisting in a pitcher with double sides, double bottom, and a hinged cover, from which the liquid contents are to be poured through or over a nose or lip, substantially as herein set forth.

2. The employment of a chain or string attached to the handle and lid of the pitcher, as described.

HENRY B. MEYERS, Cleveland, Ohio.—*Converting Railroad Car Seats into Beds or Lounges*.—Patented September 19, 1854, No. 11,699; reissued May 3, 1859, No. 711; again reissued October 8, 1861, No. 123; extended July 7, 1868.

Claim.—1. The forming of berths in railroad cars

by means of the backs of the transverse seats, substantially as described.

2. The forming of berths in railroad cars by means of the transverse seats, in combination with the corresponding supplementary cushioned or uncushioned frames, or their equivalents, to fill up the spaces between the transverse seats, substantially as described.

FINLEY LATTA, Cincinnati, Ohio, administrator of A. B. Latta, deceased.—*Steam Generator*.—Patented June 6, 1864, No. 11,025; extended July 7, 1868.

Claim.—The dividing of the coil or coils, commencing with one, then dividing into two, and then subdividing into four, or any other number, as shown and described, or any equivalent device.

CHARLES F. MARTINE, Boston, Mass.—*Sofa Bedstead*.—Patented June 6, 1854, No. 11,026; reissued December 25, 1855, No. 336; again reissued August 27, 1867, No. 2,767; extended July 7, 1868.

Claim.—1. The single-spring mattress, so constructed and arranged with a sofa having a hinged back as to form, when the back is dropped from an upright to a horizontal position for forming a bed, an even surface, without joint or center depression, substantially as and for the purpose specified.

2. So constructing and arranging the single-spring mattress with a sofa having a hinged back, that when the back is raised from a horizontal to an upright position for forming a sofa, said mattress shall be drawn in or depressed longitudinally at or near its center by means of cords or their equivalents, and will have the appearance and effect of two separate cushions, one for the seat and the other for the back of the sofa, substantially as specified.

3. The arms, separated in the center, when used in combination with the sofa and mattress, constructed in the manner and for the purpose described.

THOMAS ALEXANDER, West Hampton, Mass., executor of John Alexander, deceased.—*Metallic Grommet*.—Patented June 20, 1854, No. 11,108; extended July 7, 1868.

Claim.—1. Making that portion of the tube put through the ring to correspond, or nearly correspond, with the corners of the canvas or cloth, so that when they are bent down upon the canvas they double or bend it over the edge of the ring and confine it firmly, substantially as described for the purposes set forth.

2. The scores in the ring, which correspond, or nearly correspond, with the corners of the cloth and with the points of the tube, in combination with the points of the tube aforesaid, substantially as described.

3. Scoring or otherwise roughening the surface of the rings where they come in contact with the cloth, so as to make them hold the canvas firmer and better.

4. Making or inserting points in or on one or both of the rings, to extend through the canvas into the opposite ring, or otherwise.

5. Riveting the points of the tube, which are bent over on the cloth or otherwise, substantially as described.

WARREN SHAW and PARLEY G. GREEN, Wales, Mass.—*Tentering Cloth*.—Patented June 20, 1854, No. 11,141; extended July 7, 1868.

Claim.—The adjustable obliquely-situated tender wheels G G, provided with laterally-playing tender points *jj*, in combination with the oscillating guides *ii*, arranged and operating in such a manner as to seize the cloth and stretch it uniformly, at the same time bringing its edge perfectly even and straight, in which condition it is delivered to the tender-points of the drying apparatus, to be retained thus till dried and received by the folding apparatus, substantially as herein set forth.

COLLINS B. BROWN, Upper Alton, Ill.—*Harvester Rake*.—Patented July 11, 1854, No. 11,249; extended July 7, 1868.

Claim.—Imparting the required movements to the rake I, by combining with its handle H, the

horizontally-vibrating fulcrum lever *h*, and the outer end of the lever *G*, which has a compound vertical and horizontal movement imparted to it by means of the crank pin *e*, pivot *g*, nut *i*, and the curved slotted inner portion of said lever *G*, substantially as herein set forth.

CHARLES PARKER, Meriden, Conn. — *Cast-iron Vise*.—Patented June 20, 1854, No. 11,137; extended July 7, 1868.

Claim.—Casting the movable jaws or chap of a vise so as to inclose and secure by the operation one or more wrought-iron bars within the tail or guide rod at or near the point of greatest strain, said bars being enlarged or bent at the ends the better to secure the same to the casting, in order to act as a cord or cords to resist tensile strain, and thereby secure the maximum of strength with the minimum of metal, as described.

MARINDA STARKS, Genoa, N. Y., administratrix of ISAAC STARKS, deceased, and LYMAN PERRIGO, Groton, N. Y.—*Device for Holding Pieces in Spoke Machines*.—Patented June 13, 1854, No. 11,084; extended July 7, 1868.

Claim.—The manner of holding and operating the spoke in the carriage, so that upon slackening the tail screws at the one end, the spoke is forced backward and made capable of being turned without disturbing it from its centers, and is restrained from turning when set by means of the sliding and turning socket bar in the headstock, provided with a clamp head fitting in a V or other suitably shaped recess in the headstock, and the socket bar with its clamp head forced backward by a spring, or its equivalent, substantially as specified, whereby great expedition and truth is insured in turning and setting the spoke.

FREDERICK H. BARTHOLOMEW, New York, N. Y.—*Method of Governing the Action of Valve Cocks*.—Patented June 20, 1854, No. 11,113; reissued November 13, 1860, No. 1,071; extended July 7, 1868.

Claim.—1. The combination of these three elements or devices, viz., first, a variable chamber, provided with proper apertures for admission and discharge of fluid. * * * *

2. Two valves acting to open and close a passage through which water may flow, the one being on its seat, or closing the passage when the veritable chamber is of largest capacity, and the other being in a like position, or performing the same office, when the capacity of the chamber is smallest. * * * *

3. A proper connection between the valves and the variable chamber, so applied that the motions of the former shall be controlled by the latter, the whole three being constructed and acting in combination, substantially in the manner and for the purposes hereinbefore described, when operated upon by any competent force.

4. The combination of two valves, a variable chamber, and a connection between them all, substantially such as hereinbefore last enumerated, with a seat or platform, substantially such as is herein described, by means of a connection, substantially such as set forth, whereby the seat or platform, the valves, and the variable chamber all act in unison, substantially as set forth.

5. As a means of preventing concussions on pipes supplying urinals or hopper closets, where the amount of water used is not a material consideration, and where yielding seats or platforms are employed to open a supply valve, the combination, substantially as hereinbefore described, of a variable chamber, a single valve, and a yielding seat or platform, with proper connections and attachments, so that the motions of the valve may be caused by the seat and governed by the variable chamber, substantially as described.

6. The combination of a diaphragm performing the duty of a stuffing box, with a valve or valves, and with a variable chamber controlling the valve or valves, the whole constructed and operating substantially as hereinbefore recited.

FREDERICK H. BARTHOLOMEW, New York, N. Y.—*Method of Governing the Action of Valve Cocks*.—

Patented June 20, 1854, No. 11,113; reissued November 13, 1860, No. 1,072; extended July 7, 1868.

Claim.—1. A pan provided with a proper rock-shaft arm, or its equivalent.

2. A valve or cock to open or close a passage way leading from a street main, or its equivalent, to a basin of a pan closet.

3. A variable chamber, connected with the valve, so as to control its motions in either or both directions, by retarding either its opening or closing or both.

4. A spring, or its equivalent, compressed when the valve is opened, and expanding to close the valve when the pressure upon the spring is released.

5. A lever so connected to the pan and to the valve, as to open both when force is applied to the lever.

6. A counterbalance, or its equivalent, acting to raise or shut the pan, but not operating to close the valve; intending to claim none of these parts separately, but in combination only, and when all of them are constructed and operate in combination, substantially as herein described.

HYMEN L. LIPMAN, Philadelphia, Pa.—*Eyelet Machine*.—Patented July 11, 1854, No. 11,260; extended July 7, 1868.

Claim.—1. In combination with a fastener *C* and a reservoir of eyelets *I*, the conveying apparatus for carrying the eyelet from one to the other, made and operated substantially in the manner herein described.

2. The threading of the eyelets upon a rod or stem from which they may be delivered one at a time to the carrying apparatus, substantially as described.

GEORGE HAND SMITH, Rochester, N. Y.—*Process for Making Steel Direct from the Ore*.—Patented July 18, 1854, No. 11,338; reissued August 18, 1866, No. 3,333; extended July 7, 1868.

Claim.—1. The process, substantially as herein described, for converting iron ores directly into steel by subjecting the ore in the comminuted state, in connection with carbon and with or without other flux, in a close oven, retort, or equivalent vessel, to a high degree of heat, and when converted treating it in a reheating furnace to weld and ball the particles, and then hammering, rolling, or squeezing the balls to express the impurities and complete the welding and compact the mass, as set forth.

2. In the process of conversion, charging the comminuted ore and charcoal or other carbonaceous substance in the cementing oven, or other equivalent vessel, in alternate layers, substantially as and for the purpose specified.

HORACE SMITH and D. B. WESSON, Springfield, Mass.—*Fire-arm*.—Patented February 14, 1854, No. 10,535; reissued October 10, 1854, No. 279; extended August 11, 1868.

Claim.—1. The combining the percussion hammer, the piston slide, and the barrel, so that the said piston slide shall not only serve as a breech to the barrel but at the same time as a means of conveying (by concussion) to the priming of the cartridge at one end of the slide the force of the blow of the hammer upon the opposite end of the slide, as specified.

2. The improvement in the carrier, whereby it is not only enabled to be moved downward while the breech slide is forward against the barrel, or cartridge therein, but is caused to expel from the chamber *E*, in which it moves, the remainder of the cartridge, after such remainder has been retracted by the piston slide, and while the carrier is being elevated with another cartridge, the said improvement consisting in making the carrier with an opening or passage leading out of the cartridge chamber thereof, and of a width sufficient for the movement of the piston slide out of the carrier during the descent of the latter, and providing said carrier with one or more projections *a*², or the equivalent thereof, which, when the carrier is elevated, shall be moved against the remainder of the cartridge, and elevate and expel it from the fire-arm, as stated, the breech slide or piston slide being formed substantially as specified.

3. The arrangement and application of the percussion hammer with respect to the breech slide H and the trigger guard lever, so that the hammer may be moved and set to full-cock by the pressure or back action of the slide, induced by the action of the trigger-guard lever, as specified.

4. The improvement of making the front end of the piston slide with a dove-tail recess, *a'*, (or its equivalent,) for the purpose of enabling the slide to seize the metal or remainder of the cartridge and withdraw it from the barrel when it (the piston slide) is next retracted, the said remainder being discharged from the slide by the upward movement of the carrier, all substantially as specified.

HORACE SMITH and D. B. WESSON, Springfield, Mass.—*Cartridge*.—Patented August 8, 1854, No. 11,496; extended August 11, 1868.

Claim.—1. The arranging of the tallow within the cartridge, and between the ball and charge of powder, or in a chamber, *c*, suitably made in rear of the ball of the cartridge, whereby the necessary amount of tallow for a discharge is preserved, with the charge, in a convenient and compact form.

2. The employment in the cartridge of the metallic or indurated disk or seat plate, so that it shall rest directly on the powder, in combination with arranging the priming or percussion powder in rear of said disk, or on that side of it opposite to that which rests against the powder, said arrangement of the disk and priming affording an excellent opportunity for applying the force of the blow by which the priming is inflamed, such force being applied in the line of the axis of the cartridge.

GEORGE T. BIGELOW, Boston, Mass., administrator of SAMUEL NICOLSON, deceased.—*Wooden Pavement*.—Patented August 8, 1854, No. 11,491; reissued December 1, 1863, No. 1,583; again reissued August 20, 1867, No. 2,748; extended August 11, 1868.

Claim.—1. Placing a continuous foundation or support, as above described, directly upon the roadway, then arranging thereon a series of blocks having parallel sides endwise in rows, so as to leave a continuous narrow groove or channel way between each row, and then filling said grooves or channel ways with broken stone, gravel, and tar, or other like materials.

2. The formation of a pavement by laying a foundation directly upon the roadway, substantially as described, and then employing two sets of blocks, one a principal set of blocks, that shall form the wooden surface of the pavement when completed, and an auxiliary set of blocks or strips of board, which shall form no part of the surface of the pavement, but determine the width of the groove between the principal blocks, and also the filling of said groove, when so formed between the principal blocks, with broken stone, gravel, and tar, or other like material.

3. Placing a continuous foundation or support, as above described, directly upon the roadway, and then arranging thereon a series of blocks having parallel sides endwise, in a checkered manner, so as to leave a series of checkered spaces or cavities between said blocks, and then filling said checkered cavities with broken stone, gravel, and tar, or other like material.

4. The formation of a pavement by laying a foundation directly upon the roadway, substantially as above described, and then employing two sets of blocks, viz., one a principal set of blocks, that shall form the wooden surface of the pavement, and an auxiliary set of blocks, that shall form no part of the wooden surface of the pavement, but determine the dimensions of the tessellated cavities between the principal blocks, and then filling said tessellated cavities with broken stone, gravel, and tar, or other like material.

GEORGE A. LEIGHTON, Lawrence, Mass.—*Sewing Machine*.—Patented July 11, 1854, No. 11,284; extended August 11, 1868.

Claim.—In combining with the longitudinal movements of the two needles of the sewing machine lateral movements of one needle, so that the for-

ward and backward movements of each needle shall be respectively on opposite sides of the other, (instead of on the same side of it,) whereby the crossings of the loops are made to be drawn into or directly over the holes made through the cloth or material sewed, and so as to produce a very flat seam or sewing, substantially as specified.

GEORGE HAND SMITH, Rochester, N. Y.—*Process of Making Steel Direct from the Ore*.—Patented July 18, 1854, No. 11,338; reissued August 14, 1868, No. 2,334; extended August 11, 1868.

Claim.—The combination of the process of deoxidizing iron ore and carbonizing the metallic particles, substantially such as herein described, with the process of melting in crucibles, substantially as and for the purpose described.

JAMES BRAYLEY and MARY PITTS, Buffalo, N. Y., administrators of JOHN A. PITTS, deceased.—*Horse Power*.—Patented July 4, 1854, No. 11,232; reissued May 4, 1861, No. 81; extended August 11, 1868.

Claim.—1. So combining an internal-gear main driving wheel with two pinions working at diametrically opposite sides thereof, as that said main wheel may move in a direction transverse to that of a line drawn through said pinions, for the purpose of allowing said main wheel to automatically adjust itself to said pinions, substantially as and for the purpose set forth.

2. Hanging the pinions of a double-gear horse power in adjustable bearings, so that they may be set in close mesh with the main or master wheel, substantially as described.

3. In so combining the pinions and bevel wheels upon one shaft, in pairs, and supporting them in adjustable bearings, as that their shafts may be kept in a perpendicular position while the two gears are made adjustable to the respective wheels that they mesh with, substantially as described.

LEVI DEDERICK, Albany, N. Y.—*Hay Press*.—Patented June 6, 1854, No. 11,043; extended August 11, 1868.

Claim.—Traversing the follower parallel by two sets of levers or toggle joints, with one lever of each set extended beyond the joint of connection, so as to form a lever to operate the joints, when they are so arranged that the lever of the lower set or joint may work or vibrate between the fulcrum levers of the upper one, the two levers C and D being connected together by a rod or links, the whole being constructed and operated substantially as described, for the purposes set forth.

JOHN TAGGART, Boston, Mass.—*Machine for Excavating Earth*.—Patented July 4, 1854, No. 11,242; extended August 11, 1868.

Claim.—1. The combination of the gravitating weight *u* and its line *t* with the windlass barrel *S* and the brake wheel *w'*, so as to operate automatically and rotate both windlass and brake wheel, and not only take up the slack of the rope *o*, while the scoops are being elevated, as described, but at the same time to set the brake wheel ready for the action of the brake when it becomes necessary to drop the scoops in order to discharge their load.

2. The arrangement of the branch lines *f g* of the line *N'*, so as not only to operate through the ends of the scoop levers, but also through guiding or sheave passages of the boom, such an arrangement of the branch lines producing an increase of draught on the scoop levers during the operation of closing them, as specified.

3. In combination with the afore-described arrangement of the line *N'*, through the sheave openings of the boom *K* and the two scoop levers, or about their sheaves, as specified, the union of the branches into one line, in connection with the carrying such line through a compensating passage of the boom *K*, and permitting it to slide freely through the same, in manner as described, the same being for the purpose of enabling the scoops to close together or upon an object, whenever the movement of one of them, during the operation of closing them together, is arrested by contact with an obstacle, as explained.

4. The combining the boom *K*, and the working

ropes of it and its scoops, with a crane, substantially as specified, so that the scoops may be free to be moved, not only vertically, but also in any direction, either toward or away from, or laterally with respect to the crane and its platform, whereby, while the scoops are grasping a stump or other article adhering to the mud or earth, a lateral movement of the crane may be employed to effect leverage on the scoops in a lateral direction, so as to aid in disengaging the stump or article grasped by the scoops, and to effect this without injurious strain on the boom or the parts through which the boom slides.

LAVINIA L. BARTLETT, Bangor, Me., administratrix of RUSSELL D. BARTLETT, deceased.—*Machine for Making the Heads of Shovel Handles*.—Patented July 11, 1854, No. 11,288; extended August 11, 1868.

Claim.—To so construct the dished wheel *F* and its cutters *i*, and apply them together, substantially as described, in combination with so constructing the bearing rest *G* with a shelf *l* and bearer plate *m*, or equivalent contrivances, and applying it to the wheel, so as to cause it to extend within the wheel and enable a person to introduce the shovel head into it, and between it and the inner surface of the wheel, and support said shovel head and turn it against the cutters, so as to cut it curved in two directions, as specified.

WARREN GALE, Peekskill, N. Y.—*Straw Cutters*.—Patented September 12, 1854, No. 11,667; reissued April 3, 1860, No. 938; again reissued October 25, 1864, No. 1,800; and again reissued November 13, 1868, No. 2,393; extended August 11, 1868.

Claim.—1. The automatic mouth of a feed box, constructed by any means substantially the same as described, when used in combination with a revolving cutting cylinder, armed with one knife or with several knives, so arranged that one knife shall release its hold upon the material being cut before the following knife shall grasp it sufficiently to hold it, substantially as and for the purposes set forth.

2. The adjustable bottom mouth piece *M*, or its equivalent, constructed and operating substantially as and for the purposes set forth.

3. Combining a revolving cutting cylinder, armed with one knife, or with several knives, so arranged that one knife shall release its hold upon the material being cut before the following knife shall grasp it sufficiently to hold it, with a hinged bottom mouth piece of a feed box, substantially as and for the purpose described.

4. An automatically operating mouth to a feed box, in combination with a revolving knife cylinder, armed with one knife, or with several knives, so arranged that one knife shall release its hold upon the material being cut before the following knife shall grasp it sufficiently to hold it, when this cylinder is geared to a revolving pressure cylinder, substantially as and for the purposes set forth.

5. Making those parts of the pressure cylinder against which the knife or knives are made to cut, by having their edges brought into actual contact therewith, in sections or strips, separate from the body of the cylinder, substantially as and for the purposes set forth.

6. A revolving cutting cylinder, having one or more knives, in combination with the pressure cylinder, having one or more radial flanges, arms, or projections, so arranged that the knife or knives shall, as they revolve, meet the flange, arm, or projection, or either of them, in actual contact, so that the material to be cut is caught between the two, drawn forward, and cut off by the pressure between the knife on one cylinder and the flange on the other, substantially as and for the purposes set forth.

7. The flanged pressure cylinder, arranged and operated substantially as described, when the face of the flange is covered with suitable soft material to protect the edge of the knife, when used in combination with a revolving cutting cylinder, substantially as and for the purposes set forth.

8. An automatically operating mouth of a feed box, or an adjustable mouth of a feed box, substantially as described, in combination with a revolving

cutting cylinder armed with one knife, or with several knives, so arranged that one knife shall release its hold upon the material being cut before the following knife shall grasp it sufficiently to hold it, and with a revolving pressure cylinder armed with one or more radial arms, flanges, or projections, substantially as and for the purposes set forth.

9. A pressure cylinder provided with one or more radial flanges, arms, or projections, and a revolving cutting cylinder, armed with one knife, or with several knives, so arranged that one knife shall release its hold upon the material being cut before the following knife shall grasp it sufficiently to hold it, when these cylinders are used in combination with a hinged bottom mouth piece of a feed box, substantially as and for the purpose set forth.

REBECCA R. GILLET, Chicago, Ill., administratrix of THOMAS W. GILLET, deceased.—*Apparatus for Corking Bottles*.—Patented July 11, 1854, No. 11,281; extended August 11, 1868.

Claim.—Combining the safety cylinder or screen with the cross bar of the charging socket, or other proper part of the bottling machine, so that the said screen will surround the bottle at the same time that the charging socket is brought over the neck of the bottle, and keep it there until the filling and corking has been completed, substantially in the manner and for the purpose set forth.

HENRY OUTCALT, Wilmington, Ohio.—*Mode of Constructing Metallic Roofing*.—Patented July 11, 1854, No. 11,292; extended August 11, 1868.

Claim.—Scrolling the edges of metallic plates, so as to form a tube or cylinder, and then connecting their edges by means of other scrolls, which are formed also into tubes on the edges of a narrow strip of the same kind of plate, and being somewhat larger than the former tube or scroll, so that they will slide over and fit snugly to it, for subserving three different purposes, viz: first, for protecting the roof against injury from "contraction" and "expansion;" second, for the purpose of preventing the water from driving through the roofing at the scrolls; third, for the purpose of supporting the roof and all superfluous weight that may accumulate, such as snow, &c., without any superstructure other than those on which its ends rest, the whole being arranged and constructed as described.

GRIFFITH LICHTENTHALER, Limestoneville, Pa.—*Cultivator*.—Patented July 25, 1854, No. 11,379; extended August 11, 1868.

Claim.—The method, herein shown and described, of attaching the shares *G* to the beams *A*, viz., having metal strips *F*, perforated with holes *f*, secured to the under sides of the beams *A*, and sockets formed of two lips, *g g*, made at the upper ends of the shares, and perforated with holes *h h*, in which holes *h*, and in the holes *f* in the plates *E*, wooden pins *i j* are passed, securing the shares to the beams, as set forth.

ALEXANDER HAY, Philadelphia, Pa., administratrix of MARIE AMÉDÉE CHARLES MELLIER, deceased.—*Making Paper Pulp*.—Patented May 29, 1857, No. 17,387; patented in France August 7, 1854; patented in England October 26, 1855; extended August 11, 1868.

Claim.—1. The use of a solution of caustic soda (N A O) in a compartment of a rotary vessel separate from that which contains the steam heat, substantially as described.

2. The within-described process for bleaching straw, consisting in boiling it in a solution of pure caustic soda (N A O) from 2° to 3° Baume, at a temperature not less than 310° Fahrenheit, after it has been soaked and cleaned, and before submitting it to the action of a solution of chloride of lime from 1° to 1½°, substantially as described.

JACOB SENNEFF, Philadelphia, Pa.—*Weavers' Heddle*.—Patented July 18, 1854, No. 11,335; extended August 11, 1868.

Claim.—Forming the eye of the heddle by casting or otherwise securing around and between the strands or threads composing the same metallic clasps, in lieu of the cumbersome knots heretofore

employed, curved on their sides, and made concave and smooth on their ends, between the strands or threads, where they form the ends of the eyes, in the manner and for the purpose herein set forth.

ALBERT H. TINGLEY, Providence, R. I.—*Machine for Sawing Stone and Marble*.—Patented July 18, 1854, No. 11,347; extended August 11, 1868.

Claim.—1. The combination of the two spring pawls, their slotted connecting rod, the movable ratchet and its tripping pin, with the fixed ratchet of the shaft of the sprocket wheel U, the whole being operated and made to operate together, substantially in manner and for the purpose as specified.

2. The series of hooked pins on the water distributor, in combination with the series of notches applied to the connecting-rod for operating the water distributor, the whole being for the purpose of regulating the motion of the water distributor, and of causing that motion to take place over either a portion or the whole entire surface of the stone, as occasion may require.

HYMEN L. LIPMAN, Philadelphia, Pa.—*Eyelet Machine*.—Patented July 18, 1854, No. 11,380; extended August 11, 1868.

Claim.—The so forming of the die and counter-die or follower and anvil block of an eyelet machine by concave grooves, channels, or their equivalents, as that the eyelets may be riveted or clinched on both sides by a single operation, and without turning them over; substantially as described.

R. H. GARRIGUES, Salem, Ohio, administrator of L. A. DOLE, deceased.—*Arrangement for Lathe Chuck*.—Patented July 25, 1854, No. 11,364; extended August 11, 1868.

Claim.—The manner herein described, of combining and arranging the scroll screw A, holding jaws B, screw or mandrel C, cutter C', adjustable nut F, gauge plate G, sliding catches *c d*, and notched and grooved barrel E, or their equivalents, for the purpose of constituting a machine which is capable of boring the hub entirely through in a true and perfect manner, and also of being adjusted and set so as to cut a shoulder of the required depth, and to enter the hub the proper distance, and then of being adjusted, as the operation is proceeded with, so as to square up the shoulder in a perfect manner, substantially as herein described.

CHARLES A. WAKEFIELD, Pittsfield, Mass.—*Seed Planter*.—Patented July 25, 1854, No. 11,395; extended August 11, 1868.

Claim.—1. Soarranging and operating the plunger C, in connection with the receiving tube or chamber D, and its delivery slide B, or the equivalent thereof, that the plunger C, ejecting the corn deposited in the receiving chamber, is made to imbed the corn from the surface of the earth to its required depth obliquely into the ground, while the receiving tube or chamber D, resting, by a front stop plate, I, on or above the ground, is made to open and close clear of all surrounding dirt, and the sides of the said chamber D made to act as scrapers above the recess, to clear the plunger of adhering soil, and cover the seed therewith throughout the entire withdrawal of the plunger, substantially as specified, whereby the receiving tube or chamber D is prevented clogging with dirt at its opening sides, the width of the opening made in the earth for the reception of the seed is diminished, and the corn covered with more certainty, as herein set forth.

2. The method, herein described, of operating the planter by the hand, at the side, in such a manner that the same force or pressure applied to working the plunger up and down gives to the planter, automatically, as it were, one and the same obliquity of stroke, in a backwardly direction downward, or in a forwardly direction upward, throughout its several operations, both on entering and leaving the ground, by means of the obliquely set handle E, on the rear side of the plunger, or other equivalent arrangement of the handle producing the same action, substantially as specified, and whereby the

planter may be used with greater facility and expedition, and the recess formed for the planting of the corn so made with certainty of the necessary obliquity, without involving any delay in adjusting the direction or movement of the plunger to insure the earth on the overhanging side of the said recess falling in to cover the corn, as herein set forth.

EDWARD W. BROWN, Stillwater, R. I.—*Loom*.—Patented July 25, 1854, No. 11,352; reissued March 14, 1865, No. 1,901; extended August 11, 1868.

Claim.—1. The combination of the pattern chain, the pawls, and the reversible tappet shaft, or their equivalents, substantially as described.

2. The tappet shaft, constructed and operating substantially as herein described, to turn about its axis in either direction, or remain at rest, as desired, for the purpose specified.

3. The reversible tappet shaft, or its equivalent, in combination with the pawls, or their equivalent, constructed and arranged substantially as described, and for the purpose specified.

HORACE WOODMAN, Biddeford, Me.—*Cleaning Top Cards of Carding Machines*.—Patented August 1, 1854, No. 11,448; reissued December 8, 1857, No. 514; extended August 11, 1868.

Claim.—1. The application and adaptation of the grooved cam, arranged with a sliding bar, substantially as specified, or the equivalent therefor, as a means of producing the reciprocating motion by which the raising and depressing of a top card, or the reciprocating movements of the brush bar in cleansing a top card, may be effected.

2. The combining of lifter cams T T, and a brush bar, V, with one rotary shaft R, so that, by the movements of such shaft in the manner specified, the operations of raising and depressing a top card and cleansing it may be effected in the manner set forth.

BRADFORD S. PIERCE and CHARLES M. PIERCE, New Bedford, Mass.—*Mold for Cement or Earthen Tubes*.—Patented August 1, 1854, No. 11,440; extended September 8, 1868.

Claim.—The combination of a core and spring case, substantially as herein set forth.

DANIEL W. SHARES, Hamden, Conn.—*Cultivator*.—Patented August 1, 1854, No. 11,460; extended September 8, 1868.

Claim.—Providing the expanding and contracting hoeing wings B on either side with cultivator teeth C, projecting downward on the inside of the hoeing wings or scrapers, as and for the purposes specified.

JOSHUA GIBBS, Canton, Ohio.—*Plow*.—Patented August 15, 1854, No. 11,523; extended September 8, 1868.

Claim.—Making the working surface of the mold board in the form of a section of the interior surface of a hollow cylinder, the center or axis of said cylinder being parallel, or nearly parallel, horizontally to the base of the mold board or bottom of the plow, substantially as described.

SOLOMON S. GRAY, Boston, Mass.—*Machine for Planing Lumber out of Wind*.—Patented August 22, 1854, No. 11,582; reissued April 17, 1860, No. 945; extended September 8, 1868.

Claim.—1. The peculiar construction of cutter head herein described, the cutter head itself being made use of to turn and break the shaving, in the manner of a double iron plane, and being furthermore made concave for the purpose of facilitating this operation.

2. The clamp, as herein described, for the purpose of dogging the lumber to the bed of the machine, the body of the clamp being pivoted at *d*, and forced up by the screw F, or its equivalent, the dog *h* being adjustable therein, in the manner and for the purpose set forth.

3. The within-described method of screwing the dog M to the bed of the machine by means of the teeth or cogs *l*, and the mortises in the side pieces *m*, for the purpose set forth.

4. The bar D, or its equivalent, in combination

with a rotary cutter head and traveling bed I, provided with suitable dogs for planing straight and out of wind, substantially as set forth.

SYDNEY S. TURNER, Westboro, Mass.—*Sewing Machine*.—Patented August 22, 1854, No. 11,588; reissued March 25, 1856, No. 363; again reissued May 16, 1865, No. 1,962; extended September 8, 1868.

Claim.—1. The combination, in a sewing machine, of an automatic feed, a work-supporting surface, and a needle, when the needle is arranged to operate from below the table or work-supporting surface, and without the coöperation of a second thread (or a device carrying a second thread) above the table or work-supporting surface.

2. The combination together of a needle and awl, when the same enter the work in opposite directions, and each withdraws in a direction opposite that from which it entered.

3. The combination, in a sewing mechanism, of an automatic needle turner and automatic feed, by which the loop is kept in proper position with respect to the needle as the work progresses.

4. The method of effecting the rotation of the hook, substantially as specified.

HORATIO N. GAMBRILL, Baltimore, Md., and THOMAS D. BOND, Washington, D. C., administrator of SINGLETON F. BURGEE, deceased.—*Carding Machine*.—Patented February 27, 1855, No. 12,469; antedated August 22, 1854; reissued November 17, 1857, No. 509; extended September 8, 1868.

Claim.—1. The application of two or more sets or pairs of feeding rollers to the working cylinder of carding engines, substantially in the manner and for the purpose set forth, and this we claim whether said feed rollers deliver the material directly on to the main cylinder or to lick-ers-in, when said lick-ers-in are so arranged as to work in connection with each other and with the main cylinder, for the purpose and in the manner substantially as set forth.

2. The reversing of the relative velocities of the peripheries of the main working cylinder and stripper M at intervals, by an automatic movement for the purpose of cleaning or preventing the clogging of the main cylinder, substantially as described.

NORMAN MILLINGTON, Shaftsbury, Vt., and L. J. MATTISON, S. M. GEORGE, and A. B. GARDNER, of the same place, executors of DENNIS J. GEORGE, deceased.—*Machine for Graduating Carpenters' Squares*.—Patented August 6, 1854, No. 11,489; extended September 8, 1868.

Claim.—1. The arrangement, in a single frame, substantially as set forth, of as many gravers as there are units to be divided, so as, by the action of the cam wheel W, or its equivalent, simultaneously to trace, of the proper length, each set of division and fractional lines.

2. The balance frame V, with its appendages, to equalize the pressure of the spiral springs on the graver handles *g*, so as to give the same depth of mark on the thin as on the thick end of the taper square.

3. The inclined plane *i*, with its appendages for moving the square longitudinally, and dividing the inch into any desirable number of equal parts.

4. The carriage C, arranged to press the square up against the points of the gravers by a cam, or otherwise, all the several parts, or their equivalents, to be arranged and combined as above specified, or in any other manner substantially the same, which shall produce the intended effect.

WILLIAM O. ANDREWS, New York, N. Y.—*Centrifugal Pump*.—Patented August 22, 1854, No. 11,544; extended September 8, 1868.

Claim.—The construction of the pump as herein described and shown, viz., having a hub E, in the shape of the base of a cone inverted with arms *a* attached to its periphery, of a gradually decreasing width as they approach its base, placed within a shell corresponding in shape to the outer circumference of the arms, and having induction passages

of a spiral form, gradually decreasing in pitch to their point of delivery, and eduction passages of a spiral form, of a gradually increasing pitch until they attain a straight line, by which construction the water is made to pass, without sudden change of direction or eddies, in an unbroken volume through the pump; and I do not limit myself to the precise mechanical construction as shown, but may modify the different parts, only retaining the same general combination.

JACOB SENNEFF, Philadelphia, Pa.—*Machine for Casting Metallic Eyes or Mails of Heddles for Looms*.—Patented August 22, 1854, No. 11,589; extended September 8, 1868.

Claim.—1. The method, within described, of casting the eyes or mails on the strands of yarn or other material, by inserting the yarns successively within a mold, secured on a vibrating frame L, operated at the proper intervals of time by means of the eccentric cams I I, said mold being opened at times to disengage the mail therefrom, and provided with a core 24, for forming the eye in the mail, and capable of being withdrawn therefrom before the mold opens, substantially in the manner and for the purpose herein set forth.

2. The manner of operating the core, so as to enable it to be so withdrawn from the eye of the mail after the same is formed and while it is firmly embraced within the mold, by means of the spring S and screws 25 and 33, operating in the manner described.

3. The core carrier 27, resting in a notch formed in the top of the spring S, and having pins 26 on its face, which pass through slots in the mold plates and spring W, for moving the core horizontally from the stationary half of the mold, and keeping it midway between the mold plates, when they are opened by the lever T, and preventing it being thrown violently either way, as herein set forth.

4. The manner of operating the heddle-frame holder D, by means of the eccentric cams I on the shaft B, capable of being moved longitudinally over the grooves in said shaft, right-angled levers D, to which the heddle frame is secured, and spiral springs 21, for keeping the ends of the levers always in contact with the eccentric cams; and in combination therewith the screw shaft C and clamps J and the adjustable gearing K, at the ends of the screw and main driving shafts, the whole being constructed and operating in the manner and for the purpose herein fully set forth.

JOSEPH H. TUCK, Brooklyn, N. Y.—*Packing for Stuffing Boxes, &c.*—Patented June 26, 1855, No. 13,145; patented in England August 25, 1854; extended September 8, 1868.

Claim.—The forming of packing for pistons or stuffing boxes of steam engines, and for like purposes, out of saturated canvas, so cut as that the thread or warp shall run in a diagonal direction from the line or center of the roll of packing, and rolled into form either in connection with the India-rubber core or other elastic material, or without, as herein set forth.

Claim.—Attaching the spindles *b* of the wings or DANIEL HALLADAY, Batavia, Ill.—*Governor of Windmills*.—Patented August 29, 1854, No. 11,629; extended September 8, 1868.

sails F to a sliding head G, by means of the levers *f h*, or their equivalents, and operating said head G, by means of the lever H, or its equivalent, and a governor of any proper construction, for the purpose of giving the desired obliquity to the wings or sails, and thereby insuring an equal motion and power during the variable velocity of the wind.

SARAH W. FLANDERS, Newburyport, Mass., administratrix of JOSEPH F. FLANDERS, deceased, and JEREMIAH A. MARDEN, of Boston, Mass.—*Leather-splitting Machine*.—Patented August 29, 1854, No. 11,604; extended September 8, 1868.

Claim.—The use of the continuously-revolving or endless-belt knife, as applied to machines for splitting leather, and operating in the manner substantially as set forth.

CALEB SWAN Easton, Mass., executor of DANIEL HAYWARD, deceased.—*Manufacture of India-Rubber*.—Patented August 29, 1854, No. 11,608; extended September 8, 1868.

Claim.—The improvement in the process of vulcanizing native India-rubber, or rubber once vulcanized, compounded with other articles as above set forth, which consists in heating and curing them with steam, and under pressure, and in regulating the application of steam, and the induration of the product by the introduction of steam and water, as described, by which a very great saving is made in the time and fuel required for the process, as hereinabove stated.

BENJAMIN BRAY, Salem, Mass.—*Improvement in Spring Rollers for Window Curtains, &c.*—Patented September 5, 1854, No. 11,638; extended October 13, 1868.

Claim.—Providing the tubular or hollow curtain roller with a long spiral spring within it, when said spring is used for the purpose, not merely of drawing up the curtain by its recoil, as that is not new, but of balancing it in any position in which it may be placed, substantially as herein described.

ELIAS INGRAHAM, Bristol, Conn.—*Design for Clock Case Front*.—Design No. 107, dated September 3, 1861; extended October 13, 1868.

Claim.—The design for a clock case, as hereinabove illustrated and set forth.

WILLIAM H. AKINS and JOSEPH C. BURRITT, Ithaca, N. Y.—*Calendar Clock*.—Patented September 19, 1854, No. 11,711; extended October 13, 1868.

Claim.—1. The arrangement of the four rows of teeth on wheel L, (as shown in Fig. 8.) in combination with the corrugated plate N, the detent X, and the arm O, the rocking shaft P, and the slotted arm Q, or the equivalent of said arms and rocking shaft, and for the purposes set forth.

2. Raising the click 37 over four or more of the teeth of the wheel L, (when run down,) on the first day of the month, thereby acquiring a retaining power sufficient to be used in the short months, thus moving the wheel L, carrying the hand I, on the dial, from the 28th day of February, past the 29th, 30th, and 31st divisions of the wheel L, to the figure 1, or the 1st day of March, those teeth (the 29th, 30th, and 31st) being removed, the detent X stopping the wheel L at the point marked 1 on figure 8, indicating the first day of every month, one tooth only being used, except at the last day of a short month, the rod 30 slipping through the end of the lever Y.

3. The combination of the helix V, the lever Y, lifting rod 30, the detent X, the pin 55, the click 37, the wheel L, and spring 7, and for the purposes described, that is, giving movement to the wheel L, the rollers F, G, and H being moved by similar devices.

WILLIAM THORNLEY, Philadelphia, Pa.—*Safety Washer for Securing Wheels to Axles*.—Patented September 19, 1854, No. 11,705; extended October 13, 1868.

Claim.—A washer having a projecting flange, and stop or stops; also, the cap, with the stop or stops, as described, for the purpose specified.

HORACE W. PEASLEE, Malden Bridge, N. Y.—*Machine for Washing Paper Stock*.—Patented January 23, 1855, No. 12,283; antedated September 20, 1854; reissued January 8, 1856, No. 340; again reissued March 19, 1867, No. 2,515; extended October 13, 1868.

Claim.—1. A rotating pervious cylinder, provided with projecting teeth on the inside, and mounted, substantially as herein described, so as to be sustained and rotated without a shaft and arms, that the inside and ends may be unobstructed for the passage of the stock, substantially as and for the purpose described.

2. In combination with a pervious rotating cylinder, armed with teeth on the inside, substantially as described, the means, substantially as described, for the introduction of water through the meshes

of the cylinder to the stock inside, as and for the purpose described.

GARDNER CHILSON, Boston, Mass.—*Furnace or Heat Generator and Radiator*.—Patented September 26, 1854, No. 11,718; reissued September 27, 1864, No. 1,782; extended October 13, 1868.

Claim.—1. In combination with one or more tapering tubes, substantially as described, made to communicate in the fire chamber essentially as specified, a conical or tapering radiator closed at top, and arranged directly over the fire, and made to open near its base in the said tapering tube or tubes, and to operate, with respect to them, and the fire pot or chamber and the surrounding air or medium to be warmed or heated, substantially as specified.

2. Arranging the feed or fire-place door within the trunk or mouth piece to the fire pot or place, and so as to operate as specified.

3. In combination with the mouth piece and the door arranged in it as specified, the passage in the mouth piece and its plate *c*, for the thin sheet or stratum of air to pass under the door (while it is wholly closed) and said plate *c*, and be heated by contact with the plate before it (the said air) reaches the fuel.

4. In combination with the inclined door of the fire place, the plate *c*, and the air passage directly under it, the ledge or flange *a'*, arranged as described, the same being not only for the purpose of regulating the admission of air into the passage, but of keeping it from passing under the door and over the plate *c*, while the ledge is below the level of the top surface of the plate.

5. The arrangement of the register hole, (viz., in line of or axially with respect to the shaft of the grate,) in combination with the arrangement of the outer end of said shaft, viz., entirely within the throat of the ash pit, or in rear of the registry plate or opening as specified, the said arrangement not only enabling me to dispose the grate shaft entirely within the ash-pit mouth, (the end of said shaft, when projecting from the front face of the furnace, being, generally speaking, more or less in the way, besides presenting an appearance often disagreeable to the eye,) but to make the registry opening answer the purpose not only of admitting air to the fire when required, but of enabling a person to place a key or crank upon the shaft for the purpose of turning or moving the grate when necessary, and this without danger of ashes escaping out of the ash pit, provided its door be closed.

6. The combination of a fire pot, a dome surmounting it, a series of flues, (leading from the base or lower part of the dome,) the whole being substantially as hereinbefore described.

7. The combination of a fire pot, a dome surmounting it, a series of flues, (leading from the base or lower part of the dome,) and a series of conical or partially conical bases or semicones, serving not only to facilitate the entrance of smoke and heat into the conical radiators or flues, but the absorption of heat and its radiation toward the floor, and its reflection into the tapering radiators, the whole being substantially as specified.

8. The combination of a fire pot, a dome surmounting it or placed over it, a series of flues, (leading from the base or lower part of the dome,) and a hollow ring or annular radiator placed on and opening out of the said flues, the whole being substantially as hereinbefore explained.

STEPHEN J. GOLD, Cornwall, Conn.—*Warming Houses by Steam*.—Patented October 3, 1854, No. 11,747; extended November 3, 1868.

Claim.—1. The combination of generator, radiator, and condenser, as herein described, for the purpose of heating buildings, when the connection between the generator and condenser is perforated as specified, so as to admit of the formation of a hydrostatic column balancing the pressure of steam on the valve *h*, and permitting the water from the condensation of the steam to return to the generator, as hereinbefore specified.

2. The mode of regulating the quantity of steam admitted to the radiator, by means of the cord *o' o'*, and tubes constructed and operating as set forth.

3. The herein-described method of producing a steam-tight connection between the plates of the condensing and radiating chambers E E', by means of a cord packed between the edges of the plates, substantially as set forth.

4. The securing of the thin metallic sheets forming the chambers E and E' by depressing and riveting, as shown in Fig. 3, for giving the requisite strength to withstand the outward pressure of the steam in a simple and economical manner.

JOHN ROSS, Brooklyn, N. Y., administrator of CHARLES ROSS, deceased.—*Grinding Surface in Mills*.—Patented October 17, 1854, No. 11,811; extended November 10, 1868.

Claim.—The forming of a grinding surface in mills by lining a cast-iron concave with radial segments of burr or other stone, said segments being fitted and secured to their places in the manner herein set forth.

WILLIAM PORTER, Williamsburg, N. Y.—*Securing Lamps to Lanterns*.—Patented October 24, 1854, No. 11,849; extended November 10, 1868.

Claim.—The above-described lantern, constructed substantially as described.

JACOB SENNEFF, Philadelphia, Pa.—*Metallic Heddles*.—Patented January 13, 1852, No. 8,662; additional letters patent July 20, 1852, No. 102; extended November 10, 1868.

Claim.—Casting the eye on the wire which constitutes the heddle, harness, or heald, through which the warp passes, in the manner and for the purpose set forth, producing a heddle much superior to any other known or used, and which will remove many of the difficulties heretofore experienced in the use of the common twisted wire heddle.

Additional Claim.—Casting eyes of harness or heddles upon single or multiplied strands of worsted, silk, cotton, thread, or other material, in the manner and for the purpose herein set forth.

SAMUEL VAN SYCKEL, Titusville, Pa.—*Grate Bars*.—Patented October 31, 1854, No. 11,879; reissued June 9, 1868, No. 2,980; extended November 10, 1868.

Claim.—Constructing grate bars with pins or projections on one of the sides of the bar, and with corresponding mortises or recesses in the other side, whereby the bars can be interlocked and held together, and made self-sustaining throughout their entire length, substantially as described and specified.

JONATHAN S. TURNER, Fair Haven, Conn.—*Alarm Clock*.—Patented July 18, 1852, No. 9,123; extended November 10, 1868.

Claim.—The combination of the double-notched cam I with the locking apparatus K and L, with their appendages *f*, *m*, *r*, *n*, *i*, *j*, and *q*, when used in any kind of time pieces for giving alarms at the time desired, and giving more than one alarm with once winding, when the whole is constructed, arranged, and combined substantially as herein described.

GEORGE MILLER, Providence, R. I.—*Manufacturing Leather Banding for Machinery*.—Patented November 7, 1854, No. 11,902; extended December 8, 1868.

Claim.—An improved manufacture of round banding, as made substantially as described, that is to say, by reducing a strip of leather, or other suitable material, to the shape denoted in Fig. 1, and subsequently rolling and cementing it together into that essentially as exhibited in Fig. 2, of the drawings hereinbefore mentioned.

STEPHEN E. BOOTH, Orange, Conn., administrator of SHELDON S. HARTSHORN, deceased.—*Buckle*.—Patented November 7, 1854, No. 11,892; reissued May 26, 1868, No. 2,955; extended December 8, 1868.

Claim.—1. A buckle, in which the tongues are formed from a single piece of metal, and constructed so as to clasp the divided side, and turn freely thereon, substantially in the manner herein set forth.

2. The combination of the two parts or loops, one side of one of which is divided, and the two parts or loops hinged together, as described, and the tongue clasped and hinged upon the divided side, substantially as set forth.

HARRY H. EVARTS, Chicago, Ill.—*Shingle Machine*.—Patented October 31, 1854, No. 11,858; extended December 8, 1868.

Claim.—1. Placing the blocks to be sawed into shingles in a rotating carriage, which is combined with inclined tables *p p*, (or a single table,) and with saws *o o*, (or a single saw,) in such a manner that the blocks will be carried continuously forward and be automatically operated upon to convert them into shingles, substantially as herein set forth.

2. The arrangement of the weighted levers H H, the fastening teeth *i i*, and the inclined planes *l l*, with each other, and with the inclined tables *p p*, and the other series of teeth in the ledge *r*, substantially as herein set forth.

3. Presenting the sides of the fibers of the wood to the action of the saws in the sawing of shingles, or equivalent articles, for the purpose of giving them smoother surfaces than can be produced by the usual mode of sawing, substantially as herein set forth.

ELIZA MASCHER, Philadelphia, Pa., administratrix of JOHN F. MASCHER, deceased.—*Daguerreotype Case*.—Patented March 8, 1853, No. 9,611; additional improvement February 19, 1856; extended December 8, 1868.

Claim.—1. Constructing a daguerreotype case with an adjustable flap or supplementary lid, C, said flap or lid C being within the case, and having two ordinary lenses, D D, placed in it; by which, upon adjusting the flap or lid as shown, a stereoscope is formed of the case, and the two daguerreotypes E E, by binocular vision, are apparently formed into a like figure.

2. The combination and arrangement of a series of leaves, of any suitable material, containing photographic or other pictorial representations, (interspersed or not with blank or printed leaves,) with the supplementary lid or adjustable flap containing a lens or lenses as described, the same being united or bound together so as to form a book, substantially in the manner and for the purposes described.

GEORGE CROMPTON, Worcester, Mass.—*Loom for Weaving Figured Fabrics*.—Patented November 14, 1854, No. 11,933; reissued December 28, 1858, No. 639; extended December 8, 1868.

Claim.—1. Combining with hook jacks which are connected with the harness, and with the mechanism for operating them to open the shed, substantially as described, a pattern chain, or cylinder constructed with two or more patterns, and operated so that either of the patterns can be made to act on the hook jacks to place them in the required position to be operated upon by the mechanism for opening the shed, substantially as described.

2. In combination with a pattern chain, arranged with two or more patterns in the direction of its length, the mechanism, substantially such as herein described, for changing the movements of the chain to effect the changing of the pattern, as described.

3. Placing two or more patterns upon the rods of a pattern chain, side by side, and operating them in succession by vibrating the chain laterally, in the manner substantially as described.

4. Pivoting the lifting and depressing rods G P at one end, the other being made adjustable, in the manner and for the purpose set forth.

5. Moving the rods or jacks out of contact with the rollers on the pattern chain before the chain is moved, by means of what are termed the vibrating fingers, or the equivalents thereof, substantially as described.

CHARLES PARHAM, Philadelphia, Pa.—*Sewing Machine*.—Patented November 21, 1854, No. 11,971; reissued November 3, 1863, No. 1,562; extended December 8, 1868.

Claim.—1. So forming and constructing the shuttle driver of a sewing machine that, while it per-

forms the required duty of driving the shuttle, it serves to maintain the latter in the desired proximity to the plate C, as set forth.

2. The combination of the driver A, shuttle B, and stationary plate C, the whole being formed and arranged substantially as described, so as to retain the shuttle, during its flight, in its proper position for the purposes specified.

CLARA M. B. SNOW, Independence, Iowa, executrix of HARVEY SNOW, deceased.—*Presser Bar for Planing Machines*.—Patented November 21, 1854, No. 11,984; extended December 8, 1868.

Claim.—Combining the pressure bar H with the rotary cutters, so as to secure the same relative position of the inner edge of the bar, and the path of the cutting edge in holding and cutting the surface of a board throughout its varying thickness, substantially as described.

SAMUEL H. MILLER, Dedham, Mass.—*Anchor*.—Patented June 29, 1852, No. 9,076; extended December 8, 1868.

Claim.—1. The nature of my invention consists in having two separate shanks (marked A and B in Fig. 1 of the inclosed drawings) and flukes to them, C and D, the shanks being confined together near the rings by the bolt E, secured at one end by a large head, and at the other by a strong nut or key F, and separated at their elbows or crowns the length of one of the flukes by a spur or brace projecting from the shank A. In the other shank B there is a hole through which the end of the spur G passes, and is secured by a nut or key at H. The flukes are pointed in opposite directions, and so disposed that it is impossible for the anchor to lie otherwise than with one of the flukes in the ground.

2. There being no stock to this anchor it is not liable to become "stock foul" in "letting it go," nor can a vessel be "stock rode," as it is termed, by the stock entering the ground and being dragged along until it meets a hard vein of earth or a stone, when the stock is bent or broken, and the anchor is useless. But in this form, the instant a strain comes on the cable the anchor enters, and is drawn down into the mud until the broad surface of the fluke presents its full power of resistance. The fluke sinks readily in the ground from the effect of its plowshare-like point, which passes the earth on one side, instead of lifting up and breaking it.

3. By unscrewing the nut F, and withdrawing the bolt E, which connects the two shanks at the rings, and so detaching the shank B from the end of the spur G, both flukes can be turned downward and geared as in Fig. 2 of the drawings, becoming in effect a double "mooring anchor," which sinks with certainty both flukes in the ground by attaching to the middle of the spar chain I, which connects the two elbows, and is twice the length of one of the flukes, an empty beef barrel, small water cask, or anything of sufficient buoyancy to insure the turning of the flukes down by its resistance to the sinking of the anchor. To this chain the buoy rope is also made fast. In many ports ships are obliged to lie moored, and much inconvenience is experienced with the old form of anchor by the fluke, which stands up from the ground, catching the cables of the ships as they sheer about with the wind or tide. In my anchor this difficulty is entirely obviated, for when the flukes are sunk in the

mud there is nothing above the ground which can catch a chain or hawser. In anchoring upon a lee shore the anchor, being disposed as above, will take a double hold of the ground, thus rendering the anchorage more secure.

4. If one of the flukes or shanks should be broken near the elbow or crown, (the place where they usually break,) this anchor can yet be made available by lashing a spar of the length of the shank and one fluke across the remaining shank to the spur or brace G, as in Fig. 3. It then becomes the same as the common one-fluked mooring anchor, and can be used in the same manner, or as the double anchor described in the third specification by securing to the ends of the spar a temporary stock, a rope of twice its length, and from the middle or bight of that extend another to the ring at the elbow, then at the bight, or where the ropes are united, secure a buoy or small cask, and let go the anchor, the fluke will strike the point into the ground. Or it can be lowered down by a rope made fast to the elbow or crown, as is the mode with the mooring anchor now in use. In the old form of anchor, if the shank is broken both flukes are lost and the anchor is useless.

5. It is frequently necessary to carry out anchors in boats, which service, if in the night time, or in a heavy sea, is always attended with great peril because of the anchor stock lying athwart the boat's gunwales, embarrassing the men in rowing, and its liability to turn, and the stock catching in the boat's quarter when about to be let go. In carrying out this anchor of my invention there is no such danger. There being no stock, it lies along the middle of the boat, with flukes over the stern; and when the hawser is run out the anchor follows, without the possibility of fouling or catching in the boat.

6. By the mode in which this anchor is made greater strength is insured than can be obtained in the old one with the same weight, each shank and fluke being in shaft forged into shape, and then heated at the proper place and bent into the form requisite, without the necessity of welding any part but the spur or brace to the stock. In the old anchor there must be a weld (and commonly there are two) at the crown, and there they most frequently break.

7. While making a passage this anchor can be readily stowed by withdrawing the key H, and lifting the shank B from the spur G, and laying it upon the shank A. The anchor thus closed occupies but little space. This can be done while the anchor hangs at the cat-head, and with greater ease than when on the deck, by taking out the key, drawing off the shank B, and allowing it to drop to its fellow. Then, by the tackle hooked to the spur chain, it is taken over the ship's side.

8. In case of extremity this anchor can be separated and used as two, by lashing across the shank A, at G, a spar for a temporary stock, and driving through the hole in the shank B, at H, a handspike, and lashing thereto a spar, as on the shank A; then rig them with buoys, as described in specification 4, and illustrated in Fig. 3. Thus arranged, the anchor being provided with two rings, can be shackled to two chains or cables, thereby securing greater safety to the ship than if moored with but one.

What I claim as my invention, and desire to secure by letters patent, is, the above-described anchor for holding ships.

DESIGNS.

2,858.—LEVI HEYWOOD, of Gardner, Mass., assignor to HEYWOOD BROTHERS & Co., same place.—*Chair*.—January 14, 1868.

2,859.—JOHN T. WEBSTER, New York, assignor to EDWARD HARVEY, Brooklyn, N. Y.—*Floor Oil Cloth Pattern*.—January 14, 1868.

2,860.—WILLIAM G. ALGEO, Pittsburg, Pa.—*Coffin*.—January 28, 1868.

2,861.—CHARLES A. FLESCHÉ and JOHN PER-

PENTE, New Haven, Conn.—*Scarf Pin*.—January 28, 1868.

2,862.—CHARLES J. HAWK, Brooklyn, N. Y.—*Oil Can*.—January 28, 1868.

2,863.—WILLIAM J. LUSK, Fentonville, Mich.—*Frame*.—January 28, 1868.

2,864 and 2,865.—LEVI G. MALKIN, New York, N. Y., assignor to HARTFORD CARPET COM-

PANY, Hartford, Conn.—*Carpet Pattern, (two patents.)*—January 28, 1868.

2,866.—JOHN McARTHUR, JR., Philadelphia, Pa.—*Masonic Hall.*—January 28, 1868.

2,867 and 2,868.—THEODORE G. MEIER, St. Louis, Mo., assignor to ST. LOUIS COTTON FACTORY.—*Trade Mark, (two patents.)*—January 28, 1868.

2,869.—CHARLES J. MILLER, Philadelphia, Pa.—*Trade Mark.*—January 28, 1868.

2,870.—JAMES M. TAFT, North Providence, R. I.—*Trade Mark Label.*—January 28, 1868.

2,871.—HENRY G. THOMPSON, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn.—January 28, 1868.—*Thirty-two other patents, having the same title as the above, also granted, the numbers extending from 2,871, ending 2,903.*

2,904.—W. H. WILSON, Providence, R. I.—*Good Templar Badge.*—January 28, 1868.

2,905.—JOHN ALEXANDER, Brooklyn, N. Y., assignor to GEORGE W. BROWN & CO., Forestville, Conn.—*Lantern.*—February 4, 1868.

3,215.—HUGH CHRISTIE, New York, assignor to D. POWERS & SONS, Lansingburg, N. Y.—*Floor Oil Cloth Pattern.*—November 3, 1868.

3,216.—HUGH CHRISTIE, Morrisania, assignor to WILLIAM M. BRASHER & COMPANY, Brooklyn, N. Y.—*Floor Oil Cloth Pattern.*—November 3, 1868.

3,217.—ELIHU DWIGHT, New York, N. Y.—*Stair Oil Cloth.*—November 3, 1868.

3,218.—JEREMIAH DWYER, Detroit, Mich., assignor to DETROIT STOVE WORKS COMPANY, same place.—*Ornaments of a Stove.*—November 3, 1868.

3,219.—EBERHARD FABER, New York, N. Y.—*Pencil Trade Mark.*—November 3, 1868.

3,220.—ISRAEL FOSTER, Philadelphia, Pa.—*Carpet Pattern.*—November 3, 1868.

3,221.—HENRY C. FRY, Pittsburg, Pa., assignor to himself, FRANK SEMPLE, and JOHN D. REYNOLDS, *Ornamentation of Glassware.*—November 3, 1864.

3,222.—LUTHER W. HARWOOD, Troy, N. Y., assignor to FULLER, WARREN AND CO., same place.—*Plates of a Cook's Stove.*—November 3, 1868.

3,223.—CHARLES S. LORD and WILLIAM N. WALKER, Otter River, Mass.—*Cook's Stove.*—November 3, 1868.

3,224.—GEORGE B. OWEN, Winsted, Conn.—*Clock Case.*—November 3, 1868.

3,225.—WILLIAM J. PEAKE, New York, N. Y.—*Trade Mark.*—November 3, 1868.

3,226.—CHARLES ZEUNER, Cincinnati, Ohio, assignor to M. GREENWOOD & Co., same place.—*Shovel and Tongs Stand.*—November 3, 1868.

3,227.—CONRAD HARRIS and PAUL WILLIAM ZOINER, Cincinnati, Ohio.—*Store.*—November 3, 1868.

3,228.—HARDY N. BAKER, assignor to BENJAMIN B. WASHBURN, Boston, Mass.—*Blind Hinge.*—November 10, 1868.

3,229.—PETER BAUMGRAS, Washington, D. C., assignor to GEORGE W. THOMSON.—*Vapor Burner.*—November 10, 1868.

3,230 and **3,231.**—DAVID BENSON, Nanuet, N. Y.—*Well Curb, (two patents.)*—November 10, 1868.

3,232.—ALFRED BERNEY, Jersey City, N. J.—*Trade Mark.*—November 10, 1868.

3,233.—AMORY EDWARDS, Elizabeth, N. J., assignor to UNION METALLIC CARTRIDGE COMPANY, Bridgeport, Conn.—*Trade Mark.*—November 10, 1868.

3,234.—JAMES SPEAR, Philadelphia, Pa.—*Ornaments of a Stove.*—November 10, 1868.

3,235.—JAMES FREDERICK TRAVIS, New York, N. Y.—*Branches of a Gasolier.*—November 10, 1868.

3,236.—DAVID BRUCE, Brooklyn, N. Y., assignor to DAVID WOLFE BRUCE, New York City.—*Printers' Type.*—November 17, 1868.

3,237.—DAVID WOLFE BRUCE, New York City.—*Ray-shaded Printers' Type.*—November 17, 1868.

3,238.—PASCHAL CONVERSE, New Haven, Conn.—*Clock Case.*—November 17, 1868.

3,239.—JAMES H. DOWNS, assignor to C. COWLES & Co., New Haven, Conn.—*Coach Lamp Glass.*—November 17, 1868.

3,240.—JAMES H. DOWNS, assignor to C. COWLES & Co., New Haven, Conn.—*Coach Lamp.*—November 17, 1868.

3,241 and **3,242.**—ISRAEL FOSTER, Philadelphia, Pa.—*Carpet Pattern, (two patents.)*—November 17, 1868.

3,243.—ALONZO FRENCH, Philadelphia, Pa.—*Fruit Jar.*—November 17, 1868.

3,244.—JULIUS HERRIET, New York, N. Y., assignor to DAVID WOLFE BRUCE, New York City.—*Ornamental Type for Printers.*—November 17, 1868.

3,245.—JULIUS HERRIET, New York, N. Y., as-

signor to DAVID WOLFE BRUCE, New York City.—*Ornamented Printers' Type.*—November 17, 1868.

3,246.—JOHN W. KISSAM, New York, N. Y.—*Scale Dish.*—November 17, 1868.

3,247.—ROBERT MACDONALD, New York, N. Y.—*Ladies' Collars and Cuffs.*—November 17, 1868.

3,248.—CHARLES T. MEYER, Bergen, N. J., assignor to EDWARD C. SAMPSON, New York City.—*Floor Cloth Pattern.*—November 17, 1868.

3,249.—CARL MÜLLER, New York, N. Y.—*Clock Case.*—November 17, 1868.

3,250.—CONRAD REUTER, Cincinnati, Ohio.—*Printers' Flourishes.*—November 17, 1868.

3,251.—EDGAR A. ROBBINS, Wrentham, Mass.—*Trade Mark.*—November 17, 1868.

3,252.—SAMUEL ROEBUCK and JOHN ROEBUCK, New York, N. Y.—*Cuspador.*—November 17, 1868.

3,253.—SOLOMON C. SPRING, Bristol, Conn., assignor to WELSH SPRING & COMPANY, same place.—*Clock Case.*—November 17, 1868.

3,254.—DAVID W. STORER, Bangor, Me.—*Trade Mark.*—November 17, 1868.

3,255.—CHARLES M. THEBERATH and JACOB H. THEBERATH, Newark, N. J.—*Harness Trimming.*—November 17, 1868.

3,256.—JAMES FREDERIC TRAVIS, New York, N. Y.—*Branch of a Gasolier.*—November 17, 1868.

3,257.—EDWARD H. TURNER, Quincy, Ill.—*Trade Mark.*—November 17, 1868.

3,258.—MICHAEL WERK, Cincinnati, Ohio.—*Trade Mark.*—November 17, 1868.

3,259.—LEONARD EGGLESTON, Seneca Falls, N. Y., assignor to RUMSEY & Co., same place.—*Steam Boiler Pump.*—November 17, 1868.

3,260 and **3,261.**—D. FOERSTER, Zanesville, Ohio.—*Trade Mark, (two patents.)*—November 17, 1868.

3,262.—CALVIN W. SHERWOOD, Chicago, Ill.—*Standards of a School Desk.*—November 17, 1868.

3,263.—HENRY C. KNOWLTON, Gardner, Mass.—*Chair Seat Bow.*—November 24, 1868.

3,264.—B. B. WILCOX, New Haven, assignor to J. W. NASH, Madison, Conn.—*Trade Mark.*—November 24, 1868.

3,265.—LEONIDAS L. COLEMAN, Nashville, Tenn.—*Trade Mark.*—December 1, 1868.

3,266.—JOHN CORRIGAN, Charlestown, Mass.—*Axle Box for Railway Carriages.*—December 1, 1868.

3,267.—BENJAMIN CRABTREE, Jr., Philadelphia, Pa.—*Carpet Pattern.*—December 1, 1868.

3,268.—ISRAEL FOSTER, Philadelphia, Pa.—*Carpet Pattern.*—December 1, 1868.

3,269.—CHARLES FRASER, New York, N. Y.—*Bridle Front, &c.*—December 1, 1868.

3,270 and **3,271.**—HERMANN ILENBURG, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place.—*Printers' Type, (two patents.)*—December 1, 1868.

3,272.—PETER A. JORDAN, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place.—*Printers' Type.*—December 1, 1868.

3,273.—ANDREW LITTLE, New York, N. Y.—*Printers' Type.*—December 1, 1868.

3,274.—NICHOLAS MÜLLER, New York, N. Y.—*Clock Case.*—December 1, 1868.

3,275.—CHARLES F. RICHERS, New York, N. Y.—*Spoon or Fork Handle.*—December 1, 1868.

3,276.—GEORGE WILKINSON, Providence, R. I.—*Fork or Spoon Handle.*—December 1, 1868.

3,277.—FRANCIS C. HEISER, Brooklyn, E. D., N. Y.—*Snuff Box.*—December 1, 1868.

3,278 to 3,290.—ELEMIR J. NEY, Lowell, Mass., assignor to THE LOWELL MANUFACTURING COMPANY, same place.—*Carpet Pattern, (thirteen patents.)*—December 1, 1868.

3,291.—FRANZ DOERSCHUCK, New Haven, Conn.—*Cabinet Organ Case.*—December 15, 1868.

3,292.—HENRY H. HAYDEN, New York, N. Y., assignor to HOLMES, BOOTH, AND HAYDENS, Waterbury, Conn.—*Fork or Spoon Handle.*—December 15, 1868.

3,293 to 3,295.—CHARLES T. MEYER, Bergen, N. J., assignor to EDWARD C. SAMPSON.—*Floor Cloth Pattern, (three patents.)*—December 15, 1868.

3,296.—CARL MÜLLER, New York, N. Y., assignor to NICHOLAS MÜLLER, same place. *Figure.*—December 15, 1868.

3,297.—W. P. UHLINGER, Philadelphia, Pa.—*School Desk.*—December 22, 1868.

3,298.—N. P. CHIPMAN AND WILLIAM T. COLLINS, Washington, D. C.—*Badge.*—December 29, 1868.

3,299.—JOHN H. FRASER, New York, N. Y.—*Show Case.*—December 29, 1868.

3,300.—HENRY H. HAYDEN, New York, N. Y., assignor to HOLMES, BOOTH AND HAYDENS, Waterbury, Conn.—*Fork or Spoon Handle.*—December 29, 1868.

3,301.—FRANCIS D. PASTORIUS, Philadelphia, Pa.—*Machine Frame or Housing.*—December 29, 1868.

3,302.—HENRY G. REED, Taunton, Mass., assignor to REED and BARTON, same place.—*Spoon or Fork Handle.*—December 29, 1868.

3,303.—ARTHUR STAFFORD, Brooklyn, N. Y.—*Key Tag.*—December 29, 1868.

REISSUES.

2,830.—JOSEPH STEGER, New York, N. Y.—*Car Starting Apparatus.*—Patented July 9, 1867, No. 66,648; reissued January 14, 1868.

Claim.—1. The multiplying gear, consisting of the traction bar T, lever or equivalent L, pivoted pawl R, ratchet wheel W, spiral spring S, and spring P S, constructed and operating substantially as and for the purpose specified.

2. The gearing device, consisting of the spring P S, provided with a foot button and the pawl R, suspended from said spring, substantially as and for the purpose set forth.

2,831.—MILO S. BURR, Boston, Mass., assignee by mesne assignments of FRANCIS J. LA FORME.—*Nursing Bottle.*—Patented November 29, 1859, No. 26,327; reissued January 14, 1868.

Claim.—1. An improved nursing bottle, having its body A composed of glass or other suitable material, and provided with an elastic nipple or mouth piece, f, and a flexible or pendulous tube, C, applied thereto, substantially in manner and so as to operate as and for the purpose set forth.

2. In a nursing bottle, otherwise properly organized, the use or application of a flexible or pendulous tube, substantially as and for the purpose set forth.

3. The application of a gravitating tip or tube, e, to the lower end of the flexible tube C, substantially as and for the purpose set forth.

2,832.—THOMAS S. CLOGSTON, Boston, Mass.—*Heating Apparatus.*—Patented December 13, 1864, No. 45,389; reissued January 14, 1868.

Claim.—The application and use, for heating purposes, of one or more tubes having a corrugated or annular ribbed surface, in combination with a boiler, or other suitable steam generator, and pipes for conducting the steam or hot water from said generator to the corrugated tubes, essentially as herein shown and described.

2,833.—WILLIAM N. ELY, Stratford, Conn., assignee of EDGAR M. STEVENS.—*Pegging Machine.*—Patented May 28, 1867, No. 65,294; reissued January 14, 1868.

Claim.—1. The combination of a vibrating moving awl with a sliding or vertically moving, or a swinging head, substantially as described.

2. The combination of a feeding awl with a sliding and swinging head, or with a sliding head, or with a swinging head, substantially as described.

3. Raising and driving the awl bar and peg-driving bar, or either of them, positively and directly, by means substantially as described, in combination with a laterally moving or feeding awl.

4. So constructing the parts that the awl bar, moving up and down perpendicularly to its carriage, shall also move laterally, substantially as and for the purposes described.

5. In combination with the foregoing, the laterally and vertically moving peg-driving bar, substantially as and for the purposes described.

6. Constructing and arranging the kuife in relation to the driver and peg tube, substantially as described.

7. Cutting the peg from the strip, substantially as described.

2,834.—PINCKNEY FROST, Springfield, Vt.—*Scythe Fastener.*—Patented January 11, 1853, No. 9,531; reissued February 9, 1858, No. 524; extended seven years; reissued again January 14, 1868.

Claim.—The loop bolt, provided with the groove b and the hook or loop e, in combination with the set ring, also provided with a groove, b', all constructed and arranged substantially as and for the purpose set forth.

2,835.—JOHN T. HANCOCK, Boston, Mass.—*Boiler Furnace.*—Patented March 1, 1864, No. 41,770; reissued January 14, 1868.

Claim.—The method of supplying air and steam to ignited fuel in furnaces, by commingling and then introducing them into an inclosed space under the grate bar, by means substantially as above described.

2,836.—B. B. HILL, Chicopee, Mass.—*Hand Stamp.*—Patented November 6, 1866, No. 69,395; reissued January 14, 1868.

Claim.—1. The employment of an indicator index or calendar, R R', to represent the period of time, in combination with stamp-canoeing wheels I J, arranged and operating substantially as described.

2. The wheel case G, stud or axis pin a, with the ribbon cylinder when made in one piece of metal, substantially as and for the purpose described.

3. The calendar wheels R R', arranged upon the same axle with the wheels I J, in combination with the hand stamp, arranged and operating substantially as described.

4. The bracket H, made on or secured to the case

G, having a step, *c*, or its equivalent, to enter the lower end of the spindle, and orifice for the screw *e*, for attaching and detaching said case to the spindle E, substantially as and for the purpose described.

5. In a hand stamp, the employment of the flanch K on the chase L, in combination with the case G and bed C, for the purpose of easily and quickly attaching and detaching said chase on or off of said case.

2,837.—FRANKLIN BENJAMIN HUNT, Richmond, Ind.—*Straw Cutter*.—Patented January 5, 1864, No. 41,070; reissued October 2, 1866, No. 2,368; reissued again January 14, 1868.

Claim.—1. The bar *x*, cast in one piece, with the bearings *b b* of cutter shaft *c*, and extending cross from one to the other, substantially as shown.

2. Connecting the feed rollers G and H by means of the pinions *a'*, *b'*, *d'*, and *e'*, the pinions *b'* and *d'* being placed on studs on the swinging plate *c'*, attached to the shaft *n*, the pinions *d'* and *e'* being kept in gear by the link *f*, or its equivalent.

3. The swinging plate *c'*, connected to the shaft *n*, and carrying the pinions *b'* and *d'*, substantially as and for the purpose shown and set forth.

4. Mounting the upper feed roller H in a frame, with sling extending below the lower feed roller, and acted upon by a spring, or its equivalent, substantially as shown and for the purpose set forth.

5. The hooked slings *q q*, in combination with the yielding feed roller H and spring I, or its equivalent, whereby the said feed roller H is limited in its upward movement, as set forth.

6. The hubs or bearings *u' u'*, attached to the slings *q q*, and surrounding the shaft *p* of the feed roller H, said hubs moving in slots *b b* in plates *w*, and relieving the shaft from friction against the plates, as set forth.

7. The guide board or plate *u*, connected to and moving with the frame *t* of the upper feed roller H, and extending downward at the back of the said roller to near a level with its axis, substantially as and for the purpose set forth.

8. The slots *v v* in the plates *w*, when made concentric with shaft C, in combination with pinions *a*, *b*, *d*, and *e*, said pinions connecting feed rollers H and G, so that the adjustable roller can move up and down concentric with shaft C, and the pinions remain in gear, substantially as set forth.

9. In combination with the bar *x* and adjustable bar E, a revolving knife, D, with its axis placed above the plane of the adjustable cutter bar E, to act with a slanting and shearing cut, substantially as set forth.

2,838.—FRANKLIN B. HUNT, Richmond, Ind., assignee by mesne assignments of himself.—*Straw Cutter*.—Patented December 27, 1859, No. 26,637; reissued January 14, 1868.

Claim.—1. Combining in one piece the bed piece R, upon which the adjustable bar T rests, and the side pieces V V, substantially as shown and described.

2. The adjustable bar T, against which the knife cuts, when secured by vertical bolts U to an immovable bearing within the limits of the width of the cutting knife, as shown.

3. The plate Y, for the purpose of covering the joint between the adjustable bar T, against which the knife cuts, and the bed piece R, in manner substantially as set forth.

4. The link bearings M, attached to the shaft D, and carrying the feed roll Q, in combination with the springs W, in such manner that, as the roll rises, it shortens the operative length of the springs, and thereby gives the greatest pressure to the roll when most needed, in manner substantially as shown.

5. Attaching the fly wheel of a feed cutter to its shaft in such manner as to constitute a yielding device between said wheel and the cutting knife, for the purpose described.

6. Attaching the knife cylinder of a feed cutter to its shaft in manner shown, or in an equivalent way, to constitute a yielding device between the knife and other parts of the machine, for the purpose herein shown and set forth.

2,839.—CHARLES T. JEROME, Minneapolis, Minn.—*Fire Annihilator*.—Patented July 9, 1867, No. 66,498; reissued January 14, 1868.

Claim.—1. The application of a quick-match, or its equivalent, which will take fire at a low temperature, to an apparatus for extinguishing fires by the injection upon the same of a gaseous or a liquid non-supporter of combustion, substantially as described.

2. Preparing the ends of the quick-matches with a composition composed of the within-described ingredients mixed together in about the proportions set forth.

2,840.—C. H. KNOX, Mount Pleasant, Iowa.—*Clothes Wringer*.—Patented July 2, 1867, No. 66,362; reissued January 14, 1868.

Claim.—1. The double cog wheel P, and double pinion S, substantially as set forth.

2. The combination of cog wheel P and pinion S with rollers D D, substantially as and for the purpose set forth.

3. The arrangement and combination of lever M, hinged to box A, roller L, rods K, levers I, and plate C, arranged to operate upper roller D, as set forth.

2,841.—BRADFORD S. PIERCE, New Bedford, Mass., and MASON R. PIERCE, Woodstock, N. Y.—*Machine for Making drain Pipes*.—Patented April 19, 1859, No. 23,703; reissued February 28, 1865, No. 1897; re-issued again January 14, 1868.

Claim.—1. A mold, consisting of a case capable of being properly secured around the material while the pipe is being molded, and of being freed from the pipe when the molding is completed, in combination with a core, and also with a core socket, having a provision for freeing the socket or pipe, or both, from the core, the whole operating substantially as set forth.

2. A mold, in which the core socket is made separate and distinct from the other parts, and so formed, and so combined with such other parts, that it is capable of being connected with them when the mold is ready for use, and of being continuously kept connected with them during the entire process of molding and finishing the pipe, substantially as and for the purposes described.

3. The arrangement of the mixing apparatus and of the core relieving devices above the platform, which conveys the molds in the manner and for the purpose substantially as specified.

4. The combination of the core socket with the revolving disk which receives the core and the mold, when the disk contains a provision for enabling the socket or pipe, or both, to be freed from the core, the whole operating substantially as described.

2,842.—WILLIAM S. RYERSON, Philadelphia, Pa.—*Hoop Skirt*.—Patented August 27, 1867, No. 68,238; reissued January 14, 1868.

Claim.—A skeleton skirt, provided with buckles or their equivalents, near the waistband, for adjusting the vertical tapes or connections at the sides of the skirt to accommodate the size and shape of the hips, or vary the length of the skirt, substantially as set forth.

2,843.—WILLIAM SMITH, New York, N. Y.—*Weaving*.—Patented April 5, 1853; extended seven years; reissued June 18, 1867, No. 2,656; reissued again January 14, 1868.

Claim.—The process herein specified of weaving, consisting in the use of stationary warps, in combination with moving warps and filling that inclose such stationary warps, substantially as set forth.

2,844.—WILLIAM SMITH, New York, N. Y.—*Weaving*.—Patented April 5, 1853; extended seven years; reissued June 18, 1867, No. 2,656; reissued again January 14, 1868.

Claim.—The heddle or its equivalents, for supporting the stationary central warps, in combination with mechanism, substantially as set forth, for performing the weaving.

2,845.—DAVID M. WESTON, Boston, Mass.—*Centrifugal Machine for Draining Sugar and Other Substances*.—Patented April 9, 1867, No. 63,770; reissued January 14, 1868.

Claim.—1. In the construction of centrifugal machines for separating liquids from other substances,

suspending such machines at the top by flexible connections, operating substantially as described.

2. The combination of the spindle D, and its accessories, with the socket B, and its India-rubber bushing C, or other equivalent spring connection, to form a flexible and elastic bearing for the shaft E, by which the cylinder may be suspended, substantially as described.

3. The employment, in a centrifugal machine, of a hollow shaft, and a spindle or axle on which it runs, to support the cylinder or basket, substantially as described.

4. So forming and arranging the driving pulley F upon the shaft E, that it shall surround the spring bearing, substantially in the manner and for the purpose described.

5. The construction of the openings I in the bottom of the cylinder, in such machines, and the valve J, for the purpose of closing the same, substantially as described.

6. The combination of the cylinder G, the hollow shaft E, the driving pulley F, the spindle D, its elastic bushing C, and socket B, to form the operative part of a centrifugal machine, substantially as described.

2,846.—RICHARD YEOMANS, Cincinnati, Ohio.—*Printers' Chase*.—Patented October 24, 1865, No. 50,650; reissued January 14, 1868.

Claim.—The transverse notches or grooves, in combination with the projecting transverse obtuse edges, specifically as set forth, for the purposes designed.

2,847.—E. D. CHAMBERLAIN, Westfield, N. J., and CHARLES H. BROWN, New York, N. Y., assignees of DEXTER H. CHAMBERLAIN.—*Hand Stamp*.—Patented January 22, 1867, No. 61,396; reissued January 21, 1868.

Claim.—1. The combination, with a die in a hand stamp, of type wheels of different diameters, substantially as and for the purpose specified.

2. The die holder E, constructed and combined with the lever end *e'*, substantially as and for the purpose shown and described.

3. Making the type wheels *a b c* of different diameter, rotating upon separate and distinct axes, *a' b' c'*, substantially as and for the purpose shown and described.

4. The combination of the inking ribbon with the type wheels, substantially as herein described, so as to present a double fold of the ribbon under the type wheels, all as set forth.

2,848.—GEORGE DEAL, Wilmot, Ohio.—*Horse Rake*.—Patented July 10, 1866, No. 56,189; reissued February 4, 1868.

Claim.—1. The combination and arrangement of the hinged arms I I, adjusting screws H H, or their equivalent, tooth roller D, and rake teeth L L, substantially as and for the purpose herein specified.

2. The locking arms N O, overlapping as described, in combination with the rake, arranged in relation to said arms, substantially as and for the purpose herein specified.

2,849.—WILLIAM ALLEN INGALLS, Chicago, Ill.—*Method of Casting Screws*.—Patented May 15, 1866, No. 54,733; reissued February 4, 1868.

Claim.—1. The mode herein described for casting seamless screws.

2. The screw herein described, as a new and improved article of manufacture.

2,850.—MARY JANE LAIRD, Middletown, Pa., administratrix of the estate of ANDREW J. LAIRD, deceased.—*Horse Hay Fork*.—Patented August 21, 1866, No. 57,337; reissued February 4, 1868.

Claim.—1. The tines D D, having cutting edges, in combination with rod C, substantially as and for the purpose specified.

2. The tines D D, in combination with the rod C, when the former are pivoted to the parallel bars A A, and work in slots arranged in the end of the same, substantially as described and for the purpose specified.

3. The rod C, link E, and lever F, when the same are arranged and combined substantially as described.

4. The bars A A, when they are connected and arranged as shown, in combination with the rod C and link E, substantially as described.

5. In combination with the sliding rod C, the lever F, having its upper horizontal arm adapted to project through the ring H, substantially as described and for the purpose specified.

2,851.—E. H. BOURNE, E. DAMON, Jr., and H. M. KNOWLES, Cleveland, Ohio, assignees of SAMUEL D. LECOMPTE, Leavenworth City, Kansas.—*Instrument for Opening Sealed and Other Cans*.—Patented September 19, 1865, No. 50,011; reissued February 4, 1868.

Claim.—1. A can opener, constructed of a cutter or knife, connected to a handle or holder, having a point so arranged in relation to said holder as to form an axial pivot for the cutter, in opening cans.

2. The point, when so arranged in relation to the holder and cutter, that it acts as a point in perforating the can, and an axial pivot for the cutter.

2,852.—HUGH W. MATTHEWS, Chicago, Ill.—*Threshing Machine and Separator*.—Patented August 27, 1867, No. 68,095; reissued February 4, 1868.

Claim.—1. A longitudinally-slatted grain rack or platform, C, constructed substantially as described, in combination with vertically and longitudinally-moving shakers, D, arranged so as to play between the slats of said rack, substantially as described.

2. The combination of a threshing device, a perforated and longitudinally-slatted stationary rack, C, and blades or straw shakers D, operating substantially as described.

3. A stationary or movable rack, C, composed of perforated slats, having longitudinal spaces between them, in combination with serrated blades D, arranged and operated substantially as described.

4. The slatted and perforated grain rack, arranged so as to incline toward the threshing device, and hinged to the main box or frame A, substantially as described.

5. The combination of a slatted rack or grain platform, C, the serrated grain or straw shakers, operating through said grain rack, and a conveyer, arranged and operating substantially as described.

2,853.—JAMES H. MCLEAN, St. Louis, Mo.—*Dredging Machine*.—Patented July 9, 1867, No. 66,608; reissued February 4, 1868.

Claim.—1. The adjustable dredging frame C, when such adjustment is produced by a derrick *i i*, and fall, when constructed and operated substantially as shown and specified.

2. The scoops *d* of a dredging machine, having circular vertical cutting edges in advance of the usual lateral cutting edge *w*, Fig. 1, when constructed and operating substantially as shown and specified.

3. In combination with the dredging vessel, the pins L for the purpose of moving the same, substantially as described.

4. The dredger, the receiving and discharging-apron, and the derrick of a dredging machine, all in combination, when constructed and operated substantially as shown and specified.

2,854.—WILLIAM PAINTER, Baltimore, and CHARLES PAINTER, Owing's Mills, Maryland, assignees of WILLIAM PAINTER by mesne assignments.—*Lamp Burner*.—Patented June 30, 1863, No. 39,102; reissued February 4, 1868.

Claim.—1. Having the side pieces *h h* and the ends *g g* constructed and arranged in reverse inclined positions, in the manner herein shown and described.

2. The combination of the attachment above specified with the tubes F A, the latter being screwed into the fountain or body B, of the lamp, and inclosing the wick-adjusting wheels *b*, as set forth.

3. Making the outer case F adjustable upon the tube A, so that the height of the cap G may be regulated, as and for the purpose set forth.

4. A deflector or flame spreader, constructed so as to form a continuous plate around the flame, and fashioned so as to cut off the ascending currents of air from the edges of the flame and deflect them against the sides thereof, substantially as described, and for the purpose set forth.

2,855.—JOSEPH RIDGE, Richmond, Ind.—*Coal-Oil Lamp*.—Patented April 15, 1862, No. 39,984; reissued February 4, 1868.

Claim.—1. The use of transparent material between the base of the deflector and base of the burner, substantially as described, and for the purposes specified.

2. The combination and arrangement of the base B, of the burner, the transparent inclosure M, the deflector D, and chimney C, substantially as set forth, and for the purposes described.

3. The base of the chimney, located at a point above the base of the burner, and having interposed between said bases a transparent inclosure, for the purpose of utilizing the light emitted by the flame beneath the base of the chimney, substantially as described.

2,856.—THOMAS P. SINK, Fairton, N. J.—*Oyster Dredge*.—Patented October 4, 1859, No. 25,680; reissued February 4, 1868.

Claim.—1. The combination of a horizontal roller E, turning in bearings adjacent to the gunwale of a vessel, and a horizontal grooved roller or pulley B, substantially as and for the purpose described.

2. The combination of a horizontal roller and a vertical roller, when the outer side of the latter is beyond the outer edge of the horizontal roller, and when the said rollers are arranged, in respect to each other, on the gunwale of a vessel, substantially as described.

3. The arrangement and combination, substantially as described, of the chock or block A, its pulley B, and the roller E, for the purpose specified.

2,857.—THOMAS WELCH, Churchville, N. Y.—*Crank-pin Box*.—Patented August 1, 1865, No. 49,185; reissued February 4, 1868.

Claim.—1. In combination with the adjustable boxes B D, a pitman P, so united therewith that it will freely move and work, for the purposes set forth.

2. In combination with the adjustable boxes and pitman a, set screw S, for the purpose set forth.

3. The combination of the cap C with the boxes B D, pitman P, and set screw S, for the purposes set forth.

2,858.—JONATHAN C. BROWN, Brooklyn, N. Y., assignee of HENRY C. SMITH.—*Lath Machine*.—Patented September 28, 1852, No. 9,286; extended seven years; reissued February 11, 1862.

Claim.—1. Turning the log to be cut by driving the mandrels at each end thereof by gearing them directly with the driving-shaft, substantially as and for the purposes set forth.

2. The dog A and its appurtenances, for connecting the log with the mandrels, and disconnecting it therefrom, as specified.

3. The combination of the cylinder cutter K and the stripping knife, moved up simultaneously and automatically, all substantially as and for the purposes set forth.

2,859.—GUSTAVE LAUTENSCHLAGER, Cincinnati, Ohio, and GEORGE L. GOTT, New York, N. Y.—*Tobacco Pipe*.—Patented January 30, 1866, antedated January 17, 1866, No. 52,297; reissued February 11, 1868.

Claim.—A bowl or a nicotine receptacle of a tobacco pipe, made of coal dust mixed with pitch or other suitable cement, and formed substantially as and for the purposes described.

2,860.—E. M. MONTAGUE, Boston, assignee of NATHAN AMES, Saugus Center, Mass.—*Index Door Plate*.—Patented July 31, 1860, No. 29,430; reissued February 11, 1868.

Claim.—1. The use, in a door plate, of a tablet or slate, and an adjustable plate or disk, having figures, or readable signs or characters, for the purposes specified and set forth.

2. In combination with the above door plate, a rotating disk C, marked with the hours and parts of an hour, as shown in Fig. 2, said disk being confined in the center to a spindle D, which passes through the door, substantially as and for the purpose described.

3. The spring S, arranged, combined, and operating substantially as described.

2,861.—FRANCIS MORANDI, Boston, Mass.—*Lantern*.—Patented February 5, 1866, No. 14,201; reissued February 11, 1868.

Claim.—The funnel applied to the lantern in the manner and for the purpose substantially as herein set forth.

2,862.—GEORGE M. PULLMAN, Chicago, Ill., for himself, and assignee of BEN FIELD, Albion, N. Y.—*Sleeping Car*.—Patented September 19, 1865, No. 49,992; reissued February 11, 1868.

Claim.—1. The construction and arrangement of the berth A, hinged to the car at B, and supported by the jointed suspenders C, or other analogous devices, the whole so adapted to the car that it forms a recess to receive the same when turned up, substantially as described.

2. In combination with the berth A, the sliding partition I, substantially as described.

3. In combination with the berth A, the movable head board J, substantially as described.

4. The construction and arrangement of a car seat with the back and seat cushions hinged together and disconnected from the seat frame, so that the back cushion may be placed on the seat frame and the seat cushion extended to meet the seat cushion of the opposite chair, substantially as described.

2,863.—ADAM R. REESE, Phillipsburg, N. J., assignee of GEORGE W. LEE.—*Lantern*.—Patented November 21, 1854, No. 11,967; reissued February 11, 1868.

Claim.—1. The cast-iron ends of the seed box of a grain drill, provided with flanges formed thereon, fitting and supporting the ends of the front and rear boards, and with legs or feet for supporting the box on the main frame as described.

2. The scores o o, or their equivalent, at the extremities of the holes c, in the disks M, in combination with the gradual narrowing of the holes toward their extremities, so as to save the grain from being cut, substantially as described.

2,864.—ADAM R. REESE, Phillipsburg, N. J., assignee of GEORGE W. LEE and ADAM R. REESE.—*Seeding Machine*.—Patented January 15, 1861, No. 31,123; reissued February 11, 1868.

Claim.—1. The lifter handle that raises the seed tubes out of the ground, in combination with a mechanism or device that throws the feed out of gear, before the seed tubes are out of the ground, by the one movement of said lifter handle.

2. In combination with a grain drill tube and draw bar, a brace to support the tube, fastened at its lower end to the tube, and at its upper end embracing the draw bar, and a wooden pin, which holds the upper end in proper position, and which will allow the brace to slide back on the bar when the tube strikes an obstruction, for the purpose set forth.

3. The feed slide of a grain drill made of two bars, the one sliding in recesses of the grain stirrups, while the other is adjustable in relation thereto, in such manner as to maintain the parallelism of said bars, for the purpose set forth.

2,865.—CALVIN W. SHERWOOD, Chicago, Ill. (School, Division A.)—*Desk and Seat*.—Patented November 6, 1866, No. 59,466; reissued February 11, 1868.

Claim.—1. The joint, composed of the nave C' and axle B', constructed and operating substantially as set forth.

2. The arrangement and combination of the arms C, nave C', and axle B', with the seat D and standard A, substantially as specified.

3. The double-acting stop k, constructed and operating substantially as specified.

4. So locating and arranging the stop k and axle B' on the head B, that, with the nave C', a covered and compact joint is provided, substantially as and for the purposes specified.

5. The double-acting stop k, in combination with the shoulder l, operating in the slot or space, substantially as specified.

2,866.—CALVIN W. SHERWOOD, Chicago, Ill. (Division B.)—*School Desk and Seat*.—Patented No.

vember 6, 1866, No. 59,466; reissued February 11, 1868.

Claim.—1. The jointed braces F, when provided with lips *a* and ledges *b*, substantially as and for the purposes specified.

2. The combination and arrangement of the ledges *b*, lips *a*, and pins *d*, with the braces F and hinged shelf K, substantially as specified.

3. The arrangement and combination of the hinged arms H, jointed braces F, and hinged arms G, with the standards A and desk top I J, substantially as and for the purposes specified.

2,867.—THE MIDDLETOWN WOOL COMPANY, Middletown, Conn., assignee by mesne assignments of J. R. HENSHAW.—*Self-mousing Hook.*—Patented October 26, 1858, No. 21,897; reissued February 6, 1866, No. 2,166; again reissued February 11, 1868.

Claim.—The combination and arrangement of the hooks proper, eye, spring bar, spring, and cheeks to protect the spring, substantially as before set forth.

2,868.—THOMAS WELCH, Churchville, N. Y.—*Crank Pin and Box for Harvester.*—Patented August 1, 1865, No. 49,183; reissued February 11, 1868.

Claim.—1. The crank-pin box of a harvester, with an oil reservoir, G, for the purpose set forth.

2. A crank-pin box or head D H, of a harvester, so constructed with reference to the crank pin C that the outer end of said pin will be enveloped by the head D H, for the purposes set forth.

3. In combination with a crank-pin box, provided with an oil reservoir, a screw cap, G, or its equivalent, for the purpose of allowing the reservoir to be filled with and prevent the escape of unnecessary oil therefrom.

4. The pitman E and knife head F, connected by the taper screw head *g* and socket *f*, or their equivalents, and the bolt which passes into or through the parts, as set forth.

5. In combination with the connecting parts *g f*, and bolt, as specified, a washer, in the manner and for the purposes set forth.

2,869.—SAMUEL DARLING, Bangor, Me.—*Manufacture of Metallic Squares.*—Patented October 6, 1857, No. 18,327; reissued February 18, 1868.

Claim.—1. A hardened-edged tongue, united by soldering to a beam, constructed substantially as described.

2. A tongue for squares, which is hardened at the edges and soft in the center, substantially as described.

3. The mode or process described of hardening the edges of the tongue by pressure between plates of cold iron.

4. The mode or process described of hardening the edges of the tongue by confining it between pieces of iron, and then heating and tempering, as described.

2,870.—HARRIS M. FISH, New York, N. Y., assignee of L. K. PLIMPTON and WILLIAM FOOT, executors of JAMES M. FISH, deceased.—*Machine for Weighing and Bagging Grain.*—Patented June 5, 1860, No. 23,568; reissued February 18, 1868.

Claim.—1. The hopper A A, fitted with a sloping bottom, and with a bagging spout or spouts, and gate or gates on the side or sides of said hopper, to regulate the flow of grain, substantially as described.

2. The use of said hopper, so fitted with sloping bottom, spouts, and gates, in combination with a weighing scale, substantially as described.

2,871.—ANDREW J. HOLMAN, Philadelphia, Pa., assignee by mesne assignments of ISAAC VAN DOREN.—*Rake for Harvester.*—Patented September 22, 1857, No. 18,256; reissued February 18, 1868.

Claim.—1. The combination of the platform of a hinged-bar harvester with a rake mounted thereon, and discharging the grain automatically upon the ground, out of the way of the machine and horses on the next round.

2. The combination of an automatic rake, discharging upon the ground, with the platform of a hinged-bar harvester, which is suspended from the main frame.

3. The combination of an automatic rake with the platform of a harvester having an adjustable, suspended, hinged finger beam.

2,872.—DENNIS LANE, Montpelier, Vt.—*Head Block for Saw Mill.*—Patented July 9, 1861, No. 32,774; reissued February 18, 1868.

Claim.—1. The employment or use of the ratchets H I J K, having teeth at different distances apart, in connection with the adjustable dog P, placed on the rod O, which is provided with retaining pins *h*, the ratchets being placed on the shaft F, having pinions G G at its ends, which gear into racks D D, attached to bar C, all being arranged as and for the purpose set forth.

2. The bar C, provided with supports A², dogs *l l*, on fixed posts *k k*, dogs *e e*, and lever cams *f*, when the parts are constructed and arranged relatively with each other, and operated in the manner and for the purposes substantially as described.

2,873.—ABRAM VAN ORDER, Ithaca, N. Y.—*Construction of Boats.*—Patented September 10, 1861, No. 33,272; reissued February 18, 1868.

Claim.—1. The construction of the described layers of wood, placed one above the other, making the shell or sides and ends of the boat, the described method of spiking or bolting the said layers together, and the cross-rod bracing, connecting the bilge timbers with the gunwale timbers, when arranged in relation to each other substantially as and for the purposes described.

2. Constructing the sides and ends of boats wholly of horizontal layers of timbers, bolted or spiked one upon the other, substantially in the manner and for the purposes set forth.

3. The construction of a bilge or bottom frame, of solid timber, in whole or in part, about the bottom of a boat, when the floor timbers are attached thereunto, as described, and for the purposes specified.

4. The arrangement and construction of the bottom planking on the floor timbers within, and protected by the bilge frame, as set forth.

5. The floor timbers, dovetailed to the bilge timbers, on their inner side and top, and held in place by the horizontal layers on their ends, for strength and security against accident, as set forth.

6. Constructing the sides and ends of boats of layers of horizontal timbers, bolted or spiked one upon the other, and upon the bilge frame, and upward from it, substantially as and for the purposes described.

2,874.—CHARLES W. CAHOON, Portland, Me.—*Lamp.*—Patented December 3, 1861, No. 33,825; reissued February 25, 1868.

Claim.—1. A lever, with chimney fastenings, having that part of it on which the chimney rests extended, so as to form a deflector, substantially as described.

2. The deflector, broad, flat-shaped, or nearly so, when filling the interior of the chimney, and combined with an air screen and ring, with standards, substantially as and for the purposes specified.

3. The combination of the said deflector with the conical foraminous piece of metal and the cylindrical tubular air-screen, for the purpose of forming the air chamber A, protecting the flame, and admitting the air from below the same, substantially as described.

4. The combination, with the lever for raising the chimney, of the deflector, air-screen, and foraminous piece of metal, substantially as and for the purposes specified.

5. The ring, surrounding the wick tube, a little above the top of the same, with the standards *s s*, substantially as and for the purposes specified.

6. A chimney holder, having a projection for manipulating the same, chimney fastenings, a deflector, and a joint, substantially as and for the purpose set forth.

7. The combination of the ring *f*, supports *s s*, and air screen *c*, substantially as and for the purpose set forth.

8. In combination with the burner of a lamp having a glass body, a metallic handle, as herein described.

2,875.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignment of N. AMES and J. E. GOWEN. (Division A.) *Eyeletting Machine*.—Patented May 14, 1867, No. 64,734; reissued February 25, 1868.

Claim.—1. A reciprocating heading seat, constructed, arranged, and operated substantially as described.

2. A reciprocating piston or holding pin, in combination with the heading seat, when constructed, arranged, and operated substantially as described.

3. A spring piston rest, in combination with the reciprocating heading seat and holding pin, arranged and operated substantially as described.

4. The reciprocating heading seat and piston, in combination with a vertical header, arranged and operated substantially as described.

5. A reciprocating heading seat, in combination with a header and work-supporting table, substantially as described.

6. A heading seat, header, and work-supporting table, in combination with a work-feeding device, substantially as described.

2,876.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignments of N. AMES and J. E. GOWEN. (Division B.) *Eyeletting Machine*.—Patented May 14, 1867, No. 64,734; reissued February 25, 1868.

Claim.—1. A common receptacle or hopper, adapted and arranged for holding the eyelets when thrown in promiscuously, substantially as described, in order that they may be automatically discharged therefrom and delivered in proper position to the heading mechanism, for the purposes set forth.

2. Agitating the eyelets, so as to present them in proper position to the eyelet-feeding mechanism, substantially as described.

3. A promiscuous eyelet-holding hopper, provided with means for delivering the eyelets in proper position, an eyelet-feeding mechanism, and an eyelet-heading mechanism, when combined and operating substantially as described.

4. In combination with the above, a work-supporting table, substantially as described.

5. In combination with the elements of the third claim and a work-supporting table, a work-feeding device, for the purposes described.

2,877.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignment of N. AMES and J. E. GOWEN. (Division C.) *Eyeletting Machine*.—Patented May 14, 1867, No. 64,734; reissued February 25, 1868.

Claim.—1. A reciprocating punching table, constructed and arranged so as to be alternately removed and replaced, substantially as described.

2. The reciprocating puncher, in combination with the reciprocating punching table, substantially as described.

3. The combination of a puncher, a work-holding table, and a work-feeding device, substantially as described.

4. The combination of a puncher and gauge for the line of holes, substantially as described.

2,878.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne of N. AMES and J. E. GOWEN. (Division D.) *Eyeletting Machine*.—Patented May 14, 1867, No. 64,734; reissued February 25, 1868.

Claim.—1. The combination of a puncher and header with a movable punching table, substantially as described.

2. The combination of puncher, header, work-supporting table, and work-feeding device, substantially as described.

3. An organized eyeletting machine, in which the work is supported and fed along, the holes punched, the eyelets supplied, inserted, and headed down, substantially as described.

2,879.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignment of N. AMES and J. E. GOWEN. (Division E.) *Eyeletting Machine*.—Patented May 14, 1867, No. 64,734; reissued February 25, 1868.

Claim.—1. A puncher and header, operating reciprocally, when combined, arranged, and operating

so as to strike alternately on or over the same fixed point, substantially as described.

2. A reciprocating heading seat, in combination with the puncher and header, when arranged and operating at the same fixed point, substantially as described.

3. A laterally-reciprocating punching table, in combination with the puncher, header, and heading seat, all arranged and operating at the same fixed point, substantially as described.

4. The reciprocating punching table and heading seat, so combined, arranged, and operating as to alternately occupy the same place for punching holes and heading eyelets at the same fixed point, substantially as described.

5. Supplying the eyelets from a common hopper to the heading seat or holding point by a belt and groove, substantially as described.

6. The work-feeding device, constructed and arranged with an eyeletting machine, substantially as described.

7. The adjustable gauge, in combination with the holding table for regulating the line of eyelets, substantially as described.

8. Punching the holes and furnishing, inserting, and heading the eyelets at the same fixed point automatically, by means substantially as described.

2,880.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignment of N. AMES and J. E. GOWEN. (Division F.) *Eyeletting Machine*.—Patented May 14, 1867, No. 64,734; reissued February 25, 1868.

Claim.—1. The combination of hollow rod J and lever I, arranged and operating substantially as described.

2. The combination of hollow rod J and piston K, arranged and operating substantially as described.

3. The combination of hollow rod J, piston K, and lever I, arranged and operating substantially as described.

4. The combination of rod J, piston K, spring I', and lever I, arranged and operating substantially as described.

5. The combination of rod J, piston K, lever I, and header C, arranged and operating substantially as described.

6. The combination of hopper N, with eyelet-feeding mechanism, and rods J and K, and header C, substantially as described.

7. The combination of puncher B and sliding plate U, substantially as described.

8. The combination of plate U and levers V and I, substantially as described.

9. The combination of puncher B, header C, sliding plate U, and rods J and K, substantially as described.

10. The combination of puncher B, header C, plate U, rods J and K, hopper N, belt R, and groove X, substantially as described.

11. The combination of table U and pawl Y, substantially as described, with the set, or punch and set, of an eyelet machine.

12. The combination of hopper N, with bristles or flexible arms o, substantially as described.

2,881.—DENNIS G. LITTLEFIELD, Albany, N. Y. —*Base-burning Lamp*.—Patented August 18, 1863, No. 39,582; reissued December 22, 1863, No. 1,594; and again reissued February 25, 1868.

Claim.—1. The devices described, by means of which the magazine, and each of the several sections of which it is composed, are held in their proper positions, while, at the same time, the several parts are so adjusted as readily to admit of being separated and reunited at pleasure.

2. The corresponding notches or shoulders in the iron cylinder and the lining, as described, by means of which the lining is held in its place, notwithstanding the greater expansion of the cylinder by heat, and without danger therefrom.

3. The magazine, constructed as described, in combination with the furnace separated from it, and suspended within a chamber isolated from the chamber surrounding the magazine.

4. The combination of a magazine contracting in diameter from the middle or other line downward to its lower end, with a furnace, suspended within a

chamber isolated from the chamber surrounding the magazine.

5. The devices described, by means of which I am able to construct what I denominate the upper and lower sections of the burner, each complete in itself separately, and so to adjust them as to admit of their being conveniently separated and reunited without injury to either.

6. The intercommunication, to be opened and closed at pleasure, between the chamber of a magazine coal burner, which surrounds the furnace, and that which surrounds the magazine.

2,882.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignment of L. BAILEY and R. THAYER. — *Lamp.*—Patented May 4, 1858, No. 20,134; reissued February 25, 1868.

Claim.—1. Suspending the body of the lamp within an outer case, so arranged that the air shall pass within the case, and around the lamp body to the flame, substantially as described.

2. A hollow lamp case, pedestal, and base, constructed and arranged in relation to the lamp body, substantially as described.

3. An annular lamp body, in combination with an outer case, substantially as described.

4. Constructing and arranging the parts so as to deflect the air coming up from outside the lamp body toward the flame, substantially as described.

5. Supplying air to the flame by means of the channel formed between the body of the lamp and the outside shell or case, substantially as described.

6. Arranging and using the rod or wire K in relation to the flame and hollow pedestal and outer case, substantially as and for the purposes described.

7. The concavo-convex button, constructed and arranged substantially as and for the purpose described.

2,883.—JOHN SOLTER, Baltimore, Md.—*Tumbler Washer.*—Patented September 4, 1866, No. 57,786; reissued February 25, 1868.

Claim.—1. In a tumbler-washing machine, operating the valve *e*, by pressing the tumbler, in seating it, in the manner as shown and described, and for the purpose set forth.

2. The combination of the lever K and valve *e*, constructed and operated in the manner substantially as shown and described and for the purpose set forth.

2,884.—PHILO O. SOPER, San Francisco, Cal.—*Hay Knife.*—Patented January 29, 1867, No. 61,576; reissued February 25, 1868.

Claim.—1. The construction of the blade B, substantially as described.

2. The bearing of the shank C, in connection with the angle given to the edge of the blade B, substantially as and for the purpose described.

3. The point A, substantially as and for the purposes above described.

2,885.—AMBROSE TAYLOR, Ossawatimie, Kansas.—*Last.*—Patented November 5, 1867, No. 70,648; reissued February 25, 1867.

Claim.—1. The spring hook E, secured by its shank F, in the block B, and engaging with the hook C, set in the last A, all constructed and arranged to operate as herein set forth, for the purpose specified.

2. The prevention of lateral or backward movement of the block B, by having the hook C, extend upward above the surface of the upper side of the last, and within a recess in the under surface of the block B, substantially as shown and described.

2,886.—CHARLES L. ALEXANDER and VICTORIA A. OSBORN, Washington, D. C.—*Book-cover Protector.*—Patented September 24, 1867, No. 69,062; reissued March 3, 1868.

Claim.—1. The elastic or extensible bands or straps *b b b b*, connecting the top and bottom folds D D D D, by means of clasps or other devices, and thus applicable to various sizes of book covers, substantially as and for the purpose set forth.

2. The elastic bands or straps *a a a a*, to form an expansible connection for the two halves of the book cover protector, substantially as described.

3. Such a book-cover protector or mode of covering books, as by reason of its expansibility and extensibility, may be adjusted to books of various sizes, substantially as described.

2,887.—N. B. WALLACE, Fond du Lac, Wis.—*Watch.*—Patented September 10, 1867, No. 68,814; reissued March 3, 1868.

Claim.—The two-part cup F, for the winding post or other axis of a watch movement, substantially as and for the purpose described.

2,888.—WILLIAM HALL, Dubuque, Iowa.—*Lightning Rod.*—Patented October 18, 1859, No. 25,823; reissued March 3, 1868.

Claim.—A cylindrical lightning rod, made of sheet copper in sections, where the sheet is made to extend beyond a single cylinder, leaving the edges open or unsoldered, when the same is constructed substantially as and for the purposes herein set forth.

2,889.—SCHWEITZER PATENT BOLT COMPANY, New York, N. Y., assignee of FRANZIS SCHWEITZER, same place.—*Machine for Cutting Thread on Bolts, or Nuts.*—Patented March 5, 1867, No. 62,693; reissued March 3, 1868.

Claim.—1. The sliding or movable heads N O, in combination with the lever P and cutters or dies *a b*, substantially as and for the purpose described.

2. The adjustable lever P, provided with arms *d e*, substantially as and for the purpose set forth.

3. The elastic rest *g*, constructed and operating substantially as and for the purpose shown and described.

2,890.—JOHN STORER, New York, N. Y.—*Lubricator for Steam Engines.*—Patented March 13, 1866, No. 53,195; reissued March 3, 1868.

Claim.—A lubricator for steam engines, having a movable cap or valve, E, and a screw, F, to secure the said cap or valve in position, so arranged that the screw can turn without carrying the said cap or valve around with it, in combination with a soft-metal ring, for making a tight joint between the cap or valve and the body of the lubricator, all substantially as and for the purposes specified.

2,891.—BENJAMIN J. HARRISON and JAMES CONDIE, New York, N. Y.—*Folding Chair.*—Patented July 17, 1866, No. 56,410; reissued March 10, 1868.

Claim.—1. The pair of legs A, connected by the seat rail *b* at their upper ends, and by the rail *a* near their lower ends, in combination with the pair of legs B, pivoted at *c* to the legs A, and united only at their upper ends at the seat rail C, as specified, so that the rail *b* can pass entirely through beneath the rail C, when the legs are folded, as set forth.

2. The seat rail C, into which the side pieces or arms, E, of the back are framed, and extended through to the bar G, in combination with the tie bolt *e*, that connects the legs B, and forms the axis on which the back E F swings, substantially as specified.

3. Connecting the frame forming the back to the folding legs by a riveted bar or pivots above the point at which the flexible seat is united to the back seat rail, substantially as set forth, so that the flexible seat maintains the back in an upright position.

2,892.—LANSING MARBLE and TOWNSEND NORTH, Vassar, Mich., assignees of LANSING MARBLE.—*Basket.*—Patented January 7, 1862, No. 34,088; reissued March 10, 1868.

Claim.—1. A basket formed of two series of overlapping splints A A', substantially as described, and fastened in any suitable manner.

2. In combination with the above, the hoops *a a*, D, and G G, substantially as and for the purpose specified.

2,893.—F. S. PEASE, Buffalo, N. Y.—*Hydrocarbon Vapor Apparatus.*—Patented March 13, 1860, No. 27,470; reissued March 10, 1868.

Claim.—1. The combination of the box A, one or more pans B, for containing hydrocarbon liquid, the supply pipe C at or near the top, the exit pipe

D at or near the bottom, and the condenser E, the whole operating substantially as and for the purposes herein set forth.

2. Condenser, employed in connection with an air carbureting apparatus, substantially as and for the purposes set forth.

3. The combination, with the pans or trays B, of the perforated plates *b*, through which the air passes in its course through the carbureting chamber.

2,894.—JABEZ W. HAYES, Newark, N. J.—*Fruit Box or Basket.*—Patented August 12, 1866, No. 15,514; reissued March 10, 1868.

Claim.—1. A box or basket formed of veneers or laminae of wood, laid across each other, and turned up to form the sides, so that the bottom is made of two thicknesses, secured together substantially as specified, and the sides of single thicknesses.

2. A box or basket formed of veneers or laminae of wood, crossing each other at the bottom, and turned up to form the sides, in combination with a cord, or its equivalent, passing around the sides to hold them together, substantially as set forth.

3. A box or basket in which one lamina of wood forms two of the sides and one thickness of the double bottom, substantially as set forth.

2,895.—J. J. SAVAGE, Troy, N. Y. (Division 3.) *Coal Stove.*—Patented February 12, 1867, No. 61,956; reissued March 10, 1868.

Claim.—1. Constructing a heating stove, with its fuel doorway or aperture B below and forward of its flame or combustion chamber, and contiguous to or adjoining its fire box A, in manner substantially as and for the purposes herein set forth.

2. The combination of the fuel doorway or aperture B and the fire box A, extended contiguously thereunder, as applied to heating stoves, in manner substantially as and for the purposes set forth.

3. In combination with a heating stove having its fuel doorway in the position as herein described, the employment therewith of a lifting lever, F, substantially in manner as and for the purposes herein set forth.

4. In a heating stove, in combination with its fire-box back lining plates and its fuel doorway or aperture B, the arrangement of a front lining plate, E, in position between the flame chamber C and the said fuel aperture, in manner substantially as and for the purpose set forth.

5. In combination with a lever lifter, F, as applied to heating stoves, in manner as herein described, the employment of a holding hook, *b*, and catch ridge *e*, substantially as and for the purpose set forth.

6. A heating stove so constructed that fresh fuel may be cast or fed directly into vacant room or open places, previously formed or made for it in, below, and between the ignited fuel or coke, within the fire box of said stove, by the means and operation in manner substantially as hereinbefore fully described and shown, for the purposes as set forth.

2,896.—WILLIAM W. WILCOX, Middletown, Conn.—*Trellis for Strawberry and other Plants.*—Patented August 27, 1867, No. 68,271; reissued March 10, 1868.

Claim.—A trellis, *a*, made substantially as described, with an upright post or posts, *e*, and branching arms *e*, or their equivalent.

2,897.—WILLIAM M. DOTY, New York, N. Y.—*Washing Machine.*—Patented July 12, 1864, No. 43,484; reissued March 17, 1868.

Claim.—1. The combination of the oscillating wash board and swinging brackets with a removable hand lever or levers, operating in the manner substantially as herein shown and described.

2. The formation, in swinging brackets, to which the corrugated wash board is attached, of sockets, or the mechanical equivalents thereof, for the ready insertion and removal of the operating lever, substantially as and for the purposes herein shown and described.

3. The combination, with an oscillatory wash board and stationary wash tub, of the means herein shown and described, or the mechanical equivalent thereof, for rendering the said wash board stationary within the tub, at the pleasure of the operator.

2,898.—JOSEPH J. FRENCH and REUBEN A. McCAULLY, Baltimore, Md., assignees of JOSEPH J. FRENCH.—Patented July 2, 1867, No. 66,318; reissued March 17, 1868.

Claim.—A globe valve, composed of the body A, solid support H, carrying at its apex the hollow screw B, and lever A', with plug to stuffing box F, the parts all made and arranged substantially as shown and described.

2,899.—R. HOE & Co., New York, N. Y., assignees of WILLIAM McDONALD, same place.—*Machine for Mitering Printers' Rule.*—Patented July 3, 1855, No. 13,197; reissued March 17, 1868.

Claim.—The combination, with a movable cutter, of a sector guide plate, a rule-holding bed, and adjusting mechanism, constructed and operating substantially as described and for the purposes specified.

2,900.—P. H. ROOTS and F. M. ROOTS, Connersville, Ind.—*Cross Head for Blower.*—Patented July 24, 1866, No. 56,614; reissued March 17, 1868.

Claim.—A piston, constructed of cross heads A, fastened to a shaft B, in combination with wooden lags or pieces C, which compose the covering of the piston, and are secured to the cross heads, substantially as and for the purpose set forth.

2,901.—W. H. LOVE, R. H. CHILDS, and H. W. CHILDS, Philadelphia, Pa., assignee by mesne assignments of JOHN C. LOVE, same place.—*Lamp Burner.*—Patented December 17, 1867, No. 72,209; reissued March 24, 1868.

Claim.—1. A flat slotted plate, *d*, arranged above the dome B of a lamp burner, as and for the purpose described.

2. The plate *d* with its flange *i*, and opening *n*, in combination with the casing A of a lamp burner, when the edges of the said opening *w* are parallel to the upper edge of the wick tube, as set forth.

2,902.—THOMAS E. PURCHASE, Reading, Pa.—*Fagot for Railway Rail.*—Patented February 2, 1858, No. 19,261; reissued March 24, 1868.

Claim.—1. The manufacture of railroad rails from a pile, the top bar of which is of a superior quality of iron, immovable laterally, and sufficiently heavy to give the rail when rolled a consolidated head, connecting with the lower layers in the stem of the rail, substantially as above set forth.

2. An intermediate iron form-piece for a fagot for a railroad rail, such form-piece being constructed with an irregular welding surface for fitting a corresponding welding surface in the superior metal cap or top piece, substantially as described.

2,903.—J. O. ADAMS and E. A. WARFIELD, Northampton, Mass., assignees of ROBERT H. ALDRICH, same place.—*Dusting Brush.*—Patented March 12, 1867, No. 62,724; reissued March 31, 1868.

Claim.—A brush made of sheep skin with the wool on, cut into strips, and fastened over one or more central cores, substantially as herein shown.

2,904.—DAVID BLAKE, Waterford, N. Y., assignee of JAMES DODGE.—*Machine for Rolling, Shaping, and Forging File Blanks, Fliers and other Metallic Articles of Small Dimensions.*—Patented May 1, 1866, No. 54,310; reissued March 31, 1868.

Claim.—1. The combination of a rolling apparatus, having an intermittent movement, in combination with a swaging apparatus, all constructed substantially as described, and so used alternately that a piece of metal will, as the mean effect of the rolling and swaging operations, be fashioned into shape substantially in the manner hereinbefore set forth.

2. Governing the rotation of the rollers, so as to stop and start such rotation at any desired time or position, by the means described, or by other mechanical equivalents.

3. The combination and use of the wedges and springs, constructed and arranged as described, for regulating the distance of the rollers.

2,905.—JOHN A. DODGE, Auburn, N. Y.—*Harvester.*—June 26, 1866, No. 55,837; reissued March 31, 1868.

Claim.—1. The frame A, attached to the platform,

and arranged to support the rake and beater arms, substantially as set forth.

2. The combination, substantially as set forth, of a continuously revolving crown wheel, carrying rake and reel arms, with the frame or standard A, for the purpose described.

3. The combination of the cam B' and bed-piece B with the frame A, these parts being constructed and arranged for joint operation, as set forth.

4. Pivoting the rake and reel arms to the crown wheel L, by means of the cross-heads or bars *b* fitting into suitable cavities in the wheel L, and held in place by the plate O, substantially as shown and described.

5. The combination, substantially as set forth, of the detent plate E and ratchet plate E', with the sprocket wheel D, chain M, and pulley C, for the purpose set forth.

6. The combination, substantially as described, of the bracket I, socket I', and overhanging arm H, for the purpose set forth.

7. The combination, substantially as described, with the overhanging arm H, of the chain P and arm G, to support the inner end of the platform.

2,906.—W. N. ELY, Stratford, Conn., assignee by mesne assignments of FRANCIS D. BALLOU.—*Mechanism for Boot and Shoe Sewing Machine.*—Patented January 22, 1861, No. 34,203; reissued March 31, 1868.

Claim.—1. The foot piece C, when constructed and arranged and used as a guard, or guard and gauge, substantially as and for purposes described.

2. The lip or standard *c*, when constructed, arranged, and used as a guard, or gauge, or support for the shoe, substantially as described.

3. The combination of a guide or guard, substantially as described, with an opener for opening the channel for the action of the needle, substantially as set forth.

4. The presser D, in combination with the adjustable foot pieces C and C', substantially as described.

5. The bearing plate B and lip or standard *c*, in combination with the presser bar, substantially as described.

6. The projecting perpendicular plate B with standard *c*, substantially as and for the purposes described.

7. The combination of the bearing plate or table E with the lip or standard *c*, substantially as described.

8. The combination of the standard *c* with the foot piece C, arranged substantially as described, and for the purposes set forth.

9. The supporting, guarding, or guiding, and channel-opening mechanism, when combined and arranged in relation to each other, substantially as and for the purposes set forth.

10. The projecting horizontal table plate A, provided at its outer edge with a projecting standard, *c*, and arranged so that an opening is formed between the two for the needle, substantially as and for the purposes described.

2,907.—S. D. ENGLE, Hazleton, Pa.—*Watch.*—Patented April 24, 1866, No. 54,135; reissued March 31, 1868.

Claim.—1. The employment of a box or supplemental case, B, to receive the movement of a watch, secured in the external or principal case of the watch, by means of studs or pins and a groove, for the purpose herein set forth.

2. The cup *h*, with its flange, *h*², and washer *i*, arranged with the key hole *g*, in the manner and for the purpose herein described.

2,908.—CHARLES PARKER, Meriden, Conn., assignee of GEORGE N. CUMMINGS, Providence, R. I.—*Eye Glass.*—Patented July 30, 1867, No. 67,167; reissued March 31, 1868.

Claim.—1. The continuous spring B, combined with the two glasses A A, when attached and secured to each of the bows at or near the point D, in the manner substantially as herein set forth.

2. The arrangement of the guides E E upon each of the bows, and so as to wholly or partially surround the spring at a point above the point D, and so as to leave the spring free in the said guide, substantially as and for the purpose specified.

2,909.—JOHN S. ROWELL and IRA ROWELL, Beaver Dam, Wis.—*Cultivator.*—Patented July 3, 1866, No. 56,102; reissued March 31, 1868.

Claim.—The combination of the slotted beam A, shank B, brace bar C, and bolt D, when the parts are constructed and arranged to operate as and for the purposes herein specified.

2,910.—WILLIAM ANTHONY SHAW, GARDNER WILLARD, LEWIS COLWELL, and JOSEPH COLWELL, assignees of WILLIAM ANTHONY SHAW, New York, N. Y.—*Apparatus for Separating Shot.*—Patented January 9, 1866, No. 52,003; reissued April 7, 1868.

Claim.—1. In the process of manufacturing shot, the use of an automatic apparatus so constructed and operated as to separate the perfect from the imperfect shot, and so as to assort the different sizes of shot, and deposit them in separate places or receptacles, substantially as described.

2. Separating the perfect from the imperfect shot by the use of a series of inclined planes, so arranged and adjusted in respect to each other as to break one or more times the plane and direction of descent, and arrest in whole or in part the motion of the imperfect shot, for the purpose of changing its axis of motion, and thus gradually bring it to rest in receptacles at the foot of the various inclines, leaving the perfect shot only to descend to the bottom of the series of planes.

3. A series of revolving screens for assorting the shot, in combination with the inclines and receptacles, substantially as specified.

2,911.—HORACE BAKER, Cortland, N. Y.—*Hay Raker and Loader.*—Patented July 3, 1866, No. 55,979; reissued April 7, 1868.

Claim.—1. The two positively-actuated endless aprons, revolving in opposite directions, in combination with the toothed wheels R², or their equivalents, upon the shafts I and L, and so placed relatively that the hay may be picked by such toothed wheels, and directed between the aprons, and by them elevated, substantially as and for the purpose set forth.

2. The standards T T, when so constructed that by their elasticity they shall maintain the upper portions of said aprons face to face, and permit variations in the quantity of hay carried between them, as set forth.

3. In combination with said endless aprons, the guide boards, so constructed as to pass the hay over the forward apron and on to the wagon.

4. In combination with said endless aprons, the spur wheels F and H, and the shaft I operating in the slot I 1, and so constructed as to allow of a forward and backward movement of such shaft and forward apron, substantially as and for the purpose set forth.

2,912.—CHARLES L. LEGE, San Antonio, Texas.—*Medicinal Preparation.*—Patented June 11, 1867; reissued April 7, 1868.

Claim.—A medicament produced from the material specified.

2,913.—METROPOLITAN WASHING MACHINE COMPANY, Middlefield, Conn., assignees by mesne assignments of ALFRED F. SPAULDING and SALMON M. SCOTT.—*Meat-chopping Machine.*—Patented January 31, 1865, No. 46,153; reissued April 7, 1868.

Claim.—1. The employment, in an organized machine for chopping meat, vegetables, and other substances, of a revolving tub, and one or more cutters, and actuating mechanism, under an arrangement substantially as described, so that the meat or other substance shall be cut with a "draw cut," or by a drawing stroke of the said cutters.

2. The arrangement of the frame and method of hanging the cutter or cutters in said frame, so that, when operated, the cutters shall travel toward the bottom of the revolving tub in a curvilinear path, substantially as herein described.

3. The combination, with the cutter and its vibratory arm and mechanism, whereby it is made to operate with a drawing cut, of the means for adjusting the cutter in said arm for the purpose of regulating the stroke of the said cutter, substantially as set forth.

4. The method herein described, or its substantial equivalent, of mounting the vibratory arms of the cutters upon a padded pin, or so that the cutters may yield to intervening obstructions, as herein set forth.

5. The combination, with one or more vibratory cutters, and a tub, of a removable cover overhanging the tub, substantially as herein shown and described.

6. A machine for cutting meat and other substances, composed of the following elements combined: First, a support for the tub, mounted on a central pivot; second, one or more cutters hung in such manner as to produce, when vibrated, a "draw cut;" third, a mechanism to impart vibrating motion to the cutters, and a rotary movement to the tub.

2,914.—METROPOLITAN WASHING MACHINE COMPANY, Middlefield, Conn., assignees by mesne assignments of ALFRED F. SPAULDING and SALMON M. SCOTT.—*Meat-chopping Machine*.—Patented July 11, 1865, No. 48,734; reissued April 7, 1868.

Claim.—1. The means for operating the cutter or cutters of a machine for chopping meat, &c., substantially as herein described, so that an up-and-down and back-and-forth movement shall be imparted to the cutter or cutters in the order herein described, thereby effecting an elongated draw cut upon the material to be chopped, as set forth, in combination with a tub rotating during the intervals of stroke—that is to say, when the knife or knives are lifted off the bottom of said tub.

2. The combination, with a rotary tub, of the chopping knives connected directly or through the intermediary of suitable arms, with a revolving crank, so as to operate in the manner and for the purposes herein shown and described.

3. The combination of cutters with mechanism for vibrating the same in the manner and means herein specified—that is to say, by arms hung upon a revolving crank, and supported by an oscillatory standard.

4. The combination, with the rotary tub and one or more chopping knives, and mechanism for moving such knives up and down and back and forth in said tub, of a plough, either with or without a guard, adjustable to the frame or other stationary part of the machine in the manner described, so that the same may be held in its proper relation to and within the tub, as set forth.

2,915.—PHILO F. STEWART, Troy, N. Y.—*Cooking Stoves*.—Patented April 12, 1859. Reissued April 7, 1868.

Claim.—1. The method or the means, substantially as herein described and set forth, of preventing heat from passing through to the rising flue, leading to the chimney, by separating it from the back oven plate, and from the descending flues, by non-conducting partitions, or the equivalents therefor, and for the purposes herein set forth.

2. The employment of a double damper, filled in with cement or other equivalent non-conducting material, in combination with the flue above the oven, and with the rising flue leading to the chimney, in the manner substantially as and for the purposes herein described and set forth.

3. The separating of the direct sheet flue, under the oven, from the return sheet flue immediately below the same, by means of the dividing flue plate *i*, or any equivalent therefor, constructed, arranged, and combined with the said sheet flues, in the manner, and by the means, and for the purposes substantially as herein described and set forth.

4. The dividing of the space between the bottom plate of the oven and the bottom plate of the stove, by means of the inclined dividing flue plate *i*, or any equivalent therefor, in the manner and for the purposes substantially as herein described and set forth.

5. The employment of the space or chambers *S'*, in combination with the outer edge of the oven-bottom plate, and with the back end oven plate, in the manner and for the purposes substantially as herein described and set forth.

6. The sheet flue division plate *i*, having a recess *h'* at each front corner thereof, and the projection

A between such recesses, substantially as and for the purposes herein described and set forth.

7. The employment of a broad or sheet flue division plate, *i*, or any equivalent thereof, in combination with the oven and oven-bottom flues, in the manner and for the purposes substantially as herein described and set forth.

8. The additional bottom plate or encasement *r*, in combination with the broad sheet flue *h*, or any equivalent therefor, in the manner and for the purposes substantially as herein described and set forth.

2,916.—PATRICK KENNEDY, New York, N. Y.—*Cement for Fixing Door Knobs*.—Patented June 11, 1867, No. 65,680; reissued April 14, 1868.

Claim.—The application of a cement, which is composed of sand and alum, with or without the addition of copperas, for fastening door or furniture knob tops to their metal or other shanks, as set forth.

2,917.—EDWARD H. ASHCROFT, Lynn, Mass.—*Railroad Car Heater*.—Patented May 16, 1866, No. 54,662; reissued April 14, 1868.

Claim.—1. A safety car, constructed with a water space, with one or more showering pipes, and a fusible plug apparatus, arranged substantially in manner and so as to operate with respect to the car chamber, as specified.

2. In combination with a water space, substantially as herein set forth, a heating apparatus and circulating pipes, whereby the water shall be caused to circulate, substantially as herein set forth.

2,918.—NAPOLEON AUBIN, Montreal, Canada.—*Fluid Meter*.—Patented August 19, 1862, No. 36,201; reissued April 14, 1868.

Claim.—1. The combination of a diaphragm with a reversing apparatus and a slide valve, connected each with the other, without the use of stuffing boxes, and the whole inclosed within a proper receptacle containing a valve seat, and constituting a fluid meter, constructed and operating substantially as above described.

2. Constructing fluid meters with a single slide valve of such length that it will not cover both of the outside ports in the valve seat at the same time, in combination with a reversing apparatus arranged to throw said valve, while acting upon it, rapidly across the said ports, substantially as and for the purpose above described.

3. The use, in fluid meters, of a diaphragm, when combined with a short slide valve of the above description, substantially as and for the purpose above described.

4. The use, in fluid meters, of compression springs, when combined with a short slide valve of the above description, substantially as and for the purpose above described.

5. Constructing the receptacle of fluid meters in two pieces, one-half of which contains part of the side pipe, and the other half the other part thereof, when the joint between the two is made by a diaphragm, and the latter acts upon a reversing apparatus contained in one half of the said receptacle, substantially as above described.

2,919.—THEODORE A. HAVEMEYER, I. LAURENCE ELDER, and CHARLES F. LOOSEY, New York, N. Y., assignees of CARL KRONIG.—*Manufacture of Sugar Molds and other Articles*.—Patented June 28, 1864, No. 93,376; reissued April 14, 1868.

Claim.—1. The process, substantially as herein described, for making vessels and other articles, which process consists in saturating, with linseed or equivalent oil, vessels or articles made of paper, or equivalent substance, in manner substantially as described.

2. Coating articles, which have been made as herein described, and which have been saturated with oil, with a paste of red lead and oil, and then varnishing the same, substantially as described.

2,920.—THE METROPOLITAN WASHING MACHINE COMPANY, Middlefield, Conn., assignees of S. W. PALMER and J. F. PALMER, Auburn, N. Y.—*Gearing*.—Patented May 8, 1866, No. 54,589; reissued April 21, 1868.

Claim.—The combination of toothed or cogged

wheels, when used in pairs upon the same shaft, with a plate or plates arranged upon the interior opposite or exterior opposite faces of either pair, in the manner described, whereby the wheels on the one shaft shall be held in place by the plate or plates of the wheels on the other shaft, and thus prevent the lateral play of the one shaft with respect to the other, as set forth.

2,921.—HOMER WRIGHT, HENRY H. COLLINS, and BENJAMIN F. COLLINS, Pittsburg, Pa., assignees of HOMER WRIGHT.—*Construction of Jug Tops.*—Patented September 24, 1867, No. 69,151; reissued April 21, 1868.

Claim.—1. The flange S, when made as and for the purpose shown.

2. The hinge and knob combined in one piece, as specified.

3. The lid, when made to cover entirely the top rim of the body, as set forth.

4. The opening H, in the lid, when used in combination with the hinge and knob piece, as described.

5. The convex bulge P, or its equivalent, when used for the purpose indicated.

6. Hinging the lid so as to rotate from the inside of the body, as described.

2,922.—ELIAS SHOBELL, Ashland, Ohio.—*Pattern for Cutting Boots.*—Patented January 27, 1863, No. 37,526; reissued April 28, 1868.

Claim.—1. The plate A, in combination with the pairs of plates B B', C C', and D D', or their equivalents, with their respective slots and angles, producing the simultaneous movement of the several pairs of plates, and the consequent unequal enlargement and contraction of the pattern for boot fronts, substantially as herein set forth.

2. Stationary and adjustable plates, so constructed and arranged in relation to each other and the slots as to produce a simultaneous contraction and expansion of said plates according to any required size of boot fronts and backs, substantially as set forth.

2,923.—DAVID WHISLER, Union Township, Ohio.—*Ditching Machine.*—Patented December 31, 1867, No. 72,953; reissued May 5, 1868.

Claim.—1. The adjustable features of the mold-board and knives for cutting a wide or narrow ditch, substantially as described.

2. The peculiar construction of the shovel, as and for the purpose set forth.

3. The construction of the coulter, as and for the purpose specified.

4. The hinged platform T, for regulating the depth of the furrow or ditch, substantially as described.

5. In combination with the above, screw *h* and spring *t*, substantially as set forth.

6. Axle B, wheels C C, beam A, platform T, screw *h*, springs *t*, and vertical knife P, all combined and arranged as and for the purpose set forth.

2,924.—SIMON F. STANTON, Manchester, N. H., assignee of J. M. STANTON and S. F. STANTON, same place.—*Head Block for Saw Mill.*—Patented May 1, 1866, No. 54,432; reissued May 5, 1868.

Claim.—1. The combination and arrangement of the pinions D D D and double sets of racks *b b b*, *c c c*, for moving the uprights by the turning of the shaft E, substantially as herein set forth.

2. The arrangement of the shaft E in sections, coupled together by clutches F F, so as to be connected or disconnected at pleasure, constructed and operating substantially as and for the purpose herein specified.

3. The notched guide R, in combination with the lever Q, which actuates intermediately the pawl P, ratchet wheel O, shaft E, pinions D D D, and racks *b b b*, or the equivalent thereof, for moving the uprights different and determinate distances, constructed and operating substantially as herein specified.

4. The clamp hooks or dogs M M M, arranged and operated substantially as and for the purpose herein set forth.

2,925.—CHARLES C. PRATT, Westfield, Mass., assignee by mesne assignments of GAMALIEL KING.

—(Division 1.) *Covering Whips.*—Patented June 8, 1867, No. 65,917; reissued May 12, 1868.

Claim.—1. A water-proof coating, consisting of the combined ingredients herein shown and described.

2. The application of the dissolved caoutchouc, with or without the lead and oil, to a whip, substantially as and for the purpose shown.

2,926.—CHARLES C. PRATT, Westfield, Mass., assignee by mesne assignments of GAMALIEL KING.—(Division 2.) *Covering Whips.*—Patented June 18, 1867, No. 65,917; reissued May 12, 1868.

Claim.—1. The covering of the body of a whip with an inner braiding, *d*, substantially as shown and described.

2. The combination of the inner and outer braidings *d f* with the varnish or coatings *e e*, all applied in the construction of a whip, substantially as shown and described.

2,927.—EMANUEL ANDREWS, Williamsport, Pa., assignee of ROBERT G. PINE.—*Machine for Polishing Buckles.*—Patented April 8, 1856, No. 14,633; reissued May 12, 1868.

Claim.—1. The combination of the following instrumentalities, viz: The revolving polishing wheel, holder for the article, shaft for said holder, and springs to bear the article against the revolving wheel with a yielding pressure, substantially as before set forth.

2. The combination of the following instrumentalities, viz: The revolving polishing wheel, holder for the article, shaft for the holder, springs to exert a yielding pressure, and guides to limit the movement of the article under the yielding pressure, substantially as before set forth.

3. The combination of the following instrumentalities, viz: The revolving polishing wheel, holder for the article, shaft for the holder, springs to exert a yielding pressure, and traversing mechanism, to move the article transversely to the rim of the wheel, substantially as before set forth.

4. The combination of the following instrumentalities, viz: The revolving polishing wheel, holder for the article, guide to limit the movement of the article toward the polishing wheel, and pattern for the article, substantially as before set forth.

5. The combination of the following instrumentalities, viz: The revolving polishing wheel, holder for the article, shaft for the holder, guide to limit the movement of the article toward the polishing wheel, and pattern for the article, substantially as before set forth.

6. The combination of the following instrumentalities, viz: The revolving polishing wheel, holder for the article, shaft for the holder, springs, guide, and pattern, substantially as before set forth.

7. The combination of the following instrumentalities, viz: The revolving polishing wheel, holder for the article, shaft for the holder, springs to exert a yielding pressure, traversing mechanism, and guide to limit the movement of the article toward the polishing wheel, substantially as before set forth.

2,928.—ROBERT W. ANDREWS, Stafford, Conn.—*Operating the Treadles of Looms.*—Patented January 18, 1853; extended 7 years; reissued May 12, 1868.

Claim.—1. The combination, in a loom, of the harness frames and cords with the treadles and treadle cams, constructed and operating substantially as described.

2. The treadles and the movers or cams, combined, constructed, and arranged so that by reversal of the cams upon the shaft, a reversal of the movements and retentions of the harness frames is produced, substantially as herein set forth.

3. In a cam loom having upright treadles or harness levers strung to the harness leaves or frames, and actuated by a single set of cam wheels, the arrangement of the fulcrum shaft of the harness levers directly over or within the vertical plane of the cam wheels, substantially as described.

2,929.—FRANCES L. BARNES, New York, N. Y., administratrix of the estate of SAMUEL H. BARNES, deceased.—*Corset Spring.*—Patented July 17, 1866, No. 56,345; reissued May 12, 1868.

Claim.—A corset spring, consisting of the parts B, provided with pins *b* and slotted springs B², riveted as shown, and having suitable clasps C, and headed rivets D, and of form corresponding to the body of the wearer, constructed and operating in the manner and for the purpose herein represented and described.

2,930.—HENRY E. WOOLBURY, Washington, D. C.—*Paper File.*—Patented August 8, 1854, No. 11,504; reissued May 12, 1868.

Claim.—The box or compartment document file, consisting of a box part A, and spring platen or holder B, the said holder being hung or attached to a spring or springs C, at its back, so as to give a flexible or yielding character to the platen, all constructed and operating substantially as herein described.

2,931.—JACOB V. A. WEMPLE, Quincy, Mich.—*Harvester.*—Patented April 19, 1859, No. 23,730; reissued May 12, 1868.

Claim.—1. A separating rod or finger W, automatically interposed, for separating the falling grain from that which is being discharged from the platform.

2. The rod or finger W, pivoted piece C, and standard E, in combination with the rod B, constructed and operating substantially as specified.

3. A movable separating rod or finger, for separating the falling grain from the completed gavel on the platform, in combination with a single supporting standard or post, located at the inner end, or inner front corner of said platform, substantially as described.

2,932.—OSCAR N. BARTHOLOMEW and J. S. THURSTON, Elmira, N. Y., assignees by mesne assignments of OSCAR N. BARTHOLOMEW.—*Roofing Compound.*—Patented October 8, 1867, No. 79,612; reissued May 19, 1868.

Claim.—A composition of matter compounded from the ingredients named, and in the manner substantially as and for the purpose set forth.

2,933.—JOHN JAMES BODMER, Newport, England.—*Preparing Cement from Slags.*—Patented November 5, 1867, No. 70,510; reissued May 19, 1868.

Claim.—1. The rolling, laminating, grinding, and otherwise reducing or converting to scale or sheets, or to a lamellated or to a pulverulent state or condition, the cinder, slag, or scoria obtained from blast furnaces, copper-smelting and other furnaces, in a fluid or semifluid or pasty or visceous condition, in the manner and for the purposes substantially as described, and for other purposes.

2. The rolling, laminating, grinding, and otherwise reducing or converting to scale, or to a lamellated or to a pulverulent condition, of various descriptions of cement, and of materials from which cements are to be produced, substantially as described.

3. The application of slag, cinder, or scoria, whether artificially prepared for the purpose, or as obtained from blast furnaces or other furnaces, in the manufacture of cement, and the several modes or processes employed in the preparation of cements, substantially as described.

4. The manufacture of artificial stone from the above-described cements, either by themselves, or with the admixture of coarsely-ground materials, such as furnace slags, scoria, any descriptions of hard stones, or of shingle, sand, or other materials of a similar nature.

2,934.—W. D. GUSEMAN, Morgantown, W. Va.—*Fireplace.*—Patented June 30, 1863, No. 39,043; reissued May 19, 1868.

Claim.—1. The curved sliding blower E, in combination with the curved plate D and grate B, arranged to project in front of the chimney, as herein described, for the purpose specified.

2. The damper, in combination with the flue, sliding blower, or screen and grate, all arranged substantially in the manner as and for the purpose set forth.

2,935.—EDWARD HEATON, New Haven, Conn.—*Metallic Shank for Boots and Shoe.*—Patented February 23, 1864, No. 41,701; reissued May 19, 1868.

Claim.—1. A boot or shoe shank, composed of two strips, of different elasticities, the one being of a flexible but not necessarily elastic material, and the other of an elastic material, united, substantially as and for the purposes herein shown and described.

2. The combination of a tempered and an untempered spring, in the manner and for the purposes herein shown and set forth.

3. The combination, with a boot and shoe shank, of otherwise ordinary or suitable construction and material, of a spring united with the said shank, so as to bear upon the same at both ends thereof, substantially in the manner herein shown and specified.

2,936.—THOMAS C. RICHARDS, New York, N. Y.—*Attaching Ornamental Heads to Nails and Screws.*—Patented December 31, 1867, No. 72,905; reissued May 19, 1868.

Claim.—The attaching of ornamental heads to nails and screws by means of a clasp or groove formed on or attached to the inner side of the ornamental head, so as to admit the lateral or transverse insertion of the head proper of the nail or screw, substantially as shown and described.

2,937.—C. M. TITUS, Ithaca, N. Y., assignee by mesne assignments of E. L. BERGSTRESSER, Hublersburg, Pa.—*Horse Rake.*—Patented August 26, 1862, No. 36,268; reissued May 19, 1868.

Claim.—1. A lifting or pressure-bar, provided with hanging loops or staples, by means of which the rake teeth are lifted to discharge their load.

2. The pendent loops or staples, in combination with the rake teeth and lifting bar, all arranged as described.

3. The lifting or pressure bar, provided with lifting loops or staples, in combination with a lever connected therewith for operating the same, as described.

2,938.—A. B. WOODARD, Alfred Centre, N. Y., assignor to himself and THOMAS ELLIS, same place.—*Vulcanizing Flask.*—Patented January 16, 1866, No. 52,107; reissued May 19, 1868.

Claim.—1. Closing the flask A, within the vulcanizing vessel, by the pressure of steam, substantially as herein shown and described, so that while the rubber is gradually heated, the flask is gradually and automatically closed, and the rubber molded when in its most plastic state.

2. Applying steam pressure to close the flask A, within the vulcanizing vessel, by means of a piston.

3. Forming segmental flanges, *j*, upon the interior of the vulcanizing vessel or boiler C, and corresponding segmental flanges *k*, upon the exterior of the upper part or cover *b* of the flask A, substantially as herein shown and described, for the purpose of locking the said flask in and to the said vessel.

4. The segmental connections *e*, of the receiver B, in combination with the flattened sides of the flask A, and with the piston *f*, substantially as herein shown and described, and for the purpose set forth.

5. The combination of the annular plate *g* and ring packing *i* with the piston *f* and boiler or vulcanizing vessel C, substantially as herein shown and described, and for the purpose set forth.

2,939.—GEORGE W. GREGORY, Watertown, N. Y.—*Pulley Attachment for Raising.*—Patented August 14, 1866, No. 57,125; antedated February 14, 1866; reissued October 22, 1867, No. 2,784; and again reissued May 19, 1868.

Claim.—1. An adjustable pulley support, having one or more sockets, or their equivalents, by and through which the pulley support may be operated and changed from place to place, substantially as described.

2. An adjustable pulley support, provided with sockets or equivalents, and with means for supporting the pulley, substantially as described.

3. The combination of an adjusting pole with a pulley support, having sockets or equivalents, substantially as and for the purpose set forth.

2,940.—ROBERT O. LOWREY, Salem, N. Y.—*Composition for the Manufacture of Water-proof Paper and Other Articles.*—Patented December 10, 1867, No. 81,893; reissued May 19, 1868.

Claim.—1. The use of salt, in combination with any of the salts of alumina, or similar astringent material, for rendering a gelatinous compound or mixture insoluble in water, substantially as described.

2. The use of salt, in combination with the salts of alumina, or similar astringent material, for rendering soapy compounds or mixtures insoluble in water, substantially as and for the purposes set forth.

3. The use of alum or any of the salts of alumina, for rendering a soapy compound insoluble in water, when said soapy compound has been previously incorporated with paper pulp or fiber, substantially as described.

4. The use of glycerine, in combination with a gelatinous or a soapy compound, when applied to fibrous materials, substantially as set forth.

5. The new compound or composition of matter produced by the treatment of fibrous material, substantially as herein described.

6. The process herein described of treating fibrous material, for producing a new compound, substantially as described.

2,941.—DARIUS SKIDMORE, Seneca Falls, N. Y.—*Attaching Door Knobs to Spindles.*—Patented July 15, 1862, No. 35,899; reissued February 5, 1867, No. 2,473, and again reissued May 19, 1868.

Claim.—Covering or inclosing the end of the coupling device of the knob shank and spindle wholly or partially by the socket or sleeve of the rose, substantially as and for the purpose herein specified.

2,942.—ELIZA WELLS, Brooklyn, N. Y., administratrix of the estate of HENRY A. WELLS, deceased.—*Machinery for Making Hat Bodies.*—Patented April 25, 1846, No. 4,472; reissued September 30, 1856, No. 396; extended seven years; again reissued December 4, 1860, No. 1,087; again extended seven years by act of Congress, and again reissued May 19, 1868.

Claim.—1. The combination of the rotating brush or picker, substantially such as described, the rotating pervious cone, provided with an exhausting mechanism, substantially as described, and the bottom plate or guide, substantially as described, for directing the fur fibers toward the lower part of the cone, and preventing the fibers going to waste, the said combination having the mode of operation specified, and for the purpose set forth.

2. The combination of the feed apron, the rotating brush or picker, substantially as described, the rotating pervious cone, provided with an exhausting mechanism, substantially as described, and the guide or deflector, for directing the fur fibers on to the tip and upper part of the cone, substantially as described, the said combination having the mode of operation specified, and for the purpose set forth.

3. The combination of the rotating brush or picker, substantially as described, the rotating pervious cone, provided with an exhausting mechanism, substantially as described, and the side guides, or either of them, substantially as described, to prevent fur fibers from getting out of the proper influence of the currents traveling to the cone, and to protect the traveling fibers from disturbing currents, the said combination having the mode of operation specified, and for the purposes set forth.

4. The combination of the feeding apron, on which the fur can be placed in separate batches, as described, the rotating brush or picker, substantially as described, the rotating pervious cone or former, provided with an exhausting mechanism, substantially as described, the said combination having a mode of operation substantially such as described.

5. The combination of the feed apron, on which the fur fibers can be placed in separate batches, each in quantity sufficient to make one hat body, the rotating brush or picker, substantially as described, the rotating pervious cone, provided with an exhausting mechanism, and the devices for guiding the fur fibers, substantially as described, the combination having the mode of operation specified, and for the purpose set forth.

6. In combination with the pervious cone, provided with an exhausting mechanism, substantially as described, the covering cloth, wet with hot water, substantially as and for the purpose specified.

2,943.—HERMAN BENDIX, New York, N. Y., assignee of HERMAN BENDIX and J. H. FLEISCH, same place.—*Neck Tie.*—Patented March 13, 1866, No. 53,102; reissued May 26, 1868.

Claim.—A fastening device for neck ties, consisting of a hook, *a*, elastically secured to its holder or retainer, substantially as described.

2,944.—LA FAYETTE LOUIS, Providence, R. I.—*Melodeon.*—Patented November 18, 1856, No. 16,094; reissued February 26, 1867, No. 2,498; again reissued May 26, 1868.

Claim.—1. In combination with the reeds of a melodeon, (for that class of instruments in which the air is drawn through the reeds by the exhaust action of a bellows,) a tremolo valve or valves, so arranged that, when vibrated, it or they shall interrupt the passage of air through the reeds, and thereby produce the tremolo sound, at the will of the performer.

2. In combination with the reeds of a melodeon, a tremolo valve, actuated by a rotary fan or blade wheel, substantially as described.

3. In combination with the reeds of a melodeon, a tremolo valve or valves, having a positive connection with the valve-actuating mechanism, substantially as described.

2,945.—ROBERT RAMSEY, New Wilmington, Pa.—*Fence Post.*—Patented December 10, 1867, No. 72,086; reissued May 26, 1868.

Claim.—1. The compensating features of the posts, whether effected by the formation of the gains or by keys, substantially as and for the purpose set forth.

2. The combination of posts P P' P'', when provided with square or dovetail gains, with sills A A', and keys *e e e*, substantially as and for the purpose specified.

2,946.—E. WOOSTER AND Co., and F. HULL AND Co., Birmingham, Conn., assignees of JOHN R. LATIN.—*Skirt Hoop.*—Patented April 30, 1867, No. 64,231; reissued May 26, 1868.

Claim.—The bottom hoop for hoop-skirts, formed by combining one or more springs in a single cover, the upper edge of which is formed as described, so as to be secured to the tapes of a skirt, as and for the purpose set forth.

2,947.—L. F. ROBERTSON, West Farms, N. Y.—*Compound for Treating Hides and Skins.*—Patented April 21, 1868, No. 77,099; reissued May 26, 1868.

Claim.—A compound for treating hides and skins, made of the materials herein described.

2,948.—CHARLES H. SAWYER, Buxton, Me.—*Steering Apparatus.*—Patented March 31, 1868, No. 76,105; reissued May 26, 1868.

Claim.—The apparatus as herein described, having the wheel shaft B, with its right-and-left screw *d*, the two small double gears *a b*, and larger gear D, with the teeth on the inner periphery thereof, substantially as and for the described purposes.

2,949.—WILLIAM SHOUP, Saltsburg, Pa.—*Pump.*—Patented December 27, 1864, No. 45,647; reissued May 26, 1868.

Claim.—1. The combination, with the pump tube A, of the outer tube C and seed bag F, placed around outside of it, irrespective of the gate or valve D, substantially as and for the purpose hereinbefore described.

2. The gate or valve D, in combination with the tube C and pump tube A, arranged as described, for the purpose set forth.

2,950.—WILLIAM HEATH, Bath, Me.—*Invalid Bedstead.*—Patented March 10, 1868, No. 75,265; reissued May 26, 1868.

Claim.—1. The combination of the recesses K K, L L, or their equivalents, with the frame A, the two frames D E, and mechanism for moving and depressing or operating the back frame E, substantially in manner as described.

2. The combination of the folding legs M M with the arms *h h*, or their equivalent, the toothed sectors,

their arms *ff*, the frame A, and the parts B C D E, arranged and connected substantially as described.

2,951.—SAMUEL JOHNSTON, Buffalo, N. Y., assignee by mesne assignments of himself. — *Combined Rake and Reel for Harvester.*—Patented February 7, 1865, No. 46,300; reissued May 26, 1868.

Claim.—1. In combination with a series of revolving arms carrying heads or rakes, which all gather the grain, and a part only of which discharge the grain, so constructing and arranging a cam way as to cause all the heads or beaters to descend to the same gathering level in front of the cutters, and then to elevate those which do not discharge above the cut grain on the platform, and above the level pursued by the discharging head or rake.

2. In combination with a series of revolving arms carrying heads or rakes which all gather the grain, and a part only of which discharge the grain, a cam so arranged as to cause all the heads or beaters to descend to the same gathering level in front of the cutters, and a device for throwing those heads, or the teeth thereof, which do not discharge, above the cut grain while passing the platform, and above the level pursued by the heads, or the teeth thereof, which so discharge the grain.

3. In combination with a series of revolving arms carrying heads or rakes which all gather the grain, and a part only of which discharge the grain, and a cam so arranged as to cause all the heads or beaters to descend to the same gathering level in front of the cutters, and then to rise above the cut grain on the platform, and the level pursued by the discharging head, making said cam, or a part thereof, movable, so as to permit any one of said rakes or heads to descend while passing the platform, and become a discharging rake or head.

4. In combination with a series of revolving arms carrying heads or rakes which all gather the grain, and a part only of which discharge the grain, a cam so arranged as to cause all the heads or beaters to descend to the same gathering level in front of the cutters, and a device for throwing those heads, or the teeth thereof, which do not discharge, above the cut grain while passing the platform, and above the level pursued by the heads, or the teeth thereof, which do discharge the grain, making the said last-mentioned device movable, so as to permit any one or more of said heads, or the teeth thereof, to descend to the level of the platform and discharge the grain.

5. In combination with the movable device set forth in the last claim, a cord, or equivalent connection, extending to the driver's seat for operating the said device, so as to regulate the size of the gavel at the will of the driver.

6. In combination with a series of revolving arms carrying heads or rakes which all gather the grain, and a part only of which discharge the grain, and a cam way so constructed and arranged as to cause all the heads or beaters to descend to the same gathering level in front of the cutter, and then to elevate those which do not discharge above the cut grain on the platform, and above the level pursued by the discharging head or rake, an auxiliary cam way for guiding and controlling the arm of the rake or head which discharges the grain while said arm is passing the platform.

7. In combination with a series of revolving arms carrying heads or rakes which all gather the grain, and a part only of which discharge the grain, and a cam so arranged as to cause all the heads or beaters to descend to the same gathering level in front of the cutters, and a device for throwing those heads, or the teeth thereof, which do not discharge, above the cut grain while passing the platform, and above the level pursued by the heads, or the teeth thereof, which so discharge the grain, an auxiliary cam way opposite to the platform for guiding and controlling the arm of the rake or head, which also discharges the grain.

8. The overhanging extension attachment to the heads or beaters, in combination with the outer divider and rim of the platform.

9. The combination of the elbow of the rake arm with the roller and the outer and inner tracks or ways, constructed substantially as described and for the purposes set forth.

2,952.—ISAAC REHN, Philadelphia, Pa.—*Model of Printing Photographic Pictures.*—Patented April 14, 1868, No. 76,660; reissued May 26, 1868.

Claim.—The combination of the silver, the albumen, and the salt, with a pigmentary substance, to give increased sensitiveness and consistency to the photographic compound, substantially as described.

2,953.—O. F. STEDMAN, Ravenna, Ohio.—*Watch.*—Patented January 28, 1868, No. 73,937; reissued May 26, 1868.

Claim.—The ring or band C, beveled or made thin at one edge or side, said band being made narrower than the movement, and wide enough to cover the space between the plates *a* and *b*, substantially as and for the purposes herein set forth.

2,954.—THE GOULD MACHINE COMPANY, Newark, N. J., assignees by mesne assignments of JOHN N. DENNISON, same place.—*Fire Engine.*—Patented February 7, 1865, No. 46,219; reissued May 26, 1868.

Claim.—1. A force pump, which may be adapted to throw a larger or smaller quantity of water at each stroke, by varying the effective area of its piston surface, by means substantially as herein set forth.

2. A force pump, provided with one or more ports or passages, the opening of which will relieve a part of the piston surface from labor or pressure on the water, so that the whole power of the motor can be applied to the water delivered from the pump by the operative part of the piston, substantially as described.

3. Increasing or diminishing the effective area of the pump or pumps by means of a valve placed in the partition between them, so that the quantity of water discharged at a stroke can be increased or diminished at pleasure, without altering the speed or stroke, substantially as described.

2,955.—THE WEST HAVEN BUCKLE COMPANY, West Haven, assignees of SHELDEN S. HARTSHORN, Orange, Conn.—*Buckle.*—Patented November 7 1854, No. 11,892; reissued May 26, 1868.

Claim.—1. A buckle, in which the tongues are formed from a single piece of metal, and constructed so as to clasp the divided side, and turn freely thereon, substantially in the manner herein set forth.

2. The combination of the two parts or loops, one side of one of which is divided, and the two parts or loops hinged together, as described, and the tongue clasped and hinged upon the divided side substantially as set forth.

2,956.—JAMES M. BENT, Wayland, Mass.—*Machine for Punching Leather.*—Patented October 16, 1866, No. 58,762; reissued June 2, 1868.

Claim.—1. The combination of a die with a punch, substantially as and for the purposes described.

2. The punch and die, when made to revolve in combination, substantially as described.

3. The mechanically-revolving punch, substantially as described.

4. In combination with a cutting punch, a clearing pin, substantially as described.

5. So constructing the parts as to cause the die to adapt itself to different or varying thicknesses of leather, substantially as described.

6. The combination of a hollow cutting punch with a perforated punching table and clearing pin, substantially as described.

2,957.—COLBY BROTHERS AND COMPANY, Waterbury, Vt., assignees, by mesne assignments of HARVEY MURCH.—*Mop Head.* (Division A.)—Patented June 14, 1853, No. 9,781; extended seven years; reissued June 2, 1868.

Claim.—1. The combination of a socketed cross-head with a binder, having the two ends thereof united directly to each other, the combination being substantially such as described.

2. The combination of a socketed cross-head with a binder, having the two ends thereof united directly to or with each other, and a single fastening for holding the whole binder directly to the handle itself, in such position as to clamp rags, &c., the combination being substantially as described.

3. The combination of a socketed cross-head with

a handle and a binder, having the two ends thereof united to or with the handle itself, the combination being substantially such as described.

4. The combination of a cross-head with a handle and a binder, having the two ends thereof united directly together, and secured in clamping position on the handle proper, so as to sustain or aid in sustaining the cross-head, the combination being substantially such as set forth.

2,958.—COLBY BROTHERS AND COMPANY, Waterbury, Vt., assignees by mesne assignments of HARVEY MURCH.—*Mop Head*. (Division B.)—Patented June 14, 1853, No. 9,781, extended seven years; reissued June 2, 1868.

Claim.—1. The combination with a cross-head and binder of a ratchet fastening, the combination being substantially as described.

2. The combination of a ratchet fastening, handle, binder, and cross-head, the combination being substantially such as set forth.

2,959.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignments of LUTHER HALL.—*Eyeletting Machine*. (Division A.)—Patented May 14, 1867, No. 66,761; reissued June 2, 1868.

Claim.—1. A movable head or carrier, in combination with the punch and set, or either of them, constructed, arranged, and operating substantially as described.

2. A head or carrier, so constructed and operated as to allow the punch and set to be alternately depressed by the same lever, substantially as described.

3. So constructing the mechanism that the punching table and setting bed shall reciprocate laterally, and alternately occupy the same place, substantially as and for the purposes described.

4. The reciprocating punching table, in combination with a stationary work-supporting table, when constructed, arranged, and operated as described, so as to be moved to and from the punch, and under the material, substantially as set forth.

5. The striking lever, so constructed and arranged as to cause the set to pick up the eyelet while the punch is making the hole for its reception, substantially as described.

6. The setting die, so constructed and operating as to pick up the eyelets from the chute, and present them to the place of insertion, substantially as described.

7. The reciprocating setting bed, constructed, arranged, and operating automatically, substantially as described.

8. Feeding the material forward by means of the setting bed or holding point, substantially as described.

2,960.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignments of LUTHER HALL.—*Eyeletting Machine*. (Division B.)—Patented May 14, 1867, No. 64,761; reissued June 2, 1868.

Claim.—1. A feeding instrument, which engages with the work feeds forward, disengages, retracts, and engages again, in combination with a punch, or set, or both, substantially as described.

2. A presser foot, for holding the work to the table, in combination with a punch, or set, or both, substantially as described.

3. The spring presser foot, in combination with the feeding mechanism, arranged and operating with an eyeletting mechanism, substantially as described.

4. An adjustable work-feeding mechanism, in combination with the mechanism for punching and eyeletting, substantially as described.

5. Punching the holes, supplying, inserting, and setting the eyelets, adjustably spacing the distances, holding and feeding forward the work, by means of devices so combined as to effect this object automatically, substantially as described.

2,961.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignments of LUTHER HALL.—*Eyeletting Machine*. (Division C.)—Patented May 14, 1867, No. 64,761; reissued June 2, 1868.

Claim.—1. A hopper for holding the eyelets, in combination with agitating devices, substantially as described, and a chute, provided with an enlarged

receptacle or dish at its lower end, substantially as and for the purposes set forth.

2. A hopper and chute, constructed and arranged substantially as described, so that the eyelets shall be delivered from the hopper flaring end down, and presented to the set flaring end up, substantially set forth.

3. A hopper and chute, arranged substantially as set forth, in combination with a set and work-feeding device, substantially as described.

2,962.—WILLIAM N. ELY, Stratford, Conn., assignee by mesne assignments of LUTHER HALL.—*Eyeletting Machine*. (Division D.)—Patented May 14, 1868, No. 64,761; reissued June 2, 1868.

Claim.—1. The combination of movable carrier D with both punch E and set F, or either of them with lever K, constructed, arranged, and operating substantially as described.

2. The combination of movable carrier D, with both punch E and set F, or either of them, lever K, and cam L, constructed, arranged, and operating substantially as described.

3. The combination of movable carrier D, set F, and setting bed S, substantially as described.

4. The combination of movable carrier D, punch E, and sliding plate Q, substantially as described.

5. The combination of movable carrier D, punch E, set F, sliding plate Q, and bed S, substantially as described.

6. The movable carrier D, constructed, arranged, and operated substantially as described.

7. The combination of levers V and T and pin S, substantially as and for the purposes described.

8. The combination of plates Q and R, arranged and operated substantially as described.

9. The combination of levers V and T, pin S, and screw *w*, substantially as and for the purpose described.

10. The combination of lever T, block U, lever V, and eccentric wheel X, constructed, arranged, and operating substantially as described.

11. The combination of hopper B', chute A', dish *h'*, and set F, substantially as described.

12. The combination of presser foot N, spring O, with both punch E and set F, or either of them, and table A, substantially as described.

2,963.—JOSHUA GIBBS, Canton, Ohio.—*Machine for Grinding Plough Castings*.—Patented October 4, 1863, No. 10,068; extended seven years; reissued June 2, 1868.

Claim.—1. A frame or carriage, beneath a grindstone or polishing wheel, supported at one end by any suitable device, and at the other by the hands of the operator; said frame being capable of a lateral, longitudinal and oscillating adjustment during the process of grinding, for the purpose of adapting the stone to uneven, irregular, or plane surfaces of articles to be ground or polished, as herein set forth.

2. In combination with a carriage, supported and operated as above described, beneath a grindstone or polishing wheel, a cord or rope, or its equivalent, for relieving a portion of the weight of the frame in the hands of the operator, as is herein set forth.

2,964.—BARTON H. JENKS, Bridesburg, assignee of MATHEW SENIOR, Frankford, Pa.—*Lubricating Device*.—Patented March 17, 1868, No. 75,584; reissued June 2, 1868.

Claim.—1. Lubricating a shaft which is required to receive endwise motion, also motion about its axis, by means substantially as described.

2. The device for lubricating the feathered shaft C D from each side of the feather, through holes in the tubular journal B, and the hole *f* in the hollow cap *g*, as herein described.

3. The combination of the lubricating device with a shaft which moves longitudinally independent of its sleeve, and turns with said sleeve, substantially as described.

2,965.—FRANCIS A. MACK, Niles, Mich.—*Well Tube*.—Patented September 11, 1866, No. 57,935; reissued June 2, 1868.

Claim.—A well tube, in which the openings or inclusions *e e* are cut or formed from the inside, so as to leave a diminishing external protection from the

inside, in the manner and for the purpose substantially as specified.

2,966.—FREDERICK MEYER, Newark, N. J.—*Machine for Grinding Scale Pivots.*—Patented May 14, 1867, No. 64,686; reissued June 2, 1868.

Claim.—1. The combination of the two adjustable revolving grinding wheels G, with the reciprocating carriage E, provided with the head blocks *i*, notched rests *p*, and clamping device M, for holding the scale beam, arranged substantially as described, whereby the knife edges or pivots of scale beams are ground to great accuracy of adjustment, as set forth.

2. The construction and arrangement of the longitudinally-sliding carriage C, reciprocating carriage D, and carriage E, as herein set forth for the purpose specified.

3. Adjusting the scale pivots to be ground upon both sides, by means of the set screws or pins *k l*, secured to the arm *i* of the sliding carriage E, and bar H upon the frame A, substantially as herein set forth.

2,967.—TURNER, SEYMOUR & JUDDS, Wolcottville, Conn., assignees of FREDERICK J. SEYMOUR, same place.—*Mode of Attaching Ornamental Heads to Nails.*—Patented June 26, 1866, No. 55,917; reissued June 2, 1868.

Claim.—An ornamental picture nail head, made with a sheet-metal body or back, having within it a screw thread for the nail, substantially as specified.

2,968.—ALFRED B. ELY, (trustee,) Newton, Mass., assignee of L. R. STREETER.—*Plate for Artificial Teeth.*—Patented December 17, 1867, No. 72,428; reissued June 9, 1868.

Claim.—1. The use of hard resins or resinous bodies mixed with fibrous or textile materials, and shaped by means of heat and pressure, substantially as described.

2. The use of thin plates of metal, horn, shell, gutta serena, wood, or such other suitable material capable of being properly shaped, between or in combination with layers of the resinous and fibrous compounds, as and for the purposes substantially as described.

3. As a base for artificial teeth or gums, &c., the use of fiber or fibrous material, chemically or mechanically treated or prepared, and saturated or mixed with lac or other suitable substances, which, when heated and pressed, or pressed and heated, will assume the proper shape, and possess or acquire the proper hardness and elasticity, substantially as described.

2,969.—ALFRED B. ELY, Newton, Mass.—*Heel Stiffener.*—Patented December 31, 1867, No. 72,727; reissued June 9, 1868.

Claim.—1. The use of resinous bodies combined with fibrous materials, substantially as described.

2. A heel stiffener, made of the above described substances, and formed into shape by means of pressure, with or without heat, substantially as described.

3. A heel stiffener made of felted or woven fabric, saturated with resinous or other gums or analogous substances, which, when properly heated and pressed in molds, will assume the proper shape, and acquire or possess the proper hardness and elasticity, substantially as described.

2,970.—ROBERT GRANT, Brooklyn, N. Y.—*Charging Water with Carbonic Acid.*—Patented January 28, 1868, No. 73,712; antedated January 17, 1868; reissued June 9, 1868.

Claim.—1. The charging of water or other liquid with carbonic acid gas by the use, in combination, of two vessels, one containing the water or other liquid to be charged with carbonic acid gas, and the other containing carbonic acid gas, at a pressure greater than that of the atmosphere, the gas-holding vessel being separated from and not connected with the apparatus, by means of which the gas was generated or compressed.

2. The combination, with two vessels, one to contain water or other liquid, the other to contain gas at a high pressure, but disconnected from the gas

generator, of pipes and coupling, and suitable stop cocks, for connecting and disconnecting the said vessels, as herein described, so that the gas-holding vessel may be readily replaced by others at pleasure.

3. In apparatus, such as herein described and claimed in the preceding clause, the use of a gauge for indicating the pressure in the water vessel of the liquid charged with gas, substantially as and for the purposes set forth.

4. The combination, with an independent gas-holding vessel, of a water vessel, provided or connected with a pump or other means of supplying the same with water or other liquid, substantially as herein described.

5. The combination of the water and gas-holding vessels, as herein described, with an injector, whereby the liquid from the water vessel may be more highly charged with gas from the gas holder, substantially as set forth.

6. In combination with a gas holder, disconnected from the gas generator, a water vessel provided with means of agitating and thoroughly mixing the water and gas which it may contain, substantially as herein specified.

7. In apparatus for charging water or other liquids with gas, as herein specified, the use of a regulator, such as described, for the purpose of regulating the flow of gas and maintaining a uniform pressure in the mixing vessel, as shown and set forth.

8. The combination with the gas holder of an injector, connected with a water reservoir, as herein described, so that the water, as it flows through the injector chamber, shall be charged with gas, substantially as set forth.

2,971.—GEORGE GUENTHER, Chicago, Ill.—*Manufacture of Glue.*—Patented June 4, 1867, No. 65,377; reissued June 9, 1868.

Claim.—The mode of drying glue by revolving or rotating surfaces having their temperatures raised either by steam or hot air, substantially as described.

2,972.—GEORGE GUENTHER, Chicago, Ill.—*Article of Glue.*—Patented June 4, 1867, No. 65,377; reissued June 9, 1868.

Claim.—Seale glue, produced as herein described, as a new article of manufacture.

2,973.—P. HANNAY, Washington, D. C., and HUDSON TAYLOR, Poughkeepsie, N. Y., assignees by mesne assignments of PASCAL PLANT, Washington, D. C., assignor to HUDSON TAYLOR, trustee.—*Lamp.*—(Division A.)—Patented April 6, 1858, No. 19,896; reissued June 9, 1868.

Claim.—1. Causing a current of air to impinge upon or commingle with the lower or blue part of the flame of a hydrocarbon lamp, through the instrumentality of a cap piece or burner, without the aid of a chimney, substantially as described.

2. A cap piece or burner, combined with and applied to a hydrocarbon lamp, for the purpose of producing combustion, without the aid of a chimney, substantially as described.

3. Making the cap piece or burner adjustable relatively to the wick and wick tube, substantially as described.

4. The combination of a flat wick tube with a cap piece or burner, and arms or frame, whereby the burner is held on the wick tube, substantially as described.

5. The combination of the burner (with devices for attaching and supporting the same) with the wick tube, substantially as described.

2,974.—P. HANNAY, Washington, D. C., and HUDSON TAYLOR, Poughkeepsie, N. Y., assignees by mesne assignments of PASCAL PLANT, Washington, D. C., assignors to HUDSON TAYLOR, trustee.—*Lamp.*—(Division B.)—Patented April 6, 1858, No. 19,896; reissued June 9, 1868.

Claim.—1. Combining a cap piece or burner, substantially as and for the purposes set forth, with the wick tube or top of a hydrocarbon lamp, so that the burner may be thrown back from the wick tube, substantially as and for the purposes described.

2. The combination of a hinged cap piece or

burner, with the means of adjusting the same relatively to the wick tube, substantially as described.

3. A hinged burner or cap piece for a hydro-carbon lamp, when constructed and arranged with reference to the wick tube, wick, or flame, and the admission of air, substantially as described.

2,975.—HENRY MCCLURE and JAMES ELLIS, Terre Haute, Ind., assignees of HENRY MCCLURE.—*Steam Boiler Furnace*.—Patented October 2, 1868, No. 53,552; reissued June 9, 1868.

Claim.—1. The arrangement of a series of steam boilers within a furnace, so that they shall lie transversely with respect to the direction of the draught, so that the products of combustion on their way to the chimney shall be directed against the sides and bottom of the boilers, substantially as described.

2. Transversely-arranged boilers, in combination with an inverted arched flue, arranged beneath the boilers, substantially as described.

3. The ash troughs N, with end openings for the removal of ashes from an inverted arched flue which is beneath steam boilers, arranged substantially as described.

4. Regulating plates O, when applied beneath the spaces between transversely-arranged steam boilers, substantially as described.

5. While not claiming broadly the introduction of air into furnaces for facilitating and rendering more complete combustion of inflammable gases, we do claim air inlet pipes *a a*, applied to the ridges of the arched flue beneath spaces left between boilers, which are arranged substantially as described.

6. Transverse or cross ducts, longitudinal draught-passage, and steam generators, substantially as and for the purpose set forth.

2,976.—JAMES A. PARK, White House, N. J.—*Door and Gate Latch*.—Patented February 12, 1867, No. 62,061; reissued June 9, 1868.

Claim.—The annular latch C, constructed substantially as described, secured upon a suitable rock shaft, B, and operated in one direction, either by means of a weighted handle upon said shaft, or by means of a spring, as and for the purpose herein specified.

2,977.—S. B. ROWLEY, Philadelphia, Pa., assignee, by mesne assignments, of THOMAS G. OTTERSON, Millville, N. J.—*Fruit Jar*.—Patented November 4, 1868, No. 36,853; reissued June 9, 1868.

Claim.—The within described recess, formed on the exterior of the jar, beneath the mouth of the same, the bottom of the recess forming a continuation of the shoulder on the neck of the jar, all substantially as and for the purpose herein set forth.

2,978.—WILLIAM RYNER, Philadelphia, Pa., and JOHN C. HOPEWELL, Flemington, N. J., assignees of WILLIAM RYNER, Philadelphia, Pa.—*Steam Drying Apparatus*.—Patented August 27, 1867, No. 68,239; reissued June 9, 1868.

Claim.—A drying kiln, in which are an upper and lower series of pipes, for the passage of superheated steam to, and the introduction of the same into, the kiln, so that the material to be dried (situated between the two sets of pipes) may be subjected to the combined action of the heat from the said pipes and that of the superheated steam, as set forth.

2,979.—THE RUMFORD CHEMICAL WORKS, Providence, R. I., assignees, by mesne assignments, of EBEN NORTON HORSFORD.—*Pulverulent Acid, for use in the Preparation of Soda Powders, Farinaceous Food, and for other Purposes*.—Patented April 22, 1856, No. 14,722; reissued May 7, 1867, No. 2,597; and again reissued June 9, 1868.

Claim.—1. As a new manufacture, the above described pulverulent phosphoric acid.

2. The manufacture of the above described pulverulent phosphoric acid, so that it may be applied in the manner and for the purposes above described.

3. The mixing, in the preparation of farinaceous food, with flour, of a powder or powders, such as described, consisting of ingredients of which phosphoric acid or acid phosphates and alkaline carbonates are the active agents, for the purpose of liber-

ating carbonic acid, as described, when subjected to moisture or heat, or both.

4. The use of phosphoric acid or acid phosphates, when employed with alkaline carbonates, as a substitute for ferment or leaven in the preparation of farinaceous food.

2,980.—SAMUEL VANSYCKEL, Titusville, Pa.—*Grate Bar*.—Patented October 31, 1864, No. 11,879; reissued June 9, 1868.

Claim.—Constructing grate bars with pins or projections on one of the sides of the bar, and with corresponding mortises or recesses in the other side, whereby the bars can be interlocked and held together, and made self-sustaining throughout their entire length, substantially as described and specified.

2,981.—JULIA M. COLBURN, Baltimore, Md., administratrix of the estate of JAMES STIMPSON, deceased.—*Vessel for Holding Liquids*.—Patented October 17, 1854, No. 11,891; antedated April 17, 1854; extended seven years; reissued June 9, 1868.

Claim.—1. A pitcher for preserving ice water cool, combined with double walls, inclosing between them air or equivalent non-conducting material, so arranged as not to impair the portability of the pitcher and its capability of discharging its contents by pouring nor its capacity for holding water.

2. In combination with a double-wall ice pitcher, a nose, lip, or spout, through which the water is discharged, and a movable cover across the discharge-way, which prevents access of air into the pitcher thereat, except during the act of pouring.

2,982.—OWEN DORSEY, Newark, Ohio.—*Harvester Rake*.—Patented March 4, 1856, No. 14,350; reissued October 23, 1860, No. 1,067; and again reissued June 9, 1868.

Claim.—1. A continuously revolving rake, attached by a pivotal connection to the shaft on which it revolves, so as to allow it to describe the proper path to gather or discharge the grain, and to clear the frame.

2. The combination of a platform, a vibrating cutter, and a continuously revolving gathering and discharging rake, so arranged as to enter the uncut grain in front of the cutter, and to discharge the cut grain in the arc of a circle.

3. A continuously-revolving gathering and discharging rake, which enters the uncut grain in front of the cutters, and discharges the cut grain in the arc of a circle, in combination with one or more intermediate revolving gathering heads or beaters.

4. The combination of a continuously revolving gathering and discharging rake, which discharges the grain in the arc of a circle, and the camway or guide for regulating the course of the rake.

5. The combination of a continuously-revolving rake, which discharges the grain in the arc of a circle, with a platform, having a fender conformed substantially to the path described by the outer end of the revolving rake in passing over the same, substantially as described.

6. The combination of a continuously-revolving gathering and discharging rake, which discharges the grain in the arc of a circle, with a vibrating cutter.

7. The combination of a continuously revolving gathering and discharging rake, a camway or guide, and friction rollers, attached to the arms of said revolving rake.

2,983.—SYDNEY C. LONG and F. SCHUMACHER, Baltimore, Md., and JACKSON WARNER, Cincinnati, Ohio, assignees, by mesne assignments, of B. A. LAVENDER and KATE LOWE, administratrix of the estate of H. LOWE, deceased.—*Obtaining Cane-Fiber from Cane*.—Patented April 4, 1854, No. 10,722; extended seven years; reissued June 9, 1868.

Claim.—1. Obtaining the fiber from the cane or reed, (*Arundinaria Macrosperma* of Michaux,) for the purpose specified.

2. Cane cotton or hemp, as a new article of commerce and manufacture, for the purpose specified.

3. Breaking down woody fiber of cane and other like plants, and dissolving the gummy and other foreign matters therefrom by means of muriatic or sulphuric acid of the strength of 10° Baumé, or

thereabout, preparatory to making hemp or cotton for bagging, rope, paper pulp, &c., in the manner substantially as set forth.

2,984.—JAMES M. BEEBE, Casadaga, N. Y.—*Beehive*.—Patented November 12, 1867, No. 70,782; reissued June 16, 1868.

Claim.—1. The combination and arrangement of the outer case, A A', ventilating board H, inner hive, and packing material J, substantially as and for the purpose set forth.

2. Securing the said comb frames together by means of a wire bail, b, and wedge e, in the manner shown and described.

2,985.—HELMUTH DUEBERG, New York, N. Y.—*Brick Machine*.—Patented November 26, 1867, No. 71,466; reissued June 16, 1868.

Claim.—1. The channel F F', extending in opposite directions from the tapering spout E, and carrying the compressed clay to the reciprocating table H, substantially as and for the purpose set forth.

2. The feeder or pusher K, in combination with the forming dies F F' and molds I I', substantially as and for the purpose set forth.

3. The rocking lever M, carrying the followers L L', and operating in combination with the reciprocating table H, molds I I', and press boxes G G', substantially as and for the purpose described.

4. The recesses h in the press boxes G G', to allow the surplus clay to escape, as set forth.

5. The pieces of flannel, or other absorbent material, supplied with oil from cups m, in combination with the reciprocating table H, molds I I', and followers L L', constructed and operating substantially as and for the purpose described.

2,986.—JONATHAN HAINES, Pekin, Ill., assignee, by mesne assignments, of himself.—*Grass Harvester*. (Division D.)—Patented September 4, 1855, No. 13,523; reissued April 13, 1853, No. 545; reissued June 16, 1868.

Claim.—1. The two longitudinal ways or rails o o, located between the two driving and supporting wheels, for the purpose of supporting the driver's seat, substantially as set forth.

2. The use of an adjustable seat for the driver, when said seat is mounted upon two longitudinal rails or ways, or their equivalents, located between two driving and supporting wheels of a jointed finger-beam machine, so that the driver can, at pleasure, shift his seat backward or forward, to enable his weight to balance the machine, substantially as set forth.

2,987.—SAMUEL HARRIS and DANIEL A. HARRIS, Shippensburg, Pa.—*Horse Hay Fork*.—Patented April 23, 1867, No. 64,100; reissued June 16, 1868.

Claim.—1. The combination, substantially as set forth, in a horse hay-fork, of a slotted main bar or shank, A, a lifting finger, C, pivoted centrally in the slot of the shank, and a link rod, D, connecting the finger with a forked lever, E, pivoted to an arm, F, projecting from the shank, and having the tripping rope attached to its upper end, whereby the lifting finger is automatically locked in a horizontal position by the weight of the load.

2. The combination, substantially as set forth, in a horse hay-fork, of two parallel rigidly-connected shanks, with pivoted fingers, for the purposes specified.

3. The combination, substantially as set forth, of the parallel shanks, the pivoted lifting fingers, the link rods crossing the shanks diagonally, and the cross-bar A', whereby the load is compressed before being elevated.

2,988.—WILLIAM W. LYMAN, West Meriden, Conn.—*Fruit Can*.—Patented December 28, 1858, No. 22,436; reissued June 16, 1868.

Claim.—Compressing the cover and jar together against an intervening elastic packing ring, located between the lower edge of the flange of the cover and a seat formed below the upper end or edge of the neck or body of the jar, substantially as described.

2,989.—GEORGE MOEBS, Detroit, Mich., assignee by mesne assignments of G. ALBERT REIN-

GER.—*Machine for Making the Bodies of Cigars*.—Patented October 29, 1861, No. 33,603; reissued June 16, 1868.

Claim.—1. The combination of the aprons F and H, knife K, and traveling racks 12 12, and boxes 15 15, substantially as described.

2. The combination of the taper trunk I I' c c, the aprons F and H, the throat J, the knife K, and the revolving boxes, the whole operating together substantially as and for the purpose set forth.

3. Traveling racks and boxes, in combination with boxes for transferring the cut tobacco from the aprons to the traveling boxes, substantially as set forth.

4. The combination of endless aprons, knife transfer boxes or their equivalents, and suitable boxes to receive and keep the cigar bodies until the wrappers are applied.

2,990.—GEORGE MOEBS, Detroit, Mich., assignee by mesne assignments of G. ALBERT REINIGER.—*Machine for Putting on the Wrappers of Cigars*.—Patented October 29, 1861, No. 33,604; reissued June 16, 1868.

Claim.—1. The combination of the roller H, apron J, and fixed table D, the whole operating together substantially as and for the purpose herein specified.

2. The auxiliary roller I, in combination with roller H, substantially as described.

3. In combination with the table D and apron J, the roller L, or its equivalent, adjusting the slackness of the apron, substantially as described.

4. The receiving hooks W, or their equivalents, in combination with the table D, apron J, and roller H, for the purpose specified.

2,991.—WILLIAM B. READY, Sacramento, Cal.—*Gang Plow*.—Patented December 3, 1861, No. 33,851; reissued June 16, 1868.

Claim.—1. The curved beams A, when used in connection with a gang plow, or a series of plows connected together by cross bars B B B, constructed and operating as and for the purposes herein set forth.

2. The arrangement of the arms G, wheels I, and lever J, when attached to the right hand arms G, and connected to the central beam A, as and for the purposes set forth.

2,992.—E. W. BULLARD, Barre, Mass.—*Hay Spreader*.—Patented May 21, 1861, No. 32,350; reissued June 16, 1868.

Claim.—1. The employment, in a hay-spreading machine, of mechanism for giving motion to the forks or stirrers, so constructed and combined as to give to the fork or forks, after they have entered the hay to be spread, a sweeping or accelerated back-and-up motion, until the hay has been properly raised, and then a down or lag motion, for the purpose of disengaging the forks from the hay while the machine is drawn forward by the team, substantially as and for the purposes set forth.

2. Supporting or sustaining the forks in a hay-turning and spreading machine upon fulera which move in the arc of a circle, while the hay is being acted upon, said forks having also a rocking or back-and-forward motion upon said moving fulera, to aid in lifting the hay, and being disengaged therefrom by means of hinged levers or arms, substantially as and for the purposes set forth.

3. The combination, in an open-frame hay spreader, of a series of forks, for entering and lifting the hay, and then disengaging themselves from the hay while the team is advancing, substantially in the manner described.

4. Combining each fork with the spreader frame and the mechanism for operating the forks, by means of three joints or flexible connections, for the purposes set forth.

5. The combination, with each spreader fork, of a jointed arm, one end of which arm is hinged, or turns upon a stationary or fixed fulerum, while the other end is so hinged and combined with the fork as to move and rock the latter upon its moving fulerum, substantially as and for the purposes set forth.

6. The combination, in an open-frame hay spreader of a series of forks, arranged to alternately enter

the hay, lift it from the ground, and discharge it in the air, in rear of the advancing machine, substantially as described.

7. A double-tined fork for a hay turner or spreader, constructed from a single piece of wire, the center of the piece of wire being bent into a loop, and a spring coil formed on each side thereof, with the ends of the wire projecting from the outer ends of said coils, parallel, or nearly so, to each other, with backward curves to form the tines, substantially as described.

8. The combination, with the coils of the spreader forks, of removable journals or supports, upon which the coils are free to spring, but are not fastened thereto rigidly, whereby the said journals or supports can be easily removed from the fork coils by a lateral movement of the journals or supports, substantially as and for the purposes set forth.

9. The combination of the turner forks with their handles, so that the strain of holding the tines to their work, while lifting the hay, shall be sustained by the loops of the forks, whereby the liability of breaking and bending the tines of the forks during the operation of the machine is lessened, substantially as set forth.

10. Giving a number of forks, arranged to operate successively, a back-and-forward motion, by means of a crank shaft, to accomplish the purposes above set forth, substantially as described.

11. The combination, in a hay spreader, of the following elements, viz., a series of double-tined spring forks, to act alternately upon the hay, to lift and discharge in rear of the machine, without the aid of strippers, and an auxiliary frame, for supporting the forks from a point in rear of and above the axis of the main supporting wheels, to give room for the proper action of the forks.

12. The combination, in a hay turner or spreader, of the following elements, viz., a series of forks, arranged to lift and discharge the hay in rear of the machine, without the aid of strippers, as described; a seat for the driver, and mechanism for elevating and depressing the forks, the same mechanism being also used for throwing the forks in and out of action, whereby the driver, from his seat on the machine, can elevate or depress the forks, and also throw them in or out of action, substantially as and for the purposes stated.

2,993.—HORACE B. HAWKINS, Akron, Ohio, assignee of DAVIS B. WOODWARD.—*Horse Rake.*—Patented February 19, 1861, No. 31,507; June 16, 1868.

Claim.—1. The combination with the free, extended ends of the rake teeth, of guides which allow the extended ends to rise and fall, and also to move longitudinally, but prevent them from moving laterally, for the purposes stated.

2. The combination, in a horse hay rake, of curved metal teeth, with their support or fulcrum bar, in such a manner that neither end of the teeth shall be connected to any part of the frame, for the purposes stated.

3. The combination, in a horse hay rake, of metal teeth, with their main supporting or draught bearings, in such a manner that their upper or forward ends shall extend forward of the draught bearings or fulcrum connections, and serve as springs to keep the lower ends of the teeth down in proper positions for raking and gathering the hay, substantially as stated.

4. The combination, for the purposes stated, in a horse hay rake, of the following elements, viz., first, a rocking frame, for elevating and depressing the teeth to discharge the hay; second, a series of metal teeth, without coils, having single-draught connections or attachments in rear of the forward ends of the teeth; third, a series of bearings for the free ends of the teeth, forward of their draught connections, which admit of an up, down, and longitudinal movement of the extended ends of the teeth during the operation of raking.

5. A rocking frame in a horse hay rake, having the rear end pieces turned up for supporting the piece which elevates the teeth to discharge the hay in such a manner as to give proper room below it for the accumulating hay to form a windrow, while at the same time preventing the hay from working forward upon the teeth.

6. The combination, with the raking frame and ratchet wheels C C, of the cams or eccentric wheels or rings K K, straps or clasps e e, bar J, shaft L, and lever M, substantially as and for the purposes set forth.

7. The combination of the sliding bar J with one or both of the ratchet wheels, substantially as and for the purposes set forth.

8. The combination, with bar J and axle A, of the fingers n n and arms o o, substantially as and for the purposes set forth.

2,994.—GEORGE WHITCOMB, Port Chester, N. Y.—*Horse Rake.*—Patented October 5, 1858, No. 21,712; reissued June 16, 1868.

Claim.—1. The combination and relative arrangement of the rake head E and axle B, substantially as and for the purposes set forth.

2. The combination and relative arrangement of the hinged rake head with the supporting axle and carrying wheels, substantially as shown and described, whereby the head is supported above the rear upper edge of the axle, as shown, and the lower ends of the teeth, when gathering the hay, occupy positions in rear of the tread of the wheels, and forward of a vertical plane on a line with the rear edge of the wheels, substantially as shown in the accompanying drawings.

3. The combination of the rake head E, thills or shafts C C, hinges c, and axle B, substantially as described.

4. The arrangement of the rake head E and foot treadles H J and G K, or either, in relation to each other and the axle B, substantially as and for the purposes set forth.

5. The arrangement of the rake head E, foot treadles H J G K, and hand lever I, in relation to each other and the axle B, substantially as and for the purposes set forth.

2,995.—GEORGE WHITCOMB, Port Chester, N. Y.—*Horse Rake.*—Patented October 5, 1858, No. 21,712; reissued June 16, 1868.

Claim.—1. The combination, with the teeth of an adjustable hay guard, L, or equivalent device, substantially as and for the purposes set forth.

2. The combination, with the teeth of a horse hay rake, of a hay guard, which moves with the teeth when the head is raised or lowered, but which permits each tooth to rise and fall to a certain extent, independent of the others, while all the teeth are held from springing laterally from each other, thereby preventing wide, open, and increased spaces between any two teeth for the escape of hay while the rake is in operation.

3. The arrangement of the upwardly and inwardly inclined seat supports b b, with the cross piece a and angular braces a' a', substantially as and for the purposes described.

2,996.—C. AULTMAN, Canton, Ohio, assignee of DANIEL M. SWARTZ and JONATHAN KREAMER, Milheim, Pa.—*Harvester Rake.*—Patented May 12, 1868, No. 38,514; reissued June 23, 1868.

Claim.—1. The combination of a main frame, supported upon two wheels, a laterally-projecting platform and cutting apparatus, which shall be in advance of the main axle, with the support of a series of combined rake and reel arms, rigidly connected with the finger bar.

2. The combination with a two-wheel front cut harvester, of a main frame between the wheels, the hinged supporting bars L L, the cutting apparatus and platform, and a series of revolving rake and reel arms pivoted to a central hub, and driven by an extensible shaft from the main axle.

3. Mounting a combined rake and reel on a front cut harvester, in advance of the main axle.

4. The combination of a combined rake and reel, having independent hinged arms, a platform hinged to the main frame, and the support of the reel and rake rigidly connected with the platform and finger beam, so as to conform thereto.

5. A series of pivoted arms of a revolving rake and reel, attached near the periphery of an enlarged head or hub, in lines tangential to a circle, the center of which is in the shaft around which said arms rotate, so as to cause the revolving heads or rakes to

approach the cutter in lines parallel or nearly parallel thereto.

6. A combined revolving rake and reel, in combination with a hinged bar harvester, a coupling arm, and a movable brace or plate to support the finger bar, platform, and rake and reel.

2,997.—JONATHAN HAINES, Pekin, Ill., assignee by mesne assignment of himself.—*Grass Harvester.* (Division B.)—Patented September 4, 1855, No. 13,523; reissued April 13, 1858, No. 545; and again reissued June 23, 1868.

Claim.—1. In combination with a laterally projecting finger beam, entirely unsupported at the outer end, and provided with open slotted guard fingers, through which and across said fingers the cutters are reciprocated in straight lines, a connecting rod or brace bar *m*, having one end connected with and jointed to the heel of said finger beam, and its other end flexibly connected with the main frame of the machine, for the purpose of controlling the lateral movements of the finger beam, so that the cutters and guard fingers will be kept in unison with each other throughout the up-and-down movements of said finger beam, independent of the main frame, substantially as set forth.

2. The drooping bracket *J*, extending downward below the main frame, for the purpose of giving support to the crank shaft, and to bring the crank and pitman more nearly in the line with the cutters, substantially as set forth.

3. The shield brace *Q*, connected to the bracket *J*, to protect the crank which drives the cutters while passing over cut grass and other obstructions, substantially as set forth.

4. Connecting the upper end of the brace or bar *m* to the bracket *J*, substantially as set forth.

5. The combination of the guide *y* with the short cutter *h* and open slotted narrow divider, when all are arranged for joint operation, substantially as set forth.

2,998.—JONATHAN HAINES, Pekin, Ill., assignee by mesne assignments of himself.—*Grass Harvester.* (Division C.)—Patented September 4, 1858, No. 13,523; reissued April 13, 1858, No. 546; reissued June 23, 1868.

Claim.—1. Flexibly connecting a laterally-projecting cutting apparatus, which has its cutters reciprocated in straight lines through open-slotted guard fingers, to the main frame of a mowing machine, substantially as set forth.

2. The main frame and the gearing which drives the cutters of a mowing machine, mounted upon two driving and supporting wheels, a draught pole to draw the machine by, rigidly connected to said frame, and a finger beam and cutting apparatus, (the cutters of which reciprocate through open-slotted guard fingers in straight lines,) flexibly attached to the main frame in such a manner as will permit said finger beam and cutting apparatus to receive all their up-and-down movements from the undulations of the ground over which they are drawn, substantially as set forth.

3. In a mowing machine, having a laterally-projecting finger beam flexibly connected with the main frame, a lever so arranged that the driver can, while occupying his seat, by one single movement, raise the finger beam and cutting apparatus bodily from the ground while the machine is in motion, to pass over obstructions, &c., substantially as set forth.

4. Connecting the lever by which the cutting apparatus is raised to the heel of the finger beam, substantially as set forth.

5. In combination with the main frame which carries the gearing to drive the cutters, and to which is flexibly connected a laterally-projecting finger beam provided with open-slotted guard fingers and cutters reciprocating across said fingers in a straight line, a lever connected to said finger beam, and having its fulcrum upon the main frame, so that when the finger beam is raised by means of said lever, the weight of the entire cutting apparatus will be borne upon the main frame, substantially as set forth.

6. The combination and arrangement in a mowing machine, having a laterally-projecting cutting apparatus, the cutters of which are reciprocated in straight lines through open-slotted guard fingers, and the

finger beam flexibly connected with the main frame of a lever conveniently placed within reach of the driver, to raise the cutting apparatus from the ground while the machine is in motion, and a holding device to lock and retain said lever, and hold the cutting apparatus elevated from the ground, as desired for transportation, substantially as set forth.

2,999.—SAMUEL JOHNSTON, Syracuse, N. Y., assignee of WILLIAM T. SHAW and JOHN MANZ, Wilmington, Del.—*Harvester Rake.*—Patented November 22, 1864, No. 45,185; reissued June 23, 1868.

Claim.—1. The combination of a main frame supported on two wheels, a laterally-projecting platform and cutting apparatus, so hinged to the main frame that the cutting apparatus shall be in advance of the main axle, with a series of combined rake and reel arms revolving on a support mounted on the platform.

2. The combination of a main frame supported on two wheels, and a laterally projecting platform and cutting apparatus, so hinged to the main frame that the cutting apparatus shall be in advance of the main axle, with a series of combined rake and reel arms revolving on a support mounted on the platform in front of the main axle, substantially as described.

3. The combination, with a two-wheel front-cut harvester, of a series of combined rake and reel arms on a standard or support, mounted on a hinged platform, the arms being independently hinged, and having a rising and falling movement independent of their axis of rotation.

4. The combination, with a two-wheel front-cut harvester, of a main frame, and a series of rake and reel arms, pivoted to a crown wheel or central hub, located on the platform, and driven by an extensible connection with the main axle.

5. The construction and adaptation of a combined rake and reel, which revolves entirely around a vertical center, so that it may be applied to the platform of a front-cut hinged bar harvester, in front of the main axle and below the highest point of the drive wheel.

6. The revolving head *II II'*, made in two disconnected parts, adapted to be coupled and uncoupled by means of the key *h¹* and recess *h²*, so as to cause the rakes to operate when the machine is moving forward, and to remain at rest during the backward movement thereof.

7. The frame or casing *F*, formed with the guide *ff'*, for controlling the movement of the rakes and reels, as described.

8. In combination with the aforesaid guide *ff'*, the roller *L*, arranged and operating substantially as described, to initiate and assist in the elevation of the rake and reel arms, as and for the object specified.

3,000.—GEORGE E. KING, New York, N. Y.—*Fluting Machine.* (Division A.)—Patented February 26, 1867, No. 62,492; reissued June 23, 1868.

Claim.—The guide *E*, constructed with one or more curved or arched portions *a'*, in combination with suitable fluting rollers, substantially as herein set forth for the purpose specified.

3,001.—GEORGE EDWIN KING, New York, N. Y.—*Fluted Puffing.* (Division B.)—Patented February 26, 1867, No. 62,492; reissued June 23, 1868.

Claim.—The within-described puffing, as a new article of manufacture, the same being formed by crinkling, gathering, or irregularly waving one portion of the strip of muslin or other material simultaneously with fluting it along the edges of such portion, as at *g*, and forming flattened borders or portions *h*, outside of the flutes, or between two next adjacent rows of them, to receive stitching, substantially as specified.

3,002.—CHARLES LOCKHART and JOHN GRACIE, Pittsburg, Pa.—*Still for Petroleum, &c.* (Division A.)—Patented November 17, 1863, No. 40,632; reissued June 23, 1868.

Claim.—Providing a still used for distilling hydrocarbon, with a scraper or scrapers combined with a receiving device, said scraper or scrapers being rotated during the process of distillation, and operating, with relation to the bottom of the still and said receiving device, substantially as herein described and for the purpose set forth.

3,003.—CHARLES LOCKHART and JOHN GRACIE, Pittsburg, Pa.—*Still for Petroleum.* (Division B.) Patented November 17, 1863, No. 40,632; reissued June 23, 1868.

Claim.—A still provided with a pipe or pipes, which is or are so arranged with relation to the still and its contents, that the vapor evolved from the contents of the still can be conveyed off at different heights, substantially as herein and for the purposes set forth

3,004.—G. C. MANNER, New York, N. Y.—*Improvement in Piano Fortes.*—Patented November 13, 1866, No. 59, 619; reissued June 23, 1866.

Claim.—1. Placing the damper lifters in a slot of the metal frame behind the point supporting the strings, substantially as and for the purpose described.

2. The metal frame A, when imbedded in the wood work of the piano forte, so as to butt against the wrest plank, and when provided with an inverted hollow-filled bridge, *a*, with a slot, *b*, and a diagonal brace, *d*, all made and operating substantially as and for the purpose herein shown and described.

3,005.—GREENLEAF STACKPOLE, New York, N. Y., and J. N. WINSLOW, Portland, Me., assignees of GREENLEAF STACKPOLE.—*Bit Brace.*—Patented September 23, 1862, No. 36,538; reissued June 23, 1868.

Claim.—1. In combination with a divided bit-shank socket, having a contracted neck, the ring E, for holding the bearings upon the shank of the bit, constructed and operating substantially as set forth.

2. The bearings C C', having grooves *a*¹ and *a*² therein, to admit different sized bit shanks, without an enlargement of the grooves to the extent of the whole length of the socket or the bit shank, substantially as specified.

3,006.—MITCHELL VANCE, & Co., New York, N. Y., assignees of EDGAR M. SMITH, same place.—*Harvester.*—Patented February 23, 1864, No. 41,746; reissued June 23, 1868.

Claim.—1. In combination with the main driving and supporting wheels, running loosely on their axles or journals, the main gear wheels D, running loosely on the hubs of said drive wheels, and having a ratchet and pawl connection with each other, substantially in the manner and for the purpose herein described and represented.

2. The arrangement of the two sets of plates and boxes on the opposite sides of the main frame, so that the cutting apparatus may be arranged on either side, as set forth.

3. In combination with the two sets of plates arranged on opposite sides of the main frame, the curved bar or brace F, extending from one to the other, so as to leave unobstructed space at I, for the free action of the rake, as described.

4. In combination with the loose and shifting main wheels and main cogged gears, the pinions *b*, permanently arranged on the shaft *d*, so that said loose and shifting wheels will, when on either side of the machine, mesh with said pinions, as set forth, whichever end of the machine goes foremost.

5. Hanging the reel blades to the reel shaft by means of the crossed arms, and adjustable heads, hubs, or sockets, for the purpose of enlarging or diminishing the circumference of the reel, substantially as described.

6. The adjustable pulley plate and adjustable pulleys thereon, for the purpose of taking up or letting out the reel belt when the reel is lowered or raised on its support, substantially as described.

3,007.—E. H. BARNEY, AND JOHN BERRY, Springfield, Mass.—*Skate Fastener.*—Patented July 23, 1867, No. 66,985; reissued June 30, 1868.

Claim.—A skate fastener or key, composed of the socket B, point *f*, and button *e*, when made of one or more pieces, substantially as described, and for the purposes specified.

3,008.—JOHN COMMINS, Charleston, S. C.—*Mode of Treating Mineral Phosphate for the Manufacture of Fertilizers.*—Patented February 25, 1858; No. 74,799; reissued June 30, 1868.

Claim.—Uniting, while hot, phosphatic minerals or earths, with a solution of common salt (chloride of sodium) and water, in part or whole, as and for the purpose herein described.

3,009.—JAMES EASTERLY, Albany, N. Y.—*Base-burniag Stove.* (Division 1.)—Patented February 13, 1855, No. 12,382; reissued June 30, 1868.

Claim.—Constructing a stove as herein described with openings for the admission of air to the burning fuel at some point or points above the grate, including between said points and the grate sufficient fuel for ignition, at any one time, substantially as described.

3,010.—JAMES EASTERLY, Albany, N. Y.—*Base-burning Stove.* (Division 2.)—Patented February 13, 1855, No. 12,382; reissued June 30, 1868.

Claim.—1. A cooking stove, which is provided with a coal-supply magazine and a combustion chamber, arranged without the space inclosed by the outer walls of the stove, substantially as described.

2. The combination of a coal-supply magazine with a cooking stove, when such magazine is wholly outside of the outer walls of the stove, substantially as described.

3. In a cooking stove having a magazine for supplying the combustion chamber with fuel, inlets for the admission of air to the burning fuel, arranged at some point or points above the grate, substantially as described.

4. The relative arrangement of the several parts of the stove, whereby the heated products are caused to circulate around the oven, substantially as described.

3,011.—GEORGE MOEBS Detroit, Mich., assignee by mesne assignments of G. ALBERT REINIGER.—*Cigar Machine.*—Patented May 29, 1866, No. 55,217; reissued June 30, 1868.

Claim.—1. The table A, provided with the troughs M, in connection with the cigar machine, substantially as and for the purpose described.

2. The spring hooks *j* in combination with the table A, apron *b*, and roller *a*, constructed and operating substantially as and for the purpose specified.

3,012.—JOHN B. RAYNOR, Mazo Manie, Wis.—*Churn.*—Patented February 25, 1868.—No. 74,941; reissued June 30, 1868.

Claim.—1. The shaft C, provided with a series of straight arms, H H, when arranged in combination with the box B, having a series of rods, I I, in the manner and for the purposes set forth.

2. The angular arms G, constructed as shown and described, and arranged upon the dasher shaft, to operate substantially as and for the purposes specified.

3,013.—HENRY VALENTINE SCATTERGOOD, Albany, N. Y.—*Cotton Gin.*—Patented June 25, 1867. No. 66,202; reissued June 30, 1868.

Claim.—1. A ginning cylinder, formed with circular ribs or projections containing or supporting the teeth, said ribs or projections being elevated above the other portion of the surface of the ginning cylinder, and thus leaving grooves for the reception of the guards, substantially as specified.

2. Forming the ginning cylinder of a series of rings, between which rings or segments of rings, containing teeth, are secured, substantially as specified.

3. In combination with a cylinder carrying circular ranges of needle-pointed teeth, the guards R, formed with openings to their upper ends, as and for the purposes specified.

4. Attaching the delivering or doffing roller upon arms extending from the axis of the perforated condensing roller or cylinder, so that said delivery roller is allowed to rise and accommodate the thickness of the bat, and is kept properly in contact with the condensing cylinder, as set forth.

5. In combination with the condensing roller or rollers formed with smooth perforated surfaces, the screen V, and brush blower B, for conveying the cotton to the condenser, as specified.

6. A condensing roller or rollers formed of smooth perforated surfaces, in combination with a ginning

cylinder and a brush blower to pass the cotton fiber from the said cylinder to the said roller or rollers, substantially in the manner and for the purpose above described.

3,014.—WILLIAM SMITH, New York, N. Y.—*Corded Elastic Fabric*, (Division B.)—Patented April 5, 1853, No. 9,653; extended seven years; reissued June 18, 1867, No. 2,656; again reissued June 30, 1868.

Claim.—The corded fabric, substantially as hereinbefore described, in which the cords are elastic, and are held between the upper and under weft threads, and separated from each other by the interweaving of the upper and under weft threads with the warp threads in the spaces between the cords, and only there, substantially as above shown.

3,015.—JOHN TYLER, West Lebanon, N. H.—*Water Wheel*.—Patented July 8, 1856, No. 15,309; reissued June 30, 1868.

Claim.—1. The curved bucket head *c*, when the said head is combined with the series of segment shaped buckets *d d*, substantially in the manner herein set forth.

2. The segment-shaped buckets *d d*, when the said buckets are formed with and project from the concave surface of the curved bucket head *c*, substantially as herein set forth.

3. The combination of the buckets *d d* with the bucket head *c*, when the said buckets are located in positions tangential to the inner guiding circle *c*, substantially as herein set forth.

4. The combination of the scalloped edged rim *f* with the lower edges of the series of buckets *d d*, substantially as and for the purpose herein set forth.

5. The combination of the elevated cover *D* with the curb of my improved water wheel, when the said cover is so proportioned as to receive and sustain the upper bearing box of the shaft of the wheel, substantially as herein set forth.

6. The combination of the detachable gate box *B* with the mouth of the water way of the water wheel, all substantially in the manner and for the purpose herein set forth.

3,016.—JAMES EMERY, Bucksport, Me.—*Lamp Shade*.—Patented July 9, 1867, No. 66,576; reissued June 30, 1868.

Claim.—A lamp-shade, made of a screen, *A*, and a carrier *B*, designed to be attached, by its upper end, to the chimney of a lamp, with a portion of its body formed to rest against the side of the chimney, which thus serves as a fulcrum on which to support the shade in an inclined position, constructed and applied together, substantially as specified.

3,017.—FRANCIS H. SMITH, Baltimore, Md.—*Drier*.—Patented February 26, 1861, No. 31,566; reissued June 30, 1868.

Claim.—1. The tunnel *A B C*, furnace *R*, and chimney *L*, when the former is so constructed and arranged that the current of warm air is supplied to the same at the opposite point from which the articles to be dried enter, which causes the articles to be subjected to the action of a varying temperature, substantially as described, and for the purpose specified.

2. The tunnel *A B C*, furnace *R*, and chimney *L*, and gates *F, G, and H*, when the same are so combined and arranged as to operate substantially, as described and for the purpose specified.

3. The tunnel *A B C*, furnace *R*, chimney *L*, and gates *F G H*, when the same are in combination with the rails *E E*, and ear *J*, and the whole operates substantially as and for the purpose specified.

3,018.—JOHN TYLER, West Lebanon, N. H.—*Water Wheel*.—Patented June 1, 1858, No. 20,456; reissued June 30, 1868.

Claim.—The hinged section *m* of the inner face of the scroll-shaped water way of said wheel, when arranged and operating in conjunction with the movable curb section *k* thereof, substantially in the manner herein set forth.

3,019.—LEWIS J. ATWOOD, Waterbury, Conn., assignee by mesne assignments of himself.—*Lamp*.

—Patented October 13, 1863, No. 40,226; reissued June 30, 1868.

Claim.—1. A concave draught plate, having an elongated slot, in combination with a chimney holder below the edges of that draught plate, and attached to the burner substantially as set forth, so that the flame will be spread and the light shine both above and below the draught plate.

2. An opening or series of openings between the said concave draught plate and the interior of the chimney, to allow an auxiliary draught to pass to the flame, in combination with a foraminous air distributor, connected to the burner, substantially as set forth.

3. A foraminous air distributor, *e*, formed with or connected to the burner, in combination with a draught plate, supported from the burner and within the chimney, substantially as specified, whereby the action of the air on the flame is regulated by the joint action of said draught plate, air distributor, and chimney.

4. An air distributor, substantially as specified, in combination with the draught plate and a glass chimney, having a contraction or neck at or near the said draught plate, whereby the said draught plate can be made smaller than with a straight or tapering chimney, and not obstruct the light, substantially as shown.

5. The chimney holder and the aforesaid draught plate, in combination with mechanism, substantially as specified, for connecting the chimney holder to the burner, whereby the chimney can be removed for trimming or lighting without being detached.

6. Connecting the said draught plate to the burner by a slide, so that it may be adjusted in position or removed, substantially as and for the purposes set forth.

3,020.—CHARLES S. HALL and CHARLES F. HALL, Brooklyn, N. Y., assignees by mesne assignments of SAMUEL WING.—*Refitting Stop Valve*.—Patented August 1, 1868, No. 49,203; reissued July 7, 1868.

Claim.—1. The concave mill *B*, either provided with or not an internal yielding center *c*, and arranged in suitable bearings, *a*, in combination with the adjustable center *e*, constructed and operating substantially as and for the purpose set forth.

2. The guide *E*, and conical mill *D*, applied in combination with each other, substantially as and for the purpose described.

3. An improved portable apparatus, constructed substantially as herein described, for refitting the valves and valve seats of stop valves and water cocks.

3,021.—GEORGE O. NIXON and WILLIAM L. NIXON, Sandyville, Ohio.—*Device to Prevent Hogs from Rooting*.—Patented February 18, 1868; reissued July 7, 1868.

Claim.—The within described device, consisting of the plate *A*, arms *C C*, with holes *D D*, and wire *B*, the several parts being arranged and used substantially in the manner and for the purpose herein specified.

3,022.—GEORGE W. PACKER, Jr., Mystic River, Conn.—*Apparatus for Building Walls and Extracting Stumps*.—Patented August 29, 1865, No. 49,647; reissued July 7, 1868.

Claim.—1. The within described combination and arrangement of the pyramidal frame *M M¹ M²* and curved reaches *E¹ E²* with the four wheels and their accessories, substantially as and for the purposes set forth.

2. The employment of braces *P¹ P²*, in combination with the struts *M*, &c., and the curved reaches *E' E''*, and arranged to be supported on wheels, substantially in the manner described, so that the braces shall aid in maintaining the curvature or arching condition of the reaches by connecting each to the struts above, at one or more points, as and for the purpose herein set forth.

3. The spherical-based rocker *C*, having the king-bolt *D* connected thereto by a loose joint, as represented, in combination with a trussed frame *M*, &c., and with the wheels, substantially as and for the purposes herein set forth.

3,023.—ALEXANDER D. REEVES, Portland, Me.—*Female Supporter*.—Patented April 1, 1862, No. 34,845; reissued July 7, 1868.

Claim.—The sack *h*, made as and for the purposes herein set forth, and supported by the belt and braces, arranged as herein described.

3,024.—S. Y. BRADSTREET, Monticello, Iowa.—*Safety Truck*.—Patented April 28, 1863, No. 77,248; reissued July 7, 1868.

Claim.—1. The combination of the inclined grooved wheels *C C*, with the horizontal bracing wheels *F F*, substantially as and for the purpose set forth.

2. The spring *J*, in combination with the sliding plate *G*, and fixed plate or block *H*, substantially as and for the purpose set forth.

3. An auxiliary truck, provided with inclined wheels *C C*, and bracing wheels *F F*, and sliding vertically in guides *H H*, in the manner and for the purpose indicated.

4. The combination of the plates *G G'*, with the wheels *C C*, *F F*, the spindles *D D*, having shoulders *d d*, and the nuts *a a*, substantially as and for the purpose specified.

5. The guide blocks *H H*, when supported by pivots *M M*, working in elongated bearings, in the manner and for the purposes described.

6. The rubber cushions *e e*, when used in combination with the auxiliary safety truck above described, in the manner and for the purposes specified.

3,025.—ELI PERRY, Baldwinsville, N. Y.—*Pump*.—Patented September 20, 1864, No. 44,337; reissued July 7, 1868.

Claim.—1. The combination, with the wings *E*, of the eccentric arms or extensions *E'*, forming a division between the discharge space *B* and the interior of the case, except through passages *i*, in the manner and for the purpose specified.

2. The combination, with the wings *E* and extensions *E'*, of the flanges *k*, in the manner and for the purpose specified.

3. The under side of the wings, formed with the sharp edges *l l*, the same being used in combination with the floor of the case *A*, substantially as described.

3,026.—CALEB S. STEARNS and THOMAS COREY, Marlboro, Mass., assignees of CALEB S. STEARNS.—*Machine for Splitting and Stripping Leather*.—Patented February 9, 1864, No. 41,583; reissued July 7, 1868.

Claim.—1. A carrying cylinder, *B*, provided with an automatic grasping mechanism, substantially as set forth.

2. A carrying cylinder, *B*, with its grasping mechanism, in combination with a splitting knife, *C*, and spring presser, *D*, or equivalent, substantially as and for the purpose described.

3. A carrying cylinder, *B*, with its grasping mechanism, splitting knife *C*, and presser *D*, in combination with a pair of grooved rollers, *E E'*, a series of stripping knives, *G G'*, and knife or guide shear *I*, substantially as and for the purpose set forth.

3,027.—PHILO P. STEWART, Troy, N. Y.—*Cooking Stove*.—Patented January 18, 1859, No. 22,081; reissued July 7, 1868.

Claim.—1. The supplying of a continued current of atmospheric air, heated by the front plate of the fire box or chamber of combustion, and in a flue, chamber, or space immediately in front of the same, and in combination therewith, without the aid of any intervening plate or plates, to the oven of a cooking stove in which the oven is in the rear of the fire chamber, and at the same time extending under and beyond it, so as to include the said flue, chamber, or space at the lower part thereof, and thus and thereby permit the said heated air to enter the said oven in the manner and for the purposes substantially as herein described and set forth.

2. The flue, space, or intervening chamber *A A'*, immediately in front of the fire box or chamber of combustion, with a fire grate and ash pit or chamber combined therewith, and the whole arranged and suspended in the front and upper corner or part of

the oven *i*, into which space or intermediate chamber atmospheric air is admitted through apertures *x*, or any equivalent thereof and therefor, and which are and shall be in and through the plate or door or doors in the front part of the cooking stove, and in combination with the oven of such stove, so that the air heated within such intermediate chamber, substantially as herein set forth, may or shall be conducted to and into the oven, for the purposes and by the means substantially as herein described and set forth.

3. In a stove constructed with an oven, and with a fire box or chamber of combustion, having a fire grate therein, and an ash pit or chamber below, and all combined therewith substantially like the one herein above described and set forth, the making of the front plate of the stove to open with a door or doors, *k*, and the attaching an apron in the front of the stove so as to receive and contain a kitchen or other suitable roaster, substantially as specified herein, so that the heat radiated by the front plate of the fire box or combustion chamber shall be aided by the heat radiated by oven plates therein, in the manner and for the purposes substantially as herein described and set forth.

4. The employment and arrangement of the front doors *k*, constructed with apertures *x'* or any equivalent thereof and therefor therein, in combination with the fire box or chamber of combustion *u*, by means of which atmospheric air, in a highly heated condition, is admitted to the oven of a cooking stove, for the purposes substantially as herein described and set forth.

5. The employment and arrangement of a door or doors, *k*, or any equivalent thereof and therefor, so that the same or a part thereof shall open (in the front of the cook stove) in front of the fire box or chamber of combustion, in combination with a fire chamber or chamber of combustion, having a fire grate therein, and ash pit or chamber combined therewith, and arranged and suspended in the front part of the oven of a cooking stove, in the manner and for the purposes substantially as herein described and set forth.

6. The arrangement of a fire chamber or chamber of combustion, with a fire grate and an ash pit or ash chamber combined therewith, and the whole suspended in the front part and upper corner of the oven of a cooking stove, in the manner and by the means substantially as herein described and set forth.

7. The employment and arrangement of the additional or extra bottom and encasement *u*, in combination with the flues of the bottom of a cooking stove and immediately underneath the oven *i*, and with the space or chamber between the same and the bottom plate of the stove, in the manner and for the purposes substantially as herein described and set forth.

8. The employment and arrangement of the additional or extra back and encasement *u*, in combination with the ascending and descending flues in the rear end of a cooking stove, and between the rear end of the oven and the rear vertical end plate of the stove, in the manner and for the purposes substantially as herein described and set forth.

9. The employment of a corrugated plate, perforated along the front thereof, for the top of the oven *i*, as arranged in connection with the flue *h*, and fire chamber or chamber of combustion and with the rear and vertical plate of the oven of a cooking stove, substantially as and for the purposes herein described and set forth.

10. The employment and arrangement of the front damper or valve *Y*, in the front and hearth of a cooking stove, in combination with the flue or flues (as the case may be) immediately underneath the oven and bottom plate of the oven of a cooking stove, in the manner and for the purposes substantially as herein described and set forth.

11. The employment and management of the damper *n*, or any equivalent thereof, and so combined with the flues of a cooking stove, having a boiler or reservoir supported outside and back of the rear vertical end of a cooking stove and over a heating chamber or flue, so that the direct action of the heat upon such boiler or reservoir may be thrown or shut off, and the same caused to pass through

other parts and flues of said cooking stove before entering such chambers immediately underneath such boiler or reservoir and acting thereon for the purpose of warming or heating the water therein, in the manner substantially as herein described and set forth.

12. The employment and arrangement of the boiler or reservoir having a removable or detachable cover or top, and containing two inclined flues or tubes, which are separate at the bottom or lower end thereof from each other, and which unite at the top or upper end thereof, and thus and then form but one pipe, in the manner and for the purposes substantially as herein described and set forth.

3,028.—E. B. BISHOP, New Orleans, La.—*Dredging Machine*.—Patented April 13, 1858, No. 19,908; reissued July 14, 1868.

Claim.—A revolving excavator or dredging machine, constructed and operating substantially as and for the purposes set forth.

3,029.—JOHN GIBSON, JR., Albany, N. Y.—*Street Car Heater*.—Patented January 1, 1867, No. 60,714; reissued July 14, 1868.

Claim.—1. The stove or heater C and smoke pipe e, encased or not in whole or in part, either without or connected with other suitable heating pipes, (other than steam pipes,) when arranged under the seat of any traveling conveyance, or in a room under a seat, for the purpose set forth and described.

2. The "protection piece" D, constructed and arranged as described, or its equivalent, for the purposes set forth as specified.

3. The pinch screw P, or its equivalent, in combination with the draught doors m m, as and for the purposes specified.

3,030.—AMARIAH M. HILLS, Hockanum, Conn.—*Lawn Mower*.—Patented January 28, 1868, No. 73,807; reissued July 14, 1868.

Claim.—1. The balanced frame on the roller E, in combination with the bail Q, to which the handle S is secured, all constructed and arranged substantially as and for the purpose set forth.

2. The horizontal cutter M, having the spiral cutters c c, when hung in front of the cutter D in a frame, which is adjustable upon the shoes N N, in the manner and for the purpose specified.

3. The combination of the frame, roller, shoes, cutting device, and handle, all constructed and arranged to operate in the manner substantially as and for the purpose set forth.

3,031.—D. S. HOLMAN, Conneautville, Pa.—*Seed Planter*.—Patented January 22, 1867, No. 61,431; reissued July 14, 1868.

Claim.—1. The two seed slides H H', placed one above the other, at the upper part of the tubes G, and having springs, d, bearing against them, in combination with the wheels I and projections e, having pins, f g, in their peripheries, all arranged to operate substantially in the manner as and for the purpose set forth.

2. The regulating slides J, in combination with the seed slides H H', arranged substantially as and for the purpose specified.

3. The combination of the metallic tubes L and covering shares O, all arranged and applied so as to be capable of operating and being adjusted substantially as shown and described.

4. The seed slides H H', tubes G, springs d, wheels I, projections e, with the pins f g, in combination with the slides J, metallic tubes L, and the covering shares O, all arranged to operate in the manner substantially as and for the purpose specified.

3,032.—JOEL F. KEELER, Pittsburg, Pa.—*Platform Scale*.—Patented September 26, 1854, No. 11,729; reissued July 14, 1868.

Claim.—1. The combination of the platform scale with a device acting independently of the weighing levers, for the purpose of raising or lowering the platform simultaneously at all points, when constructed and operating substantially as described.

2. In combination with the weighing levers of a platform scale, the intermediate platform or frame

G, constructed and operating in the manner and for the purpose substantially as set forth.

3. The combination of a spring balance with the vibrating beam of a weighing scale, substantially as and for the purpose set forth.

3,033.—LOUISA R. KETCHUM, Buffalo, N. Y., executrix of the estate of WILLIAM F. KETCHUM, deceased.—*Grass and Grain Cutting Machine*. (Division A.)—Patented February 10, 1852, No. 8,724; reissued February 28, 1854, No. 259; again reissued June 2, 1857, No. 466; extended seven years, and again reissued July 14, 1868.

Claim.—1. Extending the shoe H G from the heel of the rack or finger bar upward and forward, and firmly connecting its continuation with the draft when the finger bar is located as set forth, so that the power by which the machine is drawn shall, through the shoe, be communicated to and draw forward the heel of the rack or finger bar, thus relieving the great strain which would otherwise come upon the lateral connections of the rack or finger bar with the wheel frame, while the heel is enabled to slide over obstacles or obstructions, substantially as shown.

2. When the main wheel and inner end of the short finger bar or rack D are located relatively to the frame, substantially as described, projecting the shoe H G, which supports the inner or heel end of said bar, forward and upward from the said heel to a point in advance of the cutters, and above the plane thereof, sufficiently far to keep the grass down and prevent its rising over the shoe, thus aiding the shoe to ride over the mown grass or other obstructions, substantially as shown.

3,034.—LOUISA R. KETCHUM, Buffalo, N. Y., executrix of the estate WILLIAM F. KETCHUM, deceased.—*Grass and Grain Cutting Machine*. (Division B.)—Patented February 10, 1852, No. 8,724; reissued February 28, 1854, No. 259; again reissued June 2, 1857, No. 466; extended seven years, and again reissued July 14, 1868.

Claim.—When the main wheel and inner end of the finger bar or rack D are located relatively as described, supporting the heel of the rack or finger bar sufficiently near the ground, and at a convenient distance from the main wheel, by one or more arms or braces extending upward and backward therefrom, and connected with the frame or strong bars, firmly bolted across the frame, in rear of the said rack or finger bar, while the said frame or bars are elevated or arranged so as to pass over the cut grass, substantially as shown.

3,035.—RIPLEY AND COMPANY, Pittsburg, Pa., assignees of DANIEL C. RIPLEY, same place.—*Gas Lamp*.—(Division No. 2). Patented January 7, 1868, No. 73,122; reissued July 14, 1868.

Claim.—1. The construction of the base A, and the two handles B B, of one piece, for receiving a blown glass bowl or reservoir, C, substantially as described.

2. A pressed base, A, produced with one or two handles upon it, and having a globe, C, blown upon and united to the base and handle or handles, substantially as described.

3. The construction of the base A, and handle or handles B, in one piece, by casting, and with a concave seat, for supporting and having blown upon the same a bowl or oil reservoir, substantially as described.

3,036.—CHRISTIAN SHUNK, Philadelphia, Pa.—*Refining Iron*.—Patented February 12, 1856, No. 14,257; reissued May 31, 1864, No. 1,686; again reissued November 28, 1865, No. 2,118; and again reissued July 14, 1868.

Claim.—1. The refining and decarbonizing of molten crude iron by the employment of an atmospheric air blast, uniting the oxygen of the air with the carbon of the crude metal, and thereby decarbonizing, or partially decarbonizing, and refining the same, thus preparing it to be molded into ingots, or otherwise, of iron or steel, fit for the hammer or the rolls, or to be molded into castings, or to be reconverted into fine cast steel.

2. Such alloying, when effected by the introduc-

tion of the oxide of manganese, as above described, by which the ore is not only reduced, but the metal is thoroughly fused and incorporated with the iron, through the instrumentality of the high heat produced by the air blast, in the manner above shown.

3. The use of a compound, consisting of common salt and manganese, as a flux and detergent in said process, as set forth.

3,037.—CHARLES LAFAYETTE TUCKER, Chicago, Ill.—*Manufacture and Preservation of Lard.*—(Division A.) Patented July 2, 1867, No. 56,268; reissued July 14, 1868.

Claim.—1. The box herein described, when constructed without a lid or cover rim, and with straight even sides, from top to bottom, substantially as and for the purposes specified.

2. The application of gum arabic, or its equivalent, to lard packages, for the purpose of making them tight and non-absorbing, substantially as specified.

3,038.—CHARLES LAFAYETTE TUCKER, Chicago, Ill.—*Manufacture of Lard.*—(Division B.) Patented July 2, 1867, No. 66,268; reissued July 14, 1868.

Claim.—1. The application or use of a tin or lead foil or foil paper covering for lard packages, constructed of wood or paper, substantially as and for the purposes specified.

2. The process of putting up lard in a light wood or paper casing or box, by drawing or pouring the lard therein in a fluid state, and closing up the casing or box, by inserting the head so as to leave a small space between the lard and the head, to provide for expansion, substantially as specified.

3. As a new article of manufacture, small measured or specific, quantities of lard encased in a light wood or paper casing or box, substantially as and for the purposes specified.

3,039.—CHARLES L. TUCKER, Chicago, Ill.—*Process of Putting up Lard for Storage and Transportation.*—(Division C.) Patented July 2, 1867, No. 66,268; reissued July 14, 1868.

Claim.—The mode herein described of packing lard for transportation or storage, by first packing the lard in separate small packages of light wood or paper, and inclosing such small packages in an outer close-fitting case, substantially as specified.

3,040.—JOHN WHITWORTH AND WILLIAM H. HAWKINS, Cleveland, Ohio, assignees of JOHN WHITWORTH.—*Cutter for Wood Molding.*—Patented December 3, 1867, No. 71,670; reissued July 14, 1868.

Claim.—The herein-described hard or chilled cast-iron rotary cutter for working wood, made in the manner as and for the purpose substantially as set forth, as a new article of manufacture.

3,041.—PHILO P. STEWART, Troy, N. Y.—*Cooking Stove.* (Division B.)—Patented January 18, 1859, No. 22,681; reissued May 31, 1864, No. 1,684; and again reissued July 14, 1868.

Claim.—1. The employment and arrangement of the top plate of a cooking stove, having a flue or flues immediately thereunder, and extended over and beyond the rear end and upper portion of the vertical flues, back of the oven thereof, in such manner as to receive and support a reservoir or water tank upon or over a suitable opening therein, and with a heating chamber immediately below or underneath the same, in the manner and for the purposes substantially as herein described and set forth.

2. The arrangement and employment of the heating chamber D, or its equivalent, in combination with the rear vertical end flues of a cooking stove, and with the reservoir or water tank C, in the manner and for the purposes substantially as hereinbefore fully described and set forth.

3. The combination of the chamber D, extending beyond the rear end of a cooking stove, and situated under or immediately below the reservoir or water tank C, with the flue H extending from the fire chamber or chamber of combustion, and over the top plate of the oven, and with the vertical rear-end flues of a cooking stove, in the manner and for the purposes substantially as herein described and set forth.

4. The arrangement and employment of the re-

servoir or water tank C in or upon and with the extended top plate A and A' of a cooking stove, and heating chamber D, in combination with the heating or warming closet S, in the manner and for the purposes substantially as herein described and set forth.

5. The arrangement and combination of the heating or warming closet S, or any equivalent thereof, upon the rear end of a cooking stove containing vertical flues, in the manner and for the purposes substantially as herein described and set forth.

6. An opening, O, in and through the rear-end vertical plate of a cooking stove, of sufficient capacity to allow the passage of hot air, or of heated escaping products of combustion, through the same, and into a chamber underneath a reservoir or water tank, so as to warm or heat the water therein, in the manner substantially as herein described and set forth.

7. The combination of an exit chimney pipe or flue with the heating chamber D, underneath the reservoir or water tank C, in the manner and for the purposes substantially as herein described and set forth.

8. The arrangement of a reservoir or water tank upon the extended top plate of a cooking stove, and supported over or beyond the rear-end vertical flues of a cooking stove, in the manner and for the purposes substantially as herein described and set forth.

9. The vertical end plate of a cooking stove, containing the opening O, or any equivalent therein, for the passage of the hot air or escaping heated products of combustion into a suitable chamber underneath the reservoir or water tank, the same being regulated or controlled by a suitable damper, L, and all combined with a cooking stove, in the manner substantially as herein described and set forth.

10. The combination of the chamber or flue P with the vertical flues between the oven and the rear end plate of a cooking stove, and with the chamber D, and with the flue or flues in the bottom of the stove, in the manner and for the purposes substantially as herein described and set forth.

11. A reservoir or water tank, for the warming or heating of water therein, or for other purposes, arranged and combined with a cooking stove having vertical flues in the rear end thereof, and in the rear of the oven of such cooking stove, substantially as herein described and set forth.

3,042.—CHARLES DEAVES, New York, N. Y.—*Gas Apparatus.*—Patented July 25, 1867, No. 66,004; reissued July 21, 1868.

Claim.—1. The connecting couplings D and K, in combination with the retorts, when fitted with plates E G I, to facilitate the cleaning of the retort, substantially as described.

2. The use of two or more retorts, connected together in pairs, so that the first shall volatilize the oil or oily substance, and the second shall complete the conversion thereof into a fixed gas, suitable for illuminating purposes, the said retorts being constructed and arranged substantially as and for the purpose herein above set forth.

3. The combination, with the conducting pipe K, of a cooling trough, L, the water from which supplies the wash box, substantially as and for the purpose set forth.

4. The combination, with the discharge end of the conductor pipe K, of a perforated or reticulated disk h, substantially as and for the purpose set forth.

3,043.—FERDINAND FORMHALS, San Francisco, Cal.—*Machine for Collecting and Condensing Metallic Vapors.*—Patented January 21, 1865, No. 73,519; reissued July 21, 1868.

Claim.—1. In combination with the furnace A, the screw or submerger F, formed by a covered spiral flange or blade H H, around a central shaft or axis, substantially as and for the purpose described.

2. Drawing the volatile substances from the furnace into the submerging tank E by the screw F, from thence along the spiral opening to the chamber I, and out through the pipe J to the condensing tank or tanks, substantially as described.

3,044.—JAMES GRAY, Albany, N. Y.—*Base-burning Stove.*—Patented October 28, 1864, No. 44,719; reissued July 21, 1868.

Claim.—1. In a furnace, with a fuel magazine, which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, so constructing such furnace that the products of combustion rising from the fire chamber will be conducted toward the top of the furnace through flues which are formed by cylinders D and E, and partitions *h*, and which are arranged around an ascending warm-air passage, substantially as and for the purposes described.

2. In a furnace with a fuel magazine which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, the outer case *c*, constructed with horizontal openings *d*, and air passages *e*¹, substantially as and for the purposes described.

3. In a furnace with a fuel magazine which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, the construction of case *c*, with horizontal openings *d*, vertical openings *e*, and horizontal openings *e*¹, through it, substantially as and for the purposes described.

4. The outer case *c*, constructed with openings *d*, and horizontal air passages leading from the same into the annular air chamber *e*², in combination with a fuel magazine, which is supported free from the grate, and so constructed that the inflamed gases may burn in a free space, as they are evolved from the entire outer surface of the incandescence pile of coals, substantially as described.

5. The arrangement of the damper *g*², in combination with the vertical chambers formed by the walls C, D, and E, and a depressed fire pot B, substantially as described.

6. In a furnace with a fuel magazine which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, jacketed diaphragm *c*¹ *c*², applied at the base of the fuel magazine, substantially as described.

7. In a furnace with a fuel magazine which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, air passages *b e c*¹ *e*², in combination with flues *b'* *i*, and G, operating substantially as described.

8. In a furnace with a fuel magazine which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, case *c*, in combination with the jacketed diaphragm *c*¹, *c*, *c*², and fuel magazine C, substantially as described.

9. In a furnace with a fuel magazine which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, the combination of the fuel magazine C, the intermediate cylinder D, and the outer cylinder E, substantially as described.

10. In a furnace with a fuel magazine which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, the cylinders C, D, and E, in combination with air escape pipe J, and smoke escape G, arranged and operating substantially as described.

11. In a furnace with a fuel magazine which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, the combination of the fuel magazine C and the intermediate cylinder D, with the jacketed diaphragm *c*¹ *c*² and openings *e*¹ *e*², substantially as described.

12. In a base-burning air-heating furnace, the annular flue *i*, surrounding and over the supply cylinder C, in combination with the combustion chamber *b* and jacketed diaphragm, substantially as described.

13. In a furnace with a fuel magazine which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, the manner, substantially as described, of introducing and passing cool air into the periphery of the case *c*, and across the flue space or annular combustion chamber *b'*, substantially as set forth.

14. In a base-burning air-heating furnace, having its magazine free from the grate, the window or doorway opening leading into the combustion chamber, through which the condition of the fires can be seen and regulated, substantially as described.

15. In a furnace with a fuel magazine, which is sustained from the grate, and so arranged that the inflamed gases may burn in a free space, constructing the top plate F of the same with a central opening for the escape of heated air, and also with a feed

door or passage leading to the fuel magazine, substantially as described.

16. In a furnace with a fuel magazine, which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, the combination of the annular combustion chamber *b'*, the jacketed diaphragm *c*¹ *c*², and the horizontal openings *d* through the case *c*, the latter being covered with mica for the purpose of illumination and radiation, substantially as described.

17. The central opening J, for the escape of heated air, in combination with a fuel magazine, which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, as they are evolved from the entire upper surface of the incandescence pile of coals, substantially as described.

18. In a furnace with a fuel magazine, which is sustained free from the grate, and so arranged that the inflamed gases may burn in a free space, the central opening J, in combination with the jacketed diaphragm *c*¹ *c*², substantially as and for the purposes described.

19. In an air-heating base-burning furnace, having its fuel magazine sustained free from the grate, a door-opening *d*, leading into the fire chamber above the fire pot B, substantially as described.

20. Making the jacketed diaphragm smaller at its base or lower end than it is at its upper end, substantially as shown.

21. The arrangement of a jacketed diaphragm over a grate *a'*, which is of a larger area than the bottom of said diaphragm, substantially as described.

3,045.—RUDOLPH D'HEUREUSE, San Francisco, Cal.—*Fermenting and Oxidizing Mash, Malt, &c.*—Patented August 6, 1867, No. 67,512; reissued July 21, 1868.

Claim.—The improved mode of facilitating fermentation or germination by the introduction of air or other gaseous substance of proper temperature and moisture, with mash for distillation, vinous or other substances subject to fermentation or germination, at or near the bottom of the same, substantially as and for the purpose described.

3,046.—JOSEPH PALMER, Concord, N. H.—*Mode of Manufacturing Heads for Elliptic Springs.*—Patented September 3, 1867, No. 68,454; reissued July 21, 1868.

Claim.—1. The right and left dies, constructed substantially as and for the purpose herein described.

2. As an article of manufacture, the ears, as by them manufactured.

3. The application of the ears to the main leaf of elliptic springs, substantially as and for the purpose herein described.

3,047.—JOHN L. ROHRER, Upper Leacock Township, Pa.—*Harvester Rake.*—Patented December 3, 1867, No. 71,649; reissued July 21, 1868.

Claim.—1. A series of reel blades, revolving round an inclined axis, in combination with a rake revolving simultaneously with the blades, but round a vertical axis, and which is elevated and depressed during its revolution, substantially as and for the purpose described.

2. A series of reel blades, revolving round an inclined axis, in combination with a rake revolving round a vertical axis, and with the within-described devices, or their equivalents, whereby the motion of the rake may be arrested without interfering with that of the blades.

3. A shaft, Q, bent as described, and carrying revolving sleeves D F, a rake being jointed to the sleeve on the vertical portion of the shaft, and a series of arms being connected to the sleeve on the inclined portion of the shaft, substantially as and for the purpose specified.

4. The plate Q', with its straight and curved slots, in combination with the arms and rake shaft or blades, as described.

3,048.—SAMUEL W. SEARS, New York, N. Y.—*Lawn Mower.*—Patented April 14, 1868, No. 76,831; reissued July 21, 1868.

Claim.—1. A lawn mower, so constructed that the

utter bar may be operated either by a driving wheel connection or by hand power, substantially as and for the purposes herein described.

2. In a hand mower, the combination of the roller or driver C with the concentric gear f' , supporting the frame A, the crank shaft d , the shifting sleeve gear, the shaft E, and the reciprocating cutter bar D, constructed, arranged, and operating substantially as and for the purposes herein described.

3,049.—JOHN F. SEIBERLING, Akron, Ohio.—*Harvester*, (Division B.)—Patented October 15, 1861, No. 34,496; reissued June 14, 1864, No. 1,699; again reissued July 21, 1868.

Claim.—1. The combination, in a harvester, substantially as set forth, of a platform oscillating on an axis parallel with the finger beam, with a device operated by the foot of the driver, for inclining the platform to discharge the gavel.

2. The combination, substantially as set forth, in a harvester, of two main wheels, a frame to support the gearing, a finger beam suspended from the frame by flexible connections, an oscillating platform, and a device, operated by the driver, for inclining the platform.

3. The combination, substantially as set forth, in a harvester, of two wheels, a main or gearing frame, a laterally-projecting finger beam suspended from the main frame by flexible connections, a platform oscillating on an axis parallel with the finger beam and connected with the main frame through the medium of the finger beam only, and a device to operate the platform from the driver's seat.

4. The combination, substantially as set forth, with a harvester platform, of a double-cranked rocking lever and a treadle, operated by the driver, for the purpose set forth.

5. The combination, substantially as set forth, with a harvester platform, of a treadle, P, a rod, p^3 , a lever, P' , a connecting rod, p , and an arm, O, for the purpose set forth.

6. The combination, in a harvester, substantially as set forth, of a cut-off, with a rod, m' , arms, $o o'$, a rod, p , a lever, P' , a rod, p^3 , and a treadle, P, whereby the cut-off is operated by the same devices as those which operate the platform.

3,050.—THE UNION NUT COMPANY, Unionville, Conn., assignees of Julius B. Savage.—*Machine for Making Nuts*.—Patented December 14, 1858, No. 22,310; reissued July 21, 1868.

Claim.—1. The combination of a shears with a table, transferrer, and edge swages, the whole constructed and operated substantially as described.

2. The combination of a shears with a table, transferrer, and face swages, substantially as described, in such manner that the transferers do not hold or compress the sides of the nuts while its face is being swaged, the whole constructed and operated substantially as described.

3. The combination of a shears with both face and edge swages, by means of a supporting table and transferers, the whole constructed and operated substantially as specified.

4. The combination of edge swages with face swages, by means of a table and transferrer, the whole constructed and operated substantially as described.

5. A combination of face swages with a punch, by means of a transferrer and supporting table, acting to transfer the blank, between the two operations, the combination being substantially as described, and the above parts in combination with edge swages, the whole constructed and operated substantially as set forth.

6. The combination of a shears and punch, edge swages and face swages, by means of transferers and a table, the two latter acting to transfer the blank so that it is operated upon by the former in different localities, the whole constructed and operated as described.

7. The arrangement, in succession, of, first, a shears, second, swages, and, third, a punch, substantially as herein described, so that a blank is first cut off then swaged, and finally punched, the whole constructed and operated substantially as set forth.

8. In combination with a supporting table, a

transferrer with a notched or angular acting face, operating both to turn and move a blank, the whole constructed and operated substantially as described.

3,051.—DAMON R. AVERILL, Newburg, Ohio.—*Paint*.—Patented July 16, 1867, No. 66,773; reissued July 28, 1868.

Claim.—1. A paint composed of the ingredients herein named, and prepared and compounded substantially in the manner specified.

2. A liquid paint, when prepared and mixed for use, in any color, in its manufacture, and put up in packages for sale, and which may be preserved in such condition, substantially as and for the purpose described.

3,052.—HENRY DISSTON, Philadelphia, Pa., assignee of CHARLES DISSTON, same place.—*Saw*.—Patented April 2, 1867, No. 63,486; reissued July 28, 1868.

Claim.—1. A detachable saw tooth, in which is combined a circular base adapted to a circular recess in the blade with a projection at the rear adapted to a shoulder on the blade, all as set forth for the purpose specified.

2. The lips i on the edge of the projection d of a saw tooth, or on the edge of a recess in the blade, in combination with a groove and recesses m , in the projection or in the blade, substantially as specified.

3,053.—JOSEPH W. KENDALL, Philadelphia, Pa.—*Foot for Tubs, Buckets, &c.*—Patented November 26, 1867, No. 71,311; reissued July 28, 1868.

Claim.—A movable adjustable foot for tubs, buckets, barrels, &c., substantially for the purpose shown.

3,054.—SAMUEL M. LONGLEY and E. J. GENET, New York, and SAMUEL B. SMITH and ANDREW C. GETTY, Hudson, N. Y., assignees, by mesne assignments, of SOLOMON W. RUGGLES, Fitchburg, Mass.—*Stump Extractor*.—Patented October 14, 1862, No. 36,673; reissued July 28, 1868.

Claim.—In the afore-described differential windlass, the combined use of power-multiplying toothed wheels, wrapping connected differential drums or pulleys, and a sheave block or blocks, substantially in the manner and for the respective purposes herein set forth.

3,055.—JOHN G. PERRY, Kingston, R. I., assignee, by mesne assignments, of CARLOS W. GLOVER, Roxbury, Conn.—*Harvester*.—Patented October 14, 1856, No. 15,882; reissued July 28, 1868.

Claim.—1. So constructing and operating the vibrating sickle-driving mechanism of a harvesting machine, that such mechanism shall work through the driving wheel of the machine.

2. The combination of the cogs e on the driving wheel, the pinion f , upright shaft C, and wheel g with the pinion h' of the shaft D, arranged substantially as and for the purpose specified.

3. The combination, with the driving wheel, of the guide box B, bar F, rod H, and lever I, in such manner that the angle of presentation of the cutters carried by the finger bar E may be adjusted, substantially as set forth.

3,056.—WILLIAM B. WADSWORTH, Cleveland, Ohio.—*Water Elevator*.—(Division A.) Patented January 27, 1863, No. 37,535; reissued July 28, 1868.

Claim.—1. The toothed wheel, open and adapted to the chain, substantially as shown and described.

2. The said wheel, in combination with the chain $c b b f f d d$, substantially as shown and described.

3. The tilter $g y$, in combination with the flat chain $c b b f f d d$, substantially as shown and described.

4. The arrangement of the curved tilter $g y$ and stops $h h$, substantially as shown and described.

3,057.—WILLIAM B. WADSWORTH, Cleveland, Ohio.—*Water Elevator*.—(Division B.) Patented January 27, 1863, No. 37,535; reissued July 28, 1868.

Claim.—The chain, composed of links, as shown at $c b b f f d d$, the bent cross bar e , running

through to the outside of the hooks of the last link to *b b*, then angling, as shown at *f f*, to hooks *d d*, inside of bends *b b*, substantially as shown and described.

3,058.—EDWARD WHITELEY, Boston, Mass.—*Culinary Boiler*.—Patented April 8, 1856, No. 14,622; reissued July 28, 1868.

Claim.—1. The trap *G* and cap *I*, or its equivalent, as arranged and applied to the vessel *B*, whereby the latter may be employed either as a boiler or steamer, as set forth.

2. In combination with the vessel *B*, the interior vessel *H*, perforated to admit the steam, when placed within the outer receptacle *B*, and entirely surrounded or inclosed thereby, substantially as and for the purpose set forth.

3,059.—WILLIAM H. WILEY, Fredonia, N. Y.—*Horse Power*.—Patented November 12, 1867, No. 70,768; reissued July 28, 1868.

Claim.—1. The gear table *D*, rigidly connected to the draught levers *F* by the interposed spindles *E*, or their equivalent, so as to form a gear frame for carrying the pinions and spur wheels *G H* about the internal stationary cog rim *C*, and also a support for the draught levers upon the stationary central spindle *C'*, substantially as described.

2. The pinion spindles *E*, when secured to the table *D* at varying distances from the center thereof, so that different sizes of pinions to gear with cog rim *C*, and spur wheels to gear with pinion *I*, may be used, as and for the purpose set forth.

3,060.—VIRGIL H. LYON, Plainfield, Ind.—*Fruit Gatherer*.—Patented March 3, 1863, No. 75,035; reissued August 4, 1868.

Claim.—1. The head *A A'*, furnished with the fingers *C* and *B*, when formed, constructed, and arranged substantially as herein shown and described.

2. The head *A A'*, in combination with the sack or hose *S*, substantially as herein specified.

3. The sectional handle *D*, constructed as described, in combination with the head *A A'*, substantially as and for the purpose set forth.

3,061.—JAMES ADAIR, Pittsburg, Pa.—*Card Rack*.—Patented October 2, 1866, No. 58,363; reissued August 4, 1868.

Claim.—1. A wire spring, of spiral or other continuous curve, when so made as to be fastened by hooks, eyes, or other similar device, either with or without an intermediate bed plate, to a desk, table, pedestal, or other like object, for use as a spring-rack, substantially as hereinbefore set forth.

2. A bed piece so made with raised sides and ends, as that a spring of continuous curve placed in the space inclosed therein, and properly fastened, shall be secured against both lateral and undue longitudinal motion, substantially as and for the purposes hereinbefore set forth.

3. Fastening a spring or springs of continuous curve to a bed piece, by a fastening rod passing longitudinally through or along the spring or springs, and properly secured at each end, substantially as and for the purposes hereinbefore set forth.

4. A spiral or other continuously curved spring or springs *a*, in combination with a metallic bed piece *A*, by which to fasten the spring to a table or pedestal or other like object, substantially in the manner and for the purposes hereinbefore expressed.

3,062.—AMOS BROADNAX, Montclair, N. J., and ROLIN B. GRAY, Brooklyn, N. Y., assignees, by mesne assignments, of N. N. McLEOD, St. Louis, Mo.—*Hose Coupling*.—Patented May 24, 1859, No. 24,179; reissued August 4, 1868.

Claim.—Joining the end or ends of a pipe or tube by means of a tubular coupling, one end or each end thereof made conical or beveled, and having a tubular screw nut and thread, said connection being susceptible of receiving or having cast upon it a branch or branches, without interfering with the construction of the joint or joints, all substantially as shown and described.

3,063.—THOMAS EVANS, Newark, N. J.—*Metallic Ear for Attaching Handles to Pails and Like Vessels*.—Patented June 21, 1859, No. 24,451; reissued August 4, 1868.

Claim.—1. Metallic ears, for attaching the handles to pails and other vessels, formed with concentric annular corrugations surrounding the bail orifice, substantially as and for the purposes set forth.

2. So arranging the hooked ends of the bail as to give them an additional bearing against one or more of said corrugations, substantially as set forth.

3. The drip opening or passage, formed by the downward continuation of the outer corrugation for draining the interior cavity, as shown and described.

4. A bail ear, formed with the portion surrounding the eye raised to receive the hooked end of the bail, when the marginal portion or portions thereof are formed on the plane of the part to which they are to be attached, substantially as set forth.

3,064.—JOHN ASHTON GREENE and HENRY A. TWEED, New York, N. Y., assignees, by mesne assignments, of G. W. BLAKE.—*Belt Fastening*.—Patented April 24, 1860, No. 28,033; reissued August 4, 1868.

Claim.—1. The employment, in connection with belts or bands, of a series of links or looped shanks, constructed to receive at either end a rod or locking bar, substantially as herein described.

2. The manufacture of belt studs constructed with eyes or loops, so that a series of them may be locked or fastened at either end by a single rod or cross bar, substantially as described.

3. The combination of double-eyed shanks with corresponding locking bars, substantially as and for the purpose herein set forth.

4. The method, herein described, of fastening belt by means of two metallic bars united together by shanks passing through the ends of the belt or band to be united, substantially as set forth.

3,065.—JOHN ASHTON GREENE and HENRY A. TWEED, New York, N. Y., assignees, by mesne assignments, of G. W. BLAKE.—*Belt Fastening*.—Patented March 26, 1861, No. 31,859; reissued August 4, 1868.

Claim.—1. As an article of manufacture, double-headed studs shaped substantially as described, with a view to the uses herein set forth.

2. The method of fastening or uniting the ends of belts by a series of double-headed studs, substantially as herein shown and set forth.

3. The use, in combination with the ends of belts or bands, of double-headed studs, substantially as and for the purpose herein described.

3,066.—R. HOE & Co., New York, N. Y., assignees of ALEXANDER T. DE PUY, same place.—*Printers' Galley*.—Patented December 4, 1858, No. 70,151; reissued August 4, 1868.

Claim.—The combination, with the wooden frame of a printers' galley, of a metallic lining, secured thereto by means of a groove or grooves, substantially as and for the purpose specified.

3,067.—ISAAC D. JOHNSON, M. D., Kennett Square, Pa.—*Check Brace for Carriage*.—Patented April 28, 1862, No. 67,196; reissued August 4, 1868.

Claim.—1. The brackets *F F'*, located upon the perch, substantially as and for the purpose described.

2. The brackets *H H'*, secured to the elliptic springs *C C'*, substantially as and for the purpose described.

3. The combination of the brackets *F F'* and the brackets *H H'* with the connecting plate springs *G G'*, when arranged and operating substantially as and for the purpose described.

4. The combination of the brackets *F* on the perch, the brackets *H* on the springs, the plate springs *G*, and the elliptic springs, whereby the torsion of the springs and the undue oscillation of the body are prevented.

5. The combination, with the body of the vehicle, of the shackle *e*, the spring *C*, the brackets *F H*, and the plate spring *G*, whereby the spring

is braced from the center, substantially as described.

6. The combination, with the body of the vehicle, of the shackles, springs, brackets, and connecting plate springs, substantially as and for the purpose set forth.

3,068.—CARL A. KLEEMAN, Erfurt, Prussia.—*Lamp*.—Patented March 10, 1863, No. 37,867; reissued August 4, 1868.

Claim.—1. An argand burner and chimney holder, in combination with the cone *q*, provided with openings 4, to admit air to pass in between the cone and the glass chimney, substantially as set forth.

2. The cone *q*, provided with air openings 4, in combination with the cylinder *p* and arms 5, for connecting the said cone to the argand burner, substantially as set forth.

3. The cup 3, in combination with the cylinder *p* and wick tube *o*, as and for the purposes set forth.

3,069.—ORSON W. STOW, Plantsville, Conn.—*Machine for Bending Sheet Metal*.—Patented February 28, 1860, No. 27,319; reissued August 4, 1868.

Claim.—1. Making the folding bar, commonly used in such machines, in two parts, *f* and *i*, one part, *i*, being adjustable in respect to the folding plate *e*, by means of set screws *n*, or other equivalent means, so as to form a close or open lock, for joining two pieces of metal plate, or closing around a wire, substantially in the manner as described.

2. Arranging the gripping jaw *s*, with the folding bar *f* and *i*, in such a manner that on motion being given to the folding bar *f*, on its axis *g*, the gripping jaw *s*, is made to close on the folding plate *e*, and at the same time carry along with it the folding bar *f* into such a position as will bring its axis *g* of motion nearly into a line with the edge of the folding plate *e*, thereby placing the folding plate *f* and *i* in position to be turned over onto the folding plate *e*, necessarily, and simultaneously with the motion of the folding bar *f* and *i*, on its axis *g*, substantially in the manner as described.

3. The bed plate proper, *a a'*, to which is secured the folding plate *e*, in combination with the hinged frame *b*, having journal boxes *d*, and gripping jaws *s*, the folding bar *f* and *i* having journals *g*, and cams *o*, arranged and operating together, substantially in the manner as and for the purpose described.

4. In a machine which uses but one folding bar, as described, the combination of the folding plate with the folding bar, when so constructed and operating together that the distance between their adjacent edges can be increased or diminished at pleasure, for the purpose of forming both open and close locks or bends in sheet metal.

3,070.—The AMERICAN SHOE TIP COMPANY, Conn., assignees, by mesne assignments, of NEWMAN SILVERTHORN.—*Boot and Shoe Tip*.—Patented November 29, 1859, No. 26,329; reissued September 2, 1862, No. 1,339; and again reissued August 4, 1868.

Claim.—A formed tip, substantially as described, as an article of manufacture.

3,071.—GEORGE WATT, Richmond, Va.—*Plow*.—Patented February 9, 1858, No. 19,321; improvement added August 2, 1859; reissued August 4, 1868.

Claim.—1. The combination, in a plow, of a land-side, having an inward inclination from its base toward the mold board, and a neck, breast, or standard, having a diverse or outward inclination, substantially as set forth.

2. Constructing mold board and land side of cylindrical surfaces, intersecting along the cutting edge of the plow, in combination with the curved standard *S*, the whole being constructed substantially as and for the purposes hereinbefore set forth.

3. The combination of the eccentric roller *r*, beam *B*, notches *i*, and cuff *f*, substantially as set forth.

3,072.—TRUMAN G. BAILEY, Amenia, N. Y.—*Buckle*.—Patented July 4, 1865, No. 48,503; reissued August 11, 1868.

Claim.—1. The wedge *C*, and also the wedge *D*,

with the tongue *G* attached, and forming a part thereof, each of said wedges separately, and also in combination with each other, when made in the form described and applied to a buckle frame, for the purpose of relieving, by compression, the strain upon the trace, substantially as above described.

2. The wedges *C* and *D*, with their inclined faces *C¹* and *D¹* and tongue or spur *G*, arranged relatively to the inclosing strap *B¹*, the buckle frame *B*, the strap *E*, and spring *F*, or each of their equivalents, substantially in the manner and for the purpose herein set forth.

3,073.—CHARLES BENDER, New York, N. Y.—*Suspension Bridge*.—Patented December 10, 1867, No. 71,955; reissued August 11, 1868.

Claim.—1. The construction and arrangement of one or more yielding joints connecting the beams or trusses of stiffened suspension bridges, substantially as and for the purpose described.

2. The plates *N*, fitted together as shown in Fig. 2, and combined with the fulcrum bolts *E* of the yielding joints of the trusses, substantially as and for the purpose set forth.

3. The attachment of the ends of the cables or chains at or near the first or shore piers to the longitudinal beams or to the trusses of stiffened suspension bridges, substantially as and for the purpose described.

4. The method employed to reduce the side motion of a stiffened suspension bridge, by causing the longitudinal beams or trusses to bear against the several piers by means of projections *L*, as shown in Fig. 5, all constructed and arranged as herein described.

5. The arrangement of a connection, which is rigid in a horizontal direction, between each truss and one pier, while the connections of said truss with the remaining piers are free to accommodate themselves to the expansion and contraction of the beams or trusses, substantially as and for the purposes set forth.

6. The method of connecting the ends of the beams or trusses of stiffened suspension bridges, provided with yielding joints, to their respective piers, consisting of links *v*, all arranged and as for the purpose set forth.

3,074.—ANDREW CHRISTIAN, New York, N. Y.—*Children's Carriage*.—Patented April 24, 1866, No. 54,111; reissued August 11, 1868.

Claim.—Supporting the front end of a child's carriage upon two wheels, arranged between the sills of the carriage, substantially as herein shown and described.

3,075.—F. G. FLOYD and E. A. FLOYD, Macomb, Ill.—*Broadcast Sower*.—Patented April 2, 1867, No. 63,378; reissued August 11, 1868.

Claim.—1. The frame *A*, constructed as described, shaft *B*, disk *C*, when arranged in relation to each other as and for the purpose set forth.

2. The disk *C*, with projection *e*, in combination with the shaft *B*, the former being attached to the latter in the manner described.

3. The shaft *B*, with gear wheel *b*, shaft *D*, with gear wheel *d*, and standard *E*, the whole being combined and operated as set forth.

4. The slide *F*, constructed as described, in combination with pin *f* and holes *f'*, as and for the purpose set forth.

5. The revolving disk *C*, provided with the radial flanges *c'*, having their outer ends projecting beyond the periphery of the disk, and curved in the manner shown, substantially as set forth.

6. The combination of the frame *A*, hopper *G*, slide *F*, and revolving disk *C*, constructed as above set forth, all arranged for joint operation, as herein described.

7. The frame *A*, shaft *B*, with wheel *b*, shaft *D*, with wheel *d*, disk *C*, slide *F*, hopper *G*, and bag *H*, the whole being combined and operated in the manner set forth.

3,076.—CHARLES R. HARTMAN, Vincennes, Ind.—*Subsoil Plow*.—Patented April 14, 1868, No. 76,627; reissued August 11, 1868.

Claim.—1. A colter, constructed as described,

and provided with the standard C and the rear projection *d*, as a new article of manufacture, substantially as and for the purpose described.

2. The combination, with the colter and its standard G, of the adjustable guide box *a*, substantially as and for the purpose described.

3. The combination with the hooks C and beam A, of a chain or other suitable bracing support, having an adjustable connection either with the hooks or beam, substantially as and for the purpose described.

3,077.—NIXON & Co., Alliance, Ohio, assignees of CHARLES O'BRYAN and HENRY KREPS.—*Plow.*—Patented August 20, 1861, No. 33,096; reissued August 11, 1868.

Claim.—1. The combination of the beam A, provided with the yoke B and handles C C, with shares D attached, and the braces E E, arranged as and for the purpose set forth.

2. Making the handles C and standards in one piece, and so pivoting or connecting the same to the yoke or bow B of the beam as to be rendered adjustable, substantially as and for the purpose set forth.

3. The combination of the beam A and bow B of one entire piece, and so arranged that one of the arms of said bow is longer than the other, and so attached to the handles or standards as to admit one of the shovels to be in advance of the other, substantially as and for the purpose described.

3,078.—RIPLEY & Co., Pittsburg, Pa., assignees of DANIEL C. RIPLEY, same place.—*Glass Lamp.*—(Division No. 1.) Patented January 7, 1868, No. 73,122; reissued August 11, 1868.

Claim.—A glass lamp, with two or more pressed handles, which are so formed and attached that they perform the double function of handles and braces between the base and the bulb or body of the lamp, substantially as described.

3,079.—JAMES D. SARVEN, Columbia, Tenn.—*Carriage Wheel.*—Patented June 9, 1857, No. 17,520; reissued August 11, 1868.

Claim.—1. A carriage wheel, constructed with a wooden hub, in which the spokes are arranged at the said hub so as to have a bearing surface or support between each other, so as to form a continuous body or band around the said hub, substantially in the manner and for the purpose set forth.

2. A carriage wheel, in which the hub is constructed by combining a wood center and a metallic band or bands, flange or flanges, arranged so that the said metallic band or flange forms an additional bearing or support for the spokes, when the bands or flanges upon the opposite sides of the spoke are connected together through or between the spokes, to unite the two flanges, and form, as it were, one metallic band, through which the spokes pass.

3,080.—JOHN JAY SQUIRE, New London, Conn.—*Fruit Jar.*—Patented September 26, 1865, No. 50,181; reissued August 11, 1868.

Claim.—1. Closing the vent hole D, and supply hole E of the cover of a jar, by means of a cap, F, substantially as described.

2. Holding the covers of jars or vessels in place by means of elastic bands or straps, or their equivalents, applied substantially as shown and described.

3,081.—TUCKER MANUFACTURING COMPANY, Boston, assignee, by mesne assignments, of HIRAM TUCKER, Newton, Mass.—*Spring Bed Bottom.*—Patented July 3, 1855, No. 13,188; improvement 165; dated June 9, 1857; reissued April 5, 1859, No. 683; again reissued August 6, 1861, No. 112; and again reissued August 11, 1868.

Claim.—1. The combination of a series of wooden slats or bars with a frame or box, by means of two stirrup or lifter springs for each slat, by which the latter is supported at or near the ends thereof substantially as set forth.

2. The combination of each of a series of wooden slats or bars with a frame or box, by means of coiled stirrup or lifter springs supporting the slats, and being coiled by weight imposed upon the slats, and uncoiling themselves as weight is removed

from the slats, the combination being substantially such as described.

3. The combination of a series of wooden slats with a frame or box by means of two springs supporting each end of each slat, and acting by coiling and uncoiling, whereby each slat is not only supported, but also prevented from rolling, substantially as specified.

4. The combination of cylindrical rods or bars inclosed in the coils, with coiled springs supporting wooden slats in a bed bottom, substantially in the manner set forth.

5. The combination of each of a series of wooden slats with a bed bottom, by means of stirrup or lifter springs and a band loop, whereby each slat is supported at or near the end thereof, substantially in the manner specified.

6. The combination of a series of wooden slats with a frame, by means of lifting springs and tension springs, substantially as described.

7. A series of wooden slats, arranged longitudinally in a frame, in combination with the head and foot rails thereof, by means of springs, substantially in the manner and to produce the results specified.

8. A series of wooden slats, arranged longitudinally in a frame, in combination with the head and foot rails thereof, by means of springs, and in combination with each other, by means of a flexible band, this combination being substantially such as specified.

3,082.—RUFUS SPAULDING MERRILL and WILLIAM CARLETON, Boston, Mass., assignees of CHRISTIAN REICHMANN, Philadelphia, Pa.—*Lamp.*—Patented September 21, 1858; No. 21,576; reissued August 11, 1868.

Claim.—The combination of a flat wick tube with a dome or deflector, having a corresponding oblong opening or slot, under the arrangement substantially as shown and described, so that, while directly connected with each other, the said parts shall allow light to pass out, or be reflected from between them, as set forth.

2. The combination of a flat wick tube with a slotted dome or deflector and arms or frame, whereby the said dome is held on the wick tube in an elevated position in relation thereto, substantially as and for the purposes shown and described.

3. The combination of the deflector, and its supporting arms or frame and sleeve, with the wick tube, substantially as and for the purposes set forth.

4. A lamp burner, composed of two groups of elements, the first consisting of the base, with its wick tube and wick-adjusting rack and pinions, the second, of a chimney holder, deflector, and such other parts as may be needed for the proper combustion of the fluid, so as to procure an illuminating flame, the two groups being united by friction, and the latter, when in position in the burner, being supported by the former without the intervention of any mechanical device, whereby the two may be rigidly connected together, substantially as and for the purposes herein shown and set forth.

5. The combination, with a flat wick tube, of a correspondingly slotted, but elevated dome, provided with peripheral springs for holding the chimney in proper position, as set forth.

6. The combination, with the base and flat wick tube, of a chimney rest or holder, an elevated dome provided with peripheral springs, and a sleeve and frame or arms for holding said dome in position with respect to the wick tube, substantially as and for the purposes herein shown and described.

7. The combination, with the dome or deflector, of a series of arms projecting from the periphery of said deflector, and arranged as herein described, so as to constitute both the seat or rest for the lamp chimney and the springs by which the said chimney is steadied and held in position, substantially as set forth.

3,083.—THOMAS BLAKEWELL and JOHN LIPPINCOTT, Pittsburg, Pa., assignees of DANIEL W. COLBURN, Laomi, Ill.—*Ax.*—Patented July 9, 1867; No. 66,563; reissued August 18, 1868.

Claim.—1. Making that part of the edge of an ax which lies forward of the broadest part of the bit

of a semicircular shape, or of a shape nearly semi-circular, substantially as and for the purposes hereinbefore set forth.

2. Continuing the cutting edge of an ax around the swell of the bit on both ends of the ax, substantially as and for the purposes above set forth.

3. Making an ax with a poll of gradually-increasing width from the eye toward the bit, when combined with a bit having a curved cutting edge extending around and back of its broadest part on both ends of the poll, so that the poll may be reversible, and that the handle may be inserted at either end of the eye.

3,084.—J. W. DOTY, Lockport, N. Y.—*Harvester Pitman*.—(Division C.) Patented October 30, 1866, No. 59,192; reissued August 18, 1868.

Claim.—The combination of the bolt H, ratchet nut e, and pawl p with the conical or spherical wrist m and socket n, or their equivalents, for the purpose set forth.

3,085.—JOHN K. MAYO, New York, N. Y., for himself and ANDRE CUSHING and GEORGE B. CUSHING, St. John, New Brunswick, assignees of JOHN K. MAYO.—*Material for Various Structures*.—(Division A.) Patented December 26, 1865, No. 61,735; reissued August 18, 1868.

Claim.—A compound scale board, consisting of a plurality of thin sheets, scales, or layers of wood connected together with the grain in divers directions as a material for manufactures, and for the formation, lining, or covering of land or marine structures.

3,086.—JOHN K. MAYO, New York, N. Y., for himself, and ANDRE CUSHING and GEORGE B. CUSHING, St. John, New Brunswick, assignees of JOHN K. MAYO.—*Material to be Used in Constructing Bridges, Arches, Beams, Tunnels, and Other Works in Civil Engineering*. (Division B.) Patented December 26, 1865, No. 51,735; reissued August 18, 1868.

Claim.—The employment or use of the compound scale board, hereinbefore described, in the formation of the specified or analogous structures in civil engineering.

3,087.—JOHN K. MAYO, New York, N. Y., for himself, and ANDRE CUSHING and GEORGE B. CUSHING, St. John, New Brunswick, assignees of JOHN K. MAYO.—*Construction of Ships, Boats, Buoys, and other Nautical and Marine Structures*. (Division C.) Patented December 26, 1865, No. 51,735; reissued August 18, 1868.

Claim.—The employment or use of the compound scale board, hereinbefore described, in the formation of the specified or analogous nautical structures.

3,088.—JOHN K. MAYO, New York, N. Y., for himself, and ANDRE CUSHING and GEORGE B. CUSHING, St. John, New Brunswick, assignees of JOHN K. MAYO.—*Construction and Finishing of Houses and other Buildings*.—(Division D.) Patented December 26, 1865, No. 51,735; reissued August 18, 1868.

Claim.—The employment or use of the compound scale board, hereinbefore described, in the construction and finishing of houses and other buildings, or parts thereof.

3,089.—JOHN K. MAYO, New York, N. Y., for himself, and ANDRE CUSHING and GEORGE B. CUSHING, St. John, New Brunswick, assignees of JOHN K. MAYO.—*House Decorations, Furniture, Fittings, and the Like*. (Division E.) Patented December 26, 1865, No. 51,735; reissued August 18, 1868.

Claim.—The employment or use of the compound scale board, hereinbefore described, in the formation of the specified or analogous structures or articles of house decoration, fitting, and furnishing.

3,090.—JOHN K. MAYO, New York, N. Y., for himself, and ANDRE CUSHING and GEORGE B. CUSHING, St. John, New Brunswick, assignees of JOHN K. MAYO.—*Construction of Boxes, Trunks, Buckets, Barrels, and other Containing Vessels*. (Division

F.) Patented December 26, 1865, No. 51,735; reissued August 18, 1868.

Claim.—The employment or use of the compound scale board, hereinbefore described, in the formation of the specified or analogous receptacles, or parts thereof.

3,091.—JOHN K. MAYO, New York, N. Y., for himself, and ANDRE CUSHING and GEORGE B. CUSHING, St. John, New Brunswick, assignees of JOHN K. MAYO.—*Pipes, Tubes, Funnels, Faucets, &c.* (Division G.) Patented December 26, 1865, No. 51,735; reissued August 18, 1868.

Claim.—A conductor or vessel made of thin scale boards or laminæ of wood cemented together, with the grain crossed or diversified, substantially as and for the purpose herein set forth.

3,092.—JOHN K. MAYO, New York, N. Y., for himself, and ANDRE CUSHING and GEORGE B. CUSHING, St. John, New Brunswick, assignees of JOHN K. MAYO.—*Construction of Carriages, Cars, Coaches, and other Vehicles*. (Division H.) Patented December 26, 1865, No. 51,735; reissued August 18, 1868.

Claim.—The employment or use of the compound scale board, hereinbefore described, in the formation of the specified or analogous articles and structures.

3,093.—WILLIAM H. STEVENSON, Auburn, N. Y.—*Harvester*.—Patented March 3, 1868, No. 75,070; reissued August 18, 1868.

Claim.—1. The combination, with a dished driving spur wheel D, of a spur pinion E, bevel wheel H, and bevel pinion I, which will admit of the arrangement of the crank shaft J, substantially as and for the purposes specified.

2. The arrangement of the gear wheels D E H I, the wheel E, running loosely on a shaft F, and being provided with a clutching face f and shipping lever G, substantially as described.

3. The adjustable shifter holder and guide G¹, constructed in one piece, and attached to the main or draught frame by bolts passing through one or more slots in the shifting plate G², whereby the shifter fork may be adjusted to the groove in the spur pinion, substantially as described.

4. The combination of the adjusting lever T, linked connection L, and curved guide S, the latter working endwise in a guide box K, on the frame with the drag bar P, substantially in the manner shown and described.

3,094.—JAMES C. BETHEA, Blakely, Ga.—*Plow*.—Patented February 5, 1867, No. 61,796; reissued August 25, 1868.

Claim.—1. The post A, having in combination the front flange F and projection B, or any equivalent of this projection, which sustains, in front of the vertical part of the post next below it, the holding-down mechanism of the beam.

2. Making the connection of the plow beam to the post A, having the front flange F, by the stirrup D and wedge E, or equivalents of these two parts, the stirrup of which surrounds the beam and a portion of the metal below it, and has directly in rear of the lower end a portion of the post.

3. The post A, having the front flange F and projection B, or any equivalent of this projection, which, together with the beam, is surrounded by the stirrup D and drawn together by the wedge E, or equivalents of this stirrup and wedge, which hold the beam to the post, as these parts do, without weakening either one.

4. The post A, having the front flange F and the front and rear projections B B, or any equivalent of the front projection, which, together with the beam, is surrounded by the stirrup D and drawn together by the wedge E, or equivalents of this stirrup and wedge, which hold the beam to the post in front, while the beam is so held to the rear flange as to prevent the parallelism of the land side of the beam and post being varied.

5. The combination of the post A, having the front flange F and projection B, and the stirrup D, wedge E, and land side G, with its cutting edge, or an equivalent combination of parts.

6. The post A, having the front and rear flanges FF and projections BB, and the beam C, connected to the projections with the stirrups DD and the wedges EE, or equivalents of these parts, for changing the plow from a right to a left-hand turning one.

7. The combination of the reversible landside G with the post A, having the flanges FF.

3,095.—HENRY W. HOLLY, Brooklyn, N. Y., assignee of JOHN W. HOARD, Providence, R. I.—*Marking Slates*.—Patented February 24, 1857, No. 16,687; reissued August 25, 1868.

Claim.—1. The use of liquid silex in the preparation or manufacture of artificial slates, tablets, blackboards, and other like articles for marking or writing upon.

2. The combination of an oxido as a drying, anti-deliquescent, and coloring substance, with liquid quartz or silex, as a menstruum in the manufacture of artificial slates, substantially as specified.

3. An artificial slate or tablet, formed by spreading liquid quartz or silex, either separate or mixed with other materials, on a suitable surface or body, of card or sheet form, and, prior to being dried, calendering or rolling the same under pressure, essentially as herein set forth.

3,096.—EMILE MARTIN and PIERRE EMILE MARTIN, Paris, France.—*Process for Refining and Converting Cast Iron into Cast Steel and other Combinations of Iron and Carbon*.—Patented December 10, 1867, No. 72,061; reissued August 25, 1868.

Claim.—The process, substantially as herein described, for decarbonizing cast iron, in combination with the process of recharging the molten metal with the recarbonizing or "deoxygenating" material, substantially as and for the purpose specified.

3,097.—DON CARLOS MATTESON and TRUMAN PANE WILLIAMSON, Stockton, Cal.—*Cultivator Teeth*.—Patented April 9, 1867, No. 63,647; reissued August 25, 1868.

Claim.—1. The double pointed adjustable bit A attached to the beveled foot of the curved standard C, substantially as and for the purpose specified.

2. The oblong blade or share D, in combination with the bit A, substantially as described, for the purpose specified.

3,098.—M. RICHARDS and J. VANDEGRIFT, Princeton, Ill.—*Plow*.—Patented February 5, 1867, No. 61,762; reissued August 25, 1868.

Claim.—1. Broadly, the beam C pivoted to the brace B, and arranged to turn, substantially as and for the purpose herein specified.

2. The combination of the beam C, support and brace B, landside A, and moldboard A', as set forth.

3. The arm D, in combination with the beam C, plugs h, clamp F, and mold board A', as described and set forth.

3,099.—ROBERT DUNBAR, Buffalo, New York.—*Water Wheel*.—Patented July 30, 1867, No. 67,174; reissued August 25, 1868.

Claim.—1. A passage or communication formed between the chambers M and N, outside of the hydrostatic chamber G, substantially as and for the purpose set forth.

2. The rim F connected with and extending downwardly from the plate K, on a circle of less diameter than the hub of the wheel, so as to form, in combination with the plate K and stationary disk E, the lesser annular chamber G, and, in combination with the hub, the larger annular chamber J, for the purpose and substantially as described.

3,100.—JOHN HASKINS, Boston, Mass.—*Rubber Fabric*.—Patented July 30, 1867, No. 67,298; reissued August 25, 1868.

Claim.—The within-described article of perforated rubber as an article of manufacture, the same being used as and for the purpose set forth.

3,101.—GEORGE PLACE and CHARLES PLACE, New York, N. Y., assignees of CLARK L. HAYES and MARTIN NEWMAN.—*Circular-Saw Mill*.—Pat-

ented August 12, 1862, No. 36,150; reissued August 25, 1868.

Claim.—1. In a machine for edging and slitting lumber, where the saw or saws are made adjustable on the mandrel, the combination of said saw or saws with feed rollers, constructed and arranged to operate in the manner and for the purpose specified.

2. The construction of the saw mandrel and hub which moves upon it, as described.

3,102.—HENRI L. STUART, New York, assignee of JOHN F. BOYNTON, Syracuse, N. Y.—*Steam Generator*. (Division B.) Patented September 10, 1867, No. 68,598; antedated July 19, 1867; reissued August 25, 1868.

Claim.—1. The perforated tube B within the boiler, or its equivalent, for equalizing the temperature of the steam in the boiler substantially as described.

2. In combination with a steam boiler, the automatic heater and feeder, when constructed, arranged, and operating substantially as described.

3,103.—BENOIT BLOCH, Soultz, France.—*Aniline Dye*.—Patented July 14, 1868, No. 79,942; reissued September 1, 1868.

Claim.—A dye composed of the ingredients herein named, and treated in the manner substantially as set forth.

3,104.—J. P. CHAMPION, Phelps, N. Y.—*Apparatus for Raising and Securing the Legs of Horses to Shoe them*.—Patented November 5, 1867, No. 70,523; reissued September 1, 1868.

Claim.—The lever apparatus for raising and securing horses' legs, employed in connection with a suitable frame arranged and applied substantially as herein shown and described.

3,105.—GEORGE G. LARKIN, West Amesbury, Mass.—*Carriage-Circle Coupling*.—Patented April 5, 1864, No. 42,199; reissued September 1, 1868.

Claim.—1. The lower circle J J K, formed with a depressed rear portion in combination with an upper circle, L, constructed and applied substantially as herein set forth.

2. In combination with the lower circle J J K and upper circle L, thus constructed and combined, the stop M, for the purpose specified.

3,106.—MORRIS MATTSON, New York, N. Y.—*Enema Syringe*.—Patented April 4, 1854, No. 10,742; extended seven years; reissued September 1, 1868.

Claim.—1. The combination of the thumb or finger rest d with the barrel and piston for the purpose set forth.

2. The combination of the elastic or floating disk or valve w' with its seat and chamber arranged and operating substantially as described.

3. Placing the ejection or outlet valve of a syringe at or near the extremity of the discharge or injecting tube most distant from the pump barrel, or its equivalent, for the purposes set forth.

3,107.—CHARLES MELLINGER, Cornwall, Pa.—*Furnace for Roasting Ores*.—Patented May 19, 1868, No. 78,113; reissued September 1, 1868.

Claim.—1. In combination with a desulphurizing furnace or oven for preparing iron ore for smelting, the sliding door or damper B, arranged and operated substantially as described.

2. In combination with a desulphurizing furnace for the purposes mentioned, the grated or perforated arch F, substantially as described.

3. The combination of the arch F, the chambers E and H, the apertures J and L, and the damper B, substantially as and for the purposes described.

4. A blast furnace, so constructed that the surplus heat or gas escaping from the same is utilized, thereby desulphurizing, preparing, or roasting the ore, preparatory to smelting, substantially as herein set forth.

3,108.—WILLIAM HARTLEY MILLER, Philadelphia, Pa., assignee of JAMES L. BATES, Providence, R. I.—*Steam-engine Packing*.—Patented November 25, 1862, No. 36,687; reissued September 1, 1868.

Claim.—1. The use of a braided or woven fibrous covering, in combination with a filling for packing for the purposes above described.

2. The use of the fillet or strip of cork A or other filling, in combination with the covering b or its equivalent, substantially as shown and described.

3. The construction of packing substantially as herein set forth.

4. The construction of fibrous-braid coverings for packing substantially as shown.

3,109.—HENRY WHITALL, Woodbury, N. J.—*Machine for Grinding the Cutters of Mowing Machines.*—Patented May 14, 1867, No. 64,817; reissued September 1, 1868.

Claim.—1. A rotary grinding wheel, for grinding the inclined beveled edges of the cutters of harvesters and mowing machines, on their bars, in combination with a frame, supporting the grinding wheel and its shaft, and mechanism for holding the face of the stone, and cutters, adjusted to the desired or predetermined bevel, in contact, the combination and arrangement being such that the grinding wheel and either of the opposite inclined beveled edges of the cutters may be brought, when desired, together, and retained in contact, substantially as described, and for the purpose specified.

2. The combination, in a frame, of a rotary grinding wheel and an oscillating support, for changing the relative positions of the grinder and cutters, to operate on the opposite edges of the cutters, for the purpose set forth.

3. The combination, in a frame, of a rotary and traversing grinding wheel, and an oscillating support, for changing the relative positions of the grinder and cutters, to operate on the opposite edges of the cutters, for the purpose set forth.

4. A rotary and traversing grinding wheel, supported on a shaft, and arranged angularly in the sliding frame, the position of the shaft in the frame being such that when the said sliding frame traverses parallel with the edge of the cutter, the mandrel will be parallel with the cutter-bar, substantially as and for the purpose described.

5. A rotary grinding wheel, supported on a traversing frame, and arranged to be adjusted in a horizontal plane, parallel with the faces of the cutter blades, substantially as and for the purpose described.

6. The combination of the posts B and B', provided with the sleeves C and C', of the bent frame D, jointed to the sleeves and the oscillating frame, substantially as and for the purpose described.

7. The combination, with the bent frame D, of the oscillating frame E, pivoted thereto, and provided with means for adjustment, substantially as and for the purpose described.

8. The combination, with the sliding and oscillating frame, of the driving shaft, grinder-carrying shaft, grinding wheel, and their operating mechanism, substantially as and for the purpose described.

9. The combination, with the machine, substantially as described, of the clamp P, when arranged for joint action with the same, substantially as and for the purpose set forth.

10. A grinding mechanism, substantially as described, operating to grind the cutters while in the machine.

3,110.—JAMES A. WOODBURY, Boston, assignee of JOEL WHITNEY, Winchester, Mass.—*Planing Machine.*—Patented April 13, 1852, No. 8,881; extended seven years; reissued September 1, 1868.

Claim.—1. The method of connecting the movable feed roll to the stationary roll, when moving toward and from the same, in a constant plane, perpendicular to the board, by a duplicate system of similar gears at either end of the same, substantially as described.

2. The arrangement of mechanism by which the upper feed roll is allowed to yield to any inequalities in the board, and at the same time is drawn down upon its surface to which it has yielded in proportion to the resistance to its progress, substantially as described.

3. In combination with a pair of feed-rolls geared and driven from both of their ends, and the dupli-

cate sets of intermediate gears working in and with them, the connecting of said intermediate or driving gears by substantial shafts extending clear across from one set to the opposite set, by which the lifting and driving are done at both ends of the rolls, and the twisting, bending, or straining of journals or bearings avoided, substantially as described.

4. The arrangement of the gears D, loosely, so as to turn upon their movable but non-rotating connecting shaft I, so that said shaft and gears may be free to accommodate themselves to the yielding feed roll, and avoid the necessity of movable journal boxes or bearings, substantially as represented, and for the purpose described.

3,111.—S. B. ROWLEY, Philadelphia, Pa., assignee of N. S. GILBERT.—*Fruit Jar.*—Patented December 17, 1861, No. 33,938; reissued September 1, 1868.

Claim.—1. A jar, having a shoulder on the neck, below the mouth, (a flanged cap, which overlaps the neck,) and a packing, which is compressed between the shoulder and the cap, substantially as set forth.

2. The combination of a cover, A, adapted to the mouth of a jar, and to a packing on an exterior shoulder below the mouth, with a bail, D, or its equivalent, arranged to have a screw-like action on the jar below the said shoulder, all substantially as described.

3,112.—J. J. FIELDS and A. H. KING, New York, N. Y., assignees by mesne assignments of HENRY W. JOSLIN.—*Manufacture of Rubber-Coated Leather.*—Patented November 6, 1866, No. 59,402; reissued September 8, 1868.

Claim.—1. Leather coated with India rubber or gutta percha, in the manner substantially as herein set forth.

2. Applying the rubber to the surface of the leather in a raw state, and letting it congeal on the same, as specified.

3,113.—F. G. FOWLER, Springfield, Ill.—*Propeller.*—Patented May 28, 1867, No. 65,202; reissued September 8, 1868.

Claim.—1. The blades *a'*, constructed, arranged, and operating substantially as and for the purposes herein shown and described.

2. The eccentric, *e*, with its band, and the rods *e'*, arranged and operating substantially in the manner and for the purposes set forth.

3. The removable eccentric *e*, applied to steering purposes, and arranged in the manner and for the purpose set forth.

4. The sleeve E, chain wheels *r* and *r''*, chain *r'* and shaft *s*, or their equivalents, when used substantially as and for the purpose described.

5. A propeller, constructed of the parts above described, arranged and operating as a combined steering wheel and propeller, substantially as set forth.

3,114.—DON CARLOS MATTESON, Stockton, Cal.—*Gang Plow.*—Patented June 22, 1858, No. 20,647; reissued September 8, 1868.

Claim.—The arrangement, as described, of the false beam N, goose neck G, axle *u*, lever *i*, catch L, and the system of plows attached to their frame, as set forth, the whole being constructed and operating substantially as and for the purposes specified.

3,115.—S. B. ROWLEY, Philadelphia, Pa., assignee of R. W. LEWIS.—*Sealing Preserve Cans.*—Patented February 12, 1856, No. 14,245; reissued September 8, 1868.

Claim.—1. A preserve can or jar having a plate intervening between the gum packing, and a cover, or its equivalent, for compressing the packing to its seat on the jar.

2. The plate or its equivalent, situated below the packing, and filling the throat of the jar, as set forth for the purpose specified.

3. Ribs H or recesses on the jar, in combination with notches or projections on the plate above the packing, for the purpose specified.

3,116.—J. S. ATTERBURY and T. B. ATTERBURY, Philadelphia, Pa.—*Manufacturing Glassware with Handles.*—Patented June 30, 1868, No. 79,298; reissued September 15, 1868.

Claim. 1. Producing handles for glass lamps and other glassware, by casting them in molds ready to be attached to such articles, substantially as described.

2. The manner, substantially as described, of attaching glass handles to lamps or other articles of glass, in the process of blowing such articles in a mold, substantially as described.

3. Guiding hot flexible glass, as it drops or descends from the "punty" or pipe of the operator, to the point of attachment on the bowl or other article, by means of a mold which shapes the handle.

4. Dropping hot flexible glass into a mold for the purpose of forming a handle or handles for the bowl of a lamp or other vessel.

5. A glass lamp, or other article in glass, having a molded or cast handle and a blown body, produced substantially as described.

3,117.—BERDAN FIRE-ARMS MANUFACTURING COMPANY, New York City, assignee of HIRAM BERDAN.—*Breech-loader.*—Patented January 9, 1866, No. 51,991; reissued September 15, 1868.

Claim.—1. The employment, in a breech-loading fire-arm, of a device, so applied and operated as to press back the cartridge against the face of the breech preparatory to firing, substantially as and for the purpose herein described.

2. So applying and operating the cartridge shell refractor of a breech-loading fire-arm that it shall serve the purpose of pressing back the cartridge against the face of the breech preparatory to firing, substantially as herein described.

3. So arranging the detonating pin of a breech-loading fire-arm, that it shall strike the back of the cartridge opposite to where it is supported by a movable device which serves the purpose of pressing back the cartridge against the breech, substantially as herein set forth.

4. The elongation of the hole provided in the swinging breech, for the reception of the pin upon which it swings, whereby the breech has a direct support in the breech receiver at the time of firing, and yet is free to swing back loosely, to open the barrel for reloading, substantially as herein set forth.

5. The relative position and arrangement to each other of the hammer, firing pin, swinging breech, and line of bore, by which the line of bore is unobstructed and the loading facilitated when the hammer is at half-cock, substantially as herein described.

6. The combination with one main spring, of two or more stirrups, one or more connecting the tumbler or hammer, and the other connecting a brace for locking the breech when the hammer is down, substantially as herein set forth.

7. In combination with a swinging breech piece, the employment of a suitable projection on the lower or front side of the brace or tumbler, whereby the loading at full cock is prevented, substantially as and for the purpose herein specified.

8. So constructing and applying a brace to a swinging breech, for breech-loading fire-arms, that it swings on a tumbler shaft detached from the tumbler, but is attached to the mainspring in such a way as to give a greater motion to the brace than is given to the tumbler.

9. So combining a movable brace, which operates to lock the breech at the time of firing, a three-notched tumbler, and a swinging breech, in a breech-loading fire-arm, that while the hammer is locked by the sear in the first or safety notch, the breech is locked in a closed condition by the said brace, substantially as herein set forth.

10. The combination of the flanged breech receiver or lock frame A, the pins upon which the hammer, breech, and the sear work, and the cheek pieces of the stock, by which the pins are held in place, substantially as herein described and for the purpose herein set forth.

3,118.—BERDAN FIRE-ARMS MANUFACTURING COMPANY, New York City, assignee of HIRAM BER-

DAN.—*Breech Loader.* (Division B.) Patented January 9, 1866, No. 51,991; reissued September 15, 1868.

Claim.—The recess *a*, provided in the hub or hinged portion of the breech piece, in such relation to the barrel or chamber as is herein described, for the purpose set forth.

3,119.—WILLIAM DAVIS, SAMUEL H. DAVIS, and DAVID W. DAVIS, Detroit, Mich., assignees of WILLIAM DAVIS.—*Preserving Meats, Fruits, &c.*—Patented June 16, 1868, No. 78,932; reissued September 15, 1868.

Claim.—1. The construction of a car body, ship's hold, room, box, or chest, provided with compartments A, B, C, ice receptacle D, chimney E, and hatches G, when arranged and operating substantially as described, for the purpose set forth.

2. The goose-neck trap F, or equivalent, in combination with receptacle D and compartments A, B, C, when arranged substantially as and for the purposes set forth.

3. The receptacle D, for the freezing mixture, so constructed and arranged as to be pendent from the inner upper wall of chamber C, and allowing a free circulation underneath the receptacle, and on all sides, substantially as described.

4. The construction and relative arrangement of the ice receptacle D, with the chamber C, is frozen to the wall of receptacle D, substantially in the manner and by the means described.

3,120.—JAMES S. PORTER and RUSSEL PORTER, Waterford, N. Y.—*Alarm Lock.*—Patented March 5, 1867, No. 62,683; reissued December 15, 1868.

Claim.—1. The cam or stop P, which, by being properly set, offers an obstruction to the turning of the key, substantially as described.

2. The pistol C, hammer G, latch H, and trigger L, when all arranged and combined within the interior of a lock casting, provided with a cover *o* and plug F, substantially in the manner and for the purpose described.

3,121.—CHARLES H. RIGGS, Windsor Locks, Conn.—*Planer Chuck.*—Patented May 19, 1868, No. 78,132; reissued September 15, 1868.

Claim.—1. In combination with the movable jaw B and slotted chuck bed *b*, the eccentric shaft D, with eye bolts E E and nuts G G, arranged toward the front of the jaw, being constructed with a back surface equally as high as the front, or surface next to the stock, substantially as herein shown, and for the purpose set forth.

2. The device for fastening the chuck to the base plate M, consisting of the plate K with annular groove, bed plate L, angle irons O, threaded pin B with nut and groove Q, in base plate M, all constructed and arranged in the manner described.

3. The arrangement of the round or dovetailed nuts R R, screws J J, stationary jaw C, and the movable jaw B, substantially as shown and set forth.

3,122.—HENRY SHAW and WILLIAM D. LEAVITT, New Orleans, La.—*Grinding Plate for Grist Mill.*—Patented July 14, 1868, No. 79,865; reissued September 15, 1868.

Claim.—The combination and arrangement of the cast-iron grinding plate B, the unyielding non-conducting pap *r*, packing C, and back plate D, all constructed and secured together substantially in the manner and for the purpose herein described.

3,123.—ZALMON B. WAKEMAN, Rockford, Ill.—*Railway Rail and Splice.*—Patented May 26, 1868, No. 78,404; reissued September 15, 1868.

Claim.—1. The hollow shaft rail A, when the sides are curved in toward each other so as to receive and retain the block B, as and for the purposes set forth.

2. The combination of the hollow rails A with the connecting block B, provided with a removable bar or key *b*, substantially as herein set forth.

3,124.—JOHN A. BASSETT, Salem, Mass.—*Apparatus for Carbureting Air or Gases.*—Patented March 14, 1865, No. 46,771; reissued September 15, 1868.

Claim.—1. The general arrangement and con-

struction of the apparatus, consisting of the several parts shown and described.

2. The carburation of air or gases by the use of perforated plates or cylinders, with the fibrous material partially immersed in the hydrocarbon liquid, substantially in the manner as set forth and shown.

3. The automatic regulation of the air to be admitted to the holder and carbureter by means of a valve connected with and operated by the holder, through the lever and cord, or their equivalents, when used for this purpose, as shown and specified.

4. A carbureting device placed in the gas-holder tank, in the manner as substantially described.

5. A carbureting device for enriching air or gases with the vapor of a volatile hydrocarbon, placed in a gas-holder tank, having a seat for the holder independent of the level of the hydrocarbon liquid.

6. The combination of a device for carbureting air or gases, using capillary materials, with the method of carbureting by forcing the air or gases through hydrocarbon.

7. The automatic reservoir for replenishing the hydrocarbon liquid in the carbureting chamber, in combination with a gasometer, substantially as shown and described.

8. The use of a mercury valve for controlling the admission of air to the carbureting chamber, as set forth and shown.

9. Forcing air or gas through hydrocarbon liquid, or through capillary materials charged with such liquid, within a gas holder, so as to carburet or enrich the same, substantially as described.

10. The combination of a gas holder, a vessel to contain hydrocarbon liquid within the gas holder, and an air or gas-forcing apparatus, substantially as described.

3,125.—GARRETT P. BERGEN, Brooklyn, assignee of R. W. POTTER, New York, N. Y.—*Picture Card Frame.*—Patented March 7, 1865, No. 46,699; reissued September 22, 1868.

Claim.—1. A card frame for a picture, formed with an opening embossed around its edges, substantially as set forth.

2. Cutting a hole and simultaneously embossing the border in a picture frame, substantially as specified.

3,126.—B. J. CAMP, Marion, Ohio.—*Scroll Saw.*—Patented February 18, 1868, No. 74,497; reissued September 22, 1868.

Claim.—1. Securing or clamping the lower end of the saw blade B to the slotted pin F, by means of the sleeve *a* and tenoned set screw *b*, the tenon thereof being inserted into a hole in the saw, so that the saw is clamped between the shoulder of said set screw and side of the pin F, substantially as herein set forth.

2. The forked adjustable springs H and I, arranged, as described, one above and one below the saw table, for the purpose of obviating the danger of breaking the saw, at the same time as they act as guides for it, substantially as herein set forth.

3. The up-and-down adjustable guide bar G, carrying the bent spring H, constructed and arranged to operate substantially as herein set forth.

3,127.—JOSEPH DICK, Jr., Oshawa County, Ontario, and EUGENE GLEN, Rochester, N. Y., assignees, by mesne assignments of JOSEPH DICK, Jr.—*Harvester Rake.*—Patented October 9, 1866, No. 58,617; reissued September 22, 1868.

Claim.—1. The joint ball *g*, working within the pulley or case B, both constructed and operating, with reference to each other, substantially as shown and described, for the purpose of communicating power to and in combination with an automatic rake for harvesters.

2. The hanger A, the pulley or case B, and the joint ball *g*, all constructed and operating, with reference to each other, substantially as shown and described, for the purpose of communicating power to and in combination with an automatic rake for harvesters.

3. The employment of a continuously-rotating extensible or sliding tumbling shaft, in combination with a vibrating sweep rake, for operating the same, substantially as described.

4. The arrangement of the segments G and G' upon the vertical sleeve *f*, and the segmental pinions C and C' upon the horizontal driving shaft E of the raker, as shown, so as to constitute, collectively, an entire circle of gearing, as shown and described.

5. The combination of the detachable pulley T with the sleeve or ferrule S, having one or more locking pins, *c*, substantially as and for the purpose set forth.

6. The arrangement of the elevating lever L, ratchet O', head Q, chain U, and pulley V, in combination with each other and the brace of the shoe, as and for the purpose set forth.

3,128.—WILLIAM GAGE, Buffalo, N. Y., and ANDREW WHITELEY, Springfield, Ohio, assignees of WILLIAM GAGE.—*Harvester.* (Division F.) Patented September 16, 1856, No. 15,735; reissued September 22, 1868.

Claim.—1. The harvester's cutting apparatus, having the shoe M, the finger bar N, and the narrow divider O, or their equivalents, constructed and combined, substantially as herein described, so that this cutting apparatus will have one axis of motion between said shoe and the frame of the machine, to which said shoe is connected, upon which the outer end of said cutting apparatus may rise or fall within the limit allowed it, with the undulations of the ground over which it is drawn, without affecting or being affected by the height of said axis or the vertical position of the cutter's driving wheel.

2. The combination of the herein described shoe M, finger bar N, and narrow divider O, or their equivalents, in the harvester's cutting apparatus, when one of these portions of said divider, which supports the crop while being cut, is of less width than the other, substantially as and for the purpose set forth.

3. The combination of the shoe M, finger bar N, and narrow divider O, or their equivalents, in the harvester's cutting apparatus, with the coupling frame F, or an equivalent thereof, to enable the axis at the inner end of this cutting apparatus to be raised or lowered in respect to the main frame, substantially as and for the purpose described.

4. The combination of the coupling frame F and the pivots I I, or their equivalents, with the main frame of the harvester, so as to have one portion or end of the hinge between these frames in front, and one in the rear of the axle of the cutter's driving wheel, substantially as, and to obtain the advantages described.

5. The combinations of the inward projections *ll*, and the plate G, or their equivalents, with the shoe M, finger bar N, and the narrow divider O, in the harvester's cutting apparatus, to limit the downward vibrations of the outer end of this cutting apparatus, substantially as described.

6. The combinations of the slots *m m*, the bolt *n*, the washers *o o*, and the screw nuts *p p*, or an equivalent arrangement of parts, with the shoe M, finger bar N, and narrow divider O, in the harvester's cutting apparatus, to hold up the inner end of this cutting apparatus, substantially as and for the purpose set forth.

7. The combination of the track clearer T, or its equivalent, with the shoe M, finger bar N, and narrow divider O, in the harvester's cutting apparatus, so as to separate the grass cut by this apparatus from that which is to remain uncut, substantially as described.

8. The combination of the carrying wheel P, or its equivalent, with the shoe M, finger bar N, and narrow divider O, in the harvester's cutting apparatus, so as to carry the divider in one of the ways named, substantially as and for the purpose specified.

3,129.—GEORGE GUENTHER, Chicago, Ill.—*Mode of Drying Glue.* (Division A.) Patented June 4, 1867, No. 65,377; reissued June 9, 1868, No. 2,971; again reissued September 22, 1868.

Claim.—1. Drying glue by wetting solid surfaces with the glue in a liquid state, and allowing it to dry thereon in thin flakes, as herein specified.

2. Facilitating the drying of glue in thin scales

or flakes on solid surfaces by circulating air in contact therewith, as herein specified.

3. In the production of seale glue on solid surfaces, the employment of artificial heat within the solid surfaces, or in the air, or both, as herein specified.

4. The mode of drying glue in thin scales, by revolving or rotating surfaces, having their temperatures raised either by steam or hot air, substantially as described.

5. Drying glue on thin revolving disks, as and for the purposes herein set forth.

3,130.—GEORGE GUENTHER, Chicago, Ill.—*Machine or Apparatus for Drying Glue.* (Division B.) Patented June 4, 1867, No. 65,377; reissued June 9, 1868, No. 2,971; again reissued September 22, 1868.

Claim 1.—The perforated base or air distributor E, arranged as represented relatively to the drying surfaces A, and to the current of air, artificially thrown thereon, for the purposes herein set forth.

2. The surfaces A and trough B, with operating means C, or their equivalents, whereby the surfaces A are immersed in the liquid glue and removed therefrom at will, substantially as and for the purposes herein set forth.

3,131.—METROPOLITAN ROTARY ENGINE COMPANY, New York, N. Y., assignees, by mesne assignments of ADOLPH MILLOCHAU, same place.—*Rotary Steam Engine.*—Patented November 10, 1863, No. 40,571; reissued September 22, 1868.

Claim.—The pipes *i, l, n,* and *o,* and valves or cocks *k, k', m,* and *m',* in combination with the ring *c,* and pistons acting in the steam-spaces *y* and *z,* substantially as specified.

3,132.—GEORGE W. RAY, Springfield, Mass.—*Manufacture of Paper Collars.*—Patented May 1, 1866, No. 54,404; reissued September 22, 1868.

Claim.—Paper, embossed and enameled upon either one or both sides, whether before or after its conversion into articles of wearing apparel, all substantially as herein described.

3,133.—ARCALOUS WYCKOFF, assignee by mesne assignments of LA FAYETTE STEVENS, Elmira, N. Y.—*Boring Machine.*—Patented December 15, 1857, No. 18,872; reissued September 22, 1868.

Claim 1.—The oblique traversing rests O O, in combination with the screws *t t* and pinions *u u,* when arranged in relation to one another, and used in connection with the dog Q and chain P, for the purpose of adjusting the timber to the auger, and holding it firmly, substantially as set forth.

2. The combination of the shaft K, worm *l,* pinion J, and rack *I,* arranged to operate the traversing bed E, substantially as set forth.

3. An annular auger cutter head, the cutting lips of which project in the direction of its rotation, and are formed on a curved and oblique line, substantially as set forth.

4. The loose independent collar *f,* provided with knife edges *g g,* to keep it from turning, for the purpose of furnishing a bearing for the head of the auger while in operation.

5. The sharp annular spur *c,* for the purpose of centering and guiding the auger, and at the same time leaving a core of the material bored in the center of the auger, in the manner specified.

3,134.—J. L. COLES and D. H. COLES, New York, N. Y.—*Nutmeg Grater.*—Patented July 23, 1868, No. 80,456; reissued September 22, 1868.

Claim.—1. A box, A, containing a revolving carrier, D, having a series of chambers with spring followers, which press the articles to be grated against the stationary grating-surface E, which is combined with a receiver, F, all as shown and described.

2. The combination, with the cylindrical box A, of a series of carriers at angles to each other, so as to leave supplementary chambers, *b,* substantially as and for the purpose set forth.

3. The slots or openings, *g,* in front of the teeth, *f,* of the grating surface, said slots being formed by actually cutting or leaving out a portion

of the metal, substantially as and for the purpose described.

3,135.—ALBERT FULLER, New York, N. Y.—*Faucet.* Division B. Patented August 30, 1859, No. 25,253; reissued September 22, 1868.

Claim 1.—An elastic plug-valve, encased in the above-described metallic shield, for the purposes set forth.

2. An elastic plug valve, encased in a metallic shield, as described, when the shield is constructed to present a valve face, which is transversely or laterally exterior to the plug, in combination with a valve seat or seats to both the elastic and metallic faces of the valve, substantially as shown and described.

3,136.—JAMES LA F. KING and WILLIAM W. WATSON, Springfield, Ill., assignees of WATSON KING, same place.—*Horse Rake.*—Patented April 9, 1867, No. 63,729; reissued September 22, 1868.

Claim.—1. The extension of the crank arms *a* on each end of the rake head below the axle, in crank form, as applied to horse rakes, for the purposes herein shown and in the manner described.

2. Attaching the traces to the end of the crank or draught arms *a,* which are extended below the center of the wheels from each end of the rake head, to make these the point of draught, in the manner herein described and for the purposes set forth.

3. The forming a spring or brace on the butt end of the tooth, said brace being formed with or without a loop, for the purpose set forth and in the manner described.

4. Attaching the tooth H to the rake head *a,* by means of a straight or beveled mortise and key, for the purposes set forth and in the manner described.

5. Attaching the tooth H to the rake head *a,* by passing the loop over and around the head, for the purposes herein set forth and in the manner described.

6. The thimble or metal band *g,* as a means of securing and completing the brace or spring formed by the connection of the end of the tooth bent over with the main body of tooth, for the purposes herein set forth.

3,137.—FREDERICK WITTRAM, San Francisco, Cal.—*Anchor.*—Patented June 9, 1868, No. 78,852; reissued September 22, 1868.

Claim.—1. Openings made lengthwise in the shank of an anchor, through which arms or flukes move freely to either side, substantially as herein described.

2. The placing of two or more jointed arms or flukes at different portions of the shank's length, at or about at right angles to each other.

3,138.—JOHN G. BAKER, Philadelphia, Pa.—*Machine for Grinding Saws.*—Patented February 2, 1864, No. 41,419; reissued September 29, 1868.

Claim.—1. The combination, with a grindstone or grindstones, of feed rollers J, the axes of which are parallel, or nearly so, with those of the stones.

2. Two grindstones, arranged at an angle in respect to each other, and having traversing motion imparted to them, all substantially as and for the purpose herein set forth.

3. The combination of the expansion cranks G with the slotted traverse bar F.

4. The combination of the feed roller with the frame I.

5. The frame I, made in two halves, and carrying the feed rollers J, in combination with the springs *g,* or their equivalents.

3,139.—GEORGE HADFIELD, Cincinnati, Ohio.—*Medical Vacuum Chamber.*—Patented November 6, 1866, No. 59,388; reissued September 29, 1868.

Claim.—1. The employment of hand support or rest, substantially as and for the purposes set forth.

2. The sealing cap F, substantially as and for the purposes set forth.

3,140.—GEORGE E. HAYES, Buffalo, N. Y.—*Vulcanizing Vessel.*—Patented March 5, 1861, No. 31,599; reissued September 29, 1868.

Claim.—1. A vulcanizing vessel or oven, having its opening and closing joint, for insertion and removal of the mold, at or near the bottom, by making it of two sections, the upper or inclosing one of which forms the body of the vessel, while its lower section constitutes a base thereto, substantially as specified.

2. So constructing a vulcanizing vessel, with a flattened bottom, as that the plaster mold, containing the rubber compound, shall be in contact with the inside of the lower part of the vessel, so that the heat from the lamp or other heater shall be applied directly to that part of the vessel upon which the mold lies, substantially as and for the purposes set forth.

3. A mercury chamber, formed in the upper section of the vulcanizing vessel, the same being constructed and arranged with the thermometer, essentially as described.

4. The open ring C, in combination with the bottom, A, band D, and cover E, substantially as specified.

3,141.—ALBERT H. MANCHESTER, Providence, R. I., assignee of THOMAS GOODRUM, same place.—*Portable Book Clamp.*—Patented October 16, 1866, No. 53,940; reissued September 29, 1868.

Claim.—1. A portable book-package binder, having the following elements in combination: The clamps A A, a tightening cord *e*, and windlass C, provided with a ratchet plate and pawl, or equivalent holding device, substantially as described.

2. The compound handle B and windlass barrel C, in combination with the top binding strips A, substantially as described.

3,142.—HORACE T. LOVE, New York, N. Y., assignee of WILLIAM W. GRIER and ROBERT H. BOYD.—*Drill Bit.*—Patented May 23, 1865, No. 47,812; reissued September 29, 1868.

Claim.—A rotating drill or drill bit, whose edges, of diamonds or other hard-cutting points, are separated at its forward end by a recess or notch, and are arranged with relation to the axial line of the tool and each other, substantially in the manner and for the purpose described.

3,143.—CHRISTIAN BARRY, Philadelphia, Pa.—*Machine for Making Tin Cans.*—Patented December 3, 1867, No. 71,680; reissued October 6, 1868.

Claim.—1. The mode of manufacturing cans, substantially as herein described.

2. The roll C, with beveled edge *f* and roll B, with flange edge *g*, operating together substantially as herein described, for the purpose specified.

3. The swage or die J, having bevel periphery *q* and swage or die K, having a correspondingly beveled periphery *r*, operating together substantially as described for the purpose specified.

4. The shoulder *s* on the swage or disk K, forming a gauge and support, substantially as herein described and represented.

3,144.—JARVIS CASE, Lafayette, Ind., for himself and NEWTON BALDWIN, administrator of WILLIAM BALDWIN, deceased, assignees of JARVIS CASE.—*Seed Planter.*—Patented December 7, 1858, No. 22,228; reissued October 6, 1868.

Claim.—1. A corn-planter, consisting of a front and rear frame, when said frames are connected by a central bar, said connecting bar being either an extension of the driver's seat or an independent bar, substantially as described.

2. Pivoting the rear frame to the front one by means of the forward extension of the driver's seat, connected to the post F, or its equivalent, substantially as described.

3. The locking bar or catch K pivoted to the seat bar *e*, and arranged to engage under the projection *j*, or its equivalent, substantially as set forth.

4. The reversible marker, consisting of the rigid bar L, hinged to the front frame in such a manner that its outer end shall rest upon the ground without being raised therefrom or resting on the runner while the machine is in operation, and still be raised clear from the ground when the front part of the machine is elevated, substantially as described.

5. A runner for corn planters, having the hollow or recess in its upper edge for the marker, a seed duct, formed by cutting a channel in the side of the runner, and covering it with a plate, and also having the straight edge of the runner so inclined that its heel shall be the lowest point, substantially as and for the purposes set forth.

6. The combination of the rock shaft N, with the treadle or foot lever *f* applied thereto, with the seed slide *h*, arranged to operate substantially as described, for the purpose of enabling the driver to operate the seed slides with his feet, as set forth.

3,145.—FLEURY HUOT, New York, N. Y., assignee by mesne assignments of himself.—*Refining Petroleum.*—Patented March 19, 1867, No. 63,051; reissued October 6, 1868.

Claim.—1. The process, herein set forth, of purifying petroleum and other liquids by mixing with the same boneblack or other carbonaceous material, and then separating the said liquid from the carbonaceous substances by a centrifugal filter, substantially as and for the purposes set forth.

2. The centrifugal filter, formed of two thicknesses of cloth, with an intervening layer of filtering paper, as and for the purposes set forth.

3,146.—JOEL LEE, Galesburg, Ill.—*Hydrocarbon Burner.*—Patented April 2, 1867; No. 63,400; reissued October 6, 1868.

Claim.—1. Packing the conducting tube with wood, in the manner and for the purpose set forth.

2. A gas generator made of a coiled tube, and so arranged that the gas or vapor passes through its center, substantially as set forth.

3,147.—JOHN LIPPINCOTT, THOMAS BAKEWELL, BENJAMIN P. BAKEWELL, and BENJAMIN BAKEWELL, Jr., Pittsburg, Pa., assignees of WILLIAM J. LIPPINCOTT.—*Machine for Grinding and Polishing Saws.*—Patented October 24, 1865, No. 50,606; reissued October 6, 1868.

Claim.—A machine for grinding and polishing long saws, consisting of a grindstone supported on adjustable bearings, so as to be raised or lowered at pleasure in the manner described, and having a cylindrical support for the saw plate to rest upon as it is being ground, the axis of which is in the same vertical plane as that of the grindstone, and with one or more pairs of feed rollers having pressure screws, or their equivalent, so as to hold and guide the saw in its passage under the stone, such feed rollers being geared so as to have a positive and continuous motion on their axes in such direction as to feed the saw plate forward either with or against the motion of the revolving grindstone, substantially in the manner and for the purposes hereinbefore set forth.

3,148.—JAS. SELBY, Peoria, Ill.—*Corn Planter.*—Patented August 30, 1864, No. 44,919; reissued October 6, 1868.

Claim.—1. The main frame, mounted on two wheels and having the runners pivoted at their front end to the front part of the main frame, substantially as described.

2. The levers H, connected to the hoppers or runners by the links *h*, and arranged to operate as described.

3. The hoppers F', connected by one or more cross bars located above the main frame B, so as to permit the hoppers and runners of the machine to be raised or lowered without elevating the front part of the main frame, substantially as described.

4. The semicircular cut-offs *f*, constructed and arranged to operate substantially as described.

5. The adjustable plates I, arranged to support and regulate the position of the runners, substantially as set forth.

6. The combination of the pivoted scrapers O and the adjustable plates O', when arranged to operate as described.

3,149.—MICHAEL SWEENEY, Wheeling, W. Va., assignor to SWEENEY, BELL & Co.—*Lamp Chimney.*—Patented June 23, 1863, No. 79,277; reissued October 6, 1868.

Claim.—As an article of manufacture, a lamp

chimney, constructed with the lens or lenses B, one or more, in its surface, substantially shown and described.

3,150.—LEWIS H. BAKER, Tarrytown, N. Y.—*Convertible Lounge*.—Patented June 23, 1868, No. 79,050; reissued October 6, 1868.

Claim.—1. The combination with a bedstead lounge, of an extension or folding washstand, constructed and arranged substantially as shown and described.

2. The forming of a receptacle *l*, in the part A of the lounge with an opening *k*, in the seat portion *a*, for the purpose of stowing pillows when the device is not in use as a bedstead, substantially as shown and described.

3. The hinged part D depressed, and the seat part A, having its seat *a* raised, whereby a space is left between said parts for the reception of bed clothing, as herein shown and described.

3,151.—WILLIAM K. BOYLE, Bladensburg, Md.—*Manufacture of Artificial Stone*.—Patented September 15, 1868, No. 82,202; reissued October 6, 1868.

Claim.—1. The herein-described improvement in artificial stone by which an insoluble silicate of lime is formed by the double decomposition of the silicates of potassa or soda and nitrate of lime, substantially as herein set forth.

2. The herein-described method of forming artificial stone by the use of an alkaline silicate and nitrate of lime, when the latter salt is recovered, and the washings treated in the manner described, so as to utilize the acid element or recover the nitrates for the market.

3. The utilization of all the salts left in the residual liquors, as herein described, whereby a continuous formation of nitrate of potassa or soda is kept up.

3,152.—GUY DAVIS, Syracuse, N. Y.—*Oscillating Valve*.—Patented January 17, 1865, No. 45,910; reissued October 6, 1868.

Claim.—1. An oscillating valve suspended upon adjustable bearings, substantially as shown and described.

2. The steam chamber D, constructed substantially as shown and described.

3. The arrangement of the steam passages J, E, K, and G, substantially as shown and described.

4. The arrangement of the exhaust apparatus T, with reference to the apertures G G', substantially as shown and described.

3,153.—HUGH W. LAFFERTY and ROBERT LAFFERTY, Gloucester, N. J.—*Centrifugal Machine for Draining Sugar*.—Patented April 21, 1868, No. 77,054; reissued October 6, 1868.

Claim.—1. In combination with the swinging revolving shaft S of a centrifugal draining machine, an elastic stay applied to said shaft, at a point intermediate between its flexible joint or bearings and its attached cylinder, substantially as herein set forth.

2. The combination of a fixed hollow shaft H S, with the suspending and driving shaft S of a centrifugal machine, to afford stay or support thereto, substantially as herein set forth.

3. The combination of an extended elastic ring or band D D', with the outer upper end of a fixed auxiliary stay shaft H S, combined with the revolving shaft S of a centrifugal machine, to form a seat and stay for the same, substantially as herein specified.

4. The combination of the conical divided washer C' O', encircling the shaft S with a conical seat C O, in the end of and inclosing shaft H S, and with a hollow nut H N, working against said washer, substantially as herein set forth.

5. A friction brake B' operating against the lower end of the driving suspending shaft S of a centrifugal machine, substantially as herein set forth.

6. The combination of the lower extended extremity of the driving and suspending shaft S of a centrifugal machine with the bottom of the easing thereof, substantially as herein set forth.

7. The combination of a waste cup c', with the shaft or spindle S of a centrifugal machine, to pre-

vent the passage of oil down into the basket or cylinder thereof, substantially as herein set forth.

3,154.—EDWARD MILLER, Meriden, Conn., assignee of NORMAN W. POMEROY.—*Lubricator*.—Patented September 23, 1856, No. 15,775; reissued October 6, 1868.

Claim.—A lubricator, the disk of which, forming the bottom thereof, is constructed so that the central part may be readily pressed inward, and returned to its original position when relieved from pressure, the said bottom being so attached to the cup as to be protected by the downward edge of the cup, substantially in the manner herein set forth.

3,155.—AMOS RANK, Salem, Ohio.—*Harvester*.—Patented November 5, 1867, No. 70,614; reissued October 6, 1868.

Claim.—1. The combination substantially as set forth of a vibrating platform, with a scraper, hinged to the outer divider, which removes the discharged gavel out of the way of the team in cutting the succeeding swath.

2. The combination of a vibrating platform, composed of slats, supported at one end only, with a scraper, hinged to the outer divider, which clears the track for the next round.

3. The combination of a vibrating platform, connected with the main frame, through the medium of the finger beam only, with a scraper, hinged to the outer divider, which removes the discharged gavel out of the way of the team in cutting the succeeding swath.

4. The combination of a finger beam, with a flexible track clearer or scraper, having its forward end hinged to the finger beam, and its rear end suspended by a flexible connection from the main frame.

3,156.—MARVIN WASHBURN & Co., Alton, Ill. assignees of JAMES L. SMITH.—*Sirup Filter*.—Patented April 3, 1866, No. 53,693; reissued October 6, 1868.

Claim.—The filter herein described, composed of raw wool F, suspended between the funnel or other shaped sieve D and sieve B, in the skeleton hemispherical frame H, C, within a suitable case, A, for sirup, oil, liquors, and fluids, all substantially as specified.

3,157.—IRA WOOD, Woodstock, Vt.—*Composition for Tanning*.—Patented August 18, 1868, No. 89,237; reissued October 6, 1868.

Claim.—1. A tanning liquid made of the leaves of the different varieties of the oak, or maple, or willow, beech trees, used separately, or combined with each other, or two, or more, or all, in equal or in any proportion, for the purpose and in the manner above set forth.

2. A tanning liquid, made of the leaves of the different varieties of the oak, or maple, or willow, or beech trees, used separately, or two or more, or all of them together, in combination with alun, Glauber's salts, and nitric acid, in about the proportions specified, and for the purpose and in the manner above set forth.

3,158.—JAMES DONNING, Bridgeport, Conn.—*Lamp Burner*.—Patented July 22, 1862, No. 35,925; reissued October 13, 1868.

Claim.—A deflector or cone, having a flame slot, in combination with a sliding support, the two being connected together, and removable from the wick tube, and an air space being provided between the sliding support and the side of the wick tube, substantially as specified.

3,159.—HENRY RICHARDSON, New York, assignee, by mesne assignments, of EDWIN M. SCOTT, Auburn, N. Y.—*Machine for Grinding the Cutters of Mowing Machines*.—Patented July 30, 1867, No. 67,355; reissued October 13, 1868.

Claim.—1. In combination with a revolving grinding wheel or stone, on the end of a shaft, the vertically, or nearly so, swinging frame, for holding the reaper knife to be ground, so that it may be swung up to the stone, or back, to be examined by the operator, substantially as described.

2. In combination with the swing frame, the inclining of the clamping bar, so that the sections or edges to be ground may be brought in their entire length to the grinding surface of the stone, substantially as described.

3. The combination of the disk, slides, and thumb screw, as and for the purpose set forth.

4. The combination of the disk, slides, bolt, and lever, substantially as and for the purpose described and represented.

3,160.—JOHN SWAN, Baltimore, Md.—*Sleeping Car.*—Patented June 18, 1867, No. 65,693; reissued October 13, 1868.

Claim.—1. A series of state-rooms made crosswise of the car, and provided with a side passage, and independent ventilation, substantially as and for the purpose set forth.

2. The reservoir F, pipes H H, and basins J J, for supplying water to the state-rooms, substantially as specified.

3. The side passage C, when used in combination with a series of cross-berths or state-rooms, as and for the purpose set forth.

3,161.—JOSEPH J. GEST, Cincinnati, Ohio.—*Car Spring.*—Patented March 20, 1866, No. 53,291; reissued October 20, 1868.

Claim.—In combination with arched or elliptic springs, having reversed curves at or near their ends, a correspondingly curved or inclined block abutment or bearing, so that as the spring settles or yields under its load, it will practically become shorter and stronger, but still retain its elastic quality, and be firmly held in place and to the block or bearing, substantially as herein described and represented.

3,162.—ALFORD LAMB, MARY E. LAYMAN, and WILLIAM H. MORSE, Jeffersonville, N. Y., assignees of ALFORD LAMB.—*Washing Machine.*—Patented February 25, 1868, No. 74,919; reissued October 20, 1868.

Claim.—1. The combination of the base, B, supported by springs, and a strip or strips of rubber, C, arranged as described.

2. The combination of the above with the fluted roller D, substantially as described.

3,163.—JOHN G. PERRY, Kingston, R. I., assignee by mesne assignments, of CARLOS W. GLOVER Roxbury, Conn.—*Harvester Cutter.*—Patented July 15, 1856, No. 15,334; reissued October 20, 1868.

Claim.—1. The combination, with the guard fingers of the oscillating or rocking ledger blades or cutters, constructed with recesses in their upper sides, substantially as and for the purpose specified.

2. So arranging the ledger blades or cutters, constructed as described, within the guard fingers, that they may have a rocking or oscillating movement during the reciprocating movement of the sickle, substantially as herein set forth.

3. The attachment of the ledger blades to the guard fingers, by means of the trunnions *e* on the blades extending into the cavities *f* in the fingers, substantially as and for the purpose specified.

3,164.—J. H. THOMAS and P. P. MAST, Springfield, Mass.—*Seed Planter.*—Patented July 27, 1858, No. 21,034; reissued October 20, 1868.

Claim.—1. The arms G³, mounted upon the shaft G², within the hopper G, substantially as and for the purpose described.

2. The slide G¹, having the openings *b*, with the blocks or stops *e* fitting therein, and arranged to operate as described.

3. The combination of the slide G¹, and blocks or stops *e*, with the revolving arms G³, all arranged to operate as herein set forth.

3,165.—JOSEPH W. WATTLES, Canton, Mass.—*Ring for Ring and Traveler Spinning Machine.*—Patented March 17, 1868, No. 75,610; reissued October 20, 1868.

Claim.—1. The ring receiver, constructed substantially as described, that is to say, not only with a shank to fit the rail socket, and with a bore

eccentric with the cylindrical outer surface of such shank, as described, but also so as to be capable of being sprung or contracted upon the shank of the ring, by the screw inserted in the rail, and employed to confine the receiver in the socket of the rail, as set forth.

2. The combination and arrangement of the single screw with the ring rail, and with the clamping receiver and ring, constructed as hereinbefore described, the whole being for the purpose set forth.

3,166.—JOHN M. WILSON, Seguin, Texas.—*Cosmetic.*—Patented February 25, 1868, No. 74,871; reissued October 20, 1868.

Claim.—1. The chlorinated alkalies, or the alkaline chlorides, used as a cosmetic agent, in manner and for the purposes substantially as set forth.

2. The chlorinated alkalies, or the alkaline chlorides, in combination with any acidulous wash.

3. The chlorinated alkalies, or alkaline chlorides, in connection with an acidulous wash, made from either oxalic, tartaric, or citric acid, either separate or combined, substantially as described.

3,167.—JOHN B. STONER, LEOPOLD MENDELSON, and THEODORE CROMELIN, New York, N. Y., assignees of JOHN B. STONER.—*Ballasting Vessels.*—Patented February 4, 1868, No. 74,169; reissued October 20, 1868.

Claim.—1. A ballasting weight, L, applied on the free end of a swinging arm, in combination with a recess made in the hull of a vessel, to receive said weight and arm, and a tube, P, substantially as described.

2. The use of one or more weights, secured to stiff rods, and applied to a vessel in such manner that they can be lowered considerably below a vessel's keel, or raised and secured within recesses formed in the bottom of a vessel, substantially as described.

3. A temporary ballast, consisting of a weight secured to the lower ends of one or more rods, and adapted to fit into a socket formed in the vessel, and operated from the deck, said rods being suitably inclosed within a tube rising from said sockets, substantially as specified.

3,168.—JAMES S. GOODE and JOHN W. BOOKWALTER, Springfield, Ohio, executors of the estate of JAMES LEFFEL, deceased.—*Water Wheel.* (Division A.) Patented January 14, 1862, No. 34,150; reissued October 11, 1864, No. 1,791; again reissued October 27, 1868.

Claim.—1. A wheel having two series of buckets, both receiving the water horizontally, and one series discharging the water vertically, and the other toward the center, substantially as described.

2. The annular diaphragm D, constructed and arranged to operate in combination with the buckets above and below, substantially in the manner and for the purpose set forth.

3,169.—JAMES S. GOODE and JOHN W. BOOKWALTER, Springfield, Ohio, executors of the estate of JAMES LEFFEL, deceased.—*Water Wheel.* (Division B.) Patented January 14, 1862, No. 34,150; reissued October 11, 1864, No. 1,791; again reissued October 27, 1868.

Claim.—In combination with a water wheel having two series of buckets, an upper plate, covering the wheel, with a horizontal flange, and a lower cylinder and flange, and a series of chutes for directing the water to said buckets, substantially as described.

3,170.—JAMES S. GOODE and JOHN W. BOOKWALTER, Springfield, Ohio, executors of the estate of JAMES LEFFEL, deceased.—*Case for Water Wheels.* (Division A.) Patented January 14, 1862, No. 34,150; reissued October 11, 1864, No. 1,792; again reissued October 27, 1868.

Claim.—1. A case for a water wheel, composed substantially of a crown plate A, with a horizontal flange, *e*, projecting beyond the periphery of the wheel, a cylinder, R, with a correspondingly projecting flange, *e*, and a series of oscillating gates,

placed intermediately between the flanges, substantially as described.

2. In combination with a case, substantially such as described, an upper and lower support for the water-wheel shaft, attached to the case, substantially as described.

3. The upper plate A, when constructed with the flange c, cut away to admit of the movement or oscillation of the gate plates, substantially as described.

4. The bolts that hold the crown plate and cylinder by their flanges, in proper position, in combination with the case, and the means for sustaining the wheel, substantially as described.

3,171.—JAMES S. GOODE and JOHN W. BOOKWALTER, Springfield, Ohio, executors of the estate of JAMES LEFFEL, deceased.—*Gate for Water Wheels.* (Division B.) Patented January 14, 1862, No. 34,150; reissued October 11, 1864, No. 1,792; again reissued October 27, 1868.

Claim.—1. The gates H, when constructed substantially as described, so arranged around the wheel as to form converging throats, and so pivoted that when closed there shall be an equilibrium of pressure on the opposite ends thereof, substantially as set forth.

2. Gates H, which have their faces from z'' to z' , outwardly flaring, and their faces from z' to z , when closed, on a curve concentric with the wheel, and pivoted to the flanges c and e, at a point, d, in the middle of the latter faces, substantially as set forth.

3,172.—CHARLES E. PATRIC, Macedon, N.Y.—*Lifting Apparatus for Grain Drills.*—Patented December 17, 1867, No. 72,323; reissued October 27, 1868.

Claim.—1. The employment of the racks R and pinions w, in connection with the hand lever F and shaft H, for the purposes set forth, whether the lifting chains are made to wind upon the shaft or not.

2. The arrangement of the locking latch D with the shaft H, when it is also made to act as a support, substantially as and for the purposes set forth.

3. The arrangement of the guards G with the rack R and pinions w, substantially in the manner herein shown and described, and for the purposes set forth.

4. The combination of the shaft H, with the devices for raising the same, when constructed in such a manner that, by turning the shaft on its axis, it is caused to rise or fall, for the purpose set forth.

3,173.—PETER P. RUNYON, JOHNSON LETSON, GEORGE J. JANEWAY, and T. E. McDONALD, New Brunswick, N. J., assignees by mesne assignments of DAVID D. STELLE.—*Combined Planter, Harrow, and Cultivator.*—Patented July 16, 1867, No. 66,904; reissued October 27, 1868.

Claim.—1. The employment, in combination with the main frame and driving wheels, of a rotatory cultivator, (or harrow), arranged forward of the main axle, and in a vibratory frame hung on said axle, substantially as described, for the purposes set forth.

2. The employment, in combination with the oscillating frame, in which the cultivator is hung, of a lever, u, and retaining bar j, or the equivalents, for depressing the rear end of said frame, so arranged that it may be conveniently handled by the driver while in his seat, as described.

3. The combination of the rod k, spring n, and vibratory valve arm m, with the cam i, the whole arranged to operate as and for the purpose set forth.

4. The adjustable slides, and series of slots in tube p, for varying the charge of seed to be deposited each time, as and for the purposes set forth.

5. The adaptation to the same transverse cultivator shaft g, of different sets of removable harrows and hoes, as described.

3,174.—E. S. TORREY and J. TORREY, New York, N. Y., assignees of WASHINGTON L. GILROY.—*Weather Strip.*—Patented February 4, 1868, No. 74,077; reissued October 27, 1868.

Claim.—1. The insertion of a flat elastic strip into a molding, such as above described, in an inclined position to its surface as herein set forth.

2. Affixing said elastic medium into the groove in the rigid molding by means of suitable cement, as and for the purposes specified.

3,175.—PAUL SCHMITT, New York, N. Y., assignee of JANE QUANTIN and H. A. PINTARD, administrators of ALPHONSE QUANTIN, deceased.—*Method of Bottling Fluids under Gaseous Pressure.*—Patented March 4, 1856, No. 14,368; reissued October 27, 1868.

Claim.—1. The above described device for filling bottles or other vessels with aerated water and sirup, consisting of conduits or passages A and B, a sirup-measuring chamber, and a discharging nozzle, or their equivalents, so arranged that the water and sirup may be discharged from said nozzle common to both, substantially as shown and described.

2. The combination and arrangement of the sirup-measuring chamber, and a cock or valve for admitting the aerated water thereto, substantially as shown and described.

3. The arrangement of the sirup conduit and the water conduit, as a consequence of which the sirup is expelled from its conduit, and such sirup is mingled with the water at some distance from their common outlet, substantially as shown and described.

4. The combination and arrangement of a valve or cock for drawing the water, a vessel for receiving and dispensing the sirup, and the pipe or passage connecting the same, as a consequence of which the ejection of the sirup is accomplished by the manipulation of the valve or cock for drawing the water, substantially as shown and described.

5. The construction and arrangement of the vent-opening and closing device, and the water-drawing valve or cock, as a consequence of which they are both operated simultaneously by the movement of water-drawing valve, substantially as shown and described.

3,176.—GEORGE R. CHITTENDEN, Chicago, Ill., and CHARLES A. SMITH, Milwaukee, Wis., assignees of JAMES MACGREGOR, Jr.—*Coffee Pot.*—Patented April 11, 1854, No. 10,752, extended seven years; reissued October 27, 1868.

Claim.—1. A tea or coffee pot when made with two receptacles, one for tea or coffee, and the other for water, substantially as described.

2. A tea or coffee pot so arranged that the heat shall be communicated to the tea or coffee through a water or liquid medium, substantially as described.

3,177.—JACOB GREEN, NORRISTOWN, THOMAS H. WILLSON, HIRAM WILLSON, and CHARLES R. ADAMS, Philadelphia, Pa., and SAMUEL MUNN, Hackensack, N. J., assignees of JACOB GREEN.—*Melting and Smelting Furnace.* (Division A.)—Patented March 26, 1867, No. 63,240; reissued November 3, 1868.

Claim.—1. A furnace in which currents of air are introduced above the fire, and a mixture of air and steam is passed upward through the fire, substantially as and for the purpose described.

2. A furnace, in which the gases produced by the passage of mixed air and steam through, and of air above the fire, are maintained under a pressure greater than that of the external air.

3. A furnace, in which the gases are maintained under pressure, and in which openings are arranged at the points to which the heat is to be directed, substantially as and for the purpose described.

4. The combination with a furnace of blast pipes so arranged above the fuel as to direct the heated products of combustion to any desired part or parts of the furnace, substantially as set forth.

3,178.—JACOB GREEN, NORRISTOWN, THOMAS H. WILLSON, HIRAM WILLSON, and CHARLES R. ADAMS, Philadelphia, Pa., and SAMUEL MUNN, Hackensack, N. J., assignees of JACOB GREEN.—*Furnace for Treating Iron, and for other purposes.* (Division B.)—Patented March 26, 1868, No. 63,240; reissued November 3, 1868.

Claim.—1. The combination, in a smelting fur-

nace, of pipes through which a mixture of steam and air can be introduced below the fire, and currents of air among the products of combustion previous to the latter being brought into contact with the ore, for the purpose specified.

2. A chamber or chambers, H, through which the ore is admitted to the furnace, when the said chambers are arranged in respect to the bed and to the fire-place substantially as specified.

3. The fire place D, bed F, stack G, inclined passage H, with its openings *c c* and reservoir E, all constructed and arranged substantially as and for the purpose set forth.

4. The combination of the two fire-places D D, stacks G G, passages H H, beds F F, and the basin E, the whole being constructed and arranged substantially as specified.

3,179.—DON CARLOS MATTESON and TRUMAN PANE WILLIAMSON, Stockton, Cal.—*Plow*.—Patented March 12, 1868, No. 62,766; reissued November 3, 1868.

Claim.—The curved standard A, with the lug B and the offsets D and E substantially as and for the purpose described.

3,180.—JEFFERSON PARKER, Louisville, Ky.—*Machine for Slaughtering Hogs*.—Patented February 13, 1855, No. 12,395; reissued November 3, 1868.

Claim.—The combination of the shaft K, elevating fingers *d d*, scalding vessel A, and scraping bench B, for the purpose set forth.

3,181.—MICHAEL SWEENEY, JAMES E. MATHEWS, and THOMAS HARTLEY, Wheeling, W. Va.—*Glass Mold*.—Patented January 30, 1866, No. 52,338; reissued November 3, 1868.

Claim.—1. Molds, into which glass is to be pressed, made of hot-blast iron, and cast upon metallic chills, substantially as shown and described.

2. An enlargement, formed around the middle of the mold, in order to obtain the equalization of the heat in the mold while glass is being pressed therein, substantially as set forth.

3. The manner, substantially as above shown, of attaching handles to molds for glass.

3,182.—STEPHEN R. KROM, New York, N. Y.—*Machine for Separating Ores*.—Patented September 1, 1868; antedated August 5, 1868, No. 81,794; reissued November 3, 1868.

Claim.—1. Introducing the material upon the bed F in a thin stratum, close to the surface of the bed, substantially in the manner and for the purpose herein set forth.

2. Traversing the material across the perforated bed I, transversely to the length of the machine, that is to say, extending the bed I longitudinally of the length of the framework A, and causing the material to traverse across its narrowest dimensions, substantially as and for the purpose herein set forth.

3. In combination with a perforated separating bed, and a device for producing intermittent puffs to effect separation of the granular substance on the bed, a rotating or traveling delivery device, arranged to regulate the discharge from the passage which carries off the heavier grades or particles passed through the sifting or separating bed, substantially as specified.

4. So gearing or operating the device which effects separation by intermittent puffs, and the rotating or traveling device which regulates the discharge of sifted material, as that said devices are made to work at fixed relative velocities to each other during all variations in the general speed of the machine, essentially as and for the purpose or purposes herein set forth.

5. The roller L, arranged and operating as represented, relatively to the discharge passage J, for the purposes herein set forth.

6. The trip wheel C and lever F G, or their respective equivalents, arranged, relatively to the bellows D and to the perforated bed I and its connections, as and for the purposes herein set forth.

7. In combination with the perforated bed I and with means for introducing and removing the material, as specified, mounting the bellows D on a

rocking shaft, S, and operating it by an adjustable vibrating motion, substantially as and for the purposes herein specified.

8. The gates N and K, so arranged as to allow the separate or simultaneous changes in the thickness and velocity of the strata on the ore bed I, substantially as and for the purposes herein set forth.

9. In combination, the ore bed I, with its feeding and discharging devices, the adjustable oscillating bellows D, the trip wheel C and its connections, and the means, H H¹ H², or their equivalents, for varying the rate of discharge through the passage J, all arranged for joint operation, substantially as and for the purposes herein set forth.

10. The within-described arrangement of the operating parts C F and their connections, at the end of the main framework A, so that they may operate by a direct connection through the rocking shaft S with the bellows D, and that the closed end of the frame A shall form one entire side of an inclosing case to protect the working mechanism, all as and for the purposes herein set forth.

3,183.—ELISHA M. ALLEN, New York, N. Y. assignee of GILES B. WILLIAMS.—*Apparatus for Stirring, Mixing, Heating, Cooling, and Evaporating Lard and other Substances*.—Patented February 5, 1867, No. 61,907; reissued November 10, 1868.

Claim.—The continuous flange C, secured to the shaft B by arms *ax*, leaving an opening, *bx*, between the flange and shaft, in combination with a receptacle, A, whose bottom is curved concentrically with said shaft, substantially as described, for the purpose specified.

3,184.—LAFAYETTE LOUIS, Boston, Mass.—*Piano with Melodeon and Tremolo Attachment*. (Division A.)—Patented June 10, 1862, No. 35,523; reissued November 10, 1868.

Claim.—1. The arrangement of a melodeon-tube board (including reeds and swell) above the keys and below the sounding board of a piano forte, in the manner and for the purposes and substantially as described.

2. So combining and arranging a melodeon-tube board with a piano forte that the performer can instantly and at pleasure disconnect the melodeon-tube board from the piano-forte keys, in the manner substantially as herein set forth.

3. The combination of a tremolo attachment with the melodeon.

4. In combination with a piano forte, a melodeon having a connection of the bellows with the tube board by means of a tube.

3,185.—LAFAYETTE LOUIS, Boston, Mass.—*Wind Musical Instrument*. (Division B.)—Patented June 10, 1868, No. 35,523; extended November 10, 1868.

Claim.—1. In combination with a rotary tremolo valve a tremolo-actuating wheel, placed upon the tremolo-valve shaft, or directly connected therewith, so as to actuate the rotary tremolo valve, substantially as described.

2. In combination with a wind musical instrument, a rotary wind-actuated bellows, substantially as described.

3,186.—JOHN LOVATT, Newark, N. J.—*Skate*.—Patented May 29, 1860, No. 23,495; reissued November 10, 1868.

Claim.—1. The adjustable hooked clamps D D', or their equivalents, for fastening skates, arranged to be tightened and adjusted by means of an adjusting screw.

2. Constructing a skate, having a supporting plate, with a projecting piece or lug to prevent the boot from slipping forward, and clamp fastenings adjusted by means of an adjusting screw.

3. The combination of the movable slotted blocks E E', or their equivalents, with clamps D D', and the adjustable screw G, arranged substantially as described, and for the purposes specified.

3,187.—EDWARD S. WINCHESTER, Boston, Mass.—*Tip for the Feet of Chair Legs*.—Patented November 5, 1867, No. 70,490; reissued November 10, 1868.

Claim.—An elastic foot or tip of rubber, or other

material for the leg of a chair, having its means of attachment in an external rim made to embrace the lower portion of the leg or foot of a chair, substantially as described.

3,188.—COLBY BROTHERS & Co., Waterbury, Vt., assignees, by mesne assignment, of HARVEY MURCH.—*Mop-Head*.—Patented June 14, 1853, No. 9,781; extended seven years; reissued June 2, 1868, No. 2,957; again reissued November 10, 1868.

Claim.—1. The combination of a socketed cross head with a rigid binder, that is to say, one having rigid or inflexible ends connected directly to each other, substantially as and for the purposes specified.

2. The combination of a socketed cross head with a rigid binder, having its ends connected directly together, and a single fastening for holding the binder to the handle itself in such a position as to clamp rags, &c., substantially as and for the purposes set forth.

3. The combination of a socketed cross head, handle, and a metallic binder, having rigid or inflexible ends connected directly to each other, constructed and arranged in such manner that the rigid or inflexible ends will be allowed to move freely by a graduated movement up and down on or over the handle itself, or the socket thereon, and hold or aid in holding the cross head to the handle when the parts are in clamping position, substantially as set forth.

4. The combination of a metallic cross head with a handle and a rigid metallic binder, having inflexible ends connected directly with each other, constructed or arranged in such manner that the rigid or inflexible ends of the binder will be allowed to move freely up and down on the handle, or a metallic socket thereon, so as to hold or aid in holding the cross head to the handle when the parts are in clamping position, substantially as set forth.

5. The combination of a metallic cross head, socket, handle, and a metallic binder, having rigid or inflexible ends, connected directly together, the latter being constructed or arranged in such manner that the rigid or inflexible ends will be allowed to move freely up and down on or over the handle itself, or the socket thereon, and hold or aid in holding the cross head to the handle when the parts are in clamping position, substantially as set forth.

3,189.—WILLIAM GAGE, Buffalo, N. Y., and ANDREW WHITELEY, Springfield, Ohio, assignees of WILLIAM GAGE.—*Harvester*. (Division E.)—Patented September 16, 1856, No. 15,735; reissued November 10, 1868.

Claim.—1. The shoe M, or an equivalent thereof, which, when disconnected from the frame of the harvester, to which it is connected, leaves the finger bar of the cutting apparatus entirely disconnected from said frame, and which shoe has, in combination, the guide way *i*, the horizontal slot *k*, and the projections *ll*, fitted to receive the axial bolt *e*, or equivalents of these parts, for the purposes specified.

2. The combination of the shoe M, or an equivalent thereof, constructed with the guide way *i*, the horizontal slot *k*, and the projections *ll*, with the coupling frame F, or an equivalent thereof, which enables this shoe to be moved, in respect to the main frame and the plane of the cutter's driving wheel, substantially as first herein described for the purposes specified.

3. In combination with the main frame of the harvester and the shoe M, or an equivalent thereof, which is constructed with the guide way *i*, the horizontal slot *k*, and the projections *ll*, the coupling frame F, or an equivalent thereof, which has its inner end connected to said frame by the axis *g*, or an equivalent thereof, and its outer end connected to the shoe by the axis *e*, or an equivalent thereof, and having no other axis than these two between the main frame and shoe, for the purposes specified.

4. In combination with the main frame of a harvester, and with the shoe M, or an equivalent thereof, which is constructed with the guide way *i*, the horizontal slot *k*, and the projections *ll*, fitted to receive the axial bolt *e*, or equivalent of

these parts, the skeleton coupling frame F, or an equivalent thereof, which has its inner end connected to the main frame by the axis *g*, or an equivalent thereof, and its outer end connected to the shoe by the axis *e*, or an equivalent thereof, and having no other axis than these two between the main frame and this shoe, for the purposes specified.

5. In combination with the main frame of a harvester, and with the shoe M, or an equivalent thereof, which is constructed with the guide way *i*, the horizontal slot *k*, and the projections *ll*, fitted to receive the axial bolt *e*, or equivalents of these parts, the skeleton coupling frame F, or an equivalent thereof, made of separate parts, for the purposes specified.

3,190.—JACOB O. JOYCE, Dayton, Ohio.—*Rotary Pump*.—Patented March 23, 1858, No. 19,699; reissued November 10, 1868.

Claim.—1. The exit valve chamber I, when located wholly within the curved cylinder A, and held in place by beads or projections fitting annular grooves of the curved cylinder, substantially as and for the purposes specified.

2. The centrally located shaft or bearing B, arm D, and the two arms E, provided, at their ends, with pistons or plungers, in combination with the annular chamber A, provided with the centrally interposed valve chamber I, so arranged that they can be operated by suitable levers or shafts located outside of the cylinder, substantially as and for the purposes specified.

3,191.—WILLIAM M. JONES and D. W. HALL, Horicon, Wis., assignees, by mesne assignments, of W. M. JONES and S. E. TYLER.—*Seeding Machine*.—Patented August 12, 1862, No. 36,159; reissued November 10, 1868.

Claim.—1. The cylinder I, with buckets *k* attached, secured to a rotating and sliding or longitudinally adjustable shaft, E, in connection with the head J, and semi-cylinder K, provided with an opening, *l*, all being arranged within a suitable box, D, and in such relation to a seed box or hopper, C, as to operate in the manner and for the purpose substantially as described.

3. The curved plate or gate L, placed or fitted within the semi-cylinder K, connected to the cylinder I, and arranged in relation with the opening *l*, of said semi-cylinder K and the buckets *k*, to operate substantially as and for the purpose specified.

3. The arrangement of the clutch F, collar *e*, pinion *f*, and shaft E, substantially as shown and described, for the combined purpose of permitting said shaft to be thrown in and out of gear with the wheel B¹, and also permitting said shaft to be adjusted longitudinally when desired.

4. The combination and arrangement of the cylinder I with buckets *k* arranged to traverse through the disk or head J, for the purpose of increasing or diminishing the rate of feeding or the length of the buckets, substantially as described.

5. The collar *e* and pinion *f*, arranged, in relation to the hub plate N and clutch F, substantially as and for the purpose specified.

3,192.—LUKE TAYLOR, Springfield, Vt.—*Mop Head*.—Patented February 15, 1859, No. 22,990; reissued November 10, 1868.

Claim.—1. In a mop head in which the cross head or stationary jaw is attached permanently and immovably to the handle, operating the movable jaw or binder by means of a screw fitted to the handle, and having its screw thread on its exterior, in combination with a nut encompassing the screw, and connected with the movable jaw, so as to operate substantially in the manner as shown or described.

2. Operating the movable jaw by means of the loose screw collar C, revolving between the nut D and the handle A, substantially as described.

3,193.—JOHN W. COBB, Melrose, for himself, and EDWIN A. HILL, assignee of JOHN W. COBB, Quincy, Mass.—*Machine for Filling Cylindrical Molds for Rubber Goods*.—Patented June 18, 1867, No. 65,794; reissued November 17, 1868.

Claim.—1. The combination of a molding cylinder, M, and a grinding roller, R, substantially as described, and mechanism for revolving the two at different speeds, as and for the purpose explained.

2. The combination of the pressure roller S, the molding cylinder M, and a grinding roller R, substantially as described, and mechanism for revolving the molding cylinder and grinding roller at different speeds, as and for the purpose specified, the pressure roller having applied to it mechanism for revolving it at the same speed with the molding cylinder.

3,194.—HENRY G. REED, GEORGE BRABROOK, and HENRY H. FISH, (trading as "REED & BARTON,") Taunton, Mass., assignees of ERNEST KAUFFMAN.—*Ice Pitcher.*—Patented April 6, 1858, No. 19,855; reissued November 17, 1868.

Claim.—1. An ice pitcher having an attachable and removable lining, and a continuous or unbroken outer wall and bottom, when so constructed that the lining can be attached or removed through the top of the pitcher.

2. The ice pitcher, having the inner portion or lining B, fitted to the outer portion or casing A, with screw threads, or their equivalents, which make a tight joint, but provide for its ready removal and renewal, and replacement or renewal, as set forth.

3,195.—E. P. RUSSELL, (for himself,) and PORTER TREMAIN, (assignee of E. P. RUSSELL,) Maudsluius, N. Y.—*Mode of Lighting Street Gas Burners.*—Patented October 29, 1867, No. 70,272; reissued November 17, 1868.

Claim.—A small supplemental burner, A, to be kept burning constantly, and the pipe leading thereto, when operating in connection with a main burner, substantially as and for the purposes set forth.

3,196.—WILLIAM J. WILCOX, New York, N. Y.—*Machine for Stirring Lard.*—Patented January 20, 1863, No. 37,469; reissued November 17, 1868.

Claim.—1. The employment or use, for the purpose of stirring lard, of perforated or slotted dashers E E' attached to staves F F', which are secured to reciprocating rods or bars C C', moving in opposite directions, all constructed, combined, arranged, and operated substantially in the manner herein shown and described; and, also, the last above-mentioned parts, in combination with said tank, constructed, arranged, and operated substantially as above described.

2. The combination of two or more dashers, moving backward and forward in the tank, in opposite directions to each other, substantially as described and for the purpose set forth.

3,197.—WILLIAM M. JONES and D. W. HALL, Horicon, Wis., assignees by mesne assignments of W. M. JONES and S. E. TYLER.—*Seeding Machine.* (Division A.)—Patented August 12, 1862, No. 36,159; reissued November 17, 1868.

Claim.—1. The chamber or recess n' formed on the inside of the cap K, and located between the seed opening in front of the cap and the top of the cap, to allow the edges of the buckets or partitions to pass up under the cap without injuring the seed, substantially as described.

2. Forming and arranging the cap so that a space shall be left at the rear for the seed to begin to fall from the buckets as soon as they are turned far enough to cause the seed to roll or slide over their edges, substantially as described.

3,198.—WILLIAM A. KIRBY, Auburn, N. Y.—*Harvesting Machine.* (Division A.)—Patented September 2, 1856, No. 15,659; reissued March 15, 1859, No. 673; again reissued November 17, 1868.

Claim.—1. The combination of the single plate H with the main wheel, substantially as and for the purpose described.

2. The combination of the main wheel K, single plate H, and rim L, when connected together and operating in the manner and for the purpose set forth.

3. Placing a vibrating wheel on the outside of the main frame, or so that the outside of said frame does not bear on the outside of the wheel, in combination with the triangular-shaped frame on the inside of the wheel, substantially as described.

4. Hanging the seat to the plate H and to the standard S, in the manner and for the purpose set forth.

5. A hinged lever seat, and outside supporter therefor, in combination with a wheel having no outside frame or support, substantially as herein represented.

6. In a harvesting machine having no outside support to the driving wheel, attaching a support for the driver's seat to the outer end of the axle of said wheel, substantially as described.

7. In a harvesting machine having its frame in two parts, and hinged together around the box containing the pinion shaft at one point, the plate, segment, and holding mechanism at another point, for sustaining and holding the frame at any desired height, substantially as described.

3,199.—WILLIAM A. KIRBY, Auburn, N. Y.—*Harvesting Machine.* (Division B.)—Patented September 2, 1856, No. 15,659; reissued March 15, 1859, No. 673; again reissued November 17, 1868.

Claim.—1. In a harvesting machine, with its frame wholly on one side of the driving wheel, and the driving wheel having no outside support, a foot support for the driver on the side of the wheel opposite the frame, substantially as described.

2. In a harvesting machine with a frame wholly on one side of the driving wheel, and said driving wheel having no outside support, the making of the frame in two parts, one of which supports the driving wheel and a portion of the gearing, and the other part carries the other portion of the gearing, and forming a projection on one part of the frame around the pinion shaft, and a corresponding opening in the other part, which will pass over and around said projection, thus forming a joint, the center of which is coincident with the center of the pinion shaft, for the purpose of holding their gearing in position longitudinally, substantially as described.

3. In a harvesting machine having its frame in two parts, one of which supports the driving wheel and a portion of the gearing, and the other part carries the other part or portion of the gearing, and jointed together by the projection on one and the opening in the other, as described, the use of the lug, flange, or guide a on one part of the frame, and a corresponding recess, n, on the other part thereof, in which said lug, flange, or guide works, for the purpose of holding the two parts, with their gearing, in position laterally, so as to prevent motion to either side, substantially as described.

3,200.—JOSEPH MOORE, San Francisco, Cal.—*Frictional Pawl.*—Patented May 7, 1867, No. 64,554; reissued November 17, 1868.

Claim.—As an improvement in hoisting apparatus, a pulley, which shall be, on the one hand, under the control of a brake bearing upon its outer surface, and, on the other hand, connected with the shaft by the pawl and ratchet device, or its equivalent, within the pulley, substantially in the manner and for the purposes set forth.

3,201.—NARCISSE PIGEON, Brooklyn, N. Y.—*Manufacture of Starch Sugar.*—Patented April 23, 1867, No. 64,139; reissued November 17, 1868.

Claim.—1. The within-described process of manufacturing a pure sirup, and crystallizable sugar sirup, from prepared fecula, cellulose, or other similar matter, by freeing it from salts, empyreumatic oils, &c., substantially as described, and by treating the matter so as to convert the whole dextrine, cellulose, &c., into crystallizable sugar sirup, substantially in the manner above described.

2. The within-described process of manufacturing a hard crystallized sugar from fecula, or other similar substances, substantially as herein set forth.

3. The above-described part of my process, which consists in freeing the sirup of any acid, by the double neutralization, substantially in the manner above described.

3,202.—BENJ. B. SAVARY, Boston, and FREDERICK O. RAYMOND, Haverhill, Mass., assignees by mesne assignments of ISAAC F. A. A. LYNCH.—*Weather Strip for Doors and Windows.*—Patented September 19, 1865, No. 50,016; reissued November 17, 1868.

Claim.—1. A weather strip, composed of two strips or pieces of wood, and an interposed projecting strip of vulcanized rubber, or equivalent lasting material, united by tacks or otherwise, substantially as herein set forth.

2. The employment, with a weather strip of otherwise ordinary or suitable construction, of vulcanized rubber, held in and arranged to project from face of weather strip in contact with the door or other part to which said strip is affixed, substantially as and for the purposes herein set forth.

3. The improved weather strip, as made with the strip of elastic material or India-rubber *cc* to project in opposite directions from the two faces of the divided holder or molding *ab*, substantially in the manner shown and described.

4. The combination, with the elastic strip projecting from the rear face of the molding, as described, of the rebate *d* made in the molding, and arranged with relation to the said elastic strip substantially as specified.

3,203.—SAMUEL SHEPHERD and JOSEPH GREELEY, Nashua, N. H., assignees by mesne assignments of SAMUEL SHEPHERD and AMMI M. GEORGE.—*Machine for Polishing Enamelled Paper.*—Patented July 17, 1868, No. 56,457; reissued November 17, 1868.

Claim.—1. The combination of a rotary polishing device with an endless carrying device, moving at a lower velocity than the polishing device, and supporting table, bed, or ways to the carrying device, substantially as herein set forth, for the purpose specified.

2. The combination, with an endless carrying device to the paper or other material to be operated on, of a polishing device, arranged to reciprocate across the line or plane of feed, substantially as specified.

3. Providing an elastic bearing for the paper or material under the rotary polishing device, by making either the endless carrying device or support upon which it rests elastic, substantially as herein set forth.

4. Giving the rotary polishing device a reciprocating movement transversely to the feed, as produced by the endless carrying device, simultaneously with its rotary motion, substantially as herein set forth, for the purpose specified.

5. The pressing plate *T*, applied in relation with the rotary polishing device and endless carrying device, and support or ways to the latter, substantially as herein set forth, for the purpose specified.

3,204.—GEORGE ASMUS, New York, N. Y., assignee of F. W. LÜRMANN.—*Blast Furnace.*—Patented November 5, 1867, No. 70,447; reissued November 24, 1868.

Claim.—1. A blast furnace with a closed breast where the slag is discharged through an opening or openings cooled by water, substantially as set forth.

2. The slag discharge piece or cinder block *D*, constructed and arranged substantially as described.

3. The cinder block *D* in combination with the plate *C*, to which it is attached, substantially as described.

4. The shape of the discharge opening or openings of the cinder block *D* being made flaring at its ends, and of diminished diameter in the middle or central part, substantially as described.

5. The combining of the slag discharge piece or cinder block with a series of water channels or pipes, substantially as and for the purpose above set forth.

6. Combining with the metallic plate *C* a series of water channels or pipes, substantially as and for the purpose set forth.

7. The method of controlling the discharge of slag from blast furnaces by regulating the temperature of the slag discharge piece or cinder block, substantially as described.

3,205.—AZRO BUZZELL, West Fairlee, Vt.—*Carriage Spring.*—Patented September 15, 1868, No. 82,082; reissued November 24, 1868.

Claim.—The improved arrangement of the three springs *A B C*, as described, without any connection, extending from or about from the middle of one spring *B* to or about to that of the spring *C*, the whole being as shown in the drawings.

3,206.—LEWIS S. CHICHESTER, GEORGE H. NICHOLS, and CLARK W. MILLS, Brooklyn, N. Y., assignees by mesne assignments of FRANCIS TAGGART, LEWIS S. CHICHESTER, and CLARK W. MILLS.—*Grain Elevator.*—Patented June 27, 1865, No. 48,495; antedated June 12, 1865; reissued November 24, 1868.

Claim.—1. A floating elevator, formed by two vessels or floats, connected together, and leaving a space for a boat or barge, in combination with an elevating apparatus.

2. An elevator, *d*, fitted to be raised or lowered, in combination with the floats *aa*, and platform connecting said floats and supporting the elevator, substantially as set forth.

3. A grain elevator, fitted upon a float, and arranged so that the axis of the elevator drum is at right angles, or nearly so, to the float, in order that the elevator may act longitudinally of the vessel to be discharged, substantially as specified.

3,207.—BENJAMIN P. CRANDALL, New York, N. Y.—*Velocipede.*—Patented July 7, 1868, No. 79,553; reissued November 24, 1868.

Claim.—1. The combination, with the operating lever *J*, of a tubular support, *K R*, and the independent screw *L*, substantially as described.

2. As an improvement in the mode of operating the steering apparatus of velocipedes, the pivoted rods *E*, in combination with the yoke *F* and the steering wheels *D*, substantially as described.

3. As a new article of manufacture, the detachable cast metallic plates *N*, when applied to the spokes of the wheels, for the purpose described.

4. As an improvement in the patent granted to Crandall and Couover, dated April 2, 1861, the connecting rods *M*, bent at both ends, in combination with the wheels *B*, substantially as described.

3,208.—DUNCAN MCKENZIE, Brooklyn, N. Y.—*Wooden Pavement.*—Patented July 7, 1868, No. 79,674; reissued November 24, 1868.

Claim.—The wooden pavement, constructed, as described, of the blocks *A*, secured together by means of the beveled strips attached to the opposite sides of said blocks, so as to form either a single or double dovetail or lock, substantially as herein set forth.

3,209.—PAUL A. OLIVER, New York, N. Y.—*Machine for the Manufacture of Gunpowder.*—Patented April 7, 1868, No. 76,510; reissued November 24, 1868.

Claim.—1. In the manufacture of gunpowder, the employment of one or more pairs of rollers, substantially as herein described.

2. The combination with the said rollers of a pair of toothed rollers, substantially as herein described.

3. As an improved article of manufacture, a machine for making gunpowder, consisting of a series of rollers, operating substantially as described, so as to deliver the ingredients from one pair of rollers to the next pair, and so on, as herein set forth.

3,210.—J. H. THOMAS and P. P. MAST, Springfield, Ohio.—*Seed Planter.*—Patented July 27, 1868, No. 21,034; reissued November 24, 1868.

Claim.—1. The combination of a grass-seed sower with a grain seeder, in such a manner as to distribute the grass seed behind the tubes or hoes of the grain seeder, substantially as described.

2. The combination of the grain hopper *G* and the grass-seed hopper *H*, when constructed and arranged to operate substantially as and for the purpose set forth.

3. The combined hoppers *G* and *H*, having their ends, at each side of the machine, formed of a sin-

gle plate, substantially as and for the purposes herein described.

3,211.—CHARLES F. BROWN, Warren, R. I.—*Breech-loading Cannon.*—Patented September 18, 1868, No. 30,045; reissued November 24, 1868.

Claim.—1. Exploding the cartridge of a breech-loading fire arm by means of a reciprocating plunger held within the hollow breech pin, said plunger being detained by means of a lever, released by means of a cam actuating said lever, and forced forward by means of a spring held in the breech pin, substantially as set forth.

2. Locating and exploding a cartridge in a breech-loading fire-arm by the action of one rotating shaft, I, and by means of an eccentric, K, and cam *u*, mounted on said shaft, substantially as specified, the shaft being arranged transversely through the body of the gun, as set forth.

3. The arrangement and combination with each other of the barrel A, breech pin B, plunger C, spring *i*, lever L, cam *u*, eccentric K, and shaft I, all made and operating substantially as herein shown and described.

4. The wheel J, applied, in combination with the eccentric K, or its equivalent, for the purpose of producing the rotation of said eccentric to effect the firing of the ordnance during the motion of the gun carriage, as specified.

3,212.—J. H. GUILD, Rupert, Vt.—*Float Valve.*—Patented May 14, 1867, No. 64,663; reissued November 24, 1868.

Claim.—1. The arrangement of the fulcrum of the clamping lever *e* in such manner as that, on disconnecting the float from gear with said lever, the latter drops, to effect closure of the tube, substantially as shown and described.

2. The arrangement, in the perforated vessel A, of the float B, having the perforated or notched vertical rod *b* engaging with the pivoted oscillating lever *c*, connected by the link *d* to the lever *e*, pivoted to the opposite side of the vessel in such a manner that, as the float B is elevated by the water, the projection *f*, upon said lever *e*, presses against the elastic pipe C, effectually closing the same, substantially as described, and for the purpose specified.

3,213.—DANIEL STROCK, Chambersburg, Pa.—*Horse Rake.*—Patented September 11, 1860, No. 30,010; reissued November 24, 1868.

Claim.—1. The combination of the rake head and straining frame, when arranged and operating substantially as described, for the purpose set forth.

2. The employment of the rubber or other suitable springs L, adjustable rods *l*, tightening nuts *l'*, straps *l''*, and quadrant levers I, for holding the rake teeth, and regulating their tension, substantially as and for the purpose described.

3. The combination, with the rake head G and the rake teeth, of the quadrant levers I, substantially as and for the purpose described.

3,214.—JOTHAM S. CONANT, Haekensaek, N. J., assignee, by mesne assignments, of himself.—*Sewing Machine.*—Patented January 16, 1855, No. 12,233; reissued November 24, 1868.

Claim.—An endless rotary cloth feeder, substantially such as herein described, in combination with a reciprocating eye-pointed piercing needle.

3,215.—LUKE TAYLOR, Springfield, Vt.—*Mop Head.*—Patented February 15, 1859, No. 22,990; reissued November 10, 1868, No. 3,192; again reissued November 24, 1868.

Claim.—1. In a mop head in which the cross head or stationary jaw is attached permanently and immovably to the handle, operating the movable jaw or binder by means of a tubular screw or socket fitted on the handle, and having its screw thread on its exterior, in combination with a nut encircling the screw, and connected with the movable jaw, so as to operate substantially in the manner as shown or described.

2. Operating the movable jaw by means of the loose screw collar C, revolving between the nut D and the handle A, substantially as described.

3,216.—R. B. ANDERSON, Oneida, Ill.—*Mode of Securing Buckles and Rings to Harness.*—Patented June 23, 1868, No. 79,180; reissued December 1, 1868.

Claim.—Securing buckles, rings, and snap hooks to leather straps by means of a tapering metallic box, B, secured by pegs or teats, *a a*, or their equivalents, whereby the ends of the strap are inclosed, as specified.

3,217.—EICKEMEYER HAT-BLOCKING MACHINE COMPANY, Yonkers, N. Y., assignee of RUDOLPH EICKEMEYER.—*Machine for Stretching Hat Bodies.*—Patented February 23, 1865, No. 46,553; reissued December 1, 1868.

Claim.—1. In a machine for stretching hat bodies, a skeleton or ribbed and recessed former, substantially such as is herein described.

2. The combination and arrangement of the crown and tip supporting ribs with the upper series of stretching devices, substantially as described, operating to stretch the tip and side crown of the hat body between them, substantially in the manner hereinbefore set forth.

3. The combination and arrangement of the brim-supporting ribs with the lower series of stretching devices, substantially as described, operating to stretch the brim of the hat body between them, substantially in the manner set forth.

4. In combination with the supporting ribs of the skeleton former, the stretching devices, operating as hereinbefore set forth, to stretch the hat-body between them at one operation, as required for blocking, substantially as described.

5. The clamping ring, in combination with the ribs of the skeleton or ribbed former, operating to hold the hat body thereon during the operation of stretching, substantially as described.

6. The combination, in a machine for stretching hats, of the skeleton or ribbed and recessed former, a clamping ring, and a system of stretching arms or rollers, the whole combined and operating substantially as described.

7. Making the stretching devices for the tip or brim adjustable radially, with relation to each other, so as to vary the degree of stretching of either tip or brim, substantially as described.

3,218.—HENRY W. FULLER, Brooklyn, N. Y., assignee, by mesne assignments, of ISRAEL M. ROSE.—*Tuck-creasing Attachment for Sewing Machine.*—Patented September 22, 1868, No. 40,084; reissued December 1, 1868.

Claim.—1. The mechanism, substantially such as herein described, for forming a ridge or ridges on fabrics, to be afterward folded in the line of such ridges.

2. The method of nipping or pinching the fabric, to form ridges or creases thereon, as aforesaid, by means of jaws, opened and closed at intervals, to seize and pinch the fabric when at rest, and then release it as the same is moved along intermittently by a suitable feeding mechanism, as set forth.

3. The combination, with the jaws arranged as aforesaid, for action on a fabric, of a bed plate or plates to support the fabric, receiving and resisting the impingement of the jaw or jaws thereon, substantially as specified.

4. A pinching mechanism, substantially as set forth, and in which the jaws are brought down in contact with and made to impinge upon the fabric while yet open, and are closed by the resistance then offered to the further descent of the jaws, substantially as described.

5. The combination of the creasing device or devices of a tuck marker with a jointed lever, substantially as and for the purposes set forth.

6. A tuck-creasing mechanism, substantially such as described, having its upper and lower parts connected, and together adjustable, as to its relation with the needle of a sewing machine, and operated by the sewing machine, substantially as set forth.

7. The spring G, for carrying the upper half of the creasing device away from the cloth after each creasing action, when relieved by the needle arm, substantially as set forth.

8. The combination, with a tuck marker, having upper and under parts connected and together, ad-

justable as specified, of the lever and spring, substantially as and for the purposes set forth.

3,219.—ADAM R. ROSE, Phillipsburg, N. J., assignee of ANN MORGAN, administratrix of the estate of MIRICK MORGAN, deceased.—*Horse Rake*.—Patented August 24, 1858, No. 21,268; reissued December 1, 1868.

Claim.—1. In a two-wheeled wire-tooth hay rake, having a stationary axle, with teeth separately hinged, the combination of a spring to each tooth, to assist in holding it to the ground, and attached to the rake head by the same bolt which attaches the tooth, at a point between and within the periphery of the wheels, and a lever, operated by the driver while riding on the seat, for raising and lowering the teeth.

2. In combination with a two-wheel wire-tooth hay rake, the teeth of which are each separately and independently hinged against backward strain at a point between and within the periphery of the wheels, a device, operated by the attendant while riding on the seat, for raising the teeth, and stationary cleaner rods for holding the hay down in the upward movement of the teeth.

3. Hinging the teeth independently to cast-iron plates or heads, which are, in turn, connected to a common rocking head or shaft, operated by the attendant, for raising the teeth, while riding on the seat.

4. In combination with a two-wheel wire-tooth hay rake, having a stationary axle, with the teeth separately and independently hinged to a rake head or support which is hinged or pivoted between and within the periphery of the wheels, a device, operated by the attendant while riding on the seat, for raising the teeth out of the gathered hay.

5. In a two-wheeled wire-tooth hay rake, having a stationary axle, the combination of teeth hinged separately between and within the periphery of the wheels, and a stop to each tooth, to prevent it from falling below a certain point, and for holding it while being raised by the operator while riding on the seat.

6. The combination, in a two-wheeled wire-tooth hay rake with a stationary axle, of a support for the teeth, between and within the periphery of the wheels, that will admit of an upward and downward motion to each tooth, without the movement of the head that supports them against backward strain, and a stop for limiting its downward motion, and for enabling the attendant to raise the teeth from the ground by means of a device operated while riding on the seat.

7. Independently-hinged wire teeth, each provided with a sustaining-spring applied thereto, and united to the rake shaft or roller by a single screw bolt, in such manner that each tooth can be taken off by removing a single burr that holds it in place.

8. In combination with a two-wheel wire-tooth hay rake, the teeth being supported against their backward strain between and within the periphery of the wheels, a device, operated by the attendant while riding on his seat, for locking the teeth to the ground, so as to prevent the teeth from rising over the accumulated hay while in operation, and a device for cleaning the teeth of the gathered hay in their upward motion.

9. In combination with a two-wheel wire-tooth hay rake with stationary axle, having the teeth separately hinged to a rake head, between and within the periphery of the wheels, a hand lever, attached to said head, and operated by the attendant, for raising the teeth, while riding on the seat.

10. In combination with a two-wheel wire-tooth hay rake, the teeth being supported against their backward strain between and within a periphery of the wheels, a device, operated by the attendant while riding on the seat, for raising the teeth, with stationary cleaner rods, supported at the inner end only, for holding the hay down while the teeth have their upward movement.

11. Supporting the stationary elastic wire cleaner rods of a two-wheel wire-tooth hay rake, between and within the periphery of the wheels, for the purpose of holding the hay and straw down, with a

device for raising the teeth, operated by the attendant while riding on the seat.

3,220.—NATHAN H. SPAFFORD, Boston, Mass., assignee by mesne assignments of GEORGE EDWARD BURT.—*Machine for Cleaning and Assorting Bristles*. (Division A.)—Patented February 7, 1854, No. 10,498; extended seven years; reissued December 1, 1868.

Claim.—1. A machine for combing bristles, combining in its construction the following elements, viz., a comb, a clamp for holding the bristles while subjected to the action of the comb, and suitable mechanism for passing the comb through the bristles, and for combing the same, substantially as set forth.

2. In combination with the comb, a movable clamping apparatus, by which the bristles are brought into proper position to be acted upon by the combs.

3. The combination of the movable combs T and U with the clamping belts E and L, F and M, combined and operating substantially as described.

4. In combination with the dragging and conveying mechanism, the double brush belts, arranged to act as conveyers, substantially as set forth.

5. A machine for dragging and assorting bristles, combining in its construction the following groups of elements, viz., mechanism for combing the bristles, a conveying mechanism, for carrying the bristles after being subjected to the action of the comb, and mechanism for successively taking up the bristles of different lengths, substantially as described.

6. A conveyer so arranged as to clamp the bristles between two surfaces, for holding them in such a manner that one end of the bristles may project therefrom, in combination with an assorting mechanism, so arranged in relation thereto, that the bristles shall be separated and taken out successively, according to their lengths, substantially in the manner set forth.

7. The spring board p^1 , and hammer r^1 , combined and arranged to operate substantially in the manner and for the purpose specified.

8. The combination of the combs $u^2 v^2$, with the grooved delivering rollers, arranged to operate substantially in the manner and for the purpose specified.

3,221.—NATHAN H. SPAFFORD, Boston, Mass., assignee by mesne assignments of GEORGE EDWARD BURT.—*Machine for Cleaning and Assorting Bristles*. (Division B.)—Patented February 7, 1854, No. 10,498; extended seven years; reissued December 1, 1868.

Claim.—1. The method of applying combs or rakes by giving motion to the combing or raking apparatus, by means of the crank k , rocker shaft h , or their equivalents, so combined and operated as to give a curvilinear movement to the teeth, substantially as above described.

2. The staff g , carried near its center upon the rotating crank shaft k , and connected to the main frame, near one end of the staff, by any mechanism admitting both the rotating and back and forward motion, simultaneously, so constructed and arranged as to allow the crank to revolve freely and carry the combs or rake T upon the operating end of the staff g , all arranged and operating substantially as described and set forth.

3. The combination of the staff g , attached, as above described, at one end, to the frame C, the box 2, the crank k , and the comb or rake T, when combined to operate substantially as described.

4. Connecting the comb or rake T to the main frame with three movable junctions or joints, constructed and arranged to allow the staff to assume freely any angle caused by the revolutions of the crank, substantially as described and set forth.

5. The arm h , or its equivalent, when attached to the main frame, and so constructed and arranged as to hold in position the upper end of the staff g , and admit the staff to play freely in all the various angles of the same, caused by the revolutions of the crank k , substantially as described.

6. The combs or rakes T and U, composed of any number of teeth, and attached to staves actuated

by crank shafts, and held in position by mechanism so arranged that, by revolving the cranks, there shall be imparted to the forks a curvilinear motion, substantially as described.

7. The cranks *k* and *l*, in such relative position with each other that they will cause the combs or rakes that are attached to them to act alternately, substantially as described and set forth.

8. Supporting or sustaining the combs or rakes upon fulera which move in the arc of a circle, said rakes having also a rocking or back and forward motion upon said moving fulera, substantially as described and for the purpose set forth.

3,222.—THE BARRONS PATENT STEEL MANUFACTURING COMPANY, New York, N. Y., assignees of JOHN F. BOYNTON.—*Method of Converting Iron into Steel.*—Patented July 16, 1868, No. 66,785; reissued December 1, 1868.

Claim.—1. In carrying the above-described method into effect, the use of gas surcharged with carbon by being passed through a carbonizing vessel, as above described, and mixing or combining the gas so produced with hydrocarbon vapors, by any known means of producing that result.

2. In carrying the above-described method into effect, the use of other gases hereinbefore mentioned, when charged with hydrocarbon vapors.

3. In carrying the above-described method into effect, the use of atmospheric air charged with hydrocarbon vapors, by any known means of producing that result.

4. In carrying the above-described method into effect, the heating of heavy hydrocarbons, to cause their vapors more readily to mix or combine with the gases or air, and be carried forward therewith.

5. Melting iron or the nitro-carbonized compound, after it has been converted into steel by the above-described method, and thereby converting it into cast steel, as described.

6. In carrying the above-described method into effect, the use of hydrocarbon vapors without admixture with gas or air, as and for the purpose set forth.

7. In carrying into effect the method, herein described, of converting iron into steel, coating a portion of any piece of iron with a wash, as described, to prevent the portion so coated from being converted into steel.

8. Converting the oxides of iron directly into steel by one heating, by passing carburated or carbonized hydrogen gas over and through the same when in a highly-heated state, according to the method or process herein described.

3,223.—MATTHEW H. FOSTER and HUBERT C. HART, Unionville, Conn.—*Machine for Making Nuts.*—Patented May 5, 1868, No. 77,476; reissued December 8, 1868.

Claim.—1. The combination of the sliding bed B with the mechanism for cutting, the mechanism for forming, and the mechanism for punching and swaging, substantially as described.

2. The arrangement of the formers *f f'*, the blocks *k' k3*, the set *t*, the die *x*, and the punch *p*, constructed and operated as herein described.

3. The peculiar arrangement of the ears *a b c d e s s' s'' F*, by which the several parts of the machine are made to operate at the proper time, substantially as herein set forth.

4. The improved nut machine, consisting of mechanism constructed, combined, and arranged substantially as herein set forth.

3,224.—FRANCIS BOYLSTON, New York, N. Y.—*Children's Carriage.*—Patented October 6, 1868, No. 82,683; reissued December 8, 1868.

Claim.—1. The combination and arrangement of the fixed axle A, having two revolving wheels thereon, and sills or supports B B, when the same are attached to the front part of a children's carriage or perambulator, substantially in the manner herein shown and set forth.

2. Attaching the fixed axle A to the supports B B by means of the brackets C C, and secured by the screws *a a*, or their equivalents, the whole of the parts being made and combined with a children's

carriage or perambulator, substantially in the manner herein shown and described.

3. The combination and arrangement of the fixed axle A, having thereon two loose wheels D D, brackets C C, and sills or supports B B, the whole being made and combined, with relation to each other and to a children's carriage or perambulator, substantially as and in the manner herein shown and set forth.

3,225.—EDMON L. MIX, Rochester, N. Y., and the MONUMENTAL AUTOMATIC GAS MACHINE COMPANY, Baltimore, Md., assignees by mesne assignments of HUGH L. McAVOY.—*Apparatus for Carbureting Air.*—Patented February 7, 1865, No. 46,302; reissued December 8, 1868.

Claim.—1. An apparatus for manufacturing air gas and enriching other gas, in which the carbonaceous matter is inclosed within an air-forcing apparatus, consisting of a gravitating air holder and water receptacle, substantially as described.

2. Manufacturing air gas by the described mode of using a holder C to contain air, receive the carbonaceous matter as it rises from the oil in the form of vapor, and force the gas into a pipe, wherein it is conducted off, as explained.

3. The plate E², employed in connection with the pan E, to cause the air to pass to the pipe B, in contact with the oil, and in a state of compressure, substantially as described.

4. The sealing device, consisting of the eup F, cylinders G G', and a body of liquid between the latter, substantially as described.

5. An apparatus for carbureting air, in which the vessel holding the hydrocarbon liquid is contained within the gasometer, in contact with the water in the cistern thereof, substantially as and for the purposes set forth.

3,226.—ISAAC E. PALMER, Hackensack, N. J.—*Tackle Block.*—Patented November 1, 1859, No. 25,978; reissued September 1863, No. 1,534; again reissued April 11, 1865, No. 1,932; and again reissued December 8, 1868.

Claim.—The construction of a tackle block and pulley, whereby the rope or fall, when desired, may be clamped between a portion of the pulley and a portion of, or surface connected with, the block, substantially as herein described, by simply leading it in a direction oblique or lateral to the plane of revolution of the pulley, without tying, or the use of dogs or movable stops, or any other means of fastening.

3,227.—WINCHESTER ARMS COMPANY, New Haven, Conn., assignees by mesne assignments of B. TYLER HENRY, same place.—*Magazine Fire-arm.*—Patented October 16, 1860, No. 30,446; reissued December 8, 1868.

Claim.—1. In combination with the hollow breech pin, the spring catch *m*, on the breech pin, and the piston, arranged for central or rim fire, or both, substantially as and for the purpose set forth.

2. In combination with the carrier block E and the spring catch *m*, placed on top of the breech pin L, the so forming of the top of the said carrier block, near the rear end, as shown at *d²*, Fig. 4, as to strike the cartridge forward of the center, and thus raising the forward end of the cartridge, while the rear end is held down by the spring catch, tripping it over and freeing it from the spring, and ejecting it from the gun, substantially as described.

3,228.—HENRY BETTS, Norwalk, Conn.—*Manufacture of Paper Stock.*—Patented August 1, 1865, No. 49,069; reissued December 15, 1868.

Claim.—The application of the fibers of the stalks, and also of the root of the plant, known as sedge, to the manufacture of fine white or colored paper, whether the same be used in combination with other ingredients, or separate, as herein set forth.

3,229.—CHARLES CLAPP, Ithaca, N. Y., assignee of CALVIN COLE, same place.—*Sash Stop.*—Patented May 7, 1867, No. 64,492; reissued December 15, 1868.

Claim.—1. The combination of the friction wheel

b, having a limited sliding movement, with the friction bearing or surface *c* and the sustaining cord *d* and tension plate *e*, substantially as herein described, for the purpose specified.

2. The combination of the friction wheel *b*, sustaining cord *d*, and tension plate *e*, substantially as set forth.

3. The combination and arrangement of the case *a*, containing the friction surface *c* and wheel *b*, and the cord *d*, fast at one of its ends to the window frame and the plate *e*, with the device for varying its tension at the other, as shown and described.

3,230.—MAURICE FITZGIBBONS, New York, N. Y.—*Material for the Manufacture of Boxes and other Articles.*—Patented November 3, 1868, No. 83,770; reissued December 15, 1868.

Claim.—A fabric composed of external laminae of wood and an intermediate flexible fabric, substantially as described.

3,231.—JOHN MAYS and ELIPHALET W. BLISS, Brooklyn, N. Y.—*Die Press.*—Patented January 28, 1868, No. 73,823; reissued December 15, 1868.

Claim.—1. So arranging the mandrel or slide, in combination with adjustable gibs, that either end of the mandrel can be separately adjusted in every direction, substantially as set forth.

2. The solid boxes *E E*, each holding and guiding one end of the mandrel, in combination with the sliding head *D* and the gibs *a a*, substantially as described.

3. The arrangement of the lever *I* between the boxes *E E*, in combination with the mandrel, substantially as set forth.

3,232.—JOHN B. STONER, LEOPOLD MENDELSON, and THEODORE CROMMELIN, New York, N. Y., assignees of JOHN B. STONER.—*Life-preserving Apparatus.*—Patented February 4, 1868, No. 74,168; reissued December 15, 1868.

Claim.—1. A life-preserving apparatus, consisting of a swimming suit and a floating provision chest, substantially as described.

2. An elastic tubular head band, applied to the head dress of a swimming suit, substantially in the manner described.

3. Providing a water-proof suit with a chin flap *C*, substantially as described.

4. The combination of head bands *B D E F*, and elastic cuffs *a'*, with a water-proof flexible suit of the description herein set forth, and made in one piece, with openings for the face and hands, substantially as described.

5. The combination of arm propellers *M*, or their equivalents, a float *I*, ballasting shoes *K*, and a water-proof covering *A*, constructed substantially as described, for the purpose set forth.

6. The flexible propellers *M*, adapted for being applied to the arms, and constructed substantially as described.

7. The hinged ballasting shoes *K*, when constructed and arranged substantially as described.

3,233.—ROBERT POOLE, Baltimore, Md.—*Machine for Rubbing and Mixing Paints, Chemicals, Fertilizers, &c.*—Patented May 28, 1867, No. 65,268; reissued December 15, 1868.

Claim.—1. A pan or other suitable holding vessel, revolving around its support, and a series of rubbers or mixers in said pan or other vessel revolving around their, and a different central support, so that the combined movements of the receptacle, and of the rubbers or mixers, shall be in lines substantially such as shown and represented, and for the purpose specified.

2. In combination with the revolving pan or other vessel, and rubbers or mixers, a scraper or guide, for removing the material operated upon out of the path of the rubbers or mixers, when desired, substantially as described.

3. In combination with the revolving pan or other vessel, and the revolving rubbers or mixers, and guide or scraper, a discharge opening for removing the substance from the pan, by simply drawing the plug and continuing the motion of the machine, substantially as described.

3,234.—A. E. TAYLOR, New Britain, Conn.—*Bell Attachment.*—Patented October 23, 1860, No. 30,509; reissued December 15, 1868.

Claim.—1. The combination of the bell, bell hammer, handle, turning shaft, and cam pin, substantially as before set forth.

2. The combination of the bell handle, turning shaft, cam pin, or stud *j*, one or more, forked lever, and hammer-lever arms projecting in opposite directions from their fulcra, substantially as before set forth.

3,235.—JOHN L. WHITING, Boston, Mass.—*Brush.*—Patented August 4, 1863, No. 39,439; reissued December 15, 1868.

Claim.—1. The wedge as forming a part of or being in connection with the handle, as set forth.

2. The wedge and handle thus combined and constructed with the shoulder, the whole being substantially as specified.

3,236.—HOLLAND C. BABCOCK, Cincinnati, Ohio, assignor to himself and MARSHALL JEWELL, Hartford, Conn.—*Belt Lacing.*—Patented November 12, 1867, No. 70,775; reissued December 22, 1868.

Claim.—1. Belt lacings with a hardened or metallic tip or point, as a new article of manufacture.

2. As a new manufacture or commodity, belt thongs in coil or package, substantially as described.

3,237.—FRIEDRICH EDWARD HOFFMANN, Berlin, Prussia.—*Circular Kiln.*—Patented June 13, 1865, No. 48,244; reissued December 22, 1868.

Claim.—1. The continuous kiln or gallery *A*, made in sections 1, 2, 3, &c., the several sections having separate communication with the main smoke flue *D*, in combination with the movable partition *B*, fitted to go between the adjoining sections, substantially as and for the purpose described.

2. The combination of the continuous gallery *A*, composed of successive chambers or sections 1, 2, 3, &c., the flues *C* and dampers *f*, the main flue *D*, the movable partition *B*, and the fuel-supply apertures *b* in the top of the kiln, substantially as described and shown.

3. The cavities or depressions *e* in the bottoms of the kiln chambers or sections 1, 2, 3, &c., in combination with the fuel-supply apertures *b*, substantially as described.

3,238.—AMASA C. KASSON and NELSON C. GRIDLEY, Milwaukee, Wis., assignees of A. C. KASSON.—*Tea and Coffee Pot.*—Patented April 23, 1868, No. 77,291; reissued December 22, 1868.

Claim.—1. A tea or coffee pot, when made with two chambers—one for the tea or coffee, and the other for water for generating steam, substantially as described.

2. A tea or coffee pot, so arranged that the heat shall be communicated to the tea or coffee by means of steam, substantially as described.

3. A tea or coffee pot, so arranged that the tea or coffee shall be steeped or cooked without boiling, filtering, and evaporation by means of the heat of steam, substantially as described.

4. A tea or coffee pot, consisting of an upper chamber for the tea or coffee, and a lower chamber *B* for water for generating steam, with an outer central tube *C* attached, and cover *D* with tube *E*, whistle *F*, and hood *I*, all constructed and arranged substantially as described.

5. In combination with the water and steam chamber *B* and central tube *C*, the cover *D*, with hood *I* and tube *E*, when constructed and arranged substantially as herein described.

6. The cover *D* with the tube *E* and conical deflecting tube or hood *I*, attached substantially as described.

3,239.—OSBORNE MACDANIEL, New York, N. Y.—*Process for Cleaning Wool and other Fibers.* (Division A.)—Patented November 19, 1867, No. 71,191; reissued December 22, 1868.

Claim.—1. The employment and use of petroleum benzole and naphtha, or either of them, for the purpose of cleaning wool or other fibrous substance, substantially as herein described.

2. The combination of a steam-tight washing

machine, A, with a still, C, and a condensing coil, F, constructed, arranged, and operating substantially as and for the purposes herein described

3,240.—OSBORNE MACDANIEL, New York, N. Y.—*Process for Cleaning Woolen and other Fabrics.* (Division B.)—Patented November 19, 1867, No. 71,191; reissued December 22, 1868.

Claim.—The employment and use of petroleum benzole and naphtha, or either of them, for the purpose of cleaning woolen and other fabrics, substantially as herein described.

3,241.—JACOB G. REIFF, Lancaster, Pa.—*Carriage Spring.*—Patented October 8, 1867, No. 69,588; reissued December 22, 1868.

Claim.—Elliptic and other similar springs, when constructed and arranged as described, for the purpose set forth; that is, when the number of leaves or plates is increased and their thickness diminished, for the purpose of gaining greater elasticity under the same weight, substantially in the manner described, for the purpose set forth.

3,242.—MARK L. ROBERTS, Mount Union, Ohio.—*Knitting Machine.*—Patented February 12, 1864, No. 31,404; reissued December 22, 1868.

Claim.—1. The vertically-sliding presser G and cylindrical needle carrier B, when combined and arranged so that the presser works in contact with the front face of the cylindrical carrier, substantially as and for the purpose described.

2. In combination with the above, and the reciprocating carrier D, the spring-looped needles C, when provided with the right-angled supporting and carrying shank *k*, substantially as and for the purpose described.

3,243.—T. B. STEWART, Wethersfield, Conn.—*Railroad Car Axle Box.*—Patented November 19, 1867, No. 71,241; reissued December 22, 1868.

Claim.—1. The combination and arrangement of the oblong tube B on the box, and the tube C on the wheel, with or without the flanges *a* and *b*, substantially as shown and described.

2. The crescent-shaped saddles *f*, having tenons *g g g* upon their outer surfaces, and cavities *h h h* on their inner surfaces, arranged substantially as shown.

3,244.—ROBERT BAXTER, French Camp, Cal.—*Gang Plow.*—Patented August 6, 1867, No. 67,483; reissued December 29, 1868.

Claim.—A standard for the support of the mold board, or other like part of a plow, formed in one piece with a projecting head, for the attachment of the beam, substantially as described.

3,245.—FRANCIS E. BOYD and P. SHELTON TYLER, Boston, Mass.—*Breech-loading Fire-arm.*—Patented January 21, 1868, No. 73,494; reissued December 29, 1868.

Claim.—1. A breech piece, having lips upon its upper part, in combination with elamps attached to the barrels, and projecting backward over the breech piece, substantially as and for the purpose specified.

2. The combination of the elamps *g g*, whether attached to the barrels or breech piece, and the curved and cam projections on which they clamp, with the bearing plate *d* and plate or disk *e*, constructed and operating substantially as and for the purpose set forth.

3. Two elamps, *g g*, whether attached to the barrels or breech piece, in combination with two cam projections, on which they clamp, and with two barrels, arranged to turn upon a suitable spindle, the whole being arranged so that the barrels can be thrown either to the right or to the left, all substantially as described.

4. The plate or washer *e*, formed as described, and attached to the spindle *e*, in combination with the raised or cam-shaped surface of the bearing plate *d*, as set forth.

3,246.—GEORGE CROMPTON, Worcester, Mass., assignee by mesne assignments of JOHN SHINN.—

Loom.—Patented April 30, 1861, No. 32,236; reissued December 29, 1868.

Claim.—1. The combination of the following elements, viz., heddle leaves, cords, pulleys, blades or rods, and jacks, or pieces capable of motion in two directions, the combination being substantially as described.

2. The combination of the following elements, viz., heddle leaves, cords, pulleys, rods or blades, jacks, and a pattern mechanism, the combination being substantially such as specified.

3. In combination with a depresser, having an oscillating and sliding motion, and positively depressing leaves of heddles, an elevator, elevating leaves of heddles, and having also an oscillating and sliding motion, the combination being substantially such as set forth.

4. The relative arrangement of leaves of heddles within a loom frame, as described, and elevators and depressers, having the characteristic motions specified, at one side of the loom frame, the arrangement being substantially such as described.

5. An elevator and a depresser, both having the characteristic motions specified, in combination with jacks, the depresser, and elevator, and jacks operating as specified, so that the jacks are either positively depressed or lifted by the motion of the lifter and depresser, the combination being as described.

6. A double-throw crank, or two cranks on the same revolving shaft, in combination with a lifter and depresser having characteristic motions, as specified, by means of connecting rods, the combination being substantially as described.

7. A depresser having characteristic motions, as specified, in combination with a row or series of jacks, when the acting part of the depresser is an edge, or long narrow surface, and all the jacks are so arranged that they may be acted upon by that surface, the jacks having motion derived from the pattern chain, in planes perpendicular, or nearly so, to that plane in which the depresser moves, the combination being substantially as described.

8. An elevator, having characteristic motions, as specified, in combination with a row or series of jacks, when the jacks are so arranged that their motions, derived from the pattern chain, are in planes perpendicular, or nearly so, to that in which the elevator moves, the combination being substantially as described.

9. Jacks with upper and lower edges, one suitable to be acted upon by an elevator, and the other by a depresser, so shaped, and pivoted upon blades, substantially as described, that their inclined projecting edges shall move the needles backward, as specified.

3,247.—JOEL F. FALES, Walpole, Mass.—*Machine for Sewing Carpet Linings.*—Patented February 11, 1868, No. 74,328; reissued December 29, 1868.

Claim.—1. The combination, with the mechanism for moving the material forward continuously, of a reciprocating swinging frame H, carrying the sewing mechanism, the needle entering and moving forward with the fabric, and moving back over the fabric when out, substantially as set forth.

2. The swinging frame H, carrying the sewing mechanism, when operating in connection with the bed plate *i*, and with a continuous feeding mechanism for the fabric, substantially as specified.

3. The yielding presser feet O O, arranged in the swinging reciprocating frame H, and operating substantially as herein shown and described.

4. The combination of the guide rolls B B², smoothing plate H', a sewing mechanism, and feed-rolls C C', all arranged and operating substantially as set forth.

5. In combination with a carpet-lining machine, constructed as described, the sewing devices, smoothing plate H, wheels E F, and hammer *d*, all arranged and operating as described, for the purpose specified.

3,248.—AUGUSTA P. STILES, Rochester, N. Y., assignee by mesne assignments of DAVID L. STILES.—*Cooking Stove.*—Patented February 24, 1863, No. 37,778; reissued December 29, 1868.

Claim.—1. The flue plates *b b* and *d d*, conjointly at

the bottom, but diverging toward the outer corners at the top of the oven, so that the heated air and products of combustion, in equal columns, are concentrated at those corners as it rises, in combination with the interior flue plates *ff* and movable division plates *b b*, in elevated oven stoves, for the purpose of equalizing the heat throughout the same, substantially as set forth.

2. Introducing air into the oven is not broadly claimed, nor is an air-heating chamber, but the arrangement, with reference to the fire chamber *A* and flue space *C*, of an air-heating chamber or chambers, *m*, directly back of said fire space, and underlying the flue space *C*, and connected by the tubes *i k*, or equivalent, with the bottom of the oven, substantially as and for the purposes herein set forth.

3. In combination with the chamber or chambers *m*, and elevated oven *B*, the upright internal tube *i*, and external pendent thimble *k*, attached respectively to the top plate of the chamber and bottom plate of the oven, and forming a communication between the same, substantially as and for the purposes set forth.

3,249.—THE FIRST NATIONAL REFINED IRON AND STEEL MANUFACTURING COMPANY, New York,

N. Y., assignee of JOHN ABSTERDAM, same place. —*Process for Refining Iron and Steel.*—Patented January 23, 1866, No. 52,121; reissued December 29, 1868.

Claim.—1. The within-described process of manufacturing iron and steel, by creating and maintaining a vacuum or partial vacuum within the interior of a furnace or pot containing melted iron or steel, substantially as set forth.

2. Fusing the metal and supplying the air for the combustion of the fuel, by a current or currents of air, produced by creating and maintaining a vacuum or partial vacuum within the furnace, pot, or retort containing the metal.

3. Vaporizing, dilating, or burning up the impurities and carbon contained in the metal, by means of a current or currents of air, produced by the creation and maintenance of a vacuum or partial vacuum within the furnace, pot, or retort containing the metal to be fused.

4. The conversion of molten crude iron or of remelted pig or finery iron into steel or into malleable iron, by means of current or currents of air, produced by creating and maintaining a vacuum or partial vacuum in the interior of the furnace, pot, or retort containing said melted metal.
