3. The transverse bar *i* on the spindle C, in combination with the inclined planes *m m*, substantially as and for the purposes set forth.

80,174.—WILLIAM H. HENDERSON, West Point, assignor to WILLIAM H. SNIDER, Lena, Ill.—*Churn.*—July 21, 1868.—Hinged leaves are made to oscillate on a horizontal axis, and are provided with perforations on their outer edges for the escape of air, which enters below the leaves on the upward stroke of the dasher, and is forced through the cream on the downward stroke.

Claim.—The combination of the vertically reciprocating cross head F, and end boards *f*, with the oscillating perforated dasher leaves and stops *g'*, all these parts being constructed, arranged, and operating as described.

80,175.—S. B. HILES and J. A. DANNER, Saltville, Ind.—*Straw Cutter.*—July 21, 1868.—As

the frame which holds the cutters is raised and lowered, the rake is caused at the same time to drag the straw forward to the cutters.

Claim.—The combination of the obliquely-placed serrated knives E E in the sliding frame D, with the horizontal stationary knife I, in the frame A, and the rake F, all constructed and operating as shown and described.

80,176.—PHILIP HINKLE, San Francisco, Cal.—*Bed Bottom.*—July 21, 1868.—Each slat is attached at its end by a hook to an elastic band secured to the end frames. A bridge or truss under the center of each slat rests on an elastic connection between two supporting wires.

Claim.—The combination of the rod *m* in the recess, bands *l* and *k*, suspenders *j*, bridge *b*, wires *h*, and slats *e*, as herein set forth.

80,177.—FRANKLIN G. HOLLAND, Washington, D. C.—*Metallic Paint.*—July 21, 1868; antedated July 8, 1868.—The ingredients consist of hydraulic cement, poco metallic paint, gum asphaltum, and Japan varnish, mixed in boiled linseed oil.

Claim.—The combination of the within-named ingredients, mixed in the several proportions as herein described, and for the purposes set forth.

80,178.—FRANKLIN HOYT and AARON DENIO, Moutpelier, Vt.—*Water Wheel.*—July 21, 1868.—The inlet and outlet chutes are applied to the periphery of the wheel in reversed positions; the portion between the two chutes being nearly in contact with the wheel. Vent holes, with a regulating cover, admit air to, or free the same from, the buckets.

Claim.—The adjustable inlet chute B and the extended outlet chute C, provided with regulating vents *k g*, and arranged in relation to each other and to the wheel A, substantially as described, for the purpose specified.

80,179.—CHARLES E. L. HOLMES, Waterbury, Conn.—*Machine for Drying and Scouring Sheet Metal.*—July 21, 1868.—A series of rollers, covered with some elastic or fibrous material for holding sand, is so arranged as to pass the sheet metal alternately above and below a roller. A vibrating motion is given to two of the under rollers by connecting rods attached to crank pins peculiarly arranged on pulleys. A pivoted brush is made to reciprocate across the under surface of the sheet metal.

Claim.—1. The arrangement, in a machine for grinding, scouring, and drying sheet metal, of the rollers *f h*, revolving in a direction opposite to the direction of the passing sheet metal being operated upon, and rollers *g i*, having a vibratory motion, and all the rollers acting upon the surface of the metal while in a curved position, substantially in the manner described.

2. Operating the reciprocating brush *l* by means of the lever *m*, cord 13, spring 14, and pivoted lever *l*, substantially in the manner and for the purpose set forth.

80,180.—WILLIAM HORROCKS, Poughkeepsie, N. Y.—*Mode of Attaching Carriage Tops.*—July 21, 1868.—The slat irons are each secured to the body or rail of a carriage by a separate pin or pivot, instead of by one common pivot, as in the usual manner.

Claim.—Securing the slat irons of a carriage top to the supporting pin A by means of the separate pivots *a a*, formed upon either of the disks *b c*, which fit over the pin A, both disks being clamped together upon the slat irons by means of the nut *d*, as herein described, for the purpose specified.

80,181.—SAMUEL HOWARD, Luton, United Kingdom of Great Britain and Ireland.—*Machine for Pressing Hats.*—July 21, 1868.—When pressure is required in the bag or diaphragm to press the hat or bonnet body, a tap, between the bag and upper cistern, is opened, and the downward pressure of the water rapidly fills the bag. To increase the pressure to the required extent, this tap is closed and water is injected from the lower cistern, and at the same time a second small pump is actuated by the same lever, forcing the same amount of water

which was discharged from the bag into the upper cistern, thus dispensing with the usual air vessel or reservoir.

Claim.—The pump *h*, acting directly upon the diaphragm *g* of the dome *e*, and pump *l*, which fills the cistern *a*, in combination with cisterns *a b*, and their connecting pipes, the whole being arranged in the manner and for the purpose described.

80,182.—DANIEL W. HURST, Petersburg, Pa.—*Fly Net for Horses.*—July 21, 1868.

Claim.—Connecting the ribs of a fly net by lashes, each of which passes twice through one hole in each of the ribs, and forms two loops on the central rib, and one on each of the others, substantially as described.

80,183.—GEORGE JELLEY, Roxbury, assignor to CHARLES W. GRIFFITHS, Boston, Mass.—*Knitted Fabric.*—July 21, 1868.—Each of the ground yarns is run in a zigzag across three others of snel ground yarns. At each angle of the zigzag there is a loop in the yarn.

Claim.—The arrangement and combination of the series of ground yarns, *a b c*, and the series of stripe yarns, *e e e*, in the manner substantially as described, so as to produce a knit fabric, on which the stripe yarns will appear on one side of the fabric, in right line parallel ranges, as set forth.

80,184.—AUGUR JUDSON, Newark, N. J.—*Sleeping Berth for Railroad Car.*—July 21, 1868.—A series of devices for suspending upper berths from the roof, so that they can be readily let down, lifted up, and locked in place.

Claim.—1. The combination, with the lower plate *M* and its guide, of the upper plate and its guide, substantially in the manner and for the purpose herein described.

2. The combination, with the berths, of the fixed hanging pieces *F*, having an opening, *f*, to receive the bolts which lock the berths to place.

3. The arrangement, substantially as described, of windlass, cords, and pulleys, in combination with the berths, whereby the latter may be raised and lowered.

4. The arrangement, substantially as described, of springs within the berths, when supported and held in position by the plates *C C* and *M M*.

5. The combination, with a car berth, of a folding case or closet, substantially as and for the purpose set forth.

6. The combination, with a car berth, of a hinged or pivoted curtain frame, and self-acting springs or catches to hold it in position for use, substantially as set forth.

80,185.—WILLIAM KEIL, Hastings, Minn.—*Game Table.*—July 21, 1868.—A central hollow stud is provided with a plunger, operated by levers, arranged radially in the table. A ball, placed on the said stud, is knocked off by the action of any one of the levers, and rolls down into a sectional groove, being deflected by pins in the table. Balls are also placed on the said pins to be knocked off by that from the central stud.

Claim.—The improved game table herein described, when constructed and arranged substantially as and for the purpose set forth.

80,186.—WILLIAM KENNEDY, New London, Pa.—*Water Wheel.*—July 21, 1868.—The upper rim is curved inwardly toward the axis, from the top downward, so as to contract its diameter at the bottom, and make it considerably less than the top diameter of the lower rim, in order that the water from both sets of buckets may be discharged downward.

Claim.—The above-described water wheel, having an upper and lower rim, and two sets of buckets, arranged in relation to each other substantially as described.

80,187.—WILLIAM KNOWLES, Roekville, Ind.—*Shawl Pin.*—July 21, 1868.—Three arms are united at the center by a band, and form sharpened hooks at each end.

Claim.—A shawl pin, constructed of the bent

arms *A*, *B*, and *C*, attached to the band *D*, substantially as described.

80,188.—ISRAEL LANCASTER, Baltimore, Md.—*Harvester Rake.*—July 21, 1868.—The invention relates to a side-delivery harvester rake, applied to the platform of a reaping machine, and which discharges the grain in gavels suitable for binding. Motion is communicated from the driving wheel to the rake in such a manner as to regulate its speed to snit heavy or light grain.

Claim.—1. The spring *O*, rake head *m*, pin *n*, and strip *T*, acting in combination, when used to regulate the movement of the rake head when passing over the cutter bar, and when constructed and operating substantially as described.

2. The arm *g*, provided with the pin *h*, in combination with the pin *k* and block *i*, which supports the rake *m*, constructed and operating substantially as described and for the purpose mentioned.

3. The arm *g* provided with the pin *h*, the block *i* provided with the pin *k*, and the guide bar *S*, acting in combination, when used to effect the purpose mentioned, and when constructed substantially as described.

80,189.—JOHN LANE, Chicago, Ill.—*Plow.*—July 21, 1868; antedated March 31, 1868.—The point of the share is so constructed as to be capable of being renewed at small expense, and the share, landside, and point are secured together without welding.

Claim.—1. Forming a dove-tail, tapering, open-groove matrix on the side of a removable slip plow point, substantially as described and for the purpose shown.

2. The particular form and construction of the slip point, as arranged and described, and for the purpose shown.

3. Forming and constructing a slip point, as shown and described and claimed above, with a fin cutter, as arranged and shown.

4. The particular arrangement of the share *C*, flange *E*, and landside *D*, as shown, in combination with the above-described and above-claimed slip point, either with or without the fin cutter, as described and for the purpose shown.

80,190.—JOHN W. LATCHER, Albany, N. Y.—*Curry Comb.*—July 21, 1868; antedated July 18, 1868.—The teeth are formed from one block, which constitutes the back or blank, from which the said teeth are sawed.

Claim.—Forming a series of rows of teeth, *b*, from one block, substantially as shown and described, and for the purpose specified.

80,191.—JOHN P. LIPPS, Newark, N. J., assignor to himself and HENRY GUYER, same place.—*Car Replacer or Guide Rail.*—July 21, 1868.—The guides are not connected together, and the forward end of each is so constructed as to clasp the flanged edge of the rail. The rear ends of the guides are secured to a cross-tie.

Claim.—A railway guide rail or car replacer, constructed with a portion which embraces and elings to the rail, a groove for the car wheel, and a pin or pins for securing the device to the cross-tie, substantially as shown and described.

80,192.—HENRY C. LLOYD, Cincinnati, Ohio.—*Still.*—July 21, 1868.—The main still consists of a series of heating chambers or boilers placed one over the other and surmounted by a tank or reservoir, communicating with each other and with a doubler by pipes. From the first, communication is had to a second doubler, and to condensers, for effecting the continuous distillation of alcohol without the use of vats, pumps, &c.

Claim.—1. The arrangement of chambered still *A*, *B*, *C*, and *D*, doublers *O* and *Q*, condenser *U U'*, and vapor pipes *N*, *P*, *H*, and *E*, substantially as and for the purpose set forth.

2. The condenser *U U'*, or its equivalent, having the discharge cock *X* into the doubler below the inlets of the escape pipe *V*, as and for the purpose explained.

3. The provision of exhaust and live-steam injection pipes, *I* and *J*, in the lowest chamber of series

A, B, C, and D, with their described or equivalent accessories, as set forth.

80,193.—LUCIUS M. LULL and PHILANDER C. BOWEN, Altoona, Ill.—*Washing Machine*.—July 21, 1868.—To the frame is connected a concave bottom, and is provided with rollers, the frame being hung on spiral springs. A grooved cylinder has its bearings in the sides of the frame.

Claim.—The arrangement of the open frame A, provided with the screw bolt B, to which is connected the block C, with the frame E, concave bottom F, rollers G G, arms H H which are provided with pins K K, and spiral springs I I, the whole being used with the cylinder D, as and for the purpose herein set forth.

80,194.—JOHN MAGEE, Chelsea, Mass., assignor to MAGEE FURNACE COMPANY.—*Cooking Stove*.—July 21, 1868.—Designed for keeping cooked articles of food warm.

Claim.—1. A warming closet, B, placed under the hearth of a high-hearth stove, substantially as and for the purpose set forth.

2. The warming closet B, the top of which is provided with a movable lid or door, in the manner and for the purpose described.

80,195.—EDWARD C. MAYLOY, Rochester, N. Y.—*Skate Fastening*.—July 21, 1868.

Claim.—1. A clamp made with a flange on the upper edge, turned inward, and adjustable to any thickness of sole by means of the screw, or its equivalent, so that the flange will press tightly upon the upper edge of the sole.

2. The combination of the segmental arms with the T-headed bolt *t*, and clamp slide *b* with the thumb nut, constituting the sliding bar, by which all the clamps are adjusted and tightened at the same time, as shown in Fig. 2, or the two T-headed bolts shown in Figs. 2 and 3, and thumb nut, constituting a sliding bar, and connecting the segmental arms by which all the clamps are adjusted and tightened as before.

3. Forming a sliding bar, connecting the segmental arms by means of a bolt and nuts, as shown in Fig. 5.

80,196.—GEORGE MCFADDEN, Thomaston, assignor to himself and RICHARD AUSTIN, Plymouth, Conn.—*Dress and Satchel Holder Combined*.—July 21, 1868.—Metallic holders attached to a girdle, cord, or belt are made to grasp the dress, and are held in place by a sliding clasp or band.

Claim.—As a new article of manufacture, a combined dress and satchel holder, consisting of the hook G, eyes D, spring arms *a*, rings *b*, and sliding clasp E, all arranged and operating as set forth, when all said parts, excepting the slide E, are made of one piece of metal.

80,197.—LEWIS H. MEALEY, Alpha, Ohio.—*Paper Sack Knife*.—July 21, 1868.—The handle on which the cord is wound, serves to receive the tension of the cord in tying up packages. After the knot is tied, the cord is severed without waste, by the knife.

Claim.—The within-described device, consisting of a bobbin or spool-formed handle, C, upon which the cord is wound, in combination with a cutting blade, B, operating in the manner described.

80,198.—WILLIAM MELVILLE, Paterson, N. J.—*Machine for Heading Bolts*.—July 21, 1868.—The swinging holders cause the cutter to produce a drawing cut, and are made to move simultaneously with the die toward the bar, when the front end of the blank is cut off. The separated blank is then held by the holders and its rear end is within the dies, when the punch moves forward and heads the same. The holders and dies are then simultaneously drawn apart, and the finished bolt is released.

Claim.—The improved bolt and rivet-heading machine, consisting of the oscillating holder L L, carrying the cutter N of the stationary die G and reciprocating die E, and of the reciprocating punch I, all made and arranged substantially as herein shown and described, and combined with the two cam shafts

B and C and springs *g*, F, and *e*, respectively, in the manner set forth.

80,199.—GEORGE B. MILLIGAN, Baltimore, Md., assignor to T. POULTNEY, same place.—*Horseshoe*.—July 21, 1868.—The false shoe is formed of two parts hinged together and provided with calks and projecting shanks, which latter are screwed together, by which the false shoe is secured to the ordinary shoe.

Claim.—1. An expanding false shoe, provided with interlocking projections, adapted to suitable depressions in the permanent shoe, or the equivalents thereof, for the purpose of firmly securing the ronghing or false shoe and the permanent shoe together, as and for the purposes set forth.

2. The employment of an interlocking lip or hook, *s*, in combination with the false shoe, and adapted to operate in the manner and for the purposes substantially as described.

80,200.—ANTONIO L. MORA, New York, N. Y.—*Bureau Trunk*.—July 21, 1868.

Claim.—The bureau trunk, constructed as described, its top, A, being hinged at its back to the body of the trunk, and provided with interior compartments and a flange around its lower edge, when the doors B, which cover the drawers, are hinged to the front sides of the ends of the trunk, and are held closed by the flange of the cover, which said cover is locked at two points by means of one lock, all arranged as described, for the purpose specified.

80,201.—WILLIAM B. MORGAN and J. H. TERRELL, Antioch, Ind.—*Wagon Brake*.—July 21, 1868.

—Designed more especially for wagons loaded with logs, hay, or other article that would prevent the brake from being operated in the ordinary manner.

Claim.—1. The combination of the arm or lever M, connecting bar N, and pivoted lever O, with the rock bar J, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the stationary bar D, short levers F, rock bar J, arms or levers K I M L, connecting rod N, and pivoted lever O with each other, substantially as herein shown and described, and for the purposes set forth.

80,202.—F. B. MORSE, New Haven, Conn.—*Stump Joint for Carriages*.—July 21, 1868.—A recess is formed in the meeting ends of the joint, in which is placed a link or hinge gate, so that when open or closed, the plate and parts come to a firm bearing.

Claim.—1. A stump joint, consisting of the two parts A and B, joined by the plate C and pivots *d d*, when the said plate C is arranged and fitted into the parts A and B, so as to operate in the manner specified.

2. In combination with a stump joint, the buttons or plates D D, arranged upon opposite sides of the joints, substantially in the manner herein set forth.

80,203.—ORRIN MORSE, Rochester, N. Y., assignor to C. H. MORSE AND COMPANY, same place.—*Coal Scuttle*.—July 21, 1868.

Claim.—A coal scuttle, having the bonnet cut away on both sides, in such a manner and to such a degree as to enable the devices to pack and to discharge coal properly in a side opening, as specified.

80,204.—CHARLES MULLER, Albany, N. Y.—*Cigar Machine*.—July 21, 1868.—The filling or prepared tobacco is placed in a drum or receptacle, by revolving which the filling is caused to pass through openings in its circumference, and, dropping upon a poised scale, which, when filled, empties its contents into a hopper placed below it and thence into a trough, where it is further manipulated, in combination with a series of levers, a cord and weight, and a ratchet wheel and its detent pawls.

Claim.—1. The combination of trough O with the curved metallic plate W, or its equivalent, substantially as and for the purpose set forth.

2. The scoop S, in combination with the trough O and curved plate W.

3. The combination of drum A, hoppers D D', P P', and R R', scale pan E, ratchet wheel B, levers H

and I, M, and N, substantially as and for the purpose set forth.

4. In combination with the subject-matter of my third claim, the trough O, metallic curved plate W, and cord *f* and weight *g*, substantially as shown and described.

5. The within-described process of manufacturing cigars, substantially as shown and in the manner set forth.

80,205.—GEORGE W. OTIS, Lynn, Mass.—*Lightning Rod.*—July 21, 1868.—The rope is designed to form a continuous conductor, and obviates the necessity of joints.

Claim.—The lightning conductor described, consisting of several strands of angular metallic wire laid into a rope, all as and for the purpose described.

80,206.—OSCAR D. PADRICK, Shelbyville, Ind.—*Self-Propelling Vehicle.*—July 21, 1868. The propelling mechanism is so constructed as to be readily applied to and removed from any common vehicle. A winding-up device applied to the springs, which afford the motive power, is so located that the occupant can wind up the springs when necessary without leaving his seat.

Claim.—1. The application of springs S, spring cases G, spur wheels *g'*, and spur wheels *h* to shafts *n*, which are supported upon standards P upon the axle C, in combination with spur wheels applied to the hubs of wheels B', and with means for winding up said springs S, substantially as described.

2. The arrangement of propelling devices, which I have described, on both sides of the center of the rear axle C, upon standards P, which can be readily removed from said axle, in combination with the winding-up rod E, applied to and supported by a removable plate F, substantially as described.

3. In combination with driving spurs *h h* and the devices which operate these spurs, brakes *t t*, applied so that they can be caused to act upon said spurs at pleasure, for stopping and starting the vehicle, and regulating the speed thereof, substantially as described.

4. The lever $a^1 a^2$, applied to the rod *a*, on the front axle C, and arranged as described, in combination with a catch plate R, and a vehicle which is adapted for being propelled, substantially as described.

80,207.—ALFRED PARAF, New York, N. Y.—*Manufacture of Waterproof Textile Fabrics.*—July 21, 1868.

Claim.—The asphalt cloth hereinbefore described, consisting of the combination of a textile fabric with albuminized asphaltum, substantially as before set forth.

80,208.—ANDREW PARKER, New York, N. Y.—*Bureau Bedstead.*—July 21, 1868.—A flap is hinged to the head piece of the bedstead, and provided with V-shaped grooves in its under surface, so that the same, when folded down, will catch over V-shaped projections on the foot piece and retain the same in position.

Claim.—A bureau bedstead, composed of a head piece A, and foot piece C, united by a hinged frame D, and provided with a hinged flap B, which, when folded up, is retained by lips *a* on the head piece, and which, when folded down, catches over V-shaped projections *e* on the foot piece, as shown and described.

80,209.—J. V. D. PATCH, Brownville, Nebraska.—*Escapement.*—July 21, 1868.—Two pallets are so attached to the pendulum rod as to act laterally on the verge wheel instead of on the top of the same. Between the pallets is a spring affixed to the pendulum rod, to facilitate the action of the pallets.

Claim.—The laterally-acting pallets *a* and *b*, spring *d*, and pendulum rod A, all substantially as shown and described, in combination with the verge wheels B and pendulum C of a clock, all as and for the purpose set forth.

80,210.—JOHN PERHAM, Rockton, Ill.—*Stove-Pipe Shelf.*—July 21, 1868.—A stove-pipe shelf of peculiar shape, and made open at one side, is attached to a double adjustable collar, upon which it moves

loosely, by means of slides, slots, or grooves, so that the shelf may be extended on one side of the stove pipe.

Claim.—1. An improved metallic extension stove-pipe shelf A A, constructed and arranged with the extension device, as shown, made in one or more parts, to operate substantially as described.

2. An improved metallic stove-pipe shelf, provided with and operating by means of grooved or sliding ways, to allow of an extension of the size of the shelf by elongation or lateral enlargement.

3. The peculiar shaped adjustable grooved or slotted collar B B C c, in two parts, when constructed and arranged to operate substantially as set forth, for the purpose described.

4. In combination with the foregoing, the screws or bolts and nuts D D, and radial arms and circular ribs, substantially as shown, with guard stops *o o* of the shelf A A, when the whole is constructed and arranged substantially as herein set forth and described, to operate as specified.

80,211.—JOHN PHILLIPS, Jr., Georgetown, Mo.—*Washing Machine.*—July 21, 1868.—The zigzag groove in the wheel, as the latter rotates, imparts an up-and-down movement to the rubber, and the pressure on the clothes is graduated by the sliding table.

Claim.—The zigzag groove *a* in the wheel B, and the pin *c* of the arm C, to which the rubber is attached, fitting in said groove, in combination with the sliding table E, all arranged to operate in the manner substantially as and for the purpose set forth.

80,212.—LEMAN F. PITCHER, Salina, N. Y.—*Shafting.*—July 21, 1868.—The shaft is stationary and supports a hollow revolving cylinder, having an open feeding hole in the head, and is bent so that the said head shall be kept nearly free and open while feeding the cylinder.

Claim.—The non-revolving bent shaft S, when made and applied for the purpose aforesaid, substantially in the manner above described.

80,213.—ISAAC R. POTTER, Dartmouth, Mass.—*Horse Shoe.*—July 21, 1868.—The shoe is formed with raised edges and studs, and with movable calks so that, when applied, the bearing edge will be flush with the "wall" of the hoof. The calks may be made whole or in parts, with the edge continuous or indented.

Claim.—1. The shoe A, as described, with raised edge C and studs E².

2. The removable calks B¹ B¹, made in sections or continuous, with edge continuous or indented.

3. Forming and applying the calks so that the bearing edge will be flush with the wall of the hoof.

4. Curving the calks at the heel and toe, as shown.

80,214.—ISAAC R. POTTER, Dartmouth, Mass.—*Thill Coupling.*—July 21, 1868.—One jaw of the clip is provided with a slot and a projection on the end, and the thill iron with a projection on the under side, and an arbor secured to the end, said arbor fitting in corresponding holes in each jaw of the clip.

Claim.—Making the clip C¹ with projection e^1 , and slot g^1 on and in one jaw of same, and the thill iron D² with the projection a^2 and arbor d^2 , made and operating substantially as and for the purpose specified.

80,215.—NIELS POULSON, Washington, D. C.—*Movable Window Blind.*—July 21, 1868.—The blinds are constructed in such a manner that, when not in use, they may be drawn up and kept in a hollow space above the window frame, out of sight. When the cross ties are drawn up they form several rows by the side of each other.

Claim.—1. The pivoted bars or links A A², for elevating or lowering a pivot slat blind, and permitting the tilting of the slats B, when lowered, substantially as and for the purposes set forth.

2. The arrangement of two or more slats, B, on each of the bars A, to adapt the blind to fold within a smaller vertical space, as explained.

3. The combination of the hinged bars A A², pivoted slats B, connecting bars I, and tilting cords, chains, or rods K K¹ K², substantially as described.

4. The combination of the inclosed elevating

cord or chain L, hanger N, guide pins F', vertical grooves G, and fastenings C P O, with the bars A A² and slats B B, for the purpose of raising and lowering the blind, and locking it securely in its extended or closed position.

5. The plate E, in combination with the hinged bars A A², and with the box or recess for inclosing the folded blind out of sight, as described.

80,216.—JOSEPH M. PUSEY, LEA PUSEY, and EDWARD PUSEY, Wilmington, Del.—*Spinning Machine.*—July 21, 1868.—A spring attached to an adjustable support is made to bear against the spindle at two points, in order to prevent the same from trembling or vibrating when running at a high speed. A division plate, attached to the ring rail between the spindles, prevents the threads from coming in collision when in rapid motion.

Claim.—1. The combination with the spindle of the spring bearing on the spindle, to hold and steady the same, substantially as described, for the purpose specified.

2. The combination of the spring G, the connecting rod F, the adjustable support L, the division plate I, and the brake H, with a ring spinning frame, substantially as described.

80,217.—JOHN EDWIN RACE, Chicago, Ill.—*Earth Boring Machine.*—July 21, 1868.—The auger and gearing are attached to a rocking beam, so that the position of the auger can be changed without changing the relative position of the operative parts. To the rocking beam is also attached a vertical post, which passes through a slot in a bar pivoted to the top of the auger shaft, to aid, in connection with a rope and shaft, in forcing the auger into soft soil.

Claim.—1. The bar H, in combination with the rod or post I, rope g, and shaft C, when constructed and operating substantially as and for the purposes specified.

2. The combination and arrangement of the gear wheels F and G, shaft E, and lever L, with the rocking beam K, substantially as specified.

80,218.—JAMES S. RAMSEY, Baltimore, assignor to himself and WILLIAM G. HILLMAN, Lonaconing, Md.—*Lock Label Holder.*—July 21, 1868.—A device to be used by travelers to secure the address to baggage, so that the address may be changed as often and as rapidly as desirable, without the liability of becoming detached or obliterated.

Claim.—1. The combination of the bolt D, staple B, and side fastening C, arranged and operating substantially as described.

2. The compartment E, containing address labels, which are protected by a sheet of mica, isinglass, thin horn, or similar substance, in combination with a side fastening, which closes the opening through which the same are introduced, and which is locked by a bolt within the case, as set forth.

80,219.—BENJAMIN D. RANDLEMAN, Port Lonisa, Iowa.—*Clasp for Joining Belts.*—July 21, 1868.—A combination of forked and straight links with a pair of hinged plates, the links forming a flexible connection for the hinged plates, to secure the ends of a belt.

Claim.—A belt clasp, composed of straight and forked links d and a, and hinged plates C and D, all substantially as and for the purpose shown and described.

80,220.—HENRY R. RAUB, Pymatuning, Pa.—*Gate.*—July 21, 1868.—The lower portion of the gate is made to be raised up to allow it to swing over snow and other obstructions, and permit the passage of sheep and other small stock.

Claim.—1. The combination of the sliding part E, and the stationary part C of the gate with each other, substantially in the manner herein shown and described, and for the purpose set forth.

2. The combination of the lever F and connecting bar G with the stationary part C and sliding part E of the gate, substantially as herein shown and described, and for the purpose set forth.

80,221.—SAMUEL J. REED, Camden, Ohio.—*Sulky Plow.*—July 21, 1868.—The caster wheels are

so arranged that the driver can readily guide the plow by pressing upon a foot piece, or they may be operated by a lever from the rear. The rear ends of the plow beams may be elevated by means of a lever attached to a double crank.

Claim.—1. The beam A, pole A', caster wheels B B, arms b b, cross bar b¹, lever C, and foot piece C', the whole being combined and arranged substantially as described.

2. The plow beams E E, constructed and arranged as described, in combination with lever F, crank f, and guides f', as and for the purpose set forth.

80,222.—F. M. REYNOLDS, Mile Strip, N. Y.—*Hay Loader.*—July 21, 1868.—The parts are so arranged that the driver, by a simple manipulation, may transfer at once the draught power of the team from the wagon to the derrick tackle and brake, to prevent the wagon from moving during the operation of loading.

Claim.—1. The slide S of the draught pole, applied to the permanent or fixed part P thereof, substantially as shown, in combination with the bolt Q connected with the cord K of the brake lever L, all arranged to operate in the manner substantially as and for the purpose set forth.

2. The spring W applied to the bolt Q, when said bolt is used in connection with the slide of the draught pole, and connected with the brake-actuating mechanism, substantially as and for the purpose set forth.

3. The combination of the lever L, adjustable rod M, rope K, pendant bar B^x, and rear brake shoe A^x, as herein described, for the purpose specified.

4. The connecting of the front brake bar B^x to the slide S of the draught pole through the medium of the lever G and the tackle rope C^x, arranged in the manner substantially as and for the purpose set forth.

5. The sheaves R R', in combination with the lever G, sliding pole S, rope C^x, front and rear brake shoes A^x B^x, and derrick, whereby the wagon is stopped and the load elevated at one operation, as herein shown and described.

6. Constrcting the derrick B with a jointed standard, the two parts a^x a^{xx}, each of which have oblique abutting ends, connected by a strap hinge or joint, provided with a socket, and having the arm D of said derrick connected to the standard by a metal strap, b^x, and supported or braced by a bar, d, the lower end of which is attached to the lower end of the upper part, a^{xx}, of the standard, substantially as shown and described.

80,223.—JAMES C. RHODES, Stillwater, Minn.—*Damper.*—July 21, 1868.—A device to be attached to the draught orifice of a stove, furnace, &c., to prevent the sparks from passing out and setting fire to the carpet or floor.

Claim.—1. The spark arrester, constructed, as described, of the pivoted plate B, having openings, and closing against the ling a' upon the plate A, the plate C, having the gauze-covered openings D, and pivoted centrally to the plate B, and moving with it upon the plate A, all arranged and operating as described, for the purpose specified.

2. The combination and arrangement of the plate A, the swinging plate B, wire gauze D, and pivoted plate C, as herein shown and described, and for the purpose set forth.

80,224.—EZRA RIPLEY, Troy, N. Y.—*Button Fastener.*—July 21, 1868.—The eye of the button is passed through a slot in the garment, and then through the slot in the fastener. The tongue is then passed through the eye of the button, thus securing it without the use of thread.

Claim.—A new and improved button fastener, consisting of a suitably-shaped piece of leather, or other suitable material, A, having a tongue, B, and slot C, constructed and arranged substantially in the manner and for the purposes herein fully described and set forth.

80,225.—JAMES ROBERTSON, Glasgow, Scotland.—*Excavating Machine.*—July 21, 1868.—This invention consists of an apparatus embodying a combina-

tion of conduits and mouth pieces for excavating, dredging, and transmitting earthy and other loose matter, by means of currents of water, steam, or air, singly or combined, being forced through the said apparatus.

Claim.—1. The mouth piece B, forcing pipe A¹ A², &c., and exhausting pipe C¹ C², &c., in combination with a pump for forcing a strong current of water through the apparatus, as and for the purposes herein specified.

2. In combination with the above, the rotating spike cylinder E¹, arranged to operate therewith, as and for the purposes herein specified.

3. The mouth piece B, with a pump forcing pipe and exhausting pipe, substantially as specified, connected to and arranged to operate from the floating structure H, as and for the purposes herein specified.

80,226.—EDWARD S. SCOFIELD, Rochester, N. Y.—*Carving Fork and Knife Sharpener Combined.*—July 21, 1868.—The end of the guard is beveled, and fits, when the same is closed, between the tines of the fork, and the knife is sharpened by drawing the edges of the same across the said beveled edges.

Claim.—The peculiar construction and arrangement of the guard *a*, when in connection with a fork, in the manner and for the purpose specified and described.

80,227.—EDWIN F. SHERMAN, Chicopee, assignor to himself and A. W. KELLOGG, Pittsfield Mass.—*Belt Hook.*—July 21, 1868.—A device for securing firmly together the ends of the belting.

Claim.—The four hooks *a i i a*, all connected longitudinally, by means of the central bar *e* and the two end bars *c c*, the whole constituting a belt hook, and constructed substantially as herein described, and for the purposes specified.

80,228.—ANDREW SMITH, Dayton, Oregon.—*Horse Power.*—July 21, 1868.—Designed for use in a machine where belts are employed instead of gearing, the parts being so constructed and arranged as to admit of being readily put up and taken down.

Claim.—The shaft *d*, in the frame E, arranged so as to be capable of being adjusted in two different directions by means of the screws J G, connected respectively with the slides H and bearings *e*, as indicated by the arrows 1 2, in combination with the frame A, containing the driving belt D and rollers *c c*, and the belt N, with the shaft K in frame E, all arranged for joint operation, substantially in the manner as and for the purpose set forth.

80,229.—A. F. SMITH, Ellsworth, Me., assignor to himself and LEWIS FRIEND, same place.—*Spark Arrester.*—July 21, 1868.—The two parts are connected by a hinge in the lower one of which is an inverted shell having perforations covered with wire netting. Over this shell is a cap attached to the upper portion and surmounted by a wire-gauze chamber, and also a dish-shaped plate having a hole in the center. The wire gauze prevents the escape of cinders but allows the passage of smoke, and the cinders are also deflected by the plates.

Claim.—1. The two parts A B, the shell C, cap E, and the wire-gauze chamber F, with the openings *b* in shell C, and the openings *g* in the upper part B, covered with wire cloth, all combined and arranged substantially as and for the purpose set forth.

2. The draught tubes D, placed in the lower part, A, of the device, and the openings *b* in the shell, arranged to operate substantially as and for the purpose specified.

3. The shield I, attached to the vane H, and arranged in relation with the wire-gauze chamber F, substantially as and for the purpose set forth.

80,230.—CHARLES W. SMITH, Hornellsville, N. Y.—*Cooking Stove.*—July 21, 1868.—A shallow, square fire box is arranged at one end of a cook stove for burning small wood, chips, &c., and having a large flat heating top extending over a cylindrical coal-burning fire box in the other end, so that the apparatus may be used for a large fire in winter and in summer to have as little heat as possible.

Claim.—The base A, cylinder coal fire box E at one end, and a wood fire box, F, elevated on arches

h h, at the other, as constructed and arranged, in combination with the top H H, dampers J J, and oven K, operating in the manner as and for the purpose herein set forth.

80,231.—FRANCIS H. SMITH, Baltimore, Md.—*Brick Machine.*—July 21, 1868.—Designed as an improvement on a machine patented to the same inventor, Oct. 3, 1854. The invention consists in so arranging the bed plate in relation to the mold carrier as to admit of a very nice adjustment of the parts in molding the clay.

Claim.—The adjustable bed plate Z, when vertically adjusted by means of the set screws *e*, the mold carrier O, provided with its open mold and lugs *d*, and the jointed lever arms M I, and wooden arms J, all arranged together and operated as and for the purpose herein set forth.

80,232.—JOHN C. SMITH, Troy, N. Y.—*Rock Drilling Machine.*—July 21, 1868.—The crank shaft works between jaws, two of which are placed above and one below the said shaft, the jaws being joined at their rear ends to a head piece which moves up and down on an upright stationary rod placed at the frame so as to guide the head piece and jaws in their vertical movement.

Claim.—1. The jaws J J', and K, constructed as described, and joined to the head piece L, in combination with the crank shaft *c* and stationary rod M, for the purpose of giving an up-and-down motion to the drill shaft N, substantially as and for the purposes herein set forth.

2. The wheel R, constructed as described, with lugs *m m*, working in the screw threads on the shaft C, and connected by means of rods *k k* with the flanged collar O, in combination with the lever *h* and lug *o*, on said collar, and the groove *p*, on the drill shaft N, for the purpose of giving said drill shaft a rotary motion, substantially as and for the purposes herein set forth.

3. The arrangement of the driving wheel G, pinion H, crank shaft *c*, and fly wheels I I, when constructed as described, and used, in combination with the jaws J, J', and K, for the purpose of giving motion to a drill shaft, in drilling rock substantially as herein set forth.

80,233.—JOHN C. SMITH, Troy, N. Y., assignor to WAGER, FALES AND CO.—*Stove Grate.*—July 21, 1868.—A headed pin in the grate fits in a fork on the shoulders of an arm extending through one side of the stove, so that when the arm is drawn out the grate cannot be turned. By pushing in the arm the grate will partially revolve so that the grate can be turned.

Claim.—The arrangement of the bridge C and arm D, when constructed as described, and used in combination with the grate B, which is provided with pins, *c*, *d*, and *e*, substantially as and for the purposes herein set forth.

80,234.—HIRAM STONE, Cleveland, Ohio.—*Fruit Jar.*—July 21, 1868.—Air is exhausted from the main jar and the stopper is inserted in the cover of the same by means of a stem provided with a cup-shaped socket arranged within a removable auxiliary jar.

Claim.—1. The stem I and spring A', as arranged, in combination with the auxiliary jar D, in the manner and for the purpose set forth.

2. The stem I and auxiliary jar D, in combination with the jar A, for the purpose and in the manner substantially as set forth.

80,235.—DAVID STUART and ALEXANDER WE-MYSS, Philadelphia, Pa., assignors to STUART, PETERSON AND CO., same place.—*Stove Plate.*—July 21, 1868.—A series of projections consisting of sections of hollow spheres, and serving as heat deflectors, are united by any desired ornamental tracery and so arranged as to leave open spaces between the same.

Claim.—A guard plate, having deflecting shields and open spaces, arranged substantially in the manner and for the purpose set forth.

80,236.—GEORGE J. STURDY and S. W. YOUNG, Providence, R. I.—*Japanning Metal.*—July 21, 1868.

Claim.—1. The use of plumbago, or its equivalent.

in the process of japanning, substantially as described.

2. Immersing the article japanned in a water bath, thereby setting free the naphtha, or other volatile liquid, and throwing off the excess of japan, substantially as described, and for the purposes set forth.

3. The black-lead coating, or its equivalent, in combination with a hot-water bath, in the process of japanning, substantially as described.

80,237.—GEORGE C. TAFT, Worcester, Mass.—*Improvement in Wrenches.*—July 21, 1868; antedated July 11, 1868.—The main jaw is formed in a separate piece, passing loosely through the upper jaw instead of being forged with the same as usual. The two sliding jaws are opened and closed by a right and left-handed screw on the rosset which is pivoted to the ferrule.

Claim.—The sliding jaws C and D, held on the bar A, by means of the rosset *e* fitted in the recess *d* of the bar A, all constructed and arranged to operate substantially as described.

80,238.—ALBERT L. TAYLOR, Springfield, Vt.—*Cutlery.*—July 21, 1868.

Claim.—A spiral handle for cutlery, constructed or formed out of the same piece of metal as the blade or other portion of the implement, substantially as shown and described.

80,239.—OLIVER TENNY, Littleton, Mass.—*Propelling Vessels.*—July 21, 1868.—Disks are fitted to slide freely in the cylinders between the open ends and heads of the same. As the heads are drawn inward the water enters the cylinders, and when moved outward the water is ejected so as to react and propel the vessel.

Claim.—The combination, with the cylinders *a*, of the heads or followers *e* and disks or pistons *f*, all arranged and operating substantially as described.

80,240.—EVAN O. THOMAS, Jersey City, N. J.—*Cooking Stove.*—July 21, 1868.

Claim.—The arrangement within the stove of the curved portion *a*, bottom plate *b*, and top plate *f*, whereby a crescent-shaped fire box, C, is formed upon one side the oven B, a combustion chamber, *e*, above it, and a hot-air chamber, *d*, beneath it, as herein described for the purpose specified.

80,241.—LEONARD TILTON, Brooklyn, E. D., N. Y.—*Wood-Splitting Machine.*—July 21, 1868.—A box containing two hoppers in which the wood to be split is placed, receives a reciprocating motion, while a vibrating motion is imparted to a bed so as to move the same alternately under each hopper, carrying the wood against fixed V-shaped cutters.

Claim.—1. The bed F, made V-shaped in its cross section, and provided with the journals *c* and shank *b*, said bed being arranged to oscillate in connection with the rock shaft F, so as to alternately close the bottoms of the hopper D D, substantially as herein shown and described, for the purpose specified.

2. The arrangement of the V-shaped cutters J J', K K', with relation to the slotted hopper D and oscillating bed F, as herein described, for the purpose specified.

80,242.—SAMUEL J. TONGUE, Philadelphia, Pa., assignor to himself and Jabez Jenkins, same place.—*Mincing Cleaver.*—July 21, 1868.—A cleaver and mincing knife are combined in one and the same implement.

Claim.—The cutting edge, *b*, of the cleaver, formed at one edge of the blade A, in combination with the cutting edge, *d*, of the mincing knife, formed on the outer end of said blade, all constructed substantially as and for the purpose set forth.

80,243.—SYDNEY D. TUCKER, Troy, N. Y.—*Cloth Plaiting Attachment for Sewing Machine.*—July 21, 1868.—Designed as an improvement upon a machine patented to F. A. Allen, February 7, 1860, and the invention consists in the employment of devices for breaking down the stiffness of the cloth, and shaping and guiding the same at points some distance from the place where the plait is actually folded.

Claim.—1. The folding guide C, hemmer D, plate

A, having the slot B therein, the whole being constructed, arranged, and combined in the manner herein contained, described, and set forth.

2. The arm W, supporting plate X, plate J, adjustable plate I K k, and the plate G, all and each constructed and combined and arranged substantially as herein set forth.

3. The devices constructed as herein described, and forming a plaiter, in two parts, and in which the cloth moves under the plaiter, as shown, the whole being arranged and combined in the manner substantially as herein contained, described, and set forth.

4. The folders K and L, constructed and operated substantially as and for the purposes hereinbefore fully described.

5. In combination with a plaiter, the guide M and slide N, substantially as hereinbefore described and set forth.

6. The guide T and guide bar S, in combination with each other, and with a plaiter, substantially as and for the purposes herein fully described and set forth.

80,244.—THOMAS UCKER and ANDREW HUTCHINS, Amanda, Ohio.—*Corn and Cob Mill.*—July 21, 1868.

Claim.—The upper end and lower circles of toothed staves forming the grinding surfaces of both the revolving cone and the surrounding case, the upper circle of both revolving cone and the case being composed of perforated staves, which are capable of being applied to either said cone or case, the whole banded together at top and bottom, and at the junction of the upper and lower parts of the mill, substantially as and for the purpose described.

80,245.—WILLIAM W. USTICK, La Crosse, Wis.—*Apparatus for Cutting and Mitering Printers' Rules.*—July 21, 1868.—The cutter of the mitering tool is formed with beveled edges having file teeth, the edges being at right angles to each other. The cutter of the squaring tool is similarly formed except that its file edge is at an acute angle with the sides of the stock and of the cutter.

Claim.—1. The combination of the file-formed cutter *b* with the stock B, when arranged to operate substantially as described and for the purpose set forth.

2. The improved apparatus herein described, when its several parts are constructed and arranged with relation to each other, in the manner and for the purpose set forth.

3. The combination of the file-formed cutter *e* with the stock B, when constructed as and for the purpose specified.

80,246.—A. VAN FLEET, Ashton, Ill.—*Horse-Collar Fastening.*—July 21, 1868.—A double-detachable loop is formed of a single piece of wire and secured permanently to one part of the collar, by means of a slit in the leather through which a fold of the wire is inserted, and two holes also in the leather into which the ends of the wire are inserted, in connection with adjustable hooks.

Claim.—The herein described double loop B, applied to the collar, substantially as described, in combination with adjustable hooks, as and for the purpose set forth.

80,247.—ARTHUR VAN NORMAN, Detroit, Mich.—*Potato Digger.*—July 21, 1868.—A reciprocating cutter clears off the weeds, vines, &c., in front of the scoop, which latter takes up the earth and potatoes, whence they are carried to and through the rotating screen.

Claim.—1. The rotating screen G, provided with the internal flange or screw J, in combination with the reciprocating cutter P, all arranged substantially as and for the purpose specified.

2. The scoop K, with the apron or bearing-piece *i* underneath it, in combination with the screen G and cutter P, all applied to the frame F, and arranged to operate in the manner substantially as and for the purpose set forth.

3. Connecting the shaft *b* by a rod *f*, to a crank *g* on shaft H, substantially as shown and described, for the purpose of rendering the screen and the cutter

operative and inoperative simultaneously with the rising and lowering of the scoop and cutter.

80,248.—CHRISTIAN WAHL, Chicago, Ill.—*Apparatus for Drying Glue.*—July 21, 1868.—A series of circular plates or disks, composed of enameled iron, are attached, by means of arms, to an endless belt, and in their descending motion are exposed to a current of warm dry air. The glue is dried on the said disks in a thin coat, which cracks, and readily drops off. Projections of rubber on the inside of the casing serve to partially turn the disks, and also to deflect the currents of air.

Claim.—1. The employment of earthy surfaces upon which to expose the glue, substantially as and for the purposes herein set forth.

2. The combination of the revolving disks B, with the endless belt A, or its equivalent, for transporting them for a considerable period through a drying current of air, substantially as and for the purposes herein set forth.

3. The adjustable pulley C', arranged as represented relatively to the endless belt A, and to the glue-exposing surfaces B, carried thereon, substantially as and for the purposes herein set forth.

4. The deflectors F, arranged as represented, relatively to the current of dry air, impelled as represented, and to plates or glue-presenting surfaces B, which are transported past them, substantially as and for the purposes herein set forth.

80,249.—CHRISTIAN WAHL, Chicago, Ill.—*Machine for Drying Glue.*—July 21, 1868.—An additional or intermediate pulley or drum is arranged between the two supporting pulleys, to deflect the endless chain and its plates against rotating disks carrying brushes, which latter remove the glue from the plates. During their descending motion, the plates are exposed to air chemically dried.

Claim.—1. Removing the thin glue adhering to the surfaces B by means of a brush, R, against which the surfaces are presented after drying, and before being again immersed in the glue, for the purposes herein set forth.

2. Revolving the brush or clearing-device R, so as to actively rub the surfaces of the drying plates, however slowly they may be moving, substantially as herein set forth.

3. The deflecting pulley C³ arranged to cause the carrying chain to turn partially around it in its descent, substantially as and for the purposes herein described.

4. The employment of rigid links A, polygonal pulleys C¹ C² C³, tank or caldron D, and means for impelling dry currents of air in connection therewith, as and for the purposes herein set forth.

5. The gauze chamber J j, arranged, as represented, relatively to the air currents and to the traveling plates B, carrying the glue to be dried, substantially as herein set forth.

6. In connection with mechanism for drying glue, as specified, chemically drying the air previously to its introduction to the apparatus, substantially as and for the purposes herein set forth.

80,250.—CHRISTIAN WAHL.—Chicago, Ill.—*Machine for Drying Glue.*—July 21, 1868.—A series of plates which carry the glue are attached to a large wheel, which rotates slowly, and the glue is subjected first to a current of cold air, and then to air specially prepared to increase the drying effect. Between the disks are arranged partial partitions, and projecting inwardly from the casing are inclined flexible deflectors for effecting a complete circulation of air.

Claim.—1. The within-described combination and arrangement of the passages in a glue-drying apparatus, so that the glue-drying surfaces shall be presented to the warm or chemically dried air for a longer period than to the cold air, for the purpose herein set forth.

2. Revolving the disks B, or their equivalents, two or more times when the glue is being received thereon, and chilling the glue at each revolution, substantially as and for the purposes herein set forth.

3. Actively revolving the disks B, by means of the pulleys N, or their equivalents, at the period when the glue is being removed, as herein specified.

4. The partial partitions T, arranged as represented, and adapted to serve the double purposes of deflecting the air currents and retaining the glue, substantially as herein set forth.

5. The combination of the partial partitions F and T, arranged as represented relatively to each other and to the glue-exposing surfaces B, and to the currents of air traversing the same, substantially in the manner and for the purposes herein specified.

6. The combination of the revolving disks B with the wheel A, for transporting them through drying currents of air, substantially as and for the purposes herein set forth.

80,251.—H. M. WAIT, Woodstock, Ill.—*Band Puller.*—July 21, 1868.—A lever is provided with a pivoted hook for removing the bands from piles after the latter have been driven to their place.

Claim.—The lever A, with curved end, and face A', in combination with hook B, the whole being constructed as described, and combined and operated as and for the purpose set forth.

80,252.—A. F. WARD, Marietta, Ohio, assignor to W. S. BACHELDER AND COMPANY, Pittsburg, Pa.—*Combined Plumb, Square, and Level.*—July 21, 1868.—The main portion of the frame is provided with conical sockets, and the swinging frame has corresponding conical projections fitted to the said sockets, in connection with a bolt and thumb nut, to secure a reliable and durable axial joint. A lip formed on the protractor, to work on the edge of the frame, serves to more readily adjust the same.

Claim.—1. The swinging frame B, provided with the conical projections b b, and jointed to the frame A, provided with the conical sockets a a, substantially as and for the purpose described.

2. The part d¹, provided with the flange d², and the part d, provided with lugs, as described, and both parts otherwise constructed as and for the purpose described.

3. The protractor c, provided with the lip e, and connected to the frame A, substantially as and for the purpose described.

80,253.—ELI WANGAMAN, Blairsville, Pa.—*Cider Mill and Press.*—July 21, 1868.—An arrangement of devices for grinding and pressing apples and other fruit in the same machine.

Claim.—1. The rollers a, b b, perforated sheet R, box G, chutes E E and H, arranged substantially as shown and described, within a frame, A A A, &c., and operated in the manner substantially as herein set forth.

2. The arrangement herein shown and described, upon the frame A, and with relation to the grinding and pressing mechanism, of the drive wheel B, shafts P S, M D N V, and belts C L O, all as herein set forth.

80,254.—HERMANN WENDT, Elizabeth, N. J., assignor to HENRY SEYMOUR and ROBERT H. SEYMOUR, Brooklyn, N. Y.—*Shears.*—July 21, 1868.—

Claim.—Casting the circular recess i in the shear blade, for the purpose of preventing a drop hammer from compressing or hardening the metal at the point where the rivet hole is to be made, whereby the metal within the recess is left soft, in order that the rivet hole may be formed by punching, as herein shown and described.

80,255.—HERMANN WENDT, Elizabeth, N. J., assignor to HENRY SEYMOUR AND COMPANY, New York City.—*Sheep Shears.*—July 21, 1868.—The iron and steel ears or "stops" are welded together at the same time with the blade plates.

Claim.—The combination of the projection or ears a a', formed respectively at the inner ends of the iron and steel plates C D of the blades, and welded together to constitute the stops of sheep shears, substantially as herein set forth.

80,256.—BENJAMIN F. WHEELER, Calais, Vt.—*Sleigh Brake.*—July 21, 1868.—The brake is so arranged that the team, in holding back, may apply brake with a force proportioned to the forward pressure of the load.

Claim.—1. The combination of the bent-lever dogs

K, equal-armed lever I, chains J, parallel side bars E, sliding reach H, and rear bob B, all arranged as described, for the purpose specified.

2. The combination of the short chains J with the equal-armed lever I and side bars E or bolster D, as herein shown and described, and for the purpose set forth.

3. The combination of the cam lever L, with the connecting bar or reach H and with the rear bolster D, as herein shown and described, and for the purpose set forth.

4. The arrangement of the slotted bolster C D, parallel side bars E, sliding reach H, metallic plate G, equal-armed lever I, chains J, and bent-lever dogs K, all operating as described, for the purpose specified.

80,257.—JOHN B. WHEELER, Neville, Ohio.—*Envelope*.—July 21, 1868.—A spring catch is so applied to the folding flat and the portion underneath, as to prevent the envelope from being opened without cutting or tearing the same.

Claim.—1. The piece or device A with its mortise *c*, and notch or catch *e* in same, in combination with the piece B and its spring *g*, substantially as shown and described.

2. The manner of fastening the pieces A and B to the envelope, and securing the same from being opened without mutilation, substantially as shown and described.

80,258.—WILLIAM N. WHITELEY, Springfield, Ohio.—*Harvester*.—July 21, 1868.—The axle on which the grain wheel runs is so constructed that the diameter of its bearing surface shall decrease toward the arm from which the said axle projects.

Claim.—1. The loose sleeve I, in combination with spindle H, fastened permanently to the arm E, substantially as and for the purpose set forth.

2. Reversing the taper of the bearing of the grain-wheel, substantially as herein described, so that, while the arm which supports the wheel is on the outer side of said wheel, the large end of the bearing on which the wheel turns will be next to the divider.

3. The sleeve I, made with a chambered head K, which will partially inclose one end of the hub, to retain the same in place, and to exclude dust and dirt from the frictional surfaces, in connection with a corresponding chamber made in the arm E or spindle H, to inclose the other end of the hub.

80,259.—G. W. WHITSON, Ashville, N. C.—*Self-Loading Cart*.—July 21, 1868.—To the lower end of an arm attached to the axle is pivoted a standard which carries a plow of such a form and so arranged as to throw the dirt turned up by a forward plow, into the recesses or buckets on the inner side of the wheels. The dirt is carried up by the rotation of the wheels and dropped into the body of the cart.

Claim.—1. The combination of the plow P, standard R, support S, axle B, toggle bar U, lever V, and false shafts J, substantially as described, for the purpose specified.

2. The combination of the toggle bars U and lever V with the plow standard R and false shafts J, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the plows L, standards M, arms or supports N, and draught and adjusting chain O, with the false shafts J and wheels C, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the cam levers K with the shaft bar H and false shafts J, substantially as herein shown and described, and for the purpose set forth.

80,260.—J. W. WILLIAMS, New York, N. Y.—*Pavement*.—July 21, 1868.—The blocks are provided with locking keys made rectangular in their cross-section, so that the blocks may be supported against downward pressure, and so as to be readily detached from each other.

Claim.—The arrangement and formation of spaces *d*, between and around the blocks A, by means of grooves *b* and keys B, in combination with the

rabbeted sides *a* of said blocks, substantially as set forth.

80,261.—C. WILLIAMS, New York, N. Y.—*Pavement*.—July 21, 1868.—The blocks are secured together by wedge-shaped keys, and rest upon an elastic or yielding bed, supported upon a bed of asphaltum or other concrete.

Claim.—1. The inverted wedge-shaped keys *a* or *a**, in combination with the blocks A, substantially as and for the purpose described.

2. The intermediate elastic bed C, in combination with the "sub-bed" B, and the blocks A, substantially as and for the purpose set forth.

80,262.—H. B. WILLCOX, Philadelphia, Pa.—*Carriage Thill Coupling*.—July 21, 1868.—In a metal block which is secured to the axle of the carriage, or to the clip of the same, is a circular opening, having a recess in the rear for the reception of a block of rubber against which a pin on the bent arm of the shaft bears.

Claim.—1. The block B, with its recesses *d e*, and *x*, and the block *f* of rubber, fitting the recess *x*, in combination with the bar A and its projection *b*, substantially as and for the purpose described.

2. The combination of the above, the flap *k*, and disk *i*, substantially as and for the purpose specified.

80,263.—HENRY HAYWARD, New York, N. Y.—*Felted Fabric*.—July 21, 1868.

Claim.—The within-described felted fabric, compounded of the two layers of felt A and C, with a layer or partial layer of open-worked horse-hair cloth inclosed between, the whole being firmly confined together by the interlaced fibres *a* and *c* of the felted material, substantially as and for the purposes herein set forth.

80,264.—RANSOM ALLEN, Salem, Mich.—*Needle for Knitting Machines*.—July 28, 1868.—By providing the needles with movable shanks, any number of them may be rendered inoperative without removing the yarn or loops therefrom.

Claim.—The movable shank *b*, attached to the body of a knitting-machine needle, and operated substantially as and for the purpose herein described.

80,265.—JONATHAN AMORY, West Roxbury, Mass.—*Steam Generator*.—July 28, 1868.—The curved chamber is so constructed as to introduce and mix with the gases arising from the fuel the amount of hot air necessary to complete combustion. The air to supply the heating curve is taken from the conical chamber at the front end of the locomotive.

Claim.—1. The combination of the heating curve and its pipe or pipes for receiving air, with the fire box of the boiler, arranged and operating substantially as described.

2. The combination of the heating curve and its pipe or pipes for receiving air, with an air chamber, K, arranged and operating substantially as described.

80,266.—WILLIAM LEWIS BARNES, Irvington, N. Y.—*Shutter and Window Fastening*.—July 28, 1868; antedated July 11, 1868.—When the blind is to be fastened (closed) the hasp is placed over the staple, the sash lowered over it and bolted, and thus the fastening of both shutter and sash effected.

Claim.—The bolt F, constructed as described, and secured to the inner side of the sash A, arranged in relation with the blind hasp *a* and staple, the blind being held closed when the sash is raised, and locked by the bolt F passing through the staple, above the hasp *a*, when the sash is lowered, which movement also locks the sash, as herein shown and described.

80,267.—HENRY M. BEECHER, Plantsville, Conn., assignor to H. D. SMITH AND COMPANY, same place.—*Manufacture of Carriage Shaft Couplings*.—July 28, 1868.—At the termination of this process the coupling is ready to be finished or further shaped by dies, in a drop press.

Claim.—1. The above-described process or method of making the shaft connection blank, the same consisting in forming it with the head part A and the shank B, and subsequently cutting it through on the

lines *e e*, and finally bending the portions *f f* around into right or nearly right angles with the shank part B.

2. The machine, substantially as described, for creasing or cutting the blank, and bending the portions *f f* of it around into or nearly into right angles with the shank, such machine being composed of the bed plate and standard, the two levers, the follower, and the two pairs of creasers or cutters, the whole being arranged for use in manner as specified.

80,268.—ALONZO T. BOON and ALBERT D. PERRY, Galesburg, Ill.—*Apparatus for Carbureting Gas and Air.*—July 28, 1868.—The carbureted air passes through the emery to be carbonized, while the float automatically regulates the valve which admits gasolene to the gasometer.

Claim.—The emery receptacle F, when combined and arranged with float *h*, screw rod H, valve *m*, pipe N, and pipe *a*, substantially in the manner and for the purpose as herein shown and described.

80,269.—EDWARD BOSTOCK, Albany, N. Y.—*Tuck Creaser for Sewing Machines.*—July 28, 1868.—Relates to the class of instruments in which the creasing or marking apparatus is arranged for adjustment in relation to the needle and to a gauge plate which is attachable to the bed plate of a sewing machine.

Claim.—1. A tuck-creasing device, constructed substantially as described, in combination with the plate A, and gauge plate D, both constructed and arranged substantially as described, and the plate D serving to confine A to the bed plate, as set forth.

2. A gauge plate or guide for a sewing machine, when provided with an adjustable piece, I, having a slot, as and for the purpose set forth.

3. The gauge plate H, slide I, and creasing device combined, to admit of adjusting the apparatus in any desired position relatively to the needle and feeding device of different machines by means of a single screw.

4. The tuck creaser and gauge plate, for use with or without a sewing machine, when the whole is constructed as described.

80,270.—EDWARD BOSTOCK, Albany, N. Y.—*Tuck Creaser for Sewing Machines.*—July 28, 1868.—Relates to the class of instruments whose office is to indent a well-defined crease in fabrics, preparatory to folding down and stitching the same, in the formation of tucks, and is intended for either hand or machine sewing.

Claim.—1. The combination, with the tuck-creasing devices, of a sliding wedge, eccentric, or a slide and fixed inclined plane, on the base plate, substantially as and for the purpose shown and described.

2. In combination, the spring arm, and its creasing and pressure-adjusting devices, and the fixed stand or yoke E, substantially as and for the purpose set forth.

3. The tuck creaser and its gauge plate, constructed with their coinciding slots at an angle to the creasing arm and line of stitching, as described, so that, when affixed to a machine by means of the thumb screw and screw hole, and moved in a slanting direction for adjustment, the parallelism of the line of creasing with the line of feed may always be preserved.

4. The devices herein described, the same constituting the tuck creaser, constructed as specified.

80,271.—CHARLES T. BURCHARDT, New York, N. Y.—*Car Coupling.*—July 28, 1868.—The obliquity of the tension on the coupling, in the event of a car running off the track, pulls the spring frame and its connections to one side, the effect being to allow the hook to turn and release the link. The beveled bearings on the spring frame conduce to, or may be made to effect the holding of the spring frame and its connections in the central line of the car with sufficient force under ordinary circumstances.

Claim.—1. The car coupling, composed of the hook E¹, bearing piece H, links G, and the spring frame B, when connected with the mainspring C, all substantially as herein described and for the purposes specified.

2. The beveled or double-inclined bearings *a² a³*,

arranged relatively to the mainspring C and spring frame B and its connections, as and for the purposes herein specified.

80,272.—HENRY K. BURNETT, Poughkeepsie, N. Y.—*Harvester.*—July 28, 1868.—The shoe at the inner end of the finger bar runs upon a wheel, and the finger bar is hinged to the same in such a manner that said finger bar may be turned over and lie parallel, or nearly so, to the face of the wheel.

Claim.—1. The cams D D, rotated by the gearing B C, in combination with the arm U, roller E, and jointed pitman G, connecting the arm U to the cutter bar *h*, substantially as set forth.

2. The bar K, at the end of the finger bar H, and jointed at Q to the shoe R' and arm X, as and for the purposes set forth.

3. The shoe R', jointed to the arm X, in combination with the slotted brace I, finger bar H, and cutters *i*, arranged and operating as and for the purposes set forth.

80,273.—THOMAS CABOURG, Paris, France.—*Boot-Soling Machine.*—July 28, 1868.—The wire, when uncoiled from the pulley, passes through a hollow axle, which rotates it in a plane perpendicular to its course when unwound. It thus receives a progressive spiral motion, and in this way enters a tap and is threaded. From the tap it is guided so as to enter the leather to be united, and after penetrating to a sufficient depth it is cut by a pair of knives, which leave a point upon the succeeding part of the wire to adapt it to readily penetrate.

Claim.—1. The construction and use of the pulley A, on which is wound the wire to be tapped, substantially as herein described.

2. The construction of the tapping plate, substantially as described.

3. The construction, disposition, and simultaneous action of the knives, substantially as described, and more fully shown in the drawings.

80,274.—JOHN COLLINES, Eeorse, Mich.—*Fishing Seine.*—July 28, 1868; antedated July 18, 1868.—The braces are designed to prevent the seine from becoming entangled, fouled, or caught upon projections.

Claim.—The application of the braces marked A A, as above, to a seine or net, substantially as and for the purposes herein described.

80,275.—JOHN COOPER, Dublin, Ind., assignor to himself and BENNETT F. DE WITT, Indianapolis, Ind.—*Coal Stove.*—July 28, 1868.—The object is to secure, in connection with direct radiation, an efficient mode of supplying fresh, warm air to the room and conducting impure air from it.

Claim.—The addition D, separated from the fire chamber by the partition G, and subdivided into compartments H J by the partition I, as set forth, and, in combination therewith, the induction pipe E, education pipe F, and chamber L, arranged substantially as set forth.

80,276.—JOHN DABLE, Chicago, Ill.—*Machine for Unloading Railroad Cars.*—July 28, 1868.—The object is to prevent the rope to which the scoops or shovels are attached from slipping off the pulleys; also to avoid the clogging of the pulleys by the grain.

Claim.—1. A swing frame of a car-unloading machine, provided with head plates B B, having convex surfaces presented to the sides of pulleys C C, which are perforated and otherwise constructed, substantially as described.

2. Projections *h*, adapted to serve as guards or fenders for pulleys applied to the swinging frame of an unloading machine, substantially as described.

3. Perforated guards *h*, perforated pulleys C C, and convex surface head plates B B, applied to the swing frame of an unloading machine, substantially as described.

80,277.—ELON DENIO, Baldwinsville, N. Y., and ELON C. DENIO, New Hartford, N. Y.—*Hop Hook.*—July 28, 1868.—In the cultivation of hops the hoe, as combined with the knife, enables one to loosen the earth, bare the roots, and separate them, together with the surplus sprouts or vines.

Claim.—1. The hop cultivator, formed of the hoe

or hook, combined with the knife, substantially as and for the purposes specified.

2. The ferrule, with the raised projections or ears, and slot, or their equivalents, for securing the knife in place, in combination with the hoe or hook, of one or more tines, substantially as and for the purpose set forth.

80,278.—JACOB EDSON, Boston, Mass.—*Stops for Fore-and-Aft Sails.*—July 28, 1868.—The elastic boom stop is to be arranged on the deck athwartships through and under the boom, and a rope connects the boom with the ring, so that when the boom sways, either to port or starboard, it is checked by the elastic stop.

Claim.—1. The arrangement and combination of the saddle D with the springs H H, their rods A, and the sliders F F, connected with the ring E.

2. The arrangement and combination of the arched and annular links G G *b b* and the arms *a' a'* with the ring E, and the sliders F and springs H, applied to the rod or bar A, extending between and from abutments B B, as set forth.

80,279.—SAMUEL H. FOLSOM, Winchester, Mass.—*Furnace for Treating Ores.*—July 28, 1868.—The products of combustion pass from the fire box over and in contact with the ore upon the revolving tables to the vertical flue, through a hopper at the top of which the pulverized ore is introduced, so that it passes downward under the action of the heat within the flue, and is thus subjected to a preliminary roasting. The ore is retained in the flue, but delivered to the furnace therefrom at appropriate intervals by the intermittently rotating cylinders.

Claim.—1. A series of two or more revolving tables placed within a furnace, A, and operating substantially as described for the purpose herein set forth.

2. The revolving cylinders *m n o*, with their inclined guides, in combination with the flue G, operating substantially as described, for the purpose set forth.

3. A central deflector, O, applied to a table, C or D, for the purpose of more thoroughly distributing the flame over its surface, substantially as set forth.

4. The inclined stationary stirrers *a' b'*, in combination with a revolving table, C or D, substantially as described.

5. The scrapers *f'*, on the under surface of a table, C or D, in combination with a projecting edge or shelf *e'*, beneath the table, substantially as and for the purpose set forth.

80,280.—BARTHOLOMEW GOMMENGINGER and CHARLES W. TROTTER, Rochester N. Y.—*Stove and Furnace Grate.*—July 28, 1868.—An opening is left at the front of the grate, by dropping the middle bars, and admits a poker to pry or push off clinkers, &c., from the grate. Said opening is closed by a movable ring having a notch corresponding in size with the opening.

Claim.—1. The grate *a*, when constructed and operated in the manner and for the purpose specified.

2. In combination with the grate *a*, the sliding ring *e*, when constructed and operated in the manner and for the purpose specified.

80,281.—RICHARD GORSLINE, Rochester, N. Y.—*Lamp Burner.*—July 28, 1868.—The removable frame for holding the chimney and its attachments to the lamp, is provided with a glass bottom plate to transmit the light downward.

Claim.—The combination of the open frame D and transparent bottom plate G, when arranged in connection with the removable cone H and fixed rim C, the whole as herein set forth.

80,282.—JOHN GRACIE, Pittsburg, and ROBERT H. BOYD, Fulton Station, Pa.—*Lamp Chimney.*—July 28, 1868.—When the chimney is placed on the lamp top, and turned, the projection of the lamp-top flange binds upon the wide portion of the chimney flange.

Claim.—1. Providing a lamp chimney with an elliptical flange, substantially as herein described.

2. In combination with the above, a lamp top pro-

vided with a flange, portions of which project inward for the purpose of catching, grasping, and holding the chimney in position, the contour of said flange corresponding to the form of the flange of the lamp chimney, substantially as herein described, and for the purpose set forth.

80,283.—SEPTIMUS HASLAM, Jr., New Britain, Conn., assignor to himself and JOHN B. TALCOTT.—*Machine for Producing a Reciprocating Motion in Knitting Machines, &c.*—July 28, 1868.—An independent attachment for straight-knitting machines, the object being to produce a positive and reliable reciprocating movement which may be suspended at the required intervals. If the shipper be pressed back, the drawing-across motion will be suspended during one or more revolutions of the shaft, and while the narrowing operation is being performed, after which the spiral spring couples the parts and the entire machine is put in motion.

Claim.—1. The combination with the shaft *b* of the sleeve *d*, carrying the clutch and wheels *f f'*, and the collar *k*, and collar *i*, on the shaft, and clutch *m*, or its equivalent, substantially as described.

2. The gears *f f'*, arranged upon the sleeve *d*, in combination with the clutch *e*, plate *g*, upon the shipper *p*, and spring *s*, or their mechanical equivalents, with the gears 3 4 5 1, and chain *v*, for the purpose substantially as described.

80,284.—FREDERICK LEWIS HILBRIGHT, Newark, N. J., assignor to himself and CHARLES E. WOODMAN, Boston, Mass.—*Cigar.*—July 28, 1868.—The cap, which protects the end of the cigar against breakage, may be stamped with a trade mark for the cigar. It is composed of inflammable or fusible material so that it will burn or melt away.

Claim.—The combination and arrangement of the foraminous ferrule or cap with a cigar, the same being substantially as explained and represented.

80,285.—HENRI JULIEN, Ottawa, Canada.—*Address Printing Machine.*—July 28, 1868.—The form or galley containing the names and places of residence, set up in type, is caused to pass with an intermittent motion under a vertically reciprocating press, and on said galley the folded papers lie to be forced down by the press to receive the impression. An arrangement of mechanism is embodied in the machine to effect the operations automatically.

Claim.—1. The combination with the vertically-sliding press A of the rack B, pinion C, shaft D, spring *p*, and the mechanism for operating the shaft D, substantially as and for the purpose described.

2. The combination with the pawl P and connecting rod E of the mechanism for connecting them and disconnecting them with the parts to which they communicate motion, substantially as and for the purpose described.

80,286.—FRANCIS L. KING, Worcester, Mass.—*Machine for Dressing Stone.*—July 28, 1868.—The stones are, by the machinery, made to rub each other to a smooth surface. The curb protects the bearings of the machinery under the rotary carriage from the sand and water falling from above.

Claim.—1. The peculiar construction of the self-adjusting frame, with its shaft, gears, grooved racks, and set screw B, when constructed and operating substantially as and for the purpose specified.

2. The carriage A, spindle B, or its equivalent, apron H, constructed and operating substantially as and for the purpose specified.

3. The trucks C C, disk E, and curb I, constructed and operating substantially as and for the purpose specified.

4. Gears F and L, shaft K, constructed and operating substantially as and for the purpose specified.

5. The peculiar relative positions or adjustment of the carriage A and grinders M upon different centers, whereby the irregular or eccentric motion is produced, arranged and operating substantially as and for the purpose specified.

6. The combination of the hopper R, hollow shaft N, the grinder box M with the carriage A, with its various bearings, constructed and operating substantially as and for the purpose specified.

80,287.—WILLIAM C. KNEELAND, Brooklyn, N. Y.—*Manufacture of Cigars.*—July 28, 1868.—Consists in making the "filler" of a cigar of cut, ground, or granulated tobacco, instead of forming it in the usual manner of leaf or serap tobacco.

Claim.—As a new article of manufacture, a cigar made with a cut-tobacco filler, substantially as described.

80,288.—JOHN A. KNIGHT, Durham, Me.—*Fruit Picker.*—July 28, 1868.—The fruit detached by the toothed edge drops into the conductor and falls upon a rest, when, separating the divided sides thereof, it falls through onto the next rest, and so on, till it drops gently into the bag at the bottom.

Claim.—The fruit gatherer, as described, combining the removable had *a*, edge or teeth *z*, handle or pole *a'*, jointed conductor *i*, attached, as described, to the pole, and having the peculiarly-formed chucks *p*, as and for the purposes described.

80,289.—DAVID S. LEAVITT, Grand Rapids, Mich.—*Tables, Benches, &c.*—July 28, 1868.—The wedges hold the legs or supports rigidly in position, but may be readily detached when desired; the object being to render portable and of ready adaptation to various purposes, such articles as tables, trestles, benches, chairs, and staging.

Claim.—The combination of the dove-tail fastening *B*, hinged legs *C*, wedges or pins, and rods, when applied and used in the manner and for the purposes shown and described.

80,290.—SAMUEL M. LEE, New London, Iowa.—*Car Brake.*—July 28, 1868.—Steam being admitted into the cylinder the piston is forced back against the brake bar of the tender, one of the forks of which acts on the bar of the adjacent car and through that upon the other bars, so that the brakes are supplied simultaneously.

Claim.—In combination with an independent piston, *d*, the arrangement of a forked bar, *b*, with the tender, and a single bar, *c*, with the car, for operating said bar *c* at either end, substantially as and for the purpose described.

80,291.—JOHN LETZKUS, Alleghany City, Pa., assignor to himself and RICHARD BROWN, Youngstown, Ohio.—*Teeth for Gear Wheels.*—July 28, 1868.—The teeth engage evenly throughout their length, avoid jarring, and possess great strength.

Claim.—Curved gear teeth for wheels and pinions, the upper and lower edges of which are arcs of curves of equal radius, having their centers in the same right line, constructed substantially as and for the purpose hereinbefore described.

80,292.—THOMAS LIPPIATT, New York, N. Y.—*Rose Engine Lathe.*—July 28, 1868; antedated July 11, 1868.—As the die or pattern slides up and down, the tracing pin is thrown in and out of the depressions of the design and moves the swinging frame, which in turn throws backward the tool box and graver, thus engraving upon the cup or napkin ring a fac simile of the pattern. Certain modifications as to the arrangement of the pattern are specified.

Claim.—1. The arrangement of the swinging frame *H*, carrying a tracing pin, *e*, or an equivalent device, the vertically sliding die or pattern *J*, mandrel *K*, and engraving tool *d*, operating substantially as herein specified.

2. The arrangement of the revolving die or pattern *N*, the swinging frame *O* and tool box *F*, operating substantially as herein described.

3. The combination of the screw rod *S* and shaft *L* with the sleeve *M* and die *N*, substantially as herein specified, for giving a lateral progressive movement to the said die *N*.

4. The arrangement of the revolving die or pattern *P* on the mandrel shaft *i*, the swinging frame *H*, and tool box *F*, operating substantially as herein specified.

80,293.—GEORGE LITTLE, Hudson City, N. J.—*Telegraph Instrument.*—July 28, 1868.—The pen consists of either a body capable of being magnetized by induction, or one or more permanent magnets, and a marking point, and it is placed in a telegraph instru-

ment in such relation to a coil or coils that the closing and breaking of an electric current through the coil, or the change of direction of a circuit, will cause the pen to vibrate and make marks upon paper.

Claim.—1. The combination of a pen with a reservoir.

2. The combination of a pen, reservoir, and coil.

3. The combination of a pen, reservoir, and coil, with paper properly actuated.

4. The combination of a pen, reservoir, and properly-moved paper.

5. The combination of a pen, float, and reservoir, and all of these in combination with coil, and all of these also in combination with properly-actuated paper.

6. The combination of a pen and a reservoir, having an opening therein for the protrusion of the pen, with a regulating tube, and all of these in combination, first, with a float, second, with a coil, and third, with properly-actuated paper.

7. The combination of a pen with a reservoir of fluid and a permanent magnet properly located, and all of these in combination, first, with a float, and second, with a coil, and thirdly, with both a coil and float.

8. The combination of a pen, a reservoir, and a coil, when the reservoir is vertical, and provided with an opening at the bottom thereof, and the pen passes through the opening, and the coil surrounds the vertical reservoir, and these parts thus relatively arranged in combination with a regulating tube.

9. The combination of a pen, a vertical reservoir, open at bottom, a coil surrounding the reservoir, and a permanent magnet, located above the reservoir, and all these parts thus relatively arranged, in combination with a permanent magnet, located below the reservoir and pen.

10. The combination of the following parts, viz, a pen, a float, a reservoir of fluid, a regulating tube, a coil, and paper properly actuated, and these in combination with a permanent magnet, so located as to influence the pen, all these combinations, and the parts or elements making up the combinations, being substantially such as herein specified and set forth.

80,294.—CHARLES LOCKHART and JOHN GRACIE, Pittsburg, Pa.—*Still for Hydrocarbons.*—July 28, 1868.—The smoke, dust, and products of combustion which pass from the fire chambers are drawn into the space around the bottom of the flue, into which they pass through lateral openings. The scrapers which further the process of distillation and prevent the incrustation of the still bottom, are attached to a wheel rotating in a groove of the flue. Provision is made for carrying off the vapors at different heights.

Claim.—1. The chimney *D*, combined with a series of fire chambers, *x*, and smoke chamber *m'*, constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

2. Making the chimney *D* the axis of the wheel *7*, used for rotating the scrapers, in the manner substantially as herein described, and for the purpose set forth.

3. The arrangement of the column *e*, pipes *g* and *f*³, openings *10*, and valve *x*², constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

4. Providing a still for hydrocarbons with a valve, which will act from an internal or external pressure, substantially as herein described, and for the purpose set forth.

80,295.—BENJAMIN F. LOTRIDGE, New York, N. Y.—*Bolt.*—July 28, 1868.—When the bolt is thrown forward the tongue piece is brought directly beneath the transverse opening in the case, and then forced into the latter by the spring, thus firmly securing the bolt. The set screw may be made to raise the tongue piece into the opening whenever the spring may have lost its resilience, and when the bolt is to be released the tongue piece is depressed by the set screw.

Claim.—In combination with the slotted case *B*, the bolt *C*, tongue piece *G*, set screw *H*, and spring *D*, when the same shall be constructed and operated substantially as described, for the purposes specified.

80,296.—WILLIAM W. LYMAN, West Meriden, Conn.—*Fruit Jar.*—July 28, 1868.—The cover of the preserve jar is secured in position by a yoke which is pivoted to the cover, and whose gripe may be increased as the preserves cool, thereby causing the cover to be more effectively clamped upon the gasket.

Claim.—1. The combination of flange cap *f*, having incline or wedge elevations upon its outer edge, *g*, with a gasket seat, *d*, gasket *e*, yoke *h*, and ring *b*, substantially as and for the purpose described.

2. The combination of the flange cap *f*, elevations *g*, yoke and pin *h i*, with the gasket and seat *e d*, substantially as and for the purpose described.

80,297.—WILLIAM W. LYMAN, West Meriden, Conn., assignor to MERIDEN BRITANNIA COMPANY.—*Butter Dish.*—July 28, 1868.—When it is desirable to detach the cover from the dish it is only necessary to back out the screws by turning them in the direction the cover takes in turning off from the dish.

Claim.—The right and left hand screw-actuating fulcrum, in combination with the cover *a'* and body *a*, constructed and operating substantially as and for the purpose described.

80,298.—GEORGE H. MALLARY, New York, N. Y.—*Machinery for Making Paper Bags.*—July 28, 1868.—As the continuous sheet of paper is fed to the machine the several devices perform their respective functions of delivering the paper to a knife which cuts off a piece of suitable length for a bag, drawing such piece into the folders which produce the side laps, pressing the end lap against the pasting roller and at the same time turning it upward over the edge of the folding blade, and then moving the bag forward between pressure rollers, which join the pasted edges of the laps to the bag.

Claim.—1. The clamp, formed of the bar *L*, the shaft *K* with its lags *t*, when combined with the supporting bars *u*, substantially as set forth.

2. The clamp, formed of the slides *W* and *Y*, and the jaw *3l*, when combined with the folders *6 6'* and the cams *5 5'*, substantially as described.

3. The cross-head *Z*, the folding blade *15*, and the pasting roller *13*, when combined and arranged substantially as described.

4. The levers *D* and *E*, the crank *ec*, the clamp formed of the bar *L*, and the shaft *K* with its lags *t*, and the clamp formed of the slides *W* and *Y* and the jaw *3l*, all combined and operating substantially as described.

80,299.—GEORGE W. MARTIN, Boston, Mass., assignor to himself and J. W. HASKINS, same place.—*Manufacture of Articles of Soft Rubber.*—July 28, 1868.—The object is to produce a screw joint which shall effectively obstruct the passage of fluids and liquids.

Claim.—An elastic screw thread, substantially as described.

80,300.—GEORGE W. MARTIN, Boston, Mass., assignor to himself and J. W. HASKINS, same place.—*Cane Seat.*—July 28, 1868.—The seat is detachable and will fit within the frame whether one or another of its sides be turned to the front.

Claim.—A movable cane seat, having sunken bearings *g*, as specified, and so constructed as to be reversible, and present each side to the front, substantially as and for the purpose described.

80,301.—THADDEUS MUNSON, Canandaigua, N. Y.—*Portable Roofs for Hay Stacks, &c.*—July 28, 1868.—Cross-ties or cleats at the top brace the sections of the roof together, and the cords and stakes bind the roof to the stack.

Claim.—The combination, with the sections *A A'*, connected by hooks *a a' a''* of the bracing cleats *e e* at the top, and the cords *g g'* at the bottom, passing loosely through the rings *d d*, and attached to the bars *f f* and stakes *h*, the whole arranged as described, and operating in the manner and for the purpose set forth.

80,302.—PERSON NOYES, Lowell, Mass.—*Lamp.*—July 28, 1868; antedated July 11, 1868.—The outer

jaacket regulates the flame, and the cap or stopple prevents the escape of offensive odors from the charred end of the wick.

Claim.—The use and application of a cap or stopple, *a*, to the top end of the wick tube of a lamp which has an outer jacket, sleeve, or other similar or analogous device, when said cap or stopple is constructed and arranged to operate substantially as and for the purpose set forth.

80,303.—WILLIAM W. S. ORBETON, Bradford, Mass.—*Culinary Apparatus.*—July 28, 1868.—The purpose of this apparatus is to hold a charge of charcoal in a state of combustion, and support over the same an article to be cooked or a vessel to be heated, and supply to the fuel an upward and downward current of air to secure energetic combustion. The apparatus may be placed for use in one of the boiler openings of a stove.

Claim.—1. The improved brazier, as constructed with the main air-supply openings *a a*, &c., the auxiliary air-inducts *B B*, &c., and the eduction openings *e e*, arranged and combined together substantially in manner and so as to operate as set forth.

2. In combination therewith the annular register-supporting plate *C*, as and for the purposes described.

3. The combination of the main and auxiliary air inducts *a B*, the discharge openings *e*, the fire-pot cover *D*, the annular register and supporting plate *C*, the latter having a dome or cover applied to it in manner and for the purpose as explained.

4. The combination of the hoop or band *F* with a brazier or cooking apparatus constructed in other respects substantially as set forth, the same being for the purposes explained.

80,304.—JESSE S. PERKINS, Lake Village, N. H.—*Machine for Making Knitting-Machine Needle Shanks.*—July 28, 1868.—This machine produces from a coil of wire a succession of blanks, which, however, have to be flattened, slitted, pointed, notched, bored, and bent by other mechanism before they assume a proper form to receive the latch or tongue for closing the hook on the front end of the blank.

Claim.—The combination of friction jaws *d e*, or the equivalent thereof, and the dies and cutters *f g n o p*, arranged and provided with mechanism substantially as described, for operating them in manner and for the purpose as specified.

80,305.—PETER RASAR and D. J. MAYES, Illinois, Ill.—*Hanging for Gates.*—July 28, 1868.—The gate may be opened in either direction, caused to remain open by giving it an additional impulse, or allowed to close of itself.

Claim.—The rollers *d d'*, plate *e*, and voke *k* of a self-closing gate, when arranged in relation to each other and the rest of the gate substantially as and for the purpose specified.

80,306.—RICHARD REDFIELD AND JAMES H. REDFIELD, Salem, Ind.—*Smut Mill.*—July 28, 1868.—The spirally-arranged slots compel the grain to pass rapidly from one end to the other of the smut mill case, and the machine is otherwise so constructed as to direct the grain thrown against the shell toward its discharging end, while allowing the dust and foreign substances to escape. The perforated shell is inclosed within a dust box communicating with the fan case and with a discharge spout. The dust box has a trap which receives and automatically discharges heavy foreign substances.

Claim.—1. The arrangement of the horizontal fan *J'*, blast spout *B B'*, branch spout *B'*, partition *S'*, vibrating trough *C g*, and horizontal spirally slotted case *E y*, and horizontal beater *F j*, substantially as and for the purpose described.

2. The relative arrangement of the blast spout *B B'*, *B'*, hopper *A*, box *d d'*, vibrating roughened surface trough *C*, openings *f f'*, spout *D*, hopper *P*, horizontal case *E y*, horizontal beater *F j*, passage *T*, inclined spout *T'*, vertical spout *T''*, cap *H*, and inclined receiver *H'*, substantially as described.

80,307.—THADDEUS S. REEVE, Chicago, Ill.—*Measuring Faucet.*—July 28, 1868.—The piston being

raised by means of its rod is followed by liquid from the cask, and when the desired quantity, as indicated by the gauge, is thus drawn, the stop is closed, the gate opened, the piston depressed, and the liquid discharged.

Claim.—A measuring faucet, consisting of screw A, stop B, gate D, cylinder E, piston F, and gauge H, arranged substantially as described.

80,308.—M. A. RICHARDSON, Sherman, N. Y.—*Horse Power.*—July 28, 1868.—An automatic friction device is applied to the operating parts of a horse power in such a manner that when undue resistance is offered, the said device runs independently of the power, preventing breakage or injury.

Claim.—1. The friction brake D and nut *d* applied to the operating parts of a horse power, substantially as and for the purpose set forth.

2. The combination and arrangement of the driving wheel *l* with the friction device D *d*, in such a manner as to be removable from the bed, either separately or together, by the removal of the nut *d*, as explained.

80,309.—MARVIN S. ROBERTS, Racine, Wis.—*Peat Machine.*—July 28, 1868; antedated July 14, 1868.—The apparatus is carried on a boat which is drawn forward on watery bogs by means of a capstan, a rope, and a stake driven at an advanced point. A digging apparatus delivers the peat to a small conveyor which transfers it to a grinder having a hoop whereby the peat is conducted to a large conveyor which carries it to the shore and spreads it thereon.

Claim.—1. The digging apparatus D, consisting of box E, plunger F, and endless chain G, with buckets H H, combined and operating as described, and the whole secured to the boat A, and provided with continuous automatic movement along the semicircular curve A', by means substantially as described, or other equivalent means.

2. The mode of automatically regulating the semicircular to-and-fro movement of the digging apparatus D along the curve A', by means of double wheel *m*, lever P', and stops Q, substantially as herein set forth and specified.

3. The perforated buckets H, provided with the hinged bottom *f'* and spring catch *e'*, in combination with the guides *h''*, when arranged to operate as described.

4. The segmental gear A' and A'', arranged as described, in combination with the digging apparatus, and the mechanism for operating the same, substantially as herein described.

5. The cutting flange T of the outer pulley S of the flange F, to cut peat in the bed, and to thus facilitate the operation of the buckets, substantially as set forth.

6. The grinder Z, consisting of revolving toothed and furrowed plate B', provided with spurs D' D', and constructed as described, and of stationary furrowed concave C', provided with toothed arms *o' o'*, and operating by means of set screws *p' p'*, the whole arranged and operating substantially as set forth, for the purpose of crushing, working up, and pulping peat, as described and specified.

7. In combination with the grinder Z, the partially revolving hoop E', provided with bag F', constructed as described, and secured to the great conveyor G'.

8. The boat A, constructed as described, in combination with digging apparatus D and grinder Z, to be used on watery peat bogs, substantially as herein described.

80,310.—CLARK ROBINSON, Fox Lake, Wis.—*Thill Coupling.*—July 28, 1868.—The notch in the pivot of the socket joint permits the pivot to be detached when the thills are raised. The stop, pivoted to the strap, holds the pivot in place when in use.

Claim.—The socket D D, in combination with the pivot K, having a notch M, the strap A, and stop E, substantially as set forth and shown.

80,311.—GUSTAVE H. ROTH, Boston, Mass.—*Sad-Iron Holder.*—July 28, 1868.—The body of the guard is a flat shield having the general form of a flat iron body, and it is employed to protect the hand

of a person, while grasping the handle of a flat iron, from the heat radiated from the iron.

Claim.—1. The guard, as made with the lateral passages *e e* arranged in it, and with latches D D to embrace the parts *d d* of the handle, and cover the passages *e e*.

2. The combination and arrangement of the movable covers G G with the guard, made with the slots *e e*, and provided with latches thereto, as set forth.

80,312.—ISAAC N. SHEETS, West Jefferson, Ohio.—*Bed Bottom.*—July 28, 1868.—The levers have pivotal fulcrums and are of the first order. The outer ends of the levers are connected to the bedstead by hinges, and the inner ends of the same are attached to the bed bottom by rubber springs.

Claim.—The combination of the coiled springs G, the tension rubber springs N, and the hinged levers I, substantially as set forth.

80,313.—WILLIAM S. SINCLAIR, Baltimore, Md.—*Boiler Flue Plug.*—July 28, 1868.—The plug is inserted in the end of a leaky tube and then the wedges are introduced, expanding the plug and causing it to fit tightly in the flue. The plug is then driven home, compressing the packing around the end of the flue.

Claim.—The flanged tubular plug C, constructed with a longitudinal slot or slots, *f*, between the lugs *e*, at its inner end, and a circumferential slot or slots *g*, about in line with the end of the slots *f*, for use in combination with the wedge or wedges *d*, substantially as and for the purpose set forth.

80,314.—DANIEL SMITH, Cedar Falls, Iowa.—*Plow.*—July 28, 1868.—The object is to form mold boards for plows of a substance more durable than metal, and which shall glide with less resistance through the earth.

Claim.—1. A mold board for plows, which is made entirely of glass, substantially as described.

2. The combination of a glass mold board and a metal share, substantially as described.

3. Securing a glass mold board to a plow frame, by means of clamps *a b*, or their equivalents, substantially as described.

4. The construction of the side clamps *a b* with curved overhanging lips *a' b'*, substantially as described.

80,315.—VOLNEY M. THOMAS, Brandon, Vt.—*Culinary Apparatus.*—July 28, 1868.—Formed so as to fit into an open tea kettle, and conduct the steam therefrom to the articles to be steamed which are supported upon the grate.

Claim.—The arrangement and combination of the steam chamber A, conducting pipe D, and grate G, when constructed and operating substantially as and for the purposes herein set forth.

80,316.—L. B. WATERMAN, Chicago, Ill.—*Clothes Drier.*—July 28, 1868.

Claim.—A detachable clothes drier, consisting of the hinged bands A, having the bars B pivoted thereto, and arranged to be secured to a stove pipe by means of the brace or pawl *b*, and the ratchet, or its equivalent, of rubber, as herein described.

80,317.—EDWIN WATROUS, Mystic River, Conn.—*Coffee Mill.*—July 28, 1868.—The position of the attaching flange relative to the axis affords convenience in manipulating the adjusting screw and operating the handle. The invention also refers to the structure, the object being to facilitate manufacture.

Claim.—1. The grinding mill, in which the flange or attaching device is placed at an inclination to the axis of the mill, for the purposes and substantially as set forth.

2. The hollow clamping washer 7, in combination with the lug 8, on the flange *h*, for attaching the mill when the parts are slipped behind the screw heads, substantially as shown.

3. The flanges 1, 2, and 3, constructed and applied, as shown, to the shell *b c*, in combination with the hopper for attaching the latter, in the manner herein set forth.

80,318.—THOMAS W. WELCH and GEORGE B. STARBUCK, Mechanicsburg, Pa.—*Foundation for*

Fences.—July 28, 1868.—This metallic support or foundation, which is to be inserted in the earth, is intended to prevent the superposed post from assuming an inclined position.

Claim.—The part A A, the parts B B, the parts C C, the octagonal or round top D D, the notched cross bar E, the conical or pyramidal parts F F F F, &c., and the bolts and burrs H H, all combined and operating in the manner and for the purpose herein set forth

80,319.—JOSEPH L. WETHERELL, Attleboro, Mass.—*Pad for Horses' Hoofs.*—July 28, 1868.—The cushion is applied between the sole of the hoof and the horseshoe. The flanges, by bearing against the hoof and the shoe, keep the body of the cushion in place.

Claim.—An improved elastic heel cushion, as made with the two flanges *a a*, arranged and combined with its body, and for use, substantially as specified.

80,320.—WILLIAM WICKERSHAM, Boston, Mass.—*Railway Chair.*—July 28, 1868.—The spring impels the wedge forward and thus compensates for wear. The invention also refers to a fastening wedge which is moved by another wedge operating by gravity to compensate for wear.

Claim.—1. In railway-rail chairs, the wedge *c*, in combination with the spring *i* and the chair, operating substantially in the manner and for the purpose set forth.

2. The wedge *d*, in combination with the wedge *e* and the chair, substantially in the manner and for the purpose set forth.

80,321.—WILLIAM H. WILEY, Fredonia, N. Y.—*Method of Supporting Chills in Casting.*—July 28, 1868.—The pedestals, on account of the bearing surface they present, are securely maintained in their proper position in the flask, which insures an accurate support for the chill iron without liability to derangement.

Claim.—The pedestals C C', constructed and manipulated with the flask and pattern, and supporting the chill iron D, substantially as and for the purpose set forth.

83,322.—GEORGE H. C. WILLIAMS, Chicago, Ill.—*Ottoman Lounge.*—July 28, 1868.—By raising the cover of the upholstered box which constitutes an ottoman, the section which is extended to form a bed may be replaced in said box. There is a receptacle for bedding.

Claim.—The ottoman lounge, consisting of the main body A, extension section A'', hinged to end board J, and provided with foot piece F and head board E, rod I, hinges 2 4 3, and receptacle H, when combined, constructed, arranged, and operating as herein shown and described.

80,323.—WILLIAM WILMINGTON, Toledo, Ohio.—*Car Wheel.*—July 28, 1868.—The forcing outward of the chill-hardening melted iron, first poured into the mold, by the melted softer iron immediately after poured into the same, causes an intermingling and perfect union of the two at and near their circle of contact. The chill-hardening iron forms the rim, while the softer and tougher iron forms the hub and plate or plates.

Claim.—The within-described cast-iron car wheel, the said wheel being produced by the use of two qualities of iron, and by substantially the process herein described.

80,324.—GEORGE W. WILSON, Concord, N. H., assignor to JOHN W. LITTLE, same place.—*Cane and Telescope Combined.*—July 28, 1868.—By detaching the point and handle the cane is converted into a telescope, adjustable to focus by means of an internal tube. By detaching the head of the cane and removing its cap an opera glass is afforded thereby.

Claim.—A cane with the telescope and opera glass, either or both, combined and adjusted substantially as described.

80,325.—NELSON WOODBURY, Chelsea, Mass., assignor to WILLIAM WOODBURY, same place.—*Pendants for Sheets of Fore and Aft Sails.*—July 28,

1868.—By attaching the sheet to a pendant connected with a spring, the shock and consequent wear and strain of the parts is prevented.

Claim.—The combination of a spring, a pendant, and an eye through which the pendant passes, or their equivalents, all substantially as and for the purpose specified.

80,326.—F. S. WYMAN, Chicago, Ill.—*Can Opener.*—July 28, 1868.—Square and longitudinal openings may be made in fruit cans with the same instrument that is employed to make round holes.

Claim.—The knife C, rigidly attached to the adjustable plate F of a "circular can opener," and constructed to operate substantially as herein set forth.

80,327.—BENJAMIN F. BEE, Harwich, Mass., assignor to the NEW YORK TAP AND DIE COMPANY, New York City.—*Centering Lathe.*—July 28, 1868.—Designed for adjusting the ends of articles in line with the bit of the lathe so that center holes may be properly drilled in said ends in order that they may be fitted centrally in a turning lathe.

Claim.—The two slides H I, provided respectively with the jaws M L, in connection with top plate K connected with the treadle N and the springs *d d'*, all arranged and applied to a centering lathe to operate in the manner substantially as and for the purpose set forth.

80,328.—ROBERT BERRYMAN, Philadelphia, Pa.—*Indicator for Steam Generators.*—July 28, 1868.—Two valves are arranged in the upper part of the cylinder, one of which is raised by excessive pressure of steam and acts as an ordinary safety valve, while the other is lowered by a weight when either the pressure of steam or quantity of water is reducing to a certain extent. When either of the valves is opened a whistle is blown.

Claim.—The arrangement of the vessel A, spindle C, guide *g*, valve *d*, adjustable float F, whistle B, lever E, weight D, safety valve G, weighted lever H, and whistle I, as herein described, for the purpose specified.

80,329.—FREDERICH MAX BODE, Vienna, Austria, assignor to C. B. MUELLER, Hanover, Prussia.—*Coffee Roaster.*—July 28, 1868.—The cover for the neck is attached to a rod that passes through or is braced by the upright portion of the stationary handle. Said rod is a part of the operating crank or handle. When the cover is held against the mouth of the neck and the handle turned, the engagement of the lugs causes the shell to turn.

Claim.—1. Arranging the mouth of the shell A so that it projects through the jacket B, as described, so that the contents of the shell can be easily inspected during operation, without requiring the removal of the apparatus from the stove.

2. A revolving coffee roaster which turns on an inclined axis, substantially as herein shown and described.

3. The cover D of the revolving spherical vessel A, when so arranged that it serves at once as a cover and as a clutch for connecting the said vessel with its crank handle, as specified.

4. The construction and combination with each other of the spherical vessel A, having the cylindrical neck *a*, and the pin *b* of the jacket B, with its flange *c*, and of the handle C, cover D, and handle E, all made and operating substantially as herein shown and described.

80,330.—B. F. BURGESS, Jr., Boston, Mass.—*Window Scrubber.*—July 28, 1868.—When the wiping cloth rolls on to one rod it unrolls from the other; it covers one side of the revolving frame, while a wash cloth, suitably attached, covers the other side.

Claim.—A window wiper, constructed substantially as described, that is, by the combination of the supporting frame B and the rotating frame C, arranged substantially as shown, whereby the cloth is attached to the frame, and operated as and for the purposes described.

80,331.—JOHN CALLAGHAN, St. Louis, Mo., assignor to himself and JOB NEWTON, same place.—*Track Clearer for Railroads.*—July 28, 1868.—The

roller supports the scraper at the desired distance from the rail, and the spring catch is for sustaining the scraper, &c., in an elevated position when not in use.

Claim.—The track clearer, constructed as described, consisting of the curved bifurcated beam A, bearing upon its arms *a a'* the scraper G, with roller J and the brush S, said beam extending upward in a forward direction, through the slotted plate D, having the spring catch I, and pivoted between the plates H, secured to the under side of the track frame B, all arranged and operating as described, for the purpose specified.

80,332.—JOHN V. CHAMBERLIN, Cincinnati, assignor to himself, S. D. PATERSON, and JOHN V. road Switches.—July 28, 1868.—The cam is turned by a key, so as to raise the slide and bolt and permit the switch lever to be moved. The device is self-locking, the parts gravitating to the position of engagement with the switch stand.

Claim.—A switch lock, composed of the bolt D, slide E, and the cam F, all arranged within a suitable case, A, attached to the switch bar B, substantially as herein shown and described.

80,333.—SYLVESTER CHARNLEY, Portage City, Wis.—*Oil Cup.*—July 28, 1868.—The cup is screwed into the connecting rod of an engine, over the journal, and is thus moved up and down, causing the valve to open and close and discharge the oil as rapidly as the speed of the engine may demand.

Claim.—The valve D, having a triangular stem, (as shown in Fig. 3.) the regulating screw E, valve F, spring *g*, and cage B, when arranged in an oil cup, substantially as described, for the purposes set forth.

80,334.—WILLIAM CLAYTON, Bristol, Conn.—*Table Cutlery.*—July 28, 1868.

Claim.—Securing the bolster of a knife or fork to the handle and shank of the same by means of a metal block, D, which is cast through a slot, *b*, and around the bolster and seales or handle, substantially as herein shown and described.

80,335.—PASCHAL COLVIN, Peatonica, Ill.—*Cheese Vat.*—July 28, 1868.—The stirring frame, mounted in the place of the cutting frame, is employed during the operation of scalding, salting, and cooling. The cutting frame separates the curd into cakes of suitable size to permit the elimination of the whey. The curd is extruded through the spout and the whey allowed to escape through the plug thereof. The circulating pipe merges into a coil and diffuses the heat throughout the water space. The eccentric wheels serve to tilt the vat.

Claim.—1. The semicircular cheese vat, composed of the shells I and J, having shaft bearings *t t*, furnace D, and spout Q, substantially as shown and described, and for the purpose set forth.

2. The cutting frame B, composed of longitudinal and transverse cutters *a a* and *b b*, respectively, or their equivalent, and the shaft A and crank B, in combination with a semicircular cheese vat, substantially as shown and described, and for the purpose set forth.

3. The stirring frame, constructed, as described, of the curved paddles N, attached to the arms P, curved in opposite directions upon the shaft A, the outer ends of one series of paddles being inclined in a reverse direction to the inclination given the ends of the other series, as herein described, for the purpose specified.

4. The circulating pipe *iii*, substantially as shown and described, in combination with the semicircular cheese vat and furnace D, all substantially as shown and described, and for the purpose set forth.

5. The shaft *r*, bearing eccentric wheels *q q*, in combination with a cheese vat, substantially as shown and described, and for the purpose set forth.

80,336.—PHILIPP CRAMER, Providence, R. I.—*Clothes Wringer.*—July 28, 1868.—Above the lowest roller an elastic roller is fitted loosely between rollers attached to the respective frames, and when the clothes are passed between the two lower rollers, the

tendency of said elastic roller is to force apart the upper ends of said frames, causing their lower ends to firmly clamp the edge of the tub.

Claim.—1. The combination of the frames A D, rollers B, C, E, and F, and rods *c c*, with each other, all made and operating substantially as herein shown and described, for the purpose specified.

2. The elastic scraper *j*, to clear the surface of the roller C, when arranged in combination with a wringer, made as set forth.

80,337.—WILLIAM P. CUTTER, Chelsea, Mass.—*Level.*—July 28, 1868.—A method of fitting the pendulum in the wooden stock, whereby to guard against breakage, but facilitate repair if injury should occur.

Claim.—The level, constructed as described, of the two flanged rings, B, inserted in the stock A, from opposite sides, and each provided, near their inner ends, with cross bars C, whose points of intersection furnish bearings for the pivots of the weighted angular pendulum D, as herein shown and described.

80,338.—HENRY A. DANIELS, Thomaston, Conn.—*Sawing Machine.*—July 28, 1868.—Relates to improvement of the sawing machine patented by same party November 6, 1866.

By placing the bearings of the crank shaft in the slide of the saw frame, the distance between the working and swinging centers is maintained, and a regular motion produced.

Claim.—Hanging the shaft C, by which the saw frame E is oscillated, in the slide B, to which said saw frame is pivoted, as herein described, for the purpose specified.

80,339.—PHYLANDER DANIELS, Jackson, Mich.—*Dumping Car.*—July 28, 1868.—The platform is provided with racks and pinions, so that the turning of a crank carries the platform to the edge of the ear, where it tilts to dump the load; hooks and staples engage and form pivots for the platform to tilt upon and serve to prevent it from sliding off.

Claim.—A ear-dumping bed, provided with means for actuating it, substantially as and for the purpose described.

80,340.—WILLIAM DILL, Houma, La.—*Apparatus for Clarifying Sugar Juice.*—July 28, 1868.—The centrifugal force generated by the rapid rotation of the strainer causes the juice to flow up to and discharge through the perforations around its upper edge, whereby it is effectively brought in contact with the gas which pervades the curb. The jets of juice are met by currents of gas, produced by the vanes.

Claim.—1. The combination with the curb A of the rotating strainer G, when constructed substantially as and for the purpose described.

2. The combination with the strainer G of the vanes K, substantially as and for the purpose described.

3. The rotary strainer G, constructed and arranged substantially as and for the purpose described.

4. The combination of the strainer F with the curb A and rotary strainer G, substantially as and for the purpose described.

80,341.—GEORGE E. EASTMAN, Washington Mills, N. Y.—*Pail Ear.*—July 28, 1868.—An intermediate stay or thin plate connects the main plate with the branching stay, strengthens the main plate, and secures it against injurious lateral strain.

Claim.—A pail ear, constructed substantially as and for the purposes herein shown and described.

80,342.—N. EVINGER, Terre Haute, Ind.—*Evaporator.*—July 28, 1868.—The juice having been slowly boiled in the deep boiler or pan is drawn off into one of the finishing pans through a cock, whose orifice is guarded by a strainer attached to a removable gate. The semi-tubular cover is used to keep back or retain the matter that would retard granulation. A hand hook is employed for shifting the finishing pans upon the furnace, and drawing them upon a rack or frame where the pans are tilted to pour out the syrup.

Claim.—1. The furnace A, constructed in three

parts, $a^1 a^2 a^3$, and arranged substantially as herein shown and described, and for the purpose set forth.

2. The combination of the three pans or boilers C H and I, constructed as described, with each other and with the parts $a^1 a^2 a^3$ of the furnace A, substantially as herein shown and described, and for the purpose set forth.

3. The straining device, constructed as described, of the sliding gate G, carrying the semi-conical strainer F, inclosed by the semi-tubular cover E, all arranged in relation with the faucet D and side of the pan C, as herein described, for the purpose specified.

4. The combination of the frame or rack J with the parts a^2 and a^3 of the furnace A, and with the pans H I, substantially as herein shown and described, and for the purpose set forth.

5. The hand hook K, constructed substantially as herein shown and described, when used in connection with the pans H I, as and for the purpose set forth.

80,343.—LOUIS FELLMEIMER, New York, N. Y.—*Clasp for Hoop Skirts.*—July 28, 1868.—A mode of fastening the tapes to the steel springs of hoop skirts.

Claim.—1. Fastening the steel, A, to the eyelet C, bearing the tape B, by passing the same through holes bored transversely through each side of the eyelet, and then crushing down the inner ends of said eyelet upon the steel, as herein shown and described.

2. Boring holes transversely through the sides of the eyelet C for the passage of the steel A, whereby said steel is secured to the eyelet inside the tape B, as and for the purpose specified.

80,344.—EDWIN FERNALD, Turner, Me.—*Device for Holding Tools Against Grindstones.*—July 28, 1868.—The tool to be ground is secured in the front end of the shoe, by the movement of which on the horizontal rod the tool is drawn across the periphery of the grindstone. Provision is made for raising and lowering the front end of the shoe to adapt the device to the work in hand.

Claim.—The vertically adjustable jointed bar H, bearing the wheel j , in combination with the guide G and horizontally-traveling shoe F, as herein described, for the purpose specified.

80,345.—STEPHEN FRENCH, Orange, Mass.—*Sewing Machine.*—July 28, 1868.—Relates to an oscillating shuttle driver and a double cam feed motion, the length of the feed and of the stitch being determined by an adjustable stop and lug.

Claim.—The arrangement of the cams H, i , j , upon shaft E; the pivoted lever G, having wings h ; the shuttle slide f , spring k , feed I, having lug l , and adjustable stop m , all constructed to operate in the manner and for the purposes substantially as herein set forth and shown, for the purposes specified.

80,346.—J. W. GLOVER, WILLIAM B. ORNER, and B. E. ORNER, Martinsville, Ind.—*Scaffolding.*—July 28, 1868.—The metallic saddles, with their pins for the ratchet teeth to catch upon, are fixed to the upper tie beam of the frame to be raised. The central ratchet shore is actuated by a lever to raise the frame by successive impulses, the attained elevation being maintained by the gravitating ratchet props.

Claim.—The employment of ratchet shores, saddles, and levers as a device or devices for raising the frames of houses, all substantially as shown and described.

80,347.—E. A. GOODES, Philadelphia, Pa., assignor to himself, E. L. MILLER, and W. H. MORFORD, same place.—*Nutmeg Grater.*—July 28, 1868.—A plunger is provided for forcing the vegetables against the cylinder, and another plunger clears out the particles which collect in the grating cylinder.

Claim.—The grater, consisting of the grating cylinder B, provided with crank handle E and plunger a , having rod c , and the plunger C G, with its handle D, all constructed and arranged within the case A, to operate as herein shown and described, for the purpose specified.

80,348.—JOSEPH M. GROVE and HENRY HENDRICK, Anderson, Ind.—*Machine for Bending Sheet Metal.*—July 28, 1868.—Machine for bending sheets into oval form for making wash boilers, &c. A cam is combined with the movable roller of an ordinary bending machine, so as to govern the form of the sheet which is bent by the rolls.

Claim.—The combination with the rollers of a bending machine of the cam i , substantially as and for the purpose described.

80,349.—J. D. HIGGINS, Greenville, Conn.—*Hand Punch.*—July 28, 1868.—The punch is guided so as to be brought perpendicularly against the die or lower jaw, thereby securing direct and effective action.

Claim.—The detached tubular punch G, in combination with the guide box F, formed upon the jaw D, the slotted spring H, and operating jaw C, all arranged and operating as described, for the purpose specified.

80,350.—JAMES HOFFMAN, Belvidere, N. J.—*Tanner's Hook.*—July 28, 1868.—An instrument to facilitate the manipulation of hides in the vat.

Claim.—1. Pivoting a lever hook, C, to the shank of a tanner's hook, B, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the lever hook C, connecting rod D, sliding ring E, sliding rods F, one or more sliding rings G, and the coiled spring H, with each other and with the hook B and handle A, substantially as herein shown and described, and for the purpose set forth.

80,351.—HENRY HOWE, Oneonta, N. Y.—*Bolt Cutter.*—July 28, 1868.—Reciprocating motion is imparted to the cutter by means of the cam and spring catch. To facilitate the effective motion of the cutter its end is provided with an arm, against which the initial impulse of the cam is received.

Claim.—The combination of the slotted plate B, cam D, spring catch b , and projecting arm c , all made and operating substantially as herein shown and described.

80,352.—M. G. IMBACH and I. WEIDENMAN, Hartford, Conn.—*Paper Cap.*—July 28, 1868.—The and band are distinct parts, so that the former crown may be renewed or replaced.

Claim.—As a new article of manufacture, a paper cap, having its crown formed by cutting from a rectangular sheet of paper a series of gores, or triangles, leaving them united at their bases, and having their vertices united at a common center, by means of the button C, said crown being secured to the band D, as herein described, for the purpose specified.

80,353.—RICHARD JONAS, New York, N. Y.—*Ointment for Horses, Cattle, &c.*—July 28, 1868.—Mutton suet, beef suet, hogs' lard, Venice turpentine, white turpentine, beeswax, honey, balsam of fir, castile soap, and verdigris.

Claim.—An ointment composed of the above-mentioned ingredients in about the proportions named and for the purposes set forth.

80,354.—PETER KENDRICK, Trenton, N. J.—*Machine for Flattening and Bending Chain Links.*—July 28, 1868.—The links required for the manufacture of each chain are of two sizes, and this invention provides for the flattening and bending, in one machine, of the rods of which the two kinds are formed.

Claim.—1. The arrangement of the plungers J J', rolls M M', guides K K', I I', cross heads H H', connecting rods O G, shafts C D, eccentrics P E, crank N, dies Q S, and guide R, with relation to the bed A, substantially as herein shown and described, for the purposes specified.

2. The combination of the grooved dies Q S, arranged as described, with the bending mechanism, all substantially as set forth.

80,355.—J. F. LESLIE and EDWIN A. TIBBETTS, Woburn, Mass.—*Nursery Cup.*—July 28, 1868.—The lid is adapted to contain alcohol and support the cup over the same when burning.

Claim.—The nursery cup, when its cover B is pro

vided with the stays E, and ring, whereby it is adapted to be reversed to support said cup and form a heater, as herein shown and described.

80,356.—J. C. LEONARD and J. J. GOBAR, Clinton, Mo.—*Subsoil Attachment for Plows.*—July 28, 1868.—The auxiliary plow is attached to the ordinary plow by a hook, fastened to the beam of the former and catching upon a bar extending from the land-side to the share of the latter.

Claim.—The subsoil plow A, constructed substantially as described, in combination with the sod or other plow C, all as set forth.

80,357.—ENOCH LOCKHART and FRANK ROBERTS, Louisville, Ky., and HENRY KNIGHT, Brooklyn, N. Y.—*Branch Cement Pipe.*—July 28, 1868.—A method of molding the branch pipe with the main pipe. When the mold is filled with the cement the keys and the branch core are removed and the mold (with the pipe) is lifted off the main core.

Claim.—1. The cores D and C, the collars G and J, the core pin E, with the key F, arranged substantially as described, for the purposes set forth.

2. The key F, in combination with the cores C D, as herein described, for the purpose specified.

80,358.—THOMAS J. LOWRY, Couneantville, Pa.—*Mold for Building Blocks.*—July 28, 1868.—These molds form blocks with dovetailed grooves in their ends or sides, designed to receive cement for scouring the blocks together in forming a wall. The molding apparatus is mounted as upon a wheelbarrow.

Claim.—The construction and arrangement of the improved mold for building blocks, operated as herein described.

80,359.—LAFAYETTE LYONS, Bennington, Vt.—*Water Wheel.*—July 28, 1868.—The water acts upon the buckets perpendicularly, and is discharged through openings in the cover into a circular chamber from which lateral tubes conduct it away through the curb.

Claim.—A water wheel, having a cylindrical or conical core, A, provided with the curved buckets C, and arranged in a curb, D, provided with the supply and discharge passages K, G, and H, substantially as and for the purpose described.

80,360.—THOMAS MCCREARY, Matteawan, N. Y., assignor to himself, GEORGE M. SULLIVAN, and JOHN MCCREARY, same place.—*Carriage Clip.*—July 28, 1868.—The pivot is secured to the end of the thill iron and not to the clip, as is usual. It is hung loosely in the ears of the clip and locked to the same by the spring catch.

Claim.—1. A carriage clip, in which the pivot C is swiveled in the haft, and inserted from above, into the slotted ears of the clip, and fastened to the latter by means of a spring catch, E, or its equivalent.

2. The strap D, when rigidly secured to the pivot pin C of a carriage clip, for holding the spring catch E, and for preventing the pin from turning, as set forth.

3. A carriage-thill coupling, consisting of the clip A, shaft B, pin C, strap D, and catch E, all made and operating substantially as herein shown and described.

80,361.—E. MCLANE, Young America, Ill.—*Smut Machine.*—July 28, 1868.—The cleansed grain falls through the spout, into the passage in the blast spout, where it is subjected to a second blast. The suction of the fan draws the smut and light matter from the scouring cylinder into the upper compartment of the casing, and the valve in the blast chamber regulates the amount of grain drawn into said compartment.

Claim.—The passage *f*, in the blast spout H, provided with the valve *g*, when arranged in relation with the spout G, and fan B, to operate substantially as and for the purpose set forth.

80,362.—AMZI C. MILLS, Oaktown, Ind.—*Corn Sheller.*—July 28, 1868.—The ear of corn is pressed forward by hand against the curved knives which remove the kernels from one side of the ear at each operation.

Claim.—An improved corn sheller, formed by the

combination of the curved slats or knives with the frame or conductor A, substantially as herein shown and described, and for the purpose set forth.

80,363.—WILLIAM F. MOSSER, Allentown, Pa.—*Machine for Dressing Slate Frames.*—July 28, 1868.—Each slat is automatically fed from a pile, has its corners rounded off and its edges dressed, and is then fed cornerwise to the revolving planers, by which both sides of the frame are dressed.

Claim.—1. The sliding frames Y, which carry the cutter shafts M and cutters W, in combination with the revolving table L, when constructed and operating substantially as herein shown and described, and for the purpose set forth.

2. The arms S', operated by the cam U' through the arm V', to spread the cutter frames Y, as herein described, for the purpose specified.

3. Holding the cutters up to their work by means of the bar F', acting upon the strap Δ' that drives them, arranged substantially as herein described and shown.

4. The presser or holder Q, constructed and operating substantially as herein shown and described, in combination with the revolving table L, as and for the purpose set forth.

5. The angular, pivoted stop I', in combination with the angular pusher J', substantially as described, for the purpose specified.

6. The pushers E and J', operated as described, adapted to move the slats to the cutters W and Q' respectively, substantially as herein shown and described.

80,364.—ISAAC J. PARKER, Buffalo Grove, Iowa.—*Fence-Post Driver.*—July 28, 1868.—The rollers hold the stakes while they are being driven. The sliding bar is moved into engagement with the notch of the hammer, and after the hammer has been raised by the windlass the bar is retracted, to permit the hammer to fall upon the stakes.

Claim.—1. The hammer shaft D, in combination with the sliding bar F and the windlass I, the former being connected to the latter by a rope, H, passing over a pulley, *a*, and all arranged to operate in the manner substantially as and for the purpose set forth.

2. The fixed and adjustable rollers J J', in combination with the hammer shaft D and the bar F, substantially as and for the purpose specified.

80,365.—HOBART D. PENNOYER, Athens, N. Y.—*Auger Handle.*—July 28, 1868.—The top piece fits on the upper end of the auger shank and receives the handle. When there is not room to turn the handle entirely around the spring catch may be disengaged from the lower part, when the boring may be performed by giving the handle a reciprocating motion.

Claim.—The auger top, constructed, as described, of the parts *a b*, secured together by the bolt *e*, and provided respectively with the spring pawls *h* and ratchet teeth *i*, the upper part *a* having the loop *f*, and spring catch B, and the lower part recessed to receive the shank of the auger, all arranged and operating as described, for the purpose specified.

80,366.—WILLIAM SMITH, Whitehall, Bridesburg, Pa.—*Boots and Shoes.*—July 28, 1868.—The inserted strips protect the sole from wear, and are renewable.

Claim.—1. The application to the soles of boots and shoes of strips, B, of wood, metal, or other suitable material, having beveled sides, and fitted in grooves in the sole, the grooves having dovetail sides, to correspond to the sides of the strips.

2. Cutting transversely the inner surfaces of said strips B, in order to render them yielding or flexible, substantially as shown and described.

80,367.—JOHN A. SMITH, Lacon, Ill.—*Extension Ladder.*—July 28, 1868.—Stop bolts or adjusting screws are actuated by springs so as to lock the sections together in the desired relative positions. A partial rotation causes the bolts to be detained when retracted from their locking position. When the ladder is extended the braces rest against the wall of the building to support the middle part.

Claim.—The extension ladder, constructed as de-

scribed, of the three sections A B C, sliding in grooves one within the other, and provided with the adjusting screws E F and the adjustable braces G, composed of the rods $g^1 g^2 g^3$, all arranged as described, for the purpose specified.

80,368.—HARRISON S. SNOW and EDGAR J. HUNKINS, Macon, Mo.—*Cement for Roofing, &c.*—July 28, 1868.—Sand, "Rosedale cement," iron turnings, calcined fire clay, redneed slate, salt, sal-ammoniac, and yellow ochre, Venetian red or other pigment.
Claim.—A fire and water-proof cement, composed of the ingredients and in the manner and proportions substantially as herein described.

80,369.—JOHN G. SPATHELF, Sandusky, Ohio.—*Door Lock.*—July 28, 1868.—The end of the key spindle is wedge-shaped, so that it will force the two plates apart and admit of the insertion of the key.
Claim.—The sliding plates F F, when arranged on the inner side of the covering plate of a lock case, and when forced together by means of springs $e e$, substantially as described, so as to close the key hole, as set forth.

80,370.—WARD SPRAGUE, Sandy Creek, N. Y.—*Liquid Measure.*—July 28, 1868.—Designed to facilitate the measuring and pouring out of viscid liquids, such as molasses and sirup, especially during cold weather. Warm water in the surrounding chamber increases the fluidity of the contents of the measure.
Claim.—The liquid measure, constructed with the walls $a a$ and fluid chamber c , all constructed as and for the purpose described.

80,371.—A. STEWARD, Plano, Ill.—*Ruffling Attachment for Sewing Machines.*—July 28, 1868.—Prominences or friction points incline the edge of the cloth to run in contact with the body of the guide, but not enough to disturb the proper feeding; hence the draught of the feeding apparatus, in connection with the friction, keeps the cloth properly in the guide, without being fingered by the operator.
Claim.—In combination with the presser foot and the ruffling attachment, the guide A, having the lips, tongue, and friction points, substantially as described.

80,372.—BARNETT TAYLOR, Forestville, Minn.—*Grain Register.*—July 28, 1868.—The box is provided with a yielding top which is actuated downward by the weight of a measure of grain, said top being connected with mechanism to register the number of times it is depressed.

Claim.—1. The hinged top B or its equivalent, in combination with a shaft, D, pointer a , ratchet wheel Q, and sliding upright M, and one or more pawls, all substantially as shown and described and for the purpose set forth.

2. The hinged top B or its equivalent, in combination with the sliding upright M, with one or more pawls or their equivalent, the screw shaft D and nut E, all substantially as and for the purpose shown and described.

3. The closed box, having a hinged top, B, the vibrating of which actuates the interior registering machine of the said box, by means of a sliding upright, M, all substantially as shown and described, and for the purpose of registering measures of grain by the weight of the same, all as set forth.

4. The bell plate L, clapper Z, lever Y, toothed wheel C, and sliding upright and ratchet wheel, all substantially as shown and described, in combination with the yielding top B, all as and for the purpose set forth.

5. The graduated circle U and scale b , substantially as shown and described, in combination with the pointers a and c , screw shaft D, and nut E, all as and for the purpose set forth.

6. Sliding upright M, spring J, and hinged top B of a closed box containing any registering mechanism, all substantially as shown and described and for the purpose set forth.

7. The screw shaft D, nut E, pointer c , scale b , pointer a on the said shaft, and graduated circle U, all constructed and operating substantially as shown and described and for the purpose set forth.

80,373.—CHARLES WACK, Evansville, Ind., assignor to himself, CHARLES MILLER, and A. STEINBACH, same place.—*Back-Band Hook.*—July 28, 1868.—The strap passes over the horse's back and the hooks hang at each side, to support the draught chains, used in plowing, &c.

Claim.—As a new article of manufacture, the back-band hook, constructed as described, of the plate B, cast or formed with the hook A, whose upper portion is bent in at $e f$, said plate being adapted for riveting to the strap C, as herein shown and described, for the purpose specified.

80,374.—ZERA WATERS, Bloomington, Ill.—*Hat Holder.*—July 28, 1868.—A number of such hat holders may be arranged in a rack, each having its particular key, and when a hotel guest, or person attending any public place, wishes to secure his hat, he places it on one of these, shuts down the rod, and takes away the key.

Claim.—1. A rod, B b , having any suitable lock joint, substantially as described, in combination with the hat rest A a , all as and for the purpose set forth.

2. The lock mechanism, substantially as described, in combination with a rod, B b , and rest A a , all as and for the purpose set forth.

80,375.—MARCUS BROWN WESTHEAD, Manchester, England.—*Ribbon-Roll Clip.*—July 28, 1868.—The clip clamps the end of narrow textile fabrics when coiled into a roll, and permits any part of the tape to be withdrawn or pulled out, while the tape is held in the usual manner.

Claim.—The flanged clip or slide, substantially as herein set forth, for the purpose of putting up tape or ribbon rolls.

80,376.—CYRUS B. WHITE, Port Richmond, N. Y.—*Gib and Self-Oiler.*—July 28, 1868.—The object is to avoid the waste of oil by the motion of the cross head, and at the same time secure the effective bearing of the friction roller against the guide. It is a self-lubricating gib for steam engines, and designed as an improvement on the device patented by William A. Devon, November 19, 1867.

Claim.—1. The partition plate e in the cup C, for the purpose of separating the oil from the roller D, and preventing the former being discharged from the cup under the reciprocating motion of the cross head and gib.

2. In combination with the above, the roller slide $f h$, arranged in grooves g , in the sides of the compartment d , substantially as described, and for the purpose set forth.

3. The combination of the roller D, wick E, and the cup C, divided into two compartments by the partition plate e , substantially as and for the purpose specified.

80,377.—JOB WHITEHEAD, Ames Station, Iowa.—*Carriage.*—July 28, 1868.—The coiled springs upon the framework of the body of the vehicle may be wound up by a crank and made to transmit motion to the axle of the hind wheels through the medium of belts.

Claim.—The combination of the springs I, shafts H, ratchets L, pawls M, pulleys K, with the cross piece F and framing, and with the pulleys O and axles B, when constructed and arranged substantially as and for the purpose described.

80,378.—RUFUS WRIGHT, New York, N. Y., assignor to himself and J. B. CHADWICK, New Haven, Conn.—*Crayon Holder.*—July 28, 1868.—The crayon when placed in the holder is pressed at four points, and being held by the screw nut cannot work loose.

Claim.—As an improved article of manufacture, a crayon holder, having its split ends made angular, and provided with screw threads at opposite angles for the reception of the screw nuts C, as herein shown and described.

80,379.—WILLIAM YOUNG, Jr., Franklin, Mass., assignor to himself and CHARLES LOWELL, same place.—*Door Mat.*—July 28, 1868.

Claim.—As an improved article of manufacture, a door mat, having two neat wiping surfaces, com-

posed of the rope C, wound spirally around the longitudinal wooden bars A, and rounded bars D secured to the top and bottom of said bars A, all clamped together by the transverse rods and nuts, as herein shown and described.

80,380.—ANSON ATWOOD, New York, N. Y.—*Car Wheel.*—July 28, 1868.—The internal curves of the renewable rim and the external curves of the interior or nave part of the wheel constitute corresponding eccentrics, so that when the corresponding parts are placed together and turned in opposite directions, they are firmly united. The contiguous curved parts are also beveled to hold them against lateral separation in one direction, while headed bolts and washers, or flanges or brackets, are employed to hold the parts against relative movement in the opposite direction.

Claim.—1. The construction of the exterior part of the car wheel with the ordinary chilled rim, or the rim with a part of the plate attached, having the interior edge thereof with introcessions and projections formed by eccentric curves, as and for the purpose before described.

2. The exterior and interior parts of the wheel in combination, constructed and fitted to one another in either of the modes above specified, forming the entire wheel, with the manner of putting the two parts together, and keeping them in place while in use, as and for the purpose before described.

80,381.—HAYDN M. BAKER, Harlem, N. Y.—*Cleaning Cotton Waste.*—July 28, 1868.—The saturated cotton waste is placed in a vessel with sufficient benzole or naphtha to effect a solution of the oils contained therein. The solution runs off into a still to disengage the benzole or naphtha for further use.

Claim.—The use of coal-tar benzole or coal-tar naphtha, or mixtures of same, and their equivalents, for removing oils from cotton waste, (or other fiber used for similar purposes,) and also the separation and recovery of the oils and solvents by distillation.

80,382.—HENRY BARBER, Greenfield, Mass.—*Machine for Making Wooden Trays.*—July 28, 1868.—For making oval trays or bowls of wood. The block to be cut into trays being secured to the carriage when in a horizontal position, the lever is placed against the wheel so that one of the pins thereon will catch it as the wheel revolves. As the pin strikes the lever, the carriage is started, and guided by the ends of the guide pin in guide-way grooves. The block is turned through an arc against the saws, after passing which the carriage is disconnected by the lever and let-off.

Claim.—1. The carriage J, mounted upon the free rotating shaft G, in combination with the guide plates H H' and guide pin I, or the equivalents of these parts, to give the said carriage a combined rotary and rectilinear movement, substantially as and for the purpose described.

2. In combination with the carriage J, constructed and operated substantially as described, the concentric saws C C, fixed upon a single vibrating head block, D, and placed, the one directly under the other, so that the bolt may move to the saws in a curved line, without causing the saws to cramp each other.

3. In combination with the free shaft G, guide plates H H', and guide pin I, or their equivalents, the wheel L, provided with the pins *e e*, and the lever M and let-off *f*, substantially as and for the purpose described.

80,383.—WILLIAM H. BARTON, Olney, Ill.—*Horse Rake.*—July 28, 1868.—The rake is pivoted in a pair of runners, supplemental to the main sled or vehicle, so as to allow it to conform to irregularities in the surface of the ground. Devices, operated by the feet of the driver, are employed for holding and facilitating the turning of the rake, and adapting it to override obstructions.

Claim.—1. In combination with the main sled or vehicle A, and revolving rake E, the supplemental hinged runners D D, employed and operating in the manner and for the purpose set forth.

2. The swinging frame F, *f*, G, arranged and employed substantially as and for the purpose described.

3. The combination, with the supplemental runners D and rake E, of the straps I I, pulleys H H, rock shaft F, and treadle *f*, substantially as and for the purpose specified.

4. The presser bar K, provided with the spring L and treadle *k'*, and arranged and employed, in combination with the rake E and swinging frame G, substantially as and for the purpose set forth.

80,384.—JOHN BIRKENHEAD, Canton, Mass.—*Driving Wheel for Locomotives.*—July 28, 1868.—When the wheel would be likely to stop or not turn effectively upon the rail, the spurs, by entering the ice or snow alongside of the rail, cause the wheel to propel the engine.

Claim.—The arrangement and combination of traction spurs with the tread and the flange of the driving wheel of a locomotive engine, to be used on the rails of a railway, the whole being substantially as and for the purpose as specified.

80,385.—JAMES BRIERLY, Worcester, assignor to himself and JAMES BRIERLY, Millbury, Mass.—*Operating Shuttle Boxes in Looms.*—July 28, 1868.—Relates to the changing of the shuttle boxes, and designed to give complete control of them through the medium of the pattern chain.

Claim.—1. The combination of slides O, controlled by pattern mechanism, with a carrier, as and for the purposes set forth.

2. The combination of the lifters, slides O O', and carrier H, for operating the boxes, substantially as described.

3. The combination of a sliding spring catch, L, pendant R, and notched box rod K, substantially as set forth.

4. The combination of the east-off lever P, having a pendant R, with the tripping arm S, and its operating mechanism, substantially as described.

5. The combination of the east-off and raising apparatus, consisting of the lifters, slides, carrier, and their connections, as described, whereby I can change the boxes at will, on one or both ends of the loom, substantially as set forth.

80,386.—CHARLES BURLEIGH, Fitchburg, Mass.—*Drill Holder.*—July 28, 1868.—After the drill is placed in the socket, a slight endwise movement of the plug, occasioned by turning the nut, binds the drill shank so firmly as to prevent its removal under the concussions it receives when used in a stone-drilling machine.

Claim.—A drill-holding chuck, constructed with a transverse plug crossing the socket hole for the drill butt, having a portion of the transverse plug, corresponding with the perimeter of the socket hole, removed, and having a screw and nut, or equivalent means, for giving endwise movement to the plug, all substantially as and for the purpose set forth.

80,387.—CHARLES BURLEIGH, Fitchburg, Mass.—*Drilling Machine Carriage.*—July 28, 1868.—This invention has reference to the arrangement of the cross-bars which carry the several series of drills, and to the construction of the framework of the carriage, with a view to the removal of the rock thrown down by the blast, and to allow the drill carriage to be advanced over the debris up to the breast.

Claim.—1. The arrangement of one or of a series of horizontal drill-machine bars or holders, substantially as described, so that any of the bars or holders, and especially the lower one, or the lower series, may be elevated to allow the passage of the carriage to the breast when the track rails only are cleared from debris, and to allow passage of a car through the carriage and under the lower bar or bars up to the breast.

2. A drill-machine carriage, so constructed that a car may run up through the carriage, substantially as set forth.

80,388.—OSCAR F. BURTON, Jersey City, N. J.—*Truck.*—July 28, 1868.—Especially applicable to the method of raising and lowering the ladders of a hook and ladder truck, described in patent granted to O. F. Burton and M. H. Hovey, August 7, 1860. The two trucks are connected by metallic tubes, and may be closed together or drawn apart, so as to

raise and lower the ladders. Provision is made for cramping the trucks in running around curves, and for establishing a wide and secure base by the wheels when turned askew to support the elevated ladders.

Claim.—1. The combination herein described, for cramping the truck of the bar *k*, levers *i*, and vertical shafts *h*, the latter being arranged to freely turn in the truck frame, on opposite sides or ends thereof, and carrying lateral projections, forming axles or shafts to the wheels of the truck, substantially as shown and described.

2. The combination, with adjacent or separate trucks, of an extension perch, formed of metallic tubes, fitted together in a telescopic manner, essentially as and for the purpose or purposes herein set forth.

80,389.—CHARLES CHRISTIAN, Sheboygan, Wis.—*Whip Socket.*—July 28, 1868.—The springs separate to permit the whip to be forced between them.

Claim.—A whip holder, constructed with the socket B, in connection with the springs D, substantially as and for the purpose described.

80,390.—JOHN K. CLARK, Mount Pleasant, Iowa, assignor to himself, CHARLES B. CLARK, and HENRY R. CLARK, Buffalo, N. Y.—*Door Holder.*—July 28, 1868.—A spring arm is pivoted to the door, near the bottom thereof, and carries at its free end a roller, which is caused to run upon the floor with a spring pressure and engage with a stop attachment secured to the floor, so as to hold the door in an open position.

Claim.—The pivoted arm A, provided with roller *b*, in combination with the India-rubber spring *d* and stop attachment E, the whole constructed, arranged, and operating as shown and described.

80,391.—JAMES A. CLARK, New York, N. Y.—*Ferry Bridge.*—July 28, 1868.—The hinged piece or guard is situated at the end of the floating bridge, and is lowered into place by the action of the chain in drawing the boat into dock.

Claim.—The method of lowering the guard on the bridge, by means of the chain *f* that draws in and fastens the boat to the bridge, substantially as and for the purposes set forth.

80,392.—MILTON W. CLARK, Worcester, Mass., assignor to R. BALL AND COMPANY.—*Blind Slat Tenoning Machine.*—July 28, 1868.—As the disks rotate they carry around the cutter heads, whereby a tenon is cut upon each end of the blank slat. As soon as the blank is inserted, the operator, by means of a clutch, causes the cutter heads to revolve entirely around the ends of the slat, when they are arrested until the finished blank is removed and a new blank inserted. The cutter heads may be set toward or away from the center of the disk shafts in order to cut larger or smaller tenons.

Claim.—1. The combination, with the cutter head, disks, and mechanism for imparting to them a rotary motion, of the cutter heads and their shafts, mounted eccentrically in said disks, together with mechanism for revolving the cutter heads in the manner described, so that the said cutter heads shall not only have a rotary movement upon their own axes, but shall also revolve around the axes of their supporting disks, substantially as and for the purposes set forth.

2. The combination, with the disks G' and shafts G, imparting motion to the eccentric cutter heads, and running loosely in said disks, of the bearing supports 2 and annular disk supports F, substantially as and for the purposes set forth.

3. The combination, with the disks G' and cutter-head shafts, of the adjustable quill bearings for supporting said shafts, substantially as and for the purposes set forth.

4. The combination, with one of the annular disk supports, F, and gear E', of clasp or guide piece *b*, mounted loosely upon the hub of said gear, substantially as and for the purposes set forth.

5. The combination, with one of the gears, J, and the slipper or slide, of a hooked spring, constructed and operating in connection with the said gear and slipper, in the manner set forth.

80,393.—M. J. CLARK, New Richmond, Ohio.—*Railroad Car Stove.*—July 28, 1868.—The object is to guard the stove in such a manner as to prevent the communication of fire to surrounding objects, even in the event of forcible and destructive collisions.

Claim.—1. A railroad car stove, composed of upper and lower bases J and C, connected by fenders F and B, substantially as described.

2. The cap A and fenders B, combined and arranged as herein shown and described.

3. The door and pan lock, consisting of a bolt and screw key, substantially as described.

4. The fender door I and screw fastening E, as specified.

80,394.—ISAIAH B. CONKLIN, Baltimore, Md.—*Stubble Cutter.*—July 28, 1868.—The swords cut up and so reduce the stubble and roots that they may be turned in to rot by the subsequent use of a plow.

Claim.—1. Curved or inclined cutting swords T, arranged and applied to the frame of a carriage, and adapted for cutting corn stubble, substantially as described.

2. Cutting swords T, applied to a vertically-adjustable triangular frame, E, which is supported by draught frame D, substantially as described.

80,395.—SAMUEL CUPLIN, Iowa Falls, Iowa.—*Bee Hive.*—July 28, 1868.—The objects are to render the hive easily accessible, afford protection to and ventilation for the bees, and a ready means of cleansing the hive and feeding the inmates.

Claim.—1. Providing the hive with an adjustable inclined bottom, C, when constructed as and for the purpose set forth.

2. The dish or pan *d*, furnished with the float H, in combination with the funnel-shaped device *f*, when arranged in connection with a bee hive, substantially as and for the purpose set forth.

3. The employment of one or more sliding frames, *j*, constructed substantially as described.

80,396.—JOHN DAVIS, Wilkesbarre, Pa.—*Steam Heater.*—July 28, 1868.—The series of pipes are so combined with a stove and boiler that the apparatus may be used both as a stove for heating and as a steam generator.

Claim.—The combination and arrangement of the pipes B and D, imbedded in the cast iron sides of the fire box, the pipes C forming the grate, the connecting pipes B' and C', feed pipe A, boiler I, and communicating pipes A' and E, all connected and operating substantially as described, for the purpose specified.

80,397.—D. A. DANFORTH, Elkhart, Ind., assignor to himself and ISAAC AYERS, same place.—*Wash Boiler.*—July 28, 1868.—The heat maintains a circulation of water throughout the inner and outer boilers. The flange deflects the water toward the center as it enters the inner boiler, at the top thereof, and also prevents the clothes from rising around the edges.

Claim.—The inner boiler B, having its bottom slotted, and provided with flange E, arranged to fit within and operate in connection with the boiler A, substantially as and for the purpose set forth.

80,398.—WILLIAM T. DUVALL, Georgetown, D. C., assignor to the DUVALL PATENT PUMP, DREDGING, AND GOLD WASHING COMPANY.—*Apparatus for Collecting and Separating Mineral and Metallic Substances.*—July 28, 1868.—Applicable to the recovery of gold or other metallic deposits found in the beds of streams; also adapted for the removal of sand bars, or similar obstructions to navigation. The invention embraces a novel arrangement of passages containing mercury for the retention of the metallic deposits; a mode of applying the principle of exhaustion for the purpose of raising the deposits; and a construction of the vanes and other parts of the pump to adapt it to pass solid, heavy substances, and deliver the same readily from its periphery.

Claim.—1. The arrangement of the separating chambers *m* in such manner that the flow is caused to pass through the body of the mercury therein, and

is spread or deflected by the perforated plate *r*, essentially as shown and described.

2. The application of artificial currents of air or water for the purpose of raising or removing solid matter, in the manner and by means substantially as herein set forth.

3. A suction pipe of a pump, so applied as to be capable of vertical, oscillating, vibrating, or rotary motion, substantially as and for the purposes specified.

4. The elongated foot piece of the suction pipe, substantially as represented in Figs. 6 and 7, for operation, as set forth.

5. The wheel B, constructed with one or more curved vanes, *a*, attached to the disk *e*, when said vanes are made tapering from the periphery of the disk, and vanishing, or nearly so, at its axis, as described.

6. The projection of the vanes *a*, in semicircular or other form, beyond the periphery of the disk, substantially as and for the purpose specified.

80,399.—THEODOR G. EISWALD, Providence, R. I.—*Low Water Indicator.*—July 28, 1868.—The outermost valve forms a try-cock, and the upright pipe, with its fusible plug, and its whistle, forms a low water indicator.

Claim.—The arrangement of the horizontal pipe B, vertical whistle and fusible plug tube C, plug valve E chambered screw cap G, and the valve H, with its stem I and handle K, as herein shown and described.

80,400.—THEODOR G. EISWALD, Providence, R. I.—*Low Water Indicator.*—July 28, 1868.—Provision is made for cleaning the interior of the indicator by blowing the accumulated sediment therefrom. The device also fulfills the purpose of a try-cock.

Claim.—The arrangement of the horizontal pipes A, vertical pipes C, branch pipe M, stop cock *m*, cap *c*, having fusible plugs *a a*, valve *v*, having the loose face plate I, vertical stem T, and hand wheel W, substantially as shown and described.

80,401.—T. M. FERGUSON, Rainsborough, Ohio.—*Apparatus for Sealing Fruit Cans.*—July 28, 1868.—The small quantity of air remaining after heating the cans, and before sealing, is expelled by pressing the elastic cover of the jar down upon the contents of the can, and holding it there until the operation of sealing is completed.

Claim.—The press blocks D, thumb screws E, and frame A, when used for producing a vacuum in fruit cans, as and for the purpose described.

80,402.—WILLIAM GATES, New Haven, Conn., assignor to himself and GEORGE W. HOMAN, same place.—*Apparatus for Electro-Plating.*—July 28, 1868.—A sponge or washer, and a connection to maintain the electric circuit, are combined with a zinc socket, the instrument being designed chiefly for re-coating spots or worn parts on electro-plated work.

Claim.—As a new article of manufacture, the instrument, consisting of the zinc socket, with its sponge or brush C, and connecting wire D, with or without the holder E, so as to operate in the manner substantially as specified.

80,403.—J. E. GILLESPIE, Hartford, Conn., assignor to himself and GEORGE S. LINCOLN & Co., same place.—*Governor.*—July 28, 1868.—For imparting motion in a direct manner to the gates of a water wheel, or valves of an engine, and correctly communicating the action of the governing device to the same.

Claim.—1. The clutch F, with its arm F', in combination with the lever G and stand D, substantially as specified, for the purpose set forth.

2. The shaft I and sliding portion of clutch E, in combination with the arm of the clutch F and the lever G, substantially as set forth.

3. Shaft J, with its crank 2, in combination with the fixed gear or toothed circle C'', disk H, lever G, and revolving fulcrum F'', substantially as specified, for the purpose set forth.

4. The screw rack R and its worm pinion, in combination with the gear S and shield disk H *a*, substantially as specified, for the purpose set forth.

80,404.—DAVID M. GRAHAM, Evansville, Ind.—*Gas Machine.*—July 28, 1868.—Air is admitted to the aerometer chamber through its valve, and by the pressure of the aerometer is forced through pipes into the condenser, from which it passes into the rarefier, whence it is distributed into the gasoline. The gas passes from the oil chamber into the gasometer which is raised until it is filled, whereupon the combined pressure of the gasometer and aerometer forces the gas back into the oil chamber and thence into the gas pipe. The concave rim prevents the escape of water at the first water joint. The heaters are serviceable in cold weather, the one generating steam to heat the water, and the other expanding the gas as it is delivered from the apparatus.

Claim.—1. The construction of the rarefier I with an air tight condenser L, in combination with the air pipe M, substantially in the manner and for the purpose as herein described.

2. The construction of the cylinder A with the concave rim B, substantially as and for the purposes described.

3. The rarefier I, condenser L, air pipes M, N N, and T T, gas pipe O, aerometer cylinder E with valve *a* and pulleys U U, cylinder C with movable cap D, oil chamber cylinder F with opening G, provided with flanges, and gasometer cylinder K, all combined and operating in the one cylinder A, substantially in the manner and for the purpose as described.

4. The combination and arrangement of the heaters Q R, substantially in the manner and for the purpose as herein described.

80,405.—SMITH GRAHAM, Fennimore, Wis.—*Gang Plow.*—July 28, 1868.—By depressing the rear end of the lever the beams, together with the plows, may be raised.

Claim.—The hinged frame beams *g g'*, bar *i*, lever *k*, link *j*, and metal strip or bar *s*, all combined and arranged substantially as and for the purpose described.

80,406.—WILLIAM HALL, Jr., North Adams, Mass.—*Drill Holder.*—July 28, 1868.—The removal of the material of the holder in making the slot converts the bifurcated part of the holder into stiff springs, which may be drawn toward each other by turning the nuts on the bolts, and thereby made powerfully to gripe the drill shank.

Claim.—The drill holder, made substantially as described, not only with a longitudinal shank bore, and with a slot extending about the length of the bore, but with the faces of the slot parallel with the surfaces of the holder on which the heads and nuts of the bolts *c c* bear.

80,407.—L. W. HANSON AND SAMUEL BUSH, Springfield, Mass.—*Hose Coupling.*—July 28, 1868.—The two parts are slid together and the pins enter their respective grooves at the opposite sides; the handle is then turned and the cam head locks the parts together.

Claim.—1. The combination and arrangement of the two parts A and B, having pin F and notch H on one side, and cam lock K and notch L on the other, substantially as shown and described.

2. In combination with the above, the rubber packing C, arranged in and held by the groove M, substantially as shown.

80,408.—JOSEPH G. HARRISON, New York, N. Y.—*Soap Cup.*—July 28, 1868.—One side of the cup is curved inward to correspond with the curve of the exterior of the wash tub upon which it is suspended by the hooks. The ribs support the soap above and prevent it being dissolved by the water which drains from it.

Claim.—A new article of manufacture, consisting of the cast metal soap cup A, constructed with a hollow curved side B, a hook or hooks D, and ribs *d*, substantially as shown and described.

80,409.—ABRAM HEATON, Bridgeport, Conn., assignor to himself and BRADBURY AND GOODSELL, same place.—*Water Meter.*—July 28, 1868.—The water flowing through the meter produces a recipro-

cating movement of the pistons, which vibrate the lever projecting between two of said pistons and thus actuates mechanism whereby the number of such movements are recorded and the quantity of water ascertained accordingly.

Claim.—The arrangement of the two pistons or series of pistons, each piston or series of pistons upon its independent rod, and operating in its respective cylinders and the said cylinders connected by passages in the manner described, and provided with inlet and outlet connections, so that the pistons operate in their respective cylinders substantially in the manner herein set forth.

80,410.—ROBERT HENEAGE, Buffalo, N. Y., assignor to BREED & CO., same place.—*Slate Frame.*—July 28, 1868.—The India-rubber cushions serve as binders to hold the parts of the frame together.

Claim.—The rubber mats D D, provided with the catches *b b* and nipples *c c*, in combination with the rounding corners *e e* of the slate frame, having the notches *a a*, the whole arranged as described, and operating in the manner and for the purpose specified.

80,411.—M. T. HITCHCOCK, Springfield, Mass.—*Railroad Car Ventilator.*—July 28, 1868.—The cars being in motion the air rushes through the space between the shell and the exhaust tube, closing the valves of the tube at the entering end, and having the effect to withdraw the air from the car through the opposite end of said tube.

Claim.—1. The T-shaped exhaust tube, having inclined ends, and valves *a b* attached thereto, for the purpose of adjusting the action of the ventilator to the direction of the motion of the car, and inclosed within the shell C, which is rigidly attached to the car, in such a manner as to form an air passage between the exhaust tube and shell, the whole constructed, arranged, and operating substantially as set forth.

2. An exhausting ventilator, rigidly attached to the bottom of a railway car, and so arranged as to exhaust equally well, whether said car moves in one direction or the other, substantially as set forth, and to discharge the air from the car directly beneath the same, as specified.

80,412.—DE LANCY KENNEDY, New York, N. Y.—*Hay Spreader.*—July 28, 1868.—A mode of varying the effective length of the tedder, and securing the tines to the same.

Claim.—1. An adjustable journal box B, in combination with the fork of a hay tedder, whereby the said fork may be set to operate nearer to or further from the ground, substantially as herein described.

2. The buttons D D, in combination with the extended and bent portions of the tines C C, substantially as and for the purpose herein set forth.

80,413.—SAMUEL P. LEGG, Springfield, Mass.—*Hydrocarbon Burner.*—July 28, 1868.—When the liquid is admitted into the conductor it diffuses itself over the bowl thereof, and over the funnel, and, being ignited, heats the conductor and funnel and the contained liquid, which thus becomes more inflammable. The liquid, thus ignited and heated, passes through the openings in the funnel and falls upon the bottom of the fire box, where it is entirely consumed.

Claim.—1. A fire box for burning liquid fuel in a steam boiler, having the bottom plate A elevated above the bottom of the boiler, for the purpose specified, and air flues F F, closed by valves, and so arranged that the draught is entirely supplied through the air flues, in combination with the reservoir R and supply pipe P, having a contracted nozzle *o'*, and so inserted in the fire box as to prevent heating the liquid fuel until it leaves the pipe P, the whole arranged and operating substantially as described.

2. The combination and arrangement of perforated conductor I, perforated funnel J, and the pipe P, having a contracted opening, *o*, applied to the fire box of a steam boiler substantially as described.

80,414.—CARL LEHNERT, Boston, Mass., assignor to JOSEPH M. WEILHART, same place.—*Opening and Closing Shutters.*—July 28, 1868.—Devices for holding and locking the shutters, whether

open or closed, and for adjusting them vertically when they do not hang properly.

Claim.—1. The combination of the cam surface and catch or projection *c* on the cam segment I, with the spurs *b b*, on the segment gear H, for holding the blind or shutter open or closed, substantially as described and specified.

2. The wedge *e* and adjusting devices, in combination with the segments H I, and cam surfaces thereon, substantially as described and specified.

80,415.—MITCHEL LEPP, Albany, N. Y.—*Card Rack.*—July 28, 1868.—When the cards are placed in the notches, their bottom edges rest upon the steadying slats, at their corners, and are held at an angle, so as to be readily distinguished and withdrawn.

Claim.—The steadying slat *a*, in combination with the holding slat *b*, and the rack frame *c c'* and *e*, constructed substantially as set forth, for the purpose herein described.

80,416.—J. W. LOWREY, Dayton, Ohio.—*Cook Stove.*—July 28, 1868.—The cast iron partition, with its valves and slide, is placed in the fire chamber of cooking stoves for the purpose of concentrating or distributing the heat, as desired, and rendering the stove air-tight.

Claim.—The inner chamber A, to be inserted into the stove as shown, together with its regulating valves and slide M, N, and O, and adjustable end-pieces P and Q, substantially as and for the purposes herein specified and described.

80,417.—ROBERT M. MARCHANT, Wellington, New Zealand.—*Railroad Rail.*—July 28, 1868.—The tread portion is of steel or wrought iron, in lengths or sections exceeding, by two-thirds, more or less, the length of the cast-iron seat.

Claim.—In the construction of railways, the arrangement of the rails A, with a continuous substructure B or H, either with or without the wooden foundation D or iron plates I, the whole secured or bolted together, in the manner and for the purpose herein shown and described.

80,418.—GEORGE MARSHALL, Brooklyn, N. Y.—*Pump.*—July 28, 1868.—A combination of suction pipe with two large and free water passages, both arranged at the same side of the pump, and having inlet and delivery valves, covered by doors, which open directly over them, and which are fastened by clamps sliding to their place on a locking incline or wedge. This mode of securing the lids or doors to the valve chambers renders the valves readily accessible.

Claim.—The combination of the water-ways F F' on one and the same side of the pump, suction pipe C, valves E G, and valve chambers H J, with their lids or doors L L', arranged substantially as described, loose clamping bars M M', and fixed inclines or wedges *i i'*, essentially as specified.

80,419.—SAMUEL McCAMBRIDGE, Philadelphia, Pa.—*Car Brake.*—July 28, 1868.—A machine for operating the brake levers of a train of cars is combined with one of the axles of the engine, and with a chain which runs over a series of sheaves for actuating the brake levers after the manner described in patent granted same party February 5, 1867. A spring-seated slide, connected to the rear end of the above-mentioned chain, gives elasticity to the tension upon said chain and thus prevent it from breaking when the last car spreads from the train.

Claim.—The combination of the shafts G, M, and N, cog-wheels Q and Q', cams R R, friction-wheels S S, belt P, and pulleys O and O', with the shaft B of the engine, and the wheel V and tightening strap U, when the several parts are constructed, arranged, and operated in relation to each other substantially in the manner and for the purpose set forth.

2. The combination and arrangement of the lever W, connecting rod *n*, tightening strap U, and wheel V, with the chain shaft G, for holding the chain F tight when the machine H is thrown out of gear with the engine, substantially in the manner described.

3. The combination and arrangement of the spring-seated slide J with the last truck E and chain F, substantially as and for the purpose set forth.

80,420.—SAMUEL McCAMBRIDGE and EDWARD G. MARTIN, Philadelphia, Pa.—*Car Brake*.—July 28, 1868.—By this contrivance the slack of the continuous chain is taken up under the rear car first, and then under the other cars in succession until the first car is reached, the effect being to prevent the bumping of the cars.

Claim.—The arrangement of the continuous chain C and its described connecting rods, when the same is fastened at one end to the front car or truck, and operates in combination with a fixed sheave or pulley, on the rear truck, through a rod or chain connecting directly with the actuating devices on the engine, all as and for the purpose set forth.

80,421.—CHRISTIAN GOTTHOLD, MEINHARD, Altoona, assignor to himself and BENJAMIN B. BELL, Antistown, Pa.—*Propeller*.—July 28, 1868.—On being retracted, the valve, acted upon by the water, swings backward, so that the horizontally reciprocating propelling rod may be drawn inward without resistance, the water passing freely through the ring.

Claim.—1. The propellers, consisting of the ring *j*, rim F, valve H, bars *i i' i''*, on the piston rod *r*, guide braces *g g' g''*, substantially as and for the purposes set forth.

2. Reversing the steamboat, by means of overturning the valve H, in the manner and substantially as described.

80,422.—GEORGE R. MENEELY, West Troy, N. Y.—*Attaching Bells to their Yokes*.—July 28, 1868.—Whenever the bell and cap plate are loosened, turned, and re-fastened in the yoke, to present a different part of the surface of the bell to the blows of the clapper, the center bolt, which holds the clapper, may be readily released from the cap plate, turned into the position where the clapper will swing in or nearly in the same plane as that in which the bell swings in ringing, and then re-secured to the cap plate so as to maintain said position.

Claim.—Securing the center bolt, which holds the clapper to the cap plate, which turns the bell and supports it in various positions in the yoke by means of a toothed or indented washer attached to the center bolt, in combination with an adjustable clutch attached to the cap plate, substantially as herein set forth.

80,423.—A. B. MURRAY, Henderson, Pa.—*Snow Gate*.—July 28, 1868.—In the event of a snow fall the gate may be supported in an elevated position, so as to swing above the snow in being opened and closed.

Claim.—1. The friction rollers H H', substantially as and for the purpose described.

2. The combination and arrangement of the lever K, bar I, diagonal brace D, with holes *m* and pin *n*, substantially as and for the purpose set forth.

3. The construction and arrangement of the batens C' and E, substantially in the manner and for the purpose specified.

4. The short stake P, with notch *p*, for holding the gate when closed.

80,424.—CHARLES E. PALMER, Newburyport, Mass.—*Fastening for Shirt Collars*.—July 28, 1868.—The pivoted button is thrust through the button holes of the neck band of the shirt. The collar being then passed around the neck, the oblong, detachable head is turned into such position upon the stem as to be parallel with the button holes in the ends of the collar. In this position the head is passed through both button holes of the collar, after which it is turned and locked in a position at right angles to the button holes.

Claim.—The pivoted button B, in combination with the shank *a*, fixed disk A thereon, and detachable head C, all constructed and arranged as shown and described.

80,425.—HARVEY A. REYNOLDS, Brooklyn, N. Y.—*Velocipede*.—July 28, 1868.—The front pair of wheels are rotated by the feet applied to stirrups and cranks. The hind wheels are turned by the action of a lever, which is connected to the axle of said wheels by rods. When the lever is vertical the ve-

locipede will move in a straight line, but when the lever is moved forward or backward the velocipede will be steered either to the right or left.

Claim.—The lever *m*, with the rods *n n'* connected, respectively, above and below the fulcrum, in combination with the wheels *d d* and axle *e*, to which the other ends of the rods *n n'* are connected on opposite sides of the king bolt *i*, so as to steer the velocipede by the movement of one lever, as set forth.

80,426.—LEVI SCOTT and PAUL TRIMMER, Burgettstown, Pa.—*Car Coupling*.—July 28, 1868.—As the inner end of the lever is depressed by the perpendicular rod, its curved end is caught in the offset of the latch, which holds it securely in that position, and as the coupling link is withdrawn it catches upon the pivoted arm, which, through the connecting rod, forces back the latch, when the coupling key drops into position for recoupling.

Claim.—The pivoted lever F, latch J, spring M, and pivoted arm K, in combination with the perpendicular rod G, coupling key D, and connecting rod L, when arranged and operated as herein described, for the purpose set forth.

80,427.—BENJAMIN SLUSSER, Sidney, Ohio.—*Sulky Plow*.—July 28, 1868.—The shoulder of the lever rests against the square end of the projection when the lever handle is thrown down, and thus forces the same down with the lever, and throws the crank pin up, elevating the rear end of the pole and raising the plow out of the ground.

Claim.—1. The combination of the lever L, having the shoulder *n*, with the crank *e*, having the projection *m*, and supporting the standard to which the plow is attached, when the several parts are connected and arranged so as to operate together, substantially in the manner and for the purpose specified.

2. The combination of the crank *e*, standards *g g*, seat G, rod H, and hinged post I, substantially as and for the purpose described.

3. Supporting the plow upon two standards, E F, bent in the form and attached to the rear side of the plow in the manner described.

80,428.—JOSIAH M. SMITH, Warren, N. J.—*Mortising Chisel*.—July 28, 1868; antedated July 18, 1868.—The chisel is a double one, each limb having two lips, adapting the tool to cut both sides of the mortise.

Claim.—A tenoning chisel, constructed to operate in the manner as herein set forth.

80,429.—VERLIN G. TANSEY, Indianapolis, Ind., assignor to himself and JAMES W. SIMPSON, same place.—*Fire Kindler*.—July 28, 1868.—The burner is to be placed under the grate, and is attached to a plate that closes the opening and excludes the air from the front and bottom of the grate. The manner of supplying the air to the burner insures energetic combustion and the speedy ignition of the coals.

Claim.—The burner A, enlarged tube *e*, filled with the packing E, and furnished with the deflecting plate *i*, and supplied with oil from the fountain B by the tube *g*, substantially as shown, in combination with the air ducts D *m*, through which air is supplied to the burner, when the draught opening is closed by the plate C, all arranged and operating substantially as set forth.

80,430.—EDWIN P. TAYLOR, New Bedford, Mass.—*Button Boot*.—July 28, 1868.—The purpose is to obviate the formation of seams in the manufacture of the boot, and thus render it neater and more durable.

Claim.—A button boot in which the whole upper and leg front *a* and flap *f* are made in one piece, crimped to the proper form, substantially as shown and described.

80,431.—WILLIAM R. TAYLOR and JAMES F. SLOAT, Brooklyn, E. D., N. Y.—*Steam Generator*.—July 28, 1868.—This arrangement is designed to constitute an ascending and descending flue and superheater, all within the compass of a cylindrical shell, the superheater occupying the upper part of said shell.

Claim.—Making a vertical tubular steam boiler

substantially as described, and with the tubes, water spaces, steam drum, and superheater arranged therein in relation to each other as set forth.

80,432.—AUGUSTUS THAYER, Albany, N. Y.—*Scissors and Shears.*—July 28, 1868.—Wires, cords, &c., may be readily severed in the clipping notches. The other notches are for holding or pulling needles, wires, and the like.

Claim.—1. The clipping notches o o' o'' or c c , or their equivalents, placed forward or back of the pivot p , or in the outer edges of the blades to one side, in combination with the blades A A' , and the said notches so placed as to give a sliding cut, as and for the purpose set forth and described.

2. The holding notches e e , in one or more sets, placed in the heels of the blades, as and for the purposes set forth and described.

80,433.—JOHN UMBACH, Kankakee, Ill.—*Constructing Back Pads to Harness.*—July 28, 1868.—The object is to admit of the introduction of the filling before the pad is stitched. The pocket or under side of the pad is first pressed or shaped by means of blocks, then the pocket is placed in a similarly formed cup, and the filling is introduced, after which the top part of the pad is applied. The parts being held together by a band are ready to be placed in the clamps for stitching.

Claim.—The use and application of the molding or cup in the filling, and stitching the cushion or under part of the back pad to harness.

80,434.—JAMES W. WADSWORTH, Durham, Conn.—*Rein Holder.*—July 28, 1868.—The reins are respectively drawn under and held by the springs, which are attached to the dash board of the carriage.

Claim.—The construction and arrangement of the springs B C upon the bar A and dash board, so as to be a part of the same, and operate in the manner set forth.

80,435.—JOHN A. WAY, Bristol, Conn., assignor to the DARROW MANUFACTURING COMPANY, same place.—*Washer.*—July 28, 1868.—These washers are produced by a peculiar method, involving the use of dies and punches.

Claim.—As a new article of manufacture, an axle washer, made of raw hide, substantially as described.

80,436.—CHARLES A. WILSON, Cincinnati, Ohio.—*Thermostat.*—July 28, 1868.—The set screw being located so that its pressure is directed toward the surface on which the thermostat plates are fastened, there is less liability of straining or cracking the steel plate than when the set screw is at the opposite side.

Claim.—The adjusting and stop valve screw H , located on the opposite side of the thermostat plates to the valve seat E , as described, and for the purpose specified.

80,437.—JEARUM ATKINS, Washington, D. C.—*Smoke-Stack for Locomotives.*—July 28, 1868.—The escaping steam from the cylinders of the engine is injected into the annular smoke stack through a pipe, whose mouthpiece or nozzle is so arranged that the steam is distributed equally over the circumference of the smoke stack, and thus made to effectually increase the draught of the furnace.

Claim.—1. The combination of the annular exhaust nozzle, or its equivalent, and the annular smoke passage, substantially as herein described.

2. The arrangement of the annular smoke passage and the annular deflecting plate P , substantially as set forth.

3. In combination with the annular passage G , and annular deflector P , the central receptacle H , substantially as and for the purposes set forth.

80,438.—JOHN A. BASSETT and OLIVER C. SMITH, Salem, Mass.—*Method of Removing Carbon from Gas Retorts.*—July 28, 1868.—A small, direct-acting fan and steam blower is attached directly to the retort lid, which is made with an opening and appliances to receive it. A strong current of mingled air

and steam is injected into the retort, decomposing and disintegrating the carbonaceous deposit, loosening it from the wall, and clearing it out.

Claim.—1. The apparatus shown and set forth, having the various parts constructed and operating substantially as specified, and used for the purpose described.

2. Combining an air-forcing apparatus with a retort lid having an opening for the purpose of admitting air to the interior of the retort.

3. The combination of the pipe H , and retort lid G with the air-forcing apparatus F , when used for the purpose specified.

4. The combination of the flexible steam tube E with the main C , and blower F , for the purpose set forth.

80,439.—GEORGE W. BLACKWELL, Lebanon, Ind.—*Farm Gate.*—July 28, 1868.

Claim.—The action of the gate in opening and shutting on the wheels B B , and supported between the upright posts P P , on the wheels C , and also on the latch, as shown in Fig. 5, the catch being sustained by K , and forced into the catch on post by the spring y .

80,440.—LEWIS T. BLAKE, New Haven, Conn.—*Egg Beater.*—July 28, 1868.—The beating blade is perforated so that as it is vibrated laterally the substance of the eggs passes through it.

Claim.—The combination of the case or vessel A with the beating blade B and double crank e d , when the whole is constructed, arranged, and fitted for use, substantially as herein described and set forth.

80,441.—CHARLES ALBERT BLESSING, Philadelphia, Pa.—*Sheet Metal Lining for Bath Tubs.*—July 28, 1868.—The main part of the lining is made of a single piece, and the end pieces are soldered thereto.

Claim.—A bath-tub lining made of sheets of hard metal, such as copper or zinc, consisting of the parts B C C , when the same are constructed and arranged as described.

80,442.—GEORGE W. BOWLSBY, Monroe, Mich.—*Horse Hay Fork.*—July 28, 1868.—Using the upper parts of the tines as handles, the fork is thrust into the hay, when the curved form of the tines causes them to be forced outward. The sound of the fall of the toggle upon the supporting posts indicates that it is set, whereupon the fork is elevated to the point where the hay is to be discharged by a pull upon the toggle cord.

Claim.—1. The projecting posts l , secured at an angle to the tines a a at their pivot e , in combination therewith, and with the toggle lever e , substantially as and for the purpose described.

2. The combination and arrangement of the swinging tines a , enlarged as described at e , bail d , toggle e , clevis j , extended bolts k , guards m , supporting bar h , and projecting posts l , substantially as described for the purpose specified.

80,443.—MILES D. BRADLEY, Spa, N. Y.—*Machine for Cutting and Assorting Broom Corn.*—July 28, 1868.—The function of this machine is to cut and assort the different lengths of broom corn, and other similar substances which require cutting and assorting previous to being wrought up into articles of use, such as rushes, flag, horse hair, reeds, and rattau.

Claim.—1. The perpendicular drum A , the different sized rollers e^1 e^2 e^3 , &c., and belts n^1 n^2 n^3 , &c., whether the said belts be flat or round, all constructed and operating together substantially as shown and described, and for the purpose set forth.

2. The cutters v v v , shaft E , pinion J , and toothed rim I , whether the said rim be toothed externally or internally, and drum A , all constructed and operating together, substantially as shown and described, and for the purpose set forth.

3. The chutes K K K , &c., in combination with the drum A , rollers e^1 e^2 e^3 , &c., and belts n^1 n^2 , n^3 , &c., all substantially as and for the purpose shown and described.

4. The adjustable step-bearing h , in combination with the drum A , rollers e^1 e^2 e^3 , &c., belts n^1 n^2 n^3 ,

&c., all substantially as shown and described, and for the purpose set forth.

5. The bevel gearing *r u* and pulley *G*, substantially as shown and described, in combination with the drum *A* and its belts and rollers, all as and for the purpose set forth.

6. Adjustable step-bearing *k*, in combination with the shaft *E*, cutter wheel *D*, drum *A* and its rollers and belts, all substantially as shown and described, and for the purpose set forth.

80,444.—WILLIAM BRAIDWOOD, New York, N. Y.—*Printing Press.*—July 28, 1868.—The motion of the roller carriage is independent of that of the platen and the two motions may be regulated independently, to suit circumstances. The slots in the connecting rods which impart motion to the platen, permit the platen, when the press is worked rapidly, to dwell sufficiently to admit of the adjustment of the sheets thereon; and the yielding bearings in said slots prevents shocks and concussions. When the platen moves forward the card drop is held in close contact therewith by the action of the spring arm, and as the platen recedes, after the impression has been taken, the card drop is raised, and the printed card permitted to slide off, and then the card drop is returned to the surface of the platen, ready to receive a new card.

Claim.—1. The levers *c*, hung independent of the platen, operated as described, in combination with the rods *f g*, crank pins *d*, and roller carriage *B*, substantially as and for the purpose set forth.

2. The slots *l*, in the connection rods *i*, provided with bearings *m*, springs *n*, and adjusting screws *o*, to operate in combination with the platen *D* of a printing press, in the manner and for the purpose described.

3. The spring arm *x*, in combination with the bell-crank lever *u v*, and card drop *p'*, substantially as and for the purpose set forth.

80,445.—PHILIPP BRAND, Springfield, Ill.—*Elevator.*—July 28, 1868.—Water or steam being forced into the pipes from below, the pipes extend themselves one above another, and take with them, in their ascent, the platform, which movement opens the jointed framework.

Claim.—This combination of the jointed framework *B*, platform *C*, pipes *D*, and steadying arms *F*, as herein set forth and for the purposes described.

80,446.—F. MARKHAM BRIGGS, Livonia, Mich.—*Lamp for Destroying Insects in Trees.*—July 28, 1868.—The series of wick tubes heat the pan sufficiently to destroy the insects that fall into it from the nests, as the latter are burned by the main or central flame.

Claim.—The construction of a lamp, *A*, provided with any suitable pan, *C*, and arranged to be heated by means of wick tubes *D*, substantially operating as and for the purposes herein described.

80,447.—G. H. BRISTOL, Romeo, Ill.—*Water Elevator.*—July 28, 1868.—When the lever is raised the pawl engages the teeth of the ratchet wheel and prevents the shaft from turning, but when the lever is depressed the pawl leaves the ratchet wheel, and said lever bears against the friction wheel and may be made to regulate the motion thereof. The spool is so applied that it becomes more tightly secured to the shaft as the strain upon the belt increases. The bucket fills through a bottom valve.

Claim.—The combination of the lever *L*, its pawl *d*, wheel *F*, spool *E*, shaft *D*, bail *J*, and the bucket and curb, when all are constructed, arranged, and used as specified.

80,448.—DAVID BRUCE, Brooklyn, N. Y.—*Type Machine.*—July 28, 1868.—This apparatus is attached to a type-casting machine so as to receive the type as fast as cast, and break off the jet or stem of metal adhering thereto by a continuous consecutive operation. The plug fills the discharging port in the inclined gutter, to form a continuous gutter for the descent of the type, previous to breaking the jet thereof. The adjustable plate supports and trips the hammer for breaking off the jet of metal. Combined with the adjusting plate is a bifurcated cam, or guide

ways, for operating a type-holder weight while the jet of metal is being broken off, and releasing the type from the gutter that it may be discharged from the apparatus. The compound spring prevents the escape of the type from the gutter till its jet is broken off; it also prevents the rebounding of the type. The jet is broken off by a reacting spring hammer.

Claim.—1. In combination with the right-angled lever *E*, the plug *D*, substantially as described, and for the purposes hereinbefore set forth.

2. The sliding adjusting plate *H* and tapis *M*, in combination with the right-angled lever *E*, substantially as described, and for the purposes hereinbefore set forth.

3. In combination with said sliding adjusting plate, the bifurcated cam *Q*, substantially as hereinbefore described, and for the purposes set forth.

4. The combination of the movable jaw *N*, with the inclined gutter *B*, substantially as hereinbefore described, and for the purposes set forth.

5. The combination of the compound spring *S*, with the inclined gutter *B*, for the purposes hereinbefore set forth, and made and operating substantially as described.

6. The combination of the spring or trip hammer *X*, with the inclined gutter and right-angled lever substantially as hereinbefore described.

80,449.—MARTIN V. BRYANT, North Plains, Mich.—*Spring Punch.*—July 28, 1868.—Designed to be used by blacksmiths in punching bar iron, and held in place upon the anvil by the lug, which enters a hole in the face of the anvil.

Claim.—The square lug *G*, when used in connection with the frame *A*, bifurcations *B D*, punch *C*, pin *D*, spring *E*, and die *F*, substantially as and for the purpose specified.

80,450.—S G. CABELL, Quincy, Ill., assignor to himself and Peter T. ABELL, Atchison, Kansas.—*Track Clearer for Railroads.*—July 28, 1868.—The lower end of the cast-iron box is foraminated. Steam admitted to the pipe and box is ejected upon the rail, blowing therefrom such light impediments as loose snow, insects, &c. Adhering ice, which may not be removed by the pipe, is crushed by the forward wheel and removed by steam from the box.

Claim.—The arrangement of the steam box *A* and pipe *B*, with the two way cocks *c*, and rod *L*, constructed substantially as and for the purpose herein set forth.

80,451.—WILLARD W. CHASE, Springfield, N. H., assignor to himself and SOLON W. ABBOTT, Sanapee, N. H.—*Ash Bin.*—July 28, 1868.—A frame to be inserted in a wall has an opening for a door which rests and vibrates upon the lower edge of said opening, and which maintains its open or closed position by the influence of gravity.

Claim.—A mouth or receiving aperture for ash bins, and other purposes, as an article of manufacture, constructed and operating substantially as above set forth.

80,452.—PAUL ANTOINE MARIE CHAUVASSAIGNES and JACQUES PAUL LAMBRIGOT, Paris, France.—*Telegraph Instrument.*—July 28, 1868.—This invention comprises an instrument for the preliminary notation or inscribing of the telegrams by means of certain characters traced on a band of tinned paper, and for the reproduction of these traced bands; also an additional instrument for the automatic transmission of the characters traced on the band, and the automatic and electro-chemical reception of the signals transmitted. The coloring matter for the marking roller is composed of yellow wax, rosin, bitumen of Judea, and tallow or suet. The chemical bath for the production of the signals is composed of azotate of ammonia, distilled water, gallic acid, and white sugar.

Claim.—1. The combination of the devices herein described for effecting the notation and automatic transmission of telegraphic messages, the same being constructed and arranged to operate in the manner and for the purposes set forth.

2. An insulating ink, composed of the ingredients herein named, taken in the proportions substantially as specified.

3. A decomposable liquid, made of the ingredients herein named, taken in the proportions substantially as specified.

80,453.—CHARLES B. CLARK, Buffalo, N. Y.—*Brush Holder.*—July 28, 1868.—A long-handled clamping device whereby an ordinary scrubbing brush can be held and operated by a person standing.

Claim.—Connecting the thumb nut E with the movable jaw H, by means of the flange G and slot K, together with the mortise L in the screw shank F, for the purpose specified.

80,454.—JOHN G. CLIFTON, Northfield, Ind.—*Buckle.*—July 28, 1868.—The end of the strap secured by one of the tongues is passed through the loop formed by the end bars, while the end of the strap fastened by the tongue or tongues at the opposite side of the hinge is passed through the loop formed by the hinge and the fixed central bar.

Claim.—The arrangement of the loops of the frame of the buckle at one end, and at the center thereof, between the bars *bb* and *de*, in combination with the tongues *ij*, acting upon the opposite sides of the frame in the manner and for the purpose specified.

80,455.—WILLIAM B. COATES, Philadelphia, Pa.—*Fireplace.*—July 28, 1868.—The convex grate is fitted by flanges to the bed plate of the stove and receives a reciprocating rotary movement from a peculiar shaker. The sifter is situated in a cellar or under the floor of the fireplace, and has two discharge spouts through which escape the coarse particles and fine ashes respectively. The body of the stove rests upon an offset on the top of the cylinder.

Claim.—1. The combination of the vibrating rim H, with its flange K, and the bed plate J, with its flange L, and aperture M, the shaker F, with its arm G and knob, as herein described and for the purposes set forth.

2. The construction of the body of the stove, when combined with the cylinder E, shoulder Y, and ribbed top B, as herein described.

3. In combination with the foregoing, the sifter O, with funnel-shaped top, N, grate P, spout *q*, and receptacle R, when constructed and operating as herein described and for the purpose set forth.

80,456.—J. L. COLES and D. H. COLES, New York, N. Y.—*Nutmeg Grater.*—July 28, 1868.—The grating is performed by grasping the box and turning the handle of the revolving carrier. The supplementary chambers contain a supply of nutmegs.

Claim.—1. A box, A, containing a revolving carrier, D, having a series of chambers, with spring followers, which press the articles to be grated against the stationary grating surface E, which is combined with a receiver, F, all as shown and described.

2. The combination, with the cylindrical box A, of a series of carriers, at angles to each other, so as to leave supplementary chambers, *b*, substantially as and for the purpose described.

80,457.—FRANK CALLIGON, Buffalo, New York, N. Y.—*Lubricating Device.*—July 28, 1868.—As the quantity of oil in the lubricating cup increases or diminishes, its level changes correspondingly in the glass indicating tube.

Claim.—The combination of the transparent indicator E with the lubricating cup D, substantially as and for the purposes described.

80,458.—JOSEPH CORBEIL, Lind, Wis.—*Potato-bug Cleaner.*—July 28, 1868.—As the wings or fans revolve they knock the bugs from the potato vines, and, aided by the current of air created by their motion, they sweep the bugs into the V-shaped receptacle.

Claim.—The machine for cleaning vines or vegetables of bugs or insects, consisting of a suitable frame mounted on wheels, and having the central receptacle C, and the two side revolving fans or beaters D, all constructed and arranged to operate substantially as described.

80,459.—JAMES M. CRAFTS, Boston, Mass.—*Ageing and Purifying Spirits.*—July 28, 1868.—This invention is designed to produce artificially, and in a very short time, the effects or changes which result from the lapse of time when liquor is allowed to stand in the usual way.

Claim.—1. The forcing of whisky or a distilled liquor through air, or a gas charged with ozone or antozone, or the forcing of air or gas charged with ozone or antozone through whisky or a distilled liquor, or the agitating together of whisky or other distilled liquor and air or gas charged with ozone or antozone.

2. In connection therewith, the employment, as explained, of oak shavings, or other coloring equivalent or material, from which an extract is to be obtained.

3. The treating of air by electricity, so as to ozonize such air, and subsequently passing such air in contact with or through whisky or an alcoholic liquor, the same being as and for the purpose or purposes substantially as specified.

4. For the improvement of the liquor, confining it in a close vessel, and subjecting it while therein to the action of the heat.

5. The combination of the same, and the application of ozone or antozone to the liquor, by means substantially as specified.

80,460.—FREDERICK C. CURIE.—*Manufacture of Files and Rasps.*—July 28, 1868.—The blanks being cast and rendered malleable, or cut from wrought iron, are placed in an iron box and separated in layers by a mixture of pulverized charcoal, soda or soda ash and rock salt. The box being filled and closed is placed in a converting furnace.

Claim.—1. Converting files and rasps, either cast or made from wrought or cast malleable iron, into steel, by the process substantially as herein described.

2. The new articles of manufacture, namely, files and rasps, made by the process substantially as herein described.

80,461.—OWEN R. DAVIS, Lewistown, Pa.—*Steam Safety Valve.*—July 28, 1868.—When the small valve is raised by the pressure of the steam, the steam passes upward through the passage into the piston chamber and presses the piston downward, opening the main valve and allowing the surplus steam to escape through the same, whence it passes off through the case or frame.

Claim.—1. The passage *i* communicating with the chamber O, in combination with the piston head D, piston rod E, and valve F, whereby to allow the steam to force said valve downward, and relieve the boiler of any undue pressure of steam that may accumulate in it, substantially as herein set forth.

2. The arrangement of the piston head D, piston rod E, valve F, and case or frame G, whereby to prevent tampering with the valve when once arranged for the pressure required, substantially as herein set forth.

3. The arrangement of the chamber O, passage *i*, valve rod *d*, valve *a*, vent *k*, and weight C, substantially as set forth.

80,462.—THOMAS B. DEFORREST, Birmingham, Conn.—*Corset.*—July 28, 1868.—The corset is made of felt, whether blown upon an exhausted cone of the corset shape, or wound upon a suitably shaped block in several layers of sliver from the carding engine, or blocked or stretched from a sheet of felt upon a former. A cloth stay strengthens the corset at the waist. Wire stays are also employed.

Claim.—1. A corset formed from a felted material, substantially as herein described.

2. In combination with a corset constructed as above, the body stay or band A, substantially as set forth.

3. The arrangement of the stays B B upon the surface of the corset, either inside or outside, without the formation of pockets in the body of the corset, substantially as set forth.

80,463.—ALEXANDER JOHN B. DE MORAT, Philadelphia, Pa.—*Electro-Magnetic Engine.*—July 28, 1868.—Permanent and electro-magnets are so

arranged with armatures as to admit of a constant unbroken current, the object being to obtain increased power and a regular motion from or by means of the available amount of electric, magnetic, or galvanic fluid.

Claim.—The combining and arranging of a series of magnets, with magnets or armatures having a revolving or other motion, which are made to pass from a sphere of equilibrium into a sphere of attraction, thereby obtaining a motive power by the motion produced, resulting from the power of attraction, when one or more permanent or electro-magnets are placed angularly against curves or plain surfaces of any metal possessing magnetic properties, and in this motion at the same time to bring back the system into a neutral limit or sphere of equilibrium, and in that state to arrest and carry it beyond the limits of attraction, (without the necessity of breaking circuit,) then afterward released for a subsequent action, as herein set forth and described, or any other, substantially the same, which will produce these intended effects.

80,464.—T. B. DOOLITTLE, Bridgeport, Conn., assignor to BRIDGEPORT BRASS COMPANY, same place.—*Method of Forming Lamp Tubes.*—Under this mode of manufacture a round, seamless tube, "drawn out" after the fashion of cartridge tubes, is flattened out into the required shape for lamp tubes. The wedges are designed as a most effective means of transforming the cylindrical tube into a flat one.

Claim.—Shaping or transforming the stock by means of wedging mandrels forced longitudinally, in opposite directions, into the tube, to spread it laterally and shape it, substantially as described.

80,465.—SAMUEL R. DRUMMER, New York, N. Y.—*Packing for Car Axles and Boxes.*—July 28, 1868.—The periphery of the packing is grooved so as to receive a V-shaped lining, which acts as a wedge against the grooved sides of packing, through the pressure of an elastic encircling band, whereby the packing is spread out against the sides of the lubricating chamber in which the packing is placed, thus preventing the passage of dust, dirt, &c., to the lubricating box.

Claim.—1. The V-shaped lining G, bearing against the grooved packing C, and supporting the partly yielding and non-yielding encircling line J K, substantially as herein represented and described.

2. The combination of the grooved sectional packing C D E, the V-shaped lining G, the encircling chain J, and its yielding connection K, substantially as and for the purpose described.

80,466.—S. F. EMERSON, Seville, Ohio.—*Fruit Frame.*—July 28, 1868.—In gathering the fruit it falls or is thrown into the frame, the elasticity of the lining preventing it from being bruised; it then rolls down through the tube into the basket. If it be desired to use the frame for drying fruit, the cloth is removed and the fruit hung on the cords.

Claim.—1. The covering or bag F and tube I, in combination with the adjustable arms E, substantially as and for the purpose set forth.

2. The standard A, head C, in combination with the arms D E, dogs G, and cords E', substantially as and for the purpose set forth.

80,467.—HARRISON FLINT and GEORGE P. SMITH, Danbury, Conn.—*Machine for Turning Irregular Forms.*—July 28, 1868.—The cutter is free to follow the motions of the pattern guide, while the pattern and block to be turned revolve freely and move toward or from the cutter, greater facility being thus attained in the cutting of the block. The pattern guide is secured to an arm which may be set higher or lower by set screws, so that blocks of different size may be turned from the same pattern.

Claim.—1. The swinging arm K, carrying the cutter and pattern guide, arranged relatively to the reciprocating carriage B, carrying the spindles C C' on which the pattern and the block to be turned are secured, operating substantially as and for the purpose described.

2. The link *w* and set screw *x*, for securing the pattern guide L to the arm K, and for adjustment

purposes, when operating substantially as described for the purpose specified.

80,468.—HENRY FORNCROOK, Watertown, Wis.—*Hop-Pole Cleaner.*—July 28, 1868.—The shank of the semicircular knife is driven into a block of wood imbedded in the ground, or otherwise held in place. The stems, knots, and bark are removed by drawing the poles in contact with the edge of the knife.

Claim.—A hop-pole cleaner, rosser, and trimmer, constructed in the manner and for the purpose substantially as herein specified.

80,469.—HENRY G. FUHRMANN, Brooklyn, E. D., N. Y.—*Adjustable Filter for Faucets.*—July 28, 1868.—One end of the expansible tube is stretched over the conical spout containing the strainer, while the other end may be stretched over the mouth-piece or nozzle of a common faucet.

Claim.—A straining attachment to faucets, consisting of an elastic tube A and conical spout B containing a strainer C, as a new article of manufacture.

80,470.—R. M. GANO and B. S. MILLER, Pittsburgh, Pa.—*Brick Machine.*—July 28, 1868.—A hand machine for re-pressing pressed bricks. The brick being placed in the mold, the movement of the main upright lever effects the elevation of the follower and the compression of the brick; by then reversing the movement of the lever the follower descends, and the cover of the mold is automatically raised. The follower is again raised and the brick removed from the mold by the depression of a secondary lever.

Claim.—The combination of the follower D *d*, lever I, connected to the rock shaft *n* and the levers *u* and L, connected by the rod *w* with the lever H and lugs *v*, constructed and arranged to operate substantially as and for the purpose set forth.

80,471.—E. F. GERDON and C. W. SCHINDLER, Albany, N. Y.—*Lubricating Compound.*—July 28, 1868.—Fat or oil, wax, rosin, India-rubber, and potash.

Claim.—A lubricating compound, made of the ingredients above specified, and mixed together in about the proportion and substantially in the manner set forth.

80,472.—THOMAS GIBSON, Rochester, N. Y.—*Fruit Jar.*—July 28, 1868.—The vertical edge of the cover rests upon the packing, and the hooks of the clamps engage below the flange of the jar neck and within the crease of the cover.

Claim.—The cover C, with the groove *b*, and the detachable clamps B, in combination with the flange *a* and packing ring *c*, all acting conjointly, as herein shown and for the purpose described.

80,473.—M. G. GILBERT and F. ELBERSON, Ada, Ohio.—*Hanging Eaves Troughs.*—July 28, 1868.—A clamp and brace for supporting eaves troughs, adjustably attached to a bracket fixed upon the roof.

Claim.—The combination of the fixed bracket B with the adjustable clamp C and brace D, when arranged and operating substantially as described.

80,474.—ADAM GOOD, Jr., and SIMON STROUSE, Titusville, Pa.—*Valve.*—July 28, 1868.—The valve resumes its seat by gravity. The wear of the valve upon the stem does not tend to produce leakage. The recesses are designed to produce an "intermittent motion of the valve."

Claim.—The valve D, provided with inclined or sloping recesses *i i*, in combination with sleeve E, seat C, and chambers A A', all arranged to operate substantially as described.

80,475.—JOHN GOODIN, Centralia, Ill.—*Boring and Drilling Machine.*—July 28, 1868.—The cogged cylinder and the rack bar on the frame, with their respective cranks and cog-wheels, enable the drill shaft to be rotated as well as moved vertically.

Claim.—The arrangement of the corrugated cylinder H, inclined toothed wheel K, rack bar E, cog-wheel O, and movable frame F, with the standard B, all constructed to operate as set forth.

80,476.—WILLIAM HAILES, Albany, N. Y., as signor to J. F. RATHBONE AND CO., same place.—*Damper.*—July 28, 1868.—The air is caused to enter at the bottom of the fire-box, and the escape of fire and ashes thereat prevented.

Claim.—An inclined guard, so applied to the orifices of a sliding draught apparatus, when located at or near the bottom of a fire chamber of a stove, as to prevent the escape of ashes, &c., therefrom, substantially as described.

80,477.—EDWIN HALE, Boston, Mass.—*Hand Nail Driver for Boots and Shoes.*—July 28, 1868.—The point of the instrument is placed at the spot where the nail is to be driven, the plunger is raised and a nail dropped through the feed tube; the plunger being then allowed to fall drives the nail home.

Claim.—The arrangement of the tube A, the feed tube B, and plunger C, E, and H, substantially as and for the purpose described.

80,478.—JOHN S. HALL, Pittsburg, Pa.—*Machine for Making Bolts and Spikes.*—July 28, 1868.—Relates chiefly to the operation of the header, which, though worked by a cam, comes against the end of the bar or blank with sudden force or impact.

Claim.—1. The combination of the heading ram and its lever with the gripping dies, gauge, and with the cam D, so that the ram shall have attained great momentum before it reaches the bar, bolt, or blank in the dies, and thus form the head, substantially as described.

2. The unobstructed space under or below the dies and feeding point, so that when the gripping ram recedes, after heading or upsetting of the end of a long bar or bolt, said bar or bolt may drop out of the dies, and thence be drawn out of the machine, substantially as described.

80,479.—JAMES HARRIS, Janesville, Wis.—*Harvester.*—July 28, 1868.—An arrangement of devices for harvesters whereby the ends of the cutting apparatus may be raised separately or simultaneously.

Claim.—1. The arrangement of the shaft *e*, operated by the hand lever M, and having thereon the crank *d*, with the rod *e*, crank *f*, shaft *g*, and castor wheel L, substantially as and for the purpose described.

2. The combination and arrangement of the shaft *g*, with the part *i* and brake *rp*, either with or without the clutch *h*, whereby the vertical vibration caused by the torsion of the rod is prevented, substantially as described.

3. The combination and arrangement of the rod *g*, part *i*, and arm *l*, the last two forming the castor arm of the grain wheel L when the part *i* is attached directly to the rod *g*, and is made the fulcrum upon which the castor arm turns, as well as the moving lever, by means of which the cutter bar is raised or lowered, substantially as described.

4. The combination and arrangement of the lever M, shaft *e*, cranks *d* and *h'*, rods *b* and *e*, crank *f*, shaft *g*, clutch *h*, part *i*, and brake *rp*, substantially as and for the purpose set forth.

80,480.—ANDREW J. HARRISON, Rock County, Wis., assignor to himself, W. W. DEXTER, WILLIAM M. UNDERHILL, and ALONZO K. CUTTS; and said UNDERHILL, assignor to SAMUEL C. BURNHAM, JR.—*Watch.*—July 28, 1868; antedated January 28, 1868.—The band or packing inclosing the movement may be readily applied and detached. Its function is to close the space against dirt and dust.

Claim.—A band or hoop, cut open or divided at one side, so that it may be sprung open and applied around, or partially around, the works or mechanism of a watch, between the upper and lower plates, substantially as described, either with or without a covering of felt.

80,481.—EDWARD HOLMES and BRITAIN HOLMES, Buffalo, N. Y.—*Machine for Crozing and Howeling Barrels.*—July 28, 1868.—A guide rest is combined with a cutter head, carrying chamfering, crozing, and howeling cutters in such a manner that the action of said cutters is gauged from the exterior surface of the cask.

Claim.—The combination of the cutter head H,

supported by the swinging frame I, with the rest J, supported by the swinging frame K, oscillating upon a common axis with the cutter frame, when said frames K and I are provided with a locking mechanism by which the cutter head may be held at a definite distance from the rest, and thereby made to follow the curvature of the cask, substantially in the manner and for the purpose set forth.

80,482.—EDWARD HOLMES and BRITAIN HOLMES, Buffalo, N. Y.—*Machine for Leveling the Staves in Barrels.*—July 28, 1868.—The cask, the staves of which have been placed in position, and are held together by truss hoops, is rolled between the head blocks and placed upon rests or pins. The movable head block being then made to approach the stationary head block, the projecting staves are forced endwise into line with the others.

Claim.—The combination and arrangement of the head block A, movable driver B and its operating screws D D¹ D², spur wheels E E¹ E², and driving pinion F, or their equivalents, operating substantially as herein described.

80,483.—EDWARD HOLMES and BRITAIN HOLMES, Buffalo, N. Y.—*Machine for Jointing Staves.*—July 28, 1868.—The clamp bars are adapted to hold staves of different width at different angles, in order to present them to the cutters in a manner to give them the bevel and bilge appropriate to their width. The eveners are pressed against the upper clamp bar by a weighted arm, so as to feed the staves evenly to the action of the knives, and make the ends of the staves of equal width. The friction clutch and its accessories enable the gearing which operates the clamp to be stopped instantaneously. The clamp is operated to feed the staves to the action of the cutters by grasping an arm connected to a rock shaft, carrying at its ends pinions or segments, gearing with stationary racks.

Claim.—1. The flexible hinged ribs *k'*, in combination with the stationary ribs *k*, constructed, arranged, and operating for the purpose and substantially as described.

2. The eveners or feed arms L, for the purpose substantially as set forth.

3. The combination of the friction clutch *m*, weighted lever *n*, and pedal O, arranged and operating in the manner substantially as described.

4. The combination of the horizontal rack T, pinion or segment S' upon the rock shaft S, and arm R, arranged and operating for the purpose and substantially as described.

80,484.—ELIHU HOSFORD, Chicago, Ill.—*Range.*—July 28, 1868.—The air to cool the grate is introduced by means of an enlargement of the tube through which passes the spindle supporting the grate. When the coal is ignited and the damper closed, the air to support combustion enters through the perforated feed door, is drawn down through the coal into the combustion chamber, and thence, with the products of combustion, through the columns and hot-air chamber into the smoke flue.

Claim.—1. The application of a current of cool air to the under side of the grate, in the manner and for the purpose substantially as herein described.

2. The oven H, formed by enlarging the air space and providing suitable doors, in combination with the cylinder A, combustion chamber C, columns D, and hot-air chamber E, substantially as herein specified.

80,485.—SAMUEL D. HOVEY, Brooklyn, N. Y.—*Rubber Head for Pencils.*—July 28, 1868.—Two materials, suitable, respectively, for erasing ink and lead, form the two parts constituting the head.

Claim.—The pencil and pen head or tip, composed of the pencil-mark eraser *o* and the pen-mark eraser *e*, combined substantially as described.

80,486.—HENRY R. HOWE, Hartwick, N. Y.—*Car Coupling.*—July 28, 1868.—The lever on being depressed draws down the coupling pin and frees the link, thus uncoupling the cars. At the same time the spiral spring is allowed to force out the block, which prevents the pin from returning to its place, while the chain draws down the tongue, leaving the

mouth of the buffer open, so that when the link of a car to be attached comes inside thereof it will be guided to the center, and its end striking against the block, forces it back, whereupon the spring bars raise the pin through the link.

Claim.—The combination of the buffer A, spring bars O and K, bent bar P, chain R, tongue N, block E, pin T, spring G, link I, pin J, set screw S, and lever L, when constructed and arranged substantially as described, as and for the purpose specified.

80,487.—EDWIN W. JACKSON, Brooklyn, N. Y.—*Rotary Steam Engine.*—July 28, 1868.—The main shaft has an opening from side to side, in which the pistons slide, and holes pass completely through the pistons, to allow the steam to escape when one piston is closing upon the other, and admit steam when the motion is reversed. The invention has reference principally to the means for producing the rising and falling motion of the pistons at the proper times and conducting the same past the bar of separation.

Claim.—The combination of the steam chest T, (Plate XXVII,) changeable steam ports, (Plates XIII and XIV,) main shaft, (Plate I, Fig. A,) the shifting pistons perforated completely through, (Plate I B,) they having projections or shafts on their ends, to which the four rollers C C (Plate VI) are attached, one on each end, two end pieces, called governor's guides, (Plates IX and X,) which are placed one at each end of the pistons, thick bar, described as the bar of separation, (Plate XV, *a*,) placed between the upper and lower steam ports, and back plate O, (Plate XIII,) to which the bar of separation is attached, substantially as and for the purpose set forth.

80,488.—GUSTAV L. JAEGER, New York, N. Y.—*Water Meter.*—July 28, 1868.—A wheel revolves in a case and carries an even number of hinged buckets, connected in pairs by cranks and rods in such a manner that whenever one of the buckets strikes the closing edge of the case, said bucket is closed, and the bucket which is connected thereto thrown open by a positive force. The fluid in its passage to the measuring wheel is compelled to pass through the mud cistern and strainer of the faucet.

Claim.—1. The arrangement of mud cistern *b* and strainer *a* in the plug of the stop-cock D, substantially as and for the purpose described.

2. The rods *l* and cranks *k*, connecting diametrically-opposite buckets of the wheel B, which runs in the scroll E, substantially as and for the purpose set forth.

80,489.—GEORGE W. JANVRIN, Great Falls, N. H.—*Wagon.*—July 28, 1868.—The body of the wagon may, by the same power as is exerted in its traction, be raised and lowered with or without freight thereon, for convenience in loading and unloading. The bottom may be inclined, to discharge freight like a tip-cart.

Claim.—1. A wagon, so constructed and arranged as that the body of the same may be raised and lowered at option, by means of screws attached to and forming part of the wagon, when the said screws are acted upon by attachments to the carrying wheels, substantially as described.

2. In combination with wagons, the wheel bevels, with their corresponding bevel wheels, when constructed and arranged substantially as shown and described.

3. The device shown, of the shipper slides and their appended forks, in combination with the upper and lower bevel wheels J and K, and the wheel bevels, in connection with the body of a wagon, when constructed substantially as described.

4. The shipper bar clutches shown, when arranged in combination with the notched plates, the shipper slides, and the body of a wagon, substantially as above described.

5. When in combination with wagons supported by more than two wheels, the tip-cart arrangement of two or more cross bars, U U^x, and the pivoted bottom, when constructed substantially as described.

80,490.—HENRY KELLOGG, New Haven, Conn.—*Hat.*—July 28, 1868; antedated July 14, 1868.

Claim.—A hat formed from pulp, having incorporated within the material of the body or brim,

during the formation thereof, a wire, reed, or other stiffening frame or form, substantially as described.

80,491.—DENNIS LANE, Montpelier, Vt.—*Head Block for Saw Mills.*—July 28, 1868.—The head blocks are moved at right angles to the sliding frame in consequence of the passage of the oblique bars through the grooved blocks. Provision is made for readily reversing the motion of the frame and head blocks.

Claim.—1. The grooved block P and the yielding grooved block P², arranged in line in the same head block, and successively acted upon by each of the incline bars N, arranged parallel in the reciprocating frame G, whereby the head block is made to advance or recede, as desired, all constructed and operating substantially as described.

2. The sleeve E², forming an eccentric bushing in the post W for the pinion wheel B², by which the pinion wheel B² is thrown in or out of gear with the bevel wheel A², for the purpose of advancing or retracting the carriage, constructed and operating substantially as described.

80,492.—SAMUEL LEWIS, Brooklyn, N. Y., assignor to WILLIAM H. CAMMEYER, same place.—*Portable and Adjustable Still Water Dam.*—July 28, 1868.—A portable and adjustable apparatus for producing still water in which to operate for the blasting and removal of obstructions; especially designed for continuous use where subaqueous obstructions produce a throttling or contraction of the water course, and a consequent acceleration of the current that debars operation with a view to their removal (under previously known methods) except during a limited portion of each day.

Claim.—1. The construction and arrangement of a portable and adjustable dam, in sliding or telescopic sections, in the manner and for the purposes herein described.

2. The combination of the self-anchors 3 with the dam, in the manner and for the purposes herein described.

3. The combination of the boats, supports, or floats with the dam, as above described, and the arrangement of anchors to hold such boats in position, in the manner and for the purposes described.

4. The combination and arrangement of windlasses, chains, and boats with the dam, as above described, so that by the construction thereof a series of drills may be operated within and inclosed by the dam, in the manner and for the purposes herein described.

80,493.—J. A. MANNING, Ashtabula, Ohio.—*Car Coupling.*—July 28, 1868.—The coupling hook on entering the mouth of the buffer head slides up an incline therein, pushes up the fall and engages a ledge or shoulder, whereupon the fall descends to secure it.

Claim.—The hooked fall D, as constructed, arranged, and operated in combination with buffer head B and link C, for the purpose and in the manner as described.

80,494.—JAMES MINIFIE, Baltimore, Md.—*Lamp Burner.*—July 28, 1868.—The two cones reflect the light from the lower part of the flame downward and outward. The bottom of the chimney rests upon the lower cone, and the corrugations form channels all around its lower edge to admit air to the flame, other currents being admitted to the same through the perforations.

Claim.—1. The combination and arrangement of the two corrugated cones C D, and tube *e*, substantially as described.

2. The corrugated cone D, when provided with the above-described openings along the summits of the ridges formed by the corrugations, substantially as and for the purpose herein set forth.

80,495.—WILLIAM MINSTER, Washington, D. C.—*Carpet Stretcher.*—July 28, 1868.—The end of the ratchet bar is placed against the wall and its point driven into the floor. The carpet being then clamped between the jaws and the crank turned, the carpet is stretched to the desired extent, and held by the instrument till tacked at the edge.

Claim.—1. The hinged jaws E E, pressed apart by means of a spring, and bound together by either

a set screw or the headed bolt F and its nut G, for the purpose of firmly holding the carpet, substantially as herein set forth.

2. In a carpet stretcher, the jaws E E, constructed as described, and hinged to the box B, which slides upon the ratch bar A, and operating as and for the purposes specified.

80,496.—RICHARD NELSON, Cincinnati, Ohio.—*Screen for Washstands.*—July 28, 1868.—This sheet-iron back is designed as a substitute for the marble slab commonly employed.

Claim.—The back or screen for washstands and analogous articles of furniture, provided with one or more shelves, c, substantially as herein described.

80,497.—ERNST OFFHAUS, Newark, N. J.—*Propelling Apparatus.*—July 28, 1868.—An arrangement of mechanism for operating the two pistons of a rotary pump which draws in water from the front part of the vessel, and forces it out at the rear so as to propel the vessel thereby.

Claim.—The annular cylinder E', connected to the water ways A and B', and receiving the pistons d d', in combination with the levers s and t, switch r, and stops, acting in the manner and for the purposes specified.

80,498.—NATHAN M. PHILLIPS, New York, N. Y.—*Tag Fastening.*—July 28, 1868; antedated July 18, 1868.—There is a bend near the free end of the guard, where the ring is held and prevented from slipping edwise on the spring when the tag is in use.

Claim.—The within-described hook A B C, bend or loop D, guard E, and shifting ring H, combined and arranged for joint operation relatively to the tag G and to the goods M, substantially in the manner and for the purpose herein set forth.

80,499.—LOUIS PORTNER, Chicago, Ill.—*Reflector.*—July 28, 1868.—This reflector is intended for use on the kerosene lamps of chandeliers for illuminating billiard tables. The effect of the peculiar form of the reflector is that the light of two or more lamps provided with them may be so reflected as to illuminate the table without having a shadow at the center. The wire hook suspends the reflector from the tin top of the lamp glass.

Claim.—The reflector A, constructed substantially as and in the manner herein set forth and for the purpose specified.

80,500.—DANIEL J. PRATT, Albany, assignor to himself and OLIVER AREY, Brockport, and OLIVER AREY, assignor to MICHAEL P. CAVORT, Albany, N. Y.—*Parallel Ruler.*—July 28, 1868.—The gage plate is held while the T-square is moved along as far as permitted by the slotted connection, and then, a line being first drawn, the rule is held while the gage is moved up to it, to permit the rule to be again moved the determined distance.

Claim.—The construction of a parallel ruler, by attaching to one of the limbs of a T-square ruler a gage plate for regulating the distances between the lines to be ruled, substantially in manner set forth in the specification.

80,501.—PHINEAS PRENTISS, Chester, Mass.—*Washing Machine.*—July 28, 1868.—The handle is moved to and fro horizontally, giving a reciprocating rotatory motion to the dasher. The height of the handle may be varied to suit the operator.

Claim.—In combination with the tub, with ribbed sides and dasher, with gearing, the adjustable socket, arranged so that the handle may be used with comparative depression or elevation, substantially as shown.

80,502.—HIRAM PRESTON, Orfordville, Wis.—*Cultivator.*—July 28, 1868.—An arrangement for lowering, raising, sustaining, and varying the operating position of the shovels or cultivator teeth.

Claim.—1. The adjustable V-shaped parts C, in combination with the rocking shaft B, when constructed and operated substantially as described and set forth.

2. The lever h, provided with the springs i, and the arm E, in conjunction with the parts C, and

ratchet k, for the purpose of controlling the parts C, substantially as described.

80,503.—WILLIAM B. READY, Sacramento, Cal.—*Cultivator Teeth.*—July 28, 1868.—The tongue or point may be let down to compensate for wear until the larger portion of its material is consumed in service.

Claim.—1. The groove c in stock a, as a seat for an adjustable point for a cultivator tooth.

2. The movable tongue d, pierced with holes or slots i i i i, forming an adjustable point of a cultivator tooth.

3. The combination of the grooved stock or support a with the adjustable tongue d, for the purposes of a cultivator tooth, substantially as above described.

80,504.—ALBERT RHOADES and JOHN ADAMS, Pontiac, Mich.—*Deep Well Tube.*—July 28, 1868.—When the tubes are driven to the desired depth, the outer tube is elevated sufficiently to expose the slots of the tube, which is secured to the barbed point. A contrivance having fingers to clean out the slots when clogged, may be coupled by means of its screw with a rod whereby to work said cleaner up and down.

Claim.—The arrangement of the removable rod D, having a female screw, F, to connect to the screw upon the cleaner E, at the lower portion of the slotted tube B, all constructed to operate substantially as specified.

80,505.—JOHN RICE, Bloomington, Ind.—*Railroad Car Heater.*—July 28, 1868.—An iron box or chamber, together with the fire box, is securely attached beneath the car. A central chamber contains water to moisten the air, which is admitted from below and conducted by pipes through the main box to the end chambers, from which it may be drawn off by registers. The air may be taken from said pipes at intermediate points, it being heated therein by the direct action of the heat and by the products of combustion in transitu.

Claim.—The heating apparatus A B, constructed and arranged as described, that is, having the chamber B', air tubes D in smoke tubes F, chambers C C, E E, G G, and registers and discharge pipes, as shown, the whole being attached to and combined with a railroad car, and operating substantially in the manner described, and for the purpose set forth.

80,506.—LOUIS S. ROBBINS, New York, N. Y.—*Process for Purifying Butter.*—July 28, 1868.—The butter is subjected to such a temperature as will reduce it to a semi-liquid condition, and afterward washed, first with warm and then with cold water, so as to remove the buttermilk and other impurities and solidify the butter to the desired degree.

Claim.—The within-described process for treating or purifying butter substantially as herein described.

80,507.—AUSTIN A. ROSS, Horicon, N. Y.—*Churn.*—July 28, 1868.—The pins or cogs projecting from the face of the upright driving wheel, engage the "dash-wheel" or pinion, to which the top of the dasher is united by a screw. The dasher rotates.

Claim.—The churn dasher E, when constructed as described, of wire and a tin screw, F, and provided with a screw in its upper end, in combination with the dash wheel C, constructed and operating substantially as and for the purposes herein set forth.

80,508.—WILLIAM F. ROSSMAN, Hudson, N. Y.—*Kerosene Lamp Boiler.*—July 28, 1868.—The arrangement of the water spaces in relation to the metallic chimney, induces free convection, and enables the water to be quickly heated.

Claim.—1. The combination and arrangement of reservoir or kettle A, tube a, boiler C, and aperture d, when employed in connection with a kerosene or fluid lamp, substantially as and for the purposes described.

2. The combination and arrangement of burner B and chimney e with boiler C, when the latter is connected with the reservoir or kettle A, substantially in the manner and for the purposes set forth.

80,509.—ROBERT SANDERSON, Cleveland, Ohio. *Steam Cut-Off Valve.*—July 28, 1868.—The notches admit steam under the lower edge of the valve, to counteract the pressure exerted from above, and facilitate the opening movement. The impingement of the rollers occasioned by the reciprocation of the lever which carries one of them, effects the raising of the valve, its closure being effected by the conjoint influence of gravity and steam pressure. The cam regulates the throw of the lever in case of derangement of the governor.

Claim.—1. The arrangement of the ports or openings D and notches *a*, in the manner as and for the purpose set forth.

2. The pivoted lever I and roller H', as arranged in combination with the roller H and valve D', in the manner set forth.

3. The cam G', as arranged in relation to the lever I, as specified.

80,510.—PETER SCHOONMAKER, New Britain, Conn.—*Bit for Bridles.*—July 28, 1868.—The rings of the bits are lined with German silver, to improve the appearance and increase the durability thereof.

Claim.—As a new article of manufacture, a japanned bridle or harness bit, having its rings lined with metal, substantially as described, for the purpose specified.

80,511.—JOHN SCHUMACHER and HENRY UPJOHN, Ann Arbor, Mich.—*Machine for Pressing and Grooving Seams in Tin Ware.*—July 28, 1868.—The tin being bent in the usual manner for forming a joint, is placed with its joint upon the arm, beneath the groove in the roller, the inner edge of the pieces of tin resting against the gauge. The roller being then propelled over the joint, presses the groove in the seam.

Claim.—The gauge H, used in combination with the arm C, as and for the purpose set forth.

80,512.—JOHN SHELLABERGER, Shane's Crossing, Ohio.—*Tile Machine.*—July 28, 1868.—The clay is tempered by the rotation of the armed shaft in the pug-mill box, and is expelled by the plunger through orifices in one side of the lower chamber.

Claim.—The relative arrangement of the shaft B, sweeps D D, pitman F, lever G, and plunger H I, substantially as and for the purposes set forth.

80,513.—HENRY L. SHEPERD, Osborn, Ohio.—*Horse Hay Fork.*—July 28, 1868.—Movable arms are attached to the points, for the purpose of raising and lowering the same, and hooks, levers, and lugs sustain the points in their horizontal position, and enable them to be readily lowered for discharging the load.

Claim.—1. The combination of the side bar A, connecting bar F, point C, and lever E, when constructed and operating as and for the purposes herein set forth.

2. The combination of the lever E with hook *b*, and lever G with lug *e*, when constructed and operating as and for the purposes herein set forth.

80,514.—SAMUEL R. SMITH, Cincinnati, Ohio, assignor to P. P. LANE and JOSEPH T. BODLEY, same place.—*Head Block for Saw Mills.*—July 28, 1868.—The reciprocating motion of the bar, to which the pawls are attached, gives a continuous rotary motion to the ratchet wheel, and consequently to the screw, and causes the knee to advance toward the saw. By disconnecting a hand wheel from the ratchet wheel, the motion of the knee may be reversed. Loose plates or arms are fitted upon a shaft, so that when any one of them is thrown upward it will arrest the backward movement of the knee. The plates are numbered, and those of each head block on a carriage correspond in position; hence, by turning up plates of the same number, the head blocks may be moved back in line with each other.

Claim.—1. The ratchet wheel G, containing both external and annular teeth, the pawls M M', and reciprocating bar I, all constructed and operating substantially as and for the purpose described.

2. The combination of the wheel Q, worm wheel *m*, and toothed segment P, to operate the dog R, as herein described, for the purpose specified.

3. The plates O, when constructed and operating in the manner substantially as described.

80,515.—AUGUST STEINBOK, New York, N. Y.—*Boring Tool.*—July 28, 1868.—By the combined action of the auger and gimlets, the wood included within the transverse area of the case is almost entirely removed, so that pressure on the end of the auger is sufficient to cause the cutting edges of the case to clean out the corners; a square or polygonal hole being thus produced.

Claim.—The adjustable frame B, in combination with the auger D, gimlets E E, and the case A, provided with cutting edges, constructed and operating substantially as described.

80,516.—STEPHEN STUCKY, New Albany, Ind.—*Feed Water Heater.*—July 28, 1868.—The series of partitions in the feed water heater retard the flow of water, and the chambers receive and retain such sedimentary matter as may be precipitated from the water.

Claim.—The drum A, with pipe G, perforated as described, partitions D F J I, forming chambers C H E K, with the exterior pipes, as described, and with the boilers L L, all constructed and arranged substantially as and for the purposes set forth.

80,517.—H. S. THAYER, Boston, Mass.—*Submarine Exploring.*—July 28, 1868.—A person within the darkened chamber can see beneath the surface of the water, with or without the aid of lenses, the invention being based upon the theory of looking from a dark space into one less dark.

Claim.—The boat A, provided with an opening, B, through its hull, and over which opening is placed a darkened house C, as and for the purposes specified.

80,518.—EDWIN THOMAS, Philadelphia, Pa.—*Ventilating Boots and Shoes.*—July 28, 1868.—A gum-elastie flap valve is fitted to an eyelet-hole in the upper leather, and grooves are cut in the sole leather, so that air, designed to form a cushion, can pass along the grooves and up the counter or heel piece.

Claim.—1. Ventilating boots and shoes by grooving the inner soles with grooves that are narrow at the top and wide below, so as to allow the air to pass along the grooves, as herein described, and for the purposes set forth.

2. The manufacture of leather for inner soles of boots and shoes, with grooves of a dove-tail shape, and a porous cover, for the purposes as specified.

80,519.—WILLIAM TOTTEROH, Reading, Pa.—*Lamp.*—July 28, 1868.—The object of this arrangement is to deflect the current of air and direct it against the flame, so as to produce effective combustion and a good light.

Claim.—1. The uprights C C', deflectors D D', ring A, rings or bands F and G, and the arms H, when combined and arranged as shown and described.

2. The uprights C C', deflectors D D', ring A, base B, filling tube E, wick tube *b*, and the outwardly curving wing or guide *c*, when combined and arranged as shown.

80,520.—KASIMIR VOGEL, Chelsea, Mass., assignor to EBEN W. LOTHROP, same place.—*Sewing Machine for Button Holes.*—July 28, 1868.—Relates to a mechanism which is designed to be attached to and operated in connection with common, plain sewing machines, for the purpose of stitching button holes and other over-edge work and embroidery. Each tooth and space around the periphery of the cam or former represents the length of a stitch laterally, so that by varying said teeth the stitches may be varied accordingly.

Claim.—1. The irregular toothed cam or former E, whether having an intermittent, rotary, rocking, or reciprocating movement, substantially as and for the purposes described.

2. The several parts of the described mechanism, when constructed, combined, and operating substantially in the manner and for the purposes described.

80,521.—ANDREW WALKER, Claremont, N. H.—*Gang Plow*.—July 28, 1868.

Claim.—1. A stationary frame, with adjustable plow beams underneath, pivoted to the main frame at the rear end, and suspended by the ratchet E.

2. In combination, the gear wheel C, gear circle D, lever F, and spring catch *b*, in combination with the ratchet E, for the purpose of adjusting the depth of the furrow, and locking or suspending the plows at any given point, the whole arranged, constructed, and combined, and used in combination with and for the purpose set forth.

80,522.—ANDREW WALKER, Claremont, N. H.—*Seed Sower and Harrow*.—July 28, 1868.—The harrow is attached to the rear end of a lever which is pivoted to the main axle; and a lever attachment is provided for raising and lowering the harrow.

The harrow is geared to the ground wheels so as to be rotated thereby. The discharge of seed is regulated by raising or lowering the gauge rod and valve attached thereto.

Claim.—1. The ratchet lever C, in combination with the harrow G', the gear-gauge wheel I, lever K, and circular ratchet *o*, with the spring stop *a* in lever K.

2. The valves *b b'*, attached to the seed box B, and gauge rod *e*, in combination with the fluted roller *d*, the whole combined, arranged, and used as and for the purpose set forth.

80,523.—ROBERT WARNOCK and CHARLES ABBEY, 2d, Ridgeville, Ohio.—*Grain Rake*.—July 28, 1868.—The rake is pushed forward by its handles and gathers the grain from the swath.

When sufficient for a bundle has been gathered, the handles are dropped, thereby elevating the rake from the ground. The cross-bar in front of the axle is then depressed by the foot of the operator, compressing the grain between the rake and the arms, in which condition it is tied.

Claim.—The rake F, guards H, arms A', handles C, and wheels A, all constructed and combined to operate in the manner as and for the purpose set forth.

80,524.—JAMES T. WATSON and HENRY E. ROBINSON, Richmond, Ind.—*Straw Cutter*.—July 28, 1868.—The knife has a longitudinal as well as a vertical motion, the spring aiding to produce the effective stroke.

Claim.—The combination of the box B, the table A, the knife C, and the oscillating arm D, and spring E, substantially as arranged and described, for the purpose set forth.

80,525.—F. H. WHITMAN, Harrison, Me.—*Stove for Railroad Car*.—July 28, 1868.—These devices close the draught and funnel openings of the stove in the event of the capsizing thereof.

Claim.—1. The plate *e*, suspended on plates *b b'*, so as automatically to close the funnel aperture, substantially as herein set forth.

2. The self-closing grate or draught, substantially as and for the purposes herein set forth.

80,526.—C. WILLIAMS, New York, N. Y.—*Apparatus for Cleaning Sewers*.—July 28, 1868.—The folding scraper and the folding leaves operate like a valve, closing to effect the removal of the sediment when drawn in one direction, but opening, so as to avoid resistance, during the return movement. The adjustable bail causes the open end of the bucket to be inclined downward, to adapt it to more effectively scoop up the sediment. The perforations obviate the raising of water with the non-fluid sediment. The guide frames cause the buckets to pass properly up through the man-holes.

Claim.—1. The toggle arms *i i*, braces *j j*, and head D, carrying the sheave *g*, combined and operating to hold the pulley, substantially as and for the purpose described.

2. The guide piece *m* on the dog D, to facilitate the introduction of the rope to the sheave *g*, substantially as set forth.

3. The folding scraper *e*, Fig. 5, constructed and arranged for clearing pipe sewers, substantially as shown and described.

4. The automatically folding leaves *c c*, arranged

in the bucket C, constructed as shown, and for the purpose set forth.

5. The adjustable bail *e*, in combination with the fixed bail *f* of the bucket C, substantially as and for the purpose specified.

6. The bucket C, made with perforated sides, as and for the purposes set forth.

7. The detachable guide frames E, arranged upon the man-holes of a sewer, in combination with the draught rope B^x, substantially as and for the purposes described.

80,527.—MARTIN V. B. YOUNG, New York, N. Y.—*Cigar Holder*.—July 28, 1868.—The tube terminates at top in a sharp edge which lies parallel with the axis of the smoker.

The cigar is placed upon the pin and tube, and pressed down closely against the large, conical tube, the pin and penetrating tube holding the cigar in position, and said penetrating tube also forming a channel of communication between the mouth piece and the interior of the cigar. The interior of the conical tube is a cooling and condensing chamber.

Claim.—1. The wedge-shaped piercing tube G, applied to a cigar holder, substantially as and for the purpose set forth.

2. The combination, with the piercing tube G and tube A, of the pointed stud or pin F, substantially as set forth.

80,528.—THOMAS J. CLOSE, Philadelphia, Pa.—*Settee*.—July 28, 1868.—A mode of securing the slats of a settee to the frame, the object being to dispense with the use of screws.

Claim.—1. A frame of a settee, with dovetail mortises and round or oval bosses, substantially in the manner and for the purpose specified.

2. The combination of the slats B, having holes or countersinks, with the bosses *e*, as described, on the frame A, and wedge-shaped keys *e*, substantially in the manner and for the purposes set forth.

80,529.—BENJAMIN A. BAILEY, Lewiston, Me. assignor to himself and WILLIAM H. KILVERT, same place.—*Yarn Beam for Loom*.—August 4, 1868.—The beam is provided with movable heads, each of which is made with a boss in which are mortises for the reception of metal keys fitting in serrated key seats.

By loosening the keys the heads may be adjusted to the desired length of beam.

Claim.—1. The serrated keys and key seats, for holding the head in position, substantially as set forth.

2. A yarn beam, having main heads, made movable and adjustable, in combination with serrated key seats and adjustable keys, substantially as described.

80,530.—ELI M. BARNUM, New York.—*Elevated Railway*.—August 4, 1868.

Claim.—1. The construction and arrangement of the supporting columns of three plates, two outside corrugated plates joined upon a third central plate, arranged substantially as described.

2. The construction and arrangement of the base block of the columns, substantially in the manner described, with a bearing in the top and bottom thereof, the bottom bearing being fitted with keys, by which the column can be adjusted to a vertical position after the base or foundation block has been set, and without disturbing the same, the upper bearing acting as a fulcrum, by which the keys in the bottom bearing bring the tops of the columns to their proper position, in the manner substantially as described.

3. In combination with the top of the columns, a separate cross head T, constructed, applied, and secured, substantially as described.

4. Combining, between the wooden cross tie Q and the iron cross head T, when constructed, the latter with a V-shaped top and the former with a V-shaped bottom, the India-rubber bearing pieces *i i*, inserted in the recesses cut in the bottom of the cross tie, so as to shed the water, and avoid the accumulation of ice and dirt around the rubber.

5. The method and arrangement of securing the cross tie and rail chair to the cross head, substantially as described.

6. Combining, with the columns and rails of an

elevated railway, a pipe or tube, for the purpose of supporting, sustaining, and bracing the same, substantially as described.

7. In combination with the supporting columns, the adjustable brackets *u*, Figs. 5 and 6, for supporting the awning rods *t t*, and by which they can be moved up or down, or attached to the inside or outside of the columns, substantially as described.

8. In combination with an elevated railway, and as part of the system herein described, the construction and arrangement of the described signals to govern the movements of the cars, substantially as described.

80,531.—ALLEN T. BENNETT AND WILLIAM O. ANDERSON, Cincinnati, Ohio.—*Machine for Cutting Rags*.—August 4, 1868.—A gang of hook-formed knives projecting spirally from a shaft, are caused to rotate at a high velocity through corresponding notches in a bench, upon which the rags are drawn slowly forward by a series of feed wheels, for the purpose of cutting rags into narrow strips for working into rag carpets.

Claim.—The combination of the gang of hooked knives *C C¹ C² C³*, arranged spirally along the shaft, so as to reach the material to be acted upon in rapid and regular succession, the notched bench *D*, and yielding feed wheels *E E¹ E² E³*, all constructed as described, the knives working intermediately between the feed wheels and projections of bench *D*, for the purpose set forth.

80,532.—DAVID B. COX, Troy, N. Y.—*Coal Stove*.—August 4, 1868.—The perforations in the partition allow the draught to pass down around the fire pot into the annular flue, by which the draught becomes heated and causes greater radiation of heat near the floor.

Claim.—The annular horizontally-circulating flue *b* around the base of the fire pot, and separated from the chamber above by a perforated partition *g*, substantially as and for the purpose herein specified.

80,533.—CHRISTOPHER G. CROSS, Chicago, Ill.—*Governor for Steam Engine*.—August 4, 1868.—The devices are so arranged that the action of the governor will be direct upon the throttle valve, without the intervention of a balanced bar or lever. The movement of the governor is controlled by means of pumps working in oil or other fluid.

Claim.—The arrangement of the lever or crank *T*, beam *P*, and pumps *N*, with the cylinder *D*, regulating stop *x y*, shaft *E*, rod *H*, and case *A B*, substantially as and for the purposes specified.

80,534.—GEORGE DRAPER, Hopedale, Mass.—*Let-off for Loom*.—August 4, 1868.—In this device the friction strap is connected with the lay by means of a rod pivoted to the lay, and is so operated as to prevent the delivery of the yarn at the beat of the sley.

Claim.—The combination of the connection rod *U*, or the mechanical equivalent thereof, with the lay *B*, and the mechanism applied to the whip roller *D* and the yarn beam *C*, such mechanism consisting of the friction strap *f*, its wheel *g*, and spring *d*, and the operative lever and train of gears, as explained.

80,535.—VIRGIL DRAPER, North Attleboro, Mass., assignor to EDMUND J. RICHARDS, same place.—*Apparatus for Swaging the Swivel Eyes of Watch Chains*.—August 4, 1868.—The supporter has a dovetailed groove to receive the carrier, upon which latter the swaging die plate is arranged. The blank is placed over an opening of the said plate and to this the punch is applied.

Claim.—The combination of the grooved supporter *A*, the carrier *B*, the bed die *D*, the swaging die plate *E*, and the punch *F*, such being constructed for use in manner and for the purpose substantially as described.

80,536.—SAMUEL DRIVER, Philadelphia, Pa., assignor to ROBERT H. DRIVER, same place.—*Automatic Boiler Feeder*.—August 4, 1868.—Two receivers or chambers are arranged one over the other, and communicate the one with the other, and with the feed pipe and boiler, each being opened and closed

alternately by means of revolving valves, whose shafts are provided with gearing, having an intermittent action, in connection with a central actuating shaft.

Claim.—The combination and arrangement of the chambers *B* and *B'* and valves *G* and *G'*, provided with pinions *F¹* and *F²*, and operated by means of the wheel *F*, on the driving shaft *D*, substantially in the manner above described.

80,537.—JOHN H. EDDY, Taunton, Mass.—*Cupola Furnace*.—August 4, 1868.—A pipe leads directly under the center of the furnace to the interior of the same, and upon its upper end, within the furnace is placed an air chamber.

Claim.—1. The air chamber *I*, when used in connection with cupola furnaces, as above described.

2. The introduction of the blast into cupola furnaces, at the center thereof, whether the same is accomplished in the precise method herein described, or by any other means substantially the same.

80,538.—THOMAS S. FELLOWS, Walnut Lake, Minn.—*Weather Strip*.—August 4, 1868.

Claim.—A weather strip, composed of the plates *C D*, when the former is provided with a lip *e'*, and the latter with an acute angular groove or recess *d'*, and the same are so combined and arranged that they are operated by the natural elasticity of the metal, substantially as described and for the purpose specified.

80,539.—CHARLES R. FISHER, Chelsea, Mass.—*Reversible Latch*.—August 4, 1868.—The lock is so constructed as to be readily adjusted to either a "right" or "left" hand door, as required.

Claim.—1. The slider or saddle *F*, with the reversible bolt *C* and its spring *e*, when combined and arranged as described, and so as to operate together as set forth.

2. The combination of the carriage *D*, the tumbler *E'*, and the retractile spring *E*, with the saddle *F*, the reversible bolt *C*, and its spring *e*, the whole being arranged and applied to the case *A*, in manner as described, and so as to operate together as set forth.

80,540.—GEORGE P. FULLER, Philadelphia, Pa.—*Washing and Wringing Machine*.—August 4, 1868.

Claim.—1. The guiding rings *D D*, in combination with the heads *E E* and pressing bars *C*, substantially as described.

2. The combination of the slides *d* with the pressing bars *C* and guiding rings *D*, substantially as described, and for the purpose specified.

3. A revolving drum, which has around its periphery a series of squeezing bars, supported by springs, and having metallic slides on their ends, which are caused to vibrate in radial grooves in metallic rings, that are confined to the insides of the drum heads, when the several parts are constructed and arranged in relation to each other substantially as described, and the drum is combined and arranged with a series of squeezing rollers, substantially in the manner and for the purpose set forth.

4. The combination of the segmental strips *k* with the dove-tail grooves or recesses *l* and rollers *G*, substantially as and for the purpose specified.

5. The combination of the wringing apparatus, consisting of the squeezing roller *I I¹*, carrying roller *I²*, and endless apron *J* and chains *K*, with the washing machine, substantially in the manner described.

6. The combination and arrangement of the shifter, consisting of the clutch wheel *O*, lever *P*, and horizontal rod *Q*, with the driving shaft *F* and wheel *L*, substantially as and for the purpose set forth.

80,541.—HENRY GILL, Mansfield, Ohio.—*Machine for Threshing and Cleaning Grain*.—August 4, 1868.—The straw and grain fall upon a board in the rear of the feeding cylinder and are carried by a toothed roller over a corrugated horizontal plate, from whence they are carried by a straw carrier, consisting of a series of endless belts provided with projecting pins, between a series of notched bars.

Claim.—1. The picker roll *C*, in combination with the parts *a* and *b*, when constructed and arranged to

operate substantially as and for the purpose set forth.

2. The beater or shaker arms F, in combination with the roller D, provided with the cams or tappets e, for more thoroughly shaking up the straw and separating the grain therefrom, substantially as described.

3. The straw carrier, consisting of the belts E, provided with spikes or teeth, and the notched bars R, when arranged to operate substantially as shown and described.

4. The adjustable tail piece G, in combination with the belts E, substantially as described.

5. The shoe I, when located in a threshing machine, and pivoted, at its front end, in front of the axis of the threshing cylinder, substantially as set forth.

6. Providing the shoe I with the adjustable slide h, for regulating the delivery of the grain and chaff to the blast in a thin and even sheet, as set forth.

7. The combination of the float p and the registers V, when applied to a fan, and arranged to operate substantially as described.

8. Operating the screen u by means of the springs a', and the arms f and cams n, when arranged as set forth.

9. The combination of the shoe I, inclined chute or grain board H, and operating cams n, when arranged for joint operation, substantially as described.

80,542.—EDWIN GORDON, Boston, Mass.—*Chemical Fire Engine.*—August 4, 1868.—The fire engine is divided into two compartments having in each a chamber, through the center of which passes the rod of the force pump of the engine, having upon it a series of rings or cone-shaped disks. Each chamber is divided into two parts, the upper one of which has a bottom sloping toward the center, so that the materials in the same shall slide toward the center and through an orifice provided for the passage of the pump rod.

Claim.—1. The combination, in a chemical fire engine, of chamber A, rod D, supplied with rings or conical-shaped disks E, or other equivalent measuring or graduating device, suction pump C, compartment B, sieve F, pipe a, and compartment e, operating together substantially as and for the purposes explained.

2. The combination, in a chemical fire engine, of chamber A, rod D, supplied with rings, conical disks, or other measuring or graduating device, suction pump C, compartment B, and sieve F, operating together substantially as above described, and for the purposes above set forth.

3. The combination, in a chemical fire engine, of the upper part of the chamber A, or any equivalent, for holding chemical substances for generating carbonic-acid gas, with the pump rod D, supplied with rings or disks, or any equivalent, measuring or graduating device, and the suction pump C, or any equivalent, for supplying a graduated quantity of pure water, operating together substantially as above described, and for the purposes therein stated.

4. The rod of a force pump or other expelling pump of a chemical fire engine, so constructed that it shall extend above the piston chamber of said pump, and have upon it a succession of rings or conical disks or other equivalent measuring or graduating device, for carrying down from a chamber above, through which the rod travels, a definite and regular quantity of some chemical substance or substances, for generating or assisting in generating carbonic-acid gas, substantially in the manner above specified.

5. A suction pump, so arranged that it shall furnish a regular measured supply of pure water proportionate to the amount of chemical substances used, and varying with the speed with which the engine is worked, for the purpose of dissolving and mixing with the chemical substances used for generating carbonic-acid gas in a chemical fire engine, substantially in the manner and for the purpose specified above.

80,543.—JOSEPH HARRISON, Jr., Philadelphia, Pa.—*Steam Generator.*—August 4, 1868.—Improvement upon his patent of Oct. 4, 1859. The invention consists in the application to the boiler of compensating units, by which other units, of which the

boiler is composed, are relieved from undue strain and consequent liability to become fractured.

Claim.—1. Compensating units e, combined substantially in the manner and for the purpose described, with a steam boiler constructed in accordance with that described in the patent granted to me, Oct. 4, 1859.

2. The combination of plain cast or wrought-iron pipes with the cast-iron units, in the manner and for the purpose specified.

80,544.—WILLIAM HEWETT, Pimlico, England.—*Composition for Preventing Incrustation in Steam Boilers.*—August 4, 1868.

Claim.—The use of tannic acid, in combination with unctuous animal matter, in a solid form, for the purpose of preventing incrustation in steam boilers.

80,545.—S. B. HILL, Chicopee, Mass., assignor to himself, LEVI B. TAYLOR, and CHARLES B. LANG, same place.—*Tassel Fastening.*—August 4, 1868; antedated July 18, 1868.—The cord is attached to a spring which is passed into the bobbin and held by projections against shoulders in the space within the bobbin.

Claim.—Connecting the bobbin b and cord e by means of the spring a, substantially as described, and for the purpose specified.

80,546.—GEORGE W. HUBBARD and SCOTT A. SMITH, Philadelphia, Pa., assignors to CRESSON and SMITH, same place.—*Hangers for Shafting.*—August 4, 1868.—The body of the hanger is made hollow, and cores of different sizes are used in the space so that one pattern may be used for several sizes of shafts. A self-oiling apparatus is combined with a ball-and-socket hanger so as to bring the reservoir of oil close to the lower side of the shaft, and at the same time in the center of the bearing.

Claim.—1. The cored spaces b', in combination with the enlarged opening B, in a ball-and-socket hanger, when made for the purpose specified.

2. The combination of the oil reservoir c'', in the lower adjusting screw d', with the opening o and the channel d' in a ball-and-socket hanger, all constructed substantially as described, and for the purpose specified.

80,547.—T. ROMEYN HUNTINGTON and WILLIAM W. HUNTINGTON, Minneapolis, Minn.—*Railroad Gate.*—August 4, 1868.—The flanges of the car wheels strike gradually upon flanges of the levers, causing them to revolve and the gates to open. When the train has passed the gates will fall by their own weight, and the levers will be readjusted.

Claim.—1. The revolving lever A, having, from end to end, a shoulder or groove, partly spiral and partly rectilinear, and so constructed that, when fastened upon the track alongside the rail, such shoulder or groove will receive the flange of the wheel, causing the lever to revolve, all substantially in the manner described.

2. The combination of the rod and crank I G with the revolving lever A, by means of short arm J, so constructed and arranged that the train, passing over A, shall communicate a lifting force to rod L, all substantially as described.

80,548.—GEORGE B. JENKINSON, Newark, N. J.—*Trunk Caster Frame.*—August 4, 1868.—The trunk frame is constructed of an angular form, having the pin on which the caster rotates secured in diagonal braces at and within the angle of the same, and provided with clamps which embrace the bottom cleat.

Claim.—As a new article of manufacture, the within-described trunk caster frame, formed with clamps e e, braces b b, and having the roller placed in the angle of the frame, as and for the purpose set forth.

80,549.—J. U. JOHNSON, Springfield, Mass.—*Boot Protector.*—August 4, 1868; antedated July 24, 1868.—A metallic guard plate is attached to the boot at the point where the latter comes in contact with the ice or snow, and is designed for the use of boys in coasting or sliding on a sled.

Claim.—As an article of manufacture, the boot protector, constructed and arranged as described.

80,550.—DAVID JOY, Middlesboro, Great Britain, assignor to GUSTAV BUNKMAN, assignor to J. VAUGHAN MERRICK, W. H. MERRICK, and JOHN E. COPE.—*Steam Hammer*.—August 4, 1868.—The arrangement of openings and passages causes blows to be imparted by the ram in rapid succession, without the aid of any valve, other than that required to regulate the flow of steam through the steam pipe.

Claim.—The employment of the piston or hammer bar of a steam hammer or hammers, driven by elastic fluid, as the valve for the hammer, the ports being formed in the piston, hammer bar, or cylinder, or among them conjointly, substantially as set forth.

80,551.—J. W. KELLEY, Cleveland, Ohio.—*Whiffletree*.—August 4, 1868.—The plate beneath the whiffletree is provided with segmental dove-tailed grooves in which fit corresponding ribs on the lower plate, by which means the whiffletree is secured to the cross bar.

Claim.—The dove-tailed grooved plate C, in combination with the dove-tailed ribbed plate F, in the manner as and for the purpose set forth.

80,552.—JOHN LANE, Chicago, Ill.—*Apparatus for Welding together the Lay and Landside of a Plow*.—August 4, 1868.

Claim.—An improved implement for facilitating the welding together the lay and the landside of a plow, namely, a vise, the jaws of which are so shaped as to fit the curved surface of the lay and the under edge and inner side of the landside, substantially as shown and described.

80,553.—CHARLES B. LONG and WILLIAM A. N. LONG, Worcester, Mass.—*Knife Ring*.—August 4, 1868.—A cutter is secured to a ring and protected by a cap, and is designed for cutting of threads in sewing, or twine used in tying up packages, &c.

Claim.—The combination of the peculiar-shaped knife or cutter *b* with the slotted neck *a*, cap B, and part C of the ring, substantially as and for the purposes set forth.

80,554.—J. B. LYON, East Cleveland, Ohio.—*Fruit Jar*.—August 4, 1868.—A serew tube provided with notches in its lower end to allow the air to pass out, is fitted over a valve in the top of a jar. The air is exhausted from the jar by an air pump, and the tube is serewed down upon the valve and packing.

Claim.—The serew tube G, provided with notches *a*, as arranged, in combination with the valve seat D, valve E, elastic band H, and cover B, for the purpose substantially as set forth.

80,555.—GEORGE W. MARTIN, Boston, Mass.—*Boot and Shoe and Clog for the Feet*.—August 4, 1868.—The main wearing parts of the heel are readily detached in order that new ones may be readily applied and adjusted; the two detachable parts of the two heels may be interchanged when the same have become irregularly worn away.

Claim.—1. Uniting the two parts A and B of a boot or shoe heel, by means of tongue and groove *h* and *g*, when provided with self-adjusting retaining springs *c c*, either with or without the spring *d*, for the purposes specified.

2. The tongue and groove *h* and *g*, when formed with the reeding sides *i i*, and swelled sides *j j*, when constructed and attached, as described, either with or without the projection *k*, and openings *p p*, as and for the purposes set forth.

3. The elastic adjustable pieces *m* and *n*, in use either upon heel or sole of boot or shoe, as specified and set forth.

4. The tongue *h* and groove *g*, in application to the heel of a boot or shoe, substantially in the manner illustrated, and for the purposes described and set forth.

80,556.—ROBERT McCORKELL, Philadelphia, Pa.—*Cultivator*.—August 4, 1868; antedated July 15, 1868.—The plows are operated laterally by means of a lever pivoted to the tongue, and made to actuate a rack fastened to a bar which connects the plates that govern the motion of the drag bars. The standards are fastened to the drag bar by a transverse bolt

secured by a nut, between which and the drag bar is interposed a lever and a rubber disk or ring.

Claim.—1. The lever H, rack L, and connecting rod N, in combination with the plates E, for the purpose set forth.

2. The lever *c*, in combination with the drag bars C, standard *n*, and rubber spring *r*.

3. The mode of attaching and securing the head *b* of the drag bar C, for the purpose of adjusting the angle of the plows.

4. The mode of attaching and securing the standard *x* to the bar *y*, as and for the purpose set forth.

80,557.—FRED. J. MILLER, Brooklyn, N. Y.—*Speaking Trumpet*.—August 4, 1868.—The trumpet is composed of a series of telescopic rings or sections, by which it may be reduced to a small compass to enable it to be carried in the pocket.

Claim.—As a new article of manufacture, a pocket trumpet, made in substantially the manner described and shown, and for the purposes set forth.

80,558.—JOHN MORRISON, Birmingham, England.—*Hemmer for Sewing Machine*.—August 4, 1868.—The folder, which is graduated into inches and parts of inches, is formed at the end of an arm hinged to the base plate, which is capable of being turned in a vertical plane. The base plate is jointed to a connecting piece fixed to the sewing machine so that it can be turned out of the way of the needle. Upon the folder arm is a spring slide for regulating the width of a hem or tuck.

Claim.—1. The hem holder *a*, in combination with the graduated jointed arm *b* and horizontally-swinging base plate *e*, substantially as and for the purposes herein shown and set forth.

2. The combination, with the graduated arm *b* and base plate *e*, of the spring slide *f f² f³*, constructed and used substantially as herein shown and described.

3. The combination, with the hem folder *a*, graduated jointed arm *b*, and base plate *e*, of the spring plate *h h² h³*, jointed to the arm *b* at *h⁴*, substantially as and for the purposes set forth.

80,559.—WILLIAM H. MOSS, New Richmond, Ohio.—*Oil for Wool*.—August 4, 1868.—Consists of a compound of unslaked lime, water, and lard oil.

Claim.—The preparation of a compound oil, composed of the ingredients and in the proportions, and made in the way and manner, substantially as set forth above, for application to the use and manufacture of all kinds of woolen goods, and the greasing, carding, cleansing, and spinning of all kinds of wool.

80,560.—AUGUSTUS F. NAGLE, Providence, R. I.—*Expanding Mandrel*.—August 4, 1868.—A conical arbor is closely fitted in a slotted shell, on the outside of which is cut a serew thread corresponding with that in the nuts to be faced.

Claim.—An expanding mandrel, as herein described, consisting of the slotted shell B, having spring jaws B B, and tapering arbor A, all constructed, arranged, and operating in manner set forth.

80,561.—CHARLES L. OSBORN, New York, N. Y.—*Bird Cage*.—August 4, 1868; antedated July 20, 1868.—The sills, posts, cross ties, &c., are constructed of strips of metal whose cross section is in shape like the letter L. Glass sides are provided to prevent particles of food from being scattered on the floor.

Claim.—1. The combination, in a cage, of the sills, posts, plates, girts, cross ties, &c., constructed as described, with the glass sides, substantially as herein specified.

2. The nest or sleeping compartment J, constructed below the surface of the floor of the cage, substantially as described, when used for the purpose set forth.

80,562.—HENRY H. PALMER, Rockford, Ill.—*Spring Seat for Wagons*.—August 4, 1868.—Helical springs are placed between the seat and a base board, together with yielding cross braces so as to obtain a lateral as well as vertical motion of the springs.

Claim.—The seat A, bottom B, braces C, and

straps E, in combination with the spring D, when arranged to operate substantially in the manner herein described.

80,563.—FREDERICK J. PEABODY, Medford, Mass.—*Button*.—August 4, 1868.

Claim.—A stud or button, having its back or inner plate B divided on one side into two portions, *b c*, which are bent or curved around in opposite directions, so as to overlap each other, substantially in the manner and for the purpose set forth.

80,564.—E. QUINLAN, Sheboygan Falls, Wis.—*Machine for Polishing Wooden Handles*.—August 4, 1868.—A hollow mandrel is provided with steel or other burnishing devices, so arranged that as the work passes through the mandrel, the burnishers will press on its surface.

Claim.—A hollow mandrel, A, with the burnishers D D attached thereto, substantially as and for the purpose set forth.

80,565.—GEORGE RAYMOND, Fitchburg, Mass. assignor to himself and SAMUEL E. CROCKER.—*Attaching Handles to Tools*.—August 4, 1868.

Claim.—The combination, with the handle, its ferrule, and the tang or shank of the tool, of a tapering tubular key, passing through both the ferrule and handle, and encircling and grasping the end of said shank or tang, under the arrangement and for operation as herein shown and set forth.

80,566.—ISAAC S. ROLAND, Reading, Pa.—*Water Wheel*.—August 4, 1868.—The chute chamber is supported upon an upwardly-curving rim which is secured to the perforated base supporter and is allowed to turn freely on the same so that in case of any obstruction the chute chamber will rotate with the water wheel without injury to either, when the latter can readily be stopped.

Claim.—1. The movable and self-relieving chute chamber *f j k l*, located within the series of water-wheel buckets *e e*, and operating therewith, substantially as herein set forth.

2. The arrangement of the movable chute chamber *f j k l*, and its annular supporter *g*, with the disk and buckets of the water wheel, substantially as herein set forth.

3. The combination of the tubular gate *h* with said movable chute chamber, arranged and operating substantially as herein set forth.

80,567.—GEORGE F. SACK, New York, N. Y.—*Mold for Casting Letters, &c.*—August 4, 1868.—The two parts of the mold are formed of sepia, into which the object to be reproduced is pressed, to form the pattern.

Claim.—A mold for casting letters and ornaments, which will retain an accurate impression of the most delicate lineaments of the pattern, made of a sepia or cuttle-fish bone, in the manner substantially as herein described, and for the purpose mentioned.

80,568.—JOHN SCHOLL, Soho, assignor to SAMUEL S. BATESON, Mayfair, England.—*Gas-Burner Attachment*.—August 4, 1868.—The "improver" is provided with a metal guard for the purpose of protecting it from injury. The guard is formed with fingers, which spring into slots made in the collar of the improver.

Claim.—1. The combination, with a platinum or other equivalent gas-light improver or perfecter, of a guard or protector, for the purpose hereinbefore set forth.

2. The peculiar modes of combining a gas-light improver or perfecter with a guard or protector, whereby the former is maintained, through the agency of the latter, in its proper adjusted position, substantially as hereinbefore described, and illustrated by the drawings.

80,569.—ELIJAH M. SCOVILLE and WASHINGTON L. SCOVILLE, Manlius, N. Y.—*Hoisting Apparatus*.—August 4, 1868.—This invention relates to improvements upon an apparatus previously patented to the same inventors, and numbered 69,257, and consists in devices for adjusting and shifting the article

hoisted to a transit rope, and returning the hoisting pulley to the position for hoisting.

Claim.—1. The circular discharging wedge J and roller *i*, for operating the discharge of transit pulley A B, substantially as shown and described.

2. The circular catch *k'* and latch M *n*, in connection with the transit pulley A B, constructed and operating substantially as herein shown and described.

3. The combination of retaining projections *e* with discharging levers E and hooked checks *a a''* of transit pulley A, as herein shown and described.

80,570.—EDGAR M. SMITH, New York, N. Y.—*Lighting up Picture Galleries*.—August 4, 1868.

Claim.—1. A lighter, so constructed with dimmed plate glass underneath the burners as that all that portion of a room or gallery above the line of vision shall be in bright light, and all that portion below the ordinary line of vision be in dim or obscured light, substantially as and for the purpose set forth.

2. In combination with the dimmed plate glass, the bent rods and knobs, or their equivalents, for changing the height of the bright light and the dimmed light in the room or gallery, substantially as and for the purpose described.

80,571.—BENJAMIN B. SNOW and THEODORE J. DICKERSON, Auburn, N. Y.—*Machine for Grinding the Cutters of Mowing Machines*.—August 4, 1868.—

The sliding rest enables the teeth to be held in position to be successively ground. A clamp is pivoted to the rest so as to regulate the angle at which the teeth are to be ground.

Claim.—1. The sliding rest C, moving in a slot in the frame, for the purpose of holding the knife clamp, substantially as described.

2. The rod D, moving longitudinally in the rest C, for the purpose of successively bringing the sections of the reaper knife to the stone.

3. The combination of the clamp E and rod B with the rest C, frame A, and fixed stone B, all arranged and operating substantially as described.

80,572.—W. A. STEVENSON, Athens, Mo.—*Hand-Spinning Machine*.—August 4, 1868.—

Extending from one end of the frame to the other is a rod, upon which is a movable stud provided with a fixed screw. Upon this rod is fixed a lever, connected by a rod to the step, which is pivoted on a jaw in front of the feeding drum. The said lever has an arm which engages with another lever connected to the frame. On the inside of the pulley, which is attached to the extremity of the shaft of the feeding drum, are arranged two ratchet wheels, one being attached to the wheel, while the other is moved back and forth on the shaft by means of a lever, for throwing the drum and pulley in and out of gear.

Claim.—1. The rod *e*, stud *m*, levers *r, v v'* and *t t'*, jaws *h h'*, step *s*, and plate *w* of a spinning machine, all constructed, arranged, and operating in relation to one another and the other parts of the machine, substantially as and for the purpose specified.

2. The rod *e*, stud *m*, lever *r* and its arm 4, levers *n* and *g*, with its connections, ratchets 1 2, of a spinning machine, all constructed, arranged, and operating relatively to themselves and the other parts of the machine, as and for the purpose specified.

3. The combination of the parts above mentioned with the frame A, carriage B, drum C, belt D, and roller *f* of a spinning machine, as and for the purpose specified.

80,573.—JOSEPH STOKES and JOHN BROUGH, Trenton, N. J.—*Water Boshes for Puddling Furnace*.—August 4, 1868.—The puddling furnace is provided with a hollow bosh so constructed that a current of water may be maintained within the bosh, through, under, and around the bottom of the furnace.

Claim.—Making the boshes hollow, and the hollow to extend under the bottom for the passage of a current of water, substantially as and for the purposes set forth.

80,574.—O. H. TAYLOR, Brooklyn, N. Y.—*Grate Bar*.—August 4, 1868.—The top of the bar is made of round or oval form, and the sides are serrated at a suitable angle. A lock is formed on the sides of

the bars where they rest, and form a bearing against and support to each other. To the under part of the bar are cast truss and arch work.

Claim.—1. The grate bar A, provided with serrations or indentions upon the upper slope of said bar, as herein shown and described, and for the purposes set forth.

2. The key D, in combination with the slots F F, for the purpose of locking the bars, substantially as shown and described.

3. The combination of the open truss work with the bar A, provided with serrations, and interlocked by an independent key, when constructed as shown and described, and for the purposes set forth.

80,575.—DAVID THOMAS, Hingham, Mass.—*Friction Nipper.*—August 4, 1868.—Designed more particularly as an improvement upon the windlass gear known as the "Scotch nipper" and the invention consists in making a groove, fork, or notch in the short arm of the lever and in applying a shoe which extends across the outer face of the outer flange of the ring which is secured to the windlass body, and upon which the nipper operates.

Claim.—In friction nipper feeds, the employment of a shoe in connection with the notched lever, cheeks, and flanged ring, so as to operate substantially as described.

80,576.—W. WAGSTAFF, Millbury, Ohio.—*Tea Kettle, Coffee Pot, &c.*—August 4, 1868.—Pipes communicating with the interior of the kettle are arranged transversely in a chamber or space in the center of the kettle and open at the bottom.

Claim.—The transverse arrangement of the pipes C in the chamber B, and in combination with the tea kettle or coffee pot A, in the manner as and for the purpose set forth.

80,577.—DANIEL WARNER, Boston, Mass., assignor to himself, JAMES T. BOWMAN, RICHARD C. DOUGHERTY, and DANIEL J. HUCKINS.—*Lamp-Wick Trimmer.*—August 4, 1868.—A flat tube provided with slits on opposite sides and with a flange extending from the top of either branch, is slipped on the wick tube to facilitate the regular trimming of the wick.

Claim.—The clamp gauge, as constructed of the flat tube slitted at its opposite edges, as set forth.

2. The combination and arrangement of either or both the flanges *c c*, with the flat tube slitted at its opposite edges as specified, the whole being for the purpose or purposes as explained.

80,578.—W. F. WATERHOUSE, Weyauwega, Wis.—*Hop Drier.*—August 4, 1868.—The kiln is so constructed as to cause a current of heated air to be forced through the mass of hops which are placed on a movable platform, over which is a reflecting roof open at its ends to allow the vapor to escape.

Claim.—1. A furnace, with hopper-shaped interior, in combination with movable roof D, substantially as described.

2. The roof D, hung by hinges at the eaves, so as to perform the threefold purpose of roof, or protection against the weather, as shown in Fig. 1, reflectors, to reflect artificial and solar heat, and to cover the kiln, to retain the heat when the hops are off, substantially as described.

80,579.—WILLIAM WEILER, Washington, N. J.—*Rock Drill Machine.*—August 4, 1868.—Designed as an improvement on a machine patented to the same inventor on March 31, 1868. The driving shaft is provided with wheels of equal diameter, upon which the machine can be transported from place to place. A yoke at the top of the frame affords a means of attachment to a rope or chain, for hauling the machine.

Claim.—1. The driving shaft D, carrying at the opposite ends wheels F and F', and arranged on the frame of the machine, substantially as and for the purpose described.

2. The yoke G secured to the top of the frame of the machine, for the purpose specified.

80,580.—C. ALBERT WIGGIN, North Sandwich, N. H.—*Apple Parer.*—August 4, 1868.—The under-side of the outer edge of the circular-revolving table

is constructed with a cogged surface for about one-half of its circumference, into which gears a pinion having a portion of its teeth cut away, so that when the knife has traveled its required circuit, the table will immediately return to its original position.

Claim.—1. The turn table B, cogged as described, and furnished with projection *b*, in combination with pinion F, constructed and arranged to operate substantially as set forth.

2. Shaft *b*¹, spring D, pinion F, table B, shank *g*, knife G, springs *g*¹ and *g*², fork J, shaft *j*', pinions *j*, *h*, and *h'*, gear wheel L, and shaft *f*, all combined and arranged substantially as and for the purpose set forth.

80,581.—MARVIN T. WILLIAMS, Milwaukee, Wis., assignor to himself and JOHN LUND.—*Scaffolding.*—August 4, 1868.—Two sections of a ladder are connected by bars at each side, so as to form, when swung open, a frame for a scaffold.

Claim.—The two short ladders A, pivoted to the bars C, having the spring catches D arranged to engage in the recesses in the ends of bars A, all constructed and arranged for use substantially as herein shown and described.

80,582.—ANDREW C. YAWGER, N. J.—*Adjustable Barrel Head.*—August 4, 1868.—The two side pieces of the head are held in place by a central piece secured by means of a plate and screw, so that the entire head can be easily inserted and removed without disturbing the hoops.

Claim.—The pieces A and B, when used in connection with piece C of a barrel head, and held in place by means of piece F and screw G, all constructed and operating substantially as set forth.

80,583.—ISAAC ALLARD, Belfast, Me., assignor to himself and FRANK A. HOWARD, same place.—*Screw Driver.*—August 4, 1868.—The shank of the screw driver is made in a spiral form and surrounded by a spiral spring, is inclosed partially in a tube. The shank is held by a spring catch, upon releasing which, the shank will be forced out by the recoil of the spring and turn the screw to which it is applied.

Claim.—1. The tube A, the spiral shank B, and the spring C, when the same are constructed, arranged, and operated substantially as and for the purposes shown and described.

2. The spring catch F, in combination with the spiral shank B and tube A, as herein described for the purpose specified.

80,584.—WILLIAM S. ANDERSON, Shelbyville, Tenn.—*Car Coupling.*—August 4, 1868.—The coupling device consists of two blocks connected by a hinge, and attached at the upper end to a bolt bearer, the parts being so arranged as to be self-coupling, and in case of a car being thrown from the track, the coupling would be readily broken and disengaged.

Claim.—The combination of the "lever C," "bolt bearer D," "bolt E," and "link F," in connection with the "buffer A" and "coupling frame B," secured to the car by the "bolt H," all constructed and arranged as described, and for the purpose specified.

80,585.—MOSES ATWOOD, New Sharon, Iowa.—*Seed Planter.*—August 4, 1868.—The seed dropping device is attached to a secondary frame connected by hinged bars to the front end of a truck frame. By raising the rear part of the secondary frame, through the medium of a windlass, the furrow and covering shares are elevated.

Claim.—1. The attaching of the seed distributing apparatus to a frame, G, placed on the frame A of the machine, and attached thereto by hinges, and arranged in connection with a windlass, in the manner substantially as shown, to admit of the furrow and covering shares being raised when necessary, as set forth.

2. Operating the seed distributing plates *q q*, through the media of the treadle shaft R and bent levers S S, arranged substantially as set forth.

3. The adjustable bar K, arranged as shown in connection with the bars N N, on which the seed boxes M M are secured, for the purpose specified.

4. The combination of the frame G with the frame

A, provided with truck wheels, when said frames are used in connection with a seed dropping mechanism, as set forth.

80,586.—JOHN BAHAM, ROBERT C. WILSON, and SAMUEL FRENCH, Auburn, N. Y.—*Machine for Removing Wire Teeth from Cards.*—August 4, 1868.—The toothed drums hold and feed up the cards from which the teeth are to be extracted, by which the teeth are partially loosened and are then removed by the toothed wheels, which catch into the loops on the back of the card. The knives serve to clean the face of the leather after the wire has been drawn out.

Claim.—1. The toothed drums B' and C', the card guide upon the bar U, and the adjustable plate x, provided with the guides y y, combined and arranged substantially as and for the purpose set forth.

2. The toothed wheel T', when used in combination with the drums B' and C', as and for the purpose set forth.

3. The knives E' and wheel T', in combination with the drums P, M, and Q, constructed and operating as and for the purpose set forth.

80,587.—ZEBIAH W. BASSETT, Fulton, N. Y., administratrix of the estate of N. P. BASSETT, deceased.—*Bee Hive.*—August 4, 1868.—The comb-frames are secured in the box by serews, and are pressed against spurs on the opposite side, so as to prevent them from becoming casually detached. The entrance to the hive is made sinuous in order to prevent the advent of the miller.

Claim.—1. The securing of the comb frames G in the box C by means of the serews q and spurs r, substantially as shown and described.

2. The exit passage m, in connection with the entrance passages h i, and chamber j, all arranged substantially as and for the purpose specified.

80,588.—SIMON R. BOLTON, Prescott, Wis.—*Stocking Darner.*—August 4, 1868.—Two oval-shaped pieces of wood of different sizes are connected to the ends of a wooden handle. By detaching one of the heads the handle may be used in darning the fingers of a glove.

Claim.—A stocking tree, consisting of detachable heads and shaft, the heads being of different sizes, and the shaft provided with a cavity for use as a needle case, all arranged substantially as herein described.

80,589.—ALONZO T. BOON and JAMES B. FINCHURE, Galesburg, Ill.—*Dentists' and Barbers' Chair.*—August 4, 1868.—An adjustable rest for the head is combined with a device for holding the back of the chair securely in an adjustably inclined position, so that persons of different sizes may be readily accommodated in the same.

Claim.—1. The combination and arrangement of the head rest F, crank G, with a grooved cam, b, and rubber e, affixed therein, and plate H, with the back of the chair, substantially in the manner and for the purpose as herein shown and described.

2. The combination and arrangement of the support A, rod B, spiral spring C, helical screw D, and rack E, with the seat of the chair, substantially in the manner and for the purpose as herein shown and described.

80,590.—S. C. BROCKINGTON, Groton, Conn.—*Lamp.*—August 4, 1868.—Within a lamp reservoir is arranged a float, surrounded by a perforated guard, which float, when it rises to a certain height in the reservoir, closes a valve and prevents the further supply of fluid until necessary. The supply of fluid may be regulated by a stop-cock in a pipe connected with a tank.

Claim.—1. The self-acting valve attachment to lamp reservoirs, consisting of the valve e, attached to a float, E, and made and operating substantially as herein shown and described.

2. The device set forth in the foregoing clause, in combination with the perforated guard F, arranged as shown.

3. The combination of the lamp reservoir C with the guard F, float E, and valve e, and with the pipe

B, stop-cock D, and tank A, all made and operating substantially as herein shown and described.

80,591.—ALBERT C. BROWN, Chicago, Ill.—*Weather Strip.*—August 4, 1868.—The rubber strip is folded and its edges are inserted in grooves in the molding. It is made to press against a stop or abutment upon the door or sash.

Claim.—The combination of the molding a b with the stop C, provided with a groove e, arranged substantially as and for the purposes specified.

80,592.—ROBERT BROWN, Norwich, Conn.—*Steam Trap.*—August 4, 1868.—Two disk valves are attached to a rod operating in an exhaust steam chest provided with perforated partitions, and connected with the cylinder, for the purpose of relieving the engine cylinder of under pressure at its exhaust-end, and also of the water of condensation.

Claim.—The arrangement of the steam-exhaust chest A, the perforated partitions F G, the disk valves H I, and their common stem, J, with relation to each other and the cylinder, as herein shown and described.

80,593.—THOMAS W. BROWN, Cudworth, Barnsley, England.—*Cotton Seed Cleaner.*—August 4, 1868.—The seeds to be cleaned are passed through a vertical or nearly vertical tube or funnel, which is highly heated, from a hopper and spout provided with feeding rollers. At the bottom of the heating tube is a reciprocating pan in which the seeds are agitated for the purpose of cooling the same.

Claim.—1. Removing the fiber from the hull of cotton seed by successively heating and cooling the same, by means substantially such as herein shown and described, and for the purpose set forth.

2. The combination, with the heater B, of the feeding rollers E F, hopper D, and spout G, substantially as and for the purpose herein shown and described.

3. The combination, with the heater B, of the agitating pan L, substantially as and for the purpose described.

80,594.—JOHN BURT, Sturgis, Mich.—*Skein Setter for Axles.*—August 4, 1868.—The object of this invention is to give any required taper to the wooden arm of an axle. The crank is provided with a square hole in which rest one end of the ways and the rocking box, which is pivoted between the ways. The lower end of the crank is provided with a slide to regulate the degree of taper. The knife block slides upon the inclined ways.

Claim.—1. The employment of the slide h in crank D, for adjusting the arm, substantially as and for the purpose specified.

2. The ways g g, when hinged or pivoted at both ends, substantially as set forth, for the purpose of accommodating them to the set of the arm.

3. Providing the crank D with rocking box a, and attaching screw shaft b thereto, substantially as described.

4. Finally, wheel B, constructed substantially as set forth, in combination with hinged or pivoted ways g g, screw shaft b, knife block E, divided nut e, and crank D, for the purpose described.

80,595.—DANIEL CAMPBELL, Elizabeth, N. J., assignor to HENRY SEYMOUR and ROBERT H. SEYMOUR, New York, N. Y.—*Pruning Shears.*—August 4, 1868.—A holder is so connected to a pruning shears and operated as that, when a fruit stem is cut from a branch, the said stem will be clamped and firmly held after being severed, thus combining a fruit picker with a pruning shears.

Claim.—1. The holder K, in combination with the movable blade D, and fixed blade B, of a pair of pruning shears, when said holder is applied or arranged so as to be operated automatically from the movable blade D, substantially as and for the purpose set forth.

2. Operating the movable jaw D through the medium of the cross-arm I attached to the shaft H, which is provided with the crank G, to which the spring J and rod F are attached, all arranged substantially as shown and described.

80,596.—HENRY J. CASE, Auburn, N. Y., assignor to HENRY RICHARDSON, same place.—*Clamping Knives or Cutters of Mowing Machines while being Ground.*—August 4, 1868.—Attached to the bar which holds the sickle bar, are pivoted a series of clamps connected by rods and operated by a cam lever pivoted to the roller bar, by which means the clamps are readily brought tight up against the sickle, and as readily unclamped.

Claim.—In combination with the clamping and holding bar A, the series of clamping hooks, actuated through a common lever for fastening and releasing the reaper bar or sickle, substantially in the manner and for the purpose described.

80,597.—N. H. CASS, Henryville, Ind.—*Medical Compound for Treating Hog Cholera.*—August 4, 1868.—The ingredients consist of cochineal, linseed-oil cake, sarsaparilla, Venetian red, madder, and opium.

Claim.—The compound composed of the above-mentioned ingredients, in about the proportions named, substantially as and for the purposes described.

80,598.—G. W. CHAPMAN, JR., Iowa Falls, Iowa, assignor to himself and W. A. PLANTZ, same place.—*Harvester Cutter.*—August 4, 1868.—The sickle bar is formed in two pieces, so as to secure separate cutters or teeth between them, in order to admit of the teeth being easily removed and replaced.

Claim.—The sickle bar, constructed as described, consisting of the upper bar *b'*, provided with the inclined slots *s*, for the passage of the screws *h*, the lower bar *b* having a groove for the reception of the ribs *c* of the teeth *a*, said bars being adjusted to clamp the teeth by means of the screw *e* in their upset ends, as herein described, for the purpose specified.

80,599.—NASH CHEEK, Chapel Hill, N. C.—*Burglar Alarm Lock.*—August 4, 1868; antedated July 30, 1868.—An alarm apparatus is so connected with a lock that, when properly set, the same will be put in operation and an alarm sounded, in case the bolt of the lock is improperly moved.

Claim.—1. The lever *F^x*, connected with the bar *i*, as shown in combination with the sliding bar *F* at the outer side of the lock, and attached to the shutter or door, and arranged so as to operate an alarm, substantially as shown and described.

2. The lever *G*, pivoted to the bar *F*, in connection with the spring *k*, toothed wheel *H*, cord *J*, and weight *K* or an equivalent, arms *m* on the drum of the shaft *I*, shaft *M* with arm *L'* and bell hammer *N* attached, spring *O* and bell *P*, all arranged and combined to operate in connection with the lock, substantially as set forth.

80,600.—ALVIN B. CLARK, Richmond, Ind.—*Post Driver.*—August 4, 1868.—This invention consists in driving or setting posts by the application of power from the force of gravity, from the weight of a wagon thrown upon the post by means of lever clamps, screws, and a hand beetle.

Claim.—1. The device, constructed substantially as described, and arranged upon a wagon in such a manner as to throw the weight of the vehicle upon the post, as and for the purpose set forth.

2. The combination of lever clamps *B B*, center beam or lever *C*, screw *D*, with its lever *J*, hoisting screw *G*, with its base *F*, and lever *H*, socket plate *I*, all operating substantially as described and for the purpose set forth.

80,601.—JAMES T. CLARK and JOHN B. BESLER, Galesburg, Ill.—*Switch.*—August 4, 1868.—The switch rails are so arranged and connected that if not properly placed the flanges of the car wheels, entering gradually and wedge-like into the spaces between the stationary and the pointed rails, will set the switches to their proper places.

Claim.—The combination of the two short, *G G'*, and two long *H H'*, pointed movable rails, with two stationary rails *E E'*, forming a treble safety switch, the whole arranged and operating substantially as and in the manner herein described and specified.

80,602.—O. W. CLARK, Appleton, Wis.—*Elevator Bucket.*—August 4, 1868.—The bucket is made with rounded front corners, and narrower on the front face than on the back.

Claim.—The elevator bucket, constructed in the form herein shown and described, as and for the purpose set forth.

80,603.—J. C. COLFLESH, Delaware, Ohio.—*Rack for Feeding Sheep.*—August 4, 1868.—A hopper-shaped rack is attached to a shaft and supported in an upright position, to be filled. When filled, the lid is closed and fastened, and the rack turned down by means of a crank, to allow the sheep to feed.

Claim.—The tapering rack *C*, supported on the frame *A* by means of its shaft *B*, and provided with a hinged lid, *E*, pawl *e*, and ratchet *e'*, and operated by the crank *D*, so that it can be revolved to prevent the sheep from feeding, to allow its being filled with provender, and prevent the ingress of rain or snow, as herein set forth.

80,604.—GEORGE W. COOPER, Ogeechee, Ga.—*Rice Cultivator.*—August 4, 1868; antedated July 30, 1868.—A horizontal cutter with upturned sides serves to loosen the earth, and two curved arms with cutting edges cut the loosened earth and throw it toward the middle under the beam. In rear of the cutters are toothed disks, which completely break up the loosened earth.

Claim.—1. The cutter *D* of a rice cultivator when arranged as described, with upturned cutting sides *a a*, substantially as set forth.

2. The curved cutters *E E*, when arranged on the sides of the cultivator, so as to cut close to the plants, without injuring the same, as set forth.

3. The revolving toothed breakers *H H*, when arranged with beveled edges, and when made and operating substantially as herein shown and described.

4. The revolving breakers *H H*, when made as set forth, in combination with the washer *b*, and cleaners *I I*, all made and operating substantially as herein shown and described.

5. Making the arms *F*, in which the axle *G* of the breakers has its bearings, adjustable on the beam *A*, so that thereby the height of the breakers can be adjusted, as set forth.

6. A rice cultivator, consisting of the beam or frame *A*, with the cutters *D E E*, and breakers *H H*, all made and operating substantially as herein shown and described.

80,605.—L. D. COWLES, Romeo, Mich.—*Buckle.*—August 4, 1868.—Two frames are placed one within the other, the smaller one being provided with cross bars and lugs.

Claim.—The lugs *C C*, on the sides of the frame *B*, in combination with the frame *A*, having inclined edges, whereby the end bars of the two frames are made to hold the strap, substantially as and for the purposes herein set forth.

80,606.—L. B. COX, San Francisco, Cal.—*Apparatus for Disintegrating Gravel containing Gold, &c.*—August 4, 1868.—A rotary rake is operated within a vessel in the bottom of which are a series of narrow curved slots. Below the perforated bottom is a hopper-shaped vessel, provided with a spout.

Claim.—1. The slotted bottom or floor *d* of the tub *D*, when constructed in several independently removable pieces, for the purpose specified.

2. The combination of the tub *D*, slotted floor *d*, rake *F*, shaft *G*, and receiving vessel *B*, when the several parts are constructed to operate substantially as and for the purpose set forth.

80,607.—RICHARD T. CRANE, Chicago, Ill.—*Core Bar.*—August 4, 1868.—Designed as a support for the core of molds used in casting "return bends" of steam and gas pipes. Two bars are formed in the shape of semi-tubes, so that when the same are arranged together and riveted, a hollow bar will be formed, with a narrow space between the parts to admit of the escape of the gases.

Claim.—The combination of the bars *A* and cross bar *B*, when constructed substantially as and for the purposes specified.

86,608.—GEORGE CROMPTON, Worcester, Mass.—*Loom*.—August 4, 1868.—The jack plates, for forming the shed, are lifted and depressed by means of lifter and depresser bars, which maintain a horizontality during most of their movements in forming the shed, but which are thrown into inclined positions to give the proper inclination to the shed, at the end of each movement, a corresponding motion being given to the evener levers.

Claim.—In combination with the hooked jacks, the angular lifter and depresser bars or levers, the inclination of which is effected by means substantially as set forth.

2. In combination with lifter and depresser bars, the inclination of which is effected as and by means substantially as set forth, the evener bars or levers, connected to the lifter and depresser bars by the slide rods and the links *s*, substantially as described.

3. The rocker wheel or segment *l*, for imparting movement to the lifter and depresser bars or levers, substantially as shown and described.

80,609.—HENRY J. CULP, Goshen, Ind.—*Fence*.—August 4, 1868.—The panels are secured together by pins and are held in a vertical position by crossed stakes, so as to prevent any lateral movement.

Claim.—The panels *A*, hung upon the pin *a*, in combination with the crossed stakes *D D*, whereby the lateral movement of said panels is prevented, as herein shown and described.

80,610.—W. F. DAUGHERTY, Wellington, Ohio, assignor to himself and HIRAM ELLIOTT, same place.—*Feather Renovator*.—August 4, 1868.—Pipes, provided with openings, are secured to the sides of cylinder. Each pipe is supplied with a faucet at the end for shutting off and admitting steam.

Claim.—The faucets *E*, in combination with the pipes *b* and side pipes *D D'*, for the purpose specified.

80,611.—JAMES P. DAVISON, Rome, N. Y.—*Potato Digger*.—August 4, 1868.—The potatoes are thrown up by a peculiarly-shaped share or point and passing to an endless apron, are deposited on a series of vibrating arms or fingers.

Claim.—1. The combination of the share or point *N*, apron *O*, vibrating shaker *S S'*, and clearing fingers *V V'*, arranged and operating substantially as and for the purpose set forth.

2. The endless apron *O*, consisting of the belt *o*, transverse bars *o¹ o² o³*, and links *o⁴*, employed and operating substantially as and for the purpose specified.

3. The lips or flanges *a*, in combination with the cross bars *C C'*, *G*, beam *D*, and braces *L*, substantially as described.

80,612.—JACOB S. DETRICK, San Francisco, Cal., assignor to himself and WILLIAM R. ECKERT, same place.—*Counting Register*.—August 4, 1868.—Designed for a pocket instrument for accurately determining the velocity of shafting, &c., and consists of two spur wheels provided, one with a hundred and the other with one hundred and one cogs. A detachable spindle having a worm screw that meshes with these cogs, is thrown in and out of gear with the spur wheels.

Claim.—1. The combination of the lever *G*, or its equivalent, with the detachable spindle *J* and the wheels *E I*, when the parts are constructed and arranged so as to operate together, substantially in the manner and for the purposes indicated.

80,613.—ROBERT F. DOBSON, Goderich, Canada.—*Broom*.—August 4, 1868.—The free portions of the broom corn are so fastened as to extend toward the upper end of the handle, when they are turned back and secured.

Claim.—1. The turning ring *a*, affixed to the rolling barrel *D* by means of the braces *B*, substantially as herein shown and described, for the purpose set forth.

2. As a new article of manufacture, a broom in which the corn is applied and secured as herein shown and described.

80,614.—OLIVER P. DRURY, Niles, Mich.—*Harvester Pitmen*.—August 4, 1868.—For connecting the

end of the pitman with the sickle bar, with as little wear, and liability to become loose or choked up by grass, as possible.

Claim.—The described construction of the coupling, consisting of the recessed jaw *C*, formed upon the bar *A*, the recessed jaw *B*, provided with the extension *J*, adapted to be moved between the guides *a a* by means of the screw bolt *E*, extending through the jaw *C*, all operating as described, the proximate recesses in the jaws *B C* receiving the ball *G* upon the shank of the pitman *D*, as herein set forth and shown.

80,615.—DANIEL EBERHART, New Pittsburg, Ohio.—*Spark Arrester*.—August 4, 1868.—A wire netting with inclined sides and open at the bottom, is secured in a metal box attached to the top of a chimney. Vertical pieces of wire netting surround the above and the whole is surmounted by a sloping roof.

Claim.—The within-described spark arrester, when constructed and operating substantially as and for the purposes herein set forth.

80,616.—D. A. FISKE, Delavan, Wis.—*Churn*.—August 4, 1868.—The floats are attached to shafts, so arranged in the dasher frame as to assume a horizontal position when descending. A sliding bar made in the shape of a half cylinder, prevents the cream from escaping through the cover.

Claim.—1. The paddles or floats *G*, and shafts *F*, constructed and arranged substantially as herein shown and described, in combination with each other and with the dasher frame *E*, as and for the purposes herein set forth.

2. The sliding bar *M*, in combination with the dasher handle *D*, cover *I*, side boards *L*, and cleats *J*, substantially as herein shown and described, and for the purpose set forth.

3. Forming the chamber *K*, by inserting the ends of the side boards *L* in grooves formed in the inner sides of the cleats *J*, substantially as herein shown and described, and for the purpose set forth.

80,617.—PATRICK FOLEY, Nineveh, N. Y.—*Double-Action Pump*.—August 4, 1868.—The valves are so arranged that when the pump is not to be used, they can be opened to discharge all the water from the cylinders, and prevent the freezing of the same.

Claim.—The arrangement of the lever *M* with relation to the cylinders *A B*, chamber *I*, valves *d*, and valves *b b*, whereby, as the piston *C* descends, the valve *d* is opened, by means of the lever *M*, to discharge the water from the chamber *I* into the cylinder *A*, the valves *b b* being operated to discharge the water from the cylinders *A B* into the chamber *L* by the alternate strokes of the pistons *C D*, as herein described, for the purpose specified.

80,618.—WILLIAM C. FRAILEY, Ironton, assignor to himself and D. T. WOODROW, Cincinnati, Ohio.—*Chimney Cowl*.—August 4, 1868.—The cowl or cap is constructed of light, thin, slightly ornamented plates of cast iron secured together in sections, and designed for inclosing the brick work of a chimney.

Claim.—The combination of the flanged base *B b*, sides *c c'*, cap *d*, lugs *e f g*, and connecting bolts *h*, all constructed and employed substantially as and for the purposes set forth.

80,619.—ELNATHAN G. GANIARD, New York, N. Y.—*Ottoman and Hassock Filler*.—August 4, 1868.—A tube is placed inside the ottoman or hassock and both are placed in the ring and upon the bottom piece. As the filling is introduced and pressed down the tube is gradually withdrawn.

Claim.—The vertical movable tube *C*, ring *B*, in combination with the molding bottom *D*, all arranged and acting conjointly as herein shown, and for the purpose set forth.

80,620.—CAROLINA GOESSLING, Jersey City, N. J.—*Water and Damp-Proof Paper for Covering Walls*.—August 4, 1868.—Two thicknesses of paper are coated with a composition of resin, suet, yellow wax, and flour of sulphur, and cemented together by

the composition. The two outer surfaces are then coated with the same.

Claim.—As an article of manufacture, paper, prepared substantially as described, and for the purposes herein set forth.

80,621.—JOHN GOODENOUGH, Jerseyville, Ill.—*Blacking Brush Scraper.*—August 4, 1868.—The scraper may be attached to an ordinary blacking brush, and is designed for removing the dirt from the boot or shoe.

Claim.—The scraper B, provided with the hook x^5 , straight and curving edges $x^1 x^3$, and attached at right angles to the rod B, as shown, the latter being bent at $b^1 b^2$, and fastened to handle of brush A, as shown and described, the rod and scraper being so operated in connection with the handle, that when needed for use the former is turned forward and firmly held by the notch c , and when not needed may be turned backward and held by the hook x^5 , catching in the socket in the handle, as herein fully set forth.

80,622.—WINFIELD S. GOSS, Baltimore, Md.—*Screw Driver.*—August 4, 1868.—The handle is made in three pieces, connected by clutches and stops, in such a manner that its lower part can be turned continuously in either direction, without releasing the hand from the upper part.

Claim.—The screw-driver handle, composed of the parts C C' C'', provided with holes $r r$, the bolt D, spring s , and lock bolt n , the whole being constructed to operate substantially as described.

80,623.—NILES GRANGER, Saratoga, N. Y.—*Glass Furnace.*—August 4, 1868.—The larger portion of the melting pot is filled with the material for making glass, and as this melts, it sinks down and passes through the passage-way in the bottom into the smaller portion of the pot, from whence it is worked.

Claim.—The pot B, formed of the parts C and D, connected by the passage-way E, and operating substantially as and for the purposes described.

80,624.—SAMUEL L. HALL, West Salem, Wis.—*Churn and Butter Worker.*—August 4, 1868.—The exterior vessel is designed for holding water by which the cream in the churn may be kept at any desired temperature. The frame is held in place by means of a button, so that the vessels can be readily swung out when necessary.

Claim.—1. The metal churn E, with the exterior vessel F, both attached to the frame B, suspended in the frame A, provided with the locking device o , all constructed and arranged to operate substantially as herein described, and for the purpose set forth.

2. In combination with the bevel wheel J and winch L, the dasher G, with the curved beaters p and grooved pin h , bevel pinion I, and brake H, all constructed and arranged to operate substantially as herein described, and for the purpose set forth.

80,625.—WILLIAM HALL, North Adams, Mass., assignor to himself and JOHN W. PITT, same place.—*Let-off Mechanism for Looms.*—August 4, 1868.—The pivoted bearing and bar serves as a bent lever. A belt passing over a pulley on the shaft is secured to the lower end of the bar, and to the front end of the bearing is connected a spiral spring, which causes the arm or bar to gradually rise, and the tension of the warp or web is thus rendered uniform throughout.

Claim.—The pivoted bearing c , with the bar e attached, in combination with belt B, pulley g , on shaft A, and spring i , all constructed and arranged substantially as and for the purpose set forth.

80,626.—ISAAC C. HART, Galesburg, Ill.—*Thill Coupling.*—August 4, 1868.—Hooks on the ends of the tongue or thills fit within plates attached to the axle, so that when the shafts are elevated, they will be securely held, and when the front ends are lowered, they can be easily slipped out from the said plates.

Claim.—The plate H and hook L, constructed and arranged as described, and combined with the axle A, clip P, and tongue or thills J, substantially as described, and for the purpose set forth.

80,627.—LEVI HEYWOOD, Gardner, Mass.—*Machine for Bending Wood.*—August 4, 1868.—The timber to be bent is secured to a pair of blocks or formers resting on tables which are made to move in slots, at equal rates of speed toward each other, the said blocks, when united, constituting the pattern or former of the shape desired to give the timber.

Claim.—1. Commencing to bend the wood from each end toward its center, instead of commencing to bend it from the center toward the ends, or from one end toward its other end, substantially as and for the purpose described.

2. The formers B B, with the geared tables $c c$, working in the rack D, and guided by the slots $a a$, in combination with a suitable chain, H, substantially as and for the purpose described.

80,628.—JOSEPH HOBART, Boston, Mass.—*Double Volute Spring.*—August 4, 1868.

Claim.—1. A double volute spring, composed of a single bar of metal, and made by bending said bar at the middle, doubling it upon itself, and coiling the same around a mandrel, or otherwise, substantially as described.

2. In making double volute springs, in the manner set forth in the foregoing clause, so bending the limbs that the edges thereof shall describe lines of unequal curvature, but so that the curvature, commencing at or near the point of junction of said limbs, shall increase from thence outward toward the extremities thereof, substantially as described.

3. In making a double volute spring, in the manner set forth in the first clause, bringing the two free ends near together, leaving an opening between the limbs, which narrows toward the end, substantially as described.

80,629.—ANDREW HUNTER, San Francisco, Cal.—*Machine for Separating and Concentrating Sulphurets.*—August 4, 1868; antedated July 25, 1868.—Improvement on his patent of May 23, 1865. A table, having a downward inclination from front to rear for a portion of its length, is suspended at its rear end in a frame by adjustable hangers, and is provided with a sieve and means for imparting a quick, vibratory motion.

Claim.—1. The formation of the trough or table B, with or without metallic lining, and alternately inclining and level, as shown by lines $a b d$, substantially as described, and for the uses and purposes as set forth.

2. The combination, with the table or trough B and its adjustable hangers, of the cam shaft and spring X, under the arrangement described, whereby both the oscillatory motion and percussion of the said table are effected for the purpose of separating the sulphurets and metals from the lighter particles, as set forth.

3. The eccentric strap Z, in combination with the trough B and cam, or equivalent means, for imparting an oscillatory movement to said trough, substantially as and for the purposes set forth.

4. The combination, with the table B and mechanism for imparting to the same an oscillatory movement, of the rocking trough E, arranged for operation, substantially as and for the purposes set forth.

5. The combination, with the oscillatory table or trough B, of the rotary scraper W, made of India-rubber or other suitable material, substantially as set forth, and for the purposes specified.

6. The combination, with the table or trough B, of the inclined screen T, and mechanism for imparting to the same a vibratory motion, under the arrangement and for operation as herein set forth.

7. The combination, with the oscillating trough and hanger, by which the rear end of the trough is held, of the wheels or rollers R, for supporting the front end of said trough, substantially as herein shown and described.

8. The combination of the table or trough B with eccentric troughs E and G, hangers D D, spring X, wheels or rollers R, scraper W, and sieve T, substantially as described, and for the uses and purposes as hereinbefore set forth.

80,630.—NOAH JACKSON and A. W. JACKSON, Napoleon, Ohio.—*Rotary Steam Engine.*—August 4,

1863.—A skeleton rim wheel is provided with flanges projecting on each side, between which are secured one or more partitions, so as to form separate steam-tight chambers, the whole being covered by a casing and provided with valves, and induction and exhaust pipes.

Claim.—1. The curved spring *a*, in combination with the L-shaped metal pieces *b b*, arranged in the valves F F, substantially as herein set forth.

2. The arrangement of the flanges O O, partitions N N, casing B, valves F F, induction spouts G G, and exhaust pipes H H, substantially as herein set forth.

80,631.—LEWIS JENNINGS, New York.—*Artesian Pump.*—August 4, 1868; antedated July 23, 1868.—The packing presents a metallic surface to the interior of the main pipe, and is provided with a cup leather, having its lower edges confined between collars in the fixed plunger. On the surface of the plunger is a spiral feather or projection which, in connection with ratchet rings, causes the plunger to partially rotate at each ascent.

Claim.—1. The within-described construction and arrangement of the packing D *d'* E, the same being composed of the soft and water-retaining cup leather E, and the hard and expansible exterior D, the latter being in the form of a ring or hollow cylinder, open on one side, with one or more offsets, *d'*, at the joint, all these several parts being constructed and arranged, relatively to each other and to the box B and barrel A, substantially as and for the purpose herein set forth.

2. The partial spiral or incline B⁵, and corresponding ratchet ring G¹ G² arranged as represented, the ring G¹ G² being allowed to traverse axially within the yoke or inclosing ring A³, and to lock itself in new relations thereon as the bucket B descends, substantially as and for the purpose herein set forth.

80,632.—NELSON JOHNSON, Jasper, N. Y.—*Head Block for Saw Mill.*—August 4, 1868.—This invention consists in the employment of eccentric longitudinal rests which support and "dog" the log at both bottom and top, the entire length of the carriage. Provision is made for adjustably mounting the said rests, and also for operating dogs fitted to slide vertically in the head blocks or knees.

Claim.—1. The eccentric longitudinal rests L L', either or both, when constructed with a flat fall *l* and dogs *l'*, and operating substantially as described, for the purpose specified.

2. The vertical slots *i*⁶, when employed in combination with the upper longitudinal rest L, for the purpose of rendering said rest adjustable to suit different sizes and taper of logs, substantially as described.

3. The combination of the lever 3, ratchet rack 4, link 2, and vertically sliding dog 1, with the standard 5, substantially as and for the purpose specified.

80,633.—JOHN KELSHAW, Lafayette, Ind.—*Steam Generator.*—August 4, 1868.—Water chambers are made to project from the upper and lower parts of the boiler into its interior, around which chambers pass the fire and heat.

Claim.—A zigzag or undulating flue, formed by the alternately projecting water chambers CC, substantially as herein described.

80,634.—WILLIAM KESTER, Cherryville, Pa.—*Machine for Grinding and Polishing School Slates.*—August 4, 1868.—The slates are supported upon a car which runs under the grinding stones or wheels, and alternately raises the slates against or depresses them from the stones. The cars are caused to rise and fall gradually, and yet preserve a perfect level, by means of a series of inclines.

Claim.—1. The track *b b'*, when composed of the double inclines *t t'*, and used in connection with the cars G G and grinding stones D D, in the manner and for the purpose specified.

2. The combination of the movable bed H, springs *s s*, and body of the car G, substantially as and for the purpose specified.

80,635.—T. J. KINDLEBERGER, Eaton, Ohio.—*Water Wheel.*—August 4, 1868.—Two series of buckets,

arranged one above the other, are held in place between annular rims and plates, which have an inclination for a portion of their surfaces toward the center. The gates are opened and closed by means of a pinion and segmental rack pivoted to the top plate and connected by a rod to a collar surrounding the main shaft.

Claim.—1. The water wheel, consisting of the plate A and rims B and C, with the two tiers of buckets E and F, all constructed and arranged substantially as herein described.

2. The rim C and buckets F, when constructed and combined as set forth.

3. The combination of the pinion I, segmental rack H, rod P, and collar G, when arranged in connection with the case and vertical gates of a water wheel, as herein shown and described.

80,636.—WILLOUGHBY F. KISTLER, Chicago, Ill., assignor to himself and GEORGE W. GILLETTE.—*Cooking Stove.*—August 4, 1868.—The oven doors are constructed with a chamber or passage, through which the heat and smoke are caused to pass on their way to the escape flue.

Claim.—A stove, so constructed that the heat and smoke may pass through a chamber, space, or flue in the doors of the oven, substantially as and for the purposes specified.

80,637.—THOMAS LALOR, Toronto, Canada, assignor to JOHN DEWE, GEORGE HARDING, and BARTHOLOMEW LALOR.—*Indicator Lock.*—August 4, 1868.—The key, on being inserted, acts first on the tumblers, so as to free the cylinder and to allow a slide to be raised, and it then raises the slide so as to turn the cylinder. The slide bolt is replaced in its original position by the turning back of the key after the lock has been opened.

Claim.—1. The cylinder *a*, arranged in the lock in such a manner that it will cause the motion of the indicator, whenever the key is operated, to open the lock, as set forth.

2. The slide bolt *d*, by which the cylinder *a* is moved, as described.

3. So constructing the tumblers of a lock that they will lock the cylinder *a* substantially in the manner herein shown and described.

4. The guard *p'*, attached to the slide bolt *d*, for the purpose of protecting the bolts *n*, to prevent the lock from being picked, as set forth.

5. The application of indicator wheels *f g h*, or their equivalents, to a lock, the same being moved or set, whenever the key is turned in the lock, substantially as and for the purpose herein shown and described.

6. The combination of the indicator wheels with the locking pin *i*, which can be protected by a seal, as set forth.

80,638.—JOHN Y. LANFAIR, Queensbury, N. Y.—*Water Wheel.*—August 4, 1868.—The upper portion of each bucket is larger than the lower part, and is in such position as to receive the percussive force of the water at right angles with the direction of the flow of the same, and both parts are also so inclined as to receive a power from the water as it escapes from the wheel by reaction.

Claim.—The wheel A, constructed or cast with buckets J, having two parts *b b'*, arranged as shown in combination with the curved throats H H, all arranged substantially as and for the purpose specified.

80,639.—ELIJAH LINDSLEY, Neenah, Wis.—*Hinge.*—August 4, 1868.—The pivot pin which connects the two portions of the hinge together is encircled at the center by a shoulder, and has two short bends near the same, so as to form an eccentric which adjusts itself to place whenever the hinge is opened or closed either way.

Claim.—The bent pivot *b*, in combination with shoulder *a* and plates *d d*, the whole forming a right and left hand, substantially as herein shown and described.

80,640.—R. O. LOWREY, Salem, N. Y.—*Mode of Water-Proofing Paper, Cloth, &c.*—August 4, 1868.—This invention consists in the application of soap,

salt, and alum, to the materials of which the fabrics are composed, while in the raw state, or to the fabric or article into which it is made, after being manufactured.

Claim.—1. The process of making paper, cloth, and all similar fabrics, as well as leather, comparatively water-proof, as herein described.

2. The products resulting from the application of my process to pulp, paper, cloth, and similar fabrics, as well as leather, as herein described.

80,641.—R. O. LOWREY, Salem, N. Y.—*Artificial Gum for Coating and Water-Proofing.*—August 4, 1868.—An artificial gum is formed of a combination of soap with alum and salts, which will unite with oils, resins, wax, and other similar substances, to produce a varnish or paint.

Claim.—1. The composition, made by mixing a solution of salt and alum with a solution of soap, as herein described, for the purpose of producing an artificial gum.

2. The composition, made by mixing my artificial gum with oils, resins, grease, gum, wax, fibrous materials, or their equivalents, substantially as herein described, and for the purpose set forth.

80,642.—WILLIAM L. LOWREY, Saratoga Springs, N. Y.—*Manufacture of Illuminating Gas.*—August 4, 1868.—In a bench of retorts of the usual construction is placed a pot which is nearly filled with hydrate of lime. A similar pot is then filled partially with coal tar, over which is spread a layer of coke dust, fine coal, peat, saw-dust, and sand, mixed with a solution of soap or any suitable gelatinous compound. The eliminated gas breaks through this covering into the chamber of the retort and mingles with the hydrogen from the hydrate of lime.

Claim.—1. The process of distilling illuminating gas from coal tar, hydrocarbon oils, resins, wax, and the residuum of petroleum, substantially as herein described.

2. The use of the hydrate of lime, within the chamber or retort, in the manufacture of illuminating gas, in the ordinary way or by my process, substantially as herein described.

80,643.—GEORGE F. LYNCH, Milwaukee, Wis.—*Rotary Cultivator.*—August 4, 1868.—The invention consists in defining a rule for determining the shape of a fixed tooth on a cylinder, so that the whole line of the tooth will enter the ground at the point where it first strikes the same. The teeth are placed on separate heads, each having an independent movement on the same axle.

Claim.—1. The shape of the tooth and the manner of finding the curve of the same, to suit any sized head or cylinder, as herein recited.

2. Having the heads loose on the axle, to prevent clogging or choking, as herein described, in combination with the attaching the heads to the truck by straps, so as to permit each head or cylinder to act and move over obstructions independently.

80,644.—PHILANDER MACY, Rochester, N. Y.—*Valve Arrangement.*—August 4, 1868.—The valve is so constructed and arranged as to admit of the ports being opened and closed by the direct action of the piston head itself, without the use of eccentrics or other attachments, and also of reversing the engine while under full motion.

Claim.—1. The construction of the valve K with opening *d*, bars *f f*, lugs *h h*, offset *k k*, and projection *r*, as herein set forth.

2. The combination of the rod M, provided with the turning hook *s* and collar *t*, and the lever L and spring *n*, with the valve K and its projection *r*, operating substantially in the manner and for the purposes specified.

80,645.—A. J. MAGOON, Providence, R. I.—*Stove Grate.*—August 4, 1868.—Two circular grates are pivoted to a horizontal shaft, and so connected to gearing that when rotated in one direction the coal will be sifted, and when turned in the opposite direction the grates will be dumped.

Claim.—The combination and arrangement of the revolving grates C C, horizontal shaft B, lugs *e e*, tubular shafts *a a*, and beveled pinions *b b*, all

operating as described, whereby the grates are revolved separately and dumped simultaneously, as set forth and shown.

80,646.—PETER MARTIN, Forest Grove, Oregon.—*Manufacturing and Purifying Spirits.*—August 4, 1868; antedated April 4, 1868.—The grain, from which the liquor is to be made, is soaked in water and the latter is then drawn off; more water is again added to the grain to soak the same, and is then drawn off and added to the first. After fermentation the whole is run through a still. A part is again run through the still and a quantity of salt being added, the whole is again run through the still.

Claim.—1. The manufacture of alcohol, and other spirits, in the manner substantially as herein described.

2. The use of saline matter for manufacturing and purifying spirits, in combination with my said process, substantially as described.

80,647.—JAMES A. McCLELLAND, Vernon, Ind.—*Device for Feeding Saw Dust, &c., to Furnace.*—August 4, 1868.—A curved spout is conveniently arranged to suck up the shavings and dust from a wood working machine, the shavings, &c., being carried to the furnace for consumption by a continuation of spouts. Valves and spouts are arranged to convey the shavings outside of the building if desirable.

Claim.—1. The application of a suction and blast fan to planing, circular saw, sand belt, or other wood working machinery, when arranged in the manner shown, or in an equivalent way, to draw the shavings or saw dust from the machine and feed them to a furnace or discharge them from the building or shop, substantially as set forth.

2. The arrangement of the two fans D D', spouts G K L F, and the valves I J, to operate substantially as and for the purpose specified.

3. The air escape pipe H, in combination with the spouts G K L F, and valves J I, all arranged for joint operation, substantially as and for the purpose set forth.

80,648.—CHARLES H. MELLOR, Philadelphia, Pa.—*Molding Machine.*—August 4, 1868.—The mandrel of the cutter head has two projections, (one at or near each end.) on one of which the strap runs when the mandrel rotates in one direction, and on the other when rotating in an opposite direction. The top of the frame is elevated or depressed by means of a screw plate acting on inclined faces on the sliding frame.

Claim.—The combination of the vertical cutter bearing mandrel N, having glands for controlling the belt with the table D, made adjustable vertically by wedges placed on a frame C, controlled by hand wheel F and screw *f*, all constructed and operated substantially as described.

80,649.—BENJAMIN F. MERRILL, West Lebanon, N. H.—*Gauge.*—August 4, 1868.—The gauge is inserted in a key hole and adjusted to the proper angle to fit the two inclined sides of the same, and the parts being secured in position, the gauge is removed and the proper measurement taken for forming the key, the object being to provide a gauge for measuring key holes in machinery.

Claim.—An adjustable measure for key holes, consisting of the strips B C, adapted to be forced apart by the action of springs, and clamped in the desired position by means of set screws or nuts, substantially as herein shown and described.

80,650.—LUCIUS E. MICHELL, Cincinnati, Ohio.—*Curtain Fixture.*—August 4, 1868.—The pulley around which the cord passes is attached to a spring catch which is pivoted to a frame provided with perforations in any one of which the catch may be held by means of a stud on the rear of the same.

Claim.—The combination, substantially as described, of the perforated plate B b, pivoted spring catch C D, stud *d*, and pulley E, for the purpose specified.

80,651.—CHARLES E. MILLER, Indianapolis, Ind.—*Wash Boiler.*—August 4, 1868.—Apertures in the rim of the pit cover afford a communication from

the body of the boiler to the spout. A perforated diaphragm extends obliquely across the pit and directs the heated suds into the upright pipe.

Claim.—The arrangement of cover D, having perforated rim *d'* and unperforated top *d*, oblique and perforated diaphragm E, pipe G, and uozzles *g g'*, substantially as set forth.

80,652.—LEVI MOORE, Baraboo, Wis.—*Clay Mill.*—August 4, 1868.—A revolving disk provided with wedge-shaped projections receives the clay from the hopper, and passes it outward over the periphery of the disk to the floor below, where it is further ground. The lumps, sticks, &c., are worked outward and discharged through doors, while the plastic clay is conducted by chutes to the central opening to grinding plates below.

Claim.—The disk L, with its projections, in combination with the grinding plates *a* and N, the floor D, having chutes and opening O, the horizontal grinding plates G P, having wedge-shaped projections, the shaft I, floor H, and doors Q Q, all substantially as and for the purpose shown and described.

80,653.—AARON MOREHOUSE and ALFRED R. HEATH, Danbury, Conn.—*Tuck Creaser for Sewing Machine.*—August 4, 1868.—An upright arm attached to the presser piston is provided with a tapering slot curving to one side so as to carry the upper portion of the tuck out of the way of the needle. An arm or bar attached to a stud on the said slotted arm has at one end a curved guide, and on the other end a marker which carries a pencil to mark the line for the folded edge of the next succeeding tuck.

Claim.—1. The bent arm C, attached to the presser piston A, when constructed with the slot D, needle hole B, spring guide J, and guide swell O, substantially as and for the purpose set forth.

2. The combination of the slotted arm C, constructed as described, with the adjustable bar N, and spring presser F, as set forth.

3. The combination of the presser piston A, slotted arm C, spring guide J, guide O, and spring presser F, with the adjustable guide H or marker I, arranged to operate substantially as described.

80,654.—CHARLES W. MOSHER, East Leon, N. Y.—*Log Sled.*—August 4, 1868.—An angular frame provided with trunnions at each end of its base or lower portion, with bearings in the sides of the sled, is so connected with a chain and log hooks, that the draught force of the team will act to raise the log and draw it forward upon the sled.

Claim.—A log sled, having the roller *f*, chain *a*, swinging frame B and its accessory roller *e*, chain *a'*, and any log hooks *d*, all substantially as shown and described, and for the purpose set forth.

80,655.—JOSEPH NEWCOMER, Baltimore, Md.—*Composition for Destroying Insects in Wheat.*—August 4, 1868.—The wheat, previous to being planted, is soaked in a solution of salt brine and copperas; after being sufficiently soaked it is placed on a floor and slaked lime is sifted over it.

Claim.—The compound of the salt brine and copperas in the proportion, and the mode of treating the wheat, as hereinbefore fully described.

80,656.—J. NICHOLAI, Boston, Mass.—*Folding Chair.*—August 4, 1868.—Improvement on his patent of November 19, 1867. The legs and seat are so connected that the parts will move simultaneously in folding and unfolding the chair, and the same be held in position when unfolded, without straps or arms.

Claim.—1. A folding chair, having its seat C and legs A A connected by the bar D, rings *e e*, and guide rods *d d*, all arranged substantially in the manner as and for the purpose set forth.

2. The lugs or steps *f f*, attached to the seat C, in combination with the bar D, rings *e e*, and guide rods *d d*, for the purpose specified.

80,657.—JOSEPH W. NORMAN, Eugene, Ind.—*Portable Fence.*—August 4, 1868.—The panels are connected together and to the pickets by hooked rods and links so as to allow the whole to be rolled

or folded together. The pickets are secured to cast-iron supporting posts by sliding collars.

Claim.—The combination of the pickets A' A', the rings or collars *m m*, the posts B B, having the sockets *s s*, the rods *r r*, and the links *i i*, substantially as described.

80,658.—JOSIAH OOTHOUTD, Minneapolis, Minn., assignor to himself and HENRY C. JERAULD, same place.—*Churn.*—August 4, 1868.—The churn and dasher have each a rotary motion in opposite directions, being connected respectively to shafts, one of which is hollow and surrounds the other, and operated by suitable gearing.

Claim.—The tub C, dasher B, sleeve or casing *e*, hollow shaft E, wheel F, shaft D, and gear *e e*, when all are combined and arranged substantially as and for the purpose specified.

80,659.—W. H. PARKER, Memphis, Tenn.—*Smoke Stack.*—August 4, 1868.—An extra smoke stack formed in telescopic sections serves as a fire jacket to the original stack, and in case the latter is injured by a shot or accident, the sections of the extra stack are elevated by means of levers acting upon latches or pawls engaging in racks on the said sections, the sections being held in an elevated position by spring catches.

Claim.—The combination of three sections, E, F, and G, with the levers A A A, with the latches C C, the springs D D, the racks B B, the three or more springs I I, the fulcrum *g*, constructed and operated substantially as herein set forth.

80,660.—W. A. PHILIPS, Perry Center, N. Y.—*Compound for Destroying Insects in Plants.*—August 4, 1868.—The ingredients are tobacco, lime, and soft soap boiled in water and strained.

Claim.—The composition prepared of the ingredients and in the proportions and manner substantially as herein described and set forth.

80,661.—S. B. PIERCE, Homer, N. Y.—*Fence.*—August 4, 1868; antedated July 29, 1868.—The posts, to which the panels are attached, are secured to each other by a T-shaped clasp having a screw thread on its shank.

Claim.—The combination of the fence panels B B, clasp C, as constructed, and posts A, for forming a portable fence, as set forth.

80,662.—HENRY E. POND, Franklin, Mass.—*Carriage-Curtain Fastener.*—August 4, 1868.—A metallic plate containing a sliding bolt, shutting into or through a hollow stud on the carriage top, is applied to the outer surface of the curtain, and another plate is attached to the inner surface of the curtain.

Claim.—The improved device before described, for fastening the curtains of wheeled vehicles, consisting of the two perforated plates, *a* and *b*, riveted to opposite sides of the curtain, as represented, and with the outer one provided with a locking bolt, for locking into the stud *d*, the whole being in manner and to operate as before described.

80,663.—LEVI W. POND, Eau Claire, Wis., assignor to himself and EAU CLAIRE LUMBER COMPANY, same place.—*Device for Sheering Booms.*—August 4, 1868.—The boom is hinged at one end to a firm support on the shore, and on the "down stream" side are pivoted rudders, connected together by rods, so that they will all move simultaneously.

Claim.—The combination of the rudders B with the boom A, whether said boom be made in one or more parts or pieces, substantially as herein shown and described, and for the purpose set forth.

80,664.—E. N. PORTER and P. P. ROBERTS, Morrisville, Vt.—*Swift or Reel.*—August 4, 1868.—The swift is provided with a hook, so that it can be moved to the side of its support, and be used as a reel; and the pivot around which the arms revolve is provided with a spring, so as to hold them steady and in place.

Claim.—The arrangement of the spiral spring *a*, pin E, perforated arms F F, with the block C, hook

D, and standard A, substantially as and for the purposes herein set forth.

80,665.—EDWARD J. REDDY, Bayville, N. Y.—*Bundling Machine*.—August 4, 1868.—Designed more especially for bunching or bundling asparagus and other vegetables. The handle is adjusted in position to expand the bands or straps for receiving the article to be bound, when it is drawn down, and, by a slight turn of the hand piece the machine will be locked and the bundle be held securely until tied up.

Claim.—The handle C, having the movable hand piece c^1 and stop c^2 , the toothed segment H, shaft B, and segments F, constructed to operate the flexible bands E, as herein described, for the purpose specified.

80,666.—OTIS N. RICH, Geneva, Ill., assignor to himself and WILLIAM H. HOWELL.—*Grain Separator*.—August 4, 1868.—A circular disk is secured to a shaft, and has its under side of a shape to conform to a concave perforated plate arranged independently of the shaft. Beneath this plate is a funnel-shaped receiver, which discharges into a spout on one side, while a separate discharge is provided for the perforated concave.

Claim.—1. The combination of the disk H and perforated plate I, with their adjacent faces inclined downward, substantially in the manner and for the purpose set forth.

2. In combination with said disk H and plate I, the arrangement of a receiver, J, substantially as specified and shown.

3. The combination of the disk H, perforated plate I, receiver J, and chutes K L, arranged to operate substantially in the manner described.

4. The rim M, provided with openings or notches m , when arranged with respect to the passages n , in the manner specified.

80,667.—WILLIAM D. RICHARDSON, Springfield, Ill.—*Lead Pipe Connection*.—August 4, 1868.—A ring of lead is placed over the male part of the pipe, and the joint is made by crowding the two sections of pipe together with great force.

Claim.—The improved pipe joint herein described, the lead E being compressed within the flaring lip D, by compressing the lengths of pipe forcibly together, and a space, C' , being left around the extreme end of the male part to allow the parts to be set at a slight angle without difficulty, all substantially as and for the purposes herein set forth.

80,668.—LORENZO W. ROATH, Lexington, Ohio.—*Bedstead*.—August 4, 1868.—The cords extending from one section to the other are secured in a cross-rail at the intersection of the two parts by means of loops, in order to preserve their tension.

Claim.—The cross-rail K, loops d , as arranged in combination with the cord F and sections H G, substantially as and for the purpose set forth.

80,669.—WILLIAM W. ROGERS, Hampden Corner, Me.—*Dumping Cart and Wagon*.—August 4, 1868.—As the cart or wagon body is tipped up to dump the load, the tail board will be raised automatically, and will drop back again into place and fasten itself as the said body is again raised into a horizontal position.

Claim.—1. The combination of the spring bolts G, cords or chains H, and pulleys I, with the hinged tail board E, stakes J, and body D of the cart or wagon, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the brace rods K and cross-bar L with the stakes J and shafts C, substantially as herein shown and described, and for the purpose set forth.

80,670.—J. F. SARGENT, North Thunbridge, Vt.—*Carriage Top*.—August 4, 1868.—The pivoted interior rod extends up through the hollow upper part of the jointed staff, and to its upper end is attached a grooved disk to which are secured the ribs. A sliding ferrule covers the joint in the staff. The top is designed to be readily attached to or detached from a carriage seat and compactly folded.

Claim.—The pivoted interior rod D, in combina-

tion with the double-jointed tubular shaft C, slotted near its center, sliding ferrule I, grooved and notched ring flange H, disk E, braces G, and curved radial ribs F, all constructed and operating as described for the purpose specified.

80,671.—PETER SCHMITT and PETER JACOB SCHMITT, Waterloo, Ill.—*Grain Drill Shoe*.—August 4, 1868.—Two coupling links are attached to the traction rod by a single pivot pin so as to allow of a vertical play of the parts, and a similar attachment is made between the back ends of the said links and a lug on the shoe. A rivet pin in connection with the segmental slot in the shoe lug permits the latter to give way when the machine is backed.

Claim.—1. The shoe A, when provided with a slotted lug, a , and combined with the rod B and links C, as herein described and shown.

2. The rod B, when provided with adjusting holes b^2 , and coupled with the links C, by means of the joint pin b , and the wooden pin b^4 .

3. The arrangement of the curved slot a' , pin c' , and links C, substantially in the manner herein shown and described.

80,672.—JOHANN SCHNELL, New York, N. Y.—*Sash and Window Frame*.—August 4, 1868.—The frame which confines the sashes is hung to the window casing so that it may be turned like a folded window, for convenience in washing and replacing broken panes of glass. The end of each sash cord is secured to the edge of the sash by means of a spring catch, so that the cord can be taken off and replaced without taking the sash out of the frame.

Claim.—1. The hinged frame B, in which the sashes C D slide up and down, as specified.

2. The arrangement of the window sashes C D, in a frame, B, which is hinged to the casing A, all constructed to operate substantially as herein shown and described, for the purpose specified.

3. The bars or plates G, when removably secured to the sashes, and held by means of the catch $i g$, all constructed and arranged to operate in the manner and for the purpose substantially as herein set forth and shown.

80,673.—WILLIAM SERVISS, Sidney, Ohio.—*Device for Soldering Tin Cans*.—August 4, 1868.—A tubular holder, having an annular lip near its top, against which the upper edge of the cylinder to be soldered rests, is made so as to be capable of being sprung apart to increase its diameter, and is held in any desired position by nuts and screws.

Claim.—The tubular holder A, when provided with the slots C, screws D, and nuts D', arranged and operating substantially as and for the purpose described.

80,674.—F. M. SHIELDS, Macon, Miss., assignor to himself and JOHN W. SANDERS, same place.—*Yoke*.—August 4, 1868.—A hanging and a projecting hook are attached to a halter upon the neck or head of an animal, and so arranged as to hook into a fence, to prevent the animal from jumping the same.

Claim.—1. The combination with a halter of the yoke herein described, consisting of the strip C and hooks D and E, substantially as and for the purpose described.

2. The improved animal yoke, herein described, composed of the strip C, hooks D and E, substantially as and for the purpose described.

80,675.—DAVID SLAUGHTER, West Hempfield Township, Pa.—*Meat Cutter*.—August 4, 1868.—A series of circular knives attached to a central axis, revolving on side bearings, are made to traverse to-and-fro on a rotating block, by means of a crank and screw gearing, with an adjustable bearing or weighted pressure on the knives.

Claim.—The arrangement of the circular knives N and weighted sliding car and box Q, with its slotted arms I I', in combination with a revolving block, L, and crank and screw shaft D S, substantially in the manner and for the purpose specified.

80,676.—GEORGE H. SOULÉ, Jersey City, N. J.—*Fastening for Bracelet*.—August 4, 1868.—The bracelet is fastened at or near one end to the device,

while the other end is left free to slide in the fastener and may be secured at any desired point by means of a hinged lever and spring catch.

Claim.—The clasp or fastener A, as shown and described.

80,677.—JOHN D. STEWART, La Porte, Ind.—*Balance Slide Valve.*—August 4, 1868.—In the top of the chamber of the valve chest, which is recessed for the purpose, are placed two plates, which are pressed by the steam into longitudinal grooves on the top of the valve, for the purpose of relieving the valve of friction and also of preventing the passage of the steam over the top of the valve.

Claim.—In combination with the slide valve B, valve chest G, and cover G¹, and steam chamber F, the packing plates H, to the back of which steam is admitted from the steam chamber, substantially as and for the purpose set forth.

80,678.—GEORGE W. STOFFER, Lewiston, Pa.—*Spoke Tenon.*—August 4, 1868.—The spoke tenon is formed with grooves or concavities in some or all of its sides, for the purpose of facilitating the driving of the spoke and preserving the fixedness of the wheel.

Claim.—The provision in a spoke-tenon of the grooves or concavities *b*, *b*², *b*³, employed and operating as described, for the purposes specified.

80,679.—SEDGWICK A. SUTTON, Dixon, Ill., assignor to himself, W. UHL, and LYSANDER FLAGG.—*File Cutting Machine.*—August 4, 1868.—Designed as an improvement upon a machine patented to Edward Bueklin, February 27, 1866, and relates to the construction and arrangement of the hammer shaft, and the chisel by which the latter is prevented, in its ascent, from cutting off a tooth made by a previous cut. The pressure roller is also so arranged as to admit of its being always adjusted at a proper distance from the chisel.

Claim.—1. The combination and arrangement of the pivoted guide plate B, slides C and E, and the convex pressure roller F, substantially as and for the purpose specified.

2. The loaded lever I, arranged or applied substantially as shown, with the standard J and oblong slot *h*, in combination with the slides C E and convex pressure roller F, substantially as and for the purpose set forth.

3. The clamp K, composed of the jaws *j j'*, lever M, provided with the pins *n o*, and the catch L, applied to the clamp, and all arranged to operate in the manner substantially as and for the purpose specified.

80,680.—JAMES STEWART, Hoffman's Ferry, N. Y.—*Corn and Potato Coverer.*—August 4, 1868.—The covering shares are so connected with the frame as to admit of their being readily adjusted to throw more or less soil over the rows, as desired. The rollers are mounted in hinged frames at the rear of the machine and are steadied by means of springs bearing upon the frames. The lead wheel is capable of a vertical adjustment.

Claim.—1. The covering shares G G', constructed as represented and described, and provided with the adjustments *g*, *g'*, *a*, and *g*¹ *g*¹^{*}, *g*², substantially as and for the purpose set forth.

2. The combined arrangement of the adjustable lead wheel E, shares or scrapers G G', and spring rollers H H', all substantially as described, for the purpose specified.

3. The springs J J', in combination with the frames A I and rollers H H', arranged and operating substantially as and for the purpose described.

4. The combination of the handles C, main frame A, hinged frame I, rollers H, and wheel E, all arranged to operate substantially as herein set forth.

80,681.—BENJAMIN F. TAFT, Groton Junction, assignor to himself and DANIEL NEEDHAM, Groton, Mass.—*Hay and Cotton Press.*—August 4, 1868.—Compressing power is applied through the agency of nooses in a series of ropes or chains, used for pressing hay, and through the agency of ropes, pulleys, and a follower, for pressing cotton.

Claim.—The within-described portable pressing

apparatus, consisting of the mounted wagon body A S C D, windlasses E and R, with their connecting gear, ropes or chains *d d d d*, &c., pulleys *e e e e*, *h*, and *i*, follower S, and cam *a*, all constructed and arranged together substantially as herein shown and described.

80,682.—SPENCER P. TAYLOR, Oxford, Ohio.—*Horse Collar.*—August 4, 1868.—Designed for the reception of hair or wool in one compartment, to render the collar easy for the horse's neck, the remaining two sections to be filled with some cheaper material.

Claim.—A horse collar, divided by a partition, *e*, into compartments for the reception of different materials, substantially as described.

80,683.—GEORGE S. TRUE, Leavenworth, Kansas.—*Label Holder.*—August 4, 1868.—A card holder is so constructed as to hold blank cards having any desired direction marked thereon, and secured by clamps or springs in the said holder.

Claim.—The card-holder, consisting of the parts D E, the former being hinged to the latter, which is adapted to be so attached to the trunk as to form a magazine C, substantially as herein shown and described.

80,684.—WASHINGTON H. TUCKER, Sunman, Ind.—*Wagon Brake.*—August 4, 1868.—The brake blocks are attached to swinging rods operated by a lever through the medium of rods and straps. A spring is used to keep the blocks from contact with the wheels.

Claim.—The blocks E, rods F and P, straps K and N, sheave O, rods L M, spring H, and lever J, all constructed and arranged substantially as and for the purpose set forth.

80,685.—T. W. TYLER, Cory, Pa.—*Churn Dasher.*—August 4, 1868.—The knives are secured in two wheels, and are made to incline in one direction in one of the wheels, and in the other direction in the other wheel, so that the two will revolve in opposite directions, as the dasher is moved up and down.

Claim.—The knife-wheels F E G, constructed and operating substantially as herein shown and described, in combination with the long tenon D of the dasher-handle C, as and for the purpose set forth.

80,686.—ISAAC H. WALKER, Newton, Ill.—*Combined Plow and Planter.*—August 4, 1868.—The front mold boards break the soil, while the rear ones throw up the clear soil from the bottom of the furrow. The seed is then dropped into the ground which is pulverized and compressed in a convex ridge over it by the harrow and roller.

Claim.—1. The mold boards C C, projecting rearwardly and inwardly from the front mold boards B B, at the same or a greater depth, substantially in the manner and for the purpose specified.

2. The combined arrangement of the seed box D D', dropping slide G, crank lever F, and treadle E, all constructed and employed substantially as and for the purpose described.

3. The harrow J, constructed as described, and employed in combination with the plows B C, and planter D I, in the manner and for the purpose specified.

4. The combined arrangement of the plows B C, planter D I, harrow J, and roller L, all constructed and operating substantially as and for the purpose described.

5. The hollow colter or drill I, in combination with the mold boards C C and planter D, as and for the purpose set forth.

80,687.—JOHN WAMPACH, Shakopee, Minn.—*Tire Cooler.*—August 4, 1868.—The object is to so construct the tire frame that the tire, when set, may be instantly cooled before it can injure the felloes, and without wasting the water.

Claim.—The combination of the connecting rods E, lever D, connecting rod G, and lever F, with each other, with the box B, beams C, and frame A, arranged substantially as herein shown and described, and for the purpose set forth.

80,688.—JAMES WHITE, Harrison, Ohio.—*Car Coupling*.—August 4, 1868.—The coupling pin is inclosed within a cylinder, and pressed down by a spiral spring. The pin, when the cars are uncoupled, rests upon a projection or spring bolt, which is pressed forward by a spring within a telescopic casing, and is released by the impingement of the entering link against the said bolt.

Claim.—1. The pin C, inclosed within the tight cylinder B F, and operated by a spring E, substantially as and for the purposes described.

2. In combination with the above, the lugs or projections J K, telescopic hollow stem *j*, L, and spring M, all constructed, arranged, and employed as and for the purposes specified.

80,689.—RICHARD WHITING and ALBERT HAMILTON, New York, N. Y.—*Grate for Stove Range and Heater*.—August 4, 1868.—The back part of the grate can be raised or lowered to any desired angle by means of a lever in the center of the stove. The front half can be raised or lowered vertically, by a similar device, connected with a lever in a slot in the side, under the grate bars.

Claim.—An "adjustable grate," so constructed that the size of the fire space may be readily increased or diminished, by raising or lowering one section of the grate perpendicularly, or by inclining the other section or sections thereof to any required angle, by means of a cam, lever, or other device, using either movement separately, or both combined in one stove, range, furnace, or heater.

80,690.—HIRONIMUS WILL, Columbus City, Iowa.—*Thill Coupling*.—August 4, 1868.—A hook on the end of the shaft engages with a pin or piece attached to the cross bar or axle, and is secured by means of a clutch, which is held in place by a spring.

Claim.—A shaft coupling, having pieces A and B, clutch D, and spring E, constructed, combined, arranged and operating substantially as specified.

80,691.—ISAAC WILLIAMS, Westfield, Ind.—*Weather-Board Gauge and Rest*.—August 4, 1868.—Designed for gauging the distance apart of the edges of weather-boards, and at the same time to support the board while being nailed on, so as to avoid the necessity of driving in nails to support each board.

Claim.—The combination of the hollow shouldered part A, having the parts a^1 a^2 , the graduated adjustable stem B, and the sliding wedge D, all constructed, arranged, and operating as herein described, for the purpose specified.

80,692.—ISAAC WILLIAMS, Westfield, Ind.—*Gauge for Weather-Board*.—August 4, 1868.—Designed for measuring the exact length of the space between the window frames and other places, so that the board, when marked and sawed off, may exactly fit into the desired space, without the necessity of using the plane upon the ends of the board.

Claim.—The bars A, provided each at its outer end with an adjustable pivoted blade, B, and socketed at their inner ends for the reception of the sliding connection D, which is adapted to be clamped in the desired position; said bars A being provided with flanges *a*, all constructed, arranged, and operating substantially as and for the purpose herein set forth and shown.

80,693.—W. WINDOES, Fond Du Lac, Wis.—*Tanning*.—August 4, 1868.—The skins are first fermented in a compound of brown sugar and wheat bran in water. A tanning liquor is then applied, composed of an aqueous solution of alum, saltpeter, common salt, yolks of eggs, and wheat flour.

Claim.—1. The employment of a sugar and bran dump, in combination with the usual tanning process, all substantially as and for the purpose set forth.

2. The alum and saltpeter tanning liquor, in combination with the preceding process, or other equivalent processes, all substantially as set forth.

80,694.—C. W. WITT and B. F. WITT, Indianapolis, Ind., assignors to B. F. WITT.—*Harvester*.—August 4, 1868.—The tipping rake consists of a bar pivoted to the side of the body next to the platform,

and having rigidly attached to it a series of rods, the ends of which engage under the lower edge of the apron. Across the center of the box is a bar which serves as a seat or rest for the operator, and against which the sheaf of grain is held so as to allow it to be bound.

Claim.—1. The tipping rake, when constructed and arranged to receive the grain as it is cut, and deliver it to the binder, substantially as described.

2. The box A, with the seat or binding table *d*, in combination with the tipping rake, substantially as described.

3. The combination of the reciprocating bar *m* and plate L, having the grooved rollers *o* arranged thereon to form the supports of the bar *m*, all substantially as set forth.

80,695.—JOHN S. WOOD, Lansing, Mich.—*Car Brake and Starter*.—August 4, 1868.—A metallic cylindrical case, open at one end, is attached by radial arms at the other end to a hub, through which the axle passes loosely. Within the cylinder are spiral springs attached in duplicate sets to the sleeve of a wheel at the open end of the cylinder. By means of clutches and levers the springs are wound up to aid in stopping the car, and the accumulated power is employed to start the car.

Claim.—1. The combination of the cylinder B, wheel D, clutches E and F, and flanges G, when constructed and arranged substantially as described.

2. The combination of the levers H, flanges G, and clutches E and F, when so arranged that as the flanges are disengaged from the arm, the clutch on the same side will be engaged with the teeth on the hub, substantially as set forth.

3. The combination of the cylinder B and wheel D with the flanges G, when, respectively, so constructed that a projection from the flanges may be made to engage the arms B² or D', and prevent the revolution of the wheel or cylinder, substantially as and for the purpose set forth.

80,696.—CHARLES F. WOODRUFF, Newbern, Tenn.—*Excavator*.—August 4, 1868.—The bottom of the excavator is composed of two plates hinged at one edge, so that as the body is rotated, the plates will drop upon the lower round and form a box into which the excavated dirt is received. The instrument is held in position, by means of a ratchet and pawl, which are released by a lever when necessary.

Claim.—1. In a revolving scraper or excavator, the combination of the swinging plates F F' and the rounds *d* d^2 , or their equivalents, substantially as and for the purposes specified.

2. The combination of the lever M, having the handle *m* and the hook *n*, with the pawl *p*, ratchet *w*, and body B, when the parts are constructed to operate substantially in the manner and for the purpose specified.

80,697.—WILLIAM H. ABEL, Greenville, R. I.—*Sleeve of Knitted Garment*.—August 4, 1868; ante-dated July 27, 1868.—The object is to so unite the selvage edges as to avoid the "bulgy" seam when the sleeve and body of the garment and cuff, or border, are connected. The gussets of sleeves made with selvage edges are formed by folding over the ends or corners.

Claim.—1. Making the short sleeves of undershirts, vests, and similar garments, of tapes or strips which have selvage edges, and in which the courses of stitches or loops run in the same direction as in the body of the garment, for the purpose and substantially as described.

2. Forming the gusset of such sleeves in the manner and for the purpose substantially as described.

80,698.—L. H. ALLEN and JOHN B. WILFORD, Tamaqua, Pa.—*Steam-Engine Slide Valve*.—August 4, 1868.—The bars on the face of the valve will close the exhaust ports until the exhaust steam has acted on the piston and moved the valve.

Claim.—The arrangement of the bars *m m* with the exhaust openings L L and passages *i i*, whereby to complete the stroke of the valve C, so as to make the maximum opening of the ports, substantially as set forth.

80,699.—HENRY ANSLEY, Washington, D. C.—*Button.*—August 4, 1868.—A coil is secured by a cross brace to the shank which is fixed to a disk, and the button is attached to the garment by serewing it through the button holes.

Claim.—A button or stud, constructed with the parts A, B, C, and C', arranged in relation to one another, substantially as described.

80,700.—JOHN ASHCROFT, New York, N. Y.—*Low Water Detector for Boiler.*—August 4, 1868.—When the water descends below the perforations in the low-water tube the steam will enter and dissolve the fusible plug and sound the whistle, while an undue pressure of steam will raise the weighted valve and sound the alarm.

Claim.—1. The construction, arrangement, and combination of the low-water detector tube B and fusible plug D, with the steam alarm tube F, weighted valve H, and steam whistle I, substantially as shown and described.

2. The steam connection pipe N and valve O, in combination with the fusible plug D and steam whistle I, substantially as herein shown, described, and set forth.

80,701.—JAMES F. BARCOCK, Boston, Mass.—*Apparatus for Extinguishing Fire.*—August 4, 1868.—The inner tube is provided near its upper part with an aperture, just above which is a wire or open partition, for supporting a charge, by the combustion of which a gas is evolved, and the pressure of the same will eject the water from the vessel through a suitable aperture or pipe.

Claim.—A liquid-ejecting apparatus, having a main water or liquid chamber or reservoir, *a*, and a gas-generating tube, *d*, this tube having provision, at its upper part, for holding the gas-generating composition to be burned, and the tube and main chamber being constructed and arranged substantially as described.

80,702.—ROBERT J. BARR, Philadelphia, Pa.—*Centrifugal Machine for Filtering, Draining, and Drying.*—August 4, 1868.—A yielding forked bar partially embraces a suspended vertical shaft and reduces any gyration resulting from the suspended vessel being unevenly loaded, but yielding sufficiently before the gyration is reduced to prevent the violent shocks and vibrations incident to an unyielding bearing.

Claim.—1. A forked bar, E, having a yielding bearing, and arranged adjacent to and bearing with its forked end against the suspended shaft of a centrifugal drying machine, substantially as and for the purpose described.

2. The said bar, secured in a frame hinged to the outer casing or other permanent part of the machine, for the purpose set forth.

80,703.—SAMUEL G. BLACKMAN, Waterbury, Conn.—*Car Seat.*—August 4, 1868.—By pressing down the back the seat is raised so as to form a back facing in the other direction, while what was before the back becomes the seat.

Claim.—A reversible or adjustable seat, constructed in the manner described; that is to say, the two parts which form the back and seat, according to the position in which the seat is adjusted, are pivoted upon a common center, so that both are turned to reverse the seat, substantially in the manner herein set forth.

80,704.—SANFORD O. BLANDING, Smithfield, R. I.—*Union Valve Coupling.*—August 4, 1868.—Between the faces of the coupling is interposed a circular disk of leather with a segmental piece taken out so as to leave a central circular portion attached to one side which forms a stop valve, the concentric portion of the same forming a packing.

Claim.—A combined coupling and check valve, constructed and arranged substantially as described, for the purpose specified.

80,705.—HENRY H. BOUCHER, Doylestown, Pa.—*Lamp.*—August 4, 1868.—The lamp is provided with a reservoir and adjustable regulator for the supply of oil, and also with a safety attachment to allow any

gas which may be generated in the closed reservoir to pass off.

Claim.—1. The combination, with a lamp, and a separate oil reservoir communicating therewith, of the tubular level regulator E, two-way cock G, and tube F, arranged and operating substantially as described.

2. The tube F, in combination with an oil reservoir and an escape cock, substantially as described.

80,706.—GEORGE W. BURLING, Trenton, N. J.—*Stove Leg.*—August 4, 1868.—A dove-tailed lip cast on the upper portion of the leg fits within circular slots in the bottom of the stove and secures the leg in place.

Claim.—The circular slot A, when combined with the grooved recess *a a*, and the dove-tailed lip C, or their equivalents, substantially as and for the purpose described.

80,707.—REMUS D. BURR, Kingsborough, N. Y.—*Glove.*—August 4, 1868.

Claim.—1. Cutting the front of the hand, thumb, and all the fingers, joined in one and the same piece of material, substantially as shown and described.

2. In combination with the front, cut in one piece, as above claimed, cutting the whole or three sides of the fore-finger, also joined in said piece, substantially as described.

3. Cutting the back of the hand and thumb, and the back and sides of the middle and little fingers, all joined in one and the same piece of stuff, substantially as described.

4. Cutting the back of the hand, with the back and sides of the middle and little fingers, all in one piece, as shown and described.

5. In combination with the back of the hand and the middle and little fingers, cut as above claimed, the back and sides of the ring finger, cut in one piece and sewed to the back, substantially as described.

6. In combination with the elements of the first claim, cutting the back of the thumb separate from the back of the hand, and joining it thereto by a seam.

7. In combination with the elements of the third and fourth claims, cutting the front of the thumb separate from the front of the hand, and joining it thereto by a seam.

8. In combination with the front of a mitten, cut as claimed in the first claim, cutting the back of a mitten with the back of the thumb in one piece, substantially as described.

80,708.—WILLIAM S. CARR, New York, N. Y.—*Water Closet.*—August 4, 1868.—The hopper is formed of one piece or casting, and the pan can be readily withdrawn for repairs without disturbing the hopper, the pan being mounted on an axis formed of two parts so as to allow of its being introduced. An adjustable slotted link is arranged between the pull and lever to allow for variations in the position of the pull.

Claim.—1. A water-closet hopper or container, having the inward flange *e* at the upper end, in combination with the pan *d*, the parts being formed substantially as specified, so that the pan can be introduced or withdrawn through the opening in said flange *e*, and the pan, when in place, shall set up against the under side of said flange, as set forth.

2. The divided axis *k m*, formed as shown, in combination with the pan *d* and socket *o*, as and for the purposes set forth.

3. The slotted adjustable link *v*, in combination with the lever *r* and pull *w v*, as and for the purposes set forth.

80,709.—JAMES CHALMERS, London, England, assignor to JAMES CHALMERS, Jr., same place.—*Non-Conductor of Heat.*—August 4, 1868.—Designed to prevent the radiation of heat from steam-engine boilers, pipes, &c; also to protect water pipes, cisterns, conduits, &c.

Claim.—The mixture, in the proportions above described, of glutinous and silicious clay, as the basis of a non-conducting compound, the calcination or half-charring of saw dust, in the manner proposed, so as to preserve its fibrous nature and non-

conducting qualities, and the use of wood, and other pulp or fiber, and hoofs, prepared as above, for binding and consolidating the non-conductor compound, and for adding to its non-conducting qualities.

80,710.—GEORGE D. CLARK, Plainville, Conn., assignor to himself and CLARK & COWLES, same place.—*Fastening for Button.*—August 4, 1868.—A plate or washer is formed with a central slot having its edges turned up. The eye of the button is passed through the cloth and into the slot, when the raised portion is struck down and thus secures the eye.

Claim.—The herein described button fastener, as an article of manufacture, consisting of the plate A, with the slot *a*, and one or more projections, *d*, substantially as set forth.

80,711.—JAMES J. DE BARRY, Brooklyn, N. Y.—*Changeable Stencil Plate.*—August 4, 1868.—The slots, through which the numbered or lettered strips are passed, are arranged alternately nearer to and farther from the central hole, so as to hold the strips in contact with each other and firmly in place.

Claim.—The within-described slots C D E F, arranged relatively to the opening *a* and the strips B, the whole being adapted to form an adjustable stencil plate, possessing the advantages and characteristics herein set forth.

80,712.—T. PARSONS DICKERMAN, New Haven, Conn.—*Base Burning Stove.*—August 4, 1868.—A slide or cut-off is arranged in the base of the feeding reservoir to cut off the supply of coal in case the fire is extinguished.

Claim.—In combination with the reservoir or cylinder B of a base-burning stove, the slide or cut-off D, arranged and applied substantially in the manner herein set forth.

80,713.—EDWIN A. DUER, Decatur, Ill., assignor to GEORGE W. PATTERSON, same place.—*Hominy and Pearl Mill.*—August 4, 1868.—A longitudinal recess on the interior of the cylinder serves to arrest the grain as it is carried round by the beaters, and a diaphragm near one end prevents a too rapid passage of the grain from the cylinder.

Claim.—The combination and arrangement of the cylinder B, having recess D, diaphragm I, passage K, and slotted sliding gate M, rotary shaft C, provided with beaters *a*, rotary screen Q, fan blower N, deflector O, chutes H h P, hopper E, vibrating shoe F, and conveyer on shaft C, all substantially as herein shown and described, and for the purposes specified.

80,714.—A. B. EDMONDS, Melrose, Mass.—*Water Meter.*—August 4, 1868.

Claim.—A water meter or motor, made with valve blades or flaps, hinged to and swinging against and from an axial drum, such blades being rotated by pressure of the water entering the meter case through the eduction pipe, and each valve blade being thrown out from the drum, as its outer edge passes the abutment or wall, substantially as set forth.

80,715.—JOHN FISHER, Middletown, Pa.—*Plow.*—August 4, 1868.—An adjustable wing is secured to the same post with the subsoil plow, so that the operator may regulate the amount or quantity of the subsoil turned or brought up to the surface.

Claim.—The adjustable wing C, when used in combination with a subsoil plow, B, and constructed and arranged as and for the purpose herein fully set forth.

80,716.—SAMUEL P. FORGY, Allensville, Ky.—*Bee Hive.*—August 4, 1868.—The plate closes the entrance to the hive and is so pivoted, at an inclination, that the weight of the bee, in crawling up the plate, will depress the same sufficiently to permit an entrance, and in coming out the bee will raise the lower edge, the plate being self-closing.

Claim.—The application, to the box or frame, of the self-adjusting transparent light on pivots, which will, at a given or proper time, allow the bee both ingress and egress, as herein described, using for that purpose any transparent substance which will produce the intended effect.

80,717.—WILLIAM S. FREEMAN, West Union, Ohio.—*Hand Loom.*—August 4, 1868.—The driving shaft, at the front end of the machine, is provided at its middle with a crank, so as to enable the weaver to use both hands when required, and also to reach any broken thread in the warp. A feed pawl attached to a fly-wheel on the driving shaft operates a ratchet wheel on a rearward shaft, provided with tappets which depress in succession the treadles. The picker staff projects from a shaft journaled vertically to the batten, and on this shaft is a strap, the ends of which are divided and secured to the alternate treadles.

Claim.—1. The driving shaft M, pawl P, ratchet wheel Q, shaft R, with tappets S, and treadles C, all constructed, arranged, and operating substantially as described, for the purpose set forth.

2. In combination with the elements of claim first, the picker staff U u and strap V.

80,718.—EMIL FRESE, San Francisco, Cal.—*Medicine.*—August 4, 1868.—Composed of Alexandria senna, manna, eoriander seed, lavender flowers, and tartaric acid, designed for a cathartic.

Claim.—The above described composition for cathartic tea, made of the ingredients enumerated, mixed and compounded in about the proportions specified.

80,719.—JOHN F. FRYE, Lowell, Mass.—*Ventilator.*—August 4, 1868.

Claim.—The combination of a metallic chimney with an adjoining heat-conducting tube or box, in which the air is heated by the chimney, and conveyed to rooms above the level of the fire, said tube or box being controlled by valves at both ends, so that it may be used as a ventilator in the warm season.

80,720.—EDWARD A. GALBRAITH, Boston, Mass.—*Compound for Extinguishing Fires.*—August 4, 1868.—The solutions or fire extinguishing substances are designed to be projected upon fire by pressure or force from a suitable machine.

Claim.—1. A solution of salt cake of commerce in water, for extinguishing fires.

2. A solution of chloride of magnesium and silicate of soda, in combination with salt cake of commerce, or its equivalent, for use in extinguishing fires, substantially as set forth.

3. A solution of any soluble silicate, Epsom salts, and bicarbonate of soda, in combination with salt cake, or sal-nixon, or their equivalents, for the purpose set forth.

4. A solution of chloride of calcium, and soluble silicate, any bicarbonate of soda, in combination with salt cake of commerce, or its equivalent, for use in extinguishing fires.

80,721.—CHARLES H. GARDNER, Rochester, N. Y.—*Tuck Folder for Sewing Machine.*—August 4, 1868.—The device is made in two parts or pieces, one of which consists of a plate raised at the outer end with a half-round conically-shaped channel; the other consists of a slotted horizontal plate having a flaring raised lip, a presser, and a spring lip having an open-eyed slot, for the purpose of keeping the material in a perfect fold, until after the needle has made the stitch, the open eyelet allowing the formed stitch to pass out.

Claim.—1. The piece B, constructed as described, and consisting of the parts L u H, spring *a*, with open eyelet *e*, all constructed as and for the purposes set forth.

2. In combination with the above, the part A, consisting of the raised block *c* and adjustable plate H', all constructed as described, and operating together for the purpose set forth.

80,722.—O. H. GARDNER, Fulton, N. Y.—*Vise.*—August 4, 1868.—A ball on the lower end of the shank of the movable jaw fits in a socket in the outer part of a cylindrical slide bar, in which latter is a spring that serves to hold the movable jaw open. A sliding dog on the movable jaw is made to overlap the upper edges of the slide bar, to prevent the movement of the shank upon the socket joint when the movable jaw is to be held parallel with the stationary jaw. By means of a flanged and a slotted plate

the shank of the rear jaw may be adjusted to any desired horizontal angle with the bench.

Claim.—1. The combination of the spring J with the ball H, formed upon the lower end of the shank *g'*, and with the cylindrical slide bar I, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the sliding dog O with the shank *g'* of the front jaw G, and with the outer end of the cylindrical sliding bar I, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the spring catch P with the shank *g'*, and with the sliding dog O, substantially as herein shown and described, and for the purpose set forth.

4. The described construction of the flanged plate D, and the recessed and slotted plate E, the former being attached to the shank of the jaw B by a screw, in order to be removable, as herein shown and described.

80,723.—ELIAS GILL, New York, N. Y.—*Extension Wardrobe Frame.*—August 4, 1868.—The four posts of the frame are connected longitudinally and transversely, with toggle levers or slotted extension bars, so that the wardrobe can be readily adjusted to any desired size.

Claim.—1. An extension skeleton frame, for portable wardrobes, constructed and operating substantially as described, so that it can be longitudinally and laterally extended and contracted and folded together, as set forth.

2. The posts A A, B B, when connected and combined with the grooved bars C C, and with the extension bars D D, E E, and with the jointed levers H H, or their respective equivalents, all made and operating substantially as herein shown and described, for the purpose specified.

80,724.—DARIUS GOFF, Pawtucket, R. I.—*Machinery for Picking and Separating Cotton Waste.*—August 4, 1868.—The claw-hooked teeth upon the rapidly revolving cylinder, catch and disentangle the bunches of spun yarn and thread which are wound upon the cylinder, while the unspun portion of the waste is separated and thrown off from the cylinder through an opening provided with a door in the casing. A toothed feed-roll, in connection with a retaining bar, are so arranged as to cause the portion of yarns and thread caught by the revolving teeth to be drawn out from the mass and wound parallel upon the cylinder instead of breaking and tearing the same asunder.

Claim.—1. A cylinder, B, armed with claw-hooked teeth L, so constructed that when set, their points shall all travel foremost as the cylinder revolves, substantially in a line concentric with the surface of the cylinder, in combination with the feed roller G, or other suitable feeding mechanism, as described.

2. The combination of the cylinder B, as described, with a casing or jacket, *m*, constructed with a suitable opening, H, and a door for closing the same, substantially as and for the purpose specified.

3. The combination of the cylinder B, as described, with the feed roller G and retaining bar R, or other suitable mechanism for delivering and retaining hold of the material, substantially as described, while it is subjected to the action of the cylinder, as specified.

80,725.—A. G. GRAY, St. John, New Brunswick, assignor to himself and JAMES T. MAGEE, same place.—*Machine for Cutting and Folding Sheet Metal.*—August 4, 1868.—The knife is so arranged as to have a vertical reciprocating motion in advance of a pressure bar of thin recessed section, and with a reciprocating and rocking lower knife and folder, in order to cut and fold by one operation sheets of metal. Provision is also made for cutting and folding in separate operations.

Claim.—1. The rectilinear reciprocating cutter-head E and knife B, as arranged with an independent pressure bar, F, of the cross-section shown, and a rectilinear reciprocating and rocking lower knife and folder, substantially as described.

2. The connecting rod *i*, having its opening about shaft M elongated vertically, as arranged with trun-

nion blocks *h*, coupling screw *n*, lifting and depression screws *m* and *o*, and cams *p* and *q*, substantially as and for the purpose described.

3. The pressure bar F, having notched standards *f*, as arranged with cutter head E, spring *g*, and cams *e*, as and for the purpose described.

4. The arrangement of the pressure bar F as described, in combination with the rectilinear reciprocating and rocking folder N, carrying knife C, substantially as described.

80,726.—HARRISON HOAG, Bernville, Pa., assignor to GEORGE W. YAGER, Reading, Pa.—*Machine for Making Wheels.*—August 4, 1868.—A tool, operated by a suitable handle, is arranged to slide longitudinally in bearings secured to the face of a disk, which may be so adjusted as to hold the tool at any desired angle. A sliding cross-piece is provided with two arms which are adjusted to hold the felloe in position while being bored by a set screw having a handle.

Claim.—1. A disk, J, adjustable, as described, on a standard, I, and carrying a tool, *k*, to which both a longitudinal and a rotary motion may be imparted for the purpose set forth.

2. The cross-head G, with its arms *v v* and screw rods H and *x*, sliding on the vertical standards F F', so that when in an elevated position it will serve to retain a hub, and when depressed will hold a felloe, all as and for the purpose specified.

80,727.—ALEXANDER W. HALL, New York, N. Y.—*Wash Boiler.*—August 4, 1868.—A circulating chamber is arranged within the space between the bottom of an inner shell and the bottom of the boiler, and having suitable communications with the shell and boiler.

Claim.—The combination of the circulating chamber C, attached to the shell B, with the boiler A, provided with apertures communicating with each, all constructed and arranged substantially as described.

80,728.—JOSEPH L. HALL, Cincinnati, Ohio.—*Fire-Proof Safe.*—August 4, 1868.—The stoppers of the imbedded vessels are perforated, and the perforations are closed with glue or mucilage, and the steam from the heated contents passes through perforations in the inner lining of the safe. Angle-irons are placed over metal strips or bars on the external corners of the safe.

Claim.—1. Arranging a series of jars or other anti-corrosive vessels, C, containing water or other suitable liquid, when the same are imbedded in concrete, hydraulic, or other cement, between the inner and outer casings B and A respectively, of fire-proof safes, substantially as and for the purpose shown and specified.

2. The combination, in the construction of safes, of the case A, bars *a*, and the angle irons L, when arranged as described.

3. The perforated lining B, to permit the escape of the steam to the interior of the safe, substantially as and for the purpose set forth.

80,729.—GEORGE H. HAMMOND, Davenport, N. Y.—*Clothes Drier.*—August 4, 1868.—On a central staff are fixed two hubs, formed with jaws, in which are pivoted folding arms. A jointed brace holds the arms rigidly extended.

Claim.—A clothes rack, having folding radial arms, *b*, ropes, *f*, and jointed braces, *d e*, in combination with two hubs fixed rigidly on a central staff, A, all substantially as shown and described, and for the purpose set forth.

80,730.—CLINTON R. HARDY, Lexington, Ind.—*Car Coupling.*—August 4, 1868.—A pivoted block is arranged within a slotted coupling bar, provided with a spring in the rear part. The ends of the said block are received and held in mortised springs, from which the block is readily released in case the cars are thrown from the track.

Claim.—The slotted coupling bar A, pivoted block B, spring C, and mortised spring bars D, with each other and with the draught bars of the cars, substantially as herein shown and described, and for the purpose set forth.

80,731.—D. HATTAN, Zanesville, Ohio.—*Fireplace.*—August 4, 1868.—A horizontal sliding plate is arranged in the back of a fireplace, below which is placed an air tube for the purpose of supplying air to aid in the consumption of the gases.

Claim.—In combination with a fireplace back, provided with a sliding plate, C, one or more air tubes, E, arranged in and through the back, beneath the plate, substantially as set forth.

80,732.—C. M. HAWES, New York, N. Y.—*Pattern for Trimming Hat Brim.*—August 4, 1868.—The pattern is attached to a revolving frame so constructed and arranged as to admit of one pattern being readily detached from the frame, and another, of a different size, readily applied to it.

Claim.—The revolving plate C, with upright springs or elastic bars F attached, provided with pins a, at their upper ends, to fit in holes in the pattern G, all arranged substantially in the manner as and for the purpose set forth.

80,733.—GEORGE H. HAWKINS, New York, N. Y.—*Machine for Blocking and Stretching Hats.*—August 4, 1868.—A cast-iron block is held and adjusted within a concentric base by set screws. Supported on the base rim is a curved upper rim encompassed by a perforated gas tube.

Claim.—The combination of a block or former, to form the crown and body from the inside, and a rim or former, to form the brim from the upper side, with a base rim, to aid in holding the material while it is being molded or formed, substantially as described.

80,734.—EBEN HESTER, Suffield, Conn.—*Belt Punch.*—August 4, 1868.—A square shank set in a handle is provided with two punches for cutting holes in the belt, and two punches having coneave points for heading rivets. It is also provided with a flat lacing awl.

Claim.—A belt tool, constructed substantially as and for the purpose described.

80,735.—OMER HEWES, Kankakee, Ill.—*Car Coupling.*—August 4, 1868.—The coupling pin is secured between jaws which are attached to springs, that hold the pin when the cars are coupled. The springs are forced apart, to release the coupling pin, by means of a cam.

Claim.—The lever jaws E, pivoted in the angle between the bumper head B and the side bars C, and attached at their inner ends to the slotted springs F, in combination with the cam G, whereby the coupling pin D is released from the lever jaws by the action of the cam upon the springs, as herein shown and described.

80,736.—GEORGE HIGGINSON, Newark, N. J.—*Support for Car Seat Back.*—August 4, 1868.—Blocks or bolts secured to the sides of the seat are made to rest upon spring or other elastic bearings upon which the arms to which the back is secured are supported, so as to prevent injury in case the back is reversed and allowed to fall.

Claim.—1. The elastic bearings, consisting of the spring E and sliding blocks C C, for car and other seat backs, made and operating substantially as herein shown and described.

2. The blocks C C, when combined with the springs E and cases D, and when having pins c, that fit into the slotted or grooved cases, substantially as herein shown and described.

80,737.—WILHELM HOLDMAN, New York, N. Y.—*Method of Separating Fibers from Mulberry Trees.*—August 4, 1868.—The bark of branches taken from the mulberry tree is steeped in potash lye, and then washed first in warm water and afterward in cold water. The resulting fibrous material is then steeped in an alum solution, and again washed in warm and cold water.

Claim.—The method herein described of producing silk from mulberry trees.

80,738.—WILLIAM D. HOOKER, San Francisco, Cal.—*Valve for Steam Engine.*—August 4, 1868.—Recesses in the engine piston are kept at the bottom

of the engine cylinder, and opposite the small ports, by any suitable connection made to the piston rod outside of the engine cylinder. Steam admitted to the said recesses forms a cushion for the piston and insures a steam-tight joint between the piston and small ports. The valve chamber and ports through the same are so arranged in relation to the valve, that the steam shall be allowed to escape freely before the valve has arrived at the end of its stroke, and also allowing the valve to cushion on the air or steam pent up at the end of the valve chamber.

Claim.—1. The recesses o o' in the piston b, arranged with reference to the ports h h', substantially as herein set forth and shown.

2. The arrangement, with relation to the cylinder a, valve chamber c, and the additional puppet valve chamber of the valve d d', with its recesses u u', supply port f, ports g g', h h', i i', e e', vents q q', exhaust ports j j', ports s s', and puppet valves r r', substantially as herein described and shown.

80,739.—ALFRED HORN, Silver City, Nevada.—*Amalgamator.*—August 4, 1868.—Around the inner periphery of the bottom of the pan, and the conical center, are annular channels or grooves, and beneath the dies between the said grooves, and connecting with the same, in the bottom of the pan are other grooves which allow the mercury to pass from one to the other. Projections on the ends of the shoes serve to take up the mercury and distribute it through the pulp. Curved wings arrest the rotary current of the pulp toward the rim of the pan.

Claim.—1. In combination with the annular chambers B and B', the connecting groove or grooves D D, substantially as and for the purpose specified.

2. The incline projection or scrapers F F, cast at the end of the shoe, conforming to the natural wear of the shoes and dies without adjustment, substantially as described.

3. Attaching the wings G G by the beveled slots H H and lugs H' H', substantially as described.

80,740.—CLARK S. HUTCHINSON, Burlington, N. J.—*Apparatus for Distilling Spirits.*—August 4, 1868.—To each of the sides of a flat upright condenser are secured inclined shelves, the same being a little higher on one side than the other, so as to alternately overlap each other. At the bottom of the shelves are pools connecting with pipes on the exterior of the condenser for the extraction of the fusel oil, and a pipe and doubler lead from the still to the condenser, so that liquors of different qualities can be produced, and also a superior quality at one distillation.

Claim.—1. The flat upright condenser C, having arranged within it the shelves d¹ d², overlapping each other, and shaped as described, with outlets for the escape of spirits of different grades, substantially as shown and described.

2. The pools n', either inside or outside of the condenser C, in combination with the outlet pipes g g', arranged and operating substantially as described.

3. The doubler M, constructed as described, between the still and the condenser, having the two pipes m¹ m², intermediate valve p, and inlet pipe R, and operating substantially as shown and described.

4. The arrangement and combination of the condenser with its shelves d¹ d², the pool n, with its exit pipes g g' and the doubler M, connected and operating in conjunction, as described.

80,741.—THOMAS JACOBS, Philadelphia, Pa., assignor to himself, JAMES E. KENNEDY, and JOHN H. KENNEDY, same place.—*Passenger Register.*—August 4, 1868.—On the passage of each passenger through the entrance, a gate is turned the requisite distance around to cause a vertical rod to operate suitable mechanism to turn the dial hand of a register. A lever under control of the conductor prevents the reversal of the gate by the passengers passing out.

Claim.—1. The combination of the check lever W with the gate C, arranged and operating substantially as described.

2. The combination and arrangement of the ratchet wheel U and spring pawl V, with the rod D and gate C, substantially in the manner described and for the purpose specified.

80,742.—P. N. JACOBUS, Flat Brookville, N. J.—*Screw*.—August 4, 1868.

Claim.—The screw A, having its head provided with the triangular notches *b*, extending entirely through the same, longitudinally of the screw, and adapted to receive the jaws of the screw driver in such a manner that said jaws shall complete the beveled circumference of the head, as herein described, for the purpose specified.

80,743.—JOHN JANEWAY, Indianapolis, Ind.—*Bedstead Fastener*.—August 4, 1868.—The plate is set into a dovetailed groove cut in the post, and fastened without the aid of screws, in connection with a wedge.

Claim.—The plate B, consisting of the curved and beveled edges A, and secured by the wedge K, fastening the same in the post, when made, constructed, and operated substantially as set forth.

80,744.—WILLIAM H. JOHNSON, Philadelphia, Pa.—*Socket for Tool Handle*.—August 4, 1868.—The screw socket is cast with open spaces between the threads, except at the connection of the longitudinal ribs with the bases of the ribs, the object being to decrease the weight of the screw socket.

Claim.—A cast screw socket, B, for tool handles, when the screw threads *a* have open spaces *b* between them, formed by means of a sand or composition core H, substantially as and for the purposes herein set forth.

80,845.—WILLIAM H. H. JONES and EDWARD S. HARRIS, Harrison, Ill.—*Terret*.—August 4, 1868.—The hinged section is pressed outwardly by a spring, and yields to a pressure from without, so as to permit the line to be passed into the eye of the terret on one side of the same.

Claim.—A terret, in which the spring D acts upon the hinged section C, and the latter and the section B are fitted into one another at the ends, said parts being constructed and arranged in relation to one another, substantially as described.

80,746.—JOHN F. KLINGLESMITH, Hardin County, Ky.—*Hand Corn Planter*.—August 4, 1868.—On the end of a cylinder in the bottom of the seed hopper is a crank, so connected with the lower section of the staff that, by lifting the upper section, the gravity of the lower section will cause the cylinder to make a semi-revolution, and carry a seed receptacle, on its periphery, from an upright position in the bottom of the hopper to an inverted position over the hollow of the staff, to discharge the seed.

Claim.—A rocking cylinder, F, and seed receptacles S therein, placed in the bottom of the hopper E, over a delivery tube in a divided shaft, A A', when combined by means of a crank, G, and pivoted connecting link H, with a slotted guide plate, B, secured in the lower section A' of said shaft A A', the whole being constructed, arranged, and made to operate substantially in the manner and for the purpose herein set forth.

80,747.—S. R. KROM, New York, N. Y.—*Apparatus for Concentrating Ores and Minerals*.—August 4, 1868.—The ore bed is composed of tubes or hollow, bar-like divisions, arranged within a frame so as to run in the direction of the length of the bed, and at a short distance apart. The tubes are made of wire gauze or other perforated material, and open at one end.

Claim.—1. An ore bed, composed of tubes or hollow bars, constructed and arranged to admit of the passages within and through, or out of them, of a current or currents of air or water, in such manner as that said air or water in escaping therefrom will meet in the center and cross the ore passages or openings in the bed, substantially as specified.

2. An ore bed made up of tubes of a reticulated character, having an air or water inlet or opening at their end or ends, and made either with or without bottoms, *d*, essentially as and for the purpose or purposes herein set forth.

80,748.—THOMAS LEACH, Taunton, Mass., assignor to REED and BARTON.—*Ice Pitcher*.—August 4, 1868.—The interior lining is confined within the

pitcher by means of a metal ring provided with a flange projecting downward inside. Under a lip which covers the nose of the pitcher is a filter, having a lid or valve, which opens upward, the whole being connected together and secured in place by means of a screw rod.

Claim.—1. The combination of a detachable and removable glass, earthenware, or chinaware lining, or interior pitcher with the metallic pitcher A, and a ring, plate, or other equivalent device for holding the pitcher and lining together, and yet permitting the lining to be removed when necessary.

2. The ring G, having the rim or flange *g*, when used in connection with the walls A and the lining F, in the manner and for the purpose set forth.

3. The combination of the ring G, filter H, and valve J, forming a neat attachable and removable apparatus for ice pitchers, substantially as set forth.

4. The combination of the apparatus above referred to with the wall A and the screw rod *r*, substantially as described.

80,749.—WILLIAM W. LEVERING, New York, N. Y.—*Writing and Drawing Desk*.—August 4, 1868.—On the top plate of the table part of the desk is arranged a slate, and on the front of the folding lid is a removable plate of ground glass. A stationary blackboard is placed on the back of the desk, and a drawer is so arranged as to be drawn out, half in front and half in the rear, as desired.

Claim.—1. The described arrangement of the slate G in the part F, the sliding frame and removable ground-glass plate J in the hinged portion D of the desk, the blackboard L on the back of the upper desk, and the drawer E, having the partition *c* and stop or stops *d*, all constructed to operate in the manner and for the purposes substantially as herein set forth and shown.

2. The within-described combination of writing desk, blackboard, drawing slate, and writing slate, as set forth.

80,750.—DAVIS E. LONG, Pawtucket, R. I.—*Curtain Fixture*.—August 4, 1868.—Two plates provided with spurs are attached to the stick in the lower part of the curtain. In a recess in each plate are received the bent ends of a bent piece of iron, forming a spring, in the lower end of which is an eye for the tassel cord to pass through.

Claim.—The plates C C, with the spurs *a* attached, in combination with the spring D, all constructed, arranged, and applied in the manner substantially as and for the purpose set forth.

80,751.—M. W. LONG, Bangor, Me.—*Stove Oven*.—August 4, 1868.—A circular grate is provided with projections on its under side, which fit in inclined recesses in a disk below the grate, so arranged that as the grate is rotated it will be gradually raised, and thus allow of an air passage beneath it, in order to diminish the heat when desirable.

Claim.—1. The grate *f*, when constructed and operated substantially in the manner specified.

2. In combination with the grate *f*, the disk *a*, fitted to revolve, in the manner and for the purpose substantially as shown and described.

3. The device for raising the grate, consisting of pins *k*, upon the under side of the grate, and the inclines *i* in the disk, whereby the grate is raised or lowered at will by revolving it relatively to the disk, substantially as and for the purposes specified.

80,752.—J. W. LORAINÉ, Philadelphia, Pa.—*Hanger for Shafting*.—August 4, 1868.—The permanent portion of the hanger is provided with a plummet, which is suspended over a projection in the said portion. The lower portion of the hanger, which carries the upper and lower bearings, is so connected with the permanent portion as to admit of the bearings being properly adjusted at any time.

Claim.—1. The combination, with a hanger, of a plummet, B, and projection *m*, the latter being arranged in respect to the center of the bearing and the point of suspension of the plummet, as set forth, for the purpose specified.

2. The within-described hanger, composed of the permanent portion A, with its plummet B and projection *m*, and the adjustable portion D, carrying

the bearings E and E', the whole being combined and arranged substantially as and for the purpose described.

3. The cap F, arranged to confine the bearings E and E', secured in front to the portion D of the hanger by a bolt or screw, and fitting at the rear in a recess in the said portion D, all substantially as and for the purpose herein set forth.

80,753.—WILLIAM MAROT MARSHALL, Philadelphia, Pa., assignor to himself and JOSEPH B. ALEXANDER, Washington, D. C.—*Foot Muff*.—August 4, 1868.—Consists of a covering for the front of the foot, and reaching to the top of the instep; to be made of cloth or other suitable material, and secured to the foot by a strap passing round the heel.

Claim.—As an article of manufacture, a foot muff, as and for the purposes and in the manner as herein described.

80,754.—WILLIAM MAROT MARSHALL, Philadelphia, Pa., assignor to himself and JOSEPH B. ALEXANDER, Washington, D. C.—*Gilding and Silvering Mica and Glass*.—August 4, 1868.—Consists in gilding or silvering mica or glass by means of the ordinary chemical solutions of gold and silver when rocked together in a peculiarly constructed pan under the action of moist or steam heat at a low pressure.

Claim.—The method of gilding or silvering mica and glass, in the manner and for the purposes substantially as described and set forth.

80,755.—JAMES E. MCBETH, New Orleans, La.—*Thimble*.—August 4, 1868.

Claim.—A thimble, whose body is provided with a series of openings, at the lower end of which is a circumferential projecting rim, *a*, and whose lower part, *A*, is suitably indented, all as herein shown and described.

80,756.—GEORGE W. MILLER, West Meriden, Conn.—*Tool for Mending Belts*.—August 4, 1868.—The knife and tool are so constructed as to combine in one handle the different articles generally used for mending belts. A bolt is so arranged in the handle as to secure any one article in an open or closed position.

Claim.—1. The bolt *m*, with spring *t*, in combination with the punch *e*, and awl *d* of a belt-mending implement, for the blades of pocket cutlery, when constructed and operating substantially as herein described, and for the purposes specified.

2. The punch *e*, blade *c*, and awl *d*, or any two of them, when secured in one handle for pocket use, substantially as herein described and for the purposes specified.

3. A belt punch, having the sharp edge *f* and cutting point *f'* at one end, and the shoulder and heel *o*, at the other end, and secured in a handle by means of a pivot, *i*, substantially as herein described and set forth.

80,757.—J. D. MILLER, Enon, Ohio.—*Hame Fastener*.—August 4, 1868.—The hook is so constructed as to be readily attached and detached without liability of becoming unfastened in use, and when broken can be easily replaced.

Claim.—1. The lever D, constructed with the shoulder F, and a recess behind it, in which to receive the ring B, when in working position, substantially as described.

2. The hook D, with the point returned within the fold of the hook as described, in combination with a link, proportioned so that, while naked, it may be passed over the point of the hook, but not where the strap C is present, substantially as set forth.

3. The lever D and crooked link E, constructed so as to operate in the manner and for the purpose described.

80,758.—JOHN W. MORRETT and HIRAM WATTS, Shepherdstown, Pa.—*Roller Wagon Skein*.—August 4, 1868.—The rollers turn the friction of the hub upon the axle from sliding to rolling friction.

Claim.—The rectangular metallic bar *a*, embedded in the axle *h*, and curving at *x*, in an arc along the axletree *g*, and fastened thereto by the screw *f*, the

rollers *d* and *e* resting their axles in the ends of the trapezoidal block *b*, and *c*, which slide and are adjusted in the trapezoidal gutter in the skein, all constructed and operating in the manner and for the purpose herein set forth.

80,759.—ICHABOD H. MULFORD, Orange, N. J.—*Shaft Coupling for Wagon*.—August 4, 1868.—Open or hook-shaped jaws are made to receive the shaft irons with a rubber block forming a backing or packing and provided with an adjusting or tightening screw, which latter serves to admit of the detachment of the shafts without separately removing the shaft pins forming the trunnions.

Claim.—1. The arrangement and combination of the set screw E, passing through the clip *a* and axle bed B, with the rubber-carrying plate *e*, substantially as shown and described.

2. The rubber-supporting plate *e*, or its equivalent, in combination with the hook-shaped jaws A, when so applied as to be capable of removal for detachment of the thill or whiffletree without detachment of screws or nuts, substantially as set forth.

3. A thill or whiffletree coupling, so constructed that by the operation of a set screw alone, on an intermediate block, the thills may be secured to the axle or detached therefrom, substantially as shown and described.

80,760.—S. H. NESBIT, Monmouth, Ill., assignor to himself and JAMES NESBIT, same place.—*Quilting Frame*.—August 4, 1868.—Two rollers are journaled in the front ends of the frame and one in the rear. On the outer front roller is wound the outside portion of the article to be quilted, and on the inner roller is wound the lining. The part quilted is wound on the rear roller.

Claim.—The rollers E F H, pulleys *z*, and cord U, and pawl *n*, in combination with the frame A D G I, constructed and arranged as described, and for the purpose set forth.

80,761.—S. W. PALMER and J. F. PALMER, Auburn, N. Y., assignor to E. G. STORKE, S. U. PALMER, and CLARA M. PALMER, same place.—*Machine for Grinding Cutters of Mowing Machines*.—August 4, 1868.—Motion is imparted to the grinding wheel by means of beveled gearing, so arranged as to throw the crank out of the way of the work. The grinding wheel is supported in conical bearings which can be moved toward or away from the center so as to insure a proper meshing of the gears. The table upon which the article to be ground is held is adapted to move laterally across the wheel.

Claim.—1. The combination, with the grinding wheel, and the conical adjustable bearings in which it is hung, of the beveled gearing and crank for driving said wheel, under the arrangement and for the operation as set forth.

2. The construction of the water trough, stuffing box, and frame or bearings, in which the grinding mechanism is supported, in one piece, substantially as herein and for the purposes set forth.

3. The combination, with the frame of the machine, of the adjustable rod and treadle, for holding and steadying the same while in use, as herein shown and specified.

4. The adjustable swivel clamp, for holding the machine in position without the use of legs or other like supports, constructed and operated substantially as herein described.

5. The cutter bar, supporting table O P, when constructed and hinged to frame of the machine, in the manner described, so that it may be adjusted both laterally and toward and away from the grinding wheel, as and for the purposes set forth.

6. In combination with the parts claimed in the preceding clause, the pivoted slotted bar, having its swinging end held in a segmental slot formed in said table, and the cutter-bar clamp, with or without the angle plate S, the said parts being arranged and operated substantially as shown and specified.

7. The employment, in connection with the mechanism herein described, or its equivalent, for holding and adjusting the position of reaper sections and like articles to be ground, of a grinding wheel, the surface or rim of which has a double beveled form, so that both edges of the section may be ground

without materially changing the position of the outer bar, as herein shown and set forth.

8. The combination, with the arms n^1 , their central supporting pin, the hollow post or socket for receiving said pin, and the adjusting screw for holding the same, of the knife or cutter-bar clamp, its supporting plate, and the horizontal rod upon which the same are mounted and slide, the said rod being provided with a radial arm, curved rod and spring, as described, and the whole being arranged to operate in connection with the grinding wheel, as and for the purposes set forth.

80,762.—JESSE PANNABACKER, Eagle Mills, Durlach, Pa.—*Mode of Dressing Millstones.*—August 4, 1868.—The invention consists in drilling or cutting deep, isolated cavities into the face or landsides of the stones.

Claim.—The millstone dress, with the furrows a , the landsides or rubbing surfaces b , having deep holes or cells formed therein, in the manner and for the purpose substantially as described.

80,763.—STEPHEN T. PEARCE, New York, N. Y.—*Machine for Separating Ores and Other Materials.*—August 4, 1868.—The granulated and sized substance to be acted upon is discharged upon the surface of a cone of polished metal, by the rotary motion of which the said substance will fall into various receptacles, arranged with reference to the various positions in which the particles will fall, to separate them in the order of their falling.

Claim.—1. A mechanism, arranged to separate the particles of pulverized ore or other granular substance, by impelling it, by the joint action of gravity and centrifugal force, over a metallic or other polished surface, which will modify, by the frictional contact of the same, the direction imparted to the particles of such substance, substantially as and for the purpose set forth.

2. The combination, with rotating cone A , of the receptacle D , divided into compartments, substantially as and for the purpose described.

80,764.—STEPHEN T. PEARCE, New York, N. Y.—*Machine for Separating Ores and Other Granular Substances.*—August 4, 1868.—The pulverized ore is fed by any suitable means to a vertical, hollow, rotating cylinder, provided with lateral discharging tubes near the bottom, through which the ore is impelled by the centrifugal force due to the rotation of the cylinder, the substance being discharged into graduated annular receptacles under the said cylinder.

Claim.—1. The employment of means for impelling ores and other granular substances by centrifugal force, in combination with graduated receptacles for separating them, either in the atmosphere or in *vacuo*, substantially as and for the purpose described.

2. The combination of the adjustable tube A , provided with the lateral tubes B , or their equivalent, with the receptacles F , substantially as and for the purpose described.

80,765.—J. H. QUACKENBUSH, Springfield, Mass., assignor to himself and J. H. RILEY, same place.—*Harness Round Knife.*—August 4, 1868.—The blade is made movable in its handle or socket, so that each corner of the blade may be more readily adjusted for certain operations in cutting out different kinds of work.

Claim.—The blade A , having the curved slot e therein, and hung in the slot i of the socket b by means of the pivot c , and secured in position in said slot i by means of the screw d passing through, or partially through, the socket b , and through the curved slot e , the whole forming a harness knife, and constructed and operating substantially as herein described, and for the purposes specified.

80,766.—JOSEPH H. RACEY, JR., New York, N. Y.—*Refrigerating Chamber.*—August 4, 1868.—The vent pipe allows the escape of cool air or gases generated therein, into the body of the structure, which causes a circulation, and expels the warmer air through the inverted cone vent.

Claim.—1. The pockets H , constructed of a series

of flutes or corrugations, connected in a tight manner at their upper ends with the chamber E , and at their lower ends with the trough I , said trough being provided with a waste pipe J , and vent pipe K , so arranged that the water from the melting ice shall accumulate in the trough, and prevent the circulation of air through the refrigerant contained in said pockets, substantially as set forth.

2. The combination of the vent pipe K with the inverted cone vent a , arranged and operating essentially as shown and described.

80,767.—JOHN B. REITH, New York, N. Y.—*Sofa and Bed.*—August 4, 1868.—The lower section of the seat of the sofa is hung on journals, and is connected to the back section by means of a rod attached to pins or wrists, so that when one of the sections moves, it also causes the other to move.

Claim.—The sections C and D , in combination with section B and frame A , substantially as herein shown and described, and for the purposes set forth.

80,768.—SAMUEL RICE, Westford, Vt.—*Wagon Jack.*—August 4, 1868.—A east-iron rack is let into the inner side of each of two posts between which the lever is fitted, so that the weight of the lever may be readily adjusted without being detached from the supporting frame.

Claim.—The east-iron racks $D D$, constructed substantially as described, and inserted in and held by the posts $B B$, as set forth.

80,769.—CHARLES F. RITCHELL, Chicago, Ill.—*Serial Crank.*—August 4, 1868.—The crank consists of inclined shafts having arms or pins at either end and in the same parallel plane. The arms to which the boring tools are attached pass through a stationary plate or frame, while those at the opposite end are passed through a movable plate which is rotated by ordinary crank pins, by which means a series of boring or drilling tools are simultaneously operated.

Claim.—1. The combination of a series of obtuse angled or inclined cranks, $A A$, constructed and arranged as described, and operating simultaneously, for the purpose of performing boring, drilling, or some other useful mechanical operation, substantially as herein set forth and specified.

2. In combination with the above, the stationary plate C and the movable plate D , frames or fixtures, to retain in position and to operate cranks $A A$, substantially as and in the manner herein described and specified.

80,770.—J. W. RUSSELL, Springfield, Mass.—*Lathe Dog.*—August 4, 1868.—Designed for holding nicely-finished work sufficiently firm so as to operate upon it in a lathe without injury by abrasion.

Claim.—The combination of the screw-bolt h , having the annular groove o thereon, the threaded clamp d , the hollow shank a , and the arm b , all constructed, arranged, and operating substantially as herein described, and for the purposes specified.

80,771.—AMAZIAH G. SHACKFORD, Malden, Mass.—*Lithographic Printing Press.*—August 4, 1868.—Does not admit of a brief description.

Claim.—1. The arrangement and combination of the thimble or counterbearing U , and arm 3 , with the cog-wheels $J L$, and racks $H M$ and S , substantially as and for the purpose described.

2. The swinging tooth 4 , pin 7 , spring 6 , cog wheels Q , flange wheels R , shaft P , lever 31 , shaft 32 , crank 33 , arranged and operating in combination with the cam $c' d'$, substantially as and for the purpose described.

3. The truncated flange wheels $R R$, in combination with the carriage N , substantially as and for the purpose described.

4. Operating the tympan and nippers from the shaft P , by means of cam 18 , and rod U , and gears $W X Y Z$, substantially as described.

5. The endless cloth X'' , combined and arranged with water trough r , and damping roll z , and the squeezing rolls $w w''$, substantially in the manner and for the purpose described.

80,772.—T. H. SHREEVES, Greenbush, Ill.—*Horse Rake.*—August 4, 1868.—The rake is kept from re-

volving by a pawl which is released by means of a series of rods and levers. Hooks attached to the forward thills serve to hold the frame up off the ground.

Claim.—1. The pawl X, in combination with device *d, e, F, G, H, and S*, substantially as described, and for the purpose set forth.

2. The hooks *y y*, substantially as described, and in combination with the main frame, as set forth.

80,773.—WILLIAM SKIFF, Camanche, Iowa.—*Well Boring Apparatus.*—August 4, 1868.—An auger is provided with adjustable extensible lips, operated by means of an extensible shaft, whereby earth may be taken from under a curbing or stone wall, and removed from the well. A drilling device may be substituted for the auger and operated upon any rock found in digging a well.

Claim.—1. The arrangement of the drums *m* and *b*, with the arms *B B*, points *L L*, and inclines *v v*, for purposes set forth.

2. The arrangement of the auger with the adjustable lips *N N*, with shaft *R*, all constructed as herein set forth.

3. The combination and arrangement of the drill *y*, rope *x*, lever *w*, lever *f*, and inclines on drum *b*, for the purposes herein described.

80,774.—JOSEPH SLADDIN, Lawrence, Mass., assignor to himself and JOHN LORD, same place.—*Machine for Making Harness for Loom.*—August 4, 1868.—The object of the invention is to form, by an automatically operating machine, the heddle-eyes, and at the same time firmly secure the yarn to the rig-bands.

Claim.—1. The combination, with the twister *d*, of the means, substantially as described, for operating the same, as and for the purpose specified.

2. The combination of the spoon "hookers" *g g* with the hooker fingers *e¹ e¹* and the needles *i i*, substantially as and for the purpose described.

3. The combination of the lapper cylinders, having guide eyes, as described, with the spoon-shaped hook *g g* and needles *i i*, substantially as and for the purpose described.

4. The combination, with the needle guide and support *j j*, of the presser wheels *j³ j³*, when arranged and operating as and for the purpose specified.

5. The combination with the devices for forming the loops, substantially as described, of the devices for knitting the heddles onto the rig-bands, substantially as and for the purpose described.

6. The combination, with the knitting devices herein described, of the lifting guide-bars *k k*, as and for the purpose described.

80,775.—ANTON JULIUS SMIDT, Copenhagen, Denmark.—*Conveying Live Fish.*—August 4, 1868.

Claim.—Pumping or otherwise forcing and mixing air with sea water, contained in tanks, in which salt-water fish are placed, for the purpose of keeping such fish alive, substantially as above described.

80,776.—JAMES SMITH, St. Louis, Mo.—*Stop Boxes for Cocks or Valves of Water and Gas Pipes.*—August 4, 1868.—The stop box is composed of two tubes, fitting one within the other, and provided each with caps. On the outer surface of the inner portion are formed screw threads in which fit a pin attached to the inner side of the outer part, so that by turning the inner portion the top of the stop box may be readily adjusted to the surface of the ground.

Claim.—1. An extensible stop box, constructed of the two parts *A* and *B*, and so arranged as to permit adjustment by means of screw threads or rings, substantially as herein described.

2. In combination with the above, the caps *a* and *C*, when constructed and applied as and for the purpose described.

80,777.—JAMES P. SMITH, Oshawa, Canada, assignor to himself and FRANCIS W. GLENN, same place.—*Pulley.*—August 4, 1868.—Cast metal pulleys are formed with grooves or recesses in their peripheries to receive pieces or strips of wood, to which leather, rubber, or other suitable facing may be secured, so that the same may readily be applied and removed.

Claim.—1. A metal pulley provided with grooves

or recesses in its periphery, for the purpose set forth.

2. A grooved or recessed metal pulley in combination with the strips or pieces *b* and the facing *C*, substantially as described.

80,778.—LEMUEL A. SMITH, Pekin, Ill.—*Horse shoe.*—August 4, 1868.—The rearmost clips are adjusted toward and from each other by means of slotted braces secured to the shoe by screws, to suit the desired size of the hoof.

Claim.—The braces *E E*, constructed and regulated as described, for the purpose of moving the clips *D D* in or out, as may be desired, substantially as herein set forth.

80,779.—SIMON SNYDER, Cincinnati, Ohio.—*Tanning.*—August 4, 1868.—The hides or skins are smoothly stretched or folded in an air-tight vat, and stratified with bark or matting interposed, so that they can be reversed and adjusted at will by manual power, or at set times by mechanism. The position of the vat is then variously changed.

Claim.—The method of tanning, substantially as hereinbefore described.

80,780.—L. F. STANDISH, Springfield, Mass.—*Pen and Pencil Case.*—August 4, 1868.—A knife blade and a pen or other convenient tool are attached to the opposite ends of a slide within a slotted tube, and are moved in either direction by a pin projecting through the slot.

Claim.—The combination of the slotted handle *A*, with the slide *B*, having the knife blade *H* at one end, and a pen or other convenient tool at the other, and operated by the pin *D* working in the slot *E*, substantially as shown.

80,781.—IRA H. STOCKWELL and LIZZIE C. GOODWIN, Worcester, Mass.—*Tatting Shuttle.*—August 4, 1868.—The shuttle is formed with a stationary point, and with an elongated stud or stand, composed of a curved piece of metal with round or semicircular ends.

Claim.—As a new article of manufacture, a tatting shuttle, having one of the ends of one of its sides sharpened to or provided with a point, substantially as and for the purpose specified.

80,782.—ALBERT STRASSER and B. M. LEWY, Montgomery, Ala.—*Stand for Mosquito Nets.*—August 4, 1868.—A frame bearing a mosquito net is supported on the top of an adjustable support attached to a table or stand, and so constructed as to be susceptible of adjustment either to a vertical or inclined position.

Claim.—1. The stand *A*, provided with the slide *C*, braces *K*, link *E*, and extension *F*, constructed and arranged as and for the purpose described.

2. The combination with the same of the skeleton frame *I*, or other equivalent means for supporting a mosquito net, substantially as and for the purpose described.

80,783.—JAMES S. STREETER, Providence, R. I., assignor to himself and CITY MACHINE CO.—*Fly Frame Flier.*—August 4, 1868.—The tube of the fly-frame flier is formed up, without drilling or reaming, and the top or back ear is rolled or wound over.

Claim.—Constructing fly-frame fliers of malleable or annealed cast iron, with one or both legs cast with a groove upon a core, or its equivalent, and with an ear, the flanges of said legs and the ear being rolled down, to form the grooved tube *a*, as herein shown and described.

80,784.—ROBERT K. TOMLINSON, Brownsburg, Pa.—*Washing and Wringing Machine.*—August 4, 1868.—The clothes are thinly spread between two rubbing surfaces, to which latter are given a quick and short alternately reciprocating motion.

Claim.—1. Imparting an alternate reciprocating motion to each series of upper and lower rollers *A A'* by means of the cams *D*, and a rotary motion to each roller by the double series of cords *i*, when the cords of the upper series are driven from the upper wringer roll and the cords of the lower series from

the lower wringer roll, as herein described, for the purpose specified.

2. The cam wheels D D, in combination with the rubbing surfaces A A, by which the reciprocal motion to these surfaces is imparted.

3. The combination of the upper and lower series of rollers A A', cams D, levers P, bar R, double series of cords *i*, and wringing rolls J, arranged and operating as described, for the purpose specified.

80,785.—WILLIAM F. TURNER, Philadelphia, Pa.—*Umbrella*.—August 4, 1868.—Designed as an improvement on his patent of October 29, 1867. A hollow cane is provided with a detachable ferrule, head and cap, so as to be convertible into an umbrella when desired, the ribs, stretchers, and runner of the umbrella portion being inclosed in the hollow cane.

Claim.—1. The notches in the permanently attached thimble D, or the ferrule end of the cane, wherein to hook or attach the ends of the ribs, as herein described and represented.

2. The notched runner, Figs. 5 and 11, provided with the spring L, having a detaining pin, the slide M, and the encircling ring O, and adapted to occupy the detachable head of the walking stick, as herein described and represented.

80,786.—LOUIS D. VALETON, Philadelphia, Pa., assignor to HENSEL, RICHERT, WOLFF & COMPANY.—*Loom for Weaving Fringe*.—August 4, 1868.—This invention consists in providing a loom for weaving fringes with such additional machinery as is capable of weaving and completing twist fringe of any description.

Claim.—1. The slotted shuttle G, constructed with a hook, *g'*, and applied to operate in the manner and for the purpose specified.

2. The twisting hook H, having an intermittent rotary and vertical and horizontal motion, and arranged to operate in conjunction with the shuttle G, substantially as and for the purpose set forth.

3. The spools N and N¹, attached to a bar, N², having a vertical movement within the frame, and being connected with the lever N⁷ through the medium of the rods *n n¹ n²* and levers N³ and N⁴, all as herein described and for the purpose set forth.

4. The pin *l³*, applied and operating substantially as and for the purpose set forth.

80,787.—FRIEDERICH WAGNER, Danville, Pa.—*Cock for Racking off Beer*.—August 4, 1868.—The cock is arranged to convey beer or other liquids from hogsheads, or other large reservoirs, into smaller barrels or vessels, so that the said liquor may be kept constantly flowing after having once been started.

Claim.—For the purpose specified, the arrangement in a T-shaped tube of a cock, B, in the main part of the tube, so constructed as to be capable of shutting off the whole flow, and a deflecting cock, C, at the junction of the cross-tube with the main tube, so constructed that by turning it at different angles the fluid coming from the main tube can be deflected totally or partially into either arm of the cross-tube, without the possibility of arresting in any degree the flow of the liquid through the main tube, the several parts of the apparatus being constructed and operating in the manner herein set forth.

80,788.—SYLVESTER G. WALKER, Croydon, N. H., assignor to himself, WILLIAM C. ALLEN, and ABIJAH POWERS.—*Adjustable Ox Yoke*.—August 4, 1868.—The neck pieces are hung to the beam by means of bolts and cap pieces in place of the iron bands commonly used. Levers are attached each at one end to the neck pieces by bolts, and at the other end to the advantage ring by screws, on which they partially turn as the ring revolves in one or the other direction.

Claim.—1. The method of hanging the neck pieces B B' to the beam A by means of the bolts *a a' a'' a'''*, the guide blocks D D', the slots M M', and the cap pieces C C', as above described.

2. The method of making the neck pieces B B' stationary at any given points, equidistant or not equidistant from the center block F, within the limits of the reciprocating motions of the said neck pieces, by removing the blocks K K' from the slots

M M', and screwing down tightly the cap pieces C C' upon the beam A, as above described.

80,789.—DANIEL WEAVER, Guilderland, N. Y.—*Sewing Machine*.—August 4, 1868.—The hook-needle is provided with a latch, which recedes as the needle rises, so that the hook will catch the thread presented to it, and, forming a loop, carry it down through the material, the loop of the thread being retained in the hook by a latch, which also prevents the hook, in its descent, from catching in the material. As the needle rises again, the loop is released from the hook.

Claim.—1. The spring *f* and tappet arm *g*, in combination with the latch *e* and hook-needle *n*, substantially as and for the purpose set forth.

2. The stop *h*, in combination with the spring *f*, latch *e*, and hook-needle *n*, which is secured in a bar attached to the wrist pin *a*, substantially as and for the purpose described.

3. The spring *q* and bracket *m*, sliding on the shank of the fork-feeder, and compressing the spring as the needle rises, in combination with said fork-feeder and needle, constructed and operating substantially as and for the purpose set forth.

4. The slide *u* and hinged bracket I, in combination with the needle-bar G, feed fork *k*, and lever K, or its equivalent, substantially as and for the purpose described.

80,790.—WILLIAM WESTLAKE, Chicago, Ill.—*Strainer*.—August 4, 1868.—A piece of wire gauze is secured within a continuous band of metal, so that it can be readily inserted in and removed from a pail or other vessel.

Claim.—The removable strainer A, when constructed and attached substantially as specified.

80,791.—ELONZO S. WHEELER, Westport, Conn.—*Rivet*.—August 4, 1868.—A tube, provided with a head, is passed through two pieces of leather, or other article, to be united together. The end of the said tube passes into another head, and by pressure the ends of the tube are spread and secured within the said head.

Claim.—A rivet, consisting of a tube, A, with its head B formed or attached thereon, substantially as described, with its corresponding head C, constructed so as to be attached thereto, as herein set forth, as a new article of manufacture.

80,792.—HENRY F. WHEELER, Boston, Mass.—*Nut Squaring Chuck*.—August 4, 1868.—One end of the chuck is threaded so as to screw into the revolving spindle; the other end of the chuck is made with screw threads and mortised through, and a movable shoulder is pivoted in the mortise, against which shoulder one end of each nut bears, while the other is subjected to the operation of the cutting tool.

Claim.—A chuck, for the purpose described, as made with the screw-threaded end *c*, provided with a movable shoulder, *d*, arranged to operate substantially as set forth.

80,793.—WILLIAM H. WOODS, Philadelphia, Pa.—*Curtain Fixture*.—August 4, 1868.—A shade bracket is provided with a barrel in which are inserted a shaft and a coiled spring, so arranged as to hold the shade in any desired position.

Claim.—The combination and arrangement of barrel B with coiled spring S, plate D, and shaft T, for the purpose herein set forth.

80,794.—ELIJAH YOUNGS, Tuscarora, N. Y.—*Mop and Clothes Wringer*.—August 4, 1868.—Two rollers are journaled in slotted ears attached to each side of a pail, and to one of the rollers is connected a bent lever, operated by the foot to move the same to or from the other roller. The ears are secured to the pail by means of a socket plate and cam button.

Claim.—1. The ear B, provided with the slot F, curved as described, and for the purpose set forth.

2. The combination of the ears B B, provided with slots F F, curved as described, with the rollers C C', and the lever E, substantially as and for the purpose set forth.

3. The socket plate G, provided with a cam but-

ton, H, or its equivalent, in combination with the ear B, substantially as and for the purpose set forth.

80,795.—HENRY COWING, New Orleans, La.—*Agricultural Machine.*—August 4, 1868.—A combination of plows, harrows, seeders, and markers, with steering apparatus, elevating and depressing devices, draught attachment and adjusting apparatus, by which the plows, &c., can be used in different combinations for different agricultural purposes.

Claim.—1. The application and combination of the double block system of equalizing draught, as above set forth.

2. The application and combination of the single block system, in combination with the double block system.

3. The quadruple whiffletree.

4. The application and combination of the cross-bar H² with the tongue, for the purposes specified.

5. The slotted slide-bar O for the whiffletrees to slide upon, as set forth.

6. The joint in the tongue, as and for the purposes set forth.

7. The rotary grooved cylinder, as and for the purposes specified.

8. The adjustable thumb screw *l*, in combination with a slide valve for regulating the quantity of grain sown.

9. The application of a steering apparatus to agricultural machines, composed of the wheels I, cross-bar K, sheaves *i i'*, standards I', rope or chain J, stirrups *j j*, cross-bar *l*, and the levers L and L'.

10. The standards I' and the adjustable cross-beam K.

11. The standards D¹ D² of the canopy, the cross-bars provided with screws *d d*, for the purposes set forth.

12. The curved standards *e*³ and box straps *e*⁴, for the purposes specified.

13. The semicircular rack-lever E, and handle and stop-lever spring *f*, for the purposes herein set forth.

14. The tripping lever *p* and cord or chain *p'*, for the purpose herein set forth.

15. The application of horse or other power that may be employed to draw the machine, for raising the plows and instruments out of, and from the ground, as set forth.

16. The application and combination of a scraper and presser to a gang of plows, for the purposes herein set forth.

17. The cross-bars A³ A⁴, for the purpose herein specified.

18. The construction of an axle, so that the wheels can be moved further apart or nearer together, to suit the widths of rows, as above specified.

19. In combination with a gang of plows, the digging wheel K.

20. The digging wheel, in combination with the arrangement for raising and lowering it, as set forth.

21. The three-toothed harrow G, or its equivalent, as and for the purpose set forth.

22. Making the shares and colter in one piece, as and for the purposes above specified.

23. The application and combination of a canopy to a gang of plows or harvesting machines, for the purposes above specified.

24. The manner of making canopies with an expansive cord, as and for the purpose above specified.

25. The tube on which the main wheels revolve, for the purposes herein specified.

26. The curved plow standards and the springs, for the purpose above specified.

27. The constructing of a plow so that in raking a root or stone it will be thrown out and forced immediately back, as above specified.

28. The nest of cups in the cylinder, for the purpose herein set forth.

29. The combination, as seen in Figs. 1 and 2, for the purpose of planting or sowing, as above specified.

30. The application and combination of the cross-bar H' with the tongue H, Fig. 3, for the purposes herein set forth.

31. The combination, as seen in Figs. 4 and 5, and the particular shape of the third plow with the incline for raising up the soil before turning over, as above set forth.

32. The mole plow, in combination with the

beams seen in Fig. 15, wheel-raising apparatus, quadruple trees and their arrangement, for the purposes herein specified.

33. The opening of the mold at different depths, and taking off the front molds and using their standards only, and using them all at once or separately, as above set forth.

34. The application and combination, as seen in Fig. 8, with its modifications, for the purposes herein set forth.

35. The application and combination, as seen in Figs. 10 and 11, of the gangs of plows, and the tines in the center, or before or behind the plows, as above set forth.

36. The stubble lowerer Q, and the arrangement herein set forth, for opening a deep furrow and turning the stubble into it, and the arrangement and combination of the plows, as seen in Fig. 12, or their equivalent, as set forth.

37. The arrangement and combination, as seen in Fig. 13, for covering the caves, as set forth.

38. The single-hinged arm, for the purpose herein set forth.

39. The arrangement for ditching, as set forth, and under-draining by the mold plow, as set forth.

80,796.—CHARLES E. ABBOT, Malden, Mass.—*Extinguisher for Lamp.*—August 11, 1868.—Extinguishes the flame without creating smoke and unpleasant odor.

Claim.—The lid *a*, so hinged and supported that when the wick C is lowered, the lid will fall over it and close the mouth of the wick tube B, substantially as set forth.

80,797.—JOSEPH ADAMS, Cleveland, Ohio.—*Wash Boiler.*—August 11, 1868.—The base has a cover of cloth, or wire gauze, and openings, arranged in such relation to a central upright wire frame, that the water on being heated will circulate through the clothes which are supported upon said base and around the frame.

Claim.—1. The open frame or rack F, in combination with the removable base B and boiler, all constructed and operating substantially as set forth.

2. The apron G and base B, in combination with the rack or frame F, substantially as and for the purpose set forth.

80,798.—JOHN F. ALEXANDER, Shelby, N. C., assignor to himself and PETER S. MICHIE.—*Process of Desulphurizing Ores.*—August 11, 1868.—The ores are mixed with carbonaceous material, such as graphite, or plumbago, or charcoal, and heated, in a sealed retort, to the required temperature.

Claim.—The method herein described of desulphurizing ores, by exposing them to heat, in a closed vessel or retort, in contact with charcoal, graphite, or other carbonaceous materials.

80,799.—JAMES H. BARKER, Washington, D. C., assignor to himself and D. R. B. NEVINS, same place.—*Shutter Operator.*—August 11, 1868.—When the crank is turned the screw shaft moves the nut outward or inward, and the nut carries with it the jointed bar; the shutter being thereby opened or closed and held in any desired position.

Claim.—The jointed bar G, constructed in the form herein set forth, and applied to the window blind and casing, substantially as and for the purposes set forth.

80,800.—JAMES A. BENNET, Millerton, N. Y.—*Milk Can.*—August 11, 1868.—The can is formed with two sheet metal jackets, one near the top and the other near the bottom of the outside of the can, leaving the intermediate portion exposed. The can is thus adapted to protect the milk from the heat of the sun, and yet allow the new milk to cool. After the milk has cooled a removable band is applied to the exposed portion of the can.

Claim.—1. A milk can, made with the hollow sheet-metal jackets *g h*, forming non-conducting air chambers, between which jackets the can is exposed, for the purposes and as set forth.

2. The removable band *m*, in combination with the jackets *g h*, for covering the can between said jackets, as specified.

80,801.—A. E. BLOOD, J. B. BLOOD, and F. W. POPE, Lynn, Mass.—*Couch or Cradle.*—August 11, 1868; antedated July 29, 1868.—The alternate compression and relaxation of the bows contained in the couch body are designed to produce an effect similar to tossing the child in the arms.

Claim.—1. In constructing an infant's couch, the combination of the sides A A, in combination with the bows B B, substantially as and for the purpose set forth.

2. Suspending a couch by elastic or spring hangings, so that it may be capable of vertical reciprocating movements, and also admit of being swung laterally, substantially as described.

3. Arranging the treadle bar G, in such relation to the couch that it can be raised to connect with and operate the same, and, when not in use, to drop clear of the couch, and allow it to be swung laterally, substantially as described.

80,802.—CHARLES BRADA, Charlestown, Mass.—*Reclining Chair.*—August 11, 1868.—By bringing the weight of the body to bear on the forward portion of the seat, the latter is depressed and the foot-rest elevated for the accommodation of the lower limbs, while the back adjusts itself to a reclining position of the body. The rear portion of the seat is disconnected from the back, and the latter is self-adjustable in consequence of the sliding movement of the seat.

Claim.—1. The seat frame *b*, resting loosely on the rear of the main frame, and connected with the foot-rest *e*, when constructed and operating substantially as set forth.

2. The combination and arrangement of the pivoted back frame *f g*, the sliding seat frame *b*, and the foot-rest *c*, when constructed and operating substantially as and for the purposes set forth.

80,803.—CHARLES S. BROWN, Pittston, Me.—*Supporting Attachment for Sail.*—August 11, 1868.—The object is to hold the sail extended and taut, and properly sustain it at its corner, so that the strain shall devolve upon the bolt rope thereof.

Claim.—The combination of the adjustable hook E, and its runner D, with the yard A, such being to operate in manner and for the purpose specified.

80,804.—ORAMUS W. BURNHAM, Hillsborough, and HENRY F. BURNHAM, Aeworth, N. H.—*Elevator for Sirup Pan.*—August 11, 1868; antedated March 9, 1868.—The pan is attached to a crane and may be raised and lowered by a lever and otherwise moved toward and away from the arch or furnace.

Claim.—1. The evener N, rods *h h h h*, cross H, in combination with arm C, and brace D, lever L, and standard B, arranged substantially as and for the purposes herein set forth.

2. The pan G, in combination with the hooks *k k k k*, cross H, substantially as and for the purpose specified.

80,805.—ENSIGN A. BUSHNELL, Horicon, Wis.—*Machine for Sharpening Horseshoe Calks.*—August 11, 1868; antedated July 18, 1868.—A cap, carrying the burr, is attached to the end of the main stock by means of a slot and set screw, rendering it adjustable to varying lengths of calks. A guide fits upon the spring and is adjusted by a set screw.

Claim.—The slotted adjustable gauge R, and loop D, with the screw bolt and set screw, in combination with the solid spring B, main stock and burr E, as herein described, for the purpose specified.

80,806.—ALEXANDER H. CARYL, Groton, Mass.—*Hay Spreader.*—August 11, 1868.—The shaft, to which the spreading teeth are attached, is driven by gears fixed to the ground wheel, and the connections between said spreader shaft and the rock shaft enable the spreader to be raised and lowered by the hand lever.

Claim.—The combination of the rock shaft G, provided with arms F, hand lever H, links E, levers C, and spreader shaft B, arranged and operating substantially as and for the purposes set forth.

80,807.—ETHAN R. CHENEY, South Boston, Mass.—*Die for Making Toe Calks for Horseshoes.*—

August 11, 1868.—The bar is of I-form in transverse section, and is cut by these dies, at one or more operations, into the desired form of calk, two being simultaneously produced from each length.

Claim.—The dies B B' and C C', or their equivalent, constructed and operating substantially as described, for the purpose specified.

80,808.—HENRY F. CLARK, Lowell, Mich.—*Bed Spring.*—August 11, 1868.—The springs are attached to the under side of transverse bars which are firmly secured to the head and foot boards or rails. The lower slats are fastened to said springs and support the cross pieces to which the upper slats are secured.

Claim.—The bed bottom, consisting of the double set of slats F D, when combined and arranged between the blocks A, and operating with the independent cross pieces E and springs C, in the manner and for the purposes described.

80,809.—JOHN W. COBB, Melrose, and EDWIN A. HILL, Quincy, Mass.—*Manufacture of Rubber and other Coated Cloth and Fabrics.*—August 11, 1868.—The rubber or caoutchouc is placed in the space between the main cylinder and the uppermost of the two small, hollow cylinders, which has an accelerated motion, in order to grind the material and lay or spread it on the main cylinder. The sheet of cloth is run in upon the lower small cylinder, and thence between the main cylinder and the steam jacket and under the guide roller, being led off in an upward direction. Steam may be admitted to all the hollow cylinders.

Claim.—1. The combination of mechanism for spreading rubber or a vulcanizable material on a surface or cylinder, and applying the coating to cloth, in manner as set forth, with mechanism for vulcanizing the coating of rubber or vulcanizable material, while it with the cloth may be passing about the surface or cylinder on which the rubber or said material may be spread.

2. The combination and arrangement of the steam jacket or heater K, with the steam heating cylinder A, and the two cylinders E H, arranged and connected so as to operate as and for the purposes specified.

3. The combination and arrangement of the air protective space *r*, the steam chamber *g*, and the steam cylinders A E H, arranged and connected so as to operate substantially in manner and for the purposes as specified.

4. Our process of applying rubber or caoutchouc or a vulcanizable material to cloth, and vulcanizing such rubber or material after such application of it, the same consisting in spreading the rubber or vulcanizable material on a cylinder, and forcing a sheet of cloth in contact with the coating so spread, and vulcanizing it while on the cloth, and while the latter with the rubber or vulcanizable material may be passed about the cylinder, such vulcanizing of the rubber or its equivalent being effected by heat applied to the cylinder or cylinders used in the process of spreading the rubber, as set forth, or to them and a steam jacket, as described.

5. The process of making a sheet of rubber or vulcanizable material, and vulcanizing it, the same consisting in spreading the rubber or material on a cylinder by means as described, and vulcanizing the rubber while on such cylinder by heat produced therein, by means of steam let into it, as set forth, or into it and a steam jacket arranged with it as specified.

80,810.—GEORGE CROMPTON, Worcester, Mass.—*Loom.*—August 11, 1868.—The improvement consists in making each lifter, depresser, and evener bar as a bent lever, or with a vertical arm projecting from the lever proper, the vertical arm carrying a pin which slides in or against a groove or incline as the levers rise or fall, the inclination of the groove imparting a lateral movement to the arm, which produces a corresponding movement of the lever or bar, and thereby effects the required inclination of the lifter, depresser, or evener.

Claim.—1. In combination with the harness levers operated by hooked jacks, angular lifter, and depresser levers, the inclination in which is effected

by pins or projections from arms *l*, working in or against inclines *n*, substantially as described.

2. The eveners, in combination with the inclines, constructed substantially as described, for producing the inclination of the evener levers.

3. The adjustable inclines for varying the extent of inclination of the levers, substantially as described.

80,811.—ANDREW J. CURTIS, Monroe, Me.—*Meat Chopper*.—August 11, 1868.—The lever bearing the knife which cuts the meat in the tub is raised by the cams and depressed by the spring. Attached to the knife lever is the impelling pawl which actuates the ratchet to give an intermitted rotary movement to the tub holding the meat.

Claim.—1. The arrangement of the impelling pawl *N*, the arm *O*, the ratchet *P*, the spring *I*, the knife lever *D*, and the cams *d* *E'*, as applied to the knife or knives, and the tub, as set forth.

2. The arrangement and combination of the depressing spring *I*, its abutment *K*, and adjusting serew *L*, with the knife lever *D*, and the series of cams *E'*, for operating it, as set forth.

3. The arrangement of the studs *d'* *b* *b* and the holes *f* *g* *g*, with the tub *B* and the ratchet *P*, arranged therewith in manner and so as to be operated by an impelling pawl driven by the knife lever, as set forth.

80,812.—CHARLES M. DABOLL, New London, Conn.—*Drill Stock*.—August 11, 1868.—The operator grasps the handle of the main non-rotating stock, and, holding the rest against his breast or front, turns the bit by means of the gearing and its handle. The plug of the tool pocket is fitted in a countersink in order that the breast of the operator shall not be subjected to injury or discomfort thereby.

Claim.—The arrangement of the several parts, as herein described, the rest *B*, pocket *k*, and flanged plug *m*, being included in said arrangement.

80,813.—JAMES DEVARAUX, Marshall, Mich.—*Rotary Excavator*.—August 11, 1868.—An apparatus for the sinking of wells and shafts, and raising the earth excavated by the same to the surface and there dumping it.

Claim.—An excavator, composed of the standards *A*, table *B*, disk *7*, sheave blocks *E* and *F*, sweep *Z*, frame *K*, buttons *O*, pins *P*, stirrups *L*, hinges *N*, excavator buckets *M*, bearing wheels *Q*, chains *W*, ropes *X*, the vertical rotating shaft *D*, metallic point *C*, horizontal arms *G*, adjustable guide wheels *H*, dogs *S*, springs *T*, pulleys *V*, cord *U*, and capstan *Y*, when arranged and operating substantially as described and for the purpose specified.

80,814.—ANDREW DICKEY, Albany, N. Y.—*Sad-Iron Support for Stove*.—August 11, 1868.—The bracket is adapted for attachment to the side of a stove plate section to admit of the sad-irons being placed in front of the illuminating openings of a base-burning stove in the best position for heating them. To remove the bracket lift it slightly and withdraw its arm from the opening through the stove plate.

Claim.—A removable sad-iron bracket *B*, constructed and adapted for being applied to a stove, substantially as described.

80,815.—A. H. ENHOLM, St. Louis, Mo.—*Motive Power for Sewing Machine*.—August 11, 1868.—The invention has reference to the means for winding up the springs to the peculiar system of gearing through which motion is transmitted to the point where the connection with the sewing machine is to be made, and to the mode of regulating the speed by changing the position of fan wings in relation to their supporting shaft.

Claim.—1. The drums and springs, when the same are operated by the lever and intermediate pinion wheel, substantially as described, as and for the purpose specified.

2. The drums *L* *L'*, with their springs, when the same communicate their power to the main driving shaft of the machine, through a system of its intermediate gearing, and the whole is so combined and arranged as to operate substantially as described, as and for the purpose specified.

3. Regulating the speed of the machine by means of the sleeve *E*, lever *G*, and fan blades *F* *F'*, when the same are constructed and arranged so as to operate substantially as described.

80,816.—JEFFERSON E. EVARTS, Madison, Conn.—*Coffin*.—August 11, 1868.

Claim.—The application of the substance known as papier-maché, to be used in the construction and manufacture of coffins, substantially as and for the purpose above specified.

80,817.—Canceled.

80,818.—JOSEPH FLETCHER, Providence, R. I.—*Making Braid*.—August 11, 1868.—A single strand yarn is employed on each of the bobbins of the racers of the braiding machine, and while half or nearly half of the yarns are twisted in one direction, the others are twisted in the opposite direction; the effect being to counteract the tendency of a portion of the yarns to twist the finished braid in one direction by the tendency of the remainder to twist it in the opposite direction. Hence, braid thus formed does not twist, but will lie flat.

Claim.—The improved mode, substantially as herein described, of making braid by a braiding machine, such involving the making it of single strand yarns, and the arrangement of the twists of a portion of them in directions opposite to those of the rest, the same being as and for the purpose specified.

80,819.—ADDISON L. FOLGER and A. SMITH FOLGER, Sumner, and HENRY HENSHAW, Quaker-town, Ind., assignors to A. L. FOLGER.—*Manufacture of Sugar from Sorghum Juice*.—August 11, 1868.—The sirup is subjected, first, to purification in the filters; secondly, to precipitation in the troughs; thirdly, to further purification in the hot filter after it has passed through the first pan; and, fourthly, to a further treatment by cold water used in the evaporating pans. A transparent box is employed for granulating, under the influence of solar light, the sugar placed therein.

Claim.—1. The arrangement of a consecutive series of filters, *A* *C*, and a consecutive series of precipitating troughs and connecting pipes, and of a series of evaporating pans, two, at least, of which are connected through a hot filter, substantially as set forth.

2. In combination with a series of evaporating pans, a water cistern, *N*, and a series of pipes for conducting the water into the pans, substantially as and for the purpose set forth.

3. A transparent granulator, *O*, substantially as and for the purpose set forth.

80,820.—LOREN B. FORESTER, Clyde, Mich.—*Hose Coupling*.—August 11, 1868.—The sections of pipe may be readily uncoupled by sliding the ring so as to free the ends of the levers, the latter being then swung back so as to release the shoulders; by engagement with the latter the coupling is effected by the levers when clamped against the sides of the pipe by the ring.

Claim.—1. The pipe *B*, attached to and surrounding the pipe *A*, the packing *C*, the cars *D*, the dog levers *E*, provided with shoulders *F*, and catches *N*, to form that part of the coupling attached to the pipe *A*, when operating substantially as and for the purposes herein described.

2. The coupling pipe *H*, provided with shoulder *I*, ring *J*, pin *K*, slot *L*, spring *M*, in connection with pipe *G*, when constructed and operating to form the other part of the coupling.

3. The combination and arrangement of all the above-named parts to form the two parts of a coupling, when constructed and operating substantially as and for the purposes herein set forth.

80,821.—JEROME B. GARDNER and CHARLES H. SWAIN, New York, N. Y.—*Steam Boiler Furnace*.—August 11, 1868.—Air, received from below, is admitted to the fire at a point above the grate, and the perforated pipe, through which the air is so admitted, is protected from heat by fire bricks.

Claim.—1. The combination of the feed chambers for the furnaces of steam boilers, with the perfor-

ated pipes or conductors, E, which are protected by suitable coverings, as described and set forth.

2. The arrangement of the grate bars F F', upon a concave frame, causing the fuel to fall to the center, in combination with the feed chambers and air pipes and conductors, as described and set forth.

80,822.—JETHRO J. GRIFFITH, Philadelphia, Pa.—*Artificial Teeth.*—August 11, 1868.—The depressions in the mold to form the backs of the teeth are first partially filled with the mineral substance, which is made to form shoulders to support the pins in an upright position while the filling of the depression is completed.

Claim.—The above-described mode of effecting the attachment of pins to artificial teeth in the process of molding.

80,823.—RUFUS HAM and JOSEPH DURGIN, Bangor, Me.—*Dumping Cart.*—August 11, 1868.—The rocker is secured to the spindle bolt in the head of the post, so as to turn readily upon the same, and is connected to the cart body by hinges. Suitable fastenings are employed to secure the body in a horizontal position. In turning the cart body to dump the load at either side, the trundles travel upon the circular plate and thus steady and support the load.

Claim.—The spindle-headed post E and the plate or circle F, in combination with the rocker H and the trundles I, I', and I'', constructed and operating substantially in the manner and for the purposes as shown and described.

80,824.—MARTIN HILLABOLD, Syracuse, Ind.—*Saw Mill.*—August 11, 1868; antedated August 1, 1868.—When the head blocks are mounted on top of the rails, their inner ends extend a considerable distance further in toward the saw than when they are mounted on the graduated steps of said rails. The construction of the side rails enables the blocks to be so operated that very large logs may be slabbed with a comparatively small saw.

Claim.—The side rails g g of the saw carriage E, constructed in the manner and for the purposes substantially as described and set forth.

80,825.—HORACE C. JONES, Dowagiac, Mich.—*Basket.*—August 11, 1868.—The two thicknesses of splints are secured between and held in place by loops applied to the inside and outside of the same.

Claim.—1. Constructing a basket of two thicknesses of staves or splints, the outer thickness or covering being composed of splints which extend from side to side of the basket, beneath its bottom, and the inner thickness or lining being composed of splints which extend from the center of the bottom of the basket to its top edge, substantially as described.

2. The cap h, and rivet g, fastening the tapering points of the lining splints b down to the splints a, forming the outer thickness of the basket, substantially as described.

80,826.—JOHN KERSHAW, Paterson, N. J.—*Machine for Cleaning Cotton.*—August 11, 1868.—The cotton is introduced at the smaller end of the casing, and has a progressive movement toward the discharge opening while being scutched against the grating by the beater blades. The fan operates to draw through the screen such foreign matter as does not fall through the grating. The traveling apron receives the cleaned cotton and discharges it into bins or upon the floor.

Claim.—1. The shaft C, with its disk plates H and beater blades I, in combination with the conically disposed grating B, covering E, openings K and F, and the outlet or discharge pipe L, all constructed as and for the purposes herein set forth.

2. The fan P, screen O, and apron N, when combined together, and with the conically-disposed grating B, of angular section, the cover E, the feed opening K, air opening F, outlet pipe L, shaft C, disks H, and beater blades I, or their equivalents, all arranged and operating substantially as and for the purposes herein shown and set forth.

80,827.—ISRAEL KINNEY, Detroit, Mich., assignor to EDWARD MCGIVERN and JOHN WEBBER,

Hamilton, Canada.—*Wagon Seat.*—August 11, 1868.—The sides and back of the seat are of metal, cast or stamped into shape, and provided with a flange, to which a wooden seat may be attached, and with lugs for the attachment of a top.

Claim.—The ribs or lugs E, when constructed and connected as herein set forth.

80,828.—RICHARD C. LAMBERT, Raynham, assignor to DAVID WHITEMORE, North Bridgewater, Mass.—*Machine for Trimming the Edges of Boots and Shoes.*—August 11, 1868.—Vertical, endwise, and rotary movements are imparted to the jack in which the shoe is clamped. The gauge runs between the sole and upper leather of the shoe, and prevents the paring knife from cutting into the upper leather. The cutter frame or head rests upon the periphery of the pattern which governs the depth of cut.

Claim.—The combination of the jack or shoe-holding carriage B, the pattern, the stop bolts n n, and the cutter carrier N, provided with mechanism for operating them, substantially as specified, such carrier being provided with a gauge, y, a paring knife, x, or the same and another tool or implement for smoothing or finishing the edge of a sole of a shoe.

80,829.—PATRICK LENNOX, Lynn, Mass.—*Machine for Beaming Hides.*—August 11, 1868.—These improvements have reference to the mode of effecting the reciprocating, rectilinear movements of the beaming tool carrier, and raising it above the surface of the operating bed; also to the mode of supporting and producing the vertical movements of the operating tablet; and, further, to an elastic cushion or bed piece to prevent the hide from slipping about upon the tablet under the action of the beaming tool.

Claim.—1. In a machine for beaming hides, or sleeking or dressing leather, actuating the movements of the working tool by means of the connecting rod g and eccentric rod h, the former being pivoted at one end of the sliding carriage, and the latter to the beaming tool carrier, and both being connected with the balance wheel by the means above described, the whole being arranged and operating as before described.

2. The application of the elastic apron to the revolving tablet, in manner and for the purposes as hereinbefore explained.

3. Applying the revolving tablet to the car truck frame in such manner as to be enabled to adjust its vertical positions, essentially as herein shown and described.

4. The means for accomplishing this vertical adjustment of the revolving tablet, the same consisting of the cross frame o and treadle p, combined and arranged and operating as before explained.

5. The inclination of the outer end of the horizontal beam or guide for elevating the beaming tool, substantially as before explained.

80,830.—SEBEUS C. MAINE, Boston, Mass.—*Folding Mosquito Frame.*—August 11, 1868.—This frame is supported by a strip or cornice, and when extended the cloth and netting attached thereto incloses the space about a table or bed and excludes flies and mosquitoes therefrom. The weight or rod confines the cloth to the top of the frame so that no apertures may exist.

Claim.—The folding frame B, with cloth C and netting D attached, in combination with roller A and weight E, the whole operating substantially in the manner and for the purposes specified.

80,831.—C. H. MOCK, Quincy, Ill., assignor to himself and ISRAEL DIXON, same place.—*Gridiron.*—August 11, 1868.—The juices eliminated in the form of vapor being retained within the spider by the closely-fitting cover, are condensed by the air entering at the openings in the handle.

Claim.—The spider A, cover B, projection and staple b, air passage C, and openings c c, for the purpose substantially as herein shown and described.

80,832.—FRANCIS D. PASTORIUS, Philadelphia, Pa.—*Stove-Pipe Damper.*—August 11, 1868.—As the draught increases it closes the valve, and when it:

decreases the valve opens by its own weight. The valve seat has a number of holes, to maintain combustion and permit the gaseous products of combustion to escape when the damper is closed.

Claim.—1.—A valve seat and gas escape, in combination with an automatic or self-acting valve, for the purpose specified.

2. A valve seat and gas escape, in combination with the automatic or self-acting valve D, and the stove pipe, flue, or other suitable receptacle, A, as shown.

3. A valve seat and gas escape, B, in combination with the rod C, valve D, and the counterpoise E, as shown.

80,833.—LEONCE PICOT, Hoboken, N. J.—*Comb.*—August 11, 1868.

Claim.—A double comb, formed by coupling two combs together at their backs by a sliding coupling, so that they may be detached from each other at pleasure by sliding them apart and used as single combs, substantially as hereinbefore described.

80,834.—ELIZA W. PRUSSIA, Marlboro, Mass.—*Clasp for Boots and Shoes, Belts for Ladies' Dresses, &c.*—August 11, 1868.—The disk of the clasp contains a spiral groove, in which work the ends of hooks attached to the two ends of a lady's belt, or to the two sides of a shoe, for example. By turning the disk the hooks and the parts attached thereto may be drawn together. A modification as to the form of the clasp and its cover is proposed.

Claim.—1. The device of a spiral groove in a clasp, in the manner and for the purpose described.

2. The attachment of a cover to the clasp, substantially as described and for the purpose set forth.

80,835.—FERDINAND RENZ, Poughkeepsie, N. Y., assignor to himself and JOHN A. BAYLY, same place.—*Process of Manufacturing Sulphuric Ether.*—August 11, 1868.—The steam generated in the mash tub escapes into a receiver containing heated sulphuric acid, which is consequently converted into sulpho-vinic acid. The vapor of this product passes to a heated water bath or washer, whence it escapes to a receiver containing highly-heated sulphuric acid, the sulpho-vinic acid gas being thereby converted into sulphuric ether and water. The subsequent treatment is for removing impurities and excess of acid, and obtaining the ether in a pure condition.

Claim.—The method or process of making sulphuric ether direct from the steam of boiling mashes of corn, barley, or other grains, or molasses or sugar, substantially as hereinbefore described.

80,836.—FREDERICK K. SEYMOUR, Waleottville, assignor to himself and E. MILLER & COMPANY, Meriden, Conn.—*Machine for Burnishing and Spinning Metals.*—August 11, 1868.—This mechanism is designed for holding a roll or burnisher with a yielding or elastic power against the revolving sheet metal and former. By thus mechanically adapting the tool to yield to the curvatures of the former or chuck, the skilled hand labor heretofore involved in holding the tool is dispensed with.

Claim.—1. A revolving chuck or former, in combination with a tool fitted to yield and moved automatically, in spinning or burnishing articles of sheet metal upon said chuck or former, substantially as formed.

2. The lever *w*, in combination with the tool *t*, stock *t'*, and spring for withdrawing said tool from the work, as set forth.

3. The roll *t* and set screw *s*, for converting said roll into a burnisher, as and for the purposes set forth.

4. The arrangement of the tool-holding slide *s*, nut *r'*, screw *r*, and slide rest *q*, and screws 10 10 10, for the purposes and as set forth.

5. The tool-holding slide *s*, tool *t*, spring *v*, lever *w*, slide rest *q*, secondary bed *l*, bed *k*, and hand wheel *p*, arranged and applied substantially as specified, for spinning or burnishing articles of sheet metal upon a revolving chuck or former, as set forth.

80,837.—A. R. SILVER, Salem, Ohio, assignor to himself and JOHN DERNING, same place.—*Hub-Boring Machine.*—August 11, 1868; antedated July

25, 1868.—The jaws of the chuck are adjustable simultaneously toward and from a common center, and serve to rigidly gripe and hold a hub in proper position for being bored and shouldered. The invention provides for readily withdrawing the mandrel, which carries the boring tool, after the operation is completed; also for preventing a progressive movement of the mandrel during the formation of the shoulders in the hub; also a gauge for regulating the depth of boring, the said gauge having a thread on one side and an adjustable jib at the opposite side, whereby the gauge may be adjusted upon its mandrel without turning or screwing.

Claim.—1. The combination of the radially-grooved chuck plate, sliding gripping jaws J, adjusting screws H', pinions H, and center spur wheel G, substantially in the manner and for the purpose described.

2. The sections *h h* of the feed nut, fitted in slotted bed *g'* applied to a turning box or cap D, and constructed with a neck, *g*, substantially as described.

3. The combination of the expansible nut *h*, bed *g'*, neck *e*, set screw *e'*, and stock E, substantially as described.

4. The construction of the gauge plate C, with an oblong opening, *d*, through it, one side of which is screw-cut to fit the mandrel, and the other side is provided with an adjustable screw-cut jib, C, and a set screw, *e'*, substantially in the manner and for the purposes described.

80,838.—ANDREW SMITH and WILLIAM P. WATSON, Portland, Oregon, assignors to WILLIAM P. WATSON and T. J. CARTER.—*Gang Plow.*—August 11, 1868.—The vertical rod screws through a plate or bearing, so that when it is turned it raises or lowers the hinge plate, and the forward ends of the plow beams attached thereto. The plows may be elevated out of contact with the soil by means of the ratchet, rollers, and cord. The foot lever is for disengaging the pawl, to allow the plows to fall and assume their working position. The position of the tongue may be changed, for taking more or less land.

Claim.—1. The combination of the rod K, plate J, through which the rod K screws, and which is attached to the hinge joint I, hinge plate I, plow beams F F, and standards and plows G H, substantially as described.

2. The combination of the hinged beams F F, cord *c*, rollers M and N, ratchet *m*, pawl *p*, and foot lever *r*, substantially as described.

3. Attaching the rear end of the tongue to the axle by means of a clevis, *t*, and a series of holes arranged as described, by which the draught can be adjusted, substantially as above set forth.

80,839.—ANTHONY SMITH, Schellsburg, Pa.—*Horse Hay Fork.*—August 11, 1868.—The teeth, in lifting the load, are automatically locked without the agency of springs. Before raising the load the pins or skewers are inserted crosswise into the hay, and being suspended by a cord from the shank, their upper ends are drawn together and their lower ends made to compress the hay as the fork ascends.

Claim.—1. The combination, in a horse hay fork, of the shank, the pivoted teeth, the sliding bar, the vibrating locking-lever, and the loop, the combination being and operating substantially as set forth.

2. The combination of the shank, the locking lever, and the sliding loop, with the slide bar, having a lateral projection on its foot working in the slot of the shank, and pivoted to the teeth by links, for the purposes specified.

3. The combination, as set forth, of the rectangular slotted shank, the diagonally-arranged spear head, the oscillating teeth, the slide bar, the loop, and the locking lever, for the purposes specified.

4. The combination, in a horse hay fork, of a shank, a self-locking lever pivoted on and vibrating parallel with the shank, and a loop sliding on the shank and embracing the shank and locking lever, and operating the latter by its ascent, as set forth.

5. The combination, substantially as set forth, with a horse hay fork, of pins or skewers, to be inserted crosswise into the load, to bind together and compress the hay.

80,840.—VINZENZ SMITH, Middlebury, Ohio.—*Screw Cutting Machine.*—August 11, 1868.—The socket which is fitted on the shaft, turned by the hand wheel, holds either the screw-cutting dies to thread the bolt, or a tap for threading nuts. The standard, which holds the bolt or nut to be threaded, is free to advance toward the socket, so as to feed the bolt or nut to threading device.

Claim.—Modifying the structure of the parts of said combination, and combining with said combination the several devices, in virtue of which the apparatus may be used as a drilling machine, as well as a bolt and nut-threading machine, all substantially as described and shown.

80,841.—WILLIAM STARK, White Pigeon, Mich.—*Potato Digger.*—August 11, 1868.—The devices at the front of the machine gather the vines, sever them, and remove them to one side. The devices which then come into operation scoop up the potatoes from the earth, sift the dirt therefrom, and transfer the potatoes to an elevator, which delivers them to receptacles.

Claim.—1. The angular transverse frame U, in combination with bars T, hangers V, connecting bar 2 2, endless chain P, and arms Q, when operating for the purpose set forth.

2. Grated section X, in combination with grated scoop 5, box Y, escapement W, ratchet S, all operating as and for the purposes specified.

3. The combination of the above-named parts with elevator R, sickle bar K, pitman J, crank shaft F, reel I, rollers H, plate L, provided with angular projecting arms 6, when constructed, arranged, and operating substantially as and for the purposes herein set forth.

80,842.—JOHN STAR, Grand Rapids, Mich.—*Garden Hand Plow.*—August 11, 1868.—The hand plow is made double, and constructed in such a manner that, by being reversed or turned over, it may be made to turn the furrow in either direction.

Claim.—A double hand plow, when constructed substantially as and for any or all of the purposes specified.

80,843.—EDWIN J. TOOF, Madison, Iowa.—*Lamp Burner.*—August 11, 1868.—The hinged connection of the support being formed within the periphery of the air screen, the effect is that when the chimney is turned aside to trim the lamp, the outer portion of the clamping spring bears against the flange of said screen, causing the chimney to be gripped with great firmness, so that it cannot become casually detached from the bolder. The expanding vapor within the reservoir has free escape; but on the occurrence of a partial vacuum within the reservoir, the valve closes and cuts off communication between the flame and the interior.

Claim.—1. The springs F, which are so constructed as not only to act as a support to the elevated cone E, but, at the same time, to serve to clamp the chimney, whether the same be hinged to or have spring snap connection with the foraminous air-screen A, substantially as herein shown and described.

2. The hinge joint, formed by the bend of the spring support F, in connection with an aperture or depression in the disk A, or any attachment thereto, substantially as shown and described.

3. The spring catch a, formed by the extension of the spring support F, and arranged in relation to the cone E, and locking into the central elevated portion of the air screen, or other convenient attachment to the burner, substantially as shown and described.

4. The spring clamps F, constructed with variable widths or thicknesses, for the distribution of the spring and holding parts, substantially as set forth.

5. The clamps F, constructed of one continuous strip of metal, and serving to support the cone within the chimney, and to support and connect both with the foraminous screen, substantially as described.

6. The application of the valve e to the vapor tube of a lamp burner, substantially as and for the purpose set forth.

80,844.—JOHN VANDERCAR, Brooklyn, N. Y. assignor to L. B. TUPPER, New York, N. Y.—*Fire Grate.*—August 11, 1868.—The object is to afford free expansion and contraction both transversely and longitudinally.

Claim.—A furnace grate bar, provided with a central longitudinal bar, A, and two series of cross-bars, d, the latter running diagonally from the frame B to the said central bar A, and the bars of each series adjoining the said central bar at alternate points, thereby breaking joints with each other, substantially as herein shown and described.

80,845.—ELBERTSON W. WAITE, New Haven, Conn.—*Carriage Prop Joint.*—August 11, 1868.—The prop is made with a double joint and link, doing away with the prominence of the ordinary joint and making it less difficult to finish up the joint externally.

Claim.—The carriage prop, made with the link e attached by the pins or screws d d to the bars a and b, in the manner and for the purposes specified.

80,846.—CHARLES WENDELL, Albany, N. Y.—*Slate Frame.*—August 11, 1868.—The rubber rings are confined in place by the edge of the slate in the act of securing the slate and frame together.

Claim.—The application of cushion rings C to the frame of a slate or writing tablet, substantially in the manner and for the purpose described.

80,847.—ORREN L. WHEELER, Lewiston, Me.—*Measuring Faucet.*—August 11, 1868.—The chamber being in a position to form communication between the vessel to be drawn from and the interior of the flexible tube, the disk is raised so as to draw liquid into said tube—the discharge end of the faucet being, in the mean time, closed. The chamber is then turned so as to reverse the direction of the tube's communication with the faucet, and the disk being then depressed the measured liquid is ejected from the tube through the outer end of the faucet.

Claim.—The measuring faucet, as described, having the chamber B, with vent hole o, gauged stock i, disk k, collapsible tube m, projection a, with opening 2, in combination with the nozzle C, having the socket b to receive the projection a, all as and to operate for the purposes herein set forth.

80,848.—SAMUEL WOODHULL, Linden, Mich.—*Apparatus for Setting Axle of Wheel.*—August 11, 1868.—By adjusting the graduated arms of the instrument in accordance with the dish and height of the wheel, the pitch of the axle arm may be readily determined; the object being to avoid the geometrical calculations usually involved.

Claim.—The arms K, in an axle gauge, constructed as herein described and shown.

80,849.—JOHN ASHWORTH, North Andover, Mass., assignor to GEORGE L. DAVIS, JOHN A. WILEY, and JOSEPH M. STONE, same place.—*Ring Spinning Frame.*—August 11, 1868.—The ring is secured to the rail by means of a clamping screw and two set screws, by the joint action of which it may be moved a short distance in any direction parallel to the plane of revolution of the spindle, so that each ring may be made concentric with the spindle independently of the other.

Claim.—The ring, secured to the rail, and adjustable to the spindle by the clamping screw and two set screws, substantially as described.

80,850.—THEODORE BARKER, Mexico, N. Y., assignor to JAPHET LINGENFELTER, same place.—*Brick Machine.*—August 11, 1868.—A belt is employed for transmitting motion from the main driving shaft of the pug mill to the followers, in order to guard against breakage or derangement in the event of the machine being clogged by foreign substances in the clay. A tension regulating device is applied to said belt. The empty mold boxes are fed from a receiving table to a point beneath the press box, and, being filled, are moved upon a delivery table in front of the press box. The plunger, which forces the clay from the press box into the mold boxes, receives a vertical reciprocating motion, but has intervals of rest to allow the filled mold to be

pushed out and an empty mold cell to be moved in line with the press box. An elevator supplies the clay to the pug mill at the upper part thereof.

Claim.—1. Combining with the two tables F and E, arranged at right angles to each other, and the two followers S and G, the connecting rod I, vibrating lever J, and slotted device J, arranged and operating substantially in the manner and for the purposes specified.

2. The arrangement of the slotted side table F, ledges *v v*, follower *s*, suspending guide ways *l*, and the suspended follower G, in a brick machine, substantially in the manner shown and described.

3. The combination and arrangement of the guide rods *e e*, applied to the plunger B², and provided with stops *f' f'*, the cross-head *f*, its connections with the driving shaft, the adjusting screw *g*, and tubular socket or sleeve *g*¹, all substantially in the manner and for the purpose described.

4. The belt K, with its necessary adjuncts between the spur-gear driving power of the pug mill and press, and the mechanism, constructed and arranged substantially as described, for bringing the mold boxes into proper position, in the manner and for the purpose substantially as set forth.

5. The combination and arrangement of the devices set forth for automatically feeding, elevating, and discharging clay into the pug mill, in the manner substantially as and for the purposes described.

80,851.—JOHN BARSON, EPHRAIM DANIELS, and JOANNA FARRELL, New York, N. Y.—*Lamp.*—August 11, 1868.—The movable roller is adjusted, by means of its screw, to such a position with respect to the opposite roller as to compress the intervening wick sufficiently to cause it to be moved upward or downward upon rotating the feed roller.

Claim.—In combination with the ordinary stationary roller D, the roller D', mounted on a sliding box, G, operated by the swivel screw K, substantially as and for the purpose described.

80,852.—OSCAR B. BLAKE and ORMOND E. COLONY, Keene, N. H.—*Measuring Faucet.*—August 11, 1868.—Designed more particularly for drawing oils into small cans or oilers for lubricating machinery, only a sufficient quantity to fill such can or oiler being allowed to escape at each draught.

Claim.—The inclined tube or induction pipe A, and converging measuring receptacle B, in connection with the faucet, having an outer casing, C, with orifices, D, E, and F, and a semi-rotating plug C', having chambers H and I, and stop pin L, arranged so as to form alternately the induction and eduction passages for the supply and discharge of the liquids to and from the measuring receptacle B, the same being provided with passages M and N, or their equivalents, for the admission of air to supply the place of the liquids as they are drawn from the can or reservoir; the whole being constructed and arranged substantially as herein shown and described.

80,853.—CHARLES W. BLAKESLEE and ANTHONY G. DAVIS, Watertown, and EBENEZER B. BEECHER, Westville, Conn.—*Knitting Machine.*—August 11, 1868.—Relates to the manner of mounting and operating a traveling thread-carrying arm, and to a means for varying its length of circuit of travel, for widening and narrowing, without arresting its movements, in a continuous course. These, together with the other features of the invention, are particularly applicable to such machines as have two parallel rows of reciprocating needles, and a single thread guide or eye which delivers yarn first to one and then to the other, in order to knit tubular goods.

Claim.—1. The combination, with a thread-carrying arm or bar, of a swiveling support, substantially as described, which is arranged to slide upon said arm to admit of its being held in proper place while going around the end of the machine.

2. The combination, with such arm and a swiveling support, of an adjustable rod or rods, for arresting the range of travel of the yarn-delivering eye, and causing the arm to turn around the end of the machine.

3. The combination, with such thread-carrying arm, of an automatic locking and releasing device,

operating substantially as and for the purpose set forth.

4. The combination, with such thread-carrying arm, of a tubular eye, constructed to serve as a pin or pivoting center for the thread-carrying arm, as well as to perform its duty of supplying yarn to all the needles which are brought into action for knitting.

80,854.—JOSEPH BOGAN and JOHN B. MCCRAY, Clarksville, Ohio.—*Ointment.*—August 11, 1868.—Sulphate of iron, yolk of egg, saltpeter, salt, and lard.

Claim.—The within-described compound, when mixed and used substantially as and for the purpose specified.

80,855.—GEORGE F. H. BROWN, Leominster, Mass., assignor to the UNION COMB COMPANY, same place.—*Machine for Sawing Combs.*—August 11, 1868.—The carrier, with the stock from which the comb is produced, receives a succession of movements, each advancing the comb the distance of a tooth's width. The saws enter and recede in unison with these movements, and the pointers cut nicks at starting points for the saws, which act subsequently.

Claim.—1. The combination of the shaft F, having the cams or eccentrics G and G' on it, and the two saw frames H and H', with saws A and A', for the purpose of cutting both sides of a comb at the same time, the parts being constructed and arranged substantially as shown.

2. In combination with the saws A and A', the automatic arrangement of the pointers D and D', substantially as and for the purpose shown.

80,856.—PHILIP CADUC, San Francisco, and W. H. DE VALIN, Sacramento, Cal.—*Street Pavement.*—August 11, 1868.—Asphaltum, sulphur, sand, and gravel or broken stone form a compound which may be spread upon a cobble-stone pavement, or molded into blocks. The blocks have the form of truncated, square-based pyramids, and are laid with their smaller faces upward, the interstices being filled with a composition of the same kind.

Claim.—1. The application, to a cobble-stone pavement or walk, of the herein-described composition, substantially in the manner set forth.

2. The tapering or inclined-sided blocks, molded and formed from the composition herein described, in the manner set forth.

3. A pavement or walk made of composition blocks, molded and formed as set forth, and united or cemented together after being laid or placed in position, in the manner specified.

80,857.—JOHN DECKER, Sparat, N. J., assignor to J. B. BOSS and C. C. CLARKE.—*Platform Scale.*—August 11, 1868.—The bow or curved part of the yoke-shaped lever is supported by the hooked rod of a spring balance, while the two ends of the lever rest upon stationary supports. The object of the curved plates and elastic straps is to keep the weight at an unvarying distance from the fulcral supports of the lever.

Claim.—1. A combined platform and spring balance scale, made and operating substantially as herein shown and described.

2. The yoke-shaped lever, when pivoted at its end to stationary uprights, while its middle portion is suspended from a spring, the weighing platform being suspended from the lever, between the supported and suspended part of the same, substantially as herein shown and described.

3. The combination of the elastic straps *b b* with the curved plates *c c*, for the purpose of suspending the platform from the yoke-shaped lever, substantially as herein shown and described.

4. The arrangement and combination with each other of the platform D, straps *b b*, plates *c c*, lever A, uprights B, and spring balance C, all made and operating substantially as herein shown and described.

80,858.—J. H. DENSMORE, Boston, Mass., assignor to himself and HIRAM FULLER, Hallowell, Me.—*Car Truck.*—August 11, 1868.—If the axle should break, the sleeve would afford a bearing for the stump of the axle, and the wheel continue to run

upon the rail with sufficient steadiness for the time being.

Claim.—The construction and arrangement of safety sleeve H, substantially as shown and described, in combination with the axles and wheels of car or tender trucks, when the said sleeves are made in two parts and affixed to safety beams *f f*, all as set forth.

80,859.—JOHN G. FETZER, Brunswick, assignor to FETZER & WOODSON, St. Louis, Mo.—*Plow.*—August 11, 1868.—The landside has a triangular attachment by means of which the said landside, the mold board and share are coupled together.

Claim.—The landside D, when constructed with the assembling bars *d* and *d'*, the whole being arranged as herein shown and described.

80,860.—WILLIAM HUTSON FORD, J. DICKSON BRUNS, and L. C. CLARKE, New Orleans, La.—*Distilling Spirits from Grain.*—August 11, 1868.—In the preliminary process of saccharification and fermentation of the grain or other farinaceous substance, the latter is boiled in dilute acid, either sulphuric, hydrochloric or other that will produce like effects, in order to convert all the starch into glucose. The acid is neutralized by milk of chalk, carbonate of lime or any chemical equivalent thereof which will not affect the fermentation injuriously. When this is done the liquid represents a solution of glucose, in which remains the glutinous matter on which the fermentation depends, and which, therefore, after being evolved, is ready for the admission of yeast. In distilling, fermentation is begun at a lower temperature than usual, and the temperature is maintained by means of cold water circulating through the mass in pipes.

Claim.—The process of neutralizing the acid and controlling the fermentation of mash from grain, or other farinaceous substance, which has been boiled or otherwise treated with acids for the purpose of effecting a more complete saccharification, whereby the usual loss of alcohol is obviated, by the means and in the manner substantially as set forth.

80,861.—GEORGE H. FOX and JOSEPH HUBBARD, Boston, Mass.—*Sewing Machine.*—August 11, 1868.—The general characteristics of this machine are illustrated in United States letters patent, No. 67,535. The improvements consist in the arrangement of a screw and nut so as to clamp both the needle guide and the stripper plate, and in combining therewith a spring so disposed as to prevent the slipping of either the guide or stripper when the screw is loosened.

Claim.—1. In combination with the adjustable fulcrum and guide plate *m*, and the adjustable stripper plate *j*, the screw and nut, arranged to hold both plates in position, substantially as shown and described.

2. In combination with the two plates *m* and *j*, and the screw and nut, the friction spring *q*², arranged to operate substantially as shown and described.

80,862.—FRED E. FREY, Bucyrus, Ohio, assignor to himself, D. J. SHEKLER, and JAMES M. KELLEY.—*Brick Machine.*—August 11, 1868.—The cams at the top of the shaft operate two levers, one of which acts in conjunction with an adjustable pitman and press board, to press the clay from the press box into the brick molds, while the other acts through suitable attachments, to push the brick molds, when filled, from under the press box on an adjustable platform, and replace them with empty ones.

Claim.—1. The lever *j*, compressible pitman X, spring L, nut M, lever O, the rack shaft A, and pinions *q q*, rack P P, and press board G, when constructed, combined and arranged in the manner and to operate substantially as described.

2. In combination with the rack shaft A, pinions *q q*, and racks P P, the adjustable plate *y*, friction rollers *e e*, and set screws *f f*, when combined and arranged as described, and to operate in the manner and for the purposes set forth.

80,863.—JAMES E. HOOPER, Woodbury, Md., and BENJAMIN ARNOLD, East Greenwich, R. I.—*Spinning Machine.*—August 11, 1868.—These devices are applied to a spinning or twisting frame for

the purpose of “doffing” the bobbins, that is to say, removing the bobbins of yarn when full, and supplying their places with empty bobbins.

Claim.—1. The combination of the bar *o*, or its mechanical equivalent, with the ring rail, for the purpose of throwing off the empty bobbins, substantially as herein set forth.

2. The combination, with a spinning machine, substantially as described, of the notched bar and sliding thread separator.

3. The rail *k*, and the mechanism for operating it, all constructed substantially as described, and for the purpose set forth.

80,864.—N. G. HUGHES, Waynesburg, Pa., assignor to himself and THOMAS BRADEN, same place.—*Fruit Picker.*—August 11, 1868.—The instrument being raised so as to place the ring just beneath the fruit, the cord is pulled and the cover brought down. The fruit is thereby detached and made to fall into the hose.

Claim.—The lid or cover D, spring E, ring B, hose F, and cord G, constructed and arranged as described, for the purpose specified.

80,865.—J. M. JONES, Palmyra, N. Y., assignor to himself, HENRY JOHNSON, and GEORGE M. BOWMAN.—*Printing Presses.*—August 11, 1868.—Special devices are made to bring the platen nearly up to the form, and there leave it, to be taken by arms that interlock therewith, and move it against the form to effect the impression. The disengagement of said arms from the platen is effected by the rocker arms. Said impression arms may be so held by a hooked lever or levers that they cannot connect with the platen as the machine is running. By vibrating a lever, the hook that grasps the upper edge of the chase may be raised and lowered to release the form from, or attach it to, the bed. A lever is so arranged in connection with the frame for carrying the ink roller over the form that the ink roller may be detained upon the ink cylinder, for distributing the ink or for other purpose. The frame carrying the platen has a box for the printed matter to fall into, said box constituting a counterbalance to the platen.

Claim.—1. The arm or arms N, or its or their equivalents, in combination with the platen Q, or its equivalent, when arranged to engage with the said platen, and to draw it against the form to which it has been previously raised, substantially as and for the purpose described.

2. The rocker arm or arms Q², or its or their equivalents, arranged for operation upon the arm or arms N, or equivalent therefor, substantially as described, for the purpose specified.

3. The lever or levers M³, or equivalent therefor, when arranged for operation upon the rocker arm or arms Q² of the lifting device to the impression arms N, substantially as and for the purpose described.

4. A movable hook or clasp for holding the chase to the bed of the press, when operated by lever *d*, and arranged for operation substantially as specified.

5. The lever G³, or its equivalent, in combination with the frame carrying the ink rollers to the press, when arranged for operation therewith, substantially as and for the purpose described.

6. A box or receptacle, in combination with the frame carrying the platen, when arranged thereon for operation, substantially as and for the purpose set forth.

80,866.—SAMUEL LARKIN, Bridgeport, Conn., assignor to BRIDGEPORT KNITTING COMPANY, same place.—*Knitting Machine.*—August 11, 1868.—The object is to knit in stripes with two colors, that is, to make alternate stitches with different-colored threads. The lever holds the thread away from and so as to pass alternate needles, and hence the same color is brought continually to the same needle.

Claim.—The finger *d*, constructed and operated as described, so as to carry the threads over any given number of needles, to form the stitches in the relative position to each other, substantially as set forth.

80,867.—JOHN MAGEE, Chelsea, Mass., assignor to MAGEE FURNACE COMPANY.—*Cooking Stove.*—August 11, 1868.—The front of the fire box

consists of a series of grate bars, between which the heat is directly conveyed into the roasting closet.

Claim.—A roasting closet, C, with a movable lid at its top, when said roasting closet is placed over or above a warming closet, F, and in front of the fire chamber of a cooking stove, substantially as and for the purpose set forth.

80,868.—EDMOND H. MEIGS, East Berlin, Conn., assignor to ROYS, WILCOX AND COMPANY, same place. *Hand Axe.*—August 11, 1868.—The body of the axe is cast upon the cast steel piece, which forms the cutting edge. In casting, a surplus amount of iron is supplied at the point where the iron and steel unite, to prevent too sudden chilling of the adhering surfaces.

Claim.—A hand axe, produced substantially as described, as an improved article of manufacture.

80,869.—CHRISTIAN GOTTHOLD MEINHARDT, Altoona, assignor to himself and BENJAMIN F. BELL, Antistown, Pa.—*Ship's Davit.*—August 11, 1868.—The vertical, axial support of the davit frame is secured to the railing and deck of the vessel by means of the hook, pointed foot, turn buckle, and screw. In using this davit for lowering boats, persons may get into the boat on the deck of the vessel, and be hoisted, swung round, and lowered with the boat.

Claim.—The casing B, in one end, which swings the davit A, provided with a center, g^2 , swinging around the bar G, which is secured by the three-pointed foot g^1 and hook H, and operated by the sleeve I, substantially as and for the purposes described.

80,870.—WM. A. MIDDLETON and JOHN A. HALLER, Harrisburg, Pa.—*Horse Hitch.*—August 11, 1868.—This device comprises three parts or castings, namely: the frame, the floor piece, and the journaled tongue or holder, which binds the strap against the floor. The trunnions of the holder rest upon ears formed upon the floor-piece, and as said ears occupy recesses in the sides of the frame, the latter, when screwed to its fixture, holds the floor-piece and tongue in place. The strap is passed through the upper slot of the frame, around the tongue, and out again at the bottom of the frame.

Claim.—1. So forming the slot K in the top of the frame O O', as to serve the several purposes, substantially in the manner as herein set forth.

2. The adjustable floor Z Z', provided with the trunnion rests $n n'$, and the serrated part 1, 2, 3, &c., in combination with the frame W W', substantially as herein set forth.

3. The holder S, when made with the equidistant wings $a a'$, and the thumb piece R, in combination with the frame O O', W W', and floor Z Z', for the purpose specified.

80,871.—W. B. NOYES and C. S. BAKER, Manchester, N. H.—*Saw Set and Gauge.*—August 11, 1868.—The end to which the screws are applied may be used as a wrench. The semicircular elevation at the middle of the bar, with its opening, is employed after the manner of a common saw set. The teeth are passed successively between the screws, in order to be adjusted in line if they shall have been set irregularly.

Claim.—The within-described device for gauging and setting the teeth of saws, substantially as described.

80,872.—HORACE PALMER and ASA N. CASE, Kingsville, Ohio.—*Doubletree.*—August 11, 1868.—The resistance offered to the power applied to the ends of the wooden bar is sustained at the center thereof by the iron brace rod.

Claim.—The brace rod D, whose ends enter recesses in the rear edge of the wooden bar A, and are connected therein to the elevators B, when said rod is adjusted nearer to or further from the bar by the eye bolt E, embracing its center, as herein shown and described.

80,873.—ISAAC PARDEE, Buena Vista, N. J., assignor to himself and ORSON REED, same place.—*Stump Machine.*—August 11, 1868.—The main levers,

when vibrated, act through the links upon the wind-las, and wind the pulling chain thereon. Levers are employed to disengage the pawls and links from the toothed wheels, and handles, by which the machine may be carried, are pivoted to the legs, so that they may be folded out of the way when not in use.

Claim.—1. The machine, consisting of the frame A, having the shaft B, with the wheels C mounted thereon, with the levers E F, stirrups I, and pawls e, constructed and arranged to operate substantially as described.

2. In combination with the levers E and stirrups I, the levers e, arranged as described, for raising the stirrups from the wheels C.

3. The pivoted handles H, provided with the stop rod l, and arranged to operate as set forth.

4. The hinged bars h, for supporting the levers E, when arranged as shown and described.

80,874.—O. M. PIKE, North Leverett, Mass., assignor to himself and S. S. GRAVES, same place.—*Water Wheel.*—August 11, 1868.—The periphery of the drum completely closes the end of the ease, and joining the chute through which the water enters the case, prevents water from passing out of the ease at that point. All the water that enters the ease is thus compelled to act upon the buckets. The slots through the drum allow the buckets to pass.

Claim.—The rotary slotted drum or cylinder J, in combination with the wheel B and ease C, all constructed and arranged to operate in the manner substantially as and for the purpose set forth.

80,875.—EDWIN A. PLATT, Bristol, and GEORGE PLATT, East Hartford, assignors to themselves and LINUS WILCOX, Middletown, Conn.—*Well Tube.*—August 11, 1868.—The object is to secure a free flow of water, and prevent dirt from packing at the lower end of the tube.

Claim.—A well tube, having lateral perforations and pebbles caged in the lower section, when so arranged that the pebbles shall be moved in their position by the action of the pump, all substantially as and for the purpose described.

80,876.—OSGOOD PLUMMER and JAMES SCHOFIELD, Worcester, Mass.—*Mechanism for Operating Harness in Looms.*—August 11, 1868.—The double-slotted eam-piece, which imparts motion to the harness actuating mechanism, derives motion from a shaft traversing the lower part of the frame longitudinally. The various features cannot be briefly described.

Claim.—1. The combination, with the double-slotted eam piece F, of the slotted arm f, and connection H, substantially as and for the purposes set forth.

2. The combination, with the arms D D, of the plates E E', or their equivalents, substantially as and for the purposes set forth.

3. The combination, with the arms D and plates E E', for lifting and depressing the bars L, of the pieces C and B, with which the front ends of said arms are connected, substantially as and for the purposes set forth.

4. The combination, with the bars L, or their equivalents, of the lifting and depressing plates E E', and arms D, substantially as and for the purposes set forth.

5. The combination, with the bars L, of the roll N, or its equivalent, substantially as and for the purposes set forth.

6. The combination, with the mechanism which works against the pattern wheel or chain of a fancy loom, of mechanism for freeing the pattern wheel or chain from contact with said mechanism, for the purposes set forth.

7. The jacks J, provided with the slots 12 and 13, substantially as and for the purposes set forth.

8. The combination, in a fancy loom, having elevating and depressing arms, working on fixed fulcra forward of the cloth-making point, of a series of jacks, constructed substantially as described, combined with a series of harnesses by means of cords, or mechanical equivalents, passing over a roll or rolls, L', so as to give to the harnesses a greater throw or motion than is imparted to the lifting and depressing arms, for the purposes set forth.

9. The combination, with a jack, J, and bar con-

structed as described, of a spring, 15, substantially as and for the purposes set forth.

10. The combination, with a knee jack, *J J'*, of a bar *L*, having two front projections, *i* and *j*, and a rear projection, *k*, substantially as and for the purposes set forth.

80,877.—GEORGE W. RAWSON, Cambridgeport, Mass., assignor to himself and MICHAEL HITTINGER.—*Hydraulic Press*.—August 11, 1868.—Used in the manufacture of lard oil. The lard, contained in bags, is pressed between the platform and a plate secured to the under side of the press floor.

Claim.—The combination of the platform *G*, hydraulic press *C D*, rods *a*, and plate *H*, arranged to operate substantially as described, for the purpose set forth.

80,878.—JOHN SAXBY and JOHN STINSON FARMER, Kilburn, England.—*Switch and Signal*.—August 11, 1868.—The effect of this arrangement is, that after the adjustment of a switch, the switchman is not required to exercise his judgment as to what signals should be displayed, his duty being merely to draw back such levers as he finds to be movable, when the proper signals cannot fail to be exhibited.

Claim.—A series of levers, and the within-described slides or their equivalents, combined with the switches and signals of a railway junction, substantially as set forth, the whole being arranged and so operating that, after a change in the position of a switch, the levers, connected to signals properly displayed to indicate the condition of the road, are locked in their positions, while the remaining levers may be adjusted so as to change the position of the signals or switches which are improperly arranged, all substantially as specified.

80,879.—FRANK SCHURGER and NICHOLAS ALLSTATTER, Hamilton, Ohio.—*Harvester Rake*.—August 11, 1868.—The rake has intervals of rest while the reel continues to operate. The apparatus is needed only in light grain, where, at a single revolution of the reel, enough grain is not cut to form a sheaf.

Claim.—1. The combination of the catch *L*, sliding bearing *I*, and frame or quadrant *K*, with each other and with the stop *U*, rake shaft *H*, and shaft *C*, substantially as herein shown and described, for the purpose of preventing any motion of the said shaft *H* but one revolution on its axis while the rake head is sweeping over the platform.

2. The combination of the curved racks *P* and *R* with each other and with the frame *K* and rake shaft *H*, substantially as herein shown and described, for the purpose of partially rotating the shaft *H*, and causing the rake head to sweep over the platform.

3. The combination of the fingers *N* and *M* with each other and with the shaft *H* and catch *L*, substantially as herein shown and described, for the purpose of releasing the catch *L* from the stop *U* at the proper time.

4. The combination of the clutch *Y*, lever *A'*, and arm *B'*, with each other and with the shaft *C*, collar or sleeve *W*, and frame or quadrant *K*, substantially as herein shown and described, and for the purpose set forth.

80,880.—JASPER N. SMITH and WILLIAM O. BECKLEY, Washington, Ill.—*Machine for Cutting Open Ditches*.—August 11, 1868.—The slides and knives are bolted to the nose, so that their rear ends may be set nearer to or further from each other, to adapt the machine for cutting a wider or narrower ditch.

Claim.—1. The hanging the ditcher in a frame, as shown in the drawings, thus avoiding the use of a beam, and avoiding all clogging under the beam in machines which make use of it.

2. The movable slides *A A*, in connection with the movable knives *B B*, so constructed as to carry out a greater or less width of earth as the machine is cutting.

3. The form of the rear of the nose, that is, the rear carried up, as shown, to avoid friction, and expanded, as shown, to support the slides.

80,881.—JULIUS SMITH and ISAAC E. HALL, Logan, Ohio.—*Cooking Utensil*.—August 11, 1868.—The vessels upon the interior stand contain the articles to be cooked. The spaces between the cover and lining and between the casing and reservoir protect the apparatus from the cool air, thus preventing condensation.

Claim.—1. Confining the lid of a steamer by means of spiral springs, whereby all danger from excessive pressure of steam is avoided, substantially as herein set forth.

2. The cooking apparatus, composed of the reservoir *A*, cover *B*, lining *C*, shell *D*, stand *E*, vessels *F*, and strings *G*, when constructed in the manner and for the purpose substantially as herein specified.

80,882.—JOSEPH STADLER, Detroit, and GEORGE M. STRONG, Plymouth, Mich.—*Churn*.—August 11, 1868.—The shifting wings may be made to offer greater or less resistance to the whirling contents of the churn.

Claim.—1. The vessel *A*, in combination with the rotating dasher shaft *F*, and revolving dasher wings or boards *f f'*, and the shifting wings *a*, substantially as shown and described, and for the purposes set forth.

2. The shifting wings *c*, in combination with the vessel *A*, substantially as shown and described, and for the purposes set forth.

80,883.—WILLIAM STEFFE, Philadelphia, Pa., assignor to himself and JAMES REYNOLDS, same place.—*Radiator*.—August 11, 1868.—Relates to the class of drums or radiators which are used in the air chambers of heaters, and through which the products of combustion pass. This drum, unlike those in common use, is a permanent fixture, having door-guarded openings or pipes rendering the interior accessible for cleaning purposes. The mode of disposing the plates or partitions of the drum is intended to enlarge the radiating surface.

Claim.—A permanent wrought-iron drum or radiator, constructed substantially as herein specified.

80,884.—D. S. STEVENS and LAMBERT SNEDECOR, Red Bank, N. J.—*Securing Masts of Vessels*.—August 11, 1868.—The mast, having elastic supports, yields under the sudden and excessive force of wind, and is thus relieved of undue strain until the vessel responds to the impelling power.

Claim.—Supporting the masts of vessels in flexible and elastic partners and steps, substantially as and for the purpose described.

80,885.—JOHN J. SWITZER, Roxbury, assignor to himself and EDWIN H. FITZ, Northborough, Mass.—*Stop Motion for Loom*.—August 11, 1868.—Consists in the use of a series of pivoted wings, from which warp-supporting rods or threads are suspended. So long as the warp-supporting rods or threads are kept tense by the warp thread, they hold the wings in such a position that the same do not interfere with the motion of a rising and falling flat board; but as soon as a warp thread breaks, it will cause the release of a warp-supporting rod or cord, whereupon the wing from which the same is suspended will swing upon its pivot, so as to arrest the downward motion of the flat board. The stopping of the flat board causes a vertically moving shaft to oscillate and thus impart motion to a lever, which, by means of cords, a sliding frame, a stop and bell-crank lever, is connected with a sliding rod which operates the belt-shifting lever. As soon as the rod is released by the withdrawal of the stop, it is moved by the action of a spring, so as to shift the belt to a loose pulley and thus stop the loom, the batten being simultaneously arrested by a stop on said rod.

Claim.—1. The wings *K K*, constructed substantially as described, and provided with the warp-supporting cords or rods, in combination with the rising and falling board, as and for the purpose set forth.

2. The flat board *H*, the vertically movable frame *F*, and the wings *K*, as and for the purpose set forth.

3. The vertically movable frame *F*, carrying the flat board *H* and the shaft *G*, substantially as herein shown and described.

4. The lugs *r*, projecting from the flat board, in

combination with the lugs *p*, projecting from the rock shaft *G*, all made and operating substantially as and for the purpose herein shown and described.

5. The slide *J*, connected with the shifting lever *I*, spring *e'*, and elbow crank *N*, substantially as herein shown and described.

6. The devices, herein shown and described, for transferring motion from the rock shaft *G* to the elbow crank *N*, said devices consisting of the lever *M*, cord *t*, pin *v*, hook *z*, frame *o*, and string *y*, all made and operating substantially as herein shown and described, in combination with the vibrating lever *R* and block *S*, made as set forth.

7. A thread detector, consisting of the wings *K K*, threads *m*, frame *F*, shaft *G*, flat board *H*, lugs *p*, *r*, cam *d'*, lever *M*, string *t*, pin *v*, hook *z*, frame *o*, cord *y*, elbow *N*, slide *J*, and shifting lever *I*, all made and operating substantially as herein shown and described.

8. The swinging arm *M*, cord *t*, pin *v*, and block *w*, in combination with the hook *z*, having the inner projection *a'* and hinged in the frame *o*, and combined with the slide *S*, all made as set forth.

80,886.—MERRITT L. THOMPSON, Flemington, N. J., assignor to himself and JOHN P. RITTENHOUSE, same place.—*Head for Barrel.*—August 11, 1868.—A turning button inside the head is operated from the outside, and serves to hold or release a movable section.

Claim.—1. A movable head for barrels or casks, formed in sections, with the last section that is introduced resting upon rebates, or the beveled edges of those previously introduced, and held down by a turning button, or equivalent clamp, substantially as set forth.

2. A turning button, applied to the inner side of a sectional head, and fitted substantially as specified, so as to be turned from the outside of said head and secure the sections in place, substantially as set forth.

80,887.—JAMES WALDIE, Ipswich, Mass., assignor to himself and GEORGE KENNEDY, same place.—*Knitting Machine.*—August 11, 1868.—The periphery of the cam is provided with notches, the distance between which is such that, as the cam is revolved by the action of the driver upon the ratchet wheel, a sliding bar continues its connection with any bar, carrying the thread guides, sufficiently long to admit of it being slid back and forth to weave the desired number of courses of that color of yarn. The ratchet disk, with its flanges and levers, is designed as a substitute for the above devices.

Claim.—1. A ratchet wheel, *G*, with a single cam or eccentric *H*, operated by a single driver, *F*, for weaving any even numbers of courses of three or four colors, substantially as set forth.

2. A ratchet wheel or disk, *P*, provided with three or more flanges, constructed as described, in combination with a corresponding number of levers, *R B*, and operated by two drivers, *B*, for weaving odd or even courses of three or more colors, substantially as and for the purpose specified.

80,888.—JOEL D. WEAVER, Troy, N. Y., assignor to himself, C. A. SHERWOOD, and L. S. BUNNELL, same place.—*Spirit Meter.*—August 11, 1868.—The valve is circular and oscillates in a horizontal plane to change the relation of its ports with the inlet and outlet ports. As the piston moves toward the left, the spring in the right hand end of the tube is compressed in consequence of the resistance opposed thereto by the arm projecting from the valve stem, but when the piston has nearly completed its stroke, said arm is freed and actuated by the compressed spring so as to suddenly reverse the valve. The springs being duplicated, the operation is the same under the opposite movement of the piston.

Claim.—1. The improved valve-actuating mechanism, substantially such as herein shown and described, for the purpose set forth.

2. The improved valve *K*, in combination with the valve chest *I*, provided with ports, arranged substantially as and for the purpose described.

3. The combination of the sliding rod *E*, valve stem *e*, and spring-actuated arm *f*, substantially as and for the purpose described.

4. The combination, with the arm *f*, of the tube *G*, provided with the springs *K* and *K'*, and actuated by the slide *E*, substantially as and for the purpose described.

80,889.—WILLIAM C. WILLMARTH, Philadelphia, Pa., assignor to W. B. LACY & Co., same place.—*Sewing Machine.*—August 11, 1868.—The revolving disk and arm impart a vibrating as well as a vertically-reciprocating motion to the needle, so as to effect the feed thereby. The machine forms an ordinary chain stitch, the devices below the work plate serving to detain the loop which is left by the needle, and turn the same into such position that the needle penetrates it on descending. By raising or lowering the adjustable slotted plate the extent of the needles' vibration may be varied.

Claim.—The revolving disk *k*, arm *L*, carrying a detachable needle, *n*, and the adjustable slotted plate *I'*, in combination with the vibrating lever *o*, its plate *Q*, projection *g*, and the adjustable stop *t*, the whole being constructed and operating as and for the purpose described.

80,890.—PHILIP N. WOLISTON, Springfield, Ohio, assignor to himself and FERRELL, LUDLOW & RODGERS.—*Brick Machine.*—August 11, 1868.—The clay is pressed through the tubular die in a continuous piece, to be afterward cut into bricks. The rods terminate near the mouth of the die, and the clay, in being forced through the same, is retarded in the center and thus made to pass out uniformly. Such form is given to the mouth of the die that the corners of the prism of clay shall first emerge from the die, and thus avoid the distortion which would otherwise arise from the increased friction and retardation of the corners of the clay in the die.

Claim.—1. The die *A*, in combination with rods *D*, arranged in relation thereto, substantially as and for the purpose set forth.

2. Forming the mouth of the die with projections in the middle of the sides at *A'*, substantially as and for the purpose set forth.

80,891.—GORHAM D. ABBOTT, New York, N. Y.—*Globe.*—August 11, 1868.—The printed sections of the flexible material are sewed together and made up in the globe form, or they may be cemented to some firm material, such as canvas, leather, or felt, made up in the globe form in sections, or, in the case of felt, made without seams, like hat bodies.

Claim.—A globe, constructed of flexible material, and distended by means of an elastic inflatable rubber bag, or with cork, hair, sponge, or other light elastic substance, substantially as described.

80,892.—HENRY ACKERMAN, Pittsburg, Pa.—*Corn Planter.*—August 11, 1868.—Means are afforded to allow the carriage to pass over irregular surfaces, and to raise and lower the drills as occasion requires. The marker is applied to the rotating spindle so that its ends shall enter the ground alternately, and leave marks which indicate the intervals at which the seed is dropped.

Claim.—1. Supporting the rear of the plauter by a single wheel, *B*, mounted on a rigid frame, in combination with the side wheels *O*, mounted on hinged frames, substantially as and for the purpose described.

2. The cultivators *m'*, secured at their upper ends to the angular levers *m*, substantially as and for the purpose described.

3. The removable T-shaped marker, substantially as and for the purpose described.

80,893.—EZRA ALE, Clearfield, Pa.—*Secretary.*—August 11, 1868.—The pulleys are actuated by a crank on the lower shaft, and the interior receptacles moved so as to be accessible through an opening in the case.

Claim.—The combination, with a secretary or book case, of the movable shelves or cases *H*, belts *G*, and pulleys *E* and *F*, substantially as and for the purpose described.

80,894.—ANDREW ANDERSON, Madison, Wis.—*Clamp.*—August 11, 1868.—Upon swinging the upper end of the lever forward and backward the effect

is to impart an opening and closing movement to each end of the jaws, and to reciprocate the plunger. The jaws have spikes which penetrate the joist and prevent the jaws from slipping when the plunger is used to press a floor plank to its place.

Claim.—The combination of the cams C C, the jaws A A, the lever E, the yoke H H, and the plunger F, all constructed, arranged, and operating as and for the purposes herein set forth.

80,895.—CARL F. AUSTEL, New York, N. Y.—*Machine for Printing Yarn.*—August 11, 1868.—The yarn is stretched on the two rollers of the movable carriage, which, being reciprocated, carries the yarn between the printing rollers.

Claim.—The movable carriage B, carrying two rollers, *a*, and a rack, *c*, in combination with printing rollers *e f*, suspended in the standard *g*, substantially as and for the purpose herein shown and described.

80,896.—ALEXANDER T. BALLANTINE, Titusville, Pa.—*Torpedoes for Oil Wells.*—August 11, 1868.—The plunger is first submerged, and then by pulling the lowering wire till the plunger strikes the bail, and suddenly releasing the wire, the plunger will be violently shot down by the pressure of the water upon its top and a corresponding area of the bottom of the body, the effect being to explode the percussion cap or pellet against the bottom of the pocket.

Claim.—1. The hollow and loaded exploding plunger E, acting by the pressure of the water on its end, to ignite the charge, substantially as specified.

2. The combination of the hollow and loaded exploding plunger E, with the close cylinder or pocket D, arranged to project down within the body or magazine A, said plunger and pocket being so constructed as that the latter forms an anvil, and the former carries a percussion cap or pellet, for operation together, to fire the charge in the plunger, and through the bursting of the latter and its pocket, also the charge in the body or magazine A, essentially as herein set forth.

3. The combination of the free or independent exploding plunger E with the body A, and its bail C, in such manner as that the torpedo is or may be suspended through a loop made in the lowering wire or rope, directly by said plunger, and indirectly by or through its bail, substantially as shown and described.

80,897.—GILBERT W. BARNES, Mount Vernon, N. Y.—*Safety Bridle.*—August 11, 1868.—The supplemental straps are united at one end to the sides of the check straps, and each is provided at that end with a buckle which holds the other end of said strap. In the loop thus formed the bit is suspended. On pulling the reins the check strap is drawn through the bit rings.

Claim.—The supplementary straps E, detachable and adjustable, as applied and combined with the single check strap A of the safety bridle, substantially as and for the purpose herein described.

80,899.—ELIAS BECKER, Pittsburg, Pa.—*Table, Desk, &c.*—August 11, 1868.—The writing attachment is inclosed within the table when not in use.

Claim.—The combination, with tables, desks, or other similar articles, of the sliding frame B, provided with the tablet C and spring E, substantially as and for the purpose described.

80,899.—HENRY BLAKE, East Pepperell, Mass., assignor to himself, GEORGE W. BLAKE, OTIS BLAKE, and JAMES BLAKE, same place.—*Belt Knife.*—August 11, 1868.—The shape of the blade is adapted to form the elongated perforations necessary for inserting the belt fastenings patented by G. W. Blake, March 26, 1861. The blade may be forced through the belt either by hand or by a mallet.

Claim.—The improved belt-punching knife, herein described, as a new article of manufacture.

80,900.—ROBERT BLAKE, Scranton, Pa.—*Machine for Punching Axe Polls.*—August 11, 1868.—The former or formers, made upon the dies, or operating in connection with them, prevent the necessity of trimming the bit end by giving the required

shape to the bit end at the same time that the poll is punched. The edging dies gives the required outline to the edges of the poll in the act of cutting the same from the bar.

Claim.—1. In a machine for punching axe polls and other tools, the combination with the punching pin and squeezing dies of a bit-end former or die, constructed as herein specified, and applied to the end of the dies in which the bit end of the poll is received or shapen in the manner described: that is to say, so that when the squeezing dies are brought together, the said "former" shall completely close the said end of the dies, substantially as herein shown and set forth.

2. The combination with the shears of the edging dies or formers operating in connection therewith, in the manner described, so that the poll shall simultaneously be "edged" and severed from the stock, substantially as herein shown and set forth.

3. The combination of the shears and edging dies with the cross-head, which carries the squeezing-dies, under the arrangement and for operation as herein shown and specified.

4. The combination, in a machine such as described, of the squeezing dies, "bit-end" former, shears and edging dies, when the same are operated simultaneously from a single cross-head, substantially in the manner and for the purposes shown and set forth.

80,901.—AUGUSTUS O. BOURN, Cranston, R. I.—*Elbow Support for Flexible Hose.*—August 11, 1868.—The rings are placed within the hose to prevent the same from collapsing under the action of the pumps. The ribs of each ring project into the spaces of the adjacent ring, and form eyes through which a wire is roved. The eyes permit sufficient movement of the rings to afford the necessary flexibility to the hose.

Claim.—The improved hose-rings A A, constructed and held in connection, substantially as described for the purposes specified.

80,902.—JOHN STRICKER BRADFORD, New York, N. Y.—*Ferry Bridge.*—August 11, 1868.—Persons or objects falling upon the surface of the platform slide toward the bridge, the raised edge of the platform preventing them from sliding off into deep water. It is a safeguard against the loss of life by drowning in the event of a person falling overboard, either from the end of the boat or bridge.

Claim.—A platform or grating, attached to a ferry bridge, whether submerged, or at or above the surface of the water, constructed substantially as herein described, and for the purpose set forth.

80,903.—JAMES BRIGGS, Lyons, Ohio.—*Sewing Machine.*—August 11, 1868.—By means of the shifting sleeve clutch and gear arrangement, the roller upon which the log rests may be rotated in either direction, for the purpose of adjusting the log endwise. A winch is also provided for raising and lowering the slotted, pivoted ways in which the saw pitman slides, so as to cause the saw to rest properly upon the log.

Claim.—1. The shaft B, with gear wheel *b*, sleeve clutch *b*¹, loose gear-wheels *b*², the spring E, lever F, shaft G, with gear wheel *g*, and pinion *g*¹, the shaft H, with gear-wheels *h* and roller *h*¹, the whole being combined and operated in the manner and for the purpose described.

2. The standard C C, shaft D, wheel *d*, pitman I, ways J, and stays J¹, in combination with standard K, shaft *k*, and strap *k*¹, when operated in the manner and for the purpose herein described.

80,904.—JACOB BROBST, Fort Wayne, Ind.—*Metallic Heel Pattern.*—August 11, 1868.—This adjustable heel pattern is for marking boot heels of different size. The device is set at the desired size, and the form is marked off the same as by solid patterns. The point of an awl is inserted through corresponding holes at the sides of the pattern, and a line drawn from these punctured points of the leather gives the front of the heel.

Claim.—1. Segments A A', hinged and operated in the manner and for the purposes described and set forth.

2. The combination of the hinged segments and

curved slotted arm and stud, and set screw, the same being constructed in the manner and for the purpose set forth.

3. Perforations $a a'$ on the edge of section A A', for the purpose of admitting the point of a sharp instrument, as described and for the purposes set forth.

80,905.—JOHN BROCKENSHIRE, Oswego, N. Y.—*Pump*.—August 11, 1868.—The chamber situated between the barrels receives the elevated water at a point somewhat above the lower stationary valves, so that such water, on its way to the exit nozzle, shall be compelled to descend in said chamber, and produce a vacuum around the suction pipe therein, and thus aid the plungers in elevating the water.

Claim.—1. The internal chamber E E, in conjunction with the suction pipe D, as arranged relatively with the barrels A A, plungers B B, valves C C, and discharge outlet P, substantially as herein described and for the purpose set forth.

2. In combination with the parts above, the opening in the partition G, said opening being in line with the suction pipe D, as and for the purpose described.

80,906.—NATHANIEL W. BROOME, Baltimore, Md.—*Apparatus for Cutting Tobacco*.—August 11, 1868.—The apparatus is placed in a curing room, and the heated air, as well as the smoke and products of combustion of the burning fuel therein, ascend and pass through and around the tobacco.

Claim.—The arrangement of escape pipes and deflectors on the shell or jacket of the heater, so that the rising up of the heated air shall be passed outward and through the escaping products of combustion, and the former aid the latter in being uniformly disseminated throughout the curing apartment, substantially as described.

80,907.—A. R. BYRKIT and C. S. BIRKET, Fairfield, Iowa.—*Sewing Machine*.—August 11, 1868.—The oblique action of the shuttle obviates the "twill" which is characteristic of machines of this class, by reason of the peculiarity of the stitch or passage of the locking thread in opposite directions from the double-pointed shuttle through the successive loops of the needle thread, first, in the direction of the feed and then reversely thereto. The heart-shaped cam admits of the machine being reversed at any time without missing a stitch.

1. The combination, with the shuttle face-plate, arranged obliquely to the feed movement, of the obliquely-moving vibrating carrier and double-pointed shuttle, substantially as and for the purpose set forth.

2. The combination of the heart-shaped cam N with the feeding mechanism described, for operating the feed, in whichever direction the machine is run, essentially as herein set forth.

80,908.—JULIUS CALLAN, Bridgeport, Conn.—*Needle-Sharpening Attachment for Sewing Machines*.—August 11, 1868.—The needle may be repointed or sharpened by the grinding wheel.

Claim.—The combination with the bobbin winder of a sewing machine, a grinding wheel H, arranged upon the revolving mandrel, substantially in the manner and for the purpose set forth.

80,909.—WILLIAM CARLETON, Boston, Mass.—*Lamp Burner*.—August 11, 1868.—This invention relates to that class of burners in which the chimney, resting upon a seat formed below the elevated deflector, is sustained in position by means of springs bearing outwardly against its inner surface; and the improvements have reference principally to the method of supporting the deflector in its elevated position, and of forming the chimney-holding springs.

Claim.—1. Forming the elevated deflector and the supporting standards upon its periphery in one continuous piece of metal, substantially as and for the purpose set forth.

2. Forming the elevated deflector, its supporting standards, and the chimney-holding springs in one continuous piece, substantially as herein shown and set forth.

3. The arrangements of the standards and chim-

ney-supporting springs in alternate order upon the periphery of the deflector, in the manner shown and described.

4. The combination with the air distributor and the elevated deflector, with its chimney-holding springs and standards, of a bent-over ring for holding the deflector to the air distributor, whether the said ring be formed in one piece with said standards or separately therefrom, as and for the purposes set forth.

5. The combination of the elevated deflector and its downwardly-extending peripheral springs with the chimney and chimney seat and shoulder formed on said seat or the air distributor to prevent the excessive yielding of said springs, as herein shown and set forth.

6. The combination with the base and wick tube of a sleeve for supporting the deflector and air distributor, held upon the base and wick tube in the manner described, and provided near its lower end with perforations or openings for the supply of air directly to the flame, as set forth.

80,910.—W. H. CARPENTER, New York, N. Y.—*Form Block for Basket*.—August 11, 1868.—Designed to facilitate the removal of finished baskets from the block or former upon which they are placed in the process of manufacture.

Claim.—The combination of the expanding or movable sections E, the supporting ring D, and the conical wedge B, substantially as and for the purpose herein specified.

80,911.—JOHN C. CARROLL, Litchfield, Ill.—*Oil Cup for Steam Engines*.—August 11, 1868.—The measuring chamber allows a fixed quantity of the lubricant to pass down to the cylinder at each opening of the valves. The valves are raised and lowered by turning the lever and screw cap.

Claim.—1. The oil cup A, when provided with double valves B¹ B², and an intervening measuring chamber, b¹, substantially as herein shown and described.

2. The combination and arrangement of the screw-cap A¹, lever A⁴ and valve rods B b⁴, substantially as described and set forth.

80,912.—EDMUND CASTLE, Lincoln, N. C.—*Quartz Crusher*.—August 11, 1868.—The grooves in the housing plates enable the sides of the housing frame, the inclined tables, and the covering to be joined by water-tight joints without bolts or other fastenings. The swinging gate and adjustable table govern the delivery of the pulverized ore from the mill.

Claim.—1. The end housing plates C C of a quartz-crushing mill, provided with the grooves for holding the side portions, and the inclined tables D E, and the bottom of the hopper, substantially as and for the purpose described.

2. The combination, with a quartz mill, of the swinging gate I, provided with a metal plate, the inclined table D, and the adjustable plate f, substantially as and for the purpose described.

80,913.—GEORGE W. CHIPMAN, Boston, Mass.—*Carpet Lining*.—August 11, 1868.—The sheets of paper and of soft, fibrous filling are secured together or from relative lateral displacement by spots or lines of cement distributed over the contiguous surfaces at such intervals as to permit the lining to preserve fullness and elasticity.

Claim.—A carpet lining, the wadding and paper sheets of which are confined together by the lines or spots of cement, substantially as set forth.

80,914.—PATRICK G. CLANEY, Augusta, Me.—*Sheep Shears*.—August 11, 1868.—The under side of the central blade is beveled off in order to prevent the skin from being cut, and its extremity is rounded and reduced that it may readily penetrate the wool.

Claim.—The employment of the center blade C, constructed with parallel cutting edges, substantially as and for the purpose set forth.

80,915.—LEANDER COLT, Niagara Falls, N. Y.—*Auger*.—August 11, 1868.—This attachment may be slipped on a bit, auger, or gimlet, and fastened there-

on for the purpose of boring a plug hole and screw hole in wood at the same time; and said attachment may be reversed and used for cutting plugs of wood of the proper size to fill the plug holes and cover the screws in the screw holes.

Claim.—The reversible attachment B B, constructed as described, that is, having a bit at one end, and hollow auger at the other, when operated in connection with the gauge *c** and auger A, as and for the purpose described.

80,916.—THOMAS COLWELL, Troy, N. Y.—*Cooking Stove.*—August 11, 1868.—The rake is attached to the grate at either the upper or under side thereof and vibrated horizontally to shake down the ashes.

Claim.—1. The employment of the rake C, constructed and arranged with zigzag bars *a*, substantially as shown at Fig. 6 of accompanying drawings, in combination with the stationary grate B, and with the ash pan or drawer A, the whole being arranged in the manner substantially as herein contained, described, and set forth.

2. The rake C, so arranged and constructed with zigzag bars *a*, substantially as shown at Fig. 6 of the accompanying drawings, and in the manner and for the purposes substantially as herein contained, described, and set forth.

3. The employment of the handle or lever J, in combination with the rake C and with the hearth of the stove, so that the rake C may be vibrated in a horizontal plane, when used in connection with the grate B and ash pan or drawer A, in the manner substantially as herein described and set forth.

80,917.—CHARLES O. COOK, ROCKFORD, Ill.—*Coopers' Croze.*—August 11, 1868.—The iron is attached to the screw by pushing it forcibly against the spring and shoulder, in which case the spring yields sufficiently to permit the head of the screw to pass by the shoulder and rest in the socket. To detach the iron its free end must be pulled up from the croze (the holding screw having been loosened) far enough to force the spring open, whereupon the head of the screw is permitted to slip out.

Claim.—The arm *b*, shoulder *b*¹, and spring *b*² of cutting iron B, when combined and operated in connection with the head of screw C, as and for the purpose described.

80,918.—MATTHIAS P. COONS, Brooklyn, N. Y.—*Carbureter.*—August 11, 1868.—Air or gas is discharged into the distributor, rises thence through the pumice stone and through the pores of the brick, and being thus amalgamated with the hydro-carbon liquid is taken off at the top of the retort, for consumption. Crude oil may be filtered prior to introduction to the retort, and the temperature of the retort may be regulated by a steam coil or by a lamp or burner beneath the base.

Claim.—1. Saturating the pumice stone and the series of corrugated porous bricks D, contained in the case A, with hydrocarbon liquid, and drawing off the surplus liquid by means of the siphon pipe I, communicating with the distributor G, as herein described for the purpose specified.

2. The perforated distributor G, arranged in the bottom of the case, beneath the pumice stone and porous bricks D, and above the coiled steam pipe B, as herein described for the purpose specified.

3. The construction and arrangement of the closed case, filled with pumice stone, and the series of corrugated porous bricks D, the distributor G, coiled steam pipe B, siphon pipe I, the air pipe F, extending through the centers of the porous bricks D, the discharge pipe K, the air vessel A, all operating as described, whereby no accumulation of gas is effected as herein set forth.

80,919.—DAVID COX, Cincinnati, Ohio.—*Rocking and Reclining Chair.*—August 11, 1868.—When the chair is used as a rocker, the leaf, foot rest, and arms are folded under the seat. To place the chair in a condition to accommodate the body in a recumbent position, it is thrown back until the studs meet the hooks, after which the foot rest is unfolded.

Claim.—1. The combination, substantially as described, of the chair A, rockers B B', trestles C C' :

c', flexible straps E E' *e e'*, stops *f f'*, leaf G *g*, foot rest I, and slotted arms J J' K K' *k*, or their mechanical equivalents, for the purpose set forth.

2. In combination with the elements A, B B', C C' *c c'*, E E' *e e'*, *f f'*, G *g*, I, and J J' K K' *k*, the studs L and fixed hooks M, for the object stated.

80,920.—DAVID B. COX, Troy, N. Y.—*Damper.*—August 11, 1868.—If the stove pipe extend upward from the outlet or thimble, the cheek damper is applied so that the air shall ascend in joining the draught, and *vice versa*.

Claim.—The reversible ventilating cheek damper, consisting of a damper, F, attached to an extension, *e*, of the stovepipe C, projecting in a direction opposite to or different from the said pipe, and reversible with it, substantially as and for the purpose herein specified.

80,921.—HENRY A. CRANCE, Lewisburg, Pa.—*Churn Dasher.*—August 11, 1868.—Air is imprisoned by the cones as they descend into the cream, and the cream is agitated by said air as it escapes upward.

Claim.—The attaching of the cones C C C C to the arms of a churn dasher, in the manner and substantially as described.

80,922.—MOSES G. CRANE, Newton, Mass.—*Electro-Magnetic Alarm.*—August 11, 1868.—Consists in combining with the magnet and the locking and releasing mechanism, through which, by the vibration of the armature, the bell hammer is alternately released to be thrown against the bell, and locked after giving its blow, a counterbalanced hammer so arranged that it is thrown with a slight force to effect a quick and impulsive blow.

Claim.—1. In combination with the electro-magnet and its armature, the balanced hammer, connected with the armature mechanism, and arranged to be operated substantially as shown and described.

2. In combination with the striking mechanism, the stops *x y*, and finger *a*², or an equivalent locking and disengaging mechanism, substantially as described.

80,923.—HENRY CROSSLEY, Brooklyn, N. Y.—*Lubricator.*—August 11, 1868.—The upper valve is provided with a soft metal seat, and the screw of the cover answers the double purpose of securing the cover and tightening the valve joint.

Claim.—The oil cup, having its upper valve combined with the cover, applied to the cup, all substantially as herein shown and described and for the purposes set forth.

80,924.—WILLIAM CUMMINGS, Sacramento, Cal.—*Belt Buckle.*—August 11, 1868.—The shoulders or rings limit the penetration of the points, which are pressed into the sockets of the plate by a back lever, to which the end of the belt is attached, said lever pressing against the points in consequence of the tension of the belt and the direct pressure of the body against the same.

Claim.—1. The points, provided with shoulders or rings near the end.

2. The lever, so arranged as to press said points through the belt and against the plate, substantially as set forth and described.

80,925.—SAMUEL G. DARE, New York, N. Y.—*Carpet Stretcher.*—August 11, 1868.—One set of teeth are presented to the planks of the floor and constitute a fulcrum upon which the plate is vibrated by the detachable handle. The other set of teeth are presented in the opposite direction, and, rising, they grasp the carpet, and then carry it, in the act of descending, toward the point where it is to be tacked. The operator uses his weight to maintain, during the backward movements of the lever, what is gained by the forward movements thereof.

Claim.—A carpet stretcher, having its teeth *a* and *b*, and movable handle *c*, arranged substantially as described, whereby it is caused to act upon the under side of the carpet, substantially as herein described.

80,926.—Dr. W. E. DARRAH, Baltimore, Md.—*Vapor Burner.*—August 11, 1868.—The detachable burner being applied to the wick tube is heated by a

match so as to generate vapor from the wick. This vapor escaping at the jets, and being ignited, produces the illuminating flame, and the heat of the burner being maintained and increased thereby, said burner continues to generate the vapor.

Claim.—The burner, composed essentially of the parts A A' and *a*, having the jets *c c*, when constructed substantially as and for the purpose specified.

80,927.—S. L. DENNEY, Christiana, Pa.—*Casing for Railway Car Stove.*—August 11, 1868; antedated July 30, 1868.—The base is secured to the floor, the stove set in the base and secured thereto, and the cylinder then placed over the stove and secured also to the base. In the event of the upsetting of the cars the stove will be retained in position, while the weighted arm will fall into jaws and prevent the escape of fire through the pipe hole. As the strengthening ribs of the cylinder intervene, the stove cannot rest against the cylinder.

Claim.—1. The casing A, provided with ribs *i i*, in combination with a railroad car stove, substantially for the purpose set forth.

2. The combination of base B with casing A, as and for the purpose described.

3. The weighted arm or lever *h*, operating in the manner and for the purpose specified.

80,928.—J. S. DETRICK, San Francisco, Cal.—*Lathe Chuck.*—August 11, 1868.—The chuck is attached to a back plate upon which it is made to slide with the work which it contains, so that the work may be moved from the center for boring or turning without removing the chuck from the lathe.

Claim.—The back plate D, constructed as described, in combination with the sliding chuck and adjusting screw C, all substantially as set forth.

80,929.—CHARLES DISSTON, Philadelphia, Pa., assignor to HENRY DISSTON, same place.—*Saw.*—August 11, 1868.—The tooth being forcibly driven into place, is held without the aid of fastening appliances.

Claim.—A detachable saw tooth, having a circular elastic base, adapted to a circular recess in the blade, when there is on the edge of the said base or recess, and from the circular line which defines the same, such a projection or protuberance that the elastic base will yield on fitting the tooth to its base, all as herein set forth for the purpose specified.

80,930.—W. F. DURFEE, New Bedford, Mass.—*Power Crane.*—August 11, 1868.—The object suspended by the hook may be raised and lowered by the rotation of the upright screw, the latter being turned in either direction by a clutch and pulley arrangement. The elevating hook being an appendage of the carriage, the raised object may be drawn inward on the rails by turning the shaft provided for that purpose.

Claim.—1. The screw B, with the nut *e'* and pulleys D D attached, in connection with the chains E E and carriage H, all arranged and applied to the crane, to operate in the manner substantially as and for the purpose set forth.

2. The lever F, in combination with the chains E E, for the purpose of compensating for any inequality of tension between the two chains, as herein set forth and shown.

3. The spirally grooved pulley M on the shaft L, rope or chain Q, and the shaft L, operated by the screw gear, all arranged for moving the carriage H on the bars *b b*, substantially as set forth.

4. The bevel wheel *h* on the screw B, and pinion *c'* on shaft A', arranged substantially as shown and described, for turning or adjusting the crane.

80,931.—WRIGHT DURYEA, Glen Cove, N. Y.—*Door Spring.*—August 11, 1868.—The chief object is to so construct the hinge that it shall not present the bulky appearance of such as have the closing spring confined within a tubular joint. The spring, though lying within the jamb, is, together with operating gear, made to form part of the hinge proper. The invention includes a swinging crane arranged as a free attachment to the hinge, and operated by the chain and door to give a more effective angle for the pull of the chain on the door.

Claim.—1. The combination, with the hinge proper,

of the drum H, chain or band L, spindle G, spring J, worm wheel I, and screw K, for operation together, essentially as herein set forth.

2. The arrangement, substantially as described, of the screw K, relatively to the working mechanism of the hinge, and whereby the tension of the spring may be adjusted from the exterior of the jamb, as specified.

3. In combination with a self-closing hinge, the swinging crane M, arranged for operation by the chain and door, as described, and serving to give a more effective angle for the pull of the chain on the door, as herein set forth.

80,932.—P. S. DUSOUCHET, New Orleans, La.—*Switching Apparatus for Street Railway Car.*—August 11, 1868.—The rock arm articulates upon the front axle of the car, midway between the wheels, and between two fixed collars thereon, and is operated by the driver, through the medium of chains and a lever. The guide arm, bearing against the short, curved bar or rail, midway between the rails, at the point of intersection, forces the car from one into another track.

Claim.—The rocker arm A, when provided with the radiating guide arm B and the weighted arm B', in combination with the lever C and chains *d e f*, the whole being constructed, arranged, and operating conjointly, substantially as herein described for the purpose set forth.

80,933.—CHARLES F. ESPICK, Plymouth, assignor to himself and JOSEPH and JOHN STOUGH, Marshall County, Ind.—*Tuyere Iron.*—August 11, 1868.—The position of the plate may be changed, and the draught regulated accordingly, by means of the screw.

Claim.—The arrangement of the screw D, plate C, and hinged bottom E, with the tuyere box, constructed and operating as set forth.

80,934.—LOUIS DÉSIRÉ JEANDRON-FERRY, Paris, France.—*Shoe for Bathing and other Purposes.*—August 11, 1868.—The wire gauze prevents the entrance through the water outlet perforations of gravels and such other particles as would injure the feet.

Claim.—1. A shoe, constructed with a perforated sole, through which, on the bather emerging from the water, egress is provided for the water from the interior of the shoe, substantially as herein described.

2. The metallic gauze, in combination with the perforated sole, substantially as and for the purpose herein specified.

80,935.—GILES F. FILLEY, St. Louis, Mo.—*Coal Stove.*—August 11, 1868.—Air passes through the open casing of the fire pot and through the space between the cones, when it mingles with the ignited gas to enhance combustion.

Claim.—Forming the fire pot of a coal stove of two cones B and D, having an opening or air streak, *s*, between their bases, for the admission of atmospheric air, when the same are arranged, constructed, and operated substantially as herein set forth.

80,936.—DANIEL FITZGERALD, New York, N. Y.—*Fire and Burglar Proof Safe.*—August 11, 1868.—Several shells are placed one within the other and one or more thereof are corrugated, for strength to withstand the blows of a sledge, or the like, and one or more are made in sections and hardened, to resist the operation of drills.

Claim.—1. In the construction of safes for security, the employment of the corrugated ease or cylinder.

2. In combination therewith, the outer cylinder or ease, as described.

3. The inner cylinder or ease in longitudinal sections, in combination with a ease or cylinder to surround the same and hold it in place.

4. The inner cylinder or ease in transverse sections, in combination with a suitable surrounding cylinder or ease to hold said sections in place.

5. The inserted metallic head, substantially as described.

6. In combination with a corrugated ease or cylinder, and the outer casing thereto or the inner ease, the filling in of the space formed under the arches of

said corrugations and other interstices, with a fire-proofing material, substantially as set forth.

80,937.—WALTER FORSHEE and JESSE L. JUDD, Marathon, N. Y.—*Machine for Tinners' Use.*—August 11, 1868.—This machine is especially designed for cutting out flaring work, such as the sides of pans, pails, and basins. The dies are adjustable to suit the size of the work. The sectional construction of the cutting part of the die enables the knives to be readily detached for sharpening.

Claim.—1. Forming the knives or cutting parts P of the die N in four or more pieces, separate from and adjustably secured to the body N of the die, substantially as herein shown and described, and for the purpose set forth.

2. Making the grooves O, which receive the dies N, adjustable, substantially as herein shown and described, and for the purpose set forth.

3. The combination and arrangement of the bed plate A, standard B, braces C, curved horizontal guide D, dies L M and N P, rod E, hooked lever G, spring K, connecting rod I, and treadle or foot lever J, with each other, substantially as herein shown and described, and for the purpose set forth.

80,938.—A. FROST, Seymour, Ind.—*Apple Corer and Cutter.*—August 11, 1868.—The slides are, by means of the lever, advanced toward the tube on which the apple is fixed, and as soon as the core is cut out, the cutter slide comes to rest, while the other slide continues to advance, causing the annulus to force the apple against the quartering knives and pushing the quarters through an opening in the board.

Claim.—1. The slide C, provided with rod d, head G, and knives ee, in combination with tube b, in the center of the circular hole on the board D, all constructed substantially as described, for the purpose of cutting the core out of apples, as herein set forth.

2. The combination and arrangement of the grooved head piece A, board D, lever H, slides B and C, knives a a and ee, and annular disk F, all constructed as described, and operating substantially as and for the purposes herein set forth.

80,939.—WILLIAM T. FRY, New York, N. Y.—*Flask or Bottle.*—August 11, 1868.—The papier-maché or other covering is protected against the action of water or alcoholic liquid by the japan varnish.

Claim.—A covering for dram flasks, or other glass bottles, composed of papier-maché, or an analogous substance, or a textile or felted fabric, fitted on the flask or bottle, and coated with japan or other water-proof varnish, substantially as shown and described.

80,940.—J. M. GATTMAN, New York, N. Y.—*Manufacture of Carbonate and other Salts of Soda.*—August 11, 1868.—According to this process, (which cannot be briefly described,) the sulphuric acid, as well as the lime incident to the common process, is entirely done away with; and the loss of costly material and the accumulation of an obnoxious residue are prevented.

Claim.—The manufacture of chromate of soda and the carbonate of soda, by the process substantially as described.

80,941.—HENRY A. GILBERTSON, New York, N. Y.—*Hose Tender.*—August 11, 1868.—The covering for the wheels protects the fireman from contact therewith. The fireman may ride on seats mounted upon said covering.

Claim.—A hose tender or carriage having coverings or protectors b b, seats e e e e, and brace d, in substantially the manner described and shown, and for the purpose set forth.

80,942.—ROSCOE E. J. GOULD, Newark, N. J.—*Dovetailing Machine.*—August 11, 1868.—Relates to improvements in the class of dovetailing machines in which two sets of saws are employed, one set for producing the tenons and the other the mortises or grooves. The invention consists chiefly in cutting dovetails from the bottoms of the grooves in such a manner that the distance between said bottoms shall be uniform and true, notwithstanding

the non-parallelism of the opposite edges of the board.

Claim.—1. The within-described method of cutting dovetails, by working from the bottoms of the grooves, or of the spaces between the "tenons," consisting of the adjustable stops e, in the slides of the upright gauges F J, or any equivalent means which will produce the same result.

2. The adjustable stops e, extending down into the "grooves" or spaces between the tenons, and secured in the slides e, which are movable up and down on the upright gauges F J, substantially as and for the purpose set forth.

3. The slotted bracket h, in combination with the fulcrum pin g of the swinging abutment I', substantially as and for the purpose described.

4. The combination of an abutment, I or I', with an upright gauge, F or J, movable in one direction, and provided with a slide, e, which is movable in a direction at right angles to the motion of the gauge, substantially as and for the purpose set forth.

5. The double-acting vertically-movable slides e in the upright gauges J J', substantially as and for the purpose described.

6. The arrangement of two abutments, I I', extending across the carriage H in different directions, and at angles which are supplements to each other, said abutments being provided with upright horizontally-adjustable gauges J J', and vertically-adjustable slides e, substantially as and for the purpose set forth.

80,943.—HENRY GREENFIELD, New York, N. Y.—*Mode of Canceling Postage and Revenue Stamps.*—August 11, 1868.—By printing or stamping with a solution of sulphate of ammonia, each single stamp may be canceled; and by applying fumes of sulphur in a gaseous form, a large number of stamps may be canceled simultaneously, to admit of which latter process the letters or papers, to which the stamps are affixed, are inclosed in a box.

Claim.—1. A postage or revenue stamp, prepared with acetate of lead, or other chemical, so that it can be canceled by the action of sulphate of ammonia, or other chemical, as a new article of manufacture.

2. The within-described process of canceling postage or revenue stamps simultaneously in quantities, by exposing them to the action of fumes of sulphur, or of other chemicals, in a gaseous form, substantially as set forth.

80,944.—BENJAMIN GREGG, Bennington, Vt.—*Bed Bottom.*—August 11, 1868.—The spring yields or responds to a weight until the end of the slat itself rests upon the spring, near the point of attachment to the bedstead, the spring being then relieved of further strain.

Claim.—The bed bottom, formed of plate spring e, attached to the frame b by the clamping pieces d, and formed with the croches or saddles e, at their moving ends, receiving the slats g g, as and for the purposes specified.

80,945.—EMIL HAASS and MAX A. F. HAASS, Mendota, Ill.—*Liquid Cooler.*—August 11, 1868.—The ale is conducted from the vat into the upper end of the trough, through which it runs, in a shallow stream, over the cool water, which passes in an opposite direction in the pipe below, the ale and water being separated only by a thin sheet of metal. The cooling effect is increased by the fans which throw currents of air downward upon the trough.

Claim.—The trough B and pipe B', constructed and arranged as described, in combination with fans E' E', arranged as described, the whole being operated in the manner and for the purpose set forth.

80,946.—JOHN S. HALL, Pittsburg, Pa.—*Nut Machine.*—August 11, 1868.—Under this arrangement of mechanism the nut is made by blows, instead of positive, limited pressure.

Claim.—1. The arrangement of the holing punch F, cutting-out swaging punch D, ram C, and half-toggles R R, T, with the weighted levers V W, all constructed and operated substantially in the manner described.

2. The arrangement of the perforated follower I,

matrix box H, and holder J, with slotted lever M and weighted crank lever P Q, the whole constructed and operated as herein shown and described.

3. The improved machine, as described and shown, for making nuts from hot bars of iron, in the manner specified.

80,947.—JOHN HAMMOND, Lattisburg, Ohio.—*Machine for Handling Hides.*—August 11, 1868.—The frame on which the hides are hung is placed inside of the vat and has rollers which run on the cleats, so that the frame may be easily raised or lowered.

Claim.—The frame C, provided with the rollers *a a*, in combination with the cleats B B on the sides of a vat, for the purpose of easier handling the hides, substantially as herein set forth and described.

80,948.—DAVID HARRINGTON, Worcester, assignor to himself and S. A. WOODS, Boston, Mass.—*Loose Pulley.*—August 11, 1868.—The oil chamber and oil passages are so constructed that the journal is kept free from excess of oil by centrifugal action when the wheel is rotating, while, at whatever point it stops, some one or more of the oil passages will be in position to cause the oil to be carried by capillary attraction to the shaft.

Claim.—1. In combination with the bushing *b*, (and oil passages leading through it,) and the surrounding oil chamber *c*, the enlargement of such chamber from its ends toward its center, substantially as and for the purpose set forth.

2. In combination with the enlarging chamber *c*, the bridges *g*, for keeping the oil toward the center of the chamber, substantially as shown and described.

3. The flaring oil passages *d e f*, substantially as shown and described.

4. The collar *i*, placed upon the shaft, and leading into chamber *c*, substantially as shown and described.

80,949.—CHARLES J. HARRIS, Warren, R. I.—*Spinning Machine.*—August 11, 1868.—The object of these improvements is to obtain, in the same machine, the capacity of the flier-frame spinning machine to manufacture fine and evenly twisted yarns of high number and grade, with the rapidity of production which characterizes the ring-spinning-frame.

Claim.—1. A cylindrical flier, *a*, with a thread-guiding arm, *b*, hinged thereto, constructed substantially as herein described.

2. The arrangement of the flier *a b*, constructed as described, with the spindle A, to which it appertains, so that the relation of the two shall remain unchanged, by causing both to remain in fixed planes during the spinning operation, and the winding up of the bobbin, substantially as herein set forth.

3. The combination of the flier *a b*, the independent traverse arm *d*, the block *e*, all constructed as described, with a suitably operated traverse rail, E, substantially as described.

80,950.—GEORGE W. HEATH, Burlington, Pa.—*Horse Hay Fork.*—August 11, 1868.—When the lever is lowered the points of the arms are carried inward, and the shoulders are thus placed in position to support the hay. The points, below the shoulders, are sharpened, in order that the fork may penetrate the hay readily.

Claim.—The arrangement of the bars A A and their points *a a*, bars D D, pivoted as shown, and with points *b b*, connecting bars F F, and lever E, all constructed and operating as set forth.

80,951.—G. E. HEGERMAN, Brooklyn, N. Y.—*Tin Can.*—August 11, 1868.—The sides of the can are joined by solder, at the corners where they come together, and the edges of the bent plates are also united by solder, thus forming a double joint.

Claim.—So bending the edges of the plates that form the sides of a sheet-metal can that there may be two rows, *c d*, of solder at the junction of every two adjoining plates, substantially as herein shown and described.

80,952.—CHARLES H. HELMS, Poughkeepsie, N. Y.—*Machine for Scarfing Leather.*—August 11, 1868.—The horizontal cutter, opposed to the space be-

tween the rollers, cuts the leather obliquely as it passes through the same.

Claim.—The combination of the stationary horizontal cutter with the rollers *c* and E, or either of them, having their edges or peripheries beveled obliquely to the edge of the cutter, substantially as hereinbefore described and for the purposes set forth.

80,953.—CHARLES H. HELMS, Poughkeepsie, N. Y.—*Heel Trimmer.*—August 11, 1868.—The collar limits the depth of cut made by the burr. The adjustable table board adapts the burr cutter to the varying depths of the boot heels, and the stud or roller steadies and supports the heel while being trimmed.

Claim.—1. The spindle F, in combination with the burr cutter G, a collar or shoulder of metal, J, at its base, substantially as hereinbefore described.

2. The combination of the stand or frame A with the adjustable table board D and spindle F, substantially as hereinbefore set forth.

3. In combination with the adjustable table board D, the stud or guide roller K, substantially as hereinbefore set forth.

4. The combination of the adjustable table board D with the burr cutter G and collar J, substantially as hereinbefore set forth and for the purposes described.

80,954.—E. C. HENDERSON and R. A. HENDERSON, Albia, Iowa.—*Millstone Machine.*—August 11, 1868.—The crank handle is turned alternately in opposite directions, the effect being to move the lever back and forth in the same line, and simultaneously vibrate it in a vertical plane, thus imparting a succession of blows by the picking plates, at different spots.

Claim.—1. The sliding bearing blocks B, operated by means of the rack and pinion I J, for giving to the pick of a millstone-dressing machine a horizontal motion, substantially as shown and described.

2. The shafts C D, connected by gearing K L, and provided with the pinions I and eccentric O, when said shafts have their bearings in the sliding blocks B, and are arranged with relation to the rack J and frame A, substantially as herein described.

3. The pick lever E, when fitted at one end to turn upon the shaft C, and formed with an elongated eye, P, adapted to receive the eccentric O on shaft D, said lever being arranged to be operated both vertically and horizontally within the frame A, in the manner and by the means herein shown and described.

80,955.—JOHN GEORGE HIRZEL, Wilmington, Del.—*Meat Chopper.*—August 11, 1868.—The knives do not strike until after the rotating rim has, by its arm or wing, moved the meat slightly, a different part of the surface being thus presented to the blades at each stroke.

Claim.—The combination of any convenient number of knives or blades with the intermittent rotary knife block *h*, the block *k*, its toothed rotating metallic rim *l*, and arm or wing *m*, and the pawls *n* and *o*, and guide, all arranged and operating as described.

80,956.—THOMAS HOLT, Trieste, Austria.—*Steam Generator.*—August 11, 1868; patented in England, June 10, 1867.—The tubes or chambers are set parallel to each other, and in such relative positions as to afford easy access to the rivets, which connect the tubes together; and the surfaces of the tubes, by contracting and expanding under variations of temperature, tend to prevent the adhesion of scale or deposit. A hollow water bridge or diaphragm, forming the roof of the front part of the fireplace, extends to the bridge or division in the flue chamber, and the flame and gases are thus caused to pass into the chambers and burn over the divisions therein, and escape on the other side of the bridge to the up-take flue.

Claim.—1. The combination of the inclined flues E, dividing plate E', and the removable diaphragm I in the marine boiler, as herein described, for the purpose specified.

2. The combination of the flattened tube E, composed of metallic plates, having expanded ends and

braced internally by the balls or bars, said tubes being riveted together at their ends to leave water passages between their adjacent sides, as herein described, for the purpose specified.

80,957.—J. G. C. HORTON, Gillespie, Ill.—*Water Elevator*.—August 11, 1868.—The crab is a semicircular trough, affording bearings for the lower wheel. Its short legs settle into the ground and hold the device firmly in place. The perforations admit water to the buckets.

Claim.—1. The endless chain of buckets *A a'*, and the stationary crab *B*, when combined and arranged as described, and for the purpose set forth.

2. The crab *B*, when provided with short legs, *b*, and side apertures, *b'*, and otherwise constructed and arranged as described and shown.

80,958.—WILLIAM W. HUBBARD, Manchester, N. H.—*Scroll-Sawing Machine*.—August 11, 1868.—The yoke is of a yielding character, having a lateral motion corresponding with the strokes of the saw, to prevent the heating of the slides. The trusses are adjustable to suit the varying lengths of saws.

Claim.—1. The double yoke *A B*, supporting the slide *C*, operating in combination with the boxes *K K*.

2. The mode of adjusting the trusses *J J* by means of bearings *E E*, or their equivalent, in combination with the hollow beams *D D*, substantially as and for the purpose set forth.

80,959.—ALFRED HUFFNAGLE, Philadelphia, Pa.—*Key-Hole Guard*.—August 11, 1868.—When the key is to be used from the inside, the inner escutcheon is pushed to one side, opening the inside and closing outside keyhole, when, upon being released, the side of the escutcheon is pressed into a notch in the stem of the key. Access to the lock from the outside is then prevented by the other escutcheon, through which the end of the key nearly passes.

Claim.—1. The escutcheons *E* and *F*, stud *C*, and spring *D*, when constructed and used in the manner and for the purpose substantially as herein set forth.

2. The manner of retaining the key in the lock by the escutcheon *E* fitting into a groove in the shank of the key, against which it is pressed by a spring, substantially as herein specified.

80,960.—ROBERT HUNTER, New York, N. N.—*Propeller*.—August 11, 1868.—The pivoted blades or wings feather and close by self-action as the propeller is moved forward and backward in the line of the vessel's course.

Claim.—The oscillating lever *g*, adapted to be turned upon its axis for reversing, in combination with a pivot-float propeller, substantially as and for the purposes stated.

80,961.—E. W. INGLE, New Orleans, La.—*Guide and Marker for Sewing Machine*.—August 11, 1868.—The rough surface of the roller holds the fabric as it moves along or is fed up to the needle, which, every time it descends, brings the arm of the rock shaft down upon the edge, and marks the intervening fabric upon the line at which the next fold or tuck is to be made.

Claim.—1. The rock shaft *D*, when constructed substantially as described, and provided with a spring *e*, in combination with the slotted arm *C*, when constructed and operating as set forth, for the purpose described.

2. The combination of the plate *A* with the roller *B*, springs *m* and *n*, guide plate *E*, rock shaft *D* arm *C*, and edge *s*, when these several parts are constructed and conjointly operate substantially as herein described for the purpose set forth.

80,962.—J. D. ISRAEL, Utica, Iowa.—*Fence Post Driver*.—August 11, 1868.—When the hammer is sufficiently elevated, a lever is moved so as to disengage the hand wheel from the brace upon which said wheel is mounted, thus permitting the hammer to fall on the head of the post.

Claim.—The combination of the tripod, the hammer, the rope, the sleeve, the hand-wheel, and the lever, constructed and arranged substantially as described.

80,963.—THOMAS RICHARD JOHNSON, Montreal, Canada.—*Ventilating Hat*.—August 11, 1868.—Designed to afford ventilation and protection against sunstroke.

Claim.—A hat formed in three sections, *B*, *C*, *E*, and *F*, with their fastenings *D*, and apertures *G*, *H*, and *J*, combined and arranged as herein described, and for the purposes set forth.

80,964.—WILLIAM J. JOHNSON, New Orleans, La.—*Car Brake and Starter*.—August 11, 1868.—The sudden depression of the angular lever, which is done by the driver upon the platform, partially turns forward the car wheels. If, after such depression, the lever be instantly relieved from pressure, the vibrating movement of the lever aids in starting the car; but, if, when the actuating lever is thus depressed, it be so retained, it causes the spring band to act as a brake.

Claim.—The combination of the angular lever *h i*, the elastic metallic band *j*, the hinged block *k*, and the counter-spring *l*, with each other and with the car-axle pulley *g*, substantially in the manner and for the purposes herein set forth.

80,965.—GEORGE JOHNSTONE, Philadelphia, Pa.—*Knitting Machine*.—August 11, 1868; antedated August 1, 1868.—This machine produces a tubular fabric of any desired pattern. A series of bearded needles are so arranged and made to operate in conjunction with a series of fingers that the loops of yarn may be transferred from any of the needles to others: the said fingers being capable of such adjustment that any of the loops may be retained upon or discharged from them at any time desired, while any of the fingers may be thrown out of action with the needles at any time, without interfering with the operations of the fingers in action. By means of a presser wheel, constructed with movable plates, the beard of any needle may be depressed, when desired. Combined with above devices are pattern wheels, or chains, or jacquard apparatus, so that the operations of any of the same may be suspended, resumed, or varied, as may be required to produce any desired pattern.

Claim.—1. In a circular knitting machine, a series of bearded needles, arranged and operating in conjunction with a series of fingers, substantially as and for the purpose described.

2. Fingers, substantially such as described, hung to sections admitting of separate and independent movements in the arc of a circle, substantially as set forth for the purpose specified.

3. Fingers, substantially such as described, projecting from or forming a part of jacks, to which movements may be imparted by the devices herein described, or any equivalent to the same, that some of the needles may be covered by the fingers to a greater extent than others, for the purpose set forth.

4. The adjustable jacks, in combination with the guide bars *C⁸* *C⁹*, the plate *C*, and the slides *I²* *I³*, or equivalent devices, whereby the jacks may be brought under the control of one or other of the said bars, the whole being constructed and operating substantially as and for the purposes described.

5. The combination of jacks, a bar or plate *C⁷*, and the slides *I I¹*, or their equivalents.

6. Jacks, substantially such as described, in combination with a jacquard apparatus, pattern chain or pattern wheel by which the jacks are controlled through the medium of the devices herein described, or any equivalent to the same.

7. The sections *E*, with their jacks, in combination with a jacquard apparatus, pattern wheel, or chain, operating on the said sections through the medium of the levers *F* and adjustable rollers *p p¹* *p²*, or their equivalents.

8. A presser wheel, having movable plates, secured to or forming a part of the same, so that the said plates may be controlled in the manner and for the purpose described.

9. The fingers *r*, operating in combination with needles of different lengths, substantially as described and for the purpose set forth.

80,966.—Mrs. J. D. JONES, Jersey City, N. J.—*Sieve*.—August 11, 1868.—The flanged cylindrical straining vessel receives a rotary reciprocating mo-

tion and incloses the stationary serapers and presser, whose function it is to gather the material within the pan and squeeze it against the wire cloth. The cross bars beneath the wire cloth prevent it from sagging and serape adhering matter therefrom.

Claim.—1. The dish or pan A, or equivalent vessel, hoop B, annular plate C, flanged cylindrical vessel D, wire cloth E, and detachable hoop F, having cross bars G, attached to it, in combination with each other, said parts being constructed and arranged substantially as herein shown and described, and for the purpose set forth.

2. The presser and serapers I J K L M, constructed substantially as herein shown and described, in combination with the devices A B C D E F G, as and for the purposes set forth.

80,967.—NORMAN C. JONES, New York, N. Y.—*Bale Label.*—August 11, 1868.—Two parallel slits are made in the metallic tag, and the intervening portion of metal is bent up so as to form an opening through which to pass the bale rope or hoop, the tag being thereby secured to the bale.

Claim.—The metallic tag A, when constructed and used substantially as and for the purposes herein shown and described.

80,968.—W. O. JONES, Portland, Me.—*Hoisting Gear.*—August 11, 1868.—By means of this arrangement of clutch and wheels, power may be applied from the driving wheel to the internal gear wheel, and transmitted thence through power-multiplying gears, to the drum shaft; or the power may be applied directly from the driving wheel to the shaft, so that the drum and driving wheel shall have the same speed.

Claim.—1. The combination of the geared wheel *f* with the gears *c* and *e*, having shafts *k* and *m* on the face plate F, and when the clutch *h* is inserted at the recesses in *j*, substantially as and for the purposes set forth.

2. The combination of the clutch *h i*, on shaft C, with the gears *a b c d e*, and gear *f*, as and for the purpose set forth.

3. The combination of the small gears *a b c d e*, both fixed and free, when serving in connection with *f*, not only as levers to revolve the face plate F, as is the case with the gears having shafts, but also as friction rollers for the shaft C, substantially as herein set forth.

80,969.—MUNSON F. KENT, West Union, Iowa.—*Gate.*—August 11, 1868.—The post to which the flexible gate is attached may be rotated so as to wind the gate thereon, and thus open the roadway, and said post may also be raised, together with the gate and a frame sliding upon the stationary post, the object being to render the gate freely operative when its usual field of motion is blockaded by snow or otherwise.

Claim.—1. The vertical slats *a*, connected by the chain *h* to the post C, all constructed, arranged, and operating substantially as and for the purposes herein set forth.

2. The gate post A, in combination with axle F and cord K, by means of which said gate is raised, substantially as shown and described, and for the purposes set forth.

3. The vertical post C, in combination with the cord *a'* and weight *w*, by means of which said gate is opened, substantially as shown and described, and for the purposes set forth.

80,970.—THOMAS KERR, York, Pa.—*Fanning and Rocking Chair.*—August 11, 1868.—Motion is transmitted from the chair to the fan, the vibrating motion of the former being converted into a rotary motion as applied to the latter.

Claim.—The combination of the platform A A A, the projecting pins *n n n*, the upright O O, with lever B B, straps H H, strap F F, pulley B, shaft C C, and fan A A, as described.

80,971.—JOHN H. KEYSER, New York, N. Y.—*Combined Foot Rest, Grate, and Fire Brick Base.*—August 11, 1868.—The design of this invention is to combine with a circular flange foot rest for a stove, a means of supporting and keeping in place the fire brick lining and the tilting grate.

Claim.—1. Constructing a circular flange or foot rest for a stove, with a receptacle for a fire brick lining, substantially as described.

2. Constructing a circular flange or foot rest for a stove with grate bearings, substantially as described.

3. The combination of flange A, collars *c d g*, and depressions *a a'*, substantially as and for the purposes described.

80,972.—L. W. KIMBALL, Pittsford, Vt.—*Door Panel.*—August 11, 1868.—The panel is made of two thicknesses of paper board separated by a chamber in which paper board is placed so as to brace the two layers. The ends of the layers are joined together to form the tenon of the panel.

Claim.—The panel A, constructed with side pieces *b* and chambers B, with braces, arranged substantially as and for the purpose described.

80,973.—FRANCIS A. KINGTON, Mendon, Ill.—*Wagon Lock.*—August 11, 1868.—To apply the brake, the driver, on the load, merely draws the ratchet to the rear; to release it, he raises the ratchet from the beveled part of the staple.

Claim.—A break for wagons, adapted for operation by an operator on a high load, and having lever G, block H, ratchet K, staple S, and posts O O, constructed, arranged, and operating substantially as specified.

80,974.—JACOB KINZER, Pittsburg, Pa.—*Reversible Latch.*—August 11, 1868.—Provision is made for reversing the latch bolt so as to present its bevel to either side, according to the direction in which the door opens. In order to accomplish this, without disturbing other of the working parts of the lock, the casing plate is made in two parts, the upper part, when detached, exposing only the latch bolt and its follower.

Claim.—Constructing the plate A of a reversible lock in two pieces, in the manner shown and described, and operating in combination with the latch bolt C, and spring B, which latter is confined in the lower part of the casing of the lock, in the manner shown and for the purpose set forth.

80,975.—RICHARD KITSON, Lowell, Mass.—*Screen for Machines for Treating Cotton.*—August 11, 1868.—The objects are to prevent the wires from spreading apart or from wearing or cutting each other, and to more securely connect the ends of the screen to the heads thereof.

Claim.—A wire screen cylinder constructed as described, with wires soldered together at their crossings and at their abutting ends, and the ends of the screen soldered to the heads or ends of the cylinder.

80,976.—J. A. LAFLER, Albion, N. Y.—*Brick Machine.*—August 11, 1868.—The crank above the grinding mill is clutched to its shaft during that part of its revolution in which it acts to raise the press, but is afterward automatically disengaged from its shaft, that it may offer no resistance to the quick, falling or opening movement of the press. The object of the slide, which works through the slotted press box, is to close the upper side of the latter when pressure is applied in making pressed bricks. The slide is thrown out of action when the machine is employed for making common bricks.

Claim.—1. The self-releasing crank *i*, for operating the swinging press H, substantially in the manner and for the purpose set forth.

2. The method of securing the serapers and knives S S, in the shaft E, namely, the hooked taugs *v*, in connection with keys *t* and mortised hollow shaft E, substantially as and for the purpose set forth.

3. The combination of the swinging press frame H, telescopic press box F A, slide B, and driving devices *d D c C*, working from the foot of the grind shaft E, all constructed and operating in the manner shown, and for the purpose described.

80,977.—W. O. LESLIE, Philadelphia, Pa.—*Brick Press.*—August 11, 1868.—The reciprocating table has a mold in it, in which the brick is carried under a stationary plate, the brick being then pressed, carried from under the plate, and automatically re-

moved from the mold. The machine is for repressing.

Claim.—1. The tilting rack I, constructed and arranged to operate substantially as described.

2. The combination of the stationary plate C, sliding table B, with the mechanism for operating the same, and the cams G and H, when arranged for joint operation, substantially as set forth.

80,978.—NELSON LEWIS, Troy, N. Y.—*Spider.*—August 11, 1868.—The stops limit the movement of the cover in opening, and the ventilator affords a means of egress for the vapor arising from the contents of the spider.

Claim.—1. The employment of the hinged joint D, containing the stops E, the same being constructed and arranged upon the said spider A and cover B, respectively, and so combined as to allow or permit the said cover to swing or turn upon the upper edge of said spider, in the manner substantially as herein described and set forth.

2. The damper or ventilator c, in combination with the spider A and cover or lid B, substantially as and for the purposes herein described and set forth.

80,979.—LA FAYETTE LOUIS, Boston, Mass.—*Tremolo.*—August 11, 1868.—Relates to the construction of melodeons, or similar musical instruments. Consists mainly in the employment, in connection with the mechanism which controls the supply of air to the wind chest, of a mechanism which starts the tremolo-actuating wind wheel when the air is shut off from the entrance to the wind chest, excepting through the tremolo wind pipe or passages, and which operates as a break to arrest the motion of such tremolo wheel when the air is supplied to the wind chest through the main wind passages.

Claim.—1. In combination with a wind-actuated wheel for driving a tremolo valve or wheel, a finger, or equivalent mechanism, for starting the wheel, substantially as described.

2. The employment of a finger, or equivalent device, for arresting the motion of the valve driving wheel, and for holding it stationary, substantially as described.

3. The valve and wheel-containing cylinder, having a wind pipe and valve openings, arranged substantially as described.

4. Combining with the wind pipe x, a screw or other device for contracting the pipe, substantially as set forth.

5. In combination with the wind wheel t and valve containing case o, the wings or guards c² arranged to operate substantially as and for the purpose described.

6. In combination with the wind chest and main and tremolo valve passages, the auxiliary air passage l, substantially as described.

80,980.—DAVID H. LOWE, Boston, Mass.—*Hydrocarbon Burner.*—August 11, 1868.—Consists in combining with a petroleum stove an apparatus for generating gas for illuminating purposes; the said apparatus being provided with a meter for receiving the gas as it is produced from the naphtha or gasoline employed as fuel to heat the stove. In order to light the apartment containing the stove, a lamp burner may be applied to the top of the oil reservoir.

Claim.—1. The within-described apparatus, for producing gas for illuminating purposes, substantially as set forth.

2. The combination of a lamp burner with the reservoir D, for containing the naphtha or gasoline, substantially as described.

80,981.—HIRAM LUCAS, Rowsburg, Ohio.—*Apparatus for Tanning Leather.*—August 11, 1868.—The hides are suspended upon the cross rails of the movable frame. The hides may be raised out of the ooze without being removed from the vat, but they may be further elevated by raising the frame till its gudgeons rest in the upper notch of the cleats.

Claim.—The adjustable rack frame B and cleats or bearings I, upon which the frame is pivoted when in operation, in combination with the vat, the said frame being raised or lowered with its load of skins by means of the windlass, substantially as and for the purpose set forth.

80,982.—JAMES LYALL, New York, N. Y.—*Loom.*—August 11, 1868.—These improvements have reference to the manner of constructing the shuttle and shuttle driver, and of supporting them in the lay, and giving motion to the shuttle driver, to the end that the shuttle shall be operated upon or impelled by a continuously applied power during its entire passage across the fabric being woven.

Claim.—1. A vibrating lay and a reciprocating shuttle, adapted to passing, either end first, between the warps, in combination with a carrier, provided with actuating rollers that are moved across the vibrating lay on the other side of the warps, and to which an independent rotary motion is communicated in the same direction that the rollers would be rotated by contact with the warps, substantially as and for the purposes specified.

2. In combination with the reciprocating shuttle and lay, a shuttle driver, provided with rollers, substantially as described, so that the rollers that come in contact with the warps are rotated by contact with the rollers that support the shuttle driver, substantially as set forth.

3. The reed and lay, having a raceway, l, and a shuttle rail, w, substantially as set forth, in combination with the reciprocating shuttle driver and the shuttle that is actuated by said driver, substantially as set forth.

4. A vibrating lay, in combination with a reciprocating shuttle, and a shuttle driver, that operates upon the shuttle during its entire reciprocation, the warps intervening, substantially as set forth.

5. Two or more moving pulleys, combined with the said shuttle driver and connections to the same, substantially as set forth, so as to multiply the movement in operating on the shuttle driver, as specified.

6. The cams, operating substantially as specified, to stop and start the shuttle gradually, and operate while the lay is stationary, in combination with the cams for operating the lay while the shuttle is stationary, substantially as set forth.

7. The cam w', formed of a flange, in combination with the two rollers that are connected with the lay, one of which is yielding, and between which said flange moves, substantially as set forth.

8. The shuttle driver, substantially as specified, in combination with cords, or their equivalents, that pass off on opposite sides, and are connected to the actuating mechanism at or near the line of the axis or fulcrum of the lay, substantially as specified.

80,983.—THOMAS LYONS, Hartford, Conn.—*Door Bell.*—August 11, 1868.—When the spindle is pulled outward by the knob the incline pushes aside the arm, leaving the hammer free to be thrown against the gong by its impelling spring. The hammer gravitates to its resting place.

Claim.—The arm g, in combination with the incline elevation i', on head i, and hammers d, arranged and operating substantially as and for the purpose described.

80,984.—L. J. MARCY, Newport, R. I.—*Lamp Burner.*—August 11, 1868.—The shoulders of the cone deflect the upward current of air so as to direct the air between the flames from both sides thereof.

Claim.—1. The arched perforated plate b, arranged between the wick tubes, whereby the upward current of air from the chamber B is broken, to prevent the formation of eddies when it encounters the lateral current which enters through the perforations in the upper chamber A, as herein shown and described.

2. The cap or cone C, when formed with two abrupt lateral shoulders, g g, substantially as described, and for the purpose set forth.

80,985.—JAMES E. MCBETH, New Orleans, La.—*Breech-loading Fire-arm.*—August 11, 1868.—The breech is opened by half cocking the piece. When the lock box is swung down upon its pivots it may be entirely detached for the purpose of cleaning or rendering the piece useless; but a spring bolt prevents it from disengaging itself casually. The shell of the discharged cartridge is ejected by the opening of the lock box.

Claim.—1. The bolts C C, center piece D, and

spring E, in combination with the projections *d* and *e* and spring H, for the purpose of opening the breech by the half cocking of the piece, substantially as and for the purposes herein set forth and described.

2. The elongated slots *k k* and holes *l l*, in combination with the pivots *i i* and spring bolt *m*, for the purpose of removing the lock box from the piece, and preventing it from falling out at random, substantially as herein set forth.

3. The cartridge ejector J, constructed as described, in combination with the cam *o* on the front pivot *i*, for the purpose of ejecting the shell of the old cartridge, substantially as herein set forth and described.

80,986.—E. P. McCENEY, Washington, D. C.—*File Fastener*.—August 11, 1868.—This is a paper file in which the documents are held tightly by a cord, the free end of which is clamped to a frame by a lever. A handle is hinged to the lever so that it may lie flat thereon when not in use, but on turning the handle to an angle of forty-five degrees with the lever and then pushing it, the lever is opened or raised and the cord liberated.

Claim.—Hinging a handle to the lever of a file fastener, substantially in the manner and for the purpose herein described.

80,987.—D. C. McNEILL, De Witt, Iowa.—*Camp Stove and Oven*.—August 11, 1868; antedated August 1, 1868.—The plates composing the stove body, oven, and chimney are adapted to be folded together for convenience of transportation.

Claim.—1. The folding stove, when its sides are hinged together at the angles by the vertical rods C, extending below the stove at *a*, for the purpose of being inserted into the ground, whereby the ground is made to form the bottom of the stove, upon which the fire is built, as herein shown and described.

2. In combination with the folding stove, having the open bottom, the chimney L, when composed of sections hinged together, and adapted to fold down upon the top plate G, as herein shown and described.

3. The radiating oven F, constructed as described, its top and sides hinged together at the angles, and secured to the back H, and to the back plate of the stove, by the extended pintles of the hinges C' *e*, as herein described, for the purpose specified.

80,988.—JOHN McNEVIN, New York, N. Y.—*Corset, Abdominal and Skirt Supporter*.—August 11, 1868.—The sections of the corset extend below the waist so as to constitute an abdominal supporter. The springs of the corset are of the usual length, as they could not be extended as low as the sections without producing inconvenience. The stiffened section forms a bustle and skirt supporter, and is connected with the corset by lacing or otherwise.

Claim.—The corset and skirt-supporter, constructed as described, of the sections A B C D, cut out upon the hips, and extended in front to completely cover the abdomen, and the stiffened section E, removably attached at its ends to the extended portion of the section next the hips, substantially as described for the purpose specified.

80,989.—JOHN H. MORSE, Peoria, Ill.—*Spring and Duster for Watch*.—August 11, 1868.—The metallic bar, fitting within the watch case, prevents dust from entering at the hole through which the tongue of the lid spring passes.

Claim.—The metal case D, with its steel spring F, to be used as a "lift spring" and "duster" for watch cases, in the manner and for the purpose specified.

80,990.—HEZEKIAH MUNROE, Fall River, Mass., assignor to ALBERT F. MUNROE, same place.—*Caster for Furniture*.—August 11, 1868.—The spindle plays freely in either direction, the friction roll preventing the binding thereof.

Claim.—The arrangement, in the horizontal recess formed in the side of the spindle B, of the horizontal friction roll C, bearing against the inner surface of the chamber *g*, formed at the lower end of the case E, said spindle being held within the case by the flange *e*, and shoulder *f*, all constructed as described for the purpose specified.

80,991.—FREDERICH NEUHAUS, Belleville, Ill.—*Tailors' Seat*.—August 11, 1868.—Improvements on the tailors' seat for which letters patent were granted to same party, June 2, 1868. The leg cushion is so applied as to be yielding as well as vertically adjustable. Provision is also made for regulating and limiting the inclination of the yielding back support.

Claim.—1. The combination of the leg cushion F with the bar E, socket *e*, rod D, pipe G, socket *e*, and spring H, all made and operating substantially as herein shown and described, for the purpose of making the said cushion at once elastic and adjustable.

2. The combination of the seat A and hinged seat back B with the spring *j*, arm *g*, and gauge screw *i*, all operating substantially as herein shown and described.

80,992.—E. NICHOLSON, Rockport, Ohio.—*Road Gate*.—August 11, 1868.—A carriage approaching the gate depresses a starting bar with its wheels, the effect being to raise the gate, so as to disengage it from its fastening catch, and then swing it open. The gate is held back by a catch until the wheels strike another starting bar, liberating the gate and causing it to swing to closed position.

Claim.—Pivoting the gate at *a*, and to the arm G, in combination with the shaft F and arm E, operated by means of the starting bars and rods, as and for the purpose set forth.

80,993.—WILLIAM T. NICHOLSON, Providence, R. I.—*Machine for Cutting Rasps*.—August 11, 1868.—The first movement of the bed is in the direction of its transverse axis, and is effected by the eccentric shaft. This shaft, being corrugated, constitutes, in effect, a series of eccentric wheels, no two of which in juxtaposition are of the same diameter, and consequently the file bed at the commencement of each new transverse movement, as it is moved along, occupies a new position relatively to the axis of said shaft, and the several rows of teeth will of necessity stand as much out of line with each other as there is difference between the elevations and depressions of the surface of said shaft. The file bed is made to follow the surface of the eccentric shaft as the latter revolves, by a rocking, yielding pressure frame, whose straight-edged bar rests against the edge of the bed. If the peripheral contour of the disk plate be circular, the several rows of teeth on the face of the blank will stand in straight lines, but if it be eccentric the rows of teeth will arrange themselves in the arc of a circle.

Claim.—1. In combination with a file bed and cutter, the eccentric, irregular-surfaced, rotating pattern shaft G, operating through any proper devices for maintaining the file bed or cutter in contact with such pattern shaft, to govern the movements of the former, substantially as described.

2. The combination of the disk plate O with the mechanism for giving movement to the file bed in the direction of its length, substantially in the manner described, whereby the character of the lines in which the teeth shall stand across the face of the rack may be determined.

3. The combination and arrangement of the eccentric, rotating pattern shaft G, the file bed F, and the yielding, straight-edged bar L, substantially as described, for the purpose specified.

80,994.—S. R. NILES, Rawsonville, Mich.—*Bean Puller*.—August 11, 1868.—This implement is designed to expeditiously scrape up or pull field beans and other similar plants, and, being drawn by a horse, operates upon two rows at a time.

Claim.—The combination of the shafts B B, shear cutters A, having fingers *a a a*, &c., and the adjustable frame D C I, all operating substantially as shown and described, and for the purpose set forth.

80,995.—ANDREW O'NEILL, Portsmouth, Ohio.—*Wash Boiler*.—August 11, 1868.—A removable boiler, of peculiar construction, is adapted to be placed within a common boiler, to induce an active and forcible circulation of water under the influence of heat.

Claim.—The removable inner boiler B, provided

with a packing or gasket, C, and adapted for application to an outer boiler of common construction, to constitute an automatic wash boiler, as explained.

\$9,996.—WEBSTER PARK, Norwich, Conn.—*Fluid Meter.*—August 11, 1868.—The fluid being admitted at top presses down the upper piston, whose valve in the mean time remains closed, and the downward movement of the upper piston draws upward the lower piston, through the open valve of which the fluid passes and is discharged into the exit pipe until the arm of the piston rod reaches the bottom of the channel, whereupon the spring throws the arm in a transverse direction, partially rotating the piston rods, and closing the lower piston valve and opening the upper piston valve, the effect of which is to admit fluid through the upper piston, and raise the same simultaneously with the depression of the lower piston. While the upper piston is moving downward the guide arm communicates motion to the registering apparatus, but while passing back, the spring retracts the arm, and the latter has no effect upon the register.

Claim.—1. The combination and arrangement, in a fluid meter, of two or more loose pistons, resting on their respective valves, with their rods connected by the chain T and the pulley R, or their equivalents, and the spring *n*, or its equivalent, all arranged and operated within the cylinder A, and so placed that all may be removed together, substantially as set forth.

2. The double-acting spring *n*, Fig. 8, in connection with the channel E, or their equivalents, constructed for operating the valve rods and indicator of a fluid meter, substantially as herein set forth.

3. The combination of two or more piston rods of a fluid meter, rotating together, also acting as valve rods, with their valves, the guide with the groove, in which it traverses, and the spring or springs, or their equivalents, constructed and operating substantially as and for the purposes herein set forth.

4. The arrangement of the arm *p*, of the piston rod, in connection with the spur or ratchet wheel, for moving suitably-registering mechanism, substantially as and for the purposes herein set forth.

\$9,997.—WILLIAM PEARSON, Windsor Locks, Conn.—*Clamp Nut.*—August 11, 1868.—By turning the nut to one position, the screw thread on its interior is brought concentric with the screw and into gear therewith, so that it works like a screw in an ordinary nut, but by turning the nut to another position its internal, unthreaded cavity is brought concentric with the screw, which latter may then pass freely through the nut without the hinderance of rotation.

Claim.—The eccentric, mutilated nut C, and eccentric bearing, in combination with a screw, substantially as herein described.

\$9,998.—GEORGE W. PHELPS, Conneaut, Ohio.—*Bolt Holder.*—August 11, 1868.—This device is for holding a bolt firmly while turning a nut on or off. When in use the detachable wedge rests upon the head of the bolt, and the semicircle admits of the application of a wrench or other instrument.

Claim.—The bolt holder, consisting of the lever A, wedge *b'*, button *c*, lever D, bar D', and bar E, constructed and arranged as herein described.

\$9,999.—ELAM O. POTTER, Chicopee, Mass.—*Method of Forming Stockings.*—August 11, 1868.—The sewing together of the knitted parts of the stocking is performed by a single-thread sewing machine, which is threaded with yarn of the same kind as that of which the web is formed. In knitting, a correspondence of the edges to be sewed is attained either by the transfer of the finished parts to machinery suitable for knitting the remaining parts or by adjusting machinery to the different patterns of the consecutively-produced portions.

Claim.—As an article of manufacture, a stocking formed substantially as described, and having the side seams *m c e* machine-sewed, substantially as described.

\$1,000.—JOHN PRATT, Greenville, Ala.—*Mechanical Typographer.*—August 11, 1868.—This in-

vention has reference to novel devices, that cannot be briefly described, for performing, in proper consecutive order, the operations involved in type-writing, namely: 1. The bringing of a number of type, in arbitrary succession, to one common point; 2. The making of legible impressions at that point; 3. The feeding or moving of the paper across said common point, so as to make the proper intervals between letters and words; and 5. The bringing of the paper back to its starting point, and, at the same time, moving it in a direction at right angles with the lines, so as to make the necessary spacing of the latter.

Claim.—1. The oscillating rods H I, constructed and operating substantially as and for the purpose set forth.

2. The adjusting screws *x*, substantially as arranged, and for the purpose set forth.

3. The rod G, the bell-crank lever K, links *o n*, and India-rubber joints *p*, constructed, arranged, and operating substantially as described.

4. The rod *g*¹ and oscillating rod M, tongue *g*³ and spring *d*³, constructed, operated, and arranged substantially as and for the purpose set forth.

5. The rod R, escapement wheel T, crutch U, link *c*², and arm *d*², rod M, and pulley S, arranged and constructed substantially as and for the purpose described.

6. The pinion *o*, lever *a*², and attached curved rack *b*², spring *u*¹, bell-crank lever *r*², and rod *q*², frame P, and clamp *o*, constructed, arranged, combined, and operating substantially as and for the purpose set forth.

7. The frame Q, sliding in grooves *m*³, rack *v*², the lever *t*², link rod *s*², pawl *u*², and lever W, constructed, arranged, and operating substantially as and for the purpose set forth.

8. The lever *k*², spring *n*², link *j*², bell-crank lever X, link *i*², arm *h*³, and lever W, or their equivalents, arranged, combined, and operating substantially as described.

\$1,001.—SEYMOUR CLESSON PRATT, Boston, Mass.—*Furniture Caster.*—August 11, 1868.—The entire surface of the larger ball is made available in fulfilling the functions of a roller. The friction is small, as the large ball bears against only a portion of the glass ring, and has contact at a point only with the small ring against which it bears at top when forced upward.

Claim.—1. In combination with the ball-containing socket piece *a*, the glass-bearing ring *c*, against which the slide of the caster ball rotates, substantially as described.

2. In combination with such socket ring and ball, the minor socket and ball *h i*, arranged substantially as shown and described.

\$1,002.—H. M. PRESTON, Unionville, Conn.—*Journal Box.*—August 11, 1868.—The bearing is made in three parts, movable toward a common center, to compensate for wear.

Claim.—The combination of the boxes *c' c' c*, wedges *d d*, or their mechanical equivalent, head *a*, and tightening screws, substantially as and for the purpose described.

\$1,003.—WILLIAM READ, Vernon, Ind.—*Horse Rake.*—August 11, 1868.—After releasing the teeth by the depression of the lever frame, the operator, if he wish the rake to make but a half revolution, removes the pressure from said frame, to allow the tips of the draw spring to project laterally, as at first, to act as a stop for the teeth.

Claim.—1. The device for releasing the teeth *k k*, composed of the draw spring *n*, or its equivalent, operating in connection with the lever frame described, or other similar device, all arranged substantially as described, and for the purposes set forth.

2. The arrangement of the springs G G, with suitable catches, and wipes *m m*, together with the backing and sustaining springs *g g*, for the purpose of preventing a back revolution of the rake when operating, substantially in the manner as described.

\$1,004.—WILLIAM T. B. READ, Chicago, Ill.—*Ice Elevator.*—August 11, 1868.—An apparatus for

elevating ice in the process of filling ice houses, and handling blocks of ice in other situations where its elevation is involved.

Claim.—The combination and arrangement, substantially as shown and described, of the endless chain G, the pulleys E, (with their guards F.) hooks J, and frame A, substantially as and for the purposes set forth.

81,005.—MICHAEL RICE, Upland, Pa.—*Loom-Actuating Shuttle Box.*—August 11, 1868.—The shuttle boxes are suspended on the outer ends of levers pivoted to the lay, and from the inner ends of which balancing weights are suspended. A vibrating, wedge-shaped lever, operated by a tappet wheel, deriving motion from a pawl actuated by the driving shaft, alternately raises and lowers the outer ends of said shuttle-box levers.

Claim.—The shuttle-box actuating mechanism, combined and arranged substantially as herein shown and described.

81,006.—F. T. RIEGEL, Philadelphia, Pa.—*Pressure Indicator.*—August 11, 1868.—The steam chamber communicates with the boiler, and the valve is held to its place by a variable weight applied to the yoke by means of the screw hook.

Claim.—1. The chamber B, the valve-seat tube D, the conical valve C, cone *g*, and screw F, constructed and arranged substantially as described, for the purpose set forth.

2. The yoke E, the screw *h*, and the weighted screw hook J, in combination with the chamber and valve, as above mentioned, substantially as and for the purposes described.

81,007.—THOMAS J. ROCKWOOD, St. Johnsbury, Vt.—*Machine for Milling the Knife Edges of Scales.*—August 11, 1868.—This machine finishes the knife edges after they are permanently secured in their places in the lever, treats the metal with precision by means of milling tools, carried on firmly-supported, delicately adjustable shafts, and presents the same to the milling tool in such a manner and under such adjustments that the proper relative position of the knife edge is secured, and a greater or less degree of acuteness may be given to the same.

Claim.—1. The combination of the table and holding device with the four milling tools P P² P P², when all are adjustable as herein set forth.

2. The laterally-adjustable cross-piece F, the knife-edge supports *f*, adjustable to a greater or less distance apart by means of the screws *f'* and the table D, in combination with the milling tools P P², all arranged substantially as and for the purposes herein specified.

3. The adjustable vertical stop X and screw shaft *x*, in combination with the levers C C', carriage B, table D, and the milling tools P P², as and for the purposes herein set forth.

4. The gauges N, their holders L, and fixed knife edges V on the carriage B, and the table D, in combination with the milling tools, or their equivalents, as and for the purposes herein set forth.

5. The arrangement of the milling tools P P² P P², the carriage B, the table D, and the several devices connected therewith, so as to allow the confining of levers of different sizes, and of different proportions and widths, and the ready changing of the levers and of all the several parts, substantially in the manner herein described.

81,008.—J. ROEMHELD, Chicago, Ill.—*Eye Water.*—August 11, 1868.—In carrying out this invention a sheet or sheets of writing paper may be burned in a porcelain or other enameled dish. The oily matter separated from the paper by combustion and remaining on the plate, is dissolved in Rhine wine. Distilled water, cloves, and sulphate of zinc are then added, and the liquid is filtered.

Claim.—A medical compound, consisting of the ingredients in about the proportions set forth.

81,009.—P. H. ROOTS and F. M. ROOTS, Connersville, Ind.—*Rotary Blower.*—August 11, 1868.—An improved construction of the abutments of the class of rotary blowers or engines, in which the circular portions or peripheries form arcs of circles of

different diameters. The center cylinder, being of plastic material, is cast in its exact dimensions.

Claim.—1. The co-operating abutments A B, constructed with skeleton pistons, having their external circular peripheries connected by longitudinal arms to the center cylinders, as and for the purpose specified.

2. The abutments A B, having their center cylinders made of plaster of Paris, or other plastic or molten material, substantially as and for the purpose set forth.

3. The abutments A B, having the arcs of their pistons so constructed as to become simultaneously disconnected from their respective center cylinders at certain portions of their revolutions, as herein described.

81,010.—P. H. ROOTS and F. M. ROOTS, Connersville, Ind.—*Case for Rotary Pumps.*—August 11, 1868.—The object is to obviate boring out the interior concave surface of the shell or case, and the facing or planing of the end or head plates thereof.

Claim.—1 A rotary blower case, the interior of which is rendered true and accurate by means of plastic or molten materials, substantially as set forth.

2. A rotary blower, the ends or heads of which are rendered true and accurate by means of plastic or molten materials, substantially as herein shown and specified.

3. A rotary blower, the concave or arcs of circles of which, and the ends or heads of which, are rendered true and accurate by the use of plaster of Paris, or other plastic material, or of molten metal, as described.

81,011.—WILLIAM ROSS, Paducah, Ky.—*Try Square.*—August 11, 1868.—For squaring lumber and timber in house-joining, &c. The shape of the piece of timber, whether square or not, is indicated by the top of the blades of the square. The secondary blade, which slides back and forth on the main blade and hangs loosely thereon, may be used as a bevel.

Claim.—The plate C, having the slot E, when held to the fixed blade by means of a clamping screw, *f*, passing through the transverse slot E and the longitudinal slot D, whereby the plate C is made adjustable, both longitudinally and vertically, and is rendered equally useful in dressing lumber, either to a level or bevel, as herein shown and described for the purpose specified.

81,012.—GUSTAV SCHLEICHER, Mount Vernon, N. Y.—*Stringed Musical Instrument.*—August 11, 1868.—The tongue, projecting with a downward inclination from the under surface of the sounding board, is designed to increase the power of the tone. The ribs enable the sounding board to sustain the strain of the strings. The notches in the sounding-board bridge are arranged in such relation to the hitch pins that each string, in its course from the hitch pin to the turning pin, is deviated from a right line to avoid jar and preserve the full effect of the string's vibration.

Claim.—1. The tongue B, attached to the lower or inner surface of the sounding board A, substantially as and for the purposes set forth.

2. The arrangement of ribs *f g h* at the under surface of the sounding board A, in combination with the bridges *a b* and tongue B, substantially as and for the purpose described.

81,013.—HERMAN SCHLOTTER, Kostritz, near Gera, Germany.—*Apparatus for Raising Water.*—August 11, 1868.—Water is elevated through the tubes by giving the tubes a rapid, vertical, reciprocating motion, they being immersed at their lower ends and provided at their upper ends with valves which open and close with the rising and falling motion of the tubes.

Claim.—The combination, substantially as shown and described, of tubes D D', in any desired number, with the rocking beams C, in such manner, or so arranged in relation thereto, as to produce a counterbalancing action or effect, said tubes being fitted with upper valves, and operating, when immersed at their lower ends, and reciprocating, as described, to elevate water or other liquid, as herein set forth.

81,014.—JUSTIN SCHMITT, New Albany, Ind.—*Shoe Last*.—August 11, 1868.—The screws are for adjusting the two parts of the last with relation to each other. The detachable plates are applied so as to enlarge the last at the points corresponding with corns or bunions.

Claim.—The combination of the part B with the last A, when said last is provided with the screws x on its under side, and with the plates C C, all constructed and used substantially as and for the purposes set forth.

81,015.—LEWIS SEXAUR, New York, N. Y.—*Water Meter*.—August 11, 1868.—Relates to the arrangement of a diaphragm or piston in combination with the levers and slide which impart motion to the valve, said diaphragm or piston being exposed to the direct action of the fluid, in such a manner that the valve is changed thereby without the aid of springs. The piston has a certain dead motion on its rod to afford time for changing the valve.

Claim.—1. The diaphragm or supplementary piston t , communicating with the supply pipe D, and with the valve chamber, in combination with the toggle arms n l , piston rod B, slide e , and valve F, substantially as and for the purpose described.

2. The stops a' b' on the piston rod, in combination with the projection e' on the slide e , substantially as and for the purpose set forth.

3. Giving to the piston a dead motion on its rod, so as to gain time for the projection e' to clear the stops a' b' , as set forth.

4. The stops d' on the piston rod, in combination with the projection e' and platform i , substantially as and for the purpose described.

81,016.—I. SHELLABARGER, Decatur, Ill.—*Apparatus for Dampening Grain*.—August 11, 1868.—Prevents the steam from escaping upward, its condensation being effected by reason of the obstruction presented by the bases of the inclines.

Claim.—The spout A, having inclines B B, arranged as shown, when the same is in combination with the steam chamber or pipe, and is used for conveying grain from the pipe E, or its equivalent, to the grinding apparatus, substantially as described, and for the purpose specified.

81,017.—HENRY S. SHISLER, Manheim Township, Pa.—*Farm Gate*.—August 11, 1868.—The drop bar is so connected with the latch, that by raising it, it retracts the bolt or latch; it drops of itself to thrust the bolt out again. The loop slips over a wedge piece connected with the diagonal rail.

Claim.—The self-acting drop bar B, connecting lever C to the latch bolt D, in combination with the sliding wedge bar G operated by the diagonal bar F, and the movable clamp E, all arranged and operating in the manner and for the purpose specified.

81,018.—J. A. SHONE, Holly Springs, Miss.—*Cotton Bale Tie*.—August 11, 1868.

Claim.—The bale tie, formed upon the band A by notching one of its ends upon the under side at e , and passing the same through a diagonal slot, a , formed in the folded opposite end, as herein shown and described.

81,019.—JOHN SHOREY, Lowell, Mass.—*Curtain Fixture*.—August 11, 1868.—The flange of the adjustable bearing sustains the end of the roller and holds it against lateral displacement. The end of the curtain is put into the straight slot, and the wedge being then driven into the other slot, the curtain is secured to the roller.

Claim.—1. The adjustable bearing 2, with the projecting flange for holding the end of the roller, as shown in Figs. 1 and 2, in connection with the bracket B, as shown in Fig. 2, as shown and described, and for the purposes set forth.

2. The pulley e , with the rubber packing 4, in connection with the friction pulley 5, when made and operated substantially as and for the purposes set forth and described.

3. The combination of the roller, slotted at 6 and 8, and wedge 9, for the purpose of fastening the curtain to the roller, as and for the purposes set forth and described.

81,020.—OLAUS SJÖBERG, Chicago, Ill.—*Tobacco Pipe*.—August 11, 1868.—In use, the lower section is removed and the chamber filled with tobacco, after lighting which the section is replaced. The construction of the pipe prevents fire being communicated therefrom to surrounding objects.

Claim.—1. The combination and arrangement of the elongated cap A, provided with the passage a and perforated plate b , with the tobacco chamber D, so that the pipe may operate, when inverted, substantially as specified.

2. The combination and arrangement of the chamber D, provided with the tube c , projecting into the enlarged stem or section C, with the passage E, annular oil chamber d , substantially as specified.

3. The combination and arrangement of the sections A B C, plates b and h , and perforated tube e , with the stem f and mouthpiece g , substantially as specified.

81,021.—HENRY SKIDMORE, Mount Vernon, N. Y.—*Machine for Cutting Paper*.—August 11, 1868.—

This invention provides for a variable relative velocity of the feed and cutter to change the length of sheet cut, without of necessity altering the character or shape of the cut; and it consists chiefly in a combination of an oblique or helically-shaped revolving cutter with a stationary knife, both carried by a swinging or other suitable frame, adjustable in an angular direction across the material being fed.

Claim.—1. The combination of an oblique or helically-shaped revolving cutter with a stationary knife, when both are so suspended or carried in an adjustable frame as that their angular position, relatively to the path traveled by the said material between them, may be varied, substantially as and for the purpose or purposes specified.

2. The combination, with a constant or continuous feed to the strip or material in sheet form to be cut, as established by drawing rollers, or their equivalents, of a continuously-revolving cutter, acting in concert with a stationary knife, essentially as herein set forth.

3. The knife J, beveled, as shown and described, on its cutting edge, relatively to the passage of the material over or against it, for operation, in combination with a traveling or rotary cutter, substantially as specified.

4. The knives or cutters I and J', when beveled on their cutting edges relatively to each other, and to the travel or passage of the material to be cut, essentially as shown and described.

5. In combination with a rotary cutter, a stationary knife or cutter, adjustable toward or from it, and pressed forward by a spring, or its equivalent, so as to slightly project into the path traveled by the advanced edge of the rotary cutter, and so that said stationary cutter is pressed or urged backward by the rotary one in passing it, as specified.

6. The arrangement of the cutters I J, intermediately between the drawing rollers C and the delivering rollers F, for operation, substantially as specified.

7. The combination of the feed rollers C D, delivery rollers F G, and cutters I J, whereby paper, cloth, foil, or other like material may be fed in a continuous manner, and cut up into sheets at right or other required angles, to or across the feed or edges of the strip, all being arranged and operating essentially as specified.

81,022.—JOHN T. SMELSER, Williamsburg, Ind.—*Saddle Tree*.—August 11, 1868.—The upper frame plays vertically on springs, and the upright, confined in the loop or box plate, steadies the frame and holds it in proper relative position.

Claim.—The combination of the hinged frame b , upright e , and plate t , with frame c and bow a , when constructed as described.

81,023.—OSCAR R. SMITH, Elgin, Mich.—*Animal Trap*.—August 11, 1868.—Intended principally to entrap such animals as burrow the earth. The jaws catch the animal round the body, as the trap can be sprung only when the animal has passed partly through the opening defined by the jaws.

Claim.—1. The combination of the spring S with the frames F F', the catch P, the trigger D, and the

jaws O O', all arranged to operate substantially in the manner set forth.

2. The semi-circular shape of the jaws O O', whereby they fit the burrow of an animal when the trap is set.

81,024.—W. SMITH, San Francisco, Cal.—*Valve for Water Closet.*—August 11, 1868.—A plunger is employed in combination with a spindle and tubular receiver controlled by springs, compressed by the weight of a person on the seat, and so arranged as to prevent the wash water from flowing till the weight is removed.

Claim.—1. The tube D, applied to the face of a self suspending water closet valve, with water way at its base, substantially as shown and described, for the purposes specified.

2. In combination with the tube D, the spindle E, with the disk and packing *h*, and the packing L, compressed by the spring R, substantially as shown, and for the purposes set forth.

81,025.—H. W. SOUTHWORTH, Mittineague, Mass.—*Pad for Horses' Hoofs.*—August 11, 1868.—The cushion is secured between the hoof and shoe. Raw hide is employed as a substitute for rubber, leather, &c.

Claim.—The raw hide cushion for horses' shoes, constructed substantially as herein described, and for the purposes specified.

81,026.—WILLIAM E. SPARKS, New Haven Conn.—*Snap Hook.*—August 11, 1868.—Pressure from the outside upon the tongue cannot effect its release.

Claim.—The arrangement of a divided tongue in two parts, *a* and *d*, pivoted so that each may turn independent of the other, and so that one opens outward and the other inward, each bearing upon the end of the hook A, and provided respectively with projections *h* and *l*, or other equivalent means, for operating substantially in the manner and for the purpose herein set forth.

81,027.—FRANCIS STEBBINS, Hinsdale, N. H.—*Gauge Cock.*—August 11, 1868.—When the piston is pushed inward, a port is exposed for the escape of the steam into the chamber in the piston, and thence out of the gauge cock through the jet pipe. When the piston is retracted the steam cannot escape, so that neither steam nor water can have access to the ports or channels of the cock, except during the short interval when the steam is rushing through to escape; hence the working parts are preserved free from sediment or deposits.

Claim.—The combination of the shell S, packing P P', perforated sleeve D, and packing nut B, with the cylindrical piston A, having ports G G' and steam passage C formed therein, the whole arranged and operating substantially as described.

81,028.—WILLIAM J. STOWELL, Baltimore, Md.—*Railway Switch.*—August 11, 1868.—This device is intended as a substitute for railroad frogs, and performs the function of the same in automatically guiding the wheels of a locomotive from one track to and upon another.

Claim.—1. Employing, in combination with a continuous rail track A, and a sliding C, a laterally vibrating inclined and curved guard rail C¹, and an inclined switch section C², constructed and arranged to operate substantially as described.

2. The guard rail D, with curved extremities, connected by jointed levers and rods to the rail sections C¹ C², substantially as described.

81,029.—WILLIAM J. STOWELL, Baltimore, Md.—*Railway Switch.*—August 11, 1868.—The vibrating switch rails all move at the same time in being adjusted for the main track or turnout. A lever is pivoted to the overhauling portion of the standard, so as to vibrate in a horizontal plane, and facilitate the drawing back and holding of the switch lever. The hook or fastening retains the auxiliary lever in place while holding back the switch lever.

Claim.—1. In combination of vibrating switch rails B¹ B² of the siding with the vibrating switch rail A¹, forming part of the main track, said rail sec-

tions being arranged and connected together substantially as and for the purposes described.

2. The auxiliary lever E, with its fastening *j*, applied to the standard C of the switch lever D, substantially as and for the purposes described.

81,030.—WILLIAM J. STOWELL, Baltimore, Md.—*Lock Nut.*—August 11, 1868.—When the nut is screwed up tightly upon its bolt, and one or more edges of the washer plate are turned up against the nut, the latter cannot be easily rotated, as the washer plate is seated in a recess of the object against which the nut is set.

Claim.—The locking plate *g*, having plane surfaces, in combination with a grooved seat *c*, both constructed substantially as described, and serving the purpose of fastening nuts upon bolts, as set forth.

81,031.—O. G. STRATTON, Greenfield, Mass.—*Bit Stock.*—August 11, 1868.—Consists in applying to a bit stock or brace a device for holding the shank of the bit in its socket, said device being operated by a cam and thumb piece. The action of the locking device is not only to hold the shank securely in the socket, but also to exert a slight draught to draw it into the socket in the operation of locking, and to produce a slight thrust when it is released, so as to start it from the stock.

Claim.—1. The combination and arrangement of the yoke or thumb-piece F F', shaft G, cam C, pivot *g*, and recessed and slotted lever A with a bit brace or stock, substantially as and for the purpose described.

2. A conical shank *s*, of a bit or other tool used in a bit stock, having a recess, *k'*, therein, to receive a feather or projection in the socket, in combination with a socket in the bit-stock, which is conical in longitudinal section, as described.

81,032.—EUGENE L. TARBOX, Nashville, Tenn.—*Stencil Plate.*—August 11, 1868.—The letters and figures of the stencil being arranged in the circular rotary plate may be brought singly under the openings of the shield, which covers the adjacent letters and figures and prevents them from constituting a hindrance or check to the marking of the letters in use.

Claim.—The plate B, the shield C, and the handle A, constructed and arranged with regard to the letters and figures, and to each other, substantially as and for the purpose described.

81,033.—LOUIS TASSIUS, Norwalk, Ohio.—*Artificial Leg.*—August 11, 1868.—The sling is applied to the exterior of the casing which incloses the mechanism whereby the forward impulse is given to the second segment of the leg and the heel piece made to co-operate in giving the initial movement to raise the foot from the ground. The sling passes over the shoulder of the wearer.

Claim.—The herein-described artificial leg, consisting of the heel plate K, stirrup P, springs H L, links Q R, and sling A, all constructed and arranged to operate, in combination with the articulated foot T and leg T', in the manner substantially as set forth.

81,034.—BARNETT TAYLOR, Forestville, Minn.—*Hand Cultivator.*—August 11, 1868.—For cutting weeds and stirring the ground between plants. The shovel plow is secured in place by the same wedge that secures the cutters to the beam, and is brought into requisition in case of large plants or when the ground requires to be stirred more thoroughly than can be done by the cutters.

Claim.—The combination of the cutters H, stationary upright I, pivoted uprights J, block D, adjustable block or bar E, supporting bar F, shovel-plow M N, and wedge L, with each other, and with the slotted beam A and wheel B, substantially as herein shown and described, and for the purpose set forth.

81,035.—JOSEPH TEMPLE, Terre Haute, Ind.—*Saw-Filing Machine.*—August 11, 1868.—A mode of combining and arranging several movable and adjustable plates and frames, constituting a device

whereby saws may be accurately filed, and any desired shape given to the teeth.

Claim.—The arrangement of the bed plate A, saddle piece B, and frame C, in combination with the file holder in which the file is placed, when all the parts are constructed and operated in the manner and by the means described, so as to be adjustable for the purpose of giving any depth or pitch to the teeth of a saw that may be desired, substantially as herein set forth.

S1,036.—CHARLES H. F. THIEME, North Vernon, Ind.—*Priming for Needle Gun.*—August 11, 1868.—This priming, except as to the base, does not differ from the ordinary compositions which form a fulminate to be ignited by the penetration of a pointed instrument. The hyposulphite gives the fulminate the property of refusing to ignite by concussion, and of resisting the destructive evaporation to which the essential constituents of the ordinary preparations are subject.

Claim.—An explosive or igniting composition, having hyposulphite of any metal as a base, substantially as set forth.

S1,037.—THOMAS J. THURSTON, Lewiston, Me.—*Ash Screen and Coal Hod Combined.*—August 11, 1868.—The crank shaft is rigidly attached to the sifter, which has a shouldered lip fitting into the hod, and the shaft occupies the hole and slot of the hod, the hook serving to hold together the hod and sifter when in use.

Claim.—The combination, with the hod A, having the hole *e*, slot *d*, and staple *k*, of the sifter B, having the crank shaft *a*, the combination to operate as herein set forth, and for the purposes described.

S1,038.—WILLIAM TUNSTILL, Paterson, N. J.—*Braiding Machine.*—August 11, 1868.—This stop-motion is made to operate by the breaking of any of the threads, the same consisting of a ring which surrounds the slotted plate in which the bobbin carriers are moved to operate the warp threads, and which is acted upon by either of the weights on the warp or weft carriers.

Claim.—The ring 17, applied in the manner specified, to receive motion from the weight in case a thread breaks, in combination with the stop-motion lever 23, and coupling or clutch, substantially as set forth.

S1,039.—NICHOLAS S. VEDDER, Troy, N. Y.—*Cooking Stove.*—August 11, 1868.—Relates to the construction of a flue chamber on what are termed "long top cooking stoves," by means of the top plate and a casting of peculiar form, and the adaptation of said flue to a hot-water reservoir as well as to cooking purposes.

Claim.—1. The flue chamber B, when formed by the top plate A of the stove, and the part C, substantially as herein shown, and for the purposes set forth.

2. The stove-pipe hole H, when formed on the part C, in the rear of the opening covered by the plate D, in combination with flue chamber B, substantially as herein described and shown.

3. The part C, when constructed and arranged in combination with the top plate A of a cooking stove, either for a reservoir, E, or boiler-hole plate, D, substantially as and for the purposes set forth.

S1,040.—MARCUS BROWN WESTHEAD, Manchester, Great Britain.—*Tape Box.*—August 11, 1868.—The protruding end of any coil may be drawn so as to obtain any desired length of the narrow fabric without disturbing the other coils.

Claim.—As a new article of manufacture, a tape holder, consisting of the slitted box *a*, containing a series of loose disks, *e*, to separate the rolls of tape, substantially as described.

S1,041.—JOHN H. WHISSEMORE, Mansfield, Ohio.—*Harness Tree.*—August 11, 1868.—The metallic tree has raised flanges or lips along its inner edges to form a groove for the reception of the ordinary harness-tree pad, said flanges extending sufficiently beyond the upper frame to form openings for the introduction of tug straps.

Claim.—The harness tree A and plate *b'*, when the same are provided with lips or flanges, and so combined and arranged as to form the opening *c*, and a continuous groove, *a b*, for the pad and tug strap, said groove extending in both directions beyond the plate of the tree, as described, and for the purpose specified.

S1,042.—JOHN H. WHITE, Lima, Peru.—*Rice Pounding Machine.*—August 11, 1868.—The pointed elevations within the mortars prevent the pestles from crushing the particles of rice, and also cause them to spread from under the pestles, thereby producing an agitation and mutual friction of the particles. The object is to whiten the rice by an expeditious pounding process.

Claim.—The mortars *a*, with bottoms *b*, in combination with the spring pestles *c c*, operating in the manner and for the purpose substantially as shown and described.

S1,043.—WILLIAM H. WHITEHEAD, Chicago, Ill.—*Combustion Chamber in Coal Stove.*—August 11, 1868.—The air chamber supplies air to the combustion chamber for the purpose of effecting the consumption of the gaseous products of combustion. The sinuous character of the space through which air passes into the combustion chamber, causes the air to be injected at different altitudes and angles, and thus insures its thorough commingling with the gases.

Claim.—1. The air chamber, composed of the plates or disks A and B, provided with the flanges or supports *b* and *c*, and the interior projections *e* and *f*, arranged so as to admit a continuous thin sheet of air, substantially as specified.

2. The application of the fire brick or protector D to the under surface of the air chamber, substantially as and for the purposes specified.

3. The combination and arrangement of the plates A, B, and C, with the fire brick or protector D, substantially as and for the purposes specified.

S1,044.—WILLIAM N. WHITELEY, Springfield, Ohio.—*Harvester Cutter.*—August 11, 1868.—The spiral spring coiled about the bolt performs the double function of pressing the branches asunder, so as to insure their constant pressure against the face of the nut, and of engaging with the ratchet teeth of said nut to hold it in place. The heel of the cutter bar is bent forward, so as to bring the pitman joint as nearly as possible into the real line of action and resistance of the cutter bar.

Claim.—1. The cutter bar E, bent forward at its inner end, substantially as and for the purpose set forth.

2. A spring, located between the branches of the pitman, and with one of its ends extending through one of said branches so as to engage with the ratchet of the nut G, substantially as set forth.

3. A spring, located between the branches of the pitman, and shaped and secured so as to press the said branches asunder, and at the same time penetrate through the proper hole in one of said branches, and engage with the ratchet of the nut G, substantially as set forth.

S1,045.—WILLIAM N. WHITELEY, Springfield, Ohio.—*Harvester Rake.*—August 11, 1868.—These improvements in reaping machines have reference, specifically, to the manner of mounting and adjusting the rake stand upon the coupling arm, to the arrangement and construction of the gearing, and the means for retaining the joint bolts in place.

Claim.—1. Conducting the rake stand to the coupling arm, by the pivot bolts *J' J'*, on a line parallel with and above the crank shaft.

2. The adjusting brace *K'*, or its equivalent, connecting the rake stand to the main shoe, substantially as set forth, so that the position of the rake stand may be adjusted in reference to the plane of the cutting apparatus.

3. The supplemental gear wheels *k' l' m'* driven by the pinion *h'*, on the main pinion shaft, and arranged at the outer front corner of the platform, in connection with the chain *p'* and chain wheels *M' n'*, to communicate motion to the reel and rake shaft.

4. The combination box *t*, cast in one piece, to

support the pivot pins of the supplemental gears *l' l' m'*, as and for the purpose set forth.

5. The stop *g'* interposed between the heads of the joint bolts *o' o'*, to retain them in place, substantially as set forth.

6. The tripper *c'*, constructed with a shank extending through the head, so as to be readily secured with a screw nut, for the purpose of easy removal, as set forth.

7. An adjustable guide frame *I'*, substantially as described, and for the purpose set forth.

81,046.—WILLIAM N. WHITELEY, Springfield, Ohio.—*Harvester*.—August 11, 1868.—The pipe box is cast with a lug projecting upward from its forward end, for attachment of the draw rod, which connects the upper end of said lug and the front bar of the main frame, and transmits the draught strain directly to the coupling arm and cutting apparatus. When the machine is to be transported from place to place, as from barn to field, the outer end of the cutting apparatus is raised until the bridge can be secured to the frame by the hook attached thereto.

Claim.—1. The pipe box *U*, combined with the bars of the main frame *A*, in the manner shown, so that the said box forms the brace connecting the rear bars *A A* of the frame and the bearings for the crank shaft.

2. The draw rod *W*, combined with the solid pipe box *U*, in the manner shown, and connecting said box to the front bar of the main frame, as and for the purpose set forth.

3. The bridge piece *f*, connected to the inner shoe and to the hand lever *k*, in the manner shown, for the purpose of enabling the attendant to raise the cutting apparatus, as described.

4. The hook *m*, in combination with the bridge piece *f*, as and for the purpose set forth.

81,047.—CALEB WHITMORE, North Vernon, Ind.—*Rock Drill*.—August 11, 1868.—The diagonal grooves of the cylinder travel on the stationary guide pin, as the drill and its stock are reciprocated. Devices are employed to prevent the drill stock from turning backward, and lower the carriage gradually as the hole is deepened.

Claim.—1. The grooved cylinder *S*, made substantially as described, with the points of the upper inclined guides between the points of those below, in combination with the stationary guide pin *T*, for the purpose of turning the drill automatically as it is traversed.

2. And in combination with the cylinder and guide pin thus constructed for turning the drill, the ratchet *K* and pawl *U*, for the purpose specified.

3. And in combination with the devices for turning the drill, the ratchet *a* and pawl *b*, and their connections, for traversing the carriage and feeding the drill.

81,048.—AARON WARREN WHITNEY, Woodstock, Vt.—*Tinsmith's Stake*.—August 11, 1868.—The stake may be readily detached when not required for use, and replaced by a tool of another form, so that only one standard is required for an indefinite number of stakes.

Claim.—1. The socket or head *C*, having two or more socket arms, *E*, formed upon its sides, in combination with the upright or standard *B*, whether said socket or head *C* is formed solidly upon or is detachably and adjustably screwed to said upright or standard *B*, substantially as herein shown and described, and for the purpose set forth.

2. Forming the stakes *F* without shanks, and with tenons upon their inner ends, to adapt them to the socket arms *E* of the socket or head *C*, substantially as herein shown and described.

81,049.—S. LLOYD WIEGAND, Philadelphia, Pa.—*Screw Cutting Machine*.—August 11, 1868.—The invention has reference to the mode of controlling screw cutting machinery of the class in which it is desirable to pass the cutting tool more than once in the same path upon the screw in course of production, so as to render it impossible to engage the nut into the leading or guiding screw, except at such time as the different parts are in their proper relative positions.

Claim.—1. The gear, constantly engaged in the leading screw, and the cam and the detent or pawl, combined and used therewith, substantially as shown and described, for preventing the re-engagement of the nut, or segment of a nut, in improper positions in the leading screw.

2. The gear, constantly engaged in the leading screw, in combination with the cam and detent, as described and shown, to prevent the re-engagement of the cutting tool in the work when in improper positions.

81,050.—A. G. WILKINS, Cooperstown, Pa.—*Washing Machine*.—August 11, 1868.—The tub is supported by standards and cross bars, so that it may swing freely, and is provided with two parallel rows of pounders upon its bottom, arranged so that the pounders of one row are opposite the spaces between the pounders of the other row. Combined with above, are two parallel rows of stationary arms, arranged so that when the tub is rocked they will be alternately struck by the aforesaid pounders.

Claim.—1. A rocking tub *A*, which is provided with transverse rows of beaters or pounders *G*, arranged as described, in combination with the stationary resisting arms *F*, arranged in two parallel rows, and adapted to operate substantially as described.

2. Arranging the beaters *G G* so that their edges *e' e'* overhang the bottom of the tub at the point where the squeezing of the clothes is performed, in combination with the pendants *F F*, *e e*, and the slats *H H*, substantially in the manner and for the purpose described.

81,051.—N. BANGS WILLIAMS, Providence, R. I.—*Oil Cup*.—August 11, 1868.—The bolt holds the cover against rotation, so that jars and concussions cannot loosen it, nor violent motion throw it off.

Claim.—1. The spring bolt *D* in the screw cover of an oil cup, made and operating substantially as described.

2. The combination of the bolt *D* and the screw *E* with the cover of an oil cup.

3. The regulating screw *F*, made with the tapering slot *c*, the spring point *d*, and the broad disk-like head, all made as described.

4. The packing of an oil cup with fibrous disks, when these are not encased in a tube or chamber, and where they are threaded upon a slotted screw, which at the same time forms the compressing agent for the fibrous disks, and a graduating duct, for admitting the oil into the duct on the stem of the cup, by screwing into the same, all made and operating substantially as set forth and described, or their mechanical equivalents.

81,052.—WILLIAM WILSON, Galesburg, Ill.—*Steam Piston Packing*.—August 11, 1868.—The rings are set out by steam, and adjust themselves to the interior of the cylinder, whether or not the same be perfectly round or true.

Claim.—The arrangement of the rings *C C* with the pieces *D D*, skeleton *B*, and the follower *A*, as herein set forth.

81,053.—GEORGE O. WOODCOCK, Claremont, N. H.—*Coal Stove*.—August 11, 1868.—The detachable flue is widely expanded at front, where the convex top of the back plate meets it, said back plate directing the products of combustion into the mouth of the flue. The object is to attain an effective draught. Air is admitted to the lower part of the chamber between the outer casing and the fire box, and being heated by contact with the back plate and flue, is discharged at the upper part of the stove.

Claim.—1. The flue *B*, when constructed and made detachable, and arranged within the chamber *J*, and combined with the back plate *E*, substantially as and for the purposes specified and set forth.

2. The back *E*, when made convex frontward, as and for the purposes specified.

3. The combination and arrangement of the air chamber *J*, the spaces *I I*, the convex back *E*, and the flue *D*, substantially as described and set forth.

81,054.—LEWIS R. WRIGHT, Troy, N. Y.—*Cultivator and Plow Combined*.—August 11, 1868.—All the parts may be aggregated to form the com-

pound implement—plow and cultivator—but the teeth and standards are readily detachable, in order that the plow may be used alone, and *vice versa*.

Claim.—1. The double mold board B and C, so hinged and connected together that the main part of said mold board B may be elevated or depressed at will, according to the height of furrow desired to cut, substantially as fully hereinbefore described and set forth.

2. The hinging of the sections of the mold board C and C' to the center standard E', whereby a lateral motion may be given to the mold boards B and B', to regulate the width of furrow to be cut, substantially in the manner and for the purposes more fully hereinbefore described and set forth.

3. The slotted arms, or their equivalents, D D, in combination with the mold boards B and B' substantially in the manner and for the purposes herein described and set forth.

4. The upright or tooth shoe E, in combination with the brace F, or its equivalent, all cast in one solid piece, substantially in the manner and for the purposes herein fully described and set forth.

5. The curved reversible tooth H, in combination with the tooth shoe E and brace F, each being constructed and operated substantially in the manner and for the purposes hereinbefore described and set forth.

81,055.—J. H. WYCKOFF and W. K. WYCKOFF, Ripon, Wis.—*Photographic Camera.*—August 11, 1868.—At or near the lower end of the pendant a transverse recess is cut, for one or more removable scales, which are notched upon their edges to receive a pin or spring, to indicate the lateral movements necessary in bringing the prepared plate properly across the opening and behind the lenses. On the pendant is marked a scale, indicating the proper elevation and depression that the sliding rod or bar should have in order to bring the prepared plate to its proper point transversely across the opening behind the lens tube.

Claim.—1. The adjustable, pivoted pendant D, with its sliding bar or rod E, and the frame F, for holding the dark slide or plate holder; and, further, the special and particular method with a pivoted pendant made adjustable upward and downward, and with a to-and-fro or a lateral transverse oscillating movement on the arc of a circle, carrying a chemically-prepared plate across the opening behind the lens tube or tubes in making sun pictures, substantially as set forth and described.

2. The combination and arrangement of these various parts, making the apparatus or device complete.

81,056.—CHARLES E. ZIMMERMAN, Cincinnati, Ohio.—*Churn.*—August 11, 1868.—The dashers may be removed as soon as the butter forms, and the cream chamber then revolved alone for the purpose of gathering the butter.

Claim.—The arrangement, substantially as described, of the cream chamber A, bearings B B' C C', removable frame H, with its shaft I K and dashers J, crank shaft L l' M, apertures N n, and swinging brackets R R', or devices substantially equivalent, for the purpose set forth.

81,057.—BETHEL BURTON, Brooklyn, N. Y.—*Manufacture of Water-Proof Percussion Caps, &c.*—August 11, 1868.

Claim.—The use of shellac, or other gum resin, mixed with alcohol or other readily-evaporable liquid solvent, in compounding fulminating matter, which serves the purpose of rendering it impervious to damp or wet, and indestructible by coming in contact with oil or grease, and which will preserve it from the action of the atmosphere in all climates, and for use in all purposes where ignition by friction, percussion, or concussion is required, as specified.

81,058.—BETHEL BURTON, Brooklyn, N. Y.—*Priming Metallic Cartridges.*—August 11, 1868.—When the charge is exploded the pressure of gas within the cap forcibly presses it outward against the internal surface of the cup, forming a gas-tight joint. In preparing the priming, pieces of paper or cloth are coated with gum or glue; one is sprinkled

with amorphous phosphorus, and the other with chloride of potash. When dry they are cut to the required size, and, being separated by an annular washer, are ready to be applied within the cartridge.

Claim.—1. The firing pin h, when made with a piston on its rear end, working in the cylindrical cap f, which cap also works in the cylindrical cup a, all as shown and described, and for the purpose specified.

2. The application and arrangement of the prepared fulminate on paper, cloth, or other suitable materials, which may be separately cut with safety, and combined for use in cartridges, substantially as set forth.

3. The mode of separating the two prepared disks or wafers by means of an annular washer, substantially as set forth.

81,059.—BETHEL BURTON, Brooklyn, N. Y.—*Breech-loading Fire-arm.*—August 11, 1868.—These improvements have reference to certain details in the construction of fire-arms, having the same chief characteristic as the invention patented by the same party, December 20, 1859.

Claim.—1. The construction of the breech or cylinder, with the opening for the slide e to pass under the ring c, by which means the opening is entirely closed from access of sand or dirt, when the breech is closed.

2. The recoil block q, steady-pin i, and slide e, combined with the breech pin f and sectional screws or cam, which enters the recess at o, for combining or coupling the same without the use of a screw or other fastening.

3. The manner of combining the extractor q with the slide e, by means of the slot or recess y, dispensing with screws or other fastenings.

4. The combination and arrangement of the spring hammer t with the sliding breech, so that by one and the same motion the said breech is opened to receive a cartridge and the empty cartridge shell ejected from the chamber by the pressure of the hammer, substantially as set forth.

5. The hook-ended finger h upon the trigger k, the slot and lip in breech pin f, the safety bolt, Fig. 31, for keeping the breech pin locked, and as set forth.

81,060.—E. H. ASHCROFT, Lynn, Mass.—*Device for Ventilating and Desiccating.*—August 18, 1868.—In one horizontal arm or portion of a T-shaped pipe is disposed a blast pipe terminating at or about the center of communication of the horizontal and upright portions of the T.

Claim.—The combination of the T-shaped pipe A and the inner horizontal one, d, constructed and operated in the manner substantially as shown and described and for the purpose set forth.

81,061.—ALEXANDER JOSEPH BASSET, Philadelphia, Pa.—*Soles for Boots and Shoes.*—August 18, 1868.—On the under side of the sole is a series of conical air chambers, by pressing upon which a suction is produced to hold the sole in contact with icy or slippery surfaces.

Claim.—A sole for boots and shoes, arranged substantially in the manner and for the purpose specified.

81,062.—EDWARD J. BIEDERMAN, Brooklyn, N. Y.—*Sugar Packer.*—August 18, 1868.—The barrel, to contain the sugar, rests in a cavity in the platform, and by means of a forked bar with a screw clamp on each fork end, the upper rim of the barrel, with the filling bag, is tightly clamped, while the single opposite end of the forked bar is fitted to a crank from which it receives and imparts to the barrel a reciprocating motion.

Claim.—In devices for packing barrels with sugar and other substances, the combination of the forked bar F with clamps G G and screws H H, the crank shaft D and platform A, arranged and operating substantially as and for the purpose herein set forth.

81,063.—WALTER J. BRASSINGTON, Brooklyn, N. Y.—*Gas Burner.*—August 18, 1868.—A movable internal valve is placed in the ordinary gas burner and operated so as to cut off the gas to quantity necessary to supply a small flame for the purpose of

producing a perpetual light, and dispensing with the ordinary supply cock.

Claim.—1. The valve A, placed inside of the ordinary gas burner, and operated so as to cut off the force of the gas to the desired quantity necessary to supply a miniature flame, substantially as described.

2. The valve seat I H I, formed by the under side of the tip in the ordinary gas burner, against which the valve A seats itself, for the purposes specified.

3. The application of the spiral spring B, in combination with the valve A, for the purposes herein specified.

4. The movable jacket M or casing, with the slot N, in combination with the band W, for the purpose of receiving the movable glass protector or hood R, substantially as described.

5. The combination of the internal movable valve A, with the elastic packing F and plate G and screw D, or their equivalents, substantially as shown and described, for the purposes set forth.

6. The application and use of the spring point P, attached to the movable jacket M or casing, and the notch K, to receive the same, for the purpose of securing the aforesaid movable jacket M or casing in its proper position, when it is raised to protect the small flame U, or drawn down to permit a full flame at T, as herein specified.

7. A pull or handle O, or other suitable device, attached to the movable jacket M or casing, for the purpose of operating the same, either up or down, substantially as described and herein set forth.

81,064.—JAMES BROWN, Pawtucket, R. I.—*Bearing for Fliers in Spinning Machine.*—August 18, 1868.—The flier bearing consists of a tube having an annular channel for the reception of oil, and a male screw cut on its upper half to screw up into the rail. The rail serves as a cap to the oil trough and is also provided with an oil supply and air-exit holes.

Claim.—1. The within-described arrangement of the confining screws *a b*, the tube *c*, the rail A, and the oil trough *d*, placed underneath the rail, the screws by such arrangement being within the rail, and the oil trough being below, and covered by it, in manner as specified.

2. The arrangement of the confining screws *a b*, the tube *c*, the rail A, provided with oil and air ducts *e f*, the oil trough *d*, and the oil duct *i*, substantially as described.

81,065.—WILLIAM BROWN, Worcester, Mass.—*Sofa Bed.*—August 18, 1868.—Plates fastened to the ends of the hinged back portion are so arranged that when the back is raised the upper ends of the plates will pass upon the inner sides of loops projecting from the rear of the stationary arms, and the back will be held upright by the bent ends of spring arms at the ends of the frame.

Claim.—1. The combination, with the sofa bed, of the pieces *d d* and loops, *a a'*, or either, and the spring arms *g g*, substantially as and for the purposes set forth.

2. The combination, with the hinged legs G G and loops *a a'*, of the pieces or legs H and arms, *g*, substantially as and for the purposes set forth.

3. The combined head-boards and detachable legs H, substantially as described.

81,066.—JARVIS CASE, Lafayette, Ind.—*Corn Planter.*—August 18, 1868.—A platform is connected to the tongue by means of a flexible metallic strap, and the runners are held in a raised position by means of a catch engaging with a pin on a bar rigidly attached to the under side of the bed. The seat is arranged to be shifted so as to bring the driver's weight over the bed to force the runners into the earth when necessary.

Claim.—1. Connecting the front and rear frames of the machine by means of the flexible plate *t*, when said parts are combined substantially as described.

2. The catch *n*, pivoted to the rear frame, and arranged to engage with the bar U, for locking the front and rear frames rigidly together, substantially as and for the purpose set forth.

3. The scattering device, arranged in the lower

end of the seed tubes, when constructed substantially as described.

4. The seat T, when arranged to be adjusted in rear of the axle, or over the front part of the platform, substantially as described.

5. The combination of the valve *f*, pivoted cam *g*, and sliding arm *i*, attached to the seed slides, constructed and arranged to operate substantially as shown and described.

6. The removable hopper, C, having the cut-off *e* attached thereto, when constructed and arranged substantially as shown and described.

81,067.—EDWARD W. CHADWICK, Edgartown, Mass., assignor to himself and WILLIAM P. CHADWICK, same place.—*Car Coupling.*—August 18, 1868.—In the top of the draw bar is arranged a cap provided with a spring receiving chamber, the spring serving to depress and hold the catch lever within the catch recess.

Claim.—The arrangement and combination of the chambered cap C with the chambered draw bar A, the spring *h*, and the lever catch B, made as described.

81,068.—JOHN WALTER CLARK, Philadelphia, Pa.—*Artificial Teeth.*—August 18, 1868.—Slots are cut in the dies, through which the shank of the notched pin passes so as to secure the pins in a vertical position. When the dies are placed in position the bolts are inserted and tightened up by a thumb screw.

Claim.—1. The arrangement of the double notched pin P, and the manner of securing the same in proper position by means of notches in dies 1, 2, 3, 4, 5, and 6, and slide D

2. The manner of arranging the dies 1, 2, 3, 4, 5, and 6, and drawing them out from the sides of the molds; also, the arrangement of bolts B and thumb screw S, for securing said dies firmly in place.

81,069.—RANSOM COOK, Saratoga Springs, N. Y.—*Bit for Boring Wood.*—August 11, 1868.—At the lower end of the pod which is forged in the usual manner, is formed a projection to be shaped into a center. The pod and center are subsequently formed with swages or dies.

Claim.—The improved spoon bit, constructed substantially as hereinbefore set forth.

81,070.—GEORGE CROMPTON, Worcester, Mass.—*Loom.*—August 18, 1868.—Combined with the horizontal harness levers, jointed directly to the jacks, and with angular evener levers operating directly upon the harness levers to bring them into line, and with the slide rods which operate the evener levers, are rocker links, for connecting the evener levers to the slide rods.

Claim.—1. In combination with angular evener levers and horizontal harness levers, operated upon by such eveners, (to bring the jack hooks into line,) the rocker links *t*, which connect such eveners with the slide rods, substantially as set forth.

2. In combination with jacks operating upon horizontal harness levers, and with angular lifter and depresser levers operating such jacks, the angular lifter and depresser levers, connected to the slide rods by which they are operated, by the rocker links *n*, substantially as described.

81,071.—FRANÇOIS LOUIS DEGERBETH, Dalton, England, assignor to THOMAS S. G. KIRKPATRICK.—*Manufacture of Compound Oils.*—August 18, 1868; patented in England November 11, 1867.—The apparatus consists of a battery of ten cells, each containing plates of zinc and platinized silver, and the battery is excited by sulphuric acid diluted with water.

Claim.—1. The production of an oil resembling linseed oil, and applicable to painting and varnish-making, from a mixture of petroleum or coal oil, or such like hydrocarbon and resin oil, such oils being treated with oxidizing agents, ozonized air, galvanic electricity, and driers, as herein described.

2. The treating petroleum, coal oil, or other similar hydrocarbon oil with oxidizing agents, and galvanic electricity, so as to improve the color, as herein described.

3. The production of a spirit similar to turpentine,

from a mixture of light petroleum or coal oil, or other similar light hydrocarbon oil or spirit, and light resin oil or spirit, such oils or spirits being treated with oxidizing agents, ozonized air, and galvanic electricity, as herein described.

4. The apparatus hereinbefore described, for the treatment of oils and spirits by means of ozonized air.

81,072.—J. L. DICKINSON Dubuque, Iowa.—*Governor for Steam Engine.*—August 18, 1868.—The upper ends of the ball-supporting arms are bent and journaled in adjustable boxes, so that when the motion of the governor is suddenly checked, the momentum of the balls carries them ahead of the governor, thereby acting through the crank ends of the arms upon the valve quicker than by the fall of the balls alone.

Claim.—The crank form of the upper end of the ball arms, in combination with the adjustable boxes, giving both lateral and vertical motion to the balls, for the purpose and in the manner substantially as herein described.

81,073.—EDWARD DORAN, Philadelphia, Pa.—*Machine for Making Fringe.*—August 18, 1868.—Applied to a fringe loom is a series of devices whereby the twists required in the loops of the fringe are automatically produced as the fringe is being woven in the loom.

Claim.—1. The pulley L, with its ratchet tooth or notch, in combination with the pawl O, and the arbor with its arms *l'*, the said parts being constructed, arranged, and operated by the cord *p''*, pulleys P and Q, cord *q'*, weight *q''*, and the lay B, as and for the purposes described.

2. The slotted plate M, stem *m'*, spring *m''*, bar *k''*, and lever K, the said parts being arranged and supported so as to be operated together, by means of the said spring *m''*, trigger *k'*, and the projection *r* on the lay, or their equivalents, substantially as and for the purpose described.

81,074.—JOHN DU BOIS, Williamsport, Pa.—*Lumber Drier.*—August 18, 1868.—A series of girts having a ribbed edge on the inside, for the purpose of supporting strips, are arranged within a suitable building, the strips serving to hold boards or lumber on end. The drying sheds are built double with a space between for an elevated railroad track and ear, the latter having a swivel platform.

Claim.—1. The arrangement of drying sheds, provided with grated or open floors for sticking lumber standing on end, it being held upright by series of strips or stickers, *e e e*, resting on the girts *b b* on plates *d d*, substantially in the manner as described for the purposes herein set forth.

2. The rib or raised portion on the inner edge of the girts, in combination with the cleats *i i* on the ends of the strips or stickers *e e e*, substantially as and for the purposes herein specified.

3. The application of the ear C with the turn-table frame thereon, and elevated track B, when used in combination with the drying sheds, constructed as herein set forth.

81,075.—JOHN DU BOIS, Williamsport, Pa.—*Device for Moving Vessels to and from Wharves on Docks to Water.*—August 18, 1868.—A framework, consisting of horizontal and vertical timbers properly braced for supporting a vessel, is placed upon two floats or lighters provided with water-tight compartments and arranged to pass on either side of a wharf, so that the vessel can be raised and floated upon and off the wharf.

Claim.—The floats E E, constructed and arranged as herein described, in combination with the transverse, detachable, and adjustable framework *a e d g*, in the manner and for the purpose herein set forth.

81,076.—JOHN DU BOIS, Williamsport, Pa.—*Dredging Machine.*—August 18, 1868.—A vertically-sliding frame is arranged within an opening in suitable frames. A series of scoops or buckets are attached to an endless chain and also hooked prongs for loosening the earth in advance of the scoop. Grouser boats, formed with water-tight compart-

ments and having a longitudinal vertical space centrally from one end to the other, serve to move the apparatus and secure it in proper position.

Claim.—1. The arrangement of the sliding frame E, with its elevators G G, and hook prongs *i i i*, substantially as herein described.

2. The adjustable sliding frame E, in combination with the rail-track frame N, for the raising and disposing of the mud, earth, or gravel, as herein specified.

3. The construction and arrangement of the grouser boats A' A', with their platform connections, in combination with a dredge boat or scow, substantially as set forth.

4. The mode by which the dredging scow A is moved forward and guided, while in the act of operation, substantially as herein set forth.

5. The construction and arrangement of the ear track P P, with its adjustable supporting legs R R, in combination with the mud or earth-moving vessel B, as herein described, for the purposes set forth.

81,077.—ELIAS EASTON, Prairiesville, Mich.—*Farm Gate.*—August 18, 1868.—The gate may be adjusted to any desired elevation to allow the passage of small animals. By an arrangement of cords and levers, the latch can be raised upon pulling a cord, and the gate will open in the forward direction of a rider, without the necessity of dismounting from a horse or carriage.

Claim.—1. The combination of the rear gate post B, when provided with perforations, as described, with the elasp hinges *e e*, and an ordinary gate, for the purpose of adjusting said gate at any desired elevation, as herein fully set forth.

2. The combination of the levers F and H with the cords *j j* and side posts M and pitman I, when arranged substantially in the manner and for the purposes specified.

81,078.—MICHAEL EHRET, Jr., Philadelphia, Pa.—*Roofing.*—August 18, 1868.

Claim.—Roofing consisting of granulated slag, scoria, or cinder applied to a cement surface, as set forth.

81,079.—JOHN ELMIRE, Martic Township, Pa.—*Axle.*—August 18, 1868.—A slot is formed in a stout metallic bed plate through which the bearings enter, and rest against shoulders, for the purpose of giving the greatest amount of resistance to the pressure of the hub against the under side of the wheel.

Claim.—The arrangement of a stout bed plate A, in combination with the prolonged shouldered bearings B B, inserted through the bed plates A, and secured by a nut on a screw end, in the manner shown, when combined with a cylindrical roller C, and inserted in the manner and for the purpose specified.

81,080.—HARRY C. GOODRICH, Chicago, Ill.—*Tension Device for Sewing Machines.*—August 18, 1868.—The thread passes between two plates secured to the pressure-foot arm, one of which plates is operated by means of a spring acting as a lever, by which the tension is rendered self-adjusting according to the thickness of the cloth.

Claim.—The plates A and C, in combination with the pivoted spring or lever D, and set screw *i*, constructed and arranged to operate with the pressure shank, substantially as specified.

81,081.—N. S. GREEN, Utica, (Welaunee Post Office,) Wis.—*Snow Plow.*—August 18, 1868.—The upper edges of the mold boards are curved outward and downward, and their side edges are inclined upward and curved outward and upward so as to throw the snow at a considerable distance from the track.

Claim.—The arrangement of the mold boards C C upon a V-shaped skeleton frame, when said boards are provided with scrolls F F upon their entire upper edges, and with beveled fronts, to the rear of which are formed vertical flanges G G, all as herein shown and described.

81,082.—WILLIAM H. HALSEY, Hoboken, N. J.—*Molding Watch Cases and Lockets from Hard*

Rubber.—August 18, 1868.—Cavities are formed in the die in which the case is molded, so that a hinge or other device made of metal can be securely attached to the article molded, without the necessity of rivets or fastenings being applied after the article is removed from the molds.

Claim.—1. The dies, constructed with the cavities 3 3 3', when made in the form described and shown, for the purpose of molding watch cases and locket cases of hard rubber, substantially as herein set forth.

2. As a new manufacture, watch cases and lockets, when made of hard rubber, by means of the herein described dies.

81,083.—THOMAS C. HARGRAVE, Boston, Mass.—*Wheel and Axle for Railroad Car.*—August 18, 1868.—Each pair of wheels is connected together by a hollow axle through which passes a solid axle having attached at each end a circular plate provided with a flange, which fits over a flange of smaller diameter on the outer side of the wheel, so that the one flange will bear upon the other only at one point.

Claim.—The within-described car wheel, with its plate and axles, constructed and operating substantially as set forth.

81,084.—JOSEPH HAYTHORN and CHARLES E. PRICE, Thomsonville, Conn.—*Alarm for Carding Machine.*—August 18, 1868.—Spring posts, arranged between two pairs of rollers in rear of the feed rolls, and through which the strand passes, are made to operate a bell, through a cord and lever, in the event of the breaking of a strand.

Claim.—The combination of the rolls B and C, spring posts *b b*, cord F, with bolt G, and lever H, with its bell, all arranged substantially as described, and applied to a carding machine, for the purpose set forth.

81,085.—SAMUEL E. HORNER, Shiloh, N. J.—*Thill Coupling.*—August 18, 1868.—The end of the thill forms a snap hook so as to be readily attached to the thill bolt. Between the jaws of the clip is inserted a rubber block hollowed out to fit the snap hook.

Claim.—The clip A, thill D, snap hook E, and the gum block F, when combined as shown and described.

81,086.—C. B. HORTON, Sand Bank, N. Y.—*Flour Bolt.*—August 18, 1868.—Air is conducted by spouts or tubes to the interior of the bolt chest, and delivered through a slot so as to strike the surface of the bolt obliquely, so that, while the passage of air is allowed, the escape of flour will be prevented. The rapper consists of a hammer secured to a shaft from which projects a rigid arm that serves to raise a tappet, as the cylinder revolves, to release the hammer.

Claim.—1. The combination of the blast apparatus D E *e*, for supplying air to the interior of the bolt chest, with ventilators F, constructed of any suitable cloth, and arranged substantially as herein set forth, for the purposes stated.

2. The arrangement of spring rappers H I I' J, mounted transversely upon the exterior of the bolt chest, and operating in the manner and for the purposes specified.

81,087.—A. J. F. HOWARD, Milford, Mass., assignor to himself and E. MANN, same place.—*Boot Crimper.*—August 18, 1868.—The sides of the movable jaws are made to converge as they approach the shank, for the purpose of preventing the edges of the corner of the "upper" from being bruised or injuriously spread.

Claim.—As my invention, the improved construction of the movable jaw of a boot crimper as made of a tapering or frusto-conical form, in manner and for the purpose as herein explained and shown.

81,088.—JOHN C. HOWE, Worcester, Mass., assignor to himself and THOMAS GATES.—*Meat Cutter.*—August 18, 1868.—The stationary bed is combined with the frame of the machine in such a manner as to admit of its being readily adjusted as the top of the bed is worn away by the action of the cutters. The bevel gears on the horizontal shaft are smaller than the cutters, so as to cause the latter to be

driven more rapidly, and thus produce a drawing and compound cutting motion.

Claim.—1. The combination and arrangement, in a meat-cutting machine, substantially as described, of the vertical cutters *c* and horizontal cutter shafts, in the manner set forth, whereby the said cutters, while revolving around a vertical axis, shall have an independent rotary movement in a vertical plane upon their own axes, so as to produce the compound drawing cutting motion, substantially as specified.

2. The combination, with a cutting bed, and a receptacle for meat or other material, of the central shaft N, horizontal shaft or shafts H, having cutters, *e*, of greater diameter than the gears I I, and arranged for joint operation, substantially as and for the purposes set forth.

3. The combination with the base A and cutting-table or bed G of the disk F and adjusting screws *b*, substantially as and for the purposes set forth.

4. The combination and arrangement of the parts A, F, G, and D, substantially as and for the purposes set forth.

5. The combination with the parts A, B, D, and E, of the operating shaft N and cutting mechanism, substantially as and for the purposes set forth.

81,089.—HENRY C. HULBERT and ALONZO FOLLETT, Brooklyn, N. Y.—*Hat.*—August 18, 1868.—A body of stockinet or looped fabric, of the form of the required head covering, is combined with a pliable coating, the two being consolidated by pressure between dies. An embossed coating, containing rubber, may be combined with the body to render the same water-proof.

Claim.—1. The combination of a body of stockinet, of the form of the head covering required, with a pliable coating; the said combination being consolidated by pressure between dies, substantially as before set forth.

2. The combination of a cloth body, of the form of the head covering required, with an embossed coating of India-rubber, substantially as before set forth.

81,090.—STEPHEN HULL, Poughkeepsie, N. Y.—*Harvester Rake.*—August 18, 1868.—This invention relates to improvements on the single driving-wheel and rigid finger-bar harvesters, having a revolving raking and reeling attachment.

Claim.—1. The intermediate platform E, placed between the grain platform and draught frame, and having mounted upon it the rake and reel post F, substantially as described.

2. The cam plate H, the spur wheel G, and the adjustable journal box C², applied upon the post F, in combination with the pinion shaft D and driving wheel B, substantially as described.

3. The closed cam plate H, constructed to operate upon the reel and rake arms, as described, and extended to or nearly to the inner surface of the cam rail K, so as to serve as a top shield for the rake and reel gearing.

4. The cam projection *j'*, arranged as described, in combination with the projections *j* upon the pivoted reel arm hinging portions H², substantially as described.

5. The construction of the cam rail K, inner divider L, and the device K', so that these parts unite and form conjointly a continuous closed shield at the inner front corner and inner edge of the platform, as shown, and thus serve for keeping the loose straw and other obstacles from getting under the cam plate H, as set forth.

6. The combination of the side shield L and the extended closed cam plate H, the same being constructed and arranged substantially as shown and described.

7. The removable apron N applied to the bearing B¹ and cam rail K, substantially as and for the purposes described.

8. Shaft *d*, supported at one end by a sliding bearing *c*², on post F, and connected at the other end to the axle of the wheel B by a coupling box, *h*, in combination with the pinion *e*, and a clutching device, substantially as described.

9. The slotted and pivoted extended brace *s'*, applied on the side of the tongue or pole M, and serving to brace the same, and also serving as a means for raising and lowering the same, in combination

with the vibrating latching-lever T and segment R the whole substantially as herein described.

10. A combined revolving reel and rake, mounted on a support, which is on the intermediate platform E of a harvester, such combined reel and rake having its arms hinged to one head, which revolves independently of the support, and also has its arms guided and controlled by a cam, or cam and guide rail, in their movements over the grain platform, and turned up at intervals to nearly an upright position in rear of their support or axis; the shaft or axis of said reel and rake being vertical, or nearly so, substantially as and for the purpose described.

11. The combination of a vertical shaft, which has its support on platform E of the harvester, a cam guide way and reel and rake arms combined, which revolve independently of the vertical shaft, all substantially as and for the purpose described.

12. The construction of a seat standard, A⁶, of a strip or piece of spring metal twisted, substantially as and for the purpose described.

81,091.—AARON HUFF, Swedesboro, N. J.—*Ventilator.*—August 18, 1868.—A vertically and horizontally adjustable and removable funnel is attached to an outlet pipe, and is so arranged that it may be swung into position for use, and also may have its opening closed by merely changing the position of its parts.

Claim.—1. A ventilator, having a swinging foul-air pipe, combined with an outlet or discharge pipe, substantially as and for the purpose described.

2. The above, in combination with an adjustable funnel, substantially as and for the purpose described.

81,092.—NATHANIEL IRISH, Rochester, Minn.—*Attaching Pole Straps to Neck Yokes.*—August 18, 1868.—The pole straps pass through rings in the hames of the harness and slot in the end of metallic loops, which latter engage with a catch on the end of the neck yoke.

Claim.—The pole straps C C and metallic loops B B, when constructed, arranged, and used substantially in the manner set forth.

81,093.—JOHN A. KESTLER, Chicago, Ill.—*Lubricating Oil.*—August 18, 1868.—Composed of crude petroleum, saleratus or sal soda, and brimstone. After the above is boiled and strained, kerosene is added.

Claim.—The oil composed of the ingredients, and manufactured as herein described.

81,094.—WILLIAM O. LESLIE, Philadelphia, Pa.—*Apparatus for Drying Bricks.*—August 18, 1868.—A series of drying chambers are separated from each other by iron folding doors, through which chambers a railroad track is laid. Under one end of the structure is a furnace, and hot air, of increasing degrees of temperature, is introduced successively into the separate chambers.

Claim.—The drying house above described, consisting of the brick building A, having the compartments A¹ A² A³, the furnace F, the hot-air pipes H H¹, the registers h¹ h² h³, the valve doors a a a, the doors B B and D D, and the railroad R R, all constructed, combined, and arranged substantially in the manner and for the purpose specified.

81,095.—WILLIAM P. LETCHWORTH, Buffalo, N. Y.—*Machine for Bending Wood.*—August 18, 1868.—A frame or former is provided with a groove or channel made to conform, or nearly so, with the inner beveled edge of the hames, in which frame the hame is retained while being bent. A thin strip of metal is placed on the back of the hames to prevent the wood from breaking or splintering at the edge while being bent.

Claim.—The herein-described device for bending hames, consisting of the former, A, notched at one end, and provided with a hook at the other, and employed in connection with the strip f, all constructed and arranged in the manner and for the purpose set forth.

81,096.—ELBRIDGE MANN and A. J. F. HOWARD, Milford, Mass.—*Boot Crimp.*—August 18, 1868.—The teeth of the movable jaw are made of a

curved or sectoral shape instead of straight, in order to prevent lateral displacement of the leather between the clasp and movable jaws.

Claim.—The construction of the movable jaw a, as having its teeth of a curved or irregular shape, in manner and for the purpose as before described.

81,097.—C. K. MARSHALL, New Orleans, La.—*Station Indicator.*—August 18, 1868; antedated August 6, 1868.—A series of tags, bearing the name of a street or station, is arranged on independent rods, having their bearings at regular intervals in ratchet chains, which pass over rollers in the ends of a rectangular box; the whole being operated by means of a sliding bar, spring, and pawl; the latter engaging, with suitable projections, in an endless chain.

Claim.—1. The endless chain C, when the same is composed of metal plates D and E, so united and arranged as to form the T-shaped ratchet bearing, substantially as and for the purpose specified.

2. The combination of the endless chains C C and tags F F, when the same are constructed and arranged substantially as described.

3. The combination of the chains C C, plate G, pawl I, and spring H, when the same are constructed and arranged substantially as described.

81,098.—JOSEPH McDONALD, Oshkosh, Wis.—*Cant Hook.*—August 18, 1868.—The hook is provided near its pivoted end with projections which act as stoppers, to prevent the hook from falling too far down toward the handle. The stoppers strike against a metal bar secured between the cars of the retaining band.

Claim.—The combination of the hook B and its stoppers E E with band D, bar F, and the handle A, the several parts being constructed to operate substantially as described.

81,099.—WILLIAM C. MCGOWAN and J. MADISON HALE, Georgia Plains, Vt.—*Fly Net for Window.*—August 18, 1868.—A bag of tapering form is attached to rods affixed to brackets on the outside of a window. The mouth of the bag is placed in the open part of a window and flies are driven into the same. A flap hanging below the mouth of the bag is made to close the same and thus secure the flies in the bag.

Claim.—A bag of netting, B, extended over the frame b b, &c., over the upper portion of a window, and provided with the flap C, for closing the mouth, as and for the purpose described.

81,100.—JOE V. MEIGS, Washington, D. C.—*Breech-loading Fire-arm.*—August 18, 1868; antedated August 5, 1868.—Designed as an improvement on his patent of May 22, 1866. The breech block slides loosely in an oblong slot in front of the breech plug, and is controlled by a bent lever pivoted to the guard plate. A hook on the upper end of the link serves to extract the cartridge. A sliding guard is connected with the breech block and lever, and the gun is loaded by two simple movements.

Claim.—1. The loose breech block D, constructed, arranged, and operating as and for the purposes described.

2. The bent lever or link E, constructed, arranged, and operating as and for the purpose described.

3. The hook e³, constructed as described, and vibrating in a vertical plane, to push in the cartridge as the breech is closed, and hooking over the edge of the cartridge shell as the breech is opened.

4. A cartridge inserting and extracting lever, having three movable fulera or working pivots, substantially as described.

5. The combination of the sliding guard, the vibrating lever E, and the breech block, all constructed and arranged for joint operation as described.

6. The combination of a vertically-sliding horizontally-slotted breech block, with a vibrating lever, having a pin working in the slot of the breech block, whereby the block is held up to close the breech securely without strain on the lever.

7. The combination, as described, with the hammer of the vertically-moving loose breech block, constructed as described, whereby the block can be used as a firing pin.

81,101.—WILLIAM M. NEWTON, Baltimore, Md., assignor to himself and JOHN E. ARMENDT, same place. — *Brush.* — August 18, 1868. — Relates to trenches or pencils used for painting the seams in hulls of vessels, for the white striping of brick walls, &c. This construction admits of readily replacing the bristles when worn.

Claim.—The improved trencher brush, consisting of the combined handle and frame A, made of a single piece of metal, and the plate B secured thereto, as herein shown and described.

81,102.—JAMES OHLEN, Columbus, Ohio. — *Attaching Handle to Saw.* — August 18, 1868. — Removable handle attachment for large cross-cut or log saws, whereby the socket which receives the handle is secured to the saw in a more substantial manner.

Claim.—1. The construction of the socket B, jaws B¹, and slotted or split screw bolt B² in one piece, substantially as shown and described.

2. The slotted washer E, in combination with the nut D, bolt B², jaws B¹, and socket B, substantially as described.

81,103.—GERRIT V. ORTON, and WILLIAM H. DOANE, Cincinnati, Ohio. — *Machine for Wiring Window Blind.* — August 18, 1868. — The outer end of the feed arm is depressed by the action of the driver after discharging a staple, and, upon being relieved by raising the driver, is thrown upward into a sufficiently inclined position to allow the staples to move downward by gravity preparatory to the succeeding action of the driver.

Claim.—The feed bar *d*, when so pivoted and arranged that it will be depressed by the action of the driver *b*, substantially in the manner and for the purposes herein set forth.

81,104.—J. B. PATTERSON, Portage City, Ohio. — *Compound for Preserving Eggs.* — August 18, 1868. — The eggs are covered with a solution of potash, sal-soda, sugar, vinegar, and oil.

Claim.—The herein-described compound, composed of the ingredients substantially as set forth, for the purpose specified.

81,105.—HENRY F. PHILLIPS and HENRY W. LEONARD, Auburn, N. Y. — *Machine for Grinding the Cutter of Mowing Machine.* — August 18, 1868. — The stone is fed up to the sections while the cutter bar sections are rigidly held, or the sections are presented to the stone while the stone is rigidly held. The frame is susceptible of a rocking or rolling motion, for adjusting the dip or inclination of the stone, and of a sliding motion to fix the position of the stone.

Claim.—1. In combination with the curved or hollowed out block B, the rocking and adjustable bearer *c*, for adjusting the shaft of the grindstone, substantially as and for the purpose set forth.

2. In combination with the shaft D and its stone E, the collar *e* and arm *g*, so that the stone may be fed and held up to the sections by a positive and unyielding feed, or be held rigid by said arm, substantially as and for the purpose described.

3. The combination of the table or arcs I I', with the holder G, for guiding, holding, and gauging the inclination of said holder, by devices connected therewith, substantially as described.

4. In combination with a fixed position of rotation of the stone, the screw *q*, as a feeding screw, to feed the section to the stone and rigidly hold it against jar or motion, and thus prevent the stone from wearing out of round, substantially as described.

81,106.—JOEL PUTNAM, Danvers, Mass. — *Shoe.* — August 18, 1868. — The two flaps prevent extraneous matter from working into the shoe at either side of the lacing slit.

Claim.—As my invention, the new or improved manufacture or shoe as made with two flaps applied and fastened along the sides of its lacing slit, and formed so as to overlap one another under circumstances as specified.

81,107.—GEORGE P. REED, Boston, Mass. — *Watch.* — August 18, 1868. — Affords ready access to

the spring and click of the winding ratchet, for the purpose of letting down the main spring, preparatory to taking the watch apart.

Claim.—Forming an orifice in the top on stop works plate of a watch, and partially or wholly surrounding the winding arbor thereof, such orifice being disposed above or opposite the main wheel and winding ratchet, and the spring and click of the latter, essentially in manner and to operate as herein shown and described.

81,108.—JACOB REICHARD, Fayetteville, Pa. — *Cultivator.* — August 18, 1868. — The cultivator teeth are attached to a frame whose front cross bar is grasped by a bifurcated arm projecting from a roller, which latter may be partially rotated by a lever, so as to throw upward the front and depress the rear of the frame, and thereby bury the teeth in the ground, any position of the lever being maintained by notched stationary plates.

Claim.—An improved cultivator, arranged, constructed, and operating substantially in the manner as shown and described, and for the purpose set forth.

81,109.—EDWARD SABINE RENWICK, New York, N. Y. — *Grate for Hot-Air Furnace.* — August 18, 1868.

Claim.—The combination of the following instrumentalities, viz, the fire box, two gangs of grate bars, the members of one of which are reciprocable longitudinally relatively to those of the other, a rock shaft, with which the grate bars are connected, so that they may be tipped, and a grate-bar mover, connected with one gang of grate bars in the vicinity of the axis of the rock shaft, all operating substantially as before set forth.

2. The combination of the following instrumentalities, viz, the fire box, two gangs of grate bars, having the relationship aforesaid, the rock shaft, on which the grate may be tipped, the grate-bar mover, connected with one gang of grate bars in the vicinity of the axis of the rock shaft, and a lever handle, arranged at the exterior of the ash pit, substantially as before set forth.

81,110.—CHARLES F. RICHERS, New York, N. Y. — *Harness Rosette.* — August 18, 1868. — The fringe holder being inserted in the rosette, springs to the position which insures its retention.

Claim.—The employment of the detachable fringe holder D, in combination with the rosette, provided with the spring G, substantially as and for the purpose herein stated.

81,111.—EZRA RIPLEY, Troy, N. Y. — *Screw Handle Attachment.* — August 18, 1868. — The conical shank is firmly secured to the bowl of the spoon or dipper, by soldering or otherwise.

Claim.—The conical shank B, or its equivalent, having the screw C on one end thereof, for the purposes of connecting wooden or other handles to spoons, bowls, or other culinary vessels, substantially in the manner and for the purposes herein described and set forth.

81,112.—HENRY J. RUGGLES, Poultney, Vt. — *Slate Trimming Machine.* — August 18, 1868. — This invention is based upon the discovery that by bringing an additional cutting edge into operation before the first-applied cutting edge has passed entirely through, so as to cause the two cuts to meet at some distance from the edge, no liability to chip or break off the corners is incurred.

Claim.—The arrangement of the cutting edges *f* and *g* of the moving knife, so as to cut from both opposite edges of the slate, and cause the cut to terminate at a distance from either edge, substantially as and for the purpose herein specified.

81,113.—JOHN SALSURY, Central Falls, R. I. — *Loom.* — August 18, 1868. — The object is to lessen the shock and strain which the various parts of the loom receive whenever the shipping mechanism is brought into instant use by reason of the loom failing to perform its functions in a proper manner.

Claim.—1. The protecting pin *a*, constructed as described, with a rubber packing, *b*, or spiral spring,

and slide or pin *e*, substantially as and for the purposes specified.

2. The combination of the barrel C, Fig. 3, rubber packing D, and piston E, in combination with the breast beam, in the manner and for the purposes specified.

3. The combination of the rod F, cylinder H, and spiral spring or rubber packing, constructed and arranged substantially as described, for the purposes specified.

4. The combination of the device shown in Fig. 3, the frog or shoe L, and the breast beam, in the manner described, and for the purposes specified.

81,114.—AMOS SARGENT, Brewer, Me.—*Steering Apparatus*.—August 18, 1868.—The elastic guard constitutes a track for the pinion, so that when the apparatus is in motion any obstacles which may be lying upon the deck are easily overridden in consequence of the vertical movement of which said guard is susceptible.

Claim.—The curved and elastic guard *f* applied to the rack *d* and pinion *e'*, as and for the purpose set forth.

81,115.—GEORGE F. SMITH, Plantsville, Conn.—*Carriage-Axle Coupling*.—August 18, 1868.—The cylindrical enlargement of the king bolt at its base, in connection with the socket piece or cup of the upper bed plate, is designed to afford additional strength at the center of the axle.

Claim.—The combination of the bed plate *e*, with clips *a a* joined to it, so as to embrace the axle at its middle.

2. The bed plate *e*, the king bolt E, and the middle clips *a a*, as joined together in one piece.

3. The arrangement of the ends of the bed plate within the clips *d d* of each pair of the sweep clips, when such bed plate, the middle clips, and the king bolt are joined together in one piece, as set forth.

4. The king bolt, its cylindrical cup base, the bed plate, and middle clips, as joined together and applied to the axle, as set forth.

81,116.—CHARLES F. SPENCER, Rochester, N. Y.—*Fruit Jar*.—August 18, 1868.—The stopper is held in forcible contact with the gasket by means of the cross yoke bearing upon the mouth of the jar. By thus sealing the jar from the inside, the stopper can be easily removed by loosening the clamp, when the stopper is forced down by the pressure of the atmosphere, and may be readily withdrawn.

Claim.—The combination of the annular recess C, provided with shoulders *a d* and stopper B, formed with its upper edge beveled or cone-shaped, and central lug *e*, or its equivalent, with the cross rod *g*, inclined bearings *i i*, and gasket *b*, arranged and operating substantially as and for the purposes set forth.

81,117.—EDWIN R. STILWELL, Dayton, Ohio.—*Feed Water Heater for Boilers*.—August 18, 1868.—The disk causes the water to descend in a thin sheet, but before it reaches the first or upper shelf the steam issuing from the top of the steam pipe dashes it in the form of spray toward the walls of the case. The water falls from shelf to shelf through openings near the pipe, and meeting a fresh current of steam at each opening it is separated into spray, and heated and freed from lime and other matter which are deposited upon the shelves.

Claim.—1. A distributing disk, located above the series of shelves, to receive and distribute the water from the induction water pipe, substantially as described.

2. A series of shelves to check the flow and receive the impurities of water, in combination with a steam pipe or pipes, arranged substantially as described, and provided with a series of orifices for introducing the steam at different levels, so as to bring several currents of steam into fresh and simultaneous action upon the water, substantially as described.

3. The induction steam pipe H, entering below the series of shelves, and provided with a series of openings for the escape of steam, substantially as described.

4. The dripping troughs *h h*, arranged substantially as and for the purpose described.

81,118.—JACOB STONE, Belvidere, N. J., assignor to himself and ABRAM F. RANDOLPH, Washington, D. C.—*Grate of Railroad Car Stove*.—August 18, 1868.—A horizontal lever is connected with the grate post beneath the ash chamber, and receives a handle by which the grate may be rotated reciprocally in a horizontal plane to shake down the ashes, or turned far enough to be allowed to tilt, to discharge the contents of the fire box.

Claim.—1. The combination, with a car stove grate, of a central post arranged to be turned in its bearings, and to which the grate is centrally hinged, substantially as and for the purpose set forth.

2. The combination of the grate with the central post, when the latter extends downwards through the ash chamber, and beyond its bottom plate, and is supported in the latter, so that the grate may be agitated or upset, substantially in the manner set forth.

81,119.—ISAAC VANDERSLICE, Philadelphia, Pa.—*Milk Can*.—August 18, 1868.—This invention is intended to provide a strong bottom, and enable the can to be rolled upon its lower edge without being bent or otherwise injured.

Claim.—The cast-iron milk-can bottom B, having the upward and downward projecting flanges *b¹ b²*, the latter having an external beveled surface, to form a thread upon which to roll the can, as set forth.

81,120.—JOSEPH SCOTT VANHORN and WILLIAM H. PACK, Jersey City, N. J.—*Spring Slat Bed Bottom*.—August 18, 1868.—The end pieces may be shifted toward or away from the extremities of the bed bottom for the purpose of adapting the slats to sustain more or less weight. The slats rest upon the springs, and the springs are free to yield and descend under pressure.

Claim.—1. The spring *a*, constructed substantially as shown and applied as a central bearing for a bed slat, in the crown of its arch, substantially as set forth.

2. The combination, with the springs *a* and the arched slats, of the adjustable pieces *f f*, arranged to be shifted in the side pieces, substantially as and for the purpose described.

3. The combination of the rods *e* and hooks or clasps *k*, with the slat and its central supporting spring, substantially as and for the purpose described.

81,121.—WILLIAM H. WHITEROW, New Albany, assignor to himself and WILLIAM DETRICK, Greencastle, Ind.—*Corn Sheller*.—August 18, 1868.—The bars at the rear of the upright are forced together by springs and have projecting fingers which hold the ear and prevent it from turning as it is shelled and fed through the sheller.

Claim.—1. The shelling lips *e* and spiral feeding edges *d*, the pivoted bars H H, and the wheel G, all constructed and arranged substantially as and for the purposes specified.

2. The bars J J, at the rear of the upright A, in connection with the bars H, provided with the shelling lips and feeding edges, all arranged substantially as and for the purpose specified.

3. The tube F, in combination with the bars J J, bars H H, and the wheels E G, all arranged and combined to operate in the manner substantially as and for the purpose set forth.

81,122.—CHARLES HENRY WHITEMORE, Lewiston, Me.—*Medical Compound*.—August 18, 1868.—A liniment for rheumatism. Essential oil of turpentine, linseed oil, saleratus, tincture of lobelia, and tincture of balm of Gilead.

Claim.—The combination of the three ingredients herein first named, also their combination with either or both of the others.

81,123.—WILLIAM L. WILLIAMS, New York, N. Y.—*Machine for Splitting Kindling Wood*.—August 18, 1868.—The feeding rollers act upon the ends of the pieces of wood to move them forward in a trough at the time when the splitting knives are raised above the wood, thereby causing the feed and the knives to alternate in their action. The steady-ing bars hold up the pieces of wood as they are

split, but yield to the wood as it is spread by the entering of the knives.

Claim.—1. A pair of feeding rollers, *m n*, moved progressively when the splitting knives are out of the wood, in combination with the said splitting knives, and trough in which the wood is moved along by said rollers, and supported while being split, substantially as specified.

2. The spring steadying bars *n'*, in combination with the feed rollers *m n*, and splitting knives *f*, as and for the purposes specified.

81,124.—ALBERT A. YOUNG, Boston, Mass., assignor to himself and FRANCIS McLAUGHLIN, same place.—*Street Car Lantern.*—August 18, 1868.

Claim.—1. The construction and arrangement of the lantern B, adjusted upon the roof of the car A, by suitable fastenings, whereby the light from a single lamp, reflected as described, will both light the car and indicate its destination, substantially in the manner and for the purpose described.

2. The construction and arrangement of the signal light *c*, inserted in the lantern B, at each end, substantially in the manner and for the purpose described.

3. The ventilators *b b*, as constructed and arranged, with wire netting, or its equivalent, upon the sides of the lantern B, substantially as described.

4. Lighting street cars from the center of the roof of the car by means of a lamp or other light, hung in a lantern provided with reflecting surfaces, said lantern being raised above and fastened upon the roof of the car, substantially as described.

81,125.—ENOCH J. ALLEN, Rondout, N. Y.—*Seow.*—August 18, 1868.—A method of constructing seows with a view to strengthen the same, and enable them to sustain heavier loads.

Claim.—The combination of the cross keelsons and beams H I, transverse trestles J, and longitudinal trestles G, arranged, as described, in a seow, whereby the cross keelsons support the transverse trestles, and the latter support the longitudinal trestles, as herein shown and described.

81,126.—EMANUEL ANDREWS, Williamsport, Pa.—*Saw-Grinding Machine.*—August 18, 1868.—The blade is placed in position upon the reciprocating bed and beneath the rollers, the force of the levers being then exerted to arise the bed and cause the blade to bear against the rotating grindstone. The rollers confine the blade and its supporting plate to the bed.

Claim.—1. The combination of the sliding bed F, grindstone Q, and two rollers 4 4, when the latter are geared to and their circumferences are caused to traverse at the same speed as the bed, substantially as described, for the purpose specified.

2. The combination of the traversing bed, the frame E, and the system of levers herein described, or the equivalent to the same, whereby a yielding upward pressure is applied to elevate the said frame and bed.

3. The combination of the said traversing bed, the frame E, the system of levers herein described, or their equivalents, and the set screw *m*, or its equivalent, whereby the extent of the upward movement of the said bed may be limited without preventing the bed from yielding when necessary.

4. The combination of the traversing bed, the grindstone spindle, and its bearings, when the latter admit of separate vertical adjustment as described.

5. The combination of the grindstone spindle, the operating screw P, and the devices or their equivalents connected therewith, for the purpose of imparting a lateral motion to said grindstone.

81,127.—EDWIN R. BAKER, Fairhaven, assignor to himself and JOHN R. LINTON, New Bedford, Mass.—*Wagon Hub.*—August 18, 1868.—The butts of the spokes are in contact with each other, and hence completely fill the annular space between the two parts of the hub.

Claim.—1. The metallic hub, cast in two hollow parts, with the part B cast upon the box D, both parts being fitted together as described, to clasp the ends of the spokes C between them, as set forth.

2. The metallic hub, when its hollow shell B is

east upon and with the box D, as herein described for the purpose specified.

81,128.—PHILANDER BAKER, Chicago, Ill.—*Lamp Burner.*—August 18, 1868; antedated August 5, 1868.—In one side of the tube which is screwed into the reservoir is an opening through which oil may be poured into the lamp, upon removing, with the burner, the tube which closes said aperture.

Claim.—1. The combination of the tubes B D, and the sectional or divided wick tube C C', arranged and operating as and for the purposes described.

2. The combination of the tubes B D, plate E, standards *e*, or their equivalent, and the perforated plate F, substantially as specified and shown.

3. The combination of the tubes B D, divided wick tube C C', plate E, standards *e*, and perforated plate F, arranged and operating substantially in the manner and for the purposes set forth.

81,129.—ANDREW B. BARNARD, SHERMAN R. NYE, and RICHARD L. HEWETT, West Fitchburg, Mass.—*Harvester.*—August 18, 1868.—The compound lever is connected by a chain to another cam which is operated by a lever under control of the driver to raise the cutters.

Claim.—The combination of the compound lever *e f*, the cam lever *g*, with the cam lever *i*, and foot lever *l*, or their equivalents, substantially as and for the purpose set forth.

81,130.—JAMES B. BOWEN, CLEANTHUS A. REED, and CHARLES A. WHELAN, Madison, Wis.—*Harvester Rake.*—August 18, 1868.—The rake is reciprocated by means of the grooved wheel and vibrating lever. As the rake moves in one direction, it lies horizontally upon the platform to sweep off the grain; but, in finishing this movement, the heel of the rake is depressed by a spring, and made to enter a groove in which it traverses during the return movement of the rake, the effect being to hold the rake out of contact with the platform.

Claim.—1. The rake F, mounted on the rod G, in combination with the guide board L, having the groove P formed therein, and the spring H, all constructed and arranged to operate substantially as described.

2. The combination of the wheel A, having the groove B formed therein, as described, with the lever D, pivoted to the standard M, having the arm T attached, for operating the rake, substantially as set forth.

81,131.—THOMAS H. BOWERMAN and CALVIN J. DART, Cold Water, Mich.—*Sash Fastening.*—August 18, 1868.—The catch plate vibrates upon a pivot, and the spring acts constantly to project it through the slotted plate and hold it in engagement with the notched sash. By means of the sliding pin and knob the catch plate may be drawn back flush with the slotted plate to permit the sash to be moved freely.

Claim.—The window-fastener, as constructed, with the slotted plate A, catch B, spring D, and arm *c*, as arranged in combination with the sliding pin *e* and knob C, for operating the same, substantially in the manner as and for the purposes herein set forth.

81,132.—WILLIAM A. BRICKILL, New York, N. Y.—*Feed Water Heater for Steam Fire Engines.*—August 18, 1868.—A water heater is combined with a steam fire engine in such a manner that water has to pass through the same and become heated on its way to the boiler, the object being to expedite the production of steam.

Claim.—The combination with a steam fire engine of a heating apparatus, constructed substantially as described, and for the purposes fully set forth.

81,133.—LEONARD C. BRIGGS, Boston, Mass.—*Left-Off for Loom.*—August 18, 1868.—The disk revolves upon and traverses the fixed screw in such a manner as to cause a spring, which it acts against, to react upon the spindle of the beam, and thus to produce friction and check the revolution of the beam.

Claim.—1. The combination and arrangement of

the wheel L, the screw arm D, the spring S, and friction disk F, working substantially as described, and for the purpose set forth.

2. The combination and arrangement of its pinion P, spur wheel O, shaft I, barrel pinion K, wheel L, the screw arm D, spring S, and friction disk F, working substantially as described, and for the purpose set forth.

81,134.—PAUL M. BURNS, Freetown, Mass.—*Wash-Boiler.*—August 18, 1868.—The arms prevent the clothes from rising as the water is showered upon them.

Claim.—The cylindrical sprinkler C', applied to a wash boiler, and provided with holes *a'* on the lower half of its surface, and arms D', for holding down the clothes, the whole arranged and operating substantially as described.

81,135.—NELSON G. BURR, Homer, N. Y.—*Carriage Top.*—August 18, 1868.—By moving the handle toward the center of the carriage body, both catches may be released at once, to let the top down to the position in which the bow or standards rest upon the back rail.

Claim.—1. Supporting the top of a carriage with a single bow or pair of standards, substantially as described.

2. In combination with a single bow supporting the top of the carriage, the stands to which the bow is pivoted, so as to be raised or lowered.

3. Hanging the single bow or pair of standards which support the top of the carriage on pivots, so that it may be raised or lowered as desired.

4. Extending the ends of the bow beyond the pivots on which it swings, to serve as a means of locking the bow below the pivot when the top is raised, substantially as described.

5. The spring catches for locking the bow or standards of the top in position when it is raised.

6. In combination with the spring catches K K, the lever or handle and the link Q, which connects the catches, so as to release them both at once by moving the lever or handle P.

7. In combination with the single bow supporting the top, the bars I I and ribs J, which support the covering, substantially as described.

81,136.—CAR CARPENTER, Buffalo, N. Y.—*Method of Generating Gas from Petroleum.*—August 18, 1868.—A condenser is used in connection with the boiler for collecting surplus vapor and condensing it into its original form, in case vapor is generated in the boiler quicker than the retorts can convert it into gas, in consequence of the occasional variation of the heat required for the respective processes.

Claim.—1. The method herein described of generating illuminating gas from crude petroleum or other impure liquid hydrocarbons, consisting in, first, vaporizing the same, by subjecting a body thereof to a low boiling heat in a boiler, and then converting said vapor into a fixed gas, by subjecting it to a high heat in a separate retort, substantially as described.

2. In combination with the boiler A, constructed and operating as described, a condenser, E, substantially as and for the purpose described.

3. In combination with the boiler A, constructed and operating as described, the steam or vapor gauge *a'*, substantially as and for the purpose specified.

81,137.—CAR CARPENTER, Buffalo, N. Y.—*Apparatus for Heating Railroad Cars.*—August 18, 1868.—When the cars are in motion, the steam pipe is closed, or nearly so, and the fan set in operation, to force air through the furnace-pipe and register into the different cars. The air may be moistened by the admission of a small amount of steam. In case of a detention of the cars, the air pipe near the fan is closed by a valve, the other air valves are closed, and the steam valve being opened, steam is forced through the coil in the heater, and into the radiators.

Claim.—The combination and arrangement of the steam pipe K, fan E, valve S, furnace D, conducting pipe F, branches H H', provided with valves *j j'*, and register and radiator I I', adapted for the use of steam and hot air alternately or together in heating a train of cars, substantially in the manner set forth.

81,138.—WILLIAM CARPENTER, Fairbury, Ill.—*Braiding Attachment for Sewing Machines.*—August 18, 1868.—The braid is so guided that it may be sewed to the cloth in the middle or at either edge, and twisting and kinking of the braid is avoided; the view of the marks on the cloth is unobstructed by the braid, as it is fed to the machine.

Claim.—1. The combination, with a sewing machine, of the braiding attachment herein described, consisting of the braid reel, braid foot, and pivoted guide fingers, substantially as and for the purpose described.

2. The combination, with a sewing machine, of the braid foot and pivoted guide fingers, substantially as herein shown and described.

3. The combination, with the braid foot, of the guide fingers H H and guide rod I, substantially as and for the purpose described.

81,139.—WILLIAM CAVEN, Cincinnati, Ohio.—*Stove Grate.*—August 18, 1868.—The grate may be shaken horizontally about its axis, to precipitate the ashes, or, by a slight change of location, it may be tilted into a vertical position for the purpose of dumping the spent fuel into the ash pit.

Claim.—1. The combination of the grate D, provided with a central socket E, handle G, and pivot H, the bar C, provided with the central stud F and extension *e*, and the slots or recesses I *b'*, all arranged and employed substantially as described for the purposes specified.

2. In combination with the elements of the preceding clause, the stop J, for the purpose explained.

81,140.—WILLIAM E. CLARK, Boston, Mass.—*Cutting Printers' Leads.*—August 18, 1868.—When the movable cutter descends and commences to sever a lead, said cutter presses the lead against the guide for the purpose of effecting an accurate cut. The shelf supports that portion of a lead which is to be severed from a main stock, preventing it from being bent by its own weight or other cause, when projected forward between and beyond the movable and stationary cutters.

Claim.—1. The arrangement of the guide *b*, shelf *n*, a movable and stationary cutter, and slot E, substantially as and for the purpose described.

2. The arrangement of the graduated scale I, the adjustable gauge H, the movable and stationary cutter, and a guide *b*, when constructed and operated as and for the purpose set forth.

81,141.—CHARLES CLARKE, Coral, Ill.—*Carriage Wheel.*—August 18, 1868.—Designed as an effective means of securing the spoke to the hub, and bracing the wheel against dishing.

Claim.—The brace C, having the shoulder *d* and spur *f*, all constructed as described, and applied to a wheel, substantially as and for the purpose set forth.

81,142.—JOHN N. CLARKE, Cincinnati, Ohio.—*Horseshoe.*—August 18, 1868.—The device is susceptible of adjustment, so that it may be applied to shoes of various sizes.

Claim.—The detachable calk for horseshoes, consisting of the inwardly-curved bars B C, calks *b b' c e'*, retaining screw D, and clips E either with or without the spurs *e*, substantially as herein described and set forth.

81,143.—PORTER COOK, Baltimore, Md.—*Sheet Metal Can.*—August 18, 1868.

Claim.—An angular sheet metal can, having some or all of its sides provided with depressions *a a'*, of increasing depth, forming inward convexities, for the purpose of preventing the bulging outward of said parts by pressure within the can, substantially as described.

81,144.—WILLIAM F. CORNELL, Adrian, Mich.—*Surface Gauge.*—August 18, 1868.—A surface gauge for machinists, so constructed that by the employment of a single adjustable screw, the surface and scribing points may be held in any desired position.

Claim.—1. The T-headed arbor H, having a semi-cylindrical head, and semi-spherical staple *o*, in combination with the T-ended collar N, with its concave

and semi-cylindrical end, for the purpose of forming a clasp, all constructed in the manner and for the purpose set forth and described.

2. The conical-shaped washer *b*, and feather *c*, in combination with the clasp E, nut D, and T-headed arbor H, constructed in the manner set forth and described.

81,145.—WILLIAM F. CORNELL, Adrian, Mich., assignor to himself and SILAS HURLBUT, same place.—*Ratchet Braee*.—August 18, 1868.—A ratchet braee for drilling, countersinking, and counterboring, to be used by machinists, boiler makers, and others. By the use of one screw-ring cap and pinch screw either the ratchet-drill shaft or ratchet-countersink shaft can be secured in the ratchet braee.

Claim.—1. The combination of the socketed arm B, ratchet wheel J, and shaft C, and feed screw I, substantially as and for the purpose set forth.

2. The combination of the screw-ring cap E with the cylindrical socket A, and ratchet shaft C, substantially as and for the purpose set forth.

3. The combination of the counterbore K or countersink M with ratchet shaft C, wheel J, the cylindrical socket X, shank V, feather *c*, and seat *i*, for the purpose as set forth and described.

4. The combination of the thumb nuts *n* and *o* with spindle L, constructed in the manner and for the purpose as set forth and described.

81,146.—L. W. CUSHING and STILLMAN WHITE, Waltham, Mass.—*Vane*.—August 18, 1868.—Consists in making a casting which constitutes a strong frame to which the other parts may be attached, and contains the contour or distinguishing features of the design. The convex side-pieces, to give fullness to the figure, are attached to said outline casting.

Claim.—In the construction of vanes, the cast-metal outline, in combination with the plates forming the sides, substantially as described and for the purpose set forth.

81,147.—ISAAC W. DEAN, Franklin, Conn.—*Mode of Preserving the Roofs of Buildings*.—August 18, 1868.—The roof is saturated with the preserving material whenever it rains, the water percolating through the preserving substance and carrying the soluble part thereof with it as it runs down upon the roof.

Claim.—Saturating the roofs of buildings with preserving material by means of a receptacle, or its equivalent, placed at or near the top of the roof, said receptacle containing the preserving material, substantially as described and for the purpose specified.

81,148.—J. H. DICKSON, Alford, Ind.—*Plow*.—August 18, 1868.—The ends of the plate are bent up and slotted, and secured to the beam by bolts, so that it may be adjusted to change the depth of penetration of the elod-cutting knives.

Claim.—The adjustable plate C, and the curved knives D D, when used in combination with a shovel or other plow, B, and its beam A, the several parts being constructed and arranged substantially as and for the purpose herein set forth.

81,149.—ABRAHAM D. DITMARS, Lancaster, Pa.—*Mode of Preparing Coal Dust for Fuel*.—August 18, 1868.—A proper proportion of flour of sulphur is incorporated with the coal dust, and sufficient water is added to give the mass the consistency of mortar.

Claim.—Preparing coal dust for fuel, substantially as herein shown and described, and for the purposes set forth.

81,150.—CHARLES DIXON, Weedsport, N. Y.—*Fastener for Vehicle Seat*.—August 18, 1868.—The effect of moving the eccentric lever downward is to throw the tower end of the hook lever outward and upward, thereby clamping the bar or cleat of the box and securing the seat in place.

Claim.—The cam or eccentric D, lever E, lever hook F, and ears C, constructed and combined with each other, substantially as herein shown and described, and for the purpose set forth.

81,151.—GEORGE DORN, Albany, N. Y.—*Egg Carrier*.—August 18, 1863.—Cages to receive the

eggs, hold them upright, and keep them out of contact with each other, are formed by cord, twine, or rubber strips, rove through the ends and sides of the frame, and traversing the interior of the same in opposite directions.

Claim.—The cords *e' e'' e'''*, of twine, rubber, or their equivalents, as described, woven and arranged substantially as described, for the purpose specified.

81,152.—RACHEL FEIBELMAN, Columbus, Ind.—*Compound for Curing Felons and Similar Diseases*.—August 18, 1868.—A mixture of lye, decoction of camomile and alcohol.

Claim.—The composition of matter compounded from the ingredients, and substantially in the manner set forth.

81,153.—WILLIAM G. GOODALE, Centralia, Ill.—*Fruit Crate*.—August 18, 1868.—The object is to admit air freely to the fruit, and enable the latter to be transported over rough roads without being bruised.

Claim.—The fruit crate above described, consisting of the box A B, loose plates C G, springs D S, and boxes F F¹ F², constructed and arranged in the manner described.

81,154.—CHARLES FEICKERT, New York, N. Y.—*Machine for Covering Molds for Tassels*.—August 18, 1868.—The spools and guides may be readily adjusted to correspond to the taper of the mold to be covered. The wires pass through the guide hooks, and the threads slide over the outer surfaces of the barbs of the hooks, in such a manner that the threads are deposited on the wires before the same reach the mold.

Claim.—1. The movable bracket G, in combination with the flier F, carrying the spools E and guides *i*, substantially as and for the purpose set forth.

2. The hooks *i*, forming guides for the wires *e*, on their passage to the spindle C, and also for the threads, as the same are deposited on the wires, substantially in the manner herein shown and described.

3. Depositing the threads on the wires *e* before the same reach the mold, substantially as and for the purpose set forth.

81,155.—ADDISON C. FLETCHER, New York, N. Y.—*Grate Bars*.—August 18, 1868.—The spaces between the fuel points admit air to the incandescent fuel, and afford an escape for dust and ashes from the fire bed. Provision is made for economically renewing the fuel points, and the construction is such as to afford a proper grate surface, with a copious supply of air.

Claim.—1. A grate bar, constructed or provided with separated fuel points of a detachable character, and so that the same may be readily fitted to and retained by the main portion or body of the bar at suitable fixed distances apart, leaving air ducts or spaces between them, substantially as specified.

2. In combination with the main portion or body A of the bar, the loose or detachable points B, when constructed so as to leave air spaces of an enlarged or enlarging capacity in a downward direction between them, essentially as herein set forth.

3. The combination, with the body portion of the bar, of detachable separated fuel points, having air ducts or passages through them, substantially as specified.

81,156.—F. G. FLOYD and E. A. FLOYD, Macomb, Ill.—*Stirrer for Seed Sowers*.—August 18, 1868.—Insures the regular delivery of the grain to the discharge aperture by preventing clogging and packing.

Claim.—The rotating arm D, attached to the shaft C, as shown and described, and arranged to revolve within the hopper B, for the purpose set forth.

81,157.—NORMAN FOUNTAIN, New York, N. Y.—*Means for Stopping Horses*.—August 18, 1868.—The pressure of the pads upon the nostrils causes the horse to open his mouth to breathe, and thereby loose the hold of the bit with his teeth. When the rein is released the spring relieves the horse's nose

from the action of the pads. The lever, when the reins are hitched to it, swings so as to place one of its ends between the wheel spokes.

Claim.—1. The spring *e*, carrying the pads *g*, and adapted to passing across the horse's nose, in combination with the metallic slides *d*, introduced in the headstall, and with the rein *f*, attached at the back ends of said spring, the parts operating in the manner and for the purposes set forth.

2. The lever *h*, fitted as specified, in combination with the reins, for the purposes set forth.

81,158.—HERBERT E. FOWLER, North Branford, assignor to himself, J. W. BISHOP, D. P. CALHOUN, and L. COWLES, New Haven, Conn.—*Harvester*.—August 18, 1868.—The cutters are operated by a toggle joint actuated from the driving shaft. A single revolution of the shaft, or one full movement of the toggle joint, imparts two movements to the cutter.

Claim.—The arrangement of the eccentric *M*, or its equivalent, upon the driving shaft, in combination with the toggle joint *O* and *P*, lever *R*, arm *C*, and bell crank *S*, so as to operate substantially in the manner herein set forth.

81,159.—D. A. T. GALE, Poughkeepsie, N. Y.—*Roaster for Nuts*.—August 18, 1868.—A rotary cylinder is confined in a hot air case, and provided with gas burners. A warming apparatus, to which the tube that supplies gas to the roasting apparatus is connected for supplying heat thereto, is so arranged that, after the nuts have been roasted and placed in the said warming apparatus, the flow to the roasting burner may be stopped, while that to the warming apparatus continues.

Claim.—1. The described arrangement of the perforated case *A*, having the hinged cover *B*, the rotating cylindrical heater *C*, gas pipe *G I*, provided with burners, case *K*, heating chamber *L*, and hot air chamber *M*, as herein described for the purposes specified.

2. The arrangement of the gas pipe *G I*, having the burners and cocks, with relation to the roasting cylinder *C* and warming apparatus *K*, whereby heat is applied to *C K* simultaneously or alternately, as herein described for the purpose specified.

81,160.—HARRY C. GOODRICH, Chicago, Ill.—*Tuck Creaser for Sewing Machine*.—August 18, 1868.—The notch is made to always engage properly with the point or spur, the notch and point maintaining the same relative positions whether narrow or wide tucks are being made.

Claim.—The spring *E*, when provided with a permanently attached notch *f*, which is always in position in relation to the point or blade *b*, whatever the position of the plate *A* may be, in combination with the spring arm *D*, all constructed and operating substantially as specified.

81,161.—JOHN W. GRISWOLD and EDGAR L. THOMSON, Philadelphia, Pa.—*Grate Bar*.—August 18, 1868.—A non-conducting material, such as plumbago, fire clay, or gypsum, is employed as a fixed core upon which the iron grate bar is cast. The conical holes form air passages to keep the bar cool and heat the air prior to admission to the fuel, thus promoting combustion.

Claim.—Perforating the bar *A B*, constructed as described, with vertical conical holes *D*, substantially as herein shown and described and for the purpose set forth.

81,162.—GEORGE GRÜBEL, New Orleans, La.—*Tap and Die*.—August 18, 1868.

Claim.—As my improvement of screw cutting dies and taps whose threads are divided transversely, so as to present two or more salient cutting points, omitting every alternate thread, and arranging those that remain in alternation, so that the sections of cutting thread following one another shall successively cut and give shape to opposite sides of the thread in the nut or on the bolt which is being threaded or tapped, substantially as described.

81,163.—OLIVER B. HALE, Malone, N. Y.—*Portable Cooking Stove*.—August 18, 1868.—A bed plate has a central depression forming an ash cham-

ber having a door open downward, and from the bed plate rise a number of brackets, supporting a top plate, and grooved to receive the side sections.

Claim.—1. A portable stove, whose sides are composed entirely of distinct sections *E*, fitted to slide in vertical grooves, formed in the opposite sides of posts *D*, substantially as herein shown and described, for the purpose specified.

2. A stove provided with the vertical grooved ways or guides *D*, and with boilers or vessels *F*, arranged to slide in the said ways, to be brought into or moved out of contact with the fire, substantially as and for the purpose described.

3. The combination, with the sections *E*, of the springs *G* and guide rods *H*, substantially as and for the purpose described.

4. The sections *E*, provided with the pins or hooks *b*, for suspending a boiler or other similar apparatus over the fire, substantially as and for the purpose described.

5. Perforating the sections *E* at or near their upper edges, so that when said sections are shoved down for the attachment of a cooking vessel, the draughts of air will be directed through the fire, or above the fire, when the sections are fully up to their places, substantially as herein described and represented.

6. The combination, with a stove, arranged as described, of the ash door *B*, substantially as and for the purpose described.

81,164.—B. H. HARMON and D. B. STURDEVANT, Clifton Springs, N. Y.—*Method of Removing Tin and other Coating from Sheet Metal*.—August 18, 1868.

Claim.—1. The process of removing coatings from sheet metal or other materials, by confining the latter in a closed retort, and subjecting it to a current of hot air, as herein set forth.

2. Imparting to the basket containing the scraps a jarring or vibrating action, for the purpose of liberating the melted material, as herein set forth.

3. Constructing the basket holding the scraps with an open or grated bottom, and with perforated sides, in the manner and for the purpose specified.

81,165.—BENJAMIN F. HAUGH, Indianapolis, Ind.—*Bolt for Prison Doors*.—August 18, 1868.—An arrangement of devices for securing the several doors of the prison within a compartment that is inaccessible from the interior, but which is convenient of access to the jailor or turnkey.

Claim.—1. The doors *B* and *E*, hinged hasp *L*, bolts *v*, and bar *w*, in combination with compartment *F*, all arranged as and for the purpose set forth.

2. The hasp *H* and hooks *O*, for securing the door *D*, in combination with compartment *F*, arranged as and for the purpose set forth.

81,166.—J. A. HEALD, Columbus, Miss.—*Combined Fork, Shovel, and Hoe*.—August 18, 1868.—By this method of fastening, the handle is adapted for use in connection with a variety of implements.

Claim.—The tubular handle *A*, the hook shank *B*, and the washer *E*, when the same are constructed, arranged, and combined, substantially as shown and described, for the purposes set forth.

81,167.—HENRY W. HEWET, New York, N. Y.—*Steam Safety Valve*.—August 18, 1868.—The annular groove between the inner and outer margins of the face of the valve is of greater area in cross section than that of the ports in the valve seat, thus presenting a larger surface to the action of the steam and effecting a reaction on the uncovered portion of the seat.

Claim.—1. The arrangement of the steam ports *b*, in the center or thereabouts of the valve seat, whether said seat be a concave or convex cone, or both combined, substantially as set forth.

2. The arrangement of the double seat *n n*, on the same plane, one on either side of the ports *b*, substantially as shown and described.

3. The arrangement of an annular cavity or groove, centrally or nearly so, in the face of the valve, and of greater width than that of the ports *b* in the seat, so as to span said ports, substantially as and for the purposes set forth.

4. The arrangement of the case *f f'*, in combina-

tion with the spring *e*, valve C, collar D, and locking cap G, substantially as shown and described for the purpose set forth.

81,168.—WILLIAM D. HOOKER, San Francisco, Cal.—*Direct-Acting Engine*.—August 18, 1868.—By means of two valves, one main and one auxiliary, the steam is caused to act on each end of the piston in the cylinder, alternately, without the use of eccentrics, cams, or tappets, while, by the use of a system of ports opening at different parts of the cylinder and valve chamber, the valve and piston are cushioned at each end of their stroke, so as to allow a very high rate of speed.

Claim.—1. The auxiliary ports *m m'*, together with the main ports *i i'*, in combination with the main valve *f*, piston *c*, and auxiliary valve *g*, of a direct-acting engine, constructed substantially as described.

2. The arrangement of the auxiliary valve *g*, ports *p p'* and *n n'*, in combination with the main valve *f*, and piston *c*, of a direct-acting engine, constructed substantially as described.

3. In combination with the main valve *f*, supply ports *i i'*, exhaust ports *j j'*, auxiliary valve *g*, and ports *p p'*, the small ports *l l'* and *k k'*, substantially as herein described.

81,169.—N. HORTZ, Greenpoint, N. Y.—*Coffee Pot*.—August 18, 1868; antedated August 5, 1868.—The condenser is provided with a vent in order to prevent the upper vessel being raised by the pressure of the steam in the lower portion of the coffee pot.

Claim.—The condenser C within the chamber B, having its one end open to the boiler A, and its other open to the atmosphere, by an orifice in the side of said condenser, substantially as and for the purpose specified.

81,170.—GEORGE C. HOWARD, Philadelphia, Pa.—*Machine for Finishing Cloth*.—August 18, 1868.—Rotary shears are employed for finishing both sides of the material, the latter being held in contact with said shears by means of rests, as required.

Claim.—1. The combination of the cylinders V *v*, placed on opposite sides of web W, and the rests *x* and handle Z, arranged and operated substantially as described.

2. The combination of the rolls B *b*, shaft F, and rolls D *d*, with the lever J, racks G, pinions H, and friction I, the rolls B *b* turning the shaft F, and through it, or the roll of material E, also turning the rolls D *d*, substantially as described.

3. The combination of the shaft F, provided with points N N, the threaded end and notch *m*, with the catch K and sleeve Z, substantially as described.

4. A stop-motion with the clutches S S and curved arms Q Q, in combination with the clutch R, bar O, slotted arms P P, pins K K, and guides *f f*, substantially as described.

81,171.—PETER N. JACOBUS, Flatbrookville, N. J.—*Screw-Driver and Countersink*.—August 18, 1868.—The screw-driver is so constructed that it shall grasp the screw by the head, and hold it firmly while inserting it into the wood or removing it therefrom, and that shall, while inserting the screw, ream away the wood around it to form a countersink for the head.

Claim.—1. A screw-driver, provided with sliding jaws, so operating that as they are slid inward they converge, and grasp the head of the screw firmly, and as they are slid out again, they diverge and release it.

2. The combination of the part A, having the fixed ring R, the sliding ring S, the movable jaws J J J, and the metallic piece B, substantially as described.

81,172.—BARTHOLOMEW A. JEAGER, Bowers Station, Pa.—*Compound for Preserving Wood*.—August 18, 1868.—The wood is impregnated with oxide of zinc and sulphate of copper.

Claim.—A composition for preserving wood, consisting of the ingredients herein set forth.

81,173.—AARON JENNINGS, West Cairo, Ohio.—*Shovel Plow*.—August 18, 1868.—The device operates

to uproot and cover weeds and grass close to the cultivated plants, provision being made to prevent the clods from falling upon the plants.

Claim.—The plow, provided with the side projection *a*, and with the upright guard *b*, on which the fingers *e* are secured substantially as herein shown and described.

81,174.—FREDERICK JUDSON, Castleton, N. Y.—*Wash Boiler*.—August 18, 1868.—Articles to be cleansed are placed in the boiler with water. The steam chamber is so constructed that when heat is applied to its bottom, a rapid ascent and descent of the water through the clothes is produced by the alternate pressure and condensation of steam in said chamber.

Claim.—The combination of the steam chamber B, with its top *a*, sides *b*, tubes D, and cross-bars E, with the wash boiler A, provided with the shoulders F, rack C, and supports G, in the manner and for the purposes herein described.

81,175.—GEORGE KENNY, Nashua, N. H.—*Carriage Wheel*.—August 18, 1868.—The socket flange assists in holding the spokes which are tenoned into the hub. The double tenons on the end of the spokes fit corresponding mortises in the felloe.

Claim.—1. The metallic flanged ring or casing B, provided with sockets E E, and screw threads on the inside of its inner end, when used in combination with the spokes C C, which are provided with a tenon on their ends, fitting into the mortises on the hub A, and its shoulders resting on the outside periphery of the hub, substantially as and for the purposes herein set forth.

2. Uniting the spoke and felloe by tenon, when said tenon consists of two members, H H', substantially as described and for the purpose set forth.

81,176.—JOHN H. KEYSER, New York, N. Y.—*Mode of Attaching Mica to Stove Plates*.—August 18, 1868.—The mica is confined in position by frames which fit around the opening of the stove plate, and are secured to the same by a tongue and eye fastening.

Claim.—Providing for securing transparent plates over openings made through stove plates or doors, by means of a self-fastening frame, substantially as described.

81,177.—GEORGE W. KINZER, Linden Station, Ohio.—*Combined Planter and Cultivator*.—August 18, 1868.—When the machine is employed as a cultivator, the seed box and its accessory apparatus, the markers, &c., may be removed, and the cultivator plows attached to the machine in lieu of the planter plows.

Claim.—1. The combination of the plow Y'', beam Y, and standard Y', hinged at *z*, substantially as described.

2. The combination of the distributing apparatus G H I with the valve *a*, arm J, sliding bar L, and cam wheel *h*, substantially as described.

3. The combination of the markers T T with the springs *u u'*, the shaft T', gearing *t t'*, and spur *e*, substantially as described.

4. The combination of the slide Q with the gearing *r r'*, foot rest *r''*, and plow standards *f f* or Y', substantially as described.

81,178.—FRIEDERICH KRAMER, St. Louis, Mo.—*Sash Fastener*.—August 18, 1868.—One of the inside stops or wooden strips, usually employed to hold the sash in the frame, is dispensed with. The locking device, pivoted to the face plate, is turned out over the bottom sash when it is down, so as to lock it in that position.

Claim.—1. The face plate B, provided with metallic tongues *b*, for the purpose of holding and guiding the sashes, when applied to the window frame A, as and for the purpose herein set forth.

2. In combination with the face plate B, and its tongues *b*, the pivot *b'*, for securing and locking the sashes, substantially as set forth.

81,179.—DANIEL P. LACEY, Orfordville, Wis., assignor to ROBERT R. BALL.—*Sash Holder*.—August 18, 1868.—An improvement on patent granted

to Lacey and Bartlett, September 4, 1866. The end of the bolt or dog is enlarged to increase its bearing surface, and a notch or recess is made in the face of the lock to receive said enlarged portion when the bolt is retracted.

Claim.—The combination of the widened point B', notches or depressions A², pivoted bolt or tumblers B, lock bolt C, and springs E E', all arranged and employed substantially as and for the purposes set forth.

81,180.—JOSEPH LEATHERMAN, Napoleon, Ohio.—*Flood Gate.*—August 18, 1868.—The hanging bars constituting the flood gate may rise and fall with the water, and allow drifting objects to pass through.

Claim.—1. An improved flood gate, formed by the combination of the posts A, auxiliary posts B, cross-bars C, inclined bars D, and hanging bars E with each other, substantially as herein shown and described, and for the purpose set forth.

2. The inclined bars D, upon which the hanging bars E move up and down with the rise and fall of the water, substantially as herein shown and described, and for the purpose set forth.

81,181.—A. V. LEE, Clayton, Ala.—*Medicine for Fever and Ague.*—August 18, 1868.—Quinine, sulphate of iron, phosphate of iron, sulphate of zinc, pepperine, and extract of gentian.

Claim.—A medical compound, composed of the above-mentioned ingredients in about the proportions named, substantially as and for the purposes set forth.

81,182.—WILLIAM J. LINTON, Detroit, Mich.—*Tool Holder.*—August 18, 1868.—The hole through the jaw is for the reception of the shank of a cutting tool, which may be applied to adapt the instrument for use as a pipe cutter. The hole in the stock, at right angles to that in the jaw, enables said cutting tool to be driven out.

Claim.—1. The combination, with the stock A, of the jaws P and E, when the jaw P is provided with the longitudinal opening e, extending entirely through it, and communicating with the hole f in the stock A, all substantially as herein shown and described, for the purpose specified.

2. The spring lever b, pivoted in a slot in the screw handle C, and adapted for operation as herein set forth.

81,183.—WILLIAM J. LINTON, Detroit, Mich.—*Tool Holder.*—August 18, 1868.—The device is for planing key seats in wheel hubs, and working upon large metallic objects which cannot pass under the cross-plate or between the posts of the planing machine.

Claim.—1. The bracket A, provided with the slot b in the front, and having the shoulder f, in combination with the slotted holder C, constructed and pivoted thereto, substantially as and for the purpose described.

2. The combination of the tool holder, as above described, with the tool slide of a planing machine, substantially as and for the purpose described.

81,184.—R. H. LONG, Cincinnati, Ohio, assignor to himself and R. T. TRALL, New York, N. Y.—*Window Ventilator.*—August 18, 1868.—Ventilation is effected by cutting away a portion of one of the panes of glass in a window sash, and inserting in the rails surrounding said panes a supplementary frame containing a piece of glass of sufficient size to fill the opening formed by cutting away the fixed pane.

Claim.—1. The side grooves C, applied to a sash frame surrounding a single pane of glass, in combination with the movable supplementary frame F, substantially as described, for the purpose specified.

2. The shaft H, applied to the supplementary sash frame F, substantially as described, for the purpose specified.

81,185.—ORAZIO LUGO, New York, N. Y., assignor to DAVID LYMAN, ROSS C. BROWNING, and MASON C. WELD.—*Process of Preserving Animal Substances.*—August 18, 1868.—The animal is placed

in a large receiver connected with a retort containing carbolic acid, the vapors of which being diffused into the receiver, the animal soon dies. The flesh will resist putrefying influences for a considerable length of time.

Claim.—1. Introducing phenol, or any of its equivalents, into the system of a living animal or animals until death takes place, for the purpose substantially as herein specified.

2. Introducing or diffusing phenol, or any of its equivalents, into the system of a living animal or animals just before bleeding or killing the said animals, for the purpose substantially as herein specified.

3. The within-described method of introducing phenol, (carbolic acid,) or its homologues, into the system of living animals, for the purpose substantially as herein described.

81,186.—E. B. MANNING, Middletown, Conn.—*Tea and Coffee Pot.*—August 18, 1868.

Claim.—A tea or coffee pot constructed with a hard metal or iron body, the inner side coated with porcelain or similar material, and the outer with soft metal, after the lining has been baked, substantially in the manner herein set forth.

81,187.—T. E. MARABLE, Petersburg, Va., assignor to himself and S. A. PLUMMER, same place.—*Cutter Attachment for Plows.*—August 18, 1868.—While the mold board runs under ground, the edges of the cutter graze the surface. It may be set up or down to adapt it to the depth of furrow.

Claim.—1. The cutter P, when constructed and arranged, in connection with a plow, so as to scrape the surface of the ground in front of the mold board and the whole width of the furrow, cutting the weeds, grass, &c., therefrom, and casting them out of the way of the plow, on the side opposite to the mold board.

2. The combination of the plow B, beam A, cutter P, shank G, and box strap H, substantially as described.

81,188.—B. F. MCCOLLESTER, California, Mo.—*Shovel Plow.*—August 18, 1868.—The shovel plows are so attached to their standards as to be adjusted at any inclination, and, when worn out or injured, reversed with facility.

Claim.—The combination of the double-pointed shovel plow B with the standard A, plate C, having lugs e e, block D, bolts E E, and screw nuts e e, substantially as and for the purpose above set forth.

81,189.—JACOB MEYER, Bloom Township, Ohio.—*Shovel Plow.*—August 18, 1868.—The outer plow standards vibrate upon pivots so that the movable plows may be placed nearer to or further from the central stationary plow, the desired relative position being maintained by means of the spring catches and the rigid, notched bar.

Claim.—The upright center bar A, provided with the notched cross-bar L, in combination with the springs d d, and the lugs e e, substantially as and for the purposes herein set forth.

81,190.—A. MEYER-BERCK, Frankfort-on-the-Maine, Prussia, assignor to ALFRED MELLOR and H. N. RITTENHOUSE, Philadelphia, Pa.—*Article of Food for the Sick.*—August 18, 1868.

Claim.—The employment or use of the serum of bees' blood, as a constituent in the production of a nutritive sirup for the sick and delicate, substantially as described.

81,191.—NICHOLAS MEYERS, Buffalo, N. Y., assignor to E. L. CHAMBERLAYNE and E. C. POMEROY, same place.—*Sewing Machine.*—August 18, 1868.—The feeding device is attached to the shuttle-carrier so that at separate device for operating the former is dispensed with.

Claim.—1. The plate k, provided with the wedge-shaped and inclined part k'', in combination with the pivoted triangular-shaped piece l, and the plate m, the latter being provided with the triangular-shaped slot m''' and the feed plate o, all operating together to produce the feed motion, substantially as described.

2. The shaft A, in combination with the vibrating

arm *l*, the connecting rod *e*, and the carrier *h*, bearing upon one side the shuttle, and upon the other side the feeding mechanism, substantially as described.

81,192.—G. L. MILLER, De Witt, N. Y.—*Car Brake*.—August 18, 1868.—When the friction wheel is forced into contact with the wheel of the tender axle, the pinion is made to engage with the rack bar and move the same in the proper direction to apply the brakes. The rack bar springs upward, to throw the friction wheels out of contact when the pressure is withdrawn.

Claim.—1. The construction and arrangement of the central bar *G*, having the rack *H* and lugs *e*, pivoted levers *E*, connected to the brakes *C* by the links *b b'*, the adjustable pinion *I*, and friction wheels *J K*, as herein described for the purpose specified.

2. The spring rack bar *G*, when provided with the central lugs *e*, in combination with the pivoted levers *E* and brakes *C*, as herein described for the purpose specified.

3. The pinion *I* upon the shaft *f*, when such shaft is hung in bearings adjusted vertically by the bar *i* and lever *M*, and when provided with the friction wheel *J*, engaging with the wheel *K*, upon the axle *L* of the tender, as herein described for the purpose specified.

81,193.—F. B. MORSE, New Haven, Conn.—*Stump Joint for Carriages*.—August 18, 1868.—Improvement on his patent of July 28, 1868.—Notches are formed upon the meeting end of one stump and a corresponding surface upon the contiguous end of the other stump, thus effecting an interlocking or engagement of the parts, when open, whereby to prevent jogging.

Claim.—A stump joint, consisting of the two parts *A* and *B*, hinged together by a connection *C*, pivoted to each of the parts, forming the meeting ends of the joint, of irregular form, the one corresponding to the other, so as to operate substantially in the manner specified.

81,194.—WILLIAM NEUMANN, St. Louis, Mo.—*Adjustable Car Step*.—August 18, 1868.—The step is hinged to a vertically-sliding section, which, being raised, turns the step upward, edgewise, the two then constituting a guard to prevent passengers from getting on or off at the front platform.

Claim.—The car-step *B*, when constructed so as to be convertible at pleasure into a step or guard, substantially as herein described and set forth.

2. The construction of the step *B*, riser *b*, sliding rods *a*, and platform *A*, when arranged as and for the purpose herein set forth and described.

81,195.—DANIEL NEWTON, Southington, Conn.—*Friction Brake for Sewing Machine*.—August 18, 1868.—The cylinder is retained against the fly-wheel by its own gravity. Casual reverse motion is prevented by the wedging of the cylinder under the wheel when the wheel takes the initiative of such motion.

Claim.—The loosely-inclosed cylinder *C*, of suitable material, within the trough *B*, the latter being securely held to plate *A*, and is adjustable by means of screw and slots, the whole arranged and applied substantially as described, and for the purpose set forth.

81,196.—WILLIAM E. NICHOLS, Baldwin, Mo.—*Gate*.—August 18, 1868.—An arrangement of cords and pulleys to enable a rider to open a road or farm gate without dismounting.

Claim.—1. The combination, with the gate *A*, provided with the arm *D*, of the latch rod *H* and cords *I* and *K*, suspended as described, for opening and closing the same, substantially as and for the purpose set forth.

2. The combination, with the cords *I* and *K*, of the cords *O* and *N*, suspended as described, for opening and closing the gate, the same substantially as and for the purpose described.

81,197.—B. OERTLY and XAVIER FENDRICH, Washington, D. C.—*Coal Stove*.—August 18, 1868.—

Claim.—A stove, made in whole or in part of an

iron or other metal frame work, coated or imbedded in a composition or mass of soluble glass and mineral matter that will be fire-proof, substantially as and for the purpose set forth.

81,198.—F. W. OFELDT and A. W. ALMQVIST, New York, N. Y., assignors to themselves and THOMAS FITZSIMMONS, same place.—*Apparatus for the Manufacture of Illuminating Gas*.—August 11, 1868.—A retort, an oil reservoir, a cooler, and oxygenating chambers or drums are combined with a gas holder. The mechanism is actuated, to supply the necessary amount of air, by the expansive force of the gas, it being thus self-regulating.

Claim.—1. The upright conical or spherical retort *A*, the reservoir *B*, and the cooler *J*, arranged substantially as described, for the purposes set forth.

2. The tube *E*, the valve rod *F*, and the float valve *H*, in combination with the retort and reservoir, arranged and operating substantially as and for the purposes specified.

3. The method, herein shown and described, of uniting and securing together the retort and reservoir by the flanges *C C* and swinging bolts *d d*, as set forth.

4. The method of oxygenating the gas, or the drums *O* and *P* revolving in the large drum or case *M*, constructed and operating substantially as shown and described.

5. The method of securing the gasometer to the head and bottom, by grooves and rings, substantially as described.

6. The method of securing the gasometer against the force of the gas, by means of hoops *C* suspended by cords, as shown and described.

7. The safety pipe *V*, with its valve *d*, constructed and operating substantially as and for the purposes described, in combination with the gasometer *T*.

8. An arrangement of means for supplying air for oxygenating gas, by the expansive action of the gas, substantially as and for the purpose described.

81,199.—JOSEPH J. OTT, Washington, D. C.—*Preparing Paper for the Manufacture of Floor Coverings, Belting, Window Shades, and the like*.—August 18, 1868.—The paper is passed through a solution of sulphuric acid.

Claim.—As an article of manufacture, the combination of two or more sheets of paper, when prepared by passing through a solution of acid, and connected together by puncturing with a toothed roller, substantially as herein described, for use as carpeting, belting, and other purposes, as set forth.

81,200.—GEORGE T. PALMER, Brooklyn, N. Y., and PHILO P. BUSH, New Haven, Conn.—*Machine for Cutting Soap into Slabs*.—August 18, 1868.—The machine and cutting frames are so arranged that a mass of soap can be cut into bars, and the machine passed off from the cut soap, leaving it free and clear of obstruction to the workmen when the bars are being stamped and racked, and without the necessity of making a back draw of the wires.

Claim.—1. The open-bottomed frame *A*, made in such manner that it may be passed entirely over a mass of soap, substantially as and for the purpose herein shown and described.

2. The reciprocating carrier frame *C*, when made separate from the cutting wire frame *N*, for the purpose shown and described.

3. The combination and arrangement, in relation to each other, of the carrier frame *C*, and removable cutting wire frame *N*, substantially as and for the purpose set forth.

4. The horizontally moving, open bottomed or inverted *U*-shaped carrier frame *B*, for the purpose herein shown and described, said frame moving independently of and disconnected from frames *C* and *N*.

5. The open bottomed or inverted *U*-shaped cutting wire frame *D*, for the purpose of cutting masses of soap, said frame being independent of and disconnected from frames *C* and *N*.

6. The combination and arrangement, in relation to each other, of the carrier frame *B*, and removable

cutter wire frame D, substantially as and for the purpose shown and set forth.

7. The windlass F, arranged across the end of the frame of the machine, for the purpose shown and described.

8. The removable or shifting braces M M, or their equivalents, for the purpose herein shown and set forth.

9. Operating the cutting wire frames of a soap-cutting machine with chains and pulleys, and such suitable gearing and means of propulsion as may be required therefor, substantially as herein shown and set forth.

10. A soap-cutting machine, composed of frame A, independent vertically moving cutting frame N, and independent horizontally moving cutting frame D, when combined with suitable gear or means for operating the cutting frames, substantially as herein described.

81,201.—SAMUEL L. PATTEE, Northbridge, Mass.—*Spindle Step*.—August 18, 1868.—The grit and other deposit is let out of the step at the lowest point of the spindle, while it holds securely a large amount of oil, and in such a way that when the spindle is raised for doffing and suddenly dropped, the oil does not splatter or flow out between the step and spindle.

Claim.—A spindle step, having the upper oil chamber *g*, partly covered by a flange, which encircles the spindle, the lower oil chamber *e*, the passage *d*, at the bottom of the spindle socket, and axial therewith, the passages *f f* extending from the chamber *e* to the edge of the beveled base of the socket, and passages *i i* extending from the upper to the lower chamber, the whole constructed and arranged substantially as described.

81,202.—SAMUEL PATTON, Chatsworth, Ill.—*Corn Harvester*.—August 18, 1868.—The rollers consist of long pointed spindles, arranged parallel to each other and provided with one or more longitudinal ribs for freeing the husks from the stalks, the latter being drawn to the rollers by means of wheels provided with teeth, and guided by curved projecting horns in front of the frame.

Claim.—1. The rollers *m m*, arranged as described, out of contact with each other, and provided with longitudinal ribs *n*, all operating in the manner and for the purpose specified.

2. The curved projecting horns *p' p'*, upon the front of the frame *h*, arranged in relation with the wheels *n n* and rollers *m m*, for the purpose of preventing the accumulation of refuse matter beneath said wheels, and furnishing bearings for the forward ends of the rollers *m m*, as herein shown and described.

81,203.—O. S. PEASE, Xenia, Ohio.—*Seal Lock*.—August 18, 1868.

Claim.—A lock, which will be secured by means of one or more cartridges when inserted through the easing A and tumbler *d*, and which can be unlocked only by the explosion of the cartridges, in the manner substantially as described.

81,204.—O. S. PEASE, Xenia, Ohio.—*Seal Lock*.—August 18, 1868.—A cartridge is secured in holes in the lower part of the escutcheon and the pad lock, so that in order to disengage the escutcheon to insert the key, it will be necessary to explode the cartridge, and thus give warning in burglarious attempts.

Claim.—The escutcheon or guard B, in combination with lock A, when both are so constructed and arranged that they can be bolted together with cartridges, employed substantially as and for the purpose described.

81,205.—E. F. PERCIVAL and N. S. TRUE, Hammonton, N. J.—*Fruit Basket*.—August 18, 1868.

Claim.—As an article of manufacture, a fruit basket, or other hollow wooden ware, when the slats or staves composing the same are connected at the top with a continuous band, forming both inside and outside hoop, the whole constructed substantially as herein set forth.

81,206.—J. F. POOL, Monroe, Wis.—*Bee Hive*.—August 18, 1868.—The hive is provided with an

inner and outer wall, to the space between which air is admitted through gauze-covered holes. Ventilating holes are also provided in the upper portion of the sides of the inner and outer walls.

Claim.—The hive, constructed with walls *a a'*, hinged bottom C, ventilating holes B B' F F', and opening or entrance D, all arranged substantially as and for the purpose set forth.

81,207.—WILLIAM RANDALL, May, Mich.—*Sash Supporter*.—August 18, 1868.—The weights elevate both sashes when they are free to move.

Claim.—1. The upright *h*, pulley *l*, cord *j*, and weight *e*, in combination with the upper sash B and part *o* of the window frame, all constructed and operating together, substantially as shown and described, and for the purpose set forth.

2. The slotted tubular upright *b*, cord *a*, arm *i*, rod *d*, and weight *e*, substantially as shown and described, in combination with the lower sash A and part *n* of the window frame, as and for the purpose set forth.

81,208.—AMOS RANK, Salem, Ohio.—*Harvester Rake*.—August 18, 1868.—When a gavel has accumulated upon the platform, the driver, from his seat on the main frame, depresses the walking wheel, and thus puts the endless apron in motion to discharge the gavel.

Claim.—1. The combination, in a harvester, substantially as set forth, of an endless discharging apron with a wheel on a vertically vibratable arm, for the purposes specified.

2. The combination, in a harvester, substantially as set forth, of an endless discharging apron and a propelling wheel, on a vibratable arm, with devices operated by the driver for raising or lowering the wheel to stop or start the discharging apron.

3. The combination, in a harvester, substantially as set forth, of an endless apron with a cut-off, vibrating horizontally in a circular path, for the purposes specified.

4. The combination, in a harvester, substantially as set forth, of a discharging apron, a propelling wheel to move the apron, and a cut-off, with a device operated by the driver, which simultaneously starts the discharging apron and interposes the cut-off.

5. The combination, substantially as set forth, of a reel, an apron, a walking wheel, and a cut-off.

81,209.—PETER RASAR and D. J. MAYES, Iliopolis, Ill.—*Gate Latch*.—August 18, 1868.

Claim.—A gate fastening, composed of the latch *b* and double spring *d*, constructed and arranged relatively to each other and the rest of the gate, substantially as and for the purpose specified.

81,210.—HIRAM A. REID, Beaver Dam, Wis.—*Sheep Shearing Machine*.—August 18, 1868.—The shearing comb is suspended from a crane by means of a flexible shaft, rotated by a hand wheel and belt, and descending in line with the axis of the main wheel of the shearing comb, to which it imparts motion, and from which the cutters of the comb are actuated.

Claim.—The arrangement of the wheel J, slotted rod K, cutting wheel V, pinion M, slotted bar N, and hooked plate Q, all operating as described, whereby a rotary motion is imparted to the wheel V, and a prehensile movement given to the hooked teeth *r*, as herein described, for the purpose specified.

81,211.—E. R. ROBERTS, New York, N. Y.—*Apparatus for Heating and Ventilating Railroad Cars*.—August 18, 1868.—The fresh air received at the front of the cars is distributed through the coaches by means of the surmounting conducting tubes and their branch pipes, and ventilation is secured by the exhaust tubes into which the air enters from the top of the car. The air-supply tubes may be inclosed throughout the length of a single car by a steam heating pipe.

Claim.—1. The combination, with railroad cars, of the exhaust tubes E, provided with valves, arranged substantially as and for the purpose described.

2. The combination, with the supply tubes A, of

the steam or air heater G, and heating tube H, and the pipe connecting the heater to the heating tube, substantially as and for the purpose described.

81,212.—ROBERT E. ROGERS, Philadelphia, Pa.—*Steam Generator*.—August 18, 1868.—The capacity of the boiler to sustain pressure depends upon the strength of the individual sections of which it is made up.

Claim.—1. The boiler, composed of separate elongated sections or staves, connected at bottom, for the interpassage of water, and at top for the interpassage of steam, one or more of such sections being provided with circulation tubes on the side next the fire, each being set on end, and all the sections being arranged around a common fire, so as to form the fire chamber or furnace flue, substantially as shown and described.

2. The combination of the blank sections or staves with those having circulation tubes, substantially as described.

81,213.—BOZIL S. ROY, Lowell, Mass., assignor to himself and HENRY S. MORSE, same place.—*Card Grinder*.—August 18, 1868.—An endless chain, arranged upon chain wheels and inclosed within a longitudinally-divided shaft, is connected with a grinding wheel by means of a link, and operated by a bevel gear, which rotates with the said shaft, and engages with a stationary gear secured to the end of the frame or to a stand, which may form the support for one end of the shaft.

Claim.—The endless chain A and wheels B and C, and the radial shaft a, gears G and H, and the connecting link F, combined with the shaft D and the grinding wheel E, and all arranged to operate substantially as and for the purpose set forth.

81,214.—FREDERICK M. RUSCHHAUPT, New York, and GUSTAVUS BURHENNE, Williamsburg, N. Y.—*Brewing Ale, Porter, &c.*—August 18, 1868.—For brewing lager beer, the inventors employ malt, (barley,) kiln-dried Indian corn, bran of wheat and bran of oats, (bran of rye may be substituted for either,) phosphate of potassa or of soda, phosphate of magnesia, and glycerine-phosphate of lime.

Claim.—The use of bran of wheat, bran of oats, or bran of rye, together with meal of kiln-dried Indian corn, and with a certain amount of malt, either alone or with the addition of the herein-named and specified phosphates, for the purpose set forth and herein fully specified.

81,215.—ISAAC S. RUSSELL, New Market, Md., and HENRY R. RUSSELL, Woodbury, N. J.—*Harvester*.—August 18, 1868.—Designed as an improvement on his patent of August 20, 1867. The object is to prevent the drag of the supporting wheel in turning corners.

Claim.—1. The coupling plate D, formed with a twist, so as to assume a vertical position when attached to the axis of the wheel, and an outward inclination at its hinge-pin connection with the machine, substantially as and for the purpose set forth.

2. The combination of the coupling plate D, constructed and hinged to the machine as described, with the pivoted axis of the wheel G, substantially as set forth.

3. A supporting wheel, which is so constructed and applied to a harvester that the horizontal axle about which it turns, and also the arm to which said axle is applied, shall be free to vibrate and allow the wheel to conform to the circular movements of the machine while turning, in the manner substantially as specified.

81,216.—SAMUEL SEITZ and L. D. ARNOLD, Melmore, Ohio.—*Wagon*.—August 18, 1868.—The end boards, while securely held in place, may be readily detached and reapplied.

Claim.—1. The springs F, in combination with the side boards C and end boards E, substantially as herein shown and described, and for the purpose set forth.

2. Securing the end boards E to the side boards C, by means of the springs F, catches G, projections d' of the cleats D, and the notches or recesses e' formed in the said end board E, substantially as

herein shown and described and for the purpose set forth.

81,217.—C. M. SEXTON, Aurora, Ill.—*Running Gear for Wagons*.—August 18, 1868.—In turning short about with this wagon the front axle maintains a radial relation to the circle described, and the inner ends of the two halves of the rear axle are respectively pushed backward and drawn forward by their connections with the front axle.

Claim.—1. The combination and arrangement of the divided axle C, double guide h, rods I, braces K, and slotted plates L, substantially as herein set forth.

2. The hangers O o, strap P, pulleys Q, equalizer R, and springs H, when constructed and used for the purpose substantially as herein specified.

81,218.—ALBERT P. SEYMOUR, JR., Hecla Works, and W. RILEY GOODRICH, Whitestown, N. Y., assignors to HECLA WORKS COMPANY.—*Sash Pulley*.—August 18, 1868.

Claim.—1. The construction of the cheeks B B with projections, locking in a dovetailed or hooked manner within or through the face plate A, and secured by a rivet, e, holding the said cheeks together by the lugs or ears f, at their outer edge, substantially as shown and described.

2. Forming the pivot or pivots, on which the pulley C turns, by a projection or projections, h, cast on or to the inside of the cheek or cheeks B of the frame, substantially as described.

81,219.—ELISHA SHIVER, Columbia, S. C.—*Sewing Machine Motor*.—August 18, 1868.—Both springs are wound up at one operation, and when their force is thrown upon the machinery the drum from which the driving band of a sewing machine derives motion is rotated. The balance wheel, by means of its adjustable wings, insures uniform motion. In case of breakage of the thread the catch is permitted to fall upon the fly wheel, thus instantly stopping the motive mechanism.

Claim.—1. A sewing-machine motor, when constructed with the double springs and shafts a and a', gearing, drums, and brake n, and adapted to be placed under the ordinary sewing machine, substantially as and for the purpose set forth.

2. In connection with the motor so constructed, a balance wheel when provided with wings, constructed and arranged as and for the purpose set forth.

3. In combination with balance wheel of such a motor, the catch h, with its cord and hook, all arranged to operate as and for the purpose set forth.

81,220.—ANDREW SIMMONS, Fairfield, Iowa.—*Trellis for Propagating Bees*.—August 18, 1868.—At the approach of the cold season, the external shell of the hive is removed from the base board, and the working frame, to which the honey combs are fixed, is covered with a fabric suitable to maintain warmth and preserve the inclosed bees.

Claim.—The protecting of bees during winter by means of a cloth or other textile covering substantially in the manner and form as above described, rendering other protection, as housing, placing in cellars, wrapping hives with straw, &c., unnecessary.

81,221.—ELISHA W. SKINNER, Madison, Wis.—*Harvester*.—August 18, 1868.—The cast plate and box in conjunction with the timbers are designed to form a strong and durable main frame. The position of the reel may be changed to cause it to stand parallel with or obliquely to the sickle bar.

Claim.—1. The plate A, provided with the projections or flanges for attaching the parts to, and otherwise constructed, as shown and described.

2. The main frame, consisting of the plate A, bars B and C, and the iron box D, all constructed and arranged substantially as set forth.

3. The tubular reel support l, attached at its outer end to the adjustable post n, and resting at its inner end upon the bar r in such a manner as to permit the inner end of the reel to be adjusted forward or backward, as described.

81,222.—SIDNEY SMITH, Worcester, Mass.—*Steam Boiler Furnace*.—August 18, 1868.—Designed

to produce intense combustion, upon the principle explained in letters patent granted to same party July 31, 1866. The ash pit being tightly closed, air to support combustion is admitted only through the air space behind the jacket plates, and reaches the interior of the fire chamber through perforations in the plates and in the walls themselves. The quantity of air admitted to the air spaces is regulated by dampers. The method of binding the parts together by plates and tie rods facilitates the removal of individual blocks.

Claim.—1. A fire chamber, with walls of perforated blocks, with perforated sheet-metal jackets behind said blocks, and said blocks and jackets secured between plates, substantially like plates C H I, by the rods J, so that the fire chamber may be set up and its parts secured before the construction of the enclosing wall.

2. The blocks G G', made in the form and perforated as shown, to adapt them to the construction of a fire chamber such as described.

2. The plates C and I, constructed as described, in combination with perforated fire bricks, substantially as and for the purpose described.

81,223.—W. G. SMOOT, Washington, D. C., assignor to himself and ANTONIO PELLETER, same place.—*Registering Fare Receiver.*—August 18, 1868.—The ticket or fare is placed in an opening at the top of the case and passes down one of the semi-circular tubes which terminate at the bottom at opposite sides of a concave table forming the top of a cylindrical tilting device which is actuated by means of a strap so as to deposit the fare in the lower part of the case.

Claim.—1. The registering apparatus, consisting of the stationary dial B, with the index E, operated by the tilting table G and the rotating dial wheel H, all constructed and arranged to operate substantially as described.

2. The combination of the registering apparatus, as above described, with the case A, having the tubes *f* and the tilting table G arranged therein, substantially as set forth.

81,224.—JAMES HERVEY STERNBERGH, Reading, Pa.—*Making Nuts.*—August 18, 1868.—The top of the knee-shaped lever will be forced backward and the short arm of the weighted lever depressed, when the pressure in the die box preponderates, room being thus made in the box for the extra amount of metal.

Claim.—1. The combination of the weighted lever (or levers) P W with cross-head H H, crowner L, and cam *n* on shaft B, for the purpose of throwing the finished nut or washer out of the die box at the time and in the manner specified.

2. The combination of the crowner L, with weighted lever P W and gauge T, for the purpose of graduating the space in the die box between the punch D and crowner L to different thicknesses of iron, without unnecessary waste of time, substantially as described.

81,225.—JAMES SUTLIFF, East Boston, Mass.—*Steam Generator.*—August 18, 1868.—Steam is generated within the bridge and walls, as well as in the boiler, and pipes are employed to convey steam from the walls to the drum.

Claim.—The combination of the bridge wall B, hollow sides C C, pipes *c c*, drum D, boiler A, pipes *b, d*, and *a*, all constructed, arranged, and operating as herein set forth.

81,226.—JOHN THIELEMANN, Newark, N. J.—*Piano Lock.*—August 18, 1868.—The action of the cams upon the intermediate stud produces a deflection of the hook bolts, when actuated by the key, which enables them to engage with and release the locking plate.

Claim.—The hook bolts C C', connected together by a lug and stud, and provided with cams *e e'*, in combination with a stud, *d*, substantially as and for the purpose described.

81,227.—SMITH TITCOMB, Amesbury, Mass.—*Carriage.*—August 18, 1868.—The movable rails or slides may be removed with the top; the seat is

then placed upon and supported by the fixed rails of the wagon body.

Claim.—1. The construction of a carriage body with fixed and movable seat slides, the movable slides having a carriage top attached thereto, and combined as described, so that the carriage and the same seat or seats may be used with or without the top.

2. The combination of the plates E E, *cc*, and G G with flanges *dd* and thumbscrews F F, with the fixed and movable seat slides of a carriage, substantially in the manner and for the purpose as herein described.

81,228.—E. S. TORRY, New York, N. Y.—*Weather Strip.*—August 18, 1868.—The object is to provide for the application of rubber to two faces of the molding without weakening the same, as is usually done, by the formation of two saw kerfs or deep, narrow grooves.

Claim.—As an article of manufacture, the construction of a weather strip, on one side of which is inserted, in a dovetail groove, *c*, a piece of India-rubber, or other elastic material, as described, and on the other side of which is inserted a straight strip of India-rubber, or other elastic material, *b*, as and for the purpose herein set forth.

81,229.—CHARLES L. TUCKER, Chicago, Ill.—*Cementing and Strengthening Boxes for Packing Lard and other Substances.*—August 18, 1868.—Designed to strengthen the box where the scorings are made in the box, and to render the same tight by filling the depressions and correcting the inequalities of the wood.

Claim.—1. Filling the score openings of angular boxes with cement, substantially as and for the purposes specified.

2. Filling the interstices or openings caused by imperfect construction or material in thin wood boxes with an insoluble cement, so that the boxes, are strengthened and made tight at the same time, substantially as specified.

3. As a new article of manufacture, tight or non-leaking angular boxes, when the sides *a* are made of veneers of thin wood, and cemented, substantially as described.

81,230.—BENJAMIN D. VANDERVEER and DANIEL RIDDEL, Freehold, N. J.—*Potato Digger.*—August 18, 1868.—The potatoes being unearthed by the plow, slide backward over the wings of the same and upon the shakers, which are formed of wire prongs fastened to upright bars which are jointed to the plow standard.

Claim.—1. In combination with a plow or plow-share of any construction, when used for the purpose described, the shakers J J and the vine clearers or bars *k k*, arranged substantially as described, for the purposes specified.

2. In combination with the shakers J, the double crank shaft D, connecting rods O, and gearing, whereby motion is communicated from the axle to the crank shaft, all arranged to operate substantially as herein shown and described.

3. The lever P, when connected directly with the pole R, by means of the chain *t*, and provided with the spring *p'*, adapted to rest upon the hounds, to prevent the lever P from falling forward, all constructed and arranged to operate as herein shown and described.

81,231.—MICHEL VANDER WEIDE, St. Petersburg, Russia, assignor to CASSIUS M. CLAY.—*Submarine Lantern.*—August 18, 1868.—The channels communicate respectively with flexible tubes which extend above the water when the lantern is submerged, and which admit air to supply the flame and carry off the emanations from the same.

Claim.—The submarine lantern, having the semi-circular channels B C, formed concentrically in the body of the cylinder, the former being closed at the top and opening into the cylinder at the bottom, and the latter closed at the bottom and opening into the cylinder at the top, said chambers communicating, respectively, with the supply and exhaust tubes F G upon each side of the burner, as herein described, for the purpose specified.

81,232.—P. H. VANDER WEYDE, M. D., New York, N. Y., assignor to ALFRED PHILLIPS and JOHN MACDOUGALL, same place.—*Apparatus for the Manufacture of Illuminating Gas.*—August 18, 1868.—A series of revolving, metallic disks, covered with flannel or similar material, and dipping into the hydrocarbon liquid. The flannel is thus kept saturated and presents a large evaporating surface to the air passing between the disks, such air being compelled to pass from center to circumference and *vice versa*, by stationary deflecting disks.

Claim.—1. The rotating carbonizer, consisting in a revolving disk or disks, operating in connection with shaft or pulleys and chain, as herein described and for the purposes specified.

2. The detachable carbonizer *h h* and *d d d*, with its compartments *a*, *b*, *c*, and *e e*, and valve *v*, as herein shown and described, and for the purposes specified.

3. The gas regulator *k*, with its buoyant chambers *m m* and interior valve, as shown and described and for the purposes specified.

81,233.—WILLARD B. WALTERS, Lock Haven, Pa.—*Composition for Cleaning and Renovating Brick Walls.*—August 18, 1868.—The mixture consists of lime water, refined petroleum, benzine and Indian red, and is applied with a whitewash brush.

Claim.—The combination of the ingredients above mentioned and described, and the application of the same to brick buildings, using for that purpose the aforesaid compound, or any other substantially the same, and which will produce the intended effect.

81,234.—C. W. WARNER, New Haven, Vt.—*Horse Hay Rake.*—August 18, 1868.—A lever projects from the rake head to a point convenient to the driver's hand, and a single movement of the same withdraws the locking bolt and imparts an initial movement to the rake head in the direction of its rotation. The rake may be swung upward and made to rest upon the carriage frame for transportation.

Claim.—In combination with the lever *H*, carriage frame *A*, and revolving rake *C*, the bolt *F*, link *K*, and lever *L*, or their equivalents, to operate substantially as and for the purpose set forth.

81,235.—HORACE J. WICKHAM, Manchester, Conn., assignor to himself and MILTON KEENEY, same place.—*Jack for Knitting Needle.*—August 18, 1868.—The back of the jack is cut away sufficiently to admit the shank of the needle, and a transverse notch receives the bent end of the needle. The rebate is somewhat inclined, to allow of a slight play of the needle.

Claim.—A knitting needle jack, constructed with an inclined rebate, *d*, and slot *e*, as and for the purposes set forth.

81,236.—DAVID WOLF, Easton, Kansas.—*Drum Evaporator.*—August 18, 1868.—The drawers may be drawn out for filling and also for regulating the draught; when they are closed they form a zigzag flue to increase the radiation and arrest sparks, the atmosphere being tempered by vapor from the water in the drawers.

Claim.—A safety boiler, as constructed, when the same is provided with two or more pans or troughs for holding water, so arranged as to be drawn out, one from either side of the drum or case, whereby the treble function of tempering the atmosphere in the room, arresting the sparks, and regulating the draught is accomplished, substantially as and for the purposes set forth.

81,237.—IRA WOOD, Woodstock, Vt.—*Composition for Tanning.*—August 18, 1868.

Claim.—A tanning liquid, made from the leaves of the oak and the maple, or of the willow, or of the three combined, or by the addition of the leaves of the beech, in about equal proportions, when combined with alum, Glauber's salt, and nitric acid, in about the proportions specified, for the purpose and in the manner set forth.

81,238.—HENRY WOODWARD, London, England.—*Apparatus for Carbureting.*—August 18, 1868.—A vessel of cylindrical form is divided by a horizon-

tal partition into two chambers, the lower one of which contains benzole or other carbureting fluid. In the upper chamber is a series of curved concentric diaphragms upon each of which is spread wicking extending at each end into the liquid chamber. Pipes are suitably arranged for the entrance of air and the exit of the gas.

Claim.—1. The arrangement, in a cylindrical carbureting vessel, of a partition dividing said vessel into an upper and lower chamber, in combination with concentric perforated bridges or diaphragms in the upper chamber, as and for the purposes set forth.

2. In combination with the arrangement of chambers and concentric bridges, as claimed under the preceding clause, wicking passing over said bridges, through the partition and into the lower chamber, substantially as set forth.

3. The combination, with the bridges and dividing partition, of plates arranged tangentially or nearly so to said bridges, and forming with the wicking a packing joint, as and for the purposes set forth.

4. In combination with the arrangement of chambers and concentric bridges, as claimed in the preceding clauses, an air inlet pipe, opening into the annular space formed by the casing and the outermost bridge, and a gas eduction pipe leading from the space between the dividing partition and the innermost bridge out of the carbureter, as and for the purposes set forth.

5. The carbureting vessel and float contained therein, in combination with the wicking or equivalent material, and curved bridges or diaphragms, upon which the same is spread and held, under the arrangement and for operation as herein shown and specified.

6. The combination, with a carbureter, substantially as herein described, of an inlet tube for carbureting liquid, arranged to traverse both the upper and lower chambers, and terminating at or near the bottom of the latter, as shown and set forth.

81,239.—JOHN WOODY, Mount Vernon, Ind.—*Rotary Steam Engine.*—August 18, 1868.—Upon a horizontal shaft is placed a wheel, each side of which is recessed out so as to form abutments which are arranged in reversed positions, so that the wheel may be driven in opposite directions. The induction pipes are arranged obliquely on opposite sides of the wheel, so that the motion of the engine can be changed at will.

Claim.—The arrangement of the ingress steam pipes *E E*, exhaust pipes *F F*, abutments *i i*, and easing *B B*, substantially as described.

81,240.—JAMES M. WYNN, Scipio, Ind.—*Wagon Coupling.*—August 18, 1868.—A plate is affixed to the front end of the rear hounds so as to hold the same rigidly and form a recess in which the pole rests. A bolt passes through the reach pole and hounds and is held in place by a spring button, by which the rear axle is coupled to the reach pole.

Claim.—The coupling device *a a a*, *e e*, *b*, *f*, *g*, all substantially as and for the purpose set forth.

81,241.—GEORGE W. N. YOST, Corry, Pa., assignor to the CORRY MACHINE CO., same place.—*Harvester.*—August 18, 1868.—A device for encasing and protecting the gearing of grass or grain cutting machines.

Claim.—The two cases, *A* and *A'*, combined with the main axle *G*, when the axle is put transversely through the middle of the cases, so that the body may be evenly balanced thereon, and combined with and fastened together by the axle bolt *H*, when the axle bolt is put through the cases, parallel with the main axle, midway between the middle and hind end, and also combined with the support bolt *I*, when the support bolt is put through the cases parallel with the main axle, midway between the main axle and the fore end.

81,242.—FRANCIS S. BABBITT, Taunton, Mass.—*Nozzle for Pipe.*—August 18, 1868.—A hollow screw-plug, provided with ports, is arranged within a tapering hollow tube, having two arched chambers, so that by turning a milled nut on the end of the screw plug the issuing stream may be of the full size of the bore,

or assume the form of spray, or of a hollow cone, as desired.

Claim.—An improved hose-pipe nozzle, consisting of the body A, the hollow screw plug B, the milled nut D, and the check nut E, the whole being constructed and made to operate together, substantially as above set forth.

2. The screw plug B, as made with the chamber or recess *f*, the same operating in conjunction with the stud or projection *h* disposed on the inner periphery of the body A, in the manner and for the purpose set forth.

81,243.—CHRISTIAN BARRY, Philadelphia, Pa.—*Air Tight Can.*—August 18, 1868.—The flaring end of the can, in connection with the depression of the cover, enables the tool to be applied externally.

Claim.—A cylindrical can, having ends flaring from the direct line of the body, and the lid or cover for the top or bottom of which is swaged or depressed and bent at the edge so as to overlap the flaring end of the can, to which it is secured, substantially in the manner herein described and represented.

81,244.—W. J. BENEDICT and JOHN WYLIE, South Norwalk, Conn.—*Felting Machine.*—August 18, 1868.—A fold of cloth is attached at one end to the upper part of a vertically-reciprocating steam-tight box, and passing down under a roller upon which the hat cones are placed, is secured at the other end to a plate which may be readily adjusted during the process of felting.

Claim.—1. In a hat felting and napping machine, the combination of the reciprocating steam box L, the bight or loop of cloth H, roller K, and adjustable plate M, substantially as described, for the purpose specified.

2. The racks J J, box L, and bight or loop of cloth H, constructed and arranged substantially as set forth, and for the purpose specified.

3. The arrangement of the shaft D, crank E, rod F, box L, uprights B, and looped cloth H, all substantially as and for the purpose shown and described.

4. The screw K, in combination with the plate M and looped cloth H, arranged substantially as shown for the purpose set forth.

81,245.—SILAS R. BOARDMAN, Fort Wayne, Ind.—*Water Elevator.*—August 18, 1868.—A long bucket of conical shape is provided with a disk below its bottom for conducting off the water, which latter escapes through a valve that is opened by a tilting rod and stop when the bucket is elevated from the lower apartment.

Claim.—The bucket A, the bottom valve *a*, the tilting rod *d*, the stop *s*, the disk *b*, in combination with the cylinder C, the same being constructed in the manner and for the purpose substantially as set forth and described.

81,246.—C. F. BOSWORTH, Milford, Conn.—*Attaching Wire to Brim of Hats.*—August 18, 1868.

Claim.—Attaching the wire to hat brims by a continuous or direct line of stitches parallel with the wire, the said stitches alternately crossing the wire, so as to secure the wire to the brim, substantially in the manner specified.

81,247.—ELIAS BROCK and JUDSON SHULTZ, Ellenville, N. Y., assignors to JUDSON SHULTZ.—*Machine for Unhairing Hides.*—August 18, 1868.—Designed as an improvement upon patents to E. Brock and to J. Shultz, each dated June 25, 1867.

Claim.—1. So arranging the operating mechanism of the feed of an unhairing machine that the said feed may move in the same direction with or in an opposite direction from the movement of the knife cylinder, at the will of the operator, substantially as herein shown and described, and for the purpose set forth.

2. Connecting the knife-cylinder B with the main feed roller H, by means of the gear wheels D F I J G, and lever E, constructed and arranged substantially as herein shown and described, and for the purposes set forth.

3. The combination of the roller T, ratchet wheel U, and pawl V, with the pivoted frame R, for the

purpose of adjusting the tension of the apron S, substantially as herein shown and described.

4. The combination of the rollers L M Q, and finger gear wheels N O P, with each other, and with the rollers H, substantially as herein shown and described, for the purpose of holding the hide and controlling its movement.

5. So arranging the operating mechanism of the feed of an unhairing machine, as to ease or diminish the shock caused by reversing the feed, substantially as herein shown and described, and for the purpose set forth.

6. The combination of the crank arm K with the journal of the feed roller H, and with the slotted gear wheel G, substantially as herein shown and described, and for the purpose set forth.

81,248.—ARTHUR W. BROWNE, Brooklyn, and WILLIAM F. GOODWIN, East New York, N. Y.—*Mechanical Movement.*—August 18, 1868.—Keyed to a shaft and running loosely upon it, is a series of cog wheels, between which is a series of pinions carrying arms, on the extremities of which are a pair of geared pinions, one of the same meshing with the driving cog wheel, around which they are carried by an arm, while the other is cast or attached to a cog wheel of larger diameter than itself, which gears with the next loose pinion on the shaft.

Claim.—1. Any number of revolving arms F F¹ F², each carrying a train of wheels, rotated by the wheels D D¹ D², in the manner herein described, to communicate motion with multiplied speed or power.

2. The intermediate pinions G G¹ G², employed in combination with the wheels D H I, substantially as and for the purposes explained.

81,249.—MANLY T. CAMPBELL, Lima, Pa.—*Clothes Drier.*—August 18, 1868.—Horizontal racks are attached to a main or central post and to outer hinged legs, and held by means of bolts, so that when not in use, the device may be compactly folded.

Claim.—The hinged legs E, applied to the racks C D of the main stand A, in the manner described, and held in supporting position by the bolts F, or their equivalent, for the purpose set forth.

81,250.—EDWARD CARD, North Providence, R.I.—*Shoe Buttoner.*—August 18, 1868; antedated August 7, 1868.—The button being held by the lower slotted jaw, the descending hook of the other jaw catches into the button hole and draws it upon the button, the presser performing the function necessary to complete the operation.

Claim.—The use of a jointed arm D, furnished with a hook *a* and presser *b*, operating substantially as described.

2. The combination of the opening *e*, hook *a*, and presser *b*, to insert a button in a button hole, substantially as described.

81,251.—JOHN CASHO, Newark, Del., assignor to CASHO AND COMPANY, same place.—*Link for Endless Chain for Horse Powers.*—August 18, 1868.—The construction is designed to prevent the links from spreading apart, the same being held by the through bolts or welded shanks, so as not to yield vertically, the longitudinal rib, at the same time, preventing any torsion of the through bolts.

Claim.—1. The combination of the grooved and slotted plank with ribbed journal-bearing brackets, geared links, friction rollers, and through bolts, all arranged as set forth for joint operation.

2. The combination, substantially as set forth, of the grooved and slotted plank with ribbed journal-bearing brackets, each carrying geared links and friction rollers, and secured to the plank by a shank connecting the brackets, for the purpose set forth.

81,252.—ANGELO CATTANEO, Newark, N. J.—*Felting Machine.*—August 18, 1868.—The upper rollers while revolving in one direction receive an endwise motion, so as to combine a squeezing and a rubbing effect.

Claim.—A felting apparatus, formed of two ranges of rollers, arranged in pairs, and driven by the worm pinions and gears, as represented, in combination with the frame *g*, carrying the upper range of rollers,

to which frame and rollers a reciprocating motion is given in the manner and for the purposes specified.

81,253.—WILLIAM R. CLOUGH, Cambridge, Mass.—*Paper File*.—August 18, 1868.—The saddle pieces in the base of the device, to which the pivoted links are attached, serve to hold the cap in any desired position.

Claim.—1. Combining, with the cap C, the two links E E' and D D' with the base A B, arranged and operating substantially as described, and for the purpose set forth.

2. Combining, with the links E E' and D D', the saddles N N', arranged and operating substantially as described, and for the purpose set forth.

81,254.—CHARLES S. CORSETT, Middleville, Mich.—*Water Wheel*.—August 18, 1868.—The upper face of the wheel is made concave and the lower face convex, so as to cause the water to pass to the buckets of the lower section and be discharged at the center, and thence to the upper section.

Claim.—The wheel A, composed of sections C and D, when the upper and lower surfaces of the same are concave and convex in form, and the whole is constructed and arranged substantially as described, as and for the purposes specified.

81,255.—JOHN P. COURTNEY and CHARLES REDMAYNE, Brooklyn, N. Y.—*Device for Applying Cloth Patches to Paper Collars*.—August 18, 1868.—A paste receptacle is formed with a space in its bottom part, the surrounding portion of the base being provided with perforations by which the paste is confined to the portion required for the patch.

Claim.—1. The receptacle *a*, for paste, formed with a perforated bottom, of the size and shape required, for pasting the surface of the collar for the cloth lining or patch, substantially as set forth.

2. The tube *f*, applied in the bottom of the paste receptacle *a*, in combination with the peg *e*, that acts as a guide to the button hole of the collar, the patch, and the paste receptacle, substantially as set forth.

81,256.—WILLIAM W. CRAPSTER, Mechanicsburg, Pa.—*Hoisting Apparatus*.—August 18, 1868.—The drum is placed loosely on the shaft and is made to rotate with the same by means of a clutch or dog passing through the shaft, so as to engage with the drum when required to turn the latter. A rope passing round the drum is operated by a connecting bar and bell crank to act as a brake.

Claim.—1. The combination of the drum D, shaft B, clutch or dog E, rod F, and lever G, for attaching the drum to the shaft, and detaching it therefrom, substantially as shown and described.

2. In combination with the above named elements, the connecting bar I, bell crank I', and the belt or chain K, arranged substantially as shown and described.

81,257.—JAMES A. CUSHMAN, Seneca Falls, N. Y.—*Hose Pipe Nozzle*.—August 18, 1868.—Four metallic segments are so arranged as to form a continuous ring when lapped together, and by simply turning the cap the orifice of the nozzle is contracted or expanded at pleasure.

Claim.—The overlapping segments E, operated through the medium of the pins F, fixed radial slots *i* in the parts C, and the curved movable slots K in the section H, whereby, as the nozzle is contracted and expanded, the overlapping segments form a continuous metallic ring, as herein shown and described, for the purpose specified.

81,258.—JACOB DAVID, New York, N. Y.—*Curtain Fixture*.—August 18, 1868.—The roller is so placed that one end of the curtain can be drawn up and the other down as required.

Claim.—The within-described method of hanging and operating a curtain, by securing the same to its roller at or about the middle of its length, said roller being fastened to the window frame at the middle thereof, and the curtain being operated substantially as set forth.

81,259.—ANTHONY G. DAVIS, Watertown, Conn.—*Umbrella*.—August 18, 1868.—An improvement on

his patent of March 10, 1868. The cap consists of a flanged ring cut away at regular intervals so as to leave projections which are bent at right angles to the ring.

Claim.—The cap *a*, constructed as explained, in combination with runner A, substantially as and for the purpose described.

81,260.—S. W. DAVIS, Wilmington, Del.—*Bit Stock*.—August 18, 1868.—A movable case or sleeve provided with a shoulder fits upon the shank, and slides freely upon the same against the tension of a spring, which latter serves to bear the free end of a pawl in a notch in the bit.

Claim.—The combination of the shank D, and spring *e* coiled thereon, the movable sleeve C, pawl *a*, and projection *b*, in a bit stock H G, all substantially as shown and described, and for the purpose set forth.

81,261.—JOHN S. DAVISON and NICHOLAS LORTON, Cranberry, N. J.—*Cover for Chambers and other Vessels*.—August 18, 1868.—The edge of the circular sheet of caoutchouc incloses the wire hoop, and is secured thereto by cement, in order to prevent the ingress of air or the escape of offensive odor.

Claim.—The formation of an air-tight cover, by means of caoutchouc or India-rubber, when stretched over a hoop as herein described, the whole being arranged as and for the purpose above set forth.

81,262.—ROBERT BLELOCH DUNCAN, West Roxbury, Mass.—*Bustle Attachment for Skirt*.—August 18, 1868.—A supporting frame formed with a projecting piece is secured to the waistband behind, and serves to maintain the hoop skirt in proper position and prevent its bulging out in front.

Claim.—A bustle frame or hoop shirt supporter, constructed and adapted to be used as and for the purposes set forth.

81,263.—JOB DYSON, New Britain, Conn.—*Frame for Stretching Drawers*.—August 18, 1868.—The stretcher boards are designed to shape the drawers in conformity with the natural contour of the limbs, and the bar, which retains the boards in their expanded condition, affords a ready means of suspending the instrument on a frame.

Claim.—A board or frame for stretching drawers, constructed substantially as described, with its hinge *a* arranged in direction of the width of the boards A A, at their upper or body ends, and they shaped on their edges *b c* to conform to the profile of the leg, and provided with a stretcher, B, at their opposite ends, substantially as specified.

81,264.—WILLIAM EMMETT, Paterson, N. J., assignor to himself and S. E. HORTON, Windsor Locks, Conn.—*Lathe Dog*.—August 18, 1868.—The dog is hung in the lathe plate by the pinion shank. The object to be dogged is grasped between the angular faces of the dog frame and sliding frame, and under this arrangement the faces of the sliding frame may be passed entirely beyond those of the dog frame; hence very small objects may be held.

Claim.—The construction and arrangement of the dog frame B, having angular sides D, pinion shank E and groove O, the set screw C, sliding frame F, consisting of plates G H with inclined sides I, stud or projection J, extension arms M, and lug N, and operating substantially as and for the purpose described.

81,265.—SAMUEL F. ESTELL, Richmond, Ind.—*Animal Trap*.—August 18, 1868.—The platform being depressed by the weight of the game is caught by the latch and closes the entrance.

Claim.—1. The lever, as formed by the end of latch *e*, extending beneath platform B, by which the platform is raised by the action of gate P, substantially as specified.

2. The latch *e*, for holding the platform in its reversed position when operated by means of gate P, substantially as described, in combination with the lever *e'* that raises the platform simultaneously with the opening of the gate.

3. The lock H, for securing the gate when operated by the platform, as set forth.

81,266.—JOHN A. FINNEGAN, Charlestown, Mass.—*Self-Adjusting Curb for Hydrant.*—August 18, 1868.—Relative changes between the mouth of the curb and the surface are prevented by the broad flange supporting the curb, inasmuch as the curb cannot settle materially by its weight, and any subsidence or upheaval of the surface earth is attended with a corresponding movement of the flange and curb.

Claim.—A curb made with a flange, and arranged relatively to the pipe or well, substantially as and for the purpose specified.

81,267.—JOHN F. FOLMER, Philadelphia, Pa., assignor to himself and A. J. KELLY, same place.—*Circular Saw.*—August 18, 1868.—Designed to avoid the tedious manipulation required in gumming the saw as ordinarily done, the sharpening being effected by cutting away the beveled ends of the teeth.

Claim.—A circular saw, the blade of which is composed of any desired number of straight sides, the continuation of each of which forms the back of one tooth, the front of the latter being parallel, or nearly so, with the back, as set forth, for the purpose specified.

81,268.—M. D. FOWLER, Vincennes, Ind.—*Rat Trap.*—August 18, 1868.—A pivoted drop in the bottom of the trap is so connected with tripping devices that, upon the bait being touched, the animal will fall into a receptacle below.

Claim.—The arrangement herein shown and described with relation to the catch-arm E and lever catch F, of the crank shaft M, connection N, angular lifting lever O, all arranged within the trap A G H, to operate as set forth, for the purpose specified.

81,269.—CHARLES GOOCH, Cincinnati, Ohio.—*Skate.*—August 18, 1868; antedated August 8, 1868.—The skate is secured to the boot sole by turning the thumb-nut which causes the toe clamp and movable heel to clamp the sole. The toe and heel clamp can be readily adjusted to boots of different sizes by changing their relative positions on the screw rod.

Claim.—The sliding toe clamp C, sliding heel clamp M, fixed heel clamp I, screw rod G, and thumb nut K, all constructed as described, whereby said clamps are adapted to bear only upon the sole and heel of the boot or shoe, without touching the uppers, as herein shown and described.

81,270.—ADAM GOOD, JR., and SIMON STROUSE, Titusville, Pa.—*Connection for Wooden Rod.*—August 18, 1868.—The tapering tube is driven over the wooden section of the rod to compress the wood upon the tongue piece, the latter being connected to the tube through the medium of the adjusting screw. The union coupling joins the adjacent tubes.

Claim.—As combined with the union joint A, the socketed connection, consisting of the tapering tube B, the tongue C, with its enlargements, and the adjusting screw D, all substantially as shown and described.

81,271.—WILLIAM F. GOODWIN, East New York, N. Y.—*Mechanical Movement.*—August 18, 1868.—An arrangement of gearing within a series of pulleys, upon which the driving belt may be shifted to increase the power or speed of the drum.

Claim.—1. The drum F, with its ratchet b and pawl c, in combination with two or more of the series of pulleys G, all substantially as shown and described.

2. The combination of two or more of the series of pulleys G with their circles of internal cogs g, external pinion k, and intermediate pinions i and j, and arm I, substantially as shown and described.

3. The arm I, carrying the pinions i and j, in combination with the shaft D, both so constructed that the said arm will move freely on the said shaft longitudinally, but will not revolve upon it, substantially as and for the purposes shown and described.

4. The combination of two or more of the series of pulleys G with the non-revolving shaft D and arm or arms I, all as shown and described.

81,272.—CHRISTOPHER GULLMANN, Poughkeepsic, N. Y.—*Mop Head and Wringer.*—August 18, 1868.—The mop may be compressed forcibly between

the stationary cup and the block attached to the mop head, the handle of the mop-head forming the lever, and the hooks of the stationary cup the fulcrum.

Claim.—1. The combination of the hinged jaws B D, convex block C, handle A, and sleeve b, as shown and described.

2. The hooks c, on the stationary cup E, in combination with the jaws B D, block C, and handle A, as and for the purpose set forth.

81,273.—WILHELM HOEFT, Fountain City, Wis.—*Washing Machine.*—August 18, 1868.—The parts which act directly upon the clothes are made to approach and recede from each other by the vibration of the arms to which they are attached, said arms receiving motion from a central crank shaft through the medium of yielding connections.

Claim.—1. The combination of the pivoted frames E, beaters F, connecting rods G, and double cranks c', formed upon the driving shaft C, with each other and with the tub B, when arranged so that the double beaters approach and leave each other, substantially as herein shown and described, and for the purpose set forth.

2. The arrangement of the hinged parts b' of the sides of the tub B, end boards of said tub, and removable top K with each other and with the projecting ends of the frame A, substantially as herein shown and described, and for the purpose set forth.

81,274.—EDWARD HOLMES and BRITAIN, HOLMES, Buffalo, N. Y.—*Power Windlass for Making Casks.*—August 18, 1868.—This invention combines in a windlass, a friction driving pulley, to prevent injurious strain upon the truss rope or windlass, and a clutch-coupling to the windlass drum, whereby said drum may be readily disengaged and reversed to unwind the truss rope therefrom.

Claim.—The combination of the driving pulley E, provided with a friction clutch, the screw shaft D', worm D, worm wheel C, clutch H, and windlass drum B, operating in the manner and for the purpose described.

81,275.—S. A. HOLT and C. H. WILLIAMS, Hudson, Mass.—*Peg Feed Stop for Pegging Machinery.*—August 18, 1868.—When the shoe is removed from the machine, the peg-feeding pawl is thrown out of gear, and no more pegs are supplied for the time being.

Claim.—The lever C C', or its equivalent, for actuating the pawl a a', substantially as described, and for the purpose set forth.

81,276.—ERWIN T. HOPE, Philadelphia, Pa.—*Elevator.*—August 18, 1868.—To elevate the carriage, the tubes are extended by introducing water at the bottom of the lower stationary tube. The carriage moves an arm projecting into its path, and thereby closes the cock and arrests the ascent at the proper moment.

Claim.—1. The combination, with the telescopic tubes of a carriage H, and ways K, substantially as and for the purpose described.

2. The combination, with the telescopic tubes, of the rods E and cushions L, substantially as and for the purpose described.

3. The combination of the telescopic tubes, provided with cushions L and stuffing-boxes D, and connected by rods E, the grooved ways K, carriage H I, three-way cock N, and rod M, having arms, as described, all substantially as herein set forth and shown, for the purposes specified.

81,277.—A. S. KILBY, Huntington, Ind.—*Apparatus for Printing Photographs.*—August 18, 1868.—The grouping of the heads or other pictures is accomplished by moving the slider to obtain a lateral arrangement of the impressions; the longitudinal arrangement being attained by winding up the paper on the roller.

Claim.—The leaves D E, slider G, case A, roller B, any suitable clamps f f', all substantially as described, when contributing to form an apparatus for printing photographic pictures, all as set forth.

81,278.—G. W. KING, Saratoga Springs, N. Y.—*Vagina Injector.*—August 18, 1868.—Designed to

take the place of the female syringe in common use.

Claim.—1. An improved vagina injector, formed by the combination of the bowl or cup A and tube B, said parts being constructed and arranged substantially as herein shown and described, and for the purpose set forth.

2. Forming a partial cover, C, upon the top or mouth of the cup or bowl A of the injector, substantially as herein shown and described, and for the purpose set forth.

81,279.—M. M. KNOWLES, Elmira, N. Y.—*Extension Ladder.*—August 18, 1868.—This contrivance is made to serve either as an ordinary house ladder or as a step ladder.

Claim.—The combination of ladders A and B, adjustable brace D F, and pin J, all constructed and arranged substantially as described, as and for the purpose specified.

81,280.—J. D. LEGG, Long Eddy, N. Y.—*Curtain Fixture.*—August 18, 1868.—Improvement on the curtain fixture patented to J. D. and J. W. Legg, May 5, 1868. When the curtain is hooked at bottom to the sill, the pulling of the cord will roll up the curtain from the top and lower it, the cord being fastened to a bracket to hold the curtain in the desired position.

Claim.—The coil springs J, inclosed concentrically within the cylindrical boxes G, and attached to the shafts or axes I, and the peripheries of the boxes G, in combination with the pawls e, ratchets d^x, and curtain A, all being arranged substantially in the manner as and for the purpose set forth.

81,281.—JASON B. LOOMIS, Chelsea, Mass.—*Bustle.*—August 18, 1868.—A series of bowed springs provided with end pockets, and connected at their centers by a bow spring having a hook at its lower end, which connects with an eyeleted band, so as to increase or diminish the curvature of the connecting spring.

Claim.—1. The arrangement of bow springs b (connected as described) with the bow spring e, the hook f, or its equivalent, and the adjusting strap g, the whole being applied to a waistband, as set forth.

2. The combination and arrangement of the shield or abutment k with the bustle made and provided with the spring e, as set forth.

81,282.—DUMONT MAREAU, Hubbardstown, Mass.—*Easy Chair.*—August 18, 1868.—The chair seat rocks upon its elastic supports.

Claim.—The springs E, arranged as described, in combination with the seat A, rails C, links F, and hooks g, substantially as set forth, for the purpose specified.

81,283.—JOHN MERLETT, Bound Brook, N. J., assignor to himself and JOHN SMALLEY, same place.—*Breech-loading Fire-arm.*—August 18, 1868; ante-dated August 7, 1868.—The recess, at the forward end of the breech piece, permits the same to swing laterally, and is covered by a plate to exclude dirt, &c. The breech piece being released by the retraction of the hammer, is acted upon by a spring which throws it into position to receive the cartridge.

Claim.—1. The laterally-swinging chambered breech piece C, attached to the barrel by the semi-circular joint c, and arranged in relation with the spring A^{*}, substantially as and for the purpose herein set forth.

2. The sliding plate or apron e, arranged in relation with the joint c, substantially as and for the purpose specified.

81,284.—ANTHONY NULSEN, EUGEN HAUEISEN, and ALBERT WAGNER, Cincinnati, Ohio, assignors to A. NULSEN & Co.—*Brick Machine.*—August 18, 1868.—The result of the rotation and approximation of the rolls is to both feed down and gradually temper and compress the clay, and to force the same into the molds with the requisite impetus to produce compact and homogeneous bricks.

Claim.—The relative arrangement of the endless carrier A, hopper G, case F, rolls B C D E, and throat H, constructed to operate as described.

81,285.—SAMUEL PATTON, Chatsworth, Ill.—*Belt Tightener.*—August 18, 1868.—The belt is kept in contact with the face of its pulleys, so that uninterrupted motion shall be transmitted from one shaft to another, even though one side of the belt should hang slack.

Claim.—1. The arrangement of the drums D D', in connection with the belt C and pulleys B B', in such a manner that the drums press the belt directly against the surface of the pulleys, substantially as described.

2. The combination and arrangement of the belt C, drums D D', pulleys B B', spring bearings E E', and adjusting screws, or their equivalent, F F', substantially as shown and described.

81,286.—JOSEPH A. PEABODY, Philadelphia, Pa.—*Mortising Machine.*—August 18, 1868.—Circular plates provided with rectangular slots are made to fit in flanged rings set in the side of the movable table, and, by turning the plates so that the slots will assume the required position, a right or left-hand mortise of the desired angle may be made.

Claim.—The regulators, composed of rings R and R', plates P and P', with slots S and S', bolts b, b¹, b², and b³, screws C and C', substantially in the manner and for the purpose specified.

81,287.—ANDERSON H. PILAND and ANDREW H. TURNER, Indianapolis, Ind.—*Stock Pump.*—August 18, 1868.—Water is forced from a submerged barrel into a trough by the cattle stepping on a platform, which operates a piston.

Claim.—1. The foundation framework, consisting of the elements A B C F G, constructed and arranged substantially as and for the purpose set forth.

2. The hinged platform E E' E'', supported on the timbers J and by the braces K L M, strutting from the sliding post D, and attached to the post F by the straps I I', as set forth, in combination with the lever N, eduction pipe V, and pump, all arranged and operating substantially as and for the purpose set forth.

3. The cone-shaped piston T, packed as described, in combination with the valve chamber and valve X, and eduction pipe V, attached to the vibrating platform, all arranged and operating substantially as set forth.

81,288.—J. F. POOL, Monroe, Wis.—*Grain Separator.*—August 18, 1868.—Improvement on his patent of January 14, 1868; designed to save the grass seed and effect the separation of a third grade of wheat.

Claim.—1. The spouts i i, placed one on each side of the frame A, and emptying into the conductors O O, substantially as and for the purposes herein set forth.

2. The box h, placed under the slide g, so that when said slide is removed the grass seed will drop into the same, substantially as herein set forth.

3. The adjustable and movable screens d d, when constructed as described and operating as and for the purposes herein set forth.

4. The cross-screen m, placed between the series of screens c c and screens d d, substantially as herein set forth.

81,289.—GEORGE H. REYNOLDS, New York, N. Y., assignor to himself and CORNELIUS H. DELAMATER, same place.—*Hoisting Machine.*—August 18, 1868.

Claim.—1. In a system of hoisting machines, providing for end play by the employment of the feather b, or its equivalent, in combination with the V-shaft, friction gear wheels B' C¹, substantially as and for the purposes herein set forth.

2. In combination with the shaft C and friction wheels B' C¹, the movable box M', links m², and eccentric pins O, mounted relatively to the shaft P and handle p, so that the pins o shall come nearly on their dead points when the friction wheels B' C¹ are properly connected, as and for the purposes herein set forth.

3. Connecting the shaft C and the winding drum E in a hoisting machine by the peculiarly-constructed and arranged parts C³ C⁴ and E³ E⁴, as and for the purposes herein set forth.

4. The bearings m^1 for supporting the drum E and its connections, independently of the concentric shaft B, as and for the purposes herein set forth.

5. The binders H h^1 h^2 , constructed and arranged to serve relatively to the shafts BC, and their several connections, so as to support the frame A and aid in preventing any spring or displacement of the parts under the strains and vibrations to which they are subjected, as herein set forth.

81,290.—C. B. RICHARDS, Hartford, Conn.—*Breech-loading Fire-arm.*—August 18, 1868.

Claim.—So shaping and connecting the breech plug a and a yielding hooked extractor, that the free end of the extractor will be locked to the breech plug by the relative movement of the two in the act of retraction, substantially as and for the purpose hereinbefore set forth.

81,291.—THOMAS RICHARDS, Medford, Mass., assignor to EDWARD D. MANNING, same place.—*Machine for Manufacturing Fuse.*—August 18, 1868.

The powder descends through a vertical, rotating shaft, from which it is delivered at a point where strands of thread are twisted about it, a continuous fuse being thereby formed. The fuse, pursuing a downward course, is overlaid with threads supplied from spools on a rotating frame. These overlaying strands are passed through open slots in a hollow, rotating shaft, after which a ring is fitted over it, and secured for the purpose of keeping the strands in place.

Claim.—The hollow shaft M, having open slots s at its upper end, in combination with the ring t , substantially as described, for the purpose herein set forth.

81,292.—CHARLES L. RIDGWAY, Boston, Mass.—*Corkscrew.*—August 18, 1868.—The hinged fulcrum is provided with a notch, which fits upon a shoulder on the screw portion, for the purpose of preventing the screw from being bent when in use.

Claim.—The stud or fulcrum F, provided with the notch N, working in combination with the shoulder E, substantially as described, and for the purpose set forth.

81,293.—AIVA RITTENHOUSE, Philadelphia, Pa.—*Clamp for Holding Leather.*—August 18, 1868.

On depressing the lever with the foot, the lower ends of the jaws are spread apart, and their upper ends made to firmly clamp the leather to be stitched.

Claim.—The arrangement of the jaws J and J', hinge H, and lever L, substantially in the manner and for the purpose specified.

81,294.—HIRAM H. ROBBINS, Lynn, Mass.—*Feather Renovators.*—August 18, 1868.—Two closed cylinders, one placed within the other, are provided with a steam pipe and a tubular valve, and a series of steam ports so arranged as to allow the steam to enter the inner cylinder to dampen the feathers, and then to cut off the steam from the inner cylinder and allow it to circulate about its exterior.

Claim.—The above-described device for restoring feathers, consisting of the two cylinders A and B, constructed and arranged as described, in combination with the steam conduits f f , &c., and the ports g g , &c., such conduits and ports being regulated by the tubular valve h , and the whole operating in manner and for the purpose as before explained.

81,295.—L. C. ROBINSON, Shepardsville, Mich.—*Shingle Machine.*—August 18, 1868.—The saw gate is provided with two sashes and two sets of saws, one of the latter being moved within the other, by means of a bell crank, connecting rod and feed roller. A butting saw is secured to a mandrel provided with a sliding ratchet bar and pawl, by which the action of a coiled spring is restrained until the saw has swung back from the shingles.

Claim.—1. The combination with the sash C, of the laterally moving sash b , having its saws hinged, as described, and operated by the feed roller d^2 , through the medium of the bell crank d and connecting rod d^1 , substantially as and for the purpose specified.

2. The cut-off saw D, in combination with the

sliding mandrel, spring f , ratchet bar f^1 , and pawl f^2 , operating in the manner described, with relation to the hinged saws a a' , as and for the purpose specified.

81,296.—F. ROHRBACHER and F. HORMANN, Philadelphia, Pa.—*Fruit Jar.*—August 18, 1868.

Claim.—A jar, having, at the inside of the neck, inclined recesses b , and vertical recesses c , open at the top, and above the said recesses a flanged projection, the upper edge of which is an unbroken circle, in combination with a cap, B, rubber ring i , and lugs a , arranged as specified.

81,297.—WILLIAM M. RUSSELL and D. E. HOLMES, Cincinnati, Ohio.—*Railroad Car Ventilator.*—August 18, 1868.—The deflector is fastened in a slot formed in a block which is inserted in the side of the window frame, and held in place by means of projecting pins entering the sash and the lower sash frame.

Claim.—The deflector D E, when the same is provided with projecting pins c e' , in combination with the angular base, b , and sash C, and the whole is so constructed and arranged to operate substantially as described and for the purpose specified.

81,298.—WILLIAM SAILER, Philadelphia, Pa.—*Clamps.*—August 18, 1868.—When the clamp is turned laterally by pressure at one end, the serrated projections will bite into the opposite sides of the joist and firmly hold the clamp.

Claim.—1. A clamp, consisting of a bar, a , upon which are projections, b d , serrated at their edges, and lugs f f , the said clamp being adapted for use in connection with a wedge, y , substantially as described.

2. The clamp A, consisting of a bar, a , upon which are lugs f f , and projections d b , serrated at their inner edges, the said lugs and projections being arranged as and for the purpose described.

81,299.—GEORGE SCOTT, Louisville, Ky.—*Elevator.*—August 18, 1868.—The rope that sustains the platform passes over a series of pulleys and is secured at both ends to the upper portion of the frame.

A balance weight on the rope serves to maintain a continuous tension of the same. The hoisting rope passing through "bulls'-eyes" in the corners of the platform enables a person standing on the platform to operate the same.

Claim.—1. The combination of the wheel G, rope f , axle Q, wheels Q' and P, and the clutch O, substantially as and for the purpose set forth.

2. The pulley E, when constructed with a double beveled groove, and used in combination with a rope, b , fixed at both ends, and operating substantially as described.

3. The arrangement of the rope b , fixed at both ends, at B B, the platform F, the pulleys E, L, D, and C, the latter being placed in a balance weight, M, substantially as described.

4. The arrangement of the rope f , passing through bulls'-eyes in the platform F, substantially as and for the purpose set forth.

81,300.—THOMAS S. SEDGWICK, Onarga, Ill.—*Fastener for Buttons, Studs, &c.*—August 18, 1868.

Claim.—An auxiliary attachment for securing buttons and studs, consisting of an elastic loop passing through or united to the fabric near to the button-hole or eyelet, all substantially as described.

81,301.—JACOB SHEARMAN, Fayetteville, Pa.—*Machine for Turning Boot Leg.*—August 18, 1868.—The boot leg when seamed up is slipped upon the cylinder and the straps of the legs placed on hooks attached to a rod passing through the cylinder.

A ring, surrounding the cylinder, and rising simultaneously as the hooks descend, actuates the leg upward on the cylinder, thus turning it right side out.

Claim.—1. The cylinder E, table B C C, wheels c , racks d d , rod f , hooks g , shaft a , and crank j , all arranged and operating substantially as and for the purpose shown and described.

2. The racks b , and ring i , substantially as described, in combination with the accessory mechanism, all as set forth.

81,302.—ROBERT SIDE, Union Street, Borough, England.—*Machine for Obtaining Motive Power.*—August 18, 1868.—As the cranks rotate one within the other in opposite directions in each pair of cranks, the lowermost crank will lift one end of the beam and the other crank will depress the opposite end of the said beam, and when that end of the beam which is being lifted has passed a horizontal line the opposite end of the beam will move downward, thereby lengthening this end of the beam and cause it to descend with a force equal to the difference between the long and short weighted levers of the beam thus brought into action.

Claim.—The cranks, working in pairs, one within the other, in opposite directions, for imparting rocking motion to weighted beams, having no fixed axis of motion, but so constructed that the crank pins move in slots in the said beams, substantially as above described.

81,303.—FRANZ G. SIEMERS, Winona, Minn.—*Ice Cutter.*—August 18, 1868.—To a vertically reciprocating frame is attached a series of knives or pickers against which a piece of ice is forced by means of a follower suitably operated.

Claim.—1. The reciprocating frame D, having the series of pickers *a a'*, arranged to operate substantially as described.

2. In combination with the ice-cutting frame D, the follower L, arranged and operated substantially as described, for feeding the ice to the pickers as it is cut.

3. The combined ice cutter and refrigerator, when constructed and arranged for use, as shown and described.

81,304.—THOMAS P. SINK, Fairton, N. J.—*Oyster Dredge.*—August 18, 1868.—Each end of the dredge rake is connected by bolts or pivots to the frame, so that the rake can be adjusted and set to any desired pitch, where it is held by a clevis or ratehet.

Claim.—1. The construction of an oyster dredge with an adjustable rake, as herein described, and for the purpose set forth.

2. The clevis or ratehet, or its equivalent, in combination with an oyster dredge, for the purpose of setting and keeping a dredge rake to the proper pitch, as herein described, and for the purpose set forth.

81,305.—DAVID P. SMITH, Salem, N. J.—*Faucet.*—August 18, 1868.—A washer or jam nut, having a broad face and provided with an elastic packing, is placed on the faucet, and when the latter is inserted in a vessel, the washer is screwed against the face of the said vessel.

Claim.—The washer or jam nut B, in combination with the elastic packing C and the screw cut cylindrical portion *a' a'''* of the barrel A, the said parts being constructed and arranged to operate together, when applied to the wooden vessel, substantially as and for the purpose described.

81,306.—THEODORE STEINWAY, New York, N. Y.—*Piano Forte.*—August 18, 1868.—The metallic hangers or standards are provided with holes to receive the metallic traverses, so that the derangement of the action due to expansion and contraction of the wooden rail is avoided. Flanged metallic rods, forming traverses, connect the metallic hangers of the action frame so as to form a firm connection for the same. The ends of the standard of the action frame are formed with segments or spheres, so that the ends can roll in their steps while the hangers are being adjusted by the set screws.

Claim.—1. A metallic action frame for piano fortes, said frame being secured to the wrest-plank, and composed of metallic hangers or standards A, provided with holes to receive the metallic traverses, substantially as shown and described.

2. The flanged traverses B, constructed substantially as and for the purpose set forth.

3. The intermediate plates C, provided with holes to receive the flanged traverses B, substantially as and for the purpose described.

4. The adjusting screw F, provided with a square end *n*, and jam nut *o*, in combination with the hang-

ers or standards A, substantially as and for the purpose set forth.

5. The segmental or spherical ends, *p*, of the hangers, fitting into corresponding steps, and operating in combination with the screws F, substantially as and for the purpose described.

81,307.—CHARLES O. STEVENS, Auburn, Me.—*Horse Shoe.*—August 18, 1868.—The shoe is constructed with a cap to fit over and about the hoof. It is jointed at the sides, and fastened to the hoof by means of a screw in the rear.

Claim.—The top piece B, and rear piece C, joined by the pivot G, secured to the hoof by means of the screw cross bar *e*, substantially as herein set forth, and for the purposes herein mentioned.

81,308.—JAMES STEWART, St. Cloud, Minn.—*Fastening Handles to Axes, Picks, &c.*—August 18, 1868.—A tongue is inserted into and forms a part of the handle, and is so constructed that when the handle is inserted in the eye of the tool the wood will press firmly on either side of the said tongue.

Claim.—The metal tongue C, constructed as described, and provided with a circular projection, *i*, on its lower end, and one or more bolts, *a*, on its upper end, when used for the purpose of fastening handles to tools, substantially as herein set forth.

81,309.—SQUIRE TEAL, Rochester, N. Y.—*Engine Lathe.*—August 18, 1868.—The guide bar is made in two parts to render it adjustable. Upon one part is a movable guiding pin which works in a groove of a pattern plate bolted upon a bracket, the object being to turn shafts in a tapering or an irregular form, without changing the center of the tail-block of common engine lathes.

Claim.—1. The combination of the adjustable bracket H, the pattern plate attached thereto, and the jointed guide bar B, with the tool holder, when arranged and operating substantially as described.

2. The combination of the sleeve *r*, set screw *v*, and screw *f*, with the tool holder, in the manner described, for the purpose of permitting or prohibiting to the tool holder, as may be found necessary, independent transverse movement.

3. Arranging the bracket which supports the pattern on the tail stock of the machine, and connecting the tool holder with the pattern by a jointed lever, in the manner substantially as herein described.

81,310.—FRANCIS W. TILTON and MOSES C. SWIFT, New Bedford, Mass.—*Clothes Line Supporter.*—August 18, 1868; antedated August 12, 1868.—Within a slotted tubular stand is arranged a sliding pole, having a cross piece or rod at its lower end, which rests in notches in the said stand, so as to adjust the pole at any desired height.

Claim.—1. The tubular slotted stand A, with the hooked notches *h* therein, substantially as and for the purposes described.

2. In combination with the stand A, the pole E, with the rod G and hook F, arranged substantially as and for the purposes set forth.

81,311.—JOHN WAY, Waterbury, Conn.—*Strap Holding Device.*—August 18, 1868.—The cam being free to turn upon its pivot bites the strap and holds it firmly when it is pulled upon in either direction. By holding the cam in an obvious position the strap may be inserted or withdrawn.

Claim.—A holding device, composed of a double-acting cam or eccentric button, in combination with a suitable bearing surface, the whole operating substantially in the manner described for the purpose set forth.

81,312.—THEOPHILUS WEAVER, Harrisburg, Pa.—*Clothes Hook and Line Holder Combined.*—August 18, 1868.—A pivoted lever is provided with two arms upon the ends of which are posts, between which, and stationary posts upon a metal disk, a cord or line is held, the line acting upon one of the lever posts to press the opposite one upon the portion of the line between it and the stationary post.

Claim.—The combination of the hook S, lever L,

and the posts *a b a' b'*, substantially as described and for the purpose set forth.

81,313.—DARIUS WELLINGTON, Boston, Mass.—*Brick Machine.*—August 18, 1868; antedated August 6, 1868.—The crude clay is fed from the pug mill into molds, automatically and successively brought under and fed from the mill, and is solidified in the molds and ejected from them, the surface of the mold, after being filled, being passed under a cutter which cuts off the clay in the mold from that above it, and then under a throat piece which presses the loose clay into any unfilled parts of the mold, and then under a scraper which smooths the surfaces of the bricks and scrapes off all projecting pieces or edges.

Claim.—1. In combination with the follower, (which intermittently feeds forward the series of molds,) and with the rotating pulverizing blades *d*, and feed screw *k*, (which break up the clay and force it into the molds,) the scraper bar *t'*, the throat piece *u*, and the "doctor" *y*, each arranged to operate substantially as set forth.

2. In combination with the reducing and feeding mill *b*, and with the mold-feeding mechanism, the solidifying plunger *v*, and expelling plunger *w*, when arranged to operate substantially as described.

3. The arrangement of the bevel gear *f*, at the bottom of the pulverizing and mold-filling mill *b*, to be driven by a pinion *g*, on the driving shaft, just above the bed *a*, substantially as described.

4. The arrangement of the crank and cam wheel *s*, connecting rod *r*, slides *q*, lever *d'* and slide plates *a'*, for driving the follower *o* and plungers *v w*, substantially as described.

81,314.—DARIUS WELLINGTON, Boston, Mass.—*Machine for Separating Stones from Clay.*—August 18, 1868.—The part of the pocket where the stones collect is provided with bars, placed at distances apart about equal to the spaces between the grates, so that any clay which is carried forward with the stones may escape past the bars. The bars are movable, so that when a considerable quantity of stones has collected within the pocket they may be taken out.

Claim.—In a clay mill, the arrangement of the parts, substantially as herein described; that is to say, arranging the delivery grate *d*, beyond the shaft *b*, and these in relation to the incline *e*, so that the blades on said shaft shall cause a movement of the mass of clay over the grate and under the incline *e*, by which movement the clay is forced through the grate, and the stones moved forward thereon, and into the pocket *h*, which pocket is provided with movable bars *g*, or their equivalents.

81,315.—J. BURNS WEST, Geneseo, N. Y., assignor to SAMUEL FINLEY.—*Lathes for Turning Balls.*—August 18, 1868.—The block from which the ball is turned is supported at one end only. The chucks are perforated and the tool is mounted in a swing rest having a vertical, lateral, and a longitudinal adjustment in its socket, and also a horizontal swinging movement across the axis of the mandrel.

Claim.—1. The swing rest, constructed and arranged as described, for the purpose of rounding one end and the sides of the block from which the ball is cut, by a single traverse of the tool across the axis of the mandrel, as set forth.

2. The combination, with the swing rest, of the fixed notched tool holders, and swinging locking clamps *O*, all these parts being constructed and operating as described, so as to hold the tool either horizontally or at an angle, as set forth.

3. The combination, with the swing rest and locking clamps, of the twisted gouge *L*, and stop block or gauge *k*, these parts being constructed and arranged as described, for joint operation.

4. The combination of the perforated chuck and mandrel with the pushing rod sliding through them, and with the vibrating hammer to knock out the finished balls, these parts being constructed, arranged, and operating as described.

5. The combination, as described, with the chuck supporting the block from which the ball is to be cut at one end only, of the swing rest, which carries the tool across the axis of the mandrel, as set forth.

6. The method, herein described, of finishing a

portion of the ball somewhat greater than its hemisphere, by a tool swinging transversely across the axis of rotation of the ball, (which is sustained at one end only,) and then inserting the finished end in a perforated concave chuck, and completing the remainder of the sphere by a repetition of the former swinging movement of the tool.

7. The combination, as described, with the chuck and swing rest, of the marking spring *O'*, constructed and arranged as set forth.

81,316.—GEORGE WILLETT, Richburg, N. Y.—*Turning Logs in Saw Mill.*—August 18, 1868.—Wheels mounted on a horizontal shaft in the frame receive the weight of the log, when the latter has been partly turned by the ordinary cant hook, and carry the same to its position on the carriage, adjusting it, and letting it down without jar or shock.

Claim.—The described arrangement of the wheels *E E*, relatively with the head blocks, operating in connection with the cant hook to turn the log, as herein shown and described.

81,317.—C. WILLIAMS, New York, N. Y.—*Crane.*—August 18, 1868.—The clamping brake retains the load at any desired height. In raising very heavy weights the foot piece prevents the oversetting of the apparatus. Provision is made for holding the crane in a fixed position during the operation of moving the weight vertically.

Claim.—1. The clamping brake, arranged with reference to the crane, and the lifting rope thereof, substantially as and for the purpose specified.

2. The brace, constructed with the swinging post *E*, in combination with the standard *B* of the crane, substantially as and for the purpose specified.

3. The detachable foot piece *L*, in combination with the base, *A*, of the crane, substantially as and for the purpose specified.

4. The pawl *K*, arranged in relation with the notched collar of the turning standard *B*, substantially as and for the purpose specified.

5. The collar *B**, and its sustaining braces *c*, in combination with the turning standard *B*, and the base, *A*, substantially as and for the purpose specified.

81,318.—H. C. WISSEL, Indiana, Pa., assignor to himself and H. F. SHRYOCK, same place.—*Buckle.*—August 18, 1868.—The frame of the buckle is provided with a loop near each end, with a tongue in the center, so as to connect two straps together and secure itself to the straps without being sewed or stitched to either.

Claim.—A buckle, composed of a plate, *a*, provided with loops *b b*, and a tongue, *B*, all constructed and arranged to operate in the manner substantially as and for the purpose set forth.

81,319.—ALEXANDER K. YOUNG, Boston, Mass.—*Hoop Skirt and Bustle Combined.*—August 18, 1868.

Claim.—1. The arrangement of the hoop bustle on the outside of the main skirt, and with the ends of the hoops of the bustle connected with the hoops of the skirt, as set forth.

2. The combination of an expansive hoop bustle, as described, with a hoop skirt, it being arranged on the outside of and fixed to the hoops of the said skirt, substantially as set forth.

81,320.—E. G. ALLEN, Boston, Mass.—*Steam Safety Valve.*—August 25, 1868.—The mode of applying the spring insures its even pressure upon the valve, together with an unfailing and precise action when the working pressure is exceeded. The perforations in the let-off pipe afford free egress to the steam, but preclude tampering with the valve through said pipe.

Claim.—1. The combination of a spring, *g*, sleeve *d*, and stem *c*, substantially as and for the purpose specified.

2. Constructing the let-off pipe with the perforations *s s s*, as and for the purpose described.

3. So arranging a whistle, with reference to the safety valve, that at the first escape of the steam from said valve the whistle will be sounded, and will continue to sound so long as the steam con-

tinues to escape, substantially as shown and described.

81,321.—JOHN ALLEN, New York, N. Y.—*Lamp Burner.*—August 25, 1868; antedated August 12, 1868.—When the draught needs to be increased the regulator is unscrewed to widen the space between the lamp body and the regulator.

Claim.—The adjustable draught or air regulator A, arranged, constructed, and operated on the center extension screw B, substantially as described and for the purpose set forth.

81,322.—IRA R. AMSDEN, Buffalo, N. Y.—*Railroad Car Heater.*—August 25, 1868.—An independent car, not intended for purposes of transportation, has an air inducting, forcing, and heating apparatus, which is convertible at will into a refrigerating apparatus, and from which the air, either heated or cooled, is conveyed to and distributed in the cars of the train.

Claim.—1. Constructing a furnace car, with a furnace or furnaces, C C, and surrounding chamber, K, provided with transverse or intermediate partitions *a a*, having suitable apertures for the passage of air, substantially as shown, and for the purpose described.

2. The combination of the furnace or furnaces C, space K, and partitions *a a*, constructed substantially as described, with a receiving chamber J, and fan blower I, the whole constituting the furnace car, as herein set forth.

3. As a whole, the construction of furnaces C C, surrounding chamber K, alternating partitions *a a*, receiving chamber J, fan I, driven from the axle or car wheels, and conducting pipes G F, with flexible connections H, for distributing the heated air, the whole arranged as described, and operating in the manner and for the purpose specified.

81,323.—THEOPHILUS ARNDT, Mount Joy, Pa., assignor to himself, CHRISTIAN H. NISSLEY, and ISRAEL L. LANDIS.—*Car Coupling.*—August 25, 1868.—A swinging support is provided for holding the bolt, and an interior hinged device holds the link horizontally. These features, in connection with the central prolongation of the link, produce an automatic coupling.

Claim.—The combination of the pin supporter E, link holder C, pin E, and link M, all arranged and constructed substantially as described, and for the purpose specified.

81,324.—WILLIAM ASCOUGH, Buffalo, N. Y.—*Lamp Bracket.*—August 25, 1868.—The guard is secured to the bracket ring by elastic connections, which are especially advantageous on shipboard and in similar situations, where the movement has a tendency to displace the lamp.

Claim.—Securing lamps in brackets by means of an upper guard ring, C, and connections *d*, for attaching to the supporting ring, substantially in the manner and for the purpose set forth.

81,325.—E. H. ASHCROFT and J. R. BROWN, Boston, Mass., assignors to E. H. ASHCROFT.—*Elevator.*—August 25, 1868.—Not less than two of the screw bosses are in engagement with the screw plate at any one time, and a greater number may be maintained in engagement with said plates, to afford greater power.

Claim.—1. The shafts I, having a series of screws or bosses, R, arranged therein, substantially as and for the purpose described.

2. In combination with the shafts I, having the bosses R, secured thereon, the plates J, having the semicircular grooves with screw-threads cut therein, said parts being arranged for joint operation, substantially as described.

3. An elevator, consisting of a cage or platform, having the screw plates J and the guide rollers *a* attached, and the shafts I, with the bosses R, mounted in a suitable frame, and arranged to operate substantially as herein described.

81,326.—JOHN ASHCROFT, New York, N. Y.—*Steam Safety Valve.*—August 25, 1868.—Steam has constant access to the face of the valve, from the

subadjacent chamber of the valve seat, which chamber communicates with the steam dome. As the valve opens, under excessive pressure, the steam escapes through its open body and through the spaces between the valve guides.

Claim.—1. The construction of the valve M, and its seat, F, with guides *m*, and openings I, as herein set forth.

2. The arrangement of the dome A, case B, and valve seat F, as herein set forth.

81,327.—CALVIN ATHERTON, Wales, Mich.—*Wagon Spring.*—August 25, 1868.—The elastic jacks project from bars which are secured to the rear axle and bolster, respectively.

Claim.—The arrangement of the semi-elliptic springs A and C, in connection with the jacks B and D, and the running gear of any wagon or carriage, substantially as herein set forth.

81,328.—ROBERT BARCLAY, Buffalo, N. Y.—*Sewing Machine.*—August 25, 1868.—The cam acts upon the lever, which actuates the upper arm which projects through a slot in the front plate of the machine, said arm having a spring bearing upon it. The arm constitutes the take-up, and the arm below operates as a yielding regulator to prevent the breaking of the thread by undue tension.

Claim.—The cam P and lever R, in combination with the spring arms S and V, constructed and arranged to operate as and for the purpose set forth.

81,329.—JOHN S. BARDEN, Providence, R. I.—*Mechanical Movement.*—August 25, 1868.—An external and internal gear are combined with a rotating cam or eccentric in such a manner that a rotary motion is imparted to one of the gears, while the other is held in such a way as to be allowed a limited oscillating movement.

Claim.—The combination of an external and an internal gear with an eccentric, substantially as set forth.

81,330.—CHARLES BEAN, East Douglass, Mass.—*Steam Generator.*—August 25, 1868.—The boiler is made up of a number of sections secured together, each section consisting of two outer upright tubes and a plurality of inner tubes, the whole cast in one piece, with apertures affording intercommunication throughout. Fire flues are secured within the tubes of the sections.

Claim.—The construction and combination of the section, formed of the tubes A B, and the flues D, with the apertures C, substantially as herein shown and described.

81,331.—GEORGE M. BEARDSLEY, Fenton, Mich.—*Belt Fastener.*—August 25, 1868; antedated August 7, 1868.—The pin which connects the interlocking edges of the plates has a series of notches or depressions which occur alternately at opposite sides of said hinge pin, and correspond with the loops or eyes of the interlocking parts, which latter are held engaged with the notches of the pin, so as to prevent the casual lateral displacement of said pin.

Claim.—The adjustable plates B, turning pin C, staple key E, to be fastened to belt A, all combined and arranged substantially as described and for the purpose set forth.

81,332.—PETER S. BEIDLER, South Easton, Pa.—*Sawing Machine.*—August 25, 1868.—Consists of an arrangement of devices capable of ready adjustment for sawing fellos of various sizes, and by which the feed may be automatically varied and stopped.

Claim.—1. The combination, with the adjustable carriage D, of the adjustable feeding apparatus, consisting of the trip-catch *h*, pendent bar *g*, weighted lever *f*, slotted bar *e*, connecting rod *c*, rock shaft *d*, feed shaft and pinion I, and swinging frame K, arranged as described for the purpose specified.

2. The combination, with the feeding shaft and pinion I, arranged upon the swinging frame, of the means for changing the feed, when arranged substantially as and for the purpose described.

81,333.—CORNELIUS BERNINGER, Mier, Ill., assignor to himself, WILLIAM FRIEND, and GEORGE

L. BAILEY, same place.—*Soil Pulverizer*.—August 25, 1868.—The teeth of the rotary cylinder break the clods upon the surface, while the harrow teeth operate at a greater depth to pulverize the soil.

Claim.—The harrow teeth *d* and toothed cylinder F, provided with the wheels G G, when said parts are applied or attached to a frame, E, suspended to a mounted frame, A, and all arranged substantially in the manner as and for the purpose set forth.

81,334.—HIRAM BROWN, Lowell, Mass.—*Excavator*.—August 25, 1868.—The excavator is made in two parts, each part in the form of a scoop, and opening at the bottom, the opening being effected by means of lips on the upper edge of each portion, engaging with the curved ends of hangers attached to girts, above which is a wheel bearing a chain that is connected with a shaft or with a yoke, attached to arms pivoted to the scoop.

Claim.—The scoops A B, with the lips *n*, in combination with the arms G and yoke E, when used in connection with the movable carriage, with hangers S and wheel P, ratchet 3 and pawl *d*, all constructed and arranged substantially as described, and for the purpose specified.

81,335.—GEORGE BUCKEL, Detroit, Mich.—*Plane*.—August 25, 1868.—The penetration of the plane bit may be regulated either by a rigid adjustment or by the pressure of the hand.

Claim.—A plane stock, constructed of the parts A and C, pivoted together, and provided with a spring, E, and set screw, F, substantially as and for the purpose set forth.

81,336.—GEORGE H. BUCKIUS, Canton, Ohio, assignor to himself, CORNELIUS AULTMAN, A. C. TONNER, and P. S. SOWERS, same place.—*Harness Saddle*.—August 25, 1868.—The inner portion of the crupper piece sets up against the inner top surface of the tree, while the bent portion extends around the flange of the tree, and holds the crupper loop up opposite the center of the tree flange.

Claim.—The crupper piece I, constructed as herein described, when used in combination with the tree A and water hook C, substantially as and for the purpose specified.

81,337.—A. L. BUTLER, Ripon, Wis.—*Farm Gate*.—August 25, 1868.—The gate is constructed in two sections of unequal length, the shorter section being hinged to the post, and the longer one being operated by means of a lever, through the medium of a system of bell cranks, levers, and rack gears.

Claim.—1. Making this gate into two sections, substantially as described, and the manner in which it folds.

2. The bar or lever J, extending from the gate to either one of the standards of the framework, this lever being pivoted at each end.

3. The whole of the device, comprising levers, bell cranks, latch, rack gear, and pinion, substantially as described and for the purposes specified.

81,338.—WILSON W. CAREY, Lowell, Mass., assignor to himself and GEORGE W. HARRIS, same place.—*Tool for Turning Moldings*.—August 25, 1868.—The block secures a precise adjustment of the cutter, and enables different cutters, in each tool, to be so adjusted that the moldings may be made to match the work previously finished.

Claim.—The adjustable cutter block *e*, when arranged as described, and for the purposes fully set forth.

81,339.—ELIJAH M. CARRINGTON, New York, N. Y.—*Self-cementing Band for Holding Bank Notes, Papers, &c.*—August 25, 1868.—Strips of paper or other material are provided with an adhesive coating at each end, so as to be united by simple pressure.

Claim.—The band herein described, as a new article of manufacture, having a body of paper, with the ends made adhesive by rubber cement, so as to serve in the manner and for the purposes herein set forth.

81,340.—JOHN S. CARSON, Brookhaven, Miss.—*Churn Dasher*.—August 25, 1868.—The dasher con-

sists of two thin, metallic cross-plates, the ends of which form wings of peculiar construction, and is attached to the lower extremity of the spindle. The pinion or bevel gear wheel, which operates the shaft gear, is attached to a hinged frame.

Claim.—1. A churn dasher, when composed of the plates A and C, and these plates constitute four wings, as herein described, when these wings are constructed and relatively placed with respect to each other, and are held together, and on the spindle of the churn, by the collar B, substantially as herein described, for the purpose set forth.

2. The above-described dasher, in combination with the hinged cross-table F, when the latter supports the shaft L and its appliances, as herein described, for the purpose set forth.

81,341.—JOHN S. CARSON, Brookhaven, Miss.—*Churn*.—August 25, 1868.—The four parts of each sectional helix are so arranged as to leave a narrow opening at the point where they overlap each other by curved extremities, so as to allow the milk to pass between them, and at the same time deflect the same in diverse directions.

Claim.—1. The sectional helix dasher A B, when the same is composed of the sections or parts 1 2 3 4, constructed and relatively arranged as described, for the purpose set forth.

2. The sectional helix dasher A B, when constructed as described, in combination with the pulley C, the driving wheel E, the band or cord F, and the crank H, the whole being arranged for conjoint operation, substantially as shown and described, for the purpose set forth.

81,342.—BENJAMIN F. CARTER, Manville, R. I.—*Let-off Mechanism for Loom*.—August 25, 1868.—Designed to provide means whereby the warp yarns shall be held rigidly against the action of the lay while beating up—which is essential in weaving heavy goods—and at the same time permit the tension of the yarn to effect the delivery of the same after the lay has beaten up the weft.

Claim.—1. The combination of the cam block *a* on the wheel B with the lever C, spring-actuated rod D, escapement lever Y, wheel *n*, and whip roll *b*, substantially as and for the purpose described.

2. The combination of the whip roll *b*, lever C, rod D, springs X and *j*, escapement lever Y, and wheel *n*, substantially as and for the purpose described.

3. In combination with the above, slide *g*, formed with a socket for the reception of the head of the set screw K, substantially as and for the purpose specified.

81,343.—RICHARD DOVER CHATTERTON, Bath, England.—*Snow Clearer*.—August 25, 1868.—The circumferential velocity of the bucket wheel being greater than that of the wheels of the carriage, the snow is raised and removed from the track faster than the car can be propelled. The shield and scrapers clear off any snow which the buckets may fail to raise.

Claim.—The combination of the wheel C, shield D, and spring scrapers E, arranged and operating substantially as described.

81,344.—AUGUSTUS D. CLARK, Wilkinsonville, Mass.—*Shuttle for Loom*.—August 25, 1868.—To introduce or remove a bobbin, the spindle is turned outward upon its fulcrum, and during this movement the pin meets an abutment, and then offers a positive resistance to the movement of the spring catch in the direction of the spindle's movement; the effect being to increase the distance between said spring catch and the spindle head, and permit the insertion or withdrawal of the bobbin head. A spring restores the parts to working position.

Claim.—1. The combination and arrangement of the pin *h*, plate *f*, and bent spring *g*, constructed substantially as herein described.

2. The bent spring *g*, formed as shown, for the purpose of actuating both the spindle head and the pin *h*, substantially as herein specified.

81,345.—ALONZO P. COOK, Collins Center, N. Y., assignor to himself and SYLVANUS B. COOK,

same place.—*Milk Can*.—August 25, 1868.—The bottom is composed of a circular plate having a downwardly-projecting flange, surrounded by a packing ring. Within the flange is a disk of wood acting as a follower; below which is an adjustable cross-bar, and through the latter passes a set screw for retaining the bottom in place.

Claim.—1. The removable bottom C, having a flange *c'*, in combination with the packing ring D, follower E, adjustable cross-bar F, and set screw H, all parts being constructed, arranged, and operating substantially as herein described.

2. Making the sides of a metallic receptacle for milk or other fluid beveled or flaring near its lower end, in combination with the removable bottom C, substantially as herein described.

81,346.—JOHN CRANDELL, Chicopee, Mass., assignor to LAMB KNITTING MACHINE MANUFACTURING COMPANY.—*Treadle Attachment for Sewing Machine*.—August 25, 1868; antedated August 17, 1868.—The lower or treadle end of the connecting rod forms a ball joint and the socket is composed of two parts hinged together at one end, and having a spring at the other end which passes the socket end of the cap upon the ball, so as to compensate for wear of the joint.

Claim.—A treadle attachment, consisting of the piece B and cap A hinged thereto, spring *d*, the socket formed in A and B, and the ball *m* formed upon the connecting rod C, or upon the crank G, the whole arranged and operating substantially as described.

81,347.—GEORGE CROMPTON, Worcester, Mass.—*Loom*.—August 25, 1868.—Relates to the jack mechanism of the class of fancy looms which have angular levers operating upon upright jacks to form the shed, and upon horizontal harness levers (to which the jacks are jointed) to return the jacks to their normal position for redistribution by the pattern chain or cylinder.

Claim.—1. In combination with the upright hooked jacks, the angular lifter, depresser, or evener lever or levers, connected to the actuating slide rod by means of the gear rack fixed to the slide rod, and the segment gear on the lever, substantially as described.

2. In combination with jacks and slide rods, a lever or levers adjustable in length by means of a sliding piece or pieces, substantially as shown and described.

81,348.—NATHAN R. DAVIS, Freetown, Mass.—*Attaching Gun Barrels to Stocks*.—August 25, 1868.—At the front end of the lock ease is a dovetailed socket to receive two notched tenons projecting from the breeches of the barrels, and in the lower part of the socket is a pivoted tongue having an inclined plane on its upper edge, against which a clamp screw presses to secure the tongue in place.

Claim.—1. The combination and arrangement of the tongue and clamp screw with the tenon socket of the stock or its lock ease, such being to operate with the tenon or tenons of the barrel or barrels, as specified.

2. The combination of the inclined plane with the tongue and the clamp screw, arranged with respect to and combined with the socket for receiving the tenon or tenons of the barrel or barrels, as described.

81,349.—B. F. DAY, East Freedom, Pa.—*Automatic Fly Brush*.—August 25, 1868.—This machine is for actuating pendent brushes, with a horizontal reciprocating motion, the motive power being furnished by a spring and train of wheel work.

Claim.—The rods *b*, carrying brushes *d*, when pivoted at one end eccentrically to the wheel *a*, which are adapted to be rotated automatically, said rods working in guides *g*, all substantially as herein shown and described, whereby both horizontal and vertical reciprocating motion is imparted to the brush carriers, as set forth.

81,350.—JOHN M. DEITZ, Berne, N. Y., assignor to himself, C. T. BUSH, and SANFORD &

SISSON.—*Brick Wall*.—August 25, 1868.—The wall is composed of layers of brick, inclosing a quantity of concrete, which latter is held in place, on the inner side, until set, by a guide board, sustained by stanchions and braces.

Claim.—In the construction of walls, composed of brick and concrete, the combination and arrangement of the bricks B B and H H, concrete C, stanchions P P P', braces *b b b*, cleats W W and *s*, and guide board D, substantially as and for the purposes herein set forth.

81,351.—GEORGE R. DOBBINS, Lowell, Mass.—*Boiler Flue Cleaner*.—August 25, 1868.—This device is connected to a steam pipe, and its larger cylindrical part is inserted in the flue to be cleaned out by blowing steam through the same. The spreader concentrates the steam upon the sides of the flue.

Claim.—The arrangement of the spreader *c*, flue end *c*, pipe *a*, flange *b*, and rib *d*, when constructed as herein set forth.

81,352.—OTIS EARL, Hermon, N. Y.—*Milking Stool*.—August 25, 1868.—The cow's tail is thus held to prevent her from switching or lashing with the same during the milking operation.

Claim.—The combination, with a milking stool, or a tail-clamping attachment, arranged to be actuated by the weight of the milker, substantially as and for the purpose described.

81,353.—GEORGE F. EVANS, Chelsea, Mass., assignor to himself and GEORGE P. RILEY, same place.—*Fanning Machine*.—August 25, 1868.—A strong watch spring furnishes the motive power to drive the mechanism which vibrates the lever to which the fan is attached.

Claim.—The fan D, operating as described, in combination with arm *h*, connecting rod *c*, pinion wheel *i*, crank pin *t*, large wheel K, pinion S, barrel wheel *m*, spring *d*, fan wheel W, thumb screw *b*, and crank *a*, for winding, all arranged and operating relatively to each other, substantially as described, and for the purpose set forth.

81,354.—CHARLES FAAS, North Attleboro, Mass.—*Watch-Chain Hook*.—August 25, 1868.—If the springs be pressed inward, so as to allow the band to be slidden upon the hook, the hook may be turned upon its swivel into a position admitting of the removal of the eye from the button hole.

Claim.—1. The eye A, in combination with the swiveling hook *a*, the sliding band *b*, and the springs *b' b'*, as and for the purpose set forth.

2. The divided link *c*, in combination with the band *b*, substantially as described.

81,355.—REUBEN FINK and JACOB B. HERSHOCK, Lancaster, Pa.—*Thill Coupling*.—August 25, 1868.—When the shafts are turned upward so as to be out of the way, the coiled spring causes the hinged piece to interlock with the slotted extension of the elip, and by this means the shafts are sustained in their elevated position.

Claim.—1. The combination of the hinged pieces A B, arranged and entering the slotted prolongation of the bed plate *c*, substantially in the manner and for the purpose specified.

2. In combination with the piece A, hinged at *a* to the notched piece B, the bed plate *c*, when prolonged and furnished with a slot, H, and coiled spring D, arranged and operating substantially in the manner and for the purpose described.

81,356.—JOHN FREY, Osnaburg, and JOHN M. EICHHOLTZ, Canton, Ohio.—*Sawing Machine*.—August 25, 1868.—The main frame of the machine, with the saw and its immediate connections, may be moved along the side of the log to be sawed without changing the position of the motive power.

Claim.—The driving shaft S T, composed of the tube S, with journal *s*, and shaft *t* T T', with collar *t'*, when used in combination with the driving pulley P of a sawing machine, said pulley being maintained in its relative position to the machine, by means of arms Y Y, the extended ends of which form the boxes of the driving pulley P, substantially as and for the purpose specified.

81,357.—JIM B. FULLER, Norwich, Conn.—*Machine for Drawing and Spinning Cotton.*—August 25, 1868.—The peculiar bearing enables the back top roller to be adjusted to suit the length of the fibers without changing the position of the stirrup, weights, or saddle. The "middle top roller" may be placed so close to the drawing rollers as to bear upon and straighten, the shortest fibers being drawn without holding or breaking the long ones.

Claim.—1. The bearing *d*, or its equivalent, constructed as described, so that by turning it in different positions the roller *D* may be adjusted to the length of cotton being drawn, substantially as and for the purpose specified.

2. The saddle, the back part of which is cut out, as described, so that in moving the back top roller forward or back the position of the saddle stirrup and weight or spring is not altered, substantially as and for the purpose set forth.

3. In a drawing or spinning frame, where two top rollers rest on only one bottom roller, and where the sliver is drawn partially around the said bottom roller, the middle top roller *C'*, constructed and operated as shown and described, in combination with the roller *D* and *C* and bearing *d*, substantially as and for the purpose specified.

4. The rollers *C C' D* and the bearing *d*, combined and arranged substantially as and for the purpose set forth.

5. The rollers *B', C, and D*, in combination with the saddle *a*, substantially as and for the purpose herein specified.

81,358.—ELI K. GARRETSON, Ottawa, Ill.—*Expanding Bottom for Beds, Seats, &c.*—August 25, 1868.—The weight upon the mattress or cushion devolves chiefly upon the central longitudinal bar, the perpendicular supports of which, resting on the bolts at the intersection of the cross legs, extend the legs and tighten the sacking.

Claim.—The construction of a cot, bed, or seat, with a flexible bar, *D*, in combination with legs *A B*, stretchers *C C*, supports *e e*, bolts *G G*, and friction rollers *i i*, the bottom of the cot being of canvas or other suitable materials, and secured by means of cords fastened to the edges, with rods *h h* and stretchers *C C*, substantially in the manner and for the purposes described.

81,359.—WILHELM AUGUST GENSH, New York, N. Y.—*Lamp Wick.*—August 25, 1868.—The animal fiber may be hare's hair or lamb's wool, and the vegetable fiber cotton, the two being united in a compact mass by a felting or pulling process. The immediate charring of the animal fiber on igniting the wick produces an incrustation which prevents the wick from expanding and thus secures a steady flame. The fiber, before felting, is treated with a solution of mercury, arsenic, copper and nitric acid. The felted material is steeped in a mixture of zinc, saltpeter, and analine, dissolved in sulphuric acid.

Claim.—The lamp wick composed of animal and vegetable fiber, and steeped in the composition composed of the ingredients herein set forth, in the manner and for the purpose specified.

81,360.—ISAAC H. GILDERSLEEVE, Whitewater, Wis.—*Base Burning Stove.*—August 25, 1868.—The grate is made in two parts with openings in its several arms and rings for air to pass through. The periphery of the grate is serrated to relieve the same when coal or clinkers get between the grate and bottom of the fire pot.

Claim.—1. A stove, consisting of base *A*, outer shell *B*, inner shell *C*, pot *K*, magazine *L*, grate *M*, and pipes *N N*, substantially as described.

2. Grate *M*, when made with air spaces for air to pass through, for the purpose of consuming the gases from the coal, and to keep the grate from burning out, substantially as described.

3. Grate *M*, with a serrated rim, substantially as described.

80,361.—F. D. GREEN, Williamsport, Pa., assignor to himself and GEORGE ZIMMER & Co., same place.—*Machine for Cutting Panels.*—August 25, 1868.—The cutting part of the teeth is inclined forward, and the cutting edge is made overhanging,

and on the outer edge is formed a tooth having a cutting edge on its outer end, so as to leave the edge of the raised part of the panels square and finished.

Claim.—The tooth or enter *B C*, constructed and operating substantially as herein shown and described, in connection with the cutter head *A*, as and for the purpose set forth.

81,362.—WILLIAM A. GREENE, Troy, N. Y.—*Heater Range.*—August 25, 1868.—The range is so constructed as to be used in warm weather without consuming more fuel than will suffice for cooking purposes, and produce no surplus heat, and also be used for heating and cooking when desirable.

Claim.—1. The removable contracting or dividing plate *H*, lined with fire brick or soapstone, and combined with the boiler-hole top plate *C*, fire box *G*, and exit flues *J E J E* therefrom, all in manner substantially as shown, and fully described hereinbefore, for the purposes specified.

2. The combination of the fire box *G*, boiler-hole top plate *C*, the dumping fire grate *Y*, the contracting plate *H*, and the stationary fire grate *X*, which forms a fixed support for the foot or bottom part of said plate *H*, all in manner substantially as shown and described herein, for the purposes specified.

3. In combination with a boiler hole *q*, of top plate *C*, the curve *c*, in the upper part of a removable contracting plate, constructed so as to fit or correspond with the said boiler hole, substantially as set forth herein.

4. The relative arrangement of the deflecting plates *I I*, in the boiler-hole flues *u u*, when employed in combination with the removable contracting plate *H*, with its curved recess *c*, boiler hole top plate *C*, fire box *G*, and flues *J J*, in manner substantially as herein set forth.

5. The deflecting cover plate *L*, when constructed with closed sides and open ends, and inclined so that there may be a greater current toward the front, and combined with the direct flue *F* and oven plate *M*, substantially as herein shown and described.

81,363.—CHARLES W. GRETER, Three Rivers, Mich.—*Coupling for Vehicles.*—August 25, 1868.—An arrangement of devices for accomplishing the abrupt or sharp turning of the front wheels of vehicles, without jointing the coupling or reach-pole of the same.

Claim.—1. A coupling device for vehicles, constructed and arranged substantially as described and for the purposes set forth.

2. The curved plate *m* with notch *i*, braces *j j* with curved slot *E* thereon, and cross-plate *l* with nib *g*, substantially as described, when constituting the prominent features of a vehicle coupling, all as set forth.

81,364.—WILLIAM C. GRISWOLD, Brooklyn, N. Y., AUGUSTUS PELISSE, Newark, N. J., and ALBERT H. HOOK, New York, N. Y.—*Machine for Blocking Hats.*—August 25, 1868.—The expansible block consists of two side pieces hinged to a cross-head attached to the upper end of a sliding hollow vertical rod. Surrounding a hole in the table are two annular plates, the lower one being stationary and the upper one hung on a swinging forked lever. From another forked lever is suspended a band ring having a lower sharp edge for stretching the side crown of the hat and breaking the band.

Claim.—1. An expansible block, in combination with the brim plates *b* and *b'*, constructed, arranged, and operating substantially as herein specified.

2. The combination of the band ring *r*, holding plates *b b'*, and expansible block, substantially as and for the purposes herein specified.

81,365.—JOHN S. HALL, Jeffersonville, Ind.—*Machine for Bending Wood.*—August 25, 1868.—The snath sticks are turned to the form and size required, and steamed, after which the straps are applied to them and they are bent to the mold by means of a rope, crank and levers, and a clamp, applied to the small end to hold it to the mold until it is dried or set.

Claim.—The flexible strap, provided with the sockets *C* and *D*, in combination with the mold or former *P*, constructed and arranged to operate as set forth.

81,366.—FRANCIS H. HAWKS, St. Louis, Mo.—*Attaching Soles to Boots and Shoes.*—August 25, 1868.—The screws being fully inserted, their heads rest upon the broad rim of the eyelet or washer, and the rubber or other water-proof material is thus prevented from closing over or imbedding the screw head.

Claim.—The new application and use of screws, together with washers or eyelets, as herein described, for the purpose of attaching water-proof half soles and heel taps to boots and shoes.

81,367.—WILLIAM B. HAYDEN, Columbus, Ohio.—*Wire Stretcher for Fence.*—August 25, 1868.—The lever is moved along from tooth to tooth of the lower series, and, finding a fulcrum upon each, it is vibrated so as to move the sliding pawl in the direction to stretch the wires.

Claim.—1. A hooked ratchet bar C, constructed with teeth *h l*, and a hook, *c*, in combination with a hooked sliding pawl, said parts being adapted to operate substantially in the manner and for the purposes described.

2. A hooked ratchet bar, C, and a hooked sliding pawl adapted for receiving a lever, G, for effecting the tightening and loosening of wire in fences and vine frames, substantially as described.

81,368.—JAMES L. HELMER, Rome, N. Y.—*Gate for Water Wheel.*—August 25, 1868.—A portion of the guide is hinged and has an arm at each end, the parts being so arranged that by moving the said portion to and fro, the width of the passage to the wheel may be enlarged or diminished at pleasure.

Claim.—The movable part C of the guide, in combination with the arms C² and C³.

81,369.—CHARLES E. HENDRICK, Chicopee, Mass.—*Feather Renovator.*—August 25, 1868.—Steam is introduced through one set of valves into annular valve chambers and passes through a conveyer provided with branches into the feathers; and by closing said valves and opening another set, the steam passes into a drier and dries the feathers.

Claim.—The annular chambers P P, in combination with the valves O O *m n*, and conveyer F, provided with branches *i i*, drier E, and feather box B, when constructed, arranged, and operated substantially in the manner shown and described, for the purpose set forth.

81,370.—JOSEPH E. HENDRICKS, Waterbury, Conn., assignor to BROWN AND BROTHERS.—*Lamp.*—August 25, 1868.—The base of the burner is formed with a series of radial spring leaves which bear against the internal surface of the chimney, and operate in connection with springs on the outside of the chimney.

Claim.—The sustaining and clasping springs *f*, adapted to support the base of the chimney below the base of the burner, in combination with the internal spring holder, formed on the rim of the base, the whole arranged to operate substantially as shown and described for the purposes set forth.

81,371.—CHARLES P. HOFFMAN, New Orleans, La.—*Combined Potato Planter and Cultivator.*—August 25, 1868.—This machine makes the ridges, carries the potatoes, cuts the potatoes into pieces, and drops the pieces at intervals into furrows or trenches which it makes in the tops of the ridges, the plantings being covered by the falling in of the sides of the trenches.

Claim.—1. The eccentric T, when provided with wire fingers or cups *d*, and otherwise constructed, as described, in combination with the box U and the feeding trough V, when these several parts are arranged and operate substantially as described for the purpose set forth.

2. The cutting box M, when provided with a knife, N, that is constructed and operates substantially as described for the purpose set forth.

3. The eccentric T, in combination with the trough V, the cutting box M, and the knife N, when these several parts are constructed and arranged with respect to each other, and operate substantially as herein described for the purpose set forth.

4. The eccentric T, the cutting box M, and the

knife N, in combination with the plows G G' G'' G''' and the planting "shoes" R, when these several parts are constructed, arranged, and conjointly operate substantially in the manner and for the purpose herein set forth.

5. The eccentric T, and its equivalent, when provided with the wire fingers *d*, in combination with the box *u*, when these parts are arranged for conjoint operation substantially as herein described.

81,372.—SAMUEL P. HOPKINS, Port Deposit, Md.—*Churn Dasher and Lid.*—August 25, 1868.—The dasher is formed of a series of wedge-shaped projections placed one above the other and alternating with spaces above and below. The cover is formed in two parts with a space between the two, to prevent the milk or cream from escaping over the churn.

Claim.—1. The star dasher, constructed and arranged substantially in the manner as herein described, for the purposes specified.

2. The double lid or covers D E, for dasher churns, when constructed in the manner herein described.

3. The combination of the star dasher and double cover, as and for the purposes set forth.

81,373.—FRANK A. HOWARD, Belfast, Me.—*Machine for Mitering.*—August 25, 1868.—The molding is moved transversely to the path of the cutters, in being placed in position to be acted upon thereby. The molding, when under the action of the cutters, is sustained by the notched rest plate, which permits the passage through it of the cutters at the maximum angle of inclination at which they may be adjusted. The joint is cut by successive movements, after each of which, the cutters and rest plate are simultaneously moved downward.

Claim.—1. The movable V-shaped cutters E, affixed to plates G, in combination with the notched rest plate I, operated in the manner described, for the purpose specified.

2. The cutters E E, affixed to plates G G, which are hinged together at H, and provided with rods, *n*, passing through arched slots, *m*, in the vertically adjustable holder U, whereby the said cutters are adjusted to the desired angle and there retained, substantially as described, for the purpose specified.

3. Adjusting the plate I and the cutters E E simultaneously, by means of the screw shaft Q *f*, nuts *e i*, shaft M, beveled gearing N O L W, substantially as herein described, for the purpose specified.

4. A V-shaped cutter, E E, when arranged to approach the wood to be mitered with a horizontal movement, and also provided with a vertical movement, substantially as shown and described, and for the purpose set forth.

81,374.—WILLIAM M. IRVINE, Montgomery, Ala., assignor to himself and ALFRED H. MOSES, of same place.—*Bale Fastening.*—August 25, 1868.—The end of the fastening plate is doubled over or thickened to afford a sufficient bearing for that end of the band which passes but once through the plate.

Claim.—Reinforcing one end of the plate B, and confining the ends of the strap or band, in the manner herein set forth and shown.

81,375.—GEORGE F. JOHNSON, Marshall, Iowa.—*Corn Sheller.*—August 25, 1868.—A rotating wheel having a central opening, is provided with a series of hooked shellers having gauges which press upon the cob, and provided also with radial stocks which slide in grooves in the rotating wheel, and surrounded by a spring which bears them toward the center of the rotary wheel.

Claim.—1. The radially-expanding shellers, provided with the curved plates *e e* and *e¹ e¹*, in combination with the wheel C and spring D, substantially as and for the purpose described.

2. The arrangement, with relation to the drawing rollers E E and shelling wheel C, having the toothed rim C¹ of the drive shaft S, main wheel F, pinion G, and connecting gearing, as herein shown and described, upon the frame A B B¹, for the purpose specified.

81,376.—L. A. JOHNSON, New York, N. Y.—*Guide for Scroll Saw.*—August 25, 1868.—The roller stiffens the saw and effectually holds the same to its

work, preventing it from springing backward, while the stuff is fed toward it, and also holding it against lateral movement.

Claim.—The grooved guide roller D, fitted in the pressure clamp A to receive the saw E, substantially in the manner as and for the purpose set forth.

81,377.—S. M. JOHNSON, Lockport, N. Y.—*Sad-Iron Heater.*—August 25, 1868.—An improvement on his patent dated December 10, 1867. A rod which passes through the pipe forming the axis of the heater, has a conical end fitting in a corresponding opening to form a valve, so as to be operated from the end outside. Vertical slots are made in the burner to allow of free admission of air to escaping vapor. Radial corrugations are formed on the inner surfaces of the smoothing irons in order to equalize the heat in the same.

Claim.—1. The valve *l m*, arranged with the burner F and hollow rod G, substantially in the manner and for the purpose set forth.

2. The burner F, consisting of the tube *x*, provided with slots *s s*, and radiating wire *o*, in combination with the vaporizing chamber *e*, arranged as and for the purpose specified.

3. The radial corrugations *u u*, arranged with the burner F, substantially as shown and described.

81,378.—JOSEPH L. JOYCE, New Haven, Conn.—*Button Boot.*—August 25, 1868.—The object is to prevent wrinkling at the upper instep and over the ankle.

Claim.—Cutting or dividing the fly at or near the ankle-joint line, substantially in the manner and for the purpose herein set forth.

81,379.—CARL KIHN, New York, N. Y.—*Treadle for Sewing Machine.*—August 25, 1868.—The foot-rest of the treadle is made of roughened glass held in a cast angle-iron frame to serve as a non-conductor of electricity. Spring clutches connect the frame to the shaft so as to allow it to move laterally if desired.

Claim.—The sewing machine treadle, composed of a plate, A, of roughened glass, supported in and elevated above the frame B, carrying a standard, D, or its equivalent, and the open clutches C, the whole being constructed, applied, and operating substantially in the manner and for the purpose set forth.

81,380.—JACOB KRITCH, Cleveland, Ohio.—*Die for Making Clevis Blanks.*—August 25, 1868.—The two-part dies are employed for forging or swaging the clevis, instead of doing the work by hand. One part of the die is fixed to the head of a trip hammer, while the other rests upon an anvil.

Claim.—The dies as herein described for the purpose set forth.

81,381.—JACOB KUNEMAN, Canton, Ohio.—*Joiners' Clamp.*—August 25, 1868.—The clamp is used in gluing up doors and other wide objects, and the purpose is to adapt it to fold into a small compass when not in use.

Claim.—A joiners' clamp, composed of a clamp-lever, A, with pawl *a*, ratchet bar B with ratchet teeth *b*, and clamping-head block F, and bar C D, with holes *c e*, connecting bolts *k k*, and clamping-head block E, when said ratchet bar B is pivoted to the lever A, between the bar C D and the ratchet *a*, and the whole clamp is so arranged as to fold up in the form shown, substantially as and for the purposes herein specified.

81,382.—F. D. LADENBERGER, Glenbeulah, Wis.—*Wagon Brake.*—August 25, 1868.—As the sway-bar iron is brought in contact with a roller hung under the reach, the said roller takes a portion of the draught strain, and the lengths of the slots in the cross-bar plate are so arranged that the draught strain will be proportionately distributed upon them all instead of being sustained by the king bolt.

Claim.—1. The combination, in a wagon brake, of the cross bar A, loose sway bar B, connected by any suitable rods *i i*, and kept back to the extent of their play by a spring *e*, of any suitable form or arrangement, with brake shoes, *j j*, suspended by stirrups or links, *k k*, connected with the axletree by rods,

h h, all arranged to operate as brakes by being connected with the double tree *m*, by the plates *a* and *b*, all substantially as shown and described.

2. The combination, in a wagon brake, of the concave iron *l* on the sway bar B with the friction roller *n*, the slotted plate *b*, slotted tongue, and double-tree bolt, all arranged to take the draft strain proportionately when the sway bar and cross bar are drawn forward to the extent of their forward movement, all substantially as herein shown and described.

81,383.—JOHN LEHMANN, Crown Point, Ind.—*Bridge Guard or Barrier.*—August 25, 1868.—A combination of racks, ratchet wheels and a pawl, so arranged that, with the opening of a drawbridge, a barrier is raised up to guard persons from accidents.

Claim.—The combination of cog segment A, ratchets B B, pinions C C, racks D D, pawl L, and catch levers P P', all arranged and operating substantially as herein set forth, for the purpose of operating a bridge barrier.

81,384.—WILLIAM J. LINTON, Detroit, Mich.—*Device for Locking Loose Pulleys.*—August 25, 1868.—The sleeve is screwed into a collar on a shaft or into a fast wheel, and the pin is pushed forward into a hole in a loose wheel running adjacent to the collar or fast wheel, to lock them together, or drawn back to allow the pulley to run loose, the said pin being locked in either position by the spring, and prevented from turning in the sleeve by the screw which passes through the slot and into the pin.

Claim.—The improved locking device herein described, consisting of the sleeve, sliding pin, stationary pin, spring, and stud, all arranged substantially as set forth.

81,385.—CHARLES S. LOCKWOOD, Newburg, N. Y.—*Derriek.*—August 25, 1868.—The weight, descending as the bucket ascends with its freight, assists the elevating power. The bucket descends of itself, having sufficient preponderance over the weight to raise the latter.

Claim.—The counter-weight to balance the bucket on a derriek, in the way as shown and described, and for the purpose as specified.

81,386.—WILLIAM C. LONG and HARVEY A. LOWNSBERRY, Lockport, N. Y.—*Filter.*—August 25, 1868.—The diaphragms give a zigzag course to the water in its passage through the filtering medium. The ribs serve to stiffen and stay the filter as it is handled by the pipe.

Claim.—The arrangement, in connection with the galvanized iron filter A, of the diaphragms *a b*, dividing the packing chamber, and the ribs *g g*, strengthening the water chamber, the whole operating in the manner and for the purpose specified.

81,387.—CHARLES LYNE, Padstow, England.—*Perambulator.*—August 25, 1868.—An arrangement whereby the front wheels may be controlled and guided.

Claim.—The arrangement of the axle A, cross piece C P, bolt *b*, plate P, rod R, guides G and G', and springs S and S', in the manner and for the purpose herein set forth and described.

81,388.—H. MARANVILLE, Akron, Ohio.—*Steelyard.*—August 25, 1868.—For ordinary use, the beam is suspended near the center by the loop or head in the upturned parts of which the beam is fitted so that it may slide, in order to bring the point of suspension of the beam nearer its end when the balance is to be adapted for weighing articles which are heavier than the ordinary maximum.

Claim.—The loop or head C, spring *b*, as arranged, in combination with the yokes G D and beam A, for the purpose and in the manner set forth.

81,389.—G. H. MCELEVEY, Newcastle, Pa.—*Fireplace.*—August 25, 1868.—The fuel is supplied with air at the back and ends, as well as at the front and under side of the grate. Air-heating chambers are employed in connection therewith, so as to more fully control and utilize the heat.

Claim.—1. The described arrangement of the air-

heating chambers G H I and their connecting flues, the supply flue P, the fire and smoke flue, J, and the exposed grate E, as herein described for the purpose specified.

2. The arrangement of the slide damper *m* and damper K with relation to the air-heating flues, G, H, and I, whereby the products of combustion are either directed to the flue J, between the chamber G, and fire grate, or over the chamber G, between the same and the chamber H, or over the chamber I, or over the chamber G, and downward around the chamber I, as herein described for the purpose specified.

81,390.—WILLIAM J. MCLEA, Leroy, N. Y., assignor to himself and FRANK LADD.—*Bail Ear for Pail.*—August 25, 1868.—Two tips are cut or stamped with the bail ear, the lower of which extends under the upper hoop of the vessel, or is bent inward through the side and turned up, (the latter being the case with tin vessels,) while the other tip is bent inward over the upper edge of the vessel. Rivets are thus dispensed with.

Claim.—Attaching bail cars to pails and other vessels by means of the tips *d d'*, in the manner set forth.

81,391.—THOMAS MCMULLIN, Osgood, Ind., assignor to himself and MILES MENDENHALL, same place.—*Coupling Belt.*—August 25, 1868.—To each end of the belt is attached a plate on which an eccentric roller is pivoted, having grooves formed in it immediately above prongs upon the plate, the end of the belt being clamped between the grooves and prongs when the roller is rotated.

Claim.—The combination of the eccentric rollers *a*, furnished with V-shaped grooves *b*, with the plates *A A'* and prongs *c*, when arranged and operating as and for the purpose set forth.

81,392.—W. S. MCNEIL and O. S. CADWELL, Jr., Springfield, Mass.—*Railroad Car Heater.*—August 25, 1868.—Air is purified, heated, and discharged into the car. There is no way of escape for the burning fuel in case of accident.

Claim.—1. The described arrangement of the case H, fire box A, combustion chamber D, hot air chambers E J, fire opening B, pipes K L *m*, perforated pipe F, screen *d*, water chamber *z*, air-purifying chamber X, and air supply tube and double funnel W P, as herein described for the purpose specified.

2. The hot air pipe L *n*, and the cap *o*, in combination with the perforated pipe F and hot air chambers J E, as herein described for the purpose specified.

3. The arrangement of the air-purifying chamber X, lined with absorbent material, and containing the curved deflectors, with relation to the water chamber *z*, air-supplying pipe W, and hot air chamber E, whereby the motion of the car splashes the water through the perforated bottom of the air chamber, and saturates the absorbent material for the collection of dust and cinders, as herein shown and described.

81,393.—DANIEL S. MERRITT, Mount Morris, Mich.—*Mechanical Movement.*—August 25, 1868.—Through the medium of these devices, each quarter revolution of the crank is made to impart a full stroke to the saw pitman.

Claim.—The combination and arrangement of the four levers D, the pitmen C and H, and the levers J, when attached to any suitable frame, A, and constructed and operating substantially as and for the purposes set forth.

81,394.—CHARLES H. MILLER, Buffalo, N. Y.—*Trace Buckle.*—August 25, 1868.—The cam presses the trace against the cross bars of the buckle, and securely holds the same; holes in the trace are dispensed with.

Claim.—The hinged pressure cam F, constructed and operating as specified.

81,395.—CHARLES H. MILLER, Buffalo, N. Y.—*Bridle Bit.*—August 25, 1868.—The guide levers enable the mouth piece to be actuated more forcibly than a bit having direct attachment to the reins.

The guide levers are cast in an amplified compass, so that by the subsequent permanent contraction of its sides, its appendages may be secured in position.

Claim.—The bar or mouth piece A, and slotted lever guides B, when constructed, and the latter cast distended, to permit the insertion of the bar A and tongue *m*, in the manner described.

81,396.—JOHN B. MITCHELL, Portland, Me., assignor to himself and PEREZ B. BURNHAM, same place.—*Hose Nozzle.*—August 25, 1868.—To attach the nozzle, the ring is turned off the end of the hose tube; the nozzle is then passed up through the ring, a partial rotation effecting the coupling of the two. The ring and nozzle being then turned into position over the tube, the nozzle is clamped to the tube by screwing down the collar connected to the pivotal extremities of the arms.

Claim.—1. A hose nozzle, having the adjustable tube B, ring A, arms *b*, and ring *i*, arranged to operate as and for the purpose described.

2. In combination with the above, the belt *d*, as and for the purposes set forth.

81,397.—LEONARD MONZERT, New York, N. Y.—*Car Coupling.*—August 25, 1868.—A ring fitted around the coupling box upon being turned serves to lock the jaws together, or to release them, to allow them to open, as desired.

Claim.—The pivoted ring C, arranged with relation to the jaws B B, provided with concentric depressions *d*, all operating as set forth, whereby the ring is swung back over the depressions, to permit the opening of the jaws, and swung forward to securely lock and hold them in place, as herein described and shown.

81,398.—HIRAM MOON and DEWITT C. TURNER, Red Creek, N. Y.—*Surplus Honey Box in Bee Hive.*—August 25, 1868; antedated August 21, 1868.—The inner adjustable case is provided with strings, by which it can be raised and held in an elevated position, when filled with honey, so as to provide additional space for more honey to be made below.

Claim.—1. The adjustable honey case C, when constructed as and for the purpose set forth.

2. The case C, in combination with adjustable box B and hive A, when constructed substantially as described.

81,399.—CHARLES A. MOORE, Westbrook, Conn.—*Knife and Fork Handle.*—August 25, 1868.—This mode admits of a variety of changes in form and effect. For example, the handle may be of ivory, associated with either pearl, metal, wood, or other material. Variety in respect to color, quality, and shape may also be embodied.

Claim.—The making of knife and fork handles in sections or pieces, substantially as herein specified, and for the objects set forth.

81,400.—M. P. NOEL, St. Cloud, Minn.—*Sawing Machine.*—August 25, 1868.—The invention consists in the arrangement of a sliding log-holding frame and means for communicating reciprocating motion to the saw by power applied to the driving shaft.

Claim.—1. The oscillating log-holding frame F, when pivoted to the oscillating saw-guide frame E, controlled by the lever *h* and hook *h'*, whereby the holding dogs *g* clamp the log upon each side of the saw-holding frame, and saw-guide frame, all constructed, arranged, and operating as herein shown and described.

2. The log frame B, operated in the transverse guides *a* by the lever C only, whereby the log is set to the saw by one movement of the lever, as herein set forth.

81,401.—DUDLEY L. PAGE, Lowell, Mass.—*Confection.*—August 25, 1868.—The maple syrup or maple sugar syrup being inspissated, kneaded, and indurated, is melted and molded and coated with chocolate to produce confections.

Claim.—A new and improved combination maple-chocolate cream, as herein described, using for that purpose the aforesaid ingredients or composition of matter, as a new article of confection, substantially as and for the purpose described.

81,402.—JOHN PEACE, Camden, N. J.—*Pipe Cutter.*—August 25, 1868.—The tube and its bushing are made to encircle the pipe, and the cutter is forced into the side of the pipe by turning the screw. The pipe is then severed by turning the instrument around upon it.

Claim.—The improved pipe cutter herein described, consisting of the threaded handle C, tubular holder B, having female screw therein, knife *g*, cylinders A and D, and set screw F, all constructed, arranged, and operating as described.

81,403.—THADDEUS PECK, Stratford, Conn.—*Trace Fastener.*—August 25, 1868.—The shank of the key is inserted in the recess in the whiffletree and turned partially round so as to be secured by the projections, and, when attached, is prevented from turning by a staple passing through notches in the shank of the key.

Claim.—The key C, whose shank is formed with projections *e*², when adapted to be fitted into recesses formed in the ends of the whiffletree, and prevented from turning therein by means of the staple D, passed transversely through said recess, and resting in notches formed in the sides of the shank *e*¹, all as herein shown and described, for the purpose specified.

81,404.—ELIJAH S. PIERCE, Hartford, Conn.—*Apparatus for Feeding Screw Blanks.*—August 25, 1868.—The roller, acted upon by the belt, shakes the feeding apparatus, to cause the screw blanks to pass from the hopper to the trough and thence onward.

Claim.—The combination of the roller C and belt D with the hopper and trough A B, when constructed and arranged substantially as herein described.

81,405.—BENJAMIN PORTER, Jackson, Mich., assignor to himself, JOHN GEORGE, THOMAS E. LUSK, ALFRED E. VANDERCOOK, and OSCAR VANDERCOOK, same place.—*Brick Mold Safety Guard.*—August 25, 1868.—The front faces of jack molds for brick machines are provided with proper doors and springs, to act as safety guards for the molds, so as to allow stones or other obstacles to pass out from the molds.

Claim.—The springs D, when provided with hinge joints H and braces E, which latter move in the recesses G of doors C, all operating and arranged substantially as described and for the purposes set forth.

81,406.—ANDREW J. POST, Hudson City, N. J.—*Bridge.*—August 25, 1868.—The strut is composed of four plates of rolled iron, united along the edges by flanges and rivets. The cast-iron end pieces are adapted to accommodate the diagonal braces or other parts to which the struts are to be bolted.

Claim.—In combination with a wrought-iron strut, the employment of end pieces of cast iron, fitted into and between the parts of the wrought iron, and receiving a through bolt through both the wrought and cast-iron parts, all substantially in the manner and for the purposes herein set forth.

81,407.—JOHN RICHARDS, Cincinnati, Ohio.—*Mortising Machine.*—August 25, 1868.—The screw which impels the chisel bar has reverse threads, and gearing and devices for operating said screw are employed in connection with a friction clutch actuated by the driving power. The graduated resistance of the weight which returns the chisel bar after the mortise is completed enables the operator to stop the chisel at any point of its downward stroke.

Claim.—1. The right-and-left threaded screw *m*, and fixed and movable nuts *k* and *l*, when used to operate the chisel bar of a mortising machine, as herein set forth and described.

2. The shaft *p* and bevel gears *n'* and *n*, when used in combination with the ram or carrier *a*, and as a means of rotating the reverse-threaded screw *m*, substantially as specified and shown.

3. The shaft *p* and bevel gears *n'* and *n*, for rotating the screw *m*, as specified and shown.

4. The belt *q* and pulley *r*, when used in combination with the ram or carrier *a*, and as a means of operating the reverse-threaded screw *m*, for feeding the chisel bar down, substantially as set forth and shown.

5. The friction clutch, consisting of the plate *o*, pulley *r*, in combination with the reverse-threaded screw *m* and carrier *a*, for producing a graduated feed of the chisel bar *h*, for the purposes and in the manner shown.

6. The weight *u* and belt *t*, when arranged to operate as a graduated resistance to the rotation of the screw *m*, and as a means of returning the chisel bar to its up stroke, arranged and operating as herein described.

7. The screw W, when formed with a compound or right-and-left-hand thread, and used as a means of adjusting the table bracket M, arranged and operating as set forth and specified.

81,408.—CHARLES H. RIGGS, Warwick, N. Y.—*Liquid Meter.*—August 25, 1868; antedated August 17, 1868.—The meter tank is filled and emptied by the action of siphons, and the influx of water through the receiving pipe is automatically controlled by floats, which are indirectly the means of opening and closing the inlet gate.

Claim.—1. An automatic liquid meter, having its receiving pipe C opened and closed by the buoyancy and weight of a float, I, the said float being controlled in its action by the floats G and H, and the whole in combination with the siphon F, all substantially as shown and described, and for the purpose set forth.

2. The receiving cistern D, substantially as shown and described, in combination with the meter tank B, floats I, G, and H, the siphons E and F, as and for the purpose set forth.

3. The springs *m* and *l*, or other equivalent device, substantially as shown and described, in combination with the float I, pins *e* and *n* and levers *k* and *g*, all as and for the purpose set forth.

4. The levers *q* and *b*, operated by the float I, substantially as shown and described, in combination with the gate *d*, pipe C, and tank B, and siphon E, all arranged as shown and described, and for the purpose set forth.

5. The ratchet *f* and pawl *u*, substantially as shown and described, or the equivalent thereof, for the purpose of operating the registering dial J of a meter, when in combination with the float I, rod *i*, meter tank B, and floats G and H, all as set forth.

6. The reservoir M, substantially as shown and described, in combination with the siphon F, floats I, G, and H, and meter tank B, as and for the purpose set forth.

81,409.—A. H. ROBBINS, Copenhagen, N. Y.—*Horse Rake.*—August 25, 1868.—The lever is attached to a carriage, whereon the attendant may ride, and from which a lever is made to act for raising the rake bodily from the ground. The rake may be readily detached from the carriage, when it is desired to manage it, in the ordinary way.

Claim.—1. The bars O O, attached to the handle shafts M M, and provided with oblong slots *g*, through which screws *h* pass into the shafts K K, for the purpose of admitting of the proper operation of the stop *e*, as set forth.

2. The connecting or suspending of the rake to the cart or sulky by means of the rods Q Q, arms R R, shaft S, and lever T, all arranged substantially in the manner as and for the purpose set forth.

81,410.—HENRY RODES, Clarence Centre, N. Y.—*Plaster Sower.*—August 25, 1868.—The loops on the rotating shaft act to stir up and prevent the packing of the plaster, and the raised edges arrest the plaster and cause it to be forced out of the hopper.

Claim.—1. The arrangement, in connection with the intermediate brush G, of the lifter E, provided with the spiral loops *e e* situated above, and the raised edges *h h* of the discharge openings, situated below said brush, the whole operating in the manner and for the purpose specified.

2. The hinged arm D with holding band *p* and elevating toggle *r*, and serving, with gear *b*, to give motion to the parts in the hopper, as set forth.

81,411.—FRANKLIN ROOT, Boston, Mass.—*Car Brake.*—August 25, 1868.—The lever brakes are made to clasp sheaves on the axles with their short

arms, the long arms being operated by pressure exerted by the driver. A sliding incline, connected with one of the brakes, is made to aid in starting the car, by being released from a forward position, to which it is carried when the brake is applied.

Claim.—1. The arrangement of the lever brakes B and C, pins *r* and *n*, and sheaves E, substantially as and for the purpose specified.

2. The combination of the sliding inclined plane D with lever brakes B and C, clasping sheaves upon an axle, when constructed substantially as described, and for the purpose specified.

3. The lever-clutch brakes C and B, with removable shoes, when each shoe clasps one-half the circumference of a sheave, in combination with sheaves having V-shaped grooves, into which the shoes fit, when constructed substantially as and for the purpose specified.

81,412.—SARAH RUTH, Philadelphia, Pa.—*Sun Shade for Horses.*—August 25, 1868.—The device consists of a canopy and articulated, adjustable supporting frames, whereby the animal may be shielded from either vertical or oblique rays of the sun in hot weather.

Claim.—The canopy A and the supporting frames B and C, the said parts being constructed, applied, and operated substantially as and for the purpose set forth and described.

81,413.—DAVID SATTLER, Mifflin, Ohio.—*Saw.*—August 25, 1868.—The several forms of teeth are so arranged as to cut out the sides of the cusp. plane out the center, and carry out from the same the sawdust not removed by the planing teeth.

Claim.—The peculiar arrangement and combination of the knife teeth D F, planing teeth B B, gauge tooth C, and clearing tooth E, on the saw blade A, when the several parts are constructed and arranged substantially as and for the purpose herein specified.

81,414.—S. W. Y. SCHIMONSKY, Cheyenne, Dak. Ter.—*Car Brake.*—August 25, 1868.—The shoes are attached to a sliding frame, and made to act as wedges when brought in contact with the wheels.

Claim.—The brake shoes G, rigidly attached to the frame D, sliding through the wheels E upon the guides F, and attached to the lever I, all operating as described, whereby the shoes G are alternately wedged upon each side of the wheel, between the same and the guide F, as the lever is operated in either direction, as herein shown and described.

81,415.—ALEXANDER SELKIRK, Albany, N. Y., assignor to JOHN GIBSON, Jr., same place.—*Hand Stamp.*—August 25, 1868.—The instrument is inked by applying the type end to an ink pad and is used after the manner of a mallet, striking the paper or letter with sufficient force to not only print the outer name, but cause the needle-pointed type to penetrate the paper, the latter result being insured by the momentum of the plunger.

Claim.—1. The loaded plunger B, with its slot *e*, set screw *d*, the dovetail or T-shaped terminus of the plunger B, in combination with the type blocks *h h*, with their recesses *s s*, or their equivalents, substantially for the purpose set forth and described.

2. The socket *b*, or its equivalent, and the handle *c*, in combination with the outer cylinder A, for the purposes set forth and described.

3. In combination, the cylinder A, with its printing-type end, the loaded plunger B, as described, the elastic spring *f*, the perforating type *h h*, handle socket *b*, or its equivalent, and the handle *c*, all in combination, substantially for the purpose set forth.

81,416.—W. A. SHARP and JOHN A. SHANNON, Tama City, Iowa.—*Horse-Collar Fastening.*—August 25, 1868.—The collar is severed at the part which rests under the neck of the horse, and the parts are joined and disjoined at this point by means of a dovetail fastening designed to facilitate putting on and taking off the collar.

Claim.—The described construction of the metallic sockets *d d*, secured to the ends B C of the

collar, and provided respectively with the longitudinally-beveled recess *c* and tenon *f*, arranged as described for the purpose specified.

81,417.—JEHYLEMAN SHAW, Bridgeport, Conn.—*Pump.*—August 25, 1868.—The power is applied to a pipe extending upward from one of the tubular piston rods. Cords and a pulley connect the piston rods and cause them to move simultaneously in opposite directions. Operates as a force pump.

Claim.—The two lifting pumps C^x C^x, fitted within the external case A, provided with a valve, C, at its bottom, and all constructed and arranged to operate in the manner substantially as and for the purpose herein set forth.

81,418.—PIUS LEE SHEPLER, Whitehouse, Ohio.—*Sawing Machine.*—August 25, 1868.—On either side of a spool placed upon a shaft, which is made to couple with the main shaft, is loosely sleeved a drum, each revolving independently of the other, and upon which the log rests so that the carriage can be drawn back without moving the log. A curved lever working in a slotted rest serves to elevate and depress the log.

Claim.—1. The combination of the drums M'', shaft G'', spool I'', chain J'', and carriage K'', all arranged to operate as herein described and shown.

2. The rest Z, when provided with a slot, B'', and operated by means of the curved and bent lever C'', all as and for the purpose described and shown.

81,419.—WILLIAM SHIELDS, Philadelphia, Pa.—*Die for Making Square-headed Bolts.*—August 25, 1868.—Designed as an improvement on his patent of Feb. 18, 1868. Combined with the three supporting walls and plunger is a bottom opening for preventing the "fin" from causing the bolt and heading plunger to bind in the final operation of the latter.

Claim.—The narrow ledge *e*, at the bottom of the die, in combination with the side walls thereof and the plunger, as and for the purpose herein described.

81,420.—M. M. SHUR, Delaware, Ohio.—*Device for Soldering Cans.*—August 25, 1868.—A series of expanding staves are combined with a hollow box, within which latter is a sliding staff, so that the staves can be inserted within a can and pressed against the interior. Spiral flanges, in connection with studs and operated by the handle, cause the staves to impinge more firmly against the can.

Claim.—1. The arms B, having slots *i*, and pivoted within the slots *d*, and the pins *a* fixed in the slots *b*, all constructed, arranged, and operating as and for the purpose set forth.

2. In combination with the staves A and arms B, bearing pins *l*, the eage slats *k*, as and for the purpose described.

3. In combination with the parts D C G, the collar H, when provided with inclined surfaces *m*, and the loose handle E, having pins *h*, all constructed and operating as and for the purpose specified.

81,421.—FRANZ G. SIEMERS, Winona, Minn.—*Meat Cutter.*—August 25, 1868.—The rotation of the chopping block presents a new part of the meat to each stroke of the knives. The chopping block is constructed with a view to prevent splitting and remedy shrinkage. For convenience in removing the meat from the chopping block, or in cleaning or repairing the same, the curb is adapted for ready detachment.

Claim.—1. The meat-cutting machine, consisting of the frame A B, with the tables C D, the reciprocating frame *h*, with the series of knives attached thereto, and the rotating chopping block K operated by the shaft G, the rock shaft *g*, and pawls *t* and *w*, all constructed and arranged to operate substantially as herein described.

2. The chopping block K, consisting of a series of pieces set endwise and bound together with a band *o* and set screws *p*, and provided with the removable curb M, constructed and arranged as herein described.

3. The arrangement of the tables C D, in combination with the meat-cutting apparatus, when constructed as herein set forth.

81,422.—PHILANDER SISSON, Brant, N. Y.—*Spring Bed Bottoms.*—August 25, 1868.—Between two parallel slats are placed short inclined slats acting as springs to support the upper slat.

Claim.—Supporting the slat A on the ends of the inclined spring levers B B, when arranged substantially in the manner and for the purpose set forth.

81,423.—AMOS SMITH, Vienna Cross Roads, Ohio.—*Harvester.*—August 25, 1868.—By an arrangement of bars which are connected with the shoe of the finger bar, the latter may be adjusted higher or lower as desired. To one of the said bars is furnished a lever by which the outer end of the finger bar may be raised.

Claim.—The arrangement of the bars K L, at the junction of which the cutter bar is pivoted, upon the outer end of the axle of the machine and the bearing of the pitman shaft respectively, when said bars are adjustable as described, and the bar K provided with the pivot *i*, of the lever O and the slotted standard P, for raising the outer end of the cutter bar, all constructed, arranged, and operating substantially as set forth.

81,424.—CHARLES A. SMITH, New York, N. Y.—*Lifting Jack.*—August 25, 1868.—The safety wheel, together with the band and lever, aid the pawl in holding the cog wheel stationary upon its axis, when the weight to be sustained by the rack bar is greater than usual.

Claim.—The combination of the lever H, ratchet wheel D, cogged wheel E, slide B, ratch bar C, with the safety wheel F, and brake or safety band *i*, all constructed as described, and operating substantially as and for the purposes herein set forth.

81,425.—F. SMITH and I. CARPENTER, Lancaster, Pa.—*Plane.*—August 25, 1868.—The guard rises with a gentle curve from the wedge; it prevents the shavings from catching upon the serew. The wedge is metal and serves, in conjunction with the clamping serews, as a substitute for the tightening wedges and tapered notches of the ordinary stocks.

Claim.—1. The adjustable cap, provided with the guard in front of the set screw *b*, substantially as and for the purpose described.

2. The set serews *a*² in the lugs *a*¹, arranged to clamp upon the adjustable wedge C, as herein shown and described, for the purpose specified.

81,426.—YOUNGS W. SMITH, Bristol, N. Y.—*Hop Vine Trellis.*—August 25, 1868.

Claim.—The improved hop trellis, formed of the elevated parallel supporting wires *a a* and standards A A, in combination with stakes B B, and diagonal net work of twine, alternating from row to row, and stake to stake, over the intermediate supporting wires *a a'*, arranged substantially as set forth.

81,427.—JAMES D. SOLES, Lynn Township, Ill.—*Bread Cutter.*—August 25, 1868.—The handle of a hinged cutter plays in a slotted arched frame; an adjustable guide is adapted to the size of the loaf, and a gauge determines the thickness of the slice to be cut.

Claim.—The combination of the arched standard A, its guide plate B, and flange *i*, and bed plate *m*, the gauge E, the guide F, the spring S, the lever and knife C and D, all as and for the purposes described.

81,428.—HENRY STANLEY, St. Johnsbury, Vt.—*Smut Machine.*—August 25, 1868.—The cases which surround the fans are curved in the form of scrolls, which are perforated at their sides, and into one of which the grain is admitted, and from which it is forced, by the blast of air around the scroll, to the mouth, into a spout communicating with the next fan chamber, and from thence to the mouth of the scroll, where it is subjected to the blast from another fan.

Claim.—The grain-cleaning machine, composed of one or a series of perforated scroll cases, surrounding one or more fans, the spouts E G, and the fan I, arranged substantially as and for the purpose described.

81,429.—JAMES H. STONE, Washington, D. C.—*Fan for Sewing Machine.*—August 25, 1868.

Claim.—Operating the rotary fan to a sewing ma-

chine directly from the driving shaft A, through the medium of the beveled gearing B F, as described, for the purpose specified.

81,430.—T. J. SULLIVAN, Albany, N. Y.—*Permutation Lock.*—August 25, 1868.—Attached to the disk containing the combination wheels are circular springs, each being provided with a detent pin for detaining the combination wheels at any desired point.

Claim.—The tumblers constructed as described, of the perforated annular plate *a*, grooved disk G, and divided annular spring *b*, having the pin *i*, all arranged and operated as described for the purpose specified.

81,431.—CHARLES D. SUTTON, Tarrytown, N. Y.—*Spring for Vehicles.*—August 25, 1868.—The cross springs are fitted at their centers by laying the leaves upside down upon a level surface, the leaves being laid and fitted alternately, first a leaf of one spring and then a leaf of the other. The leaves are brought together at the points where the fifth wheel rests. After the centers are fitted, the leaves are marked and numbered. They are then taken apart, turned right side up, and bent to the desired shape.

Claim.—An improved platform spring, formed by the combination of the cross springs C, constructed substantially as described, and forming a flat support for the fifth wheel, with the side springs B and shackles D, as and for the purpose set forth.

81,432.—ESAU TARRANT, Muskegon, Mich.—*Machine for Turning Logs in Saw Mills.*—August 25, 1868.—The toothed bar is pivoted to two sliding blocks, and so arranged as to enable it to move back and forth to adjust itself to the size of the log. The hoisting chain is so arranged as to force the upper end of the bar forward, causing the teeth to take firm hold of the log. A cam shaft is made to raise or lower the bridge-tree, to which the bearings of one end of the actuating shaft are attached, so as to bring the friction pulleys into or out of contact with each other.

Claim.—1. The toothed bar C, pivoted at its lower end between the blocks E, which are adapted to slide in vertical grooves formed in the posts D, whereby the said bar C is rendered vertically movable, and capable of adjustment to suit logs of different sizes, substantially as herein set forth and shown.

2. The combination with, and the arrangement with relation to, the bar C, of the cord or chain F, pulley G, shaft J, drum I, friction pulleys K L, and adjustable shaft M, all as set forth and shown.

3. The arrangement of the pivoted brake R, connection S, and pivoted bridge-tree O, (in which is formed the outer bearing for shaft M,) substantially as herein shown and described, whereby the pulley L is removed from contact with pulley K, and the brake brought into contact with the latter, and *vice versa*, simultaneously, as herein set forth.

4. The arrangement of the cam and shaft P Q and weighted arm T with relation to the connected brake and bridge-tree, to operate as and for the purpose described.

81,433.—EDWIN TAYLOR, Tecumseh, Mich.—*Steam Generator.*—August 25, 1868.—Inclosed within a fire box or furnace is a boiler connected with a counter-balance on a notched lever, so that when the boiler rises by the evaporation of its contents, the end of the lever will be depressed and cause the opening of a valve in a tank above to supply water to the boiler.

Claim.—The arrangement of the suspended counterbalanced boiler B within the fire box or chamber A, and the elevated tank or reservoir I, substantially as and for the purpose set forth.

81,434.—GEORGE THOMPSON, Nashua, N. H.—*Belt Saw.*—August 25, 1868.—The belt saw is steadied by a number of small adjustable pulleys, and runs upon a main pulley which is driven by a belt so arranged upon several other pulleys as to hug the main driving pulley for half its circumference, and transmit motion to it by friction.

Claim.—The arrangement, substantially as herein shown and described, of the pulleys *d*, each adjust-

able independently of the others, with relation to the pulley A and saw *a*, as set forth.

81,435.—THOMAS THOMPSON, Buffalo, N. Y.—*Shingle Bolt Machine.*—August 25, 1868.—The mechanism which supports and feeds the saw consists of a counterbalanced swinging frame, carrying the bolting saw, and a reversing friction apparatus, whereby the saw frame may be raised and lowered as required. A step lever, with a pivot arm extending through a stationary table, serves to present the different sides of the block to the action of the saw in dividing it into bolts.

Claim.—1. The arrangement of the rack bars H, pinions G', friction wheels I and J', and shifting rod and lever K K', with the counterbalanced swinging saw frame C, as a means of raising and lowering the same, as set forth.

2. The step lever M' and pivot arm M, in combination with the stationary table F, provided with a slit in one side for the passage of the saw, arranged and operating in the manner for the purpose described.

81,436.—THOMAS TOMPSON, JR., New York, N. Y.—*Fire Escape.*—August 25, 1868.—Designed for permanent attachment to the outer sides of buildings, and forming a convenient mode of escape in case of fire.

Claim.—The ladder D, constructed substantially as herein shown and described, that is to say, with two side bars at each side, to which the flanged ends of the broad steps are pivoted, in combination with the balcony B, permanently attached to the outer wall of the building, in the manner and for the purpose set forth.

81,437.—FRANZ VESTER, Newark, N. J.—*Burial Case.*—August 25, 1868.—A means of deliverance from interment for resuscitated persons.

Claim.—1. The application of the tube C and ladder H to a burial case or coffin, substantially as and for the purposes described and set forth.

2. In combination with the tube C and ladder H, the cord K and bell I, for the purposes substantially as set forth and described.

81,438.—ADOLPH WAGNER, New York, N. Y. assignor to SAMUEL BEINSTEIN, same place.—*Loom for Circular Weaving.*—August 25, 1868.—A circular machine for weaving petticoats and hoop skirts. The fabric is woven around a block suspended between the warp carriers and the track of the shuttles, said block being movable vertically and laterally, in order that it may be adjusted centrally. The shuttles move on a circular, or other endless track, and deposit their wool threads alternately above and below a warp thread around the block. The warp carriers receive an alternate vertical reciprocating motion from a cam on a revolving drum, from which the shuttles also derive their motion.

Claim.—1. A circular weaving machine, in which the core or block H is vertically as well as horizontally adjustable, substantially as described, so that tubular, as well as irregular-shaped, fabric may be produced, as set forth.

2. The device herein shown and described, for imparting reciprocating motion, in opposite directions, to the two sets of carriers, E or E', which compose a group, said device consisting of the pin *p*, cam on the drum B, and pinion *m*, in combination with the toothed carrier stems, substantially as and for the purpose herein shown and described.

3. The carriers E' E', when arranged in combination with the upright bars I I and sliding blocks *o o*, the bars I I being divided in the middle, as set forth, to allow the passage of the wool threads, as specified.

4. The carriers E E, when provided with diverging horizontal arms, substantially as set forth, for the purpose of distributing the warp threads, and of allowing the grouping of the carriers between the pinions *e e*, as herein described.

5. The carriers E or E', when arranged and operating as described, the shuttles L L, when made as described, and the up-and-down as well as horizontally adjustable block H, all in combination with each other and with the rotary drum B, and all made

and operating substantially as herein shown and described.

6. The sliding pins *p*, in combination with the carrier stems, substantially as and for the purpose shown and described.

81,439.—P. H. WAIT, Sandy Hill, N. Y.—*Curb for Water Wheel.*—August 25, 1868.—Water wheels of this class are secured on a vertical shaft, and rotate in a horizontal plane at the lower end of a cylindrical case, under chutes or water guides. By means of this curb, the water may be admitted into the case at either side by reversing the gate and curb, and a right or left hand wheel may thus be obtained at will.

Claim.—1. The portion F of the curb, constructed as described, of the top and bottom plates *g g'*, the latter provided with a pendent flange, *h*, forming a portion of the case A, the side and end bars *i j*, adapted to receive the gate D and door G, all arranged as described, for the purpose specified.

2. The curved gate D, constructed as described, with a flange, *f*, adapted to work against the vertical central bar *d* in the frame E, said frame being provided with the ledges *c c*, out of line with each other, as herein described, for the purpose specified.

81,440.—DANIEL F. WALLACE, Ripley, Ohio.—*Quilting Frame.*—August 25, 1868.—Movable posts, which hold the rollers, are set in base pieces or rests, and are held in position by rods, so that the rollers can be moved toward or away from each other.

Claim.—A quilting frame, constructed with rests D D, movable posts *a a a a*, rollers A B, braces E E, and nuts *b b b b*, as combined and arranged for the use and purpose as specified and herein set forth.

81,441.—ELISHA WATERS, Troy, N. Y.—*Vessel for Holding Petroleum and other Liquids.*—August 25, 1868.—It is proposed to coat, size, or cement the continuous inner surface of the vessel, or permeate the whole fiber of the paper with any varnish or substance insoluble in and suited to resist the action and prevent the leakage of the liquid the vessel is to contain.

Claim.—1. A closed cylindrical tank-like or barrel-shaped vessel, formed essentially or mainly from paper pulp, paper in sheets, or paper or straw board, of any suitable quality, and supported internally by disks or hoops at the ends, or an extended wooden shell, substantially as described herein.

2. A closed cylindrical tank-like or barrel-shaped vessel, formed essentially or mainly from paper pulp, paper in sheets, or paper or straw board, with or without internal end hoops, or an inner wooden shell, substantially as described, in combination with an exterior protecting case formed of wooden staves and heading, and fitted or secured to the paper vessel, substantially as set forth, so that the paper vessel shall not turn within the wooden case, and yet shall be free or separable therefrom along the joints of the staves.

81,442.—W. B. WEAVER, Reading Centre, N. Y.—*Saw Set.*—August 25, 1868.—To one side of the bar that bears the stationary jaw is attached an adjustable plate, formed with a grooved projection, in which groove is a strip of leather. The said projection serves as a gauge for setting fine or coarse saw teeth.

Claim.—The combination of the leather packing *l* and adjustable plate E with the jaws *f* and *f'*, as herein described, for the purpose specified.

81,443.—WILLIAM WEILD, Manchester, England, assignor to ELIAS S. HIGGINS, New York, N. Y.—*Mechanism for Operating Pile Wires in Looms.*—August 25, 1868.—Relates to mechanism for actuating the wires in that class of looms for weaving pile fabrics where the terry loop forming the pile is obtained by inserting wires in a shed formed between the body warp and pile warp, which wires are woven in the fabric to be again withdrawn in succession when a sufficient number of wires have been woven in the fabric to secure the loops or woven pile against the strain produced in the process of weaving.

Claim.—1. Wire motions, where the head of the wire only is guided during its insertion and withdrawal,

and the point is supported and transferred from the point of withdrawal to the point of insertion by a trough or bar *d*, oscillating on a fulcrum or joint, substantially as hereinbefore described.

2. The combination of wires, with heads of the shape shown in Figs. 4 and 4a, with an oscillating grooved trough *d*, substantially as hereinbefore described.

3. The spring pieces *d*³, or their equivalents, in combination with the oscillating grooved trough *d*, substantially in the manner described.

4. The slide *b*, provided with a projection *b*³, for pushing directly against the head of the wire, when combined with an oscillating trough, substantially as hereinbefore described.

5. The combination and arrangement of the mechanism of the wire motion shown by Figs. 1, 2, 3, 4, and 4a, and hereinbefore described.

81,444.—DANIEL S. WEISE, Breeknock Township, assignor to himself, JACOB H. BINGAMAN, and JOSEPH W. GOSHERT, Durlock, Pa.—*Railroad Gate*.—August 25, 1868.—A rocker shaft is so connected with a short rail placed adjacent to one of the rails of the track, as to be actuated by the tread of the car wheel, and cause the elevation of a gate to a vertical position, through the medium of a crank arm, connecting rod and bracket.

Claim.—The combined arrangement of my notched rocker T, adjoining the rail, pivoted bars L, rocker shaft B, and lever *t*; also the crank arm *c*, connecting rod D, stirrup bracket E, and gate F G H, all arranged and operated substantially in the manner and for the purpose specified.

81,445.—C. N. WHITE, Batesville, Miss., assignor to himself, W. S. HARRIS, and T. P. ROLAND, same place.—*Churn*.—August 25, 1868.—Means are provided for readily dismounting the churn from its pivotal supports. The "dasher" is made up of wings, extending from end to end as well as from side to side of the churn. The churn is turned around upon its pivots by handles fixed to its sides, and the wings and churn move simultaneously in the same direction.

Claim.—1. The combination of the dasher plates E, block F, plate G, and cover H, with each other, and with the churn body D, said parts being constructed and arranged substantially as herein shown and described and for the purpose set forth.

2. In combination with the above, and with the frame A B C, the fixed center *j* and crank screw L, all arranged and operating substantially as and for the purpose set forth.

81,446.—SAMUEL R. WHITLOW, Rosefield, Ill.—*Cough Mixture*.—August 25, 1868.—Composed of bayberry bark, Solomon seed root, sarsaparilla, Seneca snake root, red bark, (Peruvian,) black cherry bark, prickly-ash bark, spikenard root, maidenhair root, blackberry root, oil of wintergreen, pine tar, skunk cabbage, lobelia, ginseng root, comfrey root, elecampane root, hoarhound leaves, wafer-ash bark, white sugar, and water. When boiled down, Jamaica rum is added.

Claim.—The compound cough mixture, prepared and compounded, and to be used substantially as described.

81,447.—HENRY C. WILDER, Ashby, Mass.—*Bail-making Machine*.—August 25, 1868; antedated August 13, 1868.—The wire is drawn from a reel, guided through the bail wood, (the latter being held, in the meantime, by the spring supports,) gauged and cut off in proper length to form the bail, then bent to the curve of a bail and hooked at the ends.

Claim.—1. The spring supports R R so arranged with formers V V' and vibrating arms X X', or their equivalents, as to receive the pressure of the wire at the ends of the bail wood, while being bent, as described, and for the purpose specified.

2. The vibrating shaft J, the lever *g*, and the hardened steel die F, with the guide thereto, combined and operating as described, and for the purpose set forth.

3. The opening tunnel H, so arranged with other necessary parts as to guide the bail wire through the bail wood, in combination with the stationary slotted

tunnel S, constructed substantially as described, and for the purpose set forth.

4. The arrangement and combination of the bent lever B with the pivot *v*, the spring *x*, the spring top C, the incline *t*, the adjustable gauge *a*, and the set screw *b*, constructed and operating substantially as described, and for the purpose set forth.

5. The arrangement and combination of the spur-gears P P', the washer and screw *n n'*, the connections A A, the catch *r*, the spring W, and the ratchet wheel Q, constructed and operating substantially as and for the purpose set forth.

6. The arrangement and combination of the shaft D D, the gears *m n*, the pins *j j*, or their equivalent, with the lever *g*, and vibrating shaft J, operating substantially as and for the purpose set forth.

7. The arrangement and combination of the lever *g*, the spring *p*, the arms *c i*, the spring *h*, the shaft J, and the spring W, operating substantially as and for the purpose set forth.

8. The arrangement and combination of the adjustable cutter plate D, the hardened steel ring G, the hardened steel cutter *d*, the lever C C, the pin E, and the spring K, operating substantially as and for the purpose set forth.

9. The arrangement and combination of the crank *z*, the grooved rolls O O', the pivoted lever Z, or its equivalent, and the adjusting screw L, operating substantially as and for the purpose set forth.

10. The plate having thereon the guide *y*, and the incline *s*, in combination with the vibrating shaft J, having the steel die F thereon, operating as and for the purpose set forth.

11. The construction, combination, and arrangement of all the parts, substantially as described, and for the purpose specified.

81,448.—MILES D. WILLIAMS, Lawton, Mich.—*Grain Separator*.—August 25, 1868.—The upper screens, instead of being confined to a certain position by supporting grooves, are provided with jaws upon their upper inner corners that engage with the shoe, while the outer ends may be inclined to any desired degree, and held by tightening the sides of the screen case against them, by means of the bolt and nut.

Claim.—1. The upper screens L, provided with the jaws M, in connection with the shoe B, screen case A, bolt C, and nut D, operating in the manner described and for the purposes specified.

2. The combination of the above-named parts with the grain separator, constructed and arranged substantially as and for the purposes set forth.

81,449.—THOMAS WILSON, Garton, England.—*Lubricating Hubs and Axles*.—August 25, 1868.—A cam nut attached to the axle serves to operate valves, through which oil passes from a proper receptacle to conductors, and thence through spiral grooves upon the whole length of the bearing.

Claim.—1. The cam nut *v*, when arranged to operate substantially as described and set forth.

2. The oil receptacle *j*, in combination with the conductors *n n*, substantially as and for the purpose described.

3. The pistons *l l*, with their valves *m m*, when operated upon by a cam nut *v*, substantially as herein described and set forth.

4. The sand guard *g* and waste box *t*, in combination with the box *c* and bearing *p*, when arranged substantially as described and set forth.

5. The arrangement and combination of the oil receiver *j*, pistons *l l*, with valves *m m*, conductors *n n*, box *c*, with its nuts *d* and *c*, bearing *p*, with spiral groove *q*, waste box *t*, sand guard *g*, shell *f* and *f'*, and hub *a*, all when arranged substantially as described and for the purposes fully set forth.

81,450.—ALOIS WIRSCHING, Brooklyn, N. Y., assignor to himself and ALBERT WILD, same place.—*Watchmakers' Drill*.—August 25, 1868.—By pulling the string a rapid rotary motion is imparted to the drill shaft, and the spring is wound up or contracted; upon relieving the tension upon the string, the spring rotates the drill shaft in a reverse direction and winds the string upon the drum for a continuance of the operation.

Claim.—The drill shaft B, fitted within the tube A,

in connection with the spring E, arranged or applied, as shown, or in an equivalent way, and the string F attached to a drum or pulley on the drill shaft, all constructed to operate in the manner substantially as and for the purpose set forth.

81,451.—JOHN WOOD, Franklin, Pa.—*Pump Piston*.—August 25, 1868.—The packing is kept tight by the pressure of the water inside the same. The ribs constitute the cage of the valve and permit the water to pass upward as the piston descends.

Claim.—The movable sections A B C, the packing P, the ball valve V, and ribs e, arranged as herein described, for the purpose specified.

81,452.—EDMUND YEISER, Sheridan, Pa.—*Fifth Wheel for Carriages*.—August 25, 1868.—The fifth wheel or perch plate bears against curved guides secured to the axle, so that the tongue can be readily turned in either direction around the connecting pin, for conveniently changing the line of draught.

Claim.—The perch plate B, as constructed, in combination with pin g, guides C C, axle D, bar A', and supports H H, arranged substantially as set forth.

81,453.—CHARLES H. YOUNG, River Point, R. I.—*Let-off Mechanism for Looms*.—August 25, 1868.—When an extra strain is put upon the web by reason of the shuttles getting caught in the shed, the device allows such an extra amount of warp to be drawn off, by the action of the lathe, as may be necessary to prevent damage to the web by the shuttle.

Claim.—The combination of the wheel D with the escapement J, arranged so that the projections o o on the arms shall move clear of the projections r r on the wheel D, when any extra strain is thrown upon the warp, substantially as herein described and for the purpose set forth.

81,454.—LEVI O. ALLEN, Gardiner, Me.—*Caster for Sewing Machine*.—August 25, 1868.—Casters are placed upon the ends of adjustable legs pivoted to the table frame so that their slotted inner ends cross each other and form a lap over the treadle shaft. The device is operated by a foot lever.

Claim.—The arrangement of the pivoted legs A A with slots c and c, in combination with the link F, slotted clutch G, and lever D, substantially in the manner as herein shown and for the purpose specified.

81,455.—THOMAS ALSOP, Elkhart, Ill.—*Governor for Steam Engine*.—August 25, 1868.—The arrangement of the parts, and the consequent operation, are such that if the belt slips or an accident happens to the machinery, the governor will cut off the steam and stop the engine, in addition to performing its functions as a steam regulator at other times.

Claim.—1. The arrangement of the independent rod J, resting upon the rod or stem b, and having its upper end held against the rod I by means of a lever, L, or its equivalent, whereby the ingress of steam is controlled or arrested, substantially as herein set forth.

2. The combination of the parts C C', clutch m n and rods I and J, substantially as described.

3. The weighted lever L, or its equivalent, in combination with the valve stem b and steam governor apparatus, in such a way that, when the motion of the belt shaft is retarded, as compared with that of the governor balls, the weight will be dropped, and the cut-off valve thereby closed, substantially as described.

81,456.—THOMAS ALSOP, Elkhart City, Ill.—*Mode of Attaching Springs to Mill Spindle*.—August 25, 1868.—The object is to prevent the jar or backlash generally incident to the operation of mill-gearing. The pinion being moved in the proper direction, communicates motion to the spindle through the spring, the elasticity of which serves to equalize the motion. The pinion may be readily disconnected from its driving wheel by raising it, together with the spring and sleeve, upon the spindle.

Claim.—The combination of case E, pinion D, shaft A, and spring m, with its outer end attached to the case E, and the inner end attached to the

spindle by the sleeve e, arranged substantially as described, and for the purpose specified.

81,457.—ROBERT ANDREWS, Milwaukee, Wis.—*Boots and Shoes*.—August 25, 1868; antedated August 7, 1868.

Claim.—The method of making boots and shoes water-proof, by putting the hair side or grained surfaces of two pieces of leather together, and putting between them some lubricating material, to prevent abrasion and injury from attrition, as herein described, using for the purpose of lubrication any material composed by me, or any oily substance which will produce the intended effect, and using any and all kinds of leather which may be used to make boots and shoes made of any and all kinds of skins.

81,458.—DANIEL BACON, Brewersville, Ind.—*Corn Sheller*.—August 25, 1868.—Attached to the upper ends of upwardly inclined springs are four teeth which receive the end of an ear of corn. The ear is pressed downward between the teeth by a follower attached to a lever by which the corn is shelled from the ear.

Claim.—The lever f, plunger d, teeth b b, springs a a, and platform A, constructed and operated substantially as shown and described for the purposes set forth.

81,459.—A. R. BAILEY, Elmore Vt.—*Butter Tub*.—August 25, 1868.—The object of the interior cover is to press the brine and salt close upon the butter, preventing the butter from working and becoming rancid.

Claim.—In combination with a butter tub, having the usual cover, and provided with angular grooves b b, on the inner side, near the top, the additional interior cover B, having journals a a, for fitting into the grooves b b, as and for the purposes specified.

81,460.—ALEXANDER R. BALL and WILLIAM M. PHELPS, Marshall, Mich.—*Wash Boiler*.—August 25, 1868.—As soon as ebullition commences, the water below the false bottom rises through the opening at the highest part of the incline, and, permeating the immersed clothes, is drawn rapidly through the same to the space at the lowest part of the incline, through which it is returned to supply the displacement at the opposite end. When the inclination of the false bottom is reversed, the direction of the boiling current is reversed also.

Claim.—1. The inclined false bottom, B, in combination with a wash boiler, substantially as and for the purpose specified.

2. Providing said inclined false bottom B, with side flanges C, or other equivalent means for reversing its incline, when employed in combination with a wash boiler, substantially in the manner and for the use set forth.

81,461.—THOMAS BARDON, Brooklyn, N. Y.—*Engravers' Plate*.—August 25, 1868.—The lines are produced by cutting the soft-coating metal down to the surface of the plate, and the softer metal is cut with ease without spreading under the tool or breaking off.

Claim.—An engraving surface, formed of type metal, or its equivalent, fused upon the surface of a harder metallic plate, such as brass or steel, for the purposes and substantially as set forth.

81,462.—ALBERT B. BEAUMONT, Austerlitz, Mich.—*Steam Machine for Extracting Stumps*.—August 25, 1868.—The wire ropes and tackle are connected to suitable fastenings about the stump, whereupon steam is applied and the stump drawn out.

Claim.—1. The combination and arrangement, with the derrick A A, mounted upon wheels B B, of the steam-engine D E g, with stack l and the reservoir Z, the whole being in portable form, whereby the machine may be moved over a stump, and the steam applied for extracting it, as herein set forth.

2. The combination and arrangement of the connecting rods I I, jointed arms J J, pawls h h, with the ratchet wheel i, whereby the forward turning of the ratchet is produced at both strokes, in the manner and for the purpose specified.

3. The combination, with the pawls *h h*, of the cam plate *y*, having cams *j j*, rods *K K*, and lever *L*, for throwing said pawls out of gear, as herein set forth.

4. The arrangement of the wire ropes *s s*, passing through slots *t t*, and retained by a rod passing through the loops, as set forth.

5. The arrangement of the brake *Q*, connecting cord or rod *R*, and lever *S*, with the brake wheel *P*, as herein described.

6. The combination and arrangement, with the wheels *B B*, of the swing or sustaining bars *C C* and the rope or chains *c c*, pulleys *a b*, and holding devices *z z*, as herein set forth.

7. The arrangement, as a whole, consisting of the derrick *A*, steam-engine *D E g*, connecting rods *I I*, arms *J J* with pawls *h*, ratchet wheel *i*, roller *N* with wire cords or chains *s s s*, and adjusting wheels *B B*, all as herein set forth.

81,463.—JACOB BECHTEL, Roxbury, Pa.—*Boot Tree and Stretcher*.—August 25, 1868.—The screw being turned and consequently depressed by means of a crank, actuates the blocks which serve as levers to force the parts of the tree asunder.

Claim.—1. A boot tree, when made in two parts, one of which is provided with blocks and rollers worked by a screw, for the purpose of pressing them outward, substantially as and for the purposes herein set forth.

2. The last *C*, constructed as described, in two parts, adjusted by screws, and provided with a tongue fitting into a slot on the lower end of the front part of the boot tree, substantially as and for the purposes herein set forth.

81,464.—ALMA BEDFORD, Coldwater, Mich.—*Tool for Cutting Holes in Cloth or Leather for Buckle Tongues*.—August 25, 1868.—A loek plate is pivoted by its shank within the jaw of the punch and is operated by a key-like handle so that it may be made to hold and release different cutting tools. The folded end of the strap is operated upon by the cutter, and an oblong opening is formed thereby.

Claim.—A tool for cutting holes in leather or cloth, to receive buckle tongues, consisting of the cutting tool *J* and locking device *G*, constructed and arranged to operate substantially as herein described.

81,465.—ALMA BEDFORD, Coldwater, Mich.—*Rotary Punch*.—August 25, 1868.—The tubular cutters differ in size, and either of them may be readily brought into requisition. It is designed to protract the dulling of the cutters, by substituting a wooden bed for the ordinary metallic one.

Claim.—A rotary punch, having attached to its upper jaw *E*, by means of a set screw *B*, an adjustable plate, *A*, rotating parallel with it, provided with a series of punches *C*, and having its lower jaw *F* provided with a removable wooden or other bed *D*, all constructed and arranged substantially as herein described.

81,466.—CHARLES BENEDICT and O. R. FYLER, Wolcottville, Conn.—*Guide for Sewing Machine*.—August 25, 1868.—The gauge is formed at one end with a curved guiding edge or face having a groove in or through which the edge of the cloth passes. A flange above the groove retains the edge of the cloth in the groove.

Claim.—The gauge, constructed with a curved groove and flanged face, substantially as herein described.

81,467.—JACOB BERNHEISEL, Sr., Green Park, Pa.—*Lever Jack*.—August 25, 1868.—The slide, actuated by the spring, engages the teeth of the rack, to maintain the position of the same while the lever is undergoing its ineffective vibration.

Claim.—The coiled spring *H*, the slide *K*, and the curved oval slot *D*, in which the pivot *G* of the lever *C* works, when arranged, constructed, and operating as herein described and for the purpose set forth.

81,468.—GEORGE R. BLANCHARD, Baltimore, Md.—*Railway Stock Car*.—August 25, 1868.—The deck consists of two sections, hinged, respectively, to the opposite sides of the car. When raised into

a horizontal position, they meet at the center, and are sustained by a beam or beams inserted in sockets beneath, to form a platform.

Claim.—1. A car, for the transportation of animals and other kinds of freight on railroads, convertible from a double to a single deck or platform car, and *vice versa*, by means of a swinging or dropping deck or platform attached to the sides of said car, substantially as shown and described.

2. The removable section *D*², which occupies the central position between the sections *A*¹ *A*² *A*¹ *A*², substantially as shown and described.

3. The arrangement of devices, substantially such as are shown and described, for receiving and carrying the central portion of the deck when not in position for use.

4. The arrangement of the beams, and their rests or supports, with reference to the platforms or sections of the upper deck and the framework of the car, substantially as shown and described.

81,469.—THOMAS G. BROOKS, Oneida, Pa.—*Hame*.—August 25, 1868.—The connecting ring passes around both hames, and is held in place by the movable spring, covering the notches with which the ring engages.

Claim.—The hame *A*, when provided with a notched plate *b*, in combination with the slotted spring *D*, constructed as described, for the purpose of attaching the hames together by means of the ring *B*, substantially as and for the purposes herein set forth.

81,470.—N. B. BROWN, Antwerp, N. Y.—*Windlass*.—August 25, 1868; antedated August 17, 1868.—While the crank is being turned forward to wind up the windlass rope, the end of the brake merely slides upon the peripheral surface of the ratchet wheel flange; but when the crank is turned backward the clutch catches the end of the brake and forces it against the said flange to control the windlass while a weight is being lowered.

Claim.—1. The brake *j*, in combination with a ratchet wheel *E* and clutch *g*, the several parts being constructed and operated substantially as and for the purpose specified.

2. The arrangement of the shaft *B*, wheel *E*, and crank *F*, with the clutch *G*, pawl *K*, and brake *j*, when the various parts are constructed and operated as and for the purpose herein fully set forth.

81,471.—THOMAS F. BROWN, Jr., Concord, N. H.—*Skein Holder*.—August 25, 1868.—The holder is contracted lengthwise, to be introduced into the skein; it is then extended by its spring so as to stretch and hold the skein.

Claim.—The combination of the plates *A B*, slitted and notched, as described, with their connections and operative spring, arranged and applied to them substantially as specified, the whole being for the purpose as explained.

81,472.—THOMAS S. BROWN, Poughkeepsie, N. Y.—*Harvester*.—August 25, 1868.—A device for throwing the cutters into and out of action. When the wheel is in gear the pressure of the spring is exerted against the wheel and the pin, leaving the fork loose in the groove; the pressure being exerted against the fork, the wheel is at rest, and there is no friction between the parts.

Claim.—1. The shipping lever, provided with a cam or eccentric slot and notch, to receive the pin on the sliding fork, when constructed and operating substantially as set forth.

2. The combination of the slotted and notched lever with the spiral spring and the sliding fork, when constructed and operating substantially as set forth.

3. The combination of the slotted and notched lever with the spiral spring, the sliding fork, and the wheel having a grooved and ratcheted hub, when constructed and operating substantially as set forth.

81,473.—THOMAS S. BROWN, Poughkeepsie, N. Y.—*Harvester Rake*.—August 25, 1868.—An arrangement of mechanism for controlling the arms of a revolving rake and reel, so that the same will con-

form to all the movements of the hinged platform and cutting apparatus.

Claim.—1. A swinging gear frame or box mounted upon and vibrating horizontally about the vertical rake and reel shaft, substantially as described.

2. The horizontal driving shaft mounted in a swinging gear frame, whose axis of vibration is the vertical rake shaft.

3. The combination of a swinging gear frame with its gearing and a double-jointed tumbling shaft, by the use of which the usual extensible tumbling shaft is dispensed with, substantially as described.

4. The vertically adjustable switch lever for the purpose described.

5. The adjustable switch lever, in combination with an adjustable hook or spur on the revolving rake arm or rake head, for actuating said switch lever, as described.

6. A movable switch lever, in combination with means for removing said lever out of the way of the actuating hooks or spurs on the rake arms or rake head.

7. Operating the switch lever by means of a spring or equivalent device, and a hand or foot lever within reach of the driver on his seat on the machine, so that said switch lever may be made to engage the hooks or spurs on the rake arms or not, at pleasure.

8. The combination of the switch lever, spring, or weighted lever, and foot or hand lever, substantially as described.

9. Attaching the adjustable hook or stop to the iron roller check or elbow, so that an adjustment of the angle of the rake arm relative thereto will not disturb the relation of said hook to the switch lever.

10. The arrangement of the pulley R, over which the cord for actuating the switch lever passes, in the same or nearly the same plane with the joints which connect the platform with the machine.

11. Giving to the switch lever an inclination backward from its shaft, substantially as described, so that in case of a backward movement of the rake arms, the hooks or stops thereon will press said lever downward, and pass over it without injury thereto.

12. The foot lever, provided with the stops or shoulders and spring, operating substantially as and for the purpose described.

81,474.—JAMES D. BRYSON and JOHN H. HART-SUFF, Newcastle, Pa.—*Curb for Water Wheel.*—August 25, 1868.—The upper easing of the water wheel is provided with gates and sliding plates to regulate the flow of water between the chutes on the lower easing, said chutes being connected at their inner corners by a band or ring, on which the upper easing rests and revolves.

Claim.—The curved plates F F, loosely attached to the ends of the gates E E, and sliding on the chutes B B, all operating substantially as and for the purposes herein set forth.

81,475.—WILLIAM G. BULGIN, Vienna, N. J.—*Machine for Sawing Lath.*—August 25, 1868.—The larger gearing effects the gig back motion of the carriage without loss of time.

Claim.—The arrangement of the two sets of bevel gear, *k m* and *b n*, placed centrally in the machine, to be operated by the hand lever G, for reversing the motion of the log carriage, and moving it forward and back, alternately, at a different rate of speed, substantially as and for the purposes herein set forth.

81,476.—JOHN W. H. CHENEY, Hartford, Conn.—*Cutting Printers' Leads.*—August 25, 1868.—The strip of lead is fed up to the gauge by successive movements, which are continued until the strip is reduced to leads of uniform length by the cutter.

Claim.—The arrangement of the hand cutter F, and the parts by which it is operated, with the stationary cutter *a*, bed C, and adjustable gauges D and E, when constructed as described and for the purpose specified.

81,477.—PHILLIP COHEN, Chicago, Ill.—*Trunk Lid Supporter.*—August 25, 1868.—Holds the lid open at any desired angle, preventing it falling either backward or forward.

Claim.—1. Stud B, spring F, hook arm G, all operating substantially as described and set forth.

2. Quadrant bar A, provided with perforations 2, when operating in connection with case D, substantially as set forth and shown.

81,478.—JAMES F. CRANSTON, Springfield, Mass., assignor to the AMERICAN TRADING COMPANY.—*Construction of Cartridge Shells.*—August 25, 1868.—A groove is run around the shell in which groove the metal is upset, thus forming a flange at the same time that the shell is tapered by the dies.

Claim.—Forming the flange *p*, on the inside of the shell, by means of the dies E and F, at the same operation in which the shell is tapered, substantially as shown.

81,479.—ELIZABETH L. DANIELS, Boston, Mass.—*Supporter for Stockings.*—August 25, 1868.—Sliding straps, with buckles at the sides, are adapted to support the stockings without interfering with the ease and movement of the limbs. Pendent straps in front and behind support a diaper, or its equivalent, during the period of the menses.

Claim.—The combination of a stocking and diaper supporter, in the manner and for the purpose herein described, when the same consists of the band A, supports D, B, and C, and buckles *e*, substantially as and for the purpose set forth.

81,480.—GEORGE P. DARROW, Cincinnati, Ohio, assignor to JAMES L. HAVEN AND COMPANY, same place.—*Cast Nut.*—August 25, 1868.—The nuts are cast with channels at those opposite portions of their threaded surface corresponding to the seam or parting of the core, whereby any fault, step, or want of continuity, incident to the use of a worn or otherwise imperfect core box, is placed out of contact with the thread of the bolt or axle, the said channels also permitting the escape of dirt.

Claim.—A cast screw nut, whose threads are interrupted at the parting seam, as set forth.

81,481.—CLARK D. DAY, Chatham, Conn.—*Blacking Brush.*—August 25, 1868.—The dipping part of the brush—which is worn out sooner than the polishing part—is planted in a detachable base piece, and hence when unfit for use it may be replaced, the instrument proper being thus saved and renovated.

Claim.—The combination of the smaller brush *a*, fitting into the socket *b*, with the strap *e* and set screw *d*.

81,482.—ALICE M. EATON, Boston, Mass.—*Shoulder Braee and Suspender Combined.*—August 25, 1868.

Claim.—The within-described shoulder braee and suspender, consisting of the waist band B, with its buckle, elastic straps A and C C, and those, *e e* and *g g*, with their buckles and button holes, the whole combined, arranged, and operating substantially as and for the purpose set forth.

81,483.—THEODOR G. EISWALD and JAMES BARBOUR, Providence, R. I., assignors to T. G. EISWALD.—*Low Water Indicator.*—August 25, 1868.—So constructed that the fusible plug when melted shall not be blown into the whistle, but forced into the cup below.

Claim.—1. The arrangement of the cup E, fusible plug P, tube or stem B, and openings or side pieces *e e*, or their equivalents, when constructed to operate in the manner described.

2. The arrangement of the above-described apparatus within the hollow globe, cylinder, or expanded pipe A, substantially as shown and described.

81,484.—JOHN FAHRNEY, Boonsborough, Md.—*Coal Stove.*—August 25, 1868.—A detachable rim, to be applied to upright cylindrical stoves, for the purpose of supporting around the stove, dishes, &c., to be warmed by heat radiated therefrom. Slides render the rim extensible.

Claim.—1. An attachable and detachable rim B, when used in connection with base-burning or reservoir stoves, substantially as and for the purpose specified.

2. The sliding plates C C, when employed in combination with the rim B, for the purpose described.

81,485.—MOSES G. FARMER, Salem, Mass.—*Magnetic Telegraph.*—August 25, 1868.—For sending messages simultaneously, in opposite directions upon a single line of telegraph. Upon the receiving magnet is a single set of coils, and the key makes two contacts at the down stroke, closing the branch circuit through the receiving magnet, and the branch through the rheostat, both at the same time, and, at the same time disconnecting the receiving magnet from the direct ground, and connecting with the ground through the battery. The rheostat branch circuit is broken, at the key, at its upward stroke.

Claim.—The arrangement and combination of the rheostat-receiving magnet and two-point key, or their equivalents, substantially as described.

81,486.—A. J. FERGUSON, Sharon, Pa.—*Composition for Curing Corns, Bunions, &c.*—August 25, 1868.—The compound consists of spirits of turpentine, spirits of camphor, hartshorn, and olive oil.

Claim.—The within-described process of treating corns and bunions, consisting, first, in bathing the corn or bunion with muriatic acid, and then applying the compound, prepared as herein specified.

81,487.—LEVI FERGUSON, Lowell, Mass.—*Loom for Weaving Pile Fabric.*—August 25, 1868.—The purpose of this mechanism is to draw from a series of wires, each of them in succession, and move it laterally and then forward, into the space between the decessated warps of a loom, in order that such wire may be woven with the weft into the warps, so as to form pile loops in the fabric.

Claim.—1. The combination of the steadying box I with the lever catch H, and the auxiliary carriage or wire transferer G, provided with mechanism for operating it, substantially as described.

2. The combination of the steadying finger L (provided with mechanism for operating it as described) with the withdrawing carriage E, its abutment K, and the transferer G.

3. The combination of the withdrawing carriage E, the heel plate transferer G, the lever M, and its notched plate N, such being for supporting and transferring the wire, in the manner as specified.

4. The combination of the auxiliary arm *w* and its cam *x* with the lever M, the studs *s* and *d*², the carriage E, and the transferer G, arranged to operate as specified.

5. The combination of the tripping catch O, its operative rail P, and abutment Q, with the lever M and its notched plate N.

6. The arrangement and combination of the cam or inclined plane R with the withdrawing carriage E, the transferer G, and the lever catch H, to operate as specified.

81,488.—THEOPHILUS FRAVEL, Westville, Ind.—*Vacuum Apparatus.*—August 25, 1868.—The cape is composed of India-rubber cloth and made to fit closely about the neck, and is secured to flanged rim in the upper portion of the cover, where the head passes through. Below the seat is an aperture and suitable connections for exhasting the air from the apparatus.

Claim.—1. The construction of the cape II, and the manner of fastening it to the door or cover of the apparatus, substantially as shown and described.

2. The construction and arrangement of the pit A, seat D, door G, with its aperture for the neck, and exhaust aperture I, all substantially as shown and described.

81,489.—JIM B. FULLER, Norwich, Conn., assignor to himself, JAMES P. UPHAM, and EDWIN T. RICE.—*Drawing Fibrous Substances.*—August 25, 1868.—Bearing upon the surface of a roller is a band, so arranged in relation to the drawing rollers, that the sliver or roving of fibers of uneven length may be drawn with uniformity and evenness from between the said band and the roller, by the usual drawing rollers.

Claim.—The roller C, the band *d*, and drawing rollers E F, adjusted and arranged substantially as described, and for the purposes specified.

81,490.—JOHN GIBSON, Jr., Albany, N. Y.—*Fuel Size Indicator.*—August 25, 1868.—This inven-

tion consists in affixing to a stove or heater, by casting or otherwise, any representation of the size of fuel proper to be used in such stove or heater.

Claim.—1. The size representations, *a a a*, of fuel, fac similes in form and size, or outline size representations *b b b*, or measurement size representation *c*, or any fuel-size representations equivalent thereto, cast solid with or attached to any stove, heater, furnace, or the like, or cast with or attached to any part or appendage of such stove or heater, as and for the purpose set forth and described.

2. The fuel-size representations or indications *a, b, c*, or their equivalents, attached permanently to any stove or heater, or when made detachable, either with or without the words *d d*, or their equivalents, and for the purpose set forth and described.

3. The words *d d*, or their equivalents, in one or more languages, when used on any stove or heater of on any appendage thereof, in connection with a fuel-size representation, *a, b, c*, or their equivalent fuel-size representations, as and for the purpose set forth and described.

81,491.—WILLIAM F. GOODWIN, East New York, N. Y.—*Automatic Toy.*—August 25, 1868.—As the toy is moved over a floor, by hand or otherwise, the legs alternately actuate each other, the one in contact with the floor throwing the other forward.

Claim.—1. In the construction of the leg of a toy, adapted to imitate the movements of the natural leg, the attachment of the bar B⁴ to the lower end of the bar B¹, and to the foot, at a point in advance of the point of attachment of bar B³ to said foot, substantially as and for the purpose shown and described.

2. The frame or hip plate D, to which the legs are attached, and by means of which said legs are connected with the body of the toy, substantially as described.

3. The construction of the legs or movable parts of the toy, substantially as described, whereby, when the toy is moved over the floor, the said parts are caused to imitate the movements of the corresponding parts of the natural limb which it is designed to represent, substantially as set forth.

4. The legs of a toy, made of one or more pieces, connected with cranks, or the equivalents thereof, and operated or made to walk by contact of the feet or lower extremities with the surface over which the toy is propelled or drawn.

81,492.—C. B. GREGORY, Beverly, N. Y.—*Hot Air Furnace.*—August 25, 1868.—Relates to a chamber arranged above the fireplace of a furnace and having tubes open at each end and extending across it, for the passage of air to be heated; also to perforated gas plates which may be raised simultaneously above the fireplace to afford a more extended opening for the admission of air to the interior.

Claim.—1. The arrangement of the fireplace, chamber II, with its tubes *p*, chamber *x'*, and the flue E, as and for the purpose specified.

2. Perforated plates, arranged above the sides of a fire-pot, so that their lower edges may be raised from contact with the fire-pot, for the purpose set forth.

81,493.—HENRY GROSS, Tiffin, Ohio.—*Window Sash.*—August 25, 1868.—The stiles of the window frame are grooved to receive the sides of the sashes, and the latter are grooved at one side to receive the tongues, which, being acted upon by the springs, sustain the sashes in any position.

Claim.—The tongue C, spring D, set screw *g*, bar *h*, and pins *j j*, arranged in combination with the sash B, to operate as set forth.

81,494.—JOSEPH GRUEY, Kendallville, Ind.—*Water Elevator.*—August 25, 1868.—These devices are employed to cause the alternate ascent and descent of the buckets under a continuous rotation of the crank in one direction.

Claim.—The water elevator described, consisting of curb A, shifting shaft B with bar and pins *b*⁴, loose spools C C' with gear wheels *c*¹, and cylinder *c* having the face wheels *c*², standard D, adjustable shaft *d* with gear wheel *d*², lever E, elevis H and spring *h*, with wheel *h*¹, the whole being combined, arranged, and operated in the manner and for the purposes set forth.

81,495.—STUART GWYNN, New York, N. Y., assignor to SPENCER M. CLARK, Washington, D. C.—*Preparing Oils.*—August 25, 1868.—The process of preparing oil is divided into five operations, viz, oxidizing, neutralizing, steaming, evaporation of aqueous and other volatile matters foreign to the oil, and, finally, sun-bleaching.

Claim.—Oils prepared and purified in the manner which I have herein set forth.

81,496.—STUART GWYNN, New York, N. Y., and SPENCER M. CLARK, Washington, D. C., assignors to SPENCER M. CLARK, Washington, D. C.—*Apparatus for the Purification of Oils.*—August 25, 1868.—An arrangement of tanks for carrying out successively the operations of oxidizing, neutralizing, steaming and heating for evaporation, oils to be purified; and of special devices to be employed in connection with one or more of the tanks for the addition of oxidizing and neutralizing chemicals to the oils, for stirring and agitating the same, and for indicating the condition of the contents of the several tanks.

Claim.—1. The within-described combination and arrangement, in successively lower planes, of an oxidizing tank, A, provided with a detachable stirring shaft, H, and diffusing sieve P; a neutralizing tank, B, with sieve P' at top, and steam or hot-air pipes Q within the same; a steaming tank, C, containing suitable steam jet pipes R, and an evaporating tank or vessel, D, the whole being adapted and made to operate for the refinement of oils, as has been herein set forth.

2. In combination with the tanks A, B, C, and D of our apparatus, outer vertical glass indicating tubes S, communicating with the bottoms of said tanks, and operating as herein described.

3. The within-described combination of inclined or cam surfaces and suitable notches, formed upon a revolving sieve, P, with pins supporting the same, when arranged and operating to lift and drop the sieve in its revolutions, substantially as herein set forth.

81,497.—H. H. HALL, Tioga, Pa.—*Box Opener.*—August 25, 1868.—The spring holds the lower hook in convenient position to have its point forced into the side of the box; this having been done the wedge is forced under the lid, which is grasped by the upper hook to prevent the wedge from receding when the lever is vibrated to pry off the lid.

Claim.—The lever or stock A, hooks *d* and J, spring *e*, and wedge *d*, all combined, constructed, and arranged substantially in the manner and for the purpose set forth.

81,498.—WILLIAM HAMILTON, Philadelphia, Pa.—*Pan Folding Machine.*—August 25, 1868.—The machine has a folding plate with four hinged sides, whereby to fold the sides and ends of a pan or box at one operation. The die, folding plate, and adjusting rollers may be changed to adapt the machine for making pans of different dimensions.

Claim.—1. The hinged folding plate, with grooved edges, or its equivalent, the metal projections on their sides and ends, or their equivalent, and the application of the rollers and movable slides, as substantially set forth herein, by the combined action of which the operator is enabled to fold a pan or box at one motion, and of any required form or size.

2. The prepared metallic sheet E E, Fig. 5, as described, and for the uses and purposes herein set forth.

81,499.—GEORGE W. HARRIS and GEORGE ELIOT, Aurora, Ind.—*Car Spring.*—August 25, 1868.—The spring is composed of a series of steel plates or leaves bent into a curved form, tapering in width from the center toward each end, and having upturned edges or flanges which taper toward the ends, all secured together by a stepped strap, bolt and nut.

Claim.—1. A spring composed of one or more leaves, which taper from mid-length endward, and the upturned margins of which likewise taper endward.

2. A spring, composed of a series of nested leaves, A B C, which, with their upturned margins, taper in width endward, and are secured by means of a central band or strap, substantially as set forth.

3. The pack of flanged tapering and nested leaves A B C, in combination with the stepped strap E *e*, 1 2, 1' 2', bolt F, and nut G, substantially as and for the purpose set forth.

81,500.—BENJAMIN HAVILAND, Hudson, N. Y.—*Chuck.*—August 25, 1868.—In a circular plate are three radial arms which are operated concentrically by means of three cams, arranged in a plane, and within a circle of the same dimensions as the face or arm plate, in combination with the same number of radial set screws in the back plate to adjust these arms eccentrically.

Claim.—1. The general construction and arrangement of the several parts, which, taken together, constitute the chuck herein described, whereby the same may serve as a screw-cutting die, or a universal chuck, all as set forth.

2. Rotating the cam plate *e e c*, and retaining it in position by means of the rack plate, detent *a*, and stub *e*, substantially in the manner specified.

81,501.—HENRY A. HENDERSON, Avoca, N. Y.—*Gate.*—August 25, 1868.—The pulleys upon which the sliding gate is supported have two different bearings to adapt them to the position of the gate when raised, for winter, as well as when occupying its normal position.

Claim.—The adjustable pulley *b*, running in the slot *c*, and on the rail E, in combination with the movable pulley *a* on the gate post, for the purpose of allowing the gate to be slid backward and forward as well when raised as when in its proper position, substantially as herein set forth and described.

81,502.—ALBERT E. HERRINGTON and JOHN D. RICHARDS, Big Prairie Ronde, Mich.—*Corn Planter.*—August 25, 1868.—Devices are employed to raise and lower the teeth and regulate the depth of the furrow. In order to facilitate the "setting" of the machine, in starting, to plant rows, a lever and standard are made to partially elevate the machine.

Claim.—1. The combination of the collars M, on the axle B, with the shields P, provided with openings and slides, which latter are operated by levers R S, all arranged and operating substantially as described, and for the purposes set forth.

2. The combination of lever H and arms F F' with the vibrating bars G and teeth D', arranged to operate substantially as and for the purposes set forth.

3. In combination with the above, the lever T, hinged at U, and provided with standard V, to operate the frame C, substantially as and for the purpose set forth.

81,503.—LUCIAN HILL, North Brookfield, assignor to LAWSON HILL, North Brookfield, Mass.—*Crimping Clamp.*—August 25, 1868.—Upon a screw spindle is a nut beveled so as to fit against the curved inner surfaces of two outer jaws pivoted to a central jaw-piece. Between the nut and the shoulders of the central jaw-piece is a spiral spring, which forces the hinged jaws against the inclined sides of the nut.

Claim.—1. The combination, with the jaw part C, spindle A, and nut *a*, of the spiral spring, substantially as and for the purposes set forth.

2. The combination, with the jaw part C, screw spindle A, and hinged jaws B B, of the spiral spring *f* and nut *a*, substantially as and for the purposes set forth.

3. The combination, with the jaw part C and nut *a*, of the hinged jaws B B, substantially as and for the purposes set forth.

81,504.—LEWIS F. HOBBS, Quincy, Mass.—*Device for Holding Spools of Thread.*—August 25, 1868.—A piece of wire is bent so as to form the several specified members and bring them into the desired relative position.

Claim.—A spool holder formed of wire, and provided with the axle *e*, holder *b*, thread guide *c*, retaining pin *a*, and socket or eye *d*, the whole arranged and operating substantially as herein set forth.

81,505.—DANIEL M. HOLMES, Williamsburg, N. Y.—*Machine for Making Ginger Snaps, &c.*—August 25, 1868.—The dough is forced out by a follower through holes in the bottom of the dough box, and at the proper time to form snaps of the desired size. The protruding dough is cut off in slices by sliding knives.

Claim.—1. The combination of the follower C, cross-bar E, and screws F, with the dough box A, frame B, and driving shaft I, substantially as herein shown and described, and for the purpose set forth.

2. The knife frame S, adapted to slide in dovetail grooves formed in the bottom of the dough box A, upon each side the perforations, whereby the knives R are adapted to be fastened upon the under side of said frame, and work in contact with the perforations, as herein described, for the purpose specified.

3. Operating the sliding-knife frame S from the shaft M, by means of the cam wheel T and gear wheels V and X, substantially as herein shown and described, and for the purpose set forth.

4. The combination and arrangement of the gear wheels L J N O K and sliding clutch Q, with each other and with the shafts M and I, for the purpose of operating the follower C, substantially as herein shown and described.

81,506.—WILLIAM H. HOVEY, Springfield, Mass.—*Brick Machine.*—August 25, 1868.—The machine is composed of two iron rolls of different diameters and revolving at different rates of speed, in connection with a table containing a set of metallic molds, and having a reciprocating rectilinear motion beneath the rolls. Two straight-edged steel bars are so arranged as to act as scrapers in connection with a curved sheet of metal for finishing the upper side of the brick.

Claim.—1. The rolls A and B, of different diameters, and in combination with the scrapers J J' and the vibrating table, having a reciprocating rectilinear motion, with or without the curved plate C, when operating substantially as described.

2. In combination with a table, having a reciprocating rectilinear motion, as described, a gate, L, for preventing the return of the molded brick into the machine, and for depositing the same upon the carrying board b, substantially as specified.

3. The combination and arrangement of the mold bed P' and vibrating table having a reciprocating rectilinear motion, rolls A and B, scrapers J and J' and plate C, plungers P and tracks T, and the gate L, the whole arranged and operating substantially as described.

81,507.—LIVERUS HULL, Charlestown, Mass.—*Manufacture of Whips from India rubber.*—August 25, 1868.—The body of the whip is formed by rolling into taper form a piece of cloth covered with caoutchouc or gutta-percha in the sticky state; this roll, being bound by a retaining thread, is vulcanized, after which it is sheathed in thread or leather.

Claim.—1. The whip stock or body as composed not only of cloth, covered with a vulcanizable composition, and rolled up as set forth, but of a retainer or retaining covering of thread, either braided or wound thereon, for the purpose of supporting the roll during the process of vulcanizing it by heat.

2. A whip, as composed of the stock or body so made, and one or more coverings of thread, or leather, or other suitable material or materials, either wound, braided, or otherwise properly fixed on such body.

81,508.—A. T. HYDE, Rochester, Minn.—*Bitters.*—August 25, 1868.—Composed of "alcohol, aurantii amar. cortex, gentiana, juniperus, sassafras, prunus virginiana, myristica, xanthoxylum, cinnamomum, caryophyllus, tinct. oleum gaultheria, santalum," mixed in a sirup of dissolved "saccharum album."

Claim.—The within described compound for medicinal bitters, as and for the purposes herein set forth.

81,509.—SILAS Y. IVES, Meriden, Conn.—*Cheese Press.*—August 25, 1868.—The lower platen is fixed to a vertically sliding frame, and carries drums and

pinions which are rotated during the movement of the frame by engagement with stationary racks, and which wind up or unwind bands extending to a drum on the upper platen.

Claim.—1. The arrangement of the two platens, M and E, combined with the drums G and bands L, so as to operate, by the descent of the platens, substantially as specified.

2. In combination with the above, the drum M, operating as described.

3. In combination with the subject-matter of the first clause, the bands S and drum T, arranged so as to operate substantially as specified.

81,510.—A. F. JENNINGS, Sherman, N. Y.—*Abdominal Supporter.*—August 25, 1868; antedated August 15, 1868.—An elastic band and a cheek-strap are so combined with a body belt, that while a proper expansion is obtained, the cheek-strap will prevent any overstrain. A central elevation and an outer rim on the pad serve to draw the walls of the rupture together.

Claim.—1. The combination of the interposed elastic band C and the cheek-strap D with the body belt A and pad E, arranged and operating in manner and for the purposes herein set forth.

2. The formation of the pad with the central elevation c, raised rim d, and intermediate annular depression f, in the manner and for the purpose specified.

81,511.—PHILLIP H. KELLS, Adrian, Mich.—*Brick Machine.*—August 25, 1868.—The columns which support the bed plate are provided at their lower ends with screw threads that fit in corresponding sockets. The bed plate is provided with two openings, separated by a wedge-shaped center piece, so as to present its inclined face to the mold wheel. Rings are secured to the under side of the mold wheel through the opening between which the arms of the follower pass.

Claim.—1. The annular wrought iron rings K K', in combination with the mold wheel I and followers i², substantially as and for the purpose described.

2. The provision, in the bed plate B, of the openings b b, and wedge-shaped center piece b', substantially as and for the purpose specified.

3. The adjustable columns A' A', constructed and arranged as described, in combination with the bed plate B and pug-mill C, substantially as and for the purpose set forth.

81,512.—ALBERT E. KROGER, Norwalk, Conn.—*Horse Shoe.*—August 25, 1868.—Hollow calks, having a filling of felt, are attached to the shoe by means of studs or tenons fitting in mortises in the shoe.

Claim.—The arrangement and attachment of the hollow calks to the shoe, by means of the studs D and mortises C, or their equivalent, in the manner substantially as and for the purpose described.

81,513.—ABRAHAM LAPHAM, Farmington, Mich.—*Fence.*—August 25, 1868.—The inclined uprights afford a broad base to support the rails, the ends of which are beveled alternately in opposite directions so as to place the contiguous rails in line, and cause them to interlock and sustain each other laterally.

Claim.—The portable fence, consisting of the bars B and D, pivoted together near their top, the bars B, provided with cross bars A, the ends of which are beveled, and the bars D, provided with the bars E, similarly beveled, all constructed, arranged, and operating as herein described.

81,514.—WILLIAM LEACH and JOSEPH LEACH, New Harmony, Ind.—*Winding Frame for Carding Engine.*—August 25, 1868.—Upon a smooth iron roller are placed a number of thin movable flanges, so arranged as to keep each sliver or roping separate while winding, so as to produce separate rolls, for packing, &c. Above the said roller is arranged a pressing roller.

Claim.—The smooth rod or roller A, provided with movable flanges B B, in combination with a series of drums, D D, above, and another series of drums, C C, below the same, all constructed as described, and operating substantially as and for the purposes herein set forth.

81,515.—ANDREW M. LEONARD and BELMONT PERKINS, Ann Arbor, Mich.—*Chalk Holder for Billiard Table.*—August 25, 1868.—The box containing chalk is designed to be fastened by a chain to a billiard table. The circular box upon one side covers a spring lever for locking the box when necessary.

Claim.—The construction of a box, B, provided with a hinged bottom, C, and chain L, in connection with circular box D, lever E, fulcrum screw F, spring G, and key I, when arranged and operating substantially as and for the purposes herein set forth.

81,516.—JAMES S. LESTER and PERRIN H. CARDWELL, Knoxville, Tenn.—*Shoe.*—August 25, 1868.—The quarters are left open above the counter at the back, and at this part of the shoe, the facing, buckle, button, or other fastening is applied.

Claim.—The front piece A and side pieces B and C, formed in the manner described, for the purpose of forming a shoe, substantially as and for the purposes herein set forth.

81,517.—CHARLES E. LINS, Ashland, Pa.—*Horse Hay Fork.*—August 25, 1868.—A pair of jaws, composed of a plurality of tines, is attached to a handle or stock, the one by a rigid, and the other by a hinge joint. The hinged jaw is connected, by a rod or brace, to a slide or roller working in a recess in the face of the stock, and engaged by a catch to lock the jaws in a closed position.

Claim.—1. The combination with the movable jaw D of the slide G, connecting rod F, and latch H, arranged and operating in the manner and for the purpose set forth.

2. The combined arrangement of the stock A, rigid and hinged jaws C D, brace E, rod or brace F, slide G, and latch H, all substantially as described, for the purposes specified.

81,518.—DELOSS L. MAIN, Brooklyn, Mich.—*Churn.*—August 25, 1868.—The effect of this combination is to impart a rapid vibrating motion to the wings of the dasher.

Claim.—The combination of the churn A, dasher shaft B, perforated wings D, crank E, bearing F, standard G, driving wheel H, pinion I, crank wheel J, connecting rod K, and hand crank L, when constructed, arranged, and operating substantially as and for the purposes herein set forth.

81,519.—S. E. MALLETT, Corry, Pa.—*Cream Saver.*—August 25, 1868.—The device is made of metal, in the form of a truncated hollow cone, with a ring at its lower end united to the body by connections, having openings between them, and fitted in the head of a churn around the dasher rod.

Claim.—The cream saver A, constructed and operating substantially as and for the purposes herein described, with or without the openings o.

81,520.—J. C. MCAFEE, West Alexander, Pa.—*Composition for Grinding and Polishing Marble and other Substances.*—August 25, 1868.—The composition consists of pulverized flint and gum shellac, made into a paste and hardened.

Claim.—The composition above described, substantially as and for the purpose set forth.

81,521.—WILLIAM MCGUIRE, Chess Springs, Pa.—*Farm Gate.*—August 25, 1868.—By turning the nut the effect is either to give a relative rigidity to the parts composing the gate, or to relax the same, so as to adapt them for parallel motion and enable the gate to be turned up endwise.

Claim.—The paling D', provided with the slot E, in combination with the bolt or pivot f and nut f', substantially as and for the purpose herein specified.

81,522.—DAVID H. MERRIAM, Fitchburg, Mass.—*Stone Cutting Machine.*—August 25, 1868.—A series of cutters are arranged upon a hollow revolving cylinder, which latter is provided with small perforations, opening near each cutter, and also with a stuffing box and pipe, through which hot or cold water or steam, may be conducted to the stone.

Claim.—The cutter cylinder, provided with cutters and apertures, and supplied with water or steam, for

dressings stone or other material, substantially as described.

81,523.—JOSEPH S. MOODY, Saco, Me.—*Lathe Chuck.*—August 25, 1868; antedated July 23, 1868.—The gear in this device is placed at the center of the chuck instead of at the periphery, and pinions are arranged at or near the inner end of the driving screws. The gear hub is retained in place by a set screw made to play in a groove in the gear hub. Scales on the face plate serve as guider in setting an eccentric, and also in adjusting the jaws at the right point.

Claim.—1. The gear hub A and gear B, having the set screw E to play in the groove F, to operate as herein set forth, and for the described purposes.

2. The arrangement of the scales 8, 10, 12, on the face plate, as and for the purposes set forth.

3. The combination, with the center shaft or gear hub A, when operated as herein set forth, the knob D or its equivalent, as and for the purposes specified.

4. The combination and arrangement of a universal chuck with a chuck for eccentrics, when constructed substantially as shown and described.

81,524.—GEORGE MOONEY, Providence, R. I., assignor to himself, JAMES SHAW, Jr., and JOB ARNOLD.—*Gas Burner.*—August 25, 1868.—The apertures for the flow of gas are drilled at right angles with face or "tip" so as to cause the gas to flow in radiating jets from the burner. An adjustable check is so arranged that by turning the burner in one or the other direction the flow of gas will be enlarged or diminished as desired.

Claim.—1. In an argand gas burner, a beveled tip, drilled or punched at right angles with its face, substantially as described.

2. The combination of the base, A provided with shoulders A A and adjustable check C C, with or without the grooves C C C, with the surbase B and stop screw B B, constructed and arranged to operate substantially as herein shown and described, for the purpose set forth.

3. A chimney holder for an argand gas burner, with the peculiar construction of the outer edge, with the modifications thereof, as described for the purposes specified.

81,525.—GEORGE B. MONTGOMERY, Winslow, Ind.—*Saw.*—August 25, 1868.—These teeth are designed to clear the dust from the center of the log each way.

Claim.—The combination of the teeth a b c, the tooth c being shorter than the teeth a and b, and formed with the peculiar curved point, and all the different-formed teeth being alternately arranged as herein shown and described.

81,526.—JOHN A. MONTGOMERY, Crawford, N. J.—*Grinding Mill.*—August 25, 1868; antedated August 15, 1868.—The ears of the carriage clip are provided with grooves or key seats, and between the ears is a rubber packing. The end of the thill iron is made eccentric so as to press at its rear against the rubber packing.

Claim.—A grinding mill, consisting of the shell A and runner K, provided with shafts H and M, pinions E and F, and crank G, for the purpose of imparting to said runner a reciprocating rotary motion, as shown and described.

81,527.—ELI M. MORRISON and JAMES K. ROSS, Noblesville, Ind.—*Thill Coupling.*—August 25, 1868.—A concavo-convex shell attached to a shaft is placed within an outer shell, and the shaft is so arranged as to impart to the inner shell or runner a reciprocating rotary motion.

Claim.—The eccentrically-shaped thill iron E, in combination with the carriage clip A, rubber packing C, and bolt D, constructed as described, and operating substantially as and for the purposes herein set forth.

81,528.—EDWARD B. NOCK, Cleveland, Ohio, assignor to himself, O. B. PERDUE, CHARLES F. MATHews, and JOHN LONG, same place.—*Manufacture of Sheet Iron.*—August 25, 1868.—Consists in the superficial application of tin to the iron, during the process

of manufacture, giving the iron the quality of resisting the corroding influences of acids and gases.

Claim.—The application of tin to the surface of the iron, by either of the methods herein described, substantially as and for the purpose set forth.

81,529.—W. A. C. OAKS, Reading, Pa., assignor to W. M. GRISCOM, same place.—*Reversible Knob Latch.*—August 25, 1868.

Claim.—1. The follower E, or its arms *e e'*, constructed substantially as described, in combination with the steps *e* on the yoke projections *f f'*, or their equivalents, arranged in such manner as that the back movement of the latch bolt is effected for a given distance only by the follower, and so restricted by the gear of the follower, with the bolt or yoke, without, however, preventing the bolt from being moved further back by direct application of force to it, essentially as herein set forth.

2. So constructing the follower arms and bolt or yoke, against which they act to draw back the bolt, as that when the latter is pushed back beyond its unlatching position, as described, and the follower slightly further turned, said arm or arms are disengaged from gear with the bolt or its yoke to allow of the protrusion of the bolt sufficiently beyond the front edge of the case to admit of its reversal substantially as specified.

81,530.—THOMAS M. PATTERSON, Tarr Farm, Pa.—*Tool Extractor for Wells.*—August 25, 1868.—Designed for removing tools that have become fast at the bottom of an artesian well which is being bored.

Claim.—The within-described apparatus for grappling tools, consisting substantially of the hollow die or screw socket *a*, in combination with the iron poles *c c*, when said die socket and poles are provided with and connected by means of left-hand screw threads, or threads cut in an opposite direction from the threads upon the tools, substantially as and for the purpose herein set forth.

81,531.—GEORGE B. PERKINS, Utica, N. Y.—*Floor Clamp.*—August 25, 1868.—The groove in the end of the lever accommodates the tongue of the board, and when the opposite end of the lever is raised the dog bites the joint and becomes the fulcrum from which the lever acts to force the board up to a tight joint.

Claim.—A clamp for laying matched boards, consisting of the lever A, dog B, groove C, and brace E, all constructed to operate substantially as described.

81,532.—CHARLES W. PERRY, Providence, R. I.—*A Well Curbing.*—August 25, 1868.—A series of cases are fitted to slide one within the other similar to a telescope.

Claim.—In the construction of wells, the combination and arrangement of a series of tubes or cases, sliding within each other, capable of extension and contraction, when applied in the manner and for the purposes specified.

81,533.—WILLIAM POMEROY, Brooklyn, N. Y.—*Hernia Pad.*—August 25, 1868; antedated August 15, 1868.—The pad is formed with a central transverse joint or hinge, provided with an eccentric on one side to work against a corrugated shoulder on the other side of the joint, so as to bend the pad like a finger joint, to adjust the bearing upon a rupture.

Claim.—The spring plate B hinged to the plate C, and the milled eccentric D, working against the shoulder E, combined with the pad A, constructed and operating substantially as herein described.

81,534.—H. POOLE, Richmond, Ind.—*Culinary Vessel.*—August 25, 1868.

Claim.—The steamer A, divided into compartments by one or more partitions, in which the boiler is separate from the cooking chambers, and the steam is admitted to the latter at pleasure, as set forth.

81,535.—FREDERICK POST, Plano, Ill.—*Water Wheel.*—August 25, 1868.—The minor or lower and smaller wheel is attached to a sleeve upon the main shaft so that the said wheel can be moved up within a flange of the major or upper wheel, and any de-

sired or requisite quantity of water may be used in relation to the power required.

Claim.—1. The combination of the major wheel B and the minor wheel F, constructed and operating substantially as and for the purposes specified.

2. The sleeve U, in combination with the wheels B and F, substantially as and for the purposes described.

81,536.—HENRY A. V. POST, Cincinnati, Ohio.—*Spring.*—August 25, 1868.—The spring is composed of two plates, of elliptical form, deflected into three-quarter circular bends or loops at their outer ends, and continued across, so that the end of each will bear against the inner loop of the other side.

Claim.—1. The pair of folded and interlapped plates A and B, having the prolonged inner limbs *a''* and *b''*, constructed, arranged, and adapted to operate as set forth.

2. The pair of folded and interlocked plates A B, adapted to both slide upon and mutually support each other in the described combination with one or more pairs of stationary outer plates, G H.

81,537.—JOSEPH K. PRIEST and WILLIAM EARL, Jr., Nashua, N. H.—*Belt Lacer.*—August 25, 1868.—A movable jaw is pivoted to one of the levers, so as to be turned directly against the cutting end of the punch in order to seize the lacing and draw it in place. A hook projects from the end of one of the levers, and a knife is also pivoted to the lever, so as to be turned into, and out of, working position.

Claim.—1. The combination of the movable jaw *k* with the crossed lever punch A.

2. The combination and arrangement of the hook *m* with the crossed lever punch A.

3. The arrangement of the hook so as to extend from the piercer.

4. The combination and arrangement of the rotary knife *n* with the crossed lever punch.

81,538.—W. G. QUEAL, Otego, N. Y.—*Shield for Carriage-Curtain Button Holes.*—August 25, 1868.—This device fulfills the purpose of a metallic binding, preserving the button hole intact.

Claim.—The above-described combination of shields A and B with flexible or metallic back, attached to the button holes of carriage curtains for their preservation, and for security of fastening, in the manner and for the purpose as substantially set forth and described.

81,539.—JAMES H. REYNERSON, Pleasant Plain, Iowa.—*Rotating Fan.*—August 25, 1868.—The spring, when allowed to press with full force against the pinion shaft, arrests the motion of the apparatus, but its pressure may be reduced and regulated by the thumb screw.

Claim.—1. The combination of the spring D and thumb screw running through the piece O, as described.

2. The arrangement of the support B between the mainspring C and driving wheel, and the general construction of the whole machine, for the uses and purposes described.

81,540.—WILLIAM D. RICHARDSON, Springfield, Ill.—*Wooden Pavement.*—August 25, 1868.—The stringers are laid across the street from curb to curb, and break joints with each other. The form being that of an arch, any superimposed weight tends to press the blocks and stringers closer together.

Claim.—A wooden pavement, constructed of transverse-arching beams, either whole or the parts of which break joints, and which support the shouldered blocks of described shape, the interstices being filled with concrete, which concrete rests upon the transverse beams, all substantially as described and for the purposes set forth.

81,541.—GEORGE M. ROBINSON, New Wilmington, Pa.—*Hay Fork.*—August 25, 1868.—When the center bar is depressed the cutters are vertical, forming a heart-shaped head, adapted to readily penetrate the hay. The center bar being raised, the cutters assume a horizontal position, to support the hay as the fork is elevated.

Claim.—The ring F, formed on the upper end of

the slotted center bar B, in combination with the handle E, constructed as described, by the side bar D being extended and bent over, substantially as herein set forth.

81,542.—ROBERT ROSS, Bethlehem, Pa.—*Oil or Suet Cup*.—August 25, 1868.—To the upper portion of the cup is hinged a yoke, provided with a screw rod, arranged to hold a valve spindle in its seat against a pressure of steam. The valve spindle is ground to its seat and to a passage in the upper portion of the cup, so as to prevent the escape of steam between a second spindle and the passage and seat.

Claim.—An oil cup, constructed and operating as herein set forth.

81,543.—J. Q. A. SARGENT, Manchester, N. H.—*Steam Generator*.—August 25, 1868.—Relates to the construction of vertical steam boilers having submerged smoke boxes.

Claim.—A boiler, constructed and arranged substantially as herein set forth.

81,544.—HENRY SHAW, New Orleans, La.—*Mode of Connecting the Draught Lever to Horse-Power Machines*.—August 25, 1868.—Two springs are arranged in a groove in the driving wheel in such relation to the actuating or draught lever as to allow of a yielding movement of the lever in starting, and during the operation of the machine.

Claim.—The springs *d e*, in combination with the lever B, when the latter is pivoted to the driving wheel A, and the several parts are arranged, constructed, and conjointly operated substantially as herein described, for the purpose set forth.

81,545.—JACOB T. SHIMER, Easton, Pa.—*Carriage Wheel*.—August 25, 1868.—The inner ends of the spokes are screwed into a cast-iron hub malleableized, and near their outer ends are washers, which serve as bearings or sockets for the rim of the wheel, which latter is secured to the outer ends of the spokes by serews.

Claim.—The combination of the wrought-iron spokes B B, threaded at each end, with the cast-iron hub A, having screw-thread perforations, and the wooden rim C, angular plates *e*, and serews *d*, all arranged together in the manner set forth.

81,546.—WILLIAM HAMILTON SHOENBERGER, Cincinnati, Ohio.—*Spike Machine*.—August 25, 1868.—Each movement of the machine cuts the bar into blanks and heads up and points the same.

Claim.—1. The herein described series of dies *a'*, cutters *a b*, and headers *k*, all arranged, relatively to the other parts of the machine, substantially as shown, and adapted to make more than one spike at each operation from a single bar or rod.

2. The arrangement, in the cutter head B, of the head block K, headers *k k*, and cutters *b b*, substantially in the manner set forth.

3. The arrangement of the sliding block U, links *w w*, head V, ejecting rods *x x x*, lever W, and cam X, as described.

81,547.—JACOB H. STREJNER, Camp Hill, Pa.—*Grain Drill*.—August 25, 1868.—An inverted hollow frustum, open at both ends, is placed near the lower end of the conveying pipe, and forms a contractor, from which the grain falls upon a bell-shaped distributor below.

Claim.—The combination and arrangement of the boot A, with the contractor B and distributor C, when said distributor is sustained in position, substantially as shown and described.

81,548.—T. H. SMITH, Clyde, N. Y.—*Seed Planter*.—August 25, 1868.—The machine is so constructed that the seed planted thereby may be cultivated transversely as well as longitudinally, thus affording better drainage on undulating ground.

Claim.—1. The combination of frame A, wheels B, gear wheels H I, hand wheel K, wheel M¹, shaft M, wheels M² M², and markers P P, all arranged and operated substantially as and for the purpose set forth.

2. The seed boxes C¹ C¹, in combination with the

slides N, rods N', and cams *m*, constructed, arranged, and operating as described.

3. The regulating hand wheel K and wheel M¹, in combination with the shaft M, wheels M² M², and markers P P, arranged and operating in the manner and for the purpose explained.

81,549.—JOHN P. SPANGLE, Canandaigua, assignor to himself and CHAUNCEY SPEAR, Hopewell, N. Y.—*Snow Shovel*.—August 25, 1868.—The rear portion of the shovel is turned upwardly and the sides and rear edge are provided with a bead for additional strength.

Claim.—A snow shovel, composed of the blade A, provided with the upturned rear end *a*, and marginal beads *a¹ a²*, the handle B, bail C, and bracket D, all substantially as described, for the purposes set forth.

81,550.—T. M. STANSBURY and A. F. STANSBURY, Canton, Ill.—*Tire Bender*.—August 25, 1868.—The tin is passed between friction rollers and a drive roller, so arranged as to give the tin the desired diameter. The drive roller is journaled in sliding posts operated by a lever below.

Claim.—The arrangement herein described and shown of the devices, viz, the posts *d d*, rollers *e* and *e*, lever *h*, spring *i*, segment ratchet bar *k*, and frame *a*, for the uses and purposes herein set forth.

81,551.—HARVEY B. STEELE, Winsted, Conn.—*Car Coupling*.—August 25, 1868.—The appendages of the draw head are made to hold the link in a horizontal position to effect its automatic coupling.

Claim.—The construction of the bumper A with its spiral spring G, head block F with its dog D, and the dog E with its spring H, all arranged, combined, and operating the square end link B, as herein described and for the purpose set forth.

81,552.—CHRISTIAN ADOLPH STEINBRUECKE, Louisville, Ill.—*Halter*.—August 25, 1868.—The side bars of the main buckle are joined by a plate, to which an ordinary tongue is hinged and from which a supplemental tongue projects rigidly. On this buckle is also formed one of the metallic joint couplings which connect the different straps, and adapt the halter to conform to the head of the animal. The hitching strap is attached to the metallic brace.

Claim.—1. The buckle, constructed with a plate extending across from one side bar to the other, and forming a portion of the metallic joint, substantially as shown and described.

2. The metallic joints, constructed as described, and as shown in Fig. 2, in combination with the leather straps composing portions of the halter.

3. The metallic brace G, constructed substantially as shown and described.

81,553.—CHARLES H. STEVENS and WILSON GARRISON, Syracuse, N. Y.—*Breast Strap Slide*.—August 25, 1868.—A detachable tongue or pin made with a double point and a flange at the center, engages with the breast strap when the slide is to be held fixedly on the strap, and is removed when desirable that the slide should yield or play on the breast strap.

Claim.—The combination of the form *h*, inclined ribs *a a*, and loops *d*, with the detachable pin C, as herein shown, and for the purpose set forth.

81,554.—CHARLES STORE, Montana, Iowa, assignor to himself and LEVI HEIGUS.—*Mold for Casting Sleigh Shoes*.—August 25, 1868.—For casting the iron sole of sleigh runners. The hinged lid and the bottom of the mold have corresponding holes to receive steel pins, which are withdrawn after the metal has cooled, thus leaving the bolt holes.

Claim.—The flask or metallic mold for casting sleigh shoes, constructed and arranged as shown and described.

81,555.—ALFRED F. SUMMERS, Peoria, Ill., assignor to himself, CHAUNCEY NYE, and THOMAS A. SLACK.—*Post Hole Borer*.—August 25, 1868.—An adjusting slide and standards which support the boring apparatus, are so arranged that any deviation from a straight line may be readily corrected by moving the slide to the right or left. The auger is turned to bore the hole and is raised from the hole

without turning, the dirt which is raised falling upon a concave plate.

Claim.—1. The adjusting slide B B, and the standards *b b b b*, the universal axle C, containing the spherical nut, the screw D, the swivel joint *e*, and the measuring wheel H, as described, arranged, and operated, in combination with a carriage and auger, substantially in the manner and for the purposes as herein set forth.

2. The auger E F, and adjustable concave plate G, in combination with the swivel joint *e* and screw D, as described, and operating substantially in the manner and for the purposes set forth.

3. The carriage A *a a*, as described, in combination with the auger E F and its operating devices, substantially in the manner and for the purpose set forth.

81,556.—J. B. SWEETLAND and SILAS T. FENN, Pontiac, Mich.—*Wash Boiler.*—August 25, 1868.—From the center of a double bottom extends a pipe upwardly having curved spouts at the upper ends and a pipe projecting from the center at right angles, by which steam and hot suds are forced from the top and from one side upon the clothes.

Claim.—The combination of the double bottom B, pipe C, spouts D D, side pipe E, braces *a a*, and rack F, all constructed as described, and operating substantially as and for the purposes herein set forth.

81,557.—LEONARD S. SWETT and JAMES GRAHAM, Vassar, Mich.—*Gate for Turbine Water Wheel.*—August 25, 1868.—A series of gates are so connected to a circular slotted plate, that by means of a cog wheel operating a ratchet on the said guide plate, the gates can be opened so as to admit the water directly to the buckets.

Claim.—A combined gate and guide for water wheels, having gate E, guide G, guide plate A, slots C, guide pins D, lugs *e e e e*, ratchet H, cog wheel K, and shafts L and B, constructed, arranged, and operating substantially as specified.

81,558.—LOVEL F. TANNER, Milan, Ind.—*Farm Gate.*—August 25, 1868.—A diagonal brace is so arranged that the front portion of the gate can be adjustably elevated so as to take out the "sag." A rod on which the gate turns is provided with holes, in which a pin may be inserted to hold the gate in an elevated position.

Claim.—1. The combination of the removable locking pin H with the thrusting braces or struts E E', studs G, and gate A B C, substantially as and for the purposes specified.

2. The arrangement, substantially as described, of the eyes I I', perforated rod J *j*, staples *k k'*, and pin L, for the object explained.

81,559.—A. E. TAYLOR, New Britain, Conn.—*Letter File.*—August 25, 1868.—The two plates form an extendible file, the catch of one engaging the notches of the other to hold the parts in any desired relative position.

Claim.—The combination of the bent metal plates A B, plate B being provided with a ratchet slot *d*, on each side, and plate A provided with a catch, *e*, for said slot and ratchet, all operating as set forth.

81,560.—ALFRED A. TORPEY, Chicago, Ill.—*Brick Press.*—August 25, 1868.—The bottoms of the molds form the faces of movable plungers which are moved by means of two cams. Another cam gives a corresponding sliding motion to a slide bar, covering plates and receiving box, so that while the molds are being filled on one side of the machine, the clay is pressed on the other.

Claim.—The employment or use of the cams D, E, and F, pallets 4, slide bar Q, arms O and P, rock shaft N, when combined with plates J, connecting rods L, and box K, substantially as and for the purposes set forth.

81,561.—CHARLES TRUESDALE, Cincinnati, Ohio, assignor to himself and WILLIAM RESOR & Co., same place.—*Cupola and Blast Furnace.*—August 25, 1868.—The sectional structure of the iron casing and the mode of securing the tuyeres admits of the ready detachment and replacement of the tuyeres.

The inward prolongation of the tuyeres protects the throat from the change of effective area, to which the tuyere would otherwise be subjected by the burning off or clogging up of the end.

Claim.—1. A cupola or blast furnace, having its blast formed by a multitudinous number of tuyeres on different levels, and of small individual area, and adapted to deliver a diminished blast upward in the series, substantially as herein described, for the purposes set forth.

2. A cupola or blast furnace, whose tuyeres and fire-brick lining are supported upon an iron back or casing composed of staves or sections, F, substantially as set forth.

3. The mode of fastening the tuyeres upon the inner surface of the air chamber by means of a dovetail or its equivalent.

4. A tuyere, whose inner or discharging end projects beyond the opening which regulates the amount of blast discharged through the same, for the purpose set forth.

5. A tuyere, whose regulating throat or more contracted portion is protected by a prolongation, which inclines more or less downward to the interior of the cupola or furnace, substantially as and for the purpose stated.

6. The slotted tuyere K, so arranged as to discharge a greater volume below than above, for the purpose set forth.

81,562.—JAMES C. UNDERWOOD, Surrey Court House, Va.—*Machine for Picking and Cleaning Pea Nuts.*—The vines are held by the root end until the nuts are separated by the cylinder teeth; the nuts then pass from the upper to the lower apron, by which, after being separated from the stems and unsound nuts, they are conducted to the front of the machine to be deposited in sacks.

Claim.—A machine having a cylinder, D, provided with rows of teeth, *e e e e e*, in combination with the fan C, aprons L and M, and cap N, substantially in the manner and for the purpose as herein described.

81,563.—C. C. E. VAN ALSTINE, New Haven, Conn.—*Casting Chains.*—August 25, 1868.—The flask is divided longitudinally in quarters and arranged so as to receive a mold-board between each of the four quarters, and allow the links to be molded one within the other to form a succession of links.

Claim.—The herein-described process for casting metallic chains, by the employment of a four-part flask A B C D, with mold-boards E F G H, upon which the pattern is arranged in the manner specified.

81,564.—EDOUARD WENGER, Richmond, Ind., assignor to himself and JOSEPH MARTISCHANG.—*Composition for Pavement.*—August 25, 1868.—Composed of prepared coal tar, sifted sand, and burnt clay applied to a foundation of gravel and lime.

Claim.—1. Compounding an asphaltic composition with the materials above described, in the manner and with the proportions set forth.

2. Laying the same on a foundation of gravel and lime.

81,565.—J. D. WESTCOTT, Waterford, Pa.—*Pump Piston.*—August 25, 1868.—A hollow piston head is made to play between two cup-shaped shoulders secured to a hollow piston rod, so as to admit water alternately on opposite sides. The hollow piston head incloses an induction opening of the pipe at all times and in all positions.

Claim.—The hollow piston head C, inclosing the induction opening *b* in all positions, and the cup-shaped stops B B, acting in connection therewith, the whole arranged as described, and operating in the manner and for the purpose specified.

81,566.—S. LLOYD WIEGAND, Philadelphia, Pa., assignor to WALTER J. BUDD, same place.—*Steam Generator.*—August 25, 1868; antedated August 13, 1868.—Relates to a mode of constructing, and to certain modifications of engines constructed upon the general plan described in patent No. 67,621, heretofore granted to same party; it being designed to make the same conveniently portable, to more effectually burn the fuel and utilize the heat.

Claim.—1. A steam generator, constructed with

double tubes in several sections, wher the steam and water connections thereof are both applied to the upper vessel or tank C.

2. The arrangement of the sections, so constructed that the tubes will repeatedly intercept and break the currents of flame and gas passing to the flue, in combination with the furnae A and a chamber below the lower ends of the tubes.

3. The furnae, either entirely or partially projecting beyond the steam generator, in combination with the chamber below the tubes B.

4. The perforated plates, with conical depressions around the tubes; in combination with the tubes and tanks C.

5. A steam generator, constructed substantially as shown and described, in combination with a furnae, having the regulatable apparatus for admitting and heating air above the fuel, and with the chamber below the tubes, substantially as shown and described,

6. The hand-hole plate, constructed substantially as described,

81,567.—J. H. H. WISEHEART, Shawneetown, Ill.—*Grain Screen*.—August 25, 1868.

Claim.—1. The arrangement of the sieve I, with the hopper C, conveyer D, and screen B, substantially as described.

2. The arrangement of the hopper C, sieve I, screw conveyer D, screen B, incline J, and spouts E and F, substantially as described.

81,568.—THOMAS C. WOODS, Marion County, Ky.—*Car Brake*.—August 25, 1868.—The brakes or rubbers may be dropped upon the rails, in front of the wheels, so as to pass under the wheels, and operate as a sliding stop, preventing the wheels from turning, and stopping the train.

Claim.—The brakes D, constructed as described, when connected by the bar L, and held in place by the bolts T and spring W, and when operated and applied by the arrangement of catches and disengaging apparatus, all substantially as and for the purpose set forth.

81,569.—GEORGE W. N. YOST, Corry, Pa., assignor to CORRY MACHINE CO., same place.—*Harvester*.—August 25, 1868.—The cases which compose the body of the machine are held together by a bolt, which is depressed in the middle so as to receive and support a box for the gudgeon of the bevel pinion.

Claim.—The support bolt I, when used to fasten together the cases A and A', forming the body, and also to support the gudgeon box of the bevel-pinion shaft N within the body, as described, for grass and grain cutting machines.

81,570.—CHARLES B. KING, Gallatin, Tenn.—*Potato Slicer*.—August 25, 1868.—The knife and gauge plate are so arranged in the frame that the distance between the two can be adjusted to the desired width of the slices to be cut.

Claim.—The gate frame E, when the same is provided with a knife, F, and gauge plate G, and is used in combination with the table H, and the whole is so constructed and arranged as to operate substantially as described.

81,571.—ALEXANDER VAIL, Henry, Ill.—*Plow*.—August 25, 1868.—The beam which supports the plow is made literally adjustable so as to enable the plow to take more or less land. A slide is so arranged as to enable the plow to be lifted out of the ground at any moment. Two hounds hinged to the axletree support upright arms on which is a lever for operating the plow beam.

Claim.—1. The beam C, supporting the plow D, and rigidly secured to the axle A, in combination with the driver's seat S, the hinged hounds E E', and tongue F, substantially as and for the purpose herein set forth.

2. The slide K, arranged to operate in connection with the beam, hounds, and tongue, substantially as and for the purpose described.

3. The hinged hounds E E', in combination with a plow suspended from a beam, rigidly secured to the axle, substantially as described.

4. The combination of the beam C, plow D, hinged

hounds E E', tongue F, lever I, axle A, and driver's seat S, substantially as and for the purpose described.

81,572.—SQUIRE AINSWORTH, Pittsburg, Pa.—*Flexible Pipe Joint Coupling*.—September 1, 1868.—A chain is so attached to a spring-hinged coupling that when the ears are too far apart it uncouples the pipes.

Claim.—1. A pipe connection, consisting of a conical recess in the end of one pipe, and a frustum of a cone at the termination of the end of the other, said pipes being so held together by a clamp or other adequate means of support as to permit the rotary movement of one or both of the said pipes without variation from the plane of said movement, all as and for the purpose heretofore described.

2. In combination with the foregoing, the spring-hinged coupling nut C', constructed substantially in the manner described, for the purposes specified.

3. The chain G, in combination with the spring-coupling C', substantially as and for the purpose set forth.

81,573.—SAMUEL T. ALEXANDER, Pittsburg, Pa.—*Railway Chair*.—September 1, 1868.—Clamping pieces are so constructed as to act as levers to hold the rails when pressure is applied.

Claim.—A railroad chair, composed of a bed plate A, and movable clamping pieces, substantially as and for the purpose described.

81,574.—EDWIN ALSOP, New York, N. Y.—*Hand Mill*.—September 1, 1868.—Simply an arrangement of devices the combination of which and the several features are disclaimed.

Claim.—The arrangement herein described, of the vertical shaft F, removable grinding cone H, tapering cylinder I, corrugated vertically on its inside, hopper J, scraper L, chamber K, with discharge orifice K', wrought-iron frame A, screw plug G, shaft C, fly wheel B, and bevel gearing D E, for the purpose set forth.

81,575.—SAXTON J. ARNOLD and AMOS F. CLARK, Raymondsville, N. Y., assignors to SAXTON J. ARNOLD, same place.—*Machine for Making Barrels*.—September 1, 1868.—Hollow cone-shaped hubs are secured to a shaft having a right and left hand screw chased on it. Pins held down by springs play in slots in flanges on the outer ends of the hubs. The inner ends of the pins bear against cone-shaped nuts which force the pins outward against the barrel.

Claim.—The adjustable flanged cone-shaped hubs C, when provided with the sliding pins F and springs f in the flange E, in combination with the cone-shaped nuts G, and screw shaft A, as herein shown and described.

81,576.—E. H. ASHCROFT, Boston, Mass.—*Non-Corrosive Valve Seat*.—September 1, 1868.—Metals that will not corrode by the action of water.

Claim.—1. An alloy of nickel and copper, in any proportions, as set forth, for the construction of valves or valve seats for steam, &c.

2. An alloy of gold or silver, in any desired proportions, for the construction of valves or valve seats for steam, for the purpose set forth.

3. An alloy of aluminum, or aluminum alone, for the construction of valves or valve seats for steam, for the purpose set forth.

81,577.—JOHN BACHELDER, Norwich, Conn.—*Machine for Covering Cord*.—September 1, 1868.

Claim.—1. The miter gears a' a e, central shaft C, supports A¹ A², bobbin gears d¹, covering cord carriers F, guide J, and gears l L, in combination, and operating so that each thread of a strand is covered with finishing material, and the several strands thus covered, twisted, the finishing material being laid in a converse direction to the twist imparted to the respective strands, all substantially as set forth.

2. The shaft b, gears a' a, shaft C, sleeve e', and pinions e d, stationary support A¹, geared spool-carrying plates d¹, support A², gear D, covering-cord carriers F and guide J, combined and operating substantially as and for the purpose set forth.

3. In combination with the above, the winding

and twisting flier, constructed and operating as described.

81,578.—EDWARD BAGGETT, Fall River, Mass.—*Shuttle for Loom.*—September 1, 1868.—Designed to lessen the wearing action of the spring upon the shoulder of the spindle.

Claim.—The combination, with the spring A and shoulder C, of the spindle of the secondary spring B, notched, slotted, and sliding, substantially as and for the purpose described.

88,579.—JOSEPH W. BAILEY, New Orleans, La.—*Marking Weather Boarding.*—September 1, 1868.—The boards are marked to show the required lap of each board in putting on weather boarding.

Claim.—The marking of weather boards, in the manner herein described, during the operation of manufacturing them in the saw mill, or afterward, during the process of dressing them in the planing machine, as and for the purpose set forth.

81,580.—DAVID BAKER, Boston, Mass.—*Well Tube.*—September 1, 1868.—The countersinks around the holes in the bottom of a well tube are provided with double strainers and filterers, to prevent the sand from entering the tube.

Claim.—1. The double strainer D, with intervening filtering material, arranged and operating in combination with or in continuation of a well tube, substantially as and for the purposes set forth.

2. The point B, coupling C, tube A, and strainer D, all constructed, arranged, and operating, substantially as and for the purposes above set forth.

81,581.—DAVID BAKER, Boston, Mass.—*Well Tube.*—September 1, 1868.

Claim.—1. A conical point F, formed with perpendicular sides, and with shoulders between, the apex being formed with one or more drill edges, the sides *a* being elongated more or less, whereby the earth may be forced at right angles from said point in penetrating the ground, all substantially as shown and described.

2. The combination of the interior perforated tube A, and the exterior screen H, when a chamber is formed between said tube and strainer, substantially as and for the purposes set forth.

3. The arrangement of the point F, in combination with the tube E and holes therein, strainer or screen H, and the chamber or space formed between the strainer and tube, arranged and operating substantially as and for the purposes herein set forth.

81,582.—DAVID BAKER, Boston, Mass.—*Well Tube.*—September 1, 1868.—The slide forms a part of the well tube and covers a strainer while the tube is driven. On raising the tube the slide uncovers the wire strainer, which is secured to the point.

Claim.—1. The slide J, whether placed on the inside or outside of a strainer, in a well tube, so arranged and secured to the point, and operating as to leave the woven wire as the only tube near the lower part of the well, substantially as and for the purposes herein set forth.

2. The combination of slide J with strainer K, well tube I, and coupling L, with screw point M, made, arranged, and operating substantially as and for the purposes herein set forth.

81,583.—MYRON J. BARCALO, Mount Morris, N. Y.—*Mop Wringer.*—September 1, 1868.—The bearing of the skeleton all around the interior of the pail gives steadiness to the wringer, which it retains in place. The pivoted arms allow the pressing rollers to assume the most effective positions upon the larger rollers.

Claim.—1. The skeleton frame B, made up of the hoops *b b* and standards *c c*¹ *c*², and having combined therewith the rollers C D D', and bail or treadle E, the whole being so arranged as to be applied to the inside of an ordinary pail, as herein set forth.

2. The combination with the stationary roller C, of the pressing rollers D D', mounted upon the arms *f f*, arranged as described, and operating in the manner and for the purpose specified.

81,584.—LEWIS F. BETTS, Chicago, Ill.—*Lantern.*—September 1, 1868; antedated August 20,

1868.—The upper end of the globe is secured in the cap by a series of springs or a spring band. The main portion of the base is constructed in sections provided with flanges which are secured by eyelets. The guard is supported by ledges at its base so as to leave an open space between the guard ring and base of the lantern. The lamp pot is secured to the base by means of inclined edges or cams.

Claim.—1. The spring band C, for securing the upper end of the globe, substantially as specified.

2. Constructing a lantern base of two or more sections D, provided with flanches F, substantially as and for the purposes set forth.

3. Securing the flanches and forming the carrying holes for the guard by means of eyelets at *d*, substantially as described.

4. The brackets or ledges F, for supporting and carrying the guard at a distance from the main portions of the base, substantially as specified.

5. The rod or ring J, for strengthening the base and supporting the brackets or ledges without materially obstructing the light, substantially as specified.

6. The extended guard rods N, when such extended portion *e* is used for a hook or catch, substantially as described.

7. The combination and arrangement of the guard, provided with hooks *e* with the brackets F, substantially as and for the purposes specified.

8. The spring stop K, in combination with the hooks *e* and bracket F, for preventing the detachment of the guard, substantially as specified.

9. The inclines or cams *b*, for securing and tightening the lamp, in combination with the pins *c*, substantially as specified.

81,585.—LEWIS F. BETTS, Chicago, Ill.—*Can Top.*—September 1, 1868.

Claim.—1. The inclines or cams *a*, when burred or turned down so as to form the cam on the edge of the metal of which the breast or permanent portion of the top is constructed, and operating substantially as specified.

2. The handle *f*, when projecting through the removable top or cover B, so that its ends will form the lugs or pins *d*, substantially as described.

3. The permanent portion of the top or breast A, provided with the cams or inclines *a*, in combination with the removable portion or cover B, and lugs or pins *d*, substantially as and for the purposes specified.

81,586.—A. T. BLEYLEY, Conception, Mo.—*Churn Dasher.*—September 1, 1868.—The funnel-shaped body carries air down into the milk where it is forced out, producing agitation as it rises. The flange is an adjunct of the funnel in forming the butter. The wings gather the butter when the dasher is rotated.

Claim.—As a new article of manufacture, the churn dasher, consisting of the inverted funnel-shaped tube A B, dish-shaped perforated flange C, and radial wings D, all constructed and arranged to operate as herein shown and described, for the purpose specified.

81,587.—GEORGES BOSSIERE, Paris, France.—*Decolorizing Tannin Liquid.*—September 1, 1868.—Scraps or clippings cut from the skin during its treatment are freed from lime and dissolved by heat in such a quantity of water that the solution, after cooling, will remain liquid and limpid. The maeilage thus obtained, or other suitable gelatine glue, is mixed with the tannin liquid for the purpose of decolorizing the same.

Claim.—1. The use of the herein-named substance, for decolorizing tannin juices, substantially in the manner described.

2. The method of decolorizing tannin, by mixing with it the ingredients herein named, or either of them, in the proportions substantially as specified.

81,588.—EDWIN D. BRAINARD, Albany, N. Y.—*Refrigerator.*—September 1, 1868.—“Dead air” chambers constitute the walls of the refrigerator, the object being to secure a spacious and readily portable structure.

Claim.—The employment of independent metallic

chambers, closely sealed and secured together by clamps, in the construction of refrigerators, substantially in the manner and for the purposes above described.

81,589.—VICTOR M. R. BRANCH, Richmond, Va.—*Churn.*—September 1, 1868.

Claim.—1. The combination of the external dasher B with the internal dasher B', when constructed as shown and described, and revolving in opposite directions, as specified, and for the purpose set forth.

2. The combination of the dasher B, hollow spindle D, and pinion F, with the dasher B', spindle C, and pinion G, all as and for the purpose specified.

81,590.—ARTHUR BRIN, Paris, France—*Apparatus for Carbureting Air and Applying the Same.*—September 1, 1868.—The principal feature consists in the means for effecting the continuous and graduated feed or supply of the carbureting fluid to the chamber wherein the gas is formed.

Claim.—1. In apparatus, such as described, the combination, with the fluid reservoir and carbureting chamber, of an interposed feeding vessel, connected with both the reservoir and the carbureting chamber, in the manner described, and communicating with the latter by means of wicking, which supplies the quantity of fluid required to charge the air in said chamber, as set forth.

2. The combination, with the feeding vessel, and trough formed therein for receiving the liquid from the reservoir, of a series of siphons, of graduated length, and racks, and pinions, and shaft for elevating or lowering said siphons, and thus regulating the flow of the liquid to the carbureter, in the manner shown and specified.

3. The employment, in connection with an apparatus such as described, of a blowpipe, to which air from the blower, and carbureted air from the gas-generating chamber, are supplied, substantially in the manner described, and illustrated in Fig. 5.

4. The combination, with a tubular boiler, of two series of nozzles, arranged with relation to each other and the boiler flues, as represented in Fig. 6, the one series communicating with a blower or air-supply apparatus, and the other with the gas-generating chamber of the carbureting apparatus, substantially as and for the purposes herein set forth.

81,591.—GEORGE H. BROCK, Huntington, N. Y.—*Organ Pipe.*—September 1, 1868.—A series of the curved plates and intermediate disks make up the organ pipe. Air forced through the perforations in the bottom of the wind-blast is directed against the sounding edge of the pipe by the plate, whose pendent portion precludes the movement of the air backward toward the sounding edge.

Claim.—1. Constructing an organ pipe of a curved plate, A, held between the disks B, as set forth.

2. The plate D, for guiding the wind from the wind chest against the mouth of a curved organ pipe, as specified.

3. The pendent arrester *d*, arranged in the curved organ pipe, substantially as and for the purpose herein shown and described.

81,592.—WILLIAM P. BROWN, Watertown, N. Y.—*Advertising Show Frame.*—September 1, 1868.—The several appliances of the frame admit of the convenient insertion or removal of a number of advertising cards. The shutters protect the glass from breakage during the night.

Claim.—The bulletin frame, as constructed of the outer frame A and inner frame *d*, the latter divided by sash strips *a*, and provided with panes of glass and removable backs B, the frame A having moldings and fastening devices, adapted to secure the shutters *n*, all arranged substantially as herein shown and described, for the purposes specified.

81,593.—ABNER H. BRYANT, Wilmington, Del.—*Safety Attachment for Egg Carrier.*—September 1, 1868.—The interposition of these frames, with their cloth bottoms, prevents the eggs from being jostled out of the pockets of the trays.

Claim.—The frame, with its cloth bottom arranged and constructed, as shown, as a safety at-

tachment for the suspension egg-carrier hereinbefore mentioned.

81,594.—J. W. BURKHART, Cameron, Mo.—*Hand Spinning Machine.*—September 1, 1868.—An arrangement for tightening the belts.

Claim.—The combination of the pulley B, tightening pulley *f*, provided with its adjustable support *e*, pulley *b*, and multiplying wheel C, spindle arm D, and adjustable support E of the same, when constructed and arranged substantially as and for the purpose described.

81,595.—A. HARVEY CALHOUN and GEORGE W. COLLINS, West Lebanon, Pa.—*Spoke Tenoning Machine.*—September 1, 1868.—The cutters are arranged so as to form the sides and shoulders of the tenon simultaneously.

Claim.—The cutters *ln*, attached to the adjustable straight bars *m* and the curved braces O, all suspended from the upper cross bar *a* of the sash frame, and constructed, arranged, and operating as herein shown and described.

81,596.—ALEXANDER CAMPBELL, Oxford, Ind.—*Animal Trap.*—September 1, 1868.—When either of the hinged plates is depressed by the weight of the animal, the latch is raised from the notch in the catch, and the platform tilts.

Claim.—The latch E and hinged plates F, having tongues *a*, adapted to swing with the centrally-pivoted platform A, and arranged with relation to the notched plate fixed to frame D, as herein shown and described.

81,597.—S. O. CAMPBELL, Leavenworth, Kansas.—*Corn Planter.*—September 1, 1868.—Projections on the ground wheels actuate a frame and thereby retract the seed slide, bringing the cell in line with the discharge orifice in the shoe. The spring gives the slide its return movement. A clutch compels the two parts of the axle to rotate together when desired.

Claim.—1. The seed boxes F F, arranged in combination with the shoes I I, slides K K, frames L, and springs M, with the projections *m* on the wheels, substantially in the manner as and for the purpose set forth.

2. The clutch, composed of the two notched plates D D', on the axles C C', and the sliding or adjustable plate E, provided with the arms *e*, and placed on the axle C', all arranged substantially as and for the purpose specified.

81,598.—THOMAS L. CANARY, Brownsburg, Ind.—*Base Ball Tally Board.*—September 1, 1868.—Blue and black balls opposite the players' names indicate, respectively, "runs" and "outs." Green and black balls placed on the extra rows of pins at the right and left are used to keep an account of the "fly" balls caught.

Claim.—1. The use of the wire pins and variously-colored balls, as represented at D D and C, for keeping game in base-ball playing, substantially as described.

2. The use of movable or adjustable pins for keeping a game, and the method of clearing the balls from the pins, substantially as described.

3. The arrangement of the pins on the board, substantially as and for the purposes set forth.

4. The slate or other marking surface, in combination with the pins and ball, substantially as and for the purposes set forth and described.

81,599.—N. P. CHANEY, Potsdam, N. Y.—*Churn.*—September 1, 1868.—A downward flow of air through the tubular beaters, to agitate the cream, is induced by the peculiar form of the lower cross-bar. The scrapers remove the cream that adheres to the under side of the lid.

Claim.—The combination, with the tubular beaters D, of the arm B, provided with the scrapers *b b*, substantially as and for the purpose described.

81,600.—JOSEPH L. CHAPMAN, Philadelphia, Pa.—*Rolling Mill.*—September 1, 1868.—The pile to be compressed into a rod is advanced through the longitudinal space between the rollers, the latter

being so formed and arranged as to feed the pile and compress it at the same time.

Claim.—1. The arrangement of three smooth conical rollers, rotating in different planes, and operating in the manner described, to form and feed the rod simultaneously, as above specified.

2. The adjustment of the rollers C' C', to form rods of different sizes, by means of ball and socket joints at one end, and set screws and journal boxes at the other end, substantially in the manner shown and set forth.

81,601.—EDWIN CHESTERMAN, Boston, Mass.—*Interfering Strap for Horses.*—September 1, 1868.—The rubber guards are attached to the padded strap which is buckled upon the horse's leg, the object being to rectify "interfering."

Claim.—Leather interfering straps, in combination with rubber guards or projections, as herein shown, for the purpose specified.

81,602.—IRA CHOATE, Exeter, N. H., assignor to himself and DANIEL LEE, Boston, Mass.—*Locomotive Spark Arrester.*—September 1, 1868.—The tube and its adjuncts are employed to convey the smoke, steam, and sparks from the smoke-stacks of locomotive engines to the rear of the trains. Novel appliances facilitate the making up of the train. A cover is removed to enable the draught to be maintained in the ordinary manner when the engine is standing.

Claim.—1. The construction and arrangement of the tube A, smoke stack E, cover D, and air apertures a a a a a, substantially as shown and described.

2. The coupling C B, cord or band d, and guides e e, substantially as shown and described.

3. The coupling C B, constructed as described.

4. The arrangement of the cord d and guides e e, substantially as described.

81,603.—ANDREW CHRISTIAN, New York, N. Y.—*Velocipede.*—September 1, 1868.—The two operating levers are connected with the connecting rod of the crank in such a manner that the dead point of the one will be overcome by the movement of the other.

Claim.—The operating device of a velocipede, consisting of the bell crank levers G H, one having a vertical and the other a horizontal lower end, and of the rods m i, and crank b, all made and operating substantially as herein shown and described.

81,604.—JAMES CLINE, Easton, Ohio, assignor to JOHN WALLS, same place.—*Cloth Guiding Attachment for Sewing Machines.*—September 1, 1868.—To be used in sewing circular and ornamental work. The cloth being adjusted upon the machine, the pin is set at the center of the circle to be sewed, and the points of the holder settle into the cloth and prevent it from puckering or drawing.

Claim.—The revolving holder D, constructed as described, in combination with pin B, standard A, and spring C, as and for the purpose described.

81,605.—JOHN C. COOKSON, Lancaster, Pa.—*Distilling Apparatus for Spirits.*—September 1, 1868.—An extra vessel is divided into three chambers; the vapor expands and parts with the heavier particles of oil in the lower chamber; it is then conducted through a perforated bottom into a chamber supplied with charcoal which purifies it, thence into a funnel shaped chamber, from which it escapes through the apex into a condenser.

Claim.—1. An extra vessel, III, with its chamber A, in combination with the chamber B and its perforated bottom, and an upper chamber, C, with its conic head and central pipe 9, pipes 7 and 6, issuing from their respective departments, in the manner shown and specified, for the purpose set forth.

2. In combination with said extra vessel III, with its chambers A, B, and C, the still D, with its pipe 10, sleeve 8, faucet funnel d, mounted and arranged substantially as shown and described.

3. The chamber F, when combined with the worm of the condensing vessel and the extra vessel III, by means of the several pipes 6, 7, 8, and 9, substantially arranged in the manner and for the purpose specified.

81,606.—CORDIAL CRANE, Boston, Mass.—*Drier.*—September 1, 1868.—Designed as an article of furniture, which shall conceal the clothes while drying, and which, when not so used, may serve as a wardrobe, stand, table, or cupboard.

Claim.—As a new article of manufacture, a clothes-drying closet, constructed with doors and pivoted racks, and provided with inlet passages to receive heated air from register pipes, and with outlets for the escape of heated air saturated with moisture, all substantially as and for the purpose described.

81,607.—PETER CUNNINGHAM, Eckley, Pa.—*Slotting Auger.*—September 1, 1868.—The wood is fed laterally to the auger while the latter is revolving in a mortising or slotting machine.

Claim.—A mortising or slotting auger, having rows of gouge or chisel lips formed on the edge of the twist, substantially as described, for the purpose set forth.

81,608.—JONAS P. CURTISS, New Britain, Conn.—*Machine for Grinding Metal Articles.*—September 1, 1868.—A series of clamping jaws hold the articles to be ground. A quick automatic motion is imparted to the holder transversely to the grinding surface of the stone. An intermittent forward motion is given to the holder by means of an arm on the latter placing in and out of gear a bevel wheel actuating a screw which works in a nut in the holder.

Claim.—1. The arrangement of a series of clamping jaws, a, in the holder A, substantially as and for the purpose set forth.

2. The holder A, made in two parts, one part being fitted into the carriage C, and retained by the screw spindle k, while the second part is connected to the first part, so that it can be readily removed, all as and for the purpose described.

3. The combination, with the holder A, of the pitman e, crank motion d e, and screw spindle k, operating substantially as described.

4. The sliding wheel i, the wheel j, forked arm l, and screw spindle k, in combination with the reciprocating holder A, substantially as described.

81,609.—HENRY S. DECKER, New York, N. Y.—*Chimney Cowl.*—September 1, 1868.—The wind or current of air which enters the flaring mouth becomes a vigorous blast in escaping through the narrow orifice between the cone and the adjacent pipe, and thus induces a very active flow of air out of the parts communicating with the flue.

Claim.—The ventilator herein described, having an interior cone inclosed within the exterior walls of the ventilator, so as to provide an annular space between its exterior and the interior of the inclosing shell, which may be extended by a cylindrical attachment to the inner cone, as represented, the several parts being combined and arranged relatively to each other, and to the passage or pipe for distributing fresh air by the force of the wind upon the cone, substantially as shown and described, for the purposes set forth.

81,610.—HENRY E. DOSTER, Bethlehem, Pa.—*Cigar Pipe.*—September 1, 1868.—The pipe is formed of an inner metallic tube, which is covered with a wooden tube, the latter being covered with paper, in imitation of the wrapper of a cigar. A perforated mouth piece is inserted in one end and a piece of porcelain, in imitation of the ashes of a cigar, in the other.

Claim.—A cigar pipe, formed of the parts A, B, C, D, and E, arranged substantially as shown and described, and for the purposes set forth.

81,611.—JOSEPH W. DOUGLAS, Middletown, Conn., assignor to W. DOUGLAS and B. DOUGLAS, same place.—*Grindstone Frame.*—September 1, 1868.—A standard, to which the tool rest is secured, can be adjusted longitudinally on guides, and is secured in position by a set screw. The shaft has a screw thread on it where it passes through the stone, and is provided with a slot in which projections on the washers which hold the stone fit, said washers being held by nuts.

Claim.—1. The adjustable support or standard H,

with tool rest J applied to it, substantially as and for the purpose specified.

2. The providing the shaft E with a screw thread, *g*, having a slot or groove, *h*, made longitudinally in it, in connection with the washers Q Q, furnished with lips or projections *i*, to fit in the slot or groove *h*, and the nuts R R on the screw thread *g*, all arranged substantially as and for the purpose set forth.

81,612.—DANGERFIELD DUNN, Lewisport, Ky., assignor to himself and WILLIAM B. MILLER, same place.—*Baling Press*.—September 1, 1868.—The platen rod is attached to the slide by a pin, upon withdrawing which the platen may be used as a beater.

Claim.—The detachable platen G, in combination with the toggles C C' and slide D, all arranged substantially as and for the purpose specified.

81,613.—LEWIS B. ECKER, Union Bridge, Md.—*Machine for Jointing Staves*.—September 1, 1868.—A plane, provided with bits facing both ways, is arranged upon jointed adjustable guide rods, which give the plane any desired obliquity. The plane and rods are arranged on a gate which can be raised or lowered. The stave is secured to a swinging bed moved by hand and having stops behind the bed to regulate the width of the staves.

Claim.—The combination of the plane B, arranged in the adjustable gate or frame L as described, with the swinging carriage bed I and the stops O, substantially as set forth.

81,614.—JACOB ERDLER, South Bristol, N. Y.—*Cheese Press*.—September 1, 1868.—A screw works in the upper bar of a sliding frame. A weighted lever has its fulcrum on a standard secured to the main frame of the machine, so that when the screw is turned down the lever with the weight is raised, thus creating an even pressure.

Claim.—The arrangement and combination of the screw D, cross-bars E F, rods *a a*, crank shaft G, and weighted lever H, operating substantially as and for the purpose set forth.

81,615.—JOHN FASSAUER, Wheeling, Iowa.—*Churn*.—September 1, 1868.

Claim.—The dasher, constructed as described, and consisting of the radial arms H H', *e d*, *e' d'*, and vertical connecting slats *e*, perforated at *f*, all arranged upon the vertical shaft B, to operate as herein set forth.

81,616.—H. T. FOGG, San Paulo, Brazil.—*Handle for Dental and Surgical Instruments*.—September 1, 1868.—The instruments are made with short handles, provided with wedge-shaped dovetails on their ends, which fit in a recess in a handle, thus adapting one handle to a set of instruments.

Claim.—Adjustable handles for dental and other surgical instruments, constructed substantially in the manner and for the purpose herein shown and described.

81,617.—ELIAS T. FORD, Stillwater, N. Y.—*Friction Clutch*.—September 1, 1868.—A sleeve, secured to the axle, has a conical recess into which a conically-shaped collar fits, the latter being provided with cams which engage with cams on the hub of the wheel, when a forward motion is given, thus rotating the axle, but on backing, the cone is relieved from the recess and the axle remains stationary.

Claim.—The friction clutch, constructed and arranged with the drive wheels A A, and being composed of the cone D, with its corresponding hollow sleeve, E, the cam 2 D on its end, and the corresponding cam 3 D on the drive hub C, arresting and relieving the motion or movement of the main axle B in its forward and backward motions, in the manner and for the purpose described.

81,618.—THOMAS H. FOX, Hanover, Va.—*Water Wheel*.—September 1, 1868.—The upper wheel revolves around the penstock, and a wheel rotating beneath the penstock has its circumferential rim connected to the upper wheel by means of brackets, which admit of a ready disconnection when it is desired to run the lower wheel alone.

Claim.—1. A vertical penstock, which is provided with lateral passages through its side, and vertical passages through its bottom, adapted for supplying two water wheels, arranged and supported substantially as described.

2. The arrangement, consisting of the cylindrical penstock B' *d*, frame A A, stay or suspension rods N N, shaft F, gate C, wheel D D *e*, the said parts being constructed as described, and so combined that the wheel D D *e* is suspended on its shaft by the top of the penstock, as shown and described.

3. The regulator J, constructed as described, and arranged upon the bottom C' of the penstock, in combination with passages *g'*, a wheel, L L' *g*, and a wheel, D D *e*, substantially as described.

4. A cylindrical penstock, which is constructed with lateral and vertical passages through it, and a chute, G, leading into its upper end, in combination with two water wheels and their regulators, arranged to operate substantially as described.

5. The upper revolving water wheel, connected to and supported by the lower water wheel and vertical shaft F, said upper wheel being detachable from the lower wheel, substantially as described.

81,619.—FRANK FULLER, New York, N. Y.—*Garden Implement*.—September 1, 1868; antedated May 5, 1868.

Claim.—1. A universal garden implement, having one extremity provided with a chisel-shaped, bifurcated, or other pruning edge or edges, and the other extremity provided with a forked, spoon-shaped, or other digger, dibble, drill, spade, and flower and fruit gatherer, the whole constructed substantially as described.

2. Providing said universal garden implement, or any implement of similar construction, or designed for similar uses, with one or more pruning loops, *b*, arranged between the two extremities of said implement, substantially as described.

3. Providing a garden implement with a shield or protector for such portion of the hand as may be most liable to be soiled or injured, said shield being constructed of India rubber, leather, cloth, metal, or any other suitable material.

81,620.—JOSEPH GALLI, San Francisco, Cal.—*Machine for Manufacture of Screwed Boots*.—September 1, 1868.—The screw is formed on the wire as it comes from the reel and immediately before it enters the sole, the knife completing the operation by severing the wire. The jaws admit of changing the tap to suit wires of different sizes.

Claim.—1. The rigid jaw B, and movable jaw C, operated from below, attached perpendicularly to the plate A, and carrying the screw plate *a b* at their outer end, the whole constructed and operated substantially as and for the purpose herein described.

2. The cutter F, working close to the sole, together with its operating lever G, link *d*, and arm H, constructed and operating substantially as described.

81,621.—G. S. GARTH, Mill Hall, Pa.—*Wagon Axle*.—September 1, 1868.—The object is to lessen the friction of the hub on the axle-arm, and to strengthen the latter at the shoulder.

Claim.—1. An axle, provided with collars *a b*, of anti-friction metal, the latter (*b*) being cast onto a dovetailed collar, *e*, which is formed on or fitted to the axle, as herein shown and described, when the raised portions of the band *b* and shoulder *f* are encircled by a strengthening band, *d*, as set forth, for the purpose specified.

2. The strengthening band *d*, encircling the raised portions of the band *b* and shoulder *f*, substantially as herein shown and described, and for the purpose specified.

81,622.—SAMUEL H. GILMAN, Galveston, Texas.—*Cotton Picker and Cleaner*.—September 1, 1868.—The rotary fan blades impel the locks of cotton from one point to another, and their teeth beat and tear the fibers asunder. Extraneous matter thus separated from the cotton is blown through the slats, which are arranged with a view to prevent the lodgment of refuse upon their tops. As the cotton pro-

ceeds through the machine the blows of the fan beaters increase in vigor.

Claim.—1. The combination of the tapering trunk, having a flat slatted bottom, and segmental caps J J, and the combing fan blades, the extremities of which run at different speeds, substantially as and for the purpose described.

2. The pivoted, oscillating, tapering, and obliquely set slats, constructed as described, of bottom *k*, applied so as to present a flat surfaced grated bottom and inclined chutes, when the slats are in one position, and to present an irregular bottom when the slats are in another position, as shown in red in Fig. 5, the said slats being connected to reciprocating bars, all substantially as and for the purpose described.

3. The combing fan blades *s s*, the extremities of which run with differential speeds, in combination with a trunk or tunnel, which is tapering in form, and has its bottom formed of vibrating slats, constructed substantially as and for the purpose described.

81,623.—JOHN R. GRACE, Brooklyn, N. Y.—*Life Boat.*—September 1, 1868.—Designed as an improvement on his patent of March 6, 1860. Two cylindrical partitioned air chambers extend along the sides of the bottom of the boat and form keels. Air chambers also extend along the upper part of the sides of the boat.

Claim.—1. The partitioned cylindrical air chambers B B, arranged as described, forming fixed parts of the bottom C, and extending below the same, to form one or more keels, as herein described, for the purpose specified.

2. The described arrangement of the air chambers E E and cylinders B B, with relation to each other, the walls of the boat, and the bottom, C, as herein described, for the purpose specified.

81,624.—DUBY GREEN, New York, N. Y.—*Distilling Apparatus for Spirits.*—September 1, 1868.—The communicating chambers of the boiling apparatus all produce vapors from the mash contained in them; the lowest chambers, which hold the weakest mash, receiving the greatest amount of heat, and the highest the least. The stirring chamber is heated by vapor from the boiling apparatus, instead of by direct steam. The concentrating vessel is divided into several chambers, so as to bring the vapors in contact with a large cooling surface.

Claim.—1. The boiler A of a still, when subdivided into a series of chambers, one above the other, these chambers being respectively connected with each other by means of the pipes B and C, and provided with slides *e*, as set forth.

2. Connecting the valves *g*, that are in the discharge pipes *f* of the boiler A, all by one rod, E, as described, for the purpose specified.

3. Providing the stirrer with two revolving disks, H H, made as described.

4. The arrangement and combination of the vessels G, T, V, which contain the stirrers H, all made and operating substantially as herein shown and described.

5. Conveying the vapors from the boiler A to the stirring apparatus, so that no steam is required in the latter, as specified.

6. The dephlegmator O, when composed of a series of separate parts or vessels, *p, q, r*, each having two compartments, *w* and *x*, and all connected with each other by means of pipes P, all made and operating substantially as herein shown and described.

7. The arrangement and combination, in one distilling apparatus, of the boiler A, stirring vessel G T, stirrers H, rectifiers J, L, N, dephlegmator O, and cooler S, all made and operating substantially as herein shown and described.

81,625.—S. A. GREEN, Lexington, Ind.—*Combined Latch and Lock.*—September 1, 1868.—To liberate the bolts the tumbler bar is raised from the outside by a key and from the inside by a knob, after which the rack bolt is thrown back by its key or knob, and the latch bolt by one of its knobs. The pivoted spring-actuated bar causes the tumbler to engage both bolts when the lower is thrown outward, but if the lower bolt be allowed to remain in its

retracted position the latch bolt becomes operative alone.

Claim.—The two bolts C and D, the V-shaped tumbler bar, with its projections *b* and *d*, the pivot bar D, springs E and H, and the arm F, all constructed and operating substantially as shown and described, in combination with the rack *m* and pinion *k*, branches *f f* and *g g*, all as set forth.

81,626.—HENRY P. GREGG, Cincinnati, Ohio.—*Brush Holder and Mop Head.*—September 1, 1868.—The brush is held by the hook bolt and spur alone, but the bent wire and casting and hook bolt cooperate in holding the mop.

Claim.—1. The hook bolt E, operated by the thumb nut F, with the head A, and spur G, for the purpose of holding a brush, substantially as described.

2. The hook bolt E, in combination with the bent wire D and head A, for the purpose of holding a mop, as set forth.

3. Combining a brush holder and mop head of the hook bolt E, thumb nut F, wire D, spur G, and head A, substantially as and for the purpose set forth.

81,627.—JOSEPH HAAS, El Paso, Ill.—*Seeding Machine.*—September 1, 1868.—The caster wheel serves as a rear support to obviate a tendency of the machine to tilt upward at front. The driving rod of the seed slide is unshipped by the lever. The spring maintains the engagement of the rod with the crank wheel during operation.

Claim.—1. The placing of the seed box E upon the frame A, behind the wheels B, when the lower part of said frame is supported by a caster wheel, C, applied to a bar, D, secured to the under side of the frame A, and all arranged substantially in the manner as and for the purpose set forth.

2. The arrangement of the lever J and spring K, and the connecting rod H, substantially as shown and described, for the purpose of disconnecting the rod H from the crank pulley, when necessary or desired.

81,628.—JOHN C. HALL, Monroe, Wis.—*Harvester Rake.*—September 1, 1868.—The lower part of the reel staff may rotate, and as the reel revolves, the connections between the reel shaft and rake staff, together with the cam guide, cause the rake head to sweep over the platform and afterward assume a position to constitute one of the beaters of the reel.

Claim.—1. The rake staff, constructed in two parts, G and H, carrying the rake M, and pivoted directly to the reel shaft K, substantially in the manner and for the purposes set forth.

2. The jointed arm N, when its outer end is rigidly fixed to the rake staff H, for the purpose set forth.

81,629.—JOHN S. HALL, Pittsburg, Pa.—*Safety Harness Saddle Tree.*—September 1, 1868.—The keeper prevents the check rein from being casually detached from the bearing hook.

Claim.—The keeper C, when arranged and operated substantially in the manner and for the purpose described.

81,630.—JOSEPH L. HALL, Cincinnati, Ohio.—*Combination Padlock.*—September 1, 1868.—In closing the hasp its shank acts against the lock bolt and interlocks with the latter while withdrawing its dog from the gateways of the tumblers; hence, in order to lock the hasp it is only necessary to break up the combination by turning a thumb screw.

Claim.—1. The combination of a series of rotating tumblers with a rocking lock bolt, operated by the hasp only, and inclosed in a case having no key-hole, substantially as described.

2. The combination of a series of rotating tumblers, C', the rocking lock bolt D, and the tripping lever E, or its equivalent, all constructed and arranged to operate substantially as described.

81,631.—JOHN M. HARTNETT, Waukegan, assignor to ROBERT L. FABIAN, Lake Forest, Ill.—*Corn Husker.*—September 1, 1868.—The ear, dropping from the stalk-stripping rolls, is directed by the chute be-

neath the hinged top and upon the inclined rotating husking rolls, the members of each pair of which revolve toward each other, grasp and detach the husk and silk, and discharge them underneath the machine, the ear being delivered at the end. The spurred peripheral rings of the rolls act as cutting guards to prevent the end of ear from getting between the rolls.

Claim.—1. The hopper or chute *h h*, with the metal extension *m m*, as and for the purposes herein specified.

2. The hinged door *i i*, with the pendant or fastening *q*, as and for the purposes herein specified.

3. The rolls *j j* and *n n*, varying in size, working together, the combination of iron and wood, and the covering with alternate rings of metal and rubber, and of spurred and plain metal, as herein fully specified, and for the purposes set forth.

81,632.—JOSEPH HATHAWAY, Woodstock, Vt. *Water Wheel.*—September 1, 1868.—The annular gate, when in one position, holds the gates open against the pressure of the water; in another position it leaves the gates free to be closed by the water. The spindle relieves the lower step of the wheel, and the bridge-tree is connected to a shaft whereby the wheel may be raised or lowered.

Claim.—1. The chutes *C*, in combination with the gates *D*, pivoted, as shown, and connected to the annular plate *E*, all arranged to operate in the manner substantially as and for the purpose set forth.

2. The arrangement of the spindle *H*, resting on the bridge-tree *I*, in connection with the tubular part *G* of the wheel shaft, which turns on *H*, and rests upon a fixed cone *a x*, and the part *G'* of the wheel shaft, which rests on the fixed spindle *H*, all arranged to operate in the manner substantially as and for the purpose set forth.

81,633.—P. P. HEMSTREET, Galesburg, Ill., assignor to himself and DAVID GUDTNER, same place. —*Tire Heater.*—September 1, 1868.—Doors are raised by means of a pivoted lever to permit the tire to be dropped between the stationary rims and upon the cross rods connecting said rims. The heat is regulated by a chimney damper and by dampers operated by pivoted levers passing out from beneath the bottom plate.

Claim.—1. The outer rim *A*, bottom *B*, lids *Q*, chimney *Z*, lever *U*, rods *S*, band *X*, bars *N o*, and inner rim *B*, all constructed, arranged, and combined as described and for the purpose set forth.

2. The dampers *D*, rods *T* and *S''*, and lever *F*, with rods *L* and *H*, and rim *C*, constructed and arranged as described, and combined with rim *B* and *A* and bottom *B*, substantially as described, and for the purpose set forth.

81,634.—JOHN A. HEYL, Boston, Mass., assignor to himself, JOSEPH G. LORING, and JOHN H. WIGGIN, same place.—*Railway Switch.*—September 1, 1868.—An arm is fastened at one end to one of the rails, at the other to a crank on a shaft provided with a pinion which is actuated by a segmental rack receiving motion through rods in the same manner as his patent of April 16, 1867. The crank is on center when the switch is in position, thus holding the switch firmly while the train passes over. Arms on the segmental rack are provided with studs which fit in slots in a plate so as to stop the rack when the crank is on center.

Claim.—1. The arrangement and combination of the arm *h*, the crank *g*, its shaft *f*, pinion *e*, and the toothed sector *d*, with the lever *K*, the switch and either or both pairs of connecting rods *A B, C D*, applied to such lever.

2. The combination and arrangement of the studs *c c* and the slotted plate *L*, with either or both sets of connecting rods *A B, C D*, the lever *K*, the toothed sector *d*, the pinion *e*, the shaft *f*, the crank *g*, and the arm *h*, the whole being applied to the switch and the road-bed, substantially as specified.

81,635.—J. W. HILTON and R. W. GREEN, Bradford, Pa.—*Ax.*—September 1, 1868.—The elevating edge of the ax is formed upon a separate piece, attached to the poll by dowels, so as to be readily replaced.

Claim.—As a new article of manufacture, a chop-

ping ax, having a removable edge, when the two parts *A* and *B*, composing said ax, are constructed substantially as and for the purpose shown and described, and secured together by removable dowels *d d*, all as set forth.

81,636.—HENRY P. HINZ, Dunton, Ill.—*Potato Digger.*—September 1, 1868.—The potatoes are unearthed by the forward shovel and are carried through the machine upon aprons, whereby the soil and vines are separated from them. The cleaning of the potatoes is completed by a screen, whence they pass into a chute, and thence to an elevator, which deposits them in bags.

Claim.—1. The combination of the shovel *H*, the conveyers *N* and *P*, and the screen *Q*, arranged to operate substantially as and for the purposes set forth.

2. The combination of the shovel *H* and the frames *F F*, supporting the conveyer *N*, when constructed and arranged in such a manner as to be adjustable vertically, so as to make the shovel run at different depths, as herein specified.

3. In combination with the said shovel, the arrangement of the arms *G G*, cross-bar *J*, arm *K*, and lever *L*, to operate in the manner specified.

4. The arrangement of the apron *t* below the conveyer and over the chute *R*, for the purposes specified.

5. The arrangement of the chute *R* with the screen *Q*, when used in combination with a conveyer, *P*, above the same, substantially as specified.

6. In combination with the conveyers *N P* and screen *Q* and its side chute, the arrangement of an elevator, *U*, so as to operate in the manner set forth.

7. The arrangement of a tipping platform, *Z*, below and to the rear of the discharge of the elevator, to sustain the sack, in the manner described.

8. Providing the said platform with one or more rollers, to facilitate the removal of the sacks when full, substantially as herein set forth.

81,637.—S. R. HOLT, Worthington, Ohio.—*Process of Making Vinegar.*—September 1, 1868.—Apple pomace is employed as the acetifying agent, the same being contained in a vessel whose lower part holds a filtering medium, through which the vinegar is drawn off from the pomace.

Claim.—Making vinegar from cider, beer, sorgho-juice, alcoholic and saccharine mixtures, by the herein-described process for acetifying and clarifying the same, by allowing the fluid or wash to stand upon the pomace, and then filtering or drawing off the same, substantially as set forth.

81,638.—JAMES HOWARD and EDWARD TENNEY BOUSFIELD, Bedford, England.—*Steam Generator.*—September 1, 1868.—Access is afforded to the main horizontal flues at their front ends when the boiler can be approached only at that point. Currents in the inner circulating tubes are prevented from interfering with each other, said tubes being adapted to admit of the passage of a scraper along the bottoms of the main tubes below.

Claim.—1. The construction and arrangement of the vertical tubes *B* and their inner tubes with the horizontal tubes or pipes *C* and *A*, whereby access is gained to the pipes *A* through the feed pipe, as above explained, for cleaning the boiler.

2. The construction of the horizontal pipes *A*, arranged with the feed pipe, having covered openings, whereby to gain access to the interior of the boiler, for cleaning out the same.

3. The internal tubes, constructed with lateral openings at bottom, as described, whereby to keep up the circulation of the water in the boiler, and the arrangement of the tubes, as described.

4. The heating sections *G*, for heating the feed water, arranged in combination with the larger boiler sections, substantially as and for the purpose described.

81,639.—JOHN C. HUNT and JOSEPH TEMPLE, Terre Haute, Ind.—*Tool for Laying off Furrows for Millstone Dressing.*—September 1, 1868.—By means of an adjustable clamp the instrument may be entered upon spindles of different sizes, or secured to a support resting in a centering step, to be arranged

in the eye of the stone. The arm of the sliding scale indicates the position for the furrow, which, being marked out upon the face of the stone, the instrument is rotated so as to bring the gauge arm to the place where the next furrow is to be laid off. The gauge arm is expansible laterally, to lay off furrows of different widths.

Claim.—1. The combination of the graduated slide D and furrow-marking arm E with a suitable holder, C, which may be secured to the stone centrally, so as to revolve freely as desired, substantially in the manner and for the purposes set forth.

2. The combination of the adjustable bar F with the arm E, slide D, and holder C, substantially in the manner and for the purposes described.

3. In combination with the arm E, slide D, and holder C, the annular plate A and cam plate B, with the arms *a* and nibs *e*, all arranged to operate substantially as and for the purposes set forth.

4. The combination of the plate A, the plate B provided with eccentric recesses *d*, the arms *a*, nibs *e*, and springs *s*, arranged in the manner and operating as specified.

81,610.—JASPER S. JEWETT, Ottawa, Ill.—*Fence Gate.*—September 1, 1868.—The gate is balanced by the two weights, so that when released from the spring catch it opens automatically by turning upward endwise.

Claim.—The oblique rails *f f*, the top rail *g*, the horizontal rails *i i i*, the rope or chain L, the staple *l*, and the weight M, in combination with the post A, the pulley K, the casing N, the spring O, and the rock shaft Q, substantially as and for the purpose described in the foregoing specification.

81,611.—HENRY W. JOHNS, New York, N. Y.—*Fabric for Roofing and Other Purposes.*—September 1, 1868.—Designed as a fire-proof sheathing, and formed by combining asbestos with the pulp used for the manufacture of coarse felt goods, or other pulps, such as paper pulp, and pressing this pulp into a sheet or web in a manner well known to felt manufacturers.

Claim.—The combination of asbestos with felted or pulped matter, to form roofing and sheathing sheets, all substantially as described.

81,642.—ALFRED S. JOHNSON, Waupun, Wis., assignor to himself and ENOCH VAN WIE, same place.—*Carriage Coupling.*—September 1, 1868.—That part of the thill coupling rigidly connected with the axle turns on a pivot, while the part attached to the thills fits into a space with ribs or curved threads, gains and recesses, and as the ribs engage with each other the thills work up and down from the pivot, as a center of motion.

Claim.—A thill coupling, formed of the parts A and B, constructed, arranged, and operating substantially as shown and described, for the purpose set forth.

81,643.—THOMAS W. JOHNSON, New York, N. Y.—*Apparatus for Concentrating Extracts.*—September 1, 1868.—The liquid extract heated to 170° or 180° is kept uniformly mixed and free from sediment by an agitator, and the disengaged vapors rise and strike the convex top of the receiver, cooled by a jet of water, and are condensed and collected in a gutter in which the top terminates.

Claim.—The receiver A, provided with a convex top, B, gutter C, and cold water pipe *d*, in combination with the agitator F and heating chamber E, substantially as and for the purpose set forth.

81,644.—CHARLES W. JOHNSTON, Neposset, Ill.—*Tinners' Fire Pot.*—September 1, 1868.—The draught from the tool-holding tubes, inserted just above the perforated grate in front of the fire pot, acting on the fuel, all concentrates at the lower end of the chimney, producing there an intense heat.

Claim.—The arrangement of the draught tube B, and the tool-holding-tubes D, in a fire pot A, constructed and operating substantially in the manner and for the purposes herein set forth.

81,645.—ANSON JUDSON, Brooklyn, N. Y.—*Lamp.*—September 1, 1868.—Upon the wick tube,

cast with the burner, on which the chimney is centralized by two bearings, are secured wheels or ratchets, a shaft being driven into the tube and the cone or deflector fixed on the burner; all communication between the wick tube and the air chamber being cut off except at the upper end of the wick tube.

Claim.—1. The combination of the shell B of the burner, the ribs F F, and the screw G or its equivalent, substantially as and for the purpose hereinbefore set forth.

2. The combination of the ratchet shaft C, wheels *d*, and tube *e*, substantially as and to the effect hereinbefore set forth.

3. The combination of the cone II, shell B, and adjusting screws D D, substantially as and to the effect hereinbefore set forth.

4. The combination of the burner B, projections *c e*, flange *a*, notches *b b*, and right and left inclines *f* and *g*, in such a manner that by inserting the projections *c e* through the notches *b b*, and turning the burner in either direction, said burner may be secured to the lamp cap, substantially as set forth.

5. The cone or deflector, made of cast iron, with an enameled surface, as hereinbefore set forth.

6. The formation of the burner B in one piece with the wick tube, and in the manner hereinbefore described, by which the wheels for elevating the wick are received into the lower end of the wick tube, and all connection between the fountain and the interior of the burner, except through the length of the wick tube, is cut off, substantially as hereinabove set forth.

81,646.—FREDERICK JUDSON, Castleton, N. Y.—*Machine for Grinding Reaper Knives.*—September 1, 1868.—An adjustable carriage is so arranged and combined with guide rods, springs, and plates, that when the sickle bar with its knives is secured upon it diagonally to one of the plates, and brought under the grindstone, the blade of the knife will be effectively and properly ground.

Claim.—1. The sliding carriage U, so arranged as to have the side brought to the grindstone adjustable vertically, substantially as herein set forth and specified.

2. The stop P, arranged and connected with plate O, substantially as above described, and for the purpose specified.

3. In combination with the above, the bar Q, guide rods K K', standard B, arm C, screw H, and set screw I, the whole arranged and operating substantially as set forth.

4. A yielding support for the knives, so constructed as to compensate for irregularities in the surface of the knives when passing under the stone, substantially as described.

81,647.—DANIEL KANE, Tivoli, Iowa.—*Thrashing Machine.*—September 1, 1868.—Two blasts of air are directed upward, one of which goes through a space between the upper end of a grain and straw elevating belt and the lower end of a straw carrier; proper means for extending or shortening them being provided, so that as the grain and trash fall from the belt through the space, nearly all the trash lighter than the grain is blown on the straw carrier; the other blast passes through the separating shoe, so that the screens may not clog, and the light chaff and impurities are wholly separated from the good grain, the driving shaft and gearing by which the thrashing drum is moved being beneath the feeding board and thus protected from injury, or being in the way of the operator.

Claim.—1. The combination of two fanning devices with a screening shoe, F, a grain-elevating belt, and a straw carrier, said fanning devices being arranged in the manner described, so as to operate substantially as and for the purposes specified.

2. In combination with a thrashing drum, an elevating grain belt and a straw carrier, arranged as described, the revolving beater I and the tossing and shaking blades E, all being arranged over fanning devices and a screening shoe, substantially as described.

3. The reversible or tilting bottom N to the laterally discharging clean grain trough M, substantially as and for the purposes described.

4. The arrangement of the pulley *j* with shaft *k*

and gearing $l m$, beneath the feeding board H^2 , so that the cylinder is driven by a belt or other device, which runs parallel, or nearly so, with the cylinder, substantially as herein described.

5. The rolling drums $a^1 a^1$, for the upper part of the straw carrier, applied to studs upon adjustable slides, $a a$, in combination with retaining racks S' and pawls Y , substantially as and for the purposes described.

6. Providing for regulating the tension of the grain belt G by means of adjustable bearing blocks i , of drum shaft h and bolts p' , said blocks being constructed and applied to bars A^3 substantially as described.

81,648.—WILLIAM H. KEEP, Stockton, Cal.—*Pump*.—September 1, 1868.—The lower or suction valve seat rests on a flange forming a water-tight joint, and having around its upper edge a shoulder into which is received a ring connected by a skeleton frame or bars to the upper valve seat, while around on its outside is a flange forming a water-tight joint, on the shoulder of the valve chamber, thus compelling the water, when passing from the cylinder, to raise the discharge or upper valve before it can pass thereto.

Claim.—The bail J , in combination with the ring I , the valve seat H , the frame P , the ring G , and the valve seat F , as and for the purpose set forth.

81,649.—ABRAHAM KIPP, Jr., Sing Sing, N. Y.—*Steam and Fire Regulator*.—September 1, 1868.—The pressure of steam in boilers is regulated by means of a device for automatically controlling the fires, a slide valve in connection with an elastic disk, a pendant, lever arm, beam, and weight forming a mechanism that resists the pressure of the steam and opens or closes the damper, as may be required.

Claim.—The slide valve F , in connection with the elastic disks $D D K$, compartments $C C'$ in chamber A , arm E , and beam M , and the lever O , or its equivalent, all arranged to operate in connection with a fire damper, substantially in the manner as and for the purpose set forth.

81,650.—JOHN KOCH and DAVID SEACHRIST, Columbiana, Ohio.—*Hames Fastener*.—September 1, 1868.—A spiral spring hid in a recess in a pawl containing a pivot, on which it vibrates with its tooth, acts upon the teeth of a ratchet rack joined with a plate, an end of both of which is hook-shaped and catches into the eyes of the lower end of the hames.

Claim.—The pawl D , when its tooth a is held against the ratchet bar C by means of the coiled spring b , which is protected from injury by being concealed in a recess in the pawl around the pivot d , as herein shown and described.

81,651.—LUIS KRUSE, Sabula, Iowa.—*Hold Back*.—September 1, 1868.—On the front end of the tongue is a spring latch which prevents the neck yoke from coming off and the tongue dropping down, in case a tug or trace gets loose or becomes detached from the vehicle.

Claim.—The application, to the tongues of wagons and other vehicles, of the spring latch, arranged as hereinbefore set forth, which will secure the neck yoke in its place, and which may yet be removed when desired.

81,652.—JOHN LANGHAM, Jr., Philadelphia, Pa.—*Tool for Slitting Boards*.—September 1, 1868.—The board is cut into thin slices by being passed under a cutter arranged vertically to a hinge holder on a sliding stock moving on ways at each end and having a retracting spring.

Claim.—The combination of the sliding stock C , provided with a cutter, with the ways A and supporting pieces B , substantially as and for the purpose described.

81,653.—RUFUS LAPHAM, Boston, Mass.—*Apparatus for Extinguishing Fires*.—September 1, 1868; antedated August 20, 1868.—A reservoir stationary or portable, and which may be made to rotate, for chemical fire extinguishers, is connected with supply retorts and conducting pipes, the latter having branches leading to different compartments.

Claim.—1. A placed reservoir, containing and holding a chemical fire-extinguishing agent, or materials for readily generating such, when provided with pipes leading to one or more buildings, for the purposes specified.

2. The application of pipes to connect said reservoir with one or more buildings and the various rooms of buildings, for the purposes set forth.

3. The auxiliary gas-generating retorts S , one or more, used in connection with the placed reservoir R , for the purposes specified.

81,654.—ROBERT G. LOFTUS, Chelsea, assignor to himself and ALONZO FARRAR AND COMPANY, Boston, Mass.—*Process of Treating Petroleum to Remove the more Volatile Portions*.—September 1, 1868.—The petroleum discharged by a pump into an upper tank with a foraminous bottom falls through the air into the reservoir below, and thus the dangerous element is separated from it.

Claim.—The separation of the petroleum into fine streams, and causing the same to pass through the atmosphere, so as to enable the latter to vaporize and dissipate the inflammable elements thereof.

81,655.—CHARLES R. LONG, Louisville, Ky.—*Boring Machine*.—September 1, 1868.—Sliding beds, on which rest the auger shafts, are regulated by screws in the frame, so that several holes may be bored at once with precision in chair stuff which is held in an apron moved up to the bits by guides and set at the required angle by a pivoted staff.

Claim.—1. The arrangement of the sliding beds B , adjusted with relation to the fixed central shaft b' and its pulley, from opposite ends of the frame A , by means of the screws m , constructed to operate as herein described, for the purpose specified.

2. The staff p , constructed and operating substantially as shown and described, in combination with the apron M of a boring machine, all as and for the purpose set forth.

81,656.—EDWIN LOWE, Burrows, Ind.—*Hand Loom*.—September 1, 1868.—Intermittent rotary motion is given to a tappet shaft, which operates the treadles and picker staffs by means of pawls and rods connected to the lay, and which is also provided with tappets for actuating levers pivoted to the loom frame and having belts at opposite ends working over a pulley.

Claim.—The arrangement, with relation to the treadles D and levers H , of the tappet shafts $B E$, connected by gearing, the pawls $a a'$ and rods $C C'$, connected to the lay A , all constructed to operate as herein shown and described, for the purpose set forth.

81,657.—JOHN LYNCH, Columbia, S. C.—*Adhesive Plaster*.—September 1, 1868.—Springs or flexible bars are attached to the backs of plasters to prevent wrinkling and give better support to the muscles.

Claim.—1. The springs or stays C , or their equivalents, in combination with an adhesive plaster, substantially as and for the purposes herein shown and described.

2. Attaching one or more springs or flexible stays, rods, or bars to adhesive plasters, for the purposes described.

81,658.—A. F. MARSTON, Clinton, La.—*Culinary Vessel*.—September 1, 1868.—Separate vessels with tubes in their covers are placed on the perforated bottom of a large vessel, by means of which different kinds of food may be cooked separately in one general boiler.

Claim.—The arrangement, within the vessel A , upon the perforated bottom B thereof, of the vessels C , whose covers D are formed with tubes E , having perforated upper ends, whereby a communication is formed between the said vessels and the removable steamers G , supported upon internal lugs h , said steamers having partitions and a perforated bottom, all as herein shown and described for the purpose set forth.

81,659.—M. K. MAXIMILIAN, New York, N. Y.—*Sofa Bedstead*.—September 1, 1868.

Claim.—A sofa bedstead, composed of the two parts $A B$, having their upholstered parts, $a c$, con-

nected together by webbing *d*, and having arms C C, constructed as shown, attached to A, and connected to B, when desired, in the manner set forth.

81,660.—ALEXANDER MCCREIGHT, Tranquility, Ohio.—*Corn Plow*.—September 1, 1868.—The drag bars, in pairs with their shovels, are connected in front, and, being bent at right angles, and fixed to the beam, swing freely, or are raised by levers having their fulcrum on a cross beam pivoted on the pole, so as in turning to throw one of the elbows of the bars forward and the other backward, the plows being thus swung out of line or kept stationary at will.

Claim.—1. The drag bars B B¹, arranged as described, when operated by means of a fixed and movable attachment, substantially in the manner set forth.

2. Operating drag bars by means of levers having movable fulcrum, substantially as described.

3. The drag bars B B¹, as described, as in combination with levers D and cross bar C, substantially as and for the purpose set forth.

81,661.—WILLIAM McDONALD, Calais, Me.—*Hanging Circular Saw*.—September 1, 1868.—The combination of the screw pins with the saw and with a fixed and a movable collar fitted on the saw shaft holds the saw firmly upon it.

Claim.—The fixed collar B, provided with the series of pins *a*, adapted to pass through the saw C and into the loose collar D, said saw and collar D being clamped firmly to the fixed collar by the screw nut E, as herein shown and described.

81,662.—J. H. MCKNIGHT, Oakwood, Mich.—*Gate*.—September 1, 1868.—Horizontal bars are connected at their forward ends by two short bars pivoted to each other, the center bar extending beyond the rear post and supporting a weight with levers, rope, and chain. A diagonal bar is pivoted to the front and rear ends of the horizontal bars, and thus, when the gate is raised, the horizontal bars fold in toward the center bar and allow small stock to pass under it.

Claim.—1. The gate C, formed by the combination of the horizontal bars *c*¹, pivoted connecting bars *c*² and *c*³, pivoted diagonal bar *c*⁴, and weight box D, with each other and with the gate post B, said gate C being constructed and operating substantially as herein shown and described.

2. The combination of the levers F and cord or chain G with the weighted pivoted gate C, substantially as herein shown and described, and for the purpose set forth.

3. The weighted catch J, in combination with the gate C, post B, and levers F, substantially as herein shown and described, and for the purpose set forth.

81,663.—GEORGE S. MEIKLE, Sterling, Ill.—*Shellac Varnish*.—September 1, 1868.—Carbonate of ammonia boiled in water is used as a solvent for the shellac.

Claim.—A varnish formed of gum shellac, combined with the ingredient herein named, and substantially as described.

81,664.—JAMES C. MILLERD, River Point, R. I.—*Expanding Mandrel or Boring Tool*.—September 1, 1868.—Two stud cutters or boring plates mortised in the end of a metal shank are fixed at right angles to the axis of the latter so that, when set out or in by a screw, the plates will pass in contact with each other.

Claim.—1. The combination, in a boring tool, of the boring plates B B, right and left-handed screw *a*, and block *b*, when operating together within a mortise or eye in the shank A, all substantially as shown and described, and for the purpose set forth.

2. The set screw D, arranged to operate in combination with the above claimed parts, substantially as herein described.

81,665.—THOMAS MILLS and GEORGE M. MILLS, Philadelphia, Pa.—*Machine for Making Candy Toys, &c.*—September 1, 1868.—The candy passes between geared rolls in which are dies or molds and having a slight space between their outer faces; side rolls are also employed for giving uniform speed, and the

molded figures pass out on endless bands driven in opposite directions, both sides of the figures being thus set or chilled.

Claim.—1. The die rolls A A, with the molds disposed thereon, as described, and operating in combination with the side rolls C C, substantially as and for the purpose specified.

2. In combination with a pair of die rolls, the described system of endless bands I and N, when arranged and operating in the manner and for the purpose set forth.

81,666.—RICHARD MONTGOMERY and MARY J. MONTGOMERY, New York, N. Y.—*Bridge*.—September 1, 1868.—A plain longitudinal binding is inserted between the faces of double longitudinally-corrugated plates, thus forming beams and columns. Diagonal stays and braces also pass through them, the folds of the plates being increased where the greatest strength needs it.

Claim.—1. The combination, substantially as and for the purpose herein set forth, of an intermediate binding plate, D, with the doubly corrugated plates A A, forming the double corrugated beams and columns herein described.

2. In the construction of bridges, roofs, and similar structures, with double corrugated beams and columns, the combination of diagonal stays and braces with said beams and columns, by passing the stays or braces between the opposite plates of the beams and columns, substantially in the manner and for the purpose herein set forth.

81,667.—FERDINAND MOORE and GEORGE HASTIE, Florence, Ind.—*Apparatus for Handling Steamboat Stages*.—September 1, 1868.—The stage, on being launched, is hooked to the falls and hoisted free of the deck by the operation of the windlass, wheel, and hand-rope. A pressure then causes the carrier beam to roll in its guides till stopped by check-pins when it is lowered. A reverse operation hauls it in.

Claim.—The rolling carrier beam D, provided with the rollers *s s*, fall and tackle F, wheel E, windlass H, hand-rope *p*, journal *m*, pins *aa*, and guides *n n*, or their equivalents, when used in connection with the guides C C, in the manner substantially as described, and for the purposes set forth.

81,668.—WILLIAM MOSES, Buffalo, N. Y.—*Steam Generator*.—September 1, 1868.—An induction pipe and eduction orifice pass through the shank of auxiliary generating vessels, and, being attached to the crown sheet or boiler sides of a furnace, communicate with the water space, whereby the effective heating surface is greatly increased, steam being most rapidly generated by means of the large surface exposed to the fire and the small volume of water.

Claim.—The auxiliary steam generating vessels, when constructed with contracted shanks, and induction and eduction orifices, and applied to the crown sheet and sides of a boiler, substantially as herein set forth.

81,669.—GEORGE A. MOSHER, Champlain, N. Y.—*Draft Equalizer*.—September 1, 1868.—The singletrees are attached to clevises pivoted at different points by pins to the cross heads, which are braced at right angles to the doubletree and form its elongated heads.

Claim.—The clevises D, constructed as described, and provided with a series of holes, *b*, adapted for the passage of a pin, *a*, whereby said clevises are pivoted to the cross pieces C of the centrally-pivoted doubletree A, so as to be longitudinally adjustable thereon, as set forth.

81,670.—GUSTAV ADOLPH NEUMEYER, Altenburg, Saxe-Altenburg, assignor to AUGUST KLEIN, Leipzig, Germany.—*Manufacture of Gunpowder and Blasting Powder*.—September 1, 1868; antedated August 25, 1868.—Flowers of sulphur, instead of in sticks, and brown coal, or together with charcoal, are used. These being mixed and dried, are placed on an iron dish, on which two cast-iron cylinders revolve. Water is then duly mixed in when it is grained and dried.

Claim.—An explosive powder, for blasting and for

fire-arms, when made of the ingredients and in the manner and proportions herein set forth.

81,671.—EUGENE W. NOHL, Chicago, Ill., assignor to CHARLES M. GRAY, same place.—*Furnace for Smelting Ores of Gold, Silver, &c.*—September 1, 1868.—The fire chamber heats the smelting chamber, and the hearth on which rests an inclined ore table, with a cupel at its lowest end, is kept intensely hot by the flues at its ends and underneath, air being also admitted by an inclined opening at the top of the furnace to mix and direct the burning products in a stream upon the ore.

Claim.—1. The construction and arrangement of the smelting chamber, with the cupel and diving flue, for heating the same, substantially as specified.

2. The opening K through the top of the furnace, and above the gas flue or passage, for the purpose of admitting, and mixing with the burning products, atmospheric air to intensify the combustion, and direct the flame on the ore bed or table, and into the cupel, substantially as and for the purposes described.

3. The flues underneath the ore bed or table and the cupel, as and for the purpose described.

81,672.—OLIVER B. OAKLEY and HIRAM ROSEKRANS, San Francisco, Cal.—*Door Bell.*—September 1, 1868.—The end of the lever, attached by a wire to the bell pull, strikes a spur on the cam, one end of which, as it turns, forces down a bar attached by a bent wire to the hammer till the spur being released, the rebound causes the gong to be struck.

Claim.—The hammer bar G, the cam F, and the two arms *a* and *b*, together with the knob I, operating by horizontal or straight pull, either near the bell gong or at a distance, substantially as and for the purpose herein described.

81,673.—JOHN ORM, Paducah, Ky.—*Circular Saw Mill.*—September 1, 1868.—One of the truck frames is bolted and the other adjustably secured to the rack by which the carriage is moved, and as it is fed toward the saw or back, the flanges of the wheels press against the side of the inner or outer rail, adjusting it to the length of the log.

Claim.—Adjustably connecting one or more of the truck frames D to the toothed rack F, by means of the coupling G, as herein shown and described, and for the purpose set forth.

81,674.—JOSEPH OSTERHOUT, Rock Island, Ill.—*Washing Machine.*—September 1, 1868.—The apron passing between and around the rollers is kept stretched by holders or lips secured to each side by a cord, the lower rollers fitted between bars with grooves and pins, yielding to the varying thickness of the clothes acted on by the rollers in alternately different directions.

Claim.—The holders J J, secured to the inner side of the suds box, and applied to the band or apron I, substantially as and for the purpose specified.

81,675.—LOUIS J. PARSONS, New Bedford, Mass., assignor to himself, JOHN R. LINTON, and O. E. LINTON, same place.—*Whip Socket.*—September 1, 1868. A strip of sheet metal, inserted between the points of the inside of the metal fastening, is clamped over the seam of the leather tube outside by the points being turned down. The leather lip at the bottom of the metal socket is secured by an eyelet in its center.

Claim.—1. Uniting the edges of a leather whip socket by means of a metal fastening, substantially as and for the purpose described.

2. The bottom of the whip socket, constructed and united to the tubular portion of the same, substantially as and for the purpose described.

81,676.—JAMES DILLON PATRICK, San Francisco, Cal.—*Ball Alley.*—September 1, 1868; antedated August 25, 1868.—The pins are set up by means of cords with weights, reaching to and over a bar at the playing end, and when the cords are drawn the pins are free to fall, springs beneath serving to lessen the tension; the balls roll back in inclined ways on the sides of the alley.

Claim.—1. The springs I I, attached to the spring

board I', the holes E in the pins, through which the cords pass, and the weights J J, in combination with the cords, substantially as described.

2. Constructing the ways C C, so that the balls that roll from the sides of the alley will not come in contact with those that are thrown against the bank or end of the alley, substantially as herein set forth.

81,677.—JOHN W. PEARCE, Suisun, Cal.—*Car and Track for Elevating on Inclined Planes.*—September 1, 1868.—The inclined frame and tracks are so made as to assume a horizontal position at the upper end, while the car with a shortened forward axle and having the rear wheels flanged also maintains such position in ascending or descending the incline.

Claim.—In combination with the double-inclined track, of the described construction, a store or freight truck, having one axle shorter than the other, to adapt it to run on said track, and keep a horizontal position while passing up or down the same, substantially as described.

81,678.—GEORGE R. PECKHAM, Worcester, Mass.—*Wheel for Animal Cage.*—September 1, 1868.

Claim.—A wheel for animal traps or cages, with the bars *y*, formed by cutting slots *x* in a sheet of metal, as described and for the purposes set forth.

81,679.—WILLIAM CRELLIN PICKERSGILL, Providence, R. I.—*Boiler Feeder.*—September 1, 1868.—The float presses upon a rod carrying down a lever, and thus admits the steam by the valve into the cylinder and the piston-moving levers. The cocks connecting the water chamber, supply tank and boiler at water level, are alternately opened and closed.

Claim.—The combination of the float B, rod C, lever D, with the steam valve F, steam cylinder G and cocks H and I, substantially as and for the purposes set forth.

81,680.—ROSWELL PLUMMER, Brooklyn, N. Y.—*Quartz Mill.*—September 1, 1868.—The material passes all around the shaft of two upper disks, the surfaces of which conform to the partially-conical surfaces of two reversible disks below, there being a small cavity, where it comes in contact with the working surface, by which the material is gradually reduced, and then passing outward is ground into a fine powder.

Claim.—The within-described mill for grinding quartz, consisting of the reversible metallic disks C D and E F, constructed, arranged, and operating as and for the purpose set forth.

81,681.—JOHN POPPE, Green Point, N. Y.—*Pump.*—September 1, 1868.—An improvement on his patent of Dec. 5, 1867.—The valve is carried round to the valve plate, the stem of which passes up through the discharge chamber working at its upper end in a water socket, and the valve plate being raised by an inclined arm attached to the valve and wheel, allows the valve to pass the plate.

Claim.—The combination of the inclined arm C, with the valve H, wheel B, and valve plate I, substantially as herein shown and described and for the purpose set forth.

81,682.—WILLIAM B. PORTER, Plattsburgh, Nebraska.—*Iron Pier.*—September 1, 1868.—The pier is composed of a shell of iron made in sections, the lower one being bell-shaped for the base, and the upper one of inverted bell-shape, which, with the central section of uniform diameter, are held tightly together by rods in tubes fastened to bars underneath, and also by recesses into which fit the edges of the central section. The piers are filled in with concrete.

Claim.—An iron pier, composed of a series of tubes encompassed or inclosed by a shell filled in with concrete, and all secured together in the manner substantially as herein shown and described.

81,683.—E. K. PRAY, Holderness, N. H.—*Knitting Machine.*—September 1, 1868.—A segment of a ring holds the needles in place, while the detachable part of the ring to which the cams are secured is removed.

Claim.—1. The ring A, constructed with that part

to which the cams are secured, detachable, substantially as and for the purpose set forth.

2. The combination with the ring A, having the detachable part B, of the segment C, substantially as and for the purpose described.

81,684.—GEORGE W. PRENTICE, Providence, R. I.—*Eyelet*.—September 1, 1868; antedated August 15, 1868.—The eyelet is made of a composition of tin, antimony, and arsenic, in various proportions.

Claim.—The article of an eyelet, of the composition of material herein set forth, as a new manufacture.

81,685.—K. H. C. PRESTON, Manlius, N. Y., assignor to himself, STEPHEN CHENEY, and M. B. SNOOK.—*Harvester Rake*.—September 1, 1868.—The cranks of the rakes and beaters coming in contact, while the wheel rotates, with the conical friction roller on the outer end of the arm which is secured on the upper part of the standard, will be turned down, and the rake teeth will descend in front of the sickle, so that the grain will be presented to it; the teeth being turned upward by springs as the cranks pass the roller.

Claim.—1. The combination of the crank arms *d* of the beaters F, the spiral springs *e*, revolving wheel D, conical roller G, and arm *g'*, all constructed, arranged, and operating as described for the purpose specified.

2. The arm *g'*, attached to the inner end of the rake E, in combination with the projection *h* attached to the arm *g*, all arranged substantially as described, for the purpose of keeping said rake down or near the platform, while traveling over the same.

81,686.—K. H. C. PRESTON, Manlius, N. Y., assignor to himself, STEPHEN CHENEY, and M. B. SNOOK.—*Harvester*.—September 1, 1868.—The beveled sliding collars on an axle near the ratchets fit into forked levers connected to a cross-head at the lower end of a vertical shaft turned by a lever on its upper end. The pawls also have projections under which the collars catch and raise them from the ratchets as the machine moves forward; thus disconnecting the wheels from the axle, as required.

Claim.—1. The joint L, when the screw-bolts, carrying the boxes *nn*, are provided with eyes *mm*, to receive the journals of the cross-head R upon the connecting rod K, as herein described, for the purpose specified.

2. The projections *f* on the pawls F on the wheels B, in connection with the beveled sliding collars H on the axle E, all arranged to operate in connection with the ratchet G, substantially as and for the purpose set forth.

81,687.—ELIZA PUTNAM, Boston, Mass.—*Bookcase Bedstead*.—September 1, 1868.—The removable dividing piece is to give a finish to the case when the bed is shut in.

Claim.—The combination, with a case and bedstead, of a removable dividing piece, *k*, substantially as and for the purposes described.

81,688.—WILLIAM ROSS and JAMES M. ADAMSON, Day's Store, Pa.—*Washing Machine*.—September 1, 1868; antedated August 28, 1868.—The clothes, held in the clamp by pressure on its handles, are brought down on the rubber by means of a treadle connected by a pivoted upright and rod to an arm jointed to the clamp.

Claim.—1. A washing machine, for washing clothing, composed of the tub A, and rubber B, and a clamp C, for holding the clothing, operated by a handle upon the same, said clothing being held down upon the rubber B by a treadle, G, substantially as shown and described, and for the purposes set forth.

2. The clamp C, composed of two parts or jaws, connected to the arm D by a universal joint, substantially as shown and described, and for the purposes set forth.

3. The arm D, and connecting rod F, and upright E, and treadle G, in combination with each other and with the clamp C, and washing tub A, and rubber B, substantially as shown and described, and for the purposes set forth.

81,689.—ALFRED SANDERS, Penn Yan, N. Y.—*Car Coupling*.—September 1, 1868.—The coupling is made by means of a spring lever, pivoted in the draw-head, with a groove for a cam rod, its horizontal shaft ending in a crank, which on being turned forward, allows the link pin of the draw-head to pass through into the lugs. A reversed action uncouples the cars.

Claim.—The combination of the side lugs *ii*, oblong opening *kk*, and pins *l*, with the spring lever C, and cam rod *dgh*, the whole so arranged as to form a double fastening, and allow the strain to be transferred from the pin to the lever, as herein set forth.

81,690.—MICHAEL E. SAVOY, Corinth, N. Y.—*Counter and Shank for Boots and Shoes*.—September 1, 1868; antedated August 29, 1868.—A metallic shank is connected to a metal counter provided with arms having a number of holes, so as to admit of being adjusted to fit the heels of boots and shoes of different sizes.

Claim.—The curved metallic shank A, and counter B, when the latter is provided with the adjustable arms *a*, for securing said counter at its forward end to the shank A, constructed and arranged as herein shown and described, when stamped from one piece of metal.

81,691.—WILLIAM H. SCHWALBE, New York, N. Y.—*Sofa and Bed*.—September 1, 1868.—The arms of the seat being separate from the back, can be fastened to it by thumb screws, and when the seat is let down, serve as legs; the back also being hinged inside of the lower section of the seat can be let down and supported by adjustable legs; a board hinged inside of the upper section, swung upright, rests on its upper edge, serves as a footboard.

Claim.—The combination and arrangement of screw-bolts K, back I, arms H, bed A C D, and footboard L, as herein represented and described.

81,692.—CONRAD SEIMEL, Greenpoint, N. Y., assignor to CHARLES PRATT, New York City.—*Sheet-Metal Can*.—September 1, 1868.—The curved projections expanding under the heat of the molten solder will not spread apart, but remain so close as to form a tight joint when the solder cools.

Claim.—The square or rectangular sheet-metal can, constructed, as described, of the two pieces A A, bent to have the sides *aa* at right angles to each other, and having formed at the angles the semi-cylindrical projections *b*, the ends of said parts *aa* being rolled to form projections *c*, lapping within and over each other, as herein described, for the purpose specified.

81,693.—JAMES SHEPARD, Bristol, Conn.—*Protecting Plants, &c.*—September 1, 1868.—A strip of thin wood or veneer is scored and bent till the ends lap, and a ring is formed, which is placed over the plant and pressed half-way into the ground.

Claim.—As a new article of manufacture, a plant protector, when constructed and arranged specially as and for the purpose described.

81,694.—CHARLES SINCLAIR, New York, N. Y.—*Ratchet Drill*.—The spindle with its drill is supplied with two handles, one of which is bifurcated and connected with a ratchet wheel, a spring pawl and a fixed pawl, so that one of the pawls will act on its wheel and the drill be continuously revolved, in which ever way the handle may be turned.

Claim.—1. The combination of the spindle A, retaining handle D, and operating handle E with the pawl G and ratchet wheel F, and with the ratchet wheel or disk C, having internal gear with the pinion *e*, toothed wheel I, and spring bolt J, all made and operating substantially as herein shown and described, the toothed wheel I having ratchet teeth formed on its inner edge, as set forth.

2. The combination of the drill spindle A, pinion I, and spring bolt J, when constructed and arranged as described, as an adjunct to the other mechanism for communicating rotary motion to the drill, substantially as described.

81,695.—HECTOR SINCLAIR, New York, N. Y.—*Hot-Air Register Attachment*.—September 1, 1868.

—The attachment to the wall in front of the register contains a water reservoir, fan blower, and a dust box above; the fan is set in motion by the heated air, and is so revolved as to throw up the dust into the box, away from the room, while the vapor from the reservoir mixes with the air and passes into the room.

Claim.—1. An attachment for hot-air registers, provided with a hollow dust-separating mechanism, substantially as and for the purpose described.

2. The combination, with a hot-air register, of the casing F, fan blower D, and dust-pan E, substantially as and for the purpose described.

3. The combination, with a hot-air register, of the casing F, reservoir C, and fan blower D, substantially as and for the purpose described.

4. In combination with a hot-air register, a fan-blower, dust receptacle, and water reservoir, substantially as described, for the purpose specified.

81,696.—THOMAS SMITH, California, Mo.—*Self-acting Wagon Brake.*—September 1, 1868; antedated August 29, 1868.—To the ends of a spring extending from one wheel to the other in the middle to a bar which connects braces that support the brakes, are fixed friction blocks adjusted to the rims of the wheels, the said blocks being connected by rods from near their ends to a rod which extends along the tongue to the neck yoke, and thus when the yoke is thrown back the rod is drawn forward and the brakes are applied.

Claim.—The self-acting wagon brake, composed of the block *e*, pivoted to the adjustable slide G, which is itself directly attached to the spring E, and operated by the rods *h* and I and yoke J, when the parts referred to are constructed as described, and combined and arranged in the manner and for the purposes specified.

81,697.—THOMAS SMITH, California, Mo.—*Compound Tool for Cutting and Shearing Bolts.*—September 1, 1868; antedated August 21, 1868.—Two arms are connected to a standard, one being fixed, the other hinged or pivoted; a pair of lugs project from the former toward the latter and support the end of a movable jaw with a cutter working between the posts of the standard and forced down by a projection on the arm so as to act on another cutter below.

Claim.—The improved bolt-cutting and shearing tool herein described.

81,698.—HIRAM F. SNOW and JAMES H. DAVIS, Dover, N. H.—*Composition for Pavements.*—September 1, 1868.—The residuum of coal tar, after the water and gas has been distilled off, is mixed with tan bark or saw dust and gravel or mineral matters with a quantity of sulphuric acid.

Claim.—The combination of wood saw dust, or comminuted wood or bark, with the tarry residuum, and a mineral matter or matters and an acid, as specified.

81,699.—LEWIS A. SPICKLER, Clear Spring, Md.—*Sleigh.*—September 1, 1868.—The raves or fenders are attached to the upturned part of the runners by iron plates with bifurcations by which they are firmly fastened, and sockets for the eyes of the shaft irons.

Claim.—In a sleigh, adapted to be drawn by power applied in front, locating the point of attachment of the shafts behind the upturned part D, upon the rave C or bifurcated iron A, as herein shown and described for the purpose specified.

81,700.—P. H. STANDISH, Martinez, Cal., assignor to himself and OLIVER C. COFFIN.—*Gang Plow.*—September 1, 1868.—The plows are raised or lowered by a lever and pawls attached to the axle, which has a toothed wheel and has a crank near the hub for receiving the axle of the furrow wheel, the tongue also being adjusted for the line of draught by a bolt through the clevis and made fast to its rear end. The crank-shaped plow standards provided with a slot, and set screw which passes through the boss and rests on the bed, are pivoted on bolts passing through a hole in the turn of the standard.

Claim.—1. The wheel E, lever M, with pawl I and foot pawl N, and manner of arrangement thereof.

2. The tongue-adjusting rod J, clevis R, plate P *l*, as arranged, and secured to the bed or beam B.

3. The construction and arrangement of the bed B, and the manner of attaching the standards thereto, in combination with the tongue adjusting rod J, clevis R, and plate P *l*, as shown and described.

4. The crank-shaped standards, with slotted end and set screw, substantially as set forth.

81,701.—A. R. STANLEY and HENRY W. ENSIGN, Shullsburg, Wis.—*Sulky Plow.*—September 1, 1868.

—To raise the plow out of the ground the ratchet is relieved of the pawl which catches into the retain shaft, and the upper end of the lever connected with the shaft is drawn back, while the eccentric moving forward the catch relieves the front end of the plow beam.

Claim.—1. The pivoted plow beam N, spring catch O, and eccentric, H, arranged to operate in the manner substantially as and for the purpose set forth.

2. The combination of the lever G attached to the eccentric H, the shaft F, pinion E', rack D, and spring catch O fitting over the end of the plow beam N, substantially as described for the purposes specified.

81,702.—WERNER STAUFEN, Paris, France.—*Vegetable Fiber as Substitute for Hair.*—September 1, 1868.

Claim.—The manufacture, substantially as above set forth, of a species of vegetable hair from the fibrous material which grows through and proceeds from the bark situated near the foot of the palm known as the *Levistonina Chinensis Roxb.*, or *Latania Chinensis, Tacq.*

81,703.—W. C. STICKNEY and JAMES MCGEE, Steubenville, Ohio.—*Ventilating Sash Adjuster.*—September 1, 1868.—The upper end of the sliding rod is pivoted to the inner arm of the three-armed plate by a pin and slot, a coiled spring, with a friction block, holding it in place.

Claim.—The combination of the three-armed plate C and sliding rod E with the coiled spring G, friction block H, and thimble F, substantially as herein shown and described.

81,704.—BRUSH SUTHERLAND, Chicago, Ill.—*Water Wheel.*—September 1, 1868.—On the inner surface of the gate a ring or stop-water fits on the top of the wheel to prevent leakage, the top being also protected by a dome from the pressure of the water, and preventing its escape through the center; a vertical circular flange with ground edge fitting on the flange of the wheel forms a water-tight joint, while the dome is secured to the upper flange by wide arms and the spaces between them permit access to the stop water for adjustment.

Claim.—1. The combination of a stop-water, *c*, with the flange of the wheel and the gate C, arranged to operate in the manner and for the purposes shown and described.

2. The dome G, provided with a vertical rim H, and supporting arms I, arranged in relation to the flange F, substantially as described, and for the purposes set forth.

3. The combination of an adjustable stop-water, *h*, with the rim H, and the flange of the wheel, in the manner and for the purposes specified.

81,705.—NEWTON TALLMAN, West New Brighton, N. Y.—*Oiler for Machinery.*—September 1, 1868.—The perforated inner cylinder, having an outlet through the nozzle, strains the oil and is held in place by a spring, an adjusting screw and nut bearing on the bottom of the can.

Claim.—1. The perforated inner chamber *a* and spring F, in combination with each other, and with the nozzle and bottom of an oil can, substantially as and for the purposes herein set forth.

2. The adjusting screw *b* and nut *c*, in combination with the spring E and the cylinder or chamber *a*, substantially as and for the purpose herein specified.

81,706.—BENJAMIN C. TAYLOR, Dayton, Ohio.—*Horse Hay Rake.*—September 1, 1868.—The pieces

fixed in the rails are of thin metal, made semicircular in form, transversely at the middle, and are cut away at the ends to support the spiral spring and guide the tooth, and serve as a stay for the bars, which are drawn up firmly against their ends by the bolts.

Claim.—The pieces E E, and their arrangement with reference to the bars A and B, the spring F, and bolts C C, in the manner substantially as described, and for the purposes specified.

81,707.—S. D. TRIPP, Lynn, Mass.—*Reversing Cutting Machine.*—September 1, 1868; antedated August 21, 1868.—The stock to which the cutters are attached is so arranged that by means of bars inclined to each other, the position of the cutters may be reversed, and reversed curves be cut consecutively.

Claim.—1. The means employed for operating the cutter shaft B, to wit, the bars *g h i*, pivoted guide L, and the pivoted bar M on plate H, in connection with the cross-head G on the journal of shaft E, provided with the pins *e e*, all arranged to operate substantially in the manner as and for the purpose set forth.

2. Attaching of the plate H to the framing A, in such manner as to admit of the same having a reciprocating movement imparted to it, substantially as shown and described.

81,708.—JOHN UHL, Brooklyn, N. Y.—*Saw Set.*—September 1, 1868.—The saw block has an adjustable rest, with a sliding adjustable abutting plate, the length of tooth to be set being regulated by a screw with a conical head, or guide for narrow saws, with a removable anvil and with a punch which has a series of projecting ribs of widths corresponding to the tooth. The punch rests on, and is upheld by, a spring which, when the punch has been brought down on the anvil, automatically raises it clear of the ribs.

Claim.—The construction and arrangement of block A, swinging table B, screw G, adjustable plate D, anvil E, punch *d*, holding device *e*, spring *f*, substantially as herein described and for the purpose specified.

81,709.—ADOLPHE PIERRE VIOL and CÉSAIRE PIERRE DUFLO, Jr., Paris, France.—*Bleaching and Dyeing Feathers.*—September 1, 1868.—The feathers are dipped in a weak solution of nitric acid mixed with chromate or bichromate of potash, after which they may be dyed in the usual way.

Claim.—The within-described process of treating black, grey, brown, or otherwise tawny-colored feathers, by first subjecting them to a bleaching, and afterward to a dyeing operation, substantially as and for the purpose set forth.

81,710.—N. A. VURGASON, Brooklyn, N. Y.—*Lamp-Chimney Cleaner.*—September 1, 1868.

Claim.—A lamp-chimney cleaner, having four brushes, B B, C C, affixed on the arms *b b*, in combination with the staff A and spring band *a*, of rubber or other suitable material, all substantially as and for the purpose shown and described.

81,711.—GARRETT VAN WAGENEN, Racine, Wis.—*Medical Compound for Treating Horses, Cattle, &c.*—September 1, 1868.—To melted beeswax are added pine and Barbadoes tar, also Strait's oil, hæmatoxylinc, red lead mixed into a paint with Strait's oil, and chloride of zinc.

Claim.—The remedial compound, composed of the above-mentioned ingredients, and prepared in the manner described.

81,712.—F. F. WAGNER, Harrisburg, Pa.—*Car Seat.*—September 1, 1868.—Improvement on Wagner and Dickinson's patent of June 21, 1859. Projecting lugs attached on the side of each axle opposite the swinging arms, which hold the chair backs, secure them to the seat frame, so that on turning down the arms the lugs project above the axle, raise the seat on their folding side, and, turning on central pivots, always keep it higher in front. On the lower part of the seat frame is also a foot-stool, hinged to an inclined frame, for persons on the other seats, a pin fitting through the seat frame and

one of the toothed wheels connecting the arms being substituted for the notched lever.

Claim.—1. Providing the projecting lugs *f* on the axles or pins B, by which the swinging arms C D are pivoted to the seat frame for the purpose of elevating the front end of the seat, so as to have the seat incline backward in whatever position the arms may stand, as specified.

2. The pin or bolt *a*, for locking the swinging arms C D in any desired position, when said pin is fitted into one of the toothed wheels or segments by which the arms are connected for the purpose of having them move simultaneously, as set forth.

81,713.—C. W. WAILEY, New Orleans, La., assignor to NEW ORLEANS PNEUMATIC PROPELLING COMPANY.—*Paper Reservoir for Compressed Air.*—September 1, 1868.—A cylinder made by wrapping wetted paper around a former, and applying a thin coating of glue or varnish for the joints, is dried and then closed by a metallic head, having an annular groove and held in place by rods, screw threads, and nuts.

Claim.—The paper air tank A, when closed at its extremities with metallic heads B, and otherwise constructed in the manner and by the use of the means herein described, for the purpose set forth.

81,714.—GEORGE S. WALKER, Erie, Pa.—*Stone-Pipe Drum.*—September 1, 1868.—Two vertical, triangular flues are arranged in the drum with a horizontal dividing plate, so that the lower flue receives the products of combustion, deflects them to the back of the drum, and causes them to pass successively into the spaces and over the points of the plate in contact with the outsides of the upper and lower flues.

Claim.—The arrangement within the drum H, and with relation to each other, of the curved fire plates F F', to direct the products of combustion in the described manner herein set forth and shown.

81,715.—M. S. WATKINS, Mansfield, Texas.—*Hat.*—September 1, 1868.—The bands of the metallic lining are bent in front to form enlargements in the crown and rim, for relieving the pressure on the temporal arteries, small holes also giving passage to the air into them.

Claim.—As a new article of manufacture, a hat formed with radial indentations in the crown and rim, as described, and provided with a lining, perforated opposite the said indentations, the metallic band of the lining being bent at the front of the hat, as and for the purposes herein set forth.

81,716.—JOSEPH WATTS, Brazil, Ind.—*Churn.*—September 1, 1868.—As the paddles move down through the cream a vacuum is created, and the air, rushing in through the valved pipe, is carried by the paddles down into the cream, and rises through the cream and escapes by the pipe at the top, the cream being thrown by the paddles upon the screen, where it is drained.

Claim.—1. The suspended screen R and hinged lid O, in combination with the body A of the churn, and with the revolving paddles L, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the crank shaft C, arms J, and paddles L, with each other and with the body A and screen R of the churn, said parts being constructed and arranged substantially as herein shown and described and for the purpose set forth.

81,717.—DAVID M. WESTON, Boston, Mass., assignor to GREENE, TWEED & Co., Brooklyn, N. Y.—*Belt Punch.*—September 1, 1868.

Claim.—The belt punch, having its lower jaw A slotted at C, for the passage of the cutter B of the upper jaw, and provided with the gauge D, carrying the slotted guard E, all operating as described, the jaws being opened by the tension of the rubber spring F, held in sockets or recesses of the handles, as herein set forth and shown.

81,718.—GERHART WIESLER, Chicago, Ill.—*Tumbler Brush.*—September 1, 1868.—The brush head is formed of a single piece with the handle,

having in its central bore a cylindrical plug, through which passes the wire that secures the end tuft of the bristles, and forming a shoulder on which the tuft may rest, so that the wire can be drawn tight while the tuft is kept in place, without being drawn in too far.

Claim.—The combination of the cylindrical head B, provided with the bore D and the cylindrical filler or plug C, arranged within the bore, as and for the purposes specified.

81,719.—FRANCIS H. WILLIAMS, Syracuse, N. Y.—*Stench Trap.*—September 1, 1868.—The spring which holds the valve to its seat is inclosed in an inverted cup, the valve provided with water packing to keep out noxious gases, being allowed to open for the discharge of contents when the pressure or weight is too great for the spring, a collar serving as a valve seat and bridge holder, for keeping the valve stem in its place.

Claim.—1. A valve chamber, N, which is constructed with a tubular valve seat, B, and a pipe-connecting collar, C, substantially as and for the purposes described.

2. The construction of valve chamber N, of sections A A, one of which has an internally and externally-projecting collar, B, and the other an externally-projecting collar, C, substantially as and for the purposes described.

3. Valve I, applied to the inner end of collar B, and held up to its seat by a spring, *g*, which rests upon a bridge, *h*, applied to the upper end of said collar, in combination with the chamber N, substantially as described.

4. The inverted cup *f*, applied over the upper end of valve stem *e*, so as to protect the spring *g*, substantially as described.

5. A crowning or convex valve I, which is suspended by a spring, *g*, and applied to a collar, B, of the chamber N, substantially as described.

81,720.—ISAAC WILLIAMS, Westerfield, Ind.—*Adjustable Measuring Rule.*—September 1, 1868.—As the angle is varied by varying the tongue, the slotted end of the brace slides up or down on the graduated part, and is fixed as desired by a screw and thumb nut.

Claim.—The combination of the pivoted adjustable brace J, slotted at *i* with the graduated part B, and its slotted extension G, and with the graduated part A, and its slotted extension D, all constructed as described, for the purpose specified.

81,721.—HENRY F. WILSON, Fort Wayne, Ind., assignor to JACOB J. KAMM, same place.—*Paint Compound.*—September 1, 1868.—To a solution of carbonate of soda, borate of soda, and a saturated solution of hydrate of lime, is added white lead or other metallic pigment, and linseed oil.

Claim.—The combination of the above specified ingredients, as and for the purpose specified.

81,722.—HANSON H. ADAMS, Newburyport, Mass.—*Machine for Carving Wood.*—September 1, 1868.—Strips of wood are secured to the upper surface of the sliding carriage, parallel to the pattern, and in alignment with the revolving cutters. On turning the crank, the lever pivoted to the cross bar of the frame and to the sliding portion of the cutter head, depresses the cutter head, which, being brought in contact with the pattern, the cutters will cut or carve counterparts.

Claim.—1. The combination, with the vertical adjustable frame *j*, of the vibrating frames or supports *n*, and laterally-sliding or adjustable cutter head and its cutters, under the arrangement and for the operation as herein shown and specified.

2. The combination, with the frame *j*, laterally adjustable cutter head, and vibrating truss frames, by which the cutter head is supported, of the lever *z* and spring *o'*, or its equivalent, constructed and arranged to operate substantially as and for the purpose set forth.

81,723.—GARRET D. ANDERSON, Montrose, N. Y.—*Liquid Safe.*—September 1, 1868.—A metallic tank is made of a strip of metal bent and jointed tightly to plates, and has its bottom inclined from

two sides to the center, a groove being there formed increasing in depth to the faucet; and between the tank and inclosing ease of wood or metal is a fire-proof lining or filling, to protect it from being burned or heated.

Claim.—1. An oil or liquid tank, constructed without any joint at either or all of the points lettered *h i k l* in the drawing, substantially as herein specified.

2. An oil or liquid tank, provided with a bottom composed of two inclined surfaces, and provided with a depression at about the central point, substantially as and for the purposes herein set forth.

3. The combination, with a tank constructed in either of the above specified ways, of an inclosing ease, of wood or other material, substantially as herein specified.

4. The combination, with said tank for containing oil or other inflammable liquid, of some suitable fire-proof material, substantially as and for the purposes herein specified.

81,724.—JAMES H. ANDREWS, Benicia, Cal.—*Gang Plow.*—September 1, 1868.—The plows are attached to the rear end of the pole by a peculiar frame connection, so that the plow points can be elevated or depressed by raising or lowering the end of the pole. The standards are clipped to the frame and the braces are slotted and provided with bolts, so as to adjust the plows to the desired depth.

Claim.—1. Pivoting the pole C to the hounds D D by a rod, E, and linking the rear end of the pole to the arm G, of the shaft F, or equivalent device for raising and lowering the plows without lifting other parts of the frame, substantially as described.

2. The double-jointed frame I, having an apron, J, attached and arranged to operate in the manner substantially as and for the purpose set forth.

3. The manner of connecting the plows to the frame by the clips M M, slots N N, with bolts and nuts, substantially as described.

81,725.—GEORGE N. ANNAN, Buffalo, N. Y.—*Grinding Mill.*—September 1, 1868.—Sliding blocks in the heads of the easing rest against the journals on which the bed is hung, and by means of screws press outward against the journals. Screws also pass through the easing and bear on the bed, pressing oppositely to the blocks, the bed, while adjustable, being held in a fixed position, the axes or journals likewise being adjustable and adapting the opening of the cylinder and bed to grain of different degrees of fineness.

Claim.—1. The combination of the blocks *e e*, pressing outward upon the journals of the bed, and the screws *f f* and *g g*, pressing inward upon the four corners of the bed, thus opposing each other, the whole arranged as described, and operating in the manner and for the purpose specified.

2. Connecting the heads D to the ends of the ease by the two locks *e l*, in addition to the ordinary screws whereby the great strain is removed from the screws, as herein set forth.

81,726.—CHARLES S. AMBRUSTER, Woodstown, N. J., assignor to himself and CHARLES H. RICHMAN, same place.—*Hay Fork.*—September 1, 1868.—The plate being drawn up brings the arms and shanks together, the tines approach each other and grasp the hay, which being raised is released by disconnecting the block and plate, the weight of hay and fork being transferred from the plate to the block.

Claim.—1. The combination of plate C, hook *c*, stop *m*, spring *n*, trigger *o*, and rope or chain *r*, substantially as and for the purpose described.

2. The combination of the tripping attachment, above described, with the arms *a a*, shanks *s s*, tines *t t*, block I, and connecting cords, chains, or rods, *e e'*, substantially as and for the purposes specified.

81,727.—JAMES C. ARMS, Northampton, Mass.—*Paper Clasp.*—September 1, 1868.—A strip of stiff paper, as wide and three times as long as the width of a roll of tape or ribbon, having one side of it gummed one-third of its length, the tape wound twice around the roll, and over the strip, and the gummed end bent over adheres to the other end.

Claim.—The paper slide B, constructed and ap-

plied to rolls of tape, ribbon, &c., substantially as described.

81,728.—JACOB AUTENRIETH, Philadelphia, Pa.—*Cork Extractor.*—September 1, 1868.—The link or band larger than the cork, goes round its top sides and bottom, and when driven into the bottom, the lower part of it presses against the bottom of the cork while the upper part forms a loop for drawing the cork.

Claim.—The application to a cork of an endless flat strip or loop of non-elastic metal, in the manner and for the purpose herein described, and represented.

81,729.—D. S. BAKER, West Bloomfield, N. Y.—*Brake for Machinery.*—September 1, 1868.—A frame, consisting of two metallic cheeks, is supported by a spring, and provided with a friction roller which bears upon a rubber band on the periphery of a wheel, so as to prevent a reverse motion of the wheel beyond a limited extent.

Claim.—A friction brake, constructed and operated in the manner as shown and described.

87,730.—JOHN BALL, Canton, Ohio.—*Plow.*—September 1, 1868.—The double points admit of the "fashion" piece being turned when desired. The corrugated beam and handles admit of the latter being adjusted to the height of the operator.

Claim.—1. The double point I, when constructed as described, and operating substantially as and for the purposes herein set forth.

2. The corrugated beam D, in combination with the corrugated handles E E, when arranged so as to be adjustable, substantially as and for the purposes herein set forth.

81,731.—JOHN BALL, Canton, Ohio.—*Clevis for Plow.*—September 1, 1868.—The clevis is made yielding, and so arranged with a spring as to prevent injury to the plow or team in case of an obstruction.

Claim.—1. The clevis C, constructed as described, in combination with the adjustable loops D D, for the purpose of raising or lowering the front end of the clevis, substantially as herein set forth.

2. The levers B B, pivoted to the sides of the plow beam A, and their lower ends pivoted to the rear ends of the clevis C, in combination with the rod F and spring G, constructed as described, and operating substantially as and for the purposes herein set forth.

81,732.—JOSEPH B. BANCROFT, Milford, Mass.—*Spindle Step.*—September 1, 1868.—The cap fitting close to the step also surrounds the spindle, being held stationary by friction as the spindle revolves, keeping out from between them a ring or flange which extends from the spindle nearly to the inside of the cap.

Claim.—The arrangement and combination of the ring or flange D with the spindle, its step, and cap, the whole being substantially in manner and for the purpose or objects as specified.

81,733.—ARTHUR BARBARIN, New Orleans, La.—*Gas Burner.*—September 1, 1868.

Claim.—1. The method, herein described, of letting on the gas to the burner or shutting it off therefrom, by the employment, in connection with the pipe or conduit for supplying gas to one or more burners, of a reservoir of quicksilver, glycerine, oils, or other non-freezing liquid in which the end of said conduit is immersed, the pressure of the gas in such conduit being regulated in the manner specified, so that, so long as the pressure does not exceed a certain limit, the gas will be retained in its conduit by the resistance of the said liquid, without the use of stop cocks or other means ordinarily employed, but whenever the pressure is increased so as to exceed the said limit, the gas will overcome the resistance of the liquid, and pass from its conduit to the burner, as set forth.

2. The use and application, for the purposes specified in the preceding clause, of naphtha or other hydrocarbon liquid, substantially in the manner described, so that the said liquid shall not only consti-

tute the stop cock of the gas conduit, but shall also carburet the gas when the latter is forced through it by the presence of the gas in said conduit.

3. The combination, with a reservoir containing quicksilver or other suitable liquid, and carrying the gas burner, of the bent end of the gas induction pipe, held within the reservoir, and arranged as described, so as to be adjusted to a greater or less depth in the liquid in which it is immersed, the said liquid operating, in connection with the pressure of gas in said pipe, to shut off and let on the gas to the burner, as set forth.

4. The combination, with a burner to which the flow of gas is regulated by means of quicksilver, oils, or other liquids, in connection with the pressure of gas in the gas conduit, as described, of a gas-igniting device, composed of spongy or finely-divided platinum, arranged above the orifice of the burner, so as to be brought in contact with the gas issuing therefrom, as and for the purposes set forth.

81,734.—ARTHUR BARBARIN, New Orleans, La.—*Self-lighting Gas Burner.*—September 1, 1868.—The elongated ring upon the burner has on its sides two arms supporting fine platinum wires bent over at the top, between which is a spongy platinum with wires at the bottom to determine the instant ignition of the gas from the jet of the burner.

Claim.—A gas lighting device, consisting of spongy or finely divided platinum, combined with fine projecting platinum wire and fine projecting wire points or ends, in the manner herein specified, the said device being applied to a gas burner, and arranged to operate in connection therewith, substantially as shown and set forth.

81,735.—ARTHUR BARBARIN, New Orleans, La.—*Apparatus for Lighting Gas.*—September 1, 1868.

Claim.—1. The application and use of clock work, or equivalent mechanism, in combination with the armature of an electro-magnet, to let on or shut off the gas, and control at the same time the operation of the illuminating agent, substantially as described.

2. The combination of the rotary valves for supplying gas to the burners, and the mechanism for operating and stopping the same, with the armature of an electro-magnet, under such an arrangement that the motion of the said armature toward its magnet shall leave the said valves free to revolve, substantially as set forth.

3. The arrangement relatively to each other of the valves for supplying the hydrogen and illuminating gases to their respective burners, so that the hydrogen gas shall be supplied to its burners before the opening of the valve through which the illuminating gas passes, substantially as shown and described.

4. The method of transmitting a current of electricity from a main battery to the magnets of one or more valve-operating apparatus, by means of an apparatus arranged and operating so as to effect the momentary closing of the circuit between the said battery and magnets, substantially as shown, and for the purposes described.

5. The circuit-closing apparatus herein described, the same consisting of the combination of a revolving needle, and its actuating and stopping mechanism, with the armature of an electro-magnet, the whole being constructed and arranged so that the momentary passage of a current of electricity through the said magnet shall so move its armature as to effect the revolution of the needle, substantially as set forth.

6. The combination, with the said circuit-closing needle, of a plate or disk, in and to which are secured the insulated wires of one or more apparatus for operating the valves which supply the gas to the burners, substantially as and for the purposes described.

7. The method of closing the circuit of the local battery, by which the circuit-closing apparatus is actuated, by connecting the same with the operative works of a clock or other time-piece, under the arrangement herein described, so that the said circuit may be closed at any desired hour.

8. The construction and arrangement of the mechanism for closing and breaking the circuit between the operative works of the clock and the battery

connected with the magnet of the circuit-closing apparatus, substantially as shown and described.

9. The combination, with the operative mechanism of a clock or other time-piece, of the gas-lighting and circuit-closing apparatus herein described, the whole being constructed and arranged so as to cause the simultaneous ignition of any number of gas jets at any desired hour, substantially as set forth.

81,736.—JOHN ALLEN BASSETT, Salem, Mass.—*Process and Material for Carbureting Gases.*—September 1, 1868.—The case incloses a wheel, divided into compartments, into which the material is closely packed and is saturated, as the wheel revolves, by the hydrocarbon which passes through it.

Claim.—1. The combination of absorbent materials having different capillary powers, for the purpose of holding hydrocarbon liquids in suspension in carbonizing air and gases.

2. Carbureting air or gases by the combined capillary materials described and shown.

3. The apparatus, shown and described, charged with the materials specified, and used for the purpose set forth.

81,737.—AUGUSTUS BEAN, Fairview Village, Pa.—*Shaft for Vehicles.*—September 1, 1868.—Two short shafts are secured on the axle, the cart bed resting on them being hinged to one and stapled to the other. The draw shafts are connected by a cross bar and one of them is hinged to one of the short shafts, the other has a curved extension at the rear, sliding in a guard on the inside of the other short shaft, thus permitting the cart to be turned one side by the horse.

Claim.—1. The shaft H, provided with a curved extension, I, sliding under the bed of a cart in the guard J on the inner side of one of the short shafts C, and held in position by means of a spring, K, substantially as and for the purposes herein set forth.

2. The shaft F, hinged to one of the short shafts, C, and connected, by means of a cross bar, G, to the shaft H, substantially as and for the purposes herein set forth.

3. The combination of the shafts F and H, when constructed and attached to a cart in the manner described, and operating substantially as and for the purposes herein set forth.

81,738.—CORNELIUS BERRIAN, Clinton City, Iowa.—*Machine for Pressing Brick.*—September 1, 1868.—By one motion of the working lever the brick is pressed, the opposite motion causing the discharge of the brick. The same movement opens the mold to receive new clay.

Claim.—The combination and arrangement of cap B, shafts N and K, pitman F, rods S S, arm L, and traveling fulcrum J, when constructed, arranged, and operating substantially as and for the purpose herein set forth.

81,739.—EDWIN BERKENS HAW, Ashuelot, N. H.—*Teasling Machine.*—September 1, 1868.—The gig slats have projections which slide and catch under hooks on the cylinder, to which a spring provided with a lip is secured under one end of the slats, catching and holding them in place. On pressing down the spring the slats slide out from the hooks and are detached.

Claim.—The spring D and hooks C C for holding or attaching the gig slats B, the teasling gig cylinder A, when constructed and arranged substantially as herein specified.

81,740.—ADOLPHUS F. BISHOP, JOHN H. AIKEN, Norwalk, Conn., and JOHN M. PENDLETON, New York, N. Y.—*Fiber and Gum Fabric.*—September 1, 1868.—A sheet of felt is saturated with rubber and contains a quantity of sulphur or litharge. It is then vulcanized and cut or molded into the required shape.

Claim.—The within-described compound of fiber and rubber cement, formed in the proper shapes, and vulcanized, as and for the purposes herein set forth.

81,741.—THOMAS H. BOMAR, Atlanta, Ga.—*Car Coupling.*—September 1, 1868.—The coupling

link entering the draw-head slides on an incline plane and drops behind a shoulder and rests above an angular elevating link. A pivoted bar drops against the shoulder and prevents the link from unfastening. On raising the angular elevating link the block rises and the connecting link is released from the shoulder.

Claim.—1. The arrangement of the pivoted arm D, angular elevating link C, stops E E, inclined plane A, and pin B in the draw-head G, all constructed and used substantially as specified.

81,742.—C. W. BRIGGS, Springfield, Mass.—*Charcoal Furnace.*—September 1, 1868.

Claim.—1. A charcoal furnace, surrounded by the flange F, and having a smoke flue, C', opening beneath the flange, and an air flue formed by the plate B, prolonged as described, for the purpose of delivering the air supply at a point near the line of the diameter of the furnace, substantially as specified.

2. In combination with the plate C, forming the smoke flue, the flanged vessel A, having the side G below the flange flattened, substantially as and for the purpose set forth.

81,743.—AMOS BROADNAX, Mont Clair, N. J.—*Apparatus for Rendering Lard, Tallow, &c.*—September 1, 1868.

Claim.—1. Rendering fat or other oleaginous matter by putting it in a rotating or tumbling chamber, combined in or with a stationary chamber, to which the heat can be applied and regulated, substantially in the manner described.

2. Rendering fat by putting it in a tumbling perforated chamber, out of which the fat and water can be drained as fast as the melting proceeds, and in which the scrap can be dried, when said perforated tumbling chamber is confined in a chamber which can be heated to the required temperature.

3. Combining a perforated rendering vessel, which can be rotated, and which is confined in a hot chamber, over or in connection with a pan, arranged to receive the fat and water set free in the process.

4. Constructing a covered furnace, with radiating flues, substantially as described, in the bottom of a chamber, and arranging in said chamber, and over said furnace, a rendering apparatus, substantially as set forth.

5. Combining in a chamber to which the heat can be applied, and the temperature regulated, substantially as described, an open rendering kettle, divided by a perforated partition plate in such manner as to form an upper and a lower chamber, making the lower chamber large enough to hold all the grease or oil which can be extracted from a full charge of fat in the upper chamber, leaving the scrap, after the process is completed, on the plate above the surface of the rendered fat.

6. Rendering fat by forcing hot air out of a chamber in which the temperature can be regulated into the digester, by means of a pump, substantially as described.

7. Rendering fat or other oleaginous matter by drawing a current of hot air into the digester, or upon the fat, out of a chamber in which the temperature can be regulated, by means of a partial or complete vacuum created in the digester through the agency of a condenser and pump, or in any of the well-known methods of creating a complete or partial vacuum, substantially as described.

8. Separating the offensive gases from the condense-water, and destroying the same by passing said condense-water, whether out of an open or surface condenser, through a heater combined or connected with the apparatus, by which the gas is driven out of the water, as it flows from the condenser, into the fire, or is otherwise disposed of, substantially in the manner described.

81,744.—AMOS BROADNAX, Mont Clair, N. J.—*Rendering and Refining Lards, Oils, &c.*—September 1, 1868.

Claim.—1. The use of a steam superheater, in combination with a steam boiler or generator, and a rendering digester or distiller, and in which the temperature can be regulated, for the purpose of rendering fat or distilling oil by superheated steam or air, substantially as described.

2. Rendering, refining, or distilling fat or other

oleaginous matter by steam or air, superheated in a separate superheater, on its way from the boiler or generator to the digester containing the fat or oil.

3. Superheating steam or air in a magazine or chamber, E, and carrying said steam or air over into the digester or distiller by a blast or current of steam or air, substantially as described.

81,745.—CHARLES BROWN, Buffalo, N. Y., and DAVID L. MILLER, Madison, N. J.—*Baling Press.*—September 1, 1868.—Slots cut in the sides of the press-box, are covered by metal plates connected to and moving with the follower so as to prevent the escape of the hay when being pressed. One side of the box is also made movable, to facilitate the removal of the bale. The descent of the follower is regulated by friction brakes. A hinged partition is arranged in the press-box, so that two small bales may be pressed at one time.

Claim.—1. The arrangement of the covering plates J, connected to the follower, and moving therewith, substantially as herein described.

2. The arrangement of the removable side K of the part B of the press-box, suspended and moving upon the hinged bars K¹ K¹, substantially as and for the purpose set forth.

3. The combination and arrangement of the friction brakes I with the worm shaft G and worm wheels F F, and eccentric rock shaft H and its connections, substantially as described.

4. The hinged partition L, arranged in the part B of the press-box, as and for the purpose set forth.

81,746.—GEORGE C. BUNSEN, Belleville, Ill.—*Door Holder.*—September 1, 1868.

Claim.—The combination and arrangement of the spring dog or lever H with the case F, for operating as a door or window holder, substantially as described.

81,747.—HENRY BURTON, Richview, Ill.—*Bee Hive.*—September 1, 1868.

Claim.—The hive B, suspended within, but not in contact with, the base A, upon legs B¹, which supports it above the bench, said parts being respectively constructed and arranged in relation to one another substantially as and for the purpose set forth.

81,748.—ALONZO B. CALDWELL, Syracuse, N. Y., assignor to himself and JACOB PINKERTON, same place.—*Journal Box.*—September 1, 1868.—Hooks and shoulders, constituting part of the bronze metal frame, hold the cast-iron shell which is cast around the frame; the latter is provided with arms which have flanges across their ends which support the soft metal and prevent it from being crushed.

Claim.—1. The knobs or hooks h h, or their equivalents, as a part of the bronze metal frame B, substantially as and for the purposes described.

2. The flanges f f f, upon the ends of the arms b b b, when made and applied in the manner and for the purposes described.

3. The cast-iron shell A, when cast around the heads of the knobs or hooks h h upon the bronze-metal frame B, in the manner and for the purpose as above described.

4. The shoulders s s upon the bronze frame B, in combination with the knobs or nooks h h and holes a a in the cast-iron frame A, when used to hold more securely together and strengthen the bronze-metal and cast-iron portions of the box, in the manner described.

5. A journal box, composed of the bronze-metal portion B, when made with the flanges f f and shoulders s s, combined with the cast-iron frame A, made as aforesaid, with the soft metal portions m m m filled in, substantially in the manner and for the purposes described.

81,749.—JAMES CALKINS, New York, N. Y.—*Lamp.*—September 1, 1868.—The air space acts as a non-conductor and prevents the oil in the consuming chamber, which has been cooled by passing through the coil, from being heated.

Claim.—1. The divided chamber, consisting of the reservoir A and consumption chamber D, in combination with the duct or coil C, and water chamber B,

arranged and operating substantially as and for the purposes set forth.

2. The intervening air space G, between the chambers A and D, as and for the purposes set forth.

81,750.—DENNIS W. CARKHUFF, Lambertville, N. J.—*Device for Operating Wagon Brakes.*—September 1, 1868.—A handle, which is secured to the pawl, extends upward and slides in a guard attached to the brake lever. It is used to release the pawl from the ratchet.

Claim.—A slotted lever, ratchet, pawl, spring, and guard, when made and applied in the form and manner, and for the purposes herein described and set forth.

81,751.—JOSEPH B. CASSEL, Worcester Township, Pa.—*Lard Press and Sausage Stuffer.*—September 1, 1868.

Claim.—1. The vessel C, rendered detachable from the base A, having a detachable spout D, and adapted for the reception of a perforated casing E, and of plungers I or K, the whole being arranged and operating substantially as and for the purpose set forth.

2. The yoke G, hinged to the vessel C, and its spindle H and pinion l, for operating the plunger rod H', as described.

3. The combination of the perforated casing E and a funnel-shaped ring, hinged to the casing, as and for the purpose set forth.

4. The plunger K, attached to the under side of the plunger I by a dove-tailed projection r, or equivalent fastening, for the purpose specified.

81,752.—B. F. CAUFFMAN, Millerstown, Pa.—*Evaporator.*—September 1, 1868.—The dampers prevent burning when the substance in the boiler is nearly evaporated. A side furnace is provided for convenience in "sugaring off." The lids, which are raised or lowered by cords, are provided with steam pipes for carrying off the vapors. A car conveys the coal from the main grate to the side furnace.

Claim.—1. The furnace A, provided with double dampers c c and dampers g e m, in combination with a small side furnace D, boiler F, and pan H, and the lids K K, the several parts being constructed, arranged, and used as and for the purpose specified.

2. The arrangement of the track d, ear E, and windlass h, with the grate of the larger furnace A, with the side furnace D, when operated and used as and for the purpose set forth.

81,753.—CHARLES CLARK, Dayton, Ky.—*Rope-making Machine.*—September 1, 1868.—One bobbin is journaled in the frame, the others are journaled in a revolving frame with hollow journals. Each bobbin has a gravitating friction bar over which the strands pass. A triplet revolves within the frame and causes the proper twist of the strands.

Claim.—The arrangement of the hollow journaled revolving frame E, gravitating friction bars H H', hangers G, eyes L, and orifices K, triplet W, and positively-rotated delivery rollers N N', for the purpose set forth.

81,754.—PINDAR F. COOLEY, Pittsfield, Mass.—*Whip Hanger.*—September 1, 1868.—An annular rim provided with notches into which the ends of the whip fit is suspended by a rod to a swivel.

Claim.—1. The notch n with the upper curviform surface line g, substantially as and for the purpose set forth and described.

2. The rim A, constructed circular, square, oval, or any other form, provided with the notches n n n, as described, and the supporting rods o o o, or their equivalents, and all in combination with the swivel C, as and for the purpose set forth and described.

81,755.—ELIOTT H. CRANE, Burr Oak, Mich.—*Compound for Embalming Dead Bodies.*—September 1, 1868.—Nux vomica, alum, chloride of sodium, muriate of ammonia, arsenic, chloride of mercury, camphor, and chloride of zinc, separately pulverized and mixed.

Claim.—1. The discovery, application, and use of an embalming and mummifying compound for the preservation of the dead, and for taxidermic pur-

poses, as prepared, compounded, and applied substantially in the manner specified and described.

2. The application of this compound, in dry powder, to the mouth, throat, and other natural apertures of the subject, substantially as specified and described.

81,756.—GEERT DE BRETTON, New Orleans, La., assignor to himself and JOSHUA E. VOSE, same place.—*Traveling Trunk*.—September 1, 1868.—The front upper corner of the trunk is hinged to the next front corner of the trunk body, the lower rear corner being rounded to pass easily over the clothes below, its top, when open, forming a shelf. The space above is divided into compartments, an extra cover is over the whole, and a hasp and lock, with metallic straps on both sides of them, form the fastening.

Claim.—1. The combination of part D with the trunk body proper, when these parts are united, constructed, and arranged so as to be convertible into a system of shelves, substantially as herein described for the purpose set forth.

2. The above combination in combination with the extra cover A, when the several parts are united, constructed, and arranged for conjoint operation, substantially as described for the purpose set forth.

3. The hasp J and metallic straps C, when severally constructed as described, in combination with a trunk provided with a part D, and an extra cover A, substantially as herein described for the purpose set forth.

81,757.—SYLVENUS G. DELANO, Grand Blanc, Mich.—*Automatic Cradle*.—September 1, 1868.—The cradle is hung on a frame by journals attached to adjusting plates at each end, and is raised or lowered by means of screws through slots in the plates; another plate pivoted to the adjusting plate, by a fork, engages with a vibrating lever, and thus motion is given.

Claim.—1. The adjusting plates C, in connection with the cradle body A and frame B, substantially as herein described.

2. The pivoted plate E, in connection with the vibrating lever G, when attached and operating substantially as and for the purposes set forth.

3. The combination of the above named parts with any suitable clock movement, when arranged, constructed, and operating substantially as described, and for the purposes designated.

81,758.—W. H. DE VALIN, Sacramento, Cal.—*Wheel for Carriage*.—September 1, 1868.—The spokes formed of straps of wrought iron are bent and fastened at the center to the rim, diverging to each end of the elongated hub, where their ends are secured by bolts. If used for other vehicles than wheelbarrows, they are fastened to bearings formed between the two larger portions of the axle.

Claim.—1. Uniting the rim or tire to the hub or axle by means of a series of straps or flat bars of wrought iron, each bent at the middle, where it is attached to the rim, and having its diverging ends extending thence to the hub or axle, to which they are united in the manner set forth.

2. The combination, with the elongated hub, and the axle upon which it is mounted, of the rim or tire, and a series of wrought-iron straps or flat bars, for steadying and bracing the said rim, and for holding the same to the hub, the whole being arranged in the manner set forth.

81,759.—GEORGE EDMUND DONISTHORPE, Leeds, England.—*Coal Mining Apparatus*.—September 1, 1868; patented in England April 28, 1863.—Wheels on the top of the carriage are pressed against the roof of the mine according to its irregularities, they being acted upon directly or through levers on their axis, by compressed air in a cylinder with its piston, while it is moved along the floor.

Claim.—1. The combination, in mining machinery, of the traveling carriage that carries the mining mechanism, with a yielding pressure wheel, which, while pressing the said carriage upon its track and preventing its rise, permits it to be moved forward without relaxing the pressure, the combination being substantially as set forth.

2. The combination and arrangement of the said

traveling carriage, that carries the mining mechanism, with an air cylinder, to apply the pressure required to hold the said carriage upon its track, substantially as above set forth.

81,760.—GEORGE EDMUND DONISTHORPE, Leeds, England.—*Coal Mining Apparatus*.—September 1, 1868; patented in England May 22, 1861.—A cutting tool bar is mounted on a carriage running on and guided by rails, its end having a handle by which it can be driven up to produce a groove to be successively deepened.

Claim.—The combining with a carriage (capable of being moved by mechanism slowly along the face of the coal or mineral) a cutting tool, which is so supported and guided that a reciprocating to-and-fro motion may be imparted to it by the power of the workman, substantially as herein described.

81,761.—FRANK DOUGLAS, Norwich, Conn.—*Machine for Turning Rods*.—September 1, 1868.—The knives which reduce the stick to a round rod are so arranged that one of them scores directly into the stick, and at the same time feeds it along to the cutter, while the others shave off the corners of the rod and round it to the proper size.

Claim.—1. The arrangement of the inclined cross-cutting knife *e* with the knives *e' e''*, in a tubular cutter head, when constructed and operating substantially as and for the purpose above described.

2. The guide F, when constructed with the openings *m m*, and the notches *n n*, and operating in connection with the lock *o* and the tubular cutter head, substantially as and for the purpose set forth.

3. The arrangement of the grooved rollers R R', at the rear end of the cutter spindle, substantially as described.

81,762.—FREDERICK ERNST, San Francisco, Cal.—*Revolving Furnace for Roasting Ores*.—September 1, 1868.—The heat of the stationary fire gate passes in an opposite direction to the course of the rotating hearth and the ore is discharged by scrapers, connected with endless chains, crosswise of the hearth.

Claim.—1. The hearth D, revolving between the inner and outer walls B C of the furnace, with the circular rack F and flange G, operating in the grooves of the rollers H H, substantially as described.

2. The discharging apparatus, operating transversely across the furnace, above the rotating hearth, and consisting of the scrapers N N, attached to the endless chain N', operated by the wheels, substantially as described.

3. The construction of the hearth D, with the circular flange E E, so as to retain the ore upon the surface of the hearth, and the stirrer M, or its equivalent, to turn the ore as the hearth revolves, the whole constructed and operated substantially as described.

4. The dampers U U', and sliding plate S, arranged to be operated substantially as and for the purposes described.

5. In revolving furnaces, carrying the ore in one direction on the hearth, while the heat, flame, and gases pass in an opposite direction, substantially as described.

81,763.—NELSON B. FASSETT, Adrian, Mich., assignor to himself and WILLIAM HUMPHREY, same place.—*Rotary Steam Engine*.—September 1, 1868.

Claim.—1. The two steam backers S and S', in combination with their respective radial pistons P and P', constructed and operating in the manner substantially as set forth and described.

2. The circular disks *j* and *k*, in combination with the radial wings *a, b, c,* and *d*, shaft T, and rings I and I', constructed in the manner set forth and described.

3. The combination of the convex-faced bar *f* and concave-faced bar *f'*, for packing against the concave case B' and rotary piston R respectively, in the manner set forth and described.

4. The combination of the slot-wheel L with the crank arm K, friction roller *z*, and stop wheel M, constructed in the manner set forth and described.

5. The steam channel *m* and *m'* or *m''*, in combination with rotary piston R and center piece G respectively, as set forth and described.

81,764.—ISAAC FISHER, St. Louis, Mo.—*Vise.*—September 1, 1868.—An improvement on his patent of May 5, 1868. Steel facings are fastened by dove-tailed recesses to the jaws, their ends projecting so as to allow soft-metal clamps to be combined with the jaws, rectangular corrugated faces and a triangular block pivoted to a removable block serving as a jaw.

Claim.—1. The combination of the steel facings *b b* with the jaws *a a* of a vise, and the soft-metal clamps *x x*, substantially as shown and described.

2. The combination of the rectangular facings *c c* with the vise jaws *a a*, by means of the removable blocks *d d*, Fig. 2, substantially in the manner and for the purpose herein set forth.

3. The arrangement of the pivot connection of the triangular block *j* with the removable block *d*, when the said blocks are combined with one of the jaws *a* of my improved vise, substantially as and for the purpose herein set forth.

81,765.—ELIAS T. FORD, Stillwater, N. Y.—*Potato Digger.*—September 1, 1868.—As the machine moves forward, the long vines having been cut off by the knives swiveled upon the axle, the dividers are forced under the hills so as to raise the dirt with the potatoes, and by means of the leaning shafts armed with teeth, discharge the mass to the rear, most of the dirt falling between the teeth.

Claim.—1. The dividers *E E*, with the tubes *H H*, shafts *J J*, armed with teeth *Q Q Q*, arch *T*, draft bars *V V*, in connection with lugs *r r*, braces *L e L e*, the shafts *F F* hinged to axle *B*, with tubes *G G*, the adjustment of the dividers *E E* varying the line of draft with pole section *B r*, the section *b b* hinged to centers *d d*, the position of the separating teeth *Q Q Q Q* underneath the dividers *E E*, and the open space *W* between, substantially as described.

2. The pole section *B r*, hinged to the lugs *r r* underneath, and in rear of the axle *B*, in combination with the dividers *E E*, the lugs *r r* to be adjustable, in the manner and for the purpose specified.

3. The vine cutter *o o*, with knives *S S*, plane or sickle edge, as hinged with swivel *U* underneath the pole sections *B r* substantially as and for the purpose specified.

81,766.—ALEXANDER CÆSAR FREDERICK FRANKLIN, No. 4, Princes Square, Bayswater, England.—*Reciprocating Steam Engine.*—September 1, 1868.—By means of two stationary cylinders, one open in front and the other at the back, with pistons and cranks, the steam, while driving one piston, operates through the driving shaft and cranks to cause a return movement in the other.

Claim.—The improved engine, constructed substantially as described, that is, with each cylinder open at one end only to the atmosphere, and with the cranks of the driving shaft and the connecting rods of the pistons of such engines arranged to project from the shaft in the manner herein described.

81,767.—WILLIARD M. FULLER, Chicago, Ill.—*Apparatus for Amalgamating Gold and Silver.*—September 1, 1868; antedated August 28, 1868.—The upper part of the case being turned and carried down near the bottom of the kettle forms a funnel-shaped induction pipe with a shaft and deflector for distributing the gold-bearing substance through the agent, a valve being provided to regulate the flow, through the inlet. A steam jacket below the kettle has an induction and eduction pipe for the steam and water of condensation, the tailings being discharged by a pipe at the bottom of the case.

Claim.—1. Discharging the tailings of an amalgamator through a conduit or outlet, the mouth of which is immersed in liquid, so that it will close such conduit against the admission of air, and at the same time afford a free and uninterrupted passage for the tailings, substantially as specified.

2. The steam jacket *D*, in combination with the kettle or vessel *C*, and shell or case *B*, substantially as described.

3. The shell or case *B*, when provided with pipes *E, L*, and *A*, so that it can be operated interchangeably, either by water or by exhausting the air, substantially as specified.

4. Placing the kettle *C* within an air-tight case, *B*,

so as to leave an annular space or flues between them, and connecting such space or flues with a discharge pipe, *E*, placed below, substantially as specified.

81,768.—WILLIAM F. GILBERT, Derby, Conn.—*Carriage Shackle.*—September 1, 1868.—The coupling is formed by two large cheeks with a correspondingly large head upon the thill iron, through which latter and between the cheeks is a large detachable bearing secured in place by a bolt.

Claim.—The combination of the sleeve or bearing *D*, arranged between the cheek *A* and *B*, and secured by the bolt *E* with the head *G* of the thill iron, the whole constructed so as to be united substantially as herein set forth.

81,769.—FRANK GLASSER, Mystic Bridge, Conn.—*Drill.*—September 1, 1868.—The operating lever is fixed at one end to the bevel wheel, and connected at the other to a screw and handle, serving to extend it and increase, or as a crank to reduce its leverage on the wheel. It can also be used as a tread drill by means of ratchets and blocks, a wheel and shaft.

Claim.—The adjustable lever, attached to the drill stock, as described, and consisting of the pivoted handle *G*, screw *E*, and fixed arm *D*, all operating as set forth.

81,770.—E. A. GOODES, Philadelphia, Pa., assignor to himself, E. L. MILLER, and W. H. MORFORD, same place.—*Flour Dredge.*—September 1, 1868.—The perforated distributor is made to slide within the body of the dredge, and thus is made adjustable at will.

Claim.—The flour dredge *B C*, so constructed that its perforations may be entirely closed, or a greater or less number be uncovered, substantially as shown and described, for the purpose set forth.

81,771.—WILLIAM S. GRAVES, Oberlin, Ohio.—*Fence Post Driver.*—September 1, 1868.—By means of the segmental stay and transverse slotted rail, the position of the frame may be changed to bring it to a vertical line on uneven ground.

Claim.—The segmental stay *D* and slotted rail *E*, as arranged, in combination with the ways or guides *b* and frame *C*, for the purpose specified.

81,772.—WILLIAM GREEN, Holley, Mich.—*Potato Digger and Separator.*—September 1, 1868; antedated August 28, 1868.—The shovel being brought into gear by lowering the sliding frame, enters the ground and takes up potatoes, dirt, and vines, which pass into the conveyer; the dirt is shaken out and the vines thrown off by means of an agitator and rollers.

Claim.—1. Simultaneously adjusting the plow, and putting the apparatus into or out of gear with its driving wheels, by means of the sliding frame *E E'* and axle *D*, when operating together for that purpose, substantially as described.

2. The conveyer *G*, in combination with the shovel *F*, substantially as and for the purpose set forth.

3. The use of the two rollers *H H'*, for the purpose of detaching and separating the potatoes from the vines, substantially as described.

4. The combination of the conveyer *G*, cords *I I*, and rollers *H H'*, substantially as and for the purpose set forth.

81,773.—Canceled.

81,774.—STINSON HAGAMAN, Weissport, Pa.—*Machine for Polishing Wood.*—September 1, 1868.—Under the circular plane is a sliding shaft, operated by a treadle, having connected with it an adjustable sleeve to act as a gauge, and supporting a table with the slate, the sleeve resting against the thicker or thinner end of a slide above it, as the one or other side is to be planed.

Claim.—The loose sleeve *i*, set screw *j*, nut *k*, and slide *l*, in combination with the shaft *E* and treadle *M*, operating substantially as described, and for the purpose specified.

81,775.—ALEXANDER HAMAR, New York, N. Y.—*Making Iron.*—September 1, 1868.—Steam or

hydrogen is carried around the furnace and into the stack and boshes at different heights by a main and branch pipes, with valves and tuyeres; the branch pipes project into the furnace beyond its inner wall to inject the hydrogen into the charge.

Claim.—1. The method, herein described, of introducing steam, superheated steam, or hydrogen into the boshes of a blast furnace above the ordinary blast tuyeres, for the purpose set forth.

2. The method, herein described, of introducing steam, superheated steam, or hydrogen into the stack of a blast furnace, for the purpose set forth.

3. The method, herein described, of producing iron, suitable for conversion into steel, by the use of anthracite and a hot blast, in combination with the introduction of hydrogen or superheated steam into the furnace at different elevations.

4. The combination, substantially as set forth, with a blast furnace of tuyeres, arranged at different levels in the boshes and stack, for the purpose set forth.

5. The combination, substantially as set forth, with the furnace, of the jet pipes intruding into the interior of the boshes and stack, as and for the purpose set forth.

81,776.—S. M. HAMILTON, Baltimore, Md.—*Planing Machine.*—September 1, 1868.—The guide surrounds the mandrel and is adjusted by a set screw. It is made to move up and down by means of a lever so as to determine the relative bearing of the material to the cutters.

Claim.—The vertically-moving guide H, constructed and arranged substantially in the manner and for the purpose shown and described.

81,777.—WILLIAM E. HAMLIN, JR., Providence, R. I.—*Heel Plate for Boots and Shoes.*—September 1, 1868.

Claim.—The improved heel plate for boots and shoes, consisting of a plate made in two parts, A and B, constructed and fitted to each other so as to accommodate heels of different sizes in the way substantially as described.

81,778.—DEXTER D. HARDY, Cincinnati, Ohio, assignor to THOMAS H. FOULDS, same place.—*Submerged Rotary Pump.*—September 1, 1868.—Two pistons with radial flanges interlocking as they rotate, are journaled in the heads of a case, in each end of which is a recess with a packing block, adjustable by screws, and curved to suit the outside of the pistons, the water, admitted by holes in the side, being carried between the pistons up into a recess connected with the outlet pipe.

Claim.—A pump, consisting of the case F, with the pistons G inclosed therein, connected by the pipe C with the hydrant B, and operated by the rod H, all substantially as described.

81,779.—JOHN HARDY, 2d, Andover, and BYRON B. FLOYD, Lawrence, Mass.—*Locking Latch.*—September 1, 1868.—Designed for application to a stove door to prevent it from being opened, except by those employed to attend it.

Claim.—A latch, provided with the eccentric button F, when arranged within the space h, as illustrated, and operated either by removable key or retained knob J, substantially in the manner and for the purposes specified.

81,780.—EDWARD HARRISON, New Haven, Conn.—*Grinding Mill.*—September 1, 1868.—An improvement on his patent of June 5, 1854. The husk for the runner casing, and also for the bed-stone, with their parts connected are each cast in one piece, the hopper having conical studs underneath fitted closely in the sockets and a rocker arranged to vibrate and conduct the grain.

Claim.—1. The husk or runner case A, constructed in one and the same piece, with discharge spout B, frame C, connections D, bearings E and F, sockets H H, substantially as set forth.

2. Fitting hopper N into sockets H in the manner described, when said sockets are a part of one of the husks of the mill.

3. The rocker P, pivoted to the husk, and so as to be operated by an eccentric or cam, S, on the pulley

or shaft, substantially as and for the purpose specified.

4. A double-faced stone, provided on its edge with a central flange, L, when the surfaces of the said flange bear the relative position to the face of the stone as described, so as to be set and adjusted to present either face of the stone, in the same relative position to the grinding surface of the other stone, substantially as and for the purpose specified.

5. In combination with the subject-matter of the above fourth clause, the runner plate or bed-stone husk, constructed so as to receive the stone, substantially as and for the purpose specified.

81,781.—B. R. HAWLEY, Normal, Ill.—*Tubular Air Heater.*—September 1, 1868.—The perforations in the diaphragm or rear portion of the top plate of the fire box allow the flames to pass through to ignite the soot and smoke at that point.

Claim.—The diaphragm B³, when perforated at b², and otherwise arranged, as herein shown and described.

81,782.—WILLIAM H. HERBERT, Blissfield, Mich.—*Miter Box.*—September 1, 1868.—Two slotted quadrants are connected with the frame provided with ears at each end for the rod on which the guards, quadrants, and attachments oscillate, saw guides, with flanges on the guards, being adjustable by screws, and an oscillating bar also being arranged for the material to rest on.

Claim.—1. The oscillating bar R, when constructed and operating substantially as and for the purposes herein set forth.

2. An adjustable miter box, consisting of the two quadrants D and L, frame C, set screws G, M, and P, the rod J, guards K, saw guides N, and oscillating bar R, when arranged and operating substantially as herein described.

81,783.—J. W. HODGES, Plymouth, Ill., assignor to himself and A. W. KING.—*Device for Binding Loads of Hay upon Wagons.*—September 1, 1868.—The binder works up and down on the posts by means of pawls catching into teeth on the posts, and is forced down upon the hay by a forked lever embracing one of the posts and catching into its teeth, its fulcrum also catching into a notch in the binder, which, when down, is held fast by catches or pins.

Claim.—The combination of the two upright rack bars B B, the horizontal beam C, its pawls g g, with the lever D, its fulcrum h, with the rack A, all constructed and operating as herein set forth.

81,784.—WILLIAM M. IRVINE and ALFRED H. MOSES, Montgomery, Ala.—*Ventilator for Hat.*—September 1, 1868.—Screws pass through slots in the band, which may thus be adjusted or partly removed to suit heads of various sizes, a space for ventilation being left in front and behind between the hat and band.

Claim.—1. A band or ring so constructed and arranged on the inside of a hat that it may be adjusted to different-sized heads, substantially as described.

2. The band A, constructed in either one or more parts, and furnished with tubes e and a, slots C, and tube E, all arranged in the manner and for the purposes set forth.

81,785.—F. JACOBY, St. Louis, Mo.—*Apparatus for Extracting Wort and Similar Liquids.*—September 1, 1868.

Claim.—1. The application of a partial vacuum in the sub-compartment of a mash tub, to cause the wort to accumulate more quickly, and to cause its extraction more thoroughly out of the mash, substantially as set forth.

2. The combination of the pump E, its connecting pipe D, with the concentrating head C, and the drain pipes B and mash tub A, substantially as and for the purpose set forth.

81,786.—ALBERT W. JOHNSON, New York, N. Y.—*Whip Holder.*—September 1, 1868.—The end of the whip is placed in the socket, which being pressed the shaft is drawn down through the case, turning by a pin that acts in the spiral slots of the sleeves, thus opening the jaws to admit the whip. The press-

ure being stopped, the jaws are acted on by the spring to close about and hold it.

Claim.—1. A holder for whips, &c., composed of jaws B, in combination with a rest, M, or their respective equivalents, connected together so as to be operated and to operate substantially in the manner described.

2. The jaws B, sleeves E F, center shaft G, spring O, and rest M, when all constructed and arranged together for operation substantially as described.

81,787.—JESSE F. JOHNSON, Monrovia, Ind.—*Harness Maker's Clamp.*—September 1, 1868.—Adjustable notched guide plates are fitted on the inside of the jaws so as to admit of the strap being drawn through without letting the filling drop. The holding bar is composed of two horizontal bars connected by arms, and is actuated by a lever to keep the strap in place as it is drawn through the jaws.

Claim.—1. The guide plates C attached to the jaws A A', substantially as and for the purpose set forth.

2. The holding bar E, lever G H e, and elastic strap I, arranged substantially as and for the purpose set forth.

3. The channeling tool L, constructed and applied substantially as set forth.

81,788.—WILLIAM A. JORDAN, New Orleans, La.—*Harness.*—September 1, 1868.—The end of a rope enters the socket and is held by a knot in the yarn.

Claim.—A metallic connecting termination or tip, for certain parts of harness, as herein indicated, when the same consists of the self-fastening annular tapering socket clamp, A, and a projecting loop, B, and is otherwise constructed substantially as herein described, for the purpose set forth.

81,789.—WILLIAM C. KELLUM, San Francisco, Cal.—*Escapement.*—September 1, 1868.—A crown-wheel escapement, operated with two rollers on the balance staff, gives the balance an impulse in each direction as it vibrates, and by means of a double-headed screw, in connection with the detent lever, each tooth of the escape wheel is locked twice at each double vibration of the balance. The detent lever is so placed as to lock by gravitation or a spring.

Claim.—1. The escape wheel C, having escape teeth either on the side or rim, and the notched impulse rollers D and D' above and below, constructed and operating substantially as and for the purpose herein described.

2. The detent lever F, with the adjustable double-headed screw e e' or its equivalent, locking each tooth of the escape wheel twice at each revolution, either by spring or gravitation, substantially as herein described.

3. The point d on the arm G, and the point e on the roller D, for unlocking, substantially as herein described.

81,790.—GEORGE KING and LYNDHURST T. SHOPE, Frederick City, Md.—*Seeding Machine.*—September 1, 1868.

Claim.—Hinging the lower section of the seed spouts P V to the tubes or spouts R M, as and for the purpose specified.

81,791.—WATSON KING, Springfield, Ill.—*Hay Rake.*—September 1, 1868.—The axle as it revolves is kept in place by an adjustable lever and collar, and the teeth being free, the rake can be backed without raising it, the teeth being caused to turn up, so that the curved part slides on the ground, while by revolving the axle and throwing back the teeth, it may be cleared and the hay dumped.

Claim.—1. The rotating of the axle A by means of the gearing C, B, and D, herein described, whether spur or beveled, as applied to hay rakes.

2. The lever B C, as shown in Fig. 2, as applied to hay rakes.

3. The collar F, in combination with the geared lever B and C, as herein arranged and described.

4. The tooth, as constructed in Fig. 4, in combination with the adjustable brace L and nut M.

5. The adjustable brace L, as herein arranged and described.

81,792.—CHARLES H. KNOWLTON, Camden, N. J., assignor to FURBUSH & GAGE, Philadelphia, Pa.—*Cam for Operating Shuttle Box.*—September 1, 1868.—The cams operating with the respective ratchets and pawls of the vibrating arm, in connection with the drop box, which has different compartments, serve to continually change the compartments as they are alternately acted upon, one pawl being in operation while the others are disengaged.

Claim.—1. In a drop-box loom, the within-described system of ratchet wheels and cams, adapted to each other, carried by one spindle, and arranged to be operated and to operate substantially as and for the purpose herein set forth.

2. The friction clamps T, in combination with the cams which operate the drop boxes of looms.

81,793.—BALTHASAR KREISCHER, New York, N. Y.—*Burning Kiln.*—September 1, 1868.—The gases and products of combustion pass off through the doorways or double walls and openings connected with the lower flue, a top flue connecting the space between them by means of tubes for carrying off the vapor of the green material, there being a double arch for heating the air on its way to the fireplace, and returning it. A bottom flue also communicates with the kilns and smoke stacks, to prevent the loss of heat and drawing up of moisture in the kiln.

Claim.—1. The arrangement of passages E F, controlled by dampers m, substantially as herein described, for carrying off the gases and products of combustion through the doorways C of the kilns, and openings e f d, controlled by dampers g and j, communicating with an adjoining kiln or lower flue, D, as required.

2. The top flues F F, in combination with the hollow doorways C and connecting tubes or passages E, essentially as herein described.

3. The double arch G to the kilns, in combination with the openings or tubes H and chamber or passages p, made in the side walls of the whole structure or fire end of either kiln, and connecting with the grate or fireplace, as herein set forth.

4. The bottom flue D, arranged below the floor of the kilns, and transversely to them, in combination with branches running to or from each kiln, in direction of the length thereof, and connecting, by suitable openings, the kilns at their ends or doorways C with either smokestack, and controlled by suitable dampers, substantially as and for the purposes specified.

81,794.—STEPHEN R. KROM, New York, N. Y.—*Machine for Separating Ores.*—September 1, 1868; antedated August 5, 1868.—As each projection on the trip wheel comes in contact with the pin the lever is thrown back and the bellows carried down. The pin being passed, the rubber spring connecting the lever with another fixed pin carries back the lever and bellows, repeating the operation for every tooth on the wheel.

Claim.—1. Introducing the material upon the bed I in a thin stratum, close to the surface of the bed, substantially in the manner and for the purpose herein set forth.

2. Traversing the material across the perforated bed I transversely to the length of the machine, that is to say, extending the bed I longitudinally of the length of the framework A, and causing the material to traverse across its narrowest dimensions, substantially as and for the purpose herein set forth.

3. The roller L, arranged and operating, as represented, relatively to the discharge passage J, for the purposes herein set forth.

4. The trip wheel C and lever F G, or their respective equivalents, arranged relatively to the bellows D and to the perforated bed I and its connections, as and for the purposes herein set forth.

5. In combination with the perforated bed I, and with means for introducing and removing the material as specified, mounting the bellows D on a rocking shaft, S, and operating it by an adjustable, vibrating motion, substantially as and for the purposes herein specified.

6. The gates N and K, so arranged as to allow the separate or simultaneous changes in the thickness and velocity of the strata on the ore bed I, substantially as and for the purposes herein set forth.

7. In combination, the ore bed I, with its feeding

and discharging devices, the adjustable, oscillating bellows D, the trip wheel C and its connections, and the means $H H^1 H^2$, or their equivalents, for varying the rate of discharge through the passage J, all arranged for joint operation, substantially as and for the purposes herein set forth.

8. The within-described arrangement of the operating parts C F and their connections, at the end of the main framework A, so that they may operate by a direct connection through the rocking shaft S, with the bellows D, and that the closed end of the frame A shall form one entire side of an inclosing case, to protect the working mechanism, all as and for the purposes herein set forth.

81,795.—CARL KUPFER, Madison, Wis., assignor to himself and KUND J. FLEISCHER, same place.—*Plane for Cutting Blind Slats.*—September 1, 1868.—The edges of the bit cut the bottom and sides of a slat at one stroke across the stick, leaving a straight edge to guide the plane in cutting the next slats.

Claim.—1. The bit A, when constructed with sharpened upper and lower edges 1 and 2, leaving two lips, 3 and 4, said lips to be at right angles with the upper and lower cutting edges, substantially as and for the purpose set forth.

2. The combination of the bit A, as described and claimed, with the plane stock, for the use and purposes specified.

81,796.—BENJAMIN LADD, Ottumwa, Iowa.—*Horseshoe.*—September 1, 1868.—The clips are on the shoe outside the hoof, and are turned up and fastened after the shoe has been fitted on and the spurs driven into the hoof.

Claim.—1. Making the inside face of the clip, where it joins the top face of the shoe, in a line with or even with the outer edge of said top face, substantially as described.

2. In combination with clips arranged as above claimed, one or more spurs on the top of the shoe, substantially as described.

3. The shoe, as above described, provided with nail holes, as a means of fastening it on, if the clips, or some of them, get broken off.

81,797.—GEORGE T. LAPE, Summit, N. Y.—*Construction of Arches, Tunnels, &c.*—September 1, 1868.

Claim.—1. The construction of sections or voussoirs with horizontal, dovetailed tongues and grooves along their abutting ends, substantially as and for the purpose specified.

2. In combination with said dovetailed tongues and grooves, constructing said voussoirs or sections with rebates along their abutting sides, so that they will lap over each other at their joints or points of contact.

3. The construction of sewers, aqueducts, and arches for bridges, culverts, tunnels, &c., by combining and abutting or securing to each other a series of sections or voussoirs, substantially as and for the purposes herein set forth.

81,798.—H. S. LESHER, Galesburg, Ill.—*Animal Trap.*—September 1, 1868.—The hinged platform, on which the animal ascends for the bait, tilts and closes the entrance, being held by a hooked rod, which, with the tilting plate, on which he next steps, is connected with a spring, restoring both to their places, and preventing escape.

Claim.—1. The tilting platform *g*, so arranged in combination with the trigger *i* and spring *m* that when the animal presses the platform down it is retained in position to prevent its escape.

2. The hinged plate R, so arranged in combination with spring *m*, trigger *i*, and tilting platform *g*, that when the animal seeks escape over the plate R, the tilting platform will be liberated, thus allowing it to fall to its original position.

81,799.—J. B. LEWIS and J. E. UDALL, Concord, Ill.—*Sulky Plow.*—September 1, 1868.—The eccentrics, fastened to the flanges on the ends of the axle, have wrist pins, on which the traction wheels revolve, and thus the axle is raised or lowered, together with the plow beam, by the compound lever entering notches in the quadrant.

Claim.—1. The flanges G, eccentrics I, wrist pins J, and pins L, when constructed, arranged and operating substantially as herein described, and for the purposes set forth.

2. The compound lever M, when constructed, arranged, and operating substantially as herein described, for the purpose specified.

3. The combination and arrangement of the above-named parts with the frame A, axle B, bolt H, seat C, traction wheels K, plow beam D, plow E, and quadrant N, substantially as and for the purposes specified.

81,800.—THOMAS E. LEWIS, Pennville, Ind.—*Wagon Bodies.*—September 1, 1868.—The bed pieces are hinged at their inner edges, and straps fastened to the under side, so that they can be folded and lapped, the ends or gates being held by a rod inserted in eyes.

Claim.—A wagon body constructed and operating substantially in the manner described.

81,801.—LORENZO LOVEJOY, Malden, Mass.—*Well Tube.*—September 1, 1868.—Short perforated, curved, arched, or pointed tubes, arranged in the main tube, are filled with some soluble substance to prevent the entrance of clay, &c., as the main tube is forced downward, and, on pouring in hot water, the substance is melted and the water freely passes into the main tube.

Claim.—The combination, with a well tube, of a series of curved or bent perforated tubes, when constructed, applied, and operating substantially as and for the purpose set forth.

81,802.—ALBERT LYMAN, Troy, N. Y.—*Reservoir for Cooking Stove.*—September 1, 1868.—The upper edge of the reservoir has a shoulder with a vertical flange, on which respectively slides, either way, the upper or under cover.

Claim.—A metallic reservoir, constructed in the manner described, in combination with sliding covers, all arranged and for the purposes substantially as set forth.

81,803.—DONALD D. MACKAY, Whitestone, N. Y.—*Flooring Clamp.*—September 1, 1868.—The levers are set astride of a sleeper, at a proper distance from the board, against which rests the pusher block; the pointed studs are made to bite into the sleeper, and the levers being pressed forward, force up the board, which is further tightened by means of the toggle brace, and another lever then throws up the center of the toggle, casts off the ring, and spreads apart the lever, thus effecting the release.

Claim.—1. The levers A, pivoted together as at *a*, and furnished at their lower ends with adjustable fulcrum stems *c*, having spurs *c'*, substantially as shown and described, for the purpose specified.

2. The combination of the tripping lever *m* with the pusher block B, the toggle brace *g g**, and the levers A, substantially as and for the purpose specified.

3. The arrangement of the pivots *e* of the pusher block, the slots *d* in the levers A, and the springs *f*, substantially as and for the purpose herein set forth.

4. The arrangement of the ring *b*, at the upper ends of the levers A, carrying the pusher block B and toggle brace *g g**, substantially as and for the purpose specified.

81,804.—WILLIAM R. MALONE, Mason, W. Va.—*Check Valve for Pumps.*—September 1, 1868.—The slightly conical valve is prolonged into an irregular taper, with side openings into the bore, the valve stem, with jamb nuts to regulate the lift, working freely in the square end of the bore.

Claim.—The valve seat for check valves provided with the conical form from A to B, and the taper prolongation provided with the opening in the side and with the square termination of the bore D, in combination with the stem and valve, constructed and arranged substantially as and for the purpose specified.

81,805.—THOMAS D. MCCALL and SAMUEL BUSHNELL, Walton, N. Y.—*Hinge.*—September 1, 1868.—A roller or cylinder of the same length as

the door is fixed to the latter by recessed jointed clasp hinges around it, similar hinges being attached to the jamb, so that the door may open either way.

Claim.—The clasp hinges *s s* and *n n*, with their joints, *a*, and the revolving cylinder *e*, with its grooves *g g*, when constructed, combined, and arranged in the manner and to operate substantially as described.

81,806.—THEODORE J. MCGOWAN, Cincinnati, Ohio.—*Pump.*—September 1, 1868.—An improvement on his patent of May 26, 1863. The “vacuum chambers” are cast or formed on the valve chest, instead of being cast in one piece with the chambers or pockets, as in the first device.

Claim.—The “vacuum” chambers *b b'*, when cast or otherwise formed upon the valve chest, substantially as herein described, for the purpose specified.

81,807.—D. MCNEELY and C. J. CADY, Spurgeon, Ind.—*Cultivator.*—September 1, 1868.—The rear plow standard is fixed to the draught beam, and the forward standards to the cross-beam supported thereby, the wheel having its bearings below in plates pressing against the beam, and supporting the shaft in their ears, the parts being strengthened by braces. A detachable rake is also fastened behind and to the rear standard.

Claim.—1. The combination of the draft beam *A* with plates *J J*, slots and set screws *s s'*, and wheel *D*, substantially as described.

2. The arrangement of the beam *A*, handles *B B*, wheel *D*, plows *E E E*, standards *C C' C''*, cross-beam *L*, braces *K o o' o''*, and attachable and detachable rake *F*, substantially as shown and described.

81,808.—JAMES D. MEADOR, Independence, Mo.—*Moth Fly Trap for Bee Hives.*—September 1, 1868.—A metallic floor has tongues cut in it, which are bent downward to form openings between their lower ends and the plane of the floor, below which is a compartment with a glass or illuminated floor. While the bee enters the hive by the covered passage above, the moth descends the inclined tongues and is imprisoned in the cell below.

Claim.—1. The tongued floor *B*, in combination with an illuminating floor *D*, all arranged and employed as herein described and set forth.

2. The several parts *A a*, *B b*, *D*, and the covered way *e*, when constructed and combined as herein shown and described.

81,809.—MARTIN METCALF, Grand Rapids, Mich.—*Hot Air Furnace.*—September 1, 1868.—Cold air is carried up by passages between the outer case and the inner box, into the pipes below the flange, and in contact with and through the drum into the chamber above.

Claim.—1. The pipes *R*, or their equivalents, when arranged with a drum *D*, and extending downward as described, and for the purpose specified.

2. The combination of a case, *A*, provided with passages *x* and a box, *B*, provided with a projecting flange, *f*, and slots *x*, with the pipes *R* and the drum *D*, when constructed and arranged substantially as and for the purpose herein set forth.

81,810.—JOHN L. MIDDLETON, Zanesville, Ohio.—*Churn.*—September 1, 1868.

Claim.—The churn *A*, having an opening, *G*¹, constructed as described, in combination with the metallic lid *G*, locking bar *H*, screw *g*, and handle, knob, or button, *g*¹, substantially as and for the purpose set forth.

81,811.—WARREN P. MILLER, New York, N. Y.—*Saw.*—September 1, 1868.—A square shoulder is formed on the tooth, abutting against a rest on the saw plate above the recess that receives its shank, so that a shortened tooth may have its point turned down, its shoulder filed, and on being turned back its point will be projected to the cutting line.

Claim.—1. The shoulder *d*, on tooth *b*, and rest *c*, on saw plate *A*, when constructed and arranged to operate in the manner and for the purpose substantially as described.

2. A detachable saw tooth, in which is combined

a circular shank adapted to a circular recess in the saw plate, and having shoulder *d*, adapted to abut against rest *c*, on the saw plate, as described.

81,812.—WARREN P. MILLER, New York, N. Y.—*Saw.*—September 1, 1868.

Claim.—A saw, with the teeth *c c* in pairs on base *e*, having parallel sides, and deep spaces, *d*, between the pairs of teeth, constructed and arranged to operate in the manner and for the purpose described.

81,813.—GEORGE MOTTER, Jr., Henry, Ill.—*Sliding Gate.*—September 1, 1868.—The gate is supported on a roller at its forward end and near its rear end by rollers placed respectively above and below the supporting rail, so as to sustain the gate when wholly opened.

Claim.—1. The gate constructed with the triangular brace at its rear end, and having the rollers *d d* applied so as to bear upon opposite sides of the rail *a'*, and being held thereon by the projections *e*, in combination with the posts *A* and *A'* with the roller *C*, all arranged to operate substantially as herein set forth.

2. The stationary hooks *F* and *G*, constructed and applied as shown and described.

81,814.—JULIUS NUELLENS, Torquay, and MATTHIAS NEUHAUS, London, England.—*Wine Cooler.*—September 1, 1868; patented in England, May 29, 1868.—A tilting case is provided with an elastic diaphragm having a hole in its center through which the neck of a bottle passes, so as to allow the bottle to be tipped without taking it from the cooler.

Claim.—1. Constructing or providing portable coolers or cooling apparatus with a water-tight cover, substantially in the manner and for the purpose herein described and shown.

2. The combination, within the case *a*, of the series of divisions *c*, forming apartments and otherwise supporting the ring *b*, substantially as and for the purpose described.

3. The elastic diaphragm *g*, with central opening, *h*, and overlapping edges, in combination with the plate *i*, and suitable fastening devices on said plate and the case *a*, substantially as and for the purpose described.

81,815.—ALFRED PARAF, New York, N. Y.—*Water-proof Cloth.*—September 1, 1868.—The water-proof mixture consists of benzole, powdered grahamite, wheat flower, and India-rubber, with which linseed oil is to be used when applied.

Claim.—1. As a new article of manufacture, the water-proof mixture, compounded and prepared substantially as before set forth.

2. The manufacture of water-proof fabrics, by applying the water-proof mixture before described upon textile fabrics, substantially in the manner before set forth.

81,816.—WALTER PECK, Rockford, Ill., assignor to WILLIAM JOBES, SETH H. HILLS, and AMELIA C. PECK, same place.—*Windmill.*—September 1, 1868.—A series of devices by which the fans are automatically feathered or adjusted at a varied angle to the direction of the wind, and the speed thus regulated.

Claim.—1. A bounding piece, arranged to operate for controlling the speed of a windmill, substantially as described.

2. The combination of a bounding piece, for controlling the speed of a windmill, with a weighted extensible lever, substantially in the manner described.

3. The collar *m*, when supported by the shaft *n*, and held by the ratchet and pawl *n'*, and operated by pulley and cord, or band, and when in combination with the weighted lever *K*, all as and for the purpose set forth.

4. The ratchet on arm *q*, in combination with its spring pawl, when the pawl moves in guides, and is held by the drop catch *s*, substantially as and for the purpose set forth.

5. In combination with the latch, connected as described, the sliding piece *t*, with its pin *t'*, moved and operated substantially as and for the purpose set forth.

81,817.—ANDREW J. POST, Hudson City, N. J.—*Bridge.*—September 1, 1868.—The strut is received

in a hollow in the lower part of the flanged casting, through which also pass the braces fastened on top by nuts, the flanges fitting in the timbers which bear against their edges and the sides of the casting. The base of the strut rests on a casting through which, with the braces, it is secured by a cross-bolt.

Claim.—The castings *M m* fitted in the top chord, as specified, and extending up to the upper surface thereof, having inclined surfaces forming fair bearings for the nuts on the diagonal ties, and recesses at the base adapted to receive the round ends of the struts *B*, all constructed, combined, and arranged substantially as and for the purposes herein set forth.

81,818.—JOHN REINIG, Fond Du Lac, Wis.—*Eaves Trough.*—September 1, 1868.

Claim.—The construction of a hanger, for the purpose described, when constructed of one piece of metal, bent in such form as to conform to the shape of the eaves trough, and provided with bolt and nut *G*, substantially as herein described and set forth.

81,819.—EDWIN O. ROOD, Lodi, Ill.—*Mechanical Movement.*—September 1, 1868.—A vibrating lever is attached to a rock shaft between two rings, provided with teeth, those of one ring being opposite the spaces between the teeth on the opposite ring, so as to act when the rings are rotated alternately on the vibrating lever, and impart a reciprocating movement to a cutter bar or other device.

Claim.—The vibrating lever or bar *H*, or its equivalent, applied to a rock shaft, *F*, in the manner described, and employed in conjunction with two circular series of teeth or projections *e*, substantially as and for the purpose set forth.

81,820.—JOHN ROOT, Cass County, Mich.—*Farm Gate.*—September 1, 1868.—When the gate is opened half way it will nearly balance and may be swung round, the post and wheel turning with it. The gate is elevated by the action of the eccentric wheel when being opened.

Claim.—In combination with the sliding gate *B*, the eccentric wheel *H* and revolving post *E*, all arranged and operating in the manner and for the purpose set forth.

81,821.—ALEXANDER S. ROWLEY, Hudson, N. Y.—*Sewing Machine.*—September 1, 1868.—The loopers arranged under the table are operated by cams at each end of parallel bars, and catch or release the thread as the needles ascend or descend; in case of straw, &c., an endless apron takes it from the spike cylinder and carries it to the table, fingers acting both as feeders and pressers extending over the aprons, and also regulating the length of the stitch.

Claim.—1. The combination and arrangement of the two cams *C C'*, the rods *c d e*, and series of hooks *b b b*, &c., substantially as and for the purpose set forth.

2. The combination and arrangement of the angular box or hopper *E*, the spiked, toothed, or corrugated cylinder *F*, endless apron *D*, and holding and feeding fingers *s s s*, &c., substantially as and for the purpose herein set forth.

3. In combination with the above, a sewing mechanism substantially as and for the purpose described.

81,822.—SAMUEL RUE, Jr., Paoli, assignor to himself, SAMUEL McCAMBRIDGE, and EDWARD G. MARTIN, Philadelphia, Pa.—*Injector for Steam Generator.*—September 1, 1868.—Valves and valve-seats are formed on the ends of an intermediate pipe, between the steam and feed pipes, at one end, and the supply or discharge pipe, which leads to the boiler, at the other end, and on the ends of hollow plugs, which are combined with the steam and discharge pipes.

Claim.—1. The arrangement of the adjustable intermediate pipe *H* with the plugs *D* and *D'*, when said parts are provided with the valves *L* and *L'*, and the valve seats *a* and *a'*, substantially in the manner hereinbefore described.

2. The arrangement of the adjustable pipe *H*, being smaller at its receiving end than the front end of the steam pipe, whereby to increase the pressure

upon the water through the former, substantially as specified.

3. The diminished bore of the pipe *H*, for effecting a greater pressure at its receiving than at its discharging end, whereby to resist the check of the check valve, between the injector and the boiler, substantially as described.

4. The combination of the air and water chamber *K*, with the injector, opposite the feed pipe, whereby to facilitate the supply of water to the injector at the commencing of its flow, substantially as described.

81,823.—THOMAS STANDRING, Fort Richmond, N. Y.—*Beltting.*—September 1, 1868; antedated July 6, 1868.

Claim.—As a new article of manufacture, the beltting, consisting of the solid sheet of steel *a'* clamped between the leather parts *a e*, by the central rivets *R*, and prevented from loosening by being cemented to such parts, as herein shown and described.

81,824.—SIGMUND RUTSCHMAN, Philadelphia, Pa.—*Meat-chopping Machine.*—September 1, 1868.—The locking pins through the sliding boxes and flanges prevent the cross-head from turning, until desired, when they are withdrawn, a quarter turn given, and the pins are then reinserted.

Claim.—The combination, with the cross-head and sliding boxes of a meat-chopping machine, of flanges *a a*, permanently secured to the cross-head, and of the pins *f f*, inserted through the said flanges and the sliding boxes, substantially as and for the purpose herein specified.

81,825.—ALBERT H. SAUNDERS, Nashua, N. H.—*Reel.*—September 1, 1868.—The chambered plates in the hub connected with the radial arms being arrested by the stops, are brought, by means of the spring, to right angles with each other, so that the reel can be introduced into different sized skeins, and proper tension secured.

Claim.—1. The reel, made with the hub in two parts, *a' b'*, connected by a spring, as described, and having a pair of arms extending from each of the said parts *a' b'*.

2. The reel, as made with the self-adjusting radial arms, and with the hub formed in two parts, *a' b'*, connected by a spring, and having a pair of such arms extended from each of the parts *a' b'*, as specified.

81,826.—BENJAMIN SAUNDERS, Nashua, N. H., assignor to himself and ALBERT H. SAUNDERS.—*Warp Dresser.*—September 1, 1868.—The lower shaft in revolving causes the brushes and cranks to act on the warps, while they are counterbalanced by weights applied to the pulleys making one side the heavier.

Claim.—In a dresser frame, the combination of the counterbalance with the brush frame, its operative cranks and pulleys, as described.

81,827.—CHARLES C. SAVERY, Philadelphia, Pa.—*Water Cooler and Refrigerator.*—September 1, 1868.

Claim.—The combination and arrangement of the enameled ice and water tank *C C C P* and its lid, *L*, with the enameled air chamber *C'' C''*, and its door *D*, constructed substantially as herein specified.

81,828.—GEORGE W. SEYMOUR, Whitney's Point, N. Y.—*Carriage Wheel.*—September 1, 1868.—The hub is formed of two movable rings to support the axle box with its key. The rings are set apart so as to brace the spokes, and may be compressed or loosened, by means of a nut and screw, to regulate their tension.

Claim.—The combination and arrangement of the stationary key *D* with the wheel turning the axle box *E*, adjustable thimble nut *F*, and movable rings *B B*, all being constructed substantially as herein described and represented, for the purpose set forth.

81,829.—JEREMIAH SHERMAN, New Oxford, Pa.—*Animal Trap.*—September 1, 1868.—The gates as the animal from the bridgeway strikes their inner portions, are turned on their pivots and cause the animal

to drop into the cage, which is closed by their return, the side, shield, and overlapping boards being arranged to prevent his escape.

Claim.—The combination of the bridgways *m* in the side boards *b*, the inclined side boards *c*, and overlapping boards *h*, with the passage *A**, pivoted gates *C*, and cage *A*, all arranged substantially as shown and described.

81,830.—WINSLOW SHERMAN, New York, and JACOB RUSSELL, Brooklyn, assignors to JACOB RUSSELL, HENRY T. MCCOUN, JAMES L. ROMER, and THOMAS T. BUCKLEY, Brooklyn, N. Y.—*Feeding Nail Plate.*—September 1, 1868.—An improvement on patent No. 63,655, April 9, 1867.—The feed plate may be adjusted and swung one side without being detached; the oscillating bed which carries the cutter, with the adjusting lever and springs operating automatically, secures uniformity in the sizes of the heads and blanks, the nail plate being held or set loose by means of a spring clamp.

Claim.—1. The arrangement of the feed plate or frame *A*, bars *B*, socket pins *a a*, or their equivalents, and the frame of the machine, in the manner so as to admit of the feed plate being swung to one side and out of the way of the machine without detaching it therefrom, substantially as specified.

2. The combination, with the frame of the machine and the feed plate or frame *A*, of the bar or bars *B*, removable socket pins *a a*, and horizontally and vertically adjustable brackets *C C*, all for operation together and in connection with adjusting screws, or their equivalents, to facilitate the adjustment of the feed plate or frame in various directions, and to admit of its being swung to one side or back, essentially as herein set forth.

3. The combination, with the feed plate or frame *A*, and horizontally oscillating bed *G*, of the nail-plate-adjusting levers *R R*, stops *s s'*, and springs *m m'*, operating automatically to insure uniformity in the sizes of the heads to the cut blanks, substantially as specified.

4. The combination, with the bed plate or frame *A* and cutters *S S'*, of the spring clamp *T* and pin *X* on the cross-rocking beam *H*, operating to hold the nail plate during the intermissions to its feed, and to relax hold thereof while being fed, essentially as specified.

81,831.—H. N. SCHULTZ, Sabillasville, Md.—*Flour Bolt.*—September 1, 1868.—The cam of the wheel strike on the upper beveled end of the lever which is fastened below by a pin, ride over it and let its lower end drop with a shock proportioned to the height of the lift, thus jamming the bolt.

Claim.—The combination of the cam wheel *B* upon the end of the flour bolt, with the lever *C* and adjustable stop *m*, operating as described, whereby, as the bolt rotates forward, the stop holds the lever firmly in place, and as it rotates backward it allows the lever to swing out of the way, substantially as described, for the purpose specified.

81,832.—A. B. SMITH, Rochester, Pa.—*Harvester.*—September 1, 1868.—The objects are to dispense with weighty appliances, give increased freedom to the motions of the cutting apparatus in passing over an uneven surface and adapt the shoe to override such objects as may oppose themselves during either a forward or backward movement of the machine.

Claim.—1. The construction of the drag bar of two light bars, *D D*, connected by bolts *a b c*, which also serve as pivot connections respectively with the frame *A*, "false shoe" *E* and shoe *T*, substantially as and for the purpose herein specified.

2. Pivoting the drag bar to the shoe *T*, forward of the finger bar *G*, the forward end of the shoe being adjustable in height by the screw *f* or its equivalent, while the rear end has a free sliding movement on the "false shoe" *E*, under the keeper *w*, substantially as herein set forth.

3. The "false shoe" *E*, constructed and arranged as set forth, in combination with the drag bar *D D*, shoe *T*, and the finger bar *G*, substantially as and for the purpose herein specified.

4. The spring *u*, in combination with the lever *R*, vibratory arm *S*, sliding pinion *l*, and the clutch

wheels *m n*, or their equivalents, substantially as and for the purpose herein specified.

5. The spring *u* applied to the coupling bar, substantially as and for the purpose specified.

81,833.—A. B. SMITH, Rochester, Pa.—*Endless Platform for Churn-Power.*—September 1, 1868.—The cross-steps of the platform are braced and held in the same plane, under downward pressure, the object being to prevent sagging.

Claim.—The metallic braces or cleats *C C*, applied to the endless platform, substantially as and for the purpose specified.

81,834.—J. HUNT SMITH, Norwich, Conn., WILLIAM SHEDLOCK, and ALFRED SHEDLOCK, New York, N. Y.—*Braid.*—September 1, 1868

Claim.—The new and improved manufacture herein described of a triradiate braid, or braid composed of three radial members, united to each other by interlocking or interbraiding the threads of the different members with each other, substantially as herein described.

81,835.—THOMAS W. F. SMITEN, Brooklyn, N. Y.—*Breast-Pin Fastening.*—September 1, 1868.—The bridle or guard allows the tongue to work freely upon its pivot, but in the event of the latter breaking, the guard holds the pivotal end of the tongue in place and thus maintains the security of the catch.

Claim.—A guard or bridle, embracing the tongue near the joint, in combination with the body and tongue, substantially as described, whereby the breast-pin or brooch is securely held, and prevented from being lost by the wearer, should the rivet pin of the joint come out.

81,836.—JACOB SOUTHWICK, Brant, N. Y.—*Fence.*—September 1, 1868.

Claim.—A portable board fence, when constructed as described, the fence posts *A A* being formed of two pieces, locked together near the top, and spreading at the bottom, and the panels each consisting of boards *B B*, confined together by strips *C C*, and hung on the fence posts *A A*, the whole being secured by pins *a a* and stakes *E E*, substantially as herein set forth.

81,837.—E. H. STEARNS, Erie, Pa.—*Head Block.*—September 1, 1868.—The knees are automatically retracted, after the log has been sawed, by means of springs which are wound up in the act of moving the knees forward, or setting the leg to the saw. The stops and adjustable segment bars limit the backward movement of the knees according to the size of the log, and the stops serve as buffers to avoid jars. Provision is made for moving the dogs out of the way, when liberated from the sawed log.

Claim.—1. In head blocks for saw mills, the employment of springs, so applied that when the knees are released from the setting mechanism, the springs will automatically bring back the knees to the required position for the next advancing movement, substantially as set forth.

2. The segment bars *L*, constructed, arranged, and applied in the manner shown, or in any equivalent way, for the purpose of limiting the backward movement of the knees, as set forth.

3. The elastic stops *P* upon the knees of the head-block, in combination with the segment bars *L*, substantially as described, for the purpose specified.

4. The flanges *T*, for the purpose of carrying and adjusting the dogs, when disengaged from the log or remnant thereof, substantially as described.

81,838.—BENJAMIN STEPHENS, Wheeling, W. Va.—*Composition for Roofing.*—September 1, 1868; antedated April 3, 1868.—The slag is obtained from the boiling furnaces of rolling mills.

Claim.—The compound of coal tar and pulverized slag, as and for the purpose described.

81,839.—LUTHER STREETER, Chicopee, Mass., assignor to himself and RANSOM SHEPARD, same place.—*Garden Hoe.*—September 1, 1868.—The forked shank is designed to afford means of attach-

ment, and also to retain the original curve of the blade.

Claim.—In combination with the blade A D of a field hoe, which is more or less curved in the direction of its length, the forked shank terminating in a single socket or tang for the handle, and applied to the blade, as set forth, the whole constructed and arranged substantially as described.

81,840.—JAMES W. SUTTON, Detroit, Mich.—*Water Heater for Steam Generator.*—September 1, 1868.

Claim.—1. The air space within the jacket G, when connected with the annular air space F, and operating substantially as and for the purposes herein set forth.

2. The combination of the above-named parts with the boiler A, water pipes L, check valves M, three-way cocks N, stationary connections O, and escape pipe P, when arranged, constructed, and operating substantially as and for the purposes herein specified.

81,841.—THOMAS TAYLOR, Washington, D. C.—*Machine for Cleaning Feathers.*—September 1, 1868.—The inner cylinder has two compartments, the upper for live steam, the lower one for condensed steam. By contact with the deflectors the condensed portion of the entering steam is separated from the effective steam and caused to drop into the water receptacle. The outer cylinder contains the feathers, the perforated one diffuses the steam, and the central cylinder serves as an axis upon which the others revolve. When the steam is to be cut off the motion of the cylinders is reversed and a cam thereby made to act to close the valve.

Claim.—1. The combination of cylinder A B C D, supported and revolving on the center cylinder S S, in the manner substantially described and set forth.

2. The cylinder S S, constructed as set forth, being of two compartments, and operating with the valves *x x*, in the manner described.

3. The mode of keeping the valves open by the spring U, in connection with the cam or cams *t t*, operating substantially as described and set forth.

4. The deflecting tubes *i H*, *i H*, for the purposes substantially described and set forth, and as combined with the portions T T.

5. The mode of shutting the valves *x x*, Fig. 1, by the backward motion of the cylinder A B C D, as substantially described and set forth.

81,842.—J. W. THOMPSON, Bureau Junction, Ill.—*Churn.*—September 1, 1868.—The lever being vibrated the segment and belt are actuated, and the dasher is consequently moved up and down as well as right and left.

Claim.—1. The combination of the lever E, segment F, belt H, vertical dasher staff B, upright beaters J J, and horizontal beaters K K, when constructed and arranged to operate in the manner and for the purposes set forth.

2. The ventilators *c c*, substantially as and for the purposes set forth.

81,843.—JOHN TINGLEY, Philadelphia, Pa., assignor to himself and SAMUEL L. DAVIS, Camden, N. J.—*Tightening Band for Vessels.*—September 1, 1868.—A metal band is fastened to the outside of the vessel, near the upper edge, by pins passing through slots, one end of the band being secured to a plate, and connected with a screw rod and nut on the opposite end, by which means it is contracted or set free, as required.

Claim.—1. The plate G, of a shape to fit the side of the vessel, having a projection, *f*, and secured to one end of a band, a screw rod at the other end of which passes through the projection *f*, as and for the purpose described.

2. The said band, with screw rod at one end and projection at the other, in combination with a handled nut, E, arranged to conform, or nearly conform, to the shape of the vessel to which the band is applied, as set forth.

3. The slots *m* in the band D, for the purpose specified.

81,444.—CHARLES TÖLLNER, Pulaski, N. Y.—*Smoking Pipe.*—September 1, 1868.

Claim.—A smoking pipe or bowl, consisting of clay, which, in the process of manufacture, is successively baked, saturated with unctuous matter, and carbonized, substantially in the manner and for the purpose herein set forth.

81,845.—JOHN TURNER, Norwich, Conn.—*Machine for Covering Cord.*—September 1, 1868; antedated August 25, 1868.—The covering bobbins are arranged, each with its axis coinciding with that of the twisting spindle and its yarn bobbins, their centrifugal force being thus reduced, while an increased velocity being given them, a more perfect winding round the strand is effected with fewer of them.

Claim.—The covering bobbin F, arranged and operating in combination with the twisting spindle C and yarn bobbin D, substantially as shown and described.

81,846.—OLIVER VANORMAN, Ripon, Wis.—*Spring Seat for Vehicles.*—September 1, 1868.

Claim.—1. The arrangement of the detachable seat, consisting of the elevated levers or bars B B, with hooks and eyes C C, or equivalent devices, to the parallel bars D D, substantially as described.

2. The arrangement of rubber springs E E, fastened near the lower ends and on the under sides of the elevated seat bars B B, which rest upon the parallel bars or levers D D.

81,847.—JAMES VARLEY, Hudson City, N. J.—*Wash Boiler.*—September 1, 1868.—The telescopic joint in the central tube provides for the removal of the cover and regulates the ventilation of the perforated upper chamber, and the distribution of the water in the boiler, while the perforated false bottom, held fast by the lips when the steam is on, can be readily removed.

Claim.—1. The central jointed tube C, perforated upper chamber D, and false bottom B, in combination with each other, and with a wash boiler, substantially as herein described.

2. The telescopic or sliding joint *a*, in combination with the central jointed tube C, for adjustment of the upper chamber D, or removal of the cover, substantially as herein set forth.

3. The combination of the lips *p p* and notches *e e*, for locking in place the false bottom of the wash boiler, substantially as specified.

81,848.—FELIX WALKER, Memphis, Tenn.—*Sash Fastening.*—September 1, 1868.

Claim.—The eccentric duplex balance wheels *a a*, pivoted to the sash upon the same pivot, in combination with the curved keeper *e*, constructed and operating as described, for the purpose specified.

81,849.—EDWIN WANT, New Haven, Conn., assignor to himself and J. E. SPENCER, same place.—*Eye Glass.*—September 1, 1868.—An improvement on his patent of January 15, 1867. The spring has over it a plate for the purpose of strengthening it at the point of attachment.

Claim.—In combination with the bows of eye glasses, constructed and arranged upon their spring E, substantially in the manner described, the application of plates H H, at the point of attachment of the bows, to the spring E, in the manner and for the purpose specified.

81,850.—GARDNER WARREN, Boston, assignor to WILLIAM M. BYRNES, Charlestown, Mass.—*Sliding Sash.*—September 1, 1868.—A metallic spring of the same length of the sash, and formed with a flange and curved portion, is secured to the frame, the side of the sash fitting in the curved portion, so that the sash will be held in any desired elevated position.

Claim.—The metallic spring D with the flange *a*, when constructed and applied substantially as described, and for the purposes set forth.

81,851.—ALEXANDER WATT, Wandsworth, England.—*Bleaching Soap.*—September 1, 1868.

Claim.—A soap, containing a soluble chloride or hypochlorite, mixed and compounded with a previously made soap in a melted state, in the manner herein described.

81,852.—WILLIAM WEEKS, Albany, N. Y.—*Die for Stamping Wooden Boxes.*—September 1, 1868.—The block in the upper part of the die being pressed down upon the punch forms the inside of the box, while the rabbet on top of the sleeve also forms a rabbet on the box top, and a blow on the ends of the rods forces up the sleeve and the finished box to the top of the die.

Claim.—The combination of sleeve D, rods E, punch B, and collar C with a die, A, and plunger G, constructed substantially as and for the purposes herein shown and described.

81,853.—FRANCIS HERBERT WENHAM, London, England, assignor to ANDREW SHANKS.—*Hot Air Engine.*—September 1, 1868.—The stroke of the piston in one direction is produced by heated air from the furnace, while in the other direction the piston is impelled by the expansion of the compressed air above the same. Perforations in the outer portion of a fire-clay disk placed over the furnace admit jets of flame at every stroke of the piston.

Claim.—1. The cylinder *a*, constructed as herein set forth, whereby a portion of air admitted into the cylinder is retained and compressed above the piston at each upward stroke of the same, substantially as set forth.

2. The arrangement of the furnace *g*, with the hopper *i* and grate *h*, constructed with reference to the cylinder *a*, substantially as herein set forth.

3. The fire-clay disk *o*, constructed and fitted in the furnace, substantially as and for the purposes set forth.

81,854.—ALONZO WHITCOMB, Worcester, Mass.—*Planing Machine.*—September 1, 1868.—The cross head by a single movement of the handle is clamped to the uprights by means of levers operated through a handle, slide, and roller.

Claim.—The combination of the uprights B, cross head C, and the pivoted levers D, arranged to operate substantially as described, for the purpose of readily adjusting the cross head of a planer, and securing the same in position.

81,855.—JOHN WILLARD, Norwich, Conn.—*Box Opener.*—September 1, 1868.—Attached to the chisel point is a hollow stock, within which plays a loaded plunger, which, being driven against the base of the socket, serves as a hammer.

Claim.—The combination of the chisel point A, the tubular handle B, and the weighted rod C, constructed and arranged to operate substantially as set forth, as an article of manufacture.

81,856.—E. R. WILLIAMS, Rochester, N. Y.—*Fruit Jar.*—September 1, 1868.—The stopper, grooved on one side and inclined on the other, is packed into the jar by means of an elastic strap which hooks over lugs, one on the stopper, and the other on the jar.

Claim.—The construction of the stopper B, with a groove, *a*, extending part way around, and graduating into an incline, *b*, when employed in connection with the elastic band *i*, in the manner and for the purpose specified.

81,857.—W. B. WINTON, Marion, Iowa.—*Hand Plow.*—September 1, 1868.—The plow beam, pivoted at the point of connection of the handles, has secured to it a curved serrated plate working in another plate in rear of the wheel, and may thus be raised or lowered at pleasure.

Claim.—The curved serrated spring-metal bar or plate D, in combination with the pivoted plow beam C, substantially as and for the purpose set forth.

81,858.—JOHN WORDEN, Normal, Ill.—*Lubricator for Axles.*—September 1, 1868.—The oil is carried from the tank to the end of the axle, (through a groove,) and by means of a perforated skein flows to the bearing part, its weight, when at rest, closing the holes, and checking the flow.

Claim.—The circumferential reservoir C, connected with the perforated skein B and the axle A, with its longitudinal groove *x*, to operate substantially as specified.

81,859.—EDWARD S. WRIGHT, New York, N. Y., assignor to Samuel Leggett, same place.—*Cutter Head.*—September 1, 1868.—The wedges are inserted in a slot in the head which carries the knives, the central one having at its inner end a projection entering a recess, as a guide to keep it in place, and also projections on its sides passing into slots on the inner ones, a screw through the outside of the head likewise entering a recess in the outer end of the central wedge to adjust them all.

Claim.—The construction of the wedges B, B¹, and B², as described, that is, with the elongated slots *c* or recesses in the inner surfaces of the outer ones, and the projections *b* upon the outer surfaces of the inner one, for the purpose of guiding said wedges in their movements, and also for preventing them from falling out of the cutter head when the center one is driven back for the purpose of releasing the knives

81,860.—JOHN A. BURNAP, Albany, N. Y.—*Pulley.*—September 1, 1868.—One or two sets of rollers form the anti-friction journal for the pulley. When two sets are employed a flange separates the two series and serves as a guide or an end wall to the chambers in which the rollers are confined.

Claim.—1. The pulley and block, having the friction rollers constructed and arranged so as to be self-guiding, in the manner as described.

2. The combination of the pulley A, pulley block B, and two sets of cylindrical rollers *c c c c* and *c' c' c' c'* and flange F, all constructed and used as shown and described.

3. The arrangement, in the eye of the pulley B, of two or more sets of cylindrical rollers, constructed and kept in position by means shown and described.

81,861.—L. J. ADAMS AND J. H. ESALE, Avon, Ill.—*Grain Moistener.*—September 8, 1868.—The steam is forced through a perforated plate or shield and is thrown in jets into wheat as it falls from a chute. A drip pipe is placed just beneath the perforated shield and carries off the condensed steam.

Claim.—The combination of the steam pipe or pipes F, perforated shield G, and drip pipe or pipes H, with the hopper A, substantially as herein shown and described, and for the purposes set forth.

81,862.—ALFRED ARNEMANN, Guttenberg, Iowa.—*Safety Attachment for Pockets of Apparel.*—September 8, 1868.—A spring catch attached to a pocket-book prevents its being opened while in the pocket, and a wire clasp fastens it to the article of wearing apparel.

Claim.—A pocket-book protector, consisting of the wire clasp A, and of the plate B, spring *e*, hook *d*, and knob *f*, all arranged and operating substantially as herein shown and described.

81,863.—E. H. ASHCROFT, Boston, Mass.—*Steam Safety Valve.*—September 8, 1868.—A cylindrical jacket envelopes a spiral spring, the upper end of which jacket is fastened to a cross head, and the lower end slides over a projection on top of the valve.

Claim.—The arrangement of the projecting jacket *d* with the cross head C, with reference to the valve and spring, substantially as herein shown and described.

81,864.—GEORGE ASHWORTH AND ELIJAH ASHWORTH, Manchester, Great Britain.—*Portfolio.*—Patented in England, March 15, 1867.—September 8, 1868.—Bands of leather or caoutchouc are attached to the inner edges of the sides of the portfolio at each end, and can be detached on one or both sides. Wire staples or binders are fastened in the sheets and through which the bands of leather or caoutchouc are passed and then fastened to the side of the portfolio.

Claim.—The spring clips or fasteners *d*, constructed and applied to a portfolio substantially as described, in combination with a band or bands, *e*, of leather or other suitable material, and which are adapted to staples or binders secured to the sheets to be bound, substantially as specified.

81,865.—JOHN ASHWORTH, North Andover, Mass., assignor to GEORGE L. DAVIS, JOHN A. WILEY, and JOSEPH M. STONE, same place.—*Oper-*

ating Shuttle Boxes in Looms.—September 8, 1868.—A lever is connected by a link to a standard, upon which latter the shuttle boxes are mounted, and is operated by two cams in such a manner as to raise or lower the standard upon which the series of shuttle boxes is placed, so that any one of the boxes may be brought to the race from any position at every pick. The cams are actuated by a pawl and ratchet connected by rods with levers placed in contact with a revolving pattern chain.

Claim.—1. The combination of the lever E with the two cam wheels H and I, arranged with and acting on said lever, at different points in its length, substantially as and for the purpose set forth.

2. The combination of the lever E, the cam H, and its hook rod or rods for operating the same, and the cam I and its hook rod or rods for operating the same, with the vibrating pawl or driver N, and the levers P and the pattern chain, and their accessories, for controlling the movements of the shuttle boxes, substantially as described.

81,866.—VINCENT M. BAKER, Preston, Minn.—*Water Wheel.*—September 8, 1868.—The chutes are arranged so as to throw the water against the radial buckets at right angles, and the amount of water is regulated by means of gates attached to an annular ring, which is turned by a pinion engaging with a rack on its periphery.

Claim.—The chutes *ix*, in combination with the sliding gates G, operated through the medium of the ring H and gearing *kl*, all arranged substantially as and for the purpose set forth.

81,867.—GRANT O. BALDWIN, Hillsborough, Ohio.—*Still.*—September 8, 1868.—Steam is forced through fruit placed in a copper still and is condensed in a hollow cone placed above the still, over which a stream of cold water passes, and from which the condensed steam is conducted.

Claim.—The slide D and condenser E, constructed as described, when used in combination with the boiler B and steam pipe C, substantially as and for the purposes herein set forth.

81,868.—W. G. BARETTE, Canton, Md.—*Apparatus for Rectifying Spirits.*—September 8, 1868.—A vertical cylinder divided into several compartments is placed above the still. One of the compartments is used as a refrigerator for condensing the oils in the other compartments and which are again returned to the still. A pipe conveys the surplus water from the refrigerator to the still. The first portions of the vapors are condensed and carried to a receiver placed on the side of the cylinder; from there they are conveyed to the still again for redistillation.

Claim.—1. The combination, with the still A, of the cylinder B, provided with the condensing chambers D and E, refrigerator F, and pipes H and I, substantially as and for the purpose described.

2. The arrangement of the supply pipe G, discharge pipes K and M, the air tube L, and refrigerator F, substantially as and for the purpose described.

3. The receiver O, provided with a pipe, P, communicating with the still, for returning the light wines, substantially as and for the purpose described.

4. The combination, with the cylinder B, of the stop-cock R, tubes S, and worm T, substantially as and for the purpose set forth.

81,869.—WILLIAM H. BARNES, New London, Conn.—*Coffee Mill.*—September 8, 1868.—A coiled spring is placed around the arbor of the rotating grinding plate, and exerts its tension against the plane face of the shell and the eye of the crank, which latter is held against the spring by a nut working on a screw thread on the end of the arbor.

Claim.—The combination and arrangement of the coiled spring *a* with the arbor of the runner C, shell D, and nut *b*, all operating substantially as shown and described, and for the purpose set forth.

81,870.—B. B. BOLLINGER, Louisville, Ohio.—*Register for Knitting Machine.*—September 8, 1868.—The periphery of the pattern wheel is provided with

notches corresponding in distance from each other to agree with the changes required to be made in the knitted fabric, and receives motion from a pawl connected to some intermittently moving part of the knitting machine; the periphery of the said notched wheel causes a hammer to strike a bell as each notch passes a given projection on the arm of the bell hammer.

Claim.—1. The knitting-machine register, composed of a pattern wheel, E, a spring hammer, F, and an alarm bell, substantially as and for the purpose described.

2. In registers for knitting machines, the combination of the alarm bell, hammer, and mechanism for moving the pattern wheel, substantially as herein described.

81,871.—ROBERT KIRK BOYLE, New York, N. Y., assignor to himself and GIUSEPPE TAGLIABUE, same place.—*Printing Telegraph Instrument.*—September 8, 1868.

Claim.—1. Arranging a pair of electro-magnets on each side of two horseshoe magnets which are fastened to an oscillating shaft, substantially as herein shown and described, so that one pole of each horseshoe shall be attracted by but one electro-magnet, for the purpose specified.

2. The application of the adjustable springs *dd'* to the stationary part of the apparatus, said springs aiding to repel the horseshoe magnet, and to adjust the same in the center of force, substantially as herein shown and described.

3. The insulated sleeve *f*, attached to the horseshoe magnet, in combination with the slotted pillar *g*, and with the wires of the local magnet, all made and operating so that when the oscillations of the horseshoe magnet will cease, the connection of the wire of the local magnet will be completed, substantially as and for the purpose herein shown and described.

4. Connecting the local magnet F, by means of an escapement lever, *j*, with the friction wheel H, substantially as and for the purpose herein shown and described.

5. The lever I, when connected with the sleeve *m*, in combination with the friction wheel H and spring *p*, all made and operating substantially as herein shown and described.

6. The device herein shown and described for locking the bar *n* into the toothed disk L, by the action of the horseshoe and subsequently of the local magnet, said device consisting of the sleeve *m*, lever I, spring *p*, and friction wheel H, the latter having upright pins *l*, and all made and operating substantially as and for the purpose herein shown and described.

7. Connecting the friction wheel H with the escapement levers *j* and M, all made and operating substantially as and for the purpose herein shown and described.

8. Connecting the sleeve *m*, which is operated by the action of the local magnet F, with the sleeve *t*, which is moved by the action of the horseshoe magnets E E', substantially as herein shown and described.

9. The device herein shown and described for winding up the hair spring *x*, by which the sleeve *t* is turned, said device consisting of the cam *u*, arm *w*, forked bar *v*, arm *c'* ratchet wheel *y*, and block or pin *b'*, all made and operating substantially as herein shown and described.

10. Combining the horseshoe magnet and the local magnet in such a manner with the type-wheel shaft that, by the action of the horseshoe magnet, it receives the required motion, while by the action of the local magnet, it is instantaneously stopped in the desired position, substantially as herein shown and described.

11. The arm N, when secured to and projecting from the shaft J, in combination with the arm *n*, which projects from the revolving and sliding sleeve *m*, and which, by being locked in the stationary disk L, also locks the shaft J, substantially as and for the purpose herein shown and described.

12. The type wheel O, when provided with a pin, *h'*, in combination with the turning cam P, sleeve *i'*, on shaft R, pin *j'* on sleeve *i'*, arm T, and spring *m'*, all made as described, and operating in combination

with each other, substantially in the manner set forth.

13. The sliding sleeve *v'*, which is moved when the type wheel shaft is stopped, and which is combined with the pin S, having the arms M, T, and U, and operating the printing cushion V, substantially as and for the purpose herein shown and described.

14. The feed rollers *p' p'*, when receiving motion from the friction wheel H, and when combined with the support *l' U*, and with the printing cushion V, all made and operating substantially as and for the purpose herein shown and described.

15. The printing cushion V, when pivoted to an upright pin, and when operated by a spring, *o'*, which is secured to one of the arms of the pin S, substantially as herein shown and described, so that it will be forced with sufficient power against the edge of the type wheel, and will still be yielding, as set forth.

81,872.—C. W. BREWER, Racine, Wis.—*Piano Hammer*.—September 8, 1868.—A soft rubber tube or volute is inserted in the felt portion of the ordinary hammer head, so as to produce a clear rounded note instead of a prolonged ringing or bell note.

Claim.—A piano hammer, constructed substantially as and for the purpose set forth.

81,873.—HIRAM M. BRITTON, Cincinnati, Ohio, assignor to himself and JOEL F. RICHARDSON, same place.—*Railroad Car Heater*.—September 8, 1868; antedated March 9, 1868.—The heating apparatus is placed in a car separate from that of the passengers, the air being conveyed from said heating apparatus to the entire train by means of fans, pipes, and flexible tubes under control of the conductor.

Claim.—The relative arrangement within the car A of the hot-air chamber G, having double metallic walls C E, the furnace D *d d*, the induction pipes H, conducting pipes I I' M N, and fan J, substantially as and for the purpose set forth.

81,874.—HENRY L. BROWN, Mansfield Center, Conu.—*Silk Winding Machinery*.—September 8, 1868.—One of the spools revolves on a spindle attached to the frame of the machine. The other turns on a spindle fastened to a vibrating arm so that the relative parallel position of the spools shall successively change into a diverging position, first in one direction and then in the opposite, thus keeping the silk to be wound from kinking or breaking.

Claim.—The arrangement of the spools *c c'*, arms *d*, and connecting rod *e*, in a silk-winding machine, so as to produce an automatic vibratory change motion of one spool, relatively to the other, substantially as described.

81,875.—JOSEPH K. BULL, Buckingham, Iowa.—*Grain Binder*.—September 8, 1868.—The movable platform is hinged to the rear end of the cross bars pivoted to the frame of the machine. A rope connects the lower end of the movable platform with a crank attached to the reel shaft driving the rake. A box for receiving the bound grain is pivoted to standards, and held in position by a pin inserted in a catch plate attached to the box.

Claim.—1. The movable platform B, hinged or pivoted bars C, and cord or chain D, in combination with the frame A, substantially as herein shown and described, and for the purposes set forth.

2. The combination of the seat E, box or trough G, and pivoted box I, with each other, and with the movable platform B and frame A, substantially as herein shown and described, and for the purpose set forth.

81,876.—J. H. BUTTS, Stroudsburg, Pa.—*Medical Compound*.—September 8, 1868.—Designed to cure rheumatism, gout, and kindred diseases. For rheumatism, smartweed and hops in boiling water are used. For gout, alum and white-oak bark are added.

Claim.—The compound above described, composed and operating substantially as and for the purposes herein set forth.

81,877.—W. F. CHRISMAN, Trenton, Teun.—*Pessary*.—September 8, 1868.—An elastic cylindrical air vessel, having concave heads, the concavity of

which is retained by means of an axial conical tube, the whole being composed of a layer of India-rubber interposed between textile materials.

Claim.—A pessary, of the form, construction, and method of operation substantially as shown and described.

81,878.—GILBERT H. CLEMENS and EVERETT CLEMENS, New York, N. Y.—*Steam Safety Valve*.—September 8, 1868; antedated August 28, 1868.—Below the valve seat is a safety valve which is pressed upward by levers capable of adjustment, having their fulera on a plate attached to the valve seat; the short ends of said levers engaging with the bottom of the valve stem and the other ends being weighted. A chamber is formed below the valve seat for the escape of steam.

Claim.—1. The arrangement of the enclosed chamber *f*, with reference to the valve within such chamber, the levers *h h*, and weight *k*, below the same, substantially as set forth.

2. The arrangement of the levers *h h*, radially, whereby their shorter ends act directly upon the valve stem, and their longer ends sustain the weight, substantially as set forth.

81,879.—ALFRED H. COMP, Mount Joy, Pa.—*Plane*.—September 8, 1868.—A dovetailed plate is inserted flush with the wood in the face of a plane, before the mouth. A screw operates a slide in the dovetailed plate to regulate the width of the mouth.

Claim.—The beveled sliding plate A and beveled grooved plate B B, with their screw bearings, when constructed to operate in the manner and for the purpose specified.

81,880.—JAMES L. COX, Mauchester, N. H.—*Bed Lounge*.—September 8, 1868.—The back of the lounge is hinged to a right-angled piece of iron and has a ratchet attached to its lower end. The head of the lounge is adjustable and is held in position by a ratchet.

Claim.—The ratchet *b* and lock *x*, in combination with the hinge *a*, operating back A, arm A' with ratchet *m*, arm C with ratchet *h* and joint D, the several devices operating, relatively to each other, as described and for the purposes specified.

81,881.—MATTHEW CRIDGE, Allegheny City, Pa.—*Hot-bed Sash and Frame*.—September 8, 1868.—Sliding sash bars are grooved to receive the glass, and tongued to slide in grooves in the sash frame. A following bar is slotted and secured by screws in the slots.

Claim.—1. In a hot-bed sash, the sliding rails or bars *b*, constructed and used substantially as and for the purposes hereinbefore set forth.

2. A slotted following sash bar or rail *f*, which forms one side of the sash frame, and which holds the other sash bars and the glass securely in position, substantially as above described.

81,882.—HUGH DAVIDSON, New Salem, Ill.—*Wagon Brake*.—September 8, 1868.—An arrangement of devices by which the brake is automatically adjusted to all positions of the wagon.

Claim.—The arrangement, herein shown and described, of the brake bar S, slotted plate P, U-shaped levers O H, connection N, rod K formed with an eye at its rear end, bolt G, arms E, slotted plate D formed with hooks, slotted strap F, rod C having a hook at each end, and sliding sleeve A, all constructed as described, and arranged with relation to the reach Q, king bolt M, and pole B, to operate as set forth.

81,883.—MATT. J. DAWKINS, Brookston, Ind.—*Construction of Wagon and Carriage Wheels*.—September 8, 1868.—A thimble has cams on one end and fits inside of the hub. The thimble being revolved, the cams force the spokes, which rest against them, into tapering sockets and radially against the tire, dispensing with the shrinking of the tire.

Claim.—1. Setting or adjusting the wheel, with the spokes inserted therein, to the tire, by means of cams cast on to a thimble, said cams being located within the hub, and their faces bearing against the spokes, substantially as described and set forth.

2. The hub, made of three parts, viz, the back part,

with the main box cast in one piece, the front part, and the thimble, with the cams cast thereon.

3. The step-shaped form on the lower part of the spoke, which rests against the cams.

4. In combination with the foregoing, the tapering sockets in the centrally divided hnb, substantially as described.

81,884.—LOUIS ADOLPHE DE MILLY, Paris, France.—*Manufacture of Solid Fatty Acids.*—September 8, 1868.

Claim.—1. Complete saponification, by means of sulphuric acid, in the space of three minutes or less, substantially as and for the purpose set forth.

2. Saponifying by means of sulphuric acid, without distillation, of the fatty acids, and without the usual deposit of carbonaceous, insoluble, tarry matter, which accompanies the existing mode of using sulphuric acid, as described in the specification.

3. The use of water and white of egg for giving the brilliant whiteness to the candle stuff, substantially in the manner and for the purpose set forth.

4. The due mixture of the palm and animal fat, substantially as described, for giving the crystalline structure found in this compound.

5. While I do not claim the use of pressure to separate liquid and solid fats treated with the sulphuric acid, I do claim treating this material with the succession of hot and cold pressure, substantially in the manner and for the purpose described.

81,885.—EDWARD ELLINGEN, Mineral Point, Wis.—*Coffin.*—September 8, 1868.—The inside of the coffin is coated with composition of resin and lard, to render it impervious.

Claim.—The coffin, coated upon the inside with a composition impervious to moisture, as described, and rendered air-tight by the India-rubber packing *b*, let into the under surface of the lid, and held in place by the metallic strip *B*, as herein set forth and shown.

81,886.—JOHN S. FENNER, Warren, R. I., assignor to the INMAN MANUFACTURING COMPANY, same place.—*Machine for Sizing and Polishing Braid.*—September 8, 1868.—The braid is passed through a sizing trough to pressure rollers, and then over guide and tension rollers, which hold it obliquely against the brushes. It is then drawn off by a reel, which receives intermittent motion from a toothed wheel actuated by projections on the end of the lower brush shaft engaging with the teeth.

Claim.—1. The arrangement of driven guide and feed rollers with a rotary brush or brushes, such rollers presenting the braid to the brush or brushes, substantially in the manner shown and described, and so that the braid in passing through the machine shall be repeatedly subjected to the action of the brush or brushes, substantially as described.

2. The arrangement of guide and tension rollers *j j'*, *c c'*, *d d'*, *g g'* and *h h'* upon opposite sides of brush drums *C D*, substantially in the manner and for the purpose described.

3. In combination with a dressing and polishing machine, mechanism, substantially as herein described, for communicating an intermittent movement to the braid, while it is being acted upon by brushes, substantially as specified.

4. The arrangement of the weighted roller *F*², and the roller *F*, with a sizing trough and drying and dressing brushes, as described.

5. The arrangement of the guide and tension rollers *c d g* with the brushes *C D*, substantially in the manner described.

6. The combination of the reel *E*, sizing trough *F*, brushes *C D*, guide and tension rollers *j*, *c*, *d*, *g*, and *h*, and reel *E*¹, all arranged substantially as described.

81,887.—JOSEPH S. FIELD, Brooklyn, N. Y.—*Culinary Apparatus.*—September 8, 1868.

Claim.—1. The apparatus for cooking by steam, when made to be one complete and inseparable vessel, having distinct compartments, for the reception of pans or dishes, each compartment provided with a door, and so arranged that they are all supplied with steam from a common boiler, by means of a side flue, having one of its walls perforated, as herein shown and described.

2. The vessel *A*, when divided by means of partitions *B* into compartments, which are connected by means of the flue *F* with a boiler, *C*, each compartment provided with steam-tight doors *I*, and the flue *F* and boiler admitting of the passage pipe *G*, arranged as described, for the purpose specified.

81,888.—COLGATE GILBERT, Buffalo, assignor to J. J. GILBERT, Little Falls, N. Y.—*Starch Separator.*—September 8, 1868.—A receiver is supported at one end by legs and at the other by screws, so that the inclination can be changed. One end of a bolting frame slides on the frame of the receiver; the other end rests on studs in arms attached to a rock shaft. The tube conveying the grain is made extensible, so as to be readily adjusted.

Claim.—1. The method of supporting and vibrating the bolting frame *A* of a starch separator, substantially as shown and described and for the purpose set forth.

2. The method of supporting the bolting cloth *B* of a starch separator by longitudinal ribs *a a a*, &c., arranged and combined substantially as shown and described and for the purpose set forth.

3. The extensible and adjustable tube, composed of the parts *S T U V V*, when forming part of a starch separator, and arranged and combined to operate substantially as shown and described and for the purpose set forth.

4. The method of adjusting the incline of a starch separator by means of screws *g*, when the same are arranged in combination with the receiver *C*, frame *A*, and bed *G*, all substantially as shown and described and for the purpose set forth.

5. An improved starch separator, when constructed and arranged to operate substantially as shown and described and for the several purposes set forth.

81,889.—LUCIUS D. GOULD, Newark, N. J.—*Sash Fastener.*—September 8, 1868.—A bolt slides in the side of an eccentric, and is made to impinge on the window frame when the eccentric is holding up the sash, thus preventing the window from being raised.

Claim.—The combination of the bolt *e* with the eccentric *a*, when combined therewith by sliding in the eccentric, in the manner and for the purpose shown.

81,890.—W. B. GOULD, Boston, and W. H. HARRIS, Taunton, Mass.—*Anti-slipping Plate.*—September 8, 1868.—To the bottom of a metal plate is fastened a clamp, which clasps the edge of a table, and is held in position by a set screw.

Claim.—A plate, provided with a device for securing it to a table, substantially as set forth.

81,891.—JOSEPH B. GREENHUT, Chicago, Ill.—*Grain Binder.*—September 8, 1868.—The grain is gathered and delivered automatically upon a compressor by means of a rake attached to and operated by an endless chain placed in a slot in the grain platform. The compressor works in connection with a regulating device for stopping the rake and binding machinery until there is as much grain cut as there is in a sheaf, compressed and held in the compressor.

Claim.—1. The rake *C*, constructed as described, in combination with chain *E*, guide rail *a*, plate *D'*, hook *e*, plate *D*, pin *g'*, and guide *F*, or their equivalent devices, the whole arranged and operating substantially as herein set forth and specified.

2. The compressor *R*, consisting of standard *W*, provided with cam *y*, hook *v'*, and plates *u* and *v*, the compressing arms *Y Y*, plates *Y' Y'*, and adjustable spring lever *Z*, each part constructed as described, and all arranged and operating substantially as herein set forth.

3. The regulating device, consisting of segment *M*, pawl *N*, adjustable plate *S*, bent rod *2*, and connecting plate *q*, all arranged and operating substantially as and in the manner herein described and specified.

4. In combination with the compressor *R*, the cap *II*, provided with opening *1* and flange *1'*, with its pawl *2'*, substantially as and for the purposes set forth.

5. The combination of the knife *3*, fork *4*, and de-

vice IV, and cam flanges U', all arranged and operating substantially as set forth.

6. The binding device, consisting of case A'', shaft B'', rod H'', pin G'', spring h'', fingers K'' K'', pinion C'', head c'', flanges d'' d', yoke e'', and forked standard D'', or their equivalents, each and all constructed, arranged, and operating substantially as and in the manner herein described and specified.

7. The bent lever L'', brace m'', case A'', and arm 7 of the device IV, in combination with the fingers K'' K'', and the mechanism for operating the same, the whole constructed and arranged substantially as herein described and for the purpose set forth.

81,892.—JOHN T. GREENWOOD, Beloit, Wis.—*Gas Heater*.—September 8, 1868.—The body of the stove is made of wood, and has a tin lining, forming a chamber, into which cold air is admitted. A deflector is attached to the under side of the top plate. The wick tubes pass through two reservoirs of water down into the oil tank.

Claim.—A kerosene stove, herein described, or its equivalent, when made of wood, in combination with cold-air draughts *a a*, tin lining E, cold-air chambers *e e*, (*a a*), heat deflector *d*, cones L L, tank M, cover M', and cooler I, when the whole is constructed and arranged substantially as and for the purpose herein set forth and described.

81,893.—GEORGE D. HADLEY, Cincinnati, Ohio, assignor to himself and GARDNER WATERS, same place.—*Globe Valve*.—September 8, 1868.

Claim.—A globe valve, when constructed with a blank surface, A, above the screw *a* in the body or shell of the valve, and the corresponding blank surface B, above the screw *b* on the stand D, so that when the screw *b* is relieved from the screw *a* and the valve E is bearing upon its seat, the blank surfaces A and B shall form a perfect guide for the purpose of grinding the valve to its seat, without being obliged to remove the handle or the packing from its stuffing box, or the body of the valve from its connections.

81,894.—JOSEPH HAFENEGGER, San Francisco, Cal.—*Explosive Compound*.—September 8, 1868.—Compound No. 1 for blasting is composed of chlorate potash, sulphur, willow charcoal. Compound No. 2 is composed of chlorate potash, sugar, ferro-prussiate potash, and is made self-igniting by being saturated with phosphorus dissolved in bi-sulphuret of carbon. Compound No. 3 is composed of chlorate of potash, charcoal, sulphur or sugar, ferro-prussiate potash. Compound No. 4, for shells and blasting, is composed of chlorate potash, charcoal sugar, and sugar. Compound No. 5 for exploding by percussion is composed of chlorate of potash and sugar.

Claim.—1. The within-described explosive compounds, consisting of Nos. 1, 2, 3, 4, 5, made of the ingredients enumerated, mixed or compounded in about the proportions specified.

2. The self-igniting match, compounded of the liquids or fluids enumerated, whether applied separately or mixed, to the explosive compounds or materials sought to be ignited or exploded, substantially as described.

81,895.—EDWARD HAGAN, New York, N. Y.—*Service Pipe for Buildings*.—September 8, 1868.—The pipe conveying water from the main is surrounded by a casing forming a chamber around the pipe. This casing extends to the inside of the building and has an aperture for the admission of steam for thawing the pipes. A wooden casing covers the pipes and their connections on the inside of the building, and has doors opposite the union and elbow joints.

Claim.—The casing E, G, and N, inclosing the service pipes, forming spaces around the latter, the casings being provided with apertures *d*, for the introduction of steam or hot air to the spaces surrounding the service pipes, which latter are connected by union joints immediately at the points of junction of the several sections of the casing E G, doors O P Q R being formed in casing N, opposite the joints of pipes L J R, all constructed and arranged in the manner and for the purposes substantially as shown and described.

81,896.—THOMAS HAIGH, Harrisburg, Pa., assignor to himself and CHARLES M. LIGHTNER, same place.—*Churn*.—September 8, 1868.

Claim.—1. Suspending the cubical box between the posts B B, by attaching the trunnions *b d* to two of its diagonally opposite corners, whereby, as the box is rotated, the inclinations of its sides are rapidly changed, as herein shown and described.

2. The cog-wheels E G, and pulleys D H, and hollow trunnion *d*, all operating together, substantially as described, in combination with the diagonally suspended box and its dasher, all substantially as shown and described, and for the purpose set forth.

81,897.—WARREN HALL, Dennis, Mass.—*Cranberry Gatherer*.—September 8, 1868.—The front end of a carriage body is hinged to an axle, having a chute extending from it whose front end terminates in a comb or series of horizontal teeth and vertical knives. Within the carriage body is a box or receiver whose front end is hinged so as to be turned down upon the bottom of the carriage body level with the rear end of the chute.

Claim.—1. The arrangement of the joint axle with respect to the chute, when hinged to the carriage body, as set forth, the said axle, under such arrangement, being fastened to the chute.

2. The combination and arrangement of the series of knives *k k l*, with the chute, its teeth, and carriage combined, as set forth.

3. The combination of the receiver, made as described, with the carriage and the chute combined, and constructed in manner and so as to operate as specified.

81,898.—S. M. HAMILTON, Baltimore, Md.—*Planing Machine*.—September 8, 1868.—An adjustable guide is made to slide in the top of the table provided with a circular aperture in which the cutter head revolves, the lower part having connected with it a forked lever for raising and lowering the same, so as to regulate the work with reference to the knives in the cutter head.

Claim.—The combination of the adjustable guides D with the cutter head, constructed and operating substantially as described and shown.

81,899.—GUNDER E. HAMMER, Rochester, Minn.—*Stove Pipe Thimble*.—September 8, 1868.—A part of one end of the thimble is hinged to obtain access to the air chamber for cleansing.

Claim.—The stove-pipe safe, as constructed, of the inner cylinder B, outer cylindrical casing A, and perforated heads, the lower head being made in two parts, one of which is fixed to the cylinders A B, while the other, E, is hinged to the outer cylinder, and provided with fastening devices, as herein shown and described, for the purpose specified.

81,900.—CHARLES HARRISON, New York, N. Y.—*Cock or Faucet*.—September 8, 1868.—A hollow piston is made to slide in a hollow cylinder fastened to the barrel of the cock. The bottom of the cylinder is grooved for the admission of water when the piston is down, the water being gradually expelled as the piston rises so as to prevent the hammering action of the valve on its seat.

Claim.—1. The piston *h*, formed hollow, in combination with the guide *m*, valve *n*, and cylinder *f*, as and for the purposes specified.

2. The grooves *t*, within the cylinder *f*, in combination with the piston *h* and valve *n*, as and for the purposes set forth.

81,901.—PETER HAYDEN, Pittsburg, Pa.—*Brick Machine*.—September 8, 1868.—A rotating shaft provided with spiral blades carries the clay from the crushing mill to the press boxes located on the periphery of a cylinder, the clay being forced into them by means of a follower and plungers operated by a cam. The cylinder is rotated by crank arm moving in slots between the press boxes on its periphery. The bricks are removed by means of a plunger and follower.

Claim.—1. The intermittingly rotating cylinder M, provided with the press boxes L', followers T, recesses *d*, and teeth *i*, in connection with the crank arm *f* on shaft N, all arranged to operate in the

manner substantially as and for the purpose specified.

2. The plunger R, operated substantially as shown and arranged, in relation with the followers T, for the purpose of compressing the clay in the press boxes, substantially as set forth.

3. The plunger U, operated from the plunger R, through the medium of the lever V, for the purpose of discharging the bricks from the press boxes L', substantially as shown and described.

4. The combination of the pressure rollers F I, rotary shaft K, provided with the spiral wings or blades *b* and *b'*, the cylinder M, provided with the press boxes L', with the followers T therein, the plungers R U, and the fixed cam X, all arranged to operate in the manner substantially as and for the purpose specified.

81,902.—GEORGE W. HECKART, Columbiana, Ohio, assignor to himself and CHRISTIAN KRAMER, same place.—*Fifth Wheel Bender*.—September 8, 1868.—On a pedestal is a series of forms to which is secured a clamping screw for holding the iron while being bent. An adjustable bending device revolves around the forms, having its axis on the pedestal.

Claim.—A bending machine for "fifth wheels," consisting of a series of forms, B, clamping screw, C, and adjustable bending device, formed of the arm *x*, rollers *f* and *h*, levers D, 7, 8, 9, and 12, link 11, and arm 10, the whole being constructed, arranged, combined, and operating as herein described, and for the purpose set forth.

81,903.—C. C. HINSDALE, Cleveland, Ohio.—*Manufacture of Sheet and Plate Iron*.—September 8, 1868.—The bars are subjected to an acid bath to remove the oxide, then washed in clean water, then coated with a preparation of clay, lampblack, and prussiate of potash. The bars are then heated and rolled, and again coated with the above preparation, the process being repeated as often as necessary.

Claim.—1. The herein described compound, and the manner of using the same, in the process or mode of making plate or sheet iron, substantially as and for the purpose set forth.

2. Coating the metal with plastic alloy separately, and in combination with lampblack, or its chemical equivalents, for the purpose set forth in the process described.

81,904.—BENJAMIN F. HOLBROOK and EBENEZER B. RUMRILL, Boston, Mass.—*Stove Grate*.—September 8, 1868.—The bed plate rests on balls moving in slots in the base of the stove. A lug extends down on one side of the bed plate to which one end of the grate is pivoted while the other is supported by an arbor in a loop on the opposite side, by which the bed plate is rotated and grate revolved.

Claim.—1. The movable bed plate B, substantially as and for the purpose set forth.

2. A bed plate, B, revolving on balls *e e e e*, substantially as and for the purpose described.

3. The movable bearing or loop *g*, in combination with the revolving bed plate B and arbor D of the revolving grate C, substantially as described, for the purpose set forth.

4. The annular ring H, for protecting the revolving bed plate and supporting the lining, substantially as described.

5. The sliding and removable port cover F, in combination with the port E and arbor D, with its spring *m*, constructed and operating substantially as and for the purpose specified.

6. An arbor, D, so pivoted to its grate as to admit of being readily connected therewith or disconnected therefrom, substantially as and for the purpose set forth.

81,905.—WILLIAM HOLZHÄUSER, Buffalo, N. Y.—*Ventilator*.—September 8, 1868.—Air is forced downwardly in the top of a pipe supplying air to rooms by means of a revolving wind catcher or an ordinary fan blower. The supply is regulated by dampers placed near the top of the building and registers in the rooms. The impure air escapes through pipes connected with registers placed in the top of the room.

Claim.—1. The combination, with the system of

pipes B *b'* F, of a fan blower, C, for the purpose and substantially as described.

2. The combination with said system of pipes, of the revolving wind catcher D, constructed and operating substantially as and for the purpose described.

3. In combination with the above, the main regulating dampers G G', and registers H H', arranged and operating as described.

81,906.—GILBERT JESSUP, Shortsville, N. Y.—*Cotton-Seed Planter*.—September 8, 1868; antedated August 27, 1868.—Two hollow cylinders are joined on a shaft, one having its edge slotted for the seed to pass through, the other attached to the frame having a rock shaft with an arm attached to force the seed through the slots. The shaft to which the revolving cylinder is secured is capable of endwise adjustment.

Claim.—1. The construction and arrangement of the revolving cylinder B with its slots J, shaft P in combination with the stationary cylinder A or its equivalent, for the purposes herein described.

2. The rock shaft *b*, arm H, and spring *o*, in combination with the revolving cylinder B, all acting conjointly, in the manner and for the purposes shown and described.

3. The spring G or its equivalent, in combination with the pins *v*, for the purposes set forth.

4. The longitudinal adjustment of the shaft P and cylinder B, in combination with the stationary cylinder A or its equivalent, for the purposes of regulating the quantity of seed being distributed.

81,907.—FRANK G. JOHNSON, Port Richmond, N. Y.—*Watch Regulating Adjustment*.—September 8, 1868.—The object is to move the regulating hand of a watch so that it may be adjusted with the greatest nicety.

Claim.—The fixed screw shaft *a*, upon which the grooved nut *c* carrying the end of the regulating hand *d* is rotated, all arranged and operating as described, for the purpose specified.

81,908.—JOHN ALLCOCK JONES, Middlesborough, England.—*Manufacture of Iron and Steel*.—September 8, 1868.—After the iron has been puddled for a short time the temperature is lowered and a flux of oxide of manganese, salt, nitrate of soda, or sal ammonia is incorporated with the fluid metal. Crude iron is melted in a furnace lined with some oxide of iron, free from phosphorus or sulphur; the temperature is lowered and a flux of the above-mentioned materials is incorporated; heat is again applied until the iron settles to the bottom and the cinder rises, and is then plunged into water or pressed.

Claim.—1. The production of iron and steel from cast or refined iron, by first melting and puddling the same, adding thereto purifying agents or fluxes, then separating as much of the slag as it is practicable to separate therefrom, and removing the crude iron or metal resulting to furnaces or crucibles, and melting the same, as hereinbefore described.

2. The preparing the crude iron or metal without the employment of a puddling process, and melting the same into steel, as hereinbefore described.

3. The conversion of cast iron into malleable iron without the employment of the puddling process, by allowing the metal to remain for a sufficient period in the puddling or other furnace, as hereinbefore described.

4. The employment of a bath, consisting of slag or cinder, in which the crude iron resulting from the processes before referred to is melted, so as to be converted into steel, as hereinbefore described.

5. The subjecting the crude iron resulting from either of the processes hereinbefore described to pressure, so as to separate a portion of the cinder or slag therefrom, prior to its being placed in or upon the steel-melting hearth or furnace.

81,909.—THOMAS B. KELLEY, Dundee, Ill.—*Ice Boat*.—September 8, 1868.

Claim.—A boat, provided with the water-tight compartment or case B, open at top and bottom, with the propelling wheel mounted in a sliding adjustable frame D, fitted within said case B, for the

purpose of adapting the boat for use either on the ice or water, substantially as set forth.

81,910.—WILLIAM C. KELLUM, San Francisco, Cal.—*Escapement*.—September 8, 1868.—The balance receives one impulse at each complete or double vibration; the detent lever is operated by a liberating pin attached to the balance staff, and moving alternately above and below a lifting spring which operates the detent. The balance staff moves in a plane parallel with the plates of the timepiece and plane of the escape wheel and is locked by a spring or gravitation.

Claim.—1. The detent F, and the adjusting screw d, together with the curved arm H and the spring I, operated by the liberating pin a, or its equivalents, locking by spring or gravitation, substantially as and for the purpose described.

2. The escape wheel B, moving in a plane parallel to that of the balance staff and of the plates A A, and giving impulse to the pallet e, either from the sides or point of the teeth, in combination with the detent F, arm H, and spring I, substantially as described.

3. The balance staff C, standing parallel with the plate A, and the liberating pin a, passing alternately above and below the lip J at each vibration, substantially as described.

81,911.—I. J. KIDD, Young Settlement, Texas.—*Corn Planter*.—September 8, 1868; antedated August 28, 1868.—A circular feed wheel fits in a slot in the beam just behind the plow and receives motion through a band from a roller behind the plow.

Claim.—The arrangement of the feed wheel e, pulleys K K, plow beam B, cords or bands j j, roller I, spout F, and plows B and H H, the several parts being constructed and operated substantially as and for the purpose specified.

81,912.—JAMES KUHN, Mount Pleasant, Pa.—*Face Tester for Millstones*.—September 8, 1868.—The concentric annular projections are smeared with color to mark the raised portions.

Claim.—The circular block A, of wood or other suitable material, provided with concentric annular projections, a, on its face side, substantially as and for the purpose set forth.

81,913.—N. P. LARSEN, Chicago, Ill.—*Burglar Alarm*.—September 8, 1868.—An indicator is connected with the striking mechanism to show the alarm is in working order. The key is provided with a cam to discharge a pistol when the bell rings. A bobbin of thread is attached to the box inclosing the alarm machinery and is used to connect the machinery with doors, windows, &c.

Claim.—1. The lever D, plate E, with pin f, spring F, and wire H, all combined and operating as and in the manner herein described, and for the purpose specified.

2. In combination with the above, the pin b, of the hammer B, and the bobbin O, arranged substantially as set forth.

3. The key K, when used as described, and provided with cam L, for the purpose of operating the trigger N, as herein shown and specified.

81,914.—JAMES L. LINDERMAN, Rockford, Ill.—*Seeding Machine*.—September 8, 1868.—Partitions partly inclose the feed wheels and have openings in the lower and rear parts to allow the seed to flow down double inclines; spouts are placed in the front part of hopper between the partitions into which the feed wheels deliver the grain. The speed of the feeding shaft is regulated by an idle gear wheel on adjustable bearings.

Claim.—1. The wheels E, provided with seed channels upon their peripheries, extending rearward from the seed cups, and made tapering in form as shown and described, for the purpose set forth.

2. The wheels E, constructed as described, in combination with partitions F, constructed and arranged as described, double inclines G, and spouts G', the whole being combined and operated substantially as and for the purpose described.

3. The wheel C, shaft c, and slotted bearings c', in combination with gear wheels B D', and frame A, as and for the purpose described.

81,915.—E. A. LOCKE and W. N. WEEDEN, Boston, Mass.—*Lamp Shade*.—September 8, 1868.

Claim.—A lamp shade ring made from a strip, when the abutting ends of the strip are held together by projections thereon, which are inserted into a loop formed on one of the spring supports f, as specified.

81,916.—ROBERT LOVE, Hoboken, N. J.—*Varnish for Metal, Wood, and Paper, or other Fabric*.—September 8, 1868.—Varnish impervious to water or oil, composed of gum shellac, gum sandarac, gum elemi, and gum amber, mixed with boiling alcohol.

Claim.—1. An enamel, paint, or varnish, composed substantially as described, for the purposes specified.

2. Forming or compounding an enamel, paint, or varnish of the materials specified, substantially as described.

81,917.—M. N. LOVELL, Erie, Pa.—*Lamp-chimney Cleaner*.—September 8, 1868.—Curved handles are provided with clamps for holding slips of paper or cloth so that the slips may be turned over as they become foul.

Claim.—1. The handle A of a lamp-chimney cleaner, provided with the spring clamp b and hook e, substantially as and for the purpose described.

2. The handle A of a lamp-chimney cleaner, provided with the grooved and curved portion B, in combination with the clamping spring b and hook e, substantially as and for the purpose described.

81,918.—CHARLES C. MANUEL, North Troy, Vt., assignor to himself, WILLIAM G. ELKINS, and O. N. ELKINS, same place.—*Stump Extractor*.—September 8, 1868.—A strongly-braced frame is raised by uprights above the axletrees of the running gear of a wagon. A chain passes over a fixed and movable pulley, one end being fastened to the cross-beam and the other end is wound around a drum actuated by suitable gearing.

Claim.—1. The arrangement of the main timbers A A and their accessory cross-beam B, braces D and E, uprights C and H, cross-beams G, bolster J, when mounted on four wheels, and constituting the frame of a machine for extracting and removing stumps and other heavy bodies, all substantially as shown and described, and for the purpose set forth.

2. The arrangement of the chain a and its accessory sheaves or pulleys d e g, and hooks b b' c, and roller f, in combination with a frame mounted on wheels, substantially as described, and any suitable gearing for actuating the said chain, all as and for the purpose set forth.

3. The combination, in a stump extractor, of the accessory gearing k j h l m, and rope n, all arranged to operate substantially as and for the purposes set forth.

81,919.—JOHN L. MASON, New York, N. Y.—*Garbage Box*.—September 8, 1868; antedated August 27, 1868.—The receptacle is secured by an arm to a slide provided with a toothed rack; said slide moves up and down in a hollow column by means of a pinion engaging with the rack. The column is supported on a post and can be revolved.

Claim.—1. The rising and falling slide S, in combination with the garbage receptacle R, constructed and operated as and for the purpose described.

2. The revolving column P', in combination with the slide S and receptacle R, constructed and operated as and for the purpose set forth.

81,920.—DAVID P. MATHEWS, Winthrop, Mass.—*Medical Compound for Cattle and other Animals*.—September 8, 1868.—Composed of elecampane, gentian, paradise seed, fenugreek seed, and cummin seed.

Claim.—As my invention the said composition, composed of the constituents hereinbefore mentioned.

81,921.—DAVID MAX, Newton, Ill., assignor to himself and THOMAS WALTZ, same place.—*Cloth Measuring Machine*.—September 8, 1868.—An indicator, provided with a scale, is operated by rolls through which the cloth passes, the rolls being

gauged to pass a given amount of cloth at each revolution. The end of the cloth is secured to the roll proper by a clamp.

Claim.—1. The indicator, consisting of the shaft H, worm I, spur wheel F, pointer K, and annular index G, in combination with the rolls C D, L L', and friction brakes N N', all arranged and operating substantially as described, for the purpose specified.

2. In combination with a cloth-measuring machine, substantially as herein described, the rolls L L', composed of the roll proper, *a*, and clamping piece *a'*, connected by means of the flaring ferrules or bands *b*, substantially as and for the purpose set forth.

81,922.—HIRAM S. MAXIM, New York, N. Y.—*Gas Machine.*—September 8, 1868.

Claim.—1. A gas machine, in which the production of gas is automatically stopped when its pressure as well as when its quantity is excessive, and as automatically restarted when the difficulty is overcome, as set forth.

2. The cylinder *e*, connected with the inclosed tank D, to show the height and pressure of the contents of the tank, and to convey part of them to the heating chamber, as specified.

3. The burner tube G, when provided with a valve, *h*, which is connected with a diaphragm, *j*, so as to be closed when the pressure of the gas is too high, as set forth.

4. The combination with each other of the four separate vessels A, B, D, and I, the latter having the elastic diaphragm J stretched across it, substantially as herein shown and described.

5. The device for automatically operating the valve *s* which regulates the flow of gas into the gas holder I, said device consisting of the diaphragm J, pin *o*, lever L, lever *t*, arms *w*, *x*, and springs *y*, all arranged, combined, and operating substantially as herein shown and described.

6. The pipe M, for conducting the evaporated gasoline to the gas holder, and for mixing it with the required quantity of air, said tube containing the perforated partition *b'*, the interior tube *c'*, and the valve *c'*, all made and operating substantially as herein shown and described.

7. The cam *z*, for keeping the valve *s* closed, as set forth.

8. The pipe *f'*, for conducting illuminating gas from the gas holder I to the heating chamber *a*, substantially as and for the purpose herein shown and described.

81,923.—A. McDANIEL, Dubuque, Iowa, assignor to himself and S. J. HENION, same place.—*Spring Bed Bottom.*—September 8, 1868.—The mattress is placed on inverted spiral springs, supported by longitudinal rails, the ends of the rails resting on spiral springs placed upon cross-rails braced by rods running diagonally.

Claim.—1. The combination and arrangement of the rails B, rods C, spring D, and rails F, provided with the upper springs L, all substantially as and for the purpose set forth.

2. The arrangement of the rails B, rods C, springs D, and rails F, substantially as and for the purpose described.

81,924.—HIRAM McILROY, Poplar Ridge, N. Y.—*Forward Axle for Carriages.*—September 8, 1868.—A plate having an upright socket piece at its center, and steel circle plates secured to its ends, is attached to the axle. The head block has a plate secured to it provided with a pin in the center, which fits into the socket and has secured to its ends chambered circle plates which embrace the lower circle plates.

Claim.—1. The central pivot and socket, in combination with the hooks and flanges on the circles for uniting the head block and axle, substantially as described.

2. The chambered upper circles and hooks, and pivot socket, provided with the leather packing, substantially as and for the purpose described.

3. The upper circle bar or plate, provided with the chambered circles and hooks, and with the central pivot, all cast in one piece, and united to the head block in the manner described.

81,925.—FERDINAND MEHRMANN, Fountain City, Wis.—*Combined Spur and Creeper.*—September 8, 1868.—A bow-shaped bar or plate with teeth on one side is pivoted to the ordinary spur. Said plate can be turned forward under the sole of the boot to be used as a creeper, or it can be folded back over the heel, and locked in either position.

Claim.—A combined spur and creeper, made and operating substantially as herein shown and described.

88,926.—EMILIE J. MERIMAN, New York, N. Y.—*Corset.*—September 8, 1868; antedated September 4, 1868.

Claim.—Supporting the corsets, and the clothing depending therefrom, by means of straps I I, the ends of which are attached, by an adjustable lacing or other fastening, to the waistband or middle of the corset, substantially as and for the purposes set forth.

81,927.—JOHN METHERELL, Rockford, Ill.—*Millstone Ventilator.*—September 8, 1868.—The drums are made air-tight except at the eye of the stones; the air is exhausted by fans placed in pipes, connecting with the sides of the drums, and forced into a cooling box, from which it is drawn off by a large fan.

Claim.—The arrangement of the pipes F, provided with fans, as described, in combination with the cooling chamber G, central passage H, and fan I, as and for the purpose set forth.

81,928.—JOHN C. MILLER, Bushnell, Ill.—*Brick Machine.*—September 8, 1868.—A bed is grooved on each side to admit the molds. A tub sets over the bed and is open at that part of the bottom over the grooves. The molds are provided with racks and are made to slide in the grooves by means of cog wheels engaging with the racks.

Claim.—The tub E and shaft G, in combination with the frame A, ways *c c*, cog-wheels H and I I, and molds D D, all constructed as described, and operating substantially as and for the purposes herein set forth.

81,929.—JOHN H. MILLER, Oskaloosa, Iowa.—*Plane for Cutting Blind Slats.*—September 8, 1868.—Two arms slightly curved hold the timber, and are pivoted to the carriage and have their inner ends free, the outer ends being pivoted to a rod which connects them.

Claim.—The pivoted arms G and connecting rod H upon the carriage F, when constructed and operating substantially as and for the purpose specified.

81,930.—SIMON MOTTE, Paris, France, assignor to ISAAC HYNEMAN.—*Bellows Pumping Apparatus.*—September 8, 1868.—A pair of bellows pumps are operated by a single lever, and communicate with common inlet and outlet ducts provided with valves, and while one pump is receiving the other is discharging. The top of each pump is provided with a removable cover.

Claim.—1. A bellows pump having a depressed valve in its stationary base plate, and a removable cover in its vibrating piston or lid, all substantially as shown and described.

2. A bellows pump in which the fluid is received and discharged from near the end opposite the axis of vibration, by means of the piston B', through confluent pipes, substantially as described.

81,931.—W. T. MUNGER, Branford, assignor to P. CORBIN and F. CORBIN, New Britain, Conn.—*Reversible Latch.*—September 8, 1868.—The part of a divided horseshoe slide are hinged together so that the horseshoe can be opened and removed forward to allow the square end of the latch to be reversed, and the latch being pressed into the lock, the spindle is revolved and the cam thereon latches fast the swinging portion of the horseshoe.

Claim.—The divided horseshoe, formed of the part *i*, pivoted to the portion *d*, in combination with the latch *g* and shank *f*, attached to the horseshoe, so that it may be revolved for reversing said latch, substantially as set forth.

81,932.—AMOS NEWELL, Redwing, Minn., assignor to himself, HENRY S. BROWN, FREDERICK AR-

NOLD, and ALFRED ARNOLD.—*Ore and Bone Crusher.*—September 8, 1868.—The ore or bone is thrown into the top of the case and passes down between two disks, provided with hammers revolving in opposite directions.

Claim.—Two distinct sets of hammers, so made and arranged as to revolve in opposite directions, adapted to and in combination with the case A, substantially as and for the purpose described.

81,933.—**AMOS NEWELL,** Redwing, Minn., assignor to himself, **HENRY S. BROWN, GEORGE F. ARNOLD, and ALFRED ARNOLD.**—*Mill for Pulverizing Bone, &c.*—September 8, 1868.—The case is divided into compartments by disks to which the hammers are attached. An annular space is left between the inner circumference of the case and the disks, forming a passage across the path of the hammers.

Claim.—The case A, hammers B, and partitions C, combined and arranged substantially as shown for the purpose herein set forth.

81,934.—**JOSEPH OKEY,** Indianapolis, Ind., assignor to himself and **FERDINAND A. LEHR.**—*Wash Boiler.*—September 8, 1868.—A slotted hinged door sets over chambers in the bottom of the boiler and is raised for inserting soap.

Claim.—The door *m m*, when constructed with slotted sides, in combination with the chambers K K and pipes *d, e,* and *f*, substantially in the manner described, and for the purpose set forth.

81,935.—**LUCIUS M. OLDEN,** Pana, Ill.—*Seeding Machine.*—September 8, 1868.—Rotary colters are placed in front of the teeth for cutting the way for the teeth, said colters being applied to a frame hinged below the main carriage, and provided with a raising and lowering device. Each of the drill teeth is provided with an endless feeding device for compelling the discharge of seed from the channels; motion is communicated to this feeding device through the medium of a shaft driven from the main axle and stopping when the drill teeth are raised from the ground.

Claim.—1. The application, to the seed passage of a drill tooth, of a feeding device, *l*, or its equivalent, substantially as described.

2. The combination of feed wheel *y*, hinged funnel *G*³, and a drill tooth, which is constructed with a feeding device, *l*, or their respective equivalents, substantially as described.

3. The vibrating frame C, carrying colters C¹, and suspended by means of a lifting chain L, in combination with drill teeth, which are suspended from said frame C, by means of chains L', substantially as and for the purposes described.

4. The devices, substantially as described, for disengaging wheels D from their axle D', when frame C is lifted, in combination with drill teeth, which have feeding devices applied within them, substantially as described.

81,936.—**JOHN PARK,** Joliet, Ill.—*Bedstead and Quilting Frame.*—September 8, 1868.—A rod provided with journals has bearings in movable cross legs. One of said legs at each end has a ratchet bar secured to it, and the other has a pawl or brace. Rollers for holding the material are adjusted in the top of the legs, to one end of each of which is secured a ratchet wheel which engages with a pawl pivoted on the leg next to it.

Claim.—The arrangement of the shaft A, legs B B B B, with their pawl D, and rack bar C, and the rollers K K, with their ratchets *h* and spring pawls *g*, the whole combined, adjusted, and operating as herein set forth.

81,937.—**QUINTIN PARKER,** New York, N. Y.—*Steam Generator.*—September 8, 1868.—A pipe is suspended from the back end of the deflector and passes through the boiler sheet, through which pipe the accumulated dirt which obstructs the lower flues is made to pass.

Claim.—The combination of the pipe G with the boiler sheet A, suspended from the upper plate of the deflector E, in rear of the flute sheet, substantially as herein shown and described.

81,938.—**LEWIS PATRIC,** Shortsville, N. Y.—*Shaft Journal.*—September 8, 1868; antedated August 27, 1868.—The socket gudgeons are provided with lugs to receive the clamping screws, said screws working in an eye bolt fastened to the shaft.

Claim.—In combination with the socket gudgeons or journals G and shaft S, the screw or threaded eye bolt *f* and clamping screw *s*, as and for the purposes set forth.

81,939.—**THOMAS PAYNE,** Grand Rapids, Mich.—*Meat Chopper.*—September 8, 1868.—The chopping box is rotated by a pinion engaging with a circular rack attached to its under side. Two knives are suitably connected with each end of a lever, being pivoted at the center, and vibrated by suitable mechanism.

Claim.—The combination of the crank shaft I, gear wheels K and L, shaft M, crank wheel N, pitman O, arm P, rack shaft Q, cross head R, short connecting rods S, stems T, and knives U, with each other and with the frames B, and revolving chopping box C, substantially as herein shown and described, and for the purpose set forth.

81,940.—**PHILIP PEFFER,** Milroy, Pa.—*Shaft Coupling.*—September 8, 1868.—One of the shafts is pointed and fits into a socket in the end of the other. They are held together by a spiral spring secured to the flanges.

Claim.—The combination, with the shafts D and E, when connected together by a point and socket, of the spring C, substantially as and for the purpose described.

81,941.—**G. M. PETERS,** Lancaster, Ohio.—*Dropper for Harvester.*—September 8, 1868.—The platform is given a reciprocating and tilting movement, so as to be quickly withdrawn from under the gavel, to allow it to drop in front of platform behind the cutting apparatus.

Claim.—1. Hinging or pivoting the platform to a bent arm or support, by means of which it is operated, in such manner as to admit of a reciprocating and tilting movement, substantially as described.

2. The bent arm or rod to which the platform is hinged, and by means of which said platform is vibrated, in combination with the rod or link for tilting the platform upon its operating arm.

3. The bent rod or arm J, link J', crank K, connecting rod L, and lever M, or their equivalents, in combination with the platform I, arranged and operating substantially as described.

81,942.—**DARIUS G. PICKETT,** Stockton, N. Y.—*Grass Seed Sower.*—September 8, 1868.—The hopper is divided by partitions, the seed being agitated between them by pins projecting upward from a perforated slide.

Claim.—The combination, with the seed slide B, of the pins *f f*, holes *d d*, and cross partitions *g g*, the whole arranged as described, and operated in the manner and for the purpose specified.

81,943.—**HENRY POTH,** Pittsburg, Pa.—*Wheel for Vehicle.*—September 8, 1868.—The tenons of the spokes are provided with metal plates which cover the end and lateral faces of the spokes, and are indented at an angle to form a notch in which a beveled ring fits and serves as a key. The axle box is provided with a collar against which the beveled ring rests. A chamber is formed between the axle box and metal hub, and suitably packed to be used as an oil box.

Claim.—1. The combination, in a vehicle wheel, of the tenon plates *e*, beveled ring *d*, screw box B D, and metal hub A, substantially as herein shown and described.

2. The combination, in a vehicle wheel, of the screw box B D, packing rings *e* and *f*, when arranged to form an oil-tight space, *h*, between the box B and the metal hub A, and provided with holes for the screw *i*, all substantially as herein shown and described.

81,944.—**CHARLES C. RAMSAY,** Chicago, Ill.—*Gas Pressure Regulator.*—September 8, 1868.—A rubber diaphragm, placed in a case through which

the gas passes, is of such dimensions that by proper connections with the valve admitting the gas, if undue pressure is exerted, will close the valve.

Claim.—The combination of chamber B, having the diaphragm *b*, with the spiral spring H, arranged as shown, with the valve C resting on the lever E, connected to the diaphragm by a rod, F, all arranged to operate substantially as herein set forth.

81,945.—JOSEPH A. RAND, Morrisville, Vt., assignor to THOMAS A. MITCHELL, Washington, D. C.—*Clothes Pin.*—September 8, 1868; antedated August 27, 1868.—The pin is in two pieces pivoted together, and when closed holds the clothes on the line.

Claim.—The arrangement and construction of the pieces A and B, with the square head C and its aperture D at one end, as herein described and for the purposes set forth.

81,946.—DANIEL RISHER, Jr., Dravosburg, Pa.—*Device for Loading Coal.*—September 8, 1868.

Claim.—1. The mode of loading coal into boats, flats, or barges, by sliding the coal down a chute into a hopper hung to a car, and thence running it down an inclined track to the boat, flat, or barge, and discharging it from either end of the hopper into the boat, flat or barge, substantially as hereinbefore set forth.

2. The tipping coal hopper *g*, made with the bottom concave or sloping down toward the middle from the discharging ends, substantially as and for the purposes hereinbefore set forth.

3. The tipping coal hopper *g*, connected by bearers *d* with a rocking shaft *d'*, mounted on a car or truck, substantially as and for the purposes hereinbefore set forth.

4. Sliding bars *m'*, carrying a coal hopper, so connected with the bearers *d* as that, by a slight longitudinal motion imparted thereto, the center of gravity of the loaded hopper may be shifted, substantially as and for the purposes above set forth.

5. A tipping handle, *i*, attached to the rocking shaft *d'* of a coal-loading car, in combination with tripping devices, constructed and used substantially as and for the purposes hereinbefore expressed.

81,947.—CHARLES F. RITCHEL, Chicago, Ill., assignor to himself and HENRY S. HAYNES, same place.—*Chalk and Sand Paper Holder for Billiard Table.*—September 8, 1868.—The interior of two circular blocks is recessed for the reception of chalk and sand paper, the central parts of the outside faces being cut away to allow the cue to be inserted.

Claim.—An improved chalk and sand-paper holder, formed by the combination of the recessed blocks A and B with each other, said blocks being constructed and arranged substantially as herein shown and described, and for the purpose set forth.

81,948.—FRANCIS ROACH, Boston, Mass., assignor to himself and JOSEPH ZANE, same place.—*Faucet.*—September 8, 1868.—The valve is closed by the expansive power of a spring, and is raised off its seat by a rotary tubular key with cams arranged in line with and constituting part of the faucet neck.

Claim.—1. The arrangement of the induction and eduction pipes *b c*, the valve seat *a*, the valve D, the case A, the spring I, the stem C, the cap B, the neck *d*, the key E, and the cams *f f* and stops *g g*, the whole being as and to operate as hereinbefore described, and as represented in the accompanying drawings.

2. The arrangement and combination of the two holes *h i* with the key E and the spindle C, arranged and combined with the valve, its spring, and case, as specified.

3. The combination of the adjusting screw F and the annulus *k*, applied to the spindle C, as described, with the key E arranged with the spindle C, its valve, and spring, and the neck *d*, substantially in manner and under circumstances as hereinbefore specified.

81,949.—S. R. ROSCOE, Obion County, Tenn.—*Sofa Bedstead.*—September 8, 1868.—An improvement on his patent of May 14, 1867. The cushion is held in position to form the back of a sofa by hooks attached to the headboards, and is steadied by couplings attached to its lower edge, and the bottom

of the seat. The headboards are hinged to swing around and form the ends of the sofa and are held by hooks fitting in eyes.

Claim.—The combination of the cushions D and E with the folding headboards A and B, the hooks *d d*, the eyes *b b*, and the couplings *m n*, all constructed and operating substantially as and for the purpose described.

81,950.—HENRY A. RUST and LUDWIG HERRMANN, Chicago, Ill.—*Bridge.*—September 8, 1868.

Claim.—1. The arrangement of one or both ends of the main braces when constructed in a convex or rounded form, in corresponding concave grooves or recesses in the blocks B and E, substantially as specified.

2. The arrangement of the inclined end of the counter braces in a corresponding inclined recess in the top block, to operate substantially as set forth.

81,951.—DAVID SHANNON and WILLIAM SPENCER, Winslow, Ind.—*Grain Separator.*—September 8, 1868.—The case is pivoted between the rear arms, its forward end resting on a bar pivoted to the center of a lever. On the bottom of the case are metal plates inclining toward two holes in the bottom, so as to form funnels. The grain is fed into a drum of wire gauze from a spout vibrated by projections on the end of the drum.

Claim.—1. The combination of the cylindrical drum M, case C, with inclined planes I, openings H, lever E, strap G, and bar D, all substantially as herein set forth.

2. The lever E, pivoted at one end and suspended at the other by means of a strap G, in combination with the pivoted center bar D, when operating for the purpose of giving proper pitch to the box C, substantially as and for the purposes herein set forth.

3. The bent wires *i i*, on the end of the cylinder *d*, when acting in combination with the spout P, to feed the grain from the hopper O into the drum M, substantially as and for the purposes herein set forth.

81,952.—HENRY F. SHAW, West Roxbury, assignor to JAMES A. WOODBURY and SOLOMON S. GRAY, Boston, Mass.—*Lathe Head.*—September 8, 1868.—An eccentric sleeve on which the smaller gear cylinder works, is capable of being so adjusted as to cause the latter to be thrown into a position eccentric to and in gear, or out of gear, with the larger or internal gear cylinder.

Claim.—1. The combination of the gears D and E, the disk P, having the spring pin *p*, and eccentric sleeve *c* attached thereto, and the pulley block C, provided with the eccentric sleeve *d*, all arranged substantially in the manner and for the purpose specified.

2. The combination of the pulley block C, provided with the cam-sleeve *d*, disk P, and eccentric collar *c*, catch S, and gear wheel E, substantially as and for the purpose set forth.

81,953.—HENRY F. SHAW, West Roxbury, assignor to JAMES A. WOODBURY and SOLOMON S. GRAY, Boston, Mass.—*Mechanism for Operating the Bed of Planing Machine.*—September 8, 1868.—A wheel with internal spur gear is secured to the shaft that moves the bed of the planer. A toothed wheel is hung eccentrically upon a sleeve, revolving on the shaft to which the internal toothed wheel is secured, and into which it gears.

Claim.—1. In combination with the bed of a planing machine, the rack *c*, pinion *d*, and shaft *g*, or their equivalents, and the internal and external gears *f e*, eccentric sleeve *i i'*, and the fast and loose pulleys, when arranged and operating substantially as specified, and for the purpose set forth.

2. The arrangement, on the shaft *g*, of the fast and loose pulleys, the eccentric sleeve *i i'*, and the internal and external gears *e e'*, substantially in the manner shown and for the purpose set forth.

81,954.—M. M. SMITH, Nashville, Tenn.—*Ladder or Step for Street Lamp-lighter.*—September 8, 1868.—A shank is provided with horns for clasping the tapering part of a lamp post; one step is affixed

to extensions on the h_orus, the other to the horizontal part of the shank.

Claim.—A step ladder for lamp posts, constructed substantially as and for the purpose shown and described.

81,955.—H. A. SNYDER, Shullsburg, Wis.—*Fanning Mill.*—September 8, 1868.—A hinged board forming part of the cylinder is connected with gates for admitting air into the box. A spring presses down the board, and when the current of air is too violent, the board raises and closes the gates, and *vice versa*.

Claim.—The hinged board B, actuated by spring-tension acting against the blast of a fanning mill, and connected with gates or valves H, closing the ingress aperture I of the fan-wheel box A, all substantially as shown and described, for the purpose set forth.

81,956.—MICHAEL JOSEPH STEIN, New York, N. Y.—*Machine for Sewing the Uppers to the Soles of Boots and Shoes.*—September 8, 1868.

Claim.—1. In combination with the needle and the self-adapting rest, which is to rest and ride on the sole of the shoe or boot that is being sewed, and which is to bear against the bottom of the inner channel cut in the leather, to resist the pull of the needle, a second rest, so formed that it shall rest and ride on the surface of the sole, that in sewing it may not interfere with the loop of thread, the two being connected, and having a mode of operation in connection with the needle, substantially as herein described.

2. The curved needle, when made and mounted so that its inner curved surface is concentric with its axis of vibration, and eccentric on its outer surface, substantially as and for the purpose specified.

3. The pointed cast off, with its outer surface eccentric, in combination with the needle, the contiguous surfaces of the two being flat, and both being mounted, so that they shall work in contact, substantially as and for the purpose set forth.

4. Attaching the lamp and its cap, and the flue through which the thread passes, to the movable plate which carries the sewing mechanism, substantially as described, that the means for heating and guiding the thread may be always in the same relative positions, as set forth.

5. The feeding pawl, with its projections, working in cam-formed recesses, or the equivalent thereof, having a like mode of operation, in combination with the movable table on which the last holder moves, or the equivalent thereof, by means of which combination the feeding pawl spaces the stitches equally, notwithstanding it acts on the undulating surface of the sole, as described.

6. The welt guide, substantially such as described, in combination with the mechanism, or the equivalent thereof, for guiding the sole on the last relatively to the sewing mechanism, as described.

81,957.—WILLIAM STODDARD, Winona, Minn.—*Fanning Mill.*—September 8, 1868.—An oscillating feeding bar is placed beneath the mouth of a hopper and feeds the grain into a curved perforated screen. An endless belt revolves in close contact with the screen to keep the grain flat. After falling through the screen the grain is carried into rotary screens.

Claim.—1. The combination, with the hopper of a fanning mill, of the oscillating feeding bar A, substantially as and for the purpose described.

2. The combination, with the screen C, of the endless apron or belt D, substantially as and for the purpose described.

3. The rotary screens L and M, arranged as described, in combination with chute G, screen C, and fan blower, substantially as and for the purpose described.

81,958.—ELI STURGEON, Columbiana, Ohio.—*Safety Bridge for Railroad Car.*—September 8, 1868.—Springs are attached to a cross piece of wood under the center of the bridge, their ends forming hooks which are attached to four upright studs secured to the platform of the car.

Claim.—The adjustable bridge A, with spiral springs *b b*, attached to the bumpers or platforms of railroad cars, C, by means of hooks *d d* on the four

uprights *c c c c*, in the manner and for the uses and purposes set forth and herein more fully described.

81,959.—HOWARD M. THOMPSON and CHARLES W. BURBANK, Alfred, Maine, assignors to themselves and GEORGE H. KNOWLTON, same place.—*Tailor's Press Board.*—September 8, 1868.—The press board rests on the top of a standard, its end extending under a flat arm pivoted to the edge of the standard and held by a screw bolt fastened to the clamp jaw. The base board to which the standard is secured is hinged to a clamp jaw fastened to the under side of the table.

Claim.—1. The press-board supporter, substantially as described, that is, as composed of the base board D, the standard C, the arm E, and the clamp jaw F, connected in the manner so as to operate as explained.

2. The combination and arrangement of the adjusting screw *c* and nut *f* with the connection rod *c*, the clamp jaw F, the base board D, the standard C, and the arm E, arranged and combined substantially in manner and for the purpose as specified.

3. The combination of the press board B, and mechanism, substantially as described, for supporting it above, and fixing or clamping it to a table, as explained, such mechanism consisting of the base board D, the standard C, the arm E, the clamp jaw F, and the connection rod *c*, or their mechanical equivalents.

81,960.—JAMES K. THOMPSON, Chicago, Ill., assignor to himself and WILLIAM B. HOWARD, same place.—*Bridge.*—September 8, 1868.—Improvement in the wooden chords of the "Howe Truss," consisting of two or more continuous wrought iron bars placed edgewise and spaced to conform to the width of the shoes used in the "Howe Truss."

Claim.—The wrought-iron chords A A', each consisting of several bars placed apart and edgewise, and the plates *b b'* and stays E E, connecting the said bars, when used and arranged substantially as herein described and specified.

81,961.—ANSON C. TICHENOR, Council Bluffs, Iowa.—*Car Coupling.*—September 8, 1868.—The coupling pin is provided with shoulders which engage with the shoulder formed by a recess in the draw head and a shoulder on the pivoted block. The draw head has a ledge on its upper face into which a shoulder on the hinged block is made to slide when the car starts, for the purpose of locking the pivoted block.

Claim.—The combination of a draw head A, constructed substantially as described, and provided with a transverse locking edge *a*, with a hinged block B, constructed with a shoulder *c*, when said block is so connected to the draw head that the forward motion of the cars will automatically lock the shoulder *c* beneath the ledge *a*, in the manner and for the purpose specified.

81,962.—SIGMUND ULLMAN, New York, N. Y.—*Envelope.*—September 8, 1868.

Claim.—Securing the cyclet *d* in the open flap *c* of the end, by gumming a strip of paper over said eyelet, at the outer side of the flap, as herein shown and described.

81,963.—SIGMUND ULLMAN, New York, N. Y.—*Envelope.*—September 8, 1868.—The rear side of the envelope is cut obliquely from the double fold outward, the face end is notched out in V-form; the end is folded over at each side of its center, one side lapping over the other.

Claim.—An envelope, having its ends cut and folded in the manner substantially as herein shown and described.

81,964.—AUGUSTUS VAN ORSDALE, Jasper, N. Y.—*Steam Condenser.*—September 8, 1868.—Horizontal plates are arranged one above the other in the condenser and have an opening at the end of each on alternate sides. A pipe admits the steam between two of the lower plates and a deflector is placed near the end of the pipe to prevent the steam from escaping through the water-discharge pipe.

Claim.—The combination of the exhaust pipe C

and deflector D with the plates *a a*, heater A, and pipes B B', arranged and operating substantially as described.

81,965.—HEMAN WHIPPLE and ELON DENIO, Baldwinsville, N. Y.—*Making Forks.*—September 8, 1868.—An incision is made in a bar of metal to form the prong of a fork without bending down one part much below the other. The prong is bent around into the proper position for shaping, by a plunger and swinging support.

Claim.—1. The cutters *e e*, formed wider apart near the stock than at the cutting edge, in combination with the shear *h*, for the purposes and as set forth.

2. The rocking support *i*, in combination with the cutter *e* and bed shear *h*, for the purposes and substantially as set forth.

3. The swinging supports *l*, in combination with the winding, wedge-shaped, bending plunger *m*, arranged and operating substantially as and for the purposes set forth.

4. The connecting rod *b* and ball *l*, in combination with the screw *3*, head *4*, and hollow plunger *c*, carrying the cutting or bending tools, substantially as set forth.

81,966.—JOHN L. WHITING, Boston, Mass.—*Brush.*—September 8, 1868.—An improvement on his patent of August 4, 1863. A series of cone-shaped points project from the handle into the mass of bristles, the same being surrounded by a tapering ferrule.

Claim.—The combination and arrangement of the series of projections with the other parts of the brush, as described, the series being productive of new and useful effects, as specified.

81,967.—JOHN S. WILLIAMS, Chicago, Ill.—*Double Ratchet Lever Power.*—September 8, 1868.—A double ratchet pawl terminates in a lever pivoted to a plate secured to the machine, the lower end of the lever being connected with a hand lever provided with a balance weight. The ratchet pawl is arranged to operate on both sides of a ratchet pinion which communicates motion to a toothed driving wheel.

Claim.—1. The combination of the double ratchet pawl A D, ratchet pinion F, lever E, connecting rod *l*, lever, Fig. 4, arm *22*, treadle, Fig. 5, and balancing weight, Fig. 6, substantially as set forth.

2. The combination of the ratchet pinion F and gear wheel *g'*, as and for the purpose set forth.

81,968.—ARTHUR GATES WILSON, New York, N. Y.—*Oil Tank.*—September 8, 1868.—The wooden bottom is covered with corrugated material and has a tube inserted near the periphery of the tank covered with wire gauze. The head is detachable.

Claim.—1. The bottom F, strainer H, and tube G, all arranged and combined substantially as described and for the purposes set forth.

2. The detachable head B, when so arranged within the cylinder A as to have its upper surface fall below the walls of said cylinder, to operate in connection with the supplemental cover C, substantially as and for the purposes specified.

81,969.—T. F. ALLYN, Nyack, N. Y.—*Bow Spring for Railway Cars.*—September 8, 1868.

Claim.—1. A bow spring, composed of one or more plates of metal, either square, rhombic, circular, oval, or any equivalent shape, bent to the form of a bow, so as to have two outside bearing surfaces or points opposite to each other, or nearly so, substantially as described.

2. The application of the foregoing described plates, in combination with the bolsters or frames of cars or carriages, substantially as described, and for the purpose set forth.

81,970.—EDGAR JOHN AMOR, New York, N. Y.—*Combined Screw Driver and Wrench.*—September 8, 1868.—The blade is provided with slots for use as a wrench on taps, &c.; also with an oblong slot in the forward end for the insertion of a fork or other screw driver.

Claim.—The blade B, provided with a series of angular-shaped openings, *a*, near its handle end, with an oblong slot, *b*, in combination with a re-

movable or detachable fork screw, driving blade, or other bit, arranged to stand at right angles to the blade B, near its forward end, for operation essentially as described.

81,971.—JAMES ARMSTRONG, Bucyrus, Ohio.—*Feed-Water Heater and Filter.*—September 8, 1868.—The pans have flanges, and the diameter of the upper pan is less than the one next below it. The larger one has an opening in the center, around the edge of which is a flange. The water, after passing over the pans, enters a chamber containing filterers. At the bottom of the chamber containing the pans is a flanged disk, which can be removed for cleaning.

Claim.—1. The pans B B', when constructed and arranged substantially in the manner shown and described.

2. The combination of the steam pipe G, chambers F and F', substantially in the manner shown and described.

3. The chambers F F' and the filters *e* and *f*, when constructed substantially in the manner shown and described.

4. The arrangement of the pans B B' and the disk B'', substantially in the manner described.

81,972.—JAMES ARMSTRONG, Bucyrus, Ohio.—*Steam Generator.*—September 8, 1868.—Vertical tubes are arranged vertically side by side, close together, their upper and lower ends being connected by horizontal pipes. The ends of the tubes are closed by screw caps, which are removed for cleaning. The inner tubes are arranged with spaces between for the heat to circulate. The fire box is made of tubes arranged like the end and sides.

Claim.—1. The arrangement of the outer and inner tubes of the boiler, whereby the heat is caused to circulate around the inner ones, substantially as shown and described.

2. The construction of the fire box with the surrounding tubes, as herein shown and described.

3. The construction of the hollow screws *a*, and the arrangement of them with the tubes B, as herein shown and described.

81,973.—JOSEPH H. C. BACHELDER, Winstead, Conn.—*Rolling Mill.*—September 8, 1868.—The taper of the bar is regulated by sectional hinged slides, operating under the bearings of the nuder roll, and operated by pinions gearing into racks on the under side of the slides. A graduated wedge is inserted between the sections, which, during the operation of the machine, causes the rolls to rise. Attached to the frame, in front of the rolls, is a self-acting tongs, operated by a cam-wheel, connecting with a lever on the lower part of the tongs.

Claim.—1. The slides J J, with their racks O, movable bearings H H, graduated wedges K, guards L, and pinions P P, when arranged, constructed, and operating as described and for the purpose set forth.

2. The tongs V, with their lever Z, spiral spring X, lever W, and cam wheel U, when arranged, constructed, and operating as described and for the purpose set forth.

3. Pin *b* on sliding wedge, in combination with dog *c*, shaft *d*, upright slotted arm *e'*, bell lever *f*, horizontal side *g*, clutch *h*, movable coupling *l*, treadles *m* and *p*, rod *n*, spiral spring *w*, loose sleeve *s*, arm *u*, and shoulder *v*, all arranged and operating as set forth.

81,974.—JOHN A. BASSETT, Salem, Mass.—*Apparatus for the Manufacture of Heating and Illuminating Gas.*—September 8, 1868.—An air pump is used similar in construction to a wet meter. At the inlet of this pump a chamber is placed, containing a series of perforated diaphragms. A reservoir containing hydro-carbon is placed above the pump, at the bottom of which a valve is placed, so connected with the pump shaft that at each revolution of the shaft a quantity of hydro-carbon passes into the carbureter.

Claim.—1. The arrangement of the valve J, in connection with a reservoir of hydro-carbon liquid, for the purpose set forth.

2. The combination of the chamber E with the pump B, the chamber containing a series of forami-

nous diaphragms or fibrous material, for the purpose substantially as described.

81,975.—HENRY BECHTOLD and JOHN NUNAMACHER, Lancaster County, Pa.—*Yellow Wash for Barns, Buildings, &c.*—September 8, 1868.—Composed of coperas, yellow ochre, chrome yellow, alum, glue, and salt, mixed in hot water.

Claim.—The composition of a yellow wash or paint, combined substantially in the manner and for the purpose specified.

81,976.—HORATIO B. BECKMAN, Newburg, N. Y.—*Steam Safety Valve.*—September 8, 1868.—Upright, elliptical springs are placed in grooves on top of the safety valve, their upper ends being kept in place by a disk, grooved on its lower surface. The said disk is made adjustable to regulate the power of the springs.

Claim.—The arrangement of the safety valve A, adjustable elliptical springs $s^1 s^2 s^3$, and plate C, substantially as herein specified.

81,977.—CHARLES BIRKENSHAW, Chicago, Ill.—*Sewer Pipe.*—September 8, 1868.—The end of the pipe connecting with the main sewer is provided with a valve, hinged at the top and opening toward the main sewer, so as to prevent currents of gas from passing back.

Claim.—The combination of the chamber B, pipes B B', and valve C, arranged substantially as and for the purpose set forth.

81,978.—GEORGE BLAKE, Whitby, Canada, assignor to himself and THOMAS CONNAR, same place.—*Harvester Rake.*—September 8, 1868.—The inner end of the rake works in bearings in a bracket attached to a shaft working in a hollow pedestal. A toothed segment engages with a pinion attached to said shaft and revolves the rake. A finger is secured to the end of the rake shaft, and by striking a plate on the pedestal raises or lowers the rake teeth.

Claim.—1. The case G and hollow pedestal F, for containing and supporting the gearing that operates the rake, substantially as herein shown and described.

2. The combination of the connecting rod J, internally-toothed segment I, gear wheel H, shaft E, bracket D, and rake head C, with each other, and with the hollow pedestal F, and case G, substantially as herein shown and described, and for the purpose of operating the rake B C.

3. The spring L, attached at one end to the bracket D, and at the other end to the rake head C, by the pin M passing through a slot in the journal of the rake head, in combination with the finger N and fixed plane O, all arranged and operating as described, for the purpose specified.

4. The combination of the finger N, stop-pin P, and plane O, with the rake head C and hollow pedestal F, whether said plane be stationary or adjustable, substantially as herein shown and described, and for the purpose set forth.

81,979.—M. S. BRINGIER, Ascension Parish, La.—*Mode of Purifying Water.*—September 8, 1868.—A wall of felt is secured to the inner surface of the perforated sides of a drum. The felt takes up the impurities as the water is forced through by the centrifugal force caused by the revolution of the drum.

Claim.—The process of filtering water, by passing it through a vessel, constructed and operating substantially as described, whereby it is subjected to the action of centrifugal force, and a more rapid filtration is effected as set forth.

81,980.—ALBERT BURHAUS, Albany, N. Y., assignor to himself and HENRY H. BURHAUS, same place.—*Potato Digger.*—September 8, 1868.—A double share with a shoe is attached to a beam similar to that of a plow. An inclined scoop runs from the back of the share and is slotted, each slot having rollers provided with projections for breaking the soil. A vibratory sieve is placed back of the scoop, and is operated by a rod and crank connected with a toothed wheel on the axle. Two boxes supported on sled runners receive the potatoes from the sieve.

Claim.—1. The scoop E, furnished with the lateral

slots $e e e$, in combination with the rollers $r r$, or their equivalents, as and for the purpose set forth and described.

2. The double share B, in combination with the land shoe C and the scoop E, as and for the purpose set forth and described.

3. The sieve J, operated by the rod o , shaker piece s , rod d , crank e , pinion p , and gear x , and all in combination with the wheels N N', and frame G and axle F, as and for the purpose set forth, and described.

4. The sled runners L L and boxes K K', in combination with the sieve J and its carriage, as and for the purpose set forth and described.

81,981.—R. K. CHANDLER, Ruther Glen, Va.—*Stocking Stretcher.*—September 8, 1868.

Claim.—1. Constructing a stocking stretcher, with the hinged sections A B, and the catching device D arranged at the upper side of the sections, in such a manner that the stretcher is expansible after the stocking has been drawn upon it, substantially as described.

2. Providing for lengthening or shortening the foot portion of a stocking stretcher, by means of a longitudinally-adjustable toe section, C, substantially as described.

3. Forming notches or serrations, C, upon the edges of a stocking stretcher, substantially in the manner and for the purposes described.

81,982.—LEWIS CHARLES, Clear Springs, Md.—*Farm Gate.*—September 8, 1868.—The gate slides longitudinally on a supporting bar made in two pieces, one being secured to a panel and the other pivoted near its center. They are made beveling where they join; a spring keeps the pivoted bar in place.

Claim.—1. The combination of the sliding gate A with the pivoted supporting bar $d d'$, substantially as described.

2. The combination of the spring stop s , bar $d d'$, panel B, and gate A, substantially as described.

81,983.—JONATHAN M. CLARK, New York, N. Y.—*Steam Generator.*—September 8, 1868.—Tubes are combined with enlarged hollow heads covered externally with cap plates and communicating directly one with the other by orifices in their sides and edges. Said heads are square and have a rubber packing between them and are drawn together by nuts on bolts fastened to one of two adjacent heads.

Claim.—The angular hollow head B, constructed with passages e for the circulation of water or steam, secured together by pin projections g and nuts f , and with removable covers a , combined with the tubes A, substantially as shown and described for the purpose set forth.

81,984.—C. H. CLEVELAND, Selma, Ala.—*Suspender.*—September 8, 1868.—The shoulder straps have a series of eyelets through which a corset lace is inserted for increasing the bracing property of the straps.

Claim.—The suspender or shoulder brace, composed of two single straps, B B, each passing from its attaching strap at the one side over the shoulder to the attaching strap on the reverse side of the body, when shoulder straps are provided with eyelets $d d$ and a bracing cord, D, substantially as described and for the purpose specified.

81,985.—JAMES M. COOK, Washington, D. C.—*Car Coupling.*—September 8, 1868.—A spring forces the end of the lever against a shoulder on the lower side of a pivoted link and keeps the link elevated until the draw heads coming in contact, the lever is released and the link drops.

Claim.—The coupling link B, provided with a shoulder, b' , the lever C, spring D, and rod F, when the whole are arranged and combined substantially as described, as and for the purposes specified.

81,986.—JOHN H. CRANE, Charlestown, Mass.—*Flexible Abrader and Polishing Fabric.*—September 8, 1868.—A central web of flexible material is covered on both sides with the abrading material.

Claim.—As a new article of manufacture, the

double-surfaced flexible abrader, substantially as shown and described.

81,987.—WILLIAM D. CUTLER, Philadelphia, Pa.—*Method of Preparing, Desiccating, and Preserving Fish.*—September 8, 1868.—The skin and bones are removed from the fish; it is then put in a grating machine so as to disintegrate the fiber; it is then desiccated by spreading on stone slabs subjected to heat.

Claim.—1. The boned and desiccated fish, as a new manufacture and commercial article.

2. The herein-described process or method of treatment of fish, substantially as set forth and for the purposes specified.

81,988.—JOHN DILLINGHAM, Turner, Me.—*Door and Safe Lock.*—September 8, 1868.

Claim.—1. The peculiar constructed key, having projections or bits *a b c*, substantially as and for the purpose set forth and described.

2. The arrangement of the main bolt, in combination with the plunger *m* and levers *g g*, substantially as described and for the purposes set forth.

3. The form and arrangement of the plunger, in combination with the levers *g g*, acting on the pawls *f f*, substantially as described.

4. The arrangement of the sliding plates, which effectually close the several key-holes, as and for the purposes substantially as described.

81,989.—THOMAS DUTTON, Port Jervis, N. Y., assignor to himself and THOMAS MAGUIRE, same place.—*Low-water Detector for Boiler.*—September 8, 1868.—The plug is made of brass and the holes are threaded and countersunk to retain the fusible alloy; it is bell-mouthed, and the interior forms a fire chamber above the crown sheet, the top being so far above it as to melt before the sheet is uncovered by water.

Claim.—The construction of the plug *a*, substantially as herein set forth.

81,990.—NATHANIEL EDWARDS, Newark, Ohio.—*Combined Latch and Lock.*—September 8, 1868.

Claim.—1. The manner of connecting and disconnecting the two knobs, in connection with any opening face plates of locks, by making an indenture, *G'*, in connection with either one of the knobs, and a corresponding projection, *G*, in the other, substantially as above described.

2. The plate or tumbler bearer *E*, in Fig. 5, being a slotted plate, with a projection, *P*, turned out at one end to hold the tumblers in position, so that the bolt may work as latch, and with another projection *y*, or indenture in such a position as to enter a corresponding indenture *y'*, or projection in the spindle of the knobs, so as to engage with the same when the tumblers are dropped, when constructed substantially as herein shown and described.

3. The lever *D*, Fig. 7, which has a lifter, *p*, for the joint purpose of raising the tumblers and bracing back the bolt, and in combination with the locking projection *a*, and the stud *A*, and the projection *R*, or its equivalent, on the bolt, for the purpose above specified, when made and arranged substantially as above shown and described.

4. The manner of converting the lock from a latch into a night bolt, by raising the tumblers too high to be operated upon by the key, and bracing the bolt in the same operation, by elevating the lifter *p* of the lever *D*, by the assistance of *x'*, with its connections, and then locking the same in its elevated position, by causing the stud *A* to engage with the projection *a* by pulling out the tumbler bearer, as above specified.

81,991.—JERESIAH D. EGGLESTON, Canaan, Conn.—*Means for Securing Springs for Beds and Seats.*—September 8, 1868.—Holes with screw threads are made in the slats, into which the conical end of the spiral spring is made to screw.

Claim.—The screw nut *A*, combined with the spring *B*, substantially as and for the purpose set forth.

81,992.—C. E. FOX and MARY E. FOX, Gilroy, Cal.—*Dye Stuff.*—September 8, 1868.—The roots of

an evergreen shrub "mancineta" are crushed and pulverized, then boiled to extract the coloring matter.

Claim.—The extract or coloring matter of mancincta, as a new article of manufacture, for its various uses as herein specified.

81,993.—KASSON FRAZER, Syracuse, N. Y.—*Wedge Buckle for Harness.*—September 8, 1868.

Claim.—1. The wedge *W*, when made with the transverse slot *i*, hole *m*, and stop *r*; the tongue *T*, made with the journal *o*, shank *p*, and guard *q*, each substantially in the form and for the purposes described.

2. The same parts, in combination with each other, when connected by a joint, and forming a wedge and tongue, substantially in the manner and for the purposes described.

3. The wedge *W* and tongue *T*, when made as aforesaid, in combination with the buckle frame *A*, having an angular box *x*, as described, all operating in the manner and for the purposes substantially as above set forth.

81,994.—JOHN GARDINER, Philadelphia, Pa.—*Malt Mill.*—September 8, 1868.—The rollers work between vertical cast-iron plates faced with steel which are bolted to the bed plate that supports the rollers.

Claim.—The construction of the cheeks *D D* with steel plates *E E*, and the arrangements of the said cheeks with the mashing rollers *B C*, substantially in the manner hereinbefore described, and for the purpose set forth.

81,995.—CHRISTIAN GOOD, Arcanum, Ohio.—*Smoke House.*—September 8, 1868.—A flat roof covers the house and is provided with a trap door for ventilation. This roof is covered by a slanting roof provided with a stationary cap, two sides of which are open and covered with wire netting.

Claim.—A stationary smoke-house, when constructed as described, and provided with a fire pot *H*, trap door *C*, in the roof, and with openings in its sides, said openings being covered with wire netting, and closed by means of shutters *F F*, substantially as and for the purposes herein set forth.

81,996.—CHARLES T. GRIMES, Garrard County, Ky.—*Plow.*—September 8, 1868.—Two distinct plows are connected together by means of adjustable cross-pieces, so that they may be brought together or placed further apart as required.

Claim.—1. The modes of making handles *H* and *K*, and so arranging them on beams *G* and *J* that they may be used as handles for two turning plows and as helms for two shovel plows, when the turning plows and helms *V* and *S* and rods *T* and *W* are removed.

2. The mode of combining the handles *H* and *K*, and beams *G* and *J*, by means of cross-bars *A a* and *B b*, and rods *C c* and *D d*, and rods *E e* and *Z z*, so that the two plows are used by one person.

81,997.—J. P. GROSVENOR, Lowell, Mass.—*Molding Machine.*—September 8, 1868.—The mandrel has bearings in a vertically sliding frame, moving in guides. A screw shaft has fixed bearings in the guide frame and screws through a lug on the sliding frame; this screw shaft is suitably geared and connected with a hand wheel placed at the side of the machine. By turning this hand wheel the cutter head is raised or lowered to suit the operator.

Claim.—The described arrangement of the hand wheel *J*, at the side of the machine, under the edge of the table *A*, the beveled gearing *h' i*, shaft *H*, pinion wheels *h G*, screw *F*, vertically-sliding mandrel frame *D*, and guides *E*, as herein set forth, for the purpose specified.

81,998.—WILLIAM H. HALL and JOHN R. CLIFFORD, Boston, Mass.—*Anti-Interfering Band.*—September 8, 1868.—The band is of rubber and is lined with kersey or felt vulcanized in one process in a mold by combining the two together.

Claim.—As an article of manufacture, an interfering rubber guard, when constructed as described, and attached to kersey, as herein shown, and for the purposes set forth.

81,999.—WILLIAM H. HALL and JOHN R. CLIFFORD, Boston, Mass.—*Anti-Interfering Band.*—September 8, 1868.—The band is of rubber and is lined with kersey or felt vulcanized in one process in a mold by combining the two together.

Claim.—As an article of manufacture, an interfering rubber guard, when constructed as described, and attached to kersey, as herein shown, and for the purposes set forth.

S1,999.—GEORGE H. HAWKINS, New York, N. Y.—*Construction of Dolls' Heads.*—September 8, 1868.

Claim.—A toy figure head, when composed of a textile fabric, which is previously stiffened with a glutinous material, then pressed in parts between heated dies, and afterward having the edges or seams of such parts joined by means of heated dies, in the manner substantially as herein described.

S2,000.—WILLIAM H. H. HINDS, Groton, Mass.—*Candlestick.*—September 8, 1868.—A cap, perforated for the flame to pass through, is attached to a slide working on the lower part of the candlestick. The candle rests on a cap supported by a spring which can be stiffened by raising the thumb piece on which the spring rests, and which fits in slots in the lower part of the candlestick. The snuffers are operated by mechanism placed on top of the slide.

Claim.—1. The cap *a*, with its support or supports *n*, for the purposes set forth, and substantially as herein described, and as shown in Figs. 1, 2, and 3.

2. The receptacle *g*, and the slide or sleeve *h*, with the catch *p*, for the purposes set forth, and substantially as herein described and shown in Figs. 1 and 3.

3. The snuffers *f f*, supported and operated by means of the cylinder *c* and the collar *d*, substantially as herein described, and as shown in Figs. 1 and 4.

4. The slit *o* and the notches 1 2 3 4 5, together with the thumb piece *z*, for the purpose set forth, substantially as herein described and shown in Figs. 6 and 9.

S2,001.—S. L. HOCKERT, Milwaukee, Wis., assignor to G. W. PERRINE, same place.—*Abdominal Supporter.*—September 8, 1868.—A metal stud is secured to each end of the abdominal pad, and has a hook in the center to receive the end of the spring wires.

Claim.—1. Connecting the side springs to the front pad by hooks, in the manner shown.

2. The side or hip pads *D*, attached loosely to the cylindrical side springs *B B* by staples *F*, so that said pads may be perfectly free to move in any direction to adapt themselves to the surface of the body.

3. Securing the cylindrical side springs to the back pads by screwing the ends of said springs into the button studs, in the manner shown.

S2,002.—WILLIAM HOLMES, Clarksville, N. Y.—*Horse Hay Rake.*—September 8, 1868.

Claim.—1. The locking bolt *M*, moving in a guide way on the axle, and operated by means of the lever to hold the teeth down, substantially as set forth.

2. The combination, substantially as set forth, of the lever operated by the foot of the driver, and the devices for depressing and elevating the rake teeth.

S2,003.—GEORGE HOLTON, Chicago, Ill.—*Smoke Stack.*—September 8, 1868.—The lower end of a wire netting, made in the form of an inverted frustum of a cone, rests on a funnel-shaped deflector for guiding sparks outwardly, its top being attached to the outside casing.

Claim.—The inverted conical netting *D*, attached to the top of the double conical case *B*, arranged with reference to the pipe *A* and deflector *C*, the latter being held in position over the pipe *A* by rods *E*, and having a flange, *G*, at its top, for supporting the lower end of said netting, substantially as and for the purpose specified.

S2,004.—JAMES M. JOHNSON and JOHN HERIG, Cleveland, Ohio.—*Mortising Machine.*—September 8, 1868.—The chisel holders are provided with projections that fit in a slot in the cross-head, and also with tongues fitting into grooves on the lower side of the cross-head. They are held in place by a bolt passing through the chisel holders and the slot in the cross-head, which is secured by a thumb screw.

Claim.—The chisel holders *F F*, constructed as described, in combination with the cross-head *E*, to operate as and for the purpose set forth.

S2,005.—ERNEST KAUFMANN and ANTONY WEBER, Philadelphia, Pa., assignors to ERNEST KAUFMANN.—*Butter Cooler.*—September 8, 1868.—

The drip chamber is made removable and sets on a ring attached half-way round to the lower part of the cooler. Slip collars are used for holding the journals or pivots of the cover in place.

Claim.—1. The construction of the part *A* with the ring *C*, and combining the chamber *D* therewith, substantially in the manner and for the purpose above described.

2. The combination of the slip collars *E*, journals *a a*, and bearings *b b*, with the part *A*, and cover *B*, and spring *C*, substantially as described and for the purpose set forth.

S2,006.—H. A. KING, Nevada, Ohio.—*Bee Hive.*—September 8, 1868.—Through the top of the lower honey boxes are slots, at right angles with which latter are placed the guide combs. Slots are formed in the upper of the top bars, between which latter are nailed the comb guides.

Claim.—1. The slots *z*, in connection with a double tier of honey boxes with comb foundations, as specified, and for the purposes set forth.

2. Constructing the close fitting top bars *O*, with comb guides *U*, and slots, as specified, and for the purposes set forth.

S2,007.—ABRAHAM KIPP, Jr., Sing Sing, N. Y.—*Rotary Steam Engine.*—September 8, 1868.—A

stationary disk valve occupies a concentric position to, and bears freely against, the inner face of the drum. A steam opening of segmental form is made through the disk while an exhaust cavity is formed in it on the opposite side of two segmental blocks. Across the face of the drum are radial passages terminating at their outer ends in parts which communicate with the cylinders at the backs of the pistons and at their inner ends in parts covered by the disk valve.

Claim.—1. The combination of double cylinders *C C* and *D D*, open at their inner ends to a steam chamber or space, pistons *E E* and *F F*, with their rods and yoke *G* and *H*, crank *I*, and valve controlling the flow of steam to and from the backs of the pistons, essentially as herein set forth.

2. The combination of the double cylinders *C C* and *D D*, arranged, either pair at right angles, or thereabouts, to each other, and with their inner ends open, as described, and in communication with a central or intermediate steam chamber or space, pistons *E E* and *F F*, with their rods *b b*, *c c*, and yokes *G H*, crank *I*, and valve controlling the admission and escape of steam to and from the backs of the pistons, substantially as specified.

3. The valve *K*, when constructed and arranged for operation, in combination with the double cylinders, their pistons and crank, substantially as shown and described.

S2,008.—THOMAS B. KIRBY, Flowerfield, Mich.—*Animal Trap.*—September 8, 1868.—The trap is provided at one end with a bait box partitioned off with wire netting. The bottom of the trap is pivoted so that the animal will drop into water placed below.

Claim.—The combination and arrangement in the rectangular frame *A*, divided by the partitions *C* and *E*, of the valve *H*, with the perforated bait box *K*, having a hinged cover, *F*, substantially as and for the purposes herein set forth.

S2,009.—EDMUND W. KITTREDGE, Cincinnati, Ohio.—*Paving Roller.*—September 8, 1868.—One or more cressets or fire baskets are suspended within the roller in such a way as to preserve their proper position during the rotation of the roller.

Claim.—1. The suspension of one or more cressets to the axle, within the revolving cylinder, substantially as and for the purpose set forth.

2. The closing with covers the ends of a revolving roller, within which are suspended one or more cressets for holding fire, substantially as and for the purpose set forth.

3. The arrangement of cylinder *A*, revolving on a fixed axle, *D*, from which are suspended one or more cressets *J*, and to which are secured the perforated heads *F F'*, as and for the purpose set forth.

4. In combination with the elements *A*, *D*, *J*, *F*, *F'*, one or more doors *H*, for the purpose explained.

82,010.—PETER LAUSTER, Allegheny, Pa., assignor to LANG & LAUSTER, same place.—*Jug Top.*—September 8, 1868.

Claim.—1. The hinge, knob, and lid, made separate and distinct from each other, and united together by making perforations in the hinge and lid, as described, and casting the knob, to unite with them by metal used in producing the knob entering said perforations, to form a rivet, and whereby solder, to establish the junction of said parts, is avoided, and, after riveting of the knob, dispensed with.

2. The combination, with the lid, hinged to rotate from the inside of the body, of the plate or filling *b*, connected with the lower part of the interior flange *a* of the body, substantially as and for the purpose herein set forth.

82,011.—ELIJAH LINDSLEY, Neenah, Wis.—*Fanning Mill.*—September 8, 1868.—The sieves are bent at an angle near the center and elevated at their rear ends. A short screen is placed under the sieves and is provided with a spout for carrying the grain.

Claim.—1. The sieves *b* and *c*, when bent as described, and operating as and for the purposes herein set forth.

2. The screen *d*, in combination with the sieves *b* and *c*, when constructed and operating as and for the purposes herein set forth.

82,012.—JOHN M. LOSIE, Indianapolis, Ind.—*Spring Bed Bottom.*—September 8, 1868.—A piece of rubber is secured between the corrugated ends of two slats which are slotted and fastened to the spring bed bottom.

Claim.—The slotted metallic plates *E F*, constructed as described, in combination with the elastic gum *H*, as and for the purpose specified.

82,013.—HENRY D. LYMAN, Kalamazoo, Mich.—*Horseshoe.*—September 8, 1868.—Pivoted to the heels of a shoe are clips, the outsides of which will come in contact with the inside of the rim of the foot and adjust themselves to the angle of the hoof for the purpose of spreading it.

Claim.—The attachment of adjustable clips *B* to the heel of a horseshoe, when operating with a pivot, substantially as set forth and shown.

82,014.—AUSTIN Z. MASON and RICHARD B. ROBBINS, Adrian, Mich., assignors to RICHARD B. ROBBINS.—*Vise.*—September 8, 1868.—Improvement on patent of A. Z. Mason, April 28, 1868. The ring has a short hub to keep it in place on the plate, its center being concave to admit the opposite sides of a spherical bulge, said bulge being provided with ribs which fit into recesses in the ring for allowing a swivel movement. The ring is provided with stops so that it can be turned around a part of the circumference. When used for parallel work a semi-annular ring is placed over and against the stops.

Claim.—1. In combination with the ring *C*, constructed with the oblique faces *x* and *y*, the recesses *m'* and *n*, and one or more projecting stops *c* and *e*, to prevent it from turning more than one-fourth of a circumference, the whole constructed in the manner substantially as set forth and described.

2. The spherical bilge *D*, with one or more ribs *m* and *n*, or their equivalents, in combination with the ring *C*, constructed substantially as set forth and described.

3. The semi-annular ring *K*, in combination with the ring *C* and washer plate *B*, substantially as described.

82,015.—MORRIS MATTSON, New York, N. Y.—*Breast Pump.*—September 8, 1868.—The vacuum glass is made trumpet-shaped at the end, and is provided with a bulb for the reception of the milk. A bulbous exhauster is used, as in his patent of August 13, 1867, and provided with elastic floating valves similar to those described in patent of April 4, 1854.

Claim.—The combination, with a vacuum glass, constructed substantially as described, of an exhausting mechanism or instrument, having a double valvular apparatus operating substantially as and for the purposes set forth.

82,016.—WILLIAM MCFARLAND and WILLIAM H. BUTLER, Williamsburg, N. Y.—*Fire-proof Safe.*—September 8, 1868.

Claim.—1. The insulation of each section or recess of the door, in combination with the air spaces, as and for the purposes herein set forth.

2. The method of forming spaces in the filling of the safe, by inserting patterns of wood, to be with drawn after the filling substance has set, and supplying said spaces with a vaporizing substance, substantially in the manner as and for the purposes herein described.

3. The manner of securing the separate sections of doors by placing supporting blocks, made of material which is a non or inferior conductor of heat between them, so that there is no continuation of metal or good heat-conducting substance from the outside covering to the inside repository, as herein set forth.

82,017.—WILLIAM S. MCNEIL, Springfield, Mass.—*Hammer and Mallet.*—September 8, 1868.—A hammer and mallet are so combined that the mallet can be removed when not used. The pene is placed on the hammer head instead of the opposite end.

Claim.—1. A hammer and mallet combined, in which the mallet *B* fits in a socket, *a*, constructed in the piece *A*, having the head *C* with pene *c*, the parts being combined and arranged substantially as herein shown.

2. The arrangement of the pene *c* upon the head, *C*, of the hammer, substantially as shown.

82,018.—HENRY F. METZLER, New York, N. Y., assignor to LOUISA METZLER, same place.—*Swing.*—September 8, 1868.—Seats are placed on a platform resting on cross bars, the latter being pivoted to the suspended bars and extending beyond them, having foot boards placed across their ends, so that the occupant can operate the swing by moving the suspended bars.

Claim.—1. The four suspended vibrating rods or bars, in combination with the pivoted cross bars, for supporting a seat or seats, substantially as and for the purpose described.

2. The four suspended vibrating rods or bars, in combination with the pivoted cross-bars supporting a seat or seats, and the lower pivoted cross-bars and treadle or treadles, substantially as described.

82,019.—HENRY MEYER, Richmond, Ind.—*Stove-pipe Drum.*—September 8, 1868.—An arrangement of flanges within the chamber of the drum, in combination with the damper, divert the ascending currents, and by causing them to be delayed produce a greater radiation.

Claim.—The parabolical flues and damper, constructed and arranged in relation to each other and to the casing of the drum, substantially as set forth.

82,020.—PHILIP MEYERCORDT, Chicago, Ill., assignor to himself and HENRY WINTER.—*Sewer Pipe.*—September 8, 1868.—Charcoal and sawdust are mixed with clay and sand for the purpose of making the pipes porous. After being burned they are coated with sulphuric acid diluted with water.

Claim.—The ingredients herein named, when manufactured into pipes, substantially as herein set forth.

82,021.—REUBEN C. MIGHELL, Plano, Ill.—*Gate.*—September 8, 1868.—The lower end of the gate is pivoted and a weighted lever is hinged to its upper end to assist in opening it.

Claim.—1. The lever *C*, constructed and operating substantially as described.

2. The spring *V*, in combination with the fulcrum *H*, for the purposes specified.

3. The combination of the gate *A*, lever *C*, hinge *D*, weight *E*, roller *G*, and pivot *F*, all constructed and operating substantially as described.

82,022.—WILLARD F. OLIVER, Lynn, assignor to BOSTON SHOE-STUD AND BUTTON COMPANY, Boston, Mass.—*Shoe Lacing.*—September 8, 1868.

Claim.—1. A shoe, provided with a series of hooks, or their equivalents, for receiving and hold-

ing the string, when arranged substantially as set forth.

2. The catch or clamp *a*, with its arms *c* pivoted to the hook *D*, and arranged for holding the string, substantially as described.

82,023.—CLARK D. PAGE, Rochester, N. Y.—*Lime Kiln*.—September 8, 1868.—Flues are placed next to the inner edge of the wood binders for the passage of air.

Claim.—1. The combination and arrangement, with the grate bars *g g*, of the cross bars *k i*, the first being fixed, and forming a fulcrum for the leverage of the grate bars in shaking, and the latter being hinged, so as to turn up and down to secure the grates, or allow them to be shaken, as herein set forth.

2. The flues *b*, constructed as described, next to the inner edge of the wooden binders *a* of the kiln, to operate in the manner and for the purpose substantially as described.

82,024.—CHARLES T. PALMER, Norwich, Conn.—*Spice Box*.—September 8, 1868.—Improvement on his patent of June 23, 1868.

Claim.—In the spice box or can, as made with a series of holes in its cover or end, or as having a disk or cap to cover such holes, the constructing both the cover or end or head of the box and the disk, with an annular groove in the one, and a corresponding annular bead to project from the other, and to fit to or into such groove, in manner substantially as described.

82,025.—STEWART B. PALMER, Syracuse, N. Y.—*Low Water Alarm for Steam Generator*.—September 8, 1868.—The lower ends of metal tubes are connected with a chamber receiving steam from the generator, their upper ends being closed, and pivoted thereto are two arms, the other end being pivoted to a rod connected with a steam whistle.

Claim.—1. The combination of the chamber *B*, tubes *C C*, with their surmounting chambers *D D*, rods *E E*, links *a a*, and rod *H*, arranged and operating substantially as shown and described.

2. The arrangement of the rod *H*, lever *I*, and spring *b*, with reference to the whistle *J* and its valve.

82,026.—CHARLES W. PATTON, Exeter, Ill.—*Wheat Drill*.—September 8, 1868.—The seed hopper is divided by a partition having a door at the top. The discharge is regulated by two concavo-convex plates placed in the bottom of the hopper and provided with apertures; the upper plate is stationary, the lower one having a longitudinal movement, and actuated by a lever attached to a shaft having arms which engage with projections on the plate. A projection on the slide comes in contact with a key provided with notches for graduating the openings.

Claim.—1. The hopper, divided into compartments by the partition *D* and door *D'*, substantially as and for the purpose set forth.

2. In combination with the perforated plates *E* and *F*, the graduated key *G*, for regulating the amount of grain to be sown, substantially as set forth.

3. The combination of the lever *H*, shaft *H¹*, arms *H²*, and the sliding plate *E* with projection *E²*, substantially as and for the purpose set forth.

4. The combination of the sliding plate *E*, key *G*, stop *E¹*, and springs *I*, arranged to operate substantially as described.

5. In combination with the cutters *O*, and drag bars *K*, the springs on the rods *M*, segments *N¹*, shaft *N*, and lever *N²*, and cord *N³*, for raising the cutters and forcing them into the ground substantially as set forth.

6. The combination of the frame, the drag-bars, the rear frame, and vertical guide-rods *L*, arranged substantially as set forth.

82,027.—JOSEPH B. PEDRICK, Lowell Mills, Ind., assignor to himself and JOSEPH F. GENT, same place.—*Reciprocating Steam Engine*.—September 8, 1868.—The steam chest consists of a lower and upper chamber, the partition between being provided with a port at its center. A valve with an inclined open-

ing, having the widest part against the partition and the narrowest part resting over and equal to the parts in the valve seat, regulates the admission of steam to the cylinder.

Claim.—The arrangement of the valve *K*, valve boxes *G M*, and the pipes *B A* and *C D*, substantially as shown and described.

82,028.—GEORGE GILMAN PERCIVAL, Philadelphia, Pa.—*Apothecaries' Labels*.—September 8, 1868.—Ordinary bottles are converted into graduated ones by means of printed graduated labels pasted on them.

Claim.—The combination of a graduated scale with an otherwise ordinary paper label, substantially as above described.

82,029.—WILLIAM B. PERRIE, Horse Head, Md.—*Martingale*.—September 8, 1868.—Designed for fastening the horse without the necessity of unbuckling the rein.

Claim.—1. The loose ring *G*, in connection with the part *D*, provided with the stud *C*, as shown in Figs. 1, 2, 3, 4, and 5, substantially as and for the purpose set forth.

2. A solid ring martingale, *D*, with the stud *C*, projecting from its periphery in the direction of its center, substantially as and for the purpose set forth.

82,030.—OLIVER E. PILLARD, New Britain, Conn., assignor to FREDERIC H. NORTH, same place.—*Adjustable Tumbler for Permutation Lock*.—September 8, 1868.—Improvement on patent No. 71,640. Relates to that class of locks in which a series of circular tumblers is mounted on a stud, each tumbler being provided with an inner disk and stud for communicating motion to each other in setting them by the dial.

Claim.—The circular tumbler, formed of the plates 1 and 2 and flanges 3 and 4, and divided as at 6, in combination with the link plate *e*, and eccentric *i*, constructed and applied in the manner and for the purposes set forth.

82,031.—NEILS POULSON, Washington, D. C.—*Window Shutter*.—September 8, 1868.—Plates of corrugated metal are attached to jointed frames which consist of bars hinged together in pairs, so that when lowered, a corrugated surface will be presented, and when raised the plates will fit in a smaller space.

Claim.—1. The combination of the folding bars *A A²*, and corrugated plates *B*, when said plates are attached rigidly to the inner bars *A*, as herein described, for the purposes specified.

2. The sliding plates *M*, in the described combination, with the folding shutter *A A² B*, to mask or protect the vertical edges of the said shutter, substantially as explained.

3. The arrangement of the tenons *b' b'*, of the plates *B*, alternately on opposite edges of the bars *A*, substantially as and for the purposes set forth.

82,032.—NEILS POULSON, Washington, D. C.—*Awning*.—September 8, 1868.—Constructed of plates of metal or other material, attached to hinged bars, so as to fold compactly together when not in use, and when in use, present a continuous surface.

Claim.—1. The folding bars *D D'*, working upon inclined supports, *A*, and carrying plates or sheets *E*, attached to the inner bars *D*, substantially as and for the purposes specified.

2. The tubes *B*, employed in combination with the awning *D E* and trough *C*, both as a means of support and for conducting water, as explained.

82,033.—EDMUND W. QUINCY, Lacon, Ill., assignor to himself and WILLIAM H. COPP, same place.—*Wrench*.—September 8, 1868.—The jaws, provided with right and left hand screws, slide over a bar for the purpose of a double leverage, and allowing the handle to slide out of the way of an obstacle in its rotation.

Claim.—A sliding handle, as a constituent element of a hand wrench, substantially as described.

82,034.—WILLIAM L. RECK, Darke County, Ohio.—*Tile Machine*.—September 8, 1868.—The feed

ing box is provided with an air aperture closed by a gate operated by a pivoted rocking frame, which latter is actuated by the snap-bar of the pug-mill, so as to allow the escape of air from the feeding box.

Claim.—The horizontal rocking frame N, actuated by the sweep bar J, and operating the gate M, to open and close alternately the aperture *e* in the feeding box E of my improved machine, substantially as herein set forth.

82,035.—MORGAN L. RICH, Sand Bank, N. Y.—*Bin for Sugars, &c.*—September 8, 1868.—The bins are arranged around a central core, so that the top forms a counter for the scales, which may be readily accessible from all the bins.

Claim.—The bin, constructed as described, consisting of the radial portions C, around the standard B, all inclosed within the case, having inclined sides *a*² and hinged doors *a*¹, the latter adapted to close against the edge of the top D, which forms a seal support, as herein shown and described.

82,036.—JAMES ROBERTSON, Gosport, Ind.—*Hay and Cotton Press.*—September 8, 1868.—A vertical shaft, to which the platen is secured, has attached to it two tug levers connecting with another lever operated by tackle for raising and lowering it.

Claim.—The combination of the press beam, A, rollers B B, connecting beam C C, lever D, winch and axle G, and rope connecting the axle, the lever D, and the beam A, said parts being arranged in relation to one another, substantially as described.

82,037.—WILLIAM SANGSTER and JOHN BRETZ, Springfield, Ill.—*Brick Mold.*—September 8, 1868.—Partitions pivoted to a frame work of iron are made to fit in grooves in the bottom and sides of the brick mold.

Claim.—The combination of the frame bars B with the bars D pivoted thereto, supporting the partitions C, with the slotted mold box A, handles E, and ledges F, all constructed in the manner described and for the purposes set forth.

82,038.—IRVING W. SCRANTON, West Liberty, Iowa.—*Medical Compound.*—September 8, 1868.—Composed of chloroform, Jamaica ginger, pepper-mint, cinnamon, compound spirits of lavender, spirits camphor, tinct. opium, sirup and arnica.

Claim.—The above improved compound for the treatment of cholera in any of its stages.

82,039.—NICHOLAS SHOCK, Baltimore, Md.—*Corn Sheller and Cleaner.*—September 8, 1868.—The corn is fed between the serrated disks and the cob and grains of corn fall on an endless apron and are carried to the upper end of an inclined chute; the cob drops off while the grains run down the chute into a chamber from whence they are carried by an elevator to a spout.

Claim.—1. The combination of the serrated disks F F and feed spout G, substantially as shown and described.

2. The combination of the toothed disk C, the revolving apron *m*, and chute board *n*, all as shown and described.

3. The combination of the chute board *n*, the elevator, and the spout *t*, substantially as shown and described.

4. The combination of toothed disk C and the chute board *n*, substantially as shown and described.

82,040.—FRANCIS SMITH, Highgate, Vt.—*Horse Rake.*—September 8, 1868.—A cylindrical bar, having springs pressing upon the bars of the rake teeth, is pivoted to the rear side of the axle-tree and is operated by a lever. The rake teeth are raised and lowered by a strap secured to their rear ends and to a lever pivoted to the cross brace.

Claim.—The lever H, belt I, pulleys F and G, bar *b*¹, arms *e*¹, and rake teeth *t*, in combination with the pivoted bar L, bar N, and fingers *p*¹, all constructed, arranged, and operated in the manner and for the purpose set forth.

82,041.—ROBERT D. O. SMITH, Washington, D. C.—*Bit Stock.*—September 8, 1868.

Claim.—A bit stock, with the jaws D D, having a

parallel movement, and sleeve C, or the equivalents of these parts, constructed so as to hold bit truly centered by seizing it by the cylindrical portion in front of the head thereof.

82,042.—NORMAN C. STILES, Meriden, Conn.—*Device for Turning Shafting.*—September 8, 1868.—Cutters are mounted on a stand radially and moved forward and secured by screws. Centering pieces are pressed outward by springs mounted in a ring made part of the stand, their outer ends being beveled and made to fit against inclined notches in another ring which is provided with a weighted arm and fits over the first ring. A milling tool is fitted to the inner ring for reducing the shaft to an exact size.

Claim.—1. The plate A and cutters B¹ B² B³.

2. The arrangement of the centering device, the cutters, and the milling tool, substantially as and for the purpose herein described.

82,043.—MICHAEL STOLL, Conestoga Township, assignor to himself, BENJAMIN SNAVELY, and ANTHONY ISKE, Lancaster, Pa.—*Potato Plow.*—September 8, 1868.—The shovels are so arranged that when in one position the soil is thrown outward, and when reversed the soil is thrown inward.

Claim.—The arrangement and construction of my shovels 1, 2, and 3, with their respective beams, slots, screw bolts *b*, and countersunk segment G, and adjustable bearings E, in combination, with or without the separate center piece A, Fig. 2, all made in the manner and for the purpose specified.

82,044.—O. H. TAYLOR, Brooklyn, N. Y., assignor to WILLIAM E. PARRISH, New York City.—*Bit Stock.*—September 8, 1868.—The bit stock is provided with a transversely V-shaped opening to receive the bit, which is transversely V-shaped in the longitudinal line of the bit when in position.

Claim.—The socket A, contracted at one side, and adapted for the reception of a shank of a tool which may be secured in the stock by a screw, or its equivalent, so applied as to force the shank into the contracted portion of the socket, substantially as described.

82,045.—W. S. THOMPSON and R. VINCENT LOVE, Montgomery, Ala.—*Method of Fastening Hames.*—September 8, 1868.—The hook is provided with edges and held in place by a latch and button. The curved end of the latch is dovetailed and fits in a slot in the bar so as to relieve the strain on the rivet.

Claim.—1. The bar A, latch B, hook D and button *e*, constructed, operating, and arranged substantially as and for the purpose set forth.

2. The dovetail *d*, in combination with the bar A and latch B, constructed and arranged substantially as and for the purpose described.

3. The hook B, when arranged with the eyes *f f f*, and in combination with the bar A and latch B, substantially as and for the purpose described.

82,046.—THOMAS H. W. UPSHER, M. D., Norfolk, Va.—*Medical Compound.*—September 8, 1868.—Composed of extract of coffee, opium, mixed with simple cerate and hog's lard.

Claim.—A medicine for piles, compounded of the ingredients, in the manner and substantially of the proportions herein specified.

82,047.—JAMES H. VAN NORTWICK, Sturgis, Mich.—*Saw Filing Machine.*—September 8, 1868.—A spring is attached to the file handle in such a manner that when the latter moves back the spring raises the file from the saw. The file makes two strokes in the same tooth at every revolution of the crank, and as it goes back the second time the feed screw is made to revolve by suitable mechanism. The plate in which the file handle slides can be set at any required angle.

Claim.—1. The combination of cam G, secured to the shaft D, arm H, levers I I, connecting rod *d*, pawl *f*, and spring *e*, all constructed as described, and operating for the purpose of turning the feed screw M, by means of the driving wheel K, thereby moving the carriage N, substantially as herein set forth.

2. The arrangement of the shaft D, movable collar

k, wheels *O*, *P*, and *R*, in combination with the pitman *m* and walking beam *u*, all constructed as described, for the purpose of moving the file handle *S* back and forth, substantially as herein set forth.

3. The combination of the movable plate *T*, carriage *O*, and screw *U*, to turn the file at any angle desired, substantially as herein set forth.

4. The arrangement of the file handle *S*, connected with the walking beam *u*, and provided with the spring *p*, constructed and operating substantially as and for the purposes herein set forth.

5. The arrangement of the frame *A*, clamps *C C*, shaft *D*, feed screw *M*, and carriage *N*, all with their different parts constructed as described, and operating substantially as and for the purposes herein set forth.

82,048.—HENRY P. WESTCOTT, Seneca Falls, N. Y., assignor to SENECA FALLS CHURN MANUFACTURING COMPANY, same place.—The cover is held by the batting fitting into a socket in the back ear, and is fastened to the front ear, (which is recessed to receive the batting,) by a hasp and staple.

Claim.—The metallic ear *C*, socketed as described, to contain the bar *E*, in combination with the said bar, and ear *B*, with inward projections, as described.

82,049.—DAVID M. WESTON, Boston, Mass.—*Self Balancing Centrifugal Machine.*—September 8, 1868.—Improvement on his re-issued patent of January 14, 1868.

Claim.—1. The application of the easily-yielding spring *e*, as the sole support of a centrifugal machine revolving upon an upright shaft resting upon a pivot-bearing at the base, and in combination with the shaft and pivot-bearing, substantially as above described.

2. The flexible spring *e*, in combination with the upright shaft *b*, made of sufficient length to prevent the natural oscillation of the machine at an obtuse angle, substantially as described.

3. The pulley *e*, affixed to the shaft *b*, below the floor or platform *i*, so that the driving power of the machine is wholly applied below the floor.

82,050.—WILLIAM N. WHITELEY, Springfield, Ohio.—*Harvester Reel and Rake.*—September 8, 1868.—The cast-iron head is provided with arms, to which the rake arm is secured, and is made in the form of a tube, its central part being cored out. A hollow pendent stud is formed at the rear of the head to receive the bolt of the friction roller.

Claim.—1. The rake head *H* with the arms *G G*, and with a long tube bearing for the joint bolt, in the manner described, independent of the wooden arm *F*.

2. Attaching the friction roller *N* to the cast rake head *H*, by means of a wrought bolt, one end of which forms the journal or bearing of said roller, and the other penetrates through said head, and is secured therein by a screw nut, or the equivalent thereof.

3. The pendent stud *M*, with a tapered socket for the correspondingly shaped bolt *O*, which attaches the friction roller to the head *H*, as set forth and described.

82,051.—ABEL WHITLOCK, Danbury, Conn.—*Lamp.*—September 8, 1868.—A reservoir surrounds a chamber containing the wick, and is provided with a suitable valve for replenishing. A valve in the bottom of the reservoir admits the oil into the wick chamber, and is arranged to close when the replenishing valve is opened.

Claim.—A lamp pot, constructed within the interior chamber *B*, said chamber communicating with the reservoir *A* by an orifice, *E*, which may be closed with a suitable valve while the reservoir is being replenished, in combination with valves *G* and *I*, substantially as shown and set forth.

82,052.—EPHRAIM WHITMAN, Fitchburg, Mass.—*Flower Pot.*—September 8, 1868.—A wall-enclosed chamber serves as a non-conducting air space and fluid reservoir. The top of the chamber is covered by a cap ring having a lip extending down into it.

Claim.—1. A flower pot, made with inner and outer walls, *a b*, and an intervening water space *e*,

the walls *a b* being connected or relatively fixed in position, substantially as shown and described.

2. In combination with the water chamber *c*, the cap ring *i*, substantially as shown and described.

82,053.—REUBEN S. WHITTIER, Dorchester, Mass.—*Window Screen.*—September 8, 1868.—The roll is so arranged within a case that when the bar to which the end of the wire gauze is secured is drawn down a spring is wound up in the roll. The bar is provided with grooved plates, which slide over projections on the window sill, and is held by them. The window being lowered the roll rotates by means of the spring and winds up the gauze. The case is beveled on its inner edge and coming in contact with a bevel on the bar, forces it off the projections.

Claim.—1. The combination and arrangement of the shaft *B*, bushings *C* and *D*, disk *F*, and spring *E*, with the body *A* of the roll, in the manner and for the purpose specified.

2. The plate *a*, provided with a concave bearing, in combination with the square-ended shaft *B* and its connections, and with the case *G*, for the purpose and substantially as described.

3. The plate *b*, provided with a slot *p*, when used in combination with the roll *A*, and with the case *G* and the screen *S*, for the purpose and substantially as described.

4. The curved spring plates *d*, slotted as shown and described, in combination with the case *G* and the screws *c* or holding devices, which connect the case and the roll with the sash, as described.

5. The slotted plates *f*, constructed as described, in combination with the bar *H* and the screws *e*, for the purpose and substantially as described.

6. The combination, with the sash *K*, of a case, *G*, constructed as described, the case serving as a cover and protection to the roll and the screen, and also as a device for detaching the bar *H* and the screen from the sill, for the purpose and substantially as described.

7. The arrangement and combination of the roll, screen, and case, and the supporting plates, with the sash, and the bar *H* with the sill *M*, so that the screen shall more perfectly cover the open space produced by raising the sash, as and for the purpose set forth.

8. The combination of all the operative parts specified, arranged to operate substantially as and for the purpose set forth.

82,054.—C. F. WOODRUFF, Newbern, Tenn.—*Spur Wheel.*—September 8, 1868.—Improvement on his patent of May 5, 1868. Cogs are formed with shoulders so expanded as to bear against each other all around the rim of the wheel. The outer ends of the spokes are divided for the insertion of the inner ends of the cogs.

Claim.—1. The series of cogs *M*, the rim *A*, shoulders *m m*, and pins *e*, constructed and arranged substantially as described.

2. The spokes *N N*, when formed with the trifurcated end *n n' n*, substantially as described.

3. The combination of the trifurcated spokes *N N* with the projecting ends *R R* of the elongated cogs, substantially as described.

82,055.—JOHN A. WRIGHT, Keene, N. H.—*Mop.*—September 8, 1868.—Improvement on his patent of June 30, 1868.—The jaws are screwed on to a projection on the lower end of a sliding and revolving handle so as to prevent accidental unlocking.

Claim.—1. A sliding and revolving handle *A*, with its projection *e* and screw thread *d*, in combination with the jaws *B C*, one or both of which are provided with a screw thread, *h*, substantially as and for the purpose set forth.

2. A mop cloth, sewed substantially as described, to insure the projection *e* catching into and retaining the cloth when it is to be twisted for the purpose of being wrung out.

82,056.—JOHN A. WROE, Hagerstown, Md.—*Exercising Chair.*—September 8, 1868.

Claim.—A vibratory and exercising chair, when the same is constructed with hollow back, seat, arms, and foot board, and is so supported upon pivots or rockers that the chair can be readily operated by

means of springs, or their equivalents, substantially as described, as and for the purpose specified.

82,057.—DAVID MORRISON, New York, N. Y.—*Valve for Water Closet.*—September 8, 1868.—The spindle is hollow and is provided with a valve placed in it above the plunger. When the main valve is opened, the said valve opens, from the pressure of the water through the hollow spindle, and when the main valve is closed the said valve also closes but allows the water to flow back slowly through a groove in the hollow spindle, thus preventing sudden jars of the main valve on its seat.

Claim.—1. The plunger D, valve J, and hollow spindle E, with its groove *c*, substantially as shown and described.

2. The combination of the rod K, valves M and N, double valve seat I, plunger D, and spindle E, when arranged and operated substantially in the manner shown and described.

82,058.—OTIS ADAMS and JAMES HATCH, San Francisco, Cal.—*Mortising Chisel.*—September 15, 1868.—The lips are so formed that the chisel, on being withdrawn, clears the mortise of the core or chips.

Claim.—Making the lips beveled from the edge to the main part of the chisel, and with the ends beveled and inclined, as herein set forth.

82,059.—THOMAS ADAMS, Hudson City, N. J., assignor to himself, JAMES L. ROMER, and HENRY T. McCOUN, Brooklyn, N. Y.—*Lamp Burner.*—September 15, 1868.—A lifter acting upon a flat wick in connection with a tube of suitable shape, gives a tubular form to the wick as it is fed up.

Claim.—1. The flattened cone-shaped wick tube A, provided with a triangular opening, *f*, for admission of air in front, as it were, of the single wick, to establish a current through the center of the flame, and constructed so that in the passage of the single flat wick through it in a straight line, or thereabouts, from below said wick is made to assume an annular form at its exit from said tube, substantially as specified.

2. The arrangement of the wick lifter or operating device E relatively to the straight or entering portion *e* of the tube A, constructed as described, and for operation in connection with the latter to turn and convert the wick from a flat or straight into a round or annular form, essentially as herein set forth.

3. The base portion of the burner, of globular or enlarged character, as described, and divided, as at *h*, (forming a cap, D,) between the collar screw of the lamp and draught opening or openings to the flame, as and for the purpose herein set forth.

82,060.—A. H. ALLISON, Charlottesville, Ind.—*Cultivator.*—September 15, 1868.—The yoke is composed of a bar, bowed upward at the middle, but terminating in two straight arms, upon which are loosely fitted the blocks to which the shovel beams are adjustably attached.

Claim.—1. The yoke C, secured to the under side of the tongue, and provided with the adjusting blocks *g g*, in combination with the beams G G, uprights *f f*, provided with adjusting holes, double tree *c*, arms *e' e'*, and braces, connecting the ends of the yoke with the main frame, all constructed, arranged, and operated in the manner and for the purpose set forth.

2. The beams G G, hinged to the adjusting blocks *g g*, and provided with the shanks *i i* and braces *h h*, in combination with the bails J J and foot pieces Z Z, all constructed, arranged, and operated as set forth.

82,061.—HERBERT L. ANDREWS, Chicago, Ill.—*School Desk.*—September 15, 1868.—A simple noiseless joint is provided, and a guard to prevent the seat striking against the back, the seat arm being secured in place without the use of bolts and nuts.

Claim.—1. The standard, composed of two parts, A B, one provided with the projection *g*, and axle *i*, and the other with the flange *a*, in combination with the arm C, the standards being secured by the screws and nuts, all substantially as specified.

2. The combination and arrangement of the recess

b, when filled with rubber, or other elastic material, standard, B, and projecting heel, *h*, of the arm C, substantially as and for the purposes specified.

82,062.—HERBERT L. ANDREWS, Chicago, Ill.—*Blackboard.*—September 15, 1868.—A blackboard is provided with arms which can be extended, and with stationary and movable pins or hooks, on which to hang maps and charts.

Claim.—The blackboard A, when provided with the groove *b*, arms *e*, pins or hooks *c*, and supported, constructed, and operating substantially as specified.

82,063.—WILLIAM R. ANDREWS and ROBERT DINGWELL, Newark, N. J.—*Leather Stretching Machine.*—September 15, 1868.—The cross slat resting upon a friction roller on the beam operates to stretch the neck in a direction opposite to that of the hide.

Claim.—1. The movable beam B, in combination with the cross slat C, when constructed and operated substantially as and for the purpose set forth.

2. Operating the movable beam B by means of the ratchet bars E E and screws D D, when constructed and arranged as specified, and for the purposes set forth.

82,064.—W. T. ARMSTRONG, Freeport, Ill.—*Stock Pump.*—September 15, 1868.—The compound hinged platform is so arranged as to operate a rod connected with a "bellows pump," and cause the water to be forced up as the animal steps on and off the platform.

Claim.—The box pump E, constructed as described, in combination with the stationary pipe F, rod D, and the compound hinged platform B C, all constructed and arranged to operate substantially as shown and described.

82,065.—JOHN ASTON, Pittsburg, assignor to WILLIAM SMITH, Allegheny City, Pa.—*Molding Pipe.*—September 15, 1868.—The nozzle is placed underneath the flask and over one of the flue outlets, the sliding thimble extending an inch or two into the flask. Communication is thus formed between the furnaces and flask, through which latter the heat, &c., from the fire pass in order to dry the mold. The stoppers close the unemployed flue outlets.

Claim.—1. The combined arrangement of the flask G and hinged door G G, substantially as described.

2. The pit A, furnaces B with their flues C and outlets CC, ramming-up stools D, stoppers E, nozzle F, and sliding thimble F^r, the bars K and side plates L, when combined and arranged substantially as herein described, and for the purpose set forth.

3. Drying pipe molds by means of passing currents of heated air or gases through them, without removing them from the pit in which the operations of molding and casting are carried on, substantially as described.

82,066.—JOHN E. ATWOOD, Mansfield, Conn., assignor to himself, A. SPRAGUE, and W. SPRAGUE, Providence, R. I.—*Journal Box.*—September 8, 1868.—The shields prevent the oil from being thrown through the joint between the two parts of the journal box.

Claim.—The annular ribs or collars B*, near each end of the journal, in combination with the caps or shields D* and the chambers C*, provided in the journal box, all arranged substantially as herein set forth, for the purpose specified.

82,067.—JAMES E. AUSTIN, Oswego, N. Y.—*Shingle Machine.*—September 15, 1868.—The tilting table is capable of several adjustments, the chief purpose being to regulate the thickness of the shingles. The dogs automatically release the bolts to allow them to descend to the tilting tables. The movement of the bolt holders on their frame raises them sufficiently to pass over the saw without contact.

Claim.—1. The method of operating the tilting tables F F, namely, the projecting arms *f*, obliquely slotted slide bars H *h*, the hooking connecting rods I *i*, and crank wheels J, having adjustable wrists or crank pins, all arranged and operating as herein shown and described, and for the purpose set forth.

2. In connection with the tables F, the laterally-

adjustable plate and socket block N U M, and vertically-adjustable fulcrum block K L, constructed and operating as herein shown, and for the purpose described.

3. The bolt holders C C, having a horizontal movement on frame D, and provided with wedges, *s s*, for acting on inclined surfaces of said frame D in such manner that all sides of the bolt holders are lifted alike, in connection with tappet lever R and link P, or other suitable device for obtaining the sliding movement of bolt holders on frame D, as and for the purpose described.

82,068.—C. G. BACHELDER, Camden, Me.—*Wagon Axle*.—September 15, 1868.—The oil is fed to the wearing surfaces by a wick, which delivers it through a slot in the cap coinciding with the recess in the rib.

Claim.—1. The combination, with an axle provided with an oil recess, *b*, of the cap *g*, arranged oil-tight therein, and provided with a slot for the wick, substantially as and for the purpose described.

2. The recess *b*, provided with the dividing rib *e*, having a recess, *d*, for the wick, communicating with the recess *b* by the holes *e*, substantially as and for the purpose set forth.

82,069.—E. R. BALDWIN, Southfield, Mass.—*Wagon Jack*.—September 15, 1868.—The rollers prevent the sliding bracket from cramping.

Claim.—The combination, with the bracket B and stand A of the friction rollers *a* and *b*, when applied and arranged as and for the purpose set forth.

82,070.—T. C. BALL, Bellows Falls, Vt.—*Knob Latch*.—September 15, 1868.—The lock ring is made to engage the annular plates, which are respectively fastened to the door and the knob shank.

Claim.—The combination of the lock ring *h*, slots *e*, and projections *k k*, with and between the plates or escutcheon *b*, and its projections *e* and *e'*, and the ring *g* with its slot *i*, all operating together as and for the purpose set forth.

82,071.—EDWARD C. BANCROFT, HENRY M. BANCROFT, and EDWARD H. BANCROFT, Syracuse, N. Y.—*Enamel for Window Shades*.—September 15, 1868.—Copal varnish, linseed oil, and benzine, are applied to the shades to protect the paint decorations from soap and water in cleaning.

Claim.—The employment of the within compound in the manufacture of cloth window shades, for the purpose described, substantially as set forth.

82,072.—JOHN BARRON, Cincinnati, Ohio.—*Elastic Draft Attachment for Single and Double Harness*.—September 15, 1868.—The draft strain devolves upon the check strap, or equivalent non-elastic device, when the elastic attachment has been extended to its full extent.

Claim.—The combination and arrangement of the India-rubber draft attachment B, adjustable check strap, rods or case C, and coupling G, substantially as and for the purpose herein specified.

82,073.—THOMAS L. BAYLIES and EDWIN CRAWLEY, Richmond, Ind.—*Vise*.—September 15, 1868.—The jaw is first advanced with a rapidity appropriate to the preliminary movement, and when it encounters the object to be clamped, a friction spring loses its power to compel the sleeve to rotate with the handle screw, whereupon the rotation of the sleeve and double screw ceases, and the handle recedes by reason of its rotation upon the smallest pitch threads of the double screw. The sleeve, during the progress of the clamping operation, is held rigidly against rotation by a pawl, which is thrown out of engagement by the shoulder of the handle screw, acting upon a trigger, when a forward movement is given to the latter in releasing the article under pressure.

Claim.—1. The combination of the devices operating automatically, by which the action is changed from the adjusting to the compressing screw or screws, by a continuous turning of lever *a* in one direction, and the action of the screws is reversed by a continuous turning of said lever in the opposite direction, substantially as set forth.

2. The combination of the pins *c* and *c'* and slots *b* and *b'* with the sleeve G and screws F and E, substantially in the manner described and for the purpose set forth.

3. The pawl J and trigger H, in combination with screw E, adjusting screw *f*, and sleeve G, the latter being provided with a ratchet, as specified, and all operating substantially as described and for the purpose set forth.

82,074.—VALENTIN BITSCH, St. Louis, Mo.—*Plane*.—September 15, 1868.—The forward bit bevels off the top corners of the slat, which is severed from the board and beveled off at the bottom corners by the subsequent action of the open-shank bit.

Claim.—The combination of the bit *a*, having its lower cutting edges to form a re-entering angle, with the open-shank bit *a'*, having its lower cutting edges arranged with beveled corners, acting with the plane stock A to form blind slats, whose narrow edges are chamfered, substantially as set forth.

82,075.—CHARLES S. BONNEY, Penn Yan, N. Y.—*Farm Gate*.—September 15, 1868.—The hinges are so made as to admit of the gate being easily raised and lowered and held at any required height.

Claim.—The hinges D and E, when made and applied as specified, and used in combination with the gate C, substantially as and for the purpose set forth.

82,076.—WILSON BRAY, Stockton, N. J.—*Refrigerator*.—September 15, 1868.

Claim.—The forming or producing of a current of air within the provision chamber of a refrigerator, by means of a rotary fan or other mechanical device, so arranged as to impel or force the air through an ice box or water vessel surrounded by a freezing mixture, and also through a vessel containing charcoal or other absorbent of moisture and noxious gases, substantially as shown and described.

82,077.—JOHN BRETT, Memphis, Mich.—*Machine for Forming Eaves-troughs*.—September 15, 1868.—The metal is swaged into shape by closing the sectional clamp thereupon. The bead is formed by placing the edge of the metal in the slot of the roller, and giving the latter a turn.

Claim.—The eaves-trough former, constructed, as herein described, of the grooved bed plate A, crimping clamp F, hinged thereto, with its hinged continuation H I and slotted roller D, all arranged and constructed as herein shown and described.

82,078.—P. M. BRISTOL, Ludington, Mich.—*Saw-Sharpening Device*.—September 15, 1868.—The saw teeth are brought within the rest, and between the latter and the rotary shaft carrying the swaging wheel. The wheel acts in conjunction with a shoulder of the rest, to cut off any surplus length of the teeth.

Claim.—The swaging apparatus, consisting of shaft C, wheel D, and rest E, arranged and combined substantially as described.

82,079.—GEORGE H. BRONSON, New York, N. Y.—*Manufacture of Artificial Fuel*.—September 15, 1868.

Claim.—The process of making artificial fuel in which pitch or other similar material is used to produce the agglomeration of the particles of the substance or substances which constitute the basis of the fuel, by first heating the coal or other substance, and, while it is heated, introducing among it the pitch or other similar material in a powdered state, substantially as herein described.

82,080.—JOHN W. BROWN, Wooster, Ohio.—*Apparatus for Domestic Manufacture of Gas*.—September 15, 1868.—Gas from the retort is conducted to a washer, passing through a body of water in which it is freed of tar; thence it passes through a lime box, from which it is conducted to a holder which is free to rise and fall. If an excess of gas be generated the holder rises and releases a spring-actuated lever, whereupon a cock is closed to arrest the supply of gas to the holder, and another cock opened to permit the surplus gas to be conducted to the fire chamber of

the retort. The rake is used to clear the retort of coke.

Claim.—1. The retort D, in combination with a gas apparatus, adapted to domestic use, and as described, constructed substantially as set forth.

2. The arrangement whereby the apparatus is made self-regulating, by the pressure of the gas in the gas-holder, substantially as shown and described.

3. Using the surplus gas as fuel, either under the retort for generating gas, or for other purposes, by the automatic arrangement, substantially as described.

4. In combination with a gas apparatus, the washer and tar receptacle G, and the purifier K, when the same are constructed and arranged substantially as described.

5. The rake *l*, in the retort, substantially as and for the purpose set forth.

82,081.—E. L. BUCKINGHAM, Jefferson, Wis.—*Chair Seat.*—September 15, 1868.—Designed as an improvement on the ordinary plan of passing the cane strips through vertical holes.

Claim.—The strips *b*, composing the chair bottom, secured in the rails A by being passed over and under said rails, the ends being inserted in oblique slots *a*, and there retained by the strip C applied to the outer edge of the rails A, all substantially as herein shown and described.

82,082.—AZRO BUZZELL, West Fairlee, Vt.—*Carriage Spring.*—September 15, 1868.—The two shorter springs are capable of vibration longitudinally with the wagon.

Claim.—My improved arrangement of the three springs A B C, as described, without any connection extending from or about from the middle of one spring, B, to or about to that of the spring C, the whole being as shown in the drawings.

82,083.—CALVIN CARPENTER, JR., Astoria, N. Y., assignor to H. H. WOLCOTT, New York City.—*Lubricating Material.*—September 15, 1868.—Crude petroleum is set on fire in a tank and allowed to burn until the lighter constituents are separated and carried off. The residuum constitutes the lubricant.

Claim.—A lubricating material prepared from crude petroleum, in the manner above set forth.

82,084.—JOHN M. CASE, Worthington, Ohio.—*Angular Shaft Coupling.*—September 15, 1868.—An improvement on his patent of March 10, 1868. The coupling adapts itself to any variation in the angle of convergence of the shafts.

Claim.—1. Forming the bars D, upon which the segmental cogs E are cast solid, substantially as herein shown and described, and for the purpose set forth.

2. Forming rims or flanges upon the sides of the segmental cogs E, for the purpose of preventing their lateral movement, and relieving the side pressure upon the connecting bars F, as herein shown and described.

82,085.—LUKE CHAPMAN, Collinsville, Conn.—*Wrench.*—September 15, 1868.—The spring ring constitutes a means of connection between the nut and the movable jaw.

Claim.—The combination, with the jaw A, provided with the recess B and annular groove C, of the nut D and the spring ring E, substantially as and for the purpose set forth.

82,086.—W. H. CHILDE, Gainesville, Ala.—*Car Wheel and Frog.*—September 15, 1868.—Designed for uniting the varying gauges or widths of railroad tracks.

Claim.—Uniting railroads of different gauges by means of a frog, applied at the junction of two or more tracks, and constructed as described, and by railroad wheels, constructed with two or more independent treads, the said frog and wheels being employed together, but the former also permitting wheels with a single tread to pass over it, all substantially as described.

82,087.—CHARLES CHINNOCK, Brooklyn, N. Y.—*Measuring Funnel.*—September 15, 1868.—When

the stem is released, the valve opens and the contents pass out.

Claim.—The arrangement within the funnel, of the stem B, carrying the valve C at its lower end, whereby the weight of the funnel closes the valve, when the latter is suspended by the stem for filling, substantially as herein set forth.

82,088.—CHARLES CHINNOCK, Brooklyn, N. Y., assignor to J. LITTLE HYDE, New York City.—*Feed Bag.*—September 15, 1868.—The bag is self-adjusting and maintains its position, with the mouth upward, so that the feed cannot be wasted by the movements of the horse.

Claim.—The combination of the endless cord *c* and pulleys or slides *b* with the feed bag A, all arranged and operating essentially as set forth.

82,089.—JOSEPH H. CLIFTON, Newcastle, Pa.—*Cultivator.*—September 15, 1868.—The knives and spikes break up the soil, and the large wooden teeth on the cross-bar form drills.

Claim.—1. The board A, provided with the knives *a*, &c., and teeth *b*, as and for the purpose set forth.

2. The board A, in combination with the bar *c* and teeth *c'*, as and for the purpose set forth.

82,090.—NATHAN CLOUGH, Lowell, Mass., and JAMES BALDWIN, Manchester, N. H.—*Shuttle.*—September 15, 1868.—The tip is inclosed and riveted with a cylinder of wood, the whole being driven into an aperture in the end of the shuttle.

Claim.—A shuttle, having its tip shank riveted to the wooden plug, and the plug secured in the shuttle, as herein described.

82,091.—JAMES COREY, Wayne, Mich.—*Buckle.*—September 15, 1868.—The buckle is constructed with two bails and two tongues, so as to hold when pulled in either a forward or backward direction.

Claim.—The arrangement of the tongue C and cross-bar B, in connection with the bails A, in such a manner that each tongue shall operate on its bail without any intermediate bar, substantially as and for the purposes set forth.

82,092.—E. D. CRAMER, Hackettstown, N. J.—*Seed Coverer.*—September 15, 1868.—Metal plates are secured to two sides of the frame converging in front, and are capable of adjustment vertically.

Claim.—A pointed seed coverer, consisting of a triangular frame, A B, and of the up-and-down adjustable plates D D, all made and operating substantially as herein shown and described.

82,093.—DAVID DAVIES, Crumlin, England.—*Forging Apparatus.*—September 15, 1868.

Claim.—1. The steam cylinder and piston, connected with the hammer arm, so as to operate the same, in combination with the horizontal cylinder, arranged so that it can be turned, and in which the steam cylinder is mounted, substantially as described, so that the direction of the blows, relatively to the face of the anvil, can be changed.

2. The steam cylinder and piston, connected with the hammer arm, so as to operate the same, and mounted in the horizontal cylinder, arranged so that it can be turned, to change the direction of the blows relatively to the face of the anvil, substantially as described, in combination with the hydraulic ram, for raising and lowering the same, to adapt it to articles of various thicknesses or height, substantially as described.

3. Connecting the horizontal cylinder with its base, so that it can be turned in a horizontal plane, in combination with the steam cylinder and piston connected with the hammer, substantially as and for the purpose described.

82,094.—W. H. DAVIS, Brooklyn, N. Y.—*Moulding Bells.*—September 15, 1868.—The projecting lips on the outer and inner casing relieve the loam from all pressure when the casings are brought together. They also act as guides for the sweeps. Two bearing points are arranged on the lower guides of the sweep, to prevent it from tipping over.

Claim.—1. The arrangement on the outer casing

B of a downwardly-projecting lip or rim, *b*, corresponding in size and position to the upwardly-projecting rim or lip *a* on the inner casing A, substantially as and for the purpose described.

2. The arrangement of a guide for the sweep D or D' on the rim of each casing, in addition to the central guide pin *d*, substantially as and for the purpose set forth.

3. The arrangement of two bearing points on the guide F, substantially as and for the purpose set forth.

4. The additional guide G, catching over a rim, *k*, on the casing, in combination with the guide F, substantially as and for the purpose described.

5. The shank of the jaw E, fitting into a socket in the guide F, and allowing said jaw to accommodate itself to the position of the sweep, substantially as described.

82,095.—FERNANDO J. DIBBLE, Chicago, Ill.—*Vise*.—September 15, 1868.—The vise is supported in a socket secured to the bench, so that the vise jaws may be raised or lowered at pleasure. The slide which covers the screw is roof-shaped, so that the filings will slide off.

Claim.—1. The combination and arrangement of the jaws E D, the standard C, and socket B, provided with a set screw, or its equivalent, the whole operating in the manner and for the purposes set forth.

2. The combination of the jaws E D, slide H, screw F, standard C, and socket B, arranged and operating in the manner and for the purposes described.

82,096.—J. JACOB EARLEY, Fairfield, Ohio.—*Boring and Mortising Machine*.—September 15, 1868.—The auger is inclosed by and revolves within four rectangular chisels, which are kept in close relation with each other. The upper ends of the chisels are guided by adjustable radial arms, secured to circular stays. The chisels are held up by spiral springs against cams placed on the lower face of the wheel driving the auger, and which give a vertical movement to them.

Claim.—1. The adjustable chisels I I, springs N, cams O, and wheel G, when arranged and operated in combination with the auger H, for the purpose specified.

2. The circular stays L, adjustable, radial arms M, for expanding and contracting the shanks of the chisels, in the manner set forth.

82,097.—JULIUS ELSON, Boston, Mass., assignor to FLORENTINE A. JONES, same place.—*Safety Attachment to Watch*.—September 15, 1868.—A small spring, provided with one or more projections, is fitted within the barrel at one side, so that when the mainspring breaks, the stud is forced through the hole in the barrel, and stops its motion.

Claim.—1. The spring D, provided with a stud or projection, *d*, one or more, in combination with the perforated barrel, as and for the purpose specified.

2. The spring D, in combination with the mainspring, for the purpose of equalizing the tension of the latter, as set forth.

3. The stud or projection *d*, in combination with the barrel or mainspring, when used and operating substantially as and for the purposes set forth.

82,098.—HENRY ENGLISH, Wilmington, Del.—*Chimney Top*.—September 15, 1868.—The apertures are sloped upward, causing the wind striking the flue or chimney top to take an upward course, thus increasing the draught.

Claim.—The construction of chimney tops with one or more apertures at the base and upper portion, constructed and arranged as hereinbefore described for the purpose set forth.

82,099.—ENOCH S. FARSON, Philadelphia, Pa.—*Chamber Commode*.—September 15, 1868; antedated September 1, 1868.—A plate of steel is bent to form an arch across the cover, the ends being bent to catch under the rim of the pot. One end is riveted to the cover; the other slides freely under a hasp. A handle pivoted to the cover has a projec-

tion under the spring, so that when the handle is down the ends of the spring are free, and when up, the ends clasp the rim of the pot.

Claim.—The spring-catch bar E, in combination with the cover D, pot C, and adjusting handle F, the said spring-catch bar and handle being constructed and arranged to operate together, substantially as and for the purpose described.

82,100.—WILLIAM FONTLEROY, New Harmony, Ind.—*Machine for Stuffing Horse Collar*.—September 15, 1868.—The collar board is pivoted centrally on a bench, the leather being stretched and secured to it, with both ends open. The stuffing mandrel, operated by a belt and foot lever, is guided by one hand against the filling, which is inserted by the other hand.

Claim.—1. The combination of the collar board B, pulley E, collar I, and mandrel K, substantially as and for the purpose described.

2. The combination, with the same, of the belt F and treadle G, substantially as and for the purpose described.

82,101.—ORRIN FIELD, Independence, Iowa.—*Bee Hive*.—September 15, 1868.—A fixed comb frame is placed in the center of the hive. The other comb frames are connected to one another by hinged joints and to the fixed frame by detachable joints.

Claim.—The combination, with the central fixed comb frame B, of the detachable hinged comb frames C, all arranged substantially as herein shown and described, for the purpose specified.

82,102.—RICHARD FOLEY, New York, N. Y., assignor to himself and EDWIN FERGUSON, same place.—*Pavement*.—September 15, 1868.—Large blocks of wood, alternating with their strips of flagstone, secured together by cement, are laid upon a foundation consisting of a series of boxes filled with concrete.

Claim.—The combination, in a pavement, of the foundation boxes *a*, filled with concrete, with the surface blocks *b*, and the thin strips of stone *c*, the said blocks *b* and strips *c* being laid in alternation, substantially as and for the purpose described.

82,103.—A. W. FOX, Columbiaville, Mich.—*Device for Pressing, Packing, and Weighing Wool*.—September 15, 1868.—The platform is composed of leaves hinged to a central piece. The wool is laid on the leaves, which are then raised and held in position by notched bars until the package is bound, when they are lowered. A plate, connecting with a spring balance scale, is placed in the central piece and raised by a lever until the package of wool rests upon it.

Claim.—The weighing device, consisting of the circular plate *i*, rod *p*, hinged bar *j*, tube *m*, spring *l*, and lever L, in combination with the hinged parts B B, C C, and fixed part D of the packer, as herein described, for the purpose specified.

82,104.—CICERO R. C. FRENCH, Berkley, Mass.—*Permutation Lock*.—September 15, 1868.—The tumblers are so arranged as to indicate the combinations of numbers for locking and unlocking by sound, thus dispensing with any visible marks or numbers.

Claim.—1. The combination, with a series of tumblers and adjustable rings, of an indicating wheel, O, a click, P, and sliding plate C, whereby, the bolt being set at half-lock, the required combination may be formed by turning the tumblers alternately in opposite directions, substantially as set forth.

2. The curved recesses in the bolt B, in combination with the sliding plate C, when operating as and for the purpose specified.

3. The click or bolt P, provided with the projection *i*, in combination with the bolt B, as set forth.

82,105.—CHARLES A. GEISSENHAINER and GEORGE W. GEISSENHAINER, Pittsburg, Pa.—*Liquid Meter*.—September 15, 1868.—A box, through which the water passes from the main, has a water wheel so adjusted that when the water rises in the box it presses against the buckets of the wheel and

causes it to revolve, the water passing out at an opening in the side of the box.

Claim.—The arrangement, in the air-tight glass chamber A, constructed as herein described, of the straight bucket wheel B, water chamber C, pipes D, cog wheels E, and indicating devices G, all constructed as and for the purposes set forth.

82,106.—THEODORE GENNERT, New York, N. Y.—*Manufacture of Beet Sugar.*—September 15, 1868.—The odor of beet-root sugar is removed by mixing it with molasses at a temperature of 150° to 180°; it is then separated from the molasses in a centrifugal machine and then exposed to the action of water or steam.

Claim.—1. Treating beet sugar with cane sirup or cane molasses, substantially as and for the purpose described.

2. Treating beet sugar with cane sirup or cane molasses, under the application of heat, substantially as and for the purpose set forth.

3. Exposing the beet sugar to the action of water or steam, after the same has been treated with cane sirup or molasses, substantially as and for the purpose described.

82,107.—H. H. GILLETT, Warsaw, Mo.—*Mill Pick.*—September 15, 1868.—A piece of glass is secured in the forward end of the pick for allowing the operator to see his work and to protect his eyes.

Claim.—A mill pick handle, constructed as described, and provided with glass, enabling the operator to see his work, as well as shielding him from any particles of rock flying about, as herein set forth.

82,108.—P. D. F. GOEWY, Albany, N. Y.—*Cupboard Catch.*—September 15, 1868.—The pin connecting the bolt and knob has a square shoulder near the knob, which slides in a slot in the tumbler. On turning the knob the tumbler turns and the slot is placed at right angles, thus locking the bolt.

Claim.—The latch, composed of the plate A, the locking tumbler D, in combination with and operated by the doubly moving knob C, all constructed substantially as herein shown and described, and for the purposes specified.

82,109.—ERNST W. GRAM, Negaunee, Mich., assignor to himself, PETER BERG, and A. P. SWINEFORD.—*Rock Drilling Machine.*—September 15, 1868.—The drilling apparatus is attached to an oscillating frame suspended in trunnions between posts. A vertical movement is given to the drill by a lifter and a rotary movement by a cam and crown wheel.

Claim.—The combination of the stationary frame A B, oscillating frame C, trunnions D, shaft E, pinions F G H, shaft I, lifters J, rod K, wiper lifter L, spring N, drill O, cam P, plate wheel Q, spring R, and shoulder S, all constructed and arranged substantially as herein described.

82,110.—JAMES H. GRAY, Boston, Mass.—*Lubricating Pulley.*—September 15, 1868; antedated September 8, 1868.—A hollow globe, provided with an opening for admitting the oil, has a perforated stem which screws into a hole in the hub of the pulley. A wick feeds the oil to the shaft.

Claim.—An oiling device for loose pulleys, when constructed, applied, and arranged to operate substantially as and for the purpose described.

81,111.—WILLIAM GREEN, Holly, Mich.—*Lifting Jack.*—September 15, 1868; antedated September 7, 1868.—A circular pedestal has adjusted loosely in it the circular foot of the post. Catch dogs are held against the teeth on the front and sides in the post by springs, in such a manner that the dogs act as fulcrums for the lever alternately.

Claim.—1. The movable pedestal B, when used in combination with a "lifting jack," the parts being constructed and arranged as and for the purpose specified.

2. The arrangement of the springs *m m* and *j* with the lever C, catch dogs *f f* and *h*, the several parts being used as and for the purpose herein set forth.

82,112.—WILLIAM W. GREEN, JR., Janesville, Wis.—*Gate.*—September 15, 1868.—The upper part

of the gate has a pivot, setting in a washer; the lower part is provided with a Y-shaped hinge, bearing against a round post, and having a guard secured to the post above this hinge to keep the gate from being unhinged.

Claim.—1. The combination of the yoke *h k i* and guard *g*, so as to allow the gate to be removed when required, and yet prevent it from being removed by unruly animals, substantially as described.

2. The combination of the elongated rail and cap, *b a*, bonnet *d*, spur *e*, yoke *h k i*, wedge *n*, and block *l'*, substantially as described.

82,113.—J. P. GROSVENOR, Lowell, Mass.—*Machine for Planing and Molding.*—September 15, 1868.—The cutter mandrel is supported in a vertically sliding frame, the latter being supported by a laterally sliding frame. The pattern has a rebated periphery, the outer portion of which is smooth, the inner portion having a rack or an elastic perforated band which can be removed; said pattern being actuated by a pinion, one part of which has teeth engaging with the rack, the other part being smooth and in contact with the outer portion of the pattern. Guide rolls direct the motion of the pattern.

Claim.—1. The combination of the swinging mandrel frame with the vertically-adjustable slide E and laterally-adjustable slide I, substantially as described, for the purpose specified.

2. The pattern, constructed as described, with a rebated outer edge, in combination with the perforated rigid or flexible rack *r*, substantially as described, for the purpose specified.

3. The rigid or flexible rack *r*, constructed as described, and adapted to be applied to a pattern to be used in cutting irregular forms, substantially as herein shown and described.

4. A pattern, Q, provided with a rack, *r*, around its outer edge to assist the process of feeding the wood to the cutter head.

5. The feed wheel R R', when constructed of the two parts R R', so as to operate, in connection with a pattern having a rebated outer edge, in the manner described.

82,114.—JOHN HAIGNEY and FRANK M. HEDMAN, East Boston, Mass.—*Clothes Pin.*—September 15, 1868.—The levers, joined by a link, are connected, in recesses, to a brace with a spring, and a tongue which locks into a catch spring on the opposite side, and thus forms an adjustable clamp for the clothes.

Claim.—1. The combination and arrangement of the brace D and the catch spring F, with the two levers A B, connected together in manner and so as to operate substantially as described.

2. The arrangement and combination of the auxiliary spring E, with the brace D, the catch spring F, and the two levers A B, arranged and combined substantially as explained.

82,115.—FRANK HATCH, La Cross, Wis.—*Window Screen.*—September 15, 1868.—The frame of the screen is made in two parts, which slide laterally by each other and are connected by an elastic cord or spring, which holds the outer edges of the frames against the window; thus adapting the screen to windows of different widths.

Claim.—The combination of the two sections or frames A B with a spring *d*, so arranged that the spring will operate to force said sections outward against the window casing, and retain the screen in any desired position, substantially as and for the purpose specified.

82,116.—DANIEL HESS, Blandville, Ky.—*Brick Machine.*—September 15, 1868.—The plungers are pivoted to the lower side of an oscillating beam supporting a weighted box, their lower ends being enlarged and slotted to admit the partitions in the mold boxes. Circular mold beds revolve by suitable mechanism on a solid press bed and are provided with molds in which the brick is pressed edgewise.

Claim.—1. The arrangement of a centrally-poised beam B, with its weighted box A, oscillated by the arms J and connecting rod K, in combination with the plungers P, substantially in the manner and for the purpose specified.

2. In combination with my oscillating box A B, the plungers P, with their enlarged base *p p* and slots 1, 2, 3, &c., when operated substantially in the manner set forth.

3. The arrangement of the press bed G and table E, in combination with the revolving mold tables F between them, together with the molds *f* for pressing bricks edgewise, when arranged substantially as set forth.

4. The arrangement of the table E, with its hopper openings S, in combination with the revolving mold beds F and molds 1, 2, 3, arranged in the manner and for the purpose specified.

82,117.—JOHN HEUERMANN, Davenport, Iowa.—*Coupling*.—September 15, 1868.—A hollow cylinder is secured to the end of the shaft inside of which on opposite sides are two slots. At the end of the other shaft is connected a coupling jaw, through which passes an oval bolt into and through a double cross-socket into which latter another oval bolt is secured, the ends of which enter the slots in the iron cylinder.

Claim.—1. The arrangement and combination of such coupling as is shown in drawings, and described in the specifications.

2. The construction of slots extending about two-thirds of the distance from bottom to top or outer end in coupling case, as shown on drawings.

3. The construction of openings in double cross-sockets for oval bolts.

82,118.—ARNOLD HOERMANN, New York, N. Y.—*Screw Cutting Die*.—September 15, 1868; antedated September 4, 1868.—Two or more cutting threads in full sectional relief are presented to the blank, which trace the thread on it by cutting out and removing the metal, like the cutting tool of a planer. A guide prevents the bolt from springing to one side on entering the die.

Claim.—1. A screw cutting die, having a recessed surface, so as to present two or more cutting threads in full sectional relief, as described and shown.

2. The die C, having a recessed surface, so as to present two or more cutting threads in full sectional relief, combined with the slot C', set in advance of the center of the die, all as set forth.

3. The guide M, in combination with a die having portions of one or more threads entirely removed from the entering face thereof, the several parts being constructed and arranged substantially as and for the purpose herein set forth.

82,119.—WILLIAM HOWELL, JAMES C. FINN, and CHARLES A. DUY, Philadelphia, Pa.—*Floor Covering*.—September 15, 1868.—Two thin layers of veneer laid so that the grain crosses are cemented on cotton, woolen, jute, or paper.

Claim.—A covering for floors, &c., consisting of layers of cloth, paper, and wood, combined as set forth.

82,120.—THOMAS JOHNSON, Tewksbury, assignor to himself and JAMES S. HUTCHINSON, Lawrence, Mass.—*Composition for Sizing or Dressing Warps*.—September 15, 1868.—Raw hide and salt are dissolved in boiling water, then strained and alum added.

Claim.—The above described composition as composed of the before mentioned ingredients, combined by means of water and heat in manner substantially as specified.

82,121.—THOMAS W. JOHNSON, New York, N. Y.—*Extracting Tan Bark*.—September 15, 1868.

Claim.—1. The within described process of extracting tan bark, by softening the bark in chips, passing it through rollers into the saturating tank, exposing it in said tank to the action of beaters, elevating and passing it through a series of leaches, where it is washed repeatedly until all the astringent properties contained therein are taken up by the wash, substantially as set forth.

2. Passing a constantly fresh supply of crushed bark through the saturating tank, and exposing it therein to the action of beaters, substantially as and for the purpose described.

3. Separating the disintegrated bark from the liquid absorbed by it while passing through the saturating

tank, by the action of the perforated buckets on the elevator, and by that of the leach which receives the bark as the same is discharged from said elevator, the liquid absorbed by the disintegrated bark being drained off by the perforated elevator buckets, and by the perforated bottom of the receiving leach, and returned to the saturating tank, substantially as set forth.

82,122.—Mrs. R. L. JONES, Sacramento, Cal.—*Composition for Making Designs upon Fabrics*.—September 15, 1868; antedated May 6, 1868.—Composed of pulverized resin and black soot from pine, mixed and perfumed.

Claim.—The composition of rosin and soot, perfumed as above described, and for the purpose set forth.

82,123.—JOHN KAYE, Louisville, Ky.—*Hemp Brake*.—September 15, 1868.—The heaters are placed between short bars and are pivoted near their centers to the frame. Cranks radiating from the center of the shaft, at different angles, work in slots in the ends of the beaters so that the beaters will be made to strike alternately.

Claim.—The combination of the cranks and beaters, when constructed and operating substantially in the manner and for the purpose herein described.

82,124.—PETER KENDRICK, Trenton, N. J.—*Device for Blocking Chains*.—September 15, 1868.—A box, open at its ends and top and mounted on wheels, is provided with a vertical movable partition against which screws bear, and holds the chain while the wooden blocks are driven through the links. The ends of the long links are supported by blocks at the end of the box.

Claim.—The box A, provided with the movable partition C and screws F, in combination with the strips, *a a'*, at the ends of the bottom, *ax*, of the box, for supporting the long links D at the ends of the box, substantially as and for the purpose specified.

82,125.—THOMAS S. KENNARD, Exeter, N. H.—*Invalid Rest*.—September 15, 1868.—The back of the rest can be inclined at different angles. Card teeth are secured to the lower side of the seat to prevent its sliding when in use.

Claim.—The combination of the brace A, which supports the back of the rest B at different angles, and secured by the thumb screw in the socket C, and at the lower end by the hinge D, with the card teeth E E on the under side of the rest, to prevent its sliding or slipping on the bed when in use, in the manner described.

82,126.—ROBERT J. KING, Lancaster City, Pa.—*Oscillating Steam Engine*.—September 15, 1868.—The eccentric is so arranged, in connection with the arm of the rock shaft, that the valve moves four times as fast when it starts to shut off, until it opens a full port, as it does the balance of the stroke, thus getting a full exhaust at once.

Claim.—1. The arrangement of the connecting rod A, with its slot C and regulating devices D, E, and F, with the rock shaft G and eccentric S, as herein described.

2. The arrangement of the eccentric S, with reference to the parts A, C, D, E, and F, and the shaft T, as herein set forth.

3. The arrangement of the angular pipes M and R with the steam chest N and the trunnions P, as herein set forth.

82,127.—M. A. KOON, Catskill, N. Y.—*Adjustable Carriage Pole*.—September 15, 1868.—Improvement on patent of L. C. Miner, of August 4, 1863. The contiguous faces of the arms of the divided brace are toothed to prevent sliding when once adjusted, and are clamped by means of a screw which also attaches the extension pole to them.

Claim.—1. Making the extension B, through which the arms C C' of the swinging braces D D' pass, separate from the pole itself, substantially as herein shown and described.

2. The arms C C', constructed as described, and attached directly in the pole extension, by means of

a horizontal aperture fitted through, and a screw, *a*, fitted into the same, as set forth.

3. Making the contiguous surfaces of the arms C C' rough or toothed, as set forth, and forming indentations *b b*, or their equivalents, on the outer face of one of them, substantially as and for the purpose herein shown and described.

82,128.—ANDREW KRIEBEL, Hereford, Pa.—*Lifting Machine.*—September 15, 1868.—Pins are arranged in perforations in a slotted post, which act alternately as fulcrums for the lever. A chain is affixed to the end of the lever and connected with one end of an endless chain horse power so that the latter can be raised to give a proper inclination, and for which it is especially designed.

Claim.—The combination of the slotted perforated post A, two pins B, lever C, and chain D, with each other, said parts being constructed, arranged, and operating substantially as herein shown and described, and for the purpose set forth.

82,129.—JEAN LAMBERT, Jr., New York, N. Y., assignor to himself and CHARLES RUMPF, same place.—*Aniline Dye.*—September 15, 1868.—It is obtained by the action of bichromate of potash, chloride of lime, or permanganate of potash when in a solution upon a sulphate, chlorohydrate, acetate, or any equivalent salt of aualine.

Claim.—1. The new product or coloring material above described, called by me saffranine red.

2. The process employed by me for producing the said coloring material, saffranine red, substantially as above described.

82,130.—JOHN LANE, Chicago, Ill.—*Plow and Cultivator.*—September 15, 1868.

Claim.—The improvement herein described in the manufacture of plows and cultivators, that is to say, the making of them of metal plates, having a central layer of soft iron or steel, with exterior layers of cast steel, substantially as and for the purposes described.

82,131.—EDWIN E. LAZELL, Philadelphia, Pa., assignor to himself, THEODORE H. PETERS, and FRANCIS KEYSER, same place.—*Centering Device.*—September 15, 1868.—A hollow conical head is provided at its apex with a tubular stem through which the center punch passes. It is also provided on its inside with longitudinal ribs which remove the irregularities from the piece to be centered when it is rotated.

Claim.—The arrangement, with the conical conical milling head D, of the centering pin E, projecting through the head D, in the manner and for the purpose herein specified.

82,132.—JOSEPH S. LEHMAN, Mount Joy, Pa.—*Bag-holding Device and Truck.*—September 15, 1868.—Improvement on his patent of February 11, 1868. An extra bend is given to the holder to form a right angle with beveled sides, in order to slide in a dovetailed slot, made on the inner side of the jaws which embrace the truck.

Claim.—The holder C, constructed as described, and having a short angle, W, with beveled sides, so as to fit into dovetailed slots in the jaws B, all arranged and operated substantially as specified and shown.

82,133.—GEORGE W. LEIGHTON and C. O. COLE, Portland, Me.—*Out-haul for Booms.*—September 15, 1868.—The clew of the sail is secured to a loop attached to a dog, which latter has a pawl engaging with a rack on the boom. A ring is secured to the end of the dog through which a bar can be inserted for tightening the sail.

Claim.—The combination and arrangement of the rack *b* and vessel's boom, dog B, ring *f*, and loop *e*, or their equivalents, as and for the purposes set forth.

82,134.—JOHN J. LEVY, New York, N. Y.—*Playing Cards.*—September 15, 1868.—The edges of the cards are beveled for the purpose of facilitating shuffling.

Claim.—As new articles of manufacture, playing cards provided with beveled edges, substantially as

herein shown and described, and for the purpose set forth.

82,135.—A. W. LOCKHART, Sacramento, Cal.—*Device for Conducting Grain to Threshing Machines.*—September 15, 1868.

Claim.—The employment or use of a plurality of endless aprons, H K K, connected with a frame, F, and an adjustable upright pole, A, all arranged in such a manner that the aprons may be adjusted at different degrees of inclination in order to feed grain from stacks or wagons to threshing machines, and the pole rendered capable of always being adjusted in a vertical position, even when placed on uneven or inclined ground, substantially as and for the purpose herein set forth.

82,136.—SHUBAEL K. LUCE, Marion, Mass., assignor to himself and CHARLES O. LUCE, same place.—*Chimney Scraper.*—September 15, 1868.—The scraper is arranged to expand and contract, to suit the size of the chimney.

Claim.—A scraper, composed of the bars I I I I, with slots *i i i i*, the bars H H H H, with bolts *h h h h h h h h h h*, and the corner bolts L L L L, connected by the expanding springs J J J J J J J J J J, the collars K K, on the shaft F, the whole being constructed and operating in the manner and for the purpose herein described and set forth.

82,137.—JOHN S. MASON, Coal Run, Ohio.—*Combined Corn Planter and Cultivator.*—September 15, 1868.—The plow beams are pivoted to the cross piece of the frame and are connected by chains to a shaft provided with a lever for raising and lowering said beams. The rear ends of the beams form standards to and are provided with covering shares secured just above the furrow shares.

Claim.—The plow beams K K, attached to the frame A by joints *j*, in connection with the standards *h* and covering plates *i x*, crank shaft L, to the cranks *k* of which the beams are connected by chains, and the lever M at one end of the shaft L, substantially as and for the purpose specified.

82,138.—JOSHUA MASON, Paterson, N. J.—*Liquid Meter.*—September 15, 1868.

Claim.—1. The combination, with the measuring cylinder A and its reciprocating piston B, of primary and secondary valves K and P, when arranged for operation in relation to the measuring cylinder, substantially as shown and described.

2. The primary and secondary valves K and P, formed with disks or heads *j j'*, *k k'*, and *n n'*, *r r'*, for operation within valve chambers F F', in combination with ports and passages *f f'*, *i i'*, inlet passages *g*, branch *e*, passage way H, ports *s s'*, and passage G, with its opening *d*, essentially as specified.

3. The arrangement of the ports or passages which control the ingress and egress of liquid through the secondary valve, and of the passages in connection therewith, in such manner as that the flow of the liquid through the valve acts on the latter in the same direction as that to which it has been last shot, and so that said valve is kept shot or thrown in opposite or reverse positions by the pressure of the fluid on its opposite heads alternately, substantially as herein set forth.

4. The primary valve K, operated by the piston of the measuring cylinder, essentially as described, and having an open tubular stem in open communication with the latter, as and for the purpose specified.

82,139.—GEORGE MATTHEWMAN, Brooklyn, N. Y.—*Press.*—September 15, 1868.

Claim.—Operating the press through the instrumentality of two toggles arranged as represented, that is to say, the arm I operating the arm F through the link H, presenting the several angular relations at the different periods, as specified, and the motion thus transmitted being conveyed to the press rod *b*, and its connections, through the medium of the arms E. and links D, forming a second toggle, all substantially as and for the purposes herein set forth.

82,140.—J. R. MCCONNELL, Marengo, Iowa.—*Sulky Plow.*—September 15, 1868.—A bar projects at right angles from the landside of the beam, its

outer end being bent upward and provided with a series of holes and supported by a wheel. The draft pole is pivoted to the upper end of the bar and serves as a fulcrum for a lever, the forward end of which is attached to the plow beam; by means of the lever the plow is raised or lowered.

Claim.—1. The construction and arrangement of the pivoted draft pole K, adjustable side bar E, beam A, and lever L, as herein described, for the purpose specified.

2. The adjustable right-angular bar E, seed bar I, adjustable bar J, brace G, and lever L, in combination with the beam A, pivoted draft pole K, and plow C, all arranged as described, for the purpose specified.

3. The adjustable right-angular bar E, adapted to support the seat and bar H I, the bar J, brace G, and pivoted draft pole K, as herein-described, for the purpose specified.

S2,141.—LEANDER J. McCORMICK, WILLIAM R. BAKER, and LAMBERT ERPELDING, Chicago, Ill., assignors to C. H. McCORMICK AND BROTHER, same place.—*Harvester Rake.*—September 15, 1868.—The dropping platform is connected with a lever actuated by a cam so that it drops when the lever enters a recess in the cam and discharges the gavel which has just been swept on it. The cam then lifts the platform and holds it until the next discharge.

Claim.—1. The combination in a harvester, substantially as set forth, of a hinged finger beam, a narrow platform affixed to the finger beam, and a dropping platform hinged to the fixed one, with a series of reel ribs, and a rake revolving over the platform on a horizontal shaft, and mounted on a support secured on the shoe.

2. The combination, substantially as set forth, with the tripping cam, of the vibrating arm U, and oscillating dog, for the purposes set forth.

S2,142.—ROBERT R. McDONALD, Syracuse, N. Y.—*Hames Fastener.*—September 15, 1868.—The frame has teeth cut in the upper part and a spring at the lower part. On one end of the tongue are catches and near the same end a thumb screw. The tongue being inserted in the frame the catches are pressed by the spring between the teeth, and on turning the thumb screw are held rigidly.

Claim.—The frame A, the teeth B B, the catches C C, the thumb screw D, the spring E and tongue, when the parts are constructed, combined, and used in the manner as set forth and described.

S2,143.—WILLIAM MCKNIGHT, Clearfield, Pa., assignor to himself, JOHN H. FULFORD, and DANIEL W. McCURDY, same place.—*Tenoning Machine.*—September 15, 1868.—The wood to be cut is adjusted and held in such a manner, that the tenon when cut will be straight or tapered, or the shoulders of the same will be straight or mitered, as desired.

Claim.—The arrangement of the guide C, rest plates a, adjustable rest b, and sliding rest d, upon the bed, to operate in connection with a plane, as herein shown and described.

S2,144.—ROBERT MEGINNITY and JOSEPH DESSENGER, Detroit, Mich.—*Tobacco Dressing Machine.*—September 15, 1868.—The tobacco is placed on sieves in a cylinder which is oscillated and caused to vibrate. A blast of air is introduced through a tuyere into the tobacco, which loosens the matted fibers, separating the shorts, which fall through the sieves.

Claim.—1. The loosening of the fibers of fine-cut tobacco by a blast of air passing through the same.

2. The oscillating cylinder F, provided with the rock-shaft D, the inclined longitudinal screens O O, the perforated tuyere plate N, the openings S and P, the doors Q, bumper springs R, stirrup T, and step V, when arranged and operating in the manner described, and for the purposes set forth.

3. The fan blower B, driving shaft D, pulley C, crank E, connecting rod G, and rocker arm H, the air-conducting pipe J, oscillating tuyere K, trunnion U, and blast pipes M, when arranged and operating substantially as described, for the purposes specified.

4. The combination and arrangement of the above-

named parts with the frame A, substantially as and for the purposes set forth.

S2,145.—GEORGE MERRILL, Newburyport, Mass.—*Carving Machine.*—September 15, 1868.—A frame capable of adjustment vertically has hinged to it two plates; a vertical frame is hinged to the front end of the plates and has sliding in it a plate in which the cutting mandrel revolves and the guide is secured. The block and pattern are secured to a table which slides longitudinally, the guide resting on the pattern.

Claim.—1. The combination, in a machine constructed substantially as described, of the laterally-swinging arms D and the vertically-sliding tool and guide holder u, when said parts are arranged to operate substantially as and for the purpose set forth.

2. The combination of the swinging frame and the sliding plate or frame u, carrying the cutting tool and guide, arranged with the sliding table B, to operate in connection therewith, substantially as described.

3. The combination of the adjustable frame H, hinged bars D, frame T, having the pulley I mounted thereon, and the sliding plate or frame u, when arranged to operate as set forth.

S2,146.—T. H. MÜLLER, New York, N. Y.—*Steam Generator.*—September 15, 1868.—A diaphragm extends longitudinally through each tube for preventing the steam from accumulating in the top of the tube, and allowing a flow of water above the diaphragm; the ends of the diaphragm are provided with downwardly-projecting flanges to prevent the steam from obstructing the downward course of the water.

Claim.—1. The construction of the diaphragms G, extending in a longitudinal direction through the tubes B, substantially as described.

2. The construction of the flanges b at the ends of the diaphragms G, substantially as set forth.

S2,147.—WILLIAM W. NETTERFIELD, Rochester, N. Y.—*Corset.*—September 15, 1868.—Springs are arranged in such a manner that the contour of the breasts is formed without pads or stuffing, and the shoulders and hips are relieved from undue pressure. Hooks are attached to the corset for suspending the skirts without binding the waist.

Claim.—The arrangement of the stiffeners h i k, springs c c, diagonal shoulder braces l l, straps a a, back stiffeners b b, hooks or buckles m m, and side spring stiffeners f f, all as herein described, and for the purpose set forth.

S2,148.—NELSON NEWMAN, Springfield, Ill.—*Corn Harvester.*—September 15, 1868.—The fingers are supported by a bar which is held in position by springs in such a manner that if the corn will not come off the stalk readily, the arms yield and the stalk comes in contact with the knives.

Claim.—The yielding bars H, applied to the machine as shown, or in an equivalent way, to operate in connection with the teeth or cutters e and fingers c, substantially as and for the purpose set forth.

S2,149.—THOMAS A. NIZER, Hamilton, Ohio.—*Rotary Steam Engine.*—September 15, 1868.—The abutments are raised by inclined planes on the periphery of the cylinder, and forced down by the pressure of steam on a piston (connected with the abutments) working in a cylinder. The cylinders while rotating bear only against an adjustable plate.

Claim.—1. The arrangement of the cylinders k k, piston J J, steam-pipes L L, lever arrangement and cock m, double abutments E, and partition plate h, with relation to each other and the inclined planes C, as herein shown and described.

2. The adjustable packing plate n, adapted to conform to the curve O of the inclined planes C, as herein shown and described.

S2,150.—JOHN E. NOYES, New Albany, Ind.—*Lamp.*—September 15, 1868.—An opening regulated by a screw is made in the hollow shaft for feeding air to the wick or water into the lamp to elevate the oil.

Claim—1. The lamp B, provided with tube C.

hollow shaft *f*, with opening *i*, and screw regulator *g*, substantially as and for the purposes set forth.

2. The triangular plate, formed into a wick tube, *F*, with the projecting edges of the wick, in the manner set forth, and used with the lamp *B*, as constructed, and for the purposes set forth.

82,151.—JOHN E. NOYES, New Albany, Ind.—*Illuminating Oil*.—September 15, 1868.—Composed of coal oil, oil of rhodium, oil of origanum, salts of tartar, salt, and creosote.

Claim.—The within-described burning fluid, compounded and prepared substantially as set forth.

82,152.—JAMES OFFINEER, Ashland, Ohio.—*Hay Knife*.—September 15, 1868.—A two-edged knife is attached to the end of a rod, which latter has secured to its side three oblong knives, of unequal length, which have a saw-like action when cutting.

Claim.—The knives *A*, *B*, *C*, and *D*, attached to the iron strip *H*, when arranged and combined as herein described, for the purpose set forth.

82,153.—R. F. OSGOOD, Rochester, N. Y.—*Seed Planter*.—September 15, 1868.—The hoppers are adjusted to change the width of the rows, by toggle arms jointed at one end to the hoppers, at the other to a double-acting lever, moving over a segment where it is secured by a pin. The operating parts are mounted on a hinged gate turning vertically under the control of the operator for the purpose of adjusting the depth of the drills.

Claim.—1. So combining and arranging the seeding apparatus, consisting of hoppers *E*, rollers *G*, and drill teeth *H*, with the shaft *I*, that the lateral adjustment to change the width of the rows shall be effected by simply sliding in the straight continuous shaft, as herein set forth.

2. Combining with the swinging gate, and with the seeding apparatus mounted thereon, the adjusting screws *k k*, or equivalent, whereby the depth of cut of the drill teeth may be increased or lessened, as set forth.

3. The combination, with the gear bar *L*, and the swinging gate *D*, of the arm *q*, so arranged that the gate is allowed a range of motion sufficient to adjust the depth of cut of the drill teeth, before the gear is raised to be disengaged, as herein set forth.

82,154.—WILLIAM M. PAGE and EMIL B. KRAUSSE, St. Louis, Mo.—*Process of Preparing Sulphate of Barytes*.—September 15, 1868.—The "tuff" is boiled in water, to render it more friable; then boiled in an acid solution, to remove impurities, then boiled in a solution of silicate of soda; then placed in a bath of a solution of alum water, to whiten it; then agitated in a bath of distilled water.

Claim.—The process, substantially as described, for heating sulphate of baryta, and producing therefrom the refined product known to the trade as "sulphate of barytes."

82,155.—GEORGE F. PARTRIDGE, Adrian, Mich.—*Corn Planter*.—September 15, 1868.—The valves are opened and closed by a bell-crank lever connected with a lever pivoted to the frame of the machine, and operated by projections on the wheel; said wheel can be raised from the ground by means of a lever pivoted to the pole.

Claim.—1. The hopper *H*, horizontal and perpendicular spout *I*, slide *K*, valve *L*, lever *N*, connecting rod *O*, bell crank *P*, arms *S*, levers *T*, all being operated by the projections *F* upon the sides of the wheel *D*, when constructed and arranged substantially as herein set forth.

2. The lever *W*, rod *X*, bars *Y*, in connection with the bends *Z*, pole 3, hounds 4, and rod 5, when operating substantially as and for the purpose herein described.

3. The combination and arrangement of the above named parts with wheels *A* and *D*, axle *B*, frame *C*, parallel bars *E*, front bar *G*, standard 6, cultivator teeth 7, scraper 8, lugs 9, when constructed, arranged and operating substantially as and for the purposes herein specified.

82,156.—EVERETT G. PASSMORE, Jr., Philadelphia, Pa.—*Harvester*.—September 15, 1868.—De-

signed for an improvement on his patent of April 10, 1868.

Claim.—1. The combination, substantially as set forth, of the main frame, the driving wheel, the finger beam, arranged in the same vertical plane as the main axle, but on a lower level, the vertically-moving pivoted tongue, the adjusting crank, and the hand lever *J*, whereby the guards may be tipped at the will of the operator.

2. The combination, substantially as set forth, of the independently-hinged reel and rake arms, the double-tracked cam, and the vertically-adjustable guide arms, whereby the beaters are caused to descend into the standing grain in advance of the cutters, and to rise before reaching the cutters, as set forth.

3. The combination, as set forth, of the rake arm, guide, and cam way *s*, with the spring latch *u*, which is lowered to lift the rake, and the latch *s*², which falls to guide it back to the track, whereby the gavel is always removed, unless the rake is lifted by the latch.

4. The combination, in a harvester, substantially as set forth, of a series of independently-hinged rotating rake and reel arms with the double-tracked cam way and connecting guides, when so arranged that the rake descends upon the platform behind the cutters, to sweep off the gavel, while the beaters descend into the grain in advance of the cutters, and rise before reaching them, to lift fallen grain.

82,157.—EZRA PECK, Chicago, Ill.—*Plow*.—September 15, 1868.—A hollow plow beam is provided with flanges to keep it from buckling and serve as a means for riveting on strips which enable the beam to stand a greater cross strain. The inner face of the colter standard is rounded, and its cutting angle is controlled by a clasp which is adjusted by nuts.

Claim.—1. A hollow sheet metal beam, when constructed with the flanges *E E*, as set forth, and for the purpose specified.

2. Constructing a hollow plow beam by riveting or otherwise properly fastening together the two parts, *A* and *K*, or their equivalent, for the purpose specified.

3. Constructing a hollow plow standard and beam, curved and bent in one continuous piece, directly from sheet metal, in the manner and for the purpose specified, as a new article of manufacture.

4. The slotted concave support, in combination with the beam *A*, and mold board *z*, all arranged as set forth.

5. Rounding or angling the inner bearing or face of the colter standard *u*, when used in connection with the clasp *j*, in the manner and for the purpose specified.

6. The beam *A*, strip *K*, flanges *E E*, slotted support *o*, and mold board *z*, all constructed and arranged as set forth.

82,158.—THEODORE P. PECK, Savannah, Ga.—*Smoke Stack*.—September 15, 1868.—The cone box has a perforated upper section and outlets provided with covers in its lower part. An inverted truncated cone-shaped sieve is secured to the stacks and opens into the cone box.

Claim.—1. The cone box *B*, having perforated upper section, with bonneted outlets or port holes *e'*, substantially as herein described.

2. The inverted truncated cone-shaped sieve *F*, arranged within the perforated upper section of the cone box *B*, substantially as and for the purpose herein set forth.

3. The combination of the cone box *B*, and sieve *F*, with each other, and with the other parts of a smoke stack, substantially as herein specified.

82,159.—ELIAB PERKINS, Fond du Lac, Wis.—*Metallic Shutter*.—September 15, 1868.—Two recessed plates are riveted together, a chamber being thus formed. The upper part of the outside plate is slotted and the lower part of the inside plate is perforated to allow a current of air to enter from the outside. A receptacle for water is placed in the recess, so that in case of fire the steam escaping from the openings keeps the wood-work from burning.

Claim.—1. A metal shutter, formed of two plates

recessed and riveted together, in the manner substantially as described.

2. A metallic shutter, constructed substantially as herein described, and provided with a water reservoir, substantially as set forth.

82,160.—EDWARD R. PLAYLE, Great Bend, Pa.—*Furnace for Melting Steel, Iron, &c.*—September 15, 1868.—The furnace is set on trunnions and is tipped by a gear wheel and pinion.

Claim.—The furnace A, when suspended on trunnions with power gear attached, for the purpose herein described.

82,161.—JOSHUA REGISTER, Baltimore, Md.—*Stop Cock.*—September 15, 1868.—Both the screw cap and valve stem are packed with an elastic diaphragm.

Claim.—1. The valve F, constructed with a flange, *i*, and embraced by an elastic packing, *h*, which is applied between the collar and cap of the stop cock, substantially as described.

2. A right and left screw valve stem D D', a valve F, and the packing *h*, combined and adapted to operate substantially as described.

82,162.—JAMES SELBY, Peoria, Ill.—*Corn Planter.*—September 15, 1868.—The seed slide is supported at its rear by a roller on a projecting arm, and operates a cranked rod provided with a valve at its lower end, so as to close alternately two holes in the lower part of the tube, separated by a partition.

Claim.—1. The combination, with the slide C, of the roller *h* and arm or support D, when arranged to operate substantially as described.

2. The lever L, having its lower end resting in a socket or rest connected to the seed slide, for the purpose of holding the slide down while operating it, as set forth.

3. The seed tube B, provided with the vertical partition I, and horizontal partition *f*, with the holes *o* therein, substantially as described.

4. The valve rod *b'*, with the valve *n* attached thereto, said rod *b'* being located in the seed tube B, and operated by the slide C, substantially as shown and described.

82,163.—JACOB B. SIEGFRIED, Pittsburg, Pa.—*Howel and Croze.*—September 15, 1868.—The howel and croze are so combined that the work of both may be done with one tool, the edge of the bit corresponding to the curves of the working faces of the howel, and the cutters of the croze being so adjusted in a box in the case of the howeling tool that this latter may be used without the croze.

Claim.—1. In the case of a howel, or of a howel and croze, the opposite working faces *a a'*, made substantially as described, and either with or without the flat face *a''*, for the purposes set forth.

2. A howeling bite, made with two or more curved edges, *x x'*, to correspond to the shape of the working faces *a a'* of a howel case, substantially as above described.

3. The construction of a combined howel and croze, the cutting bits of the croze being placed at or a little forward of the center of the working face of the howel, and the howeling bit just back of the center, substantially as and for the purposes set forth.

4. The frame *f*, as a box or case for the crozing chisels, hung in the combined tool by a ball and socket or hinge joint, or other equivalent device, and operated substantially as and for the purposes above set forth.

82,164.—EVAN SKELLY, Plaquemine, La.—*Apparatus for Impregnating Cane-juice and other Liquids with Sulphurous Acid Gas.*—September 15, 1868.—The gas is drawn from the furnace by the wheel with draught nozzles, submerged in the water chamber, and, having passed through the water, enters into the juice trough, where it is incorporated with the juice, which is acted on by a wheel between partition plates, that throw it against a valve controlling a damper and register. There being no excess or deficiency, sugar of uniform grade is produced.

Claim.—1. The register K, and valve J, in connection with the wheel O and pendent valve L, all arranged as shown, or in an equivalent way, to admit of the supply of gas to the cane-juice being automatically regulated by the quantity of juice passing through the juice trough, substantially as set forth.

2. The wheel O in the juice trough M, in combination with the pendent partition plates N N and recesses *e e*, all arranged as shown, for the mixing of the gas with the cane-juice, and the prevention of the escape of gas from the juice trough, substantially as shown and described.

3. The wheel F, provided with the draught nozzles *a*, and submerged in the chamber E, in combination with the pipes B B' B'', and furnace A, all constructed and arranged as shown, for the purpose of drawing the gas from the chamber through the water in E, substantially as set forth.

82,165.—FREDERICK P. SMITH, Petaluma, Cal.—*Gang Plow.*—September 15, 1868.—The furrow and land wheels are adjusted through the operation of the easter wheel held by the forked arm, with the nuts, bolts, and slots of the bar attached to the tongue.

Claim.—1. The arrangement of the devices and means herein recited for raising and lowering the frame and plows.

2. The bars, with spaces on the end of the beam, and on the tongue, with the bolts and nuts for the adjustment of the land wheel axle, and the easter wheel's arm, as herein set forth.

82,166.—F. P. SMITH, Petaluma, Cal.—*Gang Plow.*—September 15, 1868.—The plow beams are connected by chains to the bent lever resting on a frame and attached to a rod pivoted to the hand lever, while their front ends are pivoted to the cranks of the shaft attached to the axle.

Claim.—The combination of the several means and devices herein set forth, for raising and lowering the plows.

82,167.—HENRY SMITH and JAMES EMERY, Buffalo, N. Y.—*Twine Box.*—September 15, 1868.—The screw-shank portion of the knife, which is attached to the twine box outside, passes through the box and fastens both the knife and bottom to the box.

Claim.—1. The adjustable and removable knife B, having a screw shank, C, and set screw C', in combination with the twine box A, substantially as described.

2. The extended screw shank C and set screw C', as a means of connecting and securing both the knife B and removable bottom D to the main body of the twine box A, substantially as herein described.

82,168.—ISAAC B. SMITH and HENRY C. BURR, Springfield, Vt.—*Hames.*—September 15, 1868.

Claim.—1. The combination of the post A, double post B, and bolt E, arranged and constructed substantially as and for the purpose described.

2. In combination with the bolt E, the washers J and K, arranged upon it, substantially as set forth.

82,169.—HENRY D. SNYDER, Carbondale, Pa.—*Coal Stove.*—September 15, 1868.—The air is supplied through the fire box and cylinder, and rising into the inner cylinder is deflected into the burning fuel, while a radiator at the top of the stove radiates the heated air into the room.

Claim.—A stove composed essentially of the wall A, formed of the system of doors as above described, the grate D, supported as described, the cylinders C and G, the upright shaft I, the centering plate *i*, and the radiating box J, all the said being constructed and put together as described.

82,170.—HENRY SPENDELOW and ROBERT HENEGAGE, Buffalo, N. Y.—*Grain Drier.*—September 15, 1868.—Air is made to pass horizontally through the chambers between the disks, instead of vertically.

Claim.—1. The arrangement, in combination with the closed chambers, of the disk plates *k*, and raised flanges *h*, in the manner and for the purpose herein set forth.

2. The combination, with the arms *l l*, of the

spreaders *p p p*, arranged as described and operating in the manner and for the purpose specified.

3. The arrangement, in combination with the drying floors C, and arms *l l*, of the series of slots *m m*, receding in position, so as to leave a closed surface in the succeeding floor below each slot, as herein set forth.

82,171.—G. W. STAATS, Newcastle, Pa.—*Guide for Scroll Saw*.—September 15, 1868.—The guide plate is let into the saw table, and has an oval part, inclosing the saw, projecting upward, the pattern on which the board is laid resting on the guide. For greater curves, the guide is placed with its base upward, and the work passes under it.

Claim.—1. The guide A *a*, substantially as described, in combination with a scroll saw and a pattern, all as and for the purpose set forth.

2. The auxiliary guide plates *h h'*, links *i i*, and suitable accessory plates *k j k* and screw *l*, for giving the proper curvature to the plates *h h'*, all substantially as shown and described, in combination with the guide plate A' *a'* and a scroll saw, all as set forth.

82,172.—FRANK STANLEY, Austin, Texas.—*Joining and Fitting Hoof Hooks*.—September 15, 1868.

Claim.—The fitting of the hoof hook or cleaner into the back of the ordinary horse brush, and the mechanism above described, by which it is confined in its sheath or thrown out at pleasure, or any similar arrangement answering the same purpose.

82,173.—CHARLES STODDARD and AMOS STODDARD, Naples, N. Y.—*Cooking Stove Ventilator*.—September 15, 1868.—A sliding sleeve on the stove-pipe has a small pipe connected with an inverted dish for conveying into the stove pipe the odors and steam from the stove.

Claim.—The sleeve *a*, as arranged and combined with stovepipe A, pipes B and D, and metallic dish C, substantially in the manner and for the purpose herein set forth.

82,174.—JOSEPH D. STRATTON and THOMAS WILSON, Macinaw, Ill., assignors to JOSEPH D. STRATTON.—*Cheese Press*.—September 15, 1868.—A cam between the pressure rollers serves to impart a constant and uniform pressure on the lower side of the substance pressed.

Claim.—A cheese press having attached thereto the cam H, lever K, rollers E and G, and sliding beams P, constructed and arranged substantially as specified.

82,175.—HOOPER B. STRAUT, Greenleaf, Minn.—*Wash Board*.—September 15, 1868.

Claim.—In combination, the construction of the rubbing board D within frame C, and the mode of attaching the same thus constructed to a common washing board, substantially as and for the purposes described.

82,176.—SENECA A. SWALM and CHARLES C. SCHMITT, New York, N. Y.—*Fire Escape*.—September 15, 1868.—The ladder is provided with tubular rungs screwed in the side ropes, and folds in a box which has a swinging bottom near its inner edge, extending out and below the window frame, being upheld by a latch while attached to the top and inside.

Claim.—1. A fire-escape ladder, attached at the upper part of the window, inside the building, in combination with a box or receptacle for holding such ladder when folded, and a swinging bottom and latch, applied substantially as set forth, to cause the ladder to pass outside the building as it is unfolded for use, as specified.

2. The tubular rungs for the ladder, formed with right and left-hand screws at their ends, in combination with the links *n*, that connect with the ropes or chains, substantially as set forth.

82,177.—GEORGE TANNER, Freetown, N. Y.—*Fruit Gatherer*.—September 15, 1868.—The saw is detachable, and when not used the hook and back of the knife serve as clamp upon a branch.

Claim.—1. The combination of the rod C, with its hook E, and the rod A with its cross head piece, to

form an adjustable clamp for the uses and purposes set forth.

2. In combination with the above, the saw F, when arranged to operate as described.

82,178.—WILLIAM H. TAPPEY, WILLIAM C. LUMSDEN, and ALEXANDER STEEL, Petersburg, Va.—*Cotton Press*.—September 15, 1868.—The ratchet wheel turns the shaft, and bringing the beam and follow block down on the cotton, it being again raised by means of the endless chain and the grooved pulley keyed on the shaft.

Claim.—The shaft G, wheel P, rack B, wheel H, pawls *e* and *d*, double arms Q, rod *k*, lever M, and roller *f*, all arranged, constructed, and operated substantially as described, in combination with the follow block C and beam A of an upright press, as set forth.

82,179.—JOHN W. THOMPSON and FRANCIS M. THOMPSON, Greenfield, Mass.—*Bit Stock*.—September 15, 1868.—The socket piece is slidden longitudinally in the bit-shank by turning a sleeve or tubular nut, so as to center and secure or release the tool shank by pivoted grippers resting in a coneave at the end of the socket and actuated by the socket piece.

Claim.—A bit stock or tool holder constructed and arranged so as to operate substantially as described.

82,180.—THOMAS THORLEY, Southfield, Mich.—*Cultivator*.—September 15, 1868.—The draught is attached to the widest part of the machine. Braces or "levers" are attached to the forward ends of the hinged plow beam, and to a rod in a slotted plate, to admit of the plows being adjusted to a greater or less width.

Claim.—1. The quadrant I, provided with flanges J, when attached, and operating substantially as and for the purposes herein described.

2. The levers K, the bolt and hand nut L and the plate N, provided with the slot N, when arranged and operating substantially as and for the purposes herein shown.

3. The combination of the beam A, the vertical standard C, the teeth D and H, the handles E and arms F, the standards G, the quadrant I, the flanges J, the levers K, the bolt and hand nut L, the slot M, and plate N, when constructed, arranged, and operating substantially as and for the purposes herein set forth, described and shown.

82,181.—WILLIAM M. TILESTON, New York, N. Y.—*Paper Fastener*.—September 15, 1868.

Claim.—Corrugating, fluting, or grooving the points and arms, for punching the holes as described.

82,182.—RICHARD H. TRADENICK, Pittsburg, Pa.—*Lubricator*.—September 15, 1868.—The top of a column in the oil cup forms a seat for a ball which is confined by a set screw above. The column is pierced by an oil passage leading to the crank pin, and the oil is fed through the same by the play of the ball when the engine is in motion.

Claim.—The oil cup C, having the column E, oil passage G, ball F, top K, and set screw L, when constructed and operating substantially as and for the purpose set forth.

82,183.—JOHN D. VANDUZER, Tyrone, N. Y.—*Sewing Machine*.—September 15, 1868.—The cam wheel connected to the arm actuating the needle bar, also actuates the shuttle propeller. The crank, and eccentric wheel fastened to the shaft, the arm being slotted, its position, and that of the connection held in place by means of the pendulous frame, may be changed to adjust the throw. The lever for feeding the cloth being also connected to the frame and the eccentric, the adjustment of the various parts allow the distance the needle moves to be increased or lessened at will.

Claim.—1. The arrangement of the cam wheel C, connection D, lever E, and pendulous frame I, when constructed and operating substantially as and for the purpose set forth.

2. The eccentric H, bar N, and pivoted lever O, in combination, when constructed as described, and arranged to give motion to the cloth, substantially as herein set forth.

82,184.—C. W. WAILEY, New Orleans, La., assignor to THE NEW ORLEANS PNEUMATIC PROPPELLING COMPANY.—*Out-off Valve Gear for Steam Engine.*—September 15, 1868.—At the end of the piston stroke the toggle is bent from a straight line and raises the induction valve, while the sliding bar opens the eduction valves the instant the piston changes its motion for the return strokes.

Claim.—1. The arrangement of the toggle joints D D' D'' D''', with reference to the induction and eduction valves, when those parts are constructed substantially as herein described.

2. The arrangement of the toggle joints D D' D'' D''' with the bars E and E', substantially as herein described.

82,185.—JACOB M. WALTER and SAMUEL SHANK, Springfield, Ohio.—*Post Hole Borer.*—September 15, 1868.—Pivoted uprights support the boring and lifting mechanism, and are made to vibrate in contact with semi-circular plates affixed to the bed frame, which serve to adjust the uprights and auger shaft in a vertical position for boring a hole on the side of a hill.

Claim.—1. The arrangement, within the frame G J K, hinged at L to the main frame, of the jointed shaft *f f*, bearing the auger, the arm *g*, and beveled gear wheel *k*, adapted to turn with and move longitudinally on said shaft, pinion *l*, on crank shaft H, windlass I, cords *p*, ratchet wheel *n*, pawl *o*, and crank M, all constructed and arranged to operate in the manner and for the purpose herein set forth and shown.

2. The hollow blocks C, fixed to frame A, and adapted to receive the head, *b*, of axle *a*, on which the wheel B is held by means of nut *d*, as herein shown and described, for the purpose specified.

82,186.—ELI G. WARNER, Union Township, Ohio.—*Rail Fence.*—September 15, 1868.

Claim.—The construction of a fence with a triangular frame, A B C, in which the rails are laid obliquely, in the manner and for the purpose as above stated.

82,187.—CHARLES S. WESTLAND and JOHN B. ALLEN, Providence, R. I.—*Kitchen Implement.*—September 15, 1868.—A stove plate lifter has a widened shank provided with slots for holding spoons, knives, &c., below which is a chamber for catching grease from said spoon, &c.

Claim.—A kitchen implement, constructed substantially as described, and for the purpose set forth.

82,188.—MARGEANNAH WHITE, Providence, R. I.—*Shoe Lacing.*—September 15, 1868.—A single piece of wire having an eye at the center and curved at each end.

Claim.—The eye A, in connection with its fastening B and C, when constructed and applied to a shoe, substantially as set forth and for the purpose specified.

82,189.—CHARLES E. WILSON, Palmyra, assignor to himself, PUTNAM WILSON, Jr., and PHILIP WILSON, of East Newport, Me.—*Attachment for Plow.*—September 15, 1868.

Claim.—The spring B, adjustable roller head D, and roller C, as an attachment for a plow, all constructed and operating substantially in the manner and for the purposes shown and described.

82,190.—FURMAN R. WILSON, Philadelphia, Pa.—*Valve Gear for Steam Engine.*—September 15, 1868.—The cams on the upper piston rod are adjustable, so as to cause the steam ports to open at any desired length of stroke. A working lever for operating the valves is provided with a roller on the end of each arm, and is actuated by the alternate movement of an elliptical and a conical cam, one above the other, on the same piston rod.

Claim.—1. The arrangement of the adjustable cams C' C', composed, as described, with reference to the screw thread *b* on the piston rod I', and the key *e* and key slot *d*, substantially as herein shown and described, and for the purpose set forth.

2. The lever O O O, with its two short arms, having the rollers *h* and *i* arranged with reference to the

valve rods M M and cams T and S, upon the piston rod I, substantially as herein described, and for the purpose set forth.

3. The cams S and T, being both arranged on one piston rod, in combination with the lever O O O, substantially as described, and for the purpose set forth.

82,191.—J. A. WOODWARD, S. S. WOODWARD, and THOMAS MASON, Sandwich, Ill.—*Cultivator.*—September 15, 1868.—Arms, to which the axles are secured, are hinged to the frame and balance the same on the axle. A seat is hinged at the rear, so that when used for a riding cultivator the wheels are thrown back and the seat folded on top. Handles are pivoted to the standards of the shovels, so that their upper ends may be adjusted, for tilling the row.

Claim.—1. The reversible axle joints H H, pivoted to the frame A B, and arranged to balance the same, substantially as set forth.

2. The combination of the above-described axle joints with the frame A B and folding seat L, as and for the purpose herein described.

3. The handles D D, pivoted to the standards E E, and made adjustable to or from each other by means of the slotted plates F F and set screws I I, as described and shown.

82,192.—LINUS YALE, Jr., Shelburne Falls, Mass.—*Permutation Lock.*—September 15, 1868.—Bearing screws at each corner of the lock are turned until they bear against the door, and bring the lock in such relation to it that the spindle will work freely. The lock is then secured by fastening screws

Claim.—1. The method of adjusting the lock to and connecting it with the door by means of the steady pins and bearing screws, substantially as described, in combination with the fastening screws, or the equivalent fastening, as and for the purpose described.

2. In combination with the lock bolt, two sets of rotating tumblers and their appendages, each set operated by one spindle, which also acts upon the bolt and the racks connected with the fence of the tumblers, and capable of being thrown separately in and out of gear with the pinion on the lock bolt, substantially as and for the purpose specified.

3. The rack, or its equivalent, to stop or liberate the lock bolt, when combined with the fence of the tumblers, by means of an interposed spring, or equivalent, substantially as and for the purpose specified.

4. Combining the eccentric roller, which is acted upon by a wheel or equivalent on the spindle, with the fence of the tumblers by a vibrating lever, or equivalent therefor, having a spring or equivalent interposed between it and the fence, substantially as described, and for the purpose set forth.

5. Balancing the tumblers, or, as the equivalent thereof, disconcerting the preponderating weight relatively to the slots for the fence, substantially as and for the purpose specified.

6. A sliding and rotating spindle, which both shoots the bolt and revolves the tumblers, as described, and is provided with a cylindrical cavity, as specified, in combination with a stationary arbor of greater length than the space occupied by the pack of tumblers, and projecting into the cylindrical cavity of the spindle, the combination being substantially such as hereinbefore set forth.

7. Combining with the case which contains the tumblers, and which is fitted to the tubular projection from the lock frame, so that it can be inserted therein and removed therefrom for the purpose of changing the combination, a spring bolt or latch, controlled by a separate lock, substantially as and for the purpose described.

8. Making the knob hollow and threaded on the inside to receive the threaded portion of the spindle to such an extent that it can be fitted to doors of various thicknesses, and then prevented from turning, the one on the other, by a feather key, as described.

82,193.—JAMES ARMSTRONG, Bucyrus, Ohio.—*Apparatus for Tilling Grain.*—September 15, 1868.—Partitions of glass are placed obliquely across the box, which distributes the grain evenly as it falls

upon them. A spout narrower than the box is placed under the end of the lowest partition and is divided, the upper part being hinged and acting as a gauge.

Claim.—The combination of the box A with partitions or chutes *e f g*, the spout *k*, and the gauge *l*, when constructed and arranged as and for the purpose herein set forth.

72,194.—HAYDN M. BAKER, Harlem, N. Y.—*Process of Refining Cast Iron.*—September 15, 1868.

Claim.—The use of soluble and fusible insoluble silicates of soda, potash, and other bases, consisting of silicate of lime, magnesia, barytes, strontian, lead and bismuth, or mixtures of same, for the purpose of removing silica, sulphur, carbon and metallic oxides from iron at very elevated temperatures, in the manner herein described and for the purposes fully set forth.

82,195.—WILLIAM M. BARTRAM, Philadelphia, Pa.—*Vapor Condenser for Lard-rendering Kettles.*—September 15, 1868.

Air forced into the cap above the fire partly condenses the vapor, which is then forced through an inclined condenser and then through a vertical condenser, from whence the uncondensed vapor escapes into the chimney.

Claim.—1. The employment of the air tube *g*, through which air is forced by a bellows, or other equivalent means, into the cap D, above the fire, in combination with the goose neck E, condensers F and G, and pipe S, leading into the chimney, whereby a part of the vapor is condensed, and the uncondensed vapor is carried up the chimney, substantially as set forth.

2. The arrangement of the kettle C, cap D, air tube *g*, condensers F and G, pipes I J N *k*, conduit pipe *m*, discharge pipes *t t'* L, and pipe S, all constructed and operated in the manner and for the purpose set forth.

82,196.—JOHN BELLERJEAU, Philadelphia, Pa.—*Lamp.*—September 15, 1868.—An annular plate sets over the burner and has attached to it three pendent springs terminating in rests. The springs expand when the chimney is placed over them, and bear against the bulging part of the chimney and hold it firmly.

Claim.—Pendent springs B, terminating in hooks or rests C, when attached to the lower side of an annular plate, F, having an annular hole, A, in its center, substantially as and for the purpose herein shown and described.

82,197.—P. R. BENNETT, Jr., Urbana, Ohio.—*Watch.*—September 15, 1868.—The jewel is suspended centrally within a cavity made in the cap, and has an elastic bearing on every side.

Claim.—Suspending the jewel or bush of a watch by means of lateral springs placed about the same, substantially in the manner and for the purpose herein set forth.

82,198.—AUGUSTE LÉON BEZY and ISIDORE AGNAN DESNOYERS, Paris, France.—*Steam Generator.*—September 15, 1868.—The casings being arranged eccentrically to each other, the water is heated faster on one side than on the other, thus creating a current and preventing any deposit of sediment.

Claim.—1. The arrangement of the inner and outer casings of a steam boiler eccentrically to each other, for the purpose set forth.

2. A boiler, the outer shell of which consists of two or more flanged sections, constructed and so secured together by screw bolts as to be detachable from each other, substantially as herein set forth for the purpose described.

82,199.—H. S. BLOOD, Jefferson, La.—*Railway Safety Attachment.*—September 15, 1868.—Two drums are supported by a frame upon a revolving shaft in such a manner that their perimeters may be kept in contact with the perimeters of the fore wheels of the car, and by this means being made to revolve in an opposite direction, will throw any obstacle off the track.

Claim.—The combination of a railroad car with the fender wheels A A, the shaft I, and the frame B,

when these parts are constructed, arranged, and operate substantially as herein described for the purpose set forth.

82,200.—AMOS BOND, Chicopee, Mass., assignor to himself and A. D. MOORE, same place—*Feather Renovator.*—September 15, 1868.—A cylindrical holder provided with perforated partitions, incloses a steaming apparatus, composed of a drying cylinder extending lengthwise through the feather holder and inclosing a steam chest from which steam passes into the holder through pipes covered with sawn caps like gas burners. Steam is admitted into the steam chest by suitable rotary valves.

Claim.—1. The combination of the revolving feather holder A, drier C, steam chest D, tubes I, valve seat E, two-way valve F, valve seat H, blow-off pipe G, exhaust valve G', reservoir K, and pipe J, substantially as and for the purpose described.

2. The removable partition P, applied to the revolving feather holder A, to form compartments therein, substantially as described.

3. The slotted or sawn caps, applied to the outer ends of the tubes I, when the latter are applied to the steam chest D and drier C, substantially as and for the purpose set forth.

82,201.—JOSEPH BOURKE, Curraghleigh, Ireland.—*Skate.*—September 15, 1868.—The sole clamp and heel clamp are connected together at any desired distance asunder by means of a hook, secured to a nut sliding in the heel plate, and a perforated plate secured to the heel clamp, which latter slides over the runner.

Claim.—The combination of the perforated plate C and hooked rod D' with the movable sole plate B, lips *b' b'*, and heel plates E E', all arranged to operate substantially as and for the purpose herein described.

82,202.—WILLIAM K. BOYLE, Brookville, Md.—*Manufacture of Artificial Stone.*—September 15, 1868; antedated September 7, 1868.—Stone formed of sand and gravel, combined with soluble silicate of potash, is submitted to the action of a hot solution of the nitrate of lime.

Claim.—1. The herein-described process of manufacturing artificial stone, by means of which the insoluble silicate of lime is formed, by the double decomposition of the silicate of potash and nitrate of lime, substantially as herein set forth and described.

2. As a secondary result, the utilization of the nitrate of potash, as a waste material, in the manufacture of artificial stone, as herein set forth and described.

82,203.—F. A. BRADLEY, New Haven, Conn., assignor to himself, JAMES G. ENGLISH, and E. F. MERSICK, same place.—*Top Prop for Carriage.*—September 15, 1868.—A piece of metal covers the screws, which secure the stud to the bow. The ends of the braces fit on a sleeve having a flange on the outer edge. Said sleeve fits over the stud, and is held against the metal cover by a nut.

Claim.—1. In combination with a stud, A, of other than cylindrical form, the sleeve F, formed with the flange *a* and the nut G, arranged so as to bear against the said flange, substantially as herein set forth.

2. In combination with the stud A formed upon the plate B, the covering plate D, with its neck or projection E, when constructed and arranged so as to cover the plate B, substantially in the manner herein set forth.

82,204.—H. K. BUGBEE, Williamstown, N. J.—*Portable Platform Scale.*—September 15, 1868.—The platform rests on levers having their fulcrums on plates secured to racks, which slide in standards resting on the surface of the ground. The wagon is placed over the bars, and the racks are raised until the wheels are free.

Claim.—1. The levers G and H, having their fulcrums on plates J, which rest upon adjustable standards A and A', or directly upon the surface of the ground or floor, in combination with a graduated

scale beam, and the within-described appliances, (or their equivalents,) connected therewith, all substantially as and for the purpose set forth.

2. In combination with the above, the bars L or platform M, for the purpose specified.

3. The frame D, with its fixed and movable arms *h* and *h'*, for the purpose specified.

82,205.—A. J. CARVER and E. P. HORN, Greenhill, Tenn.—*Hog Cholera Medicine*.—September 15, 1868.—Composed of May-apple root, rhubarb, and columbo.

Claim.—The aforesaid medicinal compound for the cure and prevention of hog cholera.

82,206.—WILLIAM CHESLEY, Cincinnati, Ohio.—*Globe Valve*.—September 15, 1868.—The detachable seat is held in position by a bolt. The valve is made of cast iron, with a groove on its periphery, and depressions, which hold the brass that is cast over the portion which comes in contact with the seat.

Claim.—1. The bolt D, screwed into the disk *e* of the seat B, and drawing said seat in the direction of the pressure of the valve, as and for the purpose specified.

2. The valve C with groove G, depressions I I, and lining L, of brass or any other suitable material, substantially as and for the purpose described.

82,207.—HOLLEY M. CLARK, Brewer, Me.—*Hand Rake*.—September 15, 1868.—The operator is behind the rake, and presses it forward. The wheel acts as a fulcrum for raising the revolving rake when it is loaded with hay.

Claim.—The shafts A B, wheel D, tie C, cross-beam E, and arms F F F F, in combination with the rotating rake G *d d d*, all constructed and operating substantially in the manner and for the purposes shown and described.

82,208.—PAUL CONDAY, Philadelphia, Pa., assignor to himself and CHARLES F. LEISEN.—*Apparatus for Brewing Malt Liquor*.—September 15, 1868.

Claim.—An apparatus so constructed that the steam rising from the brewing boiler during the process of brewing may be used for the purpose of heating and preparing the wort for each succeeding brewing, as described.

82,209.—THOMAS B. DE FORREST, Birmingham, Conn.—*Busk or Stay for Corset*.—September 15, 1868.—The stay is formed of paper, in which is inserted a flat strip of steel, to give the required elasticity.

Claim.—A dress or corset busk of paper, or similar fibrous material, having inserted longitudinally therein a metallic spring, substantially as set forth, as a new article of manufacture.

82,210.—W. B. FARWELL, New York, assignor to himself and CHARLES R. ABBOTT, Elmira, N. Y.—*Railroad Car Heater*.—September 15, 1868.

Claim.—1. The universal joints D D, and the pipes B B and C, applied to the permanent or fixed pipes A^x of the cars, for the purpose of forming a steam-tight connection between the pipes of the cars, and admitting of a free, vertical, lateral, and longitudinal play or movement of the latter, substantially as set forth.

2. The placing of the coiled or sinuous portion of the steam pipes A^x in inclined positions, with water receptacles G, communicating with them at their connecting points, said receptacles being provided with valves or siphons, so arranged as to admit of the discharge of the water of condensation at proper intervals, without permitting the escape of steam, substantially as set forth.

82,211.—SAMUEL FAWCETT, Rochester, N. Y.—*Cutter Head*.—September 15, 1868.—The wings are grooved, and slide over projections on the cutter head, and are held by set screws.

Claim.—The rotary cutter head, having one or more wings for holding the knives, made adjustable longitudinally, constructed to operate substantially as described.

82,212.—HEINRICH FEDDER, Lancaster, N. Y.—*Liniment*.—September 15, 1868.—Composed of butter oil, juniper berries, and beech-nut oil.

Claim.—The liniment, made of the ingredients, and in the manner substantially as herein described.

82,213.—HORACE B. FERREN, Batavia, N. Y.—*Device for Measuring the Feet of Horses*.—September 15, 1868.—Slotted slides placed between two plates radiate from the center in the proper direction to take the requisite measurements, and are held by a screw. A double slotted slide is placed between tongues on the plates, and held by a screw passing through the slots, and is used to ascertain the measure for placing the flanges on a "Tyrrell" horseshoe.

Claim.—1. In combination with a device, as above described, for taking an accurate measure of the form of a horse's hoof, the arrangement of the index-headed screw E, center screw *a*, and point *e*, in a straight line, so as to certainly adjust the measure to the center of the foot, as described.

2. In combination with a device for measuring the hoof of a horse, the slides G, constructed as described, the index-headed bolt E and wheel F, arranged and operating as described.

82,214.—HORACE B. FERREN, Batavia, N. Y.—*Device for Measuring the Feet of Horses*.—September 15, 1868.—Slotted slides are held between two plates in a proper direction to take measurements by a screw rod around which they rotate.

Claim.—In combination with the slides F F, the adjustable slide C, and the adjustable heel slides D D, as described, all secured to the one center screw B, as and for the purpose described.

82,215.—HORACE B. FERREN, Batavia, N. Y.—*Device for Attaching Shoes to Horses' Feet*.—September 15, 1868.—A "Tyrrell" horseshoe is secured to the horse's foot by spring bands.

Claim.—1. In combination with a shoe provided with an upward projecting flange at the heel, as shown in the patent to Tyrrell, one or more spring bands, D, fastened by nuts, or their equivalents, to said flanges, substantially as set forth.

2. The bars C C, constructed as described, with a screw at the lower end to be inserted in a horseshoe, and a loop, or its equivalent, at the upper end, for the purpose of holding a band, so that the shoe may be attached to a horse's foot by the same, substantially as herein set forth.

82,216.—ELLIOT H. FUNK, Newark, Ohio.—*Churn Dasher*.—September 15, 1868.—Wings are pivoted between perforated dash boards, which are secured to a cross piece attached to the end of the dash rod. Two perforated boards are secured to the dash rod above the boards and incline outwardly, so as to break the current caused by the wings when the rod descends.

Claim.—The pivoted swinging wings *g g*, in combination with the break boards *h h* and dash boards *d d*, all arranged substantially in the manner and for the purpose set forth.

82,217.—GEORGE GABRIEL, Pittsburg, Pa., assignor to himself and PHILIP WISENBERGER, same place.—*Apparatus for Detaching Horses from Carriages*.—September 15, 1868.—The singletree and long trace are dispensed with, the harness being attached to bars which are secured to the shafts in such a manner as to be easily disconnected from them in case of accident.

Claim.—1. The plate C, having the lock E, pin *h*, and eyes *a a' a''*, substantially as described.

2. The combination of the plate C, the bars D and F, constructed and operating substantially as described.

82,218.—GEORGE L. GERARD, New Haven, Conn.—*Bed Bottom*.—September 15, 1868.—The spring is fastened to the lower slat by a pivoted button and secured to the upper slat by a stationary strip of metal and a pivoted button.

Claim.—The arrangement of the plate or strip *d* and buttons *f* and *g*, with the spring C and slats A and B, the parts being made and used as and for the purpose specified.

82,219.—T. P. GIBBONS, Baltimore, Md.—*Lamp Feeder*.—September 15, 1868.—A valve is placed near the base of the chimney through which the nozzle of the can is inserted, said nozzle being provided with a pipe in its upper part for conveying off the gas generated in the lamp.

Claim.—1. The lamp feeder D, when constructed with the tube J extending from the end of the nozzle around to the rear side of the body of the can, near its top, and thence through the wall of the can into its interior, and operating substantially as described.

2. The combination of the cock N, having the orifice *o*, with the nozzle *d*³, having the two passages *n* *n'*, by which, at the same time that the liquid is delivered from the can D to the lamp A, the gas in the latter is conveyed to the upper part of the can, without escaping around the nozzle, and in the manner described.

82,220.—JOSEPH JOHN HARRISON and EDWARD HARRISON, Broughton, England.—*Brake for Yarn Beam of Looms*.—September 15, 1868.—The tension of the warp is regulated by chains, wound around each end of the drum, one end of the chain being secured to a spiral spring, the other end to a bar connected with a lever which is held down by a spiral spring, the tension of which can be regulated by a thumb screw.

Claim.—1. The chains or bands *f*, bearing on the ends of the warp roller, and secured to a bar, *m*, in combination with the within-described devices, or their equivalents, for adjusting the bar, and securing it after adjustment, for the purpose specified.

2. The combination of the above and the springs *l*, connected to the bands or chains *f*, for the purpose described.

82,221.—SHUBAEL E. HEWES, Albany, N. Y.—*Step-ladder Joint*.—September 15, 1868.—The ends of one section are slotted, and are also provided with buttons. The ends fit over a round and the buttons in sockets on the other section.

Claim.—The joint, composed of the foot *c* *c*, the round *s*, the button B B, and the matrix-*a* *a*, substantially in the manner and for the purpose above described.

82,222.—GEORGE M. HOPKINS, Albion, N. Y.—*Low Water Indicator*.—September 15, 1868.—A vessel is suspended in such a position by swivel joints between two pipes, which connect with the boiler, the lower one resting on a spring, so as to be full of water, when the water is at a proper level in the boiler. The water falling in the boiler empties the vessel, and the spring raising it opens the feed-water cock with which it is connected and also operates a steam whistle.

Claim.—1. The vessel A, in combination with the pipes B B and C C, and the swivel joints D D, and E F, operating in the manner substantially as shown and described.

2. The stop cocks I and O, having the spring catches L L, in combination with the vessel A, arranged to operate substantially as shown and described.

3. The vessel A in combination with the whistle P and intermediate devices for giving alarm, and regulating the supply of water, as above set forth.

82,223.—CHARLES L. HORN, Jr., and LEONARD MANCY, St. Morgan Ill., assignors to LEONARD MANCY.—*Gang Plow*.—September 15, 1868.—The furrow wheel is affixed to an adjustable post, so as to be set at any height for plowing deep or shallow; it is also arranged so that the plow can be thrown forward to lessen the draught.

Claim.—1. The frame A A¹ A², the wheels B and B¹, adjustable arm *b* *b*¹, post B², and brace B³, when combined and arranged as herein shown and described.

2. The plow beams C, their posts C¹, and the frame beam A², when constructed substantially as herein shown and described, and for the purpose set forth.

3. The beams C, post D, and seat D', when constructed and arranged as herein shown and described.

4. The arrangement of the beams C, rod E, and lever E', in the manner and for the purpose herein described and set forth.

82,224.—GEORGE HOWELL and WILLIAM SMITH, Philadelphia, Pa., assignors to GEORGE HOWELL.—*Device for Filling Marshes*.—September 15, 1868.—Improvement on GEORGE HOWELL's patent of March 31, 1868. An iron case is lowered from a scow by suitable mechanism until it rests on the bed of the river. The mud from a dredging scow is dumped into it and is removed to the land to be reclaimed by a pump connecting with a perforated pipe placed in the bottom of the case.

Claim.—1. The combination and arrangement of the case B, constructed as described, with the scow A, substantially in the manner hereinbefore described, and for the purpose set forth.

2. The combination of the perforated pipes J with the case B, substantially as and for the purpose above described.

82,225.—JOHN HOYT, Hughsonville, N. Y.—*Water Wheel*.—September 15, 1868.—The convex sides of the buckets are vertical, the concave sides are beveled; the central portion being cone-shaped, divides the water centrally, so that the pressure acts equally on all the beveled wings. The water operating centrally on the under side of the wheel supports it, thus dispensing with a step at the bottom.

Claim.—An outward-discharge water wheel, constructed as described, namely, having a top plate B, inverted cone F, buckets *d* *d*, and rim D, all constructed and arranged in relation to each other, substantially as herein described.

82,226.—JENKINS JONES and T. G. EISWALD, Providence, R. I.—*Railway Snow Plow*.—September 15, 1868.—An endless apron receiving motion from the axle facilitates the passage of the snow up the incline. A deflector made in the form of a wedge and pivoted so as to be adjusted, divides the snow and throws it off equally on both sides.

Claim.—The arrangement of the frame A, constructed as above described, with the apron G and the deflector E, substantially as herein set forth.

82,227.—TIMOTHY KENNEDY, Mount Carmel, Conn.—*Belt Fastening*.—September 15, 1868.—A plate on the upper side of the belt and two bars imbedded on the under side of the belt, are held together by screws.

Claim.—The springs or bars D D, constructed with a convex or ridge surface, so as to be embedded in the surface of the belt, and combined with the plate A upon the opposite side or surface of the belt, the plate and bars secured together through the belt, substantially as set forth.

82,228.—JOHN H. KEYSER, New York, N. Y.—*Illuminating Damper*.—September 15, 1868.

Claim.—1. The door A, constructed with openings *h* and mica-holding ribs *g* *g'*, substantially as described.

2. The mica-holding plate D, interposed between door A and plate B, substantially as described.

3. Providing an illuminating door or window for a stove with fixed mica lights *d*, and movable mica lights *d'*, substantially as described and shown.

82,229.—JOHN H. KING, Smithfield, Ind.—*Gate*.—September 15, 1868.—The hinges are placed out of line so that the front end of the gate raises as it is opened, and when opened is held in place by a prop. A bolt held by a spring in a recess in the post, and operated by a lever, fastens the gate.

Claim.—1. The combination and arrangement of the pins *d*¹ *d*², plates *d*, sliding bolt E, concealed spring F, and the weighted lever G, when constructed and operating as described.

2. The combination of pins *d*¹ *d*², plates *d*, sliding bolt E, concealed spring F, weighted lever G, hinged prop H, and catch *g*, arranged and operating as described.

82,230.—JOHN KLEE, Dayton, Ohio.—*Bottle Stopper*.—September 15, 1868.—The stopper is made of wood tapering at both ends, and has a rubber washer affixed by a tack to the end that enters the bottle.

Claim.—The stopper or slug B, made conical or tapering at both ends, and provided at one end with

the rubber packing disk A, arranged as described, and secured by a tack, F, all as and for the purpose herein set forth.

82,231.—JULIUS KOPP, Hoboken, N. J.—*Attachment for Gas Burner.*—September 15, 1868.—A cap of wire gauze, provided with flanges for holding it in place, fits over the ordinary burner.

Claim.—An adjustable cap A, constructed of woven or perforated metals, with flanges A' A' A', substantially as and for the purpose set forth, as an article of manufacture.

82,232.—B. F. KRAFT, Reading, Pa.—*Faucet.*—September 15, 1868.—The valve is held against a triangular block by a spiral spring; said block is secured to the rod to which the handle is attached and turns with it, opening and closing the valve.

Claim.—The combination and arrangement of the induction passage a, valve b, spring d, handle D, three-cornered piece E, and eduction passage i, the whole being constructed and operated as set forth.

82,233.—M. F. LANNING, White House, N. J.—*Whistle-tree Swivel.*—September 15, 1868.—The swivel maintains its position by its own weight, after the trace is secured, and prevents the latter from becoming accidentally detached.

Claim.—The movable swivel D, constructed as described, with one end longer than the other, and pivoted to the end of the iron B, for the purpose of attaching trace to a whistle-tree, substantially as herein set forth.

82,234.—JOHN W. L. LETHERBURY, Sandoval, Ill.—*Tree Box.*—September 15, 1868.—A series of slats are united together to form a folding frame capable of being enlarged or diminished as required.

Claim.—A tree wrapper, constructed and operating substantially as described.

82,235.—HENRY LABER, Bellfair Mills, Va.—*Churn.*—September 15, 1868.

Claim.—The herein-described triangular form of paddles, arranged in alternate ranks, in opposite position, as relates to their angles upon the shaft, as herein shown and described.

82,236.—MILES MAYALL, Roxbury, Mass., assignor, by mesne assignment, to GEORGE W. MAYALL.—*Carpet Lining.*—September 15, 1868; antedated June 27, 1868.

Claim.—As an article of manufacture, an under lining for a carpet, constructed from an elastic fibrous material, placed between the surfaces, one of paper and the other of a thin open woven fabric, and having perforations through the whole, substantially as described.

82,237.—JOSIAH F. MELCHER, Bloomington, Ill.—*Machine for Bending Wood.*—September 15, 1868.—A table or former of the desired curve is placed upon a cross beam, and a frame, consisting of two parallel bars, is forced down upon the interposed material to be bent.

Claim.—The construction and arrangement of the cross beam C, tables F F', and frame D D', substantially as shown and described.

82,238.—JOHN G. MOXEY, Philadelphia, Pa., assignor to himself, HENRY C. CAREY, and ABRAHAM HART, same place.—*Process of Debranning Wheat.*—September 15, 1868.—Designed as an improvement on the process described in the patent granted to SAM'L BENTZ, Feb. 11, 1862.

Claim.—The within-described improved process of debranning wheat, that is to say, subjecting the grain, without the use of steam, and while in a dry state, to the action of the blades, in the manner described.

82,239.—JOSEPH NASON, New York, N. Y., assignor to himself, CHARLES H. JAMES, and FRANK MILLWARD, Cincinnati, Ohio.—*Drop Tube Steam Generator.*—September 15, 1868.—The extension of the outer tube is designed to provide against any conflict of the ascending and descending currents at or near the top of the drop tubes, and also for taking water

into the internal tubes from the spaces between the tops of the main tubes.

Claim.—1. The within-described extension of the drop tube upward above the upper surface of the tube sheet A, and the provision for allowing a current of water to enter through the side of such extension, and descend through an inclosed passage or tube, d, combined and arranged substantially as and for the purpose herein set forth.

2. In connection with the above, making the extended top D' in a separate piece from the main drop tube D, and adapted to serve, relatively to the other parts, substantially in the manner and for the purposes herein specified.

82,240.—A. M. NEWMAN, Terre Haute, Ind.—*Saw-sharpening Device.*—September 15, 1868.—Two files are placed within an adjustable frame, so arranged as to accommodate files of different sizes, and have all the saw teeth filed at the same pitch.

Claim.—1. The adjustable standards B B, provided with heads C C, and washers e e, for the purpose of securing the files, and adapting the machine to different-sized files, substantially as and for the purposes herein set forth.

2. The combination of the slotted bar A, standards B B, handles D D, rod d, and guides i i, constructed and operating substantially as and for the purposes herein set forth.

82,241.—NELSON B. NORTON, Burlington, Wis.—*Four-wheel Plow.*—September 15, 1868.—A lever for raising and lowering the plow is connected with the plow beam and pivoted to the frame. The depth of the plow in the ground is regulated by a rod in the cap of the parallel posts and is operated by means of a nut.

Claim.—1. The arrangement of the lever H, jaws I, and metallic straps K, with the plow beam F, frame C, post or standard L, straps M, and catch h, when constructed and used as and for the purpose set forth.

2. The adjustable rod g, in combination with the frame C, and plow beam F, when arranged as and for the purpose specified.

82,242.—WILLIAM C. PETTIJOHN, St. Louis, Mo.—*Lime Kiln.*—September 15, 1868.—The kiln is fed from the top with stone and fuel, the ashes and refuse matter is discharged at the bottom; the burnt stone is drawn off through an aperture at the side of the kiln. The operation is performed continuously.

Claim.—The arrangement of the kiln A, having the chamber A', grate a, ash pit B, side aperture a', metallic dome D, constructed in two parts, and having the smoke exit d², all combined substantially as herein set forth.

82,243.—SETH G. PITTS, Leominster, Mass., assignor to himself and WILFORD L. PALMER, same place.—*Machine for Forming Buttons.*—September 15, 1868.—Over the space between the two sets of mandrels are two ways or rails upon one of which slides a toothed rack. Below the rails are two clamps which hold the sheet of horn or steel from which the buttons are cut.

Claim.—The combination of as well as the arrangement of one or two sets of mandrels A B, the toothed rack or carrier L, and its supporting rail K, and the clamps M M, the whole being provided with mechanism for operating the rack, mandrels, and clamps, substantially as described.

82,244.—JOHN T. PLASS and REUBEN H. PLASS, New York, N. Y.—*Apparatus for Carbureting Air.*—September 15, 1868.—The liquid is discharged into a trough which is presented to both chambers; orifices near the bottom of the trough in the partitions allow the liquid to flow freely into the chambers but prevent the air from entering.

Claim.—1. The gato E, in combination with the fluid trap e², constructed as described, for regulating the supply of hydrocarbon to the evaporating chamber, and returning the surplus to the reserve chamber, substantially as set forth.

2. The tubular stem of the hollow cone valve G, for the insertion of shot or other suitable weights, for adjusting the pressure in the gasometer, substantially as set forth.

82,245.—R. B. PRINDLE, Norwich, N. Y.—*Blind Hinge*.—September 15, 1868.—The upper leaf has a conical bearing fitting into a seat in the lower one; a pin is secured to the upper one, which fits in a slot in the lower one. A shoulder on the lower leaf engages with a projection on the upper leaf when the shutter is opened; by pushing against the shutter the pin slides back in the slot and the projections are disengaged.

Claim.—A self-locking blind hinge, formed by combining the pin G (with its conical base, and a corresponding seat in the disk F) with the shoulder H, engaging the leaf D, in the manner and for the purpose substantially as herein shown and described.

82,246.—HENRY W. PROUTY, Boston, Mass., assignor to himself and HOWARD TILDEN, same place.—*Animal Trap*.—September 15, 1868.—Two arms drawn together by springs are pivoted to two sides of a frame and have spears projecting across the end of the frame nearly meeting in front of a hole in which the bait is placed. They are set by being opened and their ends placed in contact with a bent lever catch which connects with the bait.

Claim.—The arrangement of the arms D D, spears K K, bait rod L, and bait cup C, in combination with the spring F and catch G, the whole being constructed and arranged upon a block or frame, substantially as described and for the purpose set forth.

82,247.—JANE C. PUTNAM, Worcester, Mass.—*Table*.—September 15, 1868.—The sides of the table are grooved and the top tongued so that it can be drawn out and used as an ironing board. The body of the table is provided with drawers and used as a refrigerator.

Claim.—1. The construction of the top B, the pieces C C, for supporting the top, in connection with the slide R, substantially as set forth and described.

2. The combination of the movable legs, leaves, drawer or drawers, and a fastening mechanism that holds both drawer and leaves, substantially as set forth and described.

82,248.—S. D. RADER, Williamsport, Pa.—*Brick Kiln*.—September 15, 1868.—A series of furnaces are constructed along the sides of the kiln and one at each end, provided with proper communication and air openings.

Claim.—The arrangement of the kiln A, end furnaces C, and long side furnaces B, composed of a series of small fireplaces *o o o*, and provided with draught holes *i i*, at the side and ends, all constructed substantially as and for the purposes herein set forth.

82,249.—JOHN T. RICH, Philadelphia, Pa.—*Gas-Burning Furnace for Steam Generators*.—September 15, 1868; antedated July 8, 1868.

Claim.—1. So arranging a furnace that the coal shall be subjected to distillation before it enters the fire box, and at the same time so arranging the draught or blast that the gases thus evolved shall be thoroughly mingled with atmospheric air, or air and steam, within the furnace, but before entering the fire box or combustion chamber to be consumed, substantially as described.

2. The chute C extending in the form of a tube into the fire chamber and serving as a retort, for the purpose of distilling the coal retained in the tube, by means of the heat of the fire box, in combination with a draught pipe F F', substantially as set forth.

3. The steam blast F, so arranged in relation to the tube or retort in which the coal is subjected to distillation, that the wet steam and atmospheric air shall be mingled with the gaseous products of the coal before entering the fire box, substantially as set forth.

4. The arches or diaphragms G, when constructed of a refractory substance, and extended entirely across the fire box, and perforated with openings K, substantially as and for the purpose set forth.

5. Double perforated arches or diaphragms G, in combination with intermediate openings P through the external walls.

6. The combination of the chute C, extending into

the fire box, to act as a retort in the distillation of the coals, and arches or diaphragms G, so located within the fire box as to reflect the heat upon such retort, substantially as set forth.

7. The steam blower, constructed with concentric funnels N, extending successively from the center, one beyond the other, and discharging the currents passing between them into a tubular extension, F', of the outer case F, substantially as set forth.

82,250.—M. H. RIPLEY and WILLIAM N. TEMPLE, Minneapolis, Minn.—*Combined Corn Sheller and Apple Grinder*.—September 15, 1868.

Claim.—The combination of the tapering and concaved-toothed cylinder B, guide F, springs G, gears D E, and frame A, with its spouts I J, when the several parts are constructed and arranged in the manner specified.

82,251.—CLEMENS B. ROSE, Sunderland, Mass.—*Bit Stock*.—September 15, 1868.—The handle is formed of two pieces, and secured in the stock by means of ferrules.

Claim.—The handle A, constructed of the two pieces applied to the stock B, as described, and secured by the ferrules C, all substantially as herein set forth.

82,252.—JOHN SCHUESSLER and JOHN KENNEDY, La Fayette, Ind., assignors to JOHN SCHUESSLER.—*Machine for Threading Bolts*.—September 15, 1868.—The heads of the cutters fit in converging grooves in an outside collar which receives a longitudinal movement by means of a lever connected thereto and moving over a graduated quadrant.

Claim.—1. The arrangement, herein described, of the hollow-slotted mandrel B, the grooved reciprocating head E, and the cutters C.

2. The combination of the devices set forth in the foregoing clause, with the lever F and graduated quadrant M, substantially as set forth.

82,253.—THOMPSON C. SEBRING, Milford, Mich., assignor to IRA A. HEBBARD, of Rochester, N. Y.—*Harvester*.—September 15, 1868.—The frame is made in a circular form with a conical or funnel-shaped bottom, and serves to inclose the gearing and to form bearings for the same.

Claim.—1. The employment, in grass and grain harvesters, of a round cast-iron main frame, F, constructed substantially in the manner and for the purposes herein shown and described.

2. In combination with the main frame F, the cover or cap C, substantially as shown and described, for the purpose of entirely encasing the gearing of the machine, and protecting it from dust and dirt.

3. In combination with the horizontal bevel wheel W, the box or step *s* and adjusting screw *v*.

4. The annular pawl *p*, provided with the inclined plane *e*, arranged and operating substantially in the manner and for the purposes herein shown and described.

5. The arrangement of the spring *f*, as shown, and operating in the manner and for the purposes described.

6. The hand lever Y, pivoted to the head H, of the cutter bar, and operating substantially in the manner and for the purposes herein shown and described.

7. Pivoting the rear end *h''* of the cutter bar head H in the shoe S, with a spherical joint, to permit any necessary vertical change in the elevation of the outer end of the cutter bar, and also of the front side, substantially in the manner and for the purposes herein shown and described.

8. The adjustable gate *r''*, secured to the standard J'' of the shoe S, arranged to operate as herein described.

82,254.—JACOB SELLER, Wilmington, Del.—*Composition for Stuffing and Filling Wood*.—September 15, 1868.—Composed of starch, concentrated ammonia, linseed oil, Japan varnish, and sugar of lead.

Claim.—The combination of the within-named ingredients, when mixed in the several quantities and proportions, as herein described and for the purpose set forth.

82,255.—THOMAS SIMMONS, Brooklyn, N. Y.—*Filter*.—September 15, 1868.—Improvement on his patent of April 11, 1865, and consists in the use of a single coil in the filter frame, dispensing with the jointed spring and double flange. The movable head and pipes admit of the filter being reversed for cleansing.

Claim.—1. The case A, provided with a movable head, and each of its heads being provided with the pipes D D, upon which serew threads are formed, so that the filter can be reversed and cleansed, substantially as set forth.

2. The frame C, as constructed and combined with the case A and pipes D D and G, when used with a force pump, as and for the purpose set forth.

82,256.—HENRY L. STILLSON, Plattsburg, N. Y.—*Combined Clothes Horse*.—September 15, 1868.—The parts are so constructed as to admit of being readily converted into a quilting frame, a clothes horse, or an ironing table.

Claim.—1. The four-armed rollers D D, constructed as described, with a series of holes through one of the arms, and provided with ratchet wheels E and journals *n n*, which revolve between the side pieces A A, substantially as and for the purposes herein set forth.

2. The combination of the grooved supports A A with the top B, and board G, and rails F, when they are adjustable, and all constructed as and for the purposes herein set forth.

82,257.—HIRAM THOMPSON, Worcester, Mass., assignor to R. HALL & CO., same place.—*Sawing Machine*.—September 15, 1868.—The saw arbors are supported in revolving disks which are supported by stationary disks, the purpose being to bring either saw above the top of the table. A binding pulley is arranged to take up the slack of the belt.

Claim.—1. The combination and arrangement, with the saw arbors E E, or either, and the stationary disks K K, of the movable disks F F, substantially as and for the purposes set forth.

2. The arrangement of the binding pulley U, in relation to the belt N, pulley O, and saw arbors E E, substantially as and for the purposes set forth.

82,258.—F. ALEXANDER THUER, East Hartford, assignor to COLT'S FIRE-ARMS MANUFACTURING COMPANY, Hartford, Conn.—*Revolving Fire-arm*.—September 15, 1868.—A laterally moving firing-pin holder is placed between the hammer and the rotating-chambered eylinder as a safety device; the ejecting mechanism is made to act by blows of the hammer.

Claim.—1. The laterally-movable piece *g*, containing the firing pin *i*, in combination with the rotating-chambered breech and the hammer of a revolver, substantially as described, and for a safety device.

2. A laterally-movable plate, located between the hammer and eylinder of a revolver, and bearing the shell ejector, substantially as and for the purpose hereinbefore set forth.

3. The combination of a movable piece, supporting both the firing pin and an ejector, with the hammer of a revolver, and with a rotating breech, having chambers open at the rear, when arranged to permit the use at will of the hammer either as a means of igniting the charges or of expelling the empty shells from the chambers, substantially as hereinbefore specified.

82,259.—JOSIAH WEBB, Spartansburg, Pa.—*Clothes Wringer*.—September 15, 1868.—A square shaft fits tightly in a corresponding opening in a wooden eylinder, the periphery of which is corrugated. A strip of rubber is wound spirally around and fastened to the eylinder by a cement of pitch.

Claim.—Constructing the rolls B B' of the wooden eylinder D, the coating of pitch and sand *m*, and the spirally-wound coil of rubber *o*, arranged in the manner and for the purposes specified.

82,260.—DEMETRY MINDELEFF, Washington, D. C.—*Manufacture of Artificial Stone*.—September 15, 1868.—The block, after being removed from the mold, is placed in a solution of some metallic salt,

the metal then extracted and deposited in the stone by magneto-electricity.

Claim.—The herein described improvement in artificial stone.

82,261.—CHARLES WILSON, Clinton, Pa.—*Cider Mill*.—September 15, 1868; antedated September 4, 1868.—The endless roller belt moves upon and against an upright circular frame, and presses the apples against the revolving bottom.

Claim.—The combination and arrangement of the endless roller belt C, hopper A, revolving bottom D, and circular upright frame G, when constructed, arranged, combined, and operated as herein described, and for the purposes set forth.

82,262.—CHRISTOPH WINTERGERST, Mobile, Ala.—*Vapor Burner*.—September 15, 1868.

Claim.—The arrangement of the reservoir A, curved tube B, burner C, screws G F, ring E, and plate D, whereby a light is produced and so divided that a larger and brighter flame is formed, all as herein specified.

82,263.—J. E. WINANTS, Brooklyn, and JOHN F. GRIFFEN, New York, N. Y.—*Still for Turpentine*.—September 15, 1868.—Conical barrel-supporters extend upward from the steam case, the heat from the cones being made to penetrate the contents of the barrels, which contents being gradually melted, are discharged into the rotating eylinder.

Claim.—1. The process, substantially as described, of distilling the crude material and extracting the fumes at a low temperature, and carrying them off from the lower portion of the still, as and for the purposes set forth.

2. The employment, in combination with the chamber or case of the still, of a steam-heated rotating agitator eylinder, into and through which the crude material passes during the process of distillation, substantially as described.

3. The employment, in combination with the melting chamber, of one or more heated barrel-supporters, F, adapted to hold and melt out the contents of the barrels, substantially as hereinbefore described.

4. The employment of steam tubes so perforated as to eject the live steam on to those surfaces which are required to radiate the greatest quantity of heat, substantially as herein set forth.

82,264.—C. F. WOODRUFF, Newbern, Tenn.—*Water Elevator*.—September 15, 1868.—Designed as an improvement on his patent of February 4, 1868. A hollow eylinder is provided with tubular bearings and revolves on a shaft, one end of which is placed against a spring in one of the bearings. The shaft is provided with a clutch which engages with apertures in a partition which is secured to the eylinder.

Claim.—1. The eylinder C, constructed with the central partition or wall C', when employed in combination with the sliding shaft F and the tubular bearings *e e*, substantially as described.

2. The arrangement of the spring *s*, tubular bearings *e e*, shaft F, clutch *m*, partition C', and eylinder, C, substantially as described and shown.

82,265.—OSCAR C. MOORE, Corunna, Mich., administrator of the estate of SAMUEL YARION, deceased.—*Sawing Machine*.—September 15, 1868.—The saw shaft works on guides forming a part of a wheel. By turning the wheel the saw is raised or lowered.

Claim.—The guides *b*, affixed to or forming part of a wheel, R, or its equivalent, in combination with a saw shaft, P, operating substantially as described, for the purpose specified.

82,266.—JOHN B. MAYER, Niagara Falls, N. Y.—*Clock*.—September 15, 1868.—The spur wheel, pinion, and escapement wheel take the place of the train of five wheels and four pinions comprising the ordinary running gear of clocks.

Claim.—1. The arrangement of the wheel A, pinion E, escapement wheel D, with the hour, minute, and second hands upon the axis of said escapement wheel, substantially as herein described.

2. In combination therewith, the ratchet wheels

k l, revolving tooth *v'*, pin *i*, and wheel *G*, operating substantially as and for the purpose described.

82,267.—JOHN B. MAYER, Niagara Falls, assignor to himself and TOBIAS WITMER, Williamsville, N. Y.—*Striking Mechanism for Clocks*.—September 15, 1868.—The notches and projections on the locking plate of the hour bell actuate a lever which transfers the action of the pin wheel from the quarter hammer to the hour hammer at the instant the quarter bell has sounded the four quarters.

Claim.—1. The spur wheel *D*, in combination with the pins *v v v* and the pinion *F'*, the tumbler wheel *E*, the spur wheel *F*, the pinion and fly wheel *G*, in combination with the hammer tails *o¹ p¹*, in order to effect the striking of quarters and hours on separate bells, as set forth.

2. The combination of locking plates *B* and *C* and locking wheel *A*, for controlling the action of the hour and quarter-hour hammers on two or more separate bells.

3. The combination and arrangement of the sliding shafts *O* and *P*, lever *q*, hammer tails *o¹* and *p¹*, springs *o²* and *p²*, and pin wheel *D*, for the purpose and substantially as herein described.

4. The lever *R*, in combination with the locking plate *C* and sliding-hammer shaft *P*, for the purpose of shifting the said hammer shaft, and alternating the action of the hammers on the bells.

82,268.—ROGERS A. ABBOTT, Worcester, Mass., assignor to himself and GUSTAVUS W. INGALLS, same place.—*Reed for Melodeon*.—September 22, 1868.—To prevent vibration of the head on the plate when riveted thereto.

Claim.—The improved reed, as made with an arched head, as and for the purpose specified.

82,269.—ABEL A. ADAMS, Felehville, assignor to RUSSELL W. PINNEY and FORREST L. PINNEY, Bridgewater, Vt.—*Head Block*.—September 22, 1868.—By means of the sector with its adjustable stop, hinged pawl, and the abutment, the vibration of the lever is regulated so as to effect equal movements of the head block, the gear being operated in either direction by means of the lever and its working pawl.

Claim.—The combination of the sector *s*, its adjustable stop *u*, and hinged stop pawl *x*, with the gear *o*, its operating lever *p*, working pawl *q*, and abutment *y*, the same being applied to the bed and to the shaft of the rack pinion of the main head block, substantially in manner and for the purpose or objects as set forth.

82,270.—EDWARD H. ASHCROFT, Lynn, Mass.—*Steam Safety Valve*.—September 22, 1868.—An alloy of pure copper, nickel, and aluminum is used for the contact parts of the valve and its seat. Aluminum alone or alloys of gold and silver may also be used.

Claim.—The construction of the valve *b*, with its alloy *t*, with reference to its seat *s*, as an article of manufacture, substantially as herein set forth.

82,271.—WILLIAM B. ATKINSON, Pittsburg, Pa.—*Clamp for Railroad Rail*.—September 22, 1868; antedated September 9, 1868.—The bolt passes between the two rails through a plate below, and bears against the lower flanges of the two rails.

Claim.—The T-headed bolt or pin *D*, plate *C*, and wedge or key *F*, combined and applied to the securing of a guard rail, substantially as herein set forth.

82,272.—SAMUEL AYRES, Danville, Ky.—*Pencil Sheath*.—September 22, 1868.—A sheath for holding a pencil to be attached by a pin or wings to any convenient part of the dress.

Claim.—1. The combination of the slotted funnel-shaped holder *A*, spring *C*, and friction roller *D*, the perforated wings *E*, and the adjustable protecting tube *G*, having the perforated diaphragm *g²* all constructed and arranged as described, for the purpose specified.

2. In combination with the slotted funnel-shaped holder *A*, roller *D*, and protecting tube *G*, the ad-

justable stop *F* upon the pencil, as herein described, for the purpose specified.

3. The combination of the protecting tube *G* with the holder *A*, constructed substantially as herein shown and described, and for the purpose set forth.

82,273.—ARTHUR BARBARIN, New Orleans, La.—*Production of Gas, and Illuminating Street and other Cars*.—September 22, 1868.—An air-tight carbureter has a pipe for the hydrocarbon, its end being immersed in the liquid. A compressed air pipe, with perforations at its end, and another for the carbureted air extending to the top and carrying burners with V-shaped slits, is used in cars or other conveyances.

Claim.—1. The method of generating illuminating gas on railway or street cars, or other conveyances, by the use, in such conveyances, of one or more reservoirs or tanks of compressed air, operating in connection with a carbureting vessel and burners, for the consumption of the carbureted air, substantially in the manner herein set forth.

2. A burner for carbureted air, the slit or opening in which for the discharge of said air is formed substantially as shown and described.

82,274.—THOMAS J. BARNES, Cambridge, Ill.—*Horse Yoke*.—September 8, 1868.—An improvement on his patent of November 5, 1867.

Claim.—1. Connecting the parts *A* and *B* of the yoke to the hames *F*, by means of the elips *G*, constructed and attached to said hames, substantially as herein shown and described.

2. Forming holes or slots in the ends of the parts *A* and *B* of the yoke, to adapt them to the elips *G*, substantially as herein shown and described.

3. Bending or curving the curved portions of the parts *A* and *B* downward, as they leave the elips *G*, substantially as herein shown and described, and for the purpose set forth.

4. Bending or curving the straight portion of the part *A* or *B*, which is below the other, at an angle of said part, and at the point where it leaves the elip *G*, substantially as herein shown and described, and for the purpose set forth.

5. Connecting the short chains *C* and equalizing bar *D* to the eyes of the parts *A* and *B* by means of hooks, substantially as herein shown and described, and for the purpose set forth.

6. The single draught chain *E* attached to the center of the equalizing bar *D*, when said chain is used between the horses, as and for the purpose specified.

82,275.—HENRY P. BEARDSLEY and GEORGE WILCOX, Corunna, Mich.—*Burglar Alarm*.—September 22, 1868.—A cylinder provided with perforations on one portion of its periphery, and containing water, is arranged to throw a spray of water upon a person asleep in case a door or window is opened by a burglar.

Claim.—1. The water cylinder *N*, provided with the opening *O*, and the perforations *P*, in connection with the clock-work *C*.

2. The casing *R*, provided with openings *S*, when operating with the water chamber, substantially as described, for the purposes specified.

3. The combination and arrangement of the bed-plate *A*, standard *B*, cord or cords *V*, loop *U*, springs *L* and *M*, rod *J*, cord *G*, loop *I*, lever *H*, rock shaft *D*, weighted lever *T*, dog *E* and catch *F*, with the clock-work *C*, water cylinder *N*, and casings *R* and *K*, all operating in the manner specified, and for the purposes set forth.

82,276.—JULIEN FRANÇOIS BELLEVILLE, Paris, France.—*Regulator for Steam Engine*.—September 22, 1868.—An improvement on his patent of June 18, 1867.—The tube of the cylinder transmits, through a fluid from the boiler, a pressure beyond that of the atmosphere, to the spring disks arranged on the rod connected with the object to be operated on, so that the transmission of movement and reaction of the springs, causing the valve to open, is in accordance with the increase or decrease of the steam.

Claim.—The arrangement, in the cylinder *F*, provided with steam admission and discharging openings, as described, of the spindle *C*, and annular spring disks, *A*, mounted upon the said spindle, and

united or riveted together in the manner specified, and provided at the points where their outer and inner edges are in contact with a packing, B, as set forth.

82,277.—WALTER C. BENN, San Francisco, Cal., assignor to himself, L. L. BAKER, and R. HAMILTON, same place.—*Spark Arrester for Steam Generator.*—September 22, 1868.—The curved top of the chimney causes the sparks to fall into the conical water tank, which is provided with supply and discharge pipes, while any sparks that may escape in the smoke are arrested by the cap of the stack moving on standards, and fall into the trough below.

Claim.—1. The stack or chimney A with the curve *a*, as shown, and the water vessel C, together with the supply and discharge pipes *b b* and *d*, the whole constructed and arranged substantially as herein described.

2. The secondary bonnet D, and the annular water trough E, as arranged, for more completely extinguishing the sparks, substantially as described.

3. The conical vessel C and bonnet D, movable in the slides *e e'*, *e*, for regulating the draught, the whole constructed and arranged substantially as herein described.

82,278.—WALTER C. BENN, San Francisco, Cal., assignor to himself, LIVINGSTON L. BAKER, and ROBERT HAMILTON, same place.—*Millstone Balance.*—September 22, 1868.—Weights, placed opposite to the driving point, and to each other, at the four quarters of the stone, are moved in ways by set screws, operated from the outside on the band, and, being properly adjusted, the true balance is obtained.

Claim.—The combination of the adjustable weights D D, and their ways C C, together with the operating screws E E, and the elevating screws *b b*, or an equivalent device, when used for balancing millstones, the whole constructed and arranged substantially as herein described.

82,279.—CHARLES E. BILLINGS, Springfield, Mass.—*Combined Pistol and Sword.*—September 22, 1868.—The barrel and operative parts of a breech-loader are inclosed within the handle of a sword or knife, while a sliding piece pushed against a catch spring lever unlocks it for loading, and another spring bearing on the barrel swings it out.

Claim.—1. The construction of the lower guard of the sword hilt and the pistol barrel in one and the same piece, and pivoting the same to the extreme forward end of the handle, substantially as and for the purposes set forth.

2. The combination of the main lock spring C of the pistol with the shank of the knife, when the former is secured in a slot in the latter, as and for the purpose described.

3. The arrangement, with the knife handle and pistol hammer, of the trigger lever D, extending the length of the handle, and having a thumb trigger at its forward end, all substantially as shown and described.

82,280.—JOSIAH B. BLOOD, Lynn, Mass.—*Clothes Drier.*—September 22, 1868; antedated September 12, 1868.—The six main, side, and wing strips are so connected and arranged as to form a quadrilateral frame moving at the point of junction.

Claim.—The combination of the strips A B, C D, E F, forming the frames in the manner and for the purpose substantially as above set forth.

82,281.—BENJAMIN BOLLINGER and GEORGE G. NODLE, New Berlin, Ohio.—*Knitting Machine.*—September 22, 1868.—Improvement on Isaac W. Lamb's patents, September 15, 1863, and October 10, 1865.—The spring, with its bent part bearing on the needle, when in use, works with it to bring it down into a position to be operated upon by the cams, and to keep it out of the way when not in use.

Claim.—The spring K N, constructed as described, in combination with a needle of a knitting machine, substantially in the manner and for the purpose herein specified.

82,282.—WESLEY L. BOWER, Joliet, Ill.—*Land Marker.*—September 22, 1868.—The portion of the

frame carrying each outside wheel is hinged to the main center pieces, and support the uprights that carry the driver's seat.

Claim.—The combination of the swing seat *m* and upright frame *i* with the hinged frame *e*, all arranged and operating as and for the purposes set forth.

82,283.—H. G. BROOKS, New York, N. Y.—*Steam Generator.*—September 22, 1868.—A pipe supplies water thrown through nozzles in a spray into the fire-brick perforations to intensify the combustion.

Claim.—1. The arrangement, in the fire box of a locomotive or other boiler, of perforated fire-brick walls, extending upwards divergingly from the contracted grate surface to the walls of the fire box, substantially as set forth.

2. The arrangement, in the upper part or mouth of the combustion chamber or fire box, of arched or hollow perforated fire-brick, or castings of fire-clay, communicating with air conduits in the manner described, so that the atmospheric air received through such conduits may be highly heated within said brick or castings, and then discharged from the same into the combustion chamber at the point of contraction and concentration of the combustible gases evolved from the fuel in the fire box.

3. The combination, with the perforated fire-brick, of a water-supply pipe, communicating with the boiler, and provided with a series of nozzles or sprayers, arranged partly within the perforations in the fire brick, substantially as set forth.

82,284.—CHARLES F. BROWN, Warren, R. I.—*Projectile.*—September 22, 1868.—When the projectile, on being discharged, strikes an object, the shock throws forward the plunger and, uncovering the apertures, the powder falls upon the red-hot wire and explodes the shell.

Claim.—1. The tube B and plunger C, arranged within the hollow projectile A, the plunger serving to separate the powder in the shell from the fuse in the tube, while the shell is undisturbed in its motion, as specified.

2. The wire *b*, formed on the plunger, for the purpose of becoming heated by the ignited fuse, and for igniting the powder or other explosive matter in the shell, as soon as the latter strikes an obstacle, as specified.

3. The tube B, fitted into the hollow shell A, and provided with apertures *c*, with a perforated plug *d*, or its equivalent, and with a fuse *g*, all arranged in combination with the plunger C, which carries the wire *b*, and all made and operating substantially as herein shown and described, for the purpose specified.

4. The perforated cap E, fitted over the rear end of the tube B, substantially as herein shown and described.

5. The combination of the shell A, tube B, plunger C, and wire *b*, with the case D, cap E, and apertures K, all made, arranged, and operating substantially as and for the purpose herein shown and described.

6. The rod *i*, in combination with the tube B, plunger C, and wire *b*, all made and operating substantially as herein shown and described.

82,285.—ARTHUR W. BROWNE, Brooklyn, N. Y., assignor to CHARLES R. SQUIRE, New York, N. Y.—*Rotary Steam Engine.*—September 22, 1868.—Steam is admitted through one of the cocks on either side and passes out through the opposite cock and acts upon the pistons, the other ends of the piston being acted upon by steam in the pressure chamber.

Claim.—1. The arrangement of the abutment E E', pressure chamber C, and the cocks D and D'.

2. The pistons G, when constructed as set forth.

3. The construction of the segment H H', forming the chamber through which the piston passes while being acted upon by the steam, as herein set forth.

4. The arrangement in the shell of the rotary engine of the abutments E E', pressure chamber C, and segments H H', substantially as set forth.

82,286.—JOHN DAVID BROWNE, Cincinnati, Ohio.—*Mop Head.*—September 22, 1868.—The fixed serrated jaw has cast in it a screw-threaded socket

with a nut, which latter is also grooved for the ends of the sliding jaws to move in.

Claim.—1. The fixed jaw A, having the grooves or recesses *c c* on the socket B, in combination with the loose jaw D *d d* and nut C, substantially as and for the purpose described.

2. In combination with the above, the serrated edges *a*, on the jaw A, as set forth.

82,287.—JOHN DAVID BROWNE, Cincinnati, Ohio.—*Sash Pulley.*—September 22, 1868.—The side plates are fixed to the lugs cast on the face plate by means of rivets in recesses formed by projections on the lugs, and which overhang the slot through which the roller passes.

Claim.—The recessed lugs *a* of the face plate A, in combination with the holding pins or rivets of the case plate B, in the manner substantially as described, and for the purpose set forth.

82,288.—STEPHEN BROWNELL, Irving, N. Y.—*Hay Rack.*—September 22, 1868.—The angular cross pieces, side rails, and center board are laid one over another, and on the bed plates, being fastened by pins projecting above so as to form stakes to hold the hay.

Claim.—The combination of the separate bed plates A, with projecting pins *a a* secured thereto, separate angular cross pieces B B, with projecting pins *b b* secured thereto, separate side rails C, and separate center board D, the parts being built up one over another, and connected together, and adapted to operate as herein represented and described.

82,289.—BENJAMIN F. BURGESS, Norvell, Mich.—*Saw.*—September 22, 1868.

Claim.—Making a saw that is to cut one way only, with the cutting teeth B and C, and the clearing tooth D forward of each section, and the space E, when constructed and all arranged as specified.

82,290.—LAWRENCE CAMPBELL, Marengo, Mich.—*Pruning and Hedge Shears.*—September 22, 1868.

Claim.—The cutting blades C and J, the latter provided with cutting hook K, when constructed as described, and operating in combination with the handles B and E and connecting arm F, substantially as and for the purposes set forth.

82,291.—FRANCIS CLAUSEN, San Francisco, Cal.—*Belt Buckle.*—September 22, 1868.—The belt is held fast by means of a catch or lip passing through a slotted bar turning on a shaft.

Claim.—In a belt buckle, the beveled projecting lip B, in combination with the slotted bar C, rotating on its axis, as shown, and operating the lever *b*, the whole constructed and arranged substantially as and for the purpose described.

82,292.—WILLIAM H. COOK, Bridgehampton, N. Y.—*Horse Rake.*—September 22, 1868.—By lowering the lever, the teeth will be inclined toward the ground, and on its being pushed back the shoe slips off the ends of the teeth, the rake head revolves, and the hay is deposited.

Claim.—The combination of the standard H, lever I, and perforated shoe K, with the rake head F G, substantially as herein shown and described, and for the purpose set forth.

82,293.—JOHN COTHRON, Illiopolis, Ill., assignor to himself and D. J. MAYES, same place.—*Post-hole Borer.*—September 22, 1868.—When the point of the shaft and the knife on its lower end enters and loosens the earth, the buckets, on the belt passing over the spur wheel, carry up the dirt and empty it on the chute, the borers being raised by the windlass and a pawl preventing its falling.

Claim.—The shaft *k*, knife M, belt N, with its buckets, gears *o m p*, and their shafts, and frame to which they are attached, wheel *a*, windlass *b*, with its connecting rope *g*, frames E and A of a post-hole borer, all constructed, arranged, and operated substantially as and for the purpose specified.

82,294.—WILLIAM W. CRANE, Philadelphia, Pa.—*Door for Furnace.*—September 22, 1868.—A rim

on the door plate conforms to the inner surface of a rim on the door, the top and bottom being so fitted and arranged as to make the door air tight.

Claim.—The door plate B, rim or elevation A, and the door C, when constructed and arranged substantially as and for the purpose shown and described.

82,295.—AUGUSTUS DAY, Detroit, Mich.—*Windlass.*—September 22, 1868; antedated September 16, 1868.—Friction bands pass around the cylinder and are secured at one end to the rear ends of the pawls. Dogs, provided with a counterpoise, hold the cylinder when the pawl and ratchets have acted to turn them.

Claim.—1. The friction bands G, in conjunction with the pawls F, the rod heretofore described, and the cylinder B, when operating substantially as and for the purposes set forth.

2. The dogs H, rod I, and counterpoise J, when arranged and operating substantially as herein described.

3. The combination and arrangement of the above mentioned parts with the frame A, the cylinder B, the sockets C, the handles or levers D, the ratchets E, and the chain or rope K, when constructed and operating substantially as herein specified, set forth, and described.

82,296.—JACOB G. DESHLER, Allentown, Pa.—*Machine for Converting Reciprocating into Rotary Motion.*—September 22, 1868.

Claim.—The combination, in a man-power machine, of the vibrating foot board A, the trunnions of which have rectilinear bearings, substantially as described, with the pitman beams B, pitman D, and crank shaft *b*, all arranged and combined substantially as shown and described for the purpose set forth.

82,297.—ANTHONY M. DUBURN, Chicago, Ill.—*Lantern.*—September 22, 1868.

Claim.—1. The sheet metal rim A, when formed in the shape shown and described, and for the purpose herein set forth.

2. The wire rim B, when used as a stiffening, in combination with the sheet metal rim A and corrugations or loops *e e e e e*.

82,298.—GEORGE EASON, Lyons, N. Y.—*Bee Hive.*—September 22, 1868.

Claim.—1. The box A, provided with the porch B, swinging side E, comb frames C, and division board D, all as and for the purpose set forth.

2. The arrangement of the ventilating passages N, L, and *b*, the latter being covered with a wire screen, as and for the purpose described.

82,299.—JAMES E. EMERSON, Trenton, N. Y.—*Hand Saw.*—September 22, 1868.—The screw bolt has shoulders on opposite sides of its head, which take respectively into the sides of the saw plate, and prevent the bolt from turning, when drawn up as the nut is turned.

Claim.—A shouldered and headed screw bolt for holding a saw to its handle, so that said screw bolt may be held from turning under the action of the nut, and constructed to operate as and for the purpose herein described and represented.

82,300.—JAMES W. EVANS, New York, N. Y.—*Car Spring.*—September 22, 1868.

Claim.—The spiral spring A, the elastic tube B, and the closed air chamber confining the column of air D, constructed and combined, substantially as and for the purposes specified.

82,301.—OWEN V. EVANS, Ripley, Ohio, assignor to himself and JAMES REYNOLDS, same place.—*Concrete Block-making Machine.*—September 22, 1868.—The table revolves in a horizontal plane, and receives intermittent motion by means of a segment, with a pawl and disk attached to its shaft, the segment being operated by a pinion rod and lever, while the slide moves the vertical presses.

Claim.—1. The combination, with the table B, of the disk O and slide F, oscillating toothed segment M, pinion P, and rack Q, substantially as and for the purpose described.

2. The combination of the mechanism for operat-

ing the sliding pistons D, with the mechanism for rotating the table B, when the same are arranged to operate relatively to each other, substantially as and for the purpose described.

82,302.—FREDERICK FLANDERS, Franklin, N. H.—*Whip Goad*.—September 22, 1868.

Claim.—The whip stock A, metallic tip B, hollow screw C, spur *e*, and screw D, when combined and arranged as and for the purpose described.

82,303.—M. R. FORY, New York, N. Y.—*Machine for Felling Trees*.—September 22, 1868.—The augers are connected by means of pinions, cog band, and cog-wheel gearing to the shafts on a frame, which slides on the trunk, and the augers being nearly in contact with each other, when they are moved up to the tree, cut in it a continuous slot.

Claim.—The frame B, carrying a series of permanent and a series of detachable augers, and constructed and adapted to the truck A, as and for the purpose described.

82,304.—FREDERICK A. GEISLER, Bristol, R. I.—*Baby Walker*.—September 22, 1868.

Claim.—The oscillating yoke G, made in two parts, *a b*, the former pivoted by the bolt *d* to the curved arm F, and provided with a socket, in which the shank of the arm *b* is adjusted by the set screw *e*, as herein described, for the purpose specified.

82,305.—CHARLES M. GILBERT, Philadelphia, Pa.—*Bedstead Fastening*.—September 22, 1868.—

The movable bolt, screwed to the post and connected with a tube having an opening to correspond with its head, has a slot, in which a flanged wedge works, while a spring operates to adjust it.

Claim.—The combination of a key or wedge, 2, with the bolt 1, tube or barrel 5, spring 3, slotted rail 4, and post 6, as hereinabove described.

82,306.—WASHINGTON L. GILROY, Philadelphia, Pa.—*Knife for Cutting Green Corn from the Cob*.—September 22, 1868.—The blade is provided with transverse cutters, and a cylindrical bar by which the pulp is forced out of the divided kernels, leaving the hulls on the cob.

Claim.—1. A green-corn knife for table use, having a blade, A, provided with a series of transverse cutting edges, *a' a'*, substantially as described.

2. In combination with a blade, A, and cutters *a' a'*, arranged as described, the bar B, arranged to operate substantially as and for the purpose described.

82,307.—BENJAMIN H. GOODALE, Newburyport, Mass.—*Wind Wheel*.—September 22, 1868.—

Sails are suspended from the outer ends of horizontal arms on a vertical shaft. Friction brakes are made to act on projecting rims of drums on the shaft, and arrest their motion, which causes cords, carried around by the arms, to wind on the drums and fold the sails.

Claim.—The combination, with the hinged wings, of means, substantially as described, for folding the sails, as and for the purpose described.

82,308.—JOHN M. GROH, Benevola, Md.—*Mat*.—September 22, 1868.—Husks or other material are fastened to wooden or metal bars and inserted into a frame, by means of flanges, notched to admit their ends.

Claim.—The mat, constructed as described, consisting of the wooden block A, having an interior groove adapted to receive the filled bars through the notch C in the flange of said block, as herein described, for the purpose specified.

82,309.—GUSTAVE A. HAGEMANN, Natrona, Pa.—*Manufacture of Bromine from Bittern*.—September 22, 1868.

Claim.—1. The use, in the manufacture of bromine, of a sandstone trough or vessel, furnished with a bore, C, for the introduction of steam, so as to dispense with the insertion into the liquor of metallic pipes.

2. The use, in the process of extracting bromine from bittern or mother water, of naked steam, in-

troduced into the body of the liquor under treatment, for the purpose of combining the mechanical action of the steam with the physical effects of its heat, to produce the desired effect.

82,310.—JOHN W. C. HASKELL and JOSEPH E. HASKELL, Chicago, Ill.—*Trunk Caster*.—September 22, 1868; antedated September 11, 1868.—A plate of metal bent at right angles has a hole to receive the ball, and over it is fixed another plate with a chamber which covers the ball.

Claim.—The plate A *a*, provided with the hole *d*, for the projection of a caster ball, and made angular, so as to form a guard for the trunk corners, in combination with the plate *b c* and ball *e*, substantially as specified.

82,311.—JOSEPH P. HAYES, Philadelphia, Pa.—*Range*.—September 22, 1868; antedated September 8, 1868.—A passage or "tunnel" projecting from the front lower end of the fuel cylinder communicates with the air-heating chamber above and the ash pit below, and is fitted with a detachable sliding plate provided with horizontal and upright grate bars. An air-heating flue is arranged to conduct pure warm air into the oven.

Claim.—1. The construction and arrangement of the tunnel B, in its relation to the cylinder A and the air-heating chamber C, whereby the air for the combustion of the fuel in the cylinder can at any time be drawn from the air-heating chamber C, substantially as and for the purposes described.

2. The construction and arrangement, in relation to each other, of the tunnel B, the detachable sliding grate E, and the adjustable opening *e'''*, in the plate *e'*, into the ash pit D, substantially as and for the purposes described.

3. The construction and arrangement of the air-heating flue F, in relation to the cylinder A, the air-heating chamber C, the cold-air space M, and the oven G, substantially as and for the purpose described.

82,312.—B. F. HAYWARD, Nebraska City, Nebraska.—*Hens' Nest*.—September 22, 1868.—The nest box is arranged to close and open automatically as the hen gets upon or off her nest.

Claim.—The nest box C, pivoted bottom board D, link *b*, levers E, and grating *d*, all constructed and operating substantially as described, within a box, A, all as set forth.

82,313.—JOHN HEATLEY, Etna, Pa.—*Furnace for Working Iron*.—September 22, 1868.—The air passes from the rear under the bottom plate to the ash pit, the dampers admitting it to the fire at any desired point, it also passing through a finely perforated plate between the fire grate and bottom of the ash pit, and by means of hot-air flues reaches the fire.

Claim.—1. An air chamber, *g*, under the bottom plate of a heating or puddling or boiling furnace, provided with such communications as to receive air from without, heat it, and discharge it into the furnace, fire space, or ash pit, substantially as and for the purposes hereinbefore set forth.

2. The use of two or more dampers, *h i*, so arranged, relatively to the air chamber *g* and lower grate *e*, as to admit heated air either above or below such grate *e*, or both above and below, substantially as and for the purposes above expressed.

3. A perforated plate or finely divided grate, *c*, at any desirable point below the fire grate *a*, and above the bottom of the ash pit, arranged and used substantially as and for the purposes hereinbefore set forth.

4. The series of flues *e e'* extending along the face of or through the lining or walls of a heating, puddling, or boiling furnace, arranged and used substantially as and for the purposes described.

5. A fire box, *o*, covering the tap hole *n* of a furnace, constructed and operated substantially in the manner and for the purposes hereinbefore set forth.

82,314.—S. S. HEPWORTH, Boston, Mass.—*Centrifugal Machine*.—September 22, 1868.—This invention is designed to obviate the injurious effects of gyrating vibration in centrifugal machines used, in this instance, in refining sugar. The curb is so sus-

pended as to partake equally of the gyrating motion and thereby remain concentric with the shaft and the sugar basket.

Claim.—1. The suspension of the shaft B, and curb A, of a centrifugal machine, from a sleeve, *a*, or other equivalent device, substantially as shown and described, and for the purposes set forth.

2. Supporting the sleeve *a* by the spherical surfaces *a'* and *l'*, or surfaces approximating to a spherical surface, for the purpose of supporting and permitting the vibration or gyration of the basket shaft B of a centrifugal machine, all as set forth.

3. Supporting the sleeve *l*, or its equivalent, by a bolt, *d*, or the equivalent thereof, substantially as shown and described, when these said parts conduce to the support of the basket shaft B of a centrifugal machine, all as set forth.

4. The bolt *d* and cam link *h*, or their equivalent, in combination with the sleeve *l* and sleeve *m*, all substantially as shown and described, and for the purpose of indirectly supporting the weight of the basket shaft B of a centrifugal machine, and elevating the said shaft to produce the contact of the breaking surfaces *c* and *m'*, all as set forth.

5. Employing the pulley C and lower end of the sleeve *m* as friction surfaces, for the purpose of retarding and stopping the revolution of the basket shaft B of a centrifugal machine, all as set forth.

6. Making the surfaces *c* and *m'* spherical, for the purpose of permitting the gyration of the basket shaft B, all substantially as shown and described.

7. Two or more rods, E, or the equivalent thereof, substantially as shown and described, in combination with arms G and curb A, for the purpose of supporting the curb A, and thereby enabling it to maintain its concentricity with the shaft B, all as set forth.

8. The gudgeon *b*, affixed rigidly to the cross bar *f*, or other equivalent bottom part of the curb A, substantially as shown and described, in combination with a roller, *r*, and cup J, or its equivalent, as and for the purpose set forth.

9. The employment of an elastic roller, *r*, substantially as shown and described, in combination with the fixed gudgeon *b*, or other equivalent device, and cup J, or its equivalent, all as and for the purpose set forth.

82,315.—GEORGE P. B. HILL, Virginia City, Nevada.—*Process of Extracting Precious Metals from Ores.*—September 22, 1868.—The calcined sulphates of copper and of iron are separately pulverized, laid on iron plates over a fire, and mixed while roasting till finely powdered.

Claim.—The ingredients above enumerated, mixed or compounded and added to the ores, pulp, tailings, and slimes, in about the proportions herein specified for the purpose set forth.

82,316.—WILLIAM H. HITESHEW, Perrysburg, Ind.—*Hay Raker and Loader.*—September 22, 1868.—The rake teeth rest on small wheels journaled in projecting arms so that their points may be held a proper distance above the ground.

Claim.—The teeth D, constructed with arm *d'* and wheels E, and operating substantially as herein shown and described, and for the purpose set forth.

82,317.—LUTHER W. HOLMES, Grand Ledge, Mich.—*Arrangement of Mechanism for Operating Punches.*—September 22, 1868.—The sliding stirrup is forced down by the cam lever moving upon the roller to operate the punch.

Claim.—The construction and arrangement of frame or standard A, with its guide pieces D and E, sliding stirrup C, with sliding pin G, cam lever L, roller I, and bed plate, in the manner as shown and described and for the purpose set forth.

82,318.—NICHOLAS HOTZ, Green Point, N. Y.—*Still.*—September 22, 1868.—The upper and lower mash expels feed, one into the other, separating chambers being between them connected by pipes with the worms in the upper, while an overflow pipe connects the separators and the column connecting the lower boiler with the worm in the upper vessel.

Claim.—1. The process, substantially as herein described, of effecting continuous redistillation within

a still, through, it may be, the action of a single heater or generator, by causing the vapor rising from the one distillation to be condensed within the mash through a worm or worms, or their equivalents arranged therein, and afterward returned for distillation over again, thus separating the more from the less highly volatile portions, and at the same time heating the mash.

2. The combination of the mash-receiving chamber or vessel A with the mash vessels D, G, and H, and pipes C, F, and J, provided with suitable plugs or valves for passage of the mash to each of the lower vessels in succession, substantially as specified.

3. The combination, with any desired number of mash chambers or vessels, A, D, and G, and mash receiver or generator H, of two or more distilling chambers or separators, N, K, arranged to connect by pipes with worms or other condensing devices, located in the mash vessels A, D, and G, for operation, essentially as described.

4. The connection of the distilling vessels or separators N and K, by means of an overflow pipe or pipes *n* and *r*, substantially as and for the purpose or purposes set forth.

5. The combination, with the mash-boiling vessel or generator H, of the column L, arranged to connect with a worm, or its equivalent, in an upper mash vessel, essentially as herein set forth.

82,319.—DAVID HUNT, JR., Worcester, Mass.—*Velocipede.*—September 22, 1868.—The seat rests on standards in a curved frame journaled on the shaft, and is connected by a rod with the crank on the shaft, the cars of a piece fixed to the under side of the chair being also pivoted to the standards. Motion is imparted to the wheels by a simple back-and-forth or rocking movement of the chair seat.

Claim.—1. The combination of the seat G with the braces or standards H H and the crank or supporting shaft A, substantially as and for the purposes set forth.

2. The peculiarly-constructed frame D, in combination with the cap E, axle A, and chair G, substantially as and for the purposes set forth.

3. The combination of the standards H H and piece P, having ears *a a*, with the chair seat G and frame D, substantially as and for the purposes set forth.

4. A velocipede, the parts of which are constructed and combined together substantially as shown and described.

82,320.—DAVID WOODWELL HUNT, San Francisco, Cal.—*Wood Pavement.*—September 22, 1868.—A space is left around each block near its center, and connected with the surface of the pavement by means of openings which are filled with asphaltum.

Claim.—A pavement, the blocks of which are secured in position by means of cement run into horizontal grooves or recesses cut around each block, the blocks and grooves being formed and arranged substantially as described.

82,321.—EDWIN HURD, Virginia City, Nevada.—*Oil Cup.*—September 22, 1868.—The cylinder has an opening at the top corresponding with one from the receiving cup when in one position, and one at the bottom, and as it rotates in the frame it is connected with either, for receiving the oil from the cup above or letting it flow out below.

Claim.—The arrangement of the frame E, the hollow cylinder *a*, pivoted within it, and having passages for the reception of oil, for the escape of air, and for the delivery of the oil through the pivots on which it turns, substantially as described.

82,322.—J. RIENZI JENNESS, Norwich, Conn.—*Heating Apparatus.*—September 22, 1868.—The vessel or table is made with double partitions, the pans with covers being separated by a double jacket, leaving a space for steam to enter and pass around a pipe in each end at the bottom.

Claim.—1. The steam space or spaces D, between the several chambers and dishes B B, substantially as described and for the purposes set forth.

2. The vessel or table A, chambers C, and space

D, with induction and eduction pipes, pans B, and covers O, when combined and arranged substantially as described, and for the purposes set forth.

82,323.—ASA JOHNSON, Brooklyn, N. Y.—*Neck Tie*.—September 22, 1868; antedated September 11, 1868.

Claim.—A neck tie formed of wire cloth or gauze, substantially as described, as a new article of manufacture.

82,324.—GEORGE NEWTON JONES, Oshkosh, Wis.—*Car Brake*.—September 22, 1868.

Claim.—1. The combination, with the friction pulleys, of the shaft P, connected from ear to ear, as described, and slides L, connected to the sliding pulleys by a cord and lever, for actuating them, substantially as and for the purpose described.

2. The combination of the slides L, actuating shaft, and means for allowing the slides to pass out of action, with the shafts, when the brakes are brought into action, substantially as and for the purpose described.

3. The combination, with the slide L, of the collar P, lever *a*, slide U, and catches C and C', substantially as and for the purpose described.

82,325.—JÜRGEN L. JÜRGENS, New Orleans, La.—*Fire Escape*.—September 22, 1868.—The car moves up and down, and from one window to another, on ways outside of the house, the wheels and axles being adjusted nearer or further apart by means of a screw-threaded shaft.

Claim.—The carriage A, provided with the adjustable-grooved pulleys B, and operating shaft D, in combination with the inclined ways E E, substantially as and for the purpose described.

82,326.—WILLIAM KEARNEY, Union Township, N. J.—*Hydrant*.—September 22, 1868.—The valve passes over an orifice which is connected with the discharge pipe, the water being admitted or shut off by means of a screw stem attached to the back of the valve, while a cavity on the lower edge opens a communication between the discharge and waste pipes.

Claim.—The arrangement and operation, in the case A, of the sliding disk valve C, perforated at S, and the sliding waste pipe J, as herein shown and described.

82,327.—JOHN H. KEYSER, New York, N. Y.—*Stove*.—September 22, 1868.

Claim.—1. The combination of sections A and B, the latter constituting the fire chamber, and the former an illuminating and heat-retaining top section for B, substantially as described.

2. The construction of section A with an internal downwardly-contracted wall, C, with inclined illuminating windows *d*, and with a downwardly-contracted base portion, *a*, said parts being adapted to fit upon a fire pot section, B, substantially as described.

82,328.—W. A. L. KIRK, Hamilton, Ohio.—*Head Block*.—September 22, 1868.—A polygonal index roller, provided with seals on its faces, over which an index hand secured to the knee moves, is attached to the side of the slide.

Claim.—The index roller D, constructed substantially as herein shown and described, in combination with the head block B C of a saw mill, as and for the purpose set forth.

82,329.—JAMES KIRKLEY, Chicago, Ill., assignor to himself and HUGH GRAY.—*Car Brake Attachment*.—September 22, 1868.—The pawl or other releasing and arresting device is inclosed in a case or box, and is operated by a treadle, all so arranged as to prevent accident from exposure of the pawl. The pawl is automatically arrested and held in a position free from the ratchet until the brake standard is turned to wind up the brake chain.

Claim.—1. A guard box F, adapted for inclosing the pawl and ratchet of a brake standard, substantially as described.

2. The combination of a treadle, E, pawl H, and ratchet wheel D, substantially as described.

3. Fitting the treadle E to the guard box F, substantially as described.

4. A spring latch *g*², a pawl, H, ratchet wheel D, a treadle, E, and means, substantially as described, for releasing the latch *g*², by the act of turning said ratchet wheel.

82,330.—JESSE B. LEWIS, Lincoln, Ohio.—*Skimmer for Sorghum Evaporator*.—September 22, 1868.—A plate attached to the lid inclines upward and is provided with small holes and pipes so arranged that the juice, as it rises, flows over the edge, down the plate, and leaving its scum flows back through the holes into the pan.

Claim.—1. The automatic skimmer lid B, formed by attaching the perforated metallic plate *b*¹, constructed as described, and having pipes *b*² inserted in it to the wooden frame of said lid, substantially as and for the purpose set forth.

2. The combination of the automatic skimmer lid B, constructed as described, with an ordinary evaporating pan, A, substantially as and for the purpose set forth.

82,331.—SAMUEL LOCKARD, Lagrange, Ind.—*Piston Rod Packing*.—September 22, 1868.—The packing rings are surrounded by a follower around which is a spiral spring bearing against a collar, the inner ring fitting the piston rod, as does the lower part of the outer one, on which the follower is fitted.

Claim.—The arrangement within the chamber K of the conical split packing rings *e f*, flanged follower *g*, and spring *d*, as herein shown and described.

82,332.—J. AUGUSTUS LYNCH and REUBEN K. HUNTOON, Boston, Mass.—*Governor for Steam Engine*.—September 22, 1868.—In the event of the breaking of the belt, the weight on the arm attached to the shaft, which is made to operate the rotary valve, becomes disconnected from and slides off the said arm, and being connected by a chain to an auxiliary arm extending from the rear of the said weighted arm, will suddenly revolve the shaft and cause the throttle valve to close.

Claim.—1. The combination of the hydraulic governor and a mechanism, substantially as explained, for effecting the closing of the main valve of the engine, in case of breakage of the driving belt of the governor, such mechanism consisting principally or in substance not merely of the auxiliary arm L', the catch *m*, and chain N', but also of the slide or disengager *n*, the spring *r*, lever catch *s*, and the arm *z*, provided with the bolt *c*², or such bolt and the spring *b*², the whole being applied to the said arm K¹, the governor case, and the weight W, substantially in manner and so as to operate as specified.

2. The combination of the hydraulic governor and the relay or reinforcing engine applied to the main valve S of the induction pipe of a steam engine, as set forth, with the described mechanism for effecting the closing of the said main valve in case of breakage of the driving belt of the governor.

82,333.—MAHLON R. MARGERUM, Trenton, N. J.—*Coffin*.—September 22, 1868; antedated September 9, 1868.

Claim.—The forming and constructing the side and rounded head of wooden coffins with two entire pieces of wood, and bending the same so as to form the coffin, substantially as above described and herein set forth.

82,334.—J. P. MCGEE, Trenton, Tenn.—*Lamp Burner*.—September 22, 1868.—The slotted base of the burner extends below the cylinder, and has a rib around it, which is pressed in when the cylinder is forced down into the lamp, and thrown out by the recoil of the tongues, acting as springs.

Claim.—The burner B, having its lower end slitted, to form a series of springs, *g*, provided with a head, *h*, which is adapted to press in the springs when the burner is inserted in the cylinder *f*, the expansion of said springs forcing the head under the lower edge of the cylinder, when it has cleared the same, thereby holding the burner in place, as herein shown and described.

82,335.—JOHN L. MCINTOSH, Boston, Mass., assignor to himself, JAMES BLENKINSOP, and WILLIAM H. VAUGHN.—*Pinking Tool*.—September 22, 1868; antedated September 7, 1868.

Claim.—A machine or device for pinking leather, cloth, &c., consisting of a lever, armed at one end with a tool and a tool-bearing socket, (the latter so arranged as that the pinking tool may be changed at pleasure,) in combination with the revolving block, when the same is supported and made adjustable by a spring beneath, all substantially as and for the purpose described.

82,336.—A. W. MEEK, Waterloo City, Ind.—*Gate*.—September 22, 1868.—The gate is drawn back by means of a rack bar with a toothed wheel, and the action of pulleys with their cords and weight.

Claim.—The rack K, pulleys *d* and *e*, and weight *l*, in combination with the gate G, substantially as and for the purpose described.

82,337.—JOHN C. MILLER, Danville, Ky.—*Side-Saddle Tree*.—September 22, 1868.

Claim.—1. As a new article of manufacture, a side-saddle tree, in which the front or pommel *c'* is formed at the same time and of a similar material to the body of the tree, substantially as and for the purpose specified.

2. The combined off horn and pommel C, formed from wood, with the grain lengthwise, by cutting, steaming, and bending, and attached, substantially in the manner described.

82,338.—P. H. MILLS, Green's Landing, Me.—*Row Lock*.—September 22, 1868.—The pin of the row lock enters and works in a roller, which is pivoted to two cars attached to the gunwale.

Claim.—The row lock D and roller C, constructed and operating in combination with each other, substantially as herein shown and described and for the purpose set forth.

82,339.—R. M. MITCHELL, Fort Atkinson, Wis.—*Grain Storer*.—September 22, 1868.

Claim.—1. The arrangement of the bins A in a vertical column, said bins being connected by means of a tube, B, provided with receiving and discharging orifices E F, respectively, substantially as described, for the purpose specified.

2. The tube B, passing through the series of bins A, and provided with receiving and discharge orifices, communicating with each bin, said orifices being provided with valves which are adapted to be operated by means of cords D, or their equivalents, in the manner and for the purpose substantially as herein set forth.

82,340.—JOHN H. NALE and JOHN W. ROGERS, Decatur, Ill.—*Spring for Wagon Seat*.—September 22, 1868.

Claim.—A spring seat for wagons, composed of reversible cross-spring braces, supported by, and in turn supporting, the seat by a bridge piece at or near their points of crossing, substantially as herein described and represented.

82,341.—J. S. NICHOLSON, Anamosa, Iowa.—*Clothes Press*.—September 22, 1868.—A series of winged or swinging bars is inclosed in a frame provided with a door, and having a cloth covering in front and rear.

Claim.—In a clothes press, the combination and arrangement of the frames A and B, uprights 1 and 2, cross piece 3, shelf 4, the coverings 5 and *j*, the arms *a*, *b*, and *c*, the bars *e*, *f*, and *g*, and rest *h*, as and for the purpose specified.

82,342.—CHARLES H. OVERTON and D. B. OVERTON, Dover, N. J.—*Valve Gear for Oscillating Engine*.—September 22, 1868.—Consists in applying a slide valve to an oscillating cylinder.

Claim.—The arrangement of the hoop G, reciprocating plate E, and guide plate *d*, with reference to the trunnion *a* of an oscillating cylinder, substantially as shown and described.

82,343.—ALVAH PATE and EDGAR WILBER PATE, Nankin, Mich.—*Wagon*.—September 22, 1868.

—The lighter ends of the springs are fixed to the axles, and are connected with a semicircular frame, which moves on a roller journaled in a hanger from the center sill, and fixed above it is the circle which supports the fifth wheel.

Claim.—The construction of a wagon or carriage, combining the springs D, body E, semicircular frame H, roller I, hanger J, circle K, "fifth wheel" L, and king bolt M, or their equivalents, with any suitable axles, B, and wheels A, when arranged, connected and operating substantially as and for the purposes herein set forth, shown, and described.

82,344.—DAVID PHILIPS, Cordova, Ill.—*Wagon Brake*.—September 22, 1868.—A shaft with rub blocks revolving on it is connected with a lever, at one end pivoted to a rod screwed to the hind bolster, and at the other to a rod connected by a ring with a bar pivoted to a plate bolted to the body, thus forming a toggle joint.

Claim.—A brake, consisting of the shaft D, having rub blocks attached, held in by the rods F, and operated by the lever C and H, connected by the rod G, all substantially as described.

82,345.—C. H. POAGE, Perry, Mo.—*Horse Rake*.—September 22, 1868.—A staple and ring are used for connecting the flexible draft chains to the head of a rake.

Claim.—The combination of the staples *e'* and rings *e* with the rake *a b c d*, and the flexible draft chains or cores or straps *g g*, substantially in the manner and for the purpose described.

82,346.—DENIS POULOT, Paris, France.—*Machine for Cutting Screw Threads*.—September 22, 1868.—A grooved plate having slide pieces, to which are pivoted the disk jaws, with corresponding dies made on their edges, is secured to a hollow shaft connected with guide rods, on which moves the carriage for the cutters, which are adjusted by a hand wheel. In front of the frame is a trough for receiving the oil and shavings.

Claim.—1. The arrangement, herein described, of the perforated, rotating, and sliding jaws D, plate C, and the hollow shaft B, with mechanism for rotating the same.

2. In combination with the above-specified mechanism, the guide rods *i* and sliding-die carriage H, constructed and operating substantially as described.

3. The arrangement, in the die carriage, of the cutting dies *k* and sliding blocks *l*, in combination with the screws, gearing shaft, and hand wheel, for operating the same, so that said dies can be moved simultaneously either toward or away from each other, as set forth.

4. The inclined and projecting trough or receptacle, located beneath the cutting mechanism, and arranged to receive the shavings or chips and lubricating oil, and to conduct the latter to a separate receptacle, as herein shown and described.

82,347.—E. K. POWERS, Grand Rapids, Mich.—*Machine for Molding Candy*.—September 22, 1868.—Consists in a means for forming the candy into sticks of proper size, and then compressing the same.

Claim.—1. The movable molds B, constructed each of a bottom piece *a*, and a vertical side strip *b*, sharpened at its upper edge, in combination with the roller G and the mold's receptacle A, all of which may be constructed of wood or any other material, and arranged substantially in the manner as and for the purpose set forth.

2. The press, composed of the bars K K', arranged and operated substantially as shown, in combination with the plunger or follower L, box M, the slide N and spring stop O, all arranged for joint operation, substantially in the manner as and for the purpose specified.

82,348.—J. W. RIST, Rochester, N. Y., assignor to himself and IRA A. HEBBARD, same place.—*Knitting Machine*.—September 22, 1868; antedated September 9, 1868.—The needle bed is made so as to be readily detached and replaced by another, and the yarn carrier, lock, and loop mechanisms are op-

erated by mechanism so as to adjust the grades of yarn and length of the stitch.

Claim.—1. The needle bed, composed of the division plates *d* and spacing plates *t*, when connected together, substantially in the manner and for the purposes herein shown and described.

2. The gib *G*, in combination with the bed Δ' and removable needle bed, as and for the purposes set forth.

3. The arrangement of the locking spring *N*, constructed as described, attached rigidly to the lock plate *P*, and operating upon the V-shaped cam *M*, on the reversing plate *H*, substantially as and for the purposes set forth.

4. The arrangement of the cam *Q* with the pivoted lever *R* and stud *g* of the wing cam *D*, on that end of the lock, substantially in the manner and for the purposes herein shown and described.

5. The arrangement of the cam *O* upon the reversing slide, in connection with the stud *g* of the wing cam, the parts all operating substantially in the manner and for the purposes shown and described.

6. The reactionary spring *l*, in combination with the stud *g* and wing cam *D*, substantially as shown and described, and for the purposes set forth.

7. The combination, with the lock plate *P*, of the needle adjuster *T*, constructed, arranged, and operating substantially in the manner and for the purposes set forth.

8. The combination, with the lock plate *P*, of the cam and needle guides or adjusters *E*, substantially in the manner and for the purposes set forth.

9. In combination with the wing cams *D* and their studs *g*, the cams *O* and *Q* and latch *R*, or their equivalents, whereby said cams *D* are moved upward simultaneously with the closing of the V-cam *C*, for the purposes described.

10. The combination of the plates *p* and studs *g* with the set nut *B*, index hand *y*, and scale *S'*, for the purposes set forth.

11. In combination with the scales *S'*, for gauging the tension or length of the loop, the pivoted lever index *y*, arranged and operating substantially as and for the purposes shown and described.

12. The pivoted yarn carrier *Y*, in combination with the friction traveler *q* and the rod *W*, all constructed, arranged, and operating as shown and described.

13. The yarn carrier or guide *Y*, slotted as shown and described, and for the purposes set forth.

82,349.—ALVAN RITTENHOUSE, M. D., Philadelphia, Pa.—*Female Syringe Bed Pan.*—September 22, 1868.

Claim.—1. The bed pan or vessel *J*, capsular vulva *H*, right angle suction tube *K*, substantially as set forth.

2. The vaginal extension tube *N O*, metallic valve tube *P*, right angle suction tube *K*, rubber bulb *R*, vessel *J*, capsular vulva *H*, strainer *L*, all combined and arranged substantially in the manner and for the purpose as herein set forth and described.

82,350.—WILLIAM DAVIDSON ROBERTSON, San Francisco, Cal.—*Track-laying Machine for Railroads.*—September 22, 1868.—The ties and rails are loaded on common platform cars, the loads being hauled forward from one car to another and up to the rear end of the machine, and the material is passed from the rear of the machine to its place forward.

Claim.—1. As a new application to construction trains, for supplying power to carry forward, from the rear car to the place of deposit, the rails and ties, the engines *a a*, mounted on the central car, substantially as described.

2. The shaft *f*, with the screw *g*, actuating the trucks *b b*, by the beveled gear *k' v'*, or their equivalents, substantially as described.

3. The pulley *u*, on the rear truck axle of the engine, for driving the friction rollers, which carry the ties to the incline trough beneath the boiler of the engine, substantially as described.

4. The friction rollers *t* and *u*, in combination with the channel or trough *v*, substantially as and for the purpose specified.

5. The pulleys *g'* and the belts *w* and *w'''*, or equivalent devices, for actuating the entters, substantially as described.

6. Carrying the rails forward at each side of the boiler, and lowering them to the road bed, by the davits *A A*, substantially as described.

7. The rollers *q q' r r' s s' s'' s'''*, the endless chains *p p'*, or equivalent device, for pressing down and holding the ties while the cutters trim them, substantially as described.

8. The entters *v' v''*, for leveling and trimming the ties to receive the rails, constructed and operating substantially as described.

82,351.—CLARK ROBINSON, Fox Lake, Wis.—*Miter Box.*—September 22, 1868.—Angular plates are fixed on the bottom of the box, to serve as bearings for the guides, and to hold the molding. At the under side of the box are a pinion and racks by which the guides are made to move on trucks and carry the frames, and thus give the required angle to the molding.

Claim.—The plates *B C D*, in combination with the frames *J J*, guides *H H*, having racks *F F*, standards *L O*, and pinion *G*, the whole being constructed and arranged substantially as and for the purpose herein specified.

82,352.—ANTHONY J. ROBRECHT, Newark, N. J.—*Carpet Bag.*—September 22, 1868.—Partitions are so arranged as to be instantly detached and replaced at pleasure.

Claim.—1. The combination of one or more partitions with a traveling bag, valise, or trunk, produced by means of hooks and eyes, constructed to be employed in the manner and for the purpose specified.

2. The combination of the metallic band *f* with the partition *e*, and also the combination of said band with hooks or eyes, employed in the manner and for the purpose specified.

82,353.—N. W. RUSSELL, Cedar Falls, Iowa.—*Mold for Casting Sleigh Shoe.*—September 22, 1868.—The upper section is constructed with transverse bars at intermediate points, and in the lower section are a number of channels to form molds for the shoes; the said channels being covered by thin metal strips in preparing the mold for casting, so as to prevent the sand from filling the channels.

Claim.—1. The sand flask or cope *A*, and metallic mold section *B*, constructed substantially as described, when used in combination with each other for the production of sleigh shoes, as set forth.

2. The covering plates *J*, in combination with the channeled metal section *B* and sand cope *A*, substantially in the manner and for the purpose described.

82,354.—DENNIS SAVERY, Wheeling, W. Va.—*Device for Holding Cut Nails while being Headed.*—September 22, 1868.—One end of a U-shaped spring is fixed to the cam end of the griper, its other end bearing on the side of the cam shaft opposite, thus holding and actuating the griper against the shaft as soon as the cam has passed the tappet on the griper.

Claim.—The arrangement of the lever *C*, tappet *a*, spring *D*, plate *b*, pad *e*, cam *B*, and shaft *A*, in the manner and for the purpose specified.

82,355.—GEORGE W. SCHERMERHORN, East Limington, Me.—*Cork Puller.*—September 22, 1868.—*Claim.*—The instrument for removing corks from bottles, consisting of the handle *A*, having the stem *B* and spring loop *D* at right angles to each other, and provided respectively with the sliding disks *C* and *E*, all constructed and arranged to operate as described, whereby the cork is first pushed into the bottle by the stem *B*, and afterward withdrawn by the loop *D*, the disks *C E* in both operations serving to prevent the contents of the bottle from spattering out, as herein shown and described.

82,356.—JACOB SHAW and W. A. SHAW, Hinkley, Ohio.—*Churn.*—September 22, 1868.—A hollow journal has an enlarged stem forming a valve to let air in or out of the churn. The lid is secured by a cross-bar placed beneath inclined curved rods.

Claim.—1. So hanging a rectangular or nearly rectangular churn box or case that its axis of rota-

tion shall be diagonal to its sides, in the manner and for the purpose substantially as set forth.

2. The curved inclined rods and cross-bar, in combination with the cap and churn, substantially as and for the purpose set forth.

3. The hollow journal and valve, in combination with the churn, arranged as and for the purpose substantially as herein specified.

82,357.—EDWIN SHEPPARD, Philadelphia, Pa.—*Automatic Boiler Feeder*.—September 22, 1868.—An arrangement of cylinders and casings applied to a steam boiler and communicating with each other and with the interior of the boiler; the said cylinders being provided with suitable pistons, floats, and piston rods, so connected with the valve lever of a water pipe as to regulate the supply of water to the boiler.

Claim.—An automatic boiler-feeder, consisting of a cylinder, B, with its float D, cylinder F, with its pistons *i i'*, operated by the float D, and cylinder G, with its piston *m'*, the cylinder F communicating with the cylinder G, and the cylinder B with the cylinder F, and the whole being arranged and applied to a steam boiler to regulate the flow of water to the same, substantially as described.

82,358.—GEORGE SKINNER, Brooklyn, N. Y.—*Fire-escape Ladder*.—September 22, 1868.—A cross-bar, secured to the lower part of the ladder, is provided with extension arms for convenience in handling the ladder. The upper end of a frame is pivoted to a brace on the ladder, the lower end is pivoted to the standard which supports a caster wheel; a rope, secured to the lower end of the frame, is attached to a shaft having bearings in the lower part of the ladder.

Claim.—1. The peculiar arrangement and combination of the pivoted frame K, caster wheel M, rope or chain O, and shaft P, with each other, and with the ladder C, axle B, and wheels A, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the frame D and leg *d'* with the ladder C, axle B, and wheels A, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the extension cross-bar E and *e e'* with the ladder C, axle B, and wheels A, substantially as herein shown and described, and for the purpose set forth.

82,359.—HENRY SLATTER, Covington, Ky.—*Carbureter*.—September 22, 1868.—The air is caused to traverse a stratum of water below the gasoline for the purpose of insulating the gas from contact with the atmosphere and saturating it with aqueous vapor. The pressure in the tank created by the receiver operates to elevate a doctor or gasometer whose pressure in turn maintains the flow of gas for another change of air.

Claim.—1. The arrangement of the water tanks A and B, principal and auxiliary receivers C and D, pipes F, H, and R, and tank E, for the purpose set forth.

2. The tank E, adapted to contain both water and gasoline, and provided with the pipes R, H, K, and M, and cocks L L', as and for the purpose designated.

3. In combination with the subject-matter of claims 1 and 2, the auxiliary carbureting chamber O, or its equivalent.

82,360.—WILLIAM SMITH, Cincinnati, Ohio.—*Folding Table*.—September 22, 1868.—The legs are hinged to the table and held by braces which are hinged to slides moving in grooves on the lower side of the table top; said slides being held by spring bolts.

Claim.—The combination, substantially as described, of the table A, hinged frames *a B C D E*, legs F, hinged braces *G g d d' e e'*, slides H, undercut grooves *I i*, stops J, and spring bolts or catches K, or their mechanical equivalents, for the object explained.

82,361.—JAMES A. SUTHERLAND, Elmwood, Ill.—*Horse Collar*.—September 22, 1868.—The collar is

made in sections, curved to rest upon the withers and breast of the horse. An iron strap extends around the lower section, to one end of which the upper section is hinged, the other end being slotted and fitting over a hook on the upper section. The hames are dispensed with.

Claim.—A horse collar, made of wood, when constructed substantially as above described.

82,362.—SAMUEL SWESEY, Malta, Ohio.—*Quartz Mill*.—September 22, 1868.

Claim.—1. Suspending the stone C above the bed stone by means of the swiveled connections F and screws *h*, in combination with the shaft D and stone C, for the purpose of adjusting the grinding face of the stone C parallel to the grinding face of the bed stone B, as herein shown and described, for the purpose specified.

2. The arrangement of the hopper K upon the yoke E, whereby said hopper is revolved with the stone C, as herein shown and described, for the purpose specified.

82,363.—JAMES TALLMAN, Clayton, Ill.—*Bee-Hive*.—September 22, 1868.—The hives may be placed in one house and made to communicate with each other to multiply colonies, or they may be separated for swarming.

Claim.—1. The arrangement and combination of a series of hives provided with inclined bottoms, and resting on inclined bars, *a*, within a frame, in such a manner that the several hives may be made to communicate with or cut off from each as may be desired, substantially as shown and described.

2. The house, composed of the frame A and box C, the latter being provided with doors, *f*, and with a lid or detachable top, F, when said house, thus constructed, is used in connection with a plurality of hives, B, adapted to the house or frame, in the manner substantially as and for the purpose set forth.

82,364.—GEORGE W. THOMPSON, Brooklyn, N. Y.—*Sweats for Hats*.—September 22, 1868.—Paper, made in imitation of leather, rendered water-proof and then embossed, is used for head lining in hats.

Claim.—As a new article of manufacture, a sweat band for hats, formed of paper, coated with Japan or other water-proof compound, and finished by embossing, substantially as described.

82,365.—JOHN A. THOMPSON, Auburn, N. Y.—*Refrigerator and Sideboard*.—September 22, 1868.

Claim.—The construction of refrigerators and household preservatives of angle wood, skeleton frames, with their entire walls of trunk board, or its equivalent, filled with a concrete of plaster of Paris and granulated carbon, or other suitable material securing the same effects, all as specified and set forth.

82,366.—JEPHTHA A. WAGENER, New York, N. Y.—*Sewing Machine*.—September 22, 1868.—The cloth plate, the braeket arm, and all the working parts of the machine are sustained on the bed frame by elastic bearings, to prevent noise when operating. An opening is made through the cloth plate beneath the needle bar, and is covered by a bridge provided with an oblong slot through which the needle works. The feeding bar is provided with two rows of projections which operate on each side of the bridge. The presser foot is provided with slots in which the projections work.

Claim.—1. The feeding device J, furnished with points on each side of an open slot, and a point or points in range with said slots, the said feeding points being applied, arranged, and operating substantially as described.

2. The combination of the bridge *u*, plate I, and feeding device J *t t'*, the said bridge slotted, and the feeding device being forked and furnished with central and side points, substantially as and for the purpose described.

3. The bridge *u*, when slotted and provided with a forked or V-shape at one end, and a bevel and shoulder at the other end, in combination with the recessed removable plate I, substantially as shown, and so that by one screw the bridge is confined in position.

4. The bridge *u*, constructed as shown in Figs. 13 and 14, for the purpose described.

5. The combination of the looper H, the feed lever J, with its central and lateral feeding points, slotted bridge, triple-slotted presser foot, and upper needle, the said parts being constructed and arranged as described, and operated by a cam pulley, constructed as described.

6. The cam pulleys E F, constructed and arranged as described, in combination with the levers E¹ F¹, rod K, looper H, looper guide *p*, lever C C⁶, needle *c*, feed arm J, bridge *u*, and presser foot V, all constructed and arranged and operating as described.

7. The arrangement of a front elastic support, *a*², for the cloth plate B, forward of and centrally between the two rear-hinging elastic supports *a*² *a*², substantially in the manner and for the purpose described.

8. The rear elastic sleeve bearings *a*², fitted in the hinging studs *a*¹, in combination with the hollow bearing boxes *a*⁷, formed in the cloth plate B, in the manner described.

9. The gimbal joint *g*, with the levers E¹ F¹ applied to it, as shown in Fig. 15, in combination with the feeding arm J, looper guide *p*, and the looper or lower needle H, all constructed, arranged, and operating as described.

10. The cloth plate B, cast with a horizontal portion forward of the axis of the needle arm C, and with a semicircular portion, B¹, in rear of the horizontal portion, and also with a bracket, B², and hollow bearing boxes *a*⁷, all substantially in the manner shown and described and for the purpose set forth.

11. The slotted cloth presser V, in combination with the elevated bridge *u*, and feeding points working on both sides of said bridge, substantially as described.

S2,367.—JOHN B. WATERMAN, Summit, Mich.—*Hames and Strap Fastener.*—September 22, 1868.—A plate provided with a pawl acts as a guide for another having a rack. A spring holds the latch and pawl in position.

Claim.—The arrangement, in a hames fastener constructed as herein described, of the latch D, having a forked end, E, and operating in combination with the spring C and ratchet bar F, all constructed and operating as herein described and shown.

S2,368.—G. WATERS, Cincinnati, Ohio.—*Lubricator.*—September 22, 1868.—The tubular discharge pipe is provided with a screw having a groove made larger at the bottom than at the top on its outside.

Claim.—A lubricator, constructed with a graduating screw or plug, in which is formed a gradually-tapering slot or groove for regulating and controlling the discharge of oil, as described.

S2,369.—SAMUEL WESSON, Worcester, Mass.—*Corn Husker.*—September 22, 1868.—The stalks are drawn through between a roller and revolving bars which break off the ears, which drop upon an ear guide constructed to feed them to two pair of rollers. Adjustable auxiliary rolls tapering toward their upper end, to prevent the husks being caught in a bunch by the rolls, are placed by the side of the husking rolls.

Claim.—1. The hinged guard or separating plate Z, in combination with the separating roll X' and bars V, substantially as and for the purposes stated.

2. The combination, with the guard or hinged separating plate Z, of the adjusting screws 12 12 and stands 14 14, as and for the purposes set forth.

3. The combination of the shield 15 with separating roll X' and bars V, substantially as and for the purposes set forth.

4. The combination with two or more sets of husking rolls, of a hinged ear-covering plate arranged as described, so as to retain the ears in proper contact with the rolls, and provided with one or more dividing pieces or partitions, extending between each two contiguous or adjoining sets of rolls, in the manner and for the purposes shown and set forth.

5. The combination with each set of husking rolls E F, of an auxiliary adjustable roll, H, arranged, with relation to the exterior or lower roll E of each set, in the manner and for the purposes shown and specified.

6. The combination, with each set of husking rolls, of an adjustable auxiliary roll, H, made tapering at its upper end, substantially as and for the purposes set forth.

7. The combination, with two or more sets of husking rolls and adjustable auxiliary rolls, of the removable ear-covering plate and guide I M, the ear guide K, and chutes or ways L, for delivering the ears to the auxiliary rolls, the whole being arranged to operate substantially in the manner and for the purposes shown and set forth.

8. The combination, with two or more sets of husking rolls, of a continuous ear cover or shield I, with its division piece or pieces M, substantially as and for the purposes set forth.

S2,370.—WILLIAM H. WILSON, Providence, R. I.—*Game.*—September 22, 1868.—A revolving index hand moves over a disk, on which numbers or words are marked, the said hand having an arm which is exposed to the action of a ball thrown by the player.

Claim.—A game, consisting of a combination of the pointer D and plate or disk C, of which one is movable, and the other stationary, the movable part being set by means of a ball propelled by the player, as set forth.

S2,371.—SAMUEL WOODRUFF and H. B. BEACH, Hartford, Conn.—*Pump.*—September 22, 1868.—Designed as an improvement on patent granted to William Wright, Nov. 15, 1869, and consists in the substitution of a series of valves for the double bent valves shown therein.

Claim.—The arrangement of the series of valves D and E in relation to cylinder B, annular chamber *a*, and chamber F, substantially as described, for the purpose specified.

S2,372.—VALENTINE ZIMMERMAN, Morris, Ill.—*Bee Hive.*—September 22, 1868.—The slatted partition is so arranged as to allow it to be withdrawn. The comb frames are supported at one end by hooks on the slatted partition, and at the other by pins fitting in holes in the rear of the hive. Slides are provided to vary the size of the entrance and are secured in position by springs.

Claim.—1. The slatted partition E, arranged to support the frames F and the front ends of the lower frames G, as herein shown and described.

2. The securing of the lower comb frames G in position by means of the pins *i*, and hooks *k*, substantially as shown and described.

3. The slides C C, applied to the box or case, in connection with the springs D, in the manner substantially as and for the purpose set forth.

S2,373.—WILLIAM A. ALLEN, Medina, N. Y.—*Car Stove.*—September 22, 1868.—The door is made of two plates perforated for air, and having a wire screen inclosed between the plates. A screen is placed in the flue.

Claim.—The combination of the above-described double door, having plates, H and B, and screen E, and provided with a lock, D, with the body of the stove and the flue, with the screen F therein, all being constructed and arranged substantially in the manner set forth.

S2,374.—JOHN G. BAKER and HENRY ASBURY, Philadelphia, Pa.—*Bung Borer.*—September 22, 1868.—Designed as an improvement on English patent to John Grist, July 25, 1853. The lower part of the cutting blade is rounded to form a gouging and boring edge by means of which the boring and reaming are done at one operation.

Claim.—The combination of the tapering tubular stock A, its boring edge *x*, reaming edge *x'*, and tapering screw *b*, the whole being constructed and arranged substantially as and for the purpose herein set forth.

S2,375.—E. H. BLOEBAUM and C. H. NAGLE, St. Charles, Mo.—*Dining Table.*—September 22, 1868.—An annular rim sustains the plates, and has resting on it a revolving center piece which supports the viands. The top is made in four pieces, hinged so as to fold up to fit in a corner of a room. The legs

are attached to a frame and can also be folded out of the way.

Claim.—1. The central board A, when composed of the pieces $a a^1 a^2 a^3$, and the annular rim B, when composed of the pieces $b b^1 b^2 b^3$, when the said parts are united and arranged, substantially as herein shown and described, and for the purpose set forth.

2. The arrangement of the frame D and legs $d d^1 d^2 d^3 d^4 d^5 d^6$, herein shown and described.

82,376.—ALBERT BOSCHKE, Boston, Mass.—*Dredging Machine.*—September 22, 1868.—A hood-shaped plow loosens the earthy material. An endless chain bucket revolves in said plow and discharges the material.

Claim.—A dredging or excavating machine, in which are combined a floating hull, a plow or scoop a , and elevating buckets, all constructed and arranged to operate substantially as set forth.

82,377.—WILLIAM H. BRADLEY, New York, N. Y.—*Angler's Reel.*—September 22, 1868.—The line is wound up in the annular space between the disks. The standards are connected at the top by a screw, so as to regulate the end motion of the reel shaft.

Claim.—1. A fish-line reel, composed of the two annular concaved disks A A, as arranged on the shaft f , with the space g at their peripheries, in combination with the frame C C, constructed and operating substantially as and for the purposes set forth.

2. In combination with the disks A A and conical journals of the shaft f , the frame C C, fixed to the foot plate B, and provided with the variable connecting piece d , for adjusting the bearings to the shaft, substantially as set forth.

82,378.—C. H. BRENEMAN, Newport, Pa.—*Clothes Rack.*—September 22, 1868.—An upright shaft is provided with hinged arms, which are supported by pivoted braces.

Claim.—The arms C C grooved on their lower side, and provided with braces E E, pivoted therein, so that they may lie in the same, and connected to the upright, A, substantially as and for the purposes herein set forth.

82,379.—EDWARD BROWN, New York, N. Y.—*Connecting Rod.*—September 22, 1868; antedated September 16, 1868.—Spiral inclines on a supplemental washer are made to engage with similar inclines on the extension rod, so as to nicely adjust the length of the connecting rod when the screws are turned.

Claim.—The combination with the double screw rod C, of the two inclines b and c , whether the said inclines be placed on the washer E and the end of the connecting rod A, or on the two washers D and E, substantially as herein described.

82,380.—BENJAMIN F. CADY, Chittenango, N. Y.—*Sled Knee.*—September 22, 1868.—A rod passes through and is made fast to the sleigh runner, its upper end protruding through the bottom board, and provided with a nut for tightening. A shield protects the rod and forms suitable bearings for the runner and cross-piece.

Claim.—A sleigh knee, having rod A and shield H, constructed, combined, and arranged substantially as described, as a new article of manufacture.

82,381.—JOHN CAMP, Olney, Ill., assignor to himself and HENRY MARSHALL, same place.—*Lifting Jack.*—September 22, 1868.—One of the recesses in which the axle rests is further from the fulcrum than the other, so that the axle is raised higher with one than the other.

Claim.—The combination of the reversible lever B $b b'$, the stand A and fulcrum pin C, relatively arranged to operate in the manner described, for the purpose specified.

82,382.—NATHAN CHAPMAN, Milford, Mass.—*Hay Spreader.*—September 22, 1868.

Claim.—1. Giving the rake teeth, when raking, a forward and an upward movement, and a backward and a downward movement, in regular succession, by means of the toothed wiper wheel G,

traversing bar N, wiper seat S, and springs L L, constructed and arranged to operate substantially as described.

2. Giving the teeth, when tedding, a forward and upward movement and a downward and a backward movement in succession, by means of the toothed wiper wheel G, traversing bar N, and inclined plane and groove on the block X, substantially as described.

3. Hinging the inclined block X so that the rear end will rise and let the pin or roller pass under it as it moves backward, and catch on the top as it moves forward, substantially as described.

82,383.—CHARLES B. CLARK and E. L. FERGUSON, Buffalo, N. Y.—*Mop Head.*—September 22, 1868.—The collar surrounding the nut is made in two portions, each provided with an oval opening, to admit the insertion of the lower part of the nut, which has a projecting flange on opposite sides. Both of the portions of the collar are provided with ledges, in which the flanges fit.

Claim.—The nut C, provided with flanges $c c'$, or equivalent, in combination with the collar portions D D, formed with elongated openings h , and ledges i , substantially in the manner and for the purpose set forth.

82,384.—WILLIAM CLIFFORD, Mina, assignor to A. F. JENNINGS AND COMPANY, Dunkirk, and THOMAS R. COVENEY, Mina, N. Y.—*Wagon Jack.*—September 22, 1868.

Claim.—The swinging bar D, pivoted to standard B, with its free end resting on the disconnected lever E, and guided by the straps d , rigidly secured to the lever, so as to operate in the manner and for the purpose as described.

82,385.—J. J. CONNELLY, Chicago, Ill.—*Equalizer for Vehicles.*—September 22, 1868.—The evener has a double pulley at the center and a single pulley at each end. The draft chains are so arranged on the pulleys that each chain shall fasten to the outside trace of one horse, and to the inside trace of the other.

Claim.—A draft equalizer, consisting of an evener or draft bar, A A, pulley H I G J, and chains O N, the chain O passing over the pulleys H G, and providing a draft attachment for the outside trace of the "nigh" horse, and the inside trace of the "off" horse, and the chain N, passing over the pulleys J I, and providing draft attachment for the outside trace of the "off" horse and the inside trace of the "nigh" horse, substantially as and for the purpose specified and shown.

82,386.—MICHAEL CULLER, Fredericksburg, Ohio.—*Washing Machine.*—September 22, 1868.—A corrugated cylinder, capable of being raised or lowered, is hung upon a frame, in which a box, provided with triangular slats on the bottom, moves forward and backward.

Claim.—In a washing machine, suspended between the oblique standards A A, and upon the rods $a a$, the adjustable, corrugated cylinder G, hung upon the frame D, and secured to operate in the tub, or inserted above it, by the clamps $i i$, all as herein shown and described.

82,387.—CHARLES CURTIS, Galesburg, Ill.—*Seed Sower and Harrow Combined.*—September 22, 1868.—A box is placed in slides and operated by a lever, so that when the machine is not sowing it can be slid under the hopper to catch the grain.

Claim.—The hopper B, drum E, box F, and bar H, constructed and arranged as described, and combined with the adjustable frame L and revolving harrows Z, substantially as set forth and for the purpose described.

82,388.—JOSEPH DAVENPORT, Massillon, Ohio.—*Arched Bridge.*—September 22, 1868.—The lever posts are set against the rear part of the shoes. Rods are secured at one end to the arch, and at the other to the lever post. Tension straps are secured at one end to the chords, and at the other to the lever, and act as suspension chains.

Claim.—1. The rods N N, when used in combi-

nation with the arch B and posts K K, substantially as and for the purpose specified.

2. The supports O, when used in combination with the arch B and rods N N, substantially as and for the purpose specified.

3. The lever posts K, when constructed of the side plates K K, bolts or rivets *k k*, blocks M M, and cross piece L, and used in combination with the chord-bolt washer iron F, the shoe G, the tension bolt J, with straps I I attached thereto and to the chords A, the rods N N, and the arch B, substantially as and for the purpose herein specified.

82,389.—WILLIAM A. DEMUTH, New York, N. Y.—*Glass Light.*—September 22, 1868.

Claim.—A glass light, constructed of solid glass rods, arranged in the manner described.

82,390.—GEORGE EDMUND DONISTHORPE, Leeds, England, — *Coal-mining Machine.*—September 22, 1868.—Patented in England, December 5, 1865. The screw projects beyond the forward end of the machine, and works in a nut supported by a pillar which is progressively moved forward.

Claim.—1. The combination of the mining machine with a screw and nut to move it forward, and with a removable pillar to sustain the thrust of the screw, substantially as before set forth.

2. The combination of the mining machine with a steadying bar, sustained by removable pillars, connected and supported as described, to steady the machine when at work, and prevent it from getting off the rails substantially as before set forth.

82,391.—GEORGE EDMUND DONISTHORPE, Leeds, England.—*Coal-cutting Machine.*—September 22, 1868.—Patented in England, April 21, 1866. The carriage is moved forward by means of a worm which works in a cog wheel engaging with a rack; this mechanism is supported by a frame which can be raised or lowered by a screw. The upper end of the piston rod is hollow to receive the stem of the cutter.

Claim.—1. The combination, substantially as set forth, of the rack on the rail, the geared pinion, the worm, and the hand wheel, with the lifting screw *l*, whereby the feeding devices on the carriage may be released from the rail.

2. The combination, substantially as set forth, of the carriage, the feeding mechanism, the guiding mechanism, and the cutting mechanism, for the purpose set forth.

3. The combination, substantially as set forth, of the carriage, the cylinder, the cutter connected directly with the cylinder, and the mechanism for controlling the induction valve of the cylinder, whereby the valve is not wholly opened unless the cutter makes a full stroke, and, consequently, the depth of one cut regulates the force applied on the next stroke of the cutters.

4. The combined arrangement of apparatus herein described, for cutting grooves or holes into the floor or roof of a mine.

82,392.—JOHN E. DOWNS, Lowell, Mass.—*Sash Fastener.*—September 22, 1868.—The leaf extends across the shutters so as to be screwed to the side and end pieces to prevent sagging. The fastener is secured on projections cast on the hinges.

Claim.—The combination and arrangement of the hinge *e f*, and fastener *k*, when arranged for the purposes as described, and fully set forth.

82,393.—J. E. EDMUNDSON, Bartlett, Ohio.—*Coffee Roaster.*—September 22, 1868.—A cylinder having a portion of its circumference cut away is made to rotate, by means of a crank to which it is secured, within a fixed cylinder which is secured to vertical walls which are attached to the stove cover.

Claim.—The arrangement of the plate A, walls B B, fixed cylindrical case C, having the door B', rotating interior cylinder D having the opening *d* in its side, and crank shaft E, substantially as described and shown, and for the purpose specified.

82,394.—RUDOLPH EICKEMEYER, Yonkers, N. Y.—*Apparatus for Preserving Beer, Ale, &c.*—September 22, 1868.

Claim.—1. The process, substantially as herein

described, of preserving beer or other perishable liquids or substances, by the connection or combination of the vessel containing the same with a carbonic acid gas generating apparatus or reservoir, in such manner as that the contents of said vessel, or vacant space of the latter, is or are kept constantly charged with said gas, in a regular and automatic manner, as rapidly as said contents absorb the gas, or contents of the vessel are drawn off, substantially as specified.

2. The arrangement, in connection with the vessel containing the liquid or article requiring to be preserved, of an upper acid reservoir, B, and lower gas generator C, for supply, in a regular and automatic manner, of the gas to said vessel, and whereby the gas is forcibly expelled into the latter by the superincumbent weight or pressure of the column of liquid acid, essentially as herein set forth.

3. The arrangement of the said reservoir B, gas generator C, and washer D, in an apparatus for supplying, in an automatic manner, carbonic acid gas to the vessel, or its contents requiring to be preserved, substantially as shown and described.

82,395.—PRIMUS EMERSON, Carondelet, Mo.—*Paddle Wheel.*—September 22, 1868.—Each of the pivoting journals has a crank, on the outer side of the wheel, and these cranks are attached to an annular cam ring held constantly in an eccentric position by the side of the wheel, by means of fixed sheaves, the whole operating so as to hold the paddles in a constantly vertical position.

Claim.—The paddles E, when hinged to the outer rim of the wheel by means of journals *e*, placed at their bottom edges, substantially as described and set forth.

82,396.—JOHN A. FALCONER and ROBERT GRAHAM, Jersey City, N. J., assignors to EGBERT C. BRADFORD, JAMES H. RENICK, and OBADIAH A. CLOUGH, New York City, assignors to JAMES H. RENICK.—*Brick Machine.*—September 22, 1868.—The upper end of a bar which gives motion to the pusher has a hinged hook, with a spring pressing against it which is held in place by a clasp that can be raised or lowered to increase or decrease the tension, the latter being so regulated, that if an obstacle gets in the way of the pusher, the arm (from which it receives motion) forces back the hook and passes without moving the arm.

Claim.—1. The hinged hook L, in combination with the spring S, connecting rod M, and crank pin *k* of the crank K, connected with the driving power of the machine, substantially as and for the purpose described.

2. In combination with the hinged hook L, spring S, connecting rod M, and crank pin *k* of the crank K, the adjustable clamp *m*, all constructed and arranged substantially as and for the purpose set forth.

82,397.—JOHN FANNING, Brooklyn, N. Y., assignor to JOHN S. ANDREWS, New York City.—*Take-up for Thread in Sewing Machine.*—September 22, 1868.

Claim.—The eye *h* upon the arm *b*, in combination with the eye *i* near the end of the lever *e* that moves the needle bar, so arranged as to draw upon and tighten the thread between the eye *h* and the guide *k* on the needle bar, as the needle descends, for the purposes set forth.

82,398.—GILBERT GIBBS, Fairview, Ind.—*Farm Gate.*—September 22, 1868.

Claim.—1. The oblique link *a*, in connection with the central lever E, when so arranged as to draw the bolt *n* from the catch or socket *c* before opening the gate, substantially as shown and specified.

2. In combination with the bolt *n*, lever B, link *a*, and central lever E, the bars S S, and hand levers D D, all arranged to operate substantially in the manner and for the purposes as set forth.

3. Attaching a panel composed of the post G, diagonal J, and bars *m m m*, and sill O, with a gate, when the panel is so arranged, that, by means of the notches in the post G, the forward part of the gate may be raised, as described and shown.

82,399.—CHARLES GILPIN and LAURENCE T. DICKINSON, Cumberland, Md.—*Rossing Machine.*—September 22, 1868.—An idle roller placed between the upper edges of the lower rollers, facilitates the passage of the bark. A knife is placed between the rear edges of the upper and lower rollers and presents a cutting edge to the bark as it comes from the rollers.

Claim.—1. The combination and arrangement, with a cutting device, of the rollers $B B^1 B^2 B^3$, provided with the teeth $e e e$, and operated by belting and gearing in such a manner that they all have an equal and uniform motion, the two upper ones rotating in one and the same direction, and the two lower ones in the opposite direction, substantially in the manner and for the purpose specified.

2. The arrangement of the knife K with reference to the rollers $B^1 B^3$, substantially as and for the purpose set forth.

3. The arrangement of the idle roller a , in combination with the rollers, substantially as described.

82,400.—CHARLES GILPIN and LAURENCE T. DICKINSON, Cumberland, Md.—*Rossing Machine.*—September 22, 1868.—Designed as an improvement on their patent No. 82,399, and consists in substituting a saw for the knife therein used, when the woody crust of the bark is hard and dry.

Claim.—1. The arrangement of the reciprocating saw M with relation to the rollers, substantially as described.

2. The combination of the saw M , pitman H , spring P , lever R , and cam u , on shaft W , substantially as described, and for the purpose specified.

82,401.—O. F. GREEN and JAMES E. CLARK, St. Louis, Mo.—*Manufacture of Small Beer.*—September 22, 1868.—The ingredients designed to cause the necessary fermentation without the use of brewers' yeast, are sugar, elder sirup, citric acid, and caramel dissolved in water.

Claim.—1. The ingredients hereinbefore mentioned, or their substantial equivalents, when subjected to the processes substantially as described.

2. The beverage formed from such ingredients, as a new article of manufacture, substantially as set forth.

82,402.—JACKSON HARRINGTON, New London, Conn., assignor to himself and A. C. LIPPITT, same place.—*Gear-cutting Tool.*—September 22, 1868.—The ends of the cutters fit into V-shaped sockets in a circular holder and are held in place by confining plates screwed upon the circular holder, and by a circular dog which is held in circular grooves in the cutters by a nut on the end of the shaft.

Claim.—1. The series of cutters $A A$, in combination with the circular socket plate or holder E , and confining plates $G G$, arranged substantially as and for the purposes described and set forth.

2. The circular dog I , circular recess J , and brace nut M , when used in combination with the cutters $A A$ and holder E , substantially as and for the purposes set forth.

82,403.—JACKSON HARRINGTON, New London, Conn., assignor to himself and A. C. LIPPITT, same place.—*Knife for Cutting Green Corn from the Cob.*—September 22, 1868.—The rectangular shank has on its outer end a concave plate, whose outer and inner ends form V-shaped cutters; a rib is formed on the concave side between the cutters to prevent the knife slipping off the cob.

Claim.—The concave plate C , with V-shaped cutters $D D$, and guide rib E , in combination with the rectangular shank B , arranged substantially as and for the purposes described and set forth.

82,404.—GEORGE HARSIN and C. T. SANDERS, Kirkville, Iowa.—*Machine for Shearing Sheep.*—September 22, 1868.—One of the cutters is stationary; the other is made to oscillate by means of a crank working in a slot in an arm secured to the oscillating plate. The crank is operated by a belt which is kept taut by means of a sliding weight.

Claim.—1. In combination with the cutter C , the belt B and cord B' , running over pulleys and kept taut by weights, arranged to operate substantially as and for the purpose set forth.

2. The combination, in a sheep-shearing machine, of a stationary blade K , and the oscillating blade I , constructed and arranged, in relation to one another, substantially as set forth.

3. The arrangement of the pulley G , having a wrist pin G^1 , slotted arm H , oscillating cutter I , and stationary knife K , within the hollow case C^1 , substantially as and for the purpose set forth.

82,405.—JAMES HAVERLY and CHARLES A. TIBITTS, La Porte, Ind.—*Thill Coupling.*—September 22, 1868.—A clasp is provided with a box which is open at the top and into which a bolt (fastened to an arm to which the shafts are secured) drops. A clasp on the bottom of the arm embraces the lower part of the box and holds the bolt in position.

Claim.—1. The construction of the clasp A with its box B attached thereto, substantially as shown and described.

2. The construction of the arm E , and the arrangement thereof with reference to the box B , substantially as set forth.

82,406.—ARCHABALD T. HEFLIN, Monmouth, Ill.—*Cultivator.*—September 22, 1868.—The vertical and horizontal joints which attach the scraper beams to the frame enables the attendant at the rear to guide and control said scrapers. An arrangement is provided for distributing the draft equally upon both scrapers.

Claim.—1. A two-wheeled elevated draft frame, with a draft pole, C , secured upon the cross beam B' of said frame A , swivelling double-tree C' , applied to the draft pole, and connected to links $b b$, in combination with levers e and scraper-carrying beams $D D$, all combined, arranged, and operating substantially as described.

2. The attaching hooks $J J$, applied to links b , which are connected to the double-trees C' and to levers $e c$, said parts being employed in a machine constructed and operating substantially as described.

82,407.—C. HOELLER, Cincinnati, Ohio.—*Stove-pipe Elbow.*—September 22, 1868.—The elbow is made of one piece of sheet metal and has the interior curved surface corrugated.

Claim.—The elbow for stove pipes, constructed as herein shown and described.

82,408.—A. S. HOPSON, Plainview, Minn.—*Clothes Drier.*—September 22, 1868.—The lower end of the rod on which the arms are placed is secured to a fixed plate; the upper end is fastened by a nut to a plate provided with slots and slide over flanges on a fixed plate, for the purpose of accommodating the drier to any quantity of clothes that may be placed on it.

Claim.—The flanged plate C and slotted sliding plate D , in combination with the rod a , nut e , arms $B B$, and plate A , all constructed as described, and operating substantially as and for the purposes herein set forth.

82,409.—OZIAL A. HOWE, Jersey City, N. J.—*Machine for Making Horseshoes.*—September 22, 1868.—A rotating die, and pressure disk in connection with an oscillating frame which carries the die, bend and shape the shoe upon the end of the bar previous to its being separated from the latter. A presser cone retains the metal in place during the operation of shaping the shoe.

Claim.—1. The combination of the rotating pressure disk G , the rotating die F , and the oscillating frame B , substantially as and for the purpose specified.

2. The cutting lip or corner i , so arranged upon the presser disk G , and in relation with the shoulder m of the die F , as to sever the shoe from the bar, substantially as and for the purpose specified.

3. The arrangement of the rotating presser cone F^* upon the oblique shaft I , when combined with the presser disk G and the rotating die F , carried upon the oscillating frame B , substantially as and for the purpose specified.

4. The arrangement of the guide notch b^1 , and wheel e upon the frame B , and in relation with the rotating die F carried thereby, and the presser disk G , substantially as and for the purpose specified.

5. The arrangement of the spring J, with reference to the rotating die F, presser disk G, and presser cone F*, substantially as and for the purpose specified.

6. The combination of the pusher rod *u*, spring *v*, and inclined plane *u**, with the shaft C and die F, substantially as and for the purpose specified.

82,410.—MOSES G. HUBBARD, Syracuse, N. Y.—*Gearing for Harvester.*—September 22, 1868.—The external spur cog wheel is held in position by a sliding ratchet clutch so that the main spur driving gear wheel will be moved at a diminished speed in proportion to the difference between the sizes of the two gear wheels.

Claim.—1. The combination of the two gear wheels C and E, of unequal size, with the spur pinion F and main gear wheel G, substantially as described.

2. The employment of two or more concentric gear wheels, all of which may be made to revolve in driving the cutters, or one or more of which may be held stationary, for varying the speed of the cutters, as described.

3. Two or more gear wheels, of unequal size, arranged upon line shafts, or upon a divided axle, in combination with a shifting clutch, whereby the speed of the cutters may be varied, as described.

82,411.—MOSES G. HUBBARD, Syracuse, N. Y.—*Gearing for Harvester.*—September 22, 1868.—An arrangement of gearing for imparting a slow speed to the cutters according to the nature of the crop, and a high speed when only absolutely necessary.

Claim.—1. The combination of the driving gear wheels E and F, of unequal size, attached permanently to the main cross-shaft, and gearing into the two corresponding loose gear wheels A and B, with sliding clutch *d*, and the firmly-attached gear wheel H on the cross auxiliary shaft C, and the straight pinion and bevel wheel I, revolving loosely on shaft G, arranged and operating specifically as described.

2. The triple gear as described, in combination with the means for changing the speed of the cutters, arranged and located relative to the main and counter shafts, substantially as and for the purpose specified.

82,412.—MOSES G. HUBBARD, Syracuse, N. Y., assignor to HUBBARD MOWER COMPANY.—*Harvester.*—September 22, 1868.

Claim.—1. Attaching the seat by the two pivoted springs arranged one in advance of the other, and in the same plane, for the purpose and substantially as described.

2. The seat plate D, provided with the two sockets or recesses, arranged in line, as described, and adapted to receive and permit the adjustment of the seat springs, substantially as and for the purpose described.

3. Mounting the driver's seat for a reaping machine upon springs so arranged as to preserve the horizontality of the seat, and at the same time to give it both a forward and downward motion, for the purpose and substantially as set forth.

82,413.—MOSES G. HUBBARD, Syracuse, N. Y., assignor to HUBBARD MOWER COMPANY.—*Harvester.*—September 22, 1868.

Claim.—1. Connecting the cutting apparatus to the main frame by the yielding elastic corner and the vertically sliding adjusting rod, arranged and operating as and for the purpose described.

2. The set screw V, in combination with the wear plate and hinged shoe, arranged substantially as and for the purpose described.

3. The lifting arrangement, consisting of the raising handle U, cam B, and chain C, combined and operating as described, whereby, when the cutting apparatus is raised, said lifting apparatus is automatically locked for holding the cutting apparatus in its elevated position, as set forth.

82,414.—MOSES G. HUBBARD, Syracuse, N. Y., assignor to HUBBARD MOWER COMPANY.—*Harvester.*—September 22, 1868.—The pole attachment is made adjustable by being bolted to the "pole extension," the latter having holes placed one above the other.

The pole is bolted to one side of the "pole extension" for mowing, and on the other side for reaping.

Claim.—1. Attaching the pole to the main frame specifically in the manner and for the purpose set forth.

2. The combination of the main frame with the pole extension piece, attached and arranged as shown for the purpose described.

82,415.—MOSES G. HUBBARD, Syracuse, N. Y., assignor to HUBBARD MOWER COMPANY.—*Harvester.*—September 22, 1868.

Claim.—1. The curved wear plate H, provided with the expanded perforated ears, whereby the height of the cutting apparatus can be adjusted without interfering with the action of the straight pitman, substantially as set forth.

2. The independent or detachable sustaining rod, by means of which the driver in his seat on the machine is enabled to raise and sustain the cutting apparatus, substantially as described.

82,416.—WILLIAM C. HURD, New York, N. Y.—*Manufacture of Paint.*—September 22, 1868.

Claim.—1. The combination of feldspar with oil and lead, zinc, or any other suitable material for paints or colors, substantially as set forth.

2. The addition of dissolved linseed gum or saponaceous oil, mixed with linseed oil in the grinding, or mixing feldspar with any other suitable materials for paints or colors, substantially as set forth.

82,417.—JOHN P. JAMISON, New York, N. Y.—*Boots.*—September 22, 1868.

Claim.—The arrangement of the longitudinal seam or seams *a* in the boot leg, so as to rise from the hollow of the shank, or thereabouts, or (when the latter is applied to the foot) in front of the ankle bone, the same also being curved, as at *b*, to admit of a forward extension of the counter, substantially as and for the purpose or purposes herein set forth.

82,418.—FREDERICK L. JOHNSON, Wallingford, Conn.—*Combined Latch and Lock.*—September 22, 1868.—The bolt shank has two sets of projections, the lower ones for carrying the bolt back and unlocking it, and the other being acted on by the arms of the tumblers, which serve as a latch.

Claim.—1. The tumbler D, held by spring E, having a lateral motion, to enable one bolt to act upon both as a lock and latch, constructed substantially in the manner herein set forth.

2. The bolt B, provided with projections *a a* and *b b*, in combination with the tumbler D, provided with arms C C, and acted on by the said tumbler, substantially as herein set forth.

3. The catch F, held by the esutecheon, and arranged to act upon and keep the tumbler from sliding laterally, constructed in the manner substantially as herein set forth.

82,419.—JOHN L. KIDWELL, Washington, D. C.—*Roofing Cement.*—September 22, 1868.

Claim.—1. A water and fire-proof composition, for roofing, flooring, &c., prepared of hydraulic cement, tar, sulphur, and naphthaline, or equivalents, substantially as described and set forth.

2. The above cement composition, incorporated with powdered minerals or metallic ingredients, substantially as described and set forth.

82,420.—GEORGE G. LARKIN, West Amesbury, Mass.—*Carriage Shackle.*—September 22, 1868.—A disk provided with a screw shank works in a hollow thread cut in the clip, its face being recessed to receive a leather pad, while it is provided with radial holes for a rod, to adjust it with more or less pressure against the eye of the shaft.

Claim.—The disk *a*, provided with radial sockets, and carrying the pad C, when formed with a screw-threaded shank *e*, adjustable in the front side of the clip A, as herein described for the purpose specified.

82,421.—W. H. LAUBACK, Philadelphia, Pa.—*Fire Extinguisher.*—September 22, 1868.—A valve, having its stem fastened to a diaphragm, is connected with the lower end of the cap, which regulates the

pressure of the spiral spring on the diaphragm, so that by serewing or unserewing it the pressure is increased or lessened, and the valve is closed or opened according as the pressure of gas on the diaphragm is greater or less than that of the spring on its opposite side.

Claim.—1. The tube C, in combination with the diaphragm E and valve D, and vent tube *a*, operated and constructed substantially as described.

2. The diaphragm E and spiral spring *f*, constructed and operated as described.

3. The cap *g*, operating on the diaphragm E, constructed and operated as described.

82,422.—JOHN L. LEAS, York Sulphur Springs, Pa., assignor to himself and ANDREW B. LEREW, same place.—*Corn Planter*.—September 22, 1868.—A box or hopper is secured by straps to a man's body, and has slides so arranged as to discharge corn from the spout at every alternate step.

Claim.—1. The slide C, in combination with the sheaves E F and straps H, J, and K, as and for the purpose described.

2. The pivoted levers M, and straps L, in combination with the elastic connections I, as and for the purpose described.

82,423.—M. F. LOWTH and T. J. HOWE, Owatonna, Minn.—*Cultivator*.—September 22, 1868.—The tooth is fastened to the beam in such a manner as to enable it to yield against an immovable obstacle.

Claim.—In combination with the mortised beam A and the tooth B, having the shanks *b b'*, and pivoted on the bolt *c*, a stirrup-shaped clamp, E, having an oblong or semicircular opening, O, the side *o* of which, that bears against the shank *b'*, being straight, and said clamp being confined to the beam A, and tightened or loosened by means of a screw shank, *r*, passing through a slot in the side of the beam, and a screw nut *n*, fitting upon it outside of the beam, and screwing against the side of the beam, or against a washer, substantially as described.

82,424.—R. E. LOWE, Upper Alton, Ill.—*Plane for Cutting Blind Slots*.—September 22, 1868.—The shoe lying in a groove of the stock is adjusted to it by screws, while the cutter iron, lying across the sole, on supporting plates screwed to the stock, is kept in place by hooks with shanks passing through the stock, and nuts on its upper side, the adjustment of the shoe thus regulating the thickness of the slot to be cut.

Claim.—1. The arrangement of the shoe C, stock A A', screws *c c'*, cutter iron D, and clamping hooks and nuts F G, substantially as described, when the parts are constructed to operate in the manner set forth.

2. The arrangement of the guards I I with the knife D, the track C, and the gauge H, constructed and operating substantially as described.

82,425.—TIMOTHY LUCEY, Salem, Mass.—*Driving Hoop*.—September 22, 1868.—The hoop has its sides hinged or jointed, and is locked by tubular slides and can be folded so as to form a bow.

Claim.—A driving hoop, having a construction substantially as described.

82,426.—JOHN C. MACK, Bristol, Conn.—*Cupboard and Table*.—September 22, 1868.—A table is arranged to fold inside of the cupboard, out of the way of the shelves and drawers, or of the doors when closed.

Claim.—The combination of the cupboard A, shelves F, and doors D, with table B and legs C, arranged substantially as and for the purpose specified.

82,427.—HARVEY McCOWN and LUTHER M. McCOWN, Enon Valley, Pa.—*Hay Elevator*.—September 22, 1868.—Designed to be applied to a hay elevator, patented to them January 7, 1868. Two bowed jaws, pivoted to loops, are so connected with a disk that when they are opened the disk will be drawn against a catch, which, being released, a wedge will pass between the jaws, open them, and release the disk, when the load will be discharged.

Claim.—The jaws I I, in combination with the disk K and wedge L, or its equivalent, when con-

structed and operated substantially as and for the purpose herein shown and described.

82,428.—FRAZEE B. MCGREGOR, Pontiac, Mich., assignor to himself and GEORGE A. HOYT, same place.—*Piano*.—September 22, 1868; antedated September 14, 1868.

Claim.—The arrangement of the couplers D D, horizontal bars C C, placed one above the other, with the elbows *e e* and levers *d d*, so that when the pedal raises the levers the upper bar is raised against the couplers, parallel, and raises the coupler against the keys, coupling them together the entire length of the key-board, right or left, or both, as herein set forth.

82,429.—DAVID M. MEFFORD, Norwalk, Ohio, assignor to himself and STEPHEN BOALT.—*Preserving Fruit*.—September 22, 1868.

Claim.—1. Preserving fruit, by treating or charging the same with sulphurous acid gas, and then subjecting it to heat, in the manner set forth.

2. Charging raw fruit with sulphurous acid gas preparatory to its being heated, by means of air pumps or bellows, substantially as set forth.

82,430.—GEORGE MERRILL, Newburyport, Mass., assignor to SAMUEL BLISH, Piscataway, N. J.—*Carving Machine*.—September 22, 1868.—A cutting tool and guide are so arranged with sliding tables and levers that the size of the latter being cut can be greater or less than the pattern, to any degree desired.

Claim.—1. The combination of the tables D and P, connected by links or rods *n m* to the lever *h*, substantially as described.

2. The shaft I, mounted in the main frame, and provided with the rigid arms *a* and *b*, carrying the adjustable guide *c* and the cutter *d*, and arranged, in relation to the tables D and P, substantially as described.

3. The table D provided with the side pieces or frame H I for supporting the upper table P, and permitting the latter to be moved thereon, as herein described.

82,431.—CLARK W. MILLS and LEWIS S. CHESTER, Brooklyn, N. Y., assignors to themselves and GEORGE H. NICHOLS, same place.—*Grain Separator*.—September 22, 1868; antedated September 14, 1868.

Claim.—The adjustable curb *i*, that can be moved toward or away from the point of delivery of the grain, in combination with the adjustable blast regulator *k*, applied substantially as and for the purposes set forth.

82,432.—CLARK W. MILLS and LEWIS S. CHESTER, Brooklyn, N. Y., assignors to themselves and GEORGE H. NICHOLS, same place.—*Grain Drier*.—September 22, 1868; antedated September 10, 1868.

Claim.—The series of air tubes *b b*, open at their under side, in combination with a hopper delivering the grain upon such series of tubes, in the manner set forth, so that a current of air shall pass through the grain as it falls from said hopper, and through the series of air tubes, and in contact with such grain substantially as and for the purposes set forth.

82,433.—FOSTER NEVERGOLD and DAVID BROSE, Pittsburg, Pa.—*Rolling Mill*.—September 22, 1868.—A series of devices for raising iron and steel plates up and putting them over the rollers.

Claim.—1. The shaft J, crank L, and pitman M, in combination with the crank N, movable collar P, and shaft O, all constructed and arranged as described, substantially as and for the purpose herein set forth.

2. The combination of the table V, arm *b*, side pieces X X, arms T T, shaft O, legs U U, hinged leaf Y, slotted arm Z, and the lever *d*, all constructed and arranged as described, and operating substantially as herein set forth.

3. The stay lever *r*, swiveled pins *s s*, and perforated lever rest, in combination with crab lever *p*, all constructed and arranged in the manner and for the purpose substantially as herein set forth.

4. The upright shaft *m*, and pinion B', in combina-

tion with pinion C', shaft A', pinions F' F', cog wheels E' E', and regulator G', all constructed, arranged, and operating substantially as herein set forth.

82,434.—W. H. NICHOLS, East Hampton, Conn.—*Door Bell*.—September 22, 1868.—The bell rod hooks into a lug of a lever, and into an opposite lug hooks a rod, connecting it with a spring, having its outer end against a center post. By drawing and letting go the bell rod the hammer makes two strokes on the bell.

Claim.—The lever H, pivoted to the plate A at one end, and provided with a slot at its other, through which one end of the hammer wire passes, said lever being provided with lugs *d* and *e*, by means of which it is connected to the spring E and to the bell rod N; the lug *d*, to which the rod N is attached, being centrally located upon the lever, to facilitate its operation, as and for the purpose specified.

82,435.—HENRY S. OSBORN, Easton, Pa.—*Refining Cast Iron*.—September 22, 1868.—The curved rabble end serews into the steam box, and has a small iron tube screwed into it which passes into the box to the supply hole to prevent water from passing to the bar end.

Claim.—The self-generating steam rabble, or the rabble in which the steam is generated by the heat surrounding the rabble, in the manner and for the purposes substantially as above described.

82,436.—ISAAC E. PALMER, Hackensack, N. J.—*Mechanical Movement*.—September 22, 1868; antedated September 14, 1863.—The toothed wheel gears into the female thread in and around a ring, having its axis transverse to that of the wheel, so that whichever rotates around the other, a slow, powerful motion is given the wheel upon its axis.

Claim.—The combination of the toothed wheel A with the ring C, having a female thread, *a*, in or around it, arranged relatively to each other for operation together, substantially as shown and described.

82,437.—FRANCIS S. PEASE, Buffalo, N. Y.—*Reciprocating Steam Engine*.—September 22, 1868.—The cylinder heads are so formed that but one packing box is needed for both cylinder heads, and is placed inside of the lower and larger cylinder head which is also made in two unequal pieces, the smaller being easily removed to adjust the packing rings, or repair the box.

Claim.—1. The construction and arrangement of the frame, or covers, or cylinder heads of the two cylinders, the lowest section or surface forming a cover to the cylinder B, and the upper surface the cover of cylinder A.

2. The combination of the lower cylinder head H' with the section *h*, whereby to gain access to the cylinder B, as herein set forth.

3. The arrangement of the stuffing box inside the cylinder and with the cylinder head, so that the bolts passing through the cylinder head can be reached from the outside between the two heads.

4. The combination of the two cylinder heads H H', formed or connected together in the manner herein described, with sufficient space between them to give access to the bolts of the stuffing box S.

82,438.—JOHN M. PERKINS, Plainfield, N. J., assignor to R. R. PERKINS, same place.—*Fruit Box*.—September 22, 1868.

Claim.—A box constructed of two strips of veneer in which the top or bottom may be used as bottom or top indiscriminately, and constructed of two pieces of veneer, in the manner and for the purposes set forth.

82,439.—JACOB S. PFRIMMER, Lanesville, Ind.—*Wagon Brake*.—September 22, 1868.—A sliding rod under the tongue is connected at its rear ends with levers extending behind the wheel, and operated by the holding back of the team.

Claim.—The arrangement, upon the front section of a vehicle, of the forked rod *a*, oblique rods *c c*, levers D D, keepers *d d*, and spring *e*, all constructed and operating as set forth.

82,440.—ALFRED RIX, San Francisco, Cal.—*Fastening for Button*.—September 22, 1868.—The button is fastened to the garment by passing the head through a hold in the same, and putting the washer open on one side over the head and closing the sides.

Claim.—The headed shank and open washer for securing the button to the cloth or garment, constructed substantially in the manner and for the purpose set forth.

82,441.—VALENTIN SCHRECK, Philadelphia, Pa.—*Wash Stand and Sick Chair*.—September 22, 1868.

Claim.—The described combination of a sick chair and portable wash stand, when the parts composing the former are permanently or otherwise attached to a swinging door, C, and otherwise arranged as and for the purpose specified.

82,442.—FREDERICK A. SEBORN, DAVID R. DUNLAP, and JOACHIM F. C. GEIST, Zanesville, Ohio.—*Window Shade Fixture*.—September 22, 1868.—The curtain, roller, and pulleys are so arranged as to enable the curtain to be rolled either from the bottom to the top or from the top to the bottom, or in both directions at the same time.

Claim.—The arrangement of the cord C, pulleys B B, roll A, fixed cord E, and cord F, substantially as shown and described.

82,443.—SETH SHADDUCK, Elk River Township, Iowa.—*Draught Equalizer*.—September 22, 1868.

Claim.—The draught bar F, provided with adjusting holes *c c c*, &c., ring K, substantially for the purpose described.

82,444.—WILLIAM C. SINCLAIR, New York, N. Y.—*Safety Guard for Locks*.—September 22, 1868; antedated September 18, 1868.—In the outside plate are two separate key holes, for the latch and bolt, and when the key is used inside, it strikes a stop and bears against a projection on the bolt, so that it cannot be stirred by a key or pick outside.

Claim.—The oscillating plate *g*, having a projecting pin, *i*, in combination with the cam slot *j* on the latch *k*, substantially as and for the purpose described.

82,445.—HENRY J. SMITH, Boston, assignor to JOSEPH C. WIGHTMAN, Newton, Mass.—*Mode of Hardening Gas Burner Tips made from Soapstone, &c.*—September 22, 1868.

Claim.—The hardening, and rendering impervious to the action of acids and heat, of gas burners and gas burner tips, or any part thereof, made from soapstone, talc, talcose rocks, or minerals, by heating them in a vessel containing carbon, substantially as above described.

82,446.—WILLIAM C. SMITH, Yantic, Conn.—*Churn*.—September 22, 1868.—An improvement on his patent of July 9, 1867. The lip is so arranged with the shaft that it may freely slide in and out when turned on one of the flat sides of the shaft, admitting the locking pin and its attachments to be drawn out or thrust in as needed.

Claim.—The groove *c* and recess *m* on the gear shaft C, and the lip E³ and arm E² on the locking pin E, constructed and adapted for joint operation relatively to each other, and to the beater shaft A, and to the gear wheel D, as and for the purposes herein set forth.

82,447.—DANIEL SNELL, Springfield, Ohio, assignor to himself and J. H. GANO, same place.—*Tumbling Shaft for Connecting Power with Machinery*.—September 22, 1868.—Designed to allow the machine, to which power is transmitted by a tumbler shaft, to be removed farther from or nearer to such power without the necessity of uncoupling the shaft, for the purpose of introducing or taking out separate pieces.

Claim.—The combination of the collar C with its interior bearing, *c*, and the block end, *b*, of the rod shaft B, sliding in the groove D of the part A, for retaining the shaft in position at any point in the line of its extension or contraction, as applied in a

tumbling shaft, for transmission of power by a rotary or revolving motion, the whole constructed substantially as described, as and for the purpose specified.

82,448.—J. W. SOULE, Boston, Mass.—*Pegging Machine.*—September 22, 1868.—The peg wood is held to the feed wheel by a leaf spring and adjusted by a screw, the feed shaft having a ratchet wheel connected with a pawl, and a slide bar working between guides, and deriving motion from a cam on the driving shaft by a lever and rod, a pin of which passes into a slot of the lever to regulate the throw of the slide.

Claim.—1. The arrangement of the peg cutting mechanism, so that but one peg is cut at the end of the peg wood, which peg, after being cut, is fed forward under the driver, substantially as described.

2. The combination of the ratchet driving pawl *m* with a reciprocating slide, *n*, to which the pawl is jointed, and by means of which it is actuated, substantially as described.

3. In combination with the peg feed wheel *d*, feed ratchet *l*, and ratchet-driving pawl *m*, the ratchet-detaining pawl *s'*, substantially as shown and described.

4. In combination with the peg-wood feed wheel *d*, the spring *h*, pressure of which is adjusted by the screw *k*, substantially as set forth.

5. In combination with the slide *b*², spring *d*², and lever *e*², the adjusting plate *h*², substantially as and for the purpose set forth.

6. In combination with the ratchet-driving pawl *m*, and the reciprocating slide *n*, to which the pawl is jointed, the cam *p*, for driving the slide *n* through the lever *r* and connecting rod *s*, substantially as shown and described.

82,449.—SAMUEL B. STEWART, Brush Valley, Pa.—*Coal Stove.*—September 22, 1868.—The lower section of the stove is made in segments, the joints of which are covered by concave strips held in place by the upper section.

Claim.—The lower section A, constructed as described, in combination with the metal plates or strips *d d* and upper section C, all arranged substantially as and for the purpose set forth.

82,450.—JOHN BLAKE TARR, Chicago, Ill.—*Carpenters' Plane.*—September 22, 1868; antedated September 16, 1868.

Claim.—1. The combination of the central clamping and tightening device with the adjustable supports C D, the said device and the supports being applied to a plane stock, and in the relation to the plane iron thereof, substantially as and for the purpose herein described.

2. Making the two supports or abutments C D adjustable, substantially as and for the purpose herein described.

3. Applying pressure to a plane iron between two supports, C D, through a device, E F, substantially in the manner and for the purpose herein described.

4. Changing the pitch and tightening the plane iron by the same means and at the same time, the means employed being constructed and operated substantially as herein described.

5. The adjusting of the plane iron by means of the clamping device, composed of the screws C D and E, nut F, and plate *b*, and applied in such manner that the bit is tightened and the pitch changed at the same time and by the same means, when constructed to operate substantially in the manner described.

6. Arranging the plane iron beneath the heads or shoulders of two adjustable bearings, C D, and under a shoulder of a nut, F, so that it may be adjusted by means of either or both of the bearings C D, and may be tightened and have its pitch changed by the screw E, all substantially in the manner and for the purpose described.

82,451.—JOHN J. THOMAS, Union Springs, N. Y.—*Harrow.*—September 22, 1868.—Several pieces of plank, provided with teeth inclining backward, are hinged together and form a flexible frame to conform to undulating ground.

Claim.—A land brush or spiked harrow, con-

structed of pieces of plank, hinged together as described, and provided with numerous inclined teeth pointing backward at such an inclination as to cast off or slip over any stalks of weeds, straw, or other refuse matter, substantially as described.

82,452.—LEOPOLD THOMAS, Allegheny City, assignor to ANDREW KLOMAN, Lawrenceville, Pa.—*Spike Machine.*—September 22, 1868.

Claim.—1. In a machine for making spikes and bolts, a sliding carriage, B, which carries the spike or bolt blank after being severed from its parent bar, and while firmly gripped by pressing dies, in combination with a header, G, constructed and operating substantially as and for the purposes hereinbefore set forth.

2. The pair of swinging and pointing tools *a'*, in combination with a pair of guiding and pressing rollers H, arranged and operated substantially in the manner and for the purposes hereinbefore described.

3. The cam F, cam lever *c*, and double parallel bars *l l*, or their mechanical equivalents, all arranged with reference to one of a pair of pressing dies in a spike machine, to secure first a partial and then a complete closing of the dies on the spike blank, substantially in the manner and for the purposes above set forth.

4. In the manufacture of railroad spikes, the header G with a slotted shank, being and operated, substantially as above described, so that it shall, except at the completion of the stroke of the machine, have its face inclined to the direction of the faces of the pressing dies, for the purposes hereinbefore specified.

5. In a machine for making spikes, the arrangement of the cams *d* and *e*, operating in cam yokes, substantially as described, so that one cam, *d*, which actuates the cutting and pointing tools *a'*, shall act a little in advance of the other cam, *e*, which operates the sliding carriage B, in order that such tools, *a'*, may be partially opened and closed in advance of the beginning of the motion of the carriage, substantially as above described.

6. The combination, in a spike machine, of swinging pointing tools *a'*, pointing rolls H, pressing dies *b b'*, and header G, substantially as and for the purposes above set forth.

82,453.—NATHANIEL S. UNDERKUFFLER, Norritonville, Pa.—*Sausage Stuffer and Lard Press.*—September 22, 1868.—The sausage reservoir is fixed to a block let into a recess of the table, so that it can be easily slipped out and the lard vessel be substituted in its place.

Claim.—The combination of the vessels H and J, constructed as specified, and connected, within the dovetailed recess in the table, with the standard C, lever E, and follower F, all as herein shown and specified.

82,454.—GEORGE WILLIAM UPHAM, Amherst, N. H.—*Cement.*—September 22, 1868.—Composed of shellac, sulphur, and resin, mixed in boiling water.

Claim.—The within-described cement, composed of the ingredients herein named, and compounded in or about the proportions set forth.

82,455.—JAMES S. UPTON, Battle Creek, Mich.—*Shaft Coupling.*—September 22, 1868.—Leather keys are inserted in the slots in a safety-coupling ring to keep the pins from moving out and catching in persons' clothes.

Claim.—The sockets B B, provided with gudgeons C C, and connected to the slotted ring A by means of the pins *a a* secured in the slots *x x* by the leather keys, all as herein shown and described.

82,456.—ELBERTSON W. WAITE, New Haven, Conn.—*Joint for Carriage Top Prop.*—September 22, 1868.—The joint pieces have ribs working in segmental grooves in the bars, which are held together by a bolt, a cylinder around it being used to keep the pieces properly apart, and the bolt firm.

Claim.—1. A joint, formed by combining segmental grooves, near the ends of the parts to be united, with a circular rib upon the joint piece, substantially as specified.

2. The joint pieces *e*, with circular ribs *d*, entering

segmental grooves *e* in the bars *a b*, in combination with the cylinder *i* and bolt or rivet *f*, substantially as specified.

82,457.—WILLIAM M. WARD and PETER BEN-
NAGE, Eureka, Ill.—*Bedstead*.—September 22, 1868.
—The bedstead is tightened by means of the swivel.

Claim.—A bedstead, having rods C, hooks D, swivels E, screws G, pin holes *a*, slats *d*, strips *e*, and blocks *b*, all arranged and operating substantially as described.

82,458.—CHARLES WEBBER and HENRY REI-
MANN, West Meriden, Conn.—*Lamp*.—September 22, 1868.—A cup fixed in the neck of the oil cistern surrounds the wick tube in the screw thimble, over which is fitted a sleeve that supports the burner, which consists of an open platform, air sieve, and a cone.

Claim.—The construction and arrangement of the cup B, recessed thimble D, supporting sleeve *e*, open platform E, air sieve F, and cone G, as and for the purpose described.

82,459.—HENRY W. WEEDON, High Point, N. C.—*Soap and Detergent Compound*.—September 22, 1868.—Composed of chalk, sal soda, aqua-ammonia, terebinthina, and oleum, mixed and boiled in water.

Claim.—The particularly-specified combination of ingredients, and the definite quantities of the same, as set forth.

82,460.—S. LLOYD WIEGAND, Philadelphia, Pa., assignor to WALTER J. BUDD, same place.—*Steam Generator*.—September 22, 1868; antedated September 4, 1868.—Spiral wings are arranged between the two boiler tubes, which latter are closed below by a cap with a fluted pyramid reaching into the central tube, and are inserted above into conical ajutages of the boiler. The internal tube has mouths directed toward the rotary current and is covered by a dome formed of wings curved inward to direct the current toward the wings of the tubes.

Claim.—1. The oblique or spiral deflectors or guides in double-boiler tubes, substantially as shown and described.

2. The tangential or spiral mouths, as shown, for conducting a supply of fluid to the descending columns in double-tube boilers, as shown and described.

3. The deflecting caps or domes, or the equivalents thereof, substantially as shown and described.

4. The conical ajutages C C, substantially as shown and described.

82,461.—J. M. WILLBUR, Cleveland, Ohio.—*Rotary Embossing Press*.—September 22, 1868.—Two rollers are provided, the one with movable stereotype plates, and the other with suitable counter plates, to be used without ink, and operated by a lever and an adjustable pawl.

Claim.—1. The combination of the rollers B C, impression plates D, and counter plates D', operated by means of the lever E, through the medium of the cog wheels B' and C', the whole being constructed and arranged in the manner shown and described, as and for the purpose set forth.

2. The lever E, with its adjustable pawl F, in combination with the rollers B C, arranged to operate as and for the purpose described.

82,462.—J. M. WILLBUR, Cleveland, Ohio.—*Ink Pad for Hand Stamp*.—September 22, 1868.—The reservoir and distributing rollers have their bearings in carriages which move on guide rods each side of the blocks, the pads being operated by a bar laid across concavities in the blocks opposite the pads.

Claim.—The improved ink pads herein described, consisting of the blocks A A', provided with the composition inking surface C, in combination with the ink reservoir H, distributing rollers G G, mounted on the carriages D D, the guide rods B B, and handles K K, all constructed and arranged to operate substantially as and for the purpose set forth.

82,463.—J. M. WILLBUR, Cleveland, Ohio.—*Machine for Forming Stereotype Plates*.—September 22, 1868; antedated September 16, 1868.—The edge of the apron is clamped between the two halves of the

roller, secured together by screws, and the sliding bed, with beveled guides underneath, has an upright concave part, which allows space for the apron and plate to pass and be bent upon the rollers.

Claim.—1. The roller C, having a milled or file cut circumferential surface, for the purpose described, in combination with the apron D, arranged and operating as and for the purpose set forth.

2. The sliding bed E, having a head or upright *g*, with its curved surface, and the adjusting set screw H, in combination with the roller C and apron D, all constructed and operating as described, and for the purpose set forth.

82,464.—J. M. WILLBUR, Cleveland, Ohio.—*Stereotypers' Putty*.—September 22, 1868; antedated September 17, 1868.—Finely ground potters' clay is mixed with pure olive oil.

Claim.—The composition hereinabove described, for the purposes specified.

82,465.—WILLIAM H. WILLSON, New York, N. Y.—*Hand Brushing and Polishing Apparatus*.—September 22, 1868.—The apparatus is designed to operate automatically, thereby dispensing with power, as ordinarily applied in similar devices.

Claim.—1. So arranging the coiled spring and the system of gearing within the cylindrical body furnished with axial handles, as to secure the rotatory movement of such body, substantially as herein set forth.

2. The arrangement of the friction brake within the cylindrical body furnished with axial handles, whereby the rotatory movement of the same may be stopped, substantially as herein set forth.

3. The arrangement of the coiled spring, the system of gearing, the stem of the handle A*, and the frame A, with reference to each other and the friction pinion *m*, dividing the cylindrical body B, substantially as and for the purpose specified.

82,466.—WILLIAM WILMINGTON, Toledo, Ohio.—*Car Wheel*.—September 22, 1868.

Claim.—1. The within described method of casting car wheels of two qualities of iron, that is to say, one of said qualities of iron being poured into the portion of the mold designed to form the hub of the wheel, and the other being poured into that portion of the mold designed to form the rim of the wheel, the two currents of iron meeting within the mold, and there acting upon and mingling with each other, substantially as set forth.

2. As an improved manufacture, a car wheel produced of two qualities of molten iron, by the method herein set forth.

82,467.—CHARLES A. WILSON, Cincinnati, Ohio.—*Oil Globe for Steam Chest*.—September 22, 1868.—The hub is traversed by a cock pierced with two apertures passing at angles through the axis of the same, and provided with a recess, and an axial channel communicating with the interior of the hub, all so constructed and arranged as to enable one cock to perform the usual functions of three.

Claim.—The arrangement, as described, of the globe A, hub C, cock E, apertures F G, recess H, channel I *i*, passages J *j*, K, L *l*, and the channel P, as herein explained.

82,468.—JAMES P. WILSON, Elmwood, Ill., assignor to himself and V. R. DAFOE, same place.—*Composition for Destroying Insects on Potato Plants*.—September 22, 1868.—Composed of Paris green and mineral paint.

Claim.—A powder, prepared of the materials and in the manner specified, to be used for the destruction of potato bugs.

82,469.—JAMES WOOD, Utica, N. Y.—*Whiffletree Hook*.—September 22, 1868.—Designed to dispense with a spring in fastening the trace.

Claim.—The cap B, with the hook B' cast or attached to it, both shaped and constructed as herein shown, and secured to the whiffletree in the manner and for the purposes herein set forth and described.

82,470.—OLIVER W. YALE, Hartford, Conn.—*Making Nuts*.—September 22, 1868.—The blank nut

is punched through the die into the channel below, the feed bar pushing it down under the die which chamfers its upper edge, while another feed bar, as the chamfer die rises, pushes the blank under the round punch and between die bars or edge swages, and a hole being punched through its center, and its sides formed, its top is flattened by being pushed under the flattener.

Claim.—1. The arrangement of the cams *c c'*, cam grooves T T, and crank shaft C, with the cross head D, levers U P S, and toggles R R, in the manner described.

2. The arrangement on the anvil L of the stationary die K, slides M O, edge swages 2 2, and stripper U, in the manner described and for the purpose set forth.

3. The combination of the punches and face swages with the edge swages, the transferers and the anvil block, all constructed, arranged, and operated substantially as described.

82,471.—GEORGE CLARK, Jr., Boston, Mass.—*Apparatus for Extinguishing Fire.*—September 22, 1868.—The tank has three compartments, two of which, for chemical solutions, are larger than the other, which contains the pump for ejecting the gas and communicates with both of the former, the main water pump being in a second tank with a suction pipe, and thus the water from the pump passes into the chemical solution chambers and is impregnated and discharged.

Claim.—The combination and arrangement of the water tank C, the compartments G and H, and the pumps J and K, (the latter being disposed within the intermediate compartments I, and both being connected with the air chamber,) the pipes *a a* and *c d*, in addition to the ordinary feed and discharge pipes of the pump.

82,472.—ALFRED SULLY, United States Army.—*Army Wagon.*—September 22, 1868.—Designed for the use of foot soldiers on the plains, and so constructed that the men can quickly jump off the seats when attacked and spring back again at once.

Claim.—1. The body, C, constructed as described, and provided with seats F F F and E, receptacle L, and railing M, all substantially as and for the purposes herein set forth.

2. In combination with the seats F F F, the hinged dash boards G G G and foot boards H H H, substantially as and for the purposes herein set forth.

3. In a wagon provided with suitable seats and foot boards, the employment of sectional tent pieces I I I, substantially as and for the purposes herein set forth.

4. The combination of the body C seats F F F and E, railing M, receptacle L, dash boards G G G, foot boards H H H, and folding tent pieces I I I, all as herein shown and described.

82,473.—H. W. OLNEY, R. R. LOGAN, and J. H. FISHER, Alleghany City, Pa.—*Lock Nut and Tightener.*—September 22, 1868.—A spring with one end inserted into a hole in the nut, is coiled around it and then passing around a screw is fastened to the plate.

Claim.—The nut lock and tightener above described, consisting essentially of the coiled spring M, bent and attached to the nut and the part C', in the manner shown, and operating in connection with a screw, *d*, substantially as described.

82,474.—JOHN W. ACKER, Copenhagen, N. Y.—*Horse Rake.*—September 29, 1868.—The handle is drawn back to remove the foot frame from the teeth, and pushed forward again to take hold of the teeth when the rake load has been discharged.

Claim.—The foot frame J, when its operating handle L is adapted to slide in slots formed in the ends of the bars G, as herein described, for the purpose specified.

82,475.—ROBERT ALLISON, Port Carbon, Pa.—*Pumping Engine.*—September 29, 1868.—The object is to avoid the destructive jar due to concussions in engines employed for raising water from deep mines, &c. A supplemental steam chest and

auxiliary cylinders and pistons are provided with a liquid regulating cylinder, whereby the piston of the engine is cushioned on steam at the terminus of each stroke.

Claim.—1. The arrangement of the sliding bar L, cam slot *g*, rods *n n*, and bell crank R, whereby the supplementary valve *k*, is operated, substantially as shown and described.

2. The valve chambers J', valves K', and reversed stuffing boxes *h'*, arranged substantially as shown and described for the purposes set forth.

3. The arrangement of the piston *w*, graduating cock *y*, and cylinder V, with reference to the rod E, pistons G G, and main valve C, as herein shown and described.

82,476.—DANIEL ARMSTRONG, Chicago, Ill.—*Machine for Pointing Horse-shoe Nails.*—September 29, 1868.—The die is made in two parts with an opening for the point of the nail. The dies are cleaned by means of a cam arranged to operate on top of the die and a lever on the bottom.

Claim.—1. The die cleaner V X, pivoted to the plate A, and operated by the cam K, in combination with the two-part die O O, as and for the purpose specified.

2. The combination of the die cleaner V X, die O O, guides *n*, and punch H, substantially as described and shown.

82,477.—GEORGE BABSON and JOHN L. BABSON, Rockport, Mass.—*Weighing Apparatus.*—September 29, 1868; antedated September 17, 1868.—A bent weighted lever, pivoted to the scale-pan supporter, is provided with a segmental rack which engages with a pinion actuating the index pointer. The lower end of the scale supporter has an arm attached to it to keep the supporter in a vertical position when weighing.

Claim.—The improved arrangement of the scale-pan rod C, the arms *b* and *f*, and the pendulum B, combined with the curved rack *h*, employed with the pinion *i*, and its dial conductor *m*, the whole being substantially as described.

82,478.—H. D. BALLARD, Findlay, Ohio, assignor to himself and ISAAC BONHAM, same place.—*Surgical Splint.*—September 29, 1868.—The splint is made in two parts joined together to be adjustable in a longitudinal direction and provided with springs to keep the parts extended.

Claim.—The improved splint, composed of the parts A and A', provided with the spring-extension joint and with the adhesive straps, all substantially as and for the purpose described.

82,479.—G. H. BAXTER, Geneseo, Ill.—*Compound for Cleaning Silverware, Jewelry, &c.*—September 29, 1868.—Composed of borax, sulphate of soda, sulphate of copper, common salt, cyanuret of potassium, alcohol, and aromatic spirits of ammonia mixed with water.

Claim.—The above-described "Yeoman's Magnetic Renewer and Cleanser," composed and operating substantially as and for the purposes set forth.

82,480.—EDWARD C. BLAKESLEE, Waterbury, Conn., assignor to BENEDICT and BURNHAM MANUFACTURING COMPANY, same place.—*Lamp Burner.*—September 29, 1868.—A cone perforated at its upper part has resting on it a bulb provided with a slot which is wider than the wick tube. The ascending flame is spread by the curved surface of the bulb, and a wide and steady flame is produced.

Claim.—Combining with a perforated base, provided with the vertical strips of metal F and cone C, the bulb E and wick tube B, when the same shall be constructed and arranged to operate substantially as shown, and for the purposes indicated.

82,481.—ELIPHALET W. BLISS, Brooklyn, N. Y., assignor to CHARLES PRATT, of New York City.—*Machine for Bending the Tops and Bottoms of the Bodies of Tin Cans.*—September 29, 1868.—A pyramidal cam working in guides receives a vertical motion by means of a treadle. Four clamping jaws are moved forward, when the treadle is depressed, by levers which bear against the cam. The can is

held down by means of a cap connecting with the treadle.

Claim.—1. The square or pyramidal cam slide, in combination with the rigid central guide, the cam levers, and the four clamping jaws, substantially as set forth.

2. The combination of the cam slide with the swinging levers M and treadle L, substantially as set forth.

3. The arrangement and combination of the cap O, lever P, connecting rod R, and treadle S, substantially as described.

82,482.—HANNIBAL S. BLOOD, Jefferson, La.—*Seat for Railway Car.*—September 29, 1868.—By means of a slotted bar with double-slotted cross arms the back of the seat can be raised, set at various angles, or laid back horizontally to form a sleeping couch.

Claim.—The slotted bar B, when provided with the double-slotted cross arm C, in combination with the socket pieces D and the pins *a*, when these several parts are constructed, arranged, and operate substantially as herein described for the purpose set forth.

82,483.—W. D. BOLLINGER, Cedar Rapids, Iowa.—*Axle for Carriages.*—September 29, 1868.

Claim.—Axles for wagons, cars, and other carriages, made in two parts, at A and B, and connected together, substantially as and for the purpose described.

82,484.—T. J. BOOTH, Jefferson Line, Pa.—*Stump Extractor.*—September 29, 1868.—The forward ends of each base beam have a clevis provided with a roller pivoted thereto, so that when the machine is drawn to another location the clevises are turned in their pivot bolts to bring the rollers under the base beams.

Claim.—1. The combination, in a stump-extracting machine, of a trestle frame, constructed as described, with the tackle, drum, and sweep bar, when arranged and operating substantially as shown and described.

2. The coupling clutch *r r*, and its accessory mechanism, when arranged to operate substantially as described, in combination with the drum, tackle, sweep bar, and trestle frame, all as set forth.

3. The clevises *m*, rollers *n*, and hooks *p* and *o*, substantially as described, in combination with the stump extractor above described, for the purpose set forth.

82,485.—WILLIAM D. BROOKS, Bethany, Pa.—*Horse Hay Fork.*—September 29, 1868.—Two cutters are sharpened at one end and pivoted at the other, and are attached to two bars, which latter on being raised open out the cutters to take hold of the hay. The bars are held, when raised, by a slotted lever pivoted within the ring to which the rope is secured.

Claim.—The beveled lever E, pivoted in the ring F, and slotted at *e*, to engage with the projections *d* upon the levers D, its forward end slotted to work upon the rib *f*, in the inner side of the ring F, said lever E adapted to be raised to receive the levers D, by means of the angular lever G, also pivoted in the ring F, as herein described for the purpose specified.

82,486.—JAMES D. BRYSON, New Castle, Pa.—*Casing for Water Wheel.*—September 29, 1868.—A curb provided with apertures for the passage of water is provided at its lower edge with an external flange and also with guides passing through the apertures tangentially to the curb and supporter ring eccentric to the curb. Between the ring and curb is passed a circular gate having a rotary and vertical motion.

Claim.—A casing for water wheels, consisting of the curb A, the flange B, the ring B', supported upon the guide plates C, and the gate D, all constructed and arranged to operate substantially as described.

82,487.—HENRY T. BUFFINGTON, Jr., Buffalo, N. Y.—*Fagot for Beam.*—September 29, 1868.—The web of sectional plates divides the flange pieces, the

spaces between which latter are filled by longitudinal side-binding plates. The cross-plates are furnished with T-heads at each end which hold the flanges against the side plates.

Claim.—1. The sectional web plates A, arranged with their fibers running transversely through the pile, in combination with the longitudinal side-binding plates B, as and for the purpose set forth.

2. The cross-clamp plates, provided with the T-heads E, in combination with the flange pieces C and side-binding plates B, as and for the purpose set forth.

82,488.—JACOB BÜHRER, Munich, Bavaria.—*Drying and Burning Kiln.*—September 29, 1868; patented in England, February 28, 1867.—The hot air escaping from the kiln is used for drying the brick in drying compartments similar in construction to those of the kiln.

Claim.—A drying kiln, as shown, consisting of a series of compartments placed back to back in a double row, and provided with the openings *g*, hot-air supply and escape flues *a, b, e, d, e,* and *f*, and communicating apertures *m* and *n*, in combination with a burning oven, also consisting of a number of compartments similarly disposed to those of the kiln, and provided with the openings *d'* and *e' e'*, all the parts being constructed and arranged as and for the purposes herein set forth.

82,489.—WILLIAM G. BUNKER, Portage, Wis.—*Trace Buckle.*—September 29, 1868.—The tongue is secured rigidly to a slotted sliding plate, which is secured to a cross-plate on the frame by a stud sliding in said slot. The trace is not bent when adjusted in the buckle.

Claim.—The buckle, consisting of the frame A, having the cross-plate *a*, with the sliding plate B secured thereto by the slot and pin *b*, and having the rigid tongue C, all constructed and arranged as herein described.

82,490.—THOMAS CARTWRIGHT, Davenport, Iowa.—*Fish Net.*—September 29, 1868.—The net is secured to transverse bars by bow cords in such a manner that it may be set or raised in a tide way.

Claim.—The application of the fyke or net E D C to the boat in the manner described, that is to say, by means of the bow cords *d*, attached to the transverse bars *e*, and the stern cord *e*, attached to the bag C, as herein set forth and shown.

82,491.—FREDERIC CHASE, Philadelphia, Pa.—*Zinking or Tinning Bath.*—September 29, 1868.—The sides of the vessel are of fire-clay, molded into the form of staves, which are tongued and grooved and bound together by bands.

Claim.—1. A zinking or tinning bath or vessel, constructed bodily of fire-clay, or its equivalent earthy substance, substantially as described.

2. Constructing a zinking or tinning bath of fire-clay, or its equivalent, substantially in the manner set forth and described.

82,492.—PETER CLARK, Brooklyn, N. Y.—*Brick Machine.*—September 29, 1868; antedated September 24, 1868.

Claim.—1. The combination, in a machine for making bricks, of an endless chain of molds A, having detachable sliding bottoms *a*, with a suitable pug mill, C, and with compressing and discharging plungers E F, while said sliding bottoms are successively transferred from the charged molds to those last emptied, to open the one and close the other, all substantially in the manner and for the purpose herein set forth.

2. The improved mold frames A, provided with and closed by sliding bottoms *a*, and combined in an endless chain, substantially in the manner and for the purpose herein set forth.

3. The sliding racks *s s*, operated by toothed sectors R, and arranged to engage with and transfer the detachable bottoms *a* of the mold frames A from charged molds to those last emptied, substantially in the manner and for the purpose herein set forth.

4. The combination of a swinging connecting beam J, links *e*, and weighted pawls *f f*, with ratchets S S on the polygonal wheels B B, and the

endless chain of molds A A, arranged and operating substantially as and for the purpose herein described.

82,493.—ADAM COLLIGNON, Closter, N. J., assignor to himself, C. O. COLLIGNON, and NICHOLAS COLLIGNON, same place.—*Folding Chair*.—September 29, 1868.—The parts of the chair are so hinged together as to fold up for convenience in transportation and storage.

Claim.—The parts A, B, D, and F, constructed, arranged, and combined substantially as shown and described, for the purposes set forth.

82,494.—CLAUDIUS O. COLLIGNON and NICHOLAS COLLIGNON, Closter, N. J.—*Folding Chair*.—September 29, 1868.—A brace is so arranged that, while it acts as a back to the chair, it serves as a supporter to the front part of the seat.

Claim.—The combination and arrangement of the stand A, seat B, back leg C, and brace E, constructed substantially as described, and for the purposes set forth.

82,495.—WILLIAM R. CRANNA, San Francisco, Cal.—*Lamp Burner*.—September 29, 1868.—The objects are to prevent the transmission of heat to the base of the burner and to isolate the base of the wick tube from those parts of the burner which are in close proximity to the flame.

Claim.—1. The combination, with the base of the burner and its shortened wick tube, and the elevated deflector, of a combined air flue and wick holder, with openings I, as described, and sleeve or cap J supported upon the upper part of said flue and wick holder, substantially as and for the purposes specified.

2. The combination, with the combined air flue and wick holder, and the sleeve or cap J, of the perforated casing or jacket by which the same are surrounded, as and for the purposes set forth.

3. The method of attaching the deflector, and of securing it in position, by means of arms *a* fitted into sockets formed on the burner for their reception, in the manner described.

82,496.—GEORGE CROUCH, New York, N. Y.—*Trunk*.—September 29, 1868.—In the center of the tray is an apartment (for a hat) having a door which is provided on the inside with a cap piece on which the hat is secured by means of elastic bands. A door is also provided on the back of the tray.

Claim.—1. The combination with a trunk, A, of a hat or bonnet apartment, constructed as described, and located in the tray C centrally, as shown, for the purposes set forth.

2. Giving access to the same, either from the bottom or top of the tray C, as shown.

82,497.—JOHN J. CURRIER, Gloucester, Mass.—*Chimney Cowl*.—September 29, 1868.—The frusta of the cones are so arranged with respect to the cover and tube that whatever may be the direction of the wind no reversal of the upward current of the smoke can take place.

Claim.—The combination, as well as the arrangement, of the three frusta B C D, the cover E, and the tube A, the whole being connected so as to operate substantially as described.

82,498.—JOB A. DAVIS, Watertown, N. Y.—*Automatic Boiler Feeder*.—September 29, 1868.—A tank, placed above the water line of the boiler, has a supply pipe and is connected to the boiler by two pipes; all of the pipes are provided with suitable valves, so arranged that when, by means of suitable mechanism, the supply-pipe valve is closed, the valves in the pipes connecting with the boiler are opened and the water in the tank flows into the boiler by force of gravity.

Claim.—1. The combination and arrangement of the water-supply tank D, the valve pipes E and F, and inlet tube G, with the valves *a*, *b*, and *c*, substantially as described.

2. The arrangement of the rod *e*, and connection arms *f f f*, for simultaneously operating the several valves connected with the supply tank D, substantially as set forth.

82,499.—JOB A. DAVIS, Watertown, N. Y.—*Shuttle for Sewing Machine*.—September 29, 1868.—A spring is placed in the bottom of the shuttle underneath and resting against the thread in the bobbin, for the purpose of securing a uniform tension of the thread.

Claim.—The combination, with the shuttle and its bobbin, of the spring C, constructed as described, fitted loosely in the shuttle case, and adjustable by a screw, for the purpose set forth.

82,500.—CHRISTIAN DEYHLE, Hartford, Conn.—*Saw Set*.—September 29, 1868.—A pivoted standard, regulated in position by a screw and spring, has sliding on it a movable rest on which the saw holders are placed. The supporter for the saw is bent at the top in the form of three chords of arcs of the same circle, and is adjustable vertically.

Claim.—1. The combination and arrangement of rack *b b*, screw *d*, and spring *y*, when used for the purpose of adjusting the inclination of rack *b b*, as described.

2. The supporter *o*.

3. The saw holders *k* and *l*, when used in combination with rack *b b* and supporter *o*, for the purpose set forth.

82,501.—WILLIAM DOBSON, Medina, N. Y.—assignor to himself and JOHN W. MOUNT, same place.—*Scroll Saw*.—September 29, 1868.—The saw below the table is run between two guide pieces, to prevent its doubling up when run at a high velocity. The saw is attached to the cross-head by means of a very thin loop of iron, so as to travel in the space between the guides with the saw.

Claim.—A sheet-iron or other saw-holding loop, *c*, made very narrow laterally, and with the saw B, run between guides F, below the table A, substantially as herein shown and for the purpose described.

82,502.—PIERRE ANTOINE JOSEPH DUJARDIN, Lille, France.—*Electro-magnetic Printing Telegraph*.—September 29, 1868.—One wheel prints letters, and the other figures; both rest upon the same axis, so that either may be readily brought opposite to the paper strip. The inking tube is filled with cotton impregnated with ink, which by the action of a piston is made to ooze through a velvet pad. The tube is set by a screw, so that the nap only of the pad can touch the wheels.

Claim.—1. In a printing telegraph, the construction and application of cross type wheels, oscillating on their common axis, and the mechanical means described, or other equivalents to produce their oscillating motions.

2. The construction and application of the adjustable inking plug, in combination with the double printing wheels, substantially as described.

82,503.—ALBERT FRIEDRICH ECKHARDT, Hamburg, Germany.—*System of Seeding and Manuring*.—September 29, 1868.—The grain is moistened with a solution of potash and water at each coating, of the following substances: bone dust, ashes powdered lime, sulphur, sulphate of magnesia, powdered plaster, and sulphate of lime; it is then dried and moistened with a solution of ammonia, and plaster again applied.

Claim.—The covering of artificially manured seed of all kinds with a case or capsule, insoluble in water, as herein described, using for that purpose the aforesaid process and compound, or any other substantially the same, and which will produce the intended effect.

82,504.—JAMES H. ESTES, Boston, Mass.—*Miter Machine*.—September 29, 1868; antedated September, 16, 1868.—A hinged frame is provided with slots for the passage of the saw, and with a plane rest by which the bevel sawn is dressed with the plane.

Claim.—The hinged frame C, provided with slots N for the passage of the saw, and with a plane rest, M, by which the bevel is not only sawed with a saw, but afterward dressed with a plane, all constructed to operate substantially as described.

82,505.—CHARLES A. FISHER, Geneseo, Ill.—*Hay Knife*.—September 29, 1868.—At the upper end

of a shank secured to the blade is a socket which receives the handle, the latter being bent to protect the hand of the operator from the hay.

Claim.—The socket D, the wooden handle C, the bend C', and the blade A, when the same are formed and combined substantially as shown and described, for the purposes set forth.

82,506.—W. P. WINKLEY, Des Moines, Iowa.—*Composition for Fire Kindling.*—September 29, 1868.

Claim.—The composition of resin, pitch, charcoal, and bituminous coal, in the proportions and manner substantially as herein described, as a new article of "kindling."

82,507.—THOMAS E. WOOD, Knoxville, Pa.—*Elastic Roofing Composition.*—September 29, 1868.—Composed of asphaltum, gas tar, clean sand, plaster, and common paint.

Claim.—The elastic roofing composition, made of the ingredients and in the proportions herein specified, compounded and applied in the manner set forth.

82,508.—ISAAC FRANCE, Peru, Ind.—*Apparatus for Jointing Circular Saws.*—September 29, 1868.—One end of a strip of wood fits over the saw mandrel; the other end projects beyond the cutting points of the teeth and supports a slide to which a file is secured, said slide being arranged to force the file against the teeth.

Claim.—The slide support A, arranged to be connected to the saw mandrel, and provided with the support F and slides D and E, substantially as and for the purpose set forth.

82,509.—WILLIAM A. GARLOCH and WILLIAM D. RICHARDS, Belpre, Ohio.—*Ice-cream Freezer.*—September 29, 1868.

Claim.—The sleeve K, secured to the cover of the inner case, and having formed upon its upper end the pinion J, said sleeve being supported in position to operate the inner case by the continuous dasher shaft only, as herein shown and described.

82,510.—E. L. GAYLORD, Terryville, Conn.—*Carriage Spring.*—September 29, 1868.—The bolt to which the spring bars are secured is arranged to turn in the clips which are fastened to the axle.

Claim.—1. A spring for wheel vehicles, composed of two bars, bent so as to diverge from each other, from and their central parts outward toward each end, at the same time have a longitudinal, curved, and twisted or torsal form, substantially as shown and described.

2. The attaching of the ends of the springs to the bolster and axle of the vehicle, by means of the swivel clips F, constructed substantially as shown and described.

82,511.—WILLIAM GILBERT, Detroit, Mich.—*Brick Kiln.*—September 29, 1868.—Furnaces are arranged on each side of a chamber, in which latter are rails for the carriages loaded with brick. Doors are provided at each end of the kiln, so that when the brick on one carriage is burned the doors are raised and a carriage of unburned brick is pushed against the others in the kiln, thus forcing out the carriage at the other end.

Claim.—A progressive burning and cooling kiln, composed of the furnace C and cooling room J, inclosed and separated by the vertically-sliding gates G G' G'', and furnished with the inclined track a b, the fireplaces E, on either side the furnace, and the chimney H, all arranged with relation to each other, and operating substantially as and for the purposes herein set forth.

82,512.—JACOB GINTHER, Mier, Ill., assignor to himself, WILLIAM FRIEND, and WILLIAM SEIBERT, same place.—*Combined Roller and Harrow.*—September 29, 1868.—The devices are so arranged as to be used as a harrow, or as a roller alone.

Claim.—The combination of the lever J, connecting rod K, elbow lever H, and connecting rod I, with the roller frame A and harrow frame E, substantially as herein shown and described, and for the purpose set forth.

82,513.—JOHN GOODIN, Centralia, Ill.—*Wrench.*—September 29, 1868.—A cam wheel provided with ratchet teeth on a part of its periphery into which a pawl held by a spring engages is used for tightening the jaws of the wrench.

Claim.—The arrangement of the notched cam wheel F, pawl d, spring e, for the purpose of adjusting the movable jaw on a monkey wrench, constructed and operating substantially as herein set forth.

82,514.—THOMAS GOODRUM, Providence, R. I.—*Caliper.*—September 29, 1868; antedated September 16, 1868.—A tapering thumb screw is pivoted in the leg of the caliper, and is held against the ratchet threads by a spring, so that the screw can be disengaged from the rack for adjusting the calipers.

Claim.—The rod A, in connection with B, and as fitted to its seat, substantially as described and for the purpose as set forth.

82,515.—WILLIAM B. GOODWIN, Effingham, Ill.—*Corn Planter.*—September 29, 1868.—A crank, acting against projections on the rod to which the dropper slides are secured, gives a reciprocating motion to the slides, which latter are provided with apertures, acting alternately, as pockets for measuring the grain. A plate placed in the bottom of the hopper prevents the seed from flowing continuously. Marking rods are actuated by the crank which operates the slides.

Claim.—1. The combination, with a corn-planting machine, of the marking rods d⁶, substantially as and for the purpose described.

2. Operating the markers d⁶, from the crank shaft d², by means of the connecting rods d³, rocker arm d⁴, substantially as and for the purpose described.

3. Operating the dropper slide by means of the crank shaft d² acting on the cam projections g g, substantially as and for the purpose described.

4. The arrangement of the hopper E, plate f, perforated ends of the dropper arm d⁵, and the tubular plows, substantially as and for the purpose described.

82,516.—JAMES GRANGER, Zanesville, Ohio.—*Propelling Apparatus.*—September 29, 1868.—A traveling bridge supports the chain and prevents it from sagging.

Claim.—The traveling bridge A, constructed substantially as shown and described, in combination with a chain propelling wheel, and for the purposes set forth.

82,517.—B. F. GROSS, Trenton, Tenn.—*Tanning Compound.*—September 29, 1868.—Composed of sal soda, alum, glauber salts, saltpeter, sal ammonia, salt, starch, oil of vitriol, sumac, bark liquor or liquor of japonica.

Claim.—The tanning compound composed of the ingredients named above, and in about the proportions given, substantially as and for the purposes set forth.

82,518.—ALLIN HACKETT, Pittsfield, Me.—*Saw Mill.*—September 29, 1868.—The lever which moves the knee is provided with pawls so arranged as to hold the knee rigidly when once set. An upright attached to the knee rack has an index wheel secured to a pinion, which latter engages with pins on the side of the head block.

Claim.—1. The gange device, constructed, as described, of the plate S, bearing the roller P, and jointed at m to the plate R, which is operated in a recess of the graduated part U by means of the feed screw o and hand wheel n, all arranged and operating as described for the purpose specified.

2. The described arrangement of the setting-up mechanism upon the head block, consisting of the sliding block o, rack c, standards L M, pointer h, indicator wheel d, having the toothed part e, the pins e', lever K, bearing the pawls a b, the standard I, and slotted notched bar J, all operating as described, for the purpose specified.

82,519.—FRANÇOIS HAECK, Brussels, Belgium.—*Apparatus for Distilling Spirits.*—September 29, 1868; antedated September 16, 1868.—A condensing

dish is arranged below the top of the still over the echannels, for freeing the vapor of water and returning it to the evaporating echannels.

Claim.—1. A still, having a continuous action, by causing the liquid to flow through a series of channels successively, in such manner that the incoming liquid is restrained from mixing with the outgoing, and so that, in its passage through the still, the evaporation is produced by its travel over steam pipes having independent inlets and outlets, so as to establish an equality, or thereabouts, of heating action throughout the several channels of the still, substantially as specified.

2. The combination, with the channels of the still, and arrangement over them, substantially as described, of the condensing plate, surface or vessel T, essentially as and for the purpose or purposes herein set forth.

82,520.—J. R. HALL, Salem, Ohio.—*Steam Slide Valve.*—September 29, 1868.—An arrangement of devices to obviate the inequality of friction in ordinary balance valves due to the full pressure when the parts are open for the steam, and no pressure when exhausting.

Claim.—The arrangement of the valve D, with its chambers $b b^1 b^2$, the recessed followers $e e^1 e^2$, and the pistons $d d^1 d^2$, with the central passages $h h^1 h^2$, and the passages $a^1 a^2 a^3$, whereby to balance the pressure of steam upon the valve, substantially as herein set forth.

82,521.—WILLIAM M. HAMILTON, Wenona, Ill.—*Bed Bottom.*—September 29, 1868.—The straps are fastened to the slats and are provided with rings which slide on standards fastened to the bearing pieces. Diagonal braces are fastened to the ends of the slats and to the under side of the bearing pieces.

Claim.—1. The straps D, having rings V V at their ends, in combination with the standards I, slats H, and diagonal braces $c c$, substantially as set forth.

2. The standards I I', plates J J, springs C, slats H, straps D, rings V V, and braces c and E, as and for the purpose specified.

82,522.—JOHN HARLIN, New York, N. Y.—*Lubricator.*—September 29, 1868.—The plug has a shoulder against which a collar with packing interposed fits and is held by a cap screwed to the socket in which the plug is placed.

Claim.—In combination with the plug C of the lubricator, said plug having parallel apertures $d e$, the packing h , collar g , and screw cap D, arranged as described for the purpose specified.

82,523.—DAVID R. P. HILL, Morgantown, W. Va.—*Paint Oil.*—September 29, 1868.—Composed of pulverized resin, sugar of lead, and sulphate of zine, boiled with petroleum oil and then mixed with lime and linseed oil.

Claim.—An improved paint oil, prepared of the ingredients, in the proportions and manner substantially as herein described and set forth.

82,524.—ANDREW J. HOLT, Peru, Ind.—*Seed Planter.*—September 29, 1868.—Inclined planes on the wheel produce a lateral movement of the dropping bar. Adjustable markers are placed at regular distances on the side of the wheel to indent the ground where the grain is deposited. A rod attached to the frame is made to fit in holes on the periphery of the wheel to stop the latter at pleasure.

Claim.—1. The hinged lever E G, for moving the horizontal dropping bar D, and its mode of disconnection with the wheel B.

2. In combination with the above-named devices, the mode of applying and using the inclined planes J J, so as to produce the lateral alternate movement of the dropping bar D, through the medium of the lever E G.

3. The adjustable markers K K, for the purpose of showing the point where the grain is deposited; and

4. The application of the rod M, for arresting the revolution of the wheel B at the point of dropping.

82,525.—MAURICE HERMANN, JACOBI and EUGENE KLEIN, St. Petersburg, Russia, assignors to GREEN, CLAY AND COMPANY.—*Galvano-plastic Pro-*

cess for Precipitating Iron on Molds, &c.—September 29, 1868.—The bath is composed of sulphate of iron, combined with either of the sulphates of ammonia, potash, or soda; gelatine is added to improve the texture of the iron deposit; anodes combined with copper, &c., are used for keeping up the concentration of the bath. The molds are covered with a thin film of copper.

Claim.—The process of precipitating iron on molds, in the manner substantially as and for the purposes herein set forth.

82,526.—AUGUSTUS JENNINGS and ISAAC JENNINGS, Fairfield, Conn.—*Paper Pail, &c.*—September 29, 1868.

Claim.—Securing the bottom or head B, formed with an outwardly-projecting flange, to the body A of the vessel, by means of the metallic binding C, substantially in the manner herein shown and described.

82,527.—WILLIAM H. JOECKEL, New York, N. Y.—*Reversible Railway Chair.*—September 29, 1868.—When the back is swung over to reverse the front of the seat, the seat itself will swing slightly so as to be lowest near the back.

Claim.—The chair, consisting of the uprights A, pivoted seat B, swinging back C, and sliding bars D E, all made, combined, and operating substantially as herein shown and described.

82,528.—P. C. JOHNSON and EDWIN FROGGOTT, Central City, Colorado.—*Construction of Horseshoes.*—September 29, 1868.—The toe and heel calks are provided with projections which fit into recesses in the bottom of the shoe, and are held in place by means of screws.

Claim.—The arms $b d$, attached to or formed with the calks, and bent down into holes in the bottom or under side of the shoe, to form a locking device, in combination with the screws a , substantially as shown and described.

82,529.—JOSEPH A. JONES, Baltimore, Md., assignor to himself and JOHN DONALDSON, same place.—*Roofing Compound.*—September 29, 1868.—Composed of coal tar, paraffine varnish, pulverized iron ore, and ground slate.

Claim.—A compound, consisting of the ingredients mentioned, and applied to roofs, substantially as and for the purposes herein set forth.

82,530.—J. BLACKBURN JONES, Sparta, Ill.—*Carriage Wheel.*—September 29, 1868.

Claim.—The metallic hub A, provided with a dovetail recess, a , extending circumferentially around it in connection with the wooden spokes B, with metal sockets at their lower ends, and provided at their inner ends with dovetail tenons d fitted in the hub, substantially as shown and described.

82,531.—SAM'L W. JONES, Bluffton, Ind.—*Corn Planter.*—September 29, 1868.—The lower end of the spout is provided with a spring connected with a bent lever, which latter also operates the slide, so that when the slide is placed in position to discharge the seed, the spring is pulled back and the seed is allowed to drop into the ground.

Claim.—The slide C, fitted in the seed box or hopper D, and passing through the staff A, in combination with the bent lever E, connected with the slide C, the lever B, and the lower spring or elastic part f of the spout F, all arranged to operate substantially as and for the purpose herein shown and described.

82,532.—FRANK KAISER, Buffalo, N. Y.—*Grinding Mill.*—September 29, 1868.—The grain falls from a hopper, which is provided with a suspended and oscillating bottom, between a serrated drum and a corrugated curved plate, this plate being adjusted by means of set screws having notched heads into which a pawl fits. An inclined sieve below the drum is oscillated by means of a rock shaft.

Claim.—The construction and arrangement of the serrated drum B, adjustable curved plate C, set screws $e^1 e^1$, with notched heads and pawls, d , the hopper E, oscillating suspended bottom, F, slotted arm h^2 , spout a^2 , inclined sieve J, and rock shaft K, substantially as described for the purpose specified.

82,533.—WILLIAM S. LANE, Beaver Dam, N. Y.—*Sheep-shearing Device.*—September 29, 1868.

Claim.—A trough for shearing sheep, in combination with a frame, so arranged that it may be adjusted by the foot to suit the operator, and substantially in the manner herein shown and described.

82,534.—VICTOR LANGLOIS, Cherbourg Dock-Yard, France.—*Steam Generator.*—September 29, 1868.—One end of a tube fits into a ring which is screwed into the end plate. The other end of the tube fits into the end of a cap, which latter is properly packed to prevent the escape of steam.

Claim.—1. The construction and arrangement of the tubes *a*, having the threaded ends *b*, and external caps *c*, the lead packing *f*, rings *A*, and plates *P P'*, substantially as herein shown and described.

2. The various tools for effecting such work of the plates and tubes as I have described, and also for putting up and off the said movable tubes, substantially as described.

82,535.—CHRISTOPHER LIDREN, Lafayette, Ind., assignor to himself and R. JACKSON, same place.—*Harvester.*—September 29, 1868.—When the machine is in motion, the ratchet-clutches are adjusted so as to connect the hubs of the wheels with the axle, and cause them to rotate together. The two cams acting against the rollers give a vibrating movement to the rock shaft, and communicate a reciprocating movement to the sickle.

Claim.—1. The combination of the hubs *b*, frame *C*, and clutches *E*, with the shipping lever *Ex*, all these parts being arranged and constructed as herein shown and described.

2. The arrangement of the two cams *G G'*, axle *B*, forked arm *H*, box *I*, rock shaft *J*, rollers *Jx*, and vibrating arm *K*, substantially as and for the purpose set forth.

3. The box *I*, attached to the arm *H*, and the rock shaft *J*, fitted therein, as shown, whereby proper adjustment may be made for the wear and tear of the rollers *Jx*, and the journals and boxes of the rock shaft, substantially as set forth.

4. Constructing the rollers *Jx* with oil chambers *n*, and providing them with exterior surfaces of leather *m*, or other suitable material, substantially as and for the purpose specified.

82,536.—CHARLES S. LOCKE, Watertown, assignor to JOHN HALL, of same place, RENSELLAER TUTE, of Cambridge, and SAMUEL A. BRACKETT, of Boston, Mass.—*Toy Gun.*—September 29, 1868; antedated September 17, 1868.—An improvement on the patent of CHARLES S. LOCKE and JOHN HALL, November 19, 1867. The magazine, having a slider and a spring to actuate it, is placed in rear of the barrel and partly over it, to force forward the ball into an oblique passage to the barrel, the discharge being effected by a helical spring, and an arm catch connected with the trigger driving forward the piston and ball through the barrel.

Claim.—1. In a toy spring pistol or gun, the arrangement of the magazine within the stock, and so as to project over and in rear of the barrel, and of the passage for conveying the balls from the magazine into the barrel, the whole being as represented.

2. The arrangement of the passage *c*, inclining, with respect to the barrel and to the magazine, as and for the purpose specified.

3. The trigger catch, as made with the ball-receiving and retracting recess, or its equivalent.

4. The combination of the mechanism for advancing the balls in the magazine, with such magazine, the barrel and the mechanism for effecting the expulsion of the balls from the latter, as specified.

5. The combination of the sliding cover *f'* and the sight *g* with the passage *c*, opening out of the barrel, and disposed with respect to it and the magazine as specified.

6. The combination or mechanism for retracting and releasing the piston in order that it may be advanced by its spring, such mechanism consisting not only of the peculiar lever trigger catch and trigger combined, and provided with a stud or studs, as described, but of the tube *B*, or its equivalent, made with longitudinal and transverse slots, and provided with one or two inclined planes and a spring, the

whole being arranged substantially in manner and so as to operate as specified.

82,537.—M. B. MARKHAM, Grass Lake, Mich.—*Gate Fastening.*—September 29, 1868.—A three-armed bar is pivoted to the upper part of a bent bar attached to the front post, one of which arms is caught at its end and held by a spring catch on the gate; the other arm projects upward and serves as a handle.

Claim.—An improved gate fastening, formed by the combination of the pivoting arm or bar *D*, the three-armed bar *E*, and the spring catch *F*, with each other, said parts being constructed and operating substantially as herein shown and described, and for the purpose set forth.

82,538.—JOHN MARQUIS, San Francisco, Cal., assignor to himself and OLE BERGERSON, same place.—*Steam-propeller Plow and Cultivator.*—September 29, 1868; antedated September 16, 1868.

Claim.—1. The construction and application of the cutters *C C C* in form similar to that of a screw, and having bits *b b b*, at the ends of the blades, substantially as described, for the purpose set forth.

2. The attachment of the said cutters or screws, in a diagonal manner, to the rear portion of the frame at such an angle as to overcome the side draft, and impart to the said cutters, in their rotation, a progressive tendency, substantially as described.

3. The bars or levers *I I*, for raising and lowering the frame and cutters, and employing the axle as a fulcrum for that purpose, substantially as described.

82,539.—CHARLES MARTIN, Chancery Lane, and WILLIAM BARRETT and THOMAS STAMMERS WEBB, Norton, England.—*Treatment and Reduction of Titaniferous Iron Ore.*—September 29, 1868.—The charge used is coke, ore, lime, and silicates of manganese, iron, alumina, lime or magnesia, either single or combined. The purification of the slag from sulphur is effected by water, hydrochloric acid, nitric and solutions of chlorine.

Claim.—The methods of treating and reducing titaniferous iron ores for the manufacture of iron, and of applying the slag or cinder produced in such processes, substantially as hereinbefore described, and set forth, or any mere modifications thereof.

82,540.—N. L. MILBURN, St. Louis, Mo.—*Elevator.*—September 29, 1868.—Two platforms are alternately raised and lowered in a frame, by an endless rope moved to and fro by power applied to a horizontal portion of the rope at the foot of the frame.

Claim.—1. The arrangement of the endless rope *h i*, with relation to the frame *A*, sheaves *k l*, pulley *g*, shaft *e*, drum *f*, and platforms *d*, whereby the former is applied in two directions to elevate and lower the platforms, as herein shown and described.

2. The described construction of the frame *A*, having the corner guides *a*, and central guide *b*, for the platforms, as herein shown and described, for the purpose specified.

82,541.—GEORGE MOHLER, Yates City, Ill.—*Medical Compound.*—September 29, 1868.—Designed for the cure of diseases of the breast and lungs, and is composed of cannabis indica, extract of calabr. licorice, tincture cubeb, tincture of quassia, extract of sarsaparilla, and salts of tartar, dissolved in water.

Claim.—The compound above described, when composed and used substantially as and for the purposes herein set forth.

82,542.—JAMES BEALL MORRISON, St. Louis, Mo.—*Operating Chair.*—September 29, 1868; patented in England December 7, 1867.

Claim.—1. The combination of a universal joint *C*, with slides *f* extending upward and downward from said joint, and provided with suitable grooves, in which suitable pieces *n*, fast to the body of an operating chair, are made to slide, constructed substantially in the manner and for the purpose described.

2. The application of a universal joint, *E*, constructed in the manner hereinbefore described, to the head rest of an operating chair, in combination

with the slotted bar 2, constructed and arranged and operating together in the manner substantially as specified.

3. A head rest, F, made with two cushions or head supporters 12 and 13, in combination with a universal joint, E, and slotted bar 2, arranged and operating in the manner substantially as set forth and specified.

4. The arrangement of the cruciformed frames *n*, attached to the body of the chair B, the slides *f*, attached to the universal joint C, in combination with the racks *p* and pinions *m*, for elevating and depressing the body of the chair, when constructed and combined in the manner and for the purpose substantially as described.

5. Arms D, provided with suitable pieces *v*, extending downward, and fitting between guide pieces *w*, fast on the sides of the chair, and provided with a pinching screw or other device, to fix the arms in any desired position, substantially in the manner and for the purpose described.

82,543.—EDGAR MURRAY, New York, N. Y.—*Skate*.—September 29, 1868.—A pair of clamps is sustained and made to slide in metal loops, on the under side of the sole plate, together with a center pin, connected with a sliding bar, and by which they are operated, acting in diagonal slots, the pin being supported and moving on a central loop receiving its head.

Claim.—The pin *i*, guided at one end by the bar or central loop *f'*, and at the other end by the longitudinal slot 2, in combination with the clamps *e e* and sliding bar *g*, as and for the purposes set forth.

82,544.—C. J. O'HARA, New Orleans, La.—*Name Plate for Street Lamp*.—September 29, 1868.

Claim.—The mode herein described of marking or placing the names of streets upon street lamps, by means of a transverse supplemental "name plate" C, when the same is provided with an edge frame *b*, beveled ends, and oblate hooks *e e'*, and is applied or placed within the lamp, as herein described for the purpose set forth.

82,545.—JASON B. PAULEY, Tiskilwa, Ill., assignor to himself and FRANKLIN B. IVES.—*Tread-power Machine*.—September 29, 1868.—A spring, connected by a cord to an arm projecting from the treadle, aids in retracting the latter after its downward movement.

Claim.—The combined arrangement of the treadle M, arm M², connection O, spring N, and shaft I, substantially as and for the purpose described.

82,546.—WILLIAM H. PECKHAM, New York, N. Y.—*Finger Ring*.—September 29, 1868.

Claim.—As a new article of manufacture, a finger ring made of cast or rolled metal, with a grooved inner face, and with its edges slightly widened to form a bearing surface upon the finger, as herein shown and described.

82,547.—JOHN C. PEDRICK, Washington, D. C.—*Combined High and Low Pressure Steam Engine*.—September 29, 1868; antedated September 17, 1868.

—The piston rod has two pistons working one at either side of the central diaphragm in the cylinder, the latter being open to the atmosphere at both ends. If high steam be used, and the exhaust pipe surrounded with cold water, the high steam will lift the flap valve, when the exhaust valve is opened, and pass out, while the attenuated steam will be condensed, giving the piston the advantage of a vacuum.

Claim.—The arrangement of the valves *i* and *j*, and pipe *k*, provided with the flap valve, with reference to the cylinder, as and for the purpose set forth.

82,548.—GEORGE W. PERRY, Shenandoah City, Pa.—*Steam Pumping Engine*.—September 29, 1868.—On a vertical arm, attached to the cross head and moving with it, is an adjustable frame provided with tappets, and from this movement, by means of two arms, two rock shafts operate the valves respectively, while the inclined surface of the frame, formed by a strap, in contact with the arms, closes the steam and exhaust ports, the stoppage being effected by means of a wheel which has two arms on one side,

and one on the other connected with the plunger of the dash pot.

Claim.—1. The construction of the cam *p*, lug *o*, wheel *i*, arms *k l*, and tappets *e e'*, substantially as herein shown and described.

2. In combination with the cam *p*, lug *o*, wheel *i*, arms *k l*, and tappets *e e'*, the arms *f f'*, strap *h*, rod A, segments *v v'*, and plunger *r* of the dash pot, as herein shown and described.

82,549.—WILLIAM PLATT, Baltimore, Md.—*Shaft Bearer*.—September 29, 1868.—A metallic hook is buckled to the "billet strap" from the saddle, and has a central opening to receive the end of a strap which laps over the shaft and is buckled to the belly band.

Claim.—The shaft bearer A, provided with a means of attachment to the "billet strap," a hook for receiving the shaft, and a loop for the attachment of the securing strap D, substantially as described and represented.

82,550.—M. M. RAY, Ellsworth, Me.—*Boat Detaching Apparatus*.—September 29, 1868.—The tackle block has a metal strap to which is fixed a hook extension, the boat ring being held thereon by means of a lever having on its slower arm a rod, while a band encircles both lever and rod, and slides up and down on them, being moved by a rod connected with the block.

Claim.—The lever D, tine *d*, rod *b*, and extension C *e*, in combination with a tackle block, A, all substantially as shown and described, and for the purpose set forth.

82,551.—CHRISTOPHER READ, Jersey City, N. J.—*Key Hole Guard*.—September 29, 1868.—A sliding block is attached to a sliding plate, with which the tumbler engages, and when it is raised the block is thrown toward the key hole by a spring, closing it when the key is taken out.

Claim.—The tumbler *f*, the sliding block *g*, and the sliding plate *d*, in combination with a door lock, operating substantially as shown and described, for closing and unclosing the key hole, when the door is locked on the outside.

82,552.—JOHN J. REICHERTS, Delaware, Ohio.—*Corpse Preserver*.—September 29, 1868.—The two parts of the case are jointed together and are each connected with an ice box, and have perforated bottoms through which, and into empty spaces, the cold air passes and circulates in the part where the body is laid.

Claim.—A corpse preserver, constructed and arranged substantially as shown and described, that is to say, with the parts A and B, the ice box F, and either with or without the ice box G, the air spaces M, platform D, perforated false bottom L, with the double glass *p p*, the whole arranged and operating substantially as and for the purposes set forth.

82,553.—JOHN D. RICE, CYRUS B. RICE, LAWSON N. RICE, and ELISHA BRIGGS, JR., Detroit, Mich.—*Combined Stalk Cutter and Husker*.—September 29, 1868.—The reciprocating scrapers are designed to clear the rollers.

Claim.—The reciprocating scrapers I, the connecting rods 8, the crank shaft Y, the pitman Z, and eccentric X, when operating and constructed substantially as and for the purposes set forth.

82,554.—J. W. RIST, Rochester, N. Y., assignor to himself and IRA A. HEBBARD, same place.—*Indicator for Knitting Machine*.—September 29, 1868; antedated September 16, 1868.

Claim.—1. The combination of the box or plate of a knitting machine indicator and its indicating hand, with a proportion table, substantially as described, to indicate the number of rounds to be knit, and the number of needles to be employed to form a knitted article of any desired form, size, and proportion.

2. In combination with the above, the adjustable pointer G, as and for the purposes set forth.

82,555.—J. W. RIST, Rochester, N. Y., assignor to himself and JOHN A. GUILLE; said JOHN A. GUILLE assignor to IRA A. HEBBARD, same place.—*Register*

for *Knitting Machine*.—September 29, 1868; antedated September 24, 1868.—The stroke of the driving spring, connected with the ratchet wheel to which the clamping nut and its screw are fixed, is limited by the U-shaped guard, between the sides and arms of which a spur from the end of the spring projects.

Claim.—The arrangement of the driving spring or latch *b*, doublestop *d*, and ratchet wheel *W*, in combination with the set nut *E* and screw *a*, substantially in the manner and for the purposes set forth.

82,556.—GEORGE J. ROBERTS, Dayton, Ohio.—*Cut-off for Steam Engine*.—September 29, 1868.—The valve seats are cast with the chest, the cut-off valves being lifted by a cam which operates on a slide attached to an arm on the shaft connected with the governor of the engine by an arm and rod.

Claim.—1. The valves *D E* and the seats *C C*, constructed as herein set forth.

2. The arrangement of the slide *N*, cam *m*, arm *o*, shaft *P*, arm *q*, and connecting rod *R*, as herein set forth.

82,557.—EDWARD SAVAGE, Chicago, Ill.—*Steam Cooking Apparatus*.—September 29, 1868.—Three chambers are arranged one above the other in such a manner that the steam is produced in one, superheated in the next, and acts on the vegetables or other articles in the third, pipes being connected therewith, for conducting the water and steam.

Claim.—1. The superheating chamber *C*, located at or near the bottom of the cooking apparatus, substantially as described.

2. The combination of the chamber *A*, water vessel *B*, and steam chamber *C*, connected by the pipes *d e f*, all arranged to operate substantially as and for the purpose set forth.

3. The combination of the coiled pipe *g*, superheating chamber *C*, water vessel *B*, and cooking chamber *A*, with the pipes *e, f*, and *d*, all arranged for joint operation, substantially as described.

82,558.—H. H. SEELEY, Hudson, Mich.—*Fanning Mill*.—September 29, 1868.—The wings, in two pieces, incline downward and are joined, the ends being higher than the center. The wind board is formed of two pieces which extend upward, with the ends lower than the center. The shoe consists of an upper and lower screen, the latter adjustable for different grain, and pivoted in the sides of the shoe, and the toll board below connected to and hung on the frame being also the shoe bottom.

Claim.—1. The wind board *E*, in combination with the wings *D D*, when constructed in a reverse manner from each other, all as herein shown and specified.

2. The adjustable screen *H*, pivoted in the sides of the shoe *F*, for the purpose of changing the same to suit any kind of grain, substantially as and for the purposes herein set forth.

3. The adjustable toll board *I*, constructed as described, and operating substantially as and for the purposes herein set forth.

82,559.—GEO. H. SELLERS, Phoenixville, Pa.—*Method of Making Eye Bolts or Links Without Welding*.—September 29, 1868.—The formers are pivoted to be swung open and shut, and supported by steel straps bolted by bolts on which the lever eams turn. The bar being placed in the shears the header is driven against it, and the metal is forced into the die, after which it is laid in the flattening dies, and as they come together, the metal is driven from where the eye is to be bored into the molds and works round the eye.

Claim.—In making weldless links, and other similar articles, subjecting the previously swelled up or enlarged end of the bar to the flattening and bulb dies, substantially such as described, for the purpose of transposing the metal from the place where the bolt hole is to be, and driving it toward the perimeter, as and for the purpose herein set forth.

82,560.—JOEL SMITH, Leominster, Mass.—*Comb*.—September 29, 1868.—The back is attached by means of a dove-tail groove, fitting in a corresponding tenon in the body:

Claim.—Attaching a horn back to the body of a

horn comb, substantially as and for the purposes described and set forth.

82,561.—FISHER A. SPOFFORD and MATTHEW G. RAFFINGTON, Columbus, Ohio.—*Toy Gun*.—September 29, 1868.—A spring is secured in the handle, extending into a recess in the rear end of a plunger fitted into the barrel, which has a chamber near the breech to receive it, and on pulling the trigger it is raised into the main bore, and forced forward by the spring.

Claim.—Providing the barrel of a toy gun with a downward extension or chamber, *c*, for the reception of the plunger, as described, the trigger raising the plunger out of such chamber, substantially as set forth.

82,562.—J. C. STROUD, Lockhart, Texas.—*Cultivator*.—September 29, 1868.

Claim.—1. Adjustably connecting the plow beams *G* with each other, by means of the slotted cross-bar *J*, to which said beams are bolted, substantially as herein shown and described and for the purpose set forth.

2. Pivoting the plow beams *G* to the stationary frame *D*, by means of the pivoting rod *K* and the pivoting crank rod *L*, substantially as herein shown and described and for the purpose set forth.

3. The combination of the hand lever *O*, connecting rod or bar *N*, and lever arm *R*, with each other and with the rods *K* and *L*, by which the plow beams *G* are pivoted to the frame *D*, substantially as herein shown and described and for the purpose set forth.

82,563.—LEVI STUCK, Bryan, Ohio.—*Method of Obtaining Dental Models*.—September 29, 1868.

Claim.—1. The method of obtaining dental model plates of metal directly from the mouth impression by casting the metal in a perforated or slitted mouth impression, *B*, substantially as described.

2. The employment of a slitted or perforated impression cup, *C*, substantially as described, in combination with a plaster mouth impression, *B*, vented through the raised surface *a*, substantially as described.

3. As a new article of manufacture, a metallic dental model plate or die, *A*, when obtained in the manner substantially as herein described.

82,564.—OLIVER C. SWEET, Albany, N. Y.—*Machine for Drying and Stretching Fabrics*.—September 29, 1868; antedated September 24, 1868.—A horizontal swinging bar is hinged to a wall and connected with a drying frame of two bars with levers hinged oppositely to and crossing each other, and toggle levers meeting at their ends, their joints being connected by a bar, while tongs formed of bars and cords are hung to a beam above, and have a hook to which the upper bar of the frame is hung. A stretcher, also, with levers, pulleys, and endless friction cords, sleeve, and rod being provided for winding on the fabric.

Claim.—1. The adjustable drying frame *C G*, suspended, by means of removable tongs *D D*, from a suitable stationary bearing, and made contractible or expansible at will, substantially as herein shown and described.

2. The hinged adjustable drying frame *C G*, arranged as described, in combination with the swinging receiving bar *A*, substantially as herein shown and described.

3. The rollers *l* and cords *m*, arranged as described, in combination with the bars *g*, standard *I j*, sleeve *i*, and arms *h*, for the purpose specified.

4. The stretcher frame *C G*, when arranged as described, in combination with the tongs *D D*, bar *A*, post *I*, and stretcher *K*, all made and operating substantially as herein shown and described.

82,565.—GEORGE TAMKIN, Newburg, N. Y.—*Stove-pipe Damper*.—September 29, 1868.

Claim.—The composite rod, composed of metallic strips *B G*, of different expansibility, riveted together, and arranged with relation to the damper and stove-pipe, as described, whereby the expansion of said rod causes it to move laterally, and thereby to close the damper, as herein shown and described.

82,566.—GILBERT F. TAYLOR, New York, N. Y.—*Guard for Carpet-sweeping Machine.*—September 29, 1868.—The pad is made as a bag, and has its ends connected by an elastic substance of such tension as to hold it on when slipped over the case.

Claim.—The placing around the body, A, of a carpet-sweeping machine, the pad C, connected at its ends by the elastic strip *e*, so as to be removable at pleasure, as herein described.

82,567.—MARSHALL TURLEY, Council Bluffs, Iowa.—*Steam Generator.*—September 29, 1868.

Claim.—The arrangement of the separate globular sections C, with the hollow upward inclined screw-arms D, as herein shown and described.

82,568.—JAMES TYZICK and HENRY W. ESKILDSON, New York, N. Y.—*Nail Extractor.*—September 29, 1868.—Two steel gripping points, one in the lever and the other in a shackle hinged to the lower end of a grooved piece, are connected with the lever, in which the tongue plays.

Claim.—An instrument for drawing driven nails, composed substantially of the lever A and shackle L, with their gripping points D and F, and hinged or linked together by the slotted piece E, the whole constructed to operate in the manner and for the purpose herein described and represented.

82,569.—THOMAS G. TYLER, New York, N. Y.—*Awning.*—September 29, 1868.—Front and tapered side slats slide one within the other, being connected together by plates with headed studs which work in slotted plates affixed on the adjacent slat.

Claim.—The awning, having its side slats B and curved top slats A connected together, to form frames, adapted to slide one within the other, by means of the slotted plates *f*, and the plates having headed bolts, substantially as herein shown and described.

82,570.—GARRETT VAN SICKLE, Auburn, N. Y.—*Device for Unloading Hay.*—September 29, 1868.—The elevating rope passes around a pulley, the block of which is tapering, forked, and slotted, and is connected to one end of a binding rope, which at the other end is held by a hook pivoted to the block, having also at its upper end an unlocking cord.

Claim.—1. The combination and arrangement of the binding rope or device with the elevating rope, and the combined pulley and hook and its tripping cord, in the manner herein described, whereby the hay or other like material, whatever may be its quantity, is first drawn and compressed into a compact bundle, and then elevated and discharged, as herein shown and set forth.

2. The combination, with the body of the hay wagon, of uprights *n* and their hooks, for holding and maintaining in position the hay-binding ropes, substantially as herein shown and set forth.

3. A combined pulley and hook, constructed as herein specified and shown in the accompanying drawings.

82,571.—JOHN R. WASHBURN, West Stafford, Conn.—*Lathe Chuck.*—September 29, 1868.

Claim.—1. The detached key D, carrying the beveled pinion *b*, and adapted to fit into a series of apertures, *e*, formed through the sides of the case A, to allow the same pinion and key to be applied at either side of the chuck, whereby the key and pinion serve to operate any number of chucks, as herein shown and described.

2. The key D, when provided with a pinion, *b*, attached to its end, in combination with the perforated case A, jaws B, and scroll wheel C of a lathe chuck, all made and operating as herein shown and described.

82,572.—J. C. WHARTON, Nashville, Tenn.—*Tumbler Stand.*—September 29, 1868.

Claim.—1. The combination, in a tumbler stand, of the coneave tray A, pipe ring B, having cocks *i*, with the racks *a*, or their equivalent, and the revolving scrolls *d*, all substantially as shown and described, and for the purpose set forth.

2. The described arrangement of the caps *h*, affixed to the lower end of the curved springs pendent

from the outside of the racks *a*, with relation to the inclined cocks *i* upon the pipe B, said spring caps being operated by the tumblers, in the manner shown and described, for the purpose specified.

82,573.—A. S. WHITE, Malone, N. Y.—*Harrow and Cultivator.*—September 29, 1868.

Claim.—1. A harrow and cultivator, composed of two sides, A A, constructed each of two parallel plates, *a a*, and a plate *c*, attached to the rear end of the inner plate of the former at an acute angle, the plates *a a* being connected by bolts *b*, and the teeth or shares clamped between said plates by the bolts, substantially as shown and described.

2. Connecting the sides A A of the harrow and cultivator to the central plate B by means of the curved bars or hooks *a^x* passing through it, which bars or hooks pass through holes in the plates *c¹*, and the inner plates, *a*, of the sides, substantially as shown and described.

3. The pin *d*, fitted in the central plate B, in combination with the curved bars or hooks *a^x*, arranged substantially as and for the purpose set forth.

82,574.—CHARLES WILLIAMS, Manchester, N. H.—*Cooking Stove.*—September 29, 1868.—The "hot closet" is connected with and surrounded by an air-heating chamber which is curved and perforated at the top, and also with the ash chamber. Flues and dampers are arranged above and in rear of the ovens and communicate with the space in front.

Claim.—1. The arrangement of the hot closet H, the ash chamber F, the air-heating chamber I, the fireplace C, the two ovens A B, and their smoke flues, provided with dampers, as described.

2. The combination and arrangement of the auxiliary air-heating chamber D, with the fireplace C, the air-receiving and heating chamber I, the ash chamber F, and the hot closet H.

3. The arrangement and combination of the air-heating chambers D I, the hot closet H, the ash chamber F, the fireplace C, the two ovens A B, and their flues, provided with dampers, as described.

82,575.—FURMAN R. WILSON, Philadelphia, Pa.—*Valve Gear for Steam Engine.*—September 29, 1868.

—The lever has two arms above the fulcrum pin, inclining from each other and over the ends of the piston rods to give the valves the proper motion, and spreading so that the roller inside of the cam guides may act thereon, and also an arm below, connected to the valve rods by its forked ends, and to the fulcrum pin and plate above.

Claim.—1. The construction of the lever H H H, in the manner substantially as described and for the purpose set forth.

2. The arrangement of the cams G G and lever H H H, and fulcrum or lug plate J, with reference to the valve rods E E.

82,576.—HENRY AITKEN, Falkirk, Scotland.—*Treating Iron Ore, &c.*—September 29, 1868.—The platform for the ores has perforations through which the heat and products of combustion are drawn down into the flues and pass to the condensing pipes connected with vessels to collect them. Above is an arched covering which is rammed on wheels upon the rails of the side walls, and beneath which the heaps are formed.

Claim.—1. Coking iron stone or iron ore upon a perforated platform, through the openings in which, and through the mass of stone or ore, the gaseous products of the coking operation are drawn downward, for the purpose described.

2. Utilizing the gaseous products of the coking of iron stone or ore, substantially as specified.

3. The coking or carbonizing of iron ores or iron stones, in combination with carbonaceous or hydrocarbonaceous matter.

4. The employment of crude oil or tar, or oily or tarry matter, for hardening coked or carbonized iron ores or iron stones.

82,577.—JAMES C. ARMS, Northampton, Mass.—*Pocket Book Fastening.*—September 29, 1868.—The plate of sheet metal is fastened by clips to the book,

a slide with T-shaped holes slipping under it, and a

clip with an inverted T-shaped lip being secured to the flap to lock into the holes.

Claim.—The clasp or fastening, consisting of the plate C, slide D, and clip B, or their equivalents, constructed and arranged to operate substantially as and for the purpose herein described.

82,578.—JOHN N. ARVIN and JOSEPH M. WHITMORE, Valparaiso, Ind., assignors to themselves and AMMI M. BENNETT, Chicago, Ill.—*Corn Planter.*—September 29, 1868.—The drum moves on a shaft in connection with two cup wheels for dropping the corn, and also with a lever, the lower end of which is attached to a spring, and its upper end supports a journal, on which revolves the wire guide wheel, and thus the wire is wound spirally and evenly upon it.

Claim.—The combination of drum D, wire L, cup wheels C C, lever F, spring G, adjustable wire guide I, arranged to run on journal J and ratchet *f*, constructed to operate as herein specified.

82,579.—JAMES S. ATTERBURY and THOMAS B. ATTERBURY, Pittsburg, Pa.—*Lamp.*—September 29, 1868.

Claim.—A glass lamp bowl and a glass stand, united together by means of a screw socket piece B, as a new and improved article of manufacture.

82,580.—FRANKLIN BABCOCK, Middletown, Conn.—*Sash Holder.*—September 29, 1868.—The thumb catch provided with a spiral spring fits in a cylindrical case which has a screw cut on its periphery for fastening it to the window frame.

Claim.—The combination of the screw socket A, sliding shoulder B with flange C, stem *a*, and spring *b*, all as and for the purposes set forth.

82,581.—FRANKLIN BABCOCK and FREDERICK BABCOCK, Middletown, Conn.—*Door Latch.*—September 29, 1868.—The eam is provided with a circumferential flange at its center, and is secured in the concave ends of the case, thus dispensing with journals.

Claim.—The revolving flanged eam *a*, when attached in the concave ends of the case A, which is provided with a screw thread on its exterior, all constructed to operate as specified.

82,582.—JAMES F. BABCOCK, Boston, Mass.—*Composition for Generating Gases in Fire Extinguishers and for Other Purposes.*—September 29, 1868.—Composed of chlorates or nitrates of potassa or soda, charcoal or sulphur, and silicates of soda or potassa, in liquid form.

Claim.—A combustible gas-generating composition, for use in fire-extinguishing and other fluid-ejecting apparatus, when combined with a vehicle for arresting rapid combustion, substantially as described.

82,583.—QUIMBY S. BACKUS, Winchendon, Mass.—*Chuck Drill.*—September 29, 1868.—The opposite sides are grooved and inclined toward the cutting edge to allow the oil to flow freely to the cutting part and afford an unobstructed passage for chips or shavings to pass out. The grooves are of such a shape as to produce a lip on the cutting edge, which enters the work readily.

Claim.—The within-described "chuck-drill," constructed to operate substantially as set forth.

82,584.—JAMES BALLARD, Almond, Mich.—*Washing Machine.*—September 29, 1868.—The rubber is secured to arms which slide in sockets on the swinging bar. A lever is pivoted on these arms and secured to another lever, which is fastened to the swinging bar.

Claim.—The combination of the sliding bar II and its stationary rubber F with the swinging bar G, and levers L and K and the tub, all constructed to operate as set forth.

82,585.—C. M. BAXTER, Lebanon, N. H.—*Scroll Saw.*—September 29, 1868; antedated September 17, 1868.—To relieve the saw of the strain, the lower end of the standard is moved back in the inclined groove, and when returned to its position the tension is renewed.

Claim.—The combination of the short arms E, the

movable standard F, and inclined groove G, with the screw and crank wheel H, being so arranged that the strain may be thrown off or on the saw by a single motion, substantially as set forth.

82,586.—ELIAS BEACH, Titusville, Pa.—*Torpedo for Oil Well.*—September 29, 1868.—A thin metallic tube, perforated throughout its whole length, extends from the lowest primer to the bottom of the torpedo, so that when the primers are discharged fire is communicated along the tube to the explosive material below.

Claim.—1. The perforated tube G, arranged and operating substantially as described, for the purpose of communicating ignition of the explosive material at the lower part of the torpedo, as set forth.

2. The primer cord C, safety string, E, and cable D, in combination with the primers *b*, substantially as described.

3. The supplementary cord F, connected and operating as and for the purpose set forth.

4. The rod B, in combination with the primers *b*, and cap A', as set forth.

82,587.—HIRAM BERDAN, New York, N. Y., assignor to THE BERDAN FIRE-ARMS MANUFACTURING COMPANY, same place.—*Metallic Cartridge.*—September 29, 1868.—The re-enforced cup is so secured in the cartridge shell as to prevent the swelling of the rear portion of the shell by the insertion of such cup.

Claim.—1. Securing the re-enforced cup in the cartridge shell by means of a projection on the interior of the head of the shell, and an opening or cavity in the bottom of the cup fitting tightly on the said projection, substantially as and for the purpose herein described.

2. The combination of the patched bullet and the brass cartridge shell, drawn from sheet metal, substantially as and for the purpose herein set forth.

82,588.—JOSÉ MARIA BLANCO Y NUÑO, Havana, Cuba.—*Preserving Fruit and Vegetables.*—September 29, 1868.—The articles to be preserved are incased in a coating of paste composed of plaster of paris mixed with salt and water dissolved.

Claim.—The process of preserving fruits and vegetables, substantially as herein described.

82,589.—DAVID BONNEL, Oswego, N. Y.—*Grain Drier.*—September 29, 1868.—Grain is conducted from an inclined drying cylinder to an inclined screen, open at the top, and agitated in a box, into which latter a blast of cold air is driven.

Claim.—1. The drying cylinder C, supplied with heated air, in combination with the cooling screen D³, supplied with cold air, substantially as described, for the purposes set forth.

2. And, in combination with the drying cylinder C and cooling screen D³, the conveyer, supplied with cold air, as described, for the purposes set forth.

3. And, in combination with the drying cylinder, cooling screen, and conveyer, arranged as shown and described, the furnace and fans for supplying hot and cold air, substantially as described, for the purposes set forth.

82,590.—BENJAMIN S. BOYDSTON, Richmond, Ind.—*Lamp.*—September 29, 1868.

Claim.—A lamp, provided with a chamber, separate from the oil chamber, for carrying a supply of extinguishing fluid, or other flowing material, and which is so arranged, by means of tubes or their equivalents, that when the lamp is overturned the extinguishing material is brought in contact with the flame, for the purpose set forth.

82,591.—JOHN T. BRIGDEN, Hornellsville, N. Y.—*Machine for Punching Tubes.*—September 29, 1868.—Under the die, into which the punch is fitted to operate by the action of an eccentric lever and eam, is a sliding wedge for tightening the pipe, and having an opening in it to liberate the chips from the pipe, which is effected by means of a connecting rod attached to a vertical lever.

Claim.—1. The die A and sliding wedge B, as constructed and arranged inside of the pipe, for

holding it firmly in place while being punched, and the rod *d* and lever C, for operating the same and removing the chips or punchings, as herein described.

2. The hollow tube A', for receiving the pipe F, in combination with a slotted plug or supporting piece, placed within said pipe, and the punch P, eccentric eam H, and lever G, substantially as and for the purposes herein set forth.

82,592.—JOHN BURT, Sturgis, Mich.—*Potato Digger*.—September 29, 1868.—Semicircular plates, provided with adjusting holes, hold at any desired point a bent bar, which is hinged to the frame, and serves to depress or elevate the axle and its wheels.

Claim.—1. The combination of bar G, semicircular plates J', provided with adjusting holes *j* and frame A, all arranged as described, for the purpose of regulating the depth of the shovel.

2. The shaker D, shovel C, slotted arm *d*, crank *f*, pinion F, gear wheel J, and axle E, all combined and arranged substantially in the manner and for the purpose set forth.

82,593.—DAVID CAMMERER, Cincinnati, Ohio.—*Beer Cooler*.—September 29, 1868.—The wort or other liquor is cooled by dribbling or trickling over the outside of a conduit or receptacle of ice water. The improvements have reference to the special formation of the cooler and the surmounting contrivance for distributing the liquor.

Claim.—The combination of the two supporting flanges I I, perforated at *i i*, the elevated ridge G, the double trough H H', perforated at *h h'*, and the vertically-corrugated hollow webs D¹ D², affording water communication throughout the length of the chambers C¹ C², or nearly so, the whole being arranged as and for the purposes set forth.

82,594.—E. P. H. CAPRON, Springfield, Ohio.—*Ladder*.—September 29, 1868.—The two parts of the ladder are pivoted by a round placed on the edges of the side piece, so that they can be folded flat upon each other.

Claim.—1. A ladder, consisting of the parts A and B hinged together by the round *b*, and having the side rails of each part notched at their ends, so as to lock upon the rounds *h* and *f*, in the manner shown and described.

2. Hinging the parts A and B by means of the round *b*, secured to the edges of the side rails thereof, by means of the eyes *e* and loops *o*, substantially as shown and described.

3. In combination with the parts A and B, hinged as described, the platform C, provided with the slotted side bars D and the series of holes for adjusting the spread of the parts A and B, substantially as described.

82,595.—WILLIAM S. CARR, New York, N. Y.—*Water Closet*.—September 29, 1868.

Claim.—A water-closet hopper or container, formed at the upper end to receive the basin, and at the lower end to connect with the soil pipe, and with a removable section, formed and located so that the swinging pan of the closet can be introduced or removed without necessarily removing the basin from said hopper, substantially as set forth.

82,596.—ANDREW M. CHEESEMAN, Trenton, N. J., assignor to himself and JOHN WATSON, same place.—*Valve Seat*.—September 29, 1868.—The lower part of a rubber valve seat fits in a slot in the base of the valve chamber, and is secured in place by a metallic thimble inside of the rubber ring.

Claim.—The rubber valve seat *a a*, secured to its position by metallic thimble *c*, substantially as shown and described.

82,597.—SAMUEL CHILD, Baltimore, Md.—*Refrigerator*.—September 29, 1868.

Claim.—The arrangement of the pan C, having the waste pipe D with relation to the provision chamber H, the ice chamber A and gutter B, as herein described, for the purpose specified.

82,598.—RICHARD H. CHINN, Washington, D. C.—*Fountain Pen*.—September 29, 1868.—The cylin-

der is elastic and has elastic points that fit upon the bevel point of the pen so as to regulate the flow of the ink, the points being adjusted to the pen by a screw collar.

Claim.—The construction of the pen E, points D, collar J, on cylinder C, when arranged and combined as herein described, and for the purpose set forth.

82,599.—FRANK O. CLAFLIN, Brooklyn, N. Y., assignor to himself and ALBRO R. CARMAN, same place.—*Implement for Lasting Boots and Shoes*.—September 29, 1868.—The operation of stretching and tacking or pegging are combined in one mechanism.

Claim.—The combination of the mechanism for stretching and holding the material to be secured, or the equivalent thereof, with driving mechanism, substantially as and for the purposes described.

82,600.—WALLACE W. CLEVELAND, Cold Water, Mich.—*Turning Wagon Hub*.—September 29, 1868.—The cutter-head carriage is adjustable, on ways, toward or away from the hub, and the cutter head is also adjustable on a line parallel with the axis of the hub so as to be brought into position for action.

Claim.—The arrangement of the revolving cutter head, carried in the lateral and longitudinal-moving frame, with the fixed arbor revolving the block of which the hub is made, all as herein described.

82,601.—NATHAN S. CLEMENT, New Britain, Conn.—*Fruit Basket*.—September 29, 1868.

Claim.—Extending the two parts which form the double bottom and sides, so as to be turned over, and form a top of the box, and so that one of the parts is detachable, the whole constructed and arranged for opening, substantially in the manner herein set forth.

82,602.—DANIEL C. COLBY, Washington, D. C.—*Chair*.—September 29, 1868.—The rest prevents the cane from being prematurely broken across the edges of the frame pieces.

Claim.—The application to cane-seat chairs of an elastic or slightly-yielding rest for the cane strands, of any suitable material, and for the purposes specified and set forth.

82,603.—ABEL CONANT, Lowell, Mass.—*Sash Fastener*.—September 29, 1868.—Both bolts lie in the same ease, transversely to the edge of the sashes, and they are respectively long enough for their lateral projections to engage the racks on the sashes. Vertical edges separate the sashes sufficiently to allow the lug of the longer bolt to be retracted without interfering with the movements of the lower sash.

Claim.—In a sash lock, such as described, the construction and arrangement of the long and short-sliding bolts E F, with their inclined lugs or projections *g*, and actuating knobs and springs, the said bolts being applied to the window jamb at the point where the sashes meet, in the manner specified, so that the projecting lugs of such bolts shall move in planes at right angles to the plane of movement of the sashes, and operate in connection with the upper and lower sash racks, as herein set forth.

82,604.—VINCENT CORDIER, Paris, France, assignor to JOHN GATLIFF and CLEMENT DIETRICH.—*Paint Oil*.—September 29, 1868.—This invention proposes to render mineral oil siccativ, not by direct treatment of the oil itself, but by admixture therewith of a vegetable oil which has been rendered siccativ in excess.

Claim.—The paint oil herein described, composed in part of mineral oil, and in part of vegetable oil, and having the proper quantity of drying material incorporated by mixing the litharge or other drier in excess with the linseed or equivalent vegetable oil, and afterward adding the petroleum or equivalent tar oil, as herein specified.

82,605.—JACOB COURTLEYOW, Chariton, Iowa.—*Machine for Setting and Cooling Tire*.—September 29, 1868.—The bench may be raised to a perpendicular position so that the wheel supported on the axis

may be placed in the water trough for cooling. By the slide the axis can be raised or lowered to suit the size of the wheel.

Claim.—The bench *a a a a* attached to the trough F. together with the slide and axis, constructed, arranged, and operated as above described, for the purpose of setting and cooling tire, for the purpose and in the manner set forth.

82,606.—GEORGE CROUCH, New York, N. Y.—*Shawl Strap.*—September 29, 1868.—The cross piece is stiffened by a corrugated metallic plate so as to prevent it from bending or doubling up.

Claim.—In combination with a rigid cross piece, A, constructed substantially as described, the handle B, and straps D, for the purposes indicated.

82,607.—FREDERICK C. CURIE, Lancaster, Pa.—*Manufacture of Axes, Hammers, &c.*—September 29, 1868.—The cast iron is converted into steel by the use of a mixture of charcoal, soda, and rock salt, which is placed in an iron box with the articles to be converted and subjected to the heat of a furnace.

Claim.—1. Converting hammers, axes, hatchets, and similar edge tools, either cast, or made from wrought or cast malleable iron, into steel, by the process substantially as herein described.

2. The new articles of manufacture, namely, hammers, axes, hatchets, and similar edge tools, made by the process substantially as herein described.

82,608.—GEORGE EDMUND DONISTHORPE, Leeds, England.—*Coal-cutting Machine.*—September 29, 1868; patented in England, January 21, 1864. The engine is mounted on a truck with the alternately acting picks. Two rollers employed in place of flanged wheels will run on rails whether or not they are laid to a fixed gauge. One rail is laid with care and guides the truck, a clip, applied at each end of the truck, fitting over and sliding along the same. A worm engages teeth on the guide rail to propel the truck or hold it stationary.

Claim.—1. The so arranging the cutting apparatus of machines employed in getting coal and other mineral that two picks or cutters, or two sets of picks or cutters, may be caused by the engine which actuates them to act alternately, so that one pick or set of picks may make its forward stroke while the other pick or set of picks makes its backward stroke, substantially as herein described.

2. The combination, substantially as set forth, with the guiding rail herein described, of a traveling carriage provided with clips or guards at each end to hold it to the rail, and a driving worm acting on the rail to propel the carriage, whereby one only of the rails need be laid with care.

3. The combination, substantially as set forth, with the traveling carriage, of a guide rail, a propelling worm on the carriage acting on the rail, on clips the carriage embracing the guide rail, cutting tools mounted on the carriage, and a pressure ram for holding the carriage to its track when working, by pressing against the roof of the mine.

4. The combination, substantially as set forth, with a carriage traveling on ways, and a locking mechanism for locking the carriage firmly while the cutters are working, of reciprocating cutters, arranged on opposite ends of an oscillating arm or lever vibrating transversely to the line of motion of the carriage, whereby a blow is made at each movement of the piston of the motor, and one cutter may deepen the groove made by the preceding one.

5. The combination, substantially as set forth, with the cutting tools, of the clearers *i*, for removing the coal loosened by the cutters.

82,609.—J. J. DOUGHTY, Lake City, Minn.—*Heater and Filter for Boiler.*—September 29, 1868.—The water flows over the two series of shelves in sheets and is heated by steam, which causes a deposition of lime and other objectionable contents of the water upon the shelves. The water passes finally through a filter, completing its purification.

Claim.—The arrangement of the horizontal shelves, with their partition pieces, the steam and water admission and discharge pipes, the lime-depositing shelves *g*, the filter *l*, and the doors formed in the heater and filter case A B, through which access

may be had to said shelves and filter, substantially as herein shown and described.

82,610.—THADDEUS FAIRBANKS, St. Johnsbury, Vt., and HENRY FAIRBANKS, Hanover, N. H.—*Charging Scale.*—September 29, 1868.—An improvement on the scale for which a patent was granted to A. B. Davis, July 30, 1867. Designed to distribute a large portion of the weight on each side of the center of motion of the beam and avoid the necessity for the large counterbalance required in the above-mentioned machine, in which the weight of the bars is all on one side of the said center of motion, necessitating a balance poise on the opposite side capable of balancing the whole of the bars so as to render ineffective those which are out of use, and inducing the making of bars so small as to involve too great delicacy of the structure.

Claim.—1. The within-described arrangement of the adjustable bars A B, &c., so that a portion of the weight of each bar shall be distributed on each side of the center of motion of the frame M, substantially as and for the purposes herein set forth.

2. The stops *a b*, and balance poise E, arranged relatively to each other and to the bars A B, &c., and frame M, substantially as and for the purpose herein specified.

3. The friction pieces J J, arranged as represented, and adapted to induce a constant friction against the bars A B, &c., substantially as and for the purposes herein specified.

4. The adjustable bars A B, &c., beam of frame M *m*, stops *a b*, &c., and pinching screws O P, &c., when provided with the bearing pieces *o*, held loosely between the shoulders 1 and 2, and adapted to receive the force of the screw in confining the stops firmly, as herein specified.

82,611.—CHARLES M. FLINT, Hancock, N. H.—*Wagon Brake.*—September 29, 1868.—By vibrating a lever a toggle arm is moved away from an inclined plane at the rear of the brake bar, and then the brake may be forced against the wheels by the back pressure of the draught animals or the gravitating power of the carriage body.

Claim.—The arrangement of the brake arm *c*, and the slotted plate *g* with the king bolt, the front axle and the front bar of the perch, the whole being substantially as specified.

82,612.—ORLANDO V. FLORA, Madison, Ind.—*Visc.*—September 29, 1868.—The parallel bars are attached to a vertical mortised post, which latter slides on a plain smooth locking bar.

Claim.—The combination of the post G and bars B C with the locking bar J, constructed and operating in connection with the movable jaw D, substantially as and for the purposes herein specified.

82,613.—JAMES T. FORSYTH, Wheeling, W. Va.—*Machine for Dressing Barrel Hoops.*—September 29, 1868.—The circular revolving bed piece, working inside of the stationary concentric arc, is constructed in such a manner as to automatically catch the end of the piece of stuff to be dressed, draw it under the dressing knives, and discharge it after being operated upon.

Claim.—1. The circular revolving bed B, the catch D, and the spring F, or their equivalents, substantially as described.

2. The concentric arc A, in combination with the knives H H and K K, substantially as described, and for the purpose set forth.

82,614.—WILLIAM FRICK, Middletown, Pa.—*Steering Apparatus for Sectional Boat.*—September 29, 1868.—The boats are fastened together in such a manner that one boat acts as a rudder for the other, thus enabling the boats to be turned in curves too short for another boat having the tonnage of the two combined.

Claim.—1. The hinged coupling bar B B¹, when fastened permanently to one boat, and attached to the other by standards C C, in such manner as to permit a free, vertical, longitudinal, and lateral oscillation, but to confine, at the same time, the boats to their relative alignment fore and aft, substantially as set forth.

2. The combination of said hinged coupling bar, standards, and cross heads C C, connected by springs B⁴, arranged to operate substantially as and for the purpose set forth.

3. The combination of the wheel, the tiller rope, and the hinged bar connecting the two boats, when arranged to operate substantially as set forth.

82,615.—JOHN FRISCH, Albany, N. Y.—*Kitchen Implement.*—September 29, 1868.—The usual position of the handle is reversed when the stove plate lifter is called into requisition.

Claim.—The shovel A, furnished with a stove lifter at its rear end and having its handle, C, pivoted, as and for the purpose set forth.

82,616.—PETER GEISER, Waynesboro, Pa.—*Writing Table and Chair.*—September 29, 1868.—The extra leg enlarges the base so that the chair cannot be upset by the weight of the table. The latter consists of a hinged lid closing a pan-like receptacle for books, papers, &c., with subdivisions for small articles. A frame for holding books, or papers to be copied, slides within the table when not in use.

Claim.—1. The combination of the chair A, socket C, leg B, arms D, and table F F, substantially as shown and described.

2. The construction of the table, as composed of the parts E F, substantially as shown and described.

3. The paper and book holder, as constructed, consisting of parts, G, H, H, I, e, and e', and their equivalents, substantially as shown and described.

4. The combination of the paper and book holder with the cover of the table, substantially in the manner shown and described.

5. The arrangement of the locking device K, catch a, and stops h, substantially as and for the purpose described.

82,617.—PETER GEISER, Waynesboro, Pa.—*Horse Power.*—September 29, 1868.—This device is to be attached to the tumbling shafts of a horse power for the purpose of making a belt connection between the power and the machine to be driven, and of multiplying the motion.

Claim.—1. The combination and arrangement of the frame A and journal box E, substantially as and for the purpose described.

2. The combination and arrangement of the vertical shaft F and the journal box E, substantially as and for the purpose described.

3. In combination with the above, the combination of the ratchet coupling and the shaft G, substantially as and for the purpose described.

4. The construction of the frame A, and the arrangement, with reference thereto, of the journal box E, shaft F, gear wheels B and C, and pins or guards b b,

5. The arrangement of the oil passages e, a, f, and h, substantially as and for the purpose set forth.

82,618.—SAMUEL GLASSON, New York, N. Y.—*Reamer and Tap.*—September 29, 1868.—The longitudinal movement of the grooved plug, produced by the turning of the screw, sets the cutters outward or inward, to adapt the instrument to openings of different sizes.

Claim.—The arrangement herein described and shown of the tubular stock A, grooved plug C, cutters B, springs s, and swiveled screw E e, for the purpose set forth.

82,619.—H. J. HARRIS, Shreveport, La.—*Pyrotechnic Signal.*—September 29, 1868.

Claim.—The trail match or fuse, constructed substantially as described, that is to say, consisting of the slow match or fuse, provided with a series of signal or cannonading balls, pyrotechnic meteors and streamers, or other equivalent devices connected with the slow match by short branch quick matches or fuses, and adapted to be used in connection with the balloon or other equivalent means for elevating and sustaining the same in the air while firing the same, substantially as described.

82,620.—JACOB HIMMER, Hartford, Conn.—*Tool for Gas Fitter.*—September 29, 1868.—A cutter for cutting off the ends of pipes, a scraper for clear-

ing its surface before forming the screw, dies for cutting the thread, and a cramp for holding the pipe to turn it, are arranged in a frame or stock fitted for the purpose.

Claim.—An improved combination tool, constructed and arranged substantially as described.

82,621.—GEORGE W. HUBBARD, Lowville, N. Y.—*Hammer.*—September 29, 1868.—The hammer holds the nail in giving it the initial thrust.

Claim.—The application, to nail hammers, of a nail-clamp attachment, using for that purpose the chamber C, the clamp E, the spring G, the lugs I, and screw F, constructed to operate substantially as herein described.

82,622.—JOHN C. KENNEDY, Chicago, Ill.—*Soda Fountain.*—September 29, 1868.—Air escapes from the fount through the open air pit while water is being pumped into the same from the reservoir. Air is subsequently pumped into the fount under pressure. In order to utilize the gas which remains in fountains after the water has been drawn off, a supplemental fountain is employed, water from which is supplied to the draw-off fount by the pump, and which, after being depleted of water, is placed in communication with the draw-off fount in order that the gas may flow or be pumped into the latter fount to be absorbed by the water therein.

Claim.—1. The pump B, the three-way cock D, pipes C and V, reservoir A, and air pit F, all arranged and operated substantially as described.

2. Fountain A, provided with an air pit and gauge tube, as described, pump B, globe check-valve E, three-way cock D, and fountain H, the whole being arranged, constructed, and operated in the manner and for the purpose specified.

82,623.—BAXTER LYON, Mount Pleasant, Ill., assignor to himself and DANA L. COHEMBIA.—*Revolving Harrow.*—September 29, 1868.—The leading pair of toothed wheels has an inclination outward and downward from the center of the bolsters, while the rear pair have an inclination inward and downward. The reach is jointed to the forward bolster, so that the harrow may be readily turned or worked in a circle.

Claim.—A revolving harrow, the front and rear portions of which, being constructed substantially as described, are connected to each other by a jointed or flexible connection, as and for the purpose described.

82,624.—LEVI MATTHEWS, Antrim, Ohio.—*Clothes Pin.*—September 29, 1868.—When the line is drawn taut it acts upon the ring, and thereby draws downward the clothes pin, so as to make it take a firm hold of the suspended article.

Claim.—The double self-adjusting clothes pin H, constructed as described, and provided with a ring, I, substantially as and for the purposes herein set forth.

82,625.—PATRICK MCGEE, North Providence, R. I.—*Let-off Mechanism for Loom.*—September 29, 1868.—The speed of the yarn beam is increased in the ratio of the decrease of the yarn on the beam.

Claim.—The combination, with the pad E and yarn beam B, of the toe a', spring bar c', lever d', abutment R, and pusher bar l, receiving motion from the sword or any other portion of the loom, and acting through the abutment R on the let-off motion in such manner that the letting off of the warp will be regulated according to the variable diameter of the beam, substantially as herein specified.

82,626.—J. C. MCKENZIE, Adrian, Mich.—*Pug Mill.*—September 29, 1868.—The clay which fills the supplemental chamber partially forms the bottom of the main tempering chamber, absorbs the water used in soaking, and is a settling place for the stones and other deposits. Stationary rods in the pug mill assist the operation of the grinding blades.

Claim.—1. The chamber or reservoir F, arranged and employed, in connection with the chamber E, substantially as described, for the purpose specified.

2. The pug mill, constructed as described, with

the chambers E F, doors I, and aperture *e*, the horizontal angular rods O, pug shaft K, and blades M¹ M², all arranged to operate substantially in the manner set forth.

82,627.—GEORGE N. MUNGER, New Haven, Conn., assignor to himself and STILLMAN MOORE, same place.—*Engravers' Vise*.—September 29, 1868.—By revolving the upper plate the jaws are caused to travel toward or away from each other. They are so formed and applied that they may turn to an angle with each other.

Claim.—The engravers' vise herein described, consisting of the two jaws D and E, arranged upon the threaded plate B, and in the plate C, so as to be adjusted to grasp the article of regular or irregular form, substantially as herein set forth.

82,628.—BENJAMIN F. NAVE, Fort Wayne, Ind.—*Bee Hive*.—September 29, 1868.—The hive is made up of a number of frames placed side by side, and bound together by an iron rod and nut. Strips, serving as comb guides, are secured to the inside of the frames.

Claim.—The frame A, constructed as described, and secured together by means of the rod *x* and nut *x'*, as shown and described for the purpose set forth.

82,629.—ORWELL H. NERDHAM, New York, N. Y.—*Atmospheric Knob*.—September 29, 1868.—The knob is made to adhere to the drawer, or other object to be taken hold of, by atmospheric pressure; the knob, as well as the sucker portion, being compressed to form a vacuum.

Claim.—An atmospheric handle, composed of a flexible face or sucker portion A, and flexible or elastic knob or knob part B, having a cavity, *b*, within it, in communication, by a passage, *c*, with the interior face of the sucker portion or space contained therein, substantially as specified.

82,630.—FREEMAN NICHOLS, Newport, Ky.—*Hub for Wagon Wheel*.—September 29, 1868.—The flare of the mortises permits the spokes to become more deeply seated within the metallic band as the tire shrinks, without crippling the spokes, while the shoulders upon the spoke prevent them from slipping too far into the hub.

Claim.—The arrangement described, consisting of the wooden core, with mortises, B, and affording seats on its periphery for the shoulders G of the spokes, together with band D, having mortises, *e e'*, the latter or outer portions being more flaring than the inner, and adapted to form sockets for the taper portions of the spokes, substantially as described and represented.

82,631.—HEZEKIAH B. NOBLE, South Windsor, Conn.—*Horse Rake*.—September 29, 1868.—These devices adjust and hold the rake properly while it is revolving, and retain it firmly in the desired positions for use or for rest.

Claim.—The crank *m*, plate *n*, head *h*, teeth *v*, (which constitute the rake head,) in combination with the bars *f f*, rack *u*, pawl *e*, (for elevating or depressing the rake head,) arms *k*, lever *p*, and holder *q*, all arranged and operating substantially as and for the purpose described.

82,632.—EUGENE THÉODORE NOUALHIER, Paris, France.—*Chimney Cowl*.—September 29, 1868.—The apparatus has a vane which turns the upper portion, so that a free exit is provided on the leeward side. The device aids in the exhaustion of the smoke or foul air from below. Vertical division plates in the space between the tapering, concentric casings prevent the wind from blowing across, and compel it to be deflected directly upward.

Claim.—The tapering concentric pipes or cases B and C, arranged as represented, relatively to the flue A, and adapted to receive the wind and deflect it upward, as represented, the space between B and C being divided in compartments, and the entire apparatus combined with a revolving hood, substantially as and for the purposes herein set forth.

82,633.—JOHN S. OLIVER, New York, N. Y., assignor to JOHN W. COX and ALEXANDER D.

SHAW, same place.—*Refining Liquor*.—September 29, 1868.—The liquor is first fed to the action of the upper drum, whence it passes to the coil chamber to be heated; it descends thence to the lower drum and into the drawing-off chamber. The action of the drums converts the liquor into spray, and the gases thus liberated are drawn off by a pump.

Claim.—1. The process of separating from spirituous, hydrocarbon, and other liquids, the free or non-condensed gases contained therein, by beating up or separating the liquid into fine particles or spray while *in vacuo*, by the action thereon of mechanism suitable for the purpose, substantially as herein specified.

2. The drums C D, arranged within a vacuum chamber, A, and operating in substantially the manner and for the purposes herein specified.

3. The combination, with the drums C D, of the worm F, arranged within the box A, substantially as and for the purposes herein specified.

4. The combination, with the chamber A, containing the drums C D and worm H, of an air pump arranged to operate substantially as and for the purpose herein specified.

5. The arrangement of the perforated plates *a*, *b*, *e*, *d*, in the box A, substantially as herein shown and described.

82,634.—J. N. OUTTEN, Caseyville, Ky.—*Bee Hive*.—September 29, 1868.—The honey boxes are placed on a series of steps in the hive, the bees passing up the incline beneath. The arrangement insures the dislodgment and fall of the moth.

Claim.—The steps F F, when arranged and used in combination with the chambers E E and honey boxes I I, inside of a bee hive, substantially as and for the purposes herein set forth.

82,635.—HENRY A. PEASE, Hartford, Conn., assignor to himself and JEREMY W. BLISS, same place.—*Manufacture of Soap*.—September 29, 1868.—The distinctive ingredients are cotton-seed stock, stearine or elain, caustic, and starch.

Claim.—A soap compound, of the ingredients, in greater or lesser proportion, as required, substantially as described.

82,636.—HOWARD PERKINS, Mansfield, assignor to himself and BENJAMIN S. LEONARD, Sharon, Mass.—*Portable Adjustable Elastic Seat*.—September 29, 1868.—The seat is intended to be folded within such a small compass that it may be carried in a coat pocket. It is a ventilating seat, being sustained above the surface by the elastic feet, and is designed to be used on cultivators, seed planters, &c.

Claim.—The construction of the elastic supplementary seat, with its hinges C, shields D, and elastic feet E, combined as herein described, and for the purposes set forth.

82,637.—ALBERT J. REDWAY, Cincinnati, Ohio.—*Coal Stove*.—September 29, 1868.—A smoke-consuming device for heating stoves. The reverberating crown plate is adjustable relative to the cowl, to vary the size of the smoke-throat to suit particular draughts.

Claim.—The central crown plate D, having perforated bars *d d*, by which it is adjusted relatively to the annular cowl C, substantially as shown and described.

82,638.—ALBERT J. REDWAY, Cincinnati, Ohio.—*Cooking Stove*.—September 29, 1868.—The oven may be surrounded on all sides by a sheet of flame of the full width of the stove, for baking or other purposes, the smoke having the most direct issue practicable, so as to prevent the rapid accumulation of soot. The oven is readily removable, to render the flues accessible.

Claim.—1. The removable oven, supported and sliding on transverse angle pieces, and over a flange, on one stove plate, and with a marginal flange fitting into a rebate on the other stove plate, so as to make a joint with the plates at the respective ends of the said oven, substantially as described.

2. The four-sided oven H, and flue plate D, so constructed and arranged as to form a non-reverting and continuous flue around the oven, and to be re-

movable to expose the flue plates for cleansing, substantially as described.

82,639.—LEWIS H. REYNOLDS, Goshen, N. Y.—*Self-adjusting Telegraphic Relay.*—September 29, 1868.

Claim.—The double electro-magnet, or two electro-magnets, placed in a helix or helices, with their like poles near each other, and attachment to armature or armature-bar of common relay, so that their repulsion will counteract, or nearly counteract, the attraction of armature of common relay to its own magnet.

82,640.—HENRY RICHARDS and JUSTUS A. TRAMT, New Britain, Conn.—*Endless Belt.*—September 29, 1868.—An endless piece of woven fabric constitutes a polishing belt, the object being to avoid the usual lap joint, which is detrimental in operation, and liable to come apart when soaking for recoating.

Claim.—As a new article of manufacture, an endless belt, constructed substantially as described.

82,641.—JOHN L. RIPLEY, Fremont, Ohio.—*Hay Knife.*—September 29, 1868.

Claim.—As a new article of manufacture, a hand hay-knife, composed of the pointed blade A with serrations *x x* on its edge, and connected to the handle B C, all as herein shown and described.

82,642.—JACQUES RIVES, Paris, France.—*Method of Casting Metals.*—September 29, 1868.—Within a metal vessel placed in a tank containing water, and provided with a detachable cap or top, is placed a mold fitted within a perforated casing, between which latter and the metal vessel is placed charcoal.

Claim.—The mold L, arranged within a vessel, A, having a detachable top, B, and between which and the mold is a body of charcoal, substantially as and for the purpose described.

82,643.—LEVERETT A. SANFORD, Wolcott, assignor to himself and ALBERT WARNER, Bristol, Conn.—*Clasp Ring.*—September 29, 1868.

Claim.—A clasp ring, made in one piece of metal, and secured by one screw, as an improved article of manufacture, substantially as described.

82,644.—LEVERETT A. SANFORD, Wolcott, assignor to himself and ALBERT WARNER, Bristol, Conn.—*Snap Hook.*—September 29, 1868.—By pressing the pad into the socket, the angle corner at the end of the lock surface will drop into the recess and allow the end of the latch to be pressed back, and on removing the pressure it will re-lock itself.

Claim.—The combination of the hook *a*, socket *c*, springs *d*, pad *k*, constructed and arranged substantially as and for the purpose described.

82,645.—JAMES S. SCHOONOVER, Corry, Pa.—*Railway Rail Joint.*—September 29, 1868.

Claim.—The jaws B B', provided with the pins or ribs on their inner surface, engaging with the corresponding notches on the bases or flanges of the rails, as shown in Fig. 4, and with the recess *d* for preventing the end-play of the clamp C, in combination with the split wedge E and the clamp C, all constructed and arranged substantially as set forth.

82,646.—GEORGE SEIBERT and JOHN SEIBERT, Ashley, Ill.—*Cultivator.*—September 29, 1868.—A combination of devices for raising and lowering the frame to accommodate it to irregularities of ground, regulating the distance between the plows and moving them one side and the other.

Claim.—1. The combination of the frame, the wheels, and two independent axles, F F', with the levers G, ratchet plates G', and pawls H, substantially as and for the purpose set forth.

2. The combination of the driver's seat K, braces I, and interior beams C'' C'', so arranged that the latter may be moved laterally by the action of the driver, substantially in the manner set forth.*

3. The combination of the parts last aforesaid with the lever L, crank M, and connecting rods N, substantially as set forth.

4. The combination of the frame B, the oscillating

beams C'' C'', and friction rollers O, arranged to operate substantially as described.

5. The combination of the connecting rods N N', the oscillating beams C'' C'', and the eye-bolts N', for regulating the relative position of the plows, substantially as described.

6. The arrangement of the tongue A, brace rod A¹, and stud screw A², substantially as and for the purpose set forth.

82,647.—FREDERICK M. SHEPARD, New York, N. Y.—*Rubber Mat.*—September 29, 1868.

Claim.—The combination of a cellular rubber web, substantially as described, with a detachable plate or receptacle, whether the same be flanged or not.

82,648.—JOHN A. SMITH, Lacon, Ill.—*Gate.*—September 29, 1868.—The gate is made to swing on its pivot until it reaches a point at right angles with the frame where it is held by a spring, by simply turning either of the knobs in either direction.

Claim.—A gate, having side posts B, cross bar C, staples O and *c c*, spring S, post E, and pivot D, constructed, arranged, and operating substantially as herein specified.

82,649.—THOMAS SMITH, California, Mo.—*Sawing and Boring Machine.*—September 29, 1868.—A combination of devices by which the various operations of sawing, planing, turning, and boring the material of which wheels and other parts of a carriage are constructed, can be performed by a single machine.

Claim.—1. The pivoted carriage table U, provided with two curved slots *s s*, and operating in combination with two concavo-convex saws, substantially as and for the purpose described.

2. In combination with the above, the inclined and adjustable table T, pivoted at *e*, and operating substantially in the manner and for the purposes specified.

3. The adjustable, attachable, and detachable support A', for the driving shaft and wheel, when provided with the swinging leg A'', and so pivoted to the frame A of the machine that its outer end can be elevated or depressed at pleasure, substantially as and for the purpose specified.

82,650.—DANIEL M. SOMERS, New York, N. Y.—*Tumbler Washer.*—September 29, 1868.—The side pressure of the tumbler on the frame and weight of the latter opens a valve to admit jets of water to the inside of the tumbler. A turbine within the supply stem gives a rotary motion to the outside washer. A vase at the top of the central stem forms a valve for the control of water to the outside sprinkler.

Claim.—1. A tumbler holder, consisting of a tubular stem, F, with fixed pendent arms G, and a jointed arm G', connected with and operating the valve H, in an automatic manner, substantially as described.

2. The arrangement of a turbine within the supply stem, and relatively to the discharge orifices of the outside washer, to give a rotary motion to the latter, substantially as shown and described for the purpose set forth.

3. The combination of the vase *d*, forming a valve, *i*, with a rotary tumbler sprinkler, substantially as set forth.

82,651.—DANIEL E. SOMES, Washington, D. C.—*Apparatus for Cooling and Filtering Liquids.*—September 29, 1868.—The supply pipe, by which the liquids are brought to the tap from which they are drawn, is connected to a cooler placed in the earth beneath and in close proximity to the tap, to the mouth of which latter is connected a filter.

Claim.—1. The supply pipe B, two-way cock *d*, and delivery pipes F B', with the cooler D, placed in the ground beneath a hydrant or tap, as set forth.

2. The combination of the supply pipe B, cooler D, delivery pipe B', and filter H, substantially as described.

3. The supply pipe B, two-way cock *d*, cooler D, and ice box G, substantially as described.

4. A cooler, tapering toward and pointed at its lower end, as arranged in relation to supply and dis-

charge pipes, substantially as herein shown and described.

82,652.—EDWARD SPAIN, Philadelphia, Pa.—*Churn.*—September 29, 1868.

Claim.—1. A dasher, having inclined perforated vanes, arranged at an angle with respect to each other and to the axis of the dasher, as set forth, for the purpose specified.

2. So perforating the vanes of the dasher that the jets of cream which pass through the said perforations shall be caused to cross each other, as described, for the purpose specified.

82,653.—JOHN SPEAR, Carbondale, Ill.—*Rain-water Cut-off.*—September 29, 1868.—The direction of the flow is changed by turning the elbow, which carries a wing to indicate the course of the water.

Claim.—A conduit for water, having pipes A and B, box C, elbow D, partition E, and indicator G, constructed, arranged, and operating substantially as specified.

82,654.—JOHN SPEAR, Carbondale, Ill.—*Fruit Drier.*—September 29, 1868.—An oven, made in two sections, is provided with a hollow rotating shaft which serves to conduct the heat and smoke. Perforated shelves in the upper section are secured to the hollow shaft, and in the lower section to a drum fastened to the shaft and having spiral flanges on the inside which cause the shaft to revolve by the draught.

Claim.—A fruit drier, having sections A and D, shaft C, drum G, flanches K, shelves H and *d*, dampers *e* and L, doors S and M, and hook and pin Y, constructed and arranged substantially as herein specified.

82,655.—GREENLEAF STACKPOLE, New York, N. Y.—*Auxiliary Power for Sewing Machine.*—September 29, 1868.—A spring within a drum is connected with a ratchet, stop gear, pinion geared into a winding wheel and several gear wheels, and these furnish the machinery for a power constituted of a balance wheel, clutch pinion, and lever connected by the pinion with one of the wheels in the case.

Claim.—The application to the sewing machine of an auxiliary power, when used in conjunction with and controlled by the treadle worked in the ordinary manner, to assist the operator, substantially as and for the purpose set forth.

82,656.—O. F. STEDMAN, Westfield, N. Y.—*Wash Boiler.*—September 29, 1868; antedated June 2, 1868.—A concave plate is placed under the movable perforated bottom, for the purpose of conducting the steam generated at the bottom of the boiler to the tubes.

Claim.—The concave plate D, in combination with the tube or tubes E, and perforated bottom C, constructed and operating substantially as and for the purposes herein set forth.

82,657.—HENRY D. STRUSE, Brooklyn, N. Y.—*Clothes Drier.*—September 29, 1868.—Frames, provided with a series of connecting clothes lines, slide vertically in standards, and are provided with ropes and pulleys for raising and lowering.

Claim.—The combination of the stretchers C, having guides *e* at each end, and carrying the clothes line *a*, with the corner posts A, pulleys *p q r*, and cords *g*, all arranged for operation, substantially as shown and described, for the purpose set forth.

82,658.—PHILIP J. STUHLTRÄGER, Philadelphia, Pa.—*Compound Safe-door Hinge.*—September 29, 1868.—A double hinge is used, the door being pulled out until it is released from the recesses in the safe, and is then swung open.

Claim.—A compound hinge, constructed and applied substantially as and for the purpose herein described.

82,659.—CLAUDE LUDOVIC TAVERDON, Paris, and JULES MORET, Sèvres, France.—*Pump.*—September 29, 1868.—When one of the heads creates a vacuum behind it, the other forces the liquid forward, and *vice versa*.

Claim.—The within-described construction and arrangement of the piston, composed of two valved heads, connected together by a tubular rod or sheath adapted for the passage of the liquid, as specified, working in a chamber divided into two compartments, S S', by a disk or partition, U, all as and for the purposes herein set forth.

82,660.—JEREMIAH C. TILTON, Sanbornton Bridge, N. H.—*Composition for Dressing Hair.*—September 29, 1868.—Composed of precipitate of sulphur, super-acetate of lead, glycerine, borax, spermaceti, and barbary fallow.

Claim.—The composition of matter made of the within-named ingredients, in or about the proportion set forth.

82,661.—WILLIAM W. TRAPP, Hartford, Conn., assignor to TOBIAS KOHN, same place.—*Polishing Thread.*—September 29, 1868.

Claim.—1. The combination of two rubber carriages, acting in opposite directions on any one or more threads, substantially as described, with one or more fliers and reels, as and for the purpose described.

2. The devices *a' c' z*, or their equivalents, for stopping and starting the pair of rubber carriages, working in opposite directions upon one thread, so that they are stopped and started at the end of the throw of the crank, substantially as described.

3. The machine, constructed and arranged substantially as described, having sets or series of rubber carriages on opposite sides of the driving shaft, which move up and down together, those on the same side having a motion in opposite directions, thereby balancing the reciprocating motions of the several parts, and causing the least possible jar in the machine.

4. The two rubber carriages, acting together upon one or more threads, and having a reciprocating motion in opposite directions, to divide and balance the strain upon the thread, substantially as described.

82,662.—JOHN W. TULL and GEORGE STEVENSON, Zionsville, Ind.—*Boot and Shoe Heel.*—September 29, 1868.—A plate of leather or metal is cut out in the center the shape of the heel, but smaller, and the part remaining is perforated. A rubber plate the shape of the heel is heated, and the perforated plate pressed over it, causing the rubber to enter the perforations.

Claim.—The employment of an India-rubber heel for boots or shoes, when used in combination with a leather or metal plate, the said heel and plate being secured together substantially in the manner herein described.

82,663.—GEORGE WALTERS and THOMAS SHAFER, Phoenixville, Pa.—*Method of Constructing Columns, &c.*—September 29, 1868.—The pointed tip is applied when the column is used as a shaft for a pile to be driven into the ground.

Claim.—1. In the construction of metallic columns and shafts, confining wrought iron or steel plates between external cramping bars or washers *b b* and internal metallic disks *d d*, by rivets, upon or around which said disks have been cast, or which are attached thereto, and headed down upon the plate while hot, so that the same in shrinking shall closely draw the plates to the disk, in the manner substantially as described.

2. In combination with the shaft, constructed in the manner set forth, the pointed tip *f*, for the purpose set forth.

82,664.—GEORGE WALTERS and THOMAS SHAFER, Phoenixville, Pa.—*Method of Constructing Columns, &c.*—September 29, 1868.

Claim.—The manner of constructing columns or shafts of wrought iron or steel plates, curved or bent on the line of their width, and attached by bolts or rivets to internal rings or disks, so shaped, in relation to said plates, that a space shall be left between them, in order that the plates may be drawn down, and their edges brought into close contact by the compression of said rivets or bolts, substantially as set forth.

82,665.—GEORGE L. WEAVER, Hartford, Conn.—*Journal Box*.—September 29, 1868.—A casing is provided with annular grooves in which balls of different diameters are placed alternately, so that the large balls will all turn in one direction, and the small balls will keep the large ones in position.

Claim.—The combination of the journal box, having annular grooves in the heads C and D, and corresponding grooves on both ends of the shaft bearings B, with balls of two different sizes, placed alternately in the annular grooves, the whole arranged and operating as and for the purpose set forth.

82,666.—S. C. WELLS, Le Roy, N. Y.—*Pantaloon Stretching Device*.—September 29, 1868.—Two clamp bars holding the pantaloons legs are provided with springs to keep said clamps apart, and weights fastened to the springs to produce the necessary tension.

Claim.—The combination of bars A A, weights *b b*, springs *a a*, and clamping device *c*, substantially as and for the purpose described.

82,667.—JOHN B. WICKERSHAM, Philadelphia, Pa.—*Lubricator*.—September 29, 1868.—The tube is formed of white metal to obviate the discoloration of the oil or the gummy consistency, incident to the use of brass and copper, which retards the action of the siphon. A chamber is placed just above the cock to receive the oil from the siphon when said cock is closed.

Claim.—1. The sleeve *f*, formed with a swell upon one side for the introduction of a feeder, in combination with the tube *e* and reservoir *a*, for the purposes and as specified.

2. A lubricator, formed with the tube *e*, of white metal, for the purposes and as specified.

3. The combination of the glass reservoir *a* and screw neck at its lower end, with the cup *c* and washer *d*, rendered permanently tight by cement, as set forth.

4. A capillary feeder formed by metal wires or rods, or a tubular strip of metal inclosed in a fibrous covering, so as to form a siphon, as and for the purposes set forth.

5. The cock *h* and chamber *k*, in combination with a capillary feeder and oil cup, substantially as set forth.

82,668.—THOMAS B. WICKHAM, Granville, Ohio.—*Farm Gate*.—September 29, 1868.—Latches or buttons are dispensed with on the gate, which is so supported as to prevent sagging in either direction.

Claim.—A farm gate, having posts A, B, and C, brace *a*, clutch *c*, trundles *b* and *h*, gate E, arm *g*, and guide slat D, constructed, arranged, and operating substantially as specified.

82,669.—CHARLES WILSON, Clinton, Pa.—*Measuring Heights and Distances*.—September 29, 1868.—Movable telescopes are attached to circular plates, one telescope being attached to the compass, and the other combined with the target; both being operated with a circular movement, and adjusted to either side by adjustable plates and screws underneath the circular plates that are marked by cross lines.

Claim.—1. The circular cross-lined plates A and P, with their curved upright bars G and U, combined and operated as herein described, and for the purposes set forth.

2. The pivot bars V, with their adjustable round and square plates, with regulating screws C and X, constructed and operated as herein described, and for the purposes set forth.

3. The adjustable target N, combined and operated with the telescope Q, as herein described, and for the purposes set forth.

82,670.—CHARLES A. WILSON and WILLIAM R. DUNLAP, Cincinnati, Ohio.—*Pump*.—September 29, 1868.—The sections slope inward on their under side, and are thus adapted to limit the ascent of the valves in opening. The protuberances on the under side of the sections prevent the valves from adhering thereto.

Claim.—1. The combination of the annular valve seats *a b c d* and annular valves E, when arranged in

a vertical series, one above another, and constructed as herein described, so as to act simultaneously around the entire circumference.

2. In combination with the sections A B C D, with their described flexible flaps, the annular stops or flanges G G'.

3. The protuberances F, on the under side of the sections B C D, for the purpose explained.

82,671.—ERASTUS WOODWARD and JOSEPH S. MILLETT, Charlestown, Mass.—*Starting Apparatus for Railroad Car*.—September 29, 1868.—These devices operate a shoe clamp and lever, through a connection with the sliding draught bar, for the purpose of applying the tractive force to the peripheral surface of the wheel at the top thereof; power being thus made more effective in overcoming the inertia of the car in starting.

Claim.—The horizontal bar B, levers A and C, and anti-friction roller R, combined with the other described parts, all constructed, arranged, and operating in the manner and for the purpose set forth.

82,672.—JOHN E. WOOTTEN, Reading, Pa.—*Draught Valve in Railroad Car Stoves*.—September 29, 1868.—A casing incloses the fire chamber, and is surrounded by two casings forming two chambers, access being had by doors to the fire chamber and ash pit, and air is supplied to the inner chamber by a short pipe between the casings, having at its mouth a deflector hung to the outer casing, and operated by means of a rod, pipes connected therewith being arranged under the seats.

Claim.—A deflector, so combined with the air-heating space of a railroad-car stove or heater, and with the delivery pipes or orifices connected therewith, that when the car is in motion the said deflector can be made to control the temperature of the car, substantially in the manner described.

82,673.—J. K. ALWOOD, Delta, Ohio.—*Sheep Shearing Device*.—October 6, 1868.—A revolving disk, actuated by suitable mechanism, is provided with several double-edged blades which project from its periphery; these blades pass directly over a set of fingers arranged in a semicircle around the edge of the bottom of the shear case.

Claim.—1. The bladed wheel *a a a*, with its blades K K K K, substantially as described, for the purpose specified.

2. The semicircular protuberance P of the shear case S, in front of the dotted line *d*, with the fingers *v v*, substantially as described, for the purpose specified.

3. The combination or connection of the bladed wheel *a a a* with the cord wheel Y, so as to receive motion therefrom.

4. The combination of the several parts described, for the purpose of forming a cutting device for sheep-shearing.

82,674.—MARCUS M. ANMIDOWN, Boston, Mass.—*Mode of Transmitting Motion*.—October 6, 1868.—A V-shaped pawl is arranged within a shell, a portion of which is made eccentric to the shaft, to which a toothed wheel with which the pawl engages is secured, so that, as the shell is turned upon the shaft which holds the gear wheel, the eccentricity of the shell will cause the pawl to be engaged or disengaged from the toothed wheel.

Claim.—1. The combination of the hub *a* and the cylindrical shell *d*, provided with the eccentric *d'*, substantially as and for the purpose set forth.

2. The combination, with the eccentric *d'*, of the pawl *e* and toothed wheel *f*, substantially as and for the purpose specified.

82,675.—JOHN J. BARRETT, Chillicothe, Ohio.—*Axle Grease*.—October 6, 1868.—Composed of saponified resin, wheat flour middlings, crude petroleum, and petroleum tar.

Claim.—The axle grease, compounded substantially as above described.

82,676.—OSCAR J. BACKUS, San Francisco, Cal.—*Nozzle for Hose Pipe*.—October 6, 1868.—The sprinkler and eduction pipe are combined in the same nozzle, and are so arranged with a hollow cock

that, when the openings in the cock are open for one, those supplying the others are closed.

Claim.—The combination with a nozzle, throwing a single stream of water, the sprinkler D, constructed and operated with the holes E F G G, in the stop-cock, and holes C C, leading into the nozzle chamber, substantially as and for the purpose specified.

82,677.—ARAD BARROWS, Philadelphia, Pa.—*Sad-iron Handle.*—October 6, 1868.—Wires are inserted through the upright portions of the cast-iron handle to prevent the handle from being broken.

Claim.—The cast sad-iron handle A, including the wires or rods C C, constructed and arranged substantially as described, as a new article of manufacture.

82,678.—WILLIAM BARTON, Troy, N. Y.—*Slat Matting for Cars.*—October 6, 1868.—The protuberances are formed by winding the string about itself and tying it; substitutes are thus formed for the buttons or washers employed to separate the slats in the matting, for which letters-patent were granted to same party March 3, 1868.

Claim.—A flexible slat matting, consisting of the slats A and flexible lines B, the knots or protuberances for keeping the slats apart being formed by the said lines B, as set forth.

82,679.—W. H. BATTELLE, Youngstown, Ohio.—*Nail Cutting Machine.*—October 6, 1868.—The nail plate is fed automatically to the action of a vertically reciprocating cutter, which, receding from the cut blank, leaves it in the grasp of a gauge spring to be acted upon by a spring nipper whose function is to turn the blank, causing it to enter a recessed seat in the stationary jaw, and then sustain the same from below, while the clamping jaw is advancing for the purpose of holding the blank while being operated upon by the laterally-moving holders.

Claim.—1. The arrangement of sliding nipper bar A, provided with the spring nipper F, the spring C, cam E, adjusting pin e, and retractor C', substantially as and for the purpose set forth.

2. The arrangement, with the feeding guide N, of the slide U, rod T, weight V, pulleys X Y, rod P, and cord W, all substantially as and for the purpose set forth.

3. The arrangement, upon the carriers H, of the headers G, enlargements I, set screws M, and detachable brackets K, substantially as described, for the purpose specified.

82,680.—RUFUS E. BEAN, Franklin, N. H.—*Axle Head.*—October 6, 1868.—By this contrivance the head is firmly secured to the axle, it being impossible for it to come off unless the spring plate be withdrawn far enough to lose its hold upon the terminal projection of the axle.

Claim.—1. An axle, with a projecting cross bar, in combination with a head, the latter having an opening in its inner face, corresponding with the cross bar, and also a spring plate, provided with a depression or points, by which latter means the cross bar is prevented from turning when once secured in place.

2. The head C, plate c, constructed as shown, projection c¹, spring c¹, rod c², and button c³, in combination with collar B, with opening b, as and for the purpose described.

3. The head C, constructed as described, in combination with the projection a of axle A, substantially as and for the purpose explained.

82,681.—JOHN BEAUREGARD, Kingsbury, N. Y.—*Hasp Lock.*—October 6, 1868.—The bolt when shot into the staple is locked so that it cannot be withdrawn, even with the proper key, without first performing an independent operation, in which the bolt is thrust yet further forward in a direction opposite to that in which it must be moved to release the hasp.

Claim.—1. The locking circle, constructed with the internal cog V and the tooth W, in combination with bolt A and lever L, substantially as and for the purpose described.

2. The bolt A, fastened substantially as described,

and provided with the ears or stops O P, as and for the purposes substantially as described.

3. The pivoted engaging lever L, with tooth l, in combination with the locking circle D, pin M, and bolt A, substantially as and for the purpose described.

82,682.—HOWARD B. BOND, Houma, La.—*Apparatus for Defecating Cane Juice.*—October 6, 1868.—The liquid to be defecated is subjected to the action of sulphurous acid gas in the cistern. The holes of the strainer through which the liquid passes to the cistern are formed with a view to prevent clogging and choking. The fender prevents the escape of gas at the admission opening for the liquid; the stuffing boxes serve a like purpose, and the man-head permits the ready insertion and withdrawal of the agitator.

Claim.—1. The closed cistern A, provided with the removable man-head and stuffing boxes, constructed and operating substantially as and for the purpose set forth.

2. The combination, with the cistern A, of the agitator herein described, when the latter is constructed substantially as set forth, and is provided with vanes, or the equivalent thereof, arranged in such manner as to produce a pressure or packing of the gas inside the cistern, substantially as described.

3. The pipe G, made removable and adjustable, as described, in such manner that it can be used for discharging the juice on either side of the cistern A, as set forth.

4. Perforating the strainer or diaphragm N with holes, that expand as they pass to the under surface of the same, for the purpose set forth.

5. The sliding gate or fender V, when constructed and operating as described, and for the purpose set forth.

6. The combination of the juice receiver M, when provided with the perforated strainer N and sliding gate or fender V, with the cistern A and its component parts, substantially in the manner and for the purpose set forth.

82,683.—FRANCIS BOYLSTON, New York, N. Y.—*Childrens' Carriage.*—October 6, 1868.—The ends of the front axle are screwed into brackets, which are provided with extensions to which the ends of the sills are bolted.

Claim.—The brackets C C, having extensions b b, bolted to the ends of the sills B, and provided with an internal screw thread, into which the ends of the front axle are firmly serewed, as herein set forth for the purpose specified.

82,684.—LUCIUS BRIGGS, Grosvenor Dale, Conn., assignor to himself and GEORGE BUNTIN, same place.—*Temple for Loom.*—October 6, 1868.—Enables the rubbing surfaces of the roller and its center pin to be easily oiled.

Claim.—1. In a roller temple, the center pin, as extended beyond the trough head, as set forth, and provided with passages leading into the extension, and through the pin, substantially as and for the purpose specified.

2. In a roller temple, the center pin, as made with an oiling passage made through it lengthwise, and opening out of the side of the pin.

82,685.—JOSEPH W. BROCKWAY, New York, N. Y.—*Straw Cutter.*—October 6, 1868.—The cutters are placed diagonally on their stock, so as to act against the bars, which form the end of the trough, with a drawing and shearing cut, and are made to operate with the feed rollers by means of gear on the main shaft.

Claim.—1. The cutter n and stock m, in combination with the handle r, applied directly to such cutter or stock, so that the same can be vibrated by hand, and swing in contact with the bars o o at the end of the feeding trough, substantially as set forth.

2. The arrangement of gearing h, d, d', k, and l, in combination with the feed rollers c c, cutter stock m, and cutters n, as and for the purposes set forth.

82,686.—ANSON R. BROWN, M. D., Albion, Mich.—*Mold for Making Acupuncture Instruments.*—October 6, 1868.

Claim.—The former, F, having slits or mortises

cast through it, as described, to receive the blades of of puncturing lancets 1, 2, 3, &c., in combination with a mold for casting the plungers E B, substantially as and for the purpose specified.

82,687.—GEORGE A. BROWN, Kalamazoo, Mich.—*Spring Bed Bottom.*—October 6, 1868.

Claim.—The application of spiral springs M M, combined with cords R R, and their attachment P P, and pulleys K L, and pins N N, when constructed and arranged substantially as herein set forth and described.

82,688.—WILLIAM H. BUELL, Union City, Mich.—*Mode of Securing Horse Power to the Ground.*—October 6, 1868.—The outer end of the stay has a hinge shoe stop made of a strap bent around it and ears into which is fastened the stake of the outer ends of the rods, the latter being jointed by a pivot bolt to the shoe stop through its ears, while the inner ends hook into eye bolts in the frame.

Claim.—In combination with each other, and with a horse-power frame, the stays C, rods D, and stakes S, when said parts are arranged relatively with each other, and with said frame, and constructed and connected substantially as and for the purpose specified.

82,689.—JOHN BURNHAM, Batavia, Ill.—*Truss.*—October 6, 1868.—The socket is made with a concave in each of its two parts, for the ball, both parts being made to press against it by means of screws, the ball having an arm from which a lever projects to which the pad is attached.

Claim.—The attaching of the pad lever C of the truss to the spring, in the band or strap thereof, by means of a ball and socket joint, substantially as shown and described.

82,690.—JOHN G. BUZZELL, Lynn, Mass., assignor to himself and CHARLES CUMMINGS, Hollis, Me.—*Carriage Wheel.*—October 6, 1868.—The hub has chambers around the outside near its ends, and a cap fixed on each end, the spokes fitting through the rims of the chambers, and fastened by nuts. The outer ends are passed through the felloe, and are fastened to elliptic springs in recesses formed in the outer edge of the felloes.

Claim.—In the carriage wheel, consisting of the hub A, having the chambers *a a* and the caps B B of the spokes C C, bent in the manner specified, the springs E inserted in the felloe D, all arranged and operating substantially as herein shown and described.

82,691.—CHAUNCEY CARRIER, Columbus, N. Y.—*Towel and Clothes Rack.*—October 6, 1868.—The ends of the bar rest in lugs, and project into the cups, a pin passing through them and the bottom of the cup, and through the top and bottom plates of a bracket to hold them together.

Claim.—The graduated cups B B, provided with lugs *a a*, to form a seat for the end of the bar, and so arranged that the bottom of each cup (except the lowest) may fit into and turn in the top of the one next below it, substantially as described.

82,692.—CHARLES CARTER, Auburn, N. Y.—*Mortising Machine.*—October 6, 1868.

Claim.—1. The tool-carrying slide G G, guides H H, and spreading wedge J, combined and adapted for lateral adjustment of the tools *g*, substantially as described.

2. The combination, with the tilting table, the right and left screws S, and wheels *s s t*, arranged for operating both screws in same direction, and thereby operate clamps R R, substantially as described.

3. The adjustable stop Z, in combination with the rack and pinion *i j*, wedge J, and spreading tool slide, and guides G H, substantially as and for the purpose described.

4. The combination and arrangement of the spreading head or slide G H, wedge J, rack and pinion *i j*, stop Z, table L, clamp R, and saw U, all constructed and operating substantially as and for the purpose described.

82,693.—WILLIAM CHAPPELL, Buffalo, N. Y.—*Chimney Cap.*—October 6, 1868.—The wheel has

spiral vanes overlapping each other, and formed so as to shed off water.

Claim.—The arrangement of the wheel D, over the mouth of a flue or chimney, when made in diameter larger than the outlet, and provided with overlapping spiral vanes E E, so as to protect the mouth of the flue, as herein set forth.

82,694.—G. W. DANA, Racine, Wis.—*Padlock.*—October 6, 1868.—Two bent levers, moved by a key with two bits, act against the two levers at the outer side of the plate, and behind it respectively throw back the annular bolts, which work in grooves. The ends of the bolts are halved, and overlap each other, their edges being beveled in reverse directions.

Claim.—The two bolts C C, halved or recessed at one end, and lapped, one over the other, and beveled at their outer edges, in connection with the bent levers D D', plate E, and spring F, all arranged, substantially as and for the purpose set forth.

82,695.—SAMUEL F. DAY, Ballston Spa, N. Y.—*Telegraphic Instrument.*—October 6, 1868.—The sounder is operated by making a continuous circuit around it through a resistance coil of greater length than that of the magnets attached to the sounder, the bulk of the current being transferred through the sounder by means of a rotary instrument connected to it for that purpose.

Claim.—1. The combination of a relay and sounder, and the resistance coil O, or its equivalent, substantially as and to the effect hereinbefore set forth.

2. The arrangement of parts herein described, or its equivalent, by which the sounder, while controlled by the relay, is also made to work the main line as a repeater, substantially as herein set forth.

3. The combination of the magnets D D, shafts Q Q, clamping pieces S and T, and adjusting screw U, or their equivalent, substantially as set forth.

82,696.—A. M. DENNEN, Folsom City, Cal.—*Liniment for Rheumatism.*—October 6, 1868.—Composed of the oils of wormwood, cassia, hemeck, tansy, lavender, anise, cloves, origanum, tar, and of tar balsam, gum opii, and gum myrrh, mixed with alcohol.

Claim.—The medical compound, substantially as herein described.

82,697.—JOHN S. DUTTON, Jaffrey, N. H.—*Screw Plate.*—October 6, 1868.—A gauge collar movable on the screw closes the dies, and is provided with a set screw to affix it at any point on the said screw, so as to limit the movement of the latter in closing the dies. Suitable marks are engraved on the collar and on the proximate reduced end of the screw plate against which the collar is stopped in closing the dies.

Claim.—In combination with a screw die plate and the screw handle C, the indexed collar *a* and the indexed shoulders *b* and *f*, arranged substantially as described.

82,698.—JOHN A. EDWARDS, Waterford, Pa.—*Milk Vat.*—October 6, 1868.—The agitators are actuated by a hand lever, causing the water to circulate under the paus, while a bulkhead provided with a gate is arranged to shut off the flow of water when desired.

Claim.—The described arrangement, within the milk vat, of the agitators C C, lever D, bulkhead F, gate G, and furnace B, as herein described, for the purpose specified.

82,699.—W. G. FARMER, Burlington, Vt.—*Cutter Head.*—October 6, 1868.—In the center of the circular plate is a collar, in which is the shaft for the matcher head, the upper side of the plate having three straight grooves forming a triangle, and in them are placed the knives, similar ones in the upper movable, circular block, with a hold to slip around the collar, holding them in place, while other knives with sharp cutting edges and a groove are used for cutting the tongue.

Claim.—The circular grooved plate A, provided with a collar, B, and movable grooved plate E, in combination with the knives D D and H H, all constructed as described, and operating substantially as and for the purposes herein set forth.

82,700.—JOSEPH H. FERREIRA, Newark, N. J.—*Floor Clamp.*—October 6, 1868.—In a bed piece, which rests on a beam and is held in place by a shackle, each side, slides a bolt, reacted on by a spring which is thrown forward by a lever and cam, against the work.

Claim.—The combination, in a clamping device, of cam G, plunger D, spring E, and shackle C, or pins H, operating substantially as and for the purpose described.

82,701.—JAMES S. FOWLER, Racine, Wis.—*Brake for Sewing Machine.*—October 6, 1868.—A box provided with a rubber block has at its rear edge the end of a spring, the other end resting against and passing through a staple under the table and holding the block in contact with the balance wheel, while the rear end of a rod rests against the front edge of the box, and its other end passes through the table, by which means the action of the brake may be controlled.

Claim.—1. The arrangement of the spring F, the pivoted box or holder E, and rubber block D, with the table and fly-wheel, as herein shown and described, and for the purpose set forth.

2. The combination of the sliding rod G with the pivoted box or holder E and rubber block D, substantially as herein shown and described, and for the purpose set forth.

82,702.—JOSEPH FUNKHOUSER, Rockingham County, Va.—*Abdominal Supporter.*—October 6, 1868.

Claim.—The iron padded brace or support A B C, the sack E, the bands, and the manner of attaching the same, substantially and for the purposes above described, using therefor the metal and material aforesaid, or any other substantially the same.

82,703.—JOSEPH P. GATES, Lincoln, Ill.—*Shaft Coupling.*—October 6, 1868.

Claim.—1. The disks D and C, secured to proper shafts, with the slide or shuttle key E, in relation to the channels S and J, and recess Q, or their equivalents, when constructed and operating substantially as and for the purposes set forth.

2. The disk C, having its shaft, K, protruding inwardly, in combination with the disk D, having an opening in its inner face, which opening forms a bearing for shaft K, substantially as and for the purposes set forth.

3. The shuttle key or slide E, with its studs F and G, or their equivalents, for the purposes shown.

4. The spring N, in connection with the oscillating stud O and slide E, or their equivalents, when operating substantially for the purposes set forth.

5. The cam L, with its semiannular channel J, arm I, lever V, head U, or their equivalents, when arranged and operating substantially as and for the purposes shown.

6. The combination of all the above-mentioned parts and their attachments, when constructed, arranged, and operating substantially as and for the purposes herein set forth and described.

82,704.—ALBERT GERDES and JULIUS REICHÉ, New York, N. Y.—*Barbers' Chair.*—October 6, 1868.—The seat shaft is connected with an upright shaft by bevel gear wheels acted on by a pinion wheel kept out of gear by a spring which keeps a shaft locked, to which a grooved collar is keyed, levers and bolts being arranged and operated in connection with another grooved collar and knob, so as to reverse the seat and back, while the head rest with its stem in a split tube is clamped by a ferrule on the upright shaft.

Claim.—1. A barbers' chair, whose seat, back, and head rest are upholstered on both sides, the same being so connected by such mechanism that the said seat, back, and head rest may be reversed simultaneously, in the manner and for the purpose substantially as herein shown and described.

2. The split tube and taper ferrule r, for the purpose of adjusting and holding the head rest, substantially as shown and described.

82,705.—SAMUEL GIBSON, Safe Harbor, Pa.—*Scrubbing Brush.*—October 6, 1868.—Strips of rubber

are inserted between the holder and clamp, and fastened by screws, while on the upper side of the clamp is attached an ordinary bristle brush held by the same screws.

Claim.—The arrangement of the shouldered plate A and flanged keeper E inclosing the strips of rubber D, upon the forward part of the bristle brush G, all as herein shown and described.

82,706.—E. H. GILLMAN, Montpelier, Vt.—*Sleigh.*—October 6, 1868.—The draw rods pass through the runners, which are screwed by nuts at the back of the sleigh, and in front, ending with a hook or eye, through which is a rod on which are fixed the shafts.

Claim.—The draw rods D D for sleighs, for the purposes and in the manner and form set forth.

82,707.—H. C. GLASGOW, Cleveland, Ohio.—*Car Coupling.*—October 6, 1868.—The coupling box is movable backward and forward, and is so arranged and connected with the car body and coupling pin that the link can be put, from above or below, even when the cars are close together, and so prevent the pin from being drawn out in case the link from an opposite car enters the box.

Claim.—1. The quadrangular metallic box B, divided into two or more spaces by the horizontal partitions g, and provided with flanges e e, to which the bent bars f f are pivoted, embracing the chafing timbers c c, whereby the box is held between and guided upon said timbers, as herein shown and described.

2. The coupling box B, with or without the block C, in combination with the block D, follower E, links i and k, spring F and stop l or m, all made and operating substantially as and for the purpose herein shown and described.

3. So arranging the top and bottom plates n and o of a coupling box, by perforating the same, that the coupling link can be inserted from the rear, substantially as herein shown and described.

82,708.—H. C. GLASGOW, Cleveland, Ohio.—*Car Coupling.*—October 6, 1868.—The sliding and detachable coupling box is arranged between two beams or bumpers and is connected with the frame of the car by rods fastened to it by pins, and which pass over the springs in rear of the transom, a block pressing against a spring between it and the transom, so that thus the connection of the cars is formed and maintained.

Claim.—1. The arrangement of the floor beams A' A', when they project through a sill, B, constructed to receive them, and serve as bumpers, and to carry the sliding coupling box, substantially as herein shown and described.

2. The manner herein shown and described of fastening the two ends of each U-shaped draught bar e to the coupling box by means of one pin, f, substantially as herein shown and described.

3. The arrangement and combination with each other of the coupling box G, block I, spring g, transom b, spring H, and draught bars e, all made and operating substantially as and for the purpose herein shown and described.

82,709.—WILLIAM W. GORDON and DEXTER PETTENGILL, Delhi, N. Y.—*Trace Buckle.*—October 6, 1868.—The clamping plate has a tongue fitted to the holes in the trace, its front end being placed under the front bar and its rear end raised over and fixed to the center bar of the frame, by means of the ends of the standard bent around it.

Claim.—The combination and peculiar arrangement of the frame A, tongue plate C, and tug strap E, in the manner and for the purposes set forth in the above specifications.

82,710.—FRANÇOIS GRENIÉR, Beroserac, France, assignor to G. H. MERCER and A. E. MONOD, New York City.—*Dough Mixer.*—October 6, 1868.—The rotating annular trough has two pairs of beaters to which are attached scrapers for its bottom, while the sides are cleared by stationary ones, and on the shafts are rods having screw blades reaching near to the bottom to raise up and knead the dough.

Claim.—1. The rotating spiral blades J J, and the

rotating beaters H H, arranged in pairs, each pair having a bottom scraper, *b*, in combination with the frame A, substantially as described for the purpose specified.

2. The dough-mixing machine, consisting of the rotating annular trough C, rotating beaters H H, rotating screws J J, and fixed scrapers I I, all made and operating substantially as herein shown and described.

82,711.—REUBEN C. GROVER, Newton, Mass.—*Manufacture of Edge Tools.*—October 6, 1868.—The face of the stock is cut away, so as to leave a longitudinal groove for the steel cutting edge plate which is fitted for insertion therein.

Claim.—The knife A *b*, constructed as described, and as a new article of manufacture.

82,712.—THEODORE GRUNDMANN, Cleveland, Ohio.—*Apparatus for the Manufacture of Vinegar.*—October 6, 1868.—An automatic distributor has two compartments, and as the liquid, passing through the perforated plates of the filter, fills one of them, its weight swings the box on its pivot and brings the other under the supply pipe, straw braids being arranged beneath, along which it flows in small streams.

Claim.—1. The braided strands D D, when used in a vinegar apparatus, for spreading the mash, and exposing it to the air, as set forth.

2. The self-regulating swinging mash-distributing box G, arranged substantially as herein shown and described.

3. The box A, when composed of a series of detachable plates, as set forth, so that the suspended braids D may be exposed to the air to be dried.

4. A vinegar apparatus, consisting of the box A, vessel B, frame C, braided pendants D, distributing box G, and supply and discharge pipes *f* and *j*, all made and operating substantially as herein shown and described.

5. The device set forth in the foregoing clause, in combination with the filter H, in which the two perforated plates *l* and *m* are arranged, as set forth.

6. The distributing sheet E, arranged between the swinging box G, and the braided pendants D, substantially as herein shown and described.

82,713.—J. A. HAMMER and THOMAS CHADWICK, Newton, Iowa.—*Wash Boiler.*—October 6, 1868.—The perforated bottom of the inner boiler has a flange fitting to the outer boiler, the space between the two forming a clothes chamber, to which the lower ends of two curved tubes are connected, and coming up at the tops into the reservoir which forms the outer chamber, in which are valves worked from the top, a safety valve being also in the lid.

Claim.—1. A clothes washer, so constructed as to form one lower or boiling chamber, one clothes chamber, and one or more reservoirs for supplying clean hot water, substantially as herein set forth.

2. A clothes washer, constructed as described, with one or more reservoirs, connected by valves to the boiling chamber below, which valves can be opened and closed at will from the top of the boiler, substantially as and for the purposes herein set forth.

3. Passing the steam-conducting tubes of a wash boiler, constructed as specified, through the water reservoirs, for the purpose of heating the water contained therein, substantially as and for the purposes herein set forth.

4. In a clothes washer, the combination of a clothes chamber, boiling chamber C, one or more reservoirs E, tubes F F, perforated mouth pieces G G, perforated bottom D, and valves *b*, *d*, and *e*, all arranged as described, and operating substantially as and for the purposes herein set forth.

82,714.—A. O. H. HARDENSTEIN, Clinton, Miss., assignor to himself and MARCELLUS A. FOUTE, New Orleans, La.—*Explosive Projectile.*—October 6, 1868.—A rod with a percussion cap on its front end is inserted into a tube bearing the fuse, the rear end being fixed to a disk, which being of equal diameter with the shell, keeps it secure till the gun is fixed, when, as it is driven forward, the cap is exploded, the bars

moving in the grooves of the bore preventing the escape of gas, and giving a spiral motion to the projectile.

Claim.—1. The combination of the disk N and rod M with a projectile, substantially as herein described, when these parts are constructed and operate substantially as and for the purpose set forth.

2. The wedge-formed bars A, in combination with a projectile, substantially as herein described, when the same are constructed and operated substantially as herein described, for the purpose set forth.

3. The bars A, in combination with the disk N, when these several parts are constructed and operate as herein described, in connection with a projectile, substantially as herein described, for the purpose set forth.

82,715.—GEORGE W. HERRICK, Stuyvesant, N. Y., assignor to himself and H. H. GIBBS, same place.—*Device for Casting Lugs and Dovetails.*—October 6, 1868.

Claim.—1. The hand tool B, for forming the mold in which the spur *b* is cast upon the lug *a* of a stove top, consisting of the hollow and slotted cone C, bearing the lever *f*, hung upon the transverse shaft *e*, the projection *g*, upon the lower end of said lever being held through the side of the cone by the spring *i*, upon the upright *d*, all arranged and operating as described for the purpose specified.

2. The tool H, for forming the mold in which the spurs *k k* are cast upon pin *j*, consisting of the cylinder I, whose lower end is slotted upon opposite sides at *r r*, the rod *l*, having the projecting foot *m*, and hung loosely upon the shaft *n*, which works in the slots *o* of the cylinder I, said projecting foot being held above the slots *r* by means of the spring *p* bearing against the shaft *n*, all arranged and operating as described for the purpose specified.

3. The tool M, for casting the beveled lugs *w w w* upon the stove plate J, consisting of the plate *a'*, having the slides *b' b'* provided with projections *e' e'*, which are kept within the projection *d'* by means of the spiral springs *e' e'*, all arranged and operating as described for the purpose specified.

82,716.—MICAH HOBBS, Natick, Mass.—*Sole Cutting Machine.*—October 6, 1868.—The bed is moved by means of springs, racks and gears connected with racks attached to the ears of the frame, while the sole cutter revolves and is raised or lowered, through its journals.

Claim.—The combination of the bed B and its mechanism for operating or moving it, as described, with the rotary cutter A, and mechanism for elevating and depressing and revolving it, in manner substantially as specified, the bed being arranged over the rotary cutter, as explained.

82,717.—H. HOCKEMEYER, Toledo, Ohio.—*Butt Hinge.*—October 6, 1868.—The collar is formed around the head of a pin, a lip on the edge of the wing projecting over it, and has two slots, one of which incloses the upper edge of the wing, and both wing and pin thus move together.

Claim.—In combination with a loose pin butt hinge, the collar *d*, the lip *e*, and the slots *f* and *g*, constructed and arranged substantially as shown and described for the purposes set forth.

82,718.—JAMES HOLMES, Belfast, Me.—*Stave Machine.*—October 6, 1868.—Pinions are attached to each end of a shaft which gear into racks sliding on guides; at the end of the bolt carriage another parallel shaft, having on one end a ratchet with a pawl connected to a lever which is fitted loosely on its other end; a third shaft, likewise parallel, being also fitted on the bolt carriage, and operating by pawls with arms, and the pinion gear.

Claim.—The pinions *f* and shaft H, arranged with reference to the racks *g* of the bolt carriage, the shaft L, pinions *l*, shaft N, pawl *o*, and lever P, whereby the bolt carriage is moved evenly toward the saw, as herein described for the purpose specified.

82,719.—J. BURROWS HYDE, New York, N. Y.—*Mode of Preserving Meats, Vegetables, and other Perishable Substances.*—October 6, 1868.—The edible

substances are packed in or surrounded by dry pulverized peat.

Claim.—The material described, for the purposes set forth.

S2,720.—EBENEZER JENNINGS, Jr., New York, N. Y.—*Suspender and Shoulder Brace Combined.*—October 6, 1868.

Claim.—1. A combined shoulder brace and suspender, provided with the loop C, on one end of each of the main straps, adapted to receive the reverse ends of the opposite straps, substantially as and for the purpose set forth.

2. In combination with a combined shoulder brace and suspender, provided with the loop C, on one end of each of the main straps, as and for the purpose described, the button-hole tags B, as and for the purpose specified.

3. In combination with the subject-matter of each of the said first and second claims, an adjustable slide, through which both of the main straps pass, crossing each other, substantially as shown and described.

S2,721.—LUMAN F. JOHNSON, Buffalo, N. Y.—*Furnace Door.*—October 6, 1868.—The bricks are rebated and fit over the flanges of the cast-iron frame supporting them, the object being to prevent said flanges from being burned.

Claim.—The rebated fire bricks B, so arranged within the cast-iron frame, as to overlap the flanges *a'* thereof, and protect the same, substantially as described.

S2,722.—JOHN STAFFORD KELLEY, New York, N. Y.—*Washing Machine.*—October 6, 1868.—The fluctuation of the water, clothes, and rubbers produces an action similar to hand rubbing, and delicate fabrics are not injured.

Claim.—The combination, in a washing machine, of an oscillating drum, barrel, or box, A, with a number of floating rubbers, composed of pliant sleeves, containing buoyant balls, arranged in a row, all substantially as shown and described, and for the purpose set forth.

S2,723.—JOHN H. KEYSER, New York, N. Y.—*Drum for Hot Air Furnace.*—October 6, 1868.—Designed as an improvement on his patent of March 19, 1867. The upper drum is constructed with a central opening which is surrounded by a collar for receiving a direct draught pipe, said opening allowing ready access to the upper drum for cleaning.

Claim.—The radiating attachment herein described, constructed with an opening through the top of its drum A, substantially as specified.

S2,724.—JOHN L. LAY, Buffalo, N. Y.—*Toy Hoop.*—October 6, 1868.

Claim.—The relatively stationary hoop B, supporting an image or images, in combination with an outer concentric and rotating hoop, A, provided with rollers *e e*, or their equivalent, which gives motion to the image through intermediate levers *h* and connecting rods *i*, or their equivalent, substantially as set forth.

S2,725.—WILLIAM J. LEWIS and HENRY W. OLIVER, Jr., Pittsburg, Pa.—*Strap Bolt.*—October 6, 1868.—The round bar is passed through rolls which give it the form and size desired for the strap bolts.

Claim.—A new article of manufacture, iron rolled to constitute a series of blanks, in bars, for strap bolts, of the form herein described.

S2,726.—JOSIAH R. LOCKE, San Francisco, Cal.—*Carriage Spring.*—October 6, 1868.—The front springs are continuous and bent around the bolster and secured to the reaches by shackles. The rear springs are of C-form connected to the side springs and secured to the reaches. A reach in the center of the frame is fastened to the bolster by a strap, beneath which is placed a cushion held by a rod attached to the rear side springs.

Claim.—1. The box J, elastic packing or spring K, and the extension braces or rods L L, attached to the side springs G G, substantially as and for the purpose specified.

2. The combination of the side springs G G with the C-spring I, by the shackle connection H, the C-springs extending around the axle bed and attached to the reaches, substantially as described.

3. The springs E E, crossing the upper ends of the springs G G, and passing over the bolster, and attached to the forward ends of the outside reaches, substantially as described.

S2,727.—JOSIAH R. LOCKE, San Francisco, Cal.—*Carriage Springs.*—October 6, 1868.—Two springs at each side of the wagon attached to the bottom of the bolster at one end and the axle bed at the other, separate in opposite directions by a goose-neck curve, and are bolted to the side rail. A double-acting spring is placed back of the springs, the upper portion being attached to the rail, and the lower portion working in a slide.

Claim.—1. In combination with the wood and steel springs A A, the goose-neck springs D D, constructed substantially as described.

2. The double-acting springs F F and the slides E E, in which the lower ends move, or equivalent device, the whole constructed to operate substantially as described.

S2,728.—KELLOGG H. LOOMIS, New York, N. Y.—*Anti-friction Steam Engine Valve.*—October 6, 1868.—A conical valve provided with steam ports, (the solid portions between each of which taper upward and form ribs which prevent the valve from springing,) fits into a correspondingly-shaped seat with suitable ports. The valve is secured to a stem provided with a yoke by which it is rotated; the upper end of the stem rests in a cross piece which is adjusted by means of a set screw.

Claim.—1. An oscillating steam valve, suspended from and having its bearing and turning upon an adjustable center point above its seat, in the line of its axis, substantially as described.

2. In combination, the valve stem, support E, yoke F, and set screw H, all constructed and arranged substantially as shown and described.

3. The arrangement of the ribs *b'* between the ports, extending from the base to the outer surface and apex of the cone, substantially as set forth.

S2,729.—JEREMIAH A. MARDEN, Boston, Mass., assignor to AUGUSTUS LYNCH and REUBEN K. HUNTOON, same place.—*Governor for Steam Engine.*—October 6, 1868.—A tubular shaft extends through the cover of the vessel and has secured to it a disk which supports a rocker shaft to which the float is attached. The lower part of a stem rests against an arm on the rocker shaft and the upper end against a lever so connected to a weighted bar operating the valve that should the steam ports be opened too far the bar drops and is disengaged from the lever operating it by cams placed on it coming in contact with a standard.

Claim.—1. The arrangement and combination of the float D, its arm *e*, the tubular shaft C, the spindle *f*, vessel A, and its cover B, as specified.

2. The arrangement of the said float D, arm *e*, spindle *f*, tubular shaft C, lever E, and its hanger H, as set forth.

3. The arrangement of the compensating arm M, and weight N, valve arm I, hanger H, lever E, spindle *f*, tubular shaft C, float D, arm *e*, and the vessel A, substantially as specified.

4. The combination of the cam *n*, slotted arm *m*, and the movable standard *o*, with the hanger H, lever E, spindle *f*, tubular shaft C, float D, arm *e*, and the vessel A, substantially as set forth.

S2,730.—GEORGE A. MARINER and JULIEN KUNE, Chicago, Ill.—*Amalgamator.*—October 6, 1868.—The outer cylinder is closed at the bottom by a conical plate in which the rotating agitator has bearings, said agitator consisting of a perforated plate provided with arms which extend upward and revolve around rods secured to the lower side of a perforated diaphragm. An inclined partition receives the spent ore which is carried off by a pipe through a furnace, the mercury adhering to the ore being sublimized and carried off by a condensing pipe.

Claim.—1. The cylinder *a e*, provided with the

conical plate or bottom *b*, in combination with the cylinder *d f*, supported above the bottom, substantially as shown.

2. The annular plate or diaphragm *e*, to regulate the dispersion of the ores, when provided by the rods *u*, substantially as specified.

3. The perforated annular plate *r*, when provided with the rods, substantially as and for the purposes described.

4. The inclined partition or chute *B*, constructed and operating in combination with the discharge spout *v*, substantially as specified.

5. The tube or pipe *b*, when made to pass through the furnace *w*, in combination with the escape or condensing pipe *G*, substantially as and for the purposes specified.

6. The extension feed pipe *l g*, whether used with or without a screw carrier, substantially as specified.

82,731.—A. H. MARRET, Water Works, Ky.—*Manufacture of Artificial Stone.*—October 6, 1868.—Sand and hydraulic cement are mixed and molded, then dried, placed in water, and saturated with a solution of silicate of potash or soda.

Claim.—The process of manufacturing block, substantially, for all building purposes, as herein described.

82,732.—JAMES GARTH MARSHALL, Leeds, England.—*Apparatus for Washing, Bleaching, and Cleansing Yarns, Bobbins and other Materials.*—October 6, 1868.—The yarns, &c., are wound around perforated bobbins which rest over nozzles proceeding from a chamber. The cleansing or bleaching solution is forced into the chamber and then through the bobbins into the material wound thereon. Woven fabrics are wound with an open web of slats between folds, and treated in the same manner.

Claim.—1. The combination, with the vessel *A*, of the supply pipe *D*, opening into a chamber, *C*, one or more sets of spool-holding studs *e* and *h*, and an exhaust pipe *N*, substantially as and for the purpose described.

2. The employment of the open web *S*, in combination with a closed vessel, *A*, substantially as and for the purpose described.

82,733.—NATHAN MAXSON, Wilmington, Ohio.—*Fence.*—October 6, 1868.—Cement is placed in sections over a ridge of earth which latter has grooves running down its sides into which the cement runs and forms ribs.

Claim.—The fence *A B C*, constructed as described, that is, having the foundation *A*, interior *B*, and covering *C*, the latter being laid on in sections, with beveling edges, and being strengthened, at regular intervals, by bars, formed in the manner described, the whole being combined and arranged as and for the purposes set forth.

82,734.—FRANK MELVILLE, New York, N. Y.—*School Slate.*—October 6, 1868.—The ends of a thin strip of wood or metal containing the copy are inserted through notches into the grooves in the side of the frame. The strip is then moved to the top of the slate and held by a spring.

Claim.—The notches *a a*, in the inner edge of the frame *B* of the slate, in connection with the spring *b* and the removable copy *C*, all arranged substantially as and for the purpose herein set forth.

82,735.—HELEM MERRILL, New York, N. Y.—*Filter for Saccharine and other Liquids.*—October 6, 1868; antedated September 30, 1868.—A filtering cloth forms an endless belt, a portion of which passes over a hollow cylinder with slotted sides; the other portion is led out of the top of the filter over guide rollers to a washing tank, where it can be cleansed. The object being to clean the cloth as fast as its action is retarded by feculent matter.

Claim.—1. The arrangement of the filtering material, partly inside and partly outside the filter.

2. Operating a sheet of filtering material so that it passes in and out of a filter, either continuously or at intervals, as may be required.

3. Supporting and securing a traveling apron by means of endless belts, substantially as described.

82,736.—JAMES MITCHELL, Philadelphia, Pa.—*Rotary Blower.*—October 6, 1868.—An auxiliary air passage is located within the fan case to receive and conduct the blast from the wings at that part of their rotation where, without such passage, they would be ineffective.

Claim.—The combination of the direct tangential discharge port *H*, rotary fan *D*, eccentric casing *A*, and concentric partition *E*, all constructed and arranged as herein represented and described, for the purpose specified.

82,737.—GEORGE R. MOORE, Lyons, Iowa.—*Water Meter.*—October 6, 1868.—The cylinder is divided into three compartments by a vertical and horizontal plate. Four water ways made in the vertical plate, two above and two below the horizontal plate, are opened and closed by a valve which is rotated by a forcing plate placed above the horizontal plate and operated by the water; said forcing plate is provided with springs which come in contact with regulating screws on bent levers, which latter actuate the rotary valve.

Claim.—1. The water ways *o o o o* through the plate *A*, in the manner and for the purpose herein set forth.

2. The forcing plate *C*, upon its journals *f*, operated by the water, substantially in the manner and for the purposes herein set forth.

3. The springs *d d*, used in operating the valve *B*, substantially in the manner and for the purpose herein set forth.

4. The levers *a a* and regulating screws *g g*, substantially in the manner and for the purpose herein set forth.

5. The dividing plate, *e*, substantially in the manner and for the purpose herein set forth.

82,738.—JAMES M. MOREHEAD, Brooklyn, N. Y.—*Clamp for Iron Structure.*—October 6, 1868.—The four plates are provided with bolts at each corner; two of them are formed with circular recesses for clamping the vertical rods, and the other two with semicircular recesses for clamping the horizontal rods.

Claim.—The four plates *A, B, C, and D*, formed and combined substantially as shown and described, for the purpose of clamping crossed rods, all as set forth.

82,739.—CHARLES H. MOSELY, Winchester, Mass.—*Machine for Desiccating Leached Tan and other Substances.*—October 6, 1868.—An endless apron passing through a hopper placed over the leaching trough carries the leached bark to another hopper, the latter feeding it between two hollow-heated rollers which express the liquid.

Claim.—1. The arrangement, as well as the combination of the endless apron or conveyer *B*, the hopper *C*, through which it passes, the auxiliary hopper *M*, and the pair of heating and expressing rollers *K L*, such being provided with mechanism for operating them, substantially as described.

2. The arrangement and combination of the leaching vat *A*, the endless apron *B*, the hoppers *C M*, and the pair of expressing rollers *K L*, the whole being disposed within a frame, as set forth.

3. The combination of the elevator *N* with the expressing rollers *K L*, the two hoppers *C M*, and the endless apron *B*, or the latter and the leaching vat *A*, the whole being arranged in a frame, and provided with mechanism for operating them, substantially in manner and for the purpose or object as hereinbefore specified.

82,740.—JAMES H. MYERS, New York, N. Y., assignor to himself and C. T. RICE, same place.—*Pattern for Cutting out Shirt.*—October 6, 1868.—The several parts of the pattern are so shaped and graduated that on the neck, chest, and waist, measurements being determined, the proper shape of the different parts is ascertained by the graduated boundary lines delineated upon said patterns.

Claim.—The diagram for cutting shirts, consisting of the back, yoke, front, bosom, neck band, and sleeve patterns, of the configuration shown, having graduated measurements delineated thereon, substantially as shown, for the purpose specified.

82,741.—JOHN NAIRN, Milton, Ind., assignor to himself and MATTHEW PFAFFLIN, same place.—*Feeding and Cooling Device for Grain Mill.*—October 6, 1868.—A vessel secured to the top of the bail of a running stone is provided with two tubes which convey the grain to the stone. A tube fixed to the mouth of the hopper extends nearly to the bottom of the vessel and is provided with arms which scrape the grain into the two tubes when the vessel is rotated.

Claim.—The arrangement of the vessel A, tubes B B C, and curved lateral tubes E E, and scraper D, when combined and operated substantially as and for the purpose herein described.

82,742.—ELIM OSBORN, Economy, Ind., assignor to himself and HENRY BEARD, same place.—*Rotary Steam Engine.*—October 6, 1868.—A revolving disk valve is keyed to the main shaft and regulates the admission of steam from the chest to the induction pipes of the engine.

Claim.—1. The combination of the revolving disk-plate valve *h*, steam chest D, and shaft A, substantially as set forth.

2. The arrangement of the steam pipes E E, steam chest D, and apertures *m*, with reference to the shaft A and wheel B, substantially as described.

82,743.—ADOLPHE ACHILLE PATHI, Paris, France.—*Cigar Pipe.*—October 6, 1868.

Claim.—A tobacco pipe, having a lid, *b*, provided with a prolongation, *d*, terminating at the outer end in a form resembling a burning cigar, and perforated for the admission of air to support the combustion of the tobacco, substantially as and for the purpose described.

82,744.—E. G. PATTERSON, Pithole City, Pa.—*Railway Rail Joint.*—October 6, 1868.

Claim.—1. The chair D, made with the inner sides of its jaws inclined or wedge-shaped, substantially as herein shown and described, and for the purpose set forth.

2. The clamps F, constructed as described, and provided with bolts G and nuts H, in combination with the fish plates C, by which they are supported, and with the wooden bar or bars E, which they support, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the fish plates C and chair D with each other and with the ends A and B of the rails, substantially as herein shown and described, to form a rigid support for the said ends of the said rails.

4. The combination of the fish plates C, chair D, wooden bar or bars E, and clamps F with each other and with the ends A and B of the rails, substantially as herein shown and described, and for the purpose set forth.

82,745.—JOHN PATTISON, Nevada, Cal.—*Quicksilver Feeder for Quartz Mill.*—October 6, 1868.—In a vertical opening of the fountain is a pipe, fitting closely to the horizontal shaft below. Another pipe also beneath leads to the battery, a set screw being placed in an opening of the shaft of only half its diameter, the rest being formed into a cup for receiving and discharging the quicksilver into the battery pipe, while the slotted ring couples the two parts of the shaft, on which rotates a toothed wheel operated by a cam, lever, and pawl.

Claim.—1. The quicksilver fountain C, with the vertical pipes D and F, above and below the horizontal shaft, substantially as described.

2. The cup G', in the horizontal shaft E, graduated by the set screw G, or their equivalents, substantially as and for the purpose described.

3. Coupling the shaft E together by the slotted ring H and keys H' H', and operating the machine by the lever K, pawl K', and toothed wheel J, the whole constructed and arranged to operate substantially as described.

82,746.—JETHRO PECKHAM and JOHN PECKHAM, Middletown, R. I.—*Ventilator.*—October 6, 1868.—The ridge cover rests on vertically-sliding posts, a windlass being used for raising or lowering it to open or close the air passage.

Claim.—The combination, with the ridge cover A, supported on the vertically-sliding studs B, of the

winding shaft C and cords D, substantially as and for the purpose specified.

82,747.—HENRY PEMBERTON, Allegheny City, Pa.—*Porous Alum.*—October 6, 1868.

Claim.—As a new article of manufacture, the sulphate of alumina, prepared in a porous or vesicular state, whether in lump or ground to a coarse or fine powder, substantially as described.

82,748.—STARR POLLEY, Brooklyn, N. Y.—*Machine for Stretching and Blocking Hats.*—October 6, 1868.—An improvement on his patent of April 2, 1867. The block is raised into contact with the stretched top of the hat, and then pushed up by means of a lever, so as to draw it up. The rubber band fits on the body, and holds it when the stretcher levers are separated at their upper ends.

Claim.—1. The arrangement of the flat, elastic ring or band T, of rubber, over or outside of the hat body *f*, as shown and described, in combination with the stretching device B, when arranged to operate relatively thereto during the stretching operation, substantially as and for the purposes herein set forth.

2. The elastic band T, in combination with a hat body, and with the block O and stretching device B, so as to perform the double function of clamping or holding the hat body in place upon the stretching machine in the act of stretching the tip, and also of holding the body upon the block during the subsequent operation, substantially as herein described.

82,749.—PETER PRESCOTT, Booneville, N. Y., assignor to ISAAC HALL, WILLIAM J. HALL, and C. M. PRESCOTT, same place.—*Horse Hay Rake.*—October 6, 1868.—The ends of the rod are attached to the shaft, and are inserted in the vertical plates affixed to the rake frame, several holes being formed in the plates for adjusting the shafts, and the arms, which are attached to the rake shaft, are also hinged to the rod.

Claim.—The plates *a a*, rods *i*, arms *b b*, arranged substantially as described, for the purpose of lessening the pressure of the shafts or tongue of a revolving horse rake, all as set forth.

82,750.—GEORGE W. PUTNAM, Boston, Mass.—*Lantern.*—October 6, 1868; antedated September 26, 1868.—The case in which is the magazine is fitted to slide within the lantern case, and when the magazine is removed and hooked on the side, the lantern may be put in and used.

Claim.—The employment or use, with a portable lantern, of a movable magazine, when all are constructed and arranged substantially as shown and described.

82,751.—GEORGE W. RAWSON, Cambridgeport, assignor to himself and MICHAEL HITTINGER, Somerville, Mass.—*Cut-off for Steam Engine.*—October 6, 1868.—An improvement on the patent of George W. Rawson and Michael Hittinger, November 12, 1867. Slide valves are used instead of cut-off valves, and are moved in one direction and stopped in another by two chairs, and by an arrangement connected therewith, a steam balance of the cut-off valves, prior to the relative movement of the slide valves, is effected.

Claim.—1. The arrangement and combination of the stopping chains with the steam chest, the sliding, main, and cut-off valves, the springs *k k*, the rods *g g*, the pawls or catches *m m*, and the tripper *p*, to be applied to a governor, the whole being to operate in manner as described.

2. The arrangement of the valve-seat projections *e'*, or the equivalents thereof, in relation to the steam chest A, the main and cut-off slide valves *B e e*, the stopping chains, the springs *k k*, the cut-off valve rods *g g*, the pawls *m m*, and the tripper *p*, the whole being as specified, the valve-seat projections enabling the steam to effect the balancing of the cut-off valves, as explained.

82,752.—HIRAM RICHMOND, West Meriden, Conn., assignor to CHARLES PARKER, same place.—*Match Safe.*—October 6, 1868.

Claim.—The match safe, constructed as described,

of the back plate A, the box B, having the vertical opening *b* for the thumb and finger, and the inclined hinged lid C, having the opening *c* corresponding to opening *b* in the box, all arranged as described, for the purpose specified.

82,753.—WILLIAM RODGERS, Linnville, Ind.—*Cultivator*.—October 6, 1868.—The rake is hung on the end of the beam, behind and under which is the steadying wheel, and a rod, attached near its center, with its top passing through the end of the beam, is adjusted by means of a screw on top, the rake being also braced by rods movably pivoted at its ends, projecting toward the main beam, thus allowing it motion, its teeth being slightly inclined inwardly.

Claim.—The rake K, supported and braced as described by the vertical and lateral rods, and having itself vertical teeth, in combination with the cultivator, provided with the steadying wheel H, all constructed and arranged as and for the purpose set forth.

82,754.—CHARLES C. SCHMITT and RUDOLPH WODRICH, New York, N. Y.—*Folding Easy Chair*.—October 6, 1868.—The upper ends of the chair are connected by means of an apron, which has one side wound around a roller, by means of which it is kept stretched, and the seat is pivoted to the rear section, while its front end rests on the rail connecting the upper ends of the stays to the front section.

Claim.—1. The application to the roller F, around which the band G is wound, of the spring *c*, ratchet wheel *a*, and spring pawl *b*, all made and operating substantially as herein shown and described, for the purpose of locking the chair automatically in any desired position, as set forth.

2. The cam J, arranged in connection with the spring pawl *b*, for the purpose of allowing the band to be unwound and the seat to be lowered, substantially as herein shown and described.

3. Pivoting the seat I to one set of supports only, of an X-shaped chair frame, when said frame is provided with a self-acting band, G, and roller F, substantially as and for the purpose herein shown and described.

4. The rod K and lugs *g*, when arranged on an X-shaped stool frame, to prevent extreme expansion of the same, as set forth.

82,755.—CHARLES C. SCHMITT and RUDOLPH WODRICH, New York, N. Y.—*Folding Chair*.—October 6, 1868.—The legs of the chair are pivoted to the seat, and connected with braces by bands or staples, so as to allow it to be folded up as desired.

Claim.—The folding chair, consisting of the combination of the seat A, which is pivoted or hinged to the legs B C, with the rods *a b d e*, bands or staples *c f*, rod *h*, slotted arms E, hinged to the legs B, pins *k*, and band *i*, all made and operating substantially as herein shown and described.

82,756.—CHARLES H. SEAWELL, St. Louis, Mo., assignor to GEORGE F. LEWIS, same place.—*Express Signal*.—October 6, 1868; antedated September 24, 1868.—A series of double signs are so arranged that the lettered sides may be thrown together and the blank sides also when a call is desired.

Claim.—The signs *c* and *c'*, placed in pairs on a pivot wire, *b*, and arranged with calling signs on one face, but blank on the reverse, so that the call shows on both sides when it shows at all, as described.

82,757.—THOMAS SHIELDS, Hillsboro, Ohio.—*Bee Hive*.—October 6, 1868.

Claim.—1. The two series of removable honey frames, of different widths, arranged the one above the other, between upper and lower ventilating air-chambers, substantially as herein set forth.

2. The glazing of the outermost of the lower series of honey frames in the hive, when the said glazed honey frames are located opposite to the removable sections B B of the side casings of the hive, substantially as herein set forth.

3. The glass face of the alighting board *h*, when the said alighting board is arranged with the other

parts of the hive, substantially in the manner herein set forth.

82,758.—JAMES P. SIBLEY and ARTHUR WALSH, Bennington, Vt.—*Governor for Engine, Water Wheel, &c.*—October 6, 1868.—The slide has a reciprocating motion by means of an arm and an eccentric keyed to the lower part of the tubular shaft, two pawls operating with the under side of a ratchet wheel, and a collar, with a groove, for the pin of a lever fixed to a shaft, with its bearing on the framing, while a shell laps over the ratchet wheel to throw its pawls out of gear.

Claim.—1. The arrangement of the eccentric L on shaft B, for operating slide N, and the collar I, fitted on shaft B, and connected by shaft K, and levers J T, and arm S, for the purpose of operating the shell R, substantially as specified.

2. The slide N, provided with the pawls O O', in connection with the wheel P, all arranged substantially as set forth.

3. The metallic strap W, attached to the spool X, on shaft Q, connected with the shafts V and K, all arranged as specified.

4. The slide A', when arranged or placed in relation with slide N and wheel P, substantially as specified.

82,759.—L. T. SMART, Ossipee, N. H.—*Saw Set*.—October 6, 1868.—The bed die and the movable die have corresponding facets with varying inclinations, the latter being provided with a projecting stem fastened by a nut, and a spiral spring to keep it in its place and at a proper distance from the bed die.

Claim.—The die A, adjusted in the holder B by the screw F, and provided upon its upper face with facets of varying inclinations, corresponding to the inclinations of the facets upon the under side of the movable die D, all constructed, arranged, and operating as herein described and shown, for the purpose specified.

82,760.—CHARLES B. SMITH, Springfield, Ill., assignor to himself and QUINCEY A. FISK, same place.—*Spring Seat*.—October 6, 1868.—The main portion of the seat is made of thin strips of metal laid crosswise of each other, the ends formed with ears hooked into loops which project from double coiled springs secured to rods connected with the seat frame.

Claim.—The improved spring-seat bottoms, composed of the hooked strips A, riveted together as described, in combination with the double-coiled springs, supported on the frame, and provided with the loops B, substantially as and for the purpose described.

82,761.—CHARLES D. F. SMITH, Geneva, Ill.—*Stove Drum*.—October 6, 1868.—The spiral inclined plane, arranged within the annular space between the cylinder and air chamber, is made up of a series of graduated sections having at each end projecting lugs, and connected by a rod, and they may be all turned so as to form a circuitous flue.

Claim.—Constructing the inclined plane, forming the spiral flue, around a central drum, cylinder, or reservoir, wholly or in part in sections, susceptible of being adjusted to form a continuous circuitous spiral flue, or to open vertically and permit a direct vertical draught, substantially as and for the purposes set forth and described.

82,762.—H. P. STAFFORD and H. H. STAFFORD, Decatur, Ill.—*Water Gauge*.—October 6, 1868.—The metallic section is connected to the float by a shank and threaded sleeve, and has a pointer pivoted to it, which is struck by the short pin of the float pointer vibrating by motion of the float attached to the shank outside of the section.

Claim.—1. The employment of an independent registering pointer, R, in combination with the float pointer P, substantially as and for the objects herein described.

2. Operating the registering pointer R by means of the float pointer P, substantially as and for the purposes shown and described.

3. Having the registering pointer R pivoted upon

the sector, substantially as and for the purpose hereinbefore shown and described.

82,763.—GEORGE A. STARKWEATHER, Waymart, Pa.—*Process of Tanning Hides*.—October 6, 1868.

Claim.—1. The process of tanning hides or skins into leather, by the use of urine, alkali, fermented wheat bran, and decoction made from plants, salt, oil of vitriol, and tan liquor, as set forth.

2. The use of plants in laying away hides or leather.

82,764.—DAVID STEWART, Corinna, Me.—*Clevis for Plow*.—October 6, 1868.

Claim.—In combination with the spiral shaft D and link E, the slotted plate F, clamp bolt C, and nut on the stirrup G, for adjusting the side draught, as herein set forth.

82,765.—G. A. STEWART, Des Moines, Iowa.—*Desk and Seat*.—October 6; antedated September 26, 1868.

Claim.—A combination of the standards A A, folding seat C, bars D D, blocks E E, folding desk F, shelf G, box H, and slide I, all arranged and operating as herein set forth.

82,766.—JOHN H. STONE, Philadelphia, Pa.—*Sheet Metal Can*.—October 6, 1868; antedated September 26, 1868.—The end plates are secured to the side plates by means of an inside bead with a broad lap joint of three thicknesses, compressed and bent to form a right-angled flange, a sliding cover being made by a plate with a hole less than the mouth of the can, over which it is secured, so as to form laps for a slide.

Claim.—1. In combination with the internal bead *a'*, a lap joint, consisting of three thicknesses of the sheet metal pressed closely together, and the upper half of the same then bent inward to a right angle, so as to produce the annular flange *d* around on the inner side of the chime of the vessel, and parallel with the end plate of the same, substantially as set forth and described, for the purposes specified.

2. The sliding stopper or cover E F, constructed and operated as set forth, for the purpose of closing the mouths of sheet-metal vessels, as described.

82,767.—GEORGE W. TALCOTT, Buffalo, N. Y., assignor to himself and ISAAC D. VOAK, same place.—*Combined Floating Fire Engine and Wrecking Pump*.—October 6, 1868.—A supply pipe through the bottom of the vessel, with a shut-off valve, has a branch pipe, also with a shut-off valve, extending up through the deck floor, and communicating with the wreck, the discharge pipe of the pump having branches which terminate in nozzles connected with the hose pipes.

Claim.—1. The pipes C D, provided with valve *e*, and valve *f*, or cap, and uniting and connecting with a force pump, B, arranged in the hold of a vessel, substantially in the manner and for the purpose set forth.

2. The combination and arrangement, within a vessel, of the pump B, pipes C, D, G G', and nozzle chamber I, forming a combined floating fire engine and wrecking pump, in the manner described.

82,768.—SAMUEL A. TENNY, Muskego, Wis.—*Buckle*.—October 6, 1868.

Claim.—A clamp or buckle, consisting of the frame A, having inclined grooves, E, made in the side pieces D, and the block B provided with inclined flanges, F, and the loop G, all substantially as described.

82,769.—JUSTUS A. TRAUT, New Britain, Conn., assignor to the STANLEY RULE AND LEVEL COMPANY, same place.—*Adjusting Spirit Level*.—October 6, 1868.

Claim.—1. Suspending the vial case *c* within the stock *b*, and adjusting the same to its relative position with the stock *b*, by means of the plate *e'*, screw or screws *e*, and springs *d*, substantially as and for the purpose described.

2. The spirit vial case B, constructed as described, with the springs *k*, screws *n*, operated through

orifices in the plate *i*, substantially as and for the purpose set forth.

3. The combination of the adjusting plate or nuts *g*, springs *k*, and screws *n'*, substantially as and for the purpose described.

82,770.—LESTER UNDERWOOD, Ottawa, Ill.—*Hay Raker and Loader*.—October 6, 1868.—The parts are so arranged that the machine can be operated without the attendant being required to come down to disengage or lift the rakes. The revolving teeth and elevator may be removed so as to obtain a simple horse rake when desired.

Claim.—1. The arrangement of the ropes *t t* and *u u*, in combination with the standards *h h* and braces *v v*, substantially as described, and for the purpose of enabling the machine to be used from the wagon.

2. The clevis D, and pin *e'*, with rope attached, in combination with the loop *b'*, substantially as and for the purpose described.

3. The peculiar arrangement of the shaft *e'*, grooved pulleys *d' d'*, wheel *f'*, lever *h'*, and stirrup *k'*, in combination with the rakes C C C, substantially as and for the purpose described in the foregoing specification.

82,771.—ISAAC VAN HAGEN, Chicago, Ill.—*Die for Stamping Stove Pipe Dampers*.—October 6, 1868.

Claim.—A die, A G, the movable part, A, of which has a V-shaped projection, C, fitting in a corresponding depression, E, in the stationary part G, and the stationary part G having V-shaped projections D F, fitting in depressions B B in the movable part A, as and for the purpose described.

82,772.—N. A. VURGASON, Brooklyn, N. Y.—*Skirt Supporter*.—October 6, 1868.—The zone with a leather margin has hooks covered by a leather fillet and a hinge, the point of the spring catch fastening into holes, and the skirt being attached to the hooks by means of loops.

Claim.—The skirt supporter, constructed as described, of the hinged metallic zone A A, whose ends are secured together by the overlapping spring catch D, and whose outer surface is provided with the hooks *a a*, covered and protected by the flap or fillet B, said zone being attached at its lower edge to the inner curtain or flap G, all arranged as described, for the purpose specified.

82,773.—WILLIAM WEBSTER, Morrisania, N. Y.—*Loom for Weaving Pile Fabric*.—October 6, 1868; antedated August 24, 1868. The vibrating lever has two grooves, the inner walls of which are formed by the edges of the oscillating guide, and so arranged in connection with the sliding block and pusher that when the latter is drawn back the end of the lever with the wire is carried forward; the oscillating block having inclined planes, and working with its pin an oscillating lever and sliding rod to hold and liberate the wire.

Claim.—1. The guide C, pusher G, and sliding block B, in combination, when constructed, arranged, and operating substantially as described, and for the purpose set forth.

2. The vibrating lever D, having grooves E E', and oscillating guide F, or its equivalent, in combination with the pusher G, or its equivalent, for the purpose set forth.

3. In combination with the vibrating lever D, with or without the grooves E E', and oscillating guide F, the oscillating lever H, oscillating block I, having incline planes, and sliding rod J, substantially as herein described, and for the purpose set forth.

82,774.—ANDREW J. WEED, Hardwick, Vt.—*Sugar Pan Derrick*.—October 6, 1868.—The frame has on its cross beam friction rollers for the circular track, while between them and on its slide bars rests and slides a frame, to which are pivoted three shafts connected by ropes, each of them having a drum, and the central one also an endless rope, a ratchet wheel and pawl.

Claim.—1. The pivoted or hinged frame A, constructed substantially as described, in combination with the circular track C, as and for the purpose set forth.

2. The combination of the adjustable sliding frame

D, shaft E, drum *e'*, shafts F F, cross bar I, adjustable vertical bar H, and pivoted bar G, with each other, and with the pivoted frame A, substantially as herein shown and described, and for the purpose set forth.

82,775.—N. W. WHEELER, Ripon, Wis.—*Combined Harrow and Cultivator*.—October 6, 1868.—On the upper part of the forward cross bar of an ordinary harrow is a series of oblique drag bars, held in place by removable iron rods. In each of the drag bars is secured an iron bar, to the lower end of which is fastened the cultivator tooth.

Claim.—The combination, and mode of attachment, of a harrow and cultivator, substantially as described, and for the purposes specified.

82,776.—OTIS C. WHITE, Hopkinton, Mass., and AUSTIN T. ASHMEAD, Hartford, Conn.—*Dentists' Chair*.—October 6, 1868.—The seat frame is upheld by a bar jointed to its ends that swivels on the upper part of a vertical spindle, on which rests a friction collar, against which latter and from the frame projects an arched and slotted bar.

Claim.—1. The combination and arrangement of the slotted arched bar H', the swivel bar G, the clamp screw I, and the friction collar *g*, applied to the spindle and the seat frame, as specified.

2. The arrangement of the metallic seat frame D, (made with the foot and arm holes, as described,) the foot-rest supporting frame E, and the elevating screws, and their operative shaft and gears, as explained.

3. The combination, applied to the stand and the seat frame for effecting the adjustment of the latter in vertical and horizontal planes, as set forth, such consisting of the spindle, the feather connection, the rack, the scroll cam, (with its cranked shaft,) the collar *g*, the clamp screw I, the arched bar H', and the swivel bar G, arranged as specified and represented.

82,777.—B. H. WILCOX, Petroleum Center, Pa.—*Horse Power*.—October 6, 1868.—A cam table is turned by a sweep bar, the cams of the table vibrating a roller lever as the table revolves. A connecting rod connects the lever with a saw or other mechanism.

Claim.—The combination of the table A, having cam profiles C, and mounted upon the cross timber and plate J I, the pivoted lever D, rollers *a a*, connecting rod E, dovetailed slide H, and bed G, all constructed and arranged to operate as described, for the purpose specified.

82,778.—FREDERICK WITTRAM, San Francisco, Cal.—*Button*.—October 6, 1868.—The movable section is depressed, the edge or point of the disk is inserted in the button hole, and the stud turned so as to work itself through the hole. The movable section being then released, the spring recloses it.

Claim.—1. A button or stud, having an opening in its fastening disk or plate, closed by a movable segment or piece, substantially as shown and described.

2. In combination therewith, a closing or retaining spring, substantially as set forth.

82,779.—WALTER D. WOODS, Bennington, N. H., assignor to himself and EBENEZER F. WOODS, same place.—*Cutlery*.—October 6, 1868.—The tang of the knife or fork connected to the handle and the bolsters, formed at the same time, by casting metal into and on the handle and tang while both are in a mold.

Claim.—1. The handle B, made tubular throughout its length, and having the connection piece E of the two bolsters arranged in the bore of such handle, as specified.

2. The handle, as made with the tang-socket chamber *g*, arranged in it in manner, and to open out of its upper end, and with a passage, *f*, extended from such chamber to the rear of the handle, as set forth.

3. In combination with the chamber or socket mold *g*, formed in the handle, as set forth, the metallic bolster C, and tang supporter *p*, cast in one piece in and against the handle, and on the tang, as set forth.

4. The combination of the rivet-projection passage

h of the handle B with the bore *f g* thereof, as set forth.

5. In combination with the handle B and its metallic bolsters C D, and their connection E, when cast in one piece in the handle, as described, the rivet-projecting molding passage of the handle, and the metal *o* cast therein, and in one piece with the connection E, as specified.

6. The combination of the rear tang hole *l* with the metallic extension *n*, the rivet projection *o*, and its molding passage *h* of the handle B, as set forth.

7. The handle as formed tubular throughout, or from end to end, and with the two bolsters and their metallic connection cast in one piece with respect to such handle, and upon the tang of the blade, the whole being substantially as described.

82,780.—HORACE B. WOOSTER, Waterbury, Conn., assignor to WATERBURY BRASS COMPANY.—*Machine for Scouring Sheet Metal*.—October 6, 1868; antedated April 6, 1868.—For cleaning sheet brass and other metal after annealing. The metal being drawn through the machine is held against the wire brushes by the riders, and it is thus scoured and polished.

Claim.—1. The described arrangement of the revolving brushes B C, guide roller F, winding-up roller D, gearing E, and adjustable riders *b c*, all operating as described, to polish thin elastic strips of sheet metal, as herein set forth.

2. The revolving brushes B and C, in combination with the adjustable riders *b* and *c*, all made and operating substantially as herein shown and described.

3. The described arrangement of the cylinder D with relation to the revolving brushes B C, and adjustable riders *b c*, for winding and unwinding the sheet metal, in the manner herein set forth and shown.

82,781.—JOHN WYKOFF, Grant City, Mo.—*Compound Doubletree*.—October 6, 1868.—The draft may be equally apportioned among the three horses if they are of equal energy and strength, but either of the outside horses may be favored by shifting the pivot bolt of its doubletree.

Claim.—The doubletrees D D, tongues A A, singletrees E G E, chains *b b*, or their equivalent, all constructed and operating substantially as and for the purpose shown and described.

82,782.—GEORGE W. N. YOST, Corry, Pa., assignor to CORRY MACHINE COMPANY, same place.—*Harvester*.—October 6, 1868.—The finger beam is attached to the forward outer corner of the floating bar, through the median of which the attachment of the cutting apparatus to the machine is made at the middle of the main frame thereof.

Claim.—The elastic floating bar S, rigidly attached to the main frame or body A and A', with the end *l* fastened to the middle of the hind end of the body, and with end *k* fastened to the middle of the fore end of the body, as described, for grass and grain cutting machines.

82,783.—ANSON T. ADAMS, Indianapolis, Ind.—*Furniture Caster*.—October 6, 1868.—A spherical ball made of any non-conductor of electricity rests in a spherical metal socket which is made in halves and held together by a nut.

Claim.—The combination of the spherical socket of the halves B C with the hexagonal edge, held together by the nut *d* and the conical screw *e*, as and for the purpose specified.

82,784.—Dr. T. H. ASHTON, Defiance, Ohio.—*Clod Crusher*.—October 6, 1868.—The rollers break and crush the large clods, rendering the soil fit for the action of the harrow.

Claim.—The double harrows A A and rollers D D, when the same are so combined and arranged as to operate substantially as described, as and for the purpose specified.

82,785.—HARISON W. AUSTIN, Portage, Mich.—*Equalizing Whiffletree*.—October 6, 1868.—This device relieves the middle horse of a part of the reactionary check which is occasioned by the sudden starting ahead of one of the outside horses.

Claim.—1. The arrangement of the equalizing eveners E with both of the doubletree strips A, grooved pulley p, chain F, and whiffletrees D and D', all constructed and operating substantially as and for the purpose herein set forth.

2. The arrangement of the eveners E E in such relation to the whiffletree D', by means of the pulley P, and chain F, that when an outside horse starts, the reaction will be divided between the other horses, in the manner substantially as described.

S2,786.—N. W. BANCROFT, Worcester, Mass.—*Gas Machine.*—October 6, 1868.—This invention relates to machines in which the atmospheric air is carbureted by passing it through the more volatile hydrocarbon oils.

Claim.—1. The pump or fan, consisting of the cylindrical case F, with the curved partitions b, and having the inlet openings e, and exit holes o, arranged substantially as described.

2. The air chamber C, having the partition h, with the valve i, and pipes p, arranged to operate as set forth.

3. The reservoir B, with the flexible diaphragm f, and the gas pipe X with its regulating valve Z, constructed and arranged to operate substantially as described.

4. The copper plate K, located under the chamber J, for the purpose of conducting and equalizing the application of heat to the fluid, as set forth.

5. The circulating chamber, formed by the application of the plate C, with its opening m arranged within the chamber J, substantially as described.

6. The use of the cement, herein described, for preparing the flexible diaphragm and other parts of the machine, as set forth.

S2,787.—E. S. BARNES, Nebraska City, Nebraska.—*Propelling Apparatus.*—October 6, 1868.—The paddles are connected to sliding heads, and are caused to simultaneously approach and recede from the central joint pin of the lazy tongs arrangement, which connects them, devices being provided whereby the backward-moving paddle is made to act upon the water while the forward-moving one is feathered.

Claim.—1. The cogged sectors C C', in combination with the paddle D, when arranged and operated substantially as set forth.

2. The combination of the reversing sectors E E' and their operating bar E², when acting to operate the bar C³ and rack c³, for feathering the paddles at either end of stroke, and reversing the same, substantially as set forth.

S2,788.—STEPHEN BARNES, New Haven, Conn.—*Composition Clock Dial.*—October 6, 1868.—The depressions in the die representing the letters and ornamental designs are filled first with a composition, colored black or otherwise, then the body of the die is filled with the white or other composition forming the main part of the dial, and a homogeneous character is given to the mass by fusion. A perforated plate imparts strength to the dial.

Claim.—1. A composition clock face or dial, formed from a plastic composition, substantially in the manner described.

2. A composition clock dial, in which the raised letters or ornamentations, while made in one piece with the body of the dial, are formed of a composition differing in color from that of which the body is composed.

3. The application, to a composition clock dial, of a perforated plate, or its equivalent, pressed into the dial while the latter is in a plastic state, substantially as set forth.

S2,789.—FREDERICK BAUSCHTLIKER, Washington, D. C., assignor to himself and FREDERICK GENTNER, same place.—*Saw for Felling Trees.*—October 6, 1868.—A pair of saws is pivoted to a reciprocating frame and fed into the tree by a ratchet wheel attached to a right and left hand serew, which latter works in the ends of the saws.

Claim.—The double-bladed saws J J, serew N, ratchet P, and movable frame G, when arranged, combined, and operated as herein described, and for the purpose set forth.

S2,790.—THOMAS BLAKE, Stockton, Cal.—*Bushing for Wheels.*—October 6, 1868.—When the eye of the bushing becomes worn by the friction upon its axle, the bushing can be driven out and replaced by a new one.

Claim.—The bushing C, provided with the cylindrical bore D, and having its external surface polygonal, as and for the purpose described.

S2,791.—PETER BORN, New York, N. Y.—*Folding Chair.*—October 6, 1868.—The arms and front legs are connected by a cross bar and are hinged to the back, so that they can be folded closely. The seat is hinged to the back and supported by the cross bar when in use.

Claim.—1. The part C, composing the arm pieces and front legs, when constructed in one piece, attached to the back, B, by pivots, a, and arranged to fold up in the manner and for the purpose described.

2. The parts B and C, when constructed as described, in combination with the hinged seat D, substantially as and for the purpose set forth.

3. The stops d and cross bar c, in combination with the part C, seat D, and part B of a chair, all constructed and operating as and for the purpose set forth.

S2,792.—T. J. BOWDLE, S. R. LAWDER, and F. E. JOHNSTON, Piqua, Ohio.—*Machine for Tenoning Blind Slats.*—October 6, 1868.—The movement of the T-shaped lever actuates the shoulder-cutting bits and the tubular rotary tenon-former simultaneously.

Claim.—1. A T-shaped vibrating lever P, in combination with toggle joint levers N N, suitable connecting links M M, and with sliding earriages C C, carrying the shoulder-cutting bits a a of a slat-tenoning machine, all arranged and operating substantially as and for the purpose herein set forth.

2. In combination with the foregoing devices, combining with one arm p', of said vibrating lever P, a connecting link R, pivoted to a collar, G, embracing the tubular center bit F of the machine for the purpose of operating the same, all substantially as is herein specified.

S2,793.—JOHN BREWER, New Vienna, Ohio.—*Combined Land Roller and Clod Pulverizer.*—October 6, 1868.—Designed to break up the ground and cover the seed at the same time.

Claim.—The drums B B, provided with knives C C, in combination with the cultivator E, when constructed and operating substantially as and for the purposes herein set forth.

S2,794.—JAS. H. BROWN, Mitchell, Ind.—*Peach Parer.*—October 6, 1868.—The fork has two prongs, one stationary, the other, pivoted to the fork shaft, has a handle resting over a spring, so that the fork can be adjusted to any sized fruit.

Claim.—The curved prong a, pivoted in its center to the arm H, above the stationary prong b, and its rear end resting on a spring, d, in combination with the knife-supporting shaft I, pivoted at its lower end, and working in a slot in the frame A, all as herein shown and described.

S2,795.—SMITH S. BROWN, Woonsocket, R. I.—*Cheese Cutter and Box.*—October 6, 1868.—The cheese rests on pins at the center and near the periphery of a rotating table, which latter is provided with radial slots on which a wire is made to slide to cut the cheese.

Claim.—A cheese box and cutter, having tables D and E, pivot d, pin e, cover A, cutting wire H, and guide g, constructed, arranged, and operating substantially as specified.

S2,796.—SMITH S. BROWN, Woonsocket, R. I.—*Curtain Fixture.*—October 6, 1868.—Designed to facilitate the mounting of the curtain roller, and to tighten the elevating cord.

Claim.—A fixture for window curtains, having roller B, slotted plates C, D, and G, with their respective thumb screws, head plate E, swinging plate O, pulley Y, and cord V, constructed, combined, and arranged substantially as herein specified.

82,797.—WILLIAM BROWN, Duncannon, Pa.—*Sash Fastening.*—October 6, 1868.—The slotted plates operate as dogs to sustain the respective sashes by engagement with the notches on the edges thereof. They also serve as shackles to lock the sashes by catching over the blocks.

Claim.—The device, composed essentially of the angular plate D, with the shafts E and F, bearing the slotted plates H H', and the weighted handles G G, when used in combination with the notches *n n*, and block I, upon a sash or door, substantially as and for the purpose specified.

82,798.—B. Q. BUDDING, Worcester, Mass.—*Boot and Shoe Heel-polishing Machine.*—October 6, 1868.—Improvement on the subject of his patent of May 3, 1864. When the shoe is being jacked or clamped, pressure upon a treadle forces the jack away from the polisher. This pressure being withdrawn the spring carries the heel up to the polisher, and the edge of the heel against the polisher flange, which prevents the outer lift from spreading away at its edge while the jack is being rocked to bring the whole edge of the heel under the action of the stationary polisher.

Claim.—1. In combination with the jack supporting bearing or bracket, a jack, held up toward the polishing tool by a spring, substantially as set forth.

2. In combination with the jack plate *r*, the heel-clamping mechanism, substantially as shown and described.

82,799.—F. P. CANFIELD, Brighton, Mass.—*Hoisting Apparatus.*—October 6, 1868.—The rope barrel is suspended upon levers so arranged that the weight on the barrel shall apply sufficient friction to the brake wheel to hold it, and enable the machine to sustain the suspended weight. Levers combined with the brake device are connected with the pull-rope, by means of which the friction may be taken from the brake wheel.

Claim.—1. The hoisting barrel C, when supported independently of the fixed bearings K K', arranged and operating substantially as shown, and for the purpose set forth.

2. The levers L L', when so arranged, in relation to the winding barrel C, as to convey a portion of the weight suspended therefrom to act upon the brake device, substantially as described, and for the purpose set forth.

3. The general arrangement of the levers Q Q', bar R, and guide rollers S S', when acted upon by the lateral motion of the pull rope T, substantially as described, and for the purpose set forth.

82,800.—JOHN CHRISTIE, Lowell, Mich.—*Bed Bottom.*—October 6, 1868.—The short removable portion of the bottom, which is to be elevated for invalids, is supported by the cross bars and held in the desired position by tightening the thumb screw.

Claim.—In a bed bottom, composed of the springs A A, connected and constructed as described, the arrangement of the short bars C C, cross bar E, and slotted diagonal bars F F, and screw G, the whole operating as specified.

82,801.—JOHN J. CLARK and THOMAS CLARK, Elgin, Ill.—*Blind Slat Tenoning Machine.*—October 6, 1868.—The slat is held in slots in the gear wheels by springs; the gear wheels are revolved to bring the slat in position to have the tenon and shoulders of the same cut, by means of cutters and saws on a rotating cylinder.

Claim.—Cylinder P, provided with saws *e* and *e'*, knives 1, 2, and 3, in combination with wheels W and W'', constructed and arranged to operate together substantially as and for the purpose set forth.

82,802.—LYMAN S. COLBURN, Oberlin, Ohio.—*Slat Machine.*—October 6, 1868.—The heads hold the slats to be operated upon, and the work is so presented to the machine that the ends are first sawed off, and the pivots or tenons formed by rotating it against the cutters. A staple-inserting mechanism is operated automatically and in concert with the cutting and tenoning mechanism, devices being employed to support the stuff against the lateral force of the staple driver.

Claim.—1. The revolving heads I, constructed with apertures therethrough, corresponding with the form of the cross section of the slat, for its insertion therein endwise, substantially as set forth.

2. The combination of the arms H H', carrying the revolving heads I, the wheel X, segmental rack J, and notched hub *f*, all supported on the rock shaft G, for operation, substantially as described.

3. The arrangement and combination of the sliding bar M and head N with the holding block W, operating together by means of the wrist *t*, toe *r*, and springs *x x'*, substantially as shown and described.

4. The staple-holder, supported on the sliding head N, consisting of two vertical standards *p' p''*, provided with a lower outlet at right angles to their position, for the passage of and to guide a single staple, when propelled by the driver *q*, substantially as set forth.

82,803.—LYMAN S. COLBURN, Oberlin, Ohio.—*Machine for Boring Window Blinds.*—October 6, 1868.—For boring the sides to prepare them to receive the pivots of the slats, and marking the position for the mortises for the insertion of the cross-bars. The mechanism marks both stiles at a time, and simultaneously with the boring operation.

Claim.—1. The marker *m*, arranged and operating in combination with the notches *e*, in the under side of the feed strip N, the pawl *q*, and reciprocating frame F, essentially as specified.

2. The feed-strip N, pawl *w*, pitman *t*, and wrist *s*, arranged and operating substantially as shown and described.

3. The combination of the reciprocating spindle frame F, the eccentric pin *k*, and wrist *s*, on the revolving head J, and the pitman *t* and pawl *w*, when said pin and wrist are so arranged as to raise the bits *i* into the wood as soon as the pawl *w* has finished each feed-motion of the stuff, substantially as set forth.

82,804.—HENRY N. CONKLIN, Indianapolis, Ind.—*Door and Gate Closer.*—October 6, 1868.—A chain fastened to the gate is secured to the upper end of a weighted lever, pivoted in such a manner as to close the gate.

Claim.—A gate or door-closing device, having lever *a*, pivot *b*, and chain *d*, constructed, arranged, and operating substantially as herein specified.

82,805.—JULES CONVERSE, Paris, France.—*Making Crank Shaft.*—October 6, 1868.

Claim.—The improved method, herein described, of making crank axles, by forging them first, as usually done, in one solid piece, then boring the shouldered parts thereof, and strengthening the same by introducing separate pins, D, of steel or other strong material, embraced entirely within the metal, as and for the purposes herein set forth.

82,806.—WILLIAM J. COWAN, Cortland, N. Y.—*Potato Digger.*—October 6, 1868.—The share enters and passes under the hill, dirt and potatoes being forced over the curved rods which separate the dirt by means of the jar of the machine. The potatoes are fed over the apron on to the ground, which has been smoothed by the apron.

Claim.—The combination of the sides *bb*, the point or share *a*, and the curved rods *c c*, with the apron *d*, when constructed substantially as above described, and for the uses and purposes set forth.

82,807.—R. A. COWELL, Cleveland, Ohio.—*Railway Car Coupling.*—October 6, 1868.—A bolt is pivoted to rods, (which slide vertically in the draw-head,) and is held in position by a spring, so that when the coupling enters the bolt rotates until the end of said coupling passes, when the bolt drops.

Claim.—1. The connecting bolt or pin C, constructed with the pivots *a* and arms *x*, and operating in combination with the spring *f* and slot *b*, substantially as and for the purposes described.

2. In a railway car draw-head, arranging the chamber D with the superior recess or apartment E, in combination with a connecting bolt or pin, as C, having a rotary and vertical action, all constructed and operated substantially as herein described.

S2,808.—CHARLES B. CURTIS, Jordan, N. Y.—*Machine for Grinding Cutters of Mowing Machine.*—October 6, 1868.

Claim.—1. A frame for supporting a cutter-bar upon the frame of an ordinary grindstone, constructed with an adjustable slotted bed piece, A, and clamp hooks B, and an oscillating support for the clutches, by which the cutter bar is secured, substantially as described.

2. The combination of the bed piece A, so constructed that it may be adjustably attached to the grindstone frame, the side pieces E, attached to the bed piece, so as to be vertically adjustable, and the clutches, for holding the cutter bar, substantially as described.

3. The clutches H, attached to the frame by crank rods, so arranged that the knives may be set at any required angle, substantially as set forth.

4. In combination with the end clutches, an intermediate clutch, attached to an adjustable standard, and sliding upon the cross bar G, substantially as and for the purpose set forth.

S2,809.—S. T. DENISE, Red Bank, N. Y.—*Plow.*—October 6, 1868.—The colter is provided with a sharp inclined front edge, and its top is so bent that the weeds, sticks, &c., which may be forced to its top, will be dropped on the mold-board side of the plow, and not catch under the beam.

Claim.—1. The colter, when terminating at its lower end in the point A, and its upper end in the bent lip, e', between which is the sharp cutting edge e, the whole being constructed substantially as described.

2. The brace rod F, when constructed of a single piece, uniting the beam and both handles, substantially as and for the purpose specified.

S2,810.—ISAAC DRIPPS, Fort Wayne, Ind.—*Railroad Car Heater.*—October 6, 1868.—A current of air from the top of the car is carried through or over a body of water, then passed around a stove or heater, then into the car through registers in the floor.

Claim.—An apparatus for heating and ventilating railroad cars, combining the following elements, viz, a double funneled hood, A, with a centrally suspended oscillating valve, V, pipe, B, water tank, C, heater, D, with inclosing casing, arranged as described, a pipe, E, and registers, R, and a ventilator so constructed as to create an outward draught, substantially as described.

S2,811.—J. B. DRISCOLE, New York, N. Y.—*Hot Air Furnace for Heater.*—October 6, 1868.—The fire box is provided with a lateral extension, in which is placed a supply of fresh fuel ready to be delivered into the fire.

Claim.—The fire pot A, with a horizontal extension, G, of pyramidal or conical form, constructed and operated substantially as and for the purpose set forth.

S2,812.—ERNEST MARIE DU BOYS, Paris, France.—*Liquid Meter.*—October 6, 1868; antedated May 9, 1867.—The interior of the gauging vessel is divided into two compartments by a movable diaphragm. A distributing cock puts one of the compartments in communication with the entrance pipe, and the opposite pipe with the delivery pipe, said cock being operated by suitable mechanism connecting with the diaphragm.

Claim.—In combination with the shallow gauging vessel, divided into two compartments by an elastic diaphragm, which moves to and fro therein, by the pressure of the liquid on one side and then on the other side thereof, a mechanism constructed and operated substantially as herein described, for putting the compartments in alternate communication with the entrance and exit pipes or passages, as and for the purpose herein described.

S2,813.—WILLIAM DUNCAN, Vinton, Iowa.—*Horseshoe Calk Sharpener.*—October 6, 1868.—The cutting wheel fits in the end of a spring, which latter is secured to a bar expanded and sharpened near the cutting wheel.

Claim.—The shank or bar A, spring b, and cutting wheel B, all combined and operating substantially in the manner and for the purpose specified.

S2,814.—DANIEL S. EARLY, Hummelstown, Pa.—*Cultivator.*—October 6, 1868.—A central beam has pivoted to it two side beams which fit in clasps attached to a cross-bar which slides over the central beam, thus regulating the width of the rows, and is held in position by a bolt passing through it and one of a series of holes in the beam.

Claim.—1. The sliding bar E, in combination with the central beam A, the hinged side beams D D', and the fastening p, substantially as described and for the purpose specified.

2. The arrangement of the beams A, D D', slide E, elevis F, wheel B, handles C C, and plows or teeth P P P, in the manner shown and described.

S2,815.—ALBERT G. EATON, Gouverneur, N. Y.—*Apparatus for Tanning Hides.*—October 6, 1868.

Claim.—1. In combination with vats for tanning hides, a series of lifting pumps, arranged in and operated at the bottom of the vat, for raising the heavier and stronger liquids from the bottom to the top of the vat, and thus by mixing render it of more uniform strength throughout, substantially as described.

2. In tanning hides, the throwing of the tanning liquid against the hides, suspended in the air, by a force pump, or in a forced column or spray or jet, substantially as described.

3. In combination with a series of pumps, arranged in and operated at the bottom of the vat for raising the liquid in the bottom of the vat to the surface, an agitating or circulating pump, also arranged in and operated at the bottom of the vat, for keeping the liquid mixed there, and of uniform strength, substantially as described.

4. In combination with a series of hides suspended in a vat, and at times dipped into the liquid and then raised therefrom and suspended in the air, a circulating and a lifting pump, or two more of each, operated by or with the vibrating frame, carrying said hides, substantially as described.

S2,816.—JACOB FELBER, St. Louis, Mo.—*Machine for Mortising, Slotting, and Dovetailing.*—October 6, 1868.—One of the rotating arbors carries the tool at one end and has a rotary motion about its axis and a pendulous motion of its tool end, which latter motion is for the purpose of giving the required length to the mortise; the line of this motion may be straight in a vertical, horizontal, or angular plane, or it may be a curved line of any desired radius.

Claim.—The combination of the arbor B, pivoted by ball-and-socket bearing at D¹, and guided by ball-and-socket bearing in the sliding head D, with said head D, the segmental plate D², pedulum D³, its slot d², and the pivot pin d³, when operating substantially as and for the purpose set forth.

S2,817.—GEORGE FENN, Boston, Mass.—*Wash Boiler.*—October 6, 1868.—An additional boiler provided with a perforated bottom and cover, is so arranged within the main boiler as to leave a space around the sides and bottom of the inner boiler to allow the water to pass up and over the perforated cover and down through the inner boiler.

Claim.—The combination, with the external boiler a, of an internal boiler, b, provided with a perforated bottom, c, cover d, and springs i, and surrounded at the bottom and sides with a space, h, substantially as and for the purpose set forth.

S2,818.—JOSEPH B. FLEMING and DANIEL J. FLEMING, Xenia, Ohio.—*Construction of Powder Kegs.*—October 6, 1868.

Claim.—1. The process of making sheet-metal kegs, cans, &c., as above described, the essential feature of which process consists in leaving a large opening, E E, in the head that is last attached, through which opening a mandrel is inserted, upon which to form the joint around the edges or chimes, after the removal of which the opening is closed up by means of a piece soldered over it.

2. A keg or can, constructed as above set forth.

S2,819.—VALENTINE FOCERTY, Roxbury, Mass.—*Magazine Fire-arm.*—October 6, 1868.—Designed as improvements on his patents of February 21, 1865, and October 23, 1866.

Claim.—1. In combination with the magazine,

the rocking finger *i*, for throwing the cartridge laterally from line with the magazine into line with the barrel, substantially as set forth.

2. Throwing the finger *i* laterally forward by the rear movement of the guard lever against the arm *l* on the finger journal or rock shaft, substantially as described.

3. Throwing the finger back to its former position by the forward movement of the breech pin, directly against it, substantially as described.

4. Combining with the breech block a notch, *v*, for receiving the cartridge flange and for preventing undue movement of the cartridge moving forward at the side thereof, when the same, in its retrograde motion, releases one cartridge and takes the next in rotation, substantially as described.

5. The lever *q*, with its tongue *v* and tip *w*, constructed substantially as shown, and operating in conjunction with spring *t*, to withdraw and expel the cartridge shell and to guide the cartridge into the barrel, substantially as set forth.

6. The combination, with lever *q*, having projections *y* and *e'* thereon, of the studs or pins *a'* and *d'*, for tripping the lever in its forward and back movements, upward and downward, by positive action in both directions.

7. Connecting the lever *q* with the breech block *e* by the link *r* by means of a pin, *b²*, projecting into a groove *e²*, in the block, substantially as and for the purpose set forth.

8. Combining with the magazine slide and the breech block the pin *f'* and its notched spring, for arresting positively the feed of the cartridges, substantially as described.

82,820.—CHARLES G. FOOTE, Indianapolis, Ind.—*Rotary Engine*.—October 6, 1868; antedated September 21, 1868.—The piston is provided with an eccentric abutment which operates the slide valve, the latter being attached to a piston working in a cylinder in such a manner that the pressure of the steam prevents the valve from falling rapidly, and thus pounding or jolting.

Claim.—1. The valve C D E, constructed substantially as set forth.

2. The combination of all the parts described in one device, constructed in the manner and for the purpose substantially as set forth.

82,821.—MERWIN FOWLER, Wolcottville, Conn.—*Buckle*.—October 6, 1868.—The tongue and loop are formed in one piece by bending the wire around the end of the frame.

Claim.—A buckle, consisting of the frame A, the loop B, and tongues C C, the said loop and tongues being formed in one piece, and hinged to the frame, so as to be retained in their proper relative position, substantially as herein set forth.

82,822.—C. O. GARDINER, Springfield, Ohio, assignor to J. H. THOMAS and P. P. MAST, same place.—*Grain Drill*.—October 6, 1868.—The cup is made of a thin shell of cast iron in two parts, bolted or riveted together, and is provided with flanges by which it is secured to the hopper. A flange projects inwardly around the apertures in which the shaft is inserted, forming a bearing for the cylinders.

Claim.—1. The cup A, formed substantially as described, with the inwardly-projecting flanges *e* on the inner face of its sides, as set forth.

2. In combination with the cup A, the cylinder B, so constructed as to leave a space between its ribs *o* and the sides of the cup, to prevent the crushing of the grain, as described.

82,823.—W. C. GARRETSON and ELWOOD DRAPER, assignors to W. C. GARRETSON, Oskaloosa, Iowa.—*Branding Stamp*.—October 6, 1868.—The stamp composed of some good conductor of heat is secured to bent wire which is attached to a shaft, which latter is provided with a handle and a spiral spring to draw the stamp back into the flame of a lamp. The post mark is burned into the letter and the stamp is cancelled by burning.

Claim.—The device herein described and set forth, consisting of the lamp *e*, the stamp *a*, actuating lever *b*, with suitable base *j*, arranged substantially

and to operate as described and set forth, for the purposes specified.

82,824.—AMOS F. GERALD, Kendall's Mills, Me., assignor to B. B. BELCHER, Chicopee, Mass.—*Curtain Fixture*.—October 6, 1868.—A spiral spring secured to a disk sets in a hollow cup-shaped head of a bracket; the disk resting and pressing against the end of the roll causes the curtain to remain in position. A tongue on the other bracket prevents the cord from escaping from the spool.

Claim.—The construction and arrangement of the cup-shaped bracket C, and the conical spiral spring B, contained within it, and having the disk A rigidly attached to its smaller end, in combination with roll R and bracket C', having projection J and tongue D', all arranged, constructed, and operating as herein described and shown, substantially as described.

82,825.—WM. E. GOODENOUGH, Newark, N. J.—*Saw Set*.—October 6, 1868.—The hammer is operated in the manner similar to the hammer of a pistol. A guide secured to the stock supports the sides of the saw teeth when being set; an adjustable arm secured to the guide has friction rollers which act as guides to the upper edge of the teeth. Another roller on the end of an adjustable arm projecting from the frame, guides to the blade and regulates the set.

Claim.—1. The combination of the guide bar *m* and adjustable frame *p*, carrying the guide rollers *n*, with the stock A, hammer B, and adjustable guide roller W, all arranged and operating substantially as shown and described.

2. The spring *e* having a projection *h*, and notch *i*, attached to the sector D, in combination with the stud *a* on the trigger, and adjustable stud *c*, for operation together, substantially as set forth.

82,826.—D. W. GOULD, Fostoria, Ohio.—*Sled*.—October 6, 1868.

Claim.—The cast-iron bob sled, when each side, including runners, knees, and fender, is cast entire in one piece, as herein set forth and described.

82,827.—PATRICK H. GRIFFIN, Albany, N. Y.—*Key for Hydrant Cock*.—October 6, 1868.—The key is composed of an oblong hollow block fitted to pass freely over the faucet handle; the upper part has a tapering socket to receive the end of the lower part of the rod.

Claim.—As an article of manufacture, the cast-metal socket C, constructed substantially as described and for the purpose set forth.

82,828.—STINSON HAGAMAN, Weissport, Pa.—*Machine for Grinding and Polishing School Slates*.—October 6, 1868.—The slate carriages, fastened to an endless belt, are mounted on four friction rollers (which run on rails on the frame) by two springs, which hold the slates against the rubbing wheels. The beds of the carriages are guided by shoulders when passing under the rubbing wheels.

Claim.—1. In combination with one or more horizontally rotating rubbing wheels, an endless belt, with slate carriages mounted thereon, for the purpose of carrying the slates under the rubbing wheel or wheels, substantially as described.

2. In combination with one or more rubbing wheels, as described, and an endless belt, for the purpose of carrying the slates, as set forth, the slate carriages H, with their friction wheels and springs, as described.

3. In combination with the endless belt, and slate carriages mounted thereon, as described, the ledges or tracks *l* and shoulders *t*, on the rails of the machine, for the purposes set forth.

4. The combination of the driving shaft G, the pulley wheels E, F, and F', with the endless belt E', for rotating the rubbing wheels, and the pinion I, worm screw J, and pulley wheels C and C', for carrying the endless belt D, all arranged and operating substantially as described.

82,829.—HENRY J. HALE, Indianapolis, Ind.—*Bed Bottom*.—October 6, 1868.—Lateral motion is prevented by attaching friction rollers to the under

side at the corners of the upper frame and allowing them to run in vertical guide pieces.

Claim.—The corner guide pieces C, in combination with the friction rollers D, hung in adjustable bearings *e*, attached to the upper metallic frame, substantially as and for the purpose set forth.

82,830.—A. F. HAMMEL, St. Louis, Mo.—*Breast Yoke for Double Harness.*—October 6, 1868.—The breast yoke is jointed and attached to the breast collar, the forward part being divided for the reception of the swivel which has a lateral motion on its pivot. The swivel has a loop for the reception of the pole strap, said loop having a vertical motion.

Claim.—1. The collar A and yoke B, jointed at *b* and *b'*, when combined and arranged substantially as described,

2. The swivel C *c*, in combination with the breast yoke B, as and for the purpose set forth.

82,831.—ELAM HARTER, Dowagiac, Mich.—*Automatic Gate.*—October 6, 1868.—The wheels of a vehicle, in passing upon the platform, depress an arm from which a system of levers is actuated to withdraw the spring catch that locks the gate.

Claim.—1. The combination of the gate, truck wheels, inclined bars or rails, and vibrating platform, with the levers and chains, (or equivalents of the latter,) by means of which, pressure upon the platform causes the gates to run asunder on the inclined rails, substantially as described.

2. The mechanism, herein described, for locking and unlocking the gate, substantially as shown and described.

82,832.—WILLIAM H. HAWLEY, Utica, N. Y.—*Grappling Iron.*—October 6, 1868.—A hooked bar suspends a pulley from a grappling iron of the kind described in letters-patent No. 69,992, to same inventor, October 27, 1867.

Claim.—The combination of the pulley A with the grappel, constructed and operating substantially as described, and for the uses and purposes mentioned.

82,833.—CHARLES H. HERSEY, Boston, Mass.—*Rotary Pump.*—October 6, 1868.—Has reference to the situation of the ingress and egress passages and to a construction by which the fluid is prevented from choking and retarding the pump at certain positions of the pivoted piston piece.

Claim.—1. The pump, constructed as described, with semi-spherical shell or body, conical diaphragm, and flat-surfaced head, when the inlet and outlet passages are located and arranged as and for the purpose set forth.

2. In combination with the parts last above named, the construction shown at 5, for the purpose specified.

82,834.—W. O. HICKOK, Harrisburg, Pa.—*Paper-ruling Machine.*—October 6, 1868.—The beam which holds the pens may be adjusted with accuracy, to suit any inequality in the paper passing under them, without binding or straining; this is due to the provision for the exact longitudinal and vertical adjustment of the pen beam.

Claim.—1. Suspending the pen beam of a paper-ruling machine by means of the ball joints D and D', in combination with sliding standards B and B', operating together, substantially as and for the purpose described.

2. The ball joint D', consisting of the socket *h*⁴ and the perforated ball therein, in combination with the stem *a'''* on the end of the pen beam, the said parts operating together substantially in the manner described.

3. In combination with the pen beam A and sliding ball joint D', the solid ball joint D, consisting of the spherical cavity within the clamp *a' a''* on the end of the pen beam A, and the solid ball *g*⁴ on the end of the screw *g''*, the said parts being constructed and arranged to operate substantially as and for the purpose described.

4. In combination with a pen beam, A, suspended upon the ball joints D and D', as described, the sliding standards B and B', operated by means of their respective screws *e''' e'''*, substantially as and for the purpose described.

5. In combination with the pen beam of a ruling

machine, the stem *a'''*, constructed and applied substantially as and for the purpose described.

82,835.—P. V. HIXON, Tioga, Pa.—*Harrow Teeth.*—October 6, 1868.—The teeth of the harrow can be withdrawn and turned so as to present new cutting edges toward the front.

Claim.—The gib A, provided with projections *a*, in combination with the shank B, provided with corresponding indentations in all of its four faces, and tightening key D, all constructed and operated in the manner and for the purpose set forth.

82,836.—B. H. HOBARD and D. C. LAMPMAN, Troy, Pa.—*Fastening Horse Collar.*—October 6, 1868.

Claim.—The hollow end piece B, provided with a spring-actuated catch concealed within the same, when secured to one side of the horse collar S, and made to fit into a socket, A, secured to the other side, the whole constituting an improved fastening for the collar, substantially as herein set forth.

82,837.—ASA HOCKETT and ALBERT C. HOCKETT, Plainfield, Ind.—*Tile Machine.*—October 6, 1868.—The clay, being fed to the front of the follower from the tub, is forced through the screen, and when the space between the screen and die is filled by the continued reciprocations of the follower, the latter presses the clay through the die, thus forming the tile.

Claim.—The arrangement of the frame or box A, tub B, sliding frame H, follower G, gravel screen L, and die M, all constructed as described, and operating substantially as and for the purposes herein set forth.

82,838.—ALFRED HOSMER, Watertown, Mass.—*Stall for Horses.*—October 6, 1868.—The gutters receive and discharge the liquid excrement which passes through the interstices of the stall floor. The space under the manger may be closed and a current of air admitted thereto to dry the bedding.

Claim.—1. The animal stall A, when constructed and arranged substantially as and for the purpose described.

2. The gutter B, provided, by means of its position or form, with an inclined groove, having one or more outlets, and applied to a double or single floor, for the purpose of draining the same, substantially as described.

82,839.—JOSEPH HOWE, Mount Pleasant, Iowa.—*Brace for Carriage.*—October 6, 1868.—The braces prevent the carriage body from swaying or pitching longitudinally. The ring turns to allow the braces to conform to the vertical motions of the body.

Claim.—The ring *a*, ball and socket joints *c* and *d*, and plate *b*, in combination with braces C, attached to the body of a carriage, as described, and operating as and for the purposes set forth.

82,840.—LIVERUS HULL, Charlestown, Mass.—*Whip Handle.*—October 6, 1868.

Claim.—1. The improved whip handle or manufacture, as having one or more knit, woven, or braided bands, laid in one or more helices, about and cemented to a braided or wound covering of thread, previously laid or formed on the stock of the handle.

2. The combination and arrangement of the "Turks' heads," or their equivalents, the body covering of thread, and the helical bands, laid on and cemented to such body covering, as set forth.

82,841.—HOSEA H. HUNTLEY, Quincy, Ill.—*Steam Boiler Furnace.*—October 6, 1868.—Cold air is passed into the apertures and through the passages and tubes, and is drawn from the chambers connected therewith, in a heated condition, to the fire. The air is thus converted into inflammable gas, increasing combustion and obviating smoke.

Claim.—A furnace, having grate bars C, with apertures D, passage G, tubes O and K, and chambers B, H, L, and M, constructed, arranged, and operating substantially as specified.

82,842.—A. B. HURD, Watkins, N. Y.—*Combined Measure and Weigher.*—October 6, 1868.—Combined with a suitable receptacle is a hinged

handle that serves as a balance or scale, and also a hook by which solids are attached.

Claim.—1. The combination of the hook *l* with receptacle *A*, and hinged balance handle *b*, in the manner and for the purpose specified.

2. The combined arrangement of the receptacle *A*, stiff arm *a*, hinged handle *b*, with balance *f*, and the hook *l*, the said receptacle answering the double purpose of weighing and measuring, and the balance being adjustable by nut *k*, the whole as described, and operating in the manner and for the purpose specified.

82,843.—CHARLES F. JAURIET, Aurora, assignor to himself and A. J. AMBLER, Chicago, Ill.—*Steam Generator.*—October 6, 1868.—Consists in flanging out both the inner lining and outer jacket of the fire box, and riveting the two flanges together, thus forming a door frame and a wall for the water space around the door way.

Claim.—The construction of the inner lining *C* and outer jacket of the door way *B*, riveted together at the outside of the fire box, whereby a single sheet of metal forms the lining for the water space around the door way, and another single sheet the frame for the door, as herein set forth.

82,844.—NATHANIEL JENKINS, Boston, Mass.—*Steam Globe Valve.*—October 6, 1868.—In the event of the destruction or weakening of the elastic packing, the metallic portions of the joint come in contact and effect a tight closure of the same.

Claim.—The arrangement of the bearing surface *l* of the valve head and the elastic packing, held in an annular recess in the valve head, as described, with the valve seat *f'* and the raised seat *f*, in the manner as shown and specified.

82,845.—ABIJAH JOHNSON, West Newton, Ind.—*Saw Set.*—October 6, 1868.—The stock has guide jaws and plates adjustable to the thickness of the blade and size of the teeth; a reciprocating setting bar actuated by cams in a disk rotated by a crank, and a mechanism which feeds one tooth at a time to the action of the setter.

Claim.—1. The reciprocating bar *B*, furnished with the adjustable setting nibs *C C*, and, in combination therewith, the adjustable guides *D* and *P*, all arranged and operating substantially as set forth.

2. Actuating the bar *B* by means of the disk *F*, furnished with the cams *r* and *s*, arranged and operating substantially as set forth.

3. The feed mechanism, consisting of the lever *G*, bent lever *H*, catch *N*, set screw *I*, spiral springs *X* and *M*, cam *J*, and pins *t*, all arranged and operating substantially as set forth.

82,846.—ISAAC B. JONES, Xenia, Ohio.—*Ditching and Boring Machine.*—October 6, 1868.—The rotation of the gears may be changed by means of a shifting lever, in order that the machine may be moved forward or backward by the movement of the sweep. The auger, backed or followed up by the sheath, upheaves the earth during its rotary and progressive movement, the mold board preventing the earth from falling back into the ditch. The auger is made to penetrate the earth by a screw shaft and crank.

Claim.—1. In combination with a ditching machine, the auger *H*, constructed as described, in whole or in sections, with a cutting edge at the lower end, and the edge along its pod, turned up and sharpened, substantially as and for the purposes herein set forth.

2. The combination of the cogged hub of the master wheel *E*, feed wheel *V*, and miter wheel *W*, for the purpose of communicating motion to the wheels *B B*, substantially as herein set forth.

3. In a combined boring and ditching machine, the shaft *Y*, miter wheels *X X*, pinion *b*, and wheel *c*, in combination with the lever *Z*, and notched latch *a*, substantially as herein set forth.

4. The combination of the auger *H*, sheath *T*, and mold board *U*, all constructed as described, and operating substantially as and for the purposes herein set forth.

5. The screw rod *d*, provided with a crank, *e*, at one end, and attached to the axle of the hind wheels,

for the purpose of turning the machine to the right or left, substantially as herein set forth.

6. The arrangement of the movable cross head *S*, provided with a shaft and pinions, as described, and operating on rack bars and slides on each side of the auger *H*, substantially as and for the purposes herein set forth.

82,847.—HENRY H. KELLEY, Philadelphia, Pa.—*Sash Fastener.*—October 6, 1868.—The wedge on the sash and roller on the frame co-operate to tighten the sash in its normal position, thus preventing rattling.

Claim.—The arrangement of the elastic roller *C*, and wedge *E*, and operating substantially as herein represented and described.

82,848.—JOHN C. KENNEDY, Chicago, Ill.—*Stove-pipe Damper.*—October 6, 1868.—Consists in the employment, instead of an ordinary damper, of a truncated hollow cone, open at both ends, and of smaller diameter than the stove-pipe within which it is fitted and which has a co-operating register.

Claim.—A cone, *B*, or its equivalent, applied to a stove-pipe, substantially as described, and employed in conjunction with a register, in the manner and for the purpose set forth.

82,849.—JOHN F. H. KING, Port Richmond, N. Y.—*Signal Flag for Vessels.*—October 6, 1868; antedated September 25, 1868.—The signal flag is held in an extended position, so that the figures thereon may be easily and distinctly read from a passing vessel.

Claim.—The constructing and combining the two frame pieces *a b* and the check chain or cord *g* with the halyards, for displaying or folding a signal flag, the whole arranged and operating substantially in the manner and for the purposes described.

82,850.—GEORGE KNEIP, New York, N. Y.—*Fountain Pen.*—October 6, 1868.—The central ventage tube insures the flow of ink to the pen when the valve is open, by pressure upon a button on the end of the valve lever. The situation of said tube does not admit of the escape of ink through the ventages. There are lateral openings for inspection of the reservoir.

Claim.—1. The ink cistern *B*, provided with a central tube, *d*, in its receiving end, and with a valve, *f*, at the discharging end, in combination with the pen holder *A*, constructed and operating substantially as and for the purpose described.

2. The opening *c* in the sides of the pen holder, in combination with the transparent ink cistern *B*, substantially as and for the purpose described.

82,851.—JOTHAM R. LAWRENCE and ISAAC G. JOHNSON, Cutler, Me.—*Boring Faucet.*—October 6, 1868.—The ends of the clamp, together with the screw, bear upon the gate, and the screw passes entirely through the lever. The effect is to hold the gate close against the face of the faucet, and rigid upon the lever.

Claim.—A faucet, having boring tool *C*, core chamber *B*, clamp *E*, thumb screw *G*, lever *F*, gate *H*, pin *I*, and cleats *o*, constructed, combined, and operating substantially as specified.

82,852.—CHARLES LEROY, Mexico, N. Y.—*Apparatus for Attaching Horses to Vehicles.*—October 6, 1868.—The springs and rods take the place of traces and obviate jerks and sudden strains upon the draught bar in stopping or rotating.

Claim.—1. The clips *C C*, constructed as described, and secured to the shafts of the vehicle as and for the purpose described.

2. Draught bar *A*, rods or traces *B B*, spiral springs *D D*, and clips *C C*, all combined, arranged, and operating substantially as and for the purpose set forth.

82,853.—M. F. LOWTH and THOMAS J. HOWE, Owatonna, Minn.—*Grain Drill.*—October 6, 1868.—A cylinder, provided with grooves extending part of the way across its face, rotates under the mouth of the hopper, and is made to slide horizontally so as to present the whole or part of the grooves to the mouth of the hopper by means of a lever, one end of which is attached thereto, the other sliding over a gradu-

ated are which indicates the number of bushels to be sown to the acre.

Claim.—1. The device, consisting essentially of the shaft G, pinion H, bearing J, sleeve L, and cylinder M, having the grooves *m m*, when constructed and operating together, as described, and in connection with a driving shaft F, seed hopper D, and a lever, K, for moving the shaft back and forth, substantially as described.

2. The combination of the graduated plate N, index lever K, and clamp *o*, for confining the lever at any point of the plate when employed in connection with the apparatus above described, and for the purpose set forth.

S2,854.—AMOS B. LOVELL, Pomfret, N. Y.—*Elastic Apron for Paper Machine.*—October 6, 1868.—The tension of an endless rubber belt passing between the couching rollers is regulated by a tightening roller over which the belt passes.

Claim.—The combination of a rubber or gutta-percha apron with the couching press rolls of a paper machine, when the same is provided with a tension roller, in the manner and for the purpose set forth.

S2,855.—ELLIS LUTHER, West Troy, N. Y.—*Horse Rake.*—October 6, 1868.—The rake is kept from revolving, when in position to gather hay, by a foot resting against one of the teeth and secured to a screw rod, and when the rake is raised the rod turns the foot around, which releases the rake, at the same time the slack in the chain supporting the rake is taken up by a windlass actuated by a rubber spring.

Claim.—1. The screw or twisted bar E, with the foot D, substantially as described and set forth.

2. The said bar E and foot D, in combination with the transverse bar L, and aperture *a*, substantially as herein specified.

3. The said bar E and foot D, in combination with the tooth, *t*, of the rake, substantially as specified.

4. The windlass N, in combination with the chain M and the head, A, of the rake, substantially as herein shown and specified.

5. The wheel I, in combination with the chain M and windlass N, substantially as specified herein.

6. The ratchet and pawl *o*, combined with the windlass N and chain M, substantially as herein set forth.

7. The cord *b*, attached to the chain M, substantially as and for the purposes herein specified and set forth.

S2,856.—ANDREW J. MARIS, New York, N. Y., assignor to himself and WILLIAM H. BURNAP, same place.—*Indicator for Steam Boiler.*—October 6, 1868.—The expansion tube is so connected to the gauge cock that the trying of the latter keeps the expansion tube free from sediment, and induces a circulation which draws away the accumulated air or gas.

Claim.—The expansion tube, alarm, and gauge cock, arranged in substantially the manner set forth.

S2,857.—LESLIE MARMADUKE, Arrow Rock, and SYDNEY T. BRUCE, Marshall, Mo.—*Mode of Attaching and Detaching Shafts and Poles of Carriages.*—October 6, 1868.—A rock shaft attached to the front of the vehicle has secured to each end a cylindrical head piece recessed to fit over a cylindrical block secured to the vehicle. Notches are made in the bottom side of both cylinders for the reception of a coupling block to which the shafts are secured. The rock shaft is turned by a lever and spring, and the head revolving covers the coupling block.

Claim.—1. The coupling heads D *a*² and the coupling block E, when arranged and operated substantially in the manner and for the purpose herein shown and described.

2. The arrangement of the axle piece A, traction rods *a a*¹, rod B, lever C, and coupling heads D *a*² E, substantially in the manner shown and described.

S2,858.—DANIEL MATER, Bellmore, Ind.—*Plow.*—October 6, 1868.—The coulter is attached to a lapped hanger which regulates the distance the coulter shall run from the shovel. The standards to

which the shovels are secured are braced by rods extending from the beam and secured to the standards by clamps.

Claim.—1. The arrangement of the transversely adjustable coulter or cutter F, with reference to the beam of the plow and shovel C, substantially as shown and described.

2. In combination with the beam and standards, the brace rods H, clamps I, and nuts I¹, arranged substantially as and for the purpose set forth.

S2,859.—HUGH MCQUAID, Canyon City, Oregon.—*Preventing Incrustation in Steam Boilers.*—October 6, 1868.—The sediment remains free by reason of the contraction of the mercurial surface upon cooling.

Claim.—The application in steam boilers of an amalgamated surface to the parts liable to incrustation; the iron plated with copper being coated with quicksilver, and being a liquid on the surface of the copper, expands, as herein set forth, using for that purpose the aforesaid metals, or any other substantially the same, which will produce the intended effect.

S2,860.—GEORGE R. METTEN, Cleveland, Ohio.—*Mechanical Movement.*—October 6, 1868.—Rotary motion is given to the balance wheel by the vibration of a treadle acting through the medium of vibrating arms and pawls, which latter operate noiselessly upon a friction band applied to the hub of the balance wheel.

Claim.—A balance wheel, B, constructed with a flanged hub, having a friction band, *p*, applied thereto, in combination with a treadle motion and vibrating pawls *c c*, arranged to operate substantially as described.

S2,861.—JAMES W. MILROY and JOHN COOK, Galveston, Ind.—*Machine for Making Drain Tiles.*—October 6, 1868.—A longitudinal box provided with suitable molds at the ends, has sliding in it a box resting on friction rollers above and below, which, being reciprocated by ratchet gearing, forces the clay which is introduced at openings at either side of the block into either end of the box, making the lower and upper tile alternately. Knives are arranged at each end to cut off the tiles as they are formed.

Claim.—The combination and arrangement of the box A, sliding block B, shaft C, cog wheel *b*, ratchet plate *c*, friction rollers *d d*, and friction roller D, molds E and F, knives G G, and table G', substantially in the manner and for the purposes as herein set forth.

S2,862.—W. H. MITCHELL and J. F. MITCHELL, Macomb, Ill.—*Broadcast Seed Sower.*—October 6, 1868.—Two wires passing through and into the hopper are actuated by a crank, and stir up the seed in front of the slides. The scatterer has two wings tapering toward their outer ends and forming tubular spouts. The slides are arranged so that each will cover half of the opening.

Claim.—1. The stirrers *c*, operated by the compound crank R, when arranged to operate substantially as described.

2. The distributor *l*, constructed and arranged to operate substantially as set forth.

3. The two slides *h* and *f*, arranged to be operated independently or jointly, as herein described.

S2,863.—EDWARD W. MUNSON and WILLIAM P. THOMAS, Waterbury, Conn.—*Window Spring.*—October 6, 1868.—A rod is secured to the bolt so that on withdrawing the latter from the sash a shoulder on the rod engages with the side of a rose and holds the bolt back, allowing both hands to be used in raising or lowering the window.

Claim.—The case A, within which is arranged the bolt C, and combined with the rod D, constructed with a shoulder, *a*, and with a rose, F, the whole constructed and arranged so as to operate in the manner substantially as specified.

S2,864.—GEORGE D. NEAL, Mt. Vernon, Ohio.—*Horse Rake.*—October 6, 1868.—The frame supporting the rake is provided with double-hinged platforms to allow it to support a load. A standard

supporting the rake, slides through a mortise in the central beam, and is provided with notches on the rear side into which a rod provided with a spiral spring is forced for holding the rake in position.

Claim.—1. The arrangement of the trap doors on the described frame, in combination with any suitable holding devices, as and for the purpose set forth.

2. The central standard E, connected to the rake beam and sliding through the mortise of central beam and in combination with the outer standards and arms, substantially as shown and described.

3. In combination with such standard, the spring detent, with its catch, all constructed and operating substantially as and for the purpose set forth.

82,865.—A. M. OLDS, New York, N. Y.—*Portable Folding Fence.*—October 6, 1868; antedated September 26, 1868.—The ends of the boards are connected together by wires passing through them, serving as hinges when folded for transportation. Braces secured to horizontal pieces are provided with notches in which the boards rest.

Claim.—The herein-described combination, consisting of a fence constructed in pivoted panels, and supported by clamping braces, substantially as described, and for the purposes set forth.

82,866.—JOEL A. OTIS and THOMAS BARBER, Watertown, N. Y.—*Apparatus for Treating Milk.*—October 6, 1868.—The furnace is surrounded by a jacket and the space filled with water. A horizontal flue extends the length of the boiler and is bent around and returns, terminating at a smoke-stack. The boiler resting over this flue receives a uniform heat and transmits it to the milk.

Claim.—The arrangement of the double-walled furnace A, with the boiler B and flue C C, when the furnace is made a part or extension of the boiler, and the flues are convoluted or bent back and forth, as shown, all the said parts being constructed, combined, and arranged in the manner described.

82,867.—OSCAR PADDOCK, Watertown, N. Y.—*Horse Hay Fork.*—October 6, 1868.

Claim.—The combination, with the center or claw-operating bar in a fork, such as described, of a vibratory locking-lever arm, arranged to catch over and press upon the head or upper end of the center bar, when the latter is depressed, and connected with a tripping cord, or other suitable means for effecting its disengagement from the said center bar, substantially in the manner herein shown and set forth.

82,868.—BENJAMIN M. PARKS, St. Louis, assignor to himself, A. C. ROBINSON, and WILLIAM SEYMOUR, Louisiana, Mo.—*Pruning Hook.*—October 6, 1868.—A pair of pruning shears attached to the upper end of a rod is operated by a sliding handle which is so connected with the shears as to regulate the opening for different-sized branches.

Claim.—The hand slide D, when operating by the rods *d* and *e*, the lever C, rod *b*, lever B, the lower knife *a'*, against the pressure of the spring E, and arranged in combination with the rod A, and the hook knife *a*, substantially as herein set forth.

82,869.—JULIA W. D. PATTEN, New York, N. Y.—*Ice Preserver.*—October 6, 1868.—The walls are made of a non-conductor of heat, to prevent the melting of ice or the decomposition of food.

Claim.—An ice preserver, consisting of a box or cover, having an outside wall of paper or pasteboard, lined with mica on the inside, substantially as described.

82,870.—BENJAMIN F. PERKINS, Holyoke, Mass.—*Globe Valve for Steam Engines.*—October 6, 1868.—A lock nut prevents the packing nut from turning when the spindle is rotated to open the valve.

Claim.—The combination and arrangement of the lock nut D with the stand A and packing nut C, of a globe or angle valve, substantially as herein described.

82,871.—DR. M. PERL, Houston, Texas.—*Mode of Preserving Meat.*—October 6, 1868.—The meat is

sewn up in a bag which is rendered air-tight by saturation in a compound including tar, linseed oil, yellow ochre, and rock lime.

Claim.—Covering meat with a flexible material, when said covering is saturated with a compound prepared substantially as herein set forth.

82,872.—D. J. POWERS, Madison, Wis.—*Harvester Rake.*—October 6, 1868; antedated September 28, 1868.—The gaveler sweeps across the platform as the swinging apron is pressed up to meet the gaveler at the end of the platform, thus collecting the grain in bundles ready to be bound.

Claim.—1. The combination of a hinged, pivoted, or yielding platform, located in the rear of the cutter bar, with a gaveler or rake, operating substantially in the manner for the purpose described.

2. The combination of lever *a*, cam *p*, and sweep lever *g*, operating substantially as specified.

3. The combination of the lever *a*, yielding platform B, and spring *c*, so arranged that the driver, while in his seat, may adjust the spring and regulate the size of the gaveler, substantially in the manner and for the purpose set forth.

4. The combination of gaveler D with swinging apron G, when said apron and gaveler are arranged to be operated by means of cord *y* and sweep lever *g*, all being arranged and operated in the manner and for the purpose set forth.

82,873.—JOHN RAMSBURGH, Sr., New Madrid, Mo.—*Medical Compound.*—October 6, 1868.—Remedy for pulmonary affections. Spikenard, elecampane, comfrey, and Indian turnip, mixed with honey and whisky.

Claim.—The improved medicine, prepared of the materials and substances as set forth.

82,874.—JOHN H. RANDALL and CHARLES E. RANDALL, Boston, Mass.—*Steam-engine Governor.*—October 6, 1868.—The fluid is forced from a pump connecting with the engine into a cylinder provided with a waste pipe and cock and with a piston connecting with the throttle valve. The cock is opened to allow part of the water to escape, but if the speed of the engine increases, the piston is raised and the throttle valve closed, and *vice versa*.

Claim.—1. The combination of the double-acting force pump with the pipe *h''*, cylinder *i*, and with the throttle valve *m* and waste pipe *n*, as herein specified.

2. The arrangement of the cock *p* with the waste pipe *h*, cylinder *i*, pipe *h''*, and double-acting force pump, substantially as herein set forth.

82,875.—SIMON B. REEDER, Meacham, Ill.—*Corn Planter.*—October 6, 1868.—A roller placed beneath the hopper contains two or more boxes, which are provided with spring levers to drop the corn. Two cam catchers, immediately over the ends of the spring levers, are so arranged that when the boxes are immediately over the mouth of a funnel reaching to the ground, they press upon the spring levers, thus opening the boxes and allowing the corn to enter the funnel.

Claim.—A corn planter, when the same is provided with a roller, C, having in it two or more dropping boxes *a*, with springs *b* attached, which springs are operated upon by a cam catch, *c*, substantially as described and for the purpose specified.

82,876.—JACOB REESE, Pittsburg, Pa.—*Machine for Working Iron.*—October 6, 1868; antedated October 2, 1868.—The object is to reduce blooms to "muck bars" by means of compression, as distinguished from the rolling process. The compressing dies are of such shape and so combined with operating cams that the balls or blooms, when placed in the machine, are fed through, worked, and reduced to the required size and shape, and then discharged; the length of the bar thus formed being limited, not by the size of any single ball, but by the quantity of iron fed into the machine.

Claim.—1. The combination of a pair of reciprocating and compressing die blocks (or jaws) with one or a pair of non-reciprocating compressing die blocks, (or cheek plates,) acting perpendicularly

thereto and alternately therewith, substantially as described.

2. An arrangement of mechanism for imparting to one or both of a pair of compressing die blocks a reciprocating movement simultaneously or alternately with a movement of approach toward or recession from each other, substantially as described.

3. In combination with one or more compressing die blocks, a pair of reciprocating and compressing die blocks, the coacting faces of which are, in their normal condition, more widely separated from one another at the point where the metal is introduced between them than at the point where the metal is extruded from them, substantially as described.

4. In combination with one or more compressing die blocks, a pair of reciprocating compressing die blocks, the coacting surfaces of which, one or both, are curved, substantially as described, for the purpose, in part, of permitting and aiding to produce a more or less retrograde or backward movement of the metal while the same is being acted on alternately with the general forward movement of the same, substantially as hereinbefore set forth.

5. In combination with a pair of reciprocating and compressing die blocks, operating substantially in the manner described, an inclined feeding trough, for guiding and facilitating the forward movement of the bloom or puddle ball to and between said die blocks, substantially as herein described.

6. As a whole, the improved machine, consisting of the several parts, constructed and combined substantially as and for the purpose described.

82,877.—WILLIAM H. REMINGTON, Boston, Mass., assignor to himself, SARAH A. T. PEABODY, and GEORGE D. ALLEN.—*Process of Electroplating with Nickel.*—October 6, 1868.—A solution is prepared by dissolving refined nickel in nitric acid, then precipitating the nickel by the addition of carbonate of potash, washing the precipitate with water, and dissolving it in a solution of sal-ammoniac, after which it is filtered.

Claim.—1. Suspending or supporting or holding a mass of the particles of nickel within the solution, so as to present an extended surface, and connecting them with the positive pole of the battery by means of platinum, or other suitable conductor of electricity, not materially affected by the electric current or the solution employed, substantially as described.

2. A positive electrode, composed of a plate of metal, carbon, or other conductor of electricity, upon which a coat of nickel of sufficient thickness shall have been deposited, substantially as set forth.

3. The within-described solution, prepared of the ingredients and in a manner substantially as described.

4. A substance coated or plated with nickel, as herein set forth, as a new article of manufacture.

82,878.—DAVID M. REYNOLDS, Port Deposit, Md.—*Lubricator.*—October 6, 1868.

Claim.—The employment, in combination with the oil vessel, having arranged in the bottom thereof an internal chamber or receptacle, so that the sediment or other impurities of the oil shall collect around said chamber, of a fibrous or other suitable filtering substance, together with a disk, whether perforated or not, but provided with a regulating screw, the whole being so arranged within said internal chamber that the filtering medium may be more or less compressed, thereby regulating both the supply of the oil and the density of the filtering medium, substantially as herein set forth.

82,879.—CHARLES H. L. ROBERTS and WILLIAM C. DUDLEY, Morrison, Ill.—*Collar Fastening.*—October 6, 1868.—The buckles are made of bent wire, the ends catching on hooks in the side of the collar. Elastic straps pass through holes on one side of the collar and through the hooks on the other, and are held by loops. A slotted housing is secured by a hook. A pad protects the horse from this fastening.

Claim.—The arrangement of the adjustable straps D D, looped wires *j j* and *l l*, with the collar A, provided with the pad B, loop *g*, and slotted housing C,

all constructed and used as and for the purposes set forth.

82,880.—GEORGE C. SCNEIDER, Adrian, Mich.—*Bee Hive.*—October 6, 1868.—The bottom of the feed box forms the top of the hive, which is composed of sections, one above the other, and between this bottom and the cap is an opening, the passage between which and the inside of the hive is covered by a small, movable lid, which may be set aside to allow the bees to go through it.

Claim.—A bee hive, constructed of three or more similar interchangeable sections, D, D', and D'', &c., in combination with the hollow cap A, feed-box B, opening S, and small movable lid *h*, the whole constructed and operating in the manner and for the purposes set forth and described.

82,881.—EDWIN R. SHEPARD, Scranton, Pa.—*Railroad Rail.*—October 6, 1868.—The two sections of the rail are secured together by bolts, the inclined heads of which conform to the inclined side of the rib of the lower section, fitting tightly into it, and serving also to keep the upper section down to its lower bearing, without interfering with the downward movement of the rail.

Claim.—1. A rail, consisting of two sections, A B, the former having an inclined bearing below the head, adapted to the inclined edge of a rib on the lower section, and the latter having at the base an inclined bearing for the rib on the upper section, substantially as and for the purpose described.

2. The lower section B, with its rib *d*, the upper section A, with its slotted rib *b* inclined at the outer side, and the bolt D, with its head bearing against the inclined side of the rib *b*, the whole being constructed and arranged substantially as and for the purpose specified.

81,882.—SAMUEL SHEPHERD and AMMI M. GEORGE, Nashua, N. H., assignors to SAMUEL SHEPHERD and JOSEPH GREELEY, same place.—*Machine for Polishing Paper.*—October 6, 1868.

Claim.—1. The combination with any number of burnishing rolls, B, operating substantially as described, of a revolving annular bed, C, supported at or near its periphery, and of open character or construction at its center, or within its interior periphery, for operation relatively to each other, essentially as and for the purpose or purposes herein set forth.

2. The combination, with a circular traveling bed, C, of a reducing emery, or other equivalent roll, D, having a rotary and longitudinal reciprocating action on or against, and in contact with said bed, substantially as and for the purpose specified.

82,883.—SAMUEL SHEPHERD and AMMI M. GEORGE, Nashua, N. H., assignors to SAMUEL SHEPHERD and JOSEPH GREELEY, same place.—*Burnisher for Enamelled Paper.*—October 6, 1868.—Calced and powdered flint and feldspar are mixed with potter's clay and water, worked till sufficiently fine and solid, molded, dried for eight or nine days, then put into a furnace and intensely heated for fifty hours, allowed to cool two or three days, then fitted and ground to present a smooth burnishing surface.

Claim.—A polishing surface or device made of stone ware, substantially as specified.

82,884.—JOHN SIDDONS, Rochester, N. Y.—*Fruit-jar Cover.*—October 6, 1868; antedated September 26, 1868.—A corrugation, forming a shoulder on one of two disks joined together, is made to fit the inside of the corrugations of the other.

Claim.—Providing fruit-jar covers, consisting of two metal disks, *a b*, with a corrugation, *e*, or its equivalent, for the purposes herein set forth.

82,885.—THOMAS SMITH and JOHN O. REILLEY, Baltimore, Md.—*Railroad-Car Heating Apparatus.*—October 6, 1868.—The air from the pump is forced into a receiver, within which is a furnace, and thence by pipes, connected by a coupling and knuckle joint, onto the reservoir in the car, which has also a pipe guarded by a check valve opening upward, and held so by a clutch screw, and in case the heat in the reservoir is not enough, a cock allows

the air to escape into pipes under the seats and discharge it into the cars.

Claim.—1. The compressed-air reservoirs and radiators H, located in the passenger cars, in combination with a heating apparatus, located outside of said cars, substantially as set forth.

2. The combination of the air pump A, compressed air receiver B, and furnace C, substantially as described.

3. The combination of the pipe coupling F and conducting knuckle joint G, as and for the purpose set forth.

4. The combination of the elastic conducting pipes D E E', air-forcing and heating apparatus A B C, and reservoir H, substantially as described.

5. The construction and arrangement of the valve mechanism I J K, in combination with the pipes E' and reservoirs H, for the purposes explained.

6. The air-conducting and discharging pipes M N, in combination with the reservoirs H, and cocks or valves L, as and for the object specified.

82,886.—THEODORE SNELL and WILLIAM TUCKER, Philadelphia, Pa.—*Apparatus for Cutting Metallic Bars.*—October 6, 1868.—A pair of die stocks into which the dies are mounted in a frame, one of them turning on the other, from which projects a pair of rigid arms, while a segment lever with ratchet teeth projects up from the turning die, and a pair of arms turn concentrically on both of the die stocks. A screw of unequal threads fits into nuts mounted on trunnions in the ends of the different arms, which have pawls attached to them engaging with the ratchet of the lever.

Claim.—1. Locating the two cutting dies in their respective die stocks, so that a bar placed within them to be cut shall extend in the direction, and occupy the position, of the axis of rotation of one or both of said cutting dies, substantially in the manner described.

2. In a rotary shears, constructed as specified in the preceding clause, the dies K L, made each in two parts and pressed together by screws C', for the purpose of clamping the metal bars between them, as explained.

3. The differential screw H H', in combination with the levers B' E, die stocks B and C, and supporting frame A, substantially as described.

4. The pawl J and toothed segment lever D d, in combination with the arm E and the stock C, for the purpose stated.

82,887.—DANIEL E. SOMES, Washington, D. C.—*Canal Boats and Other Vessels for the Transportation of Grain.*—October 6, 1868.—The vessel or car is provided with a perforated lining at the bottom and walls of the grain chamber with an air space around it, in which are inclined partitions forming flues, air tubes connected with air ducts opening above the deck, and pipes by means of which steam may be applied to heat the grain.

Claim.—1. A canal boat or other vessel or vehicle, having a perforated lining or casing, with spaces for the circulation of air between it and the walls of the vessel or vehicle, substantially as and for the purpose set forth.

2. A canal boat or other vessel or vehicle, with a perforated false floor, with air space between it and the bottom of the vessel or vehicle, substantially as set forth.

3. Heating apparatus, in combination with ventilating tubes G, perforated tubes E, and hoods f, substantially as set forth.

4. Perforated lining B, ventilating tubes G, hoods f, openings c, guards c¹ c², substantially as described.

5. A canal boat or other vessel or vehicle, having a perforated casing or lining, inclosing air flues and a heating apparatus, substantially as and for the purpose set forth.

6. The perforated lining B, perforated tubes E, and air ducts F, or their equivalents, substantially as described.

7. The perforated lining, with inclined partitions, forming flues between it and the walls or bottom of the vessel, or both, substantially as described.

8. The heating apparatus, in combination with the perforated lining and ventilating tubes G, as set forth.

9. The air tube E, in combination with the ventilating tubes G, as set forth.

82,888.—HENRY STANLEY, St. Louis, Mo., assignor to G. and W. TODD & Co., same place.—*Oil Cup.*—October 6, 1868.

Claim.—The combination of the oil cup A, stopper a', wooden end piece B, slotted at b², and capped by the metallic cap C, having the minute perforation c, substantially as hereinbefore set forth.

82,889.—EDWARD J. STEPHENS, North Providence, R. I.—*Machinery for Printing Yarn.*—October 6, 1868.

Claim.—The contrivance and arrangement of the color carriers, F F, as shown in the drawings, and their combination with the color rollers E E and the fluted or ribbed rollers A A, so as to put different colors upon different flutes or ribs of the rollers A A, and thus to print the yarn with different colors, with distinct intervals or spaces between.

82,890.—LYMAN B. STILSON, Woodland, assignor to himself and AUGUST LEICH, St. Anthony, Minn.—*Harvester.*—October 6, 1868.—The cutter bar is attached in front of the main axle by cross pieces, which are hinged at right angles from the bar to the axle, the heavy end of the bar being sustained by an arm and caster wheel, and the light end sliding on the ground.

Claim.—The arrangement, in a front draught machine, of the finger bar A and bars B B, the latter hinged to the axle of the machine and connected with the bar A, as shown and described, and constructed and operating substantially as set forth.

82,891.—THOMAS TAYLOR, Washington, D. C.—*Mode of Preparing Plaster Casts.*—October 6, 1868.

Claim.—1. The use of silicate of soda or other soluble silicate, with or without glycerine, as a varnish, for the purposes as substantially set forth and described herein.

2. The use of alkalies, or their equivalents, when used as solvents of silicates, when used substantially as in the manner herein set forth and described.

82,892.—MORGAN H. THOMAS, Dansville, N. Y.—*Churn Dasher.*—October 6, 1868.

Claim.—The cone-shaped top, A, perforated with holes a a, as described, and dasher rod B, in combination with the cross bars C C, when the latter are hinged to the lower part of the top, A, on one side, and fastened to the opposite side of said top, A, by a clasp, all arranged, constructed, and operated in the manner and for the purpose set forth.

82,893.—C. F. TRILL, Baltimore, Md.—*Steam Generator.*—October 6, 1868.—The boiler is wound tightly around by wire, the shell being divided into three chambers. The lower one of which has a supply pipe and branches, with burners, while the central and longest one, is provided with vertical pipes resting on the floor, over the burners, the upper ends being fixed to an upper partition, so that the products of combustion pass into the upper chamber, which has also steam pipes, and thence to the open air.

Claim.—1. The combination of the boiler A with the layer or layers of wire a a, wound around it, as described.

2. The arrangement, within the steam generator A, of the chambers E F G, with the pipes D J K and burners i i, substantially as described.

82,894.—S. N. TRUMP, Baltimore, Md.—*Tea Tray.*—October 6, 1868.—Nearly around the upper edge of the wooden body, made single or in panels, extends a metallic rail supported on short posts, the whole resting on legs.

Claim.—As a new article of manufacture, a tea tray, composed of the wooden body A, metallic rail B, standards C C, and feet D D, substantially as described.

82,895.—ALBERT M. UTLEY, H. N. KIMBALL and WILLIAM REYNOLDS, Watertown, N. Y.—*Boxing, Bandaging, and Preparing Cheese.*—October 6, 1868.—Strips of paper, of a hoop-shape form, are

secured at their ends by metal fasteners bent over and clasped, flaps being attached at top and bottom, and over the top and bottom of the cheese, so prepared, are fitted paper covers for transportation.

Claim.—1. The use, in connection with covers for the top and bottom of the cheese, of a paper bandage, encircling and permanently united, during the process of curing, with the sides of the cheese, substantially in the manner and for the purposes set forth.

2. The combination, with the paper bandage for encircling and holding the sides of the cheese, of top and bottom flaps of cotton or other suitable fabric, applied and used in the manner specified.

82,896.—MEDDERS VANDERPOOL, Polk County, Oregon.—*Grain Harvester.*—October 6, 1868.

Claim.—1. The arrangement of the spiral screw A with the right hand board of the coneave 20, whereby the standing grain is conducted to said head board without being pulled from the ground, as herein shown and described.

2. The combination of the obliquely-ribbed drums O, ribbed coneaves 20, and spiked drums 2 2, substantially as described, for the purpose specified.

3. So constructing and arranging the rod D D, provided with tapering spurs, that the standing straw is forced to the rear, to deposit the threshed grain upon the bed X, before said straw is drawn out of the machine, substantially as herein shown and described.

4. The combination of the ribbed drums O O, spurred wheels 2 2, ribbed coneaves 20, and troughs 40, substantially as described, for the purpose specified.

82,897.—NICHOLAS S. VEDDER, Troy, N. Y.—*Cooking Stove.*—October 6, 1868.—Two upright pieces and a cross-piece form a three-sided hollow piece under the ash guide slides, and connected by a channel with the air chamber formed by a rear, a sliding, and a bottom plate of the stove.

Claim.—1. The piece F, when constructed as and for the purposes herein described.

2. The plate C, forming the air chamber E, when made sliding, as herein shown and described.

82,898.—J. C. WAGONER, St. Louis, Mo.—*Smut Mill.*—October 6, 1868.—A feed shoe, with inclined floors, is connected by a blast pipe with a pocket, whence the grain, by means of distributors, is thrown upon beaters, and by the discharging wings it escapes into the upcast blast tube.

Claim.—1. The feed shoe F, arranged with two short inclined floors, *f*, upon which the falling grain shall strike and from which it shall be precipitated in a "shower" upon the pocket G¹, and in combination with the superpoised blast tube G, substantially as set forth.

2. The discharging wings H, in combination with the curved beaters C, acting substantially as set forth.

3. The blast tubes G and K, and their ducts, G² K², the regulating slides L and L', and the fan E, all acting substantially as and for the purpose set forth.

82,899.—F. F. WAGNER, Harrisburg, Pa.—*Railway Car Seat.*—October 6, 1868.—The body is held on its supporting rail by clips, its end being joined by rails parallel to the seat. At each end of the seat are two arms, one being pivoted to the middle of the arm seat, and the other to the center of the base of the rails and connected to the back. The seat is moved and the sliding body locked by a pin traversing a cam.

Claim.—1. The curved body frame K K', connected to the arc rails *x* of the support by means of the clips P, and with the sliding seat by means of the cams S, pins *n*, and the fulcrum rods B O *n*, all constructed and arranged substantially as and for the purpose specified.

2. The slotted connecting rods N A, in combination with the fulcrum rods B O *n*, when arranged on the sides of the sliding frame N K K', to effect reversion in the manner as herein expressed.

82,900.—R. K. WALTON, Clarington, Ohio.—*Spike.*—October 6, 1868.

Claim.—A spike, formed with an opening, *o*, through it, and a guide groove, leading from its upper end to the opening, substantially as above set forth.

82,901.—Mrs. RUTH ANN N. ATWOOD WARD, Philadelphia, Pa.—*Brace and Skirt Supporter Combined.*—October 6, 1868.—Three lines of bracing are connected by means of straps; the first for the upper part of the body, the second to throw back the shoulders, and the third to balance the others and support the back.

Claim.—The improved brace and supporter, consisting of pieces *a*, straps of belting *b, d, e, f*, and *l*, buckle straps *i* and *m*, and elastic straps *g h k*, when arranged to operate for bracing and supporting, substantially as described.

82,902.—WILLIAM WARD, Cleveland, Ohio.—*Metallic Roofing.*—October 6, 1868.—On each side of the plate, near the end, is cut a small slit, below which the metal is turned up, oppositely for the two, to form a flange. The end is also turned up and flanged; the portion of the plate at the sides without flange is then bent down and forms a return, the flanges overlapping and interlocking together.

Claim.—The metal roofing, composed of sheets of metal cut and bent, as shown in Figs. 3 and 4, having flanges or lips turned thereon, as described, and used with strips D to form the roof, all constructed and arranged in the manner and for the purpose as described.

82,903.—WINTHROP WARD, Mystic Bridge, Conn.—*Window-strip Attachment.*—October 6, 1868.—A spring expanding pin is attached to the window strip and engages with a tubular socket inserted in the frame.

Claim.—The provision, on a window strip, of spring pins, adapted to slip into tubular sockets in the window frame, for the purpose of attaching said strip, substantially as described and represented.

82,904.—JOHN T. WARING, Yonkers, N. Y.—*Felted Fabric.*—October 6, 1868; antedated September 28, 1868.—The jiggering table has a steam box in the middle, with a perforated top plate, and a jiggering board held down by a vibrating standard pivoted in the cross-frame, and a crank shaft and connecting rod, by which motion is given to the board.

Claim.—1. The new manufacture of a tufted fabric, having tufts of wool or other fibrous materials and a felt body wholly of wool or other suitable felting material, or of mixed felting and non-felting materials, the body and tufts being made into a fabric by the process of felting in the manufacture of the fabric, substantially as hereinbefore described.

2. The perforated tuft holders, or their equivalent, in combination with the jigger board and steam box, substantially as herein described.

82,905.—E. K. WARREN, Rochester, N. Y.—*Tank for Fermenting Ale, Beer, &c.*—October 6, 1868.—An improvement on patent No. 63,994. The pontoon has a conical top connected with a chamber into which the concentrated yeast is discharged, while a double coil of pipe is so arranged that the water first cools the fermenting mass, and then passes to the upper surface of the top to condense the liquid, which is brought back to the pontoon by means of pipes.

Claim.—1. The employment of the conical or inclined top C, in combination with pontoon A, for concentrating the yeast and facilitating its escape, as herein described.

2. The combination and arrangement, with the pontoon A, and conical top, B, of the two coils, E E', of water pipe, the water passing first into E and then upward into E', the whole as described, and for the purpose specified.

82,906.—FAYETTE M. WELLER, Chicago, Ill.—*Trace Fastener.*—October 6, 1868; antedated September 24, 1868.—An improvement on his patent of January 17, 1864.

Claim.—1. The curved hook A', to be placed on the whiffletree, in the manner as represented by

Figs. 1, 2, 3, and 4, is the improvement which I desire to secure by letters patent; hence—

2. The curved hook Λ' , constructed and arranged substantially as and for the purposes herein set forth and described.

82,907.—CHRISTOPHER C. WELSH, Pleasant Valley, Pa.—*Machine for Converting Rotary into Reciprocating Motion.*—October 6, 1868.—The wheels, pinions, shafts, weights, cords, and sleeves are so arranged with an arm and a rocking lever pivoted to a rod connecting with a swinging lever, that as the shaft connected with the crank wheel rotates it, a vibrating motion is given to the arm and thereby a swinging up-and-down motion to the arms of the rock shaft.

Claim.—In combination with the single set of gearing, the arrangement of the swinging lever V, vertical connecting rod U, rocking lever R S, vertical arm T, and crank O, when constructed and operating substantially as herein represented and described.

82,908.—DANIEL WERNER, St. Louis, Mo.—*Breech-loading Pistol.*—October 6, 1868.

Claim.—The barrels B, of the described pistol, provided with the catch f , located as shown and described, and having the studs $c e$, sliding upon the rod d , and operated in connection with the spring o , as described, when said barrels are combined with the stock and locks of an ordinary pistol, in the manner and for the purpose set forth.

82,909.—MINNA WESSELHCEFT, Baltimore, Md.—*Extract of Barley Malt.*—October 6, 1868.

Claim.—A new article of manufacture for dietetic and remedial purposes, a concentrated extract of malt, prepared in the manner described.

82,910.—ERASTUS D. WESTON, Taunton, Mass.—*Cooking Stove.*—October 6, 1868.—Each of the sectional plates which is connected with the top of the plate by its circumscribing flange has a flange which overlaps the next one, the two inner lateral sectional plates having also flanges extending up to the plate.

Claim.—1. The bottom plate of the air flue, as made of the five sections $e d e f g$, having their joints arranged transversely and longitudinally of the top plate, and provided with overlapping flanges, h , as described, in order that the lateral and longitudinal expansion of the top plate may freely take place.

2. When the series of partition plates of the air flue is extended partially across the space underneath the top plate, the combination of the end flanges $m m$ with such plates, and the extension of the jambs and end plates of the stove body up against the said flanges, the partition and top plates, and these latter with the partition and top plates, beyond the jambs and end plates or body of the stove, in the manner as represented.

3. The said end flanges $m m$, as constructed with notches or openings $o o$, for the exit of air from the air flue into the smoke flue over the oven.

82,911.—RUDOLPH WHITE, Newport, Pa.—*Clothes Line Adjuster.*—October 6, 1868.—The hook has a swivel joint connected with a spring and pulley within the bearings and turns so that when the clothes line is slipped between the spring and the open bearing it is held in the groove of the pulley and can be fitted to any angle.

Claim.—The arrangement of the spring D, in combination with the swivel hook A, and bearings B B', in the manner and for the purpose set forth.

82,912.—JOHN C. WILMARTH and AVERY FOBES, St. Louis, Mo.—*Knife Ring.*—October 6, 1868.—The knife blade is secured to a stud on the back of a finger ring, overlapping the front edge of the blade, and, though partly covered by a shield, can be adapted for cutting the strings of packages.

Claim.—The combination and arrangement of the ring A, having the stud a , knife a' , and shield a'' , as and for the purpose described and set forth.

82,913.—GEORGE D. ALLEN, New York, N. Y.—*Eel Pot.*—October 13, 1868.—A perforated funnel of

India rubber with a contracted mouth is forced over the mouth of the basket and by contracting holds itself. Needles pointing toward the neck of the funnel prevent the retreat of the animal.

Claim.—1. The eel-pot funnel, of India rubber, and perforated substantially as above set forth.

2. The eel-pot funnel, formed of India rubber, with a contracted mouth, substantially as before set forth.

3. The combination of the eel-pot funnel with needles pointing toward its neck, substantially as before set forth.

4. The eel-pot funnel, having the two characteristics of perforation and a contracted mouth, substantially as before set forth.

5. The combination of the body of the trap with a funnel of India rubber, substantially as before set forth.

82,914.—CHRISTIAN BARRY, Philadelphia, Pa.—*Alkali Can.*—October 13, 1868.—Clay is introduced between the covers and body of the can for making a tight joint capable of resisting the penetrating action of the alkali.

Claim.—An alkali can, in which clay is used for producing a tight joint, substantially in the manner described.

82,915.—ELIAS BLAIR, Bucyrus, Ohio.—*Corn Husking Pin.*—October 13, 1868.—An eye is made through the body of the husker between two blades for the insertion of the finger, the instrument being adapted to be used by either the left or right hand.

Claim.—An instrument for husking corn, constructed substantially in the manner shown and described.

82,916.—CHARLES J. BOUCHÉ, Louisville, Ky.—*Pen Rack.*—October 13, 1868.—Four plates are hinged at their vertical edges and maintained in a rectangular form by a rod. Two hinged plates form the roof. The ends of the stand are provided with pen racks, and lips are placed on the margin of the side plates for the reception of cards.

Claim.—A pen rack, composed of the sides A B C D, connected by hinge joints, as shown, the hinged roof H I, brace F, and racks M, all constructed and arranged substantially as described, and provided with calendars O P Q and lips S, for the reception of cards, substantially as set forth.

82,917.—GEORGE W. BROOKS, Clinton, Mass.—*Centering Square.*—October 13, 1868.—The angle of 90° in a centering square is divided equally by a movable tongue secured to the square by a bolt and thumb nut.

Claim.—In combination with the square, the adjustable slotted bar b , when constructed as and for the purpose substantially as described.

82,918.—JOHN A. BURCHARD, Beloit, Wis.—*Corn Planter.*—October 13, 1868.—The device is so arranged that the operator has in view the several cells containing seed for successive hills, and is enabled to discover any failure to plant correctly.

Claim.—1. Broadly, the employment of the dropping device D, when constructed and arranged substantially as herein described and set forth, and used for the purpose of enabling the operator to know by ocular demonstration whether the machine is dropping the seed with certainty and accuracy.

2. In combination with the device D, the pawl K and stop latches g and l , when used for the purpose herein set forth.

3. The combination and arrangement of the several parts of the planter herein described, when used for the purpose set forth.

82,919.—T. A. CAMBENSY, Chicago, Ill.—*Hollow Window Cross Bar of Sheet Iron.*—October 13, 1868.—A strip of sheet iron of the proper dimensions is bent and placed on a suitably-formed bar of iron or lead and passed through suitably-formed rollers.

Claim.—As a new article of manufacture, the hollow sheet-metal window bars, constructed substantially as shown and described.

82,920.—CHARLES B. CLARK, Buffalo, N. Y.—*Blind Hinge.*—October 13, 1868.—The pintle of the

lower hinge has a longitudinal angular recess on one side. The socket to receive the pintle is notched to form a projecting catch. When the shutter is opened a positive lock is produced, but in all other positions the pintle forms a close joint with the eye and prevents rattling.

Claim.—Forming the cylindrical pintle *a*, with the depressed slot *b* and the circular eye *c*, with outside catch *d*, the whole combined and arranged as described, and operating in the manner and for the purpose specified.

82,921.—JOHN L. COOPER, Preston, Conn., assignor to himself and JOSHUA E. FELLOWS.—*Metallic Counter Brace.*—October 13, 1868.—The spur is secured to a gutta-percha counter brace which is attached to the counter of the boot or shoe.

Claim.—The new article of manufacture of a spur socket, in combination with a counter brace, when made and applied substantially as herein described.

82,922.—WILLIAM COOPER, Paris, Me.—*Ox Yoke.*—October 13, 1868.—A slotted plate, to which is fastened the ring which attaches the yoke to the shaft of the cart, is secured to the yoke by two staples and can be adjusted to regulate the leverage of the yoke of a pair of oxen.

Claim.—The sliding slotted plate *a*, held by staples *b b'*, and adjusting nuts *c c'*, and carrying the shaft ring *f*, as and for the purposes set forth.

82,923.—ANDREW J. CRAIG, Ashmore Station, Ill.—*Harrow.*—October 13, 1868.—The teeth are bent over forward and riveted together at the point where they are bent so as to form two sides of a triangle.

Claim.—The bent teeth *A A*, pivoted together as described, so as to form a harrow with flexible sides, substantially as and for the purposes herein set forth.

82,924.—CHARLES H. CRAMER, Rutland, N. Y.—*Washing Machine.*—October 13, 1868.—A corrugated roller has bearings in a hinged frame which is raised and lowered by a treadle connecting therewith. Screws are provided at the end of the frame for regulating the pressure of the roller on the clothes.

Claim.—The combination of the adjustable frame *B*, and the treadle *I* for raising the same, and the screws *II* for regulating its pressure, substantially in the manner and for the purpose described.

82,925.—SUTTON EDWARD CROW, Stratford, England.—*Hydrocarbon Burner.*—October 13, 1868; patented in England June 14, 1867.—The object is to adapt steam boiler and other furnaces for burning creosote and other combustible liquids.

Claim.—The arranging the apparatus in such manner that a jet or jets of steam, under pressure, (or, it may be, of air,) issues into the furnace in a direction parallel, or nearly parallel, to a pipe or passage by which combustible liquid is led into the furnace, such jet being immediately in rear of and below the mouth of such pipe or passage, substantially as described.

82,926.—FRANKLIN A. DELAND and LUKE PHILLIPS, Memphis, Mich.—*Mortising Machine.*—October 13, 1868.—A collar is rigidly attached to the spindle and revolves in a guide which is provided with jaws fitting over a perforated plate secured to the frame. The back rest is hinged and can be set at any angle by means of a slotted lever to which it is secured, and which is provided with a pin fitting in a series of holes in the side of the bed.

Claim.—1. The combination of the vertical guide *C'*, bed *C*, slotted lever *D'*, and pin *E'*, substantially as and for the purposes herein set forth.

2. The independent perforated guide plate *O*, in combination with the jaw guide *N* and vertical bar *E*, when constructed, arranged, and operating substantially as and for the purpose herein set forth.

82,927.—WILLIAM L. DENIO, Rochester, N. Y., assignor to himself and IRWIN DAVIS, same place.—*Attaching Rosettes to Harness.*—October 13, 1868.—

The screw loop is secured to the head stall, and, being a fixture, facilitates the application and detachment of the rosette.

Claim.—The rosette *A*, provided with the screw socket or nut *b*, in combination with the screw loop *B* and attaching straps *g h*, the whole arranged as described, and operating in the manner and for the purpose specified.

82,928.—CHARLES H. DE VINE, Buffalo, N. Y., assignor to DE VINE BROTHERS.—*Piano Forte Bridge.*—October 13, 1868.—The ivory bridge cap aids in holding the cut-off pins firmly in the wood, and permits the strings to slide freely in tuning.

Claim.—The curved bridge *A*, composed of veneers *a a a* and *b*, having the ivory or equivalent top plate *F* attached, as herein described.

82,929.—DAVID DUCHARNE, Mechanicsville, N. Y.—*Apparatus for Setting Axles to Wagons.*—October 13, 1868.—The guide serves to indicate when the crooked or bent axle is set or straightened under the action of the screw jack.

Claim.—1. The hook or jack *B C*, and the upright fulcrums or studs *E* and *E'*, in combination with the horizontal cross bar *F*, each being constructed and operated substantially in the manner and for the purposes herein described and set forth.

2. The triangular-shaped guide *II*, in combination with the jack *B*, studs *E* and *E'*, and cross bar *F*, substantially in the manner and for the purposes herein described and set forth.

82,930.—CHARLES N. DUNHAM, Philadelphia, Pa.—*Mounting Spectacle and Eye Glasses.*—October 13, 1868.—The pieces to which the nose spring is fixed and those which hold the glasses together when folded up, are cemented instead of being riveted to the glass.

Claim.—The glasses *A A*, having the pieces *B B*, *D D*, cemented to them, as a new article of manufacture.

82,931.—JOHN ENRIGHT, Louisville, Ky., assignor to himself, WILLIAM WALL, and THOMAS ENRIGHT, same place.—*Core Bar for Casting Pipes.*—October 13, 1868.—Longitudinal bars and levers are actuated by means of screw nuts so as to expand and contract the segments. Iron pipe are cast upon the cylindrical coating of clay, which is applied to the cylinder, and when the iron begins to cool and set the segments are allowed to contract.

Claim.—The collapsable metallic core rod or cylinder, having four longitudinal segments *A*, so constructed and arranged as to be operated independently of each other, as herein shown and described.

82,932.—RUFUS B. FERRIS, Holland, Mich.—*Stump Extractor.*—October 13, 1868.

Claim.—The combination of the lever *II*, sheave *F*, chain *I*, rope *J*, sheave blocks 3 and 4, sills *A*, post *B*, tie beams *C*, standards *D*, pulley *E*, and half-yard *K*, when constructed, arranged, and operating substantially as described, and for the purposes set forth.

82,933.—E. B. FOSTER and JOHN G. WITT, Elmira, N. Y.—*Adjustable Square and Bevel.*—October 13, 1868.—The wings, in conjunction with the ruler of the *T*-square, may be used after the manner of the common center square, and they are also set at any angle by means of the screw, so as to serve as a bevel.

Claim.—The combination, with a try or *T*-square, of the wings *D D*, and the screw *F*, for adjusting the angle of the same, substantially as described.

82,934.—ANDREW FRIBERG, Moline, Ill.—*Plow.*—October 13, 1868.—The interposed plate supports the attached end of the handle in a position sufficiently removed inward from the landside to avoid friction with the land and the consequent wear.

Claim.—The plate *C* constructed and applied between the landside *A* and the handle *B* of the plow, substantially as described.

82,935.—JOEL GARFIELD, Groton, Mass.—*Ratchet and Pawl Mechanism.*—October 13, 1868.—

By adjustment of the screw pin the pawl may be fixed out of engagement with the ratchet teeth.

Claim.—1. In combination with the ratchet wheel and pawl, arranged substantially as shown and described, the loose collar or disk *h*, having an inclined slot, into which the pawl pin projects, rotation of the pawl plate in one direction forcing the pawl up into engagement with the ratchet teeth, and its rotation in the opposite direction carrying it out of engagement therewith, substantially as set forth.

2. In combination with the ratchet wheel and pawl and the loose collar, the stud *l*, and adjustable screw or pin *n*, operating substantially as shown and described.

82,936.—RICHARD GORNALL, Baltimore, Md.—*Steam Engine Piston Valve.*—October 13, 1868.—An extra valve extends longitudinally through the main valve. When the piston is upon the point of terminating its stroke, steam from the cylinder enters a chamber in the end of the extra valve, and, acting thence against the end of the steam chest, moves the extra valve until its flanges come in contact with the main valve; thereupon more direct communication is established between the extra valve and the steam cylinder, and the steam from the cylinder acts with great force to slide both valves to the remote end of the steam chest and thus reverse the piston. The auxiliary steam ports prevent the induction steam from being shut off by the valve when it is midway between the ends of the steam chest.

Claim.—1. The combination of the main valve *C* with the interior sliding valve *D*, having the flanges *e e*, substantially as and for the purposes specified.

2. In combination with the valve *C* and the interior sliding valve *D*, the auxiliary steam ports *n n'*, substantially as and for the purpose specified.

82,937.—JOSIAH GRAY, Chicago, Ill.—*Railway Frog.*—October 13, 1868.—In the passage of the wheels over the frog the flange traverses the shield and raises the wheel, thus preventing undue wear of the "point."

Claim.—1. The shield *H*, constructed substantially as described, in combination with the point *C* and guard bars *B*, as and for the purposes set forth.

2. The combination of the chairs *E*, bars *F*, guard bars *B*, shield *H*, and point *C*, all operating substantially as set forth and shown.

82,938.—B. F. GUY and J. V. GUY, Macomb, Ill.—*Cultivator Plow.*—October 13, 1868.—The forward end of each plow beam is jointed to a rod fitted to turn in the forward cross bar of the frame. Upon the rod is mounted a shoe which holds horizontally a spring bar connected to the plow beam by a chain to regulate the depth of plowing. A transverse rod or rack is raised upon its pivoted arms to elevate both plow beams and sustain them.

Claim.—1. In combination with plows thus hung in a frame, the spring bars and connecting chains or cords, as and for the purpose set forth.

2. In combination with the plows, their bifurcated rods, and spring bars, the shoes *e e*, substantially as and for the purpose described.

3. In combination with spring bars and plows of described cultivator, the rack *i* with its handle *i'*, as and for the purpose described.

4. The cultivator plow, when constructed of the several parts, all arranged to operate substantially as and for the purposes set forth.

82,939.—EARL GUYER, Wolcott, Vt.—*Butter Tub.*—October 13, 1868.—The cross bar and the keys serve as alternative means for holding the cover in order to keep the butter down in the brine. The cross bar is only serviceable when the cover is at the top.

Claim.—The combination of the butter tub *A*, cover *B*, keys *C C*, cross bar *D*, and bent metal bars *E E*, or their equivalents, substantially as and for the purposes herein set forth.

82,940.—JOHN W. HABBERLEY, South Malden, Mass.—*Anchor.*—October 13, 1868.

Claim.—An anchor, when constructed of the shank

A of wrought iron, inserted into the east hub *B*, which latter is provided with sockets for the reception of the square inner ends of the flukes *D*, which are secured by pins or keys, substantially as described.

82,941.—THOMAS C. HARGRAVE, Boston, Mass., assignor to himself, WILLIAM B. CHARLTON, and H. K. MOORE.—*Device for Changing the Speed of Machinery.*—October 13, 1868.—The speed of the shaft to be driven is determined by the action of the driving belt upon one or the other of the pulleys, but owing to their constant gear connection with said shaft the pulleys revolve simultaneously, though at different speeds.

Claim.—The pulleys *B C*, secured to independent shafts *d L*, revolving one within the other, and connected, by means of gears *I K* and *g M*, to the driving shaft of the machine, the pulley *A* and belt slipper *E*, by means of which the rate of speed may be expeditiously changed, the whole combined and arranged substantially as described.

82,942.—DAVID M. HARKRADER, Chilli, Ill.—*Combined Harrow and Cultivator.*—October 13, 1868.—The two frames united together, with all their appurtenances, constitute a harrow, but the detachable inner frame may be used alone as a cultivator.

Claim.—1. The knives or cutters *Q Q*, combined with the frame pieces *B, C, D*, and *E*, and the shovels *P P*, teeth *O O*, handles *K K*, cross pieces *R R*, bows *S S'*, and hitching device *T T U*, constructed and arranged as described, and for the purpose set forth.

2. The combination of the frame *A F*, substantially as described, with the frame *B, C, D*, and *E*, constructed and arranged as described, and for the purpose set forth.

82,943.—WILLIAM T. HARVEY, Jr., Philadelphia, Pa., assignor to himself and PETER GRIMES, same place.—*Saw Handle.*—October 13, 1868.—The two screws which secure the fastening pin pass through the plates and the pin, and into the wood of the handle.

Claim.—The combination of the handle *A*, metallic plate *M'*, with lug *L*, for fitting into the notch *N*, plates *M M*, pin *P*, confined by screws *S S*, for retaining a saw blade, the whole constructed to operate in the manner and for the purpose set forth and described.

82,944.—JOHN HASKIN, Boston, Mass.—*Elastic Goring for Boots and Shoes.*—October 13, 1868.—The attaching stays and the rubber goring are saturated with an elastic varnish which protects them against the rotting effect of oil from the leather.

Claim.—As a new article of manufacture, a goring for boots and shoes, made of perforated rubber sheets, with stays *B B*, saturated with an elastic varnish, as and for the purposes described and specified.

82,945.—A. J. HASWELL, Circleville, Ohio.—*Heating Stove and Fireplace.*—October 13, 1868; antedated October 6, 1868.—The smoke and gases pass over the top of the back wall of the fire chamber and thence descend in order to reach the exit flue through an opening in the division plate. Air is heated while passing from the exterior of the stove to the combustion chamber through the tubes and orifices of the division plate.

Claim.—1. The division plate *b*, applied in connection with the stove *A* in the rear of the fire plate *a*, to produce the passages *h* and *i*, in the manner and for the purpose explained.

2. The division plate *b*, provided with the tubes *b'* *b''*, and the orifices *d*, substantially as described.

82,946.—CYRUS HAY, Stoneham, Mass.—*Boot and Shoe Bottoming.*—October 13, 1868.—Any suitable binding or covering texture is made to encase the sole or simply embrace the edges. The covering is applied to such soles as are unfit for exposure or incapable of receiving the proper finish, as, for example middle soles.

Claim.—A shoe "bottoming," made substantially as described and for the purpose set forth.

82,917.—MARTIN HELIKER and ORSAMUS A. WHITE, Norwalk, Ohio, assignors to themselves and J. W. BOSTWICK, same place.—*Churn Dasher.*—October 13, 1868.

Claim.—The concentric circles or coils of wire C, as arranged in combination with the radial arms B, for the purpose specified.

82,948.—JOHN I. HESS, Philadelphia, Pa.—*Hot-air Furnace.*—October 13, 1868; antedated September 26, 1868.—The products of combustion, on their way to the discharge pipe, are checked by passing through winding passages in the drums, in order to utilize the heat. The grate rests upon a turn-table supported beneath the bed plate of the stove. An annular water box or evaporator surrounds the base of the fire chamber.

Claim.—1. The combination and arrangement of bed plate B P, fire chamber F C, heating drums H D and H D', and C D and C D', with their spirals, connecting pipes P, P¹, P², P³, P⁴, P⁵, P⁶, and P⁷, turn-table, composed of parts L P and T P, water box W B, for the purpose specified.

2. The application of the within described turn-table to stoves or other heating apparatus, for the purpose specified.

82,949.—LUCIUS C. HEYLIN, Philadelphia, Pa.—*Compartment Cane.*—October 13, 1868.

Claim.—A cane arranged as herein described, whereby one portion thereof is adapted to be used as a pipe, the handle of which is contained in a compartment formed in the same, and other portions of the body of the cane being provided with receptacles for cigars, tobacco, and matches, the whole constructed as herein described.

82,950.—D. K. HICKOK, Morrisville, Vt.—*Potato Washer.*—October 13, 1868; antedated September 30, 1868.

Claim.—The arrangement of the arm D and shaft C with the vessel B, when provided with a lid and feet and perforations, as described, the several parts being constructed and used as and for the purpose herein set forth.

82,951.—BENJAMIN HITCHINGS, Lynn, Mass.—*Last.*—October 13, 1868.

Claim.—Attaching the block of a last to the body of the same by means of a continuous dovetail-formed bead C' D', said bead being curved longitudinally, forming an arc of a circle, which fits into corresponding dovetailed groove C D, formed in the body of the last, substantially as described, and for the purpose set forth.

82,952.—HORACE B. HOOKER, Rochester, N. Y.—*Skate.*—October 13, 1868; antedated October 6, 1868.—The toe is bent back in front, being held to the plate by means of a depression between two holes, and a clamp on each side of it, the heel plate being supported by three posts, having a flange in front with spurs, and from the ends of which is a bail running back, part of it being a spiral spring, and with a cam on its rear portion.

Claim.—1. A skate, having a heel plate, H, with its flange *g* and spurs *d*, in combination with the bail D and cam *v*, all acting conjointly, as and for the purposes herein set forth.

2. The tripod heel-plate support, composed of the post F, as herein described.

3. The adjustable toe plate B, in combination with the self-adjusting clamps G, as and for the purposes shown.

82,953.—HORACE B. HOOKER, Rochester, N. Y.—*Skate.*—October 13, 1868; antedated September 23, 1868.

Claim.—A skate, having a heel plate, D, with its flange *a* and spurs *b*, in combination with the adjustable clamp G and jam nut C, all acting conjointly, as herein shown, and for the purpose set forth.

82,954.—JOHN HUGHES, Newark, N. J.—*Gig Saddle.*—October 13, 1868; antedated October 3, 1868.

Claim.—1. The seat A, with the recesses B and R, the piece C, and back piece E.

2. The crupper loop F, arranged with the recess, and piece of leather I.

3. The plate L, with the pins M, or their equivalents, in combination with the frame G.

4. The construction of the jockey P by encasing the extra plate L, and fitting the upper end of the jockey to the shape of the seat A, substantially as and for the purpose specified.

5. The whole in combination, substantially as and for the purposes specified.

82,955.—JAMES INGRAM, Troy, N. Y.—*Folding Camp Stool.*—October 13, 1868.—To the upper part of the center piece are hinged arms, and at the lower end legs, to which the springs are attached to keep them apart for sitting, the whole being so arranged that they can be readily folded.

Claim.—The arms D D', legs E E', hinged to the center piece A, and the springs F F', each and all being constructed, arranged, combined, and operated as a whole, in the manner and for the purposes substantially as herein described and set forth.

82,956.—W. A. IVES, New Haven, Conn.—*Expansive Bit for Wood Boring.*—October 13, 1868.—The stock has a groove in which the upper edge of the cutter is received, held, and forced back by means of a wedging screw in the slot of the cutter.

Claim.—1. The mode of holding in place the adjustable cutter C by its upper edge, by means of the groove B, the wedging screw *a*, and slot *b* in the cutter C, and set screw *d*, constructed and arranged substantially in the manner as above specified.

2. The adjustable cutter, when constructed in such a manner as that all the wood is removed without the necessity of the ordinary fixed central cutters upon the stock, substantially as set forth.

82,957.—W. A. IVES, New Haven, Conn.—*Hollow Auger.*—October 13, 1868.—The circular stock has a slot into which are fitted two movable dies or knife holders with grooves, and into one side is inserted a screw which is held by a collar in the center.

Claim.—The combination of the circular stock A, slot B, and screw E, and two movable jaws or knife holders C C, constructed and operated substantially for the purposes and manner as above specified.

82,958.—DANIEL L. JOHNSON, Yorkville, Mich.—*Flour Dispenser.*—October 13, 1868.

Claim.—The construction and arrangement of the hopper A, tube B, and vertically-adjustable spindle D, having disk F and wing *w* attached thereto, with the casing C and guard L, all combined and operated substantially in the manner and for the purposes set forth.

82,959.—GEORGE W. KEELER, New Haven, Ohio.—*Plow.*—October 13, 1868.—The standard is fixed to a metallic plate to which are hinged wings or mold boards, connected to each other by adjusting segments or braces secured by a pin, and also to a plate which has a shoe bolted to it.

Claim.—1. The wings F, when hinged to the plate D and standard B, so as to allow of their being contracted or expanded, in the manner as and for the purpose specified.

2. The plate I, as arranged in combination with the plate D and wings F, for the purpose set forth.

82,960.—J. B. KELLEY and N. P. KINGSLEY, Brandon, Vt.—*Spring Bed Bottom.*—October 13, 1868.—The springs of three pieces of wood placed crosswise, and at each end of the bedstead, rest on blocks, the two lower ones being fastened in the middle by a clamp screw with two blocks between them, and the upper one also, supporting the top spring, having on it slats held in place by ropes.

Claim.—1. The combination and arrangement of the springs *c' c'*, blocks B B, and clamp screw *s*, substantially as and for the purposes set forth.

2. The arrangement and combination of the springs *c' c'*, blocks B B, and clamp screw *s*, with the spring *c*, blocks *b b*, and slats *a a a*, substantially as and for the purposes set forth.

82,961.—JACOB F. KNOOR, Orange, N. J., assignor to FRANK K. HIPPLE, Philadelphia, Pa.—*Har-*

ness Saddle-tree.—October 13, 1868; antedated October 3, 1868.—The saddle-tree has tubular openings for the crupper loop, saddle hook, and back band, the burrs or nuts being carried through an opening also in the lower end of the jockey, and fixed to the end of a back-band, to receive the screw end of the terrets.

Claim.—1. A loop or bridge spanning the avenue through which the back-band, crupper-loop, and saddle-hook pass, substantially as described, and for the purpose set forth.

2. The affixing the burrs or nuts of the terrets to the back-band, and conveying it beneath the bridge, to receive the screw end of the terrets, substantially as described, and for the purpose set forth.

82,962.—E. J. LEYBURN, Lexington, Va.—*Wrench.*—October 13, 1868.—On one end of a tubular hub in the eye-piece is formed a ratchet wheel, and on the other is an enlargement from which extend arms, to which are fixed adjustable jaws, while on the handle is pivoted a pawl which engages in the ratchet wheel, by which it is turned.

Claim.—1. The arrangement of the arms E E and jaws F F, in relation to the unbroken ratchet, (which ratchet is capable of being turned through a complete circle,) so that said jaws are adjustable for large and small nuts, within the capacity of the wrench, without a corresponding enlargement of the ratchet wheel being necessary, substantially as described.

2. The combination of the pivoted right-and-left pawl *a a* with the arms E E and adjustable jaws F F, substantially as and for the purpose described.

3. The jaw-holding portion D¹, E E, hub D², ratchet-wheel D, adjustable jaws F F, handle A, and pawl C, *a a*, all combined and arranged substantially as described.

82,963.—CONRAD LOCHER, Oroville, Cal.—*Agricultural Locomotive, with Spading Apparatus.*—October 13, 1868.

Claim.—1. The application of equalizing gears between the axles of a wagon, so, in turning a curve, each wheel adopts the speed which the curve requires, and receives its propelling motion from the engines, by means of gearing, or their equivalent.

2. The gearing and connection through the king bolts.

3. The spaders, so constructed that they enter the soil like a pick, (nearly vertical,) cut off a slice like a spade, and turn it over like a plow.

4. Turning the spaders in the same direction as the wagon, thereby assisting locomotion.

5. The combination of the whole, in the way and manner herein set forth.

82,964.—JOHN J. P. LYON, Ypsilanti, Mich.—*Apparatus for Producing Reciprocating Motion.*—October 13, 1868.

Claim.—The wheel A, support B, lever C, connecting rods D, and counterpoise-weight F, when used in connection with pump rods E and weights G, and operating substantially as and for the purposes herein described.

82,965.—WILLIAM S. MCINTOSH, Alleghany City, Pa.—*Grate Bar.*—October 13, 1868.

Claim.—Grate bars having a broad upper face, with sides tapering downward, when made hollow, for the passage of water through them, substantially as and for the purpose hereinbefore described.

82,966.—SAMUEL MADDEN, Eureka South, Cal.—*Car Coupling.*—October 13, 1868.

Claim.—The above-described combination and arrangement of devices to form an automatic car-coupling, consisting of the sliding bumper E, with the slots G and G', opening J, and spring F, the pin I, with collars H and H', and the guiding plate K, with or without the rollers D at the end of the link, substantially as specified.

82,967.—JOHN MASLIN and DAVID BIRDSALL, Jersey City, N. J.—*Water-Level Detector for Boilers.*—October 13, 1868.—On the outer end of the plug is a two-horned cam, which, by the action of the float on the plug, serves to depress a disk connected with the valve of a steam whistle, a spring around its stem keeping it closed before the steam is on.

Claim.—The combination, with the stem or plug D, of the cam K, disk L, the valve *d* of the whistle with its stem, and the spring *f*, as described.

82,968.—ELISHA MATTESON, Brooklyn, N. Y., assignor to himself and JAMES M. TRIPPE.—*Buoyant Propeller.*—October 13, 1868.

Claim.—The cylinder A, air tight, and provided with independent air-tight V-shaped buckets C, arranged on the exterior of said cylinder, and within a suitable frame, B, to operate substantially as set forth.

82,969.—LA FAYETTE H. MAYOTT, Springfield, Mass.—*Gauge.*—October 13, 1868.—The gauge has a screw-nut which turns upon a thread cut in its beam, and is so connected with the slide as to carry it with it when it turns.

Claim.—The construction and arrangement of the graduated beam A, having a thread cut thereon, in combination with the sliding arm B, and nut C engaging therewith, set screw and stationary arm, the whole constituting an adjustable slide gauge, substantially as described.

82,970.—ALEXANDER MCCREIGHT, Tranquillity, Ohio.—*Saw Mill.*—October 13, 1868.—A moving frame held on the fixed frame, by guides which slide in grooves, carries two ratchet bars, which gear into ratchet wheels, on a bar, having its bearings in the fixed frame, while an upper wheel gears into and is revolved by a cog wheel, on the shaft to which the power is applied, and an under wheel is revolved by a worm screw on the same.

Claim.—1. The ratchet bars *g g*, ratchet wheels *h h*, and bar K, when combined with the fixed frame *b b b' b'*, moving frame *d d d' d'*, and operated substantially as described.

2. The shaft C, of the described mill, in combination with the shafts H and H', with their connections of gearing upon the shaft C, and bearings in the levers *m m'*, and connecting bands with roller M, all as and for the objects described.

82,971.—PETER B. MCKELVEY, Albany, N. Y.—*Machine for Cutting Soap.*—October 13, 1868.—Stationary wires are placed in notches in the plates, and tightened by nuts and screws, and the soap on a carriage moved up against them and cut into bars.

Claim.—1. The carriage I, constructed and operated substantially as hereinbefore specified and set forth.

2. The said carriage, when combined with stationary wires, in the manner and for the purposes above described and set forth.

3. The combination of the stationary wires with the notched plates B and C, the screws G, and nuts F, substantially in the manner and for the purposes hereinbefore specified and set forth.

82,972.—G. M. L. McMILLEN, Dayton, Ohio.—*Horse Rake.*—October 13, 1868.—The lug bolted to the axle has a hollow, and a flat, wide, slotted arm, and is connected with another sliding lug, through which extends the hollow arm, and is adjusted by a screw bolt through the slotted arm, thus forming a joint, from which each tooth passes over a spring bar and through a slotted guide standard, having a spring with a head to keep it in place.

Claim.—1. The adjustable fastening for the rake teeth, consisting essentially of the lugs D and G, and screw bolt and nut H, the lugs being constructed with the flanges and arms as described, and the whole operating together in the manner and for the purpose set forth.

2. The guide standards J J, when constructed with the head *j*, and the slot *i*, extending about half way from the spring bar to the head *j*, and when made adjustable in relation to the spring bar by means of the screw thread and nut, or any equivalent device, and operating in connection with the spring K and the rake teeth, substantially as described.

82,973.—FRANKLIN S. MILES, Philadelphia, Pa.—*Bolt Head.*—October 13, 1868.—The under part of the shoulder of the bolt is riveted into the under part of the washer into which it is forced.

Claim.—As a new article of manufacture, a bolt head constructed as above described.

82,974.—WILLIAM MOORE, Kokomo, Ind.—*Low Water Indicator.*—October 13, 1868.—An improvement on his patent of June 5, 1866.

Claim.—The combination and arrangement of the chamber A, index lever, and scale, with the water regulator, all for the purposes and substantially as herein described and set forth.

82,975.—ALBERT G. MOREY, Chicago, Ill.—*Mattress.*—October 13, 1868; antedated September 30, 1868.

Claim.—1. A mattress or cushion composed of alternate layers of elastic sponge and some semi-elastic material, substantially in the manner and for the purpose set forth.

2. Supporting one or more layers of elastic sponge with some less elastic substance in the construction of mattresses or cushions, substantially in the manner and for the purposes described.

82,976.—CHARLES G. MURCH, Chicago, Ill.—*Coffee and Tea Steamer.*—October 13, 1868.—Vessels with double walls extending nearly to the bottom are placed in the boiler so as to allow the water to pass all around them, while upon them set vessels with perforated bottoms and containing each a strainer in which the coffee is placed.

Claim.—In a coffee or tea apparatus, the inner vessels A A G, with the stop-cocks, and the upper vessels B B, pipes E, and strainer C, the whole combined and arranged substantially as and for the purposes shown.

82,977.—WILLIAM H. NOBLES, St. Paul, Minn.—*Railway Frog.*—October 13, 1868; antedated October 10, 1868.—Across the rails are ordinary flange grooves, which cut one rail so as to leave a piece, the facings being so bent and arranged that the bent ends lie parallel with the rails, leaving between them space enough for the flanges of the wheels.

Claim.—A railway frog, when constructed with the rails B B, with their flange grooves and facings C C, all arranged as described, and for the purpose set forth.

82,978.—WILLIAM H. NOBLES, St. Paul, Minn.—*Car Wheel.*—October 13, 1868; antedated October 10, 1868.

Claim.—The construction of the wheel A with two flanges B B and three threads C C C, as shown and described and for the purposes set forth.

82,979.—JOHN K. O'NEIL, Kingston, N. Y.—*Horse Hay Fork.*—October 13, 1868.—To a strong iron lever is pivoted a short one, each having a half hook beak at one end which are held together by a detent hinged to the long lever and with a catch for the heel of the other, and acted on by a spring, the forks being connected therewith and operated by means of rods, arms, and cords.

Claim.—The two levers A B, with their beaks a b, and spring detent c, connected and operating in combination with the prongs G G of the fork, substantially as and for the purpose herein specified.

82,980.—OSCAR PADDOCK, Watertown, N. Y.—*Blind Shutter Fastening.*—October 13, 1868.—A segment of a crown wheel is secured to one of the blind slats. A worm mounted in bearings formed in the blind frame engages with the segment, and upon said worm being rotated the blind slats are opened or closed without raising the window.

Claim.—1. A device for opening or closing and fastening blind slats, composed of the herein-described toothed segment and endless screw for operating the same, the said parts being applied to the blind slats and shutter or blind frame, respectively, and combined for operation in the manner shown and specified.

2. The combination, with the hollow plunger, or sliding rod and set screw, or equivalent device, upon the same, of an auxiliary adjustable rod, supported in said plunger, and provided with a follower, for engaging with the blind-slat fastener, substantially as described, for the purposes shown and specified.

82,981.—HENRY PALMER, Evanston, Ill.—*Voltaic Battery.*—October 13, 1868.—The positive and

negative elements are so connected by means of wires, which are concealed and protected from the corrosive action of the solution used in moistening the cloth as to prevent deposits on such connections.

Claim.—The combination of the plates B and the positive and negative elements, when arranged to operate in the manner and for the purposes specified.

82,982.—WILLIAM PATTON, Springfield, Mass.—*Apparatus for Dyeing Hair.*—October 13, 1868.

Claim.—1. In combination with a comb A, or other suitable device for applying them to the hair, beard, or moustache, simultaneously, for the purpose of coloring either, alternate coats of nitrate of silver and gallic acid, conveyed and attached to such comb, or other device, by means of suitable vehicle, such as gum arabic, gum tragacanth or caoutchouc, substantially in the manner herein described.

2. The combination of the nitrate of silver with the gum arabic, or other suitable gelatinous vehicle for the purpose, prepared and applied substantially in the manner described.

3. The arrangement of the comb A with two rows of opposite teeth, one row prepared with nitrate of silver and the other with gallic acid, in the manner described.

82,983.—JOHN P. PEARS, Birmingham, Pa.—*Manufacture of Glass Ware.*—October 13, 1868.

Claim.—A mold for making footed or footed and stemmed glass ware, whereof that part in which the body, stem, and foot are formed is in a single piece, without part or division, in combination with the bottom plate having a projecting core, substantially as and for the purpose described.

82,984.—EDWARD PREVEAR, Leominster, Mass.—*Meridian Time Indicator.*—October 13, 1868.—A fixed bed plate formed with bearings to receive a swinging meridian arm is supported, so that the bearings for the arm stand east and west. A lens is attached to the top of the arm and an index plate divided into minutes to the sides of the nonius at the bottom.

Claim.—The meridian arm g, fitted to swing, in combination with the lens i and index k, substantially as specified.

82,985.—ELIJAH K. PURDY, Schoolcraft, Mich.—*Clamp.*—October 13, 1868.—The short arms of the clamps are pointed and engage with the boards, the long arms, being forced apart by the lever, press the boards together. A brace secures the clamp at any angle.

Claim.—1. The floor clamp, consisting of the clamps A, hinged together at B, and provided with prongs C, the curved lever D, and slotted lever E, with holes F, all constructed and arranged substantially as and for the purposes set forth.

2. In combination with the above, the brace A, provided at its lower end with a sharp serrated edge and hole, I, substantially as and for the purpose described.

82,986.—WILLIAM K. RAIRIGH, Rural Valley, Pa.—*Clamp for Saddlers, &c.*—October 13, 1868.—A shaft, journaled in the rigid jaw of the clamp; has secured to one end a ratchet wheel which revolves in a chamber in the end of the clamp, and is provided with a pawl, the end of which projects beyond the chamber. A strap secured to the movable jaw and to the shaft closes the jaws when the shaft is rotated.

Claim.—The shaft B, with its ratchet D, the chamber C, pawl e, and spring g, when arranged upon and made to operate the jaws of a clamp, substantially as and for the purposes specified.

82,987.—AMOS RANK and JOSHUA H. COX, Salem, Ohio.—*Harvester.*—October 13, 1868.—An overhung reel, made adjustable vertically, is driven by a pinion made to slide on a shaft having bearings in brackets on the reel post. The teeth of the wheel secured to the reel shaft and also of the pinion driving it are cut tangentially so as to mesh without having a common center.

Claim.—1. The combination, substantially as set forth, in a two-wheeled hinge-joint harvester, of an

overhung reel, adjustable vertically on a single post mounted on the shoe, with a driving shaft mounted on the reel post, and carrying a sliding pinion, for the purposes specified.

2. The combination, as set forth, with the reel and reel post of the clasp I, bracket i^1 , pinion m , wheel M, and driving shaft L', whereby the reel can be raised or lowered without deranging the gearing.

3. The combination, substantially as set forth, of the reel shaft and its driving shaft, with tangentially-toothed gearing, for the purpose specified.

82,988.—LOUIS RANSOM, Lansingburg, N. Y., assignor by mesne assignment to LOUIS RANSOM and EUGENE HYATT, same place.—*Clasp for Trunk, &c.*—October 13, 1868.—Each of the two parts is provided with a longitudinal slot in which fits a tongue pivoted to the upper part. When the tongue is shut down its outer surface is flush with the two parts, and its head fits into a recess in the lower part, and is held by a spring.

Claim.—A trunk clasp, consisting of the two parts A and B, the clasp-tongue c , and spring d , constricted, combined, and operating substantially as described.

82,989.—P. N. RECKER and JOSEPH RECKER, Dayton, Ohio.—*Grain Separator.*—October 13, 1868.—The grain is cleaned by several distinct currents of air which can be regulated at pleasure. A valve in the bottom of the feeding tube regulates the quantity of grain to be fed. The discharge tube is also provided with a valve.

Claim.—1. The triangular shaped horizontal bars $m m$, and perpendicular bars $n n$, constructed as described, and forming a frame, to be covered with wire netting, for the purpose of scouring grain, substantially as and for the purposes herein set forth.

2. The wire netting N, when constructed in sections, or otherwise, of square wire, and used substantially as and for the purposes herein set forth.

3. The arrangement of the valve a , rod b , slotted bar c , and screw d , for the purpose of regulating the discharge of grain out of a tube, substantially as and for the purposes herein set forth.

4. The arrangement of the chamber D with valve e and valve g , covering the entrance to the chamber G, constructed as described, and operating substantially as and for the purposes herein set forth.

5. The arrangement of the hopper H, passage I, and valve h , constructed as described, and operating substantially as and for the purposes herein set forth.

6. The arrangement of the passage Q, chamber R, with its valve w , and the valve y , covering the entrance to the chamber S, constructed as described, and operating substantially as and for the purposes herein set forth.

7. The arrangement of the chambers C, D, G, Q, R, and S, passage I, and the hopper H, carrying the different currents of air through the chamber E, and into the drum F, substantially as and for the purposes herein set forth.

82,990.—FRANCIS REESE, Elyton, Ala.—*Plow.*—October 13, 1868.—A guide plate secured to the main frame runs near the ground and prevents the scraper from breaking the ground that the plant stands on, and also the hilling plow from covering the plant.

Claim.—The guide plate, and the combination of the scraper, hilling plow, and other parts, as described.

82,991.—THADDEUS S. REEVE and CHARLES D. SMITH, Chicago, Ill., assignors to themselves and WILLIAM SCHWARTZ, same place.—*Harvester Rake.*—October 13, 1868.—The reel and apparatus are arranged to gather the grain at any angle. The reel is provided with sliding sections which descend and deliver the grain at the rear of the machine.

Claim.—1. The adjustable plate C, in combination with the standard D, sleeve J, and lever H, for supporting the reel, as fully set forth and shown.

2. The boxed sleeve J, oscillating on the standard D, in combination with the adjustable lever H, pin A'', or its equivalent, and slotted standard F, substantially as set forth.

3. The sliding section of the reel M, slide N, and lever G, as fully set forth and shown.

82,992.—CHARLES RICH, Poughkeepsie, N. Y., assignor to SARAH A. RICH, same place.—*Baby Jumper.*—October 13, 1868.—A spring can be adjusted on the rocker so that its resilient power will agree with the weight of the child. The seat rail is hinged under the saddle and can be swung up to allow the child to mount and dismount.

Claim.—1. The rocking yoke C, pivoted to the base A, supporting the seat bar D, and connected with the up-and-down adjustable spring E, all made, arranged, and operating substantially as herein shown and described.

2. The post B, which carries the spring E, when arranged in combination with the base A, yoke C, and seat bar D, all made and operating substantially as herein shown and described.

3. The bow-shaped swinging railing F, when attached to a standard f , which is pivoted to the under side of the seat, and when fastened with its ends to the fixed horn $d e$, substantially as and for the purpose herein shown and described.

4. The projecting lugs h , and the pin i , in combination with the swinging standard f and rail F, for locking the same, substantially as set forth.

5. A baby jumper, consisting of the base A, post B, swinging yoke C, spring E, seat bar D, saddle G, horn $d e$, and swinging rail F, all made, arranged, and operating substantially as herein shown and described.

6. The sliding foot rest H, in combination with the wedge j and seat bar D of a baby jumper, substantially as and for the purpose herein shown and described.

82,993.—WILLIAM T. RICHARDS, Bridgeport, Conn.—*Punching Machine.*—October 13, 1868.—A vertical slide provided with two inclined grooves receives motion from a crooked lever secured to the punch slide. The ends of two levers pivoted to a supplemental frame on the bed plate fit in the inclined grooves, while the opposite ends of the levers carry guides which insure the central position of the plate to be punched.

Claim.—The arrangement, herein described, of the gauge levers k and l , slotted plate H, lever I, and the punch stock or gate c , as and for the purpose set forth.

82,994.—EDWIN P. RUSSELL, Manlius, N. Y.—*Wrench.*—October 13, 1868.—One of two levers is provided with a tongue over which slides a jaw provided with a pin which fits in a slot and is actuated by the other lever.

Claim.—The jaw C, when operated upon the tongue c , by means of the lever B, the pin p' , and the slot s .

82,995.—LARKIN S. SAFFORD, Hope, Me.—*Stanchion for Fastening Cattle.*—October 13, 1868.—The upright parts of the stanchions hang loosely in the top of the frame. A yoke connecting their lower ends is secured to the floor by a link.

Claim.—1. The manner of hanging the pieces D E loosely in the top piece A.

2. The yoke L.

3. The combination of the link T, the yoke L, the pieces D E, and the top piece A, substantially as and for the purpose set forth.

82,996.—ABISHA SCOFIELD, Starkey, N. Y.—*Grape Trellis.*—October 13, 1868.—A socket attached to a stake in the ground supports a standard to which arms are secured that support the bars. A screw in the socket secures the standard in position, and when loosened, allows the trellis to be rotated or removed.

Claim.—In combination, the post A, socket B, set screw G, standard C, arms F F', and bars D, arranged as and for the purpose set forth.

82,997.—MATTHEW SCRANNAGE, Boston, Mass.—*Tumbler Washer.*—October 13, 1868.—The tumbler placed on arms attached to a swivel is rotated by jets of water flowing tangentially from a rose.

Claim.—1. The swivel K H H H on the stem E, arranged and operating substantially as described, and for the purpose set forth.

2. The rose D, when provided with tangentially discharging orifices $d d'$, &c., operating in combina-

tion with the swivel K H H H, arranged substantially as described, and for the purpose set forth.

82,998.—GEORGE A. SEAVER, New York, N. Y.—*Swing*.—October 13, 1868.—An additional pair of ropes is attached to the upper part of the frame, slightly in advance of the points of suspension of the swing, and also attached to handles sliding on the suspension ropes, so that the swing can be operated without being pushed.

Claim.—The combination of the propelling rope or ropes with the movable handles or sliding sockets, substantially as described.

82,999.—N. MENDAL SHAFER, New York, N. Y.—*Washing Machine*.—October 13, 1868.—The clothes and soap are placed between two wire boxes, the lower one of which is stationary, while the upper one is connected to the pump handle and has a vertical motion. Water is forced through the lower box into the clothes by a pump, while the upper box squeezes the suds through them.

Claim.—The method of squeezing the suds through the clothes, by means of unresisting wire boxes B and L, or their equivalent, in combination with the pump H E and D, as herein described and set forth.

82,000.—GEORGE C. SHALER, Gilboa, and HARRY BARLOW, Herbert, N. Y.—*Horse Rake*.—October 13, 1868.

Claim.—The platform *a*, rigidly attached to the revolving axle *b*, in which the curved teeth are fixed, and the platform *c* hung between the projections *d d* of the axle-tree, and carrying the clearers *e*, as herein shown and described, whereby, as the driver steps from *a* to *c*, the latter is depressed, the axle partially turned, and the teeth and clearers operated as set forth and shown.

83,001.—JACOB J. SMITH, Philadelphia, Pa.—*Bed Bottom*.—October 13, 1868; antedated October 1, 1868.—The cord is wound or tightened on a cylinder which is provided with a ratchet and pawl.

Claim.—1. An elastic bed bottom, consisting of a series of separate wooden slats B B, arranged parallel with each other and with the side rails of the bedstead, and having a round knob *b'*, fixed near each end, in the middle of the width of the under side of each slat, B, and the said slats suspended by means of two single cords, C and C', which respectively pass in a strained or stretched manner from the knobs *b'* of the slats to like knobs *a''*, fixed in the head and the foot rails A A', in the zigzagged or laced manner shown and described, for the purpose specified.

2. In combination with the mechanical devices claimed in the preceding clause, the winding apparatus D, arranged to operate substantially as and for the purpose described.

83,002.—JOHN B. SMITH, Newton, assignor to himself, JAMES B. STEVENS, and U. G. STEVENS, Jasper County, Ill.—*Horse Rake*.—October 13, 1868.—The inner sides of the hubs of the wheels are formed with ratchet teeth which engage with slides on the rake shaft and revolve the rake. The slides are operated by crank arms engaging with the ends of levers which connect with the slide.

Claim.—The levers D D, in connection with the slides *f f* and clutches D^x, oblique arms *h* at the front ends of the levers, the crank ends *i* of shaft E^x, and the projections on the slides *f* and thills, all arranged to operate in the manner substantially as and for the purpose specified.

83,003.—GEORGE R. SNEATH and C. H. SNEATH, Wilmington, Del.—*Dumping Wagon*.—October 13, 1868.—The wagon body is arranged to tip backward on a trunnion shaft which has bearings in the bed frame. Bolts attached to a crank shaft release or secure the wagon body on the frame. The bed frame is braced and provided with devices for relieving the trunnion shaft from the weight of the wagon body when the latter is in a horizontal position.

Claim.—1. The combination, in a dumping wagon, of the box A, hung on trunnions, with bed frame timbers *h h*, cross-bar *t*, bent axle-tree *s*, all operating

substantially as shown and described, and for the purpose set forth.

2. The crank shaft *v'* and hinged bolts *v v*, arranged to operate as herein described, for the purpose specified.

3. The bed frame of a dumping wagon, when composed of the parts *h h*, *t*, *i i i*, *u u*, and *j*, arranged as herein described.

4. The arrangement of the frame *l l o* with the fifth wheel *k* and springs *m n n*, substantially as described, when forming part of the running gear of a dumping wagon, substantially as herein described.

83,004.—GREENLEAF STACKPOLE, New York, N. Y.—*Toy Pistol*.—October 13, 1868.—A slot is made in the bottom of the pistol in which a screw fastened to the plunger slides. A rubber band fits over this screw and is secured to the front of the barrel. A spring trigger is arranged to hold the screw which, on being released, discharges the pistol.

Claim.—A pistol or gun, having the spring trigger E and slot A, in combination with the rubber band B and plunger F, when the parts are constructed and operated substantially as set forth.

83,005.—NOAH SWICKARD, Galva, Ill.—*Wagon and Car Unloader*.—October 13, 1868.—The wheels of the wagon rest on bars pivoted in slots in the platform. The bars are connected together at one end by a plank which rests on spring toggle keys. When the keys are drawn back the platform drops and the wagon is prevented from moving by dogs pivoted to the bars.

Claim.—1. The slotted platform A, in combination with the pivoted balance bars B B, board C, end bars I I, and stops H H, all constructed and operating substantially as and for the purposes herein set forth.

2. The pivoted balance bars B B, provided with one or more self-acting dogs, G, in combination with the spring toggle keys E E, and key F, all constructed and operating substantially as and for the purposes herein set forth.

3. The arrangement of the slotted platform A, balance bars B B, and lid D to the hopper, substantially for the purposes set forth.

83,006.—JOSEPH TANEY and JOHN H. BROWN, Bangor, Me.—*Railway Car Bumper*.—October 13, 1868.—A rubber spring is inserted in the head of the draw beam, which gives additional elasticity to the draw bar, and prevents the breaking of the transient beam or center pin.

Claim.—The rubber spring D, when constructed as described, and inserted into the draw head C, substantially as and for the purposes herein set forth.

83,007.—NELSON C. THOMAS and JACOB H. COE, Brighton, Mich.—*Hay Elevator*.—October 13, 1868.—The conveyor slides on a tight rope and is held in position while the hay is being elevated by a lever operating a catch which engages with a stop secured to the rope. The lever disengages the catch when a projection on the elevating rope near the hay comes in contact with the lever.

Claim.—The conveyor H, when constructed as described, traveling on the rope D, provided with stop F, having pivoted in it the lever N, and operating in combination with the ropes S and J, screw bolts A, with hand nuts E and blocks C G, all arranged and operating substantially as described.

83,008.—W. O. TROWBRIDGE, Newton Corner, assignor to "MASON & HAMLIN ORGAN COMPANY," Boston, Mass.—*School Desk and Musical Instrument*.—October 13, 1868.—The case containing the reeds and key board, is arranged to slide on ways under the desk and can be drawn out when used as a musical instrument, or pushed back and concealed by a lid hinged to the front edge of the key board, when used as a desk.

Claim.—In combination with a desk, a keyed musical instrument, so arranged that its keys may be concealed from view, or may be brought into position for playing, substantially as set forth.

83,009.—JESSE TUCKER and ABEL B. PALMER, Adrian, Mich.—*Water Wheel*.—October 13, 1868.—The wheel is provided with an upper side issue, a bottom issue, and an auxiliary series of buckets projecting outwardly over the lower part or bottom issue.

Claim.—A water wheel, having three series of buckets C, d, and e, constructed as shown, and arranged in relation to each other, substantially as and for the purposes set forth.

83,010.—PETER WALRATH and JESSE WALRATH, Chittenango, N. Y.—*Brick Machine*.—October 13, 1868.—An endless chain of molds, hinged together and running over two sprocket wheels, are provided with movable bottoms, which are acted upon to press the contents of the mold and also to force the brick out of the mold at the proper time.

Claim.—The grind mill and crowding devices a b c, endless chain of molds D D, with movable bottoms d, delivering wheel L m, press I H, with the intermittent operating devices F f² G², and ratchet e, with throwing devices F f G, all constructed and operating as herein described, and for the purpose set forth.

83,011.—ARTHUR L. WARING, Coshocton, Ohio.—*Animal Trap*.—October 13, 1868.—The cover is composed of four square sections pivoted to the sides of the box. A diaphragm with spikes on its under side and an opening in the center is placed beneath the cover.

Claim.—The described trap, consisting of the box A, having the hinged covers b b b b, arranged as described, and diaphragm B with points x x arranged as described, the whole being combined as and for the purpose set forth.

83,012.—JOHN W. WETHERBEE, Charlestown, assignor to himself and RICHARD ROWSE, Chelsea, Mass.—*Reclining Chair*.—October 13, 1868.—The front and back pieces are hinged to the main frame and connected together by a bar which is provided with notches in which a latch is dropped when the back is in the proper position.

Claim.—1. In combination with the stationary seat frame and stationary arms, the swinging back e, and foot-and-leg frame f, pivoted to the side frame, and jointed together by links k, and moved from vertical to inclined or horizontal position, or *vice versa*, (one frame by the other,) substantially as described.

2. In combination, with the adjustable back and foot piece and stationary seat, the links k, the notches m, and latch n, arranged to operate substantially as set forth.

83,013.—JOHN R. WIDGEON and FRED. E. FREY, Bucyrus, Ohio.—*Automatic Boiler Feeder*.—October 13, 1868; antedated September 26, 1868.—A hollow cylinder revolves in and has its seat on the bottom of a case provided with four pipes. It is provided with two parts diametrically opposite, which alternately allow the steam from the boiler to enter the chamber while the water escapes into the boiler, and the steam to escape from the chamber as the water enters.

Claim.—The combination of the case Q with the chamber A, having ports l m, and with the seat B provided with holes d e f g, substantially as herein described.

83,014.—JOHN E. WIGGIN, Stoneham, Mass.—*Automatic Punching Machine*.—October 13, 1868; antedated September 26, 1868.—Designed for punching holes in material of boots and shoes, for the insertion of eyelets.

Claim.—1. In combination with a punching device, an automatic intermittent moving feed, to which the material to be punched is affixed, substantially as and for the purpose described.

2. The combination of the coupling i k with the work-feeding device through the piece x, the rocker y, lever l v, latch pull o, and spring n, or their equivalents, substantially as described.

3. The combination of the brake m with the lever l v, spring n, and fixed part k of the coupling.

4. The combination of a segmental rack with clamping jaws, substantially as described.

5. The combination of the piece h' with the pull o, for throwing the pawl w out of gear with the rack.

6. The employment of a friction-applying device arranged to operate on rack t to steady its movement, and to prevent it from moving beyond the distance intended, substantially as described.

83,015.—SAMUEL YATES, Marshall, Mo.—*Churn Dasher*.—October 13, 1868.—A tubular churn-dasher shaft has an air chamber at the lower end which is provided with a valve opening downward. The air is conducted into the cream by air tubes on top of the dasher connecting with the air chamber.

Claim.—The combination of the hollow or tubular shaft A with air chamber B, valve C, dasher D, and air tubes E, as constructed and arranged, substantially in the manner and for the purpose described.

83,016.—V. D. ANDERSON, Milton, Wis.—*Steam Generator*.—October 13, 1868.—The boiler consists of two cylindrical parts, each provided with water spaces, said parts being placed one within the other and secured together with a communication between them. The steam is superheated in a pipe coiled in the furnace and leading from the reservoir.

Claim.—1. The arrangement of the parts A and B, when constructed and joined together, substantially as set forth.

2. The arrangement of the boilers A and B and the reservoir of the superheater Q, substantially as described.

83,017.—W. H. H. BABBITT, New Corner, Ind.—*Gaiter Boot*.—October 13, 1868.—A slotted plate secured to the outer edge of the leg of the gaiter by a folding leather, fits over a lip on a plate attached to the other edge of the leg of the gaiter.

Claim.—1. In combination with a gaiter, the plates A and E, and the folding leather D, arranged substantially as described, for the purposes set forth.

2. The flap G, in combination with the plates A and E, arranged and operating substantially as described, for the purposes set forth.

83,018.—JOSEPH BACKUS, Green Vale, Ill.—*Device for Unloading Hay*.—October 13, 1868.—A beam over which the elevating chain passes is hinged by a universal joint to the top of the derrick. The front end of the chain is provided with a hook which engages with one end of the strap encircling the hay; the other end of the strap is provided with a latch hook which is fastened to the chain. The hay and end of the derrick are raised by the chain.

Claim.—The derrick A B C, in combination with the beam D, chain d, and hooks e and F, all made and operating substantially as herein shown and described, and for the purpose of unloading hay from wagons, as set forth.

83,019.—THOMAS BAGGOTT, Baltimore, Md.—*Wire Cloth*.—October 13, 1868.—The warp is formed by winding spiral cords of wire, one inclining to the right the other toward the left; these coils placed side by side are filled with wires bent like a staple.

Claim.—The production of wire cloth, constructed as herein described, whether the ends of the webs are joined together or not, as an article of manufacture.

83,020.—WILLIAM BANZETT, Brooklyn, N. Y.—*Leach Tub*.—October 13, 1868.—An elastic packing strip is interposed between the edge of the tub and the cover. A series of hooks pivoted to the tub securely clamp the cover.

Claim.—A leach tub, constructed as described, namely, with the cover C, battened around its edges on top, and having the hinged portion e, and held by the clamps B, having beveled forward ends, said clamps being hinged to the ears a, which are secured to the sides of the tub, all arranged as herein shown, for the purpose specified.

83,021.—ARTHUR BARBARIN, New Orleans, La.—*Combined Hatchet, Hammer, and Scraper*.—October 13, 1868.—A scraper projects laterally from one side of the head.

Claim.—As a new article of manufacture, a com-

bined hammer head, nail puller, hatchet blade, and scraper, formed of one piece of metal, substantially as herein shown and described.

83,022.—ARTHUR BARBARIN, New Orleans, La.—*Box Opener.*—October 13, 1868.—A circular flange formed on a metal shank serves the purpose of a hammer. A blade with its edge rounded is formed beyond the shank so as to be readily inserted between the parts of the box to be separated.

Claim.—The herein-described tool for opening cigar boxes and other articles, as a new article of manufacture.

83,023.—ARTHUR BARBARIN, New Orleans, La.—*Shoemakers' Implement.*—October 13, 1868.—Combines in one implement, such devices, as a shoemaker requires most in cutting out, fitting, and sewing together the different pieces of which a shoe or boot is made.

Claim.—As a new article of manufacture, a tool, the shank and handle of which are combined with the hammer head, claws, and rotary-cutting disk, with or without the screw-driver, in the manner and for the purposes set forth.

83,024.—ARTHUR BARBARIN, New Orleans, La.—*Liquid Sampler.*—October 13, 1868.

Claim.—1. The combination of the induction tube of a siphon with a discharge pipe provided with a throat for receiving said induction tube, a vacuum-creating rubber bulb, and stop-cocks *c d'*, located, one on each side of the said throat, with or without the reservoir C between them, substantially in the manner and for the purposes shown and set forth.

2. The receiving chamber or reservoir C, arranged between the induction end of the pipe and the rubber bulb, substantially in the manner herein shown, and for the purposes described.

3. Providing the liquid-receiving chamber or reservoir of the siphon or liquid sampler with a discharge tube and cock, as shown in Fig. 4 of the accompanying drawings, by means of which the liquid in said chamber can be drawn off, substantially as and for the purposes specified.

4. The combination, with the screw-threaded end of the siphon, of a nut, grooved and provided with pins by which the said siphon may be held to the vessel to which it is applied, substantially in the manner herein shown and set forth.

5. A liquid sampler, consisting of a hollow rubber bulb in combination with a tapering tube provided with a stop-cock at or near the point where it is united with the said bulb, with or without a reservoir of glass or other suitable material interposed between the said stop-cock and the open end of the said tube, substantially as and for the purposes herein shown and specified.

83,025.—WILLIAM P. BARCLAY, Chicago, Ill.—*Sofa Bedstead.*—October 13, 1868.—The back of the sofa is turned forward on the seat and forms a bed without using the seat. Hinged end pieces serve as head and foot boards when open, and when closed keep the bedding in place. The ends of the sofa have hinged arms which when open serve as legs for the bedstead.

Claim.—1. Constructing the back of a sofa so that the same forms a complete bed, substantially as specified.

2. The frame C C', D D', in combination with the seat and ends of the sofa, and forming the back thereof, and pivoted to the ends, so as to turn forward, substantially as and for the purposes specified.

3. The folding head and foot boards herein described, in combination with the frame C C', D D', and ends and seat of a sofa, substantially as and for the purposes specified.

4. The supporter *f*, in combination with the head-board herein described, and frame of the back of the sofa, substantially as and for the purposes set forth.

5. The jointed arm I J, constructed substantially as and for the purposes specified.

6. The pieces C C', in combination with the end pieces E of a sofa, and slats *a*, when so constructed as to form both the back of a sofa and also a complete bed, substantially as described.

83,026.—JOHN A. BASSETT, Salem, Mass.—*Gas Generator.*—October 13, 1868.—An ordinary wet meter is used in connection with a chamber containing hydrocarbon. The air passes through the chamber and enters successively the compartments in the chamber of the wheel, by the revolution of which the evaporation of the hydrocarbon is secured.

Claim.—An apparatus for charging air with hydrocarbon vapor, automatically revolved by the weight of the column of vapor, and used in combination with the chamber C, substantially as set forth.

83,027.—WILLIAM D. BAXTER, New York, N. Y.—*Pump.*—October 13, 1868.—The air vessel forms the fulcrum for the lever, the ends of which latter are provided with rollers which slide in yokes secured to the top of each piston rod. A water way is provided above the pumps.

Claim.—The pistons *e* and yoke pieces *p*, actuated by the rollers *o* and lever *l*, in combination with the pumps *d d*, and water way *f*, provided with stuffing boxes for the piston rods *n*, and an air vessel *k*, the parts being arranged and constructed substantially as specified.

83,028.—BENJAMIN S. BENSON, Baltimore, Md.—*Pipe Molding Machine.*—October 13, 1868.—The flask is revolved and the screw packer is not revolved, but rises as the flask becomes packed.

Claim.—In combination with a revolving flask, a non-revolving but rising and falling screw packer, which rests upon and rises with the sand packed in the flask, and is guided in its rising, substantially as and for the purpose set forth.

83,029.—BENJAMIN S. BENSON, Baltimore, Md.—*Packer for Packing Sand in Molders' Flasks.*—October 13, 1868.—Two-thirds of the length of the screw is made of zinc, the other third of steel plates.

Claim.—1. The packing instrument, with a screw thread of gradually diminishing pitch from its first end, and a zinc or other soft metal or alloy-of-metal fillet under and around it, as and for the purpose herein described and represented.

2. In combination with the screw thread and fillet, the sectional and removable steel plates D and E, substantially as and for the purpose described.

83,030.—M. BERDAN, Manmee City, Ohio.—*Plow.*—October 13, 1868.—A screw rod connecting the handles passes through an oblong slot in a bar secured to the share. The bar is held in position by nuts on the screw rod placed on each side of the rod.

Claim.—The slotted bar F, and screw rods E and H, so arranged that the share G can be adjusted both vertically, laterally, and longitudinally, as specified.

83,031.—SAMUEL C. BISHOP, New York, N. Y.—*Compound for Insulating Telegraph and Electric Wires.*—October 13, 1868.—Composed of asphaltum, gutta-percha, crude rosin, spirit of turpentine, boiled linseed oil, and nuber, and applied to wire covered with a layer of flax, jute, &c.

Claim.—The insulating compound for telegraph and other electric wires or conductors, composed of the ingredients described, in, or about in, the proportions specified.

83,032.—SIMEON R. BOLTON, Prescott, Wis.—*Wagon Brake.*—October 13, 1868.—The shoes are wedge-shaped and made to slide on rollers in a box secured to the brake bar so as to release the wheels when the wagon is backed.

Claim.—1. The brake shoe *e*, constructed as described, with its rear face inclined downward, and sliding by the dovetailed edge *i* and bent plate *h* upon the rollers *g* in the box *f*, all arranged as described, for the purpose specified.

2. The arrangement of the bent lever *j*, connecting rods *k l m*, lever *n*, spring *p*, rod *o*, guide iron *d*, brake bar *a*, box *f*, and sliding shoe *e*, all operating as described for the purpose specified.

3. The arrangement of the brake bar *a*, sliding by means of staples upon the guide iron *d*, the box *f*, rollers *g*, and sliding shoe *e*, as herein described, for the purpose specified.

83,033.—DAVID BOOKWALTER, Gardner, Ill.—*Corn Husking Machine.*—October 13, 1868.—Grooves are so disposed on the husking rollers that the teeth on one roller are opposite the grooves on the other. The cleaning plate is provided with slots through which the teeth pass and free themselves.

Claim.—The combination of the rollers A, provided with the grooves *a* and the teeth B, and the shields or cleaners C, all constructed and arranged as shown and described.

83,034.—ASAHEL C. BOYD, Grafton, Mass.—*Folding Chair.*—October 13, 1868.—The seat is hinged to the back legs and connected to the front legs by rods; when open it rests on the top of the front legs, and when folded back it causes the leg to be folded.

Claim.—The standards A A, B B, pivoted at *a a*, and provided with strengthening rounds or cross bars, in combination with the pieces H H, curved hinges I I, or their equivalent, and hinged connecting rods or plates J J, when the several parts are constructed to operate together in the manner and for the purposes above described.

83,035.—CHARLES K. BRADFORD, Lynnfield, Mass.—*Velocipede.*—October 13, 1868.—The steering rope is applied directly, or nearly so, to the axis of revolution of the steering wheel.

Claim.—1. Connecting the body of a velocipede to its driving shaft, in such manner as to vary the position of such body, and its seat, with respect to such driving shaft, in manner and for the purpose as hereinbefore explained.

2. Combining with a velocipede a compound crank, or series of cranks, or eccentrics of different radii, for enabling the speed and power of the vehicle to be varied, essentially as herein shown and described.

3. The arrangement of the rope *n*, or its equivalent, as affixed to the forked bar *m*, and supported and guided by the guides *o*, *o*¹ *o*² *o*³ *o*⁴ *o*⁵, or their equivalents, substantially as before described, and herein shown.

4. The combination, with the body of a velocipede, of a seat adjustable thereon, substantially in the manner and for the purposes set forth.

5. The combination of the body of a velocipede, formed as described, and its adjustable seat, with a compound crank, or its equivalent, substantially as and for the purposes set forth.

83,036.—JAMES CAMPBELL, New Town, Ill.—*Plow.*—October 13, 1868.—The plows are secured to the beam by iron stirrups. A cross piece parallel to the beam is provided with hooks to which the colter chains are attached. A lever secured to the beam fits in notches in a bar and raises or lowers the plows.

Claim.—1. The partially-revolving square beam B, carrying plows or shovels, secured to the plow frame at an acute angle to the line of the draft, constructed and operating substantially as and in the manner set forth.

2. In combination with the above, the stirrups F F, lever D, notched bar E, brace chain M M, cross piece P, and the angle axles N N, the whole arranged and operating substantially as set forth.

83,037.—SAMUEL E. CARR, Danville, Pa.—*Composition for Forming Building Blocks, Pavements, Tiles, &c.*—October 13, 1868.—Composed of sand, hydraulic cement, ground slate, lampblack, and a solution of sulphate of zinc.

Claim.—An improved composition for forming building blocks, pavement tiles, &c., formed of the ingredients, and in the proportions and manner substantially as herein set forth and described.

83,038.—J. M. CHAPLIN, Middleport, N. Y.—*Fence.*—October 13, 1868.—The wires are attached at one end to a wooden spring, at the other to wheels which are revolved to tighten the wire and then held by pins passing through into the post. The wires fit in oblique slots in the pickets which prevent the latter from moving laterally.

Claim.—The wires C C, with the wheels E E, spring D, and pickets B, all arranged in connection with the posts A A', substantially as and for the purpose set forth.

83,039.—CARL AUGUST CLASS, St. Louis, Mo.—*Child's Pedal for Pianos, &c.*—October 13, 1868.—Pressure slides are secured to the stool so as to be readily attached to the pedals of the piano. The upper part of the slides affords the necessary footing for the operation of the pedals.

Claim.—The stool A and the pedal slides B, when employed as and for the purpose described and set forth.

83,040.—GEORGE R. CLEMENTS, Prescott, Wis.—*Dropper for Harvester.*—October 13, 1868.—A lever is composed of two parts which are connected together and pivoted, on the stud to which the rods operating the cut-off and grain platform are attached. The lower end of one part is pivoted to the frame of the machine, and the end of the other has attached to it a rod which causes the grain platform to swing around.

Claim.—The lever II, composed of two parts *l l*, connected by a pivot, *m*, in combination with the cut-off and grain discharger, connected to said lever in the manner substantially as and for the purpose specified.

83,041.—DAVID CLEMONS, Scranton, Pa.—*Hames for Harness.*—October 13, 1868.—A lever pivoted to one end of the hame is provided with a hook on which the chain is placed. By drawing back the lever the chain is fastened. The lever is held back by a ring sliding on a staple.

Claim.—The lever E, hook F, and holding ring G, in combination with the chain D and the lower end of the hames A, substantially as shown and described, and for the purposes specified.

83,042.—JOSEPH COCKSHOOT, Jr., and HENRY WEATHERILL, Manchester, Great Britain.—*Car Brake.*—October 13, 1868; antedated October 10, 1868.—The pinions on the axles actuate the racks to apply the brakes. The springs restore the brakes to their normal positions.

Claim.—The combination of the longitudinal bar or plate *b*, and its racks, the pinions on the axles, and the springs *m m*, the whole being arranged and applied to a railway car, substantially as and for the purpose herein set forth.

83,043.—JACKSON CORRISTON, Sandusky City, Ohio.—*Air Spring.*—October 13, 1868.—Perforated concave diaphragms are arranged in pairs and united together at their outer and inner edges. A valve in the bottom of the spring has a hollow nut on its stem by which the valve may be closed tightly.

Claim.—An air spring, constructed as herein described, and provided with the valve *f*, in combination with the spring A B, composed of metallic disks, substantially as and for the purpose set forth.

83,044.—GARDNER COX, Pierpont, N. Y.—*Water Wheel.*—October 13, 1868.—The upper parts of the buckets are inclined at an angle of 15° or 20° with a horizontal plane. The lower parts are inclined in the opposite direction, the two parts being connected by a quick curve.

Claim.—The buckets G, composed of three parts, *a b c*, arranged as shown, when said buckets are attached to the concave periphery of the hub or body F of a wheel, as and for the purpose herein set forth.

83,045.—JOHN C. CRUMPTON, Philadelphia, Pa.—*Vise.*—October 13, 1868.—The sliding jaw is cast with the nut, and slides in slots in the stationary jaw. The rear end of the screw rests in a cup which fits over the rear of the bed plate and shield.

Claim.—1. The bed piece A, jaw B, and shield C, when cast in one piece, and provided with the slots D D, substantially as and for the purpose described.

2. The combination, with the same, of the sliding jaw F, when fitted to operate in connection therewith, and provided with the nut G, substantially as and for the purpose described.

3. The arrangement of the cap I, and screw L, and stationary jaw B, with the remaining parts of the vise, in the manner and for the purpose described.

83,046.—STEPHEN S. DAVIS, Edgerton, Wis.—*Gate.*—October 13, 1868.—The gates are pivoted at

their lower extreme ends and connected to a lever which is provided with suspended handles, so that the gates are opened or tilted back when the handles are lowered.

Claim.—The combination of the wires *a a*, levers *F F*, and handles *G G*, or their equivalents, for the purpose of opening and closing the gates *C C*, substantially as herein set forth.

83,047.—E. C. DICEY, Montague, Mich.—*Feeding Roller for Circular Saws.*—October 13, 1868.

Claim.—The feed roller for edging-saws, provided with *V*-shaped grooves and projections at right angles to its axis, for the purpose of preventing lateral movement of the board, while being fed to the saws, as herein shown and described.

83,048.—VALENTINE DOANE, Jr., Harwich Port, Mass.—*Fish Bait Cutter.*—October 13, 1868.—Knives are secured to plates on the periphery of a cylinder, which rotates in a box provided with knives and having a hinged bottom.

Claim.—A mill for cutting fish bait, having cylinder *A*, plates *f* and *h*, and the series of knives connected therewith, as described and shown; plank *C*, block *D*, bottom *E*, and cover *K*, constructed and arranged substantially as specified.

83,049.—C. S. DOOLITELL, Mansfield, Ohio.—*Coal Stove.*—October 13, 1868.

Claim.—1. The arrangement of the air pipe *C*, fire chamber *B*, slotted pipe *H*, and flattened flues *F*, whereby the current of air entering the pipe *C* is heated in its passage through the fire chamber, and distributed through the slotted pipe *H* into the series of flattened flues *E*, where it mingles with the cool air entering said flues through the pipes *D*, as herein shown and described.

2. The flattened air flues *E*, constructed as described, and arranged in respect to the outer case *F* and egress draught openings of the fire chamber *B*, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the slotted pipe *H* with the flattened flues *E*, and with the pipe or pipes *C* passing through the fire chamber *B*, substantially as herein shown and described and for the purpose set forth.

4. The combination and arrangement of the air-pipes *D* with the fire chamber *B* and with the flattened flues *E*, substantially as herein shown and described, and for the purpose set forth.

83,050.—WILLIAM C. DOUTHETT, Rochelle, Ill.—*Churn.*—October 13, 1868.—Designed as an improvement on his patent No. 77,873. A rod secured to the dasher fits in a swivel which is pivoted in a ring, which latter is hung in jaws on the arm attached to the crank shaft. The arm is adjustable in the shaft and held by a set screw.

Claim.—1. The double-oscillating or swing joint, when constructed substantially as above described, and for the purposes set forth.

2. The hub *P*, in combination with the adjustable rod *F*, arms *H*, ring *I*, piece *K*, and rod *O*, all operating to regulate the length of the stroke of the dasher *C*, as well as to produce the stroke itself, substantially as described.

83,051.—C. H. DREYER, Nashville, Tenn.—*Pump.*—October 13, 1868.—The cylinder is made to reciprocate on a fixed hollow piston rod, which is provided with a piston made in two parts, the lower one of which has four valves on its upper face, two of which alternately open and close communication to the lower part of the cylinder, while one of the others governs the passage from the lower portion of the cylinder to the exhaust and the other from the upper part of the cylinder to the exhaust.

Claim.—The fixed piston *D E*, constructed of two parts, and provided with the valves *a* and *b*, *c* and *d*, and their passages *e f g*, and *h i*, leading to the lower and upper parts of the cylinder, and the passages *k l*, all substantially as and for the purpose described.

83,052.—ALBERT J. ELDER, Kansas City, Mo.—*Automatic Car Coupling.*—October 13, 1868.—The

spring bar has a head to its free end which projects over upon the tooth of the draw head, and a hook which catches under the link, to lift it and uncouple the cars, by means of the lever pivoted to the draw head.

Claim.—The spring bar *D*, when provided with the hook *m*, and arranged in the open draw head *A*, to operate in connection with the tooth *a*, in the manner and for the purpose specified.

83,053.—FREDERICK ENGEL, Romeo, Mich.—*Window Shutter.*—October 13, 1868.

Claim.—A window shutter, composed of metal plates, *C*, which are separately formed with rolls and overlapping edges, and connected by metal rods, *D*, forming hinges that work in opposite directions, and when folded up, constituting a roof to shield the window from snow or rain, all as herein shown and described.

83,054.—RICHARD EXELBY and GEORGE W. MARSHALL, Buffalo, N. Y., assignors to themselves, JOHN S. LACY, Jr., and JOHN A. SEYMOUR, same place.—*Oat Dusting Machine.*—October 13, 1868.—

A valve in the hopper has a rod within reach of the operator, and is connected by a passage with the central disk above the beaters, and a fan, motion being given by means of a crank and gearing, with which the screen in the hopper is connected, being operated by a bar with an eccentric and bevel wheel.
