318.

Eugene Johnson, Co. D. 9th U.S. Cav. (Colored.) was shot through the neck just below the lower jaw with a stone-headed arrow by the Commanche Indians, while acting as escort to the U.S. Mail from Fort Stockton to Fort Lancaster, Texas, in the summer of 1869, was discharged about four months after receipt of wound. Mail was being conveyed on mules, which were killed; mail captured and torn up by the Indians; another one of the escort received a gunshot wound in the breast and two were killed, one Corp'l Wright, and one Priv. John —. The attack was made about ten miles from Ft. Stockton and the escort were obliged to return.

(The foregoing are the man's own statements.)

Photographed at the A. M. M. May 23/1871.

Mr. Haviland. (Div. Surg'l. Records, S. G. O.) states that the Monthly Report states that this man was discharged from service for syphilis. The above data are copied from E. T. Parker's Memorandum.

A. B. Eugene Johnson, "D." 9. U.S. Cav. Discharged August 29th 1868, from Ft. Stockton, Texas, for Syphilis, — not in line of duty.

see
311.

Ly. R. V. Carwood, a farmer, aged 77 years, was admitted into Providence Hospital, Wash. D.C. May 14th 1871 for the removal of a fatty tumour, (see 311. P. S. photographed at the A. M. M. May 15/1871) which had begun to develop twenty years ago and was gradually increasing. It was attached to and developed from the base of the neck, above & between the scapulae, having a pendant position much like a bag or knapsack thrown across the shoulder. At its most dependent portion there were several large superficial ulcers. The patient, being anaesthetized with two parts of ether and one part of chloroform, Dr. C. M. Ford, assisted by others of the hospital staff, proceeded to remove the morbid growth. The first incision, encircling the tumour near its base, required to be full twentyfour inches in length. After removal the morbid mass weighed twenty two lbs: it appeared to be nourished by one large artery, which required ligation. There was considerable hemorrhage but the operation was successful; patient discharged, well. June 19th 1871.

Vide Letter of A. J. A. King. Wash. D.C. July 17th 1871.

Photographed at the A. M. M.

June 17th 1871.

(Tumour removed is numbered 5915. A. M. M. and was presented by the operator.)

Colonel J. T. Charlesworth, 25 Ohio, wounded at the battle of Crook Keys by a minie ball cal. 58 which entered a little ~~a little~~ over two inches to the left of the umbilicus, passing through his sword belt and clothing evidently through the abdomen making its exit a short distance to the left of the spine and falling between his clothes, was picked up and preserved. The illium was fractured. Fecal matter discharged through both wounds for several days and from the wound of exit until it was almost healed. For twelve days ^{after} the reception of wounds he took no nourishment, excepting milk, and that in very small quantities. During the healing process a large number of specula of bone from the fractured illium were discharged, about 75 in all, one of these measured $1\frac{1}{2}$ inches long and $\frac{3}{8}$ of an inch wide.

Constitutional symptoms were at no time severe.

341.

Urinary calculus, the nucleus is a rifle ball.

CASE 800.—Private F. H. McIntosh, Co. A, 1st Massachusetts, aged 21 years, was wounded at Gettysburg, July 2, 1863. Surgeon H. Janes, U. S. V., records that he was treated at the Seminary Hospital until July 15th, for a "gunshot wound of the back." He entered Mason Hospital, Boston, on July 24th, and Acting Assistant Surgeon W. E. Townsend reported a "penetrating shot wound of the pelvis, the ball still remaining in the pelvic cavity," and, subsequently, that "the patient was discharged March 5, 1864, with inability to walk without a crutch, and total disability." The history of the progress of the case may be condensed from the admirable account recorded by Dr. Cabot: "Three weeks after the reception of the wound, a probe was passed through the entrance orifice at the left of the spine of the second sacral segment, across the pelvis, to the os pubis. The bullet could not be detected by a Nélaton probe or by burr drills, but a scale of lead and twenty-three fragments of bone were removed. Early in September, 1863, an abscess pointed an inch above the horizontal ramus of the left pubis. When this was incised, a sinus extending along the pectineal line to the sacrum was revealed. Free drainage thus established, no further treatment was pursued. The left leg became flexed on the thigh, but sufficient extension was recovered to permit locomotion after a year. For five years there was pain in the sacral region and in the course of the sciatic nerve, but none in the anterior part of the pelvis, till 1870. Necrosed fragments escaped from both orifices of the sinuses, which discharged pus, but never urine or feces. In the summer of 1869, the orifices healed, and all symptoms disappeared except the sciatic pain. Toward the close of 1870, painful and frequent micturition began, and augmented until the patient was unable to work, and incontinence ended in a constant dribble from his urethra. On November 25, 1871, the patient was etherized at the Massachusetts General Hospital, and Dr. Cabot performed lateral lithotomy. The stone was brittle, and the firm pressure requisite to remove one of its size and the diminished cohesion due to the hard nucleus, caused its fracture. Chemical examination of the calculus showed it to be composed principally of phosphate of lime; it also contained some carbonate of lime, the triple phosphates of ammonia and magnesia, and uric acid. The patient had a good night, and took nourishment well the following day. A continuous stream of warm water was passed through a catheter into his bladder for ten minutes, and several coagula and calculus fragments were washed out of the perineal opening. A catheter was retained in the bladder. The wound healed rapidly. On January 13, 1872, the patient was reported well. On September 3, 1873, the Pension Examining Board at Boston reported that "the ball entered the back about three inches from the sacrum, ploughing the tissues, and entered the pelvis just to the right of the sacrum, injuring the bone in its course. The cicatrix is three inches in length and quite tender. Anteriorly at the lower part of the abdomen, just over the bladder, is a cicatrix, the result of an abscess undoubtedly caused by the presence of the bullet, that has been removed from the bladder by perineal section, forming the nucleus of a stone. Is obliged to wear a urinal, being unable to hold his water. This incontinence is total. Suffers from pain in bladder and bowels, which have lost their tone. Has lost some twenty or twenty-five pounds of flesh. Disability total, third grade." The concretion is represented in FIG. 5 of PLATE VII.

²A full and interesting report of the later history of this case is printed in the *Proceedings of the Boston Society for Medical Improvement*, in the *Boston Med. and Surg. Jour.*, 1872, N. S., Vol. IX, p. 169.

246 David Barry, Pvt. "G" 1st U.S. Ia.

Private Barry stated that he was wounded in an engagement with Indians at Rogue River, Oregon in 1854, and that his thigh was amputated at junction of upper and middle thirds by Dr. Geo. Fuchley at the post hospital at Fort Dalles, Oregon.

Dr. Fuchley reports that the statement of this soldier was false - that his leg was fractured by a wagon when he was drunk, and that he was never in any engagement with the Indians.

Barry is a pensioner at the Soldiers Home, July 1865.

Copied from Submitted Photos, Vol. XIII, p. 19, Jan. 19th 1874, by order of Dr. Otis.

247. James McGrocks, Pvt. "F" 20th Ia. This soldier while en route from Fort Wadsworth D.S. to Fort Ransom D.S. had his right foot frost bitten, - Dec. 6th. The foot was amputated Dec. 25-71. "Pirogoff's Modification of Gyner operation performed". The patient made an excellent and rapid recovery; the stump healed over in three weeks and in four weeks he was able to walk about with the aid of crutches.

Memorandum.

Case 1705.—Captain W. G. Tracy, A. A. D. C., was wounded at Chancellorsville, May 2, 1863, receiving a postero-anterior musket-ball perforation of the inferior extremity of the right humerus. On May 5th, Surgeon H. E. Goodman, 28th Pennsylvania, assisted by Surgeon R. W. Pease, 10th New York Cavalry, excised the joint, removing four and a half inches

FIG. 607.—Lower fourth of right humerus excised for shot injury. Spec. 1155.

of the lower extremity of the right humerus. The large portion of the humerus removed, of which two views are presented in the annexed wood-cuts (FIGS. 607, 608), was presented to the Army Medical Museum by the operator. The amount of comminution is very extensive. The operation appears from the cicatrix to have been practised through an H-shaped incision. The nerves have escaped injury, and the muscles have regained attachments advantageously to a remarkable degree. A letter from Captain Tracy, received through the courtesy of Surgeon-General James E. Pomfret, of New York, and dated April 2, 1866, mentions these facts, and that "the bones of the forearm were not touched," and continues: "I returned to the army August 15th, the wound being perfectly healed, the bones remaining disunited, and I continued to serve on the staff of General Slocum until the close of the war. My arm has become about three inches shorter. The muscles have never withered away, and sensation is perfect in the limb. I can write as well as ever [with great elegance, it may be remarked, in passing], but experience some difficulty in raising my arm." Captain Tracy, having served gallantly through the war, resigned at its conclusion, and was discharged October 13, 1865, and pensioned. The reports of the Pension Examining Board at Syracuse for November, 1865, and September, 1875, recapitulate the facts above recorded. In

FIG. 608.—Posterior view of the same specimen.

October, 1875, Captain Tracy was in good health, and the usefulness of his mutilated limb had in no wise deteriorated. At this time he had the kindness to have made two photographs of the injured limb, which are bound with the contributed surgical photographs of the Army Medical Museum, one of them being copied in the left-hand figure of PLATE LIII, opposite page 850,

of Part II, Vol. II, Medical and Surgical History of the War of the Rebellion.

Otis. curator A.M.M.

369.

Joseph L. Jackson, Pvt. Co. 4th, 2d Ohio Vol., was
wounded at the Siege of Vicksburg, Miss., June 8, 1863, by a
conoidal musket ball which passed through the left elbow joint.
About two hours after the reception of the injury, Surg. Jno. B. Rice,
2d Ohio Vol., excised the elbow joint, on the field. Healed about
four weeks after operation. Jackson visited the Army Med.
Museum, Dec. 19, 1877, and his Photograph was taken by Mr.
Ward. He stated that he had very good use of his limb,
and could lift 100 lbs. in weight any time - has never had
any trouble with limb since operation. Is employed
in the Bureau of Engraving & Printing, U.S. Treasury
Department.

Sent to printer April 12, 1879.

Memoranda

370. Photograph of specimen 2090. V. A. A. C. 26. Section I. A.
U. S. A., consisting of three inches of the right acromion
and the head and two inches of the shaft of the humerus.
The bullet entered from behind, fractured the scapula and
completely shattered the epiphysis. The cancellated portion
of bone appears excavated as though the missile had
entered point first in the direction of the long axis
of the bone.

Memoranda

374 Trumpeter Elmer A. Snow, Co. M, 3d Cavalry,
and wounded in action on Rosebud River, Montana Territory,
375 June 17, 1876. Ball entered the right elbow, at posterior part
of external condyle, and made its exit an inch and one-half
above, at the anterior aspect; the same ball then passed
through the left wrist joint, entering on the dorsal
and making its exit through the lower portion of the
palmar surfaces. The wrist is very stiff. After great
swelling and inflammation, the wound of the wrist
healed in the Autumn of 1876; but the wound
at the right elbow resulted in persistent exfoliations
and did not close permanently until September, 1878.
With the assistance of a wire the hand is so supported
as to enable the patient to write. The loss of sensation
in both hands is very great. There is but little
prehensile power. This ~~soldier~~ ^{patient} visited the Army
Medical Museum February 24, 1879, and was ex-
amined by Dr. Otis. On February 25, 1879, two
photographs were made, one with his apparatus
on (374), and one with it off (375), by Mr. Ward
by order of the Curator, Asst. Surgeon George C. Otis,
U.S.A.

Patient of P. S. No. 18, visited the A. M. M. September 21, 1880, when he was examined by Dr. Otis and another Photograph ordered, showing his present condition. He stated that his P. O. address was Hampton Junction, Huntington Co., New Jersey; and that his health was a poor and was unable to do any kind of work, and his business here was for an increase of pension. Photographed by Mr. Ward, September 21, 1880.

377

Pvt. John C. Johnston, Co. C, 1st Penna. Vols., aged 38 yrs, visited the Army Medical Museum, May 26, 1884. He was wounded at the battle of Spotsylvania Court House, Va., May 10, 1864, by a fragment of shell, which fractured the left superior and inferior maxillary bones. He was left on the field one day, during which time he was unconscious. He was operated on at Pittsburg, Pa., in the Fall of 1865, by Dr. A. Walters, assisted by Dr. Barber. A photograph was taken of him at the A. M. M., by Mr. C. Troughton, showing the result of the operation of 1865. Mr. Johnston, can masticate his food; articulates very well; has occasional severe pains in the back of his head, and suffers much from neuralgia. A plaster Cast, 1401 A. M. M., represents this case before Dr. Walters operated on him. He is County Clerk of Harney Co., Kansas & his P. O. address is Newton, Kansas.
