The bee-keeper may well rejoice, as the vigor, beauty, fragrance, and long-continued bloom of these trees insure that they will be more and more extensively planted in our State. The last feature makes them of special value to bee-keepers. Abundant nectar-secretion in late summer, fall and winter, makes them of much value for stimulative breeding.

Los Angeles Co., Calif.

No. 3.—The A B C of Marketing Honey.

BY HERMAN F. MOORE.

[Continued from page 500.]

If you leave the town and call at the farm houses, you may think best to reduce your price two or three cents a pound from your town price; but if you do so, by all means double your size of package, or you will be placed, oftentimes, in an embarrassing position, when your town customer meets your farmer patron, and they compare notes on your price-list. It is perfectly legitimate for you to take a smaller price if you can thereby double the sale. This is simply wholesale dealing applied to small transactions.

Let me urge you to put the same price on liquid honey as on comb, when both are of the best quality. Many, many times I have been asked the question, "How does it come that extracted honey can be bought for less than comb honey? I should think it would be worth more?" The thought in their minds is, that if pure it must, and should, bring more, as there is more actual honey in a pound of liquid honey than in a pound of comb, the difference being, of course, the percent of loss in wood and wax. My answer has been, "It is really worth more to eat, and I get about the same price. You see, we can produce more liquid honey from a colony of bees than

comb, consequently our profit is greater on the clear than on the comb honey, on account of more scientific and improved methods of caring for our bees."

I contend that there is no good reason why we should accept half the price of comb for honey without comb, if equally good, well ripened and delicious. That the price is less in the wholesale markets in the cities is no answer; we are selling in the retail markets exclusively. We care nothing for the wholesale markets, except as information. The wholesale price of liquid honey has no claim to bind us; our customers would not touch it in those markets. When they buy our honey they receive our guarantee that the honey is pure and delicious. That of itself is worth money. Liquid honey in the cities goes to families at 20 to 25 cents a pound bottle, and 12 to 15 cents for a half pound. The difference between the so-called wholesale price of liquid honey and these retail prices, make the profits of the commission merchant, the retail grocer, the honey-bottler, the adulterator. In any case, the producer of fine honey—either comb or clear—is rightfully entitled to the profit of these middlemen, when he sells his crop to the consumer.

The most potent factor in all sales of goods is personal acquaintance. Job lots of fancy-colored shirts sell for 59 cents each in the big department stores, and the fancy haberdasher gets two dollars apiece for a shirt that to the uninitiated looks very like, only the latter is made to measure, of the best material, well stitched, and neatly fashioned.

An old customer and schoolmate of the writer, on his death-bed, being almost unable to take any food, asked for honey. The family sent to the nearest grocery for some, but on finding whence it came, the sick man refused to touch it, saying he wanted some of mine (I had supplied them honey for years). The sick man's sister wrote me at once, 13 miles away, to bring them a pail of honey quick, as her brother was very ill, and wanted it.

Honey has not come down so much in price as it seems to the producer, who markets his crop through the commission merchant and retail grocer. The commission man gets 10 percent, and the shipper pays freight and drayage. The retail grocer gets 40, 50, or 75 percent on his purchase of your fine comb honey; you get 11 to 12 cents a pound, and the consumer pays 18 to 25 cents a pound. I knew of one store that sold gilt-edged Wisconsin honey in one-pound sections for 25 cents a pound, within the past two years.

For a package of comb honey the most successful I find is the 12-pound, two-row case. You can sell this from \$1.80 to \$2.40 a case, and will find hundreds of families that will take from one to five of them in a year's business. I think we should all aim to get as near 20 cents a pound for our honey as possible. That is low enough for fine, delicious honey, and five cents cheaper than the old-time price when I was a boy.

The no-drip shipping-case is more work, and unnecessary, if you hand your honey directly to consumers.

How best to advertise your honey and yourself to your trade will always be one of the burning questions. You can't avoid a certain amount of advertising of yourself along with your goods. People seem to desire a personal acquaintance with those they patronize, no doubt rightfully concluding that a man of high aims and broad thought is a good man to depend upon for pure food.

To always sell the best goods is the first and most important way to advertise.

By all means limit yourself to 12 pounds to the gallon for extracted honey, never less in weight. Twelve-pound extracted honey will almost run comb out of the market at the same price per pound. Most people buying thin, unripe honey, decide at once that it is half glucose. This, of course, works dead against the man who sells such stuff, and it has usually been the retail grocer who has suffered for a fault that belonged to the producer who rushed the thin stuff to market through the commission merchant.

As to comb honey, too much scraping of the sections is no advantage when selling to your family trade. The fine, delicious flavor is the main thing, and must be secured even at the expense of looks. People are so used to having goods of all kinds look pretty, and then utterly fail on the table, that I have felt as if too great beauty and attractiveness were a disadvantage rather than otherwise. For example: One-pound combs, so pretty that the customer instantly decides "no bee made that." Attract the eye, by all means if you can, but be sure you charm the palate first and foremost.

In starting out to get orders, take a fair sample of your comb (one section) and one of your pails half full of liquid honey. Never try to sell extracted honey alone. People will go for you like this: "You haven't got comb honey?" "You are selling this manufactured honey?" "How much glucose do you use?" etc. The presence of some comb honey shuts their

mouths, and gives more tone to your business than you can imagine.

It is surprising how interested people are in the story of how you manage your bees, and a personal knowledge of bees and constant practice in handling them you will find essential to the greatest success in selling honey. Tell them about the three kinds of bees and the three kinds of cells. Take a brood-comb out of a hive, shake off the bees, and take it with you on your next trip. Choose a comb having worker-cells, drone-cells, and, if possible, a queen-cell or two along the edge. People are perfectly fascinated with the explanation of the six-sided construction, the grouping of six cells around each central one, and looking down the corn rows in the rows of cells. A sheet of comb foundation half drawn out is the best for this exhibition.

Have everybody taste your liquid honey, by all means. Many a person will say, "No, I don't care for honey;" and after tasting a few drops of your delicious clover or basswood will buy, "if what you bring is like that."

Toothpicks are sometimes used to give a taste of honey. You can't carry a teaspoon along, for people will not like to eat after another. If you are calling at private houses, you can ask each lady to bring a teaspoon, but even then it is best to have a small stick along in case she don't want to bother.

The nicest thing I know of is sold under the name of "clar lighters." They are pieces of soft wood $4\frac{1}{2}$ inches long, $\frac{1}{4}$ inch wide, and $1/16$ inch thick. They are sold very cheap. Stick one of them one to two inches into the liquid honey, and by rolling it up like a string you can give any one almost a teaspoonful of honey, if you and the other person are dextrous. The lady who won't go after a spoon, will be pleased with your ingenuity, and will taste your honey just for fun, and you have made a sale.

It may be useful to provide some jelly-glasses full of your finest honey, to leave for a free sample with families whose trade you are real anxious to secure, and who are hard to reach. The first order is oftentimes the sticker. The writer has chatted with certain people as long as three years before getting their first order, and after that permanent customers.

In advertising your business, remember you are in this for the remainder of your life, and nothing but a straightforward course will avail.

Always provide yourself with a certain amount of printed matter, so that you can leave your address with every person you ask for trade. Cards and circulars are both rather necessary in this day of advertising. In writing your circular, give your location, average number of colonies kept; largest crop produced in one year, and names of flowers your bees pasture upon. Write a clause about candied honey, and the method of making it liquid again. Give a short history of yourself or family as bee-keepers, and a few things that would be of interest to the general public about bee-keeping. A cut of a honey-extractor is always a curiosity to the non-bee-keeping public. Cuts of queen-bee, drone, worker, bee-hive, etc., can often be used to advantage. A pictorial circular will be more likely read than any other kind. Somewhere in your circular say, "We sell only pure honey to every one." Come out as flatfooted and decided as possible. You will find that people will believe you, for adulterators do not usually use such terms.

Every package of honey sold must have a label, giving your name and address. A rubber stamp to put the same on every comb of honey sold is also a good plan. You will even find that a copy of Gray's Botany is a valuable ally in selling honey. In the front of my order book I have written a list of the 30 or so different kinds of clover. Look up and name the different kinds of clover in your county and adjoining counties, and be able to talk intelligently upon them. Nowadays botany is taught and studied in nearly all our good schools, and this may be a valuable means of interesting young and old.

Write for your local paper bee and honey notes, under your own proper name and address. This may be a most valuable means of acquainting the people with your name and business. No great amount of originality will be required. If you take the three or four best bee-papers you can almost clip enough matter to fill your column once a week.

But, after all is said and done, nothing in the way of advertising is so good as personal conversation with prospective customers; and if both you and your goods are "all wool and a yard wide," they will soon satisfy themselves of that fact, and your golden reward will follow.

See "Bee-Keeper's Guide" offer on page 527.

Plain Sections and Fence Separator.

BY S. A. DEACON.

I see it stated (page 726, 1897) that Mr. Root, Sr., "claims no new feature" for the plain box-like section and cleated separator combination, but we are told that his firm has "just awaked to the proper appreciation of the combination." This is a rather humiliating confession, and certainly very slow-moving on the part of the leaders of our industry! For, as stated in my last contribution to your columns, the said combination is nothing new in this out-of-the-way semi-civilized corner of the world. Mr. Root's admission hardly justifies Mr. C. P. Dadant's assertion, or, at least, implication, that you United States are about the smartest and most practical men on the face of the earth! It strikes me there are imitators of Old Rip at Medina, as well as in Decatur Co., Iowa.

In my opinion a perfect 7-to-the-foot section, to be used with the cleated and slotted separator, is made by reducing two-inch sections, having four scallops, to $1\frac{11}{16}$; i. e. 7-to-the-foot width. This does not do away *entirely* with the scallops, but leaves just so much of them as to afford a full bee-way on all four sides when two sections are placed together, giving the bees ample access from all sides; this is how I and others here have used them, with a separator 'twixt every two rows. Of course this does not give us a section having, as Mr. Root says, "four plain sides of equal width throughout," but very nearly so; and the slight scallop left gives the section a far more pleasing appearance, I think, than the severe, inartistic "dry-goods-box arrangement," as one of your contributors terms the pattern so greatly admired by Mr. Root, and which, it must be borne in mind, necessitates a separator ($\frac{3}{8}$ inch thick, including the cleats) for each row of sections, instead of between every two rows (as used by its originator, the late Mr. B. Taylor).

This will necessarily reduce the capacity of the dovetailed 8-frame hive super from 24 to 20 sections. Of course the sides of the Root super can be made of $\frac{1}{2}$ -inch stuff, a change greatly to be desired: for, as I mentioned in a former communication, the present dovetailed supers are quite unnecessarily lumbersome and heavy. Even then the cleated separators will have to be made, not of $\frac{1}{8}$ -inch stuff, but, as I make them, of sawn wood separators, the slots being cut with a $\frac{1}{4}$ -inch chisel. Then, with the sides made of $\frac{1}{2}$ -inch stuff, 24 sections 7-to-the-foot, and 7 cleated separators may be got comfortably in; tho, by rights, the two outside separators, should have $\frac{1}{4}$ -inch cleats on their outer sides, and be puncht chock-full of holes, *a la* Pettit.

I make my super sides of $7/16$ -inch stuff, and I reckon that's good enough for anything; and if the senior Root's awakening to the advantage of using narrow sections and cleated separators will prove the death-knell of the clumsy, unnecessarily heavy dovetailed super, he will not have opened his blinkers by any means in vain. South Africa.

[We think Mr. Deacon does not know that 24 of the plain $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{2}$ sections (the same as with $1\frac{1}{4}$ sections and plain separators) are used in the regular 8-frame $\frac{3}{8}$ -inch super with the fences or cleated separators, and not 20, as he says.—EDITOR.]

Selling Comb Honey to the Grocery Trade.

BY G. K. HUBBARD.

[Continued from page 502.]

At your next call you find a man who hardly ever keeps any honey unless he gets a little occasionally from a customer.

"The times are too hard. It won't sell."

"But sometimes people buy honey because times *are* hard."

"How so?"

"I see you have some high-priced preserves and jams on your shelves here. The trade that has been getting such goods is apt to buy 15 cents' worth of honey just because it does not feel flush enough to buy something more expensive. Or, instead of going home without candy or something that the children want and expect, a man will take home a few sections of honey and tell the children that these hard times they will have to get their sweetmeats at the table with their meals. In such cases you would sell the honey, if you had it, when you would not sell either the expensive preserves or confectionery. You are not paying store rent, and putting in your time for amusement, but you are here to sell goods; and if the people do not find what they want here they will buy elsewhere."

"I don't think my trade would pay the price for the fancy honey, and I do not like the cheaper grade."

Removing the contrast by turning the fancy case so that

the honey in it cannot be seen, you reply, "This is a better grade of honey than you think. The only possible objection to it is that of color. It is just as pure and healthful, is well filled, and is in every way as good an article as the bees can make from the flowers it was gathered from. You would be surprised at the ease with which you can sell this grade of honey by mentioning its purity and flavor if any one remarks about its color. I have only three cases of this dark grade left, and I can't see how you would regret it if you would let me bring in the lot."

"I could not use three cases of it, but I believe I will try one case and see how it goes."

At your next call where you find any prospect of a sale the proprietor says, "Yes, that is fine looking honey; but I have had it here as nice, or nicer; and when I took it home to eat I found so much filler in it that it was tough inside."

"You mean the comb foundation used in the middle, I suppose. Yes, I know some bee-keepers are very careless about this. They use an inferior grade of home-made foundation which cannot be detected until the honey is cut, and it is bound to give anything but satisfaction. We all use some foundation in order to get the combs built straight in the sections; but I am very careful to use only the best article that can be made. The foundation I use runs 12 square feet to the pound, is the purest and best to be had, and is actually thinner than much naturally-built comb. In all the little points in honey-production I try to keep posted, and put out as fine an article for its grade as any bee-keeper I know. If I sell you the four cases I have left, and you do not find them to be strictly all right I will take them off your hands and refund the money the first time I am over; or if you write me a line I will come promptly and get them. I am not here to-day merely to sell what honey is now needed, but to build up a trade and make an outlet for my large crop this season, and probably for other seasons."

"We always sell our honey by the frame, and we sometimes get it that is every weight and thickness, which results in a lot of culling over, and then having to sell the last few frames at a discount, may be below cost. I see this case is pretty much all one thing, but you have irregular or partly filled frames sometimes, don't you?"

"Yes, sir; but when you buy regular-grade honey of me, that is exactly what you get. I dispose of extra thick and thin combs at some boarding-houses near home. The honey I put on the general market is cased up with the wishes of the grocer in view. Well cased sections that will not weigh 12 ounces are cased by themselves and sold together. There are some grocers who prefer these light-weight sections because they cost less, and they prefer to sell something that goes at a small price. By having the honey in a case somewhat uniform in weight it saves the picking over that is apt to happen when there is a great difference in either color or weight in the sections in a given case."

"But I wouldn't want to buy four cases. You would sell me one of your best grade, wouldn't you?"

"Yes; but surely one case of honey is a small matter for a man with the trade you appear to have. I should like to sell you enough to last until I come over again. Better take one case of each grade, at least."

"My trade does not go much on a poor article."

"But my dark honey is not a poor article; in fact, many bee-keepers who are not so careful with their honey would call this their best. It is a good idea to let a customer have his choice in such matters, and then you will not have people saying they can buy for a cent or two less elsewhere. It is easy for them to be deceived in quality while remembering the price. To illustrate, you probably have a great variety in price in the same kind of canned goods, and your customers make their selection. Why not give them the same chance on honey?"

He objects to the price, and wants a liberal discount if he takes two cases; but you emphasize the rebate on the cases if in good condition; tell him the last section in a case will sell as readily as the others, and that you warrant satisfaction.

You get your money, and go back to your wagon with two cases yet to dispose of. You have been to all the groceries, and are not sold out. Now you try the bakeries.

"I see you do not have any honey on sale here, yet some of the bakeries over our way sell more than some of the groceries."

"We never have any call for it."

You smile, and say, "Yet that does not prove you could not sell it. You do not have call for strawberries at this time of the year, either; but they would surely sell if you had them in sight. Probably half the comb honey that is sold is carried home because the customers are in the store on other business,

and, seeing the honey, take a fancy to it and buy it. If you had this case of honey on the shelf back of you, right here in plain sight, it would not be long before some customer, taking home some fresh bread or rolls, would want to take along a section or two of honey also."

"But we buy some strained honey for use in our baking, and we have some Mason jars of it on the shelf up there, you see, and it does not pay for the bother of fussing with it, for we hardly ever sell any."

"Well, I'm not much surprised, because it is not labeled, and people do not know what it is. When you strain your honey the 'poetry' is all taken out of it, as a lawyer friend of mine says. Comb honey is always attractive, will sell itself, and if other bakers do well with it, I don't see how you would miss it. You can make 25 percent on it, and whatever you make will be just that much extra to help pay rent and keep business on the move. You can rest assured that if you had these two cases here in sight the people would buy it. Besides it is attractive, and helps give your place a neat and filled-up appearance."

"If you want to leave one case here and let me try it I will pay you for it if it sells, and if not you can get it again some time."

"I thank you for the offer, but I can't accept it. If I should do business that way I should have to raise my prices to cover an occasional loss from failure or fire, or something else. My prices are as low as they can be for a good article, and I have to sell for cash."

"Another sale made; but the other bakeries do not care to take the remaining case, and so you go to the hustling young fellow who runs a fruit and confectionery store in a little 7x9 room under a stairway a few feet from the leading business corner of the place."

"You occasionally have quite a loss by your fruit spoiling on your hands. Here is an article that will make you a good percentage, and will last for years, so far as its keeping qualities is concerned. The investment is absolutely a safe one because it is sure to sell, even if it does not go off with a rush."

He likes the idea first rate, and your purse is heavier and your wagon empty.

Now, do you think I have made this appear too easy? Not a bit of it, unless the market is actually glutted with an enormous crop. In that case my advice would be, that if you cannot make sales after trying various places within your reach, wait a few months and try it over. You would better borrow money and hold your crop than to sacrifice it. I am sure, however, that some earnest work along this line will give you good results under almost any circumstances that you are apt to find, for conditions vary greatly in towns within a few miles of each other. I know of two cities nine miles apart where the retail price of honey has been different by 25 to 40 percent. You will find a good many things that are new to you if you will do some exploring along this line.

If you are fortunate enough to have a crop of honey that averages very high, you will be surprised to see how easy it is to interest people; but your lower grades should be pushed along in proportion to what you have. You do not want a lot of low-grade honey on hand, with the best all gone. The price-mark is the safety valve. You can sell anything if the price is right; but have your price high enough so you will have to talk it up to sell it.

One party said to me, "Your honey gives good satisfaction, and I have made a good profit on it; and any time you are over come in and see how I am stocked."

No wonder he was pleased, for he had sold lots of it, and at prices from 20 to 25 percent higher than I supposed he was getting, and higher than the other grocers in town were getting. He had a large and fancy trade, and was actually clearing 40 to 45 percent on my honey.

Give your customer a square deal on grading, etc., and you will often be pleased to hear such expressions as: "Just set it right on the counter; here is your money. I am too busy to open it and look at it. The other was all right, and I will risk this being the same." "How many have you? Two cases of fancy and three of amber? All right; carry it to the back of the store; I'll take your word for it." "I don't know but your price is a little high; but I like the way you put it up, and it sells as well as any honey I ever bought."

You will soon get acquainted with your trade, and if you do your part you will get a top-notch price, will not hear anything about "trade it out," will not be badgered about cutting prices, and will be treated in a friendly and businesslike way on every trip, with numerous invitations to "call again when you are over."

Once on my first call, as I set a beautiful case of honey with a three-inch glass front on a gentleman's counter, and

removed the covering, he read aloud the 14-inch label on the front of the case, "Gathered from Orange Blossoms;" and then as he saw the 28 neat labels printed in red ink, pasted on the sections, with the snow-white honey smiling up at him from between, he slapt his hands together and exclaimed, "By jolly!" I need not tell you he has been my steady customer since, altho he thought my price was high, and I knew it was high enough.

With the finest honey from clover, orange, willow-herb, sage, etc., you need not be doubtful about placing it to advantage in almost any market; and while I know that the majority of readers will not take the pains with their crops that I do, nevertheless if you will take the honey you have, and make a businesslike effort something like the one above, you will find that you can dispose of it, even if that supplied by more expert apiarists does surpass yours in quality. With a first-class article you will find yourself taking too small a load to market oftener than too large.

I do not label all my honey, but I think I shall do more of it in the future. I have observed that it gives the honey a finish, and pleases the customer well enough so that I am pretty safe in counting it to bring 25 cents per case extra.

The labels cost less than three cents, and a boy will stick them for one cent per case. The cost of this is offset by using second-grade sections. I get my finest honey that I expect to label in the cheapest sections. In fact, the only advantage worth mentioning that I know of in using snow-white sections, is in the clean appearance when the cover is removed. The labels do the same; and while I have had scores of merchants take out the sections and examine my labeled honey I never heard one remark that the sections were not the whitest. They look at the honey and not at the frame it is in. There is too much straining after "snow-white," "extra polish," etc., according to my way of thinking.

There are a good many ideas in the above that may be helpful to those who sell their crops by peddling from house to house; but in such cases the point I would emphasize is to first quote the price per case, or so many sections for a dollar. If there is to be any talk about your selling just a few sections, let the other party start it, or you can make the offer after your first proposition has been refused. You will never sell a case to one party by trying hard to sell 25 cents' worth. Work for large sales, and expect to make them.—Gleanings.

Do Italian Bees Produce Better Honey?

BY EDWIN BEVINS.

Referring once more to a matter which does not seem worthy of much space in the American Bee Journal, I wish to say to Mr. Hart (see page 451) that I am sorry that he took my little squib on page 322 so seriously. I did not mean to be offensive. As what I said was not an answer, nor intended to be an answer to Mr. Hart's question, it is probable that I ought not to have said anything about it. But unfortunately, perhaps, I did, and now I am willing to take the consequences.

I would like, as well as Mr. Hart, to know why Italian bees store a better quality of honey than other bees when all have access to the sources of supply.

Looking at pages 133 and 134 of the American Bee Journal for the "opinions and statements" that led Mr. Hart to ask the question, I find that Mr. Baxter express the opinion, or made the statement, that the quality of the honey stored by the Italians is better than the quality of that stored by blacks or hybrids. He gave no reason for this superiority, but did give a reason for the better appearance of the honey stored by blacks and hybrids.

Dr. Besse thought the reason why Italians store honey of better quality than blacks and hybrids is that the Italians work more industriously on red clover. But that opinion "cuts no figure," as Mr. Hart wanted to know why Italians store a better quality where all have access to the same sources of supply. Dr. Besse goes on to say that blacks and hybrids do not work on red clover, so their source of supply must necessarily be something else.

Mr. Hart mistakes; I did not say or intimate that his question was entitled to no consideration. But for the two hypotheses which he made use of to explain the difference in question, I had a very poor opinion; and, from his own admissions, I am led to believe that he did not think them worth much himself. The only reason (?) thus far elicited for the difference under consideration is that given by Mr. Volkert. He says that it is because the Italians are more active than other bees. Is Mr. Hart satisfied with that? My belief still is that there is no difference under the conditions named, and that Mr. Hart has started bee-keepers in the pursuit of an ignis fatuus. But let us have peace. Decatur Co., Iowa.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. O. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

What Caused the Inverted Brood?

Before the larvæ gets large enough to cap over, it turns in the cell with the head downward and dies thus. About $\frac{1}{2}$ of the brood is that way—not all in one place but scattered through the hive.

IOWA.

ANSWER.—Just as you put it, I don't know that I ever heard of the like before. Up to the time of sealing, the brood, I think you will find, is coiled in a circle. But after it is sealed over it may finally get wrong-end-to, and that same thing has been reported in a few cases, the young bee being found dead in the cell with its head toward the bottom. It may result from weakness on the part of the bees.

Mothy Foundation.

We have a lot of brood-foundation which has been used and is dark in color; something has gotten into it like moth, and weaves a web over portions, and it looks like eggs under the web in the cells. How would you advise me to get rid of this? Can the bees work where this is? Is it not rather extravagant to cut it out and throw it away?

NEW MEXICO.

ANSWER.—Try giving it to the bees just as it is, and see if they'll not clean it up all right.

Cessation of Honey-Flow Stops Work.

I raised the section up and put another case on when the first was about half full. The bees immediately stopt work in the sections. What was the cause? Some colonies stopt work when I took a few full sections off the hive; they had only one super on.

The bees would draw out the foundation in sections and not complete them. Why?

CALIFORNIA.

ANSWER.—You have in all probability given the answer yourself to both questions when you say, "This is a poor year with me." Raising up a partly-filled super and putting an empty one under had nothing to do with the bees stopping work. About that time the honey-flow let up, and the bees would have stopt work in the super if you hadn't toucht it. The same is true as to your taking out the filled sections. If the honey-flow had kept up they would have gone right on in both cases.

Examining for Filled Sections, Etc.

1. Can bees be disturbed too often in examining through the sections to hinder them from working in them?

2. How often ought they to be looked after to see if the sections need removing?

3. One of my colonies came out three or four times in June and went back. The last time it staid out, and on examining I found it had two queens. I put the finest one in, and it seemed to do well for about six days, when it came out, flew around, and went back into the hive. On examining it I found it had no brood and no queen. What became of the queen? I gave it a frame of brood, and in 12 days lookt and it had failed to rear a queen. Why did it not rear a queen?

4. Are not some bees better workers than others?

OHIO.

ANSWERS.—1. No doubt they could be disturbed too much, but it isn't at all likely you need be anxious about it. It isn't necessary to look once a day to see how the sections are progressing, but a daily visit would hardly do any harm.

2. Perhaps every 5 to 10 days. If honey is coming in rapidly, they need closer attention than when it is coming in slowly.

3. The first time it came out, the probability is that the old queen was present, but she couldn't fly or was killed in some way. A week or more after the first time they came out, the young queens had emerged from their cells, and then when

the swarm came out you found two of the queens. Five or six days later you saw the swarm come out, fly around and return. That was at the time of the queen's wedding-flight. You examined it and found no brood, because the old queen had been gone so long there was no unsealed brood in the hive (there was probably sealed brood present) and the young queen had not commenced to lay. You found no queen, but that's very far from proof there was no queen present, for the most experienced fail sometimes to find a queen that is not yet laying. They probably refused to rear a queen from the brood you gave them because they already had a queen. If nothing has happened to the queen you probably will find there is plenty of brood in the hive now. The study of a bee-book will be of great benefit to you in clearing up this and many other points.

4. Yes, indeed, there's a big difference in bees. One colony will store up quite a surplus, while another standing right beside it, and apparently just as strong, will not more than make its own living.

Chickens in the Apiary—Sowing Alfalfa.

1. Would it do to put enough old hens or young chicks in the apiary to keep down the grass? Would that be a proper place for bees?

2. When is the best time to sow alfalfa? Could it be sown in the fall after taking off a potato crop? MARYLAND.

ANSWERS.—1. It would be all right so far as the bees are concerned. The only question is whether you care to have the fith the poultry would make. Sometimes I get so tired that I want to stretch myself out on the ground for a few minutes (alho this is more especially so in the out-apiaries), and then I want to have a perfectly clean place.

2. Inquire of the farmers in your neighborhood as to the best time to sow.

Something for an Entomologist.

I send a sample bee. I find a great many of them in my neighborhood. What species is it? CINCINNATI.

ANSWER.—I'm not entomologist enough to tell what kind of a bee it is, if indeed it is a bee at all. Send a specimen to your State entomologist, but don't simply put it in a letter, for it gets so masht in the mails as to be beyond recognition. Bore a hole in a little block of wood, and it will go safely in that.

Not Working in the Super—Ants in Hives.

1. I have a colony of bees in a Langstroth hive, and about a week ago I put the super on, but it seems they don't want to work in it. What shall I do about it?

2. I have a mother colony in an old-fashioned hive which has only seven frames, and a small honey-board over them, and under the honey-board is a whole pile of ants; they seem to be bothering the bees a great deal. How can I get rid of them without disturbing the bees?

3. Do ants eat honey?

4. How much space should there be between the brood-frames and the super? ILLINOIS.

ANSWERS.—1. Put in the super a section that has had the comb drawn out in it. It may be a section that had some honey in it last year and was emptied out by the bees, or it may be a section taken from another colony that is working in its super. If you have neither of these, put a piece of drone-brood from the hive in one of the sections, and you may be sure the bees will go up and take care of it. It is quite possible, however, that your bees are like a great many others—they are not working in the supers because they are not able to get any more stores than will easily be used in the brood-chamber. Bees cannot store when there is no harvest, and when the harvest is poor only the strongest can store.

2. If, as appears to be the case, the ants are under the honey-board and over the frames, they are in a place where the bees have free access, and the colony must be very weak to allow them there. The remedy is to strengthen the colony, or wait till it gets stronger. You may, however, outwit the ants by having the hive set on four feet, each foot resting in an old can or dish of some kind containing oil.

3. Ants probably eat honey when they get a chance, but perhaps that's not their usual aim in settling over a colony of bees. They settle there because it is a warm, comfortable place. When I used sheets or quilts over my brood-frames,

and covers over these, the ants troubled greatly by making their nests over the quilts. Since board covers have been used with no quilt between the top-bars and the board cover, there has never been the least trouble from ants. The bees take care of them.

4. About $\frac{1}{4}$ of an inch.

DR. H. BESSE.

The following sketch of Dr. Besse, of Delaware Co., Ohio, is kindly furnished us by himself:

I was born in Licking Co., Ohio, May 12, 1823. My father, with his parents, settled there in 1812, and were the first settlers in the township of Lima.

From my earliest recollection there were many wild bees in the woods, and men that knew how to handle them. I will give one instance:

I had an uncle for whom I was named—Henry Besse—who was out hunting one day, and came across a large swarm of bees clustered on a bush, $1\frac{1}{2}$ miles from his home, yet he was bound to take them home. So he took off his shirt, a home-made linen one, and the only one he had on. He was also bare-footed. This left him with nothing on except a pair of linen trousers and a straw hat. He tied a knot in each sleeve of the shirt, then took thorns and pinned the bosom and neck securely. He then took hold of the lower part of the improvised sack and shook the bees into it, and tied it securely with bark. He put his gun through a loop in the bark string, and shouldered his gun and bees, marching proudly home without receiving a sting. He used to keep 25 to 30 colonies all in the old gum hives. When I was a small boy I used to accompany this uncle on his bee-hunts. This, I suppose, is where I got my first inspiration for bee-culture.

The first money I ever earned for myself when 12 years old was for dropping corn for a farmer, who had five or six colonies. When he came to pay me I took one of his colonies instead of three silver dollars, and have had bees ever since, except a short time during the Civil War, when I was a surgeon of the 45th O. V. I., and also surgeon of the 145th O. V. I.

I have practiced medicine and surgery since 1847, but have almost given it up for the last 10 years on account of disability contracted in the army.

I have now (July 29) over 100 colonies of bees, but the honey crop in this locality is almost an entire failure. If we do not get a fall flow of honey I shall have to feed my bees or let them starve.

I have taken the old American Bee Journal ever since its birth, and should feel lost without it. H. Besse.

It will be remembered by many of our readers that Dr. Besse is the man who had a field of sweet clover mowed down by the township trustees about two years ago, they thinking that the law was still in force including sweet clover as a noxious weed in that State. The Doctor lost his case in the local court, and we do not know whether an appeal was taken.

Dr. Besse is one of the very few who have taken the American Bee Journal continuously from its birth—January, 1861. In former years he used to write for it. But when a man gets to be 75 years old he isn't expected to do as much as when a score or more of years younger.

We have had the pleasure of meeting Dr. B. at several of the annual bee-keepers' conventions, in which he takes great interest, and gets in his share of bee-talk.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it. See premium offers on page 523.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

Place and Date of Next Meeting:

Omaha, Nebr., Sept. 13, 14 and 15, at the Delone Hotel, Cor. 14th Street and Capitol Avenue.

VOL. 38. AUGUST 18, 1898. NO. 33.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Omaha Convention Rates may be lower than at first announced. Secretary Mason received a letter from Mr. Whitcomb, Aug. 6, in which he wrote:

"We are quite confident that the rates will be lower than those named, and that we will be able to get a one-cent rate before the convention."

We hope that all who possibly can do so will arrange to go to the Omaha convention. Remember the date—Sept. 13, 14 and 15.

Facing Comb Honey.—We had not intended saying anything more on this subject, but as Mr. Doolittle, in a private letter, express the hope that we would have the "moral courage" to publish an editorial by Mr. Hill, of the American Bee-Keeper, we of course gladly comply, but of course it doesn't take any "moral courage" on our part to do it. Here is the editorial in full:

Quite a thorough discussion through some of the bee-journals has been occasioned by an article from Aaron Snyder in *Gleanings*, wherein bee-keepers are accused of dishonesty in crating honey for market, it being averred by Mr. Snyder that inferior grades are, to a damaging extent, fraudulently concealed behind a facing of finer goods next to the glass.

In the course of discussions pro and con, Mr. Doolittle express the opinion that so long as honey was shipped to be sold on commission, there could be nothing really dishonest in the act of packing a variety of grades in any particular manner that might suit the fancy of the producer, in one crate. Tho he distinctly says he doubts the wisdom of such packing, we regret to note an inclination upon the part of certain of his

critics to place an entirely unwarranted construction upon what he has written. Who will say that any producer has not a moral right to ship any crate of his product, whether it be good, bad or indifferent, to a commission house handling such goods, to be sold on its merits, and for what it will bring? And who, again, cannot see the fallacy of mixing up several grades in a case, when, by separating them into their respective classes, according to established rules, a better price is obtained?

As a final result of the controversy, the American Bee Journal instituted a canvass of the leading commission houses, soliciting an expression of their views upon the subject of "facing," etc., and the publisher replies in nearly every case accord with Mr. Doolittle's views, that tho not necessarily fraudulent, it is an unwise practice, reacting to the detriment of the shipper.

We see no reason to reconsider our stand against facing comb honey by anyone or anywhere. Not only would such a shipper justly suffer directly, but often an odium attaches to a whole fraternity on account of the actions of a careless few, causing many innocent ones to suffer unjustly. We don't believe any one has a "moral right" to do that which will injure himself and others.

Editor Hutchinson, of the *Bee-Keepers' Review*, wisely said this, when referring to the subject of facing comb honey:

"The best rule that I can give in the matter, is called the *golden rule*. So crate your honey that, if by chance you should unknowingly buy one of *your own cases* of honey, you would not be disappointed when you opened it."

All who wish to do right ought to be able to stand on that non-facing platform.

While we think that Mr. Doolittle took a rather peculiar stand on the "facing" question, we are sure he did not intend to advocate deception in any way in putting up comb honey for market. He is too righteous a man to knowingly advise doing wrong, or even countenance it. If anything we have published seemed to reflect upon Mr. Doolittle's good character, we wish to say that we did not so intend it.

Abbreviating This Journal.—After copying our editorial on page 473, Editor Hutchinson, of the *Bee-Keepers' Review*, had this kind word to say in regard to it:

There are minor points in the foregoing to which I might take exceptions, but perhaps it isn't worth while to argue over them, as I most certainly agree with Bro. York that credit should be given in such a manner that no doubt of the identity of the journal referred to can exist. I am satisfied, however, that no abbreviations are used that are not fully understood by any bee-keeper who is at all conversant with apicultural literature; but new readers might not fully understand; besides this, there is another point that I did not consider before, viz.: if a copied article with an abbreviated credit should be re-copied, say, into a farm journal, full credit would probably be lost, as most of the readers of an agricultural journal might not know the meaning of "A. B. J.," nor of "Review," nor "Gleanings," nor "Progressive."

In the same issue, Mr. R. L. Taylor—our contemporary's critic—referring to this same subject, said:

Editor York also takes me to task for using the letters "A. B. J." for *American Bee Journal*. I beg his pardon. A man's name should be written and pronounced as he chooses to have it, and the name of a man's publication should also, I suppose, appear as he likes it. But I was innocent. I thought it was a great distinction to be conscious that one's journal enjoyed the eminence of being known everywhere by the initials of its name simply. But it is so unusual to have to write the full name in a reference, in parenthesis, that I hope he will have the grace to yield to that extent.

All right, Mr. Taylor, in a parenthetical reference you can initial this journal provided you treat all others in the same way. We want to be as "graceful" as possible, and so we want nothing that the other papers do not get. We prefer not to have any partiality shown toward our paper. But we are quite willing to trust the *Bee-Keepers' Review* to do the right thing hereafter in this matter. And we hope that the other bee-papers will also do likewise.

The "C. B. & Q."—Chicago, Burlington & Quincy—is one of the greatest railroads in all this western country. It is the direct route from Chicago to Omaha—where the United States Bee-Keepers' Union will hold its annual meeting Sept. 13, 14 and 15. Only about a month yet, and then

there should be assembled the largest convention of bee-keepers ever held on this continent.

On the "Burlington Route" the round-trip fare from Chicago will be only \$14.75. The editor of the American Bee Journal, and President of the Union, expects to go to Omaha on the C. B. & Q. The train will leave here at 5:50 p. m., Monday, Sept. 11, and arrive in Omaha at 8:10 a. m., Tuesday—about two hours before the convention opens.

Why cannot a large company from the East and around Chicago arrange to go on that train? We will see to it that splendid accommodations are secured, if all will notify us in time, that they have purchased their tickets over the "Burlington Route" from Chicago to Omaha.

Please let us know if you can join the company that will leave Chicago as mentioned above.

Farmer's Institutes—Eucalyptus.—Prof. A. J. Cook is still working in the farmer's institutes of Southern California. August 1 he wrote us as follows:

Last week I conducted three large, enthusiastic farmer's institutes in San Diego county—the greatest bee-county, I believe, in the world. The institutes were held at Fallbrook, Lemon Grove, and Ramona. All these places—especially the first and the last—are in close proximity to the mountains, indeed are nestled right in the mountains, and are famous for the honey product secured. At Ramona and on up to Julian the rains have been exceptionally copious this season, and so a honey crop has been secured, which in some cases has been quite satisfactory.

At the Fallbrook Institute a Mr. H. M. Peters gave a fine paper on honey-production. Mr. Peters urges that in off years, like the present in his section, bee-keepers study to restrain breeding so as to conserve the honey stores. A Mr. Gunn—a very intelligent bee-keeper of Julian—said honey in that region is as near a free gift as is anything that the farmer produces.

The male pepper-trees are now ringing with the hum of the bees. Of course, the bees are there for pollen. There are some bees visiting the pistillate bloom, but comparatively few.

The brilliant red eucalyptus is now in full bloom. The beautiful scarlet flowers are sparkling with nectar-drops, and are favorites with the bees, as they are with all lovers of grace and beauty. Others of the eucalyptus are also in bloom, but the flowers are white. These have been throwing out their showy tassels for weeks, and as I pass under the trees in the early morning—5:30 each day—I am greeted with the music which is so enjoyed by all apiarists. I believe that the eucalyptus will be a very valuable adjunct to honey-production in this region, as the many species now being set out come into bloom.

Los Angeles Co., Calif., Aug. 1.

A. J. Cook.

Bees Destroy 300 Cattle.—The following report was published in the Chicago Record of Aug. 1:

BANCROFT, Nebr., July 31.—J. McKeegan's famous bunch of short-horned cattle, numbering 300 head, was totally lost yesterday in a singular manner. The stock was pasturing in the reservation on a high bluff overlooking the Missouri river. The cattle were suddenly attacked by several swarms of wild bees, which occupy trees on the bluffs. In their terror and pain the whole herd jumped over the bluffs into the river and were either dashed to pieces or drowned before assistance could reach them.

As in most cases of this kind, later reports may considerably modify the account.

MR. JAMES T. KELLIE, of Kearney Co., Neb., called on us last week, when on his way home from Canada, where he had been to attend the funeral of his aged father. Mr. K. has about 40 colonies of bees.

MR. JOHN S. FRANKS, of Perry Co., Indiana, writing us July 18, said:

"I read everything contained in the American Bee Journal, and would not be without it for five times its cost. If I had only one colony of bees I would want it."

MR. W. J. FOREHAND, of Lowndes Co., Ala., wrote us Aug. 9:

"Enclosed find 25 cents for the Langstroth Monument Fund from Lorain Langstroth Forehand—my little boy whom I named for Father Langstroth. Also 25 cents from myself for the same purpose.

MR. WM. A. SELSER, of Philadelphia, is reported by the Bee-Keepers' Review, to have bottled and sold 30 tons of honey last year. That shows what push and enterprise will do. Suppose every large city were thus to be supplied. What an enormous outlet for honey that would be. Where are the Sellers of other cities?

MESSEURS CHAS. AND C. P. DADANT—father and son—the great comb foundation makers, gave us a very pleasant call Aug. 11. The senior Dadant will spend six weeks or so in Wisconsin, and "C. P." will make a two or three weeks' trip on the lakes. They report a good foundation business this season, but no honey crop worth mentioning.

MR. A. I. ROOT—that man of hobbies—has given up his market wagon that he has been running for a dozen years, and is also giving up the department store that has been running many years longer. He is tapering off on wheat and potatoes, with electricity as a side-dish. But he won't get through "hobbying," until, like Alexander the Great, there are no more worlds for him to conquer, or explore.

MR. W. A. GRIDLEY, of Douglas Co., Oregon, when renewing his subscription July 23, and also taking the book, "Langstroth on the Honey-Bee," said:

"I love the American Bee Journal—yes, I do. I have the 'A B C of Bee-Culture,' 'Bee-Keepers' Guide,' 'Advanced Bee-Culture,' and 'Success in Bee-Culture,' and could not spare any one of these—they are all very useful to me; and now I want to see what 'Pap' has to say."

MR. G. M. DOOLITTLE, of Onondaga Co., N. Y., writing us Aug. 5, gave this report:

"I have about 25 pounds to the colony of white comb honey here, and 50 pounds at the out-apiary, while neighbors have little or nothing. A poor year shows that proper manipulation of bees counts, while in a good year even the novice may succeed."

The foregoing shows the estimate Mr. Doolittle places on "proper manipulation of bees." Knowing how is a great thing—the difference between success and failure.

HON. R. L. TAYLOR, in the August Bee-Keepers' Review, referring to our criticism of his attempt to reform the grammar used by correspondents of the bee-papers, thinks that we have a poor opinion of the literary ability of bee-keepers. He closes with this good comment on us:

"An editor who so lately started out to reform spelling should not so suddenly despair on the point of grammar."

That does take out a little of the inflation in our sails. But, Mr. Taylor, let us whisper in your ear that the editor is to blame if he permits anything ungrammatical to appear in his paper. It is his business to "edit" the copy before it is put in type. It is not supposed that all who write for the public press are experts in a literary way. They do the best they can, and then it is the editor's duty to see that errors of all

kinds are corrected before it is finally printed. So when Mr. Taylor criticises the grammar or language used in the bee-papers, he is really hitting "ye editors." And we all need it, occasionally, for some of us get careless betimes. Even Critic Taylor himself has his lapses occasionally, but we'll not take the space to refer to more of them now. But he's a bright man, and knows it. However, the best of us do err sometimes. None is perfect.

A QUEEN-BEE ADVERTISER from the South wrote us last week:

"My advertisement in the American Bee Journal has panned out very well. I have sold over 50 queens from the last three insertions, and a lot more prospective orders from them. When I want to do some more business quick, I will try the American Bee Journal again."

There are many more queen-dealers who might increase their business if they would advertise in this paper. Let people know where you are and what you have to sell, if you wish to do business.

MR. J. S. HARTZELL, of Somers Co., Pa., has sent an article for publication on the "Golden" method of comb honey production, which we will try to give next week. In an accompanying letter, Mr. H. says:

"Enclosed is a reply to Mr. S. A. Deacon's inquiry on page 483, in which my name appears as an advocate of the Golden method of producing comb honey, and being such I am not ashamed of the cause espoused, by any means; and much more jubilant this year than last, as I have more colonies running on the Golden plan, and results will be more satisfactory in regard to the financial part of the remainder of the story when told."

The Price of Bees in movable-frame hives, says G. M. Doolittle, in Gleanings, should be, in lots of 10 or more, \$3.50 a colony in the fall, and \$5.00 in the spring.

Raising Hives on Four Blocks, while it reduces swarming and prevents hanging out, according to Mr. Burt, in Gleanings, is a big nuisance in swarming-time, for a clipped queen may go out at any one of the four sides, and the bee-keeper doesn't know where to look for her.

Bees Hanging Out is credited by M. H. Dunn (in Gleanings) in large measure to the presence of drones. So he prevents it by keeping out drones. At the same time he gives plenty of room and ventilation, which alone might prevent hanging out without involving the drones.

The Average Annual Yield of Honey for an Italian colony throughout the United States among specialists is 50 pounds, says Doolittle. His own annual average for nearly 20 years, up to the time he went largely into queen-rearing, was 80 pounds, ranging from 30 in his poorest year to 166 in his best year.—Gleanings.

Getting Sections Filled Out to the Wood.—At the convention at Buffalo, Mr. Danzenbaker showed some sections that were greatly admired, the cells being filled and capped clear out to the wood. One secret of it, according to Mr. Weed, in Gleanings, is in having full sheets of foundation, the sheets reaching out clear to the sides and touching the wood. If it reaches only to within $\frac{1}{8}$ -inch of the sides, pop-holes are sure to result.

Rearing Queen-Cells a la Doolittle.—Gleanings reports that their Mr. Wardell is now very successful in rearing queens according to the plans given in "Doolittle on Queen-Rearing." He obtains the best results by giving the artificial cell-cups to colonies about to supersede their queens. From one colony he has taken three batches and has given them the fourth. As they have a queen they don't get discouraged, but go right on starting cells afresh. After the cells are sealed they are put in a queenless colony, and about the ninth day are put in West's protectors, the protector-cage is put into a

hatching-cage at the bottom of which is honey for the young queen when she hatches, and she can wait there two or three days to be introduced where desired. Editor Root says: "One great feature of the Doolittle system is that it enables one to rear all or nearly all the queens from one selected mother."

The First Successful Shipment of Bees to New Zealand was made by Judge Noah Levering, says Rambler, in Gleanings. Previous efforts to obtain Italian bees had failed, but in 1880 Mr. Levering shipped two colonies which made safely the sea voyage of 7,000 miles. Ample ventilation was given, the combs were old and strong, natural stores were used, and a sponge provided water which was renewed as needed. He made many subsequent shipments without a single loss.

Apis Dorsata.—Rev. W. E. Rambo, the missionary in India who is trying to get Apis dorsata for the A. I. Root Co., reports that he hears big stories about them, but can't get hold of any, as yet. He says:

"Everything seems to point to their being migratory. However, the fact that the government lets out the gathering of honey and wax to a contractor whose business it is to make his profit by seizing every colony he can find at its highest development, may indicate a habit which, if the bees were undisturbed, would not exist."

Foundation in Sections.—R. C. Aikin thinks foundation does not differ from natural comb in taste, but is tougher. The main object he has in using foundation in sections is to start the bees in the right place, a narrow strip at the top and one at the bottom being sufficient. But a full sheet has a good effect in the way of bait. He does not value full sheets to prevent drone-comb in sections, believing that drone-comb in sections looks just as well as worker comb. The editor of Gleanings differs from him in this last view. Moreover, he has shown that nature-built drone-comb is considerably gobbler than worker-comb built on ordinary thin foundation.

A Recipe for Starting Foul Brood is thus given by J. F. Teel, in Gleanings:

"Cut out about three gallons of brood, both drone and worker. Put it between ice, so it will freeze to death, then put it out in some warm place, about 70 or 80 degrees. Keep it in bulk, and moist all the time for 10 or 12 days; then put it in water, and make the bees sip at it a few days, and that will be sufficient."

Some people would prefer to go without foul brood rather than to go to all that trouble. The editor agrees with many others that no foul brood can be started without the seed, that is, the spores of bacillus alvei, Mr. Teel believing, however, that the seed is present in every larva, only developing under proper conditions.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 20 cents; 50 for 35 cents; 100 for 65 cents; 250 for \$1.50; 500 for \$2.75. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Bee-Keeping for Beginners is the title of a 110-page book just out, from the pen of that expert bee-keeper of the South, Dr. J. P. H. Brown, of Georgia. It claims to be "a practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit." Price of the book, postpaid, 50 cents. Or, we will club it with the Bee Journal for one year—both together for \$1.40; or, we will mail it as a premium to any of our present subscribers for sending us one new subscriber to the Bee Journal for a year (at \$1.00), and 10 cents extra.

The McEvoy Foul Brood Treatment is given in Dr. Howard's pamphlet on "Foul Brood; Its Natural History and Rational Treatment." It is the latest publication on the subject, and should be in the hands of every bee-keeper. Price, 25 cents; or clubbed with the Bee Journal for one year—both for \$1.10.

FOR THE READERS OF THE AMERICAN BEE JOURNAL.

PROFITABLE BEE-KEEPING, WITH HINTS TO BEGINNERS.....

By Mr. C. N. White, of England,

Author of "Bees and Bee-Keeping," "Pleasurable Bee-Keeping," etc.

Mr. White is owner of one of the largest apiaries in the country where he lives, and has made a life study of the subject. He is also lecturer, under the Technical Education Scheme, to several County Councils in England. He will treat the subject in a

Series of Nine Illustrated Articles :

- 1. General and Introductory. 2. Bees. 3. Handling Bees. 4. Swarming. 5. Hives. 6. Foundation. 7. Supering. 8. Diseases. 9. Wintering.

This is a series of practical articles that bee-keepers of the United States will not want to miss reading. They will appear only in the AMERICAN BEE JOURNAL.

We want our present readers to begin at once to get their neighbor bee-keepers to subscribe for the Bee Journal for the last six months of 1898, and thus read the articles by Mr. White. In order that all may be able to take advantage of this rare opportunity to learn from a successful and practical English authority on bee-keeping, we will send the American Bee Journal for

The balance of 1898 for only 40 cents-- To a NEW Subscriber--thus making it

SIX MONTHS FOR ONLY FORTY CENTS--

Which can be sent in stamps or silver. If you are a subscriber already, show the offer to your bee-keeping neighbors, or get their subscriptions, and we will give you, for your trouble, your choice of ONE of the following list, for each NEW 40-cent subscriber you send:

For Sending ONE New 40-cent Subscriber :

- 1 Wood Binder for a Year's Bee Journals. 2 Queen-Clipping Device. 3 Handbook of Health--Dr. Foote. 4 Poultry for Market--Fan Field. 5 Turkeys for Market--Fan Field. 6 Dr. Tinker's Bee-Keeping for Profit. 7 Capons and Caponizing--Field. 8 Kendall's Horse-Book. 9 Mullen's Horse-Book. 10 Foul Brood--by Dr. Howard. 11 Silo and Silage--by Prof. Cook. 12 Foul Brood Treatment--by Prof. Cheshire. 13 Foul Brood--by A. R. Kohnke. 14 Muth's Practical Hints to Bee-Keepers. 15 15 "Honey as Food" Pamphlets. 16 Rural Life.

For Sending TWO New 40-cent Subscribers :

- 1 Potato Culture--by T. B. Terry. 2 Green's Four Books. 3 Kopp's Commercial Calculator. 4 Dr. Tinker's Bee-Keeping for Profit. 5 40 "Honey as Food" Pamphlets. 6 Winter Problem in Bee-Keeping--by Pierce. 7 Hutchinson's "Advanced Bee-Culture". 8 Dr. Brown's "Bee-Keeping for Beginners". 9 Bienc-Kultur--German. 10 Bees and Honey--160 pages--by Newman. 11 People's Atlas of the World.

All New Subscriptions Begin July 1.

Please remember that all the above premiums are offered only to those who are now subscribers, and who will send in new ones. A new subscriber at 40 cents cannot also claim a premium.

Now, let every one go to work, and help roll up the largest list of subscribers the old American Bee Journal ever had. It can easily be done if ALL who possibly can get a few new subscribers will kindly do so.

Expect Better Honey-Flow.

Bees are in fine condition. I have 93 colonies now, and I had 41 last spring. We have had good rains, so the honey-flow will be better in a week from now. C. G. MATSON.

Chisago Co., Minn., Aug. 4.

Had a Good Honey-Flow.

We have had a good flow of honey for the last 30 days. I keep nothing but the best Italian bees, and they will average 75 pounds to the colony, of comb honey. Our main flow is from cotton. We have had a heavy honey-dew, but my bees do not work on it. J. B. SCOGGIN.

Red River Co., Texas, Aug. 8.

Side or Top Storing.

Mr. Frank Benton says in Farmers' Bulletin, No. 59: "A construction (of bee-hives) which readily admits of expansion and of contraction is desirable." Why do bee-keepers most generally prefer to have the honey stored on top of the brood-frames instead of at their side? Does a construction with all combs in one long hive not admit more expansion and contraction than a hive with stories? German bee-keepers of long experience say the first arrange-

Southern Home of the Honey-Bee

ment gives more honey than the latter; why, then, should it not be preferred, provided with good care for wintering? Would bees rather enter a super above the brood-chamber than one at the side? VIRGINIA.

Bees Doing Poorly.

Bees are doing poorly. It was too wet in the spring, and too dry and cold now. I have 29 colonies, and will get about 200 pounds of honey.

S. W. CLELAND.

Wabaunsee Co., Kan., Aug. 2.

Not Half a Crop.

The bee and honey business is under a cloud in this vicinity this season. After the abundant rains we were expecting a good crop, as we have white and sweet clover in abundance. But so far there has been but little swarming, and many bee-men report no surplus honey. We have had good rains and may yet get a fair crop from fall flowers and buck-wheat. It is now safe to say, tho, that the crop in this county will not be one-half of last year's. KANKAKEE.

Kankakee Co., Ill., Aug. 1.

Honey Crop Very Good.

The honey crop is very good, with respect to both quantity and quality. We dispose of our surplus at our door—comb, 12½ cents; extracted, 10 cents per pound. Our prices, like the laws of the Medes and Persians, are unchangeable, wet or dry, hot or cold.

WM. J. DURBIN.

Fayette Co., Ind., Aug. 2.

Wet Season.

The season was so wet here that the bees did not do much in apple-bloom, but white clover and basswood were good. There is a dry time now that seems to have stopt the honey-flow, but bees seem to be busy carrying pollen from corn and hemp. W. A. SAVAGE.

Sauk Co., Wis., July 27.

Poor Honey Crop.

The honey crop in this locality has been poor—very little surplus—the bees are in fine condition, and the conditions have been fine for queen-rearing, that being a small amount of honey coming to all the time, sufficient to keep up the proper excitement, and no inclination to want to rob, tho we are having a great deal of rain. I can leave honey exposed in my apiary of 150 colonies without any trouble.

W. J. FOREHAND.

Lowndes Co., Ala., Aug. 9.

Top Ventilation of Hives.

In nearly every edition of the American Bee Journal some reference is made to the ventilation of the hives. Many of the bee-keepers say they wedge the cover of the hive up on sticks.

I have edgewise cleats across the ends of my hive-covers, and to give ventilation the rear end of the cover is raised a little and shoved forward until the rear cleat rests on the hive. This gives an abundant amount of ventilation, and one does not have to be bothered with carrying around a handful of wedges, and which are eternally being misplaced. In the event of a storm, and the bee-

Sweet Clover

And Several Other Clover Seeds.

keeper desires to close the top, just slide the cover back, and there you are. This is one of those "little things."

LOUIS R. LIGHTON.

Douglas Co., Nebr., July 26.

Good Prospect for Dark Honey.

The honey crop here from clover and basswood was very light, but there is a good prospect for dark honey.

A. W. SMITH.

Sullivan Co., N. Y., Aug. 5.

Too Wet and then Too Dry.

I bought a colony of bees and increase one more. It was too wet last spring for a good flow of honey, and now it is too dry; the bees do not show much surplus yet, but I hope they soon can, for there is good prospect of golden-rod and many other wild flowers coming into bloom.

R. C. SUPPE.

Woodson Co., Kans., Aug. 5.

In the multitude of counsellors there is safety.—Prov. 11-14.

Gathering Propolis—Can it Be Lessened by Hive Construction?

Query 80.—Do bees gather a certain amount of propolis without regard to their needs, or do they gather only as they find places to put it? In other words, can one lessen the gathering of propolis by proper construction of hive and contents?—Ohio.

Dr. A. B. Mason—Yes.

J. M. Hambaugh—"I don't know."

Mrs. L. Harrison—They may gather more to stop up cracks.

E. France—I don't think we can do anything to change the outcome.

P. H. Elwood—The gathering of propolis is somewhat, but not altogether, the result of necessity.

Dr. C. C. Miller—They'll gather some, whether they need it or not, and perhaps they'll gather more if they need it.

Prof. A. J. Cook—I believe they gather what they need. Some would feel greater need than others, no doubt.

E. S. Lovesy—The same as with honey; as a rule they gather an abundance without any regard as to their needs.

R. L. Taylor—The amount of propolis gathered is owing more to the peculiarities of the colony than to the character of the hive.

Emerson T. Abbott—I think some colonies gather propolis just for the fun of it, and the construction of the hive has nothing to do with it.

G. M. Doolittle—Some colonies gather many times the propolis that others do. With the former the construction of hives would have little influence.

D. W. Helse—Some colonies are much worse propolizers than others, and the proper construction of hives cuts very little figure with some bees, as they will

Excursion to Boston.

The Nickel Plate Road will sell excursion tickets from Chicago to Boston and return for trains of Sept. 16, 17 and 18, at rate of \$19.00 for the round trip. Tickets will be valid returning until Sept. 30, inclusive. On account of heavy travel at this particular time, those desiring sleeping-car accommodations should apply early to J. Y. Calahan, General Agent, 111 Adams St., Chicago. Telephone Main 3389. (58-32-6)

lavishly daub propolis on a smooth surface of the hive interior. But, generally speaking, the absence of rough surface, cracks and corners, will greatly lessen the desire to propolize.

Eugene Secor—I think bees gather propolis largely because of lack of nectar. I have noticed that during a generous honey-flow but little propolis is gathered.

Mrs. J. M. Null—Regardless of their needs, some localities exceed others in the production of propolis. Reduction is possible through construction of hive and fixtures.

O. O. Poppleton—Yes. I think bees gather propolis with some regard to needs, and that the amount of gathered propolis can be lessened some by the means suggested.

Rev. M. Mahin—I think that the quantity is governed largely by their feeling of need. There will be much less propolis in a hive that is smooth inside than in a rough one.

W. G. Larrabee—Sometimes bees gather propolis when they have no place to put it, and consequently they daub it anywhere it happens. I think they gather about so much, anyway.

J. E. Pond—Bees follow their own sweet will in the matter, but it may be assumed that the closer the joints in the hive, and the less space given generally for air to circulate, the less propolis will be used.

C. H. Dibbern—At certain times bees seem to gather propolis, tho there is no apparent use for it. I presume if the inside of the hive is smooth and tight this propensity will be somewhat lessened.

Chas. Dadant & Son—They often gather more than they need. (Witness queenless colonies whose combs become overladen with pollen.) But they often do not find enough, and it depends upon the season.

Dr. J. P. H. Brown—In seasons with a good honey-flow they generally propolize in proportion to their needs. But when the bees have a long spell of idleness they are more prone to deposit propolis to excess.

Jas. A. Stone—I think they gather it just as they happen to be disposed, for I have had some hives all stuck up with it, when at the same time other hives would have very little of it, and of a great difference as to stickiness.

R. C. Aikin—Very little is gathered during a good honey-flow. When nothing else to do, a scant or abundant supply as it may be found in the fields, much as pollen supply is governed by the field supply. We do not have a surplus of either in my present field.

S. T. Pettit—Yes, one may in a measure lessen the quantity gathered by good workmanship and careful adjustment of appliances in all their parts. But, after all, where propolis is plentiful bees will usually gather more than they can find use for, and they will daub it somewhere.

G. W. Demaree—The honey-bees in a state of nature needed some substance—propolis—to fix up their rough homes, and the instinct to gather propolis is deeply seated in the bee. How long it will take to change the habit and abate the nuisance of much bee-glue in the cleanly constructed modern hive—well, who can answer?

J. A. Green—Some colonies gather a

THE BIGGEST OFFER YET!

Last year only about one per cent—only one subscriber in 100—ordered his Review discontinued. If the Review could secure 1,000 new subscribers the present year, there is an almost absolute certainty that at least 900 of them would remain; not only next year, but for several years—as long as they are interested in bees. Once a really good bee-journal visits a bee-keeper a whole year it usually becomes a permanent member of his family.

I would have no difficulty whatever in getting twice 1,000 new subscribers this year, if all of the bee-keepers in this country had read the Review the past year. I have sometimes thought that it might pay a publisher to give away his journal one year, simply for the sake of getting it into new hands. There are, of course, decided objections to such a course; but I am going to come as near to it as I dare. Here is my offer:

If you are not a subscriber to the Review, send me \$1.00, and I will send you twelve back numbers, the Review the rest of this year and all of next year.

Each issue of the Review, especially if devoted to the discussion of some special topic, is really a pamphlet containing the best thoughts and experience of the best men upon the topic under discussion. Twelve back numbers of the Review are, to a certain extent, so many little books devoted to as many different phases of bee-keeping. Some issues of the Review are now out of print; of others only a few are left; while of others there are several hundred. Of course, I shall send those of which I have the most, but no two alike.

Most people subscribe for a journal at the beginning of the year. In this case there is no use of waiting, as you will get the Review for next year just the same as tho you waited until next January to subscribe, and you get all the rest of the numbers for this year FREE. The sooner you subscribe, the more free issues will you receive.

Let me tell it over once more. For \$1.00 you get twelve back numbers, the Review the rest of this year, and for all of 1899.

great deal more propolis than they need, judged by our standards at least. Others gather a much smaller quantity. At a time when bees are gathering honey very freely they gather comparatively little propolis. We can certainly greatly lessen the quantity of propolis gathered and its deposit in the hive by a proper construction of the hive and fixtures.

Don't Forget

G. B. LEWIS CO., WATERTOWN, WIS.

Special Agent for the Southwest—

E. T. ABBOTT, St. Joseph, Mo.

Mr. Abbott sells our Hives and Sections at factory prices.

Ho, for Omaha!

AS we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful straw-

colored transparent Foundation, Improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, **Leahy Manufacturing Company, Higginville, Mo.,** or **1730 South 13th St., Omaha, Neb.**

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Aug. 10.—Some shipments of the new comb honey are coming forward; white, in good order, sells at 12c. Extracted is very steady at unchanged prices with fair arrivals. Beeswax, steady at 27c.

R. A. BURNETT & Co.

Kansas City, Aug. 11.—Fancy white comb, 13@14c; No. 1, 12@13c; amber, 10@12c. Extracted, white, 5½@6c; amber, 4½@5c. Beeswax, 22@25c.

The receipts of new honey are very light; demand fair.

C. C. CLEMONS & Co.

New York, July 30.—There is some little new Southern comb honey on the market, mostly irregular quality and selling at from 9 to 11c. Extracted of all kinds is in good demand. Common grade Southern, 50 to 52c per gallon; good, 55 to 57c.; choice, 5 to 5½c. per pound; some exceptionally fine lots sell at 6c. Beeswax is very quiet at 26 to 27c.

HILDRETH BROS. & SEGELKEN.

Boston, July 9.—Fancy white in cartons, 13c.; A No. 1 white in glass-front cases, 11 to 12c.; No. 1, 10 to 11c.; No. 2, 8 to 9c. Extracted, white, 6 to 7c.; light amber, 5 to 6c. Beeswax, pure, in good demand with very light supply, 30c.

At the present time the demand for both comb and extracted honey is very light with but little stock on hand.

BLAKE, SCOTT & LEE.

San Francisco, Aug. 3.—White comb, 8½ to 10c; amber, 6½ to 7½c. Extracted, white, 5¼@6c.; light amber, 4¾ to 5¼c. Beeswax, 23@25c

Market is lightly stocked, and must so continue the current season, as the yield this year is very small. While tolerably stiff values are ruling, not much honey is required to satisfy the demand at prevailing figures. Very little beeswax is offering. Quotable rates are unchanged, but values are more apt to go higher than lower before the season closes.

Detroit, July 21.—Fancy white, 11@12c; No. 1, white, 10@11c. Extracted, white, 5@6c; dark, 4@5c. Beeswax, 25@26c.

New honey is arriving, but prices are hardly established.

M. H. HUNT.

Minneapolis, July 26.—Fancy white clover comb is now selling at 11@12c.; amber, 10½c. Extracted fancy white clover, 5½c.; amber, 4¾@5c. Dark grades, both comb and extracted, not wanted at low prices.

S. H. HALL & Co.

Indianapolis, July 18.—Fancy white comb honey, 12@12½c; No. 1, 10@11c. Extracted, white, 6@7c. Beeswax, 25@27c.

Only a few arrivals of fancy white comb; market almost bare, and demand good. Quite a little comb honey from honey-dew is being offered, but there is simply no demand for the stuff.

WALTER S. POWDER.

Milwaukee, July 14.—Fancy 1-pound sections, 11@12c; A No. 1, 10@11c; No. 1, 8@10c; amber, 7@7½c; dark and old, 6@7c. Extracted, in barrels, kegs or pails, white, 6@6½c; dark and amber, 4@5c. Beeswax, 26@28c.

Since our last the sales of honey have not been large, altho a fair demand has existed and continues, altho the fruit consumption makes some difference with eaters of honey. There is not a very large supply of old stock left, and we shall be in good order for new crop both extracted and comb. The outlook is good.

A. V. BISHOP & Co.

Buffalo, Aug. 12.—Fruit prevents a large demand for any kind of honey at present. A few cases of fancy one-pound new comb can be sold daily at 11@12c.; but any grade below must be urged at proportionately lower prices. Would advise writing us before shipping there. There is no demand yet for extracted.

BATTERSON & Co.

St. Louis, July 9.—Fancy white comb, 10 to 11c.; No. 1, 10c.; amber, 9 to 10c.; dark, 8 to 9c. Extracted, white, 5½ to 6c.; amber, 5 to 5½c.; dark, 4 to 4½c. Beeswax, 20 to 22c.

WESTCOTT COM. CO.

Cleveland, Aug. 3.—Fancy white, 13@14c; No. 1, white, 12@12½c.; light amber, 11c.; buckwheat, 9c. Extracted, white, 7c.; light amber, 6c.

The demand for honey is exceptionally good, owing to the crop in this vicinity being very light.

A. B. WILLIAMS & Co.

Cincinnati, July 9.—Demand is slow for all kinds of honey, especially comb. Prices for best white comb honey, 10 to 13 cents. Extracted honey brings 3½ to 6c, according to quality. Beeswax in good demand at 25 to 28c for good to choice yellow.

CHARLES F. MUTH & SON,

 **Talk about
... Comb Foundation**

WE can now furnish the very best that can be made from pure wax. Our New Process of Milling enables us to surpass the previous efforts of ourselves and others in the manufacture of Comb Foundation.

**It is always Pure and Sweet.
It is the kind that does not sag.
It is the kind you want.**

If you once try it you will have no other. Samples furnish **FREE**. Large Illustrated Catalog of all kinds of

Bee-Keepers' Supplies,

And a copy of the American Bee-Keeper, sent upon application. Address,

PROFITABLE BEE-KEEPING, WITH HINTS TO BEGINNERS,

BY
C. N. WHITE, OF ENGLAND.

Author of "Bees and Bee-Keeping," "Pleasurable Bee-Keeping," etc.

No. 8.—MARKETING AND DISEASES.

Having learnt, and become able to carry into practice the principles of success that have been enunciated in these articles, there would appear to be no difficulty presenting itself to the enthusiastic bee keeper. But this is not so, for there are many successful producers of honey who are unsuccessful in disposing of it. "What are we to do with our honey?" is a frequent cry. The general reply, "Sell it," will not be a sufficient answer to that question here, and therefore I will give a few hints on the preparation of honey for the market and the means of its disposal.

It is an undoubted fact that, as a rule, those who cry out most for markets are those who do the least to find them, or when they have got them, to keep them.

Honey, unlike many other commodities, will keep good almost indefinitely, if properly taken and stored. Queries forwarded to editors of bee-papers frequently have reference to the disposal of honey that is fussy and almost bursts the vegetable parchment covers. The best thing to do with such stuff is to throw it away, because it is useless as a food to the bees or the bee-keeper. Fermentation and the consequent spoiling of honey should be avoided by making sure that all honey, when taken from the hive, is ripe. If it is allowed to remain on the hive until there is no doubt of its ripeness, there need be little fear of fermentation. Fermentation is said to be caused in some instances by the presence in the honey of pollen-grains, but if the brood-nests are properly managed, it is seldom that pollen will be found at all in the supers.

When the heat in the brood-chamber, generated by the bees, has extracted the superfluous water from the honey by evaporation, the sealing of the cells takes place because the honey is then in a condition which the bee-keeper terms ripeness. After being extracted the honey should be put into a deep cistern at the bottom of which is fitted a treacle-tap. A convenient size would be about a foot in diameter, and 2½ feet deep, unless large quantities are dealt with. The cistern should be allowed to stand in a warm room two or three days; then the ripest honey will be in the lower part, and may be drawn off into one-pound glass bottles or into 7, 14, or 28-pound tins with lever-opening lids. The bottles may be either

screw-capt or covered with vegetable parchment; but the former will cost nearly twice as much as the latter. After being securely covered a nice, attractive label should be affixed on the side, giving, if possible, the source of the honey and the name of the honey-producer.

Honey sets, or candies, early or late, according to the source from which it is gathered. That from mustard and the Brassica tribe generally candies quickly, while that from clover and sainfoin usually remains liquid some considerable time, particularly if kept in a dry, warm cupboard and protected from the atmosphere. If customers prefer the honey in a liquid form it may, whether in bottles or cans, be liquefied by placing it in hot water, but it must not be boiled or it will lose the flavor and aroma distinctive of good samples of honey, and become dark and objectionable.

Sections require much care to keep them in good condition, and therefore, unless there is a good demand for honey in this form at remunerative prices, it is best to devote attention almost solely to the production of extracted honey. The removal of sections from the super is a very delicate operation as they are frequently cemented to the bars upon which they stand by propolis or bee-glue. If, by careless handling, the sections are pulled the least out of shape, the surface of the comb will be cracked and the honey will gradually ooze out, giving the cappings a damp and unattractive appearance. To command the best prices sections should be glazed—that is, a square of glass should be pasted with ornamental paper on each side. This, of course, adds to the trouble, but it pays if a good market is secured. Sections may be kept in good con-

Honey-Cistern.

Honey-Jar.

dition if they are wrapt in paper and then packed in an air-tight case such as a tin biscuit-box. When a good market cannot be secured at the close of the season on account of the rush of new honey, it should be packed away for filling orders later in the year when there is sure to be a market for high-class honey.

As honey varies much both in color and flavor, it is advisable to grade both kinds of honey immediately they are pre-

pared for market. The best sections will be those in which the comb is built up to the sides and filled with honey. Such sections, if also evenly and rather thickly capped, will not only be the most attractive, but they will also keep and travel best.

Markets near home are desirable, and generally friends and neighbors become ready purchasers when they find they can depend upon the quality of the honey. The next customers to whom we must turn are the middlemen in the form of shop-keepers, but all bee keepers would act wisely in joining a county association, for they would then be able to assist in the establishment of depots for the sale of members' honey. In this case it is usual to have a county label, and as each one bears a number it is an easy matter to check any attempt to lower the reputation of the county honey. Many associations have lately followed the lead of the Berkshire Bee-Keepers' Association, and been most successful in a work that is of the utmost importance to those members at least who reside some distance from towns, or fail to find a market for their produce near home.

DISEASES—DYSENTERY.

In dealing with feeding, one disease—dysentery—has already been referred to as likely to be caused by leaving in the hive a large quantity of thin, unsealed food when the colony is being closed up for winter. The disease being caused by improper food and damp surroundings need not exist except in apiaries carelessly managed. The food the bees take during their confinement acts injuriously upon them, and instead of being able almost wholly to remain in a state of comfort until fine weather gives the opportunity for a cleansing flight, they void the excrement on the combs and create surroundings that ultimately cause the loss of the colony. If found out in time the hive might be moved into a warm room so that a re-arrangement of the brood-nest might be effected. The worst combs should be taken away and destroyed, or cleansed if others cannot be supplied; then, having made their home as sweet and clean as possible, a pint of warm syrup may be given, to be followed by a good cake of candy. If kept in a warm room for the night the bees would be able to arrange their food and themselves for the out-door temperature, whatever it might then be.

FOUL BROOD.

There is, unfortunately, one disease to which bees are subject, and if it once finds lodgment in an apiary it is liable, and almost certain, to spread like wild-fire throughout the apiaries of the whole neighborhood. Foul brood (*Bacillus alvei*) is a germ disease—that is, like the diseases to which human beings are liable, it is caused by the presence and growth of a germ or seed of minute proportions. The disease is spread from apiary to apiary chiefly, if not wholly, by carelessness or ignorance in introducing colonies standing in a diseased apiary or in an infected district, that are either diseased or have in them germs that subsequently find a suitable medium in which to germinate. In those districts where the disease has not yet shown itself bee-keepers cannot be too careful in obtaining fresh swarms or colonies from districts that are known to be quite free from the disease.

The first symptoms of foul brood are only noticeable to the expert on examining the combs in the brood-chamber. The grubs, when attacked, turn a yellowish color and stretch out in their cells instead of being a pearly white and curled up at the bottom. They are then a prey to the multitude of bacilli produced from the germs, and when the nutrient matter is all consumed the bacilli die, leaving behind them innumerable germs to spread the disease whenever they fall into a proper medium.

A bad case is easily recognized by the stench arising from the hive and given off by the state of rottenness within. On examining the combs the open cells will be found to contain a dark coffee-colored substance of a stringy and sticky nature, while those sealed over will be pierced with irregular-shaped holes, and appear sunken instead of exhibiting the prominent and rounded appearance so characteristic of healthy capped brood.

With these instructions as a guide the novice should have no difficulty in detecting a case of foul brood in any of its stages. Whenever a case is found, the hive should be instantly closed and every precaution taken to prevent other colonies robbing it. At the close of the day, when the bees have about ceased work, it should be thoroughly overhauled. The best plan to adopt would be to obtain a clean hive, place in it fresh combs, if there are any on hand, then shake the bees from their frames on the alighting-board of the clean hive which should stand in the place of the affected colony. Let the bees run in, and then, if there are not sufficient frames, add to the number from another hive as many, free from signs of disease, as will compel the bees to be crowded,

for under such conditions remedial measures are more likely to have a proper effect.

When the bees have settled themselves among the combs, syrup should be given which has been medicated with naphthol beta or Izal. A shilling's worth of the former will be sufficient to medicate about 1-1/2 pounds of syrup. Izal should be given in the proportion of a quarter of an ounce (fluid) to 15 pounds of honey or syrup. This treatment must be carried on thoroughly in the case of every affected colony, and the result will doubtless be that in a season the apiary will be quite rid of the pest. Absolute cleanliness in the apiary is imperative. The hives from which the bees have been removed must not be allowed to stand about while they are holding diseased combs and harboring germs. The frames, combs, quilts, and other movable parts of the hives should the same evening be put upon a bonfire and not left until every scrap is consumed.

As a means of precaution against the introduction of the disease, and also to stop its progress when once it appears in a hive, an antiseptic should always be used. The best for the purpose is naphthaline—also carbon—usually sold in balls about the size of marbles. Two, split and dropt between the combs at the tack of the hive, on the floor-board, constitute a proper quantity to be given at one time. As they disappear, which they do like camphor, they should be replaced with a fresh supply, but one dose will last a long time. The fumes given off by the naphthaline are deadly to the bacilli: therefore, if only this treatment is continued and the hives are kept scrupulously clean, the disease may be kept in check.

[Concluded next week.]

“Pickled Brood” and “Bee-Paralysis.”

BY DR. WM. R. HOWARD.

These maladies have for years haunted the bee-keepers with their mysterious appearance, and ghost-like disappearance. “Pickled brood” has only recently been separated from “foul brood,” and “paralysis,” for years the destroyer of apiaries, remains to-day one of the unsolved problems in the way of successful and progressive apiculture. For natural reasons these diseases are not so extensive in the South as in the North.

About four years ago I kept a few colonies in my own yard, and had my first experience with “pickled brood,” and in the American Bee Journal for Sept. 10, 1896, the first account of this disease was published. In this contribution a full natural history, including the differences between “pickled brood” and “foul brood,” with illustrations and details was given. Since this was written I have carefully investigated the subsequent cases coming under my observation, and have developed, or rather discovered, other interesting and valuable facts. I find that not only the larvæ and pupæ are affected, but that many young bees hatching and crawling about for some time become afflicted and die by the thousands; and many are carried from the hive while yet alive.

Again, I have examined hundreds of old bees from the same yard and from the same hive, when there appeared to be an epidemic of destruction prevailing in certain isolated colonies—not only in the yard affected—and have found, after the most careful research (using the same strict laboratory technique practiced in bacteriological experiments), that these old bees were suffering from the same disease, so far as could be definitely determined. The spores producing the same fungus were found, and no other disease-producing element was developed. Now, that old bees suffering from this trouble have been taken for paralysis, I have not a doubt, and that many of the symptoms ascribed to paralysis by some of the writers, are so nearly in accord with those I have noticed in these cases, further evidences the fact that they have been considered identical. There is one symptom always noticed in this trouble with perfect or old bees, that is, they appear as if they had been frozen and were just able to move a foot or leg when disturbed; even young bees just hatching fall to the bottom-board unable to crawl.

There are certain conditions, in common, present, which aid in the production or development and maintenance of these diseases:

1. Old, moldy pollen in the hive.
2. The absence of fresh pollen.
3. The proper amount of heat and moisture, which always obtains in a prosperous colony.
4. Brood-rearing actively going on.
5. Cold or rainy weather, which prevents the bees from flying out.
6. A dearth of natural pollen in the fields, from late frosts or continued heavy rains.

Again, there are conditions in common conducive to health and the prevention of these troubles:

1. Clean combs, with plenty of fresh pollen in the hive.
2. Continued fine weather, with both honey and natural pollen coming in.
3. The absence of brood-rearing—a queenless colony.

These latter conditions present no pickled brood will occur, and in only extreme cases will paralysis continue. The former conditions present whole colonies will be depopulated in a few hours with either disease before anything can be done to relieve them.

In the treatment of "pickled brood" I have recommended, with the best of success, the removal of all old pollen, and if no new natural pollen were coming in, giving the bees access to sterilized artificial pollen. Unbolted wheat or rye flour thoroughly heated—not baked—makes a good substitute for pollen.

Another point worthy of special attention is access to plenty of pure water; even when brood-rearing is going on in such weather as bees are temporarily unable to leave the hive pure water will be eagerly taken from feeders, and with a sanitary benefit.

Last spring several bee-keepers wrote to me and consulted me personally in regard to paralysis; in all cases I ask that dying and dead bees be sent to me for examination. A careful study, and experiments made by removing the alimentary tract and cultivating the contents in a moist chamber, have in all cases developed the white fungus (*aspergillus pollini*) of pickled brood; and in all cases several of the above-mentioned conditions favorable to the disease were present. The removal of the old pollen, and the substitution of artificial pollen, have yielded satisfactory results.

In many cases where it was advisable to open the hives, the access to artificial pollen until natural pollen could be obtained had the desired effect. The most common cause here, last spring, was that in the very height of brood-rearing, when bees were nearly ready to swarm, a heavy frost came, killing everything green, which caused a cessation of natural pollen for ten days, in which case all the pollen in the hive was consumed; this, with a few days' confinement on account of dally rains, brought about very unsanitary conditions, causing the diseases to develop.

If any one having a case of paralysis will send me a few bees placed in a sterilized bottle, well corked, I will gladly investigate and report the results.

502 Main St., Ft. Worth., Tex.

[We trust that our readers will avail themselves of the kindly offer made by Dr. Howard in his last paragraph, and send him samples not only of paralysis, but of any other disease that they fear their bees may be suffering from. We shall be very pleased to publish the Doctor's reports thereon. With every copy of Dr. Howard's book on "Foul Brood" that we mail at 25 cents, we also mail free a leaflet on "Pickled Brood."—EDITOR.]

No. 4.—The A B C of Marketing Honey.

BY HERMAN F. MOORE.

[Continued from page 516.]

In conversing with the people, you must avoid certain subjects. Never mention sugar syrup, for the people are all too ready to believe that many bee-keepers feed sugar syrup and sell it for honey. My answer always is, "No bee-keeper practices that." But this same thought is fired at me nearly every day.

In all trades and vocations there are things and methods that need not be given to the public. In our pursuit, the feeding of bees for winter stores, or stimulative feeding of sugar syrup in spring, and the wholesale price of extracted honey should be kept from the general honey-eating public. All the great lines of business and manufacture guard most zealously their cost prices, cost of manufacture, wholesale prices to dealers, etc. One principal reason is that the consumer can't, or won't, understand how much profit one must have to pay expenses and leave a margin. If he knows your profit he won't buy of you, for he thinks you are making too much money out of him.

The line, "I will feed you sugar syrup," that occurred in a poem in a bee-paper, never could get into a paper that I controlled.

Now for actual work among the people: Early in 1887 the writer hitch the bay colt to the family carriage and started on his first trip selling honey to the farmers of Seneca

county, Ohio. Two or three dozen jars of honey were loaded into the carriage, being packed in boxes to prevent breakage.

My first start was made by sending for a 60-pound can of the best white clover honey. This came duly to hand, and was emptied out into the jars and other dishes, by tipping up the can, and, when full, cutting off the stream of honey with a case-knife, that being, I believe, before the day of the honey-gate, or at least before I had one.

Many families were visited in this way through the farm country, and more or less sales made. I suppose the colt and I were both somewhat fractious, for I can well remember when I slapt her hard for not agreeing with me on some subject, she gave a sudden jump, lifting the front wheels of the carriage and knocking out the bottoms of several of my glass jars. That was my first big daub; but it has been continued with variations ever since, so that a dish of water and a rag are my constant companions. I mention this now, when it occurs to me, for I heartily recommend the rag and water. If you wish to live in peace with your better half and the neighbors, and if you don't wish to accumulate your neighbors' stocks of flies, don't try to do your cleaning up of honey-spills once a week, but instantly apply the rag-and-water cure when first discovered.

After following this plan for some time I became dissatisfied with it, for farm houses are too far apart, and farmers are too thrifty, and spend their money too sparingly to make good trade. Then, I was compelled to sell for a price that did not pay, owing to many farmers keeping their own bees.

By going to my county towns 10 miles away I could get 3 to 5 cents a pound more for my honey. Then instead of a quarter mile between prospective customers, I made calls almost every 20 feet. Of course, I could not well carry a load with me in the carriage and stop so often, so I naturally fell into the drummer's way of selling by sample.

Taking a quart Mason fruit-jar half full of delicious clover honey under my arm, I "made a break" for the little city of Tiffin—determined to win, or die in the attempt. My report read like the Roman's—"Veni, vidi, vici"—"I came, I saw, I conquered"—for in a very short time 800 pounds of liquid honey were sold and delivered to Tiffin families. I believe the price was 15 cents a pound, and 10 cents extra for the jar. Those were the days when Mason jars cost us \$12 for 12 dozen, and were well worth 10 cents to any family.

How did I do it? Well, I took my sample jar and order-book and pencil, and started down the first street I came to, calling at every house. Then I took every street in town running that way; then, every street crossing the first lot of streets, taking every street in order. Sometimes I would make a nice sale in the last house in a row, when the temptation was to skip those, "for they won't buy anyway."

Taking the first house I came to, I went to the front door and rapt, or rang the doorbell. My mother had taught me always to be neat and clean, and I have never been mistaken for a tramp or a disreputable person. You will find, if you circulate at all extensively, that even such a thing as this may count heavily in your favor when among strangers. They must of necessity judge you at a glance by your appearance.

When the lady came to the door I said, "Good morning. Are you fond of honey? I have some here in the jar"—(holding it up and rolling it so as to show the body and clearness). "Will you please get a teaspoon and try it?"

This method of approach seemed to take a good many off their guard, so much so that some would even ask, "Are you selling it?" If I had said in the start, "Do you want to buy some honey?" 99 out of 100 would answer, "No!" with an emphasis.

The lady went for the teaspoon. I dipped it in the honey and gave her a liberal taste. If there were others—children, neighbors, relatives, present—I saw that each and every one had a taste of the honey. The little boy or girl saying—"Oh, mamma, ain't that nice? Get some"—has often made a sale.

Some people are skeptical, and you will find those who know least or nothing about bees and honey, are most so. Those who have had bees, or who have had honey from friends who had bees, are easy to handle. Ordinarily they are satisfied by the smell and taste as to the purity of your honey.

You will find the best argument in the whole catalog to use with skeptical people is, "My honey is pure honey. I never sell anything else. I keep bees over in Melville, 100 colonies. I take honey in July out of my own bee-hives. Come over any time and I will show you my bees, and how I get the honey away from them."

This is the best course, when you will find again and again that no words you can use will change their idea that "there is lots of manufactured honey on the market." "All liquid honey is mixt." Arguing with a man has very often had the same effect as I am told it has to argue with a man

about religion—only makes him the more firm in his own belief, or unbelief.

When you start in on a town make a thorough canvass, for you may make sales when you least expect. By leaving your circulars with every one, you will make friends and acquaintances who will buy at your second or third trip.

On covering the same ground awhile after my first trip, I called where I had sold a lady some honey, expecting another order. She brought out my honey, nearly unused, and candied solid, and said, "Sugar! You cheated me; no honey." Of course I delivered a lecture on the nature and properties of candied honey, but I fear she thought I was lying, for she never made her second purchase. By all means, put in some explanations in your circulars about the nature of honey, temperature to keep it, etc.

Now here is something for you to try: After canvassing a town carefully, calling at every house, turn right around and go over the same ground the second time. My brother went over my ground after me in this way, and he said, "I can sell more honey than you can on the same ground." My answer was, "That is nothing; I got the people in the notion, and you happened along and got the order." I have repeatedly gotten orders where I supposed I had fooled my time away, when I happened to call back for some reason or another.

Right there in Tinian, at the very start, the pretty girl told me I was "sweet enough without honey;" and another said, "It takes money to buy honey; isn't that funny?" and the same jokes have followed along all these years, even down to the present day.

To me, the work of selling honey is most fascinating. Meeting so many people, hearing their crude remarks on bees, honey, etc., giving them tastes of honey, and hearing their exclamations of delight—"Isn't that fine? That is honey. That is *bee* honey. My, but don't that take me back to the old farm in Pennsylvania? My uncle kept a *bee* out in Illinois when I was a child," etc. I often say, "I get my money's worth in the fun I have, and what I make is clear gain."

The only drawback of consequence in the honey-trade is, the people who eat honey are too small a percent of the whole number, and those who eat honey don't eat *enough*. This necessitates covering a wide range of territory so as not to call on the same family oftener than once in three or four months.

Those who like your honey and want more can call at your house or drop you a postal card. Perhaps it would be wise to say in your circular, "Mail orders promptly attended to."

[Continued next week.]

Queen-Rearing—Some of the Ingenious Plans and Devices Now Employed in the Business.

BY W. H. PRIDGEN.

This article will not treat of all the ways by which queens can be reared; nor of such as work well under the most favorable circumstances, with the least labor, but, at other times, are attended with a partial or total failure. Instead, it will give a sure way of securing good ones and having cell-cups invariably accepted, whether the honey-flow is continuous, or feeding has to be resorted to, and it is suited to the rearing of a few or to queen-rearing on an extensive scale.

The preparation of the cell-builders is an important factor. To begin with, we will fill a hive with combs of brood, without bees, taking from the colonies that can best spare them, substituting empty combs or frames filled with foundation. Place this brood over a populous colony with a queen-excluder between. Ten days later remove all queen-cells, if any; give the hive-body a top and bottom, set the lower hive containing the queen off a few feet, and the other in its place. If the bees are flying freely, the queenless half will be ready to accept a batch of cells in four or five hours.

This plan has the advantage of having young bees added to the cell-builders, for a day or two, from the part containing the queen and brood, and adds much to the quality of the young queens.

When the batch of queen-cells are removed, select the next colony for cell-building; find the queen and hang the comb she is on in an empty hive near by. Set her hive off its stand, and the former cell-builders on it with an empty body over the latter. Now shake the bees from nearly all the combs in among the queenless bees; return the comb and queen, and place her hive where the queenless one stood. In a few hours, or as soon as the bees become restless, or show the queenless

sign, they will be ready for cell-building. As they have no brood, we must not forget to place a comb on each side of the cells as soon as they are sealed; as it has a good effect generally and prevents the bees from gnawing off the points of the cells too soon. Besides, if this is not done, this operation cannot be repeated more than twice before laying workers will appear, and then we will have to start with a new set of combs. In fact, when the second batch is removed, the queen from the next colony to be prepared should be given to them, the bees to build the next cells shaken off on combs free from unsealed brood, and the brood placed over an excluder, as in the first case, to be used ten days later for cell-building. If one is in so much of a hurry that ten days is too long to wait, the first batch can be built by bees prepared as in the last case by forming a nucleus with the queen, or otherwise disposing of her.

Whenever the combs are to be used the second time, by exchanging places and shaking bees into the hive so as to get young ones, the brood given about the time the cells are sealed should be from over an excluder or from bees long enough queenless so that all the brood will be sealed by the time the first batch of cells mature, then it will not have to be removed. The main idea is to have bees just deprived of their queen and of unsealed brood. The cups can be given in an hour or so when they have some sealed brood.

Those who do not desire increase, but wish to rear a few queens, can give the swarm on empty combs on the old stand, cage the queen and place her on the frames and return her to the parent colony at night.

The cells should be given as soon as they can be prepared after the swarm is hived; and when they are mature the parent colony returned to its former position, having been set back a few feet, at the time of swarming, and the swarm shaken from the combs.

No one can tell, in one article, of all of the little things connected with the manipulation of the bees or anything else about queen-rearing, but it is hoped that some ideas will be advanced that will aid others in properly varying matters according to circumstances, for no one can make a success of it unless he can do some planning and thinking for himself.

The dipping-stick should be made as shown in the illustration, and not larger than $\frac{5}{16}$ of an inch in diameter. The tapering part should be $\frac{5}{16}$ of an inch long; reduced rapidly for the first $\frac{1}{8}$ of an inch and then gradually reduced to the end. It should slip into a worker-cell $\frac{1}{8}$ of an inch before filling the mouth of the cell, form a sink in the wax-cup that will bear sufficient pressure to make the cocoon fit snugly without touching the bottom.

The stick should be dipped rather less than $\frac{1}{2}$ of an inch deep into the wax, and four dips complete a cup and attach it to the bar. For the first three times hold the stick so that the drops will form and set on first one side and then the other, and thus form a foot to fit in the notches, as shown in bar with cells attach. [See the cut on page 535.] Then loosen it up on the stick, dip again, place in the notch, and it will adhere, and not snap off when the transfer of cocoon is made. The notches are exactly $\frac{5}{8}$ of an inch apart from center to center, and the tin divisions in the nursery the same, so that a whole batch can be placed into it without detaching the cells.

Some may imagine that the notches in the bar interfere with the cutting off the cells when it is desirable to do so, but such is not the case, as a table-knife inserted at one side of a cell will easily pry it out. After a bar is notched it should be moist with melted wax, especially in the notches, before the cups are attached. During a honey-flow the cells are joined together by the bees building wax between, but they can be easily separated with a hot knife. Any number of cups desired can be used. I usually have 18, and out of five batches built within the last few days there were only three cups rejected.

Cut out the lower half of a comb and notch the end-bars of the brood-frame even with the part left, and by having the slat or bar (I use bars $\frac{1}{2} \times \frac{3}{8}$ of an inch) just the right length they can be slipped in and out very handily.

Instead of alternating the cells, I now have them built in one straight row, so as to be convenient to insert in the nursery. If it is not desirable to remove and introduce the young queens as fast as they hatch, which I prefer doing, so as to discard such as I do not like, it will be found that the cells will be more readily accepted if protected by the nursery until the first queen emerges.

I have not yet determined how many days in advance of hatching it will do to protect the cells with the nursery, and thus reduce the number of days of queenlessness by the cell-builders.

The comb should be quite old, such as has been used for

many generations of brood; so that the cocoons that are to be transferred from will be thick and heavy, and then shaven down with a thin, sharp knife, slightly heated, so that the cells are barely $\frac{1}{8}$ of an inch deep. It should be cut very smoothly so that there will be no ragged edges; and when bent back and forth the cocoons will loosen up, and can easily be removed. Some allow them to fall out on a piece of flannel, and then take them up, but with a properly-made transfer-stick, such as shown at the small end of the forming stick, made a little tapering, so as to stretch the cocoon a little just above the hollowed-out point, I have no trouble in taking the cocoons right out of the comb. By having cups warm (at a temperature of 90°) they stretch when the cocoon is prest in, and then a little twist of the stick makes all smooth and nice.

This plan is objected to by some because the combs have to be cut, but practice will prove that the advantages in being

Dipping-Stick.

Cluster of Queen-Cells.

able to use larvæ too small to transfer otherwise, surrounded by food supplied by the bees to suit its age, will more than counterbalance the damage to combs. Besides, old ones that have been in use until they need removing can be used repeatedly during a season.

In selecting the larvæ, that used in the different sets of cups should all be of the same age, if it is expected that all will be accepted, fed alike and hatch the same day. For the best results it should not be larger than can be just seen easily with the natural eye; and many times I use it when only a tiny wet spot can be seen in the bottom of the cell. It is best after a comb is filled with eggs to give it to queenless bees, as the larvæ is fed more abundantly; especially is this the case during a honey-dearth. My experience is that there is not as much difference in the hatching of the queens as there is in the age of the larvæ used; and unless surrounded with an abundance of food, one larger than the head of an ordinary pin produces a black-tipt, runty queen.

If it be desirable to form nuclei, a hive can be filled with combs of brood (sealed and hatching preferred) and placed under the cell-builders when the cells are sealed. In any of the cases mentioned, when the cells mature slip them in the nursery described on page 535, or any nursery you have convenient, and as soon as enough young queens hatch, form nuclei by using a comb of honey and one of brood, giving each a queen. Place them in a dark room one day for them to become accustomed to their changed condition, when most of the bees will remain, when the nuclei are set out; especially so if

the weather or conditions have been such that they have not flown freely for several days.

If only one batch of cells is to be built, and the first arrangement be used, when the nuclei are formed as described above, the hive over which the first brood was placed can be set in its former position, and it will be seen that a batch of cells has been built, and a number of nuclei formed without stopping a queen from laying or removing her from her hive.—Bee-Keepers' Review. Warren Co., N. C., June 22.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. O. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Why the Brood Was Present.

We had a small colony of bees in a soap-box and wanted to transfer them. July 11 and July 14 they swarmed; 21 days after the first swarm issued we transferred them, but on opening the soap-box we found about a dozen small queen-cells, and also brood from the eggs to be sealed. What is the reason of all the brood being in the hive at the time?

"FRED."

ANSWER.—Twenty-one days after a prime swarm issues, there will be found no worker-brood present, as a rule. But it is quite possible that the swarm which issued July 11 was not a prime swarm. One thing that looks like it is that a swarm issued only three days later, and generally a second swarm is at least a week after the prime swarm. It is quite possible that a prime swarm issued about July 3, and the two swarms you report both had young queens. In any case, there was probably left in the hive a young queen of about the same age as the one that left July 14, and if she began laying any time before July 24, there would be eggs to sealed brood present Aug. 1, or 21 days after the first swarm you report. The small "queen-cells" present were probably the remains of cells in which the young queens had been reared, which cells are not entirely removed at once, if indeed ever.

Pickled Brood—Ventilating a Bee-Cellar—Wintering, Etc.

1. Will you please give me some information on a disease called pickled brood? I have several colonies that have the disease. I treated one colony as follows:

I shook the bees off of their frames into a hive containing frames with starters, and melted up their former combs into wax. I have several colonies that have only a very few cells affected with the disease. Is there any way to cure the disease without destroying their combs? A colony that has the disease seems to do nothing—only just live—that is, if it is affected very badly. In strong colonies it seems to disappear by spells, and then reappear again.

I noticed the disease first in the spring. I thought perhaps it was neglected brood, or chilled brood, as we had a cold, backward, rainy spring. But clover bloom was good and bees did well. Basswood bloom was good, and buckwheat now is first-class.

Perhaps, Doctor, you have not had any experience with the disease called "pickled brood." I will explain how it works in my apiary: The larvæ die in the cell usually after they are full grown. Then they gradually shrivel up and dry down in the cell, and the bees clean them out.

2. I am thinking of putting in some ventilating-tubes to my bee-cellar. Would you ventilate from the top or bottom of the cellar? My reason is this: The combs mold some on the lower side. I thought perhaps I could ventilate so as to take out the dampness.

3. Do you think that, as a rule, a queen ought to lay the eggs for a colony over two seasons? Or is it best to let the bees attend to their own business about queens and replacing them?

4. How would it do to clean the bees all out of honey as soon as the buckwheat flow is over, and feed them up for

winter on granulated sugar—say 25 pounds of sugar to each and water according to rule—and do the feeding about Sept. 1, for inside wintering?

5. How is buckwheat honey for inside wintering of bees? White honey granulates in the comb quicker than buckwheat.

6. There is a bee-keeper a short distance from me that says it is foolish to have bees go into winter quarters with so many bees in a hive. He says he wants only 2,000 bees and a queen in the hive when winter comes, as they consume less honey. I dumped five colonies into one hive and saved the best queen last fall, and they did not consume any more honey than the rest of my other colonies, and they did the business this season, you may be sure. What do you think about a few bees in a hive, and the queen, to go into winter quarters?

NEW YORK.

ANSWERS.—1. The only knowledge I have of pickled brood is what I have read. On page 419 of the American Bee Journal for 1897, E. S. Lovesy says he has treated the disease by sprinkling a good handful of salt on the bees.—[See page 530.—EDITOR].

2. Probably it doesn't make any great difference whether the ventilator works from the top or bottom of the cellar, only so the air of the cellar is changed. If convenient, let the ventilating-tube start from the bottom of the cellar. It should go into a chimney or be in some way arranged that there will be a draft. In perhaps all cases there is enough inlet for fresh air through the cracks and crevices of the wall without making any special provision for entrance of air, if only there is draft enough to take it out. The worst time to get up ventilation is on warm days and nights in spring, when the temperature of the cellar is the same as that of the outer air. At such times the only thing—or perhaps the best thing—is to open doors and windows wide at night, closing them up next day as soon as the bees show signs of flying out.

3. Opinions are divided. If you kill all your queens when two years old, replacing them with queens equally good, your bees will probably do well. And perhaps they will do just as well if you leave the matter in their own hands. The latter plan is certainly the least trouble.

4 and 5. Buckwheat honey is very good for wintering and so is granulated sugar, and it's doubtful if you would get any pay for your labor if you empty out the buckwheat and feed sugar.

6. Some years ago there was something of a sensation made by a Mr. Hosmer about killing off all but a small number of bees in a colony, but the matter died out, and little has been said about it lately. I think the theory was that the older bees died before spring any way, and there was no use putting them into winter quarters. You can easily try the experiment. About the first of September on a warm day move a colony to an entirely new location. The old bees that fly out will not return to the hive, and thus you will have only the younger bees. It's a good plan to unite several weak colonies, in the fall, but you may overdo it, for no matter how strong the resulting colony, when the harvest comes you will have only the progeny of the one queen. If you unite three weak ones, making one strong one, that one strong one may do more than the three weak ones would have done. If, however, you unite six, making twice as strong a colony in the fall, you will have no stronger colony for the next harvest than you would from uniting the three.

Bees Playing—Comb or Extracted.

1. My bees come out and fly around in front of the hive, go back in and make lots of noise as if something was wrong. Oftentimes when one colony quits another one begins. What is the cause?

2. Which is the most profitable, super for comb honey? or two and three-story hives for extracted honey?

3. Which will the bees work in the best, two-story frame hives or pound boxes? My wife wants pound boxes, and I want two-story hives.

IDAHO.

ANSWERS.—1. If the weather is fair enough, you will probably find that each colony has a daily play-spell, when the young bees that fly for the first time and the house-keeping bees take a fly for exercise. They will be flying very busily at one hive, the bees flying much of the time with their heads toward the hive, taking little circles close to the hive and gradually getting farther away; then after a time they will quiet down and other colonies will be at it.

2. For some places and for some bee-keepers comb honey is best. For others extracted. If that were not so, you would hardly find one man working entirely for comb honey and another for extracted, as is the case at present.

3. It is easier to get bees to work in extracting supers than

in sections or pound boxes. It is generally believed that you can get considerably more extracted honey than comb, but comb generally brings a better price. It is considered a matter that requires more skill and experience to get comb than extracted. If you are not certain which is best for you, it may not be a bad plan for you to try both. Indeed, some of the best bee-keepers think it's a good plan to combine and work for both. Moreover, it is not to be wondered at that a good house-keeper should want some nice section-honey to grace her table, considering the difference in looks between that and extracted.

Unfavorable Experience with the Bee-Escape.

I got a Porter bee-escape and fixt the escape-board according to directions. Somehow the bees uncapped the honey before they pass through the escape. As I tried the escape-board on two hives, with the same result, I put it under a super in the evening, and took the super off the next morning. The bees were all out of the super, but the capping was gnawed off. Please let me know what's the reason, and if such honey is fit for sale.

ILLINOIS.

ANSWER.—It is possible that your bees have a large proportion of black blood in them, for when black bees are frightened they seem to attack the first spot they come to on the combs to fill themselves with honey, tearing holes in many places of the capping, while the Italians are more deliberate, and hunt around for unsealed cells from which to load up. Even with black bees there ought to be no uncapping unless the bees get too much frightened. The remedy, of course, is to put on the escape without exciting the bees, and, as soon as you can, get Italian blood.

It is not often that bees, on leaving the super, gnaw holes enough in the capping to materially hurt the sale. Of course it is mainly a matter of looks, and the more nearly perfect a section is the better it will sell.

Bees Affected with Some Disease.

I bought 10 colonies last spring in a good, healthy condition, apparently, as they were handled by an experienced bee-man last season, and I got a man of some experience to take them and care for them. They did splendidly during the forepart of the season, putting out some good, strong swarms. After they had ceased to work on basswood, he took two frames of old comb out, and put in two frames of foundation, thinking to get them all on foundation. He then placed the combs in the top of the hive, to feed back to them, and he thought they had begun robbing, and thought he had traced it to one swarm; so he closed the entrance to the hive with wire screen (a chaff hive) during the day, and at night they had all smothered, and the combs all melted down. We moved the hive some distance away, and let the bees have free access to it. Now he thinks two colonies have foul brood, as there seems to be dead brood in the combs.

What is it? and what was likely the cause? Also, how should we treat it? Could they have contracted any disease from the dead brood of the smothered colony? Or, if it is foul brood, could they contract the disease from bees in the vicinity?

MICHIGAN.

ANSWER.—Foul brood is such a terrible disease, and the risk of danger from it so great that it will well pay every bee-keeper to be thoroughly informed upon it. Get Dr. Howard's book and fully post up. The expense is trifling, and may save much. What can be given in the small space here allowed must be very unsatisfactory compared with the information given in a book wholly devoted to it. Foul brood might easily be contracted from affected colonies in the neighborhood, indeed, just as far distant as bees would fly to rob. It is hardly likely the bees contracted any disease from robbing, unless it was foul brood. [We mail Dr. Howard's booklet on foul brood for 25 cents.—EDITOR.]

Bees Have Foul Brood.

I have about 20 colonies of bees, and almost all, if not all, have foul brood. I have had bees 21 years, and never saw any foul brood before. What would you recommend for a cure?

WINDSOR.

ANSWER.—You probably can do no better than to use the McEvoy treatment as recommended and described in Dr. Howard's book on foul brood. If you have not the book, by all means get it at once. In a matter of so much consequence it pays to be as fully informed as possible.

Modern Queen-Rearing.

BY W. Z. HUTCHINSON.

Queen-rearing has kept pace with the other strides made in the apicultural line; and it is doubtful if any queen-breeder uses any more advanced methods than those employed by Mr. W. H. Pridgen, of North Carolina. He also furnishes the originals from which the accompanying engraving was made. The process of dipping the cell-cups is described on page 532.

After the cups are attached to a stick, as shown in the illustration, they are supplied with just-hatched larvæ, using the small, concave end of the forming-stick, whereby the larva can be picked up, cocoon and all, and deftly transferred to the bottom of the cell-cup. This is "taking up the baby without waking it up," as somebody called it.

After the cells are supplied with larvæ, the stick is fitted into a frame from the lower half of which the comb has been cut away, and given to a queenless colony. How these cells appear after the bees are through with them is well shown in the engraving. Isn't this away ahead of the old way, where the bees went at it to suit themselves [as shown on page 533], where it is almost impossible to save all of the cells?

Before the cells are ready to hatch they are placed in the nursery. This is done without so much as detaching them from the stick. They are all an even distance apart, and this distance just equals the distance between the tin divisions in the nursery, so that the cells can be lowered all at once into the nursery, and each cell has a little apartment all by itself. If a queen hatches it can do no damage, and it can find food in the shape of soft candy placed in a depression or cavity in the top of the wooden plug that closes the lower part of each little cage. The queens are safe and well cared for here until needed to put in nuclei.

It would seem that so far as securing virgin queens is concerned, we had pretty nearly reached perfection. The great cost, however, of rearing queens, is in getting them fertilized and laying—the nuclei and bees cost much more than the queens.

When this part of the business is cheapened and simplified to the same extent as has been done with that of cell-building and queen-hatching, queens may be sold for a "quarter"—I guess. Some attempts have been made in this direction by having small frames, section honey-boxes, for instance, for nuclei, and massing them on top of a colony of bees so that they may derive warmth from the colony; but such methods have never come into general use. It is clear to me that there would be some disadvantages.—Editorial in Bee-Keepers' Review.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

Place and Date of Next Meeting:

Omaha, Nebr., Sept. 13, 14 and 15, at the Delone Hotel, Cor. 14th Street and Capitol Avenue.

VOL. 38. AUGUST 25, 1898. NO. 34.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

"Feeling is something that magnifies the sting of a bee about five thousand times." So says a daily newspaper. That editor probably has "been there."

Small Crop and Higher Price.—Judging from the many reports as to the crop of honey this year, it must be quite small. As Mr. P. H. Elwood, of New York State, says in the following letter, the price of honey should be considerably higher in consequence of its scarcity:

"The crop of white honey here is small. A communication from your largest firms in Chicago states that the price will be materially higher, owing to the general short crop, and to the fact that prices recently have not been proportionate to the cost of production. This last is true, indeed, and should be emphasized by every bee-paper and honey-producer in the United States.

P. H. ELWOOD.

Fences and Plain Sections are very strongly endorsed by Messrs. O. P. Hyde & Son, of Texas, in Gleanings for July 15. Here is what they say about them, after giving them a good test, having used the plain-tall sections in the experiment:

MR. EDITOR:—We beg leave to report on those plain sections and fence separators. This spring we bought 35 supers of the Ideal kind, with plain sections and fence separators. They were bought as a trial, and put to a test, and we are pleased to say they have stood the test very satisfactorily. We ran several colonies with them at one of our apiaries. The colonies were good average ones, as near like the other colonies at the apiary as possible. The bees went to work in the

plain sections sooner than in the old style; and, would you believe it, up to the present time these colonies with the plain sections have produced twice as much as those with the old style. This is not guesswork, but facts, as careful records were kept, and we are ready to verify what we say. The only reason we can assign is that the plain sections and fence separators gave more perfect communication.

As to the character of the honey, we will say we did not have a single bulged or washboarded section. The honey came to about 1/12 inch of the wood; and, coming so close, it made a pretty section of honey. It was advanced in the spring—that owing to the fact that the honey would come so close to the edge of the wood that it would be easier to get broken or bruised in handling than the old style. We thought the same; but after handling them filled with honey we must say that they are less apt to get broken in handling than the old style.

O. P. HYDE & SON.

Minnesota Fair Apiarian Premiums.—Mr.

J. P. West, the superintendent of the apiarian department of the Minnesota State Fair, desires us to call the attention of the bee-keepers in that State to the very liberal premiums offered, as shown by the following list:

| | 1st. | 2d. | 3d. | 4th. |
|---|------|------|-----|------|
| Most attractive display and best quality of white clover comb honey..... | \$12 | \$10 | \$5 | \$3 |
| Most attractive display and best quality of basswood or linden comb honey..... | 12 | 10 | 5 | 3 |
| Most attractive display and best quality of extracted white clover honey..... | 12 | 10 | 5 | 3 |
| Most attractive display and best quality of extracted basswood or linden honey..... | 12 | 10 | 5 | 3 |
| Most attractive display and best quality of fall comb honey..... | 12 | 10 | 5 | 3 |
| Most attractive and finest display of comb honey.... | 10 | 6 | 4 | 3 |

GRAND SWEEPSTAKES.

Largest, best, and most attractive exhibition in this department, all things considered..... 15 8 5 3

The 39th annual Fair and Exposition of the Minnesota State Agricultural Society will open Sept. 5 and close Sept. 10. The bee-keepers have a meeting on the Grounds, commencing Wednesday morning. It is earnestly hoped that all who can do so will make a special effort to be present.

For any further information, address J. P. West, Hastings, Minn.

Rules for Awarding Apiarian Premiums.

—Mr. S. H. Herrick, of Winnebago Co., Ill., having been appointed judge of the apiarian exhibits at their county fair, requests the re-publication of the rules for awarding apiarian premiums adopted by the Illinois State Bee-Keepers' Association, and which have been in successful operation at the State fairs of Illinois held at Springfield in 1896 and 1897.

For Mr. Herrick's benefit, as well as others of our readers who may be selected as judges at the fairs this fall, we give the Illinois rules referred to above, as follows:

RULE I.—Each entry shall be scored upon its merits in each and every respect in which it can be scored, according to the formulas given below.

RULE II.—The entry which is best in any respect shall be taken as the standard and be scored the highest number of points allowed in that respect, and all other entries competing for the same premium shall be marked in proportion to their merits when compared with the standard.

RULE III.—Entries ranking equally in any respect shall be scored equally in that respect.

RULE IV.—The entries scoring the highest aggregated

prune trees, 250 apple trees, 70 pear, 70 cherry, etc. Mrs. Dunn has 15 colonies of bees there, and she tells us that their "honey from white clover is most delicious." We haven't a doubt about it. Mr. Thos. Topping is the experienced English gardener and bee-keeper who has the care of Mrs. Dunn's extensive interests near far-away Tacoma.

MR. W. H. PRIDGEN, of Warren Co., N. C., has been called "A Queenly Deceiver." This will be no surprise to any who see the kind of queens he sends out. We have a sample before us, and she is a beauty in appearance—a rich, golden yellow. And the bees accompanying her are just as sunny looking.

MR. M. P. FICHTENMAYER, of Bristol Co., Mass., who has sent us several new subscribers, wrote us Aug. 13:

"I don't recommend the American Bee Journal in order to get the premiums you offer, but for what it is worth to any bee-keeper, which is more than just the dollar it costs for a whole year. It saved me more than that besides other information I have out of it."

ONTARIO AGRICULTURAL COLLEGE.—The following is the report of the Department of Apiculture, kindly sent us by a subscriber in Toronto:

"THE APIARY.—The season has been a good one for honey, bees swarming early, and in some neighborhoods excessively. The supply of nectar was profuse, especially from clover, but basswood yielded little, and latterly there has been a scarcity by reason of the dry weather. The average yield will be nearly 50 pounds per colony, and there has been a good increase in colonies."

PAGE FENCE AGE is the name of a monthly 4-page paper issued by the Page Woven Wire Fence Co., of Adrian, Mich. It is sent free to any farmer asking its publishers to place his name on their mailing list. The Page fence has been advertised in the Bee Journal regularly now for about two years. We presume many of our readers have that fence on their farms or places of residence.

By the way, should you ever write to the Page Woven Wire Fence Co., please tell them you saw their name in the American Bee Journal.

JOINT MEETING—WIS., IOWA, MINN.—Mr. Harry Lathrop, of Browntown, Wis., sent us the following, Aug. 13:

FRIEND YORK:—At the last convention of the South-western Wisconsin Bee-Keepers' Association a committee was appointed to arrange for the next annual meeting, and it was suggested that we arrange to hold a joint meeting of our association and those nearest to us in Iowa and Minnesota. North McGregor, Iowa, was mentioned as a good place for holding the meeting. As I do not know the names and addresses of the officers of those Associations—in Iowa and Minnesota—I would like to have them write to me.

Our people think it would be real nice to hold such a joint meeting, and we would like to know what the others think about it. If you will kindly publish this letter in the Bee Journal it may aid us in getting together.

Yours truly,

HARRY LATHROP.

Bees Carrying a Queen.—G. Gross reports in Gleanings that he found a swarm on the ground with a clipped queen. As the nearest bees were 200 yards distant, he thinks the bees must have carried her there. The wary editor doesn't commit himself as to his opinion in a foot-note, but it is probable that he is responsible for the heading, which reads, "Do bees carry the queen when swarming?"

The Market Problem.—Under this title a discussion has been started in the American Bee-Keeper that bids fair to occupy considerable space. Messrs. Jolley and Doolittle are disputants-in-chief, and wheat, leather trust, speculator Leiter, unearned charges, and other things are thrown into the discussion with a lavishness bewildering to a common bee-keeper.

Evidently the editor has some fear that some of the every-day bee-keepers may not understand all the talk, and may object to taking up room with it, for he commences a foot-note by saying, "So far from introducing a foreign subject, we regard this discussion as dealing directly with fundamental principles," and he promises if the brethren express their minds freely on the subject he'll put in some extra pages for practical bee-talk while the discussion is on.

Clipping Queens.—With a pair of very small scissors Mr. Alkin follows the queen as she walks on the comb, and when he gets one of the blades under the wing he snips. Doolittle catches the queen by the wings, holds her an inch or so above the frames, and with the small blade of a pocket-knife, made very sharp, cuts off the wing, letting her drop on the frames.—Progressive Bee-Keeper.

Bee-Spaces of Italians and Blacks.—Some difference of opinion has developed in Gleanings as to the space bees will leave between two opposing surfaces of sealed honey, or between the comb and an adjoining surface of wood. The editor says $\frac{1}{4}$ and J. E. Crane says $\frac{3}{16}$. It transpires that the difference of opinion may be caused by the difference in bees, Italians having the larger space, and blacks $\frac{3}{16}$.

Prevention of Increase.—Here's C. Theilmann's plan as given in the American Bee-Keeper: Let the bees swarm naturally; when a swarm issues, cage the queen, lay her at the entrance, and let the swarm return. The queen may be left at the entrance a week or more. Usually a young queen will have hatch by the seventh day, but whether she has or not, all queen-cells are cut out and some of the ripest laid at the entrance, for the bees to care for, and the first one hatcht will reign, the others being killed. The old queens are killed if not needed elsewhere.

Introducing Valuable Queens.—G. M. Doolittle says, in the American Bee-Keeper, that he doesn't lose one queen in 50 by following the instructions for introduction that are sent out by queen-breeders when they mail queens, but that one in 50 may happen to be one of most value, so when he has a valuable queen to introduce he takes another plan, a plan he has now followed for more than 15 years without a single failure. With wirecloth he makes a cage that will hold a brood-comb, at each end the cage having a piece of wood 2 inches wide, $\frac{3}{16}$ inch thick, and $\frac{1}{8}$ inch longer than the depth of the frame. A cover is made so that when a brood-comb is fastened in it no bee can get in. Into this cage is put a frame of hatching brood with no usealed brood, the queen and her escort are put in, and the frame thus caged is put in the middle of any colony strong enough to keep it warm, the caged frame taking the place of two frames. In five or six days, when the cage has plenty of young bees, the frame is put into an empty hive in a new place with a frame of honey, as a nucleus. Frames of hatching brood may be given to hurry matters.

Large vs. Small Entrances.—The editor of Gleanings has been fomenting a quarrel between G. M. Doolittle and Dr. Miller as to the size of entrances, Dr. Miller maintaining that a colony in a hive raised half an inch or more on four blocks is less likely to swarm because cooler. Dr. Miller had his inning in the number for June 1, and no reply came till August 1. But Mr. Doolittle was not keeping still for nothing, and now comes with testimony gathered direct from the bees, and plainly says he expects to drive the Doctor from the "arena," and then annihilate the arena itself. He had 10 colonies with usual entrances and 10 others of equal strength with the entrance enlarged after the Pettit plan, measuring $15 \times 1\frac{1}{2}$. Three of the colonies with large entrances swarmed before any with the common entrance did.

He says that not only does the large entrance all around do no good, but it does harm, for the bees can easily keep the hive cool with a $15 \times \frac{1}{2}$ entrance. With the large entrance all around, aggregating 60 square inches, the fanners have no power to send the heated air circulating all about the combs and hives, while they do have such power with the $\frac{1}{4}$ -inch entrance. "And why the bees come out of the hive on hot days is so that they will not be so much in the way of the circulation of the air caused by the fanners, and not because it is cooler outside, for in reality it is cooler inside."

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it. See premium offers on page 539.

FOR THE READERS OF THE AMERICAN BEE JOURNAL.

**PROFITABLE BEE-KEEPING,
—WITH—
HINTS TO BEGINNERS.....**

By Mr. C. N. White, of England,

Author of "Bees and Bee-Keeping," "Pleasurable Bee-Keeping," etc.

Mr. White is owner of one of the largest apiaries in the country where he lives, and has made a life study of the subject. He is also lecturer, under the Technical Education Scheme, to several County Councils in England. He will treat the subject in a

Series of Nine Illustrated Articles :

- | | | |
|------------------------------|----------------|--------------|
| 1. General and Introductory. | 4. Swarming. | 7. Supering. |
| 2. Bees. | 5. Hives. | 8. Diseases. |
| 3. Handling Bees. | 6. Foundation. | 9. Wintering |

This is a series of practical articles that bee-keepers of the United States will not want to miss reading. They will appear only in the AMERICAN BEE JOURNAL.

We want our present readers to begin at once to get their neighbor bee-keepers to subscribe for the Bee Journal for the last six months of 1898, and thus read the articles by Mr. White. In order that all may be able to take advantage of this rare opportunity to learn from a successful and practical English authority on bee-keeping, we will send the American Bee Journal for

**The balance of 1898 for only 40 cents--
To a NEW Subscriber--thus making it**

SIX MONTHS FOR ONLY FORTY CENTS--

Which can be sent in stamps or silver. If you are a subscriber already, show the offer to your bee-keeping neighbors, or get their subscriptions, and we will give you, for your trouble, your choice of ONE of the following list, for each NEW 40-cent subscriber you send :

For Sending ONE New 40-cent Subscriber :

- | | |
|---|---|
| 1 Wood Binder for a Year's Bee Journals | 10 Foul Brood—by Dr. Howard |
| 2 Queen-Clipping Device | 11 Silo and Silage—by Prof. Cook |
| 3 Handbook of Health—Dr. Foote | 12 Foul Brood Treatment—by Prof. Cheshire |
| 4 Poultry for Market—Fan. Field | 13 Foul Brood—by A. R. Kohnke |
| 5 Turkeys for Market—Fan. Field | 14 Muth's Practical Hints to Bee-Keepers |
| 6 Our Poultry Doctor—Fan. Field | 15 15 "Honey as Food" Pamphlets |
| 7 Capons and Caponizing—Fleid | 16 Rural Life |
| 8 Kendall's Horse-Book | |
| 9 Mullen's Horse-Book | |

For Sending TWO New 40-cent Subscribers :

- | | |
|---|---|
| 1 Potato Culture—by T. B. Terry | 7 Hutchinson's "Advanced Bee-Culture" |
| 2 Green's Four Books | 8 Dr. Brown's "Bee-Keeping for Beginners" |
| 3 Ropp's Commercial Calculator | 9 Blenc-Kultur—German |
| 4 Dr. Tinker's Bee-Keeping for Profit | 10 Bees and Honey—160 pages—by Newmao |
| 5 40 "Honey as Food" Pamphlets | 11 People's Atlas of the World |
| 6 Winter Problem in Bee-Keeping—by Pierce | |

All New Subscriptions Begin July 1.

Please remember that all the above premiums are offered **only** to those who are now subscribers, and who will send in new ones. A new subscriber at 40 cents cannot also claim a premium.

Now, let every one go to work, and help roll up the largest list of subscribers the old American Bee Journal ever had. It can easily be done if ALL who possibly can get a few new subscribers will kindly do so.

Harvested a Fair Crop.

I have had a very busy summer with my bees. They have harvested a fair crop of white honey, but unless we have rain soon, there will be no fall honey here. I have some very fine white honey but it is selling slowly.

I am much interested in the new Union, and will send Mr. Secor my dollar for membership fee as soon as honey gets to selling a little faster.

I will give the report of my honey harvest later. The Bee Journal comes promptly every Thursday, and is ever welcome. **MRS. PAUL BARRETTE.**
Crawford Co., Wis., Aug. 11.

Not a Bad Report.

My bees have retrieved themselves somewhat this year. I have taken off 109 pounds from three colonies so far, which is not bad, considering the number of bees in this locality.

L. T. CHURCHILL.
Cheboygan Co., Mich., Aug. 11.

Very Light Crop.

I am located in a good honey-producing locality, and generally the bees find plenty of forage, but this year I will have to mingle my voice with the complaining, for the honey-crop has been

small so far. During the basswood season the flow of honey was good, but since then the bees have not stored as much as they have consumed.

From 175 colonies I have taken some 1,500 pounds this season, and it is all nice honey, but many of the colonies are light, and will need much more honey to winter on. They swarmed freely this season, sending out big swarms which gained in weight rapidly, but everything has come to a standstill all at once. We have had plenty of rain and there seems to be a great many wild flowers in blossom.

B. M. BULLARD.

Clark Co., Wis., Aug. 11.

Has Been a Poor Season.

The season has been a poor one thus far, but if the weather and rains continue during the summer the next season will be a good one, as white clover is coming up everywhere.

LEWINER BROS.

Putnam Co., Ohio, Aug. 11.

Extremely Poor Season.

The season for honey has been extremely poor in this locality. I was obliged to feed the bees just at the time that white clover ought to have been doing its best.

H. G. QUIRIN.

Huron Co., Ohio, Aug. 12.

Honey Like Lubricating Oil.

I have taken off a small quantity of honey—a mixture of white clover, basswood and honey-dew—looking more like oil that has been used for lubricating iron shafting than anything else I can think of; and of course totally unsalable. Very poor season this, yet I feel satisfied, for I'm paid as the days pass.

I look with interest for the arrival of the American Bee Journal each week and usually finish reading it at a sitting. I am anxious to know, you know, what the "old bee-cranks" have to say, even if I don't believe it all.

WM. M. WHITNEY.

Kankakee, Ill., Aug. 12.

About Drowned Out.

Bad weather. All rain—three inches the last 24 hours. We were about drowned out before then.

HENRY ALLEY.

Essex Co., Mass., Aug. 12.

A Light Honey Crop

The honey crop in this locality is light and quality not very good—no distinctly white clover or basswood, but a mixture of almost everything. S. H. HERRICK.

Winnebago Co., Ill., Aug. 12.

Bees Doing Well, Etc.

My bees are doing well this year. I have taken 60 pounds of surplus honey to the hive, up to date. Our honey crop doesn't come in till July. We get our most and best honey, alfalfa, as sweet clover has but just got started in this part of the country. We also have the American bee-weed here, but the bees do not work on that much this year.

There are quite a number of bee-keepers here, but they do not want to take any bee-paper. They expect to make a success in the business by the experience and knowledge of their neighbors, and if one doesn't come up to

Sweet Clover

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

the excursion to Boston over the Nickel Plate Road, Sept. 16 to 18, inclusive, at rate of \$19.00 for the round trip. Good returning until Sept. 30, 1898, inclusive. Tel. Main 3389. (61-32-6)

Minnesota.—The adjourned meeting of the Minnesota Bee-Keepers' Association will be held on Wednesday forenoon during State Fair week, at the place where the honey exhibit is made on the fair grounds. Make an effort to be there, and invite other bee-keepers who are not members to come and join the Association.
L. D. LEONARD, Sec.
Minneapolis, Minn.

California.—The next meeting of the Fresno County Bee-Keepers' Association is to be held in the City Hall, Fresno, Calif., Wednesday, Sept. 14, at 10 o'clock a. m. All honey-producers are requested to attend.
Caruthers, Calif. W. A. H. GILSTRAP, Sec.

Globe Bee Veil

By Mail for One Dollar.

Five cross-bars are riveted in the centre at the top. These bend down and button to studs on a neck-band. The bars are best light spring steel. The neck-band is hard spring brass. The netting is white with face-piece of black to see through.

It is easily put together and folds compactly in a case, 1x6x7 inches, the whole weighing but 5 ounces. It can be worn over an ordinary hat; fits any head; does not obstruct the vision, and can be worn in bed without discomfort. It is a boon to any one who: bites rather, mosquitos bite, or bees sting.

For sending us only **TWO NEW** subscribers to the Bee Journal for one year (at \$1.00 each) we will mail to a regular subscriber one of these Globe Bee-Veils; or, for \$1.75 we will send the Bee Journal one year and the Veil to any address.

GEORGE W. YORK & CO.,
CHICAGO, ILLS.

Tickets will be valid returning until Sept. 30, inclusive. On account of heavy travel at this particular time, those desiring sleeping-car accommodations should apply early to **J. Y. Calahan, General Agent, 111 Adams St., Chicago.** Telephone Main 3389. (58-32-6)

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co., Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can add to the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—in a beautifully printed in the blindest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dadant—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 320 pages; bound in cloth. Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 176 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers. \$1.40.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called **BEES OF HONEY**. 10. page pamphlet. Price, 40 cents.

Convention Hand-Book, for Bee-Keepers, Thomas G. Newman.—It contains the parliamentary law and rules of order, for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Why Eat Honey?—This Leaflet is intended for FREE distribution, to create a Local Market. 100 copies, by mail, 30 cts.; 500 for \$1.25; 1000, \$2.00.

How to Keep Honey and preserve its richness and flavor. Price same as Why Eat Honey.

Alfalfa Clover Leaflet—Full directions for growing. 50 for 25 cts.; 100 for 40 cts.; 200, 70c.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from **BEES AND HONEY**. Price, 10 cents.

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from **BEES AND HONEY**. Price, 10 cents.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

History of Bee-Associations, and Brief Report of the first 20 conventions. Price, 10 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 p. illustrated. 25c.

Commercial Calculator, by C. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2 in fine artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. P. Eggers. This book gives the latest, most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st. How We Made the Old Farm Pay; 2nd. Peach Culture; 3rd. How to Propagate Fruit-Plants, Vines and Trees; 4th. General Fruit Instructor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for casting up the price of grain, produce, hay, etc. Price, 25 cts.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Turkeys for Market and Turkeys for Profit, by Fanny Field.—All about Turkey-Raising. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters. 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published today. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Page & Lyon Mfg. Co. New London, Wisconsin,

Operates two sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of

Bee-Keepers' Supplies.

They have also one **One of the Largest Factories** and the latest and most-improved machinery for the manufacture of

Bee-Hives, Sections, Etc.,

that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the **clearest and whitest Basswood** is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equip't with best machinery, all combine to enable this firm to furnish the

Best Goods at the Lowest Prices.

Send for Circular and see the Prices on a Full Line of Supplies.

We want EVERY BEE-KEEPER

.....To have a copy of.....

Our 1898 Catalog

Send us your name and address and we will take pleasure in mailing you a copy.

G. B. LEWIS CO., WATERTOWN, WIS.

Special Agent for the Southwest—

E. T. ABBOTT, St. Joseph, Mo.

Mr. Abbott sells our Hives and Sections at factory prices.

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful straw-colored transparent Foundation, Improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, **Leahy Manufacturing Company, Higginsville, Mo., or 1730 South 13th St., Omaha, Neb.**

Please mention Bee Journal when writing.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Aug. 18.—The new crop is now coming forward and meets with a fair demand. Best grade of white comb honey in 12 to 24 section cases, 12c; that which is faulty, 10 to 11c; ambers, 8 to 10c; dark, 7 to 8c. Extracted, 5 to 7c for white; 5 to 6c for amber; 4 to 5c for dark. Beeswax, 27c.

R. A. BURNETT & CO.

Kansas City, Aug. 11.—Fancy white comb, 13@14c; No. 1, 12@13c; amber, 10@12c. Extracted, white, 5½@6c; amber, 4½@5c. Beeswax, 23@25c.

The receipts of new honey are very ; demand fair. C. C. CLEMENS & CO.

New York, July 30.—There is some little new Southern comb honey on the market, mostly irregular quality and selling at from 9 to 11c. Extracted of all kinds is in good demand. Common grade Southern, 50 to 52c per gallon; good, 55 to 57c.; choice, 5 to 5½c. per pound; some exceptionally fine lots sell at 6c. Beeswax is very quiet at 26 to 27c.

HILDRETH BROS. & SEELKEN.

Boston, July 9.—Fancy white in cartons, 13c.; A No. 1 white in glass-front cases, 11 to 12c.; No. 1, 10 to 11c.; No. 2, 8 to 9c. Extracted, white, 6 to 7c; light amber, 5 to 6c. Beeswax, pure, in good demand with very light supply, 30c.

At the present time the demand for both comb and extracted honey is very light with but little stock on hand.

BLAKE, SCOTT & LEE.

San Francisco, Aug. 10.—White comb, 9 to 10c; amber, 7 to 8½c. Extracted white, 6@6½c.; light amber, 5½ to 6c. Beeswax, 23@25c.

Although stocks are very light, the quality of this year's crops is of a much higher average than was generally expected, considering the dry season. There is some of this year's product which is of exceptionally fine quality. Market is firm at quotations.

Detroit, July 21.—Fancy white, 11@12c; No. 1, white, 10@11c. Extracted white, 5@6c; dark, 4@5c. Beeswax, 25@26c.

New honey is arriving, but prices are hardly establish. M. H. HUNT.

Minneapolis, July 26.—Fancy white clover comb is now selling at 11@12c.; amber, 10½c. Extracted fancy white clover, 5½c.; amber, 4½@5c. Dark grades, both comb and extracted, not wanted at low prices.

S. H. HALL & CO.

Indianapolis, July 18.—Fancy white comb honey, 12@12½c; No. 1, 10@11c. Extracted, white, 6@7c. Beeswax, 25@27c.

Only a few arrivals of fancy white comb; market almost bare, and demand good. Quite a little comb honey from honey-dew is being offered, but there is simply no demand for the stuff.

WALTER S. POWDER.

Milwaukee, Aug. 18.—Fancy comb, 11 to 12c; A No. 1, 10 to 11c; No. 1, 9 to 10c; amber, 7 to 8c; old and dark, 5 to 6c. Extracted, white, in barrels or kegs, 5 to 6c; dark, 4 to 5c. Beeswax, 25 to 26c.

The market for honey is in very good condition; while there is yet a little of the old crop on hand, it is in very good order, and some demand, which will clear off everything before the new crop will arrive, very plentifully. There is already some receipts of new, but mostly extracted, and some very good quality, yet we fear the danger is in extracting too early, before the honey is fairly ripened. We anticipate a good demand a little later, and think values will remain about the same as present quotations. A. V. BISHOP & CO.

Buffalo, Aug. 12.—Fruit prevents a large demand for any kind of honey at present. A few cases of fancy one-pound new comb can be sold daily at 11@12c.; but any grade below must be urged at proportionately lower prices. Would advise writing us before shipping here. There is no demand yet for extracted. BATTERSON & CO.

St. Louis, July 9.—Fancy white comb, 10 to 11c.; No. 1, 10c.; amber, 9 to 10c.; dark, 8 to 9c. Extracted, white, 5½ to 6c.; amber, 5 to 5½c.; dark, 4 to 4½c. Beeswax, 20 to 22c. WESTCOTT COM. CO.

Cleveland, Aug. 3.—Fancy white, 13@14c; No. 1, white, 12@12½c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c.; light amber, 6c.

The demand for honey is exceptionally good, owing to the crop in this vicinity being very light. A. B. WILLIAMS & CO.

 **Talk about
... Comb Foundation**

WE can now furnish the very best that can be made from pure wax. Our New Process of MILLING enables us to surpass the previous efforts of ourselves and others in the manufacture of Comb Foundation.

CHICAGO, ILL., SEPTEMBER 1, 1898.

No. 35.

**Burlington
Route**

This Grand Route (Chicago, Burlington & Quincy) to Omaha and the great West, is almost too well known to need any explanation from us. But we wish our readers to know that it is the road that bee-keepers east of Omaha will be pleased to take when attending the annual convention of the United States Bee-Keepers' Union, Sept. 13, 14 and 15, at Omaha. The editor of the American Bee Journal, with all that can join

him, will leave Chicago over the C. B. & Q. at 5:50 o'clock p.m., Monday evening, Sept. 12, and arrive in Omaha at 8:10 o'clock the next morning—about two hours before the opening session of the convention. We wish that the bee-keepers from here might fill a special car. It can be arranged if all who will accompany us will notify us in advance. The round-trip rate on the C. B. & Q. will not be over \$14.75 from Chicago.

While Omaha already has been exceedingly well advertised, we may say that it is the metropolis of half a dozen States. The population tributary to it in Nebraska and the States which touch her borders, exceeds 9,000,000 all told. This is called the Trans-Mississippi area, and gives name to the exposition. Omaha has a

of every one. The mighty arch, suggestive of the 24 participating States, fronts the collection of massive buildings and forms a most imposing gateway. It is modeled upon the design of the great arches of Paris and Milan and crowned by a colossal shield, supported by two stalwart genii, with the nation's eagle perched aloft.

Within, the scene necessarily reminds one of the Court of Honor at the Chicago Exposition of 1893. An artificial canal or lagoon stretch for half a mile between two rows of majestic edifices. At its western end this canal widens out into a lake, the sides of which describe a perfect trefoil. This has been well named "The Mirror," and facing it, looking down along the lagoon, stands the great Government Building, capt by an heroic figure of Liberty Enlightening the World. From the Government Building, reaching along either side of the lagoon, and all connected, are the buildings devoted to Agriculture, Administration, Mines, Machinery, Arts and Liberal Arts and Manufactures. Across Sherman Avenue, and reached by a viaduct, are the individual buildings of the States, the Horticultural Building and the streets of foreign villages.

An interesting feature of the exposition is the American Indian Department, under the direction of the United States Indian Commission. Representatives of almost all the tribes in the country are camped on the broad piece of prairie apportioned them.

Agricultural Building at the Trans-Mississippi and International Exposition, at Omaha, Nebr.

population of 145,000, chiefly American born. It lies on a high plateau, overlooking the valley of the Missouri River, which at this point is over two miles wide. The view of the river valley from Omaha is most impressive. The city proper is on a gently undulating plane, which at the north end develops into a stretch of prairie as level as a kitchen floor. Here is the site of the Trans-Mississippi Exposition. It is approached by three wide sweeping avenues, with an extensive system of steam and trolley lines, quite adequate to any demand that is likely to be made for transportation. The scene which greets the visitor challenges the admiration

There they have pitched their tents, built their fires, and live their wild life for the benefit of the multitude.

Realizing that visitors come to the exposition for pleasure as well as instruction, the management have been very active in developing the amusement section. Attractions of all kinds have been gathered together, surpassing in some respects the famous "Midway" itself. Moorish, Irish, Tyrolean and Chinese villages have been established, and Old Vienna, Old English Country Fair, Hagenbeck's Animal Show, Wild West, etc., are some of the many features.

PROFITABLE BEE-KEEPING, —WITH— HINTS TO BEGINNERS, —BY— C. N. WHITE, OF ENGLAND.

Author of "Bees and Bee-Keeping," "Pleasurable Bee-Keeping," etc.

No. 9.—WINTERING.

Every spring reports from all parts of the country deal with extensive losses of colonies. The ordinary observer may be excused if he infer from such accounts that as losses usually occur early in the spring wintering is a subject of difficulty, and a great stumbling-block to the great majority of bee-keepers. As a matter of fact, the losses are, I venture to assert, due in nine cases out of ten to absolute carelessness or neglect, the oftentimes the result of ignorance as to the bees' requirements in the shape of food. It is not so much that bees require in the winter proper, as the consumption of food then by a strong and well protected colony is comparatively small; but it is rather when breeding has commenced in earnest that stores rapidly diminish; and this is in March and April, just before new honey is brought into the hive in quantity sufficient to supply the daily wants of the bees and the ever-increasing number of hungry grubs.

To winter bees successfully is not a difficult matter in the British Isles, but it is one of the most important problems that the bee-keeper has to face, and if he can solve it, as he may and should without difficulty or expense in time or money, he will have got one step, and a big one, too, nearer that success in bee-keeping we hear much about but seldom realize in our own apiaries.

A colony properly wintered should come out in the spring stronger in bees than it was when closed up early in October the previous autumn, instead of being, as colonies too often are, weakly and thin in numbers throughout the spring. Sealed stores should also remain in such quantity as will ensure the colony having a sufficient supply to carry it well on to the time when the new honey comes in abundantly. The requirements of success are: (1), a good, substantially-made and weather-proof hive; (2), a good colony of bees, by which must be understood that there are several seams of bees between the combs instead of two or three, and that the bulk of them are bees that have done little work, being in fact such as have been brought into existence by the system of feeding resorted to from the close of the honey-flow. Some lots are permissible sometimes, but only when young queens are being preserved to take the place of any that for any reason have died during the winter. If these small lots are confined to about three frames, and are well packed, they may in case the queens are not required for other colonies, be built up into really good colonies in time to take advantage of a late honey-flow; (3), combs well stored with honey or syrup, and sealed; (4), winter passages and abundance of covering to the frames.

If colonies are carefully tended from the close of the honey-flow to Oct. 1, and the above conditions observed, strong, vigorous colonies may be assured the following season.

THE HIVE.

Dealing with each point in order, we must first consider the hive. It is a fact that a single-walled hive costs less than one with double-walls, but it certainly is not more economical. By using hives with double walls all around we shall find the colony better protected both from winter cold and summer heat than would be possible with single-walled hives. We can regulate the temperature in summer by ventilation, but without double walls we cannot give that protection in winter which is of the first importance when we deal with the consumption of stores. The novice or beginner in bee keeping should therefore score one point in successful wintering by starting with double-walled hives. The wood should be pine

or red deal well seasoned and thoroughly painted. In winter color is of little importance, but in summer a reflection, not absorption, of heat is required. Mr. A. I. Root, the noted American bee-keeper, said some years ago that he had stopt the melting and falling of combs, and in some cases the consequent loss of bees, by painting all his hives white. I strongly advise white, or a light stone-color paint for the hives.

THE BEES.

As at the beginning of the honey-flow a large quantity of worker-bees is necessary if full supers are to be obtained, so at the commencement of winter we must make a point of getting and then keeping all colonies strong.

If there are weak lots unite two or more together after removing the least valuable queen. To unite, shake both or all lots on a cloth and let them run together into an empty skep, where they had better remain until evening. Then shake them in front of a hive that has been properly prepared for wintering. The bees of two lots may be united peaceably by sprinkling them thinly with flour from a dredger and then placing the frames with adhering bees alternately in a fresh hive. The stronger the colony in bees the less is the honey consumed. This appears strange, but it is quite true; a small lot of bees in a hive containing several combs are restless, with the consequence that they consume honey to raise the temperature lowered by the cool air surrounding them.

The food supply may be ample owing to a particularly favorable season after the supers have been removed, but even if feeding has to be resorted to very little time will be needed to perform this part of the work. In order to obtain young bees for wintering a supply of Puerto Rico sugar, given at the close of the honey-flow, will probably be all that is necessary to continue breeding up to the middle of September, when whatever further supply is needed to make the colony safe for the winter can be given in the form of syrup in one or two doses. No colony should be considered safe unless it has stored in the combs at least 20 pounds of honey or syrup and sealed most of it over. The arrangement of this food is a matter of some importance, for if the bees are crowded upon a few frames and fed liberally they will fill every available cell with syrup, and then they will be compelled to cluster during the winter upon sealed combs instead of upon empty cells, as is more natural, and having stores above and around. With the movable-comb hive the arrangement of the combs for wintering is, in the hands of a good bee-keeper, a simple matter; but if feeding is continued up to the middle of September, and the proper amount of food is then given, the bees will arrange it around the brood, which gradually diminishes by the bees hatching, conveniently for their comfort and convenience. If the combs are arranged by the bee-keeper, the center ones should have sealed stores about half-way down, the amount of stores increasing to the outside of the brood-nest.

WINTER PASSAGES.

Bees often starve in the midst of plenty. They winter in lots called "seams" between the combs, and may be seen pack like slates upon a house-roof, the top row removing the food from the cells above them to feed themselves, and by passing it down, those below. While the weather remains mild the bees are able to move about from comb to comb in search of food, or with the object of bringing to the center combs food stored in the outer frames; but this activity ceases as soon as really cold weather sets in and they then pack themselves close together for mutual warmth. Then, as the food around them is consumed, they die simply on account of the cold air by which they are surrounded; they cannot pass around or under the frames to a probable abundant supply close by. Tho they are prevented going around or under the frames a provision may be made for allowing them to pass over the top-bar in the warmest part of the hive. This is done by giving what are known as "winter passages." The old method, now almost discarded, was to cut a hole through the comb in each frame near the top-bar. A more effective passage could hardly be devised, but apart from spoiling the combs it is a tiresome and troublesome operation, and is therefore not recommended. A simple plan is to lay across the top-bars four pieces of wood half inch square and about six inches long, half inch apart. If the quilts are then laid evenly across, effective passages for the bees will be provided. Then again a cake of candy laid upon the frames when closing up the hives in October will be equally satisfactory, for passages will be formed as the candy is consumed over the bars.

QUILTS.

Quilts are the coverings which the bee keeper places upon the frames in order that the heat generated in the brood-chamber may be there confined. The less bees are disturbed the better are they likely to succeed, but at no time is it more

necessary to protect them from disturbing influences than during winter. This matter may be tested by placing under observation two colonies as nearly equal as possible on Oct. 1. No. 1 being in a single-walled hive, and the frames covered with a single thickness of calico or ticking; while No. 2 is placed in a double-walled hive and covered with an abundance of woollen wraps or chaff cushions, in addition to the first quilt of calico or ticking. Presuming both colonies to be alive on Feb. 1, the following year, a great difference in their condition will then be perceptible. No. 1, which has been scantily protected from low winter temperature, will show stores greatly diminished, which, if the bees are owned by a careless bee-keeper, might cause the loss of the colony altogether later on when breeding is in progress. No. 2, on the contrary, owing to the protection of the brood-nest, would be little disturbed by weather, and consequently the bulk of the food stored the previous autumn would remain for use in brood-rearing. Under ordinary circumstances the bees of a colony in a normal condition are said by an eminent authority to consume only about $1\frac{1}{4}$ ounces of food per day during their period of inactivity.

The necessity, therefore, for conserving the heat in the brood-chamber is evident; and the importance of double-walls and coverings of non-conductive materials is recognized. But as a preliminary to packing the bees up snugly for their winter rest, the size of the brood-nest should be limited to the size of the cluster; for instance, if there are only bees to cover six frames in September, it is folly to allow them nine or ten, or even more. It is seldom that more than seven or eight frames are necessary for an ordinary colony, and the removal of superfluous frames should be the first step to successful wintering, so that the space in which cold air can circulate may be reduced as much as possible, with a view to lessening the activity of the bees, and the consequent consumption of stores. It is from all points of view better to unite two or more weak colonies in the autumn than to allow each to stand and take its chance with or without a lot of coddling, unless it is to preserve valuable queens.

The first quilt should be of ticking, because it is a stout substance not easily bitten through by the bees. Upon the first quilt two or three pieces of felt or carpet must next be placed; and then, to make doubly sure, a chaff cushion might be added.

Any colony prepared according to the directions here given will, as a rule, pass satisfactorily through the winter and be in an encouraging condition when taken in hand the following season. (THE END.)

Wax-Spoon for Fastening Foundation, Etc.

BY DR. C. C. MILLER.

Some time ago I received a letter containing a spoon used for putting foundation in sections and frames. Before replying to it I waited until I had given it a fair trial, not that I think I can afford to try every new thing that appears, but this spoon—if an almost flat piece of tin can be called a spoon—look rather promising. It is a very simple affair. A piece of tin 6 or 8 inches long and an inch or more wide has one end cut off at an angle of 45° , and commencing perhaps $\frac{1}{8}$ inch from the point each side has a little curve cut out, making it look just a little after the shape of a steel pen. It is folded or bent a little for holding the wax. But let me give the letter:

MY DEAR DR. MILLER:—I have read your valuable suggestions now more than three years with much profit. I now feel that a small return should be made, and I enclose you a wax-spoon for fastening foundation in sections. Some time ago my plan of putting in foundation was illustrated in the American Bee Journal. You suggested at that time that too much wax might be used in attaching; the enclosed spoon will hold enough melted wax (which must be quite liquid) for two sections. With skillful manipulations 200 an hour can be filled with top and bottom pieces—never a top piece drops down or bottom (3%) one curls down.

Really you must excuse me, but I have been much concerned about you as twice I have seen you advise neophytes (when they ask how to fasten foundation) to take fragments of wax and make a candle with a piece of cord (how mussy that must be), and so make bold to send you my device. To complete the equipment a small oil or alcohol lamp and a 4 inch tin pan in which to melt the wax, are necessary. One pound will do two or three thousand sections and brood-frames for 20 hives. My top-bars have $\frac{1}{8}$ -inch saw-kerf instead of 5-16 I see you recommend in one of your articles. Why 5-16?

Can't we do something for Editor York? His reform spelling will surely ruin the "Old Reliable." After reading the American Bee Journal I am all "masht" up when reading other papers. I have not "learnt" (Webster learned) to tolerate it, and will be obliged to give up the paper with all your valuable pointers. Can't

you prevail on him to give up attempting to reform the language orthography?

This has been a bad month for bees; my colonies, which were blooming, are now dying off rapidly, and the first white clover blooms in sight.

Passaic Co., N. J., May 27.

Fraternally yours,
B. F. ONDERDONK.

The first opportunity I had of trying the spoon was when putting foundation in a lot of brood-frames. I had used for the same purpose a spoon, and also a tin cup with a specially constructed spout, and latterly a wax candle. I may say to you, Mr. Onderdonk, that you can't always tell till you try a thing just how it will work. I couldn't be sure just how your spoon would work, just by looking at it, and altho you say of the candle, "How mussy that must be," if you were expert at using it you would not find it very mussy. I think it was rather less so than either of the plans I had previously used. Only one drop falls at a time, the temperature is always just at the right point, but unless you are careful the one drop may not fall just in the right place. It has the advantage that it takes little time to get ready. Simply light your candle, and it's ready for work, and if there's only a short job to do, I'll be all through with the candle while you're heating the wax for the spoon.

I had some 200 brood-frames in which to fasten foundation, and I thought I would be polite to the stranger—the new-fangled spoon—by giving it the first chance. I found that sharp point would enter an angle nicely, it could be held much closer in the angle than an ordinary spoon, giving a chance to send it to the right place every time. Indeed, it worked so well that I went right over to the enemy and finished up the whole lot without lighting the candle. I doubt if ever I shall use a candle again. The Onderdonk spoon ought to be on the list of bee-keepers' supplies.

As to using it for fastening foundation in sections, that's another thing. If you should put in a few thousand starters with the Daisy foundation fastener, I doubt if you would go back to the spoon. Aside from anything else, the spoon plan is more expensive. A lamp is burning in either case, so the expense is alike in that respect. A Daisy fastener will last long enough so that a cent a thousand sections for cost of machine will be an extravagant estimate. To offset that you have about 10 cents a thousand for wax with the spoon plan. But if melted wax is to be used at all, the Onderdonk spoon will be a great help.

AGAIN THE REFORM IN SPELLING.

With regard to reforming Editor York in the matter of spelling, I'm afraid you're going at it in the wrong way. It's only a very mild form of insanity at most, but don't you know that you only make such cases worse by threatening pecuniary loss? Once get it into the head of a fanatic of that sort that he is suffering loss for what he believes is right, he at once feels the thrill of a martyr for the truth, and the case is hopeless. I, too, should be sorry to witness the ruin of the "Old Reliable," but he will glory in it and take a pride in telling how much smaller is his subscription list now than when he began the spelling reform.*

After all, I doubt whether there will be any very large number whose prejudices are so strong that they will forego the knowledge they can gain for the sake of a little matter of looks. If you and I met a man who was well informed in some particular of bee-culture, we wouldn't refuse to listen to him because one word in 50 was mispronounced. And if we could get him to write to us, I think we would hardly refuse to read his letter because he told how he "workt" his bees instead of how he "worked" them. I doubt whether there can be found a large number of bee-keepers so given up to blind prejudice that they would seriously object to having one word in a thousand spelled as it sounds rather than as they have been accustomed to see it.

If you and I object to changing a spelling to which we are accustomed, then some older man will object to some earlier change, and if the rule works in one case it ought to in another, resulting finally in going back to an old spelling that would land you and me where we couldn't read a sentence of the English language.

We may as well give up to the inevitable. It's only a question of time when "workt" instead of "worked" will be used by all. It is reasonable to suppose it will be so, from the history of the past. I don't recall a single change in the way of improved spelling but has become permanent. Only a short time ago a few began to write "program" instead of "programme," but gradually all are falling into line with the new spelling. Many now living remember when honour, labour, Atlantick and Pacific appeared in the spelling here given. Of course there were those who opposed any change in the spelling, just as there are some who object now to putting "t" in place of "ed" when the spoken sound is "t." But it

would be hard to find one now who would "favour" the old spelling. And so we may as well give up first as last and write "workt." It may be a little rough on our prejudices for a time, but it will be a fine thing for the coming generation.

McHenry Co., Ill.

[*We believe that the whole of *three* subscribers have ordered their copies of the American Bee Journal discontinued on account of our effort to help bring about a sensible and much-needed reform in spelling. As to our subscription list, we can say it has increased very much since we began to use "t" in certain words ending in "ed" and pronounced "t." But of course we do not attribute the increase to the stand we have taken in the spelling reform.

There are many things that we can't understand, and, one of them is, that any really intelligent man would stop his paper just because it did not spell one word in 50 or so to suit him.—EDITOR.]

Pollen in Sections and the "Golden" Method.

BY J. A. GOLDEN.

After reading S. A. Deacon's criticism on page 484, I could not help thinking he is quite a little inconsistent, after contrasting his preliminary reflections. It is an old saying, yet true, that the wise practice what they preach. Mr. Deacon starts out by saying:

"It goes without saying that altho an abundance of nectar-secreting flowers and strong colonies are the main requisites for securing a good honey harvest, unless this be supplemented by intelligent manipulation we cannot expect to get the best results."

Such reasoning as this is both intelligent and wise, and is the result of practical information. Then further on, in the same paragraph, he says:

"A few apparently very insignificant matters of detail in the management of colonies may favorably affect the 'sum tittle' at the cessation of the flow, so we are not justified in lightly or contemptuously ignoring *any* suggestions calculated to work to the desired end. . . . and the older and more experienced the propounder of any new suggestion, the more ready we should be to receive it with respect, and analyze, etc."

This also is practicable and commendable, and ought to be recognized to the very letter in the life of all mankind, and more especially by the noble and good.

But it seems that Mr. Deacon, after reading of my method of producing comb honey, back in 1896, did not recognize my practical observations, as I found them, with the least shadow of respect, more than to consider it complex and fussy, until he read Mr. Hartzell's article in 1897, which seems to have waked him up from his unimproved hours of practical slumber, and then he reviews the whole formula, theoretically, and concludes that for his life he can't see that I have adduced the least proof that my method was any better than other methods. Let this be as it may, I cannot see how I could give a more explicit explanation of the method in detail from beginning to end than I did in the various articles in the several bee-papers; and if Mr. Deacon has not read them I can't help it, and ought not to be censured as being reserved.

In presenting my method to the bee-keeping fraternity, I endeavored honestly and truthfully to present every feature of the system in as clear and distinct a manner as it was possible from a practical knowledge, giving accurate results by the two methods, for the reason that the majority of apiarists hold that more honey can be produced by the non-swarming colonies. Mr. Hartzell also gave a statement of practical evidence in manipulating bees by my method—that he found it more advisable than any other method, which ought to be proof enough for the apiarist to test the method with one colony, at least, as recommended in former articles, and not theoretically assail a system which has proved satisfactory in practice.

But as the years roll on, and apiarists are reaping profit by manipulating my living-back method, Mr. Deacon says he never tried Mr. Golden's plan—and why? for the reason that he is thoroughly convinced (theoretically) that he would get as much pollen as honey in the sections. He says he is sure he could not keep it (the pollen) out, and breathes forth a little prayer, saying, "What about the pollen?" after previously stating that it was beyond those new and peculiar traits of his thinking qualities that he speaks of, how I manage to keep pollen out of the sections. This seems to be a sticker.

I answer that, as a rule, bees deposit pollen in as close

proximity to the brood, larvæ or eggs, as it is possible, and as my method has neither where the caged queen remains for the five days, neither does she deposit eggs during confinement, the bees take the side passage and deposit their pollen in the brood-combs, or that has been my observation, at least. However, there are exceptions to all rules—some apiarists have found pollen deposits in sections, but I have never as yet discovered one cell, in all of my experience. If sections of drawn or partly drawn comb were placed in the supers, bees might deposit a few cells during a brisk gathering of pollen, for it is a fact that bees at such a time do deposit occasional cells of pollen above the brood in section honey.

Again, sometimes loaded bees with pollen are frequently caught in a swarm when issuing, and they may deposit their load at their first opportunity after hiving under the excitement of the swarming-fever. I don't know that such is the case, and the most convincing evidence that I can suggest to Mr. Deacon is for him to practically test the method by manipulating one colony, at least, as recommended, for I don't know how I could state facts any more convincing than I have in previous articles.

In his closing paragraph Mr. Deacon thinks it is time we old boys gave our inventive faculties a rest, etc. Altho I am four years his senior, I shall not agree to his proposition, but so long as I have the power to think, reason and work, I'll improve the allotted time God has given me, to the good of my fellow creature, man, and the little honey-bee. I hope that Mr. Deacon will not become doty, and refuse to supply the wants of his South African bees. Morgan Co., Ohio.

No. 5.—The A B C of Marketing Honey.

BY HERMAN F. MOORE.

[Continued from page 532.]

I filled Tiffin full of honey in short order, and departed for pastures new in Fostoria, a near-by town of 5,000. Trade was not good there, owing to abundant honey crop in the near-by townships. Farmers brought in their honey and sold it for anything to get tobacco money.

From there, after a short rest at home, and some recreation with the bees, I went to Toledo, the third in size in the State. I took a young cousin with me, and together we drummed the capital of Lucas county from one end to the other. Here we were in a city, and as expenses were heavier we raised our price on honey to 18 cents a pound, and packages extra. We had been selling pints or quarts, as desired, and a large percent of our sales were pints. This was a losing business, as the expense of handling so small a sale to a family ate up the gain. We stumbled out to this fact wholly by accident—that people buy, as a rule, whatever you offer them.

There were five of us drumming up one territory, and most of the boys were using pint Mason jars for samples, as they were small and convenient. One day one of the boys (salesmen) had no pint, and of necessity took a quart Mason instead. He made a good day's sales, and all quarts. That settled me; everybody used quart samples after that, and we quit selling pints entirely. We sold half a quart jar as a last resort, but no more pints. This was a considerable saving in expense, for we had only one size of package to keep in stock.

In getting our trade we made a clean sweep of residences, business houses, depots, elevators. In those days calling at houses did not seem to be so overdone as now. Nearly everyone gave us a pleasant reception at their homes. We had good honey to sell, and most of us were clean, wholesome young fellows.

But there are plenty of towns and cities nowadays where an attempt to solicit from house to house will cause certain failure. To any one meeting this condition let me say, "There are more ways of killing a cat than by choking him with butter," as grandpa used to say.

You will observe that honey is somewhat different from other family supplies. It is not used with any degree of regularity, like potatoes or butter, consequently, the father of the family can, and will, buy honey as readily as the lady of the house, and, what is more to the point, is more liberal in buying. He has the pocket-book, as a rule, and feels a natural pride in making a liberal provision. The lady too frequently is limited to just so many dollars a week to feed the family, and can't spare any for honey. So when such conditions arise, go to the offices and business houses, ask the men for their orders, and when they say "see my wife," explain to them why you don't call at the houses, and they will think all the more of you for it, and will usually give you kind attention and liberal patronage.

We made quite a little profit on beeswax. We moulded

two-ounce cakes of nice, pure yellow beeswax, and they sold well at 10 cents a cake. We filled our pockets with them, and often sold 10 or more a day. This was 80 cents a pound, which made a good profit.

I was much amused by a letter written to my cousin by his father, saying that "he would better come home, as I would be out of honey soon." That reminds me of what a policeman said to me. Said he: "Now you know very well that nearly all the honey here is manufactured honey" (and tried to have me admit it). "You know it is a fact that there is not enough honey in the whole United States to supply Chicago alone." What answer can you make to such a man? He was almost ready to hit me between the eyes if I did not agree with him. I said: "My supply of honey lasts pretty well, as I am only selling to private families, and they only buy five or ten pounds at a time. I never sell anything but pure honey to my trade." The Book says: "Answer a fool according to his folly," and you may find the best way often is to ignore his remarks, and branch off into something interesting or instructive.

Recurring to the question of sending to another State for part of your honey, I had several experiences in Toledo that were somewhat interesting. I happened to run up to Chicago, and needing some honey I dropt into the commission-house and lookt at two barrels of fine, white honey. I spoke for them to be shipt to me at Toledo. When they came they were red. It must have been Southern honey, or possibly golden-rod. They attach the bill of lading to a draft, so I paid for the honey before seeing it. Of course I protested, and they stood a small reduction, but that did not change my red honey to clover or basswood. It is a mystery how I ever got rid of that lot of honey; but one thing helpt me—the fact that people prefer a honey that has a deep, strong honey flavor; they think they are surely getting pure honey.

Another lot of honey was sent to me by a prominent Michigan bee-keeper. This was the strangest lot of honey I ever saw. It was 200 pounds of comb honey in one-pound sections. At first I thought it was extra nice and thick; it was so thick that when broken the honey would not run out. I took a cake of it home when I went to spend Sunday, and our folks would not touch it; they threw it away. I sold several cases to a grocery firm, and when they saw me (or I believe they wrote me) they told me to take it away. I am uncertain to this day what was the matter with that honey. It was most beautiful in appearance, but entirely lacking in honey smell or taste. My first thought was that it had been kept in a hot, dry place, and was more ripened than honey usually is. Some of my friends said the man had fed glucose to his bees. But I am told that bees will not store glucose.

I only go into these matters to emphasize the importance of greatest care in getting the honey you offer your trade. When you sell them something they don't like, they never forget or forgive. One of my customers kept telling me for three or four years that I had sold him molasses. The honey I sold him was, I believe, Utah or Colorado alfalfa, with perhaps half cleome or some other weed honey.

Very many people put the case thus: If you are a producer of honey, and if you are honest, your honey must always be good and always alike.

One of the things we must expect to do is to educate the people. Tell them about the different kinds of clovers, naming in particular the varieties in their immediate vicinage. Explain to them that even the different clovers ("cousins" I call them) give us honey with different colors, odors, flavors; that while there is a general similarity in different kinds of honey, there is also a dissimilarity as between different varieties of peaches, etc.

Some writers advocate selling candied honey to the public. I believe it will never succeed on a large scale. The easiest way, and perhaps the best, is to sell people what they want, and not what you think would be just as well for them, and save you some work.

The consumer judges our extracted honey by the comb honey that suits him, naturally enough. And comb honey is condemned by everybody when candied. Candying indicates age at least, and a good deal of the clean-cut, strong honey-flavor is gone when honey is in the crystallized form.

When a man takes home his purchase of honey he expects to enjoy a few meals of it with the zest of hunger for it. Now it must be in perfect honey condition to perfectly please his family these first meals from the new purchase.

I think no one will claim, from the consumer's standpoint, that honey is in perfect condition when candied. Many people have remarkt to me that candied honey "had no taste," "did not taste like honey." After having the honey for a time, the consumer is prepared for some change or other. Nearly every article of food is subject to some material

change, usually souring or spoiling; and often when asking a customer for another order he has said, "That honey spoilt before I got it used up." Then I questioned him and brought out the candied honey condition, and explanations followed.

In melting candied honey care must be taken not to over-heat it, and always strain it through two thicknesses of cheese-cloth. If stored in barrels slivers are often found in honey, and occasionally a bee or ant. Nothing of this kind should be allowed to reach your customer, as the effect is much like "settling" in milk.

[To be continued.]

"Golden" Method of Producing Comb Honey.

BY J. S. HARTZELL.

In answer to, and for the benefit of Mr. S. A. Deacon (whose article appeared on page 483), or any others desiring in like manner to know of the merits of the Golden plan of producing comb honey, I will endeavor to set forth my findings in regard to the plan.

But before doing so, let me say that I had fully determined that I would not be entangled with the bees this summer on any plan, but my intentions were thwarted, and I now have 40 colonies on the Golden plan, and 21 colonies on the ordinary or orthodox plan. Each method has been treated to the best of my ability, and I have been able to hold all within the bounds of increase.

Mr. Deacon says that neither Golden nor Hartzell, as far as he can see, makes any comparison between swarms treated on the Golden plan and by any of the older or ordinary methods. Please, Mr. Deacon, read my article again. Did I not give the amount of surplus honey obtained from my apiary, with the number of colonies in all, and of the six on the Golden plan at that time—what did I say concerning the one that did the best, and also of the one doing the least? Had all colonies in the yard done equal to the poorest on the Golden plan, the surplus would almost have trebled in the amount obtained. Is that not sufficient evidence, or enough in favor of the Golden method?

This season will soon close, and I propose again to give my experience for the season, and results as to surplus honey from both the Golden and the older or orthodox plans, which will be a final settlement with me on the plans as now in vogue, and with only one eye open I can plainly see at present where the most favorable results will come from.

Mr. Deacon appears to think that a swarm hived on starters with supers placed where their name indicates—viz.: on top—would equal a returned swarm on the Golden plan. This is a great error, misleads, and is calculated to determine to hold fast to the old taught theories. Practically, a swarm returned, remember, is not going to lessen in number, but increase, whilst from being hived on starters before any gain in numbers could be produced, there would be a loss in force, and comb to build in the brood-chamber, necessitating a loss in honey. Theo, too, hives must be bought and got in readiness, and if at the beginning of the season we have as many colonies as desired, at the "winding up" we can safely count on twice as many.

This theory of hiving swarms on starters, and honey going upstairs, is only partially true. Bees will have honey and pollen in the brood-chamber, and if worker-comb cannot be prepared fast enough for the queen to lay in, and for storing honey and pollen, the result is drone-comb will be built and used first for storing honey, then for rearing drones, and I have my doubts whether drone-comb would be built to any great extent when bees are merely securing a living from the fields.

Mr. Deacon seems to think the Golden method can be used only with a swarming colony. He certainly misunderstands. But, *preferably, I want the colony to swarm.*

In regard to pollen in sections, let me say more will appear in the sections where a single section or half-story supers are used, is my experience. I have used, this summer, several double-tier or full-story supers, and found in one, at the time of liberating the queen, a few cells of pollen in three sections, and none in any others, and I attribute pollen in the sections named to the queen being caged in the lower tier of sections, therefore too far from the brood; but with a half-story or single-tier supers no pollen in sections, owing, presumably, to the cage being near the brood-nest, and the bees knowing by instinct that there is where the pollen and the queen both belong.

To sum up: According to my views, as experienced by using the Golden and old or orthodox plans this season in my

apiary, I anticipate from the Golden plan far the best results in securing honey.

Then, in regard to wintering, no winter-cases are needed, no ticks or chaff cushions to be prepared and kept in order, housed and stored during the summer. The feeder, when needed, is always in a safe and convenient place for use, and if the queens are to be superseded that is easily accomplished; and once the hives are prepared and the number of colonies in stock wanted, you need not fear of being tied up by not being able to have your order for hives filled, as was the case the past summer.

Mr. Deacon appears to appreciate, or realize, that he is growing old, approximating three score years, and thinks Mr. Golden nearing the same; and that both should cast aside inventive ideas, letting the younger ones run the advance department. Can Mr. Deacon, or any one with a mind, cease thinking? And as new ideas or thoughts enter the cranium, our desire is, if after due deliberation they appear feasible, to put them into practice, which tests or proves whether practical and of value. This I deem right, and Mr. Deacon coincides with me, for he has concluded, and I presume fully tested to his own satisfaction at least, that his "Rapid Drawer Feeder" is not only superior to Golden's, but any other feeder. Now, Mr. Deacon, lay aside the various ideas that may enter your cranium; don't think on bettering that feeder in any way or to improve on any of your methods in managing your apiary, for many perplexing things present themselves daily, and our minds must be fully at rest. Or, we must endeavor to fathom the problem before us. Which are we most likely to do?

Somerset Co., Pa., Aug. 8.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. O. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Question on Italianizing.

I live on the outskirts of the city, and keep bees for fun. I have seven colonies, six on frames and one in a box. Also three colonies six miles from here with a man to keep on shares— $\frac{1}{2}$. What I wish to find out is this:

June 5 hive No. 3 cast a big swarm. I hived them, moved hive No. 3 to a new place, and set the new swarm on the old stand. June 6 No. 1 cast a very large swarm. I hived and set it in a new place, and left old hive in its old place. The same day I sent for a queen and cut out all queen-cells in No. 1. The new queen was promised in two or three days; I waited till the 11th, and no queen received, so I countermanded the order. I had ordered another queen which I received June 11. I cut out the queen-cells in No. 3, and put a cage on top of the frames; opened it the 13th, and found they had liberated the queen. July 15 I saw the first Italian bees. Since then they have increased until they are nearly all Italians.

Now we will go back to hive No. 1. I had cut out cells in No. 1 June 6; June 16 I received another queen and put her on the frames; the 18th I opened No. 1 and found the queen liberated. I waited ever since to see Italian bees, and three or four days ago I saw four, and none since, until to-day (Aug. 2) at noon I saw perhaps 100 out, but did not stay long. I also saw a few yellow drones. I thought the queen must be killed, and sent for another which I received to-day.

Why is it that no yellow bees showed up before? What has the queen been doing all this time? The hive should be full of Italian bees by this time.

There is plenty of white clover all about me in fields and by the roadside. I have looked for bees on it 50 times, and have never seen but two bees on white clover.

I do not know what to do with my new queen. I have a 12-story hive nearly full. I suppose I might take it off and give the queen and make a new colony, but I have more than I want now.

MASSACHUSETTS.

ANSWER.—No. 1 swarmed June 6, and on that same day you cut out the queen-cells. The probability is that there were plenty of eggs present, as also brood in all stages. That would allow the bees to rear a young queen, and the young queen would depose the queen introduced and assume the reins of government. That is what one would most naturally expect. It may be, however, that the color of the young bees showed clearly that they were the progeny of the queen you

introduced. In that case the probability is that for some time the bees kept the new queen balled for a time, and then she may not have begun laying for a number of days. Such delay on the part of a queen introduced is not so very unusual.

It is quite possible that eggs were laid earlier than you suppose. From what you say, it appears that you depended on seeing the young bees outside, without looking into the hive. Young bees do not commence field-work till about 16 days old, so you would not see any of the new bees outside for two weeks after plenty of them may have been inside, unless you happened to be at the hive when they were having their play-spell.

Perhaps "Bare-Headed" Bees.

I have 30 colonies in modern hives, all in good condition, only in looking through them I found in a few of them some unsealed brood that seemed to be dead. Some of it was turned wrong end out, and that that was right end out (head) had pink eyes. It is all full size, and very tender. What can be the matter with them? I never had any experience with foul brood, and do not want any.

There has been no surplus honey in this part of the country this season—too much rain. We look for a fine honey-flow this fall when the yellow blossom and smart-weed bloom. The nights are too cool now for anything but sickness.

I get a great deal of information out of the American Bee Journal.

MISSOURI.

ANSWER.—Probably yours is a case of what is called "bare-headed bees." If so, the brood is all right, altho it may appear dead. It is motionless but not dead, and you will find that in due time it will hatch all right. Just why it is that sometimes patches of these bare-headed bees occur, bee-keepers are not agreed. I feel pretty sure, however, that the wax-worm has something to do with it. Often I have seen a row of these unsealed larvæ in just such shape as one would expect where the gallery of a worm had been run through the cappings, and you will probably find that bare-headed bees are much more common with blacks than Italians, as Italians do not allow the presence of worms to the same extent as blacks.

Closed-End Frames—Enameled Cloth—Long-Idea Hive, Etc.

1. If I understand correctly, "Common Sense Bee-Keeping" condemns the bee-space between the frame end-bars and the hive wall, so as to have the frames close to the latter. Wouldn't there be great danger of crushing bees and queens in handling such frames, besides the general difficulty to get them in and out?

2. Do you use an enameled cloth on top of the sections, also frames in hives? and do you think it such an essential and necessary attribute to the bees' comfort?

3. What kind of a hive is the "Loug Idea Hive"? and how is it constructed? Where did it originate? I never found it mentioned in any of the catalogs.

4. On page 139, the "Lareese escape" is recommended for getting the bees out of supers. In what way is this one different from the Porter escape? Is it preferable?

5. Which is the better, tin or zinc rabbets? Frank Benton, in Gov. Bul. No. 1, "The Honey-Bee," a manual of instruction in apiculture, gives preference to tin rabbets without giving any reason for his assertion. Are they one chemically?

6. How are observation hives constructed, generally, with one or more frames? with glass on one or both sides? I do not recollect having seen one.

7. What color is borage honey—white or amber? Bees are working on it from morn to night.

8. You certainly have some knowledge about the fuchsia flowers. Do they contain sufficient nectar to guarantee some bee-pasturage? Which is preferred, the single or the double?

9. J. S. Sleeth, on page 414, asks what caused the bees to discharge feces of the color of dandelions in large blotches, etc. As I had the same occurrence last fall, and again lately just after dividing, that the bees of the newly-made colony were bespattering the front of the hive when coming out—(but my bees didn't roll over and die)—I accounted for it as a usual happening after overfilling with honey to follow it up with some diarrhea; or that it was the cause of robber bees. Can you give me more light on it? CALIFORNIA.

ANSWERS.—1. Yes, they require care in handling.

2. Since using flat board covers I have used no enameled cloth, or cloth of any kind. It is warmer in cold weather with the cloth, and it is a protection in hot weather against the sun,

but the advantages are overbalanced by the trouble and the daubing with bee-glue.

3. The "long-idea hive" is what may be called a horizontal hive, like the *lager* hive of the Germans or the Layens hive of the French. Simply make any hive large enough to contain 20 frames, more or less, and you have a long-idea hive. No second story is used, and the surplus frames are at one or both sides of the brood-frames. It was first advocated in this country some years ago by a bee-keeper in Kentucky, and I think is not listed in catalogs.

4. J. S. Reese perhaps deserves chief credit for bringing to the notice of the public the bee-escape for clearing supers. He used a cone escape. W. G. Larrabee improved it by making a series of horizontal cones, somewhat after the manner of a set-net for fishing. The editor of *Gleanings*, desiring to give credit to both men, combined their names, calling it the La-Reese or "Lareese" escape. I don't find it now in the Root catalog. For use under or over a pile of supers it is better, in my opinion, than the ordinary Porter escape, but it may be that the honey-house Porter escape is just as good.

5. Tin is generally used, perhaps because cheaper. I don't know that there's any other difference.

6. You will find an observatory hive illustrated in Root's ABC of Bee-Culture, and in Langstroth's book. Simply make a hive of one frame with glass on two sides.

7. I don't remember to have seen the color of borage honey given. Unless a honey-plant is so abundant that bees work on it almost exclusively, it is very hard to tell much about the honey. There are a good many plants that are considered good honey-plants from the fact that bees are seen busily working on them, but no one knows just what the honey is like, because it has not been obtained unmixed with other honey. If your bees have much of it to work on possibly you may be able to tell us about it.

8. Practically I know nothing about the fuchsia as a honey-plant. I have a plant some six feet high with hundreds of blossoms on it, and altho while in the house in the winter I've seen drops of honey falling from it, I have never seen a bee on it outdoors. What it might do in your California if present on a large scale is another question. At a guess I should say it would be a good honey-plant, but would not pay for cultivation. Very likely the single variety would be better than the double. That's the general rule with any plant.

9. The bees discharge their excrement in the way mentioned after being confined for some time, and also sometimes under unusual excitement, the latter probably in the case you mention.

Demented with Bee-Fever.

I have the bee-fever real bad, from hearing my mother-in-law talk about some bees which were once kept by her father, down in Georgia. She says there is money in it, and talkt so about it I soon took the fever, and nothing must do but I must go bee-keeping, for she is awfully fond of all kinds of sweet things, when they are not too sour, like jams and syrups, so I know she will like to eat the honey if I take the fever—and don't get stung up too much by the "king-bee" when the time comes to take the honey off the "gum," so that I won't quit the business from being stung and give up trying to produce honey before I make a success of the business. And so, to know a little more before I embark, I want to ask some questions:

1. How can I knock out the moth from killing the bees and eating up all the honey before I can get some for my mother-in-law and the balance of the family, and also some to sell at the store?

2. Also, if I wear a red shirt (which I almost always do), will it act on the "king-bee" like a red rag does on a bull, and makes him mad so he will come out and go to fighting and stinging me?

3. Mr. Johnson, who is a carpenter and wheelwright, has some bees about three miles from here, and says there is only one "king" in a "gum," and he starts the fuss and the others follow up, and that's how a person gets stung all up while taking honey, unless he kills them all with sulphur, which I don't want to do if I can help it. I know there are two kinds of honey in a gum—one comb honey and the other extracted honey. I will try to produce comb honey, as it looks more as if bees made it. But Mr. Johnson says comb honey is apt to break down unless you stick wires through it.

3. How do you stick the wires through the comb honey before you sell it? And must it be galvanized wire? What is the right size to stick through?

4. I heard there are two kinds of bees—the honey-bee and the Italian bee—which is the best kind for storing sweet honey from the flowers?

I will wear heavy gloves and thick overcoat, and a wire hat over my face, when I take the honey in the fall of the year, so the "king-bee" can't get his stinger through and start a fuss in the "gum." I am very anxious to start bee-keeping, but want to know how to manage the bee-moth before he eats up the honey and I get ready to take it.

VIRGINIA.

ANSWERS.—1. One way is to catch the moths, cut off all their wings on one side, carry them three miles from the apiary, and then they can't find the way back. But that's too much trouble. A better way is to have very strong colonies. It's the weak colonies that give a foot-hold for moths. If you have Italian bees, even a rather weak colony will keep the moth at bay. I've seen woolen cloth that was moth-eaten, but never honey. I think the larvæ of the bee-moth never eat honey, only wax.

2. I wouldn't advise you to take off your red shirt. The bees might sting you a good deal worse if you had no shirt on. I think a white shirt would be better than a red one, and black is the worst.

3. Mr. Johnson has got mixt up about sticking wires through honey. It's rock candy he's thinking of, which doesn't have wire, but thread stuck through it. I wouldn't stick wire in the honey, but try to find some other way to kill off the mother-in-law without feeding her on wire. If you must use wire, pieces an inch long would be about the right size. She's more likely to strangle on them than on pieces of smaller size.

4. Get the combined article, the Italian honey-bee. If there's anything more I can do to help you, don't hesitate to write.

Bee-Keeping in Puerto Rico.

We will have scarcely any surplus honey here this year, but bees are in good condition.

Can you give any information in regard to bee-keeping in Puerto Rico? I see it stated that there is exported from there one million dollars' worth of honey per year. What effect will it have on our market if Puerto Rico becomes a part of the United States? Would their honey come to the United States free of duty?

VIRGINIA.

ANSWER.—I know nothing about bee-keeping in Puerto Rico, but it is likely somewhat the same as in Cuba. When Puerto Rico becomes a part of the United States, undoubtedly the rest of the United States must stand the competition of its honey without any duty. If honey can be produced there cheaper than elsewhere, by all means that production should be encouraged, just as we should encourage its production in Wisconsin or California. If Puerto Rico becomes part of the United States, it will be because we started out to give Spain a thrashing for bullying Cuba, and we mustn't go back on that unselfish spirit by doing anything to handicap Puerto Rico.

Colony on Cross Combs.

What shall a beginner do with a colony of bees that is in a frame-hive, but the combs crost and warpt every way, only one straight comb in the whole hive. Should I transfer them? I have a new hive on top with three good frames of honey; the five I took out and put in empty frames with starters, and they have them workt almost down. I had them last year but didn't have the American Bee Journal, and so didn't get a pound of surplus honey. This year I got 100 pounds. Since I have the Bee Journal I am learning more than I did last year.

BEGINNER.

ANSWER.—Better leave them right where they are till next year. It is possible that if transferred now they might come out all right, but if there's little fall honey they would perhaps not be in good shape to stand the winter, and in any case they will likely winter better where they are than to be changed so late in the season. Very likely you did better for having the Bee Journal, but the season may have had something to do with your getting 100 pounds more than last year. You are fortunate, as most bee-keepers are complaining of poor yields this year.

The Names and Addresses of all your bee-friends, who are not now taking the Bee Journal, are wanted at this office. Send them in, please, when sample copies will be mailed to them. Then you can secure their subscriptions, and earn some of the premiums we are offering. The next few months will be just the time to easily get new subscribers. Try it earnestly, at least.

GEORGE W. YORK, EDITOR.

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

Place and Date of Next Meeting:

Omaha, Nebr., Sept. 13, 14 and 15, at the Delone Hotel, Cor. 14th Street and Capitol Avenue.

VOL. 38. SEPTEMBER 1, 1898. NO. 35.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Migratory Bee-Keeping in Europe is more common than in this country. Colonies are moved to get the benefit of rape-fields in some cases, in others beather-fields or buckwheat-fields may be the point of attraction. Gravenhorst's Deutsche Illustrierte Bienenzeitung gives two illustrations showing a load on each ready to start for the buckwheat-fields in the great buckwheat-region of Marchfeld. The wagons are very long-coupled (ladder-wagons), perhaps three times as long as common wagons. One of them takes 40 to 50 movable-comb hives, or 70 to 80 straw skeps.

The Name "Old Reliable."—Mr. John H. Martin, in a department in Gleanings in Bee-Culture called "California Echoes," gives this "echo" which will be of special interest to our readers:

The other day when Mr. Levering was washing dishes and I was wiping them (you see we are baching together), said he, "Do you know where the term 'Old Reliable' originated, as applied to the American Bee Journal?"

"No, I have not the least idea," said I.

"Well," said he, "when I lived back in Missouri there was a stage-driver whose arrival was as regular as the rising of the sun, and seemingly the most violent storms would not interfere with his regularity, and he became noted far and near as the 'old reliable.'" When I edited the bee-department in the Los Angeles Herald the American Bee Journal came to the office so regularly that I was reminded of the old stage-driver, and noted the fact, and in the next issue inserted an item calling it the "Old Reliable." Soon after I saw it copied,

and from that time to this it has borne that name. Now, some one else may have suggested the same name, but nevertheless the term applied was original with me."

We are glad to know this, even if it did occur years before we were publishing the American Bee Journal. But we have striven ever since to keep up its former reputation, and think we have succeeded pretty well in so doing. It takes planning and steady work to do it, but with a fair degree of health, love of the work, and faithfulness and devotion on the part of our employees, we have been enabled to keep the "Old Reliable" as reliable as ever in its weekly visits to its far and near subscribers.

English Views of American Appliances.—

W. Woodley, a leading contributor of British Bee Journal, does not seem to be greatly taken with some of the things that are exciting interest on this side of the water. He has tried the plain section and fence, and finds no advantage over the ordinary two-bee-way section, the latter being just as well filled, easier to handle, and presenting a better appearance. It may be remarked by way of parenthesis that Gleanings presents some very favorable reports on the plain section and fence.

Mr. Woodley sees no advantage in a section-folder, as the sections fold easily by hand and are readily locked together by a little hand pressure. Some bee-keepers on this side who have several thousand sections to fold find it to their advantage to have the machine because little folks can fold sections with it whose hands would not be strong enough to force the dovetailed ends together. He has no use for a "section-cleaner," no scouring or cleaning being required, as his sections are *never made dirty*.

Weights of Bees and their Loads.—

Mr. C. P. Gillette, in the report of the 8th annual meeting at Detroit of the Society for the Promotion of Agricultural Science, shows in a table the results of some interesting experiments regarding the weights of bees and the loads they carry. Editor Root, in Gleanings, says of it:

According to the table there would be in a pound, on an average, 5,578 unloaded worker-bees; 3,532 honey-laden bees; 5,060 pollen-bearing bees; 5,447 unloaded pollen-bearers; 5,394 idlers taken on the front of the hive; 2,206 drones; 10,965 loads of honey; and 40,580 loads (the amount carried on both legs) of pollen.

These experiments are interesting, as they confirm largely the work of others. They also show what is very interesting to me, that a worker-bee may carry a weight of honey equal to its own weight, and that pollen-loads do not usually run more than a tenth of the weight of the bees.

A Japanese Bee-Book, called simply "Bee-Culture," is one of the curiosities that we received recently from the publishers, J. Ikeda & Co., of Tokyo, Japan. The author is Prof. Tamari, once a student in the Michigan Agricultural College, when Prof. Cook was connected with that institution. The book is, of course, printed in the Japanese language, which in appearance looks very nearly like Chinese. When we went to Dr. Miller's, a few weeks ago, we took it along for the Doctor to review, but he seemed to think he'd have to "draw the line" on that book. And we think even Mr. Cowan would have to add another language to his present number before he could do much with it. But we wouldn't advise him to attempt to learn Japanese thus late in life.

Accompanying the Japanese bee-book was the following letter, from Mr. J. Ikeda, who writes English fairly well:

TOKYO, Japan, June 1, 1898.

GENTLEMEN:—We are told that your American Bee Journal is the oldest American bee-paper, and influential on this line. In Japan bee-culture is not developed yet, and the species of bee belong to some inferior kind.

Prof. Tamari, of our Imperial University, studied this line with Prof. Cook, during his stay at the Michigan Univer-

sity. He is the only man who taught us how to keep bees after some developed manner. He wrote a work on bee-culture, and I am very glad to announce that I am the publisher, and have the honor to distribute this valuable book. It is now reaching the third edition, and you can guess how eager people are to grasp Western knowledge on this subject.

Our Agricultural Department imported some Italian bees, but we are sorry to say that it is not a success, except in Ogasawara—a remote island in Japan. If we put two hives, one with Italian and the other Japanese native bees, the former is stronger and steals honey from the Japanese hive, and at last the Italian kills the latter. But the latter endures the winter season best, and the failure comes from this fact. We are told that we would better cross the Italian with Japanese bees, and we are going to try it this or next season. We have some native bees, and wish to let apiculture become more prosperous.

We have an agricultural magazine called the Popular Agriculturist, and will try to do something on this line. We mail you in a separate package a copy of Prof. Tamari's work, and a copy of our poor journal.

Yours truly,

J. IKEDA.

J. Ikeda & Co. are seed growers and publishers of books for the farm and garden in Japan. They issue a work in four volumes, called "Useful Plants of Japan," containing descriptions of over 1,000 plants with names in Latin, Japanese and Chinese, and carefully illustrated in proper colors. Ikeda & Co. must be an enterprising firm.

Honey-Dew is reported by many this year as being unusually plentiful, in some cases sections of white honey being more or less tainted by it. Regarding the danger of having it for winter bee-food, the editor of *Gleanings* says:

But perhaps some of you may say, "What am I going to do if I find some of the stuff in the brood-frames?" I would do nothing about it at all—just leave it there. Our knowledge of wintering has progressed so far since 1885 that I believe the majority of bee-keepers will be able to winter their bees on this food almost as successfully, perhaps, as on the best sugar syrup. Indeed, I am coming to believe that the food has less to do with successful wintering than we formerly supposed it had; for we have for years wintered our bees successfully on all sorts of stuff, even including the vile "bug-juice" of which we had so much in our hives during the winter of 1884. The loss that year was only 5 percent, and there were heavier losses that year, attributed to honey-dew, than any year since 1881.

On the origin of honey-dew, Editor Root has this to say for the benefit of the newer readers:

It is a secretion or excretion usually found on the leaves of trees; and in most cases it is the product of an insect. This saccharine matter sometimes dries on the leaves. After a light rain it is moistened, and then the bees will roar around the trees and tumble into the entrances as if they were working on basswood. If the storm continues the sticky stuff will be washed off the leaves, and the poor bees will be humming around for that which has suddenly disappeared; and then, my, oh my! how they will sting! just as if you and I were to blame!

This peculiar secretion is usually found on the leaves of maple-trees. In such cases it comes from the maple-bark louse. Sometimes it is present on the leaves of hickory, and then, again, on low-spreading bushes. Whether the insects deposit it or not, this peculiar kind of "dew" sometimes falls in the form of spray, and many and many a time the sidewalk under the trees will be marked or spotted with the "juice."

Honey-dew was formerly supposed to be a real dew from heaven, hence its name; but it is now known that the greater part of it is the product (or, more properly speaking, perhaps, excreta) of insects. But there is a kind of honey-dew that is a secretion from certain fungi, and also the leaves of certain plants. That this is true is proven without doubt.

Side-Issues in Class-Journals.—The editor of the *Bee-Keepers' Review*, speaking of matters other than bee-matters in bee-papers, says: "A little touch of them occasionally, like pepper in our food, may be all right, but the less the better." Which probably expresses the views of most readers.

MR. M. H. HUNT, one of Michigan's bee-supply dealers, in Wayne Co., wrote us Aug. 17:

"The season has been a good one with us in the supply business, but the honey crop is short."

MR. E. KRETCHMER, of Montgomery Co., Iowa, writing us Aug. 11, said: "Bees have done nothing in this part of the country." That seems to be the report from quite a number of localities this year. Too bad, but "what can't be cured must be endured," and trust that a better season may follow.

MR. L. KREUTZINGER, of Chicago, had his annual "honey harvest gathering" at his home apiary last Saturday afternoon, Aug. 27. He has about 125 colonies in this apiary, and about 100 in an out-apiary. Next week we hope to have more to say about Mr. Kreutzinger's "honey harvest" and crop.

MR. W. H. LEWIS, of British Columbia, writing us July 26, said:

"There are not a great many bee-keepers in this Province. Last year there was no surplus honey; this year every one has a little. I don't think it much of a bee-country on account of cold, wet springs."

THE LEAHY MFG. Co. report that during the past year they have sold "22,000 hives, counting 1½ stories to each; 500,000 frames of all descriptions; 3,000 smokers, and a little over 3,000,000 sections." They are planning to enlarge for another year, by adding about \$2,000 worth of machinery, and doubling their present factory capacity. They will thus try to avoid working more than 10 hours a day in the busiest part of the season.

GENERAL GREELY'S 278 DAYS OF DEATH.—The true story of those 278 days of suffering by Greely's heroic little band of explorers in the arctic region has been told by Geo. Greely himself, for the first time, for the *October Ladies' Home Journal*. For years Gen. Greely has kept an unbroken silence about his fearful experience and that of his companions, as they dropt dead one by one at his side, and it was only after the greatest persuasion that the famous explorer was induced to write the story.

MRS. L. HARRISON, of Peoria Co., Ill., writes thus for *Gleanings* on the subject of "facing goods":

"Let's have none, be it apples, potatoes or honey. I bought fancy Ben Davis apples for a Christmas-tree in the South, and was chagrined to find that they were only 'faced.' I was willing to pay the price for 'fancy' for the whole package."

Heaven must be a nice place. There'll be no deception there. But why not have a foretaste of Heaven here?

MR. M. P. FICHTENMAYER, of Bristol Co., Mass., wrote us as follows July 20, when sending a new subscriber for a year:

"Knowing well your efforts in apiculture, I will try to send you one new subscriber every year, as I know they will be satisfied with your journal as well as I am. I hope every one will help you along."

Thank you, Mr. F. Just think what a list we would have if every reader would do as you are doing! Why, the number of the *Bee Journal* readers would just double every year. Wouldn't that be splendid?

MR. H. GALLOWAY, of Skagit Co., Wash., is one of the hustling kind of bee-keepers. When sending another new subscriber lately, he said:

"I think this makes four new subscribers that I have sent you. If the rest of the readers would do as well I think you would have the required number the old *American Bee Journal* is worthy of. Let every reader of the *American Bee Journal* send Editor York four new subscribers before Jan. 1,

and see what a smile he will have on his face when he goes home to that wife of his."

Yes, Mr. Galloway, that *would be* a great smile-producer. If we had four or five times the present number of regular subscribers, we would—well, we would do a number of the things we have been aching to do in connection with the American Bee Journal. But if each one can't send four yearly subscribers, then send two besides your own renewal. That would make three times our present list—enough to put in at least two of the biggest improvements in the old American Bee Journal that we have had in mind for several years.

Two-Pound Plain Sections are made by Geo. O. Morris by taking two one-pound sections, putting a sheet of foundation between them, and then pressing together.—Gleanings.

Snow-White or Cream-Colored Sections.—G. K. Hubbard is endorsed by Review and Gleanings in saying that it is not consumers but bee-keepers that demand such white sections, honey looking nicer and whiter in the darker wood.

Arranging the Brood-Nest for Winter.—When the four central combs contain little honey, the outer combs on each side having the bulk of it, Mr. Doolittle often puts the four central ones at one side and the combs with honey at the other. That prevents the bees being stranded in winter at one side while there is plenty of honey at the other.—Progressive Bee-Keeper.

Pacific Bee-Papers.—They never live long. The Fresno County Bee-Keepers' Association voted money out of its treasury to pay for "our California newspaper" on the generous terms offered by the publisher. Months have past, and no publisher, paper, nor money has been located yet. I guess California soil or climate is not good for such literature.—W. A. H. Gilstrap, in Gleanings.

Must Read the Bee-Papers.—The editor of American Bee-Keeper has a distinct conviction that a bee-keeper must take one or more bee-papers if he would keep up with the procession. He says: "In conversation with an up-to-date man, a bee-keeper who neglects to read the journals devoted to his interests, will invariably 'give himself away' in the opening sentence. There is no disguising a 'back number.'"

Drone-Rearing in Swarms with Young Queens.—Referring to a question by C. Theilmann in this paper, asking whether any one had ever known drone-comb built the first day of swarming with a young prolific queen, or drone-brood reared the first two or three days, Editor Hill, of the American Bee-Keeper, is anxious to hear whether such a thing ever occurred under the conditions named, within three weeks after hiving.

Prevention of Swarming.—"With the Heddon hive you can have the lower story on the bottom-board all the season, and put another story of combs or foundation on this one when the hive becomes sufficiently crowded, and you will have practically no swarming," says W. A. H. Gilstrap in Gleanings. "After the swarming fever commences the only way I know of to stop it at once is to kill the bees or close the hive so they cannot fly. . . . My bees will not carry honey up-stairs *a la* Heddon when the cases of the brood-chamber are alternated."

Shall All Farmers Keep Bees?—Somnambulist, in the Progressive Bee-Keeper, refers to the question on this point in the Question-Box of this paper, and quotes "We will be what we will be." "Can everyone be a bee-keeper? Just as well ask, Can every one be a doctor, lawyer, minister, merchant, or any other thing he might desire?" Referring to the importance of bees as fertilizers, Somnambulist says:

"Will not the same bees, in the hands of a specialist, accomplish as much in the way of fertilization, as tho they belonged to the separate farmers of the neighborhood?"

Then why not relegate the whole business to the skilled hands of the apiarist, who will not only make the most of the resources, but will many times save to the neighborhood whole apiaries that would have died of starvation had they been sitting around in out-of-the-way corners waiting for the overcrowded farmer to think of them and their needs."

Some Rich Advice.—The American Bee-Keeper gives a clipping from an agricultural journal as a sample of the bee-lore therein contained, and follows it with some remarks about "visionary amateur" and "delirium tremens." It will bear reading more than once: "In the spring and summer provide the bees with plenty of honey-making food and pure water, and do not keep them near orchards on which insecticides are used. A field of Alsike, white or crimson clover, with a flower garden near by, will remove all necessity for the bees seeking the orchards for nectar."

A Pretty Picture of an Evening in Cuba, with a reference to the music of an apiary at night which will thrill every genuine bee-keeper, is thus given in an editorial in American Bee-Keeper:

"When the brilliant hues of sunset had faded from the mountain peaks, and in their stead a craggy outline of the southern horizon was dimly seen through the shades of night, and the doleful sounds of the tom-tom from the slave quarters of a distant plantation came faintly upon a zephyr from the sea, gently rustling the coarse leaves of the towering palms, then it was, after a day of active work in the apiary, we returned again, to hear the one familiar sound—that of an apiary at night. No sweeter music ever fell upon more appreciative ears. There is something akin to magic in the influence of this sound 'like rushing waters'—the rapid vibrations of a million wings—and the odor of nectar upon the air, by which a bee-keeper is instantly translated from this ordinary old world of ours, through spontaneous meditation, to another realm. It is the voice of success—the hum of prosperity—which captivates the mind, and he becomes for the time monarch of the municipalities represented."

Finding the Queen.—The Progressive Bee-Keeper has some good hints from Messrs. Aikin and Doolittle. Aikin says avoid much smoke, jarring, or anything to make bees run or leave the combs. Commence lifting out the combs next to you, and before looking at the comb you lift out, look *first* over the face of the next comb. Often you'll see the queen on that, when you can quickly put down the comb you have and secure the queen. Doolittle says take an empty hive, or preferably a light box, and set the frames in this as you take them out, setting the first frame on the *further side from you*, next close to it, and so on. That gives a chance to see if the queen has been left in the hive, and the order of placing gives a chance to glance over the sides of the frames in the box before lifting out, as you give them a second search in putting back into the hive. Hold the frame well from you, so as to be able to glance over the whole of the comb at one glance. Holding the comb obliquely will also help, a larger part of the comb coming in the field of vision, and the abdomen of the queen showing better at a side glance than if you look square upon her back.

Nature's Plan of Enlarging the Brood-Nest—Advising a beginner how he might become a successful bee-keeper, G. M. Doolittle, in Gleanings, instructs to shut off with a division-board as many brood-combs as the bees can cover, and when these are filled with eggs part them in the middle, and insert a comb of honey with the sealing broken, and in a few days this will be filled. "Thus it will be seen that, instead of the queen laying her eggs on the outside of the cluster, she lays them in the center of the brood-nest, where they should be." A Stray Straw (July 15) says: "That 'where they should be' raises the question whether Nature's plan of enlarging the brood-nest in spring is all wrong. To this Mr. Doolittle replies:

"Say, Doctor, what is Nature's plan of brood-rearing? Where are the *first* eggs deposited—in the center of the cluster, or on the outside of it? 'Ah!' I hear you saying, 'In the center, always.' Then that's Nature's way, is it not? And the queen would lay *all* of her eggs there every time were it not that, as the brood increases, she is obliged to lay her eggs in the next nearest cells to those in which she laid the first, and so on and on, keeping just as near the center at all times as possible, consistent with those already in the cells. To prove your point, Doctor, you must show that the queen would naturally lay the *very first* eggs of the season on the outside of the cluster or brood-nest. Can you so prove?"

FOR THE READERS OF THE AMERICAN BEE JOURNAL.

**PROFITABLE BEE-KEEPING,
—WITH—
HINTS TO BEGINNERS.....**

By Mr. C. N. White, of England,

Author of "Bees and Bee-Keeping," "Pleasurable Bee-Keeping," etc.

Mr. White is owner of one of the largest apiaries in the country where he lives, and has made a life study of the subject. He is also lecturer, under the Technical Education Scheme, to several County Councils in England. He will treat the subject in a

Series of Nine Illustrated Articles :

- | | | |
|------------------------------|----------------|---------------|
| 1. General and Introductory. | 4. Swarming. | 7. Supering. |
| 2. Bees. | 5. Hives. | 8. Diseases. |
| 3. Handling Bees. | 6. Foundation. | 9. Wintering. |

This is a series of practical articles that bee-keepers of the United States will not want to miss reading. They will appear only in the AMERICAN BEE JOURNAL.

We want our present readers to begin at once to get their neighbor bee-keepers to subscribe for the Bee Journal for the last six months of 1898, and thus read the articles by Mr. White. In order that all may be able to take advantage of this rare opportunity to learn from a successful and practical English authority on bee-keeping, we will send the American Bee Journal for

**The balance of 1898 for only 40 cents—
To a NEW Subscriber—thus making it**

SIX MONTHS FOR ONLY FORTY CENTS—

Which can be sent in stamps or silver. If you are a subscriber already, show the offer to your bee-keeping neighbors, or get their subscriptions, and we will give you, for your trouble, your choice of ONE of the following list, for each NEW 40-cent subscriber you send:

For Sending ONE New 40-cent Subscriber :

- | | |
|---|---|
| 1 Wood Binder for a Year's Bee Journals | 10 Foul Brood—by Dr. Howard |
| 2 Queen-Clipping Device | 11 Silo and Silage—by Prof. Cook |
| 3 Handbook of Health—Dr. Foote | 12 Foul Brood Treatment—by Prof. Cheshire |
| 4 Poultry for Market—Fan Field | 13 Foul Brood—by A. R. Kohnke |
| 5 Turkeys for Market—Fan Field | 14 Muth's Practical Hints to Bee-keepers |
| 6 Our Poultry Doctor—Fan Field | 15 15 "Honey as Food" Pamphlets |
| 7 Capons and Caponizing—Field | 16 Rural Life |
| 8 Kendall's Horse-Book | |
| 9 Mullen's Horse-Book | |

For Sending TWO New 40-cent Subscribers :

- | | |
|---|---|
| 1 Potato Culture—by T. B. Terry | 7 Hutchinson's "Advanced Bee-Culture" |
| 2 Green's Four Books | 8 Dr. Brown's "Bee-Keeping for Beginners" |
| 3 Ropp's Commercial Calculator | 9 Blenc-Kultur—German |
| 4 Dr. Tinker's Bee-Keeping for Profit | 10 Bees and Honey—160 pages—by Newman |
| 5 40 "Honey as Food" Pamphlets | 11 People's Atlas of the World |
| 6 Winter Problem in Bee-Keeping—by Pierce | |

All New Subscriptions Begin July 1.

Please remember that all the above premiums are offered **only** to those who are now subscribers, and who will send in new ones. A new subscriber at 40 cents cannot also claim a premium.

Now, let every one go to work, and help roll up the largest list of subscribers the old American Bee Journal ever had. It can easily be done if ALL who possibly can get a few new subscribers will kindly do so.

An Average Crop of Honey.

Query \$1.—1. What do you consider an average crop of honey in your locality for the past 25 years?

2. What would be an average honey crop in your locality for an apiary of 250 colonies?—N. Y.

E. S. Lovesy (Utah)—1 and 2. From 60 to 70 pounds.

Dr. J. P. H. Brown (Ga.)—1 and 2. About 30 pounds.

Jas. A. Stone—1. 50 pounds per colony. 2. About one-half that much.

W. G. Larrabee (Vt.)—1. 40 pounds per colony. 2. Probably a little less.

Emerson T. Abbott (Mo.)—1 and 2. I am not posted with regard to the matter.

P. H. Elwood (N. Y.)—1. 40 pounds, and growing less yearly. 2. I don't know.

R. C. Aikin (Colo.)—1. This country has not been settled so long. 2. Probably 40 pounds.

G. W. Demaree (Ky.)—1. It is only a guess—a guess with me—40 or 50 pounds to the full colony. 2. I think

For particulars, address J. Y. Calahan, General Agent, 111 Adams Street, Chicago, Ill. Telephone Main 3389. (59-32-6)

250 colonies are too many for my locality in one apiary; I don't know how they would succeed.

E. France (Wis.)—1. About 50 pounds of extracted. 2. I never tried so many in one apiary.

Eugene Secor (Iowa)—1. 50 pounds, if properly managed. 2. If kept in one apiary, 10 pounds.

Mrs. L. Harrison (Ill.)—2. In this locality there should never be more than 100 colonies in one place.

Prof. A. J. Cook (Calif.)—I think it is put, for the time bees have been kept here, at about 75 pounds.

Dr. C. C. Miller (Ill.)—1. At a guess, somewhere from 25 to 30 pounds. 2. Considerably less than nothing.

R. L. Taylor (Mich)—1. 40 pounds of comb honey for good colonies. 2. 40 pounds a colony if they were good colonies.

Mrs. J. M. Null (Mo.)—1. Extracted, 60 to 100 pounds; comb, 35 to 60 pounds. 2. A distance of a few miles sometimes doubles the crop.

Chas. Dadant & Son (Ill.)—1. 50 pounds per colony, or thereabout, of extracted honey. 2. We would not think of keeping 250 colonies in one apiary.

J. E. Pond (Mass.)—1 and 2. I have given no attention to the matter, and don't know; but not enough bees are kept within miles of myself to make an answer of any value.

J. A. Green (Ill.)—1. At a guess I should say 25 pounds. 2. In an apiary of that size I should not expect the average to go any higher than the general average of the locality, perhaps less.

G. M. Doolittle (N. Y.)—1. 75 to 90 pounds. My average has been not far from 80 pounds for the past 30 years. 2. 250 colonies would be likely to overstock any locality, if placed all together.

J. M. Hambaugh (Calif.)—1. In accord with best information I can obtain, 100 pounds per colony where bees are in the hands of practical bee-keepers. 2. 250 colonies would be 25,000 pounds annually.

S. T. Pettit (Ont.)—1. Where the bees are properly handled, 75 pounds of comb, or 125 pounds of extracted. But the number who attain to those figures, on an average, are exceedingly few. 2. I don't know, but it would usually make a big difference.

O. O. Poppleton (Fla.)—1. I cannot answer, as my locality has not been settled by white men anywhere near 25 years—not long enough to make an estimate, but not to exceed 100 pounds. 2. I do not know. No such size of apiaries has ever been kept in this section.

Rev. M. Mahin (Ind.)—1. That is a poser. Taking bee-keepers as they are, with the methods that have been followed, I think that the average has not been more than 25 pounds. Yet I have sometimes gotten more than 100 pounds. 2. I think an apiary of 250 colonies would starve.

C. H. Dibbern (Ill.)—My average has been about 40 pounds of comb honey; some seasons a good deal more, but some seasons none at all. 2. 250 colonies would overstock my locality, as I have found by experience, and that would likely bring the average down to 10 pounds.

D. W. Heise (Ont.)—1. The average with me for the past five years is 69

pounds, but I think the general average would fall below that figure for the past 25 years. 2. I do not think the pasturage is sufficient in this locality for the accommodation of 250 colonies in one apiary, therefore the average yield would necessarily be very low.

The Nickel Plate Road
will sell tickets to Boston, Mass., and return at a fare and one-third for the round trip, on certificate plan, account of meeting of Street Railway Association of America, Sept. 6-9, 1898. GENERAL ITEMS

Storing Surplus Honey.
I have 8 colonies of bees in good condition, and all storing surplus. I got 130 pounds of honey from 2 colonies, and sold 83 pounds for \$10.40.
R. L. HASTIN.
Dade Co., Mo., Aug. 12.

Half Black Honey-Dew.
I commenced the season of 1898 with five colonies, increase to 8, and got only about 100 pounds of comb honey—one-half of it black honey-dew.
E. R. MUNN.
Clarion Co., Pa., Aug. 16.

May Get a Fall Crop.
This has been a very poor season for bees so far, but if it is not too dry from now on we may get a good crop of fall honey.
J. S. BARB.
Trumbull Co., Ohio, Aug. 16.

Must Feed for Winter.
I have 80 colonies of bees, but no honey this year. I will have to feed for winter.
W. H. DUNCAN.
Douglas Co., Kan., Aug. 17.

Short Honey Crop.
I will have a short honey crop this season, like all others in this part of the country.
D. N. RITCHEY.
Licking Co., Ohio, Aug. 16.

Raising Hive Cover for Ventilation.
I read on page 509, a scheme for ventilating hives, by Alder Bros., of Texas. This seems to be good enough for a man who has plenty of time to do all such fixings on a few hives, but a bee-keeper who has hundreds of hives could not take the trouble and time to do it. I have the 8 and 10-frame dovetailed hives, and I am living in a very warm country (Southern portion of Louisiana). Last year my bees hung out a good deal on account of warm weather and heat in the hive. This year everything is all right—I never saw one colony (have nearly 100 now) loafing or hanging out, by employing my own invention, which is very simple. It is nothing else

Best Basswood Honey in Barrels ***

We have a limited number of barrels of very best Basswood Extracted Honey, weighing NET about 280 lbs. which we are offering at 7 cents per lb. f. o. b. Chicago. Do you want a barrel or so of it? If so, address, with the cash,
GEORGE W. YORK & CO.,
CHICAGO, ILLS.

California.—The next meeting of the Fresno County Bee-Keepers' Association is to be held in the City Hall, Fresno, Calif., Wednesday, Sept. 14, at 10 o'clock a. m. All honey-producers are requested to attend.
Caruthers, Calif. W. A. H. GILSTRAP, Sec.

Excursion to Boston.
The Nickel Plate Road will sell excursion tickets from Chicago to Boston and return for trains of Sept. 16, 17 and 18, at rate of \$19.00 for the round trip. Tickets will be valid returning until Sept. 30, inclusive. On account of heavy travel at this particular time, those desiring sleeping-car accommodations should apply early to J. Y. Calaban, General Agent, 111 Adams St., Chicago. Telephone Main 3389. (58-32-6)

THE BIGGEST OFFER YET!

Last year only about one per cent—only one subscriber in 100—ordered his Review discontinued. If the Review could secure 1,000 new subscribers the present year, there is an almost absolute certainty that at least 900 of them would remain; not only next year, but for several years—as long as they are interested in bees. Once a really good bee journal visits a bee-keeper a whole year it usually becomes a permanent member of his family.

I would have no difficulty whatever in getting twice 1,000 new subscribers this year, if all of the bee-keepers in this country had read the Review the past year. I have sometimes thought that it might pay a publisher to give away his journal one year, simply for the sake of getting it into new hands. There are, of course, decided objections to such a course; but I am going to come as near to it as I dare. Here is my offer:

If you are not a subscriber to the Review, send me \$1.00, and I will send you twelve back numbers, the Review the rest of this year and all of next year.

Each issue of the Review, especially if devoted to the discussion of some special topic, is really a pamphlet containing the best thoughts and experience of the best men upon the topic under discussion. Twelve back numbers of the Review are, to a certain extent, so many little books devoted to as many different phases of bee-keeping. Some issues of the Review are now out of print; of others only a few are left; while of others there are several hundred. Of course, I shall send those of which I have the most, but no two alike.

Most people subscribe for a journal at the beginning of the year. In this case there is no use of waiting, as you will get the Review for next year just the same as the you waited until next January to subscribe, and you get all the rest of the numbers for this year FREE. The sooner you subscribe, the more free issues will you receive.

Let me tell it over once more. For \$1.00 you get twelve back numbers, the Review the rest of this year, and for all of 1899.

W. Z. HUTCHINSON, Flint, Mich.

DOING DOUBLE WORK.

With an ordinary high wheeled, narrow-tired wagon, on the average country road a man with a single team of horses can haul a load of a ton or a ton and a half of produce. When an

...ELECTRIC HANDY WAGON...

equipped with our **Low Steel Wheels, with Wide Tires** is used, the load may be increased to two or three tons, and it will be drawn more easily by the same team for the same driver. Just stop and figure up the profit of thus increasing the working capacity of both man and team. It will amount to a snug sum at the end of the year. **ELECTRIC LOW STEEL WHEELS FIT ANY WAGON** and last indefinitely. Our free book, "Farm Savings" contains much of value. Send for it.

ELECTRIC WHEEL CO.
Box 16, Quincy, Ills.

SPECIAL OFFER ***

For the next 90 days we will sell warranted purely mated **ITALIAN QUEENS** at 50 cts. each; half dozen \$2.50; tested, 60 cts. each; half dozen, \$3.00. Sale arrival guaranteed. Fifteen years' experience in queen-rearing.

LEININGER BROS, Fort Jennings, Ohio.

\$26.00 to Boston and Return on certificate plan, via the Nickel Plate Road, account of meeting of Street Railway Association of America, Sept. 6-9, 1898. For further information, write J. Y. Calahan, 111 Adams Street, Chicago Depot, Van Buren Street Passenger Station, on the loop. Telephone Main 3389. (63-35-1)

Finest Alfalfa Honey!

IT SELLS ON TASTING.

The Honey that Suits All Who Buy It.

We can furnish **White Alfalfa** Extracted Honey, in 60-pound tin cans, on board cars in Chicago, at these prices: 1 can, in a case, 7 cents per pound; 2 cans in one case, 6 1/2 cents; 4 cans (2 cases) or more, 6 cents. The Cash must accompany each order.

A sample of the honey will be mailed to an intending purchaser, for 8 cents, to cover postage, packing, etc. We guarantee purity.

GEORGE W. YORK & CO., 118 Michigan Street, CHICAGO, ILL.

than that I lift the cover of the second story at the rear about 1/4 inch, and in the middle I insert a common nail between the hive and the cover. This gives about 1/4 inch air space in the rear of the hive; there is therefore a continual current of air from the entrance to the upper story in the rear, and no bees will hang out. I never have seen any robber bees going in there—even the bees do not work through this opening. By looking in, you see only guards all around the opening. I take a nail, as metal the bees will not attach to the wooden hive; and to keep the hive-cover in this position on the hive I only lay one brickbat on the middle of each cover.

J. H. HEMPEL.

Tricksters at Agricultural Fairs.

Wherever large numbers of people gather, a class of persons is usually found who make a living by deceiving the public. They have schemes and tricks innumerable that appear to be easy and simple; but in reality they are quite difficult, and in some cases impossible to successfully perform. They have wheels and machines that are doctored to turn as the proprietor may wish to make them. They have cocoanut-headed negro dodgers to arouse the brutality in men and boys. They have tented shows which are disgusting in coarseness and vulgarity.

Among the throngs at Agricultural Fairs these leeches are out of place. They contribute nothing helpful or good. They do not add to the attraction of the fair. They do not bring desirable patrons. They do not swell the gate receipts.

They are not patronized by intelligent patrons of the fair. They are not wanted by honest farmers. They are shunned with fear by thoughtful parents. Because of their presence, even the fair is not patronized by many of our best citizens' families.

The harm accomplished by these self-invited fakirs would doubtless surprise us, were it possible to gather and trace back to their door all the results of their work. They distract the thought, they divert the attention, they destroy the interest in the real work of the fair. The competitive exhibitions, the meritorious displays, the awarding of prizes, are all robbed of the undivided interest that belongs to them, and which the proprietors have labored day and night to develop.

The morals of the country suffer seriously, we believe, from actions and words that, without warning, are sprung upon inquisitive audiences in the tent shows.

We are glad to see that a strong effort is being put forth this season to keep these objectionable features out of the grounds, and the attitude of managers is encouraging.

E. B.

Minnesota.—The adjourned meeting of the Minnesota Bee-Keepers' Association will be held on Wednesday forenoon during State Fair week, at the place where the honey exhibit is made on the fair grounds. Make an effort to be there, and invite other bee-keepers who are not members to come and join the Association.

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published today. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us **Two New Subscribers** to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Page & Lyon Mfg. Co. New London, Wisconsin,

Operates two sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of

Bee-Keepers' Supplies.

They have also one **One of the Largest Factories** and the latest and most-improved machinery for the manufacture of

Bee-Hives, Sections, Etc.,

that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the **clearest and whitest Basswood** is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equipmt with best machinery, all combine to enable this firm to furnish the

Our 1898 Catalog

Send us your name and address and we will take pleasure in mailing you a copy.

G. B. LEWIS CO., WATERTOWN, WIS.

Special Agent for the Southwest—

E. T. ABBOTT, St. Joseph, Mo.

Mr. Abbott sells our Hives and Sections at factory prices.

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful straw-colored transparent Foundation, Improved Smokers and Hokey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Aug. 18.—The new crop is now coming forward and meets with a fair demand. Best grade of white comb honey in 12 to 24 section cases, 12c; that which is fancy, 10 to 11c; ambers, 8 to 10c; dark, 7 to 8c. Extracted, 5 to 7c for white; 5 to 6c for amber; 4 to 5c for dark. Beeswax, 27c.

R. A. BURNETT & CO.

Kansas City, Aug. 23.—Fancy white comb, 13@14c; No. 1, 12@13c; amber, 11@12c. Extracted, white, 5 1/2@6c; amber, 4 1/2@5c. Beeswax, 22@25c.

We are receiving few shipments of new comb and extracted honey. The demand is good for this time of the year.

C. C. CLEMONS & CO.

New York, Aug. 26.—We have a good demand for new crop comb honey, and it is beginning to arrive. Have sold some shipments at 14 to 15c for fancy white, 12 to 13c for No. 1 white, and 10 to 11c for fair white. We think these will be about the ruling prices this fall; exceptional fine lots may sell at a little more. Extracted is in good demand at unchanged prices. Beeswax dull at 26 to 27c.

HILDRETH BROS. & SEGELKEN.

Boston, Aug. 19.—Fancy in cartons. 13c; A No. 1, 11@12c; No. 1, 10@11c; No. 2, 9c.

New comb honey is now coming in, and while the demand is light owing to the warm weather, yet it is being well taken. Extracted, very little California on hand, and selling readily at 6 1/2@7 1/4c. Florida now arriving and selling at 5@6c. White clover scarce and wanted.

BLAKE, SCOTT & LEE.

San Francisco, Aug. 10.—White comb, 9 to 10c; amber, 7 to 8 1/4c. Extracted, white, 6@6 1/2c.; light amber, 5 1/2 to 6c. Beeswax, 23@25c.

Although stocks are very light, the quality of this year's crop is of a much higher average than was generally expected, considering the dry season. There is some of this year's product which is of exceptionally fine quality. Market is firm at quotations.

Detroit, July 21.—Fancy white, 11@12c; No. 1, white, 10@11c. Extracted, white, 5@6c; dark, 4@5c. Beeswax, 25@26c.

New honey is arriving, but prices are hardly establish.

M. H. HUNT.

Minneapolis, July 26.—Fancy white clover comb is now selling at 11@12c.; amber, 10 1/2c. Extracted fancy white clover, 5 1/2c.; amber, 4 1/2@5c. Dark grades, both comb and extracted, not wanted at low prices.

S. H. HALL & CO.

Indianapolis, July 18.—Fancy white comb honey, 12@12 1/2c; No. 1, 10@11c. Extracted, white, 6@7c. Beeswax, 25@27c.

Only a few arrivals of fancy white comb; market almost bare, and demand good. Quite a little comb honey from honey-dew is being offered, but there is simply no demand for the stuff.

WALTER S. POWDER.

Milwaukee, Aug. 18.—Fancy comb, 11 to 12c; A No. 1, 10 to 11c; No. 1, 9 to 10c; amber, 7 to 8c; old and dark, 5 to 6c. Extracted, white, in barrels or kegs, 5 to 6c; dark, 4 to 5c. Beeswax, 25 to 26c.

The market for honey is in very good condition; while there is yet a little of the old crop on hand, it is in very good order, and some demand, which will clear off everything before the new crop will arrive, very plentifully. There is already some receipts of new, but mostly extracted, and some very good quality, yet we fear the danger is in extracting too early, before the honey is fairly ripened. We anticipate a good demand a little later, and think values will remain about the same as present quotations.

A. V. BISHOP & CO.

Buffalo, Aug. 12.—Fruit prevents a large demand for any kind of honey at present. A few cases of fancy one-pound new comb can be sold daily at 11@12c; but any grade below must be urged at proportionately lower prices. Would advise writing us before shipping here. There is no demand yet for extracted.

BATERSON & CO.

St. Louis, July 9.—Fancy white comb, 10 to 11c.; No. 1, 10c.; amber, 9 to 10c.; dark, 8 to 9c. Extracted, white, 5 1/2 to 6c.; amber, 5 to 5 1/2c.; dark, 4 to 4 1/2c. Beeswax, 20 to 22c.

WESTCOTT COM. CO.

Cleveland, Aug. 3.—Fancy white, 13@14c; No. 1, white, 12@12 1/2c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c.; light amber, 6c.

The demand for honey is exceptionally good, owing to the crop in this vicinity being very light.

CONTRIBUTED ARTICLES

No. 6.—The ABC of Marketing Honey.

BY HERMAN F. MOORE.

[Continued from page 549.]

While we were in Toledo we took occasion to run out to see Dr. A. B. Mason, well known to all bee-keepers. I had some misgivings lest the genial Doctor would think I was intruding upon his "preserves," but he assured me that my systematic drumming up of the honey consumers of Toledo would inure to his benefit, for I would, no doubt, get many people to using honey who never had before, and when I was gone they would come to him for further supply.

I think in general the producers of honey need feel no jealousy of each other for the "harvest [of buyers] is great and the laborers are few," speaking generally.

In almost any part of the country you will find unoccupied territory, if you look for it, and where your work will bring a good return.

If by chance two or more of you are occupying ground so near that your interests seem to conflict, get together and agree upon your shares of the territory, and also on prices alike as nearly as possible.

In case you are unable to agree, never try to injure a competitor, but compete in an honorable manner, charging fair prices, and giving better stuff than any one else, if possible.

Never slander your rivals in business, and a good business man has said, "Don't advertise them in any way." If you cut prices or abuse your competitors, you will injure yourself more than them.

There is an advantage you will find in working the large towns in your locality more closely than the small ones. You can generally get more per pound for your honey, and can deliver larger amounts at a time with less travel. Also, you will be more likely to find in large towns and small cities wholesale dealers in everything you may need in glass or tin ware, and they will usually give you the same low prices they give to grocers and tradesmen. You will need to introduce yourself, and explain that you are buying to sell again, and as a rule you will have no trouble in getting almost the lowest wholesale prices on everything. This matter of buying such things as you need as cheap as possible is very important.

In the cities the great stores pay large salaries to their buyers, and can well afford to do so, for a good buyer can save several times his pay in a single year.

If possible buy 100 or more at a time, of any article you may need, as by so doing you are more likely to get a low price. Business men and dealers don't always tell the truth about articles they sell, but you can call upon different dealers in the same line, and you will very soon find out the facts in any case where you are interested.

After several months of pretty thorough work in Toledo, we began to feel as if pastures new might pay better for a time. So trips were made to Zanesville, Columbus, Canton, Akron, Massillon, Cleveland, and later on Ft. Wayne, Lafay-

ette, Logansport, Indianapolis, in Indiana. I believe in Ft. Wayne was the only place that I was requested to pay a license. You will remember our method of selling honey could not be correctly described as peddling, but selling by sample for future delivery, usually called soliciting. Under the laws of most of the States those who sell by sample are exempt from license charges, but Ft. Wayne was a law unto itself in this case, I believe.

The best course in such cases is to pay the license. You cannot afford to spend your time and money contesting their right to tax you; and you can rest assured that no great time will pass before some one with plenty of money and fighting qualities will test such a law if there is an opportunity to do so.

Right here it may occur to you to ask, "What shall I do about adulterated honey found in retail grocery stores?" If your own good only is in view—I mean your own selfish interest—I say, do nothing; for the more poor stuff the grocers sell under the name of honey, the better your trade will be, and the more sure you are of lasting success.

I think three-fourths of my trade has been from people who were afraid of buying impure honey from the store.

You may ask, "What is best for the producers of honey as a class in regard to this matter of selling impure honey by the dealers?" My judgment is that if it were possible to sup-

Herman F. Moore.

ply all honey for use on the table directly from the producer to the consumer, that there seems no doubt but that the adulteration of honey must cease entirely. There seems no doubt but the poor quality of store honey as a rule works directly into your hands as producers, if you sell your crop to the family trade alone.

In your travels selling honey it will be a constant surprise to you how much you have to learn. When you start out your bump of self-esteem may be quite well developed, but the longer you deal with the great public the more modest you will become if you are the right sort. In fact, you will find that a teachable disposition and a willful mind are necessary to success in this as in many other undertakings. If on searching yourself you are unable to find these qualities, there

is no need to begin. The old ideas that "anybody can farm," "anybody can keep bees," "anybody can sell honey," have been long since exploded. Constant study, constant vigilance, constant work, are necessary in order to the greatest success in anything, and no less so in selling honey than in any other department of human industry.

It may be a hard question to answer why "Do you want to buy some honey?" won't sell much honey for you in any place on earth, but it won't. One reason is the constant variety of ways in which the wholesale dealers approach their trade. People get used to being amused and expect it, and if you intend to make a success where another man made a failure, you must study up new ways to amuse and instruct and educate the people. There is no business which affords greater opportunities for this than selling honey. Your bee-hives, your apiary, your honey-house, are chock-full of things about which the general public knows almost nothing. You will find that the head of a great business house will listen, like unto a fairy tale, to your account of rearing a queen-bee in a hive, especially when illustrated by a queen-cell in your hand.

When you start out to-morrow morning, take along with you a brood-frame selected from one of your hives. You will need one that has no larvae or sealed brood in it. Also take one that has some drone-comb on the lower edge, also one or two queen-cells that have been used, that is, that have hatched queens. You can get a very nice comb by inserting in a strong colony a brood-frame with half sheet of foundation and leave in two days and then remove it.

People are very curious about the "manufactured comb," as they call it. If you put in a half sheet of starter, as suggested, a good way would be to protect one-fourth the length by thin pieces of boards, so as to keep the bees from drawing it out. Then people can see just what you give the bees and just what work they do upon it. This will save you lots of words of explanations that would otherwise be necessary.

My first call is on a man in the leather business I have known for years. A salesman sitting at his elbow greets me with, "Oh, that is some of the manufactured honey, is it?" I hold up the brood-frame fresh from my bee-hive, covered with propolis in spots and adorned with burr-combs of greater or less size. I say, "Would you accuse a man of fooling his time away sticking beeswax all over on the edges of the wood? What do you think of this red, sticky stuff? Do you think that adds to the beauty? That we call bee-glue, and a nasty stuff it is. This frame is just as the bees built it in my bee-hive, except the nails and wood and wire. We make them very strong, as they are part of our capital. We use these frames 15 or 20 years in our hives if we chance to keep bees so long. Just look at this red, yellow, blue and green stuff in the cells of comb. That is bee-bread. The bees store that in the combs to feed their young. Why, my dear sir, this frame of honey-comb hears upon its face the impress of the insects' work, just as much as the spider's web; and you might just as well say, 'Oh, that is a manufactured spider's web,' as to say so about this honey-comb. Just notice the bridge or trestle work construction where the honey-comb is fastened to the wood. A man can't fasten wax to wood in any such way. Look at the six-sided shape of the little wax-buckets the bees have built to hold their winter's supply of honey. Did you notice these big cells on the lower edge of the frame?"

"What are those?"

"Those are cells to rear the male bees in the bee-hive. Poor fellows, they have no sting to fight with, no honey-sac to gather honey—they don't know how to work wax or feed young bees or gather pollen; and just as soon as the honey-flow in the flowers stops, they are all put to death without remorse."

"What is this funny looking thing on the edge of the comb?"

"That is a queen-cell. The bees take any worker-egg, build around it one of these big black cells, and feed it five times as much as it can eat, and it hatches in 16 days into a perfect female, capable of laying 2,000 to 3,000 eggs a day in the busy season of two or three years of her life. It would have taken 21 days for this same egg to hatch in the little cell when fed less bountifully."

"Isn't that wonderful?"

"Yes, sir, that is truly strange even to us who work with the bees constantly, and handle them fearlessly. The study of the bees brings forward new things unlimited in number, even tho you spend your life among the bees."

"Then, do you mean to say that men don't make comb honey, fill it with glucose, and wax the cells shut with a hot iron, as I have read it in the papers?"

"Yes, sir, I say it can't be done. Men are mean enough to do anything, but they can't put the wax together that way at all, and even if they could the cost would be too great.

Could you make a honey-comb like this for one dollar, labor and material? I think not; but my bees made it for 20 cents or less. Can even the cheap Chinese or Japanese compete with that? I think not. And as to capping wax with a hot iron, that is too ridiculous. Try your hot poker near some honey-comb; it will melt away like frost under the sun."

[Continued next week.]

The Thumb-Tack Method of Keeping a Record of the Operations in the Apiary.

BY JOHN ATKINSON.

Several years ago D. D. Palmer, in the American Bee Journal, advocated the use of small slates with holes drilled in one end to hang them on a nail or screw on the back of the hive for this purpose. I myself use wooden tags in the same way, planing them off when they get full of writing; and various other devices, such as Root's queen-registering cards, have been and are being used for recording purposes.

But we often wish to mark frames as well as hives, especially in queen-rearing operations. For this purpose Mr. Doolittle and Mr. Alley, in their books on queen-rearing, tell us to scrape off the wax and propolis from the top-bar of a frame, or take off a shaving and write dates, etc., on the top-bar. You scrape a bar or two and your knife becomes so dull it won't scrape worth a cent. If the bar is not well scraped you can't write on it worth a cent. (Did you ever try it, and refrain from profanity? Then you are a daisy.) You think you will "take off a shaving." The top-bar is a little cross-grained, and, of course, you happen to start the knife the wrong way of the grain, and it's a cold day if you do not split the top-bar in two. Then, at the next operation this all has to be done over again, and finally you have taken off so many shavings that the frame is practically spoiled, and, of course, contains a nice, straight, worker-comb which you don't want to lose or transfer into another frame. In short, there is no satisfaction, but lots of disappointments and heart-burnings in this method of keeping a record.

Palmer's slates for the outside of the hive were well enough as far as they went, but he had to make them by removing the frames from school slates and sawing the slates into small pieces and drilling the holes, thus paying for frames only to throw them away, besides probably spoiling saws and breaking slates in drilling.

Root's queen-registering cards are probably very handy for keeping a record of the transactions on queen-rearing nuclei, but the pins may easily be moved by accident, thus knocking your record into a "cockt hat," and any cards are easily spoiled by the action of the sun and rain.

Doolittle keeps some kind of a record with small stones placed in certain positions on the hive-cover. So do I. I open a hive; in doing so I tip the cover a little, off roll the stones. (Don't talk to me about flat stones—we haven't got 'em in this "neck of the woods"), and unless I can remember how they were placed, my record is again gone to the "demnition bow-wow." Anyhow, I have to pick them up and replace them.

What am I going to do about it? Well, I can't do anything but make a suggestion, which is this: That some of the manufacturers of apiarian supplies get us up a set of thumb-tacks similar to those used by draughtsmen to hold their paper on the draught-board, with numbers from 1 to 31, for the days of the month, or more if hives are to be numbered with them, and all the letters of the alphabet stamp or cast in the metal of the tack-heads, put up in boxes or "fonts" containing each several alphabets and several sets of numbers, the box to have a convenient handle attached so that it can be easily carried in one hand from hive to hive.

These thumb-tacks can be easily placed upon a hive-body, the top-bar of a frame, or anything else, and as easily picked off with the thumb-nail and dropt into their proper compartment of the box, and this can be done much quicker than any writing, either on slate, wood, or pasteboard; would be impervious to the action of the weather; where used on top-bars of frames it could be easily cleaned of propolis by soaking for a short time in gasoline; would last a life time if properly cared for—in short they would, in my humble opinion, "take the bakery."

On page 439, our Boller gives a quotation from Gleanings, of Mr. Doolittle's management of pollen-filled combs; says white clover pollen has honey stored over it, and is saved till spring, "care being taken as to worms." I have lots of such combs now in which the bees are just covering the pollen with honey. They will be sealed over after awhile, and if in new comb the pollen may be seen by holding the combs up to

the light; but if in old, black combs it cannot be detected after the cells are sealed. Now, if I had a lot of thumb-tacks with the letter P on their heads, I could stick one on the top-bar of each such frame and let it remain there till spring, leaving the comb in the hive without any "care as to worms," and next spring I could put my hand right on it when wanted. See!

Like Dr. Miller, I keep a "queen-book" in which is recorded the age, race, strain, etc., of queens, but in order to keep track of them it is necessary to know "where they are at." I don't like numbering the hive-bodies, as it is an odd trick of mine, when handling a colony, to move it off the stand, placing an empty body on the stand, and handling the frames over into it; and my numbers would have to be constantly changed; therefore I number the stand by driving a flat stake of hard wood into the ground at the back of the stand. I number these stakes with a hammer and cold-chisel, using the Roman notation. When it comes to, say, XXXIX, there is considerable chiseling to be done. Oh! for a thumb-tack to stick on the head of that stake, and save all that "monkey work!"

When the hives are placed in the cellar for winter, a corresponding number on a thumb-tack could be stuck on the hive-body, and every hive placed on its old stand in the apiary, if desired, with just no bother at all. And there are a thousand and one other places where they could be used with pleasure and profit to the apiarist.

Words, instead of single letters, could be used to designate certain operations, abbreviating the longer words. For instance, when a queen commences to lay, a tack with the word "eggs" on it, in connection with another containing the date, would be sufficient. "Q's" would answer as well as the word "queenless" in full, and so on, *ad infinitum*.

The body of the tack ought to be short, perhaps not more than $\frac{1}{4}$ of an inch, while the head could be from $\frac{3}{8}$ to $\frac{1}{2}$ of an inch in diameter, the latter size, perhaps, the best.

Hi, there, you "Rootvillians!" You windy fellows who stamp "A. I. R." on everything you make, here's the "root" of an idea which I should like to see you make

"Bravely to burgeon, and broadly to grow,"

till we should have a system of keeping records of operations in the apiary easier, quicker, and more effective than any I have yet seen. Will you help us out? Or, if you won't, will some one else? Perhaps you think I have "thumb-tacks" on the brain. Well, I haven't got them any more than I have "bees in my bonnet." If you object to thumb-tacks "on the brain," please give them to us in a box, as outlined above. The old Scotchman's advice to his son, "Be aye sticking in a tree, Jock; it'll be growing while ye're sleeping." I would modify thus: Be aye sticking in a thumb-tack, Jock, it'll save ye lots of heart-burnings.

At any rate, for all kinds of records which are kept on the frames, these tacks would be invaluable, as it is almost impossible to make a legible mark with a lead-pencil on wood which has the least bit of wax or propolis on it; and constant cutting or shaving off the frames is, to say the least, bad practice; and lots of time can be saved by being able to put your hand on the frame you want at once, without having to handle a number of frames to find it; while the time saved over scraping and writing is no small item of itself.

Crow Wing Co., Minn.

A Consideration of Extracting-Frames.

BY S. A. DEACON.

"Who shall decide when doctors disagree?"

That great English bee-master—Mr. S. J. Baldwin—says in his "Bee-Keepers' Instructor:"

"Shallow frames for supers are recommended by some as the best for extracting purposes, and they would have you believe that by their use an increase harvest of honey may be secured. That the bees can fill a 5-inch comb quicker than one of 8 inches is, of course, undeniable, but I fail to see the advantage of having a given number of the former filled in, say five days, if the same number of the latter are filled in eight days. My experience has proved that this is the case, and, therefore, I contend that there is an immense advantage in using one size of frame only for all purposes. The necessity for extracting and interference is less frequent, vexatious complications are prevented, and, above all, swarming may be more easily controlled, as the combs from the top hives, after extracting, can be exchanged for those below, and thus the cause of swarming removed."

It would not appear to have occurred to Mr. Baldwin that there is not likely to be much, if any, swarming after the sea-

son's honey is extracted! And tho I do not profess to know much about it—my object in penning these remarks being, in fact, to elicit information from those far more experienced than myself in the production of extracted honey—still, I should think that to remove two or three hundred of Mr. Baldwin's 10-deep-frame supers full of honey, from apiary to bee-house, would necessitate the laying down of a tram along the rows of hives, and the erection of a traveling crane! Is it to this *weighty* objection that we owe the universal use of shallow extracting-frames in the United States? Or, on what ground have they the preference? Be the cause what it may, what I particularly wish to know is, what decided A. I. Root, for instance, to make the dovetailed hive's extracting-frames only $4\frac{1}{2}$ inches in depth; and the Dadants, for instance, to make theirs 6 inches? I suppose there is some intelligent explanation; if so, will Mr. E. R. Root or Mr. C. P. Dadant kindly furnish it—and obligingly reply to this, as also to what follows, in the columns of the American Bee Journal?

In anticipation of their reply I may say that I have in my mind a very humorous picture which appeared some years ago in the London Punch. An amiable-looking old gentleman is seen at the door of a marquee greatly interested evidently in the cricket match being played. He seeks information from an athletic but not highly intelligent looking cricketer as to the meaning, or origin, or cause of use of a certain term used by the players, thus:

OLD GENT—"Why is a ball like that called a 'Yorker,' sir?"

PROFESSIONAL PLAYER—"A 'Yorker,' sir? Oh, when the ball's pitch right up to the block,"—

OLD GENT—"Yes, yes—I didn't ask you *what* a 'Yorker' is"—(with dignity)—"I know that as well as you do. But *why* is it called a 'Yorker'?"

PROFESSIONAL PLAYER—"Well, I can't say, sir. I don't know what else you could call it."

It may not be very complimentary to either Mr. Dadant or Mr. Root to say that I expect no more intelligent an answer to my query than, "Well, I don't know what else depth you could make them;" but, really, I find it impossible to conceive any intelligent reason for fixing upon either of these two greatly-varying sizes. If the frame used by such veterans in the pursuit as the Messrs. Dadant is the best size, what defence can the A. I. Root Co. offer for giving us those *extremely* shallow frames? What has governed the choice of these particular sizes in either case? Is it due to the fact that in the case of Root's dovetailed hive two supers are just equal in size to one brood-body? I fail to see any advantage in that—whatever it may have for the supply manufacturer—and think it would have been more sensible to have made the frames $5\frac{1}{2}$ in place of $4\frac{1}{2}$ inches, so that two would go easily into the extractor-basket—Cowan's. Dadant's frames, again, are a trifle too deep to admit two in this basket, which I find measures $11\frac{1}{2}$ inches—thus taking comfortably two of the Heddon frames, and which are of the sensible depth of $5\frac{3}{8}$ inches. Root's—*i. e.*, the dovetailed hive's extracting-frames—are *absurdly* shallow.

Another matter in connection with extracting-frames: An important consideration in the construction of an extracting-super and its frames is, one would think, bulk and weight; that it should be as light and handy as possible, commensurate with the requisite strength. Those obtained from the supply dealers are unnecessarily heavy, with their $\frac{3}{8}$ -inch sides; $\frac{3}{8}$ inch being thick enough for anything, the ends only being $\frac{3}{8}$ thick, and cleated with perpendicular pieces $\frac{3}{8} \times 2$ at each corner. That is how I make mine; and put together with 2-inch wire-nails, they will last quite as long as the unnecessarily heavy, clumsy dovetailed Root super. The cleats afford so much surface, or such a thickness for nailing, that they are less liable to warp than are even the thick sides of the dovetailed super.

These thin sides allow, moreover, of 9 frames in the super, in place of the now too loosely fitting 8; and it would allow of another *very* necessary improvement, *viz.*: increase width of the shallow extracting-frames by $1/16$ of an inch each. As it is, these extracting-frames are the same width as the brood-frames, whereas they should, or might with advantage, be fully $\frac{1}{8}$ inch wider; for the veriest tyro at bee-keeping knows that the honey-combs are always built thicker than the brood-combs. This extra width would, moreover, save 10 percent of the labor of capping and putting in and taking out frames in process of extracting.

Another fault with the dovetailed super is, that the side frame lies close against the side-wall of the super; whereas two little cleats, or offsets, $3/16$ inch thick, should be tacked snugly into the corners, keeping the side or end frame that distance away from the sides of the hive, and allowing

space for the bees to fill that frame as plump full as the others. In short, the whole thing is as slipshod and faulty an arrangement as can well be; unnecessarily heavy, frames too shallow and too narrow, and these offsets wanting.

Altho it would be the very height of presumption for me to call in question the wisdom and correctness of such experienced veterans as the Messrs. Dadant in the construction of their appliances and fixtures, still I am puzzled exceedingly to know why they make the top-bar of their shallow extracting-frames as heavy as those of their very deep brood-frames, viz.: $1\frac{1}{2}$ inches square. Does not this add unnecessary size, and consequently weight, to the super? If Messrs. Dadant can assign good reason for having these top-bars so enormously thick and heavy, then Root *again* must be wrong; for in proportion to the depth of the "dovetailed's" extracting-frame its top-bar should be nearly an inch thick in place of $\frac{1}{4}$ of an inch, as now made.

Nor is it easy to understand why the Dadants use such a thick bottom-bar—both for brood and extracting frames—viz.: $\frac{1}{2}$ inch square, where Root's bottom-bars are only half that thickness, or $\frac{1}{4}$ inch. We may be assured that were there not good and sufficient reason for the use of these *seemingly* unnecessarily thick bars the Messrs. Dadant would not increase the size and weight of their supers by using them; hence Messrs. Root are here, we must assume, again wrong. There is no gainsaying the experience and the intelligence which guides and directs the Dadants in even the minutest particular connected with their system of honey-production; and we must admit them to be standing authorities in the matter of producing *extracted* honey; hence, more satisfaction would be given to their customers were supply manufacturers to take their cue from such men, and make their goods in accordance with what the very many years of intelligent practice have decided to be best. As it is, this divergence of opinion (in many small, yet important details) among our recognized experts is, to say the least, confusing to the intellect of the average bee-keeper who is anxious to conduct his business aright, and in accordance with the methods most approved by men of long experience, and who have brought a high order of intelligence to bear upon their, and our, pursuit.

South Africa.

The Use of Comb Foundation.

BY E. R. MAGOON.

I should like to reply to S. A. Deacon's article, on page 579 (1897), headed, "Comb Foundation—Is its Use Profitable?" If the author of that article is a practical and experienced bee-keeper he must know from observation and experience that the use of comb foundation is very profitable for the bee-keeper, both in the brood-chamber and super.

As to whether it will take 20, or even 6, pounds of honey to make one pound of comb or wax, I shall not say, but I am of the opinion that we lose, or fail to get, more than six pounds of honey by the bees having to produce one pound of wax. To help prove my assertion I will mention a little experience I had last season (I had the same experience many seasons before).

I hived a large swarm in a 10-frame hive, each frame being filled with nice, clean comb. I placed the hive on scales, and balanced the scales early the next morning. At night they tipped the beam at $12\frac{1}{4}$ pounds gain, and $7\frac{1}{2}$ the next day. Now I am of the opinion that had the same swarm been put in an empty hive the gain would have been $2\frac{1}{4}$ to 3 pounds. That had been my experience in previous tests.

Another assertion that I consider altogether misleading, and as far from the truth as the east is from the west—"That the bees go on producing wax whether they need it or not; and if we furnish them foundation the wax-scales are dropt on the floor of the hive, etc."

Now I know from personal observation that the bees do not produce wax (to amount to anything) unless it is needed for comb-building or filling cracks. Also, that the bees do draw out the extra wax in the sidewalls of foundation and build it into the comb, so that not one particle is wasted; I have watched the process by frequently examining foundation of bright yellow wax, that the bees were building into comb, and I could see just how far the wax extended in the comb; and in some cases there was wax enough to nearly finish the comb. In nor any other manufacturer of or dealer in comb foundation ever claimed that the foundation furnishes all the wax necessary for the completion of the comb.

Mr. D. wants to know if the use of foundation is as advantageous as it is supposed to be. I answer yes, and even more than it is popularly supposed to be, or there would be

more used, or it would be more generally used. I believe we get enough more honey to pay the extra cost of foundation, and get nice, straight worker brood-combs to boot.

Athens Co., Ohio.

Improving Stock—Methods of Selection.

BY W. A. VARIAN.

Improvement of stock and methods of selection are subjects in which there seems to be a little burst of interest at present. I am just through my swarming season, and while it has been going on I have been reasoning on the occurrences as they went. I have been running by the natural-swarm system, commencing with 38 colonies and increasing to 66. I lost seven swarms that I knew of, and some more that I did not see go. Before the season was nearly over I saw I should not have hives enough for near all the swarms cast, so I began to double in nearly every case; in two or three cases where the bunches were small I put in three, and even turned the hive on double swarms when I knew where the last one came from; and with all this doubling I have as yet to find a colony that is queenless among them.

What has impressed itself on my mind is the quantity and thoroughness of forced natural selection put through in running an apiary in this fashion. Of course the contests of the queens are but seldom on even terms, so the work done in selection for vigor is not as great as it looks at first. I should expect that where an old queen and a virgin were hived together the young one is killed. But in all cases where two laying queens, or two virgins, are hived together, the most active and strongest is the one that survives.

Then there is the natural selection of wintering (which paralyzes weakness). Of course this applies to all apiaries whatever way the bees are managed.

It appears to me that the selection for vigor that goes on in hives under this system must be very great. This safeguard against degeneracy is totally absent in all kinds of artificial increase and non-swarming systems; therefore, some form of artificial selection should be practiced. I suppose that a nucleus is a requisite in nearly every apiary (at least where they de-wing the queens and cut queen-cells), and the eggs, brood and bees used in forming the nucleus we can generally count on being taken from some of the stronger colonies, and give part of the improvement or maintenance of vigor, but I do not think to as great an extent as in the natural system, so they ought to be requeened from specially selected stock once in awhile.

I think the improvement caused by natural selection in the stock of some of the old-timers who have, and still follow, the natural-swarming plan is the chief cause of the great crops of honey they sometimes produce. At least that, and being rapid, easy workers in the apiary themselves.

The preceding paragraphs were written before I received and read the Bee Journal for July 21, and Mr. Crane's article, which pleased me greatly. I look on it that the producers of the honey crop should be able to weave into their systems of management, automatic selection for honey crop—or productivity—by rearing all extra queens from those colonies which fill the supers and work the extractor. And that the other selection for vigor will be attained by the better wintering of the stronger, and the occasional doubling of swarms. All special variations, such as color, length of tongue, size, quietness, and such things, are in the domain of the queen-breeder, and to be introduced by purchase when produced.

Weld Co., Colo.

The Golden Method—A Swarm-Hiver.

BY L. A. SYVERUD.

On page 483, Mr. S. A. Deacon seems to ridicule Golden's method of producing comb honey, and further says he cannot see how there can be any difference between this and the old method of putting back swarms. I think there is a wide difference between the two. First, it will be the same as to provide the bees with a new home, to hive them in the supers, as they will be settled down and have begun work by evening of the same day as hived, when the brood-chamber is set on top. By the old way of putting the swarm back they will only try the same thing over again, or else hang around and do nothing, as a rule.

Secondly, you will save the expense of an extra hive; and taking into consideration the extra labor to tend to the larger number of colonies with a greater amount of winter stores re-

quired for the two, this must be economized as much as possible in order to get the most out of poor pasturage.

It is, however, somewhat difficult to manage to get the bees to swarm at the proper time, which is right in the beginning or during a honey-flow. If no honey is coming in it will prove a failure; and I came very near abandoning the method last season before giving it a second trial, as the few I tried swarmed two weeks before the main flow, during which time they gathered no honey. Besides I was not prepared for the trial—did not have a decent hive, nor a single queen's wing clip.

This season I was better prepared, and as a comment on Golden's method I will say that hereafter I expect to follow it altogether, when possible, as this season I gave it a second trial and found it entirely satisfactory.

I cannot give the number of pounds obtained by the above method over those hived in brood-chambers (as I kept no record), but I am satisfied they gave me one-half greater yield than the others.

Mr. Deacon says he expects as much pollen in the sections as honey. I wish to say that in not a single section could I detect the least speck of pollen, and the comb and honey was as nice as you could wish for. Mr. D. should try a couple or half dozen colonies next season; I am sure he will be pleased with the results.

Mr. Golden says he never saw an egg in a section cage after her five days' confinement. In two cases out of three I found them literally filled with eggs—two to four in a cell.

I do not like the double super. I use two supers of the ordinary size, and next to the cage I remove the one separator on each side of the cage, and replace them the fifth day. If a super holding 35 tall sections is used on a medium swarm, I think one super is sufficient, especially if honey is not coming in very fast.

A HOME-MADE SWARM-HIVER.

As I live in the timber I had to devise something to get down the swarms which clustered high in the trees. For this purpose I found a crotch of wood large enough to spread wide open a large bran sack, which I secured to the outer ends of the crotch, with rings for the other side of the sack to slide up and down the arms of the crotch. When I wanted to catch a swarm I pulled the sack wide open with a string, held it under the cluster and shook the bees into it. I then let go of the string and the sack closed on them, when I let them down to the ground by the aid of a heavy twine.

If this should be of service to any one I shall feel repaid for writing these lines.

Lincoln Co., S. Dak.

Out-Apiaries—How a New Yorker Manages.

BY W. L. COGGSHALL.

My first out-yard was established in 1878. I have now three, ranging from three to 26 miles from home. I take entire charge of them myself from home, with the help of a man and my 13-year-old boy, except during the extracting season when I have more.

To accomplish this I get everything ready at home when there is no work to be done at the out-yards, then the first trip in the spring sees every yard supplied with their supplies for the season. These include fuel for smokers, and even the matches to light them with. The kegs for the honey are taken direct from the factory to each of the yards just before the season opens. Of course I sometimes make a mistake in estimating the amount of store-room required, but it is an easy matter to equalize them when occasion requires.

Each yard also has its regular lot of tools and furniture which stays there the year through. This includes the extractor, store-can, uncapping-dish and knife, strainer, and plenty of tin pails for water, etc. There is a supply of nails, screws, racks, wire-cloth, and of course the hammer and screw-driver, two bellows, one automatic smoker, long wisp brooms and a wheelbarrow make up part of the outdoor equipment. In fact, each yard has about everything that is likely to be needed there except the bee-veils, which always go with the man who does the work. The spring locks which are on the houses are all alike, so that one key fits them all.

I always try to get as protected a location as possible when locating a new yard. This is usually in the edge of a piece of woods where a space can be cleared off and leveled down sufficiently for the purpose. I always try to get them at least 20 rods from the road, so as to have no trouble with passing teams.

When I make the lease for the location I include the right of way to and from it, and the right to move off the building, which I put up, when I go away. This building is usually

12x16 feet, and 8 feet high at the eaves. This will accommodate from 80 to 100 colonies, which is as many as the location will support in this section of New York. The bees are all wintered out-of-doors, either in chaff-packet hives or in large packing-boxes holding eight colonies. Those in the chaff hives remain packed the year round, but those in the boxes are unpacked at the time of apple-bloom, and are used as single-walled hives during the summer, being packed again in October for the winter.—Canadian Bee Journal.

Tompkins Co., N. Y.

CONVENTION PROCEEDINGS

Report of the Northern Illinois Convention.

The annual meeting of the Northern Illinois Bee-Keepers' Association was held at Freeport Aug. 16 and 17. The local papers, by mistake, advertised the meeting for Wednesday and Thursday instead of Tuesday and Wednesday, as it should have been, consequently only those who take the American Bee Journal were in attendance.

In the absence of the President, the convention was called to order by Vice-President Herrick, at 1:30 p.m., Aug. 16. The attendance was rather light, but the time was fully occupied in the discussion of questions, among which were the following:

QUEEN-REARING—WINTERING—WAX-RENDERING.

"Shall we rear our own queens, or shall we buy them of the breeders?" The general opinion was that the best way was to select the best colony in the yard and rear our own queens.

"How do you winter your bees?" Mr. France, of Wisconsin, winters his in chaff hives on the summer stands. Nearly all in the vicinity, however, winter them in the cellars, some giving top ventilation and others only bottom ventilation. All agreed that the cellar must be well ventilated.

"What shall we render our wax in? and how?" The larger bee-keepers should render by steam or hot water. The smaller by the use of a sun extractor. Old combs, however, will yield a much larger amount of wax if rendered in water.

As nearly all present came from other points, and would stop over to the next day's session, it was voted to have an evening session.

Nearly all present at the afternoon session put in an early appearance, and an animated session was held, and the hour for closing came all too soon. Very much of the interest was occasioned by the presence of one of Wisconsin's most noted apiarists, Mr. N. E. France, who is State inspector of apiaries for his State, where they have a most excellent law in regard to foul brood among bees, and appropriate an abundance of money for putting the law into effect, in consequence of which the dread disease will soon be stamped out in that State. This question was discussed to quite an extent in both afternoon and evening sessions, and consumed considerable time the second day.

No ladies graced the sessions on the first day, but Mrs. Stewart—the aged wife of one of Freeport's pioneer bee-keepers—sent in a beautiful bouquet of gladioli, which graced the President's desk, and was highly appreciated by all.

The second day's session began promptly at 9:30 a.m., with Vice-President Herrick in the chair. A large number of questions were in the box, and kept the meeting going at a lively pace, a few of which were as follows:

FOUL BROOD—JOINING THE UNION.

"Are the bee-keepers of Northern Illinois interested in the subject of foul brood? Do they want any laws on this subject, as a protection to their business?" This brought out a lively discussion, but was finally deferred till the afternoon session.

"What good can we expect by joining the Bee-Keepers' Union?" The objects of the United States Bee-Keepers' Union were ably set forth by Mr. France. Among others, the suppression of dishonest honey commission men, and the suppression of the sale and manufacture of adulterated honey. All agreed that it was a good thing, and all it needed was a large membership and a full treasury with which to prosecute

the rascals. The laws of this State for the purpose are all-sufficient. As a result of the discussion eight gave in their names and dollars, which the Secretary was instructed to forward to General Manager Secor.

"Has this Association paid anything towards the Langstroth Monument Fund?" Mr. Herrick reminded the Association of the debt due the late Rev. L. L. Langstroth in the invention of a movable-frame hive from which he received no benefit, on account of a horde of unprincipled men who stole his patent to such an extent that he was unable to prosecute them. He died poor, and it is now proposed by the bee-keepers of this country to raise \$200 to buy a suitable monument to place over his grave. The result was a collection of \$3.50 toward the fund, which the Secretary was instructed to send Mr. George W. York, to be forwarded to the proper person. The following are the names of those contributing:

H. W. Lee, M. R. Bliss, Lewis Schmetzman, N. A. Kluck, Wm. Glasser, George Frei, Geo. H. Weed, A. W. Hart, S. H. Herrick, B. Kennedy.

PREACHERS AND BEE KEEPING.

By request of one of the reverend gentlemen of Freeport, the following question was handed in:

"Would it be advisable for a preacher to keep bees for rest and recreation?" It was unanimously agreed that if he was interested in the study of insect life it would most assuredly be advisable, and would prove one of the most fascinating as well as interesting studies that he could take up.

The afternoon session was called to order at 1:30 p. m., when the following officers were elected:

President S. H. Herrick; Vice-President, Jonathan Stewart; Secretary, B. Kennedy, of New Milford; and Treasurer, O. G. Cummings.

It was decided to hold the next annual meeting at Rockford, and hereafter alternate between Rockford and Freeport. It was also decided to have two meetings on the third Tuesday in May, each year, one in the vicinity of Rockford, and the other near Freeport, the latter to be in charge of Vice-President Stewart.

AN ADDRESS ON FOUL BROOD.

Mr. N. E. France then gave an interesting address on the subject of foul brood among bees, which was listened to with close attention. He exhibited specimens of comb filled with foul brood, and explained how it was carried from one apiary to another. He also told how nearly it was stamped out in Wisconsin by the excellent law provided for its suppression. He said that there is foul brood in quite a number of localities in this State.

A resolution was unanimously adopted in favor of a law in Illinois, similar to the Wisconsin law, and urging the Illinois State Bee-Keepers' Association to do all in its power to secure the passage of such a law by our next legislature.

While the attendance was somewhat limited, there was a lively interest maintained all through, and the convention adjourned only when it became necessary for members to reach their trains for home. This was rather surprising, since this is a very poor year for honey.

The number of colonies represented was: Spring count, 865; fall count, 1,104; amount of honey, 26,452 pounds. Of this amount 21,000 pounds belongs to Mr. France, and also 500 colonies, fall count.

Mr. France sang a number of bee-songs which enlivened the meeting. He also helped very materially all through, for which a vote of thanks was extended him.

S. H. HERRICK, Pres.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. O. O. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Feeding for Winter Stores.

I have 48 colonies of bees, and they have not done any good this summer. It was too cold and wet in the spring, so they did not breed up until late in the season. I put supers on and took them off empty. They have not enough honey to winter. There is not one solid frame in the whole lot. Some have sealed honey along the top-bars and in the corners, and some have no sealed honey at all. Honey is coming in from

wild flowers just fast enough to keep them breeding. We do not get any flow here after basswood. They are rearing another crop of drones. The hives are full of bees and brood—not much room for honey.

Now I want to know how to get the bees over winter as cheap as I can. I have only 16 feeders—one feeder for three hives. My feeder is a thin board with a hole in it, and a small box on top a wire-cloth lid. In it I place two Simplicity feeders.

When shall I commence feeding? If I commence now, will they not keep on breeding so there will be no room for stores, and waste the sugar? Will one barrel do, or must I get two? Can I feed twice a day—morning and evening? When must I commence? OHIO.

ANSWER.—If you're sure your chance of a harvest is all over for the season, you may as well commence feeding at once and crowd the work through as fast as possible. You can feed so as to have the feed used up to a greater or less extent by feeding regularly and slowly, but if you give them a big lot at a time it will be stored in the combs. If I understand you correctly, you put two Simplicity feeders on a hive, each feeder holding about a pound of feed. That makes slow work, the best you can do. It's doubtful if two barrels of sugar will be enough, considering the description you give of the condition of the brood-chambers. Better get at least a few feeders large enough to take at once all you want to give to a colony. You can put a Millier feeder on a hive, put in 10 or 15 pounds of sugar, fill up with water, and the job is done. In a day or two they will take it all down, and if you don't get in quite enough water first time you can fill in more next day. Then you can move the feeder to another hive. If you don't care to be at any expense for feeders, you can use the crack-and-plate plan so often described in these columns. Put sugar in a stone crock, then as many pints of water as sugar, put a piece of woolen cloth or flannel over the crock (two pieces if thin), or five or six thicknesses of cheese-cloth, put a plate over this, with one hand under and one hand over, shake around pretty well, and then suddenly turn the whole thing upside down. Set this over your frames with an empty hive-body over it, well covered up so no robbers can get in. When you commence feeding a colony, crowd it right through, then tackle another colony. Get all fed as early as you can.

What to Do with Brood-Frames.

What am I to do with the brood-frames that are about half full of honey and the remainder full of young bees?

PENNSYLVANIA.

ANSWER.—I've studied over your question and can't think of a thing you ought to do only to let such frames alone. If the brood-frames are half full of honey and the balance contains brood, you can hardly desire anything better. If there's anything I don't have straight in my understanding of your question, let me know and I'll be glad to try again.

Eight-Frame Hives—Supers in Winter.

1. Why do you recommend 8-frame hives to beginners when they are inadequate? I find one of my hives overflowing with bees. They hung out, so I put on the second super with sections, which helped things considerably.

2. What will they do when I take the supers off to pack them in chaff for the winter?

3. Could I leave on one of the supers with partly-filled sections without any material damage to the bees, then transfer them to a larger hive in the spring? NEW YORK.

ANSWERS.—1. I have more than once said that an 8-frame hive was not as good as a larger one for any one who does not pay considerable attention to his bees. But there is no reason why the largest number of bees possible as the progeny of one queen may not find plenty of room by the use of 8-frame hives. If one story will not accommodate them, additional room can be given either by giving a second story of eight frames, or else by giving sufficient super room. You say your bees hung out with only one super on. I should be very sorry to have many colonies so weak that they could be contained in an 8-frame hive and a single super during the honey harvest. Last year (there has been no harvest this year) I had many colonies that filled an 8-frame hive and as many as five supers at the same time. Some had more than that.

2. Those colonies of mine that filled the hive and five or more supers had no trouble in being confined to an 8-frame hive when fall came. Just wait, and you'll find your hive is large enough for fall and winter.

3. Yes, that will be a good thing for the bees, but it will

be rough on the sections. But you can take off the the sections and I think you'll find there will be no difficulty about there being room enough in the hives. If proper attention is given to the bees, so that they will not be allowed to get short of stores, an S-frame hive serves a very good purpose. I'm inclined to think I shall use that size of hive in the future as I have for a number of years past. If the eight frames do not give the bees room enough, I can give them another story at any other than harvest time, and at harvest time I can give enough supers to hold all the bees. But for any one who leaves his bees to themselves, merely hiving them when they swarm, and taking away the surplus in the fall, a larger hive is decidedly safer and better.

Rearing Queens and Drones—Purely-Mated Queens.

1. I examined my bees to-day (Aug. 16) and found queen-cells with eggs in them. Why are there eggs in queen-cells at this season of the year? The hives are full of brood, but there is little honey coming in. The prospect for a fall flow is good.

2. Why are my bees rearing so many drones? There is more drone-brood in the hive now than in the spring.

3. Can I rear purely-mated queens where there are no black bees within two miles of me? VIRGINIA.

ANSWERS.—1. It is possible the bees contemplate swarming. A colony strong in bees is as likely to swarm in a partial honey-flow as when the flow is unusually strong. More likely, however, the eggs in queen-cells mean the superseding of the queen. Remember that about one-third of your queens must be superseded annually, and this superseding generally takes place after the time of swarming.

2. The same reason that would make them have eggs in queen-cells would account for the drones, as there would be no use in rearing queens if there were no drones.

3. Taking that question as an every-day, common-sense question, I should say no. For it's pretty nearly certain that black drones are not very far away. If there are no black bees anywhere within two or three miles—nothing but pure Italians—then you may be pretty safe in expecting your queens to be purely mated.

A Too-Prolific Queen.

I have a queen that is too prolific for my management. If I reduce the brood-chamber she swarms out, and if given room she will keep all the colony busy rearing brood. What can I do to secure surplus? I got no surplus from her colony this year, and a colony by its side gave me 40 pounds of comb honey in 1-pound sections. I workt her on the Heddon plan. OREGON.

ANSWER.—It's difficult to say what may be best. The first question is whether the bees are such poor gatherers that they yield no surplus, no matter how strong. If that is the case the evident remedy is to change their queen for a better one. If the character of the bees is all right, and the only trouble is that they are strong and swarm, put the swarm on the old stand, and give them the supers they had on, and you ought to get a good report in surplus. You say if given room the queen keeps all the colony rearing brood. If that is early enough, so that the colony comes to about its fullest development about the beginning of the honey-flow, unless there is something radically wrong in the character of the bees you ought to have fair results. If she has all the room needed for brood, and the additional room is in the super, such a strong force of bees ought to be able to do something unless swarming takes place, in which case the result ought to be as previously mentioned. It is possible that it might have helped somewhat toward a decision if you had told more particularly what you mean by reducing the brood-chamber, how many frames you use for the colony, and the size of frames.

Preserving Extracting-Combs.

On page 468, John Newton writes that "after the extracting season is over he places the combs three high with a quilt between the brood-chamber and supers, with a corner turned back to allow the bees to clean them up."

1. Which do you think is the better way to place them—as above stated, or to put them under a colony?

Again, he says: "After combs are clean they are again placed in the store-room, with a sheet of paper between each, until they are wanted again the following spring." He does

not say if they are hung up or piled close together with paper between, nor what kind of paper.

2. Could I not put the cleaned combs in a box made of wire-screen to keep out moths?

3. Please give what you think is the best way to preserve extracting-combs from now until next spring.

MINNESOTA.

ANSWERS.—1. Probably there isn't a great deal of difference. Until lately I have put extra combs (much the same as extracting-combs) under the brood-chamber, but on some accounts it is better to put them above. In either case, if the brood-chamber is crammed full of honey, except what is occupied with brood, the bees will be slow to empty out the extracting-combs. They will clean them up nicely, but the honey got in the cleaning up will be put in the extracting-combs. But late enough in the season there will usually be enough room in the brood-chamber for all purposes. One objection to putting combs under, in case they are to be cleaned up to be put away, is that if they are put there early enough and the bees still do some gathering, they are likely to put pollen in them instead of in the brood-chamber. Another reason for putting them over instead of under, is that it is easier to put them there, and also easier to take them away.

2. That will work very well, providing you are sure the combs are entirely clear of eggs and worms when stored, or providing they are brimstoned, if needed.

3. On the whole, it is perhaps as easy and safe a plan as any to let the bees take care of the combs till too late for the moths to do any harm. If they are taken from the bees toward the end of November in Northern States, there will be no further trouble about worms till next spring, and none then if the combs are well frozen in the winter. If fastened in the hives away from the bees—I mean fastened so no mice can get in through the winter—they can be left out-doors with safety.

The Queen in Making Increase—Extracting Frames.

1. In forming a new colony by taking a frame of brood with adhering bees and queen from hive No. 1, and placing it in empty hive No. 2, and placing No. 2 on the stand of a strong colony, No. 3, just moved to a new location, would it be best to cage the queen until the field-bees of No. 3 became acquainted with her, she being a valuable queen?

2. I use Hoffman frames in the brood-chamber. Would you use them in extracting-supers, or shallow ones, half depth?

3. If shallow frames, would thin surplus foundation do?

4. If full size, would you advise them to be wired?

GEORGIA.

ANSWERS.—1. If honey is coming in well it is hardly necessary, still it might be well as an extra precaution with a valuable queen. I once removed a strong colony from its stand, set in its place a hive filled with empty combs, putting in a queen without a single worker attendant, and it was an entire success. At another time the queen was killed.

2. That's a hard question to answer. The regular brood-frames have the advantage that they may be used either place interchangeably. The shallow frames have the advantage that they are a little better for extracting purposes on account of size, being easier to uncap, and the honey being more uniformly ripened, for it often happens that the upper part of a large frame will be sealed some time before the lower part. It is also urged that a comb that has been used for brood should not be used for extracting purposes, as a slight darkening of the honey will occur from using dark combs. If you have shallow extracting-frames, there is not much danger they will be used for any other purpose. On the whole, it might be a good plan to use full-sized frames for extracting until you have all the frames of that kind you want as brood-combs, then confine yourself to shallow combs for extracting. The fact that such able men as the Dadants use shallow frames for extracting is a strong argument in their favor. For one thing, they say a queen is less likely to lay in the shallow combs.

3. It might. Certainly thinner foundation will do in shallow than in deep frames, and it would not be quite so bad to have foundation stretch in extracting as in brood-combs.

4. Yes.

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY
118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

Place and Date of Next Meeting:

Omaha, Nebr., Sept. 13, 14 and 15, at the Delone Hotel, Cor. 14th Street and Capitol Avenue.

VOL. 38. SEPTEMBER 8, 1898. NO. 36.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Omaha—the place. The time—next Tuesday, Wednesday and Thursday. The occasion—the 29th annual convention of the United States Bee-Keepers' Union.

From Chicago to Omaha we expect to have a very pleasant time. Mr. A. I. Root wrote us Aug. 30 that he and Ernest R. Root expect to be with us next Monday evening to start over the C. B. & Q. road at 5:50 o'clock. Mr. Root said he would make the announcement in Gleanings for Sept. 1, and that they wanted "Dr. Miller to be in the crowd, sure." Of course the Doctor will be along, and we hope that many more will join us.

Remember that we will reserve sleeping car accommodations in the same car with us if we receive instructions in time. We ought to know by Saturday of this week, if any more wish us to reserve berths for them.

Honey-Dew for Winter Stores.—The Bee-Keepers' Review gives the following as its opinion on the use of honey-dew for winter stores for bees:

"Quite a number have written me that their bees have gathered honey-dew this year. In some localities the bees have filled their hives with it.....there is a difference in honey-dew; some is almost black, and sickening in flavor, while some is light in color and rather pleasant in taste. I remember that Prof. Cook used to tell us of these two kinds of honey-dew, and explain that one came from one source and the other from some other source, but I have forgotten now

what was the exact difference in the sources. He used also to tell us that he considered the light-colored wholesome, and that with the right conditions it might be safe for winter-food for the bees; but he most emphatically condemned the dark, ill-flavored variety. It is quite likely that in Southern localities, where it is not so cold, and where bees may enjoy an occasional flight during the winter, honey-dew may be all right for winter-stores, but there have been too many heavy losses from this source, where the winter is long and cold, to trust it for winter-stores."

The Omaha Convention will be held next week—Tuesday, Wednesday and Thursday, Sept. 13, 14 and 15, at the Delone Hotel, Cor. 14th St. and Capitol Ave.

Are you going to be there? Better go if you can. It should be the best and largest convention of bee-keepers ever held in this country. It can be, if every bee-keeper will make a big effort to attend.

Some may say it costs too much to go. In one hundred years from now you won't miss the amount you spent in attending conventions. And you will never realize how much you miss if you stay away.

Of course you will be at Omaha next week, if at all possible.

The Chicago Bee Keepers' Association is the newest organization among bee-keepers. It was started here Sept. 1, at the Briggs House. The intention is to build up a strong society among the bee-keepers residing in Cook county, which practically is Chicago. There are over 100 of them in this county. A constitution was adopted, fixing the annual dues at 50 cents, the meetings to be held quarterly, the first Thursday of December, March, June and September. The officers elected are—President, C. Beers; Vice-President, Mrs. Fannie Horstmann; and Secretary and Treasurer, H. F. Moore.

Of course, all bee-keepers in Chicago and Cook county will wish to become members of this association. If it is more convenient to send your dues to the Bee Journal office, do so, and we will hand it to Mr. Moore, who will mail you a receipt.

Using Narrow-Width Sections.—In a recent issue of the Bee-Keepers' Review, Editor Hutchinson gave this paragraph on the width of sections:

"The width of sections that I used this year is only 1½ inches. Several years ago, when I lived at Rogersville, I used several thousands of sections of this width. This is the width that bees naturally build their comb, and they build this width of combs more even and straight without separators than they do the thicker combs. They complete and cap the combs quicker. Fourteen sections weigh about 12 pounds. I like sections of this width."

Editor Root, after copying the foregoing, has this to say on the subject:

"If I can read the signs of the times the trade will gradually work toward lighter-weight section honey-boxes—not for the purpose of deception, but because the wholesale price of honey has got down so low that one or two things must happen: The price must go up or quantity decrease. In good years the former is out of the question."

While no doubt many grocers who retail comb honey by the section, and not by weight, would prefer the lighter-weight sections, still the consumers, we think, would prefer to have the heavier section, and pay a little more for it. It will be a hard matter to get the bees to put 14 ounces of honey in the 1½-inch sections oftener than—well, it will not be their rule, we think.

Honey Cherry-Phosphate.—A "straw" in Gleanings says that a Mrs. Collins recommends, for a hot weather drink, cherry phosphate sweetened with honey. It can always be on hand, even when lemons cannot, and a set of threshers gave coffee the go-by for this drink.

Yes, the "B(ce)-Route" is the Chicago, Burlington & Quincy for Omaha next week, when attending the annual convention of the United States Bee-Keepers' Union. Be sure to see that your ticket takes you over the great "Burlington Route." If you are east of Chicago, and can do so,

ride on the "Nickel Plate" road, then from here on take the "C. B. & Q." right to Omaha.

The editor of the American Bee Journal, with others, expects to leave Chicago via the "Burlington Route" next Monday, Sept. 12, at 5:50 p.m., arriving in Omaha at 8:10 o'clock the next morning in ample time to be at the opening session of the convention at 10 o'clock.

We learn that bee-keepers from all over this great country are expecting to be at Omaha next week. It will be a fine opportunity to meet many that you have read about in the newspapers, and whose writings you have enjoyed. And then, the program—gotten up according to Dr. Mason's very best prescription—that will be a treat long to be remembered.

Last year it was, "Put me off at Buffalo." This year the "Burlington" conductor will "Put me off at Omaha!"

The Omaha Convention Program.—On the program built by the Secretary, Dr. A. B. Mason, for the Omaha convention next week, appear the following subjects and essayists:

- General Advice to Bee-Keepers—Rev. Emerson T. Abbott, St. Joseph, Mo.
- Bee-Keeping in Cuba and Porto Rico—O. O. Poppleton, Stuart, Fla.
- Co-operation Among Bee-Keepers—P. H. Elwood, Starkville, N. Y.
- Organization Among Bee-Keepers—W. F. Marks, Chaplinville, N. Y.
- Bees in America—Prof. Lawrence Bruner, Lincoln, Nebr.
- Recent Progress in Apiculture—E. R. Root, Medina, Ohio.
- Feeding Bees for Best Results—W. Z. Hutchinson, Flint, Mich.
- President's Address—George W. York, Chicago, Ill.
- Bee-Keepers and Supply Manufacturers—Dr. C. C. Miller, Marengo, Ill.
- Foul Brood in the Apiary—Wm. McEvoy, Woodburn, Ont.
- Advanced Methods of Comb Honey Production—S. T. Pettit, Belmont, Ont.
- Experiences and Suggestions in Marketing Honey—S. A. Niver, Groton, N. Y.
- Best Method for Creating and Maintaining a Market for Honey—Herman F. Moore, Chicago, Ill.
- Migratory Bee-Keeping—H. E. Hill, Titusville, Pa.
- Honey-Producing Plants—Prof. Charles E. Bessey, Lincoln, Nebr.
- The Scientific Side of Apiculture—C. P. Dadant, Hamilton, Ill.
- A Half Century of Bee-Keeping in America—Hon. Eugene Secor, Forest City, Iowa.
- Best Size of Hives to Use in the Apiary—J. F. McIntyre, Sespe, Calif.
- Report of Secretary—Dr. A. B. Mason, Sta. B., Toledo, Ohio.
- Report of General Manager—Hon. Eugene Secor, Forest City, Iowa.
- The Relation Existing Between the Apiary and the Successful Production of Fruit—G. M. Whitford, Arlington, Nebr.
- The Apiary on the Farm and in the Orchard—E. Whitecomb, Friend, Nebr.
- Needs of Bee-Culture in the South—Dr. J. P. H. Brown, Augusta, Ga.

Besides a list of the various features of the convention, the program contains a number of bee-keepers' songs, the pictures of the nine officers, etc. Send 5 cents to the Secretary, Dr. A. B. Mason, Sta. B, Toledo, Ohio, and get a copy of it. The music is worth fifty times the price asked for the program.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it.

Honey Crop Poorest in Years.—Editor Root, in Gleanings for Aug. 15, says this when referring to the honey crop of the United States for 1898:

Later reports seem to confirm previous reports to the effect that the season this year comes as near being a failure, so far as honey is concerned, as any year bee-keepers have had for many a year back. A few have been fortunate enough to secure good crops, and market quotations, owing to scarcity, indicate an advance in both comb and extracted. The season seems to have been the poorest in our own State of Ohio. In sections of West Virginia, Pennsylvania, Indiana, Michigan, Wisconsin and Minnesota, good crops are reported; the season in Vermont seems to have been exceptionally good; and reports indicate fair honey-flows in other portions of New England. Of course, the season in central and southern California was a complete failure, owing to a lack of rain. In northern California some honey was gathered. Colorado is the one State out of all the rest that will be the banner honey State this year, for the season was considerably ahead of last year. Very flattering reports have come from Florida.

To Organize a Bee-Association.—Rev. L. Allen, of Clark Co., Wis., sends us the following, looking toward the starting of a local bee-keepers' association:

EDITOR YORK:—Please give notice through the "Old Reliable" that the bee-keepers, and all others that may be interested in apiculture, are requested to meet in Greenwood, Clark Co., Wis., Saturday, Sept. 10, 1898, for the purpose of organizing a bee-keepers' association. The invitation is extended to the ladies as well as gentlemen, the young as well as the old. Come one, come all. Come expecting to bear some humble part in the gathering and its doings.

We don't know just exactly the nature the meeting will assume—probably will open by way of relating experiences. I am inclined to the opinion we will have a good time and profitable.

By order of committee.

L. ALLEN

We trust that all who can arrange to be present next Saturday will not fail to attend and aid in getting the association organized.

Beet vs. Cane Sugar.—Now and then the question comes up as to whether beet sugar is as good for wintering as cane sugar. Across the water opinion seems to be nearly unanimous that it is not. On this side bee-keepers in general do not concern themselves about it. R. L. Taylor says in Review, "The highest chemical authority at the Michigan State Agricultural College says they are identical—beet sugar is cane sugar." Editor Root says that equally diamond and charcoal are chemically the same, but for all that there is a vast difference in them. He says that years ago their bees didn't winter as well on cane sugar as now when they are supposed to have nothing but beet sugar, but the sugar may have had nothing to do with the difference, and he has much respect for the opinion of such a man as T. W. Cowan, who recommends cane in preference to beet.

Why Eat Honey?—the leaflet heretofore used to some extent—is now out of print, and we do not now expect to have any more of them. The 24-page pamphlet, "Honey as Food," is so much superior, and more effective and helpful in creating a demand for honey. See prices on another page, also in the book columns.

Cream-Colored vs. Snow-White Sections.—Referring to this subject in Gleanings for Aug. 15, Editor Root says:

The editor of the Bee-Keepers' Review quite agrees with Mr. G. K. Hubbard, that it is only the bee-keepers who demand snow-white sections; that neither the merchant nor consumer asks for them. And in turn I quite agree with Mr. Hutchinson, that it is poor business management to pay for extra whiteness. In our catalog for the last two years we have tried to educate our fraternity up to this sort of doctrine, but somehow bee-keepers will insist on white goods, in spite of the fact that white honey would show off to better advantage

in the darker or cream-colored box. Put a cake of nice white honey, for instance, down on some clean snow and it will appear dark by contrast. Of course, snow is whiter than the whitest basswood; but there is a great deal of this wood that is much whiter than the average of white honey, and I cannot and never could see the sense of paying more money for the so-called snow-white when it is quite liable to make the honey it incloses appear darker by contrast.

The supply dealer is perfectly willing to give his customers their choice, and if they are determined to pay more money for the white sections, he has no fault to find.

All the same, we prefer the white sections. Not necessarily "snow-white," but fairly white. And at the price of sections, were we using a great quantity of them, we would prefer to pay a little more and get the whiter sections. For marketing purposes, we certainly like to have the white sections, and of course want the white comb honey in it. Here in the city appearance goes a long way when it comes to comb honey. Only the very whitest—both of comb and section—will bring the highest price. And, after all, isn't it advisable to aim always at producing the very best honey in appearance as well as in flavor? Do the very best you can, there will still be plenty of the lower grades produced.

Folding Paper-Trays for Shipping-Cases.

—Editor Hutchinson gives this method in the August Bee-Keepers' Review, being the same as was described in that paper a year ago:

"If any one experiences any trouble in folding up the paper-tray that goes in the bottom, let him make a board about one-eighth of an inch, or a trifle more, smaller than the inside of the case. Place the sheet of paper on top of the case, lay on the board, and then gently press down upon the board, forcing the paper to the bottom of the case. A nail driven in the upper end of the board will furnish a handle for removing the board. The lower corners of the board may need rounding off to prevent their puncturing the paper. It may require a little patience and practice to get the board just right, and to learn how to use it, but the neatness and dispatch that follow will amply repay the trouble."

A Flowing Honey-Stream.—This occurred in the Episcopal church in Tulare county, Calif., it is said. A swarm of vagrant bees, while in search of a suitable home, found an admirable location in the loft of that church, where, having an abundance of space, they increase and multiplied, and at the same time laid up a large store of honey.

Great white combs were attached to the rafters overhead, and added to until hundreds of pounds of honey were hidden away in the waxen cells. One hot day the wax gave way, and down rafters, scantlings and joist began to flow streams of liquid sweetness. Through every crevice it poured, and soon altar, pulpit, chancel and pews of the sacred edifice were treated to such a flood of honey as had never been witnessed before.

MR. EVAN J. DAVIS, of Lyon Co., Minn., wrote us Aug. 31:

"I have 15 colonies of bees, but not much honey. Long live the American Bee Journal."

C. J. H. GRAVENHORST, the much esteemed editor of Deutsche Illustrierte Bienenzeltung, has been very sick since the beginning of the year, and is still confined to his bed. Altho past his threescore years and ten, he is a man of remarkable vigor, and it is to be hoped that he may be yet

spared long years for the benefit of bee-culture in Germany and throughout the world. [Friend Gravenhorst, despite his age, seems to be one of the most progressive bee-keepers in Germany. All that he has written on the subject of bees, so far as I know, seems to sparkle from the fountain of eternal youth.—ED.]—Gleanings.

MISS MATHILDA CANDLER, of Grant Co., Wis., writing us Sept. 1, said:

"My bees have done fairly well so far, on basswood, and are now busily working on fall flowers."

MY NEIGHBOR KOEPPEN, who has six apiaries, will have at least 20,000 pounds of white comb honey. From some of his apiaries he may get some fall honey. He had a young man help him about three months this season.—Editorial paragraph in Bee-Keepers' Review.

MR. W. J. PICKARD, of Richland Co., Wis., called on us last week, and reported their crop as being 50,000 pounds of extracted basswood honey this year, from about 400 colonies in four apiaries. It was a great season at his place, and the honey is fine. Mr. Pickard's wife and daughter seem to manage the bees. And judging from the yield they know how.

YE EDITOR AND WIFE spent a very pleasant week in northeastern Ohio—from Aug. 19th to the 27th—visiting among the former's parents, brothers, sisters, and old friends. It is over 14 years since we left our boyhood home for Chicago, and during that time many are the changes that have taken place. Some of the then older friends have past on to the "other shore," and others begin to show the wear of years. Yes, we are all fast hastening to that long home whence none return.

MR. C. A. HATCH is now in Colorado, engineering an apiary, and hobnobbing with R. C. Aikin and others. Mr. Hatch should not have been discouraged at the failure of the honey crop in Southern California, for there are many places where the bees will roll in quite a honey crop, even in California. Here am I, where the alfalfa is yielding honey quite rapidly, and the conditions are so nice the ranchers believe it makes better hay to stand awhile in bloom, and that is just pleasing to the bee men.—J. H. MARTIN, in Gleanings.

MR. HARRY E. HILL—the new editor of the American Bee-Keeper—is going to give us all warm competition. His experience in keeping bees is probably more varied than that of any other apicultural editor in the United States. He has seen and kept bees from New York to California, from California to Florida, and from Florida to Cuba. He, if any one, ought to know the influence of locality and its effect upon bees. The American Bee-Keeper, under his editorial management, fairly bristles with good things.—Gleanings.

MRS. E. A. STARR, editress of the Philadelphia Public Ledger's apiarian department, has kept a colony of bees on the window-ledge outside of her room, on the fourth floor of the Ledger office, for the past four years. A covering of newspapers over the frames is the only protection given the colony during the winter seasons. "The bees" says M. F. Reeve, "come and go at their pleasure, and gather a great deal of sweetness from Independence and Washington Squares—the former directly across the street, and the latter about a block away." The Quaker City has another lady bee-keeper who keeps 18 colonies in a third-story window up town. These are located inside, and the laden workers have for an alighting-board the window-sill, while an opening is left at the top for the exit of the out-bound force.—American Bee-Keeper.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

BEST EXTRACTED HONEY FOR SALE

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 7½ cents a pound; 2 cans, 7¼ cents per pound; 4 or more cans, 7 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, "HONEY AS FOOD," will be a great help in creating customers for honey. See prices on another page.

Bees Are Doing Well.

Blackhart and buckwheat have come into bloom again, and they are yielding honey in abundance. Bees have been swarming some in this locality. I can extract about 1,000 pounds a week. We did not get any clover honey. I think it was too wet in the spring and too dry in the summer, but clover never bloomed better than it did the past summer. I have extracted about 2,100 pounds already, and am going to extract to-morrow. I use the 7 two-frame Novice honey-extractor, and with some help can extract 1,000 pounds in a day. I do not do much with my bees in the summer, as I have so much other work to do, but I always have them watch in swarming-time. The one who hived the swarms helps me extract the honey. She wrote a little for the Bee Journal some time ago, and is much interested in bees.

J. F. WIRTH.
Henry Co., Ill., Aug. 30.

Poorest Year of All.

This is the poorest year I have had yet. Bees were never as strong in numbers before, and plenty of blossoms, but little honey. I hope they will have some soon. There is a good show now, but it was so wet in the spring, and then so dry, but lots of rain lately. I have had but few swarms, only 7 out of 20 very strong colonies. Last year I had only 5 swarms from 20 colonies. I have taken

off only about 60 sections of honey as yet, but they are all filling up now with all kinds of mixt colors. I never keep over 20 colonies. My bees are all fine Itallaus, and extra-strong colonies.

I am 75 years old, and 53 years ago we were married. I can see as well as I could when a hoy. I can take dog and gun and walk from daylight till dark and be not much the worse for wear. We have reared 15 children, and my wife is quite young-looking yet, and nimble—71 years old. I have been used to bees ever since a hoy, off and on. I was born in Sussex, England; lived in Canada 27 years, and I have been here 17 years.

HENRY WHITE.

Humboldt Co., Iowa, Aug. 26.

Short Honey Crop.

Our honey crop will be short this year, with 10 swarms to our credit—the first May 24, and the last Aug. 24. Not very encouraging for an apiary of 50 colonies.

PAUL WHITEBREAD.

Luzerne Co., Pa., Aug. 29.

Prospects Not Good.

The prospects for a honey crop here are not good. It was too wet in forepart of the season, and when locust came into bloom it was so hot that the bees did not gather much honey. It is too wet to expect much from the buckwheat crop also.

JOHN SUTER.

Clinton Co., Pa.

Bees Not Doing Well.

Bees are not doing well here this season, altho mine have for some reason done well. From nine colonies in the spring, up to date I have taken off 300 pounds of comb honey, while other bee-keepers have no honey at all. I had an increase of only three colonies this season.

C. M. CHASE.

Wood Co., Wis., Aug. 23.

A Report for 1897.

Last year I began in the spring with 12 colonies, and had 8 swarms. The strongest one took nature's flitting on me when gone to see a patient. I made one colony from a nucleus, thus ending the season with 20 colonies. My bees stored 3,160 pounds of honey in 1897. I believe this to be the greatest record ever made in the United States.

ALBERT SAYLER, M. D.

Clermont Co., Ohio, Aug. 27.

Disappointing Season.

The season here has been very disappointing. There was an abundance of clover and other bloom, but the bees did not work on it. The honey crop is very short—I have only about one-third of a crop. Bees are in good condition for a fall crop; the prospect is good, and I hope to get some honey this fall. The late rains have brought out the aster and golden-rod.

I have had very bad luck this season. On the night of Aug. 4 we had a terrible flood which destroyed everything in its course. The water came down in the hollow which I live like a river; it came within one inch of the floor of my dwelling-house. It was 10 inches deep in my apiary, and drowned many bees. I am preparing to move my house, as I cannot live and be contented in the place I am. There are a good many bee-keepers around here, but very few

make it a paying business. They keep bees on the old way—square boxes and black bees. My brother was the first one in this part of the country to introduce Italian bees. They are superior to any I ever saw. He has his apiary stocked with Italians. I like the American Bee Journal very much.

W. O. MAY.
Page Co., Va., Aug. 20.

Gathered Most from Buckwheat.

I wintered 7 colonies of bees in old-fashioned chaff-hives; they cast their first swarm May 1, and I saved 11, the last one coming off Aug. 23. I had no hive for it, so I put it into a store-box. I think of putting it with the weakest colony after awhile. I have taken off about 100 pounds of honey in sections, and from the prospects I think I will get 400 or 500 more. I have for bee-pasture here white and Alsike clover, basswood and buckwheat by the hundreds of acres within a 5-mile radius of this place, but from some cause the buckwheat honey will be the largest crop, but the majority of the people here like it the best. This year's swarms I believe are going to store the most honey. I am selling my honey now at 15 and 17½ cents a section.

J. M. ROSS.
Clearfield Co., Pa., Aug. 27.

A Poor Record.

The honey crop is very poor this year in this locality, and what little we have secured is of very poor quality, being mostly all honey-dew. Sometime I will give an account of this "heavenly" honey, as some people think it comes from above. It is my first failure in six years, but that is not going to stop the old stand by—the American Bee Journal.

P. J. SCHATZ.
Cook Co., Ill., Aug. 29.

Bees Did Fairly Well.

I see by some of the reports from this county that the honey crop is quite limited. I am of the opinion that this is not general. My bees have done fairly well. The spring opened very favorably, and the prospect bid fair for a large yield of honey. There was an abundance of white clover bloom. Shortly after the bloom, the weather changed suddenly to cool and rainy. After basswood came into bloom the bees began to store honey in the supers. I think this was kept up for 8 or 10 days, and then ended. Not much honey was gathered from buckwheat, but now honey seems to be coming in quite plentifully. I think it is gathered from golden-rod, wild sunflowers, asters and other wild flowers. The weather is warm, and it is comparatively dry.

L. ALLEN.
Clark Co., Wis., Aug. 25.

Report for 1898—Sowing for Bees.

The American Bee Journal has been a very great help to me in caring for my bees—in fact, I could not get along without it, and every number is carefully bound and preserved for reference. Last spring I started in with 24 colonies of bees in 8-frame Langstroth hives. These increased to 72, not counting 8 or 10 swarms which "took to the woods." Of these 72 colonies I have sold 4, leaving 68 on hand. Some of the first swarms have filled one super, and are now at

A Book Recommended by Dr. Gallup.

THE NEW METHOD

In Health and Disease.

By W. E. Forest, M. D., 12th Edition, Revised, Illustrated, and Enlarged. This is the greatest and best work ever published as a HOME PHYSICIAN, and as

A Guide to Health.

It makes the way from **Weakness to Strength** so plain that only those who are past recovery (the very few) need to be sick, and the well who will follow its teachings **cannot be sick**. It is now in many families the only counsellor in matters of health, saving the need of calling a physician and all expenses for medicines, as it teaches Hygiene and the use of Nature's remedies, **not a drug treatment**.

All Chronic Diseases

are considered, and there is not a curable disease that has not been helped by some of the "New Methods" given here; even those who have been pronounced **Consumptive** have been entirely cured. While for **Rheumatism, Indigestion, Dyspepsia, Constipation, Dysentery, Liver and Kidney Troubles, Catarrh, Emaciation, General Debility, Nervous Exhaustion, Diseases Peculiar to Women**, etc., the methods are sure, and can be carried out at one's own home and with little or no expense.

A Guarantee.

So confident are the publishers of the results, that they offer to refund the money to any one who will try "New Methods" thoroughly, if the book is returned in good condition.

The New Edition

is illustrated with a number of Anatomical plates from the best English work on Anatomy published, and others made expressly for this work; contains 300 pages, printed on fine calendered paper, and although the price of the first edition (much smaller in size and without illustrations) was \$2.50, we sell this at \$1.00, postpaid; or club it with the Bee Journal for one year—both for \$1.60.

PREMIUM OFFERS.

For sending us two new subscribers to the Bee Journal for one year, we will mail you the book free as a premium, or we will mail it for sending your own advance renewal and one new yearly subscriber. This is a wonderful premium offer. Address all orders to—

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,
Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times." In all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—is beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dandant.—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth. Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 176 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bee. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers, \$1.00.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book entitled BEES OF HONEY. 10 page pamphlet. Price, 40 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 p., illustrated. 25c.

Convention Hand-Book, for Bee-Keepers.—Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 17 cts.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents.

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The format of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices:—A sample for a stump; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by C. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2 in fine artificial leather, with pocket, silicate plate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st, How We Made the Old Farm Pay; 2nd, Peach Culture; 3rd, How to Propagate Fruit-Plants, Vines and Trees; 4th, General Fruit Instructor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for fixing up the price of grain, produce, hay, etc. Price, 25 cts.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Turkeys for Market and Turkeys for Profit, by Fanny Field.—All about Turkey-Raising. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters. 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

Book Clubbing Offers.

(Read Carefully.)

The following clubbing prices include the American Bee Journal one year with each book named. Remember, that only one book can be taken in each case with the Bee Journal a year at the prices named. If more books are wanted, see postpaid prices given with the description of the books on this page. Following is the clubbing list:

work on the second, while the smallest and latest swarms are now in a fair way to store enough honey to winter on. Like almost all bee-keepers I would prefer more honey and fewer swarms of bees. Now for a question:

I sowed, last spring, about 1½ acres of buckwheat, and ½ acre of mignonette. It seems to be the opinion of most bee-keepers that it does not pay to sow anything especially for bee-feed, but in my opinion the mignonette certainly pays, and I shall sow more of it next year.

J. A. WATKINS.

Latah Co., Idaho, Aug. 16.

May Have a Fall Crop.

My bees did nothing more than make a living all season, until Aug. 20, when they started in the sections, and if the frost holds off until late in September I will have a fair crop of smart-weed honey. I have 62 colonies.

J. Q. SMITH.

Logan Co., Ill., Aug. 26.

Bees Have Done Well.

I could ill afford to keep bees without the American Bee Journal. My bees have done well this spring, and recent rains give promise of a good fall honey-flow.

MRS. M. M. DUNNEGAN.

San Patricio Co., Tex., Aug. 26.

Small Yield Per Colony.

I have 45 colonies, and got no swarms, but have about 20 pounds per colony of comb honey. I never could do much with extracted honey, tho I would like to try some. I haven't extracted any for three years.

WM. A. RIDENOUR.

Allen Co., O., Aug. 27.

A Cooling Well-Spring.

A little spring had lost its way amid the grass and fern;
A passing stranger scooped a well, where weary men might turn;
He walled it in and hung with care a ladle at the brink;
He thought out of the deed he did, but judged that toll might drink,
He passed again, and lo! the well by summers never dried
Had cooled ten thousand parching throats, and saved a life besides.—Farm Journal.

Convention Notices.

Minnesota.—The adjourned meeting of the Minnesota Bee-Keepers' Association will be held on Wednesday forenoon during State Fair week, at the place where the honey exhibit is made on the fair grounds. Make an effort to be there, and invite other bee-keepers who are not members to come and join the Association. L. D. LEONARD, Sec.
Minneapolis, Minn.

California.—The next meeting of the Fresno County Bee-Keepers' Association is to be held in the City Hall, Fresno, Calif., Wednesday, Sept. 14, at 10 o'clock a. m. All honey-producers are requested to attend.
Caruthers, Calif. W. A. H. GILSTRAP, Sec.

Excursion to Boston.

The Nickel Plate Road will sell excursion tickets from Chicago to Boston and return for trains of Sept. 16, 17 and 18, at rate of \$19.00 for the round trip. Tickets will be valid returning until Sept. 30, inclusive. On account of heavy travel at this particular time, those desiring sleeping-car accommodations should apply early to J. Y. Calahan, General Agent, 111 Adams St., Chicago. Telephone Malu 3389. (58-32-6)

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published today. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Page & Lyon Mfg. Co. New London, Wisconsin,

Operates two sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of

Bee-Keepers' Supplies.

They have also one **One of the Largest Factories** and the latest and most-improved machinery for the manufacture of

Bee-Hives, Sections, Etc.,

that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the **clearest and whitest Basswood** is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equip with best machinery, all combine to enable this firm to furnish the

Best Goods at the Lowest Prices.

Special Agent for the Southwest—

E. T. ABBOTT, St. Joseph, Mo.

Mr. Abbott sells our Hives and Sections at factory prices.

Please mention Bee Journal when writing.

Ho, for Omaha!

AS we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful straw-colored transparent Foundation, improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, **Leahy Manufacturing Company, Higginsville, Mo., or 1730 South 13th St., Omaha, Neb.**

Please mention Bee Journal when writing.

See Honey Offer on page 571.

HONEY and BEESWAX MARKET QUOTATIONS.

Chicago, Sept. 1.—The new crop is now coming forward and meets with a fair demand. Best grade of white comb honey in 12 to 24 section cases, 12c; that which is faulty, 10 to 11c; ambers, 8 to 10c; dark, 7 to 8c. Extracted, 5 to 7c for white; 5 to 6c for amber; 4 to 5c for dark. Beeswax, 27c.

R. A. BURNETT & CO.

Columbus, O., Aug. 30.—The present demand for honey is rather limited, owing to the large quantity of cheap peaches now arriving. It is also a little early for this market to take a large amount. Receipts are ample but little now arriving that can be called fancy. The greater part of it will grade No. 1 and No. 2. We quote: Fancy, 14 to 15c; No. 1, 12 to 13c; No. 2, 10 to 11c.

COLUMBUS COM. AND STORAGE CO.

Kansas City, Sept. 1.—Fancy white comb, 13@14c; No. 1, 12@13c; amber, 11@12c. Extracted, white, 5½@6c; amber, 4½@5c. Beeswax, 22@25c.

We are receiving few shipments of new comb and extracted honey. The demand is good for this time of the year.

O. C. CLEMONS & CO.

New York, Sept. 1.—We have a good demand for new crop comb honey, and it is beginning to arrive. Have sold some shipments at 14 to 15c for fancy white, 12 to 13c for No. 1 white, and 10 to 11c for fair white. We think these will be about the ruling prices this fall; exceptional fine lots may sell at a little more. Extracted is in good demand at unchanged prices. Beeswax dull at 26 to 27c.

HILDRETH BROS. & SEGELKEN.

Boston, Sept. 1.—Fancy in cartons 13c; A No. 1, 11@12c; No. 1, 10@11c; No. 2, 9c.

New comb honey is now coming in, and while the demand is light owing to the warm weather, yet it is being well taken. Extracted, very little California on hand, and selling readily at 6¼@7¼c. Florida now arriving and selling at 5@6c. White clover scarce and wanted.

BLAKE, SCOTT & LEE.

Indianapolis, Sept. 1.—Fancy white comb honey, 12@12½c; No. 1, 10@11c. Extracted, white, 6@7c. Beeswax, 25@27c.

Only a few arrivals of fancy white comb; market almost bare, and demand good. Quite a little comb honey from honey-dew is being offered, but there is simply no demand for the stuff.

WALTER S. POWDER.

Milwaukee, Sept. 1.—Fancy comb, 11 to 12c; A No. 1, 10 to 11c; No. 1, 9 to 10c; amber, 7 to 8c; old and dark, 5 to 6c. Extracted, white, in barrels or kegs, 5 to 6c; dark, 4 to 5c. Beeswax, 25 to 26c.

The market for honey is in very good condition; while there is yet a little of the old crop on hand, it is in very good order, and some demand, which will clear off everything before the new crop will arrive, very plentifully. There is already some receipts of new, but mostly extracted, and some very good quality, yet we fear the danger is in extracting too early, before the honey is fairly ripened. We anticipate a good demand a little later, and think values will remain about the same as present quotations.

A. V. BISHOP & CO.

Buffalo, Sept. 1.—Fruit prevents a large demand for any kind of honey at present. A few cases of fancy one-pound new comb can be sold daily at 11@12c; but any grade below must be urged at proportionately lower prices. Would advise writing us before shipping here. There is no demand yet for extracted.

BATTERSON & CO.

St. Louis, Sept. 1.—Fancy white comb, 10 to 11c; No. 1, 10c; amber, 9 to 10c; dark, 8 to 9c. Extracted, white, 5½ to 6c; amber, 5 to 5½c; dark, 4 to 4½c. Beeswax, 20 to 22c.

WESTCOTT COM. CO.

San Francisco, Aug. 24.—White comb, 9 to 10c; amber, 7 to 8½c. Extracted, white, 6@6½c; light amber, 5½ to 6c. Beeswax, 24@26c.

Stocks are of very moderate volume, both of comb and extracted, and market remains firm at ruling rates, especially for water white or light amber of desirable flavor. There is a fair local demand and some business on foreign account. The bark J. C. Glade, clearing Monday for Europe, took 808 cases, valued at \$3,250.

Cleveland, Sept. 1.—Fancy white, 13@14c; No. 1, white, 12@12½c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c; light amber, 6c.

The demand for honey is exceptionally good, owing to the crop in this vicinity being very light.

Is Bee-Keeping Overdone?—How About It?

BY C. P. DADANT.

Once in awhile we come across a bee-keeper who thinks the business is overdone, that there is too much honey produced, and that the editors of the bee-papers are to blame for inducing people to enter into an already overcrowded pursuit.

Are there really too many bee-keepers? or is so much honey produced that there is more than the world can consume?

To answer the first of these questions it is only necessary to travel over the country a little. I have lately taken a trip to Omaha, to see the Exposition, and have stopt with friends at different places on the way. Nearly everywhere I was struck by the almost entire absence of bees in spots where hundreds of colonies could be kept profitably. In fact, one would almost think there were no bees in the United States if one did not know just where to find the bee-keepers. As you pass by the villages on the train you can see plenty of chickens, pigs, horses, cows, and even sheep; fields of all kinds and meadows covered with bloom, and often an endless waste of lowlands where nothing is produced but wild blossoms, the honey of which is wasted one year after another; but the apiary is an exceptional sight. Does one farmer out of every 20 keep bees? I much doubt it. And in many instances when

The Great Willow-Herb in Full Bloom (See page 580)—From the Bee-Keepers' Review.

the farmer has bees, he has only just about enough to supply his own family with the honey they need, and, if he sells any, must deprive his children of it.

It is true that in a few favored spots—in the basswood regions of Wisconsin, or on the lowlands of the Mississippi, or of the Missouri—bee-keepers are more numerous, as also in some districts of Southern California; but, after all, these are exceptional spots, favored districts, which are as grains of sand to the sea. It is nevertheless a fact that the greatest portion of the land does not have one-twentieth of the bees it could support, and millions of pounds of honey go to waste for want of harvesters. Yet perhaps some crank may be found who will say that the bees occupy every foot of territory in the United States. Did I not just read in the Chicago Record the opinion of a noted man who claims that the United States should hold Cuba, "and everything else we can get," because we need "room to spread," as there is, according to him, "no place now for a young man to go!" This fellow would surely consider the United States overstocked with bees, if there was one colony to every one hundred square miles. His name is Chas. E. Hay, of Springfield. Pass it to posterity.

"Many men of many minds. many birds of many kinds."

I believe there is plenty of room, for centuries to come, on our own soil, for both our young men and for our bees; and I sincerely hope that we will not try to spread over foreign lands and give our enemies a chance to prove true the shameful assertion that has so repeatedly been made by some Europeans, that "America is fighting under the hypocritical plea of humanity, but in reality only for gain and conquest."

But I must not digress too far and forget that I am talking "honey" and not "war."

Now, if there are not too many bees, or bee-keepers, in the country, is there too much honey? Is honey so plentiful that every person in the land has all of it that he or she may wish and to spare? No, certainly not; but for all that, honey is too cheap, and it does not pay. So our critics will say. Does wheat-growing pay? Does hog-raising pay? Does cattle-raising pay? Is either of these lines of farming overdone? Yes, in one way. The farmer does not get enough for what he sells. But does everybody get all the beef to eat that he wants? It seems to me this question is very much like the question of labor.

A few years ago we had a young German working for us, who was fresh from the Fatherland. He could speak but broken English, and I used to ask him many questions about his former home. He liked America much better than Germany, and said it was easier to make a living here.

I said to him: "It is your standing army that causes the hard times over there. You have to feed nearly a million men and keep them idle during the best years of their life. That is what drains your country."

At this he protested. "No, sir; it is just the other way; if we did not have a standing army there would be just so many more men seeking work, and the poor fellow who has nothing but his labor would have to starve, as he surely could not find anything to do. There are too many laborers there already."

What do you think of this, friend bee-keeper? Have we too many men, too many bees, too much wheat, and too much cattle? Would it be better to have less honey, less bread, less meat, and less men? Has the old adage—that he who makes two blades of grass grow where only one grew before is a public benefactor—become a falsehood, and should we now consider that he is a public benefactor who will teach us how to decrease production so as to enhance prices?

No, I do not believe too much honey is produced. I believe that ten times as much honey could be consumed as is now produced if we had made as much improvement in the distribution of food as we have made in its production. I believe that if we could kill the adulteration of honey, and the fear of this adulteration, which is yet the greater of these two evils, we would have a ready sale of all the honey that all the bee-keepers could produce, and that there would be no longer any fault-finding with our editors, because they try to encourage the pursuit which gives them their living.

Hancock Co., Ill.

Queens Laying in Queen-Cells—Moving Larvæ

BY G. M. DOOLITTLE.

By what I read I see that there are still some who claim that the queen never lays eggs directly in the embryo queen-cells found in the hive during times of natural swarming and when the bees supersede their queen. This is only in accord with what was claimed years ago, it being put forth, at that

time, that the queen had such an antipathy toward rival queens that it would be impossible for her to lay eggs in the cells prepared for her rival in the hive. But as eggs were found in these rudimentary cells by all, something must be put forth to account for their being there, so it was claimed that the workers carried the eggs found in these cells and deposited them there, keeping the queen from removing or destroying these eggs, and the larvæ which might hatch from them by clustering about the cells.

Right here I wish to place myself on the side with those who claim that bees never remove eggs, for in all of my experience of nearly 30 years I have never known of a single egg being conveyed from one cell to another, but in scores of cases have I known larvæ to be transferred by the bees to different combs and queen-cells. On this point I have been more particular than on most others—so much so that I have often found myself wondering whether those who told about bees removing eggs did not really mean larvæ. I call to mind one particular case, where larvæ were removed by the hundred, as it were, but only the eggs were found in embryo queen-cells, altho the bees had a laying queen. The circumstances were these:

A swarm came out one day when I was away from home, and as the queen had her wings clipped they returned. Not desiring them to swarm, the hive was opened in the afternoon and all queen-cells cut off. The next day this colony swarmed again, and before I had a chance to pick up the queen (she having run under the bottom-board of the hive) the bees commenced to return; and while they were doing so another swarm came out, and, without stopping to circle, as they usually do in the air, went directly in with the returning swarm.

Before things became settled another swarm issued from still another hive, and, almost immediately, another, or the fourth, came out and went in with those already returning, so that I had four prime or first swarms in and on that one hive; the queen in the meantime crawling out from under the bottom-board and going in with them.

As the three queens belonging to the other hives had their wings clipped they could not go with the bees, but were returned to their respective hives and the bees allowed to remain to see what would become of the matter. The next day the four swarms came out as one and were hived in an especially prepared hive, from which I secured more than 100 pounds of comb honey inside of two weeks.

An examination of the old hive showed hundreds of queen-cells started all over the combs; and, as I now remember it, nearly 200 of these cells had larvæ in them, swimming in royal jelly, while only two had eggs in them. As a number of these cells were built on the sides of the frames it would have been impossible for larvæ to have gotten in them (or the cells built over larvæ) other than by the bees carrying them there.

About this time such men as Gallup, Grimm, and others, began to advocate that the queen deposited in the queen-cells the eggs for all queens that were started while the old queen was in the hive, and, if my memory serves me rightly, Mr. Grimm saw a queen laying in a queen-cell, while Mr. Gallup believed they did so by the position of the egg in the cell. Later on, a hired man whom I had work with me in the apary witness the whole act of a queen laying in a queen-cell while I held the frame in my hand, and I have a letter in my possession from J. E. Ginn, of Ellsworth, Maine, which reads as follows:

"I have just seen [date June 22, 1893] the queen lay an egg in a queen-cell, the same being not more than 10 minutes ago. I thought I would write you at once so I could give all the details correctly. There is a one-inch space between the frames and the glass [Mr. E. has a glass in the back of a part of his hives], and the bees built a piece of drone-comb in this space, the same having drone-brood in it. Looking in to-day I saw a queen-cell half built on the edge of this in plain view. The queen was about an inch from this cell, and one of the bees was feeding her. After a moment she past in between the frames for a second or so, when she came back and went directly to the queen-cell, put her head up into the cell, then curving her abdomen, she inserted it well up in the cell and deposited the egg. After laying the egg she again examined the cell, remaining in it with her head perhaps 10 seconds. I have written at some length, for the queen seemed to be so particular. I have seen queens lay in worker-comb many times; and while they would examine the cells before laying in them, yet I never saw one look into a cell after she had laid an egg in it, as did this queen in the queen-cell she had laid in."

It will be noted that the correspondent says that the queen inserted her abdomen "well up in the cell," thus assuming the position she does in laying in a worker-cell, as far

as the cell is concerned. I touch on this matter as one of the strong points brought up by the doubting ones is the ridiculous position the queen must occupy when laying in a queen-cell. But why should not a queen lay in a queen-cell as well as in any of the other cells in the hive? None of the eggs laid in queen-cells, produced during natural swarming, can possibly grow into rival queens to the old one, for she has either departed from the hive before any of the young queens hatch, or the cells are torn down by the workers on account of a scarcity of honey or unpropitious weather, whereby swarming is postponed indefinitely.

When the issue went forth by the Creator of all things—"Go forth, multiply and replenish the earth"—it became just the thing all animate creation desired to do, and hence the queen has just as much desire to do her part toward the replenishing of the earth with colonies of bees as have the workers, all working together in harmony, as far as the issuing of a prime swarm is concerned, and the leaving behind of that which shall insure the perpetuation of the old or parent colony.

Of late years I have often wished there was no such thing as swarming, but God has so ordered it, and I am faithless in regard to non-swarming bees, for what God has ordered the puny arm of man cannot well set aside.

Laying Workers—How to Get Rid of Them.

BY EDWIN BEVINS.

It was, I presume, not the intention of Mr. C. N. White, whose series of articles have been published in the American Bee Journal, to treat exhaustively or even largely any one topic relating to apiculture; but particularly unsatisfying was his reference to the subject of laying workers. Not more so, however, than has been the references to it of all the other writers whose writings I have read.

The question, "What shall I do with a colony having a laying worker?" is one that is often found in the bee-papers. The questioner is sometimes told to break up the colony by distributing its combs among other colonies; sometimes he is told to introduce a fertile queen, and again he is told to carry the colony away to a distance from its old stand and shake all the bees off the combs—this in the hope and expectation that the laying worker or workers will get lost in the operation.

The two methods last named are the ones advised by Mr. White. Now, it is my experience that if one gives a fertile queen by any of the direct methods in common use, he will as a general thing have his labor for his pains. The other method mentioned by Mr. White is more laborious and equally uncertain in its results.

Distributing the combs of the laying-worker colony among the other colonies is less satisfactory to me than any other method yet named. When one is building up an apiary he does not like to suffer any diminution of the number of his colonies. Again, in a small apiary, one may not have the other colonies in condition to take the frames of the laying-worker colony. In a large apiary there would probably be no trouble of this kind, but the distribution might be found necessary at a time when it might be better to leave the other colonies undisturbed. In any event the distribution is a laborious and disagreeable work. Even if distributed the bees would not be of any great advantage to the colonies thus strengthened, as it is likely they are bees pretty well advanced in life.

There are two easy and sure ways of disposing of laying-worker colonies so as to get all the service out of the bees that they are capable of rendering, and at the same time keep the number of your colonies up to what it was before.

The first way is to place the hive having the laying worker over a strong colony with a fertile queen, placing a newspaper with a small hole in it between the two hives. The bees will unite peaceably, and when considerable worker-brood appears in the upper hive the hive can be placed on another stand, and the bees will rear a queen from the brood if you leave the old queen in the lower hive; or, you can introduce a fertile queen after about three days from the time of the removal.

The other plan contemplates the taking of a couple of frames of hatching brood from some of your hives and placing them in another hive over a strong colony with a frame having wire-cloth nailed to both sides of it between the two hives. Then release a fertile queen and her escort on these two combs, and in a few days you will have a nucleus strong enough to take care of your queen. Then set this hive with the nucleus down by the side of the hive holding your laying worker. Then every two or three days transfer a frame with

its bees from the laying-worker hive to the nucleus. By the time that all but two of the frames are placed in the new hive your queen is doing business there, and all is harmony in the hive.

No suggestions are needed as to the disposal of the two frames taken to form the nucleus, but I will just say that they can be returned to the places from which they were taken, or these places can be filled by the frames remaining in the laying-worker hive.

I will add, too, in this connection, that a laying-worker colony, if strong enough, can, at the proper seasons of the year, be utilized for the building up of two or three new colonies just as well as for the building up of one. Keeping brood warm is about all these laying-worker bees are good for, anyhow.

By taking a couple of frames of hatching-brood and treating as I have mentioned, you have an absolutely safe way of introducing any queen, no matter what may be her value. These laying-worker bees, if discovered at the right season, instead of being a bugbear may be turned to good account as an aid in the improvement of your stock.

No. 7.—The A B C of Marketing Honey.

BY HERMAN F. MOORE.

[Continued from page 562.]

You will notice that some writers on selling honey say, "Always sell for spot cash." Another says, "I let them have the goods and collect on my next trip." The writer may be excused for saying a few words on this seemingly threadbare subject.

Almost any one will agree that farmers as a class are more apt to fall into a slipshod method of business than tradesmen. Also, that in the big lines of trade in the great cities, correct business methods are more sure to prevail than elsewhere. Let us learn a little from the methods of the great business houses. Take for instance the business of a large wholesale grocery house having trade in four or five States. The credit department is one of the most important in their business. A man is selected to run this department that has been in their employ for many years, often since childhood. This great care is used in selecting the credit man because no department has more to do with the permanent success or speedy failure of the business than this.

Let us suppose a letter is received from a prospective customer, containing a list of goods he wishes to buy to the amount of \$1,000. Now, on general trade the wholesale houses are accustomed to allowing 30, 60 or 90 days as credit to those in whom they have confidence. You can see at once the importance of deciding rightly as to whether this man is entitled to the customary credit or not. Great volumes of Dun's and Bradstreet's commercial reports are examined, also any special reports that may have been furnished from the customer's town. If the credit man is on friendly terms with John Smith, credit man for a rival house in the same line, he steps over to see whether the customer has owed them a bill and not paid it, or whether they have special reports on him, favorable or otherwise. If after all this labor the report on his case seems unfavorable, a trip may be made to the customer's home town, if not too distant, to see him personally and talk with him face to face. Or, the telegraph may be used to ask some trusted attorney to look over the ground and the probabilities in the case. There are without doubt millions of money lost every year in our large cities by reason of too great competition in business, and lack of care in selecting customers.

A personal friend of the writer, in the woolen trade, was wiped off the earth financially by a matter of about \$50,000 of uncollectable bills. Hundreds of business houses are added to the long list of failures every year by giving too much credit. In these lines of wholesale business they are obliged to give credits. If you take the broadest view of general business you will see that business would be paralyzed without credits.

Why all this care and labor? This is the way they reason: Once a rogue always a rogue. If your father was a good business man, and successful, and paid his debts promptly, they reason that the son will do likewise. If a big business has been run for 5, 10 or 15 years successfully, they reason that success will be theirs for as many more years, in all human probability. But, alas, "the best laid plans of mice and men gang aft a-glee."

It has been said that "misfortune makes men rascals." I think this is an error, but the effect seems the same as far as their creditors are concerned.

Take the case of the hardware man selling plows and

tools of all kinds to the farmers, and waiting till after harvest or husking for his money. In his case about all he cares for is whether the customer is honest. Often his problem is a hard one, for he must refuse credit if he follows his best judgment, to a neighbor, one who will be his enemy if credit is dealt.

Let it be clearly understood that only strict business must govern. Your duty to your family requires that each case be settled upon its merits regardless of friendship or nearness of residence. It is always harder to draw the lines of business strictly with neighbors and friends than with strangers.

In the great business houses some require the credit man to stand any losses that are caused by his act. Other houses are more liberal, and only require losses made good where a fault or negligence has been committed. Long service as a credit man in a large, wealthy house oftentimes will cause the firm to overlook losses that would be fatal, in a small business, both to the firm and the credit man himself.

A few rules can be gathered from the foregoing. You must of necessity be your own credit man. You must stand all the losses, both small and great, yourself. Your consolation must be that no one can discharge you. Remember that honey is a luxury, and that ordinarily any one who has not one or two dollars to pay for a small purchase of honey should do without it. But there are many exceptions to this. Farmers sell produce at certain periods. Men are paid by the month. If you set your foot down, that you will not sell except for spot cash, you will certainly suffer a reduction of 15 to 20 percent in your year's business. But use your brains in every case, and where you are in doubt *don't give credit*.

Every man, every business, bears certain ear-marks that speak to the intelligent observer a clear language as to prosperity and permanence. A nice barn, comfortable house, owns the place, sleek horses, fine flocks of poultry, neat wife, clean children, etc., will tell you plainly if you ask whether you will seek in vain for your two dollars on your next trip.

Such cases as this will come to you: "I have been hard up lately; had a good deal of sickness; would like some honey, but haven't got the money." Don't put this case as a business problem at all. Figure this as almost a certain loss. Call it charity, and if your duty to your family and your own obligations allow the donation, why, make it freely, if you think it is a proper case. It is very often a proper case to refuse. There is a great difference between asking credit for honey and trying to buy a barrel of flour on time. In general, any one who asks credit of a stranger for a plain luxury—something he can get along without—should rightly be an object of suspicion. An honorable man will be more ready to ask favors of one who knows him and his reputation, than from strangers.

Look your ground over carefully. Note how other business men give credit. If you know a good business man near by, go to him and put certain questions to him that bear on your case and trade. You will learn many valuable principles by talking with one who has made business and credits a life study. In case of doubt about any particular person, go to his postmaster or to his grocer. Tell them in confidence that you expect to have some business with Blank, and ask if he is a safe man to trust. You will in many cases get an entirely candid answer. Remember a bad debt means loss of your honey, loss of the customer, loss of the time consumed in making the sale and in trying to collect.

Many of you will find that spot cash is the best rule for the honey-trade, even where it might not be possible for the hardware.

After looking over the ground carefully and conscientiously, make a set of rules by which to govern yourself. Then when asked for credit say, "That is contrary to my rule in this case. I should like to oblige you, but I will be unable to do so now."

Such an answer will convince the customer you wish to treat all alike, and may turn aside any feelings of resentment that might arise on being refused a favor. Cook Co., Ill.

Great Willow-Herb—Its Home, Habits and Honey.

BY W. Z. HUTCHINSON.

Years ago, when I lived at Rogersville, I for several years made annual trips to the home of two ladies living in Northern Michigan, near Farwell, and bought and brought home a portion of their bees. I well remember that among other dainty viands appearing upon their tea-table was a comb of the whitest, sweetest honey I had ever tasted. The flavor was not very pronounced, but contained a suggestion of spli-

ness. Upon inquiry I was told that this honey was from the great willow-herb. It is known under various names, such as fire-weed, Indian pink, rose bay, etc. Its scientific name is *Angustifolium epilobium*. Later, when collecting samples of different kinds of honey to exhibit at fairs, I sent for a bottle of this honey. When it came and I held it up to the light, I could compare it with nothing else than a bottle of spring water—it was so clear. It certainly has no more color than so much water.

This plant grows from two to six feet in height, and, as a rule, inclines to a single stalk. The blossoms are a dark pink and arranged in a cluster around the central stalk. In fact, they remind me of the phlox of the flower-garden. One peculiarity of the bloom is that it continues from July until frost. So long as it is in bloom there seems to be a cluster of buds pushing themselves up from the center of the bloom. As these buds unfold, others take their place, and so the stalk pushes up and up, always tipped with a sprig of buds, below which is a cluster of bloom that in time gives way to seed-pods. Thus we have, on the same stalk, buds, blossoms and seed-pods, and, in many instances, the oldest pods have burst, and winds are scattering the downy seeds far and near. I think such seeds might be carried to great numbers—well, possibly hundreds of miles. Perhaps this explains why it springs up, apparently in a spontaneous manner, after the ground has been burned over by fires; whereas the fire simply burns the turf and furnishes a seed-bed for the wandering seed. It grows most profusely among the stumps and burned forest districts of Wisconsin, Northern Michigan and Canada.

Two or three years ago, in the month of June, while on my way to visit my father and brother in an adjoining county (Tuscola), I noticed a few stalks of what I took to be this plant growing by the roadside. I had never seen any of it before, but I had read descriptions of it. In August my brother wrote me that the highways and byways, hedges and swamps, old clearings and "slashings" were fairly purple with the bloom of the willow-herb, and the hives were filling up with honey to beat all. I packed up my camera and took another trip expressly to get a characteristic view of this plant on its native heath. The result is the picture which shows the willow-herb right in its glory. The splashes of white are seed-pods that have burst and are scattering their contents to the four winds.

As a rule, willow-herb yields honey every year. In my knowledge of the matter it has failed once in a dozen years. For two years in succession our Michigan bee-keepers have met at Mt. Pleasant, which is the region of country where the willow-herb flourishes at its best; and it really makes us outsiders feel just a bit envious to hear those folks talk about their 100 and 125 pounds of surplus honey, per colony, each year.

There are thousands and thousands and thousands of acres of this plant in Northern Michigan that actually waste their sweetness on the desert air. If I were going into the business of honey-production as a specialty, I should go to Northern Michigan where I could have the benefit of wild raspberries, clover, basswood, and willow-herb. There are locations in that part of the State that are veritable bee-keepers' paradises; and they can be found by patient search.—*Bee-Keepers' Review*. Genesee Co., Mich.

Facing Comb Honey—Price of Honey.

BY PROF. A. J. COOK.

A few weeks since I was visiting Lemon Grove, San Diego Co., arranging for a Farmers' Institute. Lemon Grove is one of the famous strawberry regions. I was invited to tea, and as my host was in the midst of the strawberry harvest, and much driven to fill his orders, I volunteered to become for the nonce one of the army of pickers. I take naturally to work in a fine strawberry-field. I showed very soon that I was a novice, for I removed all the stems, whereas the market wish stems and all. But my chiefest blunder was in filling the box evenly, so that one, as he delved to the bottom of my boxes, would find all alike from top to bottom. I was shown that I must place smaller berries below, and reserve a goodly number to face the box at the top with large, even highly-colored berries. I said, "Is that quite honest?"

The answer was, "Yes; everybody does that, so it is expected."

I said, "Is it wisdom? Would not an even, honest pack beget a reputation, sell more berries, and secure a better price?" Of course the berry-grower thought not, else his practice would change.

Forty tons of berries were shipped from Lemon Grove into San Diego the past season. I presume my friend was correct.

All are faced with superior fruit, which is no indication of what lies beneath.

A few days afterward I was in San Diego, and took pains to examine the berries at the fruit stands. I found all packed as my friend had stated—the best to the front.

One of the hucksters that comes to our door to sell fruit here at Claremont, has the same theory. His boxes always wear a smiling face, but he who digs beneath finds a different aspect. Mrs. Cook only patronizes him when our necessities or convenience would otherwise be ill served, or not served at all.

I know of several fruit-growers that have stemmed this temptation to deception and pretense, who always pack evenly and honestly. These men have that "peace within that passeth all earthly dignities, a clear and quiet conscience." These men sleep well of nights; they may stand by and see their boxes emptied with no sense of shame and no disquiet. And tho' the best, this is not all their gain; they are trusted, their fruit is purchased at the top figures, and always taken without question. Their practice has earned them a reputation which is as excellent as their fruit—as good as their pack.

I believe the same holds true of honey. Facing with white or better-filled sections may deceive once, and secure a little more of "that which we may grasp thus," but soon our habit will be understood, our business methods will be questioned, distrust will dog our footsteps, sales will be slow and labored, and, worst of all, the best fun of it will be lost to us—the fun of doing a genuine, square, honest business.

The fact that a fine appearance always attracts attention and wins favor, places a tremendous temptation in the way of the ambitious man. But the true Christian course, and in the end the politic, business course, will push aside all thought of such action, and make things just what they seem. The wisest honey-producer will so pack his honey that the outside tier of sections will truly label the whole case.

HOLD FOR HIGH PRICES.

I was asked a few days since, by a gentleman who has secured a good crop of honey even in this season of general scarcity, whether I would advise him to hold on to his honey. So far as I can determine, the crop throughout the country this season is light. Very few localities have a full crop, while in most sections, like Southern California, the crop is very light indeed. Altho' honey is not so much a staple article as to be governed in price by the law of supply and demand, as are many of our agricultural productions, yet it does follow the law in some degree, enough so so that all should hold for a reasonable price.

Had I first-class extracted honey, here in Southern California, I should hold it for 6 cents, and an equal grade of comb honey should command at least 10 cents.

Los Angeles Co., Calif.

Honey-Dew, What is It?—An English View.

(An Editorial in British Bee Journal.)

It is more than probable that 1898 will be set down in bee-history as a record-year for the production of what is known as "honey-dew." Anyway, with over 30 years of active bee-experience behind us—and an intimate knowledge of current bee-literature during 25 of those years—we venture to say that nothing so remarkable in the way of honey-seasons, so far as the extent of the area covered by the plague, has occurred within living memory. Honey-dew has, no doubt, been abundant enough in bygone years, at rare intervals and in scattered districts wide apart, quite enough to spoil or seriously damage the crop of many a bee-keeper; but none will remember when the mischief was so generally prevalent as this year. From all parts of the kingdom we have reports, accompanied by scores of "samples" wherewith to verify the same, declaring that the like of it has never been seen before; a proposition with which we entirely agree. Since we briefly referred to the matter last week, it has been demonstrated, to our satisfaction at least, that honey-dew has "fallen" not in equal abundance everywhere, but quite plentiful enough to cause a serious monetary loss in the value of their crop of honey to a large number of our readers.

The varying nature of the complaints just received as to the extent of the evil, and the numerous enquiries regarding the nature and real cause of it, render it incumbent on us to say a word or two on the broad question, What is "honey-dew?" so-called from its being supposed by the ancients to descend from above, as does the "dew" known to us all. That it is not "sent from heaven like the manna in the wilderness," most bee-keepers will agree; but, let us add, neither is it quite so bad as to warrant its connection with the "other

place," dominated by "*Beelzebub*, the lord of flies," as is, again jocosely, added by a reverend friend. That is to say, not in the exact sense in which some regard the simile; and especially those who claim the title of bee-experts.

To be very plain then, and to remove a false impression—where such exists—in regard to honey-dew, let us say it is not "the excreta of the aphid, or green-fly," as some suppose. "Excreta" is the refuse, or waste matter from food which is, perforce, discharged from the animal body after all the nourishing material has been extracted. "Honey-dew," on the contrary, is a saccharine substance, or sweet juice which at times, and under certain atmospheric conditions, exudes from the surface of the leaves of trees and plants. Consequently, there is no real analogy between the two substances. The connection of the aphidæ with the matter no doubt arises from the fact of bees visiting trees where the so-called honey-dew abounds, and carrying off the saccharine substance to their hives. Now, when we state that in some seasons (happily rare)—of which we may quote the present one as a model for enforcing our argument—so abundant is honey-dew that it is discharged by the aphidæ in the form of a fine liquid spray on to the surrounding leaves, and, after accumulating there, it drops from the leaves in such quantity as to wet the ground beneath. This being so, it will be readily understood by readers what an amount of damage will thus be done so far as the quality of honey already stored in the hives.

But we must go still further in differentiating between aphidian honey and the nectar gathered by bees from flowers, in order to account for the very objectionable error regarding the nature of honey-dew. It is generally known to bee-keepers that the bee regurgitates the contents of its honey-sac directly into the store cells by means of the long proboscis-like tongue with which it gathers the nectar. On the other hand, the sweet juice referred to above is ejected by the aphidæ through two straight tubes, which project beyond the body of the insect above the ordinary orifice. This fact, no doubt, gave rise to the "excreta" notion, which is an entirely erroneous one. It is bad enough to acknowledge the existence of aphidian honey as a veritable transformer of good honey into bad, but there is no reason why we should make bad worse by propagating errors of this kind.

So much, then, for honey-dew, which it must be admitted has spoiled a good part of the crop gathered during the past month, and operated very adversely against the success of honey shows so far held this season. It was hoped, however, that Scotland and Ireland would have been spared from the blight which has fallen on England, and, we fear, Wales; but, judging from reports to hand, our Scotch and Irish friends have fared little better than our own northern counties of Yorkshire, Cumberland, and Durham, while the latest news we have from Ireland refers to a honey show held at Ennis, Clare county, where we learn that "the remarkably large amount of honey-dew that showed itself in both comb and extracted honey served to disqualify many otherwise fine exhibits."

The question then arises, Will honey of good quality have already been secured, or is it likely to be got this year in sufficient quantity to meet the demand for such? We are led to make this inquiry because of our having only two or three days ago received a couple of samples which were to us a revelation for honey of 1898! One of the two is simply perfect in color; good in consistency and aroma, and of capital flavor; in fact, an excellent honey for any year. The second is far behind on all points, but still a good honey compared with what we expected to see, bearing in mind what had gone before. If, however, there are even a few districts where bees are kept in quantity and where honey such as we are referring to has been obtainable, the inevitable conclusion follows that the blight has not extended entirely over the three kingdoms. It is also just possible that the recent heavy rain (which has gone a long way towards exterminating the aphidæ in our own district of the south) may be more helpful in saving the crop further northward. Therefore, as good honey this year will doubtless fetch full value, those who are fortunate enough to secure it should take the hint and act in accordance therewith to fixing prices.

We fear, however, that the bulk of our readers will have to consider a large proportion of the dark honey gathered this season as food for bees only.

Langstroth on the Honey-Bee, revised by The Danants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. O. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Cross Bees—Feeding for Winter.

1. I have a colony of bees which is very cross. If I take a frame out of the hive they will come out and sting like angry hornets. What is the matter with them? and what am I to do with them?

2. What is the best to feed for winter? How would you feed it, and where?

3. What is the best to do, to feed the bees in winter, or feed them now for winter? WISCONSIN.

ANSWERS.—1. There's no little difference in the tempers of bees, just as there is among people. When a colony shows such a vindictive disposition, it's a good plan to give them a queen of better blood. Very likely the flow of honey has stopt, and that makes matters a good deal worse. If robbers have been annoying them, they may take out their spite on you. Be careful not to do anything to excite robbing. Do your work in the forenoon, if you must handle them, for generally there will be a little gathering in the forenoon. Don't leave combs of honey or brood exposed to robbers, but keep everything covered up.

2. There's nothing better than sealed combs of honey. Get in the way of looking out for this, and always have some on hand. If you have nothing of the kind, feed granulated sugar, best quality. If you have no feeders, you can use the crock-and-plate plan lately described in these columns.

3. By all means don't think of waiting till winter. Don't wait a day. Go at it right straight. If you have no fall flow, August is a good time to feed, or as early in September as you can accomplish it.

Robbing—Bees Drawing Out Comb—Rapid Well-Feeder.

1. I rather injudiciously opened a number of hives late one afternoon, two or three weeks after a flow had ceased, in order to remove some dark honey from strong colonies, where-with to feed weak ones. This resulted in wholesale robbing, and at 8 a.m. the next morning I found a battle royal going on at every one of the hives which I had opened. My first thought was to try a remedy I have more than once successfully used, viz: painting about the flight-holes; but it is messy and troublesome, and I concluded I would give each and every hive attach a good shower-bath, and which I have found to answer *sometimes*.

It was a very close, sultry morning, with not a breath of air stirring, but before I got back to the bee-yard with the garden watering-pot, a deliciously cool breeze from the sea had suddenly sprung up. I doubt if I was away 15 minutes, but during my short absence robbing had greatly diminished, the invading forces being quite withdrawn from some of the hives; and I put it down to the sudden change of atmosphere; for I have often observed that when a cool, fresh breeze is blowing, hives may be handled with impunity, where otherwise it would be dangerous to even lift a cover.

But I must also tell you that just before going to the yard that morning I had uncovered some cases of sections in my workshop, which I had taken off the previous evening, and which, containing a mere sprinkling of honey (too little to extract), I wanted the bees to clean up, leaving the window open to give the bees access to them. On returning from the yard I found my workshop full of bees, going for these partially-filled sections in grand style. I then began to reason that this counter attraction was the cause of the siege being raised at the hives, and that atmospheric conditions had nothing whatever to do with it. If this conclusion is correct, then how would it answer, in your opinion, should robbing and fighting be, through carelessness or accident, set up on a large scale, to at once place a shallow tray or two of diluted honey outside the apiary, but within easy smell and reach of the robbers—as a counter-attraction? If the remedy is as good and as certain as I have reason to believe it to be—and it was permanent—it is worth knowing, and as one of those things which every—even the most careful—apiarist would do well to make a note of. What may be your opinion of the matter? Have

you ever had a like experience? It seems to offer a very simple means of curing an occasionally (in the best regulated apiaries) very troublesome disorder.

Could not, on the same principle, the horrors of war be in a measure averted? Just when a battle begins, have a special corps hovering about the flanks and rear of the combatants, with wagon-loads of delicious honey-jumbles—counter-attraction!

2. As freight, etc., on the new Weed "drawn foundation" would come too costly for me, I have to set my own little workmen to make it, feeding strong colonies "during the recess," and making them draw out super foundation. In filling frames for that purpose with the ordinary super foundation, I came across a couple of sheets of "extra thin." I had had it by me two or three years, but I think the other was just as old. Anyhow, tho I put this "extra thin" right in the center of the super, the bees, while drawing out the other to my greatest satisfaction, would have none of it; they wouldn't look at it. I have had it on now 14 days, but ne'er a draw—it remains just as when I put it on. Why is this? Have you ever noticed this with sections, viz: that the bees will neglect the "extra thin" in favor of the ordinary super foundation, or be more dilatory in getting to work on it?

3. I have a big roll of queen-excluder zinc, and no use for it. How would it be to use it for separators? Would it answer, think you? If free passage is of any advantage, that ought to give it. Mr. Pettit's suggestion of ventilating with wedges, and followers jabbed full of holes on either side of the sections, with $\frac{1}{4}$ inch space between such perforated followers and the super's walls, is, I should say, excellent. But instead of taking the pains to bore countless holes in these wooden side-separators, don't you think he might preferably make them of excluder-zinc?

4. I forwarded Editor York a description and a sketch of my rapid well or "climax" feeder. May I ask you to be so good as to give your opinion of it? I began very cautiously with its use, first trying it on only two hives, for I thought it was too simple and too convenient and easy not to have some great objection lurking about it somewhere, but everything having worked smoothly and nicely so far, and no objections having revealed themselves, I set to work and made more, and am now using them on several of my hives, and that with the most intense satisfaction. I can feed half a dozen of the colonies having this feeder while my mate is feeding one with a "Boardman," and with less trouble, too! There must surely be some objection to it which I have not yet discovered, or how is it possible that so simple, safe, rapid and really pleasant a method of feeding has not been long since generally adopted, in preference to all and every one of the numerous other messy, irritating (both to bee-keeper and bees) and troublesome contrivances whose praises are so loudly sounded in the papers and bee-books.

With these simple "Drawer" or "Well" feeders, a mere child could be trusted to feed a large apiary; and I will challenge anybody to produce a better or more satisfactory feeder, better in any way! If you can see any fault to find with it will you please say? Personally I am so delighted with it that I consider no floor-board complete without one; and would have, had I my way, no floor-board (unless specially ordered otherwise) sent out from the factory without this attachment, as essentially part and parcel of a hive. SOUTH AFRICA.

ANSWERS.—1. If robbing commences, and you set out some feed at a short distance from the hives, the bees will be very likely to go right on with their robbing if they have never before had feed in the same place. But if some days before, they have had feed given them at a certain place, and it is set out again at the same place as soon as the attempt to rob begins, the attention of the robbers would very likely be diverted providing some weak or queenless colony had not been attacked and partly overcome. Of course there's a big difference between a genuine case of successful robbing and the attempt to rob from strong colonies able to protect themselves. Not long ago, in a European journal a kindred idea was presented, the advice being that in case one wanted to work at hives in a time of scarcity, it could be made safe by first getting the bees to work on some feed at a little distance from the hives.

2. Your question is rather too much for me. If the foundation was as fresh as the thicker, and both kinds put on at the same time, I see no reason why they ought not to work one as well as the other. If the foundation had previously been on the hive and not drawn out, or if it was left on the hive for some time whether partly drawn out or not, so as to have a very slight coating of propolis, then the bees might be expected to leave it untouched, or at least to be very slow about commencing upon it. I have used extra thin so little that I hardly know how it does compare with thin. I know that when it is left on the hives and not used, the bees seem more

inclined to gnaw the extra thin than the thin. I can hardly think age was the trouble. I used a good deal of brood foundation this year that was six years old, and I could not see but the bees accepted and worked it as well as any.

3. Excluder-zinc will probably be all right for separators. Very likely Mr. Pettit would tell you that he objected to the cost of the perforated zinc, although it is just possible that he preferred larger perforations than were to be found in the zinc. Even although he might make a few of perforated zinc cheaper than he could make the wood ones by hand, he was no doubt looking out for the general future, and with proper machinery no doubt the wood separators could be furnished at lower price than the zinc.

4. That's a dangerous question to answer. When a woman holds up her baby before you and says, "Isn't he sweet?" you're in a bad box if you can't honestly answer "Yes." However, Africa's a long way from here, so I venture to say that it needs only one reason to make your feeder objectionable, and that is that it requires syrup to be made. The day of feeding syrup is past with me and with many others. I have given my bees a little more than 700 pounds of sugar so far this season, but it was given to them as dry sugar and water added afterward. That's less trouble than to make syrup. When the dry sugar is put in, there's no danger from robbers, even if the feeder is left standing open, as dry sugar doesn't tempt the robbers. Then water is poured in, and if any of the water is spilled it does no harm. If syrup is spilled there may be trouble.

Another reason why your feeder could not be used in many apiaries, is that the hives stand back to back, in groups of four, an arrangement that would not be readily given up, even if it caused a good deal of inconvenience in feeding. Feeding is a thing that comes only occasionally, and the convenience of arrangement is a thing of permanency.

You can hardly draw out the drawer-feeder in less time than you can lift a cover off a Miller feeder, and there are times when a colony will work in a feeder on top when you could not get them to go down cellar. But perhaps the distance to Africa is not sufficient to make it safe to say more.

The "Illick" Hive-Tool.

The tool I use to raise supers, scrape propolis, take out frames, etc., is made out of the back half of an old file. The wide end is drawn out and ground to a chisel edge. The small end is bent down about an inch, and also thinned down—the heel or fulcrum is rested on top of the frame towards me and the sharp point under the frame to be raised. The frame comes every time, no slipping.

J. F. ILLICK.

ANSWER.—Mr. Illick has gotten hold of two important points in the construction of a hive-tool. One end must be a straight chisel edge for raising supers, etc., and the other end must be crook for moving frames. One trouble in getting a tool to suit every one is that all do not use frames alike. Mr. Illick rests the tool on the frame toward him, evidently pushing the frames from him as he loosens them. That wouldn't work in my hives with frames at six distances. The dummy is next me, and the frames must be loosened toward me. But the same tool would work. It is desirable that the corners of the chisel edge be quite rounding. Then they will not catch in the wood when you crowd between hive and super.

Contracting Foul Brood—Preparing Bees for Winter.

1. Is there any danger of bees contracting foul brood, if allowed to eat honey from a frame containing also larvae which have been killed by chilling them?

2. Is it positively necessary to have chaff below the brood-nest in a chaff hive?

3. What is the latest time in the season that bees swarm?

4. When would you begin to put bees up for winter?

IOWA.

ANSWERS.—1. If there was no foul brood in the combs, I should have no fear.

2. While it may be better to have chaff below, it is not nearly so much consequence as at the top and sides.

3. I don't know. It depends upon the season. They may swarm any time when warm enough and gathering enough. Probably in Iowa they might swarm as late as the first or middle of September. But the general swarming business will probably be through in July, with occasional cases in August.

4. In August. See to the important part of having plenty—not only plenty but abundant—stores for winter, unless

pretty sure you'll have a fall flow. See that each colony has a good laying queen. Other things may come on later, but get everything done a little before you think it necessary. From your second question you seem to have chaff hives. With them you can't be any too early getting ready, after this time, unless bees are storing so much that you must see to giving them room.

Number of Bees in a Colony—Tiering Up.

1. About what number of bees do you suppose it would take to make a strong colony? I am working mostly for increase.

2. How high would you advise tiering up on the brood-chamber?

3. I have two brood-chambers with eight frames in each, and the bees occupy all the frames. Will they winter safely?

VIRGINIA.

ANSWERS.—1. When you reach 50,000 you have a strong colony. You are not likely to have that number as the progeny of a single queen until the season is well advanced. It is possible that you might reach double that number. In the spring you'll do well if you have 10,000.

2. I'd pile on just as long as the bees showed they needed more room. They may need two or three stories, and if they have much honey they may need a good deal more. You're not likely to do any harm by giving too much room after the weather gets hot, but you may do harm by crowding.

3. You will probably find they winter just as well with two stories as one, and possibly better.

Milkweed Pollen-Masses.

There are some bees in two of my colonies that have many feet or claws to their legs, also on their antennæ. They are smaller than the workers, do not seem to work any. The workers take them by the collar and walk them out, police fashion. What are they? and will they do any harm?

INDIANA.

ANSWER.—From the masht specimens enclosed in your letter, I should say your bees have been working on milkweed and the pollen-masses cling to them to such extent that they can hardly get about, and the other bees expel them. As soon as the milkweed is through blooming the trouble will disappear. A few bees are lost in this way, but perhaps the bees gather enough from milkweed to pay for the loss.

Sealed Empty Cells.

Why do bees seal up empty cells in the supers? In uncapping some extracting-frames I found the bees had sealed up some of the empty cells?

ARIZONA.

ANSWER.—I have been very much puzzled sometimes to understand what it meant to find a sealed cell entirely empty. It hardly seems the bees would take the trouble to seal up a cell containing nothing but air, and I've thought it just possible the cells may have been filled with honey and sealed, and then the cell may have been opened through one of the walls from an adjoining cell.

Referred to the State Botanist.

Within find a few samples of a shrub for name. They will show you blossoms, undeveloped berries, and some berries about fully developed. The latter one is very small this year on account of the great dryness; they were twice as large in years gone by, as I can recollect.

CALIFORNIA.

ANSWER.—The shrub is one I am not acquainted with. Your State botanist will be able to tell you what it is.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY
118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. SEPTEMBER 15, 1898. NO. 37.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Omaha Convention will have reached its closing sessions when the majority of our readers receive this number of the Bee Journal. Week after next we expect to begin publishing the full report of the convention proceedings. This should make interesting reading for many weeks. All who were not fortunate enough to attend the convention will thus be able to get it "second hand," which is next best thing to being present in person.

Honey Imported from Puerto Rico.—In a pamphlet recently issued by the United States Department of Agriculture, on the "Trade of Puerto Rico"—our lately acquired possession—we find that in 1897 there was imported into the United States from there, 225 gallons of honey and 80 pounds of beeswax. Not a very sweet island, if that was all they had to export. But if it is anything like Cuba as a paradise for bee-keepers, in a few years we may expect the production of great honey crops in Puerto Rico.

A Warning to Honey-Shippers.—For the benefit of the newer honey-producers we wish to say that about three years ago there were a number of fraudulent commission firms who handled honey. Some of them were actually in business for just what they could defraud bee-keepers out of, by sending out circular letters in which they over-quoted the market. Many bee-keepers were caught in the net, and some lost very heavily.

The scheme was to get in a lot of honey by offering a much higher price than the market warranted, then afterward

claiming the price had dropt, and the bee-keeper would get just about what the crooked dealer felt like sending him.

Now, we hope that no honey-producers will fall into that trap this year. Be sure you know something about the firm you ship to. Don't take much risk, for what use is there in working to get a crop of honey, and then lose it through some scheming commission firm? Better a thousand times sell it for less nearer home, or give it to your neighbors and friends.

Right in line with this is the following paragraph taken from the Orange Judd Farmer—one of the best farm papers printed to-day:

RESPONSIBLE COMMISSION MERCHANTS.—We again caution our people in the interior who ship to the city markets against consigning goods to irresponsible firms. A favorite trick of these concerns is to over-quote the market in sending out circular letters, in some instances pledging themselves to make returns at a little above the market, or perhaps claiming to have a special outlet for goods, thus enjoying better advantages than the average commission merchant. We have recently had called to our attention soliciting letters of this character, which have some of the outward appearance of frauds, and all such should be promptly ignored. Many of these shady people go just as far as the law will allow, taking advantage of innocent shippers who have scant recourse. Something more than a fair bank rating is necessary to insure satisfactory returns. Do not ship to strangers unless you have every reason to know they are all right.

Are there Too Many Bee-Keepers?—Mr. C. P. Dadant has a very interesting article on page 577, showing that bee-keeping in this country is far from being overdone. In our recent trip to Ohio we think we saw only two or three small apiaries along the route of over 400 miles, tho we past hundreds of farm-houses all along the way.

We think we have encouraged very few people to go into bee-keeping. But what we have endeavored to do is, to get all who are already keeping bees, to take the American Bee Journal, and thus learn how to manage them more successfully. This surely is a legitimate effort, and so would be an attempt to induce more of those who are favorably situated to begin to keep bees and produce at least what honey their families could eat.

But everybody will never keep bees any more than everybody will grow strawberries or other fruit that requires more than ordinary care and intelligence to make a success of it.

Bee-keeping can never be overdone, especially in view of the ever-recurring failure of the honey crop to materialize. Of course, there will always be some part of the country that will produce a crop of honey, no matter if there be a total failure in almost every other place. And even when there is a good crop practically all over the country, honey need not be a drug on the market if properly distributed. There always will be plenty of people who will never learn the value of honey as a food, but who, once they learned it, would use it more and more.

Attending Bee-Conventions Pays.—Mr. Harry S. Howe, one of the expert handlers of bees in the State of New York, in the American Bee-Keeper says this about the value of attending bee-conventions:

"Take time to go to your bee-convention, even if you have to hire a man to work in your place while you are gone. I got an idea at the last Cortland county convention that has been worth all I ever paid for conventions, so far this season. Even if there are no new ideas, it is worth the price to get the 'bee-fever' up to a higher temperature."

There are but very few conventions of bee-keepers that are unprofitable to those who attend. And we have never gone to one that was not abundantly helpful to those present. Especially has this been true of the national meetings of bee-keepers. Of course, we hardly think it would pay to go from California to Maine just to attend a convention, but within any reasonable distance we feel it cannot fail to be exceedingly

valuable. Why, just to meet and get acquainted with some of the grand men of the pursuit ought to be worth much to any one.

It was somewhat expensive for us to attend the national convention held in Toronto, Ont., in 1895, but we felt it paid us well, because there we met Father Langstroth (who in a month after died), G. M. Doolittle, J. B. Hall, S. T. Pettit, Wm. McEvoy, D. W. Heise, Wm. Couse, and others that we might name, whom it was an exceedingly great pleasure to see, especially as it was the first time we had met them.

And then the World's Fair convention, where we met for the first time Prof. Cook, G. W. Demaree, Chas. F. Muth, E. S. Lovesy, Mrs. L. Harrison, Mrs. J. N. Heater, Mrs. J. M. Null, Mrs. Sherman, Rev. E. T. Abbott, and hosts of others equally pleasant to meet. Did it pay us? Did it pay *you*, reader, if you were there? Of course it did.

Southern California is kept track of pretty well by Prof. Cook, who quite regularly reports as to the apiarian conditions in that region. Writing us Aug. 31, he reported as follows:

While in most sections of Southern California the drouth remains unbroken, up in the mountains of parts of San Bernardino county there have been heavy rains, so that the railroads have been washed away. The Indians say this promises a wet winter. It is to be hoped that the Indian knows. At least these rains help to wet the earth, and give promise of a harvest in 1899.

In passing apiaries of late, I find already many empty hives. Unwisdom permitted too free extracting last season. The extreme drouth this year, and consequent honey famine has brought on starvation. Deserted hives will attract moths, and general starvation is threatened. It would seem the wise thing in such countries—and all countries are uncertain—to have a generous supply in the hive each season—enough to bridge over one year of famine, at least; and also wise in case this precaution was neglected, to find enough to prevent starvation. Our own good, no less than the good of the cause, demands such action.

The extreme drouth this year in Southern California has paralyzed bean-production, so that source for honey is wanting. The alfalfa fields, and a very limited area of more abundant rainfall, are the only bright spots in the apicultural sky of 1898. A. J. Cook.

Summer Honey-Drinks.—Dr. Miller, in *Gleanings* for Sept. 1, says British B. Mann sent him the following summer drinks:

HONEYED BUTTERMILK.—One spoonful of honey to $\frac{1}{2}$ glass of buttermilk. Stir well, then add as much soda as will lie on a dime.

HONEY PICK-ME-UP.—One egg well beaten in a pint of cold milk, with one tablespoonful of honey added.

We should think that either of these "honeyed-pick-me-buttermilk-ups" would be good. We'll have to try them the next time we "take a drink."

The Past Season's Experiences in the apiary are quite fit subjects for discussion in the columns of the *Bee Journal*. You are invited to tell about them, and what you have learned in connection with them. Perhaps many of you never wrote a line for publication. But that won't make any difference at all. Just write us about your work as you would in a private letter, and we will attend to putting it in proper shape for printing.

A Correction.—In the second paragraph from the bottom of the second column on page 549, and in the first line, it should read "*none*" instead of "more," where it says: "In regard to pollen in sections, let me say *none* will appear," etc. We regret the error, as it conveyed an entirely different idea than was intended by Mr. Hartzell, who so greatly appreciates Mr. Golden's method of producing comb honey.

W. S. YEATON, of Woodbury Co., Iowa, writing Sept. 3, said: "Bees are booming on golden-rod."

FRANK RUFFNER, of Shelby Co., Ill., wrote us Sept. 5: "We are having quite a fall flow of honey."

THE PROPRIETOR of what is believed to be the oldest apiary in Alameda county, Calif., writes us that he has taken 80 pounds of extracted honey from each of his colonies this season. This is the average; some colonies yielded 120 pounds.

SENOR T. ESTRADA DE PALMA, of the Cuban junta, it is said, has received, during his day of peaceful residence in his native land, in one year from bee-hunters \$800 for the privilege of removing the honey and beeswax from his estate in Santiago province.—*American Bee-Keeper*.

MR. THOS. WM. COWAN, editor of the *British Bee Journal*, writing us Aug. 16, reported that Mrs. Cowan was then with their two daughters in Scotland, and that he had returned from Switzerland a couple of days before where he had met the leading bee-keepers.

MR. G. M. DOOLITTLE, of Onondaga Co., N. Y., writing us Sept. 3, said:

"It is awfully hot here, and has been for four days; but I am driven to work from 5 a. m. to 9:30 p. m., out in the hot sun the larger part of the time."

MR. THOMAS EVANS, a bee-keeper of Lansing, Iowa, died Aug. 12, 1898, after a lingering illness of many months, at the age of 52 years. He claimed to be the inventor of a new process of sheeting wax for making comb foundation, which we think is used by some of the smaller comb foundation makers.

MR. H. D. CUTTING, of Clinton, Mich., an ex-president of the United States Bee-Keepers' Union, and for years one of the corps of experts who answer questions in our "Question-Box" department, still continues to suffer from almost total blindness. We were hoping that he would recover ere this. He will have the sincere sympathy of his many old-time bee-keeping friends in his sore affliction.

MR. C. M. MARTENSON, the business manager of the well-known firm of G. B. Lewis Co., bee-supply manufacturers, called on us last week, when in Chicago. Mr. M. reports a busy year—the like of which he doesn't care soon to pass through again. You see, he doesn't want to leave this world just yet. His firm expects to make up a large amount of stock before next season, so as to be prepared for any emergency.

MR. J. H. MARTIN is about to get a bicycle and travel over California a wheel, so as to get a store of material for his Rambles. He hopes, by this means, to make more side-trips than he was able to do when using a team. He expects to purchase a "Cleveland" wheel; wouldn't a "Rambler" make be more appropriate for the Rambler? The "Rambler" folks could not do better than to send one of their wheels to the well-known correspondent, for it would be a big advertisement for them.

MR. E. TIPPER, editor of the *Australian Bee-Bulletin*, writing us July 18, said:

"We are having what we may call a nice winter—a fair amount of rain, with bright, sunny days between. On the ridges above my apiary the white box-trees are laden with bloom, but the days are too short, and the weather too cold (it is our winter here) for the bees to gather much. The yellow box is also well in bud. We had a good convention in Sydney, the beginning of this month. It was a gathering of practical bee-keepers, and good practical work was done."

When we received Mr. Tipper's letter (Sept. 3), we were having our hottest days of summer—90° above zero. And in Australia it was winter.

Does His Full Share.—"The editor of the American Bee Journal does his full share to help the honey market. I've just had the pleasure of a two-days' visit from him, and I think he ate honey at every meal."—Dr. Miller, in *Gleanings*.

Tall Plain Sections are reported a success by C. E. Hammond, in *Gleanings*. Wherever the bees work on them at all, they finish the greater part of those they began on, instead of beginning on all and finishing none as they had generally done with the ordinary $4\frac{1}{4}$ sections in T supers without separators.

Are Separators Needed?—Dr. S. H. Hurst says in *Gleanings*, "He who produces honey without a separator of some kind is just a little too slow to keep abreast of the times." Per contra, Editor Hill says he had no idea that the majority of bee-keepers used separators, never used them himself except 400 or 500 as an experiment, and doubts their advantage.

Naphthalin in Place of Sulphur has been used for some years by Ulr. Gubler, and he finds it just as effective against the bee-moth, and less objected to by the bees. Powder the combs with naphthalin, or else put small pieces in the closets where combs are kept, renewing when evaporated.—*Revue Internationale*.

Why are Hybrids in the Majority?—*Gleanings* thinks "the majority of progressive bee-keepers use hybrids, because they secure as much honey as Italians, and more than blacks." American Bee-Keeper thinks that is not the true reason why hybrids are in the majority, but does not say what the true reason is. Don't they have hybrids just because it is too much trouble to keep pure Italians?

Width of Bottom Starters.—The editor of *Gleanings* says he has had trouble with bottom starters toppling over when as wide as half an inch. Dr. Miller says when too narrow the bees seem inclined to gnaw them down. He uses them deeper than half an inch, but has the top starter come within less than $\frac{1}{4}$ inch of the lower. Then the bees tack the two starters together before they have time to topple over.

Bees and Horses.—Edwin Wide reports in the British Bee Journal that he had a meadow mowed without having a horse stung, the high horse going within a yard of the entrances of 17 colonies. Prior to the horses being taken to work, he made a solution of carbolic acid and water, and, with a cloth dipped in the solution and then wrung out, carefully wiped the horses all over their bodies and limbs.

Swarms Deserting.—D. W. Heise complains in Canadian Bee Journal that nearly 50 percent of his swarms, after having been hived in new, well-made hives, with new frames and full sheets of foundation, deserted, some the second, third, and even the fourth day. Hives were well shaded. He wants some one to tell him what was the trouble. The editor says desertion has given much trouble to every one this season.

Cutting Queen-Cells to Prevent Swarming.—The practice of cutting queen-cells to prevent prime swarms, Doolittle says in *American Bee-Keeper* he believes often results in loss of honey, throwing the bees out of balance and making them swarm right in the harvest. For after-swarms, the usual plan

of cutting cells six days after the prime swarm may only make matters worse. Makes after-swarms later, but that's all. Wait till eight days after the prime swarm, then cut all cells and give a choice cell, and you have a sure thing. His favorite plan is to listen the evening of the 8th day for piping, and if no piping is heard, to listen each night till the 16th, after which there will be no swarming. When piping is heard, he cuts out all cells the next morning, knowing for sure that there is a free queen in the hive.

Size of Worker-Cells.—In France some attempt to rear larger bees has been made, and partly at least through using foundation with cells of larger size than natural. M. Sergeant, writing in *L'Apiculteur*, says if the size of cells controls the size of bees, his bees should all be of the same size, as he has used the same foundation for all. But he finds his Cyprians and Carniolans perceptibly smaller to the eye than the blacks.

Plain Sections Without Separators.—A conspiracy is being hatched in Canadian and American Bee Journals and *American Bee-Keeper*, to make bee-keepers crazy guessing. C. A. Bunch, supported by D. W. Heise, and Editor Hill, darkly hints at a plan for having plain sections bee-space apart with no separators. In the interest of common humanity, let Mr. Bunch tell us how he manages to keep plain sections spaced apart.

Swarms Losing Weight in Transit.—Trouble has been reported in the British Bee Journal between sellers and buyers, the buyer complaining that the colony sent by rail was not up to the agreed weight. The trouble comes from the fact that the journey by rail, with its accompanying jolting and excitement, causes a loss in weight. Even without any journey there is a serious loss in weight. One man reports that a swarm hived at noon lost 5 ounces in $10\frac{1}{2}$ hours, and 14 ounces in the first 24 hours. Another swarm sent by rail lost 27 ounces from one day to the next.

Peanut Queen-Cells.—Those big peanut queen-cells on a stick, *a la* Doolittle, give larger and better queens, according to our Mr. Wardell, than by the old method. I supposed this was true, but there is some satisfaction in having it proved before our eyes. I have just received a line from Mr. Alley, inquiring why we fuss with artificial Doolittle cups when the natural ones can be reared more cheaply by the bees, as per directions in his book. But there is one great advantage in artificial cups; viz., they stiffen the base of the cells so that one can mash them right into the side of a comb, without crushing the cell itself. The natural cell-cups are frail things, and require to be handled like eggs.—*Gleanings*.

Why Frame Hives are Better is a topic handled by G. M. Doolittle in the Canadian Bee Journal. With movable frames we can lift out the frames and actually see how much honey is present in spring, and if needed an extra frame of honey can be given, whereas only a guess can be made at the honey in a box-hive, and if too cold for the bees to work on a feeder there is no help for them in case of scarcity.

If a colony is overstuffed with honey, the queen being thereby crowded, an empty frame can be given for a full one.

Whether a queen is doing good work can be seen by actual inspection with movable frames, and if the queen is poor the matter can be remedied.

Drone-comb can be removed and worker put in its place.

The frames can be manipulated so as to hasten the development of the colony, thus getting them ready sooner for the harvest.

If some colonies are extra strong and others weak, bees and brood can be taken from the strong and given to the weak. That's much easier than to drum bees out of a box-hive.

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY :

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 7½ cents a pound; 2 cans, 7¼ cents per pound; 4 or more cans, 7 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, "HONEY AS FOOD," will be a great help in creating customers for honey. See prices on another page.

Bees Doing Well.

Bees throughout the section of Virginia and Pennsylvania traversed by the Second Division of the Second Army Corps, seem to be doing well. The honey, however, is inferior to that gathered in Vanderburgh Co., Indiana. My wife reports our bees there as very strong, and is putting on second supers. The best flow is just about to set in from smartweed and fall flowers in the river bottoms, which yield a good crop of water-white honey every season without fail, up till frost sets in.

Our present camp on the banks of the Susquehanna is a most beautiful spot.

SERG. J. C. WALLENMEYER,
Company S, 159th Ind. Vol.
Camp Meade, Pa., Sept. 6.

Honey Superior in Quality.

While we did not get any honey last spring, and don't look for much of a crop this fall, what has been secured is of a superior quality.

I favor Editor York's views about buying direct from one another, so we can supply the demand on our producers, and thereby help keep up a stipulated price on our crop; and if necessary let Virginia go to Cuba or Puerto Rico—anywhere we can get honey to fill our orders with, so that it is a pure article. Of course, I would prefer

Virginia to stay at home, as we have a large territory here to develop in apiculture, the majority of bees being kept in box-hives, and the people want to know if there is but one king in a hive!

I am for bees and honey, first, last, and always. PARK T. SOUTHARD.

Woodruff Co., Ark., Sept. 5.

Great Find of Bee-Trees.

My bees are doing finely. From three colonies I increased to nine, but saved only seven, and found six bee-trees. One I cut July 25, and took out 105 pounds of honey. From the others I got from 30 to 150 pounds. My partner found 40 trees. He cut one last week and got 685 pounds. It was a small ash tree. We went with a little tin bucket, but as we sawed in we could feel the saw strike honey. When the tree fell over, the honey extended awny down into the root of the tree, all of which we took out, and then we started at the tree. We had to go for more buckets, as the combs ran away up into the tree. I split it open and we took out 16 feet of honey, nice and white. We started to saw at 6 o'clock, and we were through with the job the next morning at 6:30. It was hard work. At first we thought the tree was no good, but it paid to cut it. These were black bees. I took them home, and they are doing finely.

I have 11 colonies in good condition. Wild and tame buckwheat is in bloom now. B. F. SCHMIDT.

Clayton Co., Iowa, Sept. 5.

For Business Reasons.

The United States Department of Labor has just issued a bulletin entitled "The Economic Aspects of the Liquor Problem," in which a few points are worthy of notice. The first is the change that has occurred in the consumption of liquor. In 1840 the per capita consumption of distilled spirits was 2.52 gallons. In 1896 it was one gallon, or about two-fifths of what it was 55 years ago. But this does not represent the actual decrease in the consumption of spirits as a beverage. In both cases this quantity includes the amount used in arts, manufactures, medicines, etc., which must have been vastly greater in 1896 than it was in 1840; so that our people use less than two-fifths as much spirituous liquor as their fathers and grandfathers did. Certainly our elderly readers, who remember the time when no harvest or threshing or barn-raising was without a liberal supply of liquor, will sustain this assertion.

But there is another side to this consumption of intoxicants. While the use of spirituous liquors has decreased, and of vinous liquors has changed little, that of malt liquors has grown at a wonderful rate. In 1840 Americans consumed but 1.36 gallons of malt liquors per capita, while in 1896 they consumed 15.16 gallons. This shows that the tendency has been toward the milder beverages as well as toward the restriction of the use of stimulants.

But probably the most interesting point in the investigation is that which shows how employers regard the use of liquor by their employees. To questions asked by the Com-

missioner of Labor as to their position regarding the use of liquor by employes, 6,901 establishments replied, representing 1,745,000 men. Of these 5,363 reported that when hiring men they endeavor to ascertain whether the prospective employes use liquor. Of establishments engaged in the business of transportation nearly all take such precautions.

Of the 6,901 establishments mentioned 3,527 absolutely require that their employes shall not use liquor when on duty, and most of them require that employes shall not use it at any time. The reasons given for this are instructive. Unreliability, inefficiency, incompetency, bad work, irregularity, dishonesty, accidents, abuse of animals, wastefulness, and bad example are some of the reasons given for not employing men who use liquor. Sober employes mean the opposite of all these things, and that is why business men want them.

Bear in mind that these figures are not compiled by a "temperance crank," and that cranks did not furnish the reports from which they were taken. They are merely the result of an investigation made for business reasons among business men, and there is no sentiment about them except that of common-sense.—Nat. Stockman.

Bees Didn't Do Well.

I am well pleased with the American Bee Journal. I always read it through once, and some of it twice. I think if there ever was another man with as much patience as Job it surely is Dr. Miller.

My 30 colonies have not done very well this season—only about 350 pounds of surplus, all sold and delivered at 12½ and 10 cents a pound.

White clover was a total failure so far as neectar was concerned, and there was but a small amount of linden. TENN.

Cannon Co., Sept. 6.

Afflicted With Honey-Dew.

I commenced the season of 1898 with 28 colonies, all black bees. I use a hive with Langstroth size frames. I increase to 36 colonies by natural swarming, and had 1,400 one-pound sections filled, but the honey was mostly dark on account of so much honey-dew. There was a wonderful amount of it during the month of June, and just as the basswood began to bloom it started to rain, and hasn't quit yet, so we got but little basswood honey. Consequently honey is very cheap on account of its dark color. In July I took a case of honey to a little railroad town some nine miles distant, and askt 14 cents a section, and the merchant said they had been offered all the honey they would want for 10 cents a pound by one of my neighbors living some 2½ miles from me.

A few days later my wife and self went to see this neighbor and his honey. I found him in the field at work. After shaking hands I inquired about his crop of honey. He said, "Oh, I have lots of it, or I reckon I have. I haint took any yet." It was then the 16th of August. He went on to say that his honey was the very best of honey, as it was all gathered from honey-dew. I told him what I had read about

the excursion to Boston over the Nickel Plate Road, Sept. 16 to 18, inclusive, at rate of \$19.00 for the round trip. Good returning until Sept. 30, 1898, inclusive. Tel. Main 3389. (61-32-6)

this stuff, and he hooted at the idea, and contended that it formed and fell just like rain.

Before leaving, I askt to look in some of his hives, so we opened five or six, and with but one exception we found a great ant-nest on top of the sections, or frames, as a part of his hives contain shallow frames in the upper story; and the honey was as black as if it had been used for brood-rearing. He is also one of those "king bee" men; doesn't read any text-book or bee paper, or anything of the sort, but knows all about bees!

I marketed a part of my honey a few days ago in the towns of Beverly and Elkins, in our own county (Randolph), at 12½ cents, partly in goods.

West Virginia, Sept. 5. **IRA SHOCKEY.**

Bees Have Foul Brood.

I am well pleased with the American Bee Journal; it has been a great help to me. This is my third year with bees. The first year I got no surplus honey from two colonies. Last year, from four, I got 75 pounds; this year I had six, and from the instruction received from the Bee Journal I learnt that they had foul brood, so I transferred them into new hives on full sheets of foundation, and united, making three colonies, and burnt the old hives and brood. Foul brood is quite bad in this part of the county. Quite a number of colonies have been burned.

Some bee-keepers tell me they don't need a bee-paper. One bee-keeper living half a mile from me has three colonies and got no surplus honey. I have the same number and got 150 pounds of section honey, thanks to the American Bee Journal.

JOHN F JOHNSON.

Schoharie Co., N. Y., Sept. 5.

Where Noah Kept His Bees.

Dr. James K. Hosmer, while recently visiting Boston, had occasion to visit the new Public Library. As he went up the steps he met Edward Everett Hale, who askt the Doctor's errand.

"To consult the archives," was the reply.

"By the way, Hosmer," said Dr. Hale, "do you know where Noah kept his bees?"

"No," answered Hosmer.

"In the ark hives," said the venerable preacher, as he past out of ear-shot. —Ladies' Home Journal.

The Clover Housewives.

BY PERCIA V. WHITE.

The merry wives in Cloverland
Are flying round in glee,
For they've received a message from
That gay brigand, the Bee.

"Now load your three-leaved tables down
With sweets in colors three,
For I'm very fond of honey!" quoth
That gay brigand, the Bee.

"And I will find the pollen-boards
Of the Miser of Cloverlea,
And fling his gold among you!" cried
That gay brigand, the Bee.

So they're loading down their tables small
With sweets in colors three—
In red and white and gold—to please
That gay brigand, the Bee.

—Youth's Companion.

In the multitude of counsellors there is safety.—Prov. 11-14.

Snow at Hive-Entrances.

Query 82.—Is it advisable after a heavy snow-storm to clean all the snow away from the entrance of the hive, or would you let it remain?—Mich.

E. France—We let it remain.

W. G. Larrabee—Let it remain.

Mrs. L. Harrison—Let it remain.

R. C. Aikin—If much, clear it away.

Prof. A. J. Cook—I would clear it away.

Dr. C. C. Miller—Sometimes, and sometimes not.

R. L. Taylor—Clean it away if it gets soft and heavy.

Chas. Dadant & Son—Let it remain till it begins to thaw.

James A. Stone—It does not snow on my bees, as they are in the cellar in winter.

P. H. Elwood—The most successful winterers say that the entrances should be kept open.

Rev. M. Mahin—Whenever there is snow enough to cover the entrance, I remove it as soon as I can.

Eugene Secor—The snow will do no harm unless ice is formed at the entrance, obstructing ventilation.

O. O. Poppleton—If dry, I should let it alone; but if not, and liable to be frozen solid, I should take it away.

Emerson T. Abbott—Let the snow alone. It will do no hurt, and you may do a deal of harm trying to remove it.

Dr. J. P. H. Brown—Without having much experience on the "snow question," I would venture to clean it away.

J. M. Hambaugh—Leave it alone during extreme cold weather. When it begins to thaw, remove it from the entrance.

J. E. Pond—In my own apiary I let the snow remain. In other localities it might be advisable to clear it away. The question, it seems to me, is local and not general.

C. H. Dibbern—I would not winter bees where snow would cover them up at all. If I did, I think I should not disturb them by shovelling the snow from about them.

Mrs. J. M. Null—As long as light and porous in its nature let it remain at the entrance. If in danger of solidifying, remove. Ice in front of the entrance is anything but desirable.

Dr. A. B. Mason—If the hive were properly tipped forward I would let the snow remain unless a crust should form on the snow. I would then break the crust and let the snow remain.

D. W. Heise—It depends very much whether the snow drifts solid or loosely; if packed hard, and to any extent of depth, past experience teaches me that it is advisable to remove it instantly.

J. A. Green—I would let the snow remain unless the weather was such that

by thawing and freezing the entrance was apt to get clogged with ice. I would clear away the snow if the weather was so warm that the bees wanted to fly. At other times I would let it remain.

S. T. Pettit—If there is a porch or board leaned up against the hive, or other contrivance to keep the ventilation clear, let the snow alone; otherwise it is generally better to clear it away.

E. S. Lovesy—We let it remain; if the bees attempt to come out, and they meet the snow at the entrance, they will return, but if the snow is swept away they will often fly out and fall and die in the snow.

G. M. Doolittle—Leave a wide board in front of the entrance, and pay no attention to snow unless it covers the hive. I think it best not to have hives covered entirely with snow for many days at a time.

G. W. Demaree—Situated as far South as I am I could give you no advice of value on this subject. There were some bees lost in this locality some years ago by wet snow and sleet closing all ventilation to the hives.

Minnesota.—The adjourned meeting of the Minnesota Bee-Keepers' Association will be held on Wednesday forenoon during State Fair week, at the place where the honey exhibit is made on the fair grounds. Make an effort to be there, and invite other bee-keepers who are not members to come and join the Association. L. D. LEONARD, Sec. Minneapolis, Minn.

ELECTRIC WHEEL CO.

They Don't Break Down.

We know of nothing that will occasion more annoyance and possible loss in the midst of a busy season hauling than to have your wagon break down. The remedy lays in buying a wagon that is so constructed that it can't break down.

THE ELECTRIC HANDY WAGON

is that kind of a wagon. It is equipped with **ELECTRIC LOW STEEL WHEELS** which brings the wagon down where it is easy to load. Broad face tires which do not cut in or rut in the fields or on the road makes it draw easy. No wood hubs and felloes to rot or warp; no wood spokes to shake loose and break; no tires to get loose. Stands up under any load a team can draw. Buy it and save all expense of repairs. **ELECTRIC LOW STEEL WHEELS FIT ANY SKEIN.** Convert the old wagon into a new one, and make it last indefinitely. Can't tell all about it here. Write for our free book, "Farm Savings." It tells the whole story.

Electric Wheel Co., Box 16, Quincy, Ills.

Please mention Bee Journal when writing.

THE BIGGEST OFFER YET!

Last year only about one per cent—only one subscriber in 100—ordered his Review discontinued. If the Review could secure 1,000 new subscribers the present year, there is an almost absolute certainty that at least 900 of them would remain; not only next year, but for several years—as long as they are interested in bees. Once a really good bee-journal visits a bee-keeper a whole year it usually becomes a permanent member of his family.

I would have no difficulty whatever in getting twice 1,000 new subscribers this year, if all of the bee-keepers in this country had read the Review the past year. I have sometimes thought that it might pay a publisher to give away his journal one year, simply for the sake of getting it into new hands. There are, of course, decided objections to such a course; but I am going to come as near to it as I dare. Here is my offer:

If you are not a subscriber to the Review, send me \$1.00, and I will send you twelve back numbers, the Review the rest of this year and all of next year.

Each issue of the Review, especially if devoted to the discussion of some special topic, is really a pamphlet containing the best thoughts and experience of the best men upon the topic under discussion. Twelve back numbers of the Review are, to a certain extent, so many little books devoted to as many different phases of bee-keeping. Some issues of the Review are now out of print; of others only a few are left; while of others there are several hundred. Of course, I shall send those of which I have the most, but no two alike.

Most people subscribe for a journal at the beginning of the year. In this case there is no use of waiting, as you will get the Review for next year just the same as tho you waited until next January to subscribe, and you get all the rest of the numbers for this year FREE. The sooner you subscribe, the more free issues will you receive.

Let me tell it over once more. For \$1.00 you get twelve back numbers, the Review the rest of this year, and for all of 1899.

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published today. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us **Two New Subscribers** to the Bee Journal (with \$2.00), and we will mail YOU a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

EVERY BEE-KEEPER

.....To have a copy of.....

Our 1898 Catalog

Send us your name and address and we will take pleasure in mailing you a copy

G. B. LEWIS CO., WATERTOWN, WIS.

Special Agent for the Southwest—

E. T. ABBOTT, St. Joseph, Mo.

Mr. Abbott sells our Hives and Sections at factory prices.

Please mention Bee Journal when writing.

Ho, for Omaha!

AS we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful straw-

colored **Leahy Patent** Foundation, Improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the **PROGRESSIVE** free, and a beautiful Catalog for the asking.

Address, **Leahy Manufacturing Company, Higginsville, Mo.,** or **1730 South 13th St., Omaha, Neb.**

Please mention Bee Journal when writing.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Sept. 10.—Honey has sold well for past few days, and all of the best white comb that is in proper shape sells at 12c. Off grades of white, 10 to 11c; amber, 9 to 10c; dark grades, 7 to 8c. Extracted, white, 5 to 7c; amber, 5 to 6c; and dark, 4½ to 5c. Beeswax, 27c. R. A. BURNETT & Co.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c.; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c.; dark and partially filled from 5 to 8c. as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax, prime, 24c; choice, 24½c. At present, there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c; amber, 10@11c. Extracted, white, 5½@6c; amber, 5@5½c; dark, 4½@5c. Beeswax, 22@25c.

The receipts of comb honey are larger.

C. C. CLEMONS & Co.

Columbus, O., Aug. 30.—The present demand for honey is rather limited, owing to the large quantity of cheap peaches now arriving. It is also a little early for this market to take a large amount. Receipts are ample but little now arriving that can be called fancy. The greater part of it will grade No. 1 and No. 2. We quote: Fancy, 14 to 15c; No. 1, 12 to 13c; No. 2, 10 to 11c. COLUMBUS COM. AND STORAGE CO.

New York, Sept. 1.—We have a good demand for new crop comb honey, and it is beginning to arrive. Have sold some shipments at 14 to 15c for fancy white, 12 to 13c for No. 1 white, and 10 to 11c for fair white. We think these will be about the ruling prices this fall; exceptional fine lots may sell at a little more. Extracted is in good demand at unchanged prices. Beeswax dull at 26 to 27c. HILDRETH BROS. & SEGELEN.

Boaton, Sept. 1.—Fancy in cartons, 13c; A No. 1, 11@12c; No. 1, 10@11c; No. 2, 9c.

New comb honey is now coming in, and while the demand is light owing to the warm weather, yet it is being well taken. Extracted, very little California on hand, and selling readily at 6½@7½c. Florida now arriving and selling at 5@6c. White clover scarce and wanted. BLAKE, SCOTT & LEE.

Indianapolis, Sept. 1.—Fancy white comb honey, 12@12½c; No. 1, 10@11c. Extracted, white, 6@7c. Beeswax, 25@27c.

Only a few arrivals of fancy white comb; market almost bare, and demand good. Quite a little comb honey from honey-dew is being offered, but there is simply no demand for the stuff. WALTER S. POWDER.

Milwaukee, Sept. 1.—Fancy comb, 11 to 12c; A No. 1, 10 to 11c; No. 1, 9 to 10c; amber, 7 to 8c; old and dark, 5 to 6c. Extracted, white, in barrels or kegs, 5 to 6c; dark, 4 to 5c. Beeswax, 25 to 26c.

The market for honey is in very good condition; while there is yet a little of the old crop on hand, it is in very good order, and some demand, which will clear off everything before the new crop will arrive, very plentifully. There is already some receipts of new, but mostly extracted, and some very good quality, yet we fear the danger is in extracting too early, before the honey is fairly ripened. We anticipate a good demand a little later, and think values will remain about the same as present quotations. A. V. BISHOP & Co.

Buffalo, Sept. 1.—Fruit prevents a large demand for any kind of honey at present. A few cases of fancy one-pound new comb can be sold daily at 11@12c.; but any grade below must be urged at proportionately lower prices. Would advise writing us before shipping here. There is no demand yet for extracted. BATTERSON & Co.

San Francisco, Aug. 24.—White comb, 9 to 10c; amber, 7 to 8½c. Extracted, white, 6@6½c.; light amber, 5½ to 6c. Beeswax, 24@26c.

Stocks are of very moderate volume, both of comb and extracted, and market remains firm at ruling rates, especially for water white or light amber of desirable flavor. There is a fair local demand and some business on foreign account. The bark J. O. Glade, clearing Monday for Europe, took 808 cases, valued at \$3,250.

Cleveland, Sept. 1.—Fancy white, 13@14c; No. 1, white, 12@12½c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c.; light amber, 6c.

The demand for honey is exceptionally good, owing to the crop in this vicinity being very light. A. B. WILLIAMS & Co.

See Honey Offer on page 587.

CONTRIBUTED ARTICLES

Bee-Eating Insects—Cow-Killers, Etc.

BY PROF. A. J. COOK.

Mr. J. H. Hempel, of Louisiana, writes as follows:

"By this mail I send you in a queen-mailing box two insects, which species are plenty among the bee-hives. I think they kill bees and eat honey, as I see them frequently going into the hives. Of course I kill them when I see them, but they are difficult to kill, as they have red scales over the body which are as hard as a hickory-nut; so of course the bees cannot sting them, and they do what they please in the hive. Please let me know the name of this insect, and all you know about it. They also have a terrible sting, and I am informed that their sting is far more painful than is a bee's sting. They may be alive when they reach you."

This is a "cow-killer," "cow-killer ant," or "solitary

ant," all of which names are applied to the species. They are known to kill bees, and one is figured and described in my Bee-Keepers' Guide, page 427. They are found from Illinois to the Gulf, and through Texas to this coast. They are comparatively common here. The most common ones here are like the ones sent by Mr. Hempel—red, with a black band. Others here are gray. The females are wingless, but the males usually possess wings. The insects look much like ants, but are solitary, not living in colonies. They are fossorial. That is, they dig holes in the earth in which, like many of the wasps, they rear their young. They belong to the family *Urtillidæ*. They have a very hard crust, which serves as an armor. It is this crust, not the hairs—red or gray—which makes them so hard to kill. It is often quite difficult to pierce them with a strong pin. As Mr. H. says, they are possessed of a powerful sting. I suppose this gives the name "cow-killer."

They do kill bees, surely. I should like to know if they ever do eat honey. I have never had proof of that, but it may be true. Wasps and ants of similar habits possess a sweet-loving tooth. As I have never seen these off the ground, that is, in trees or shrubs, where they could glean nectar or honeydew, I surmise that they are simply predaceous, and kill and eat other insects, and do not feed on honey.

Like most insects that kill bees, I think these do far more

Company Gathered in Mr. Kreuzinger's Apiary to witness the "Honey Harvest," Aug. 27, 1898.—See page 596.

good than harm. They are not sufficiently common to kill many bees, and for the most part feed on injurious insects and so do great good. While I would not complain of Mr. H., or blame him for killing these when he sees them, yet I would have him know that they have their good side, and are by no means exclusive enemies.

CALIFORNIA BEE-KILLER.

There is another animal in California—not at all rare—which I figure and describe briefly, in my book, as the "California bee-killer." It is not an insect at all, but belongs to the scorpion branch of the spider class. Therefore, it is possessed of eight instead of six legs. It looks, as will be seen by the figure (Bee-Keepers' Guide, page 432), like a long spider, but in having a segmented abdomen, and pincer-like jaws, it is more closely related to the scorpions. All that I have seen are whitish, gray, or dark in color. These, like the cow-killers, enter bee-hives and kill and eat the bees. I have heard of this work in Northern California, and in Inyo as well as in Southern California. Like the cow-killers, these are predaceous, and so do much good—I think far more good than harm. The double-acting jaws which resemble the pincers of the scorpion and lobster enable this animal to give a formidable bite, as I have often proved by teasing them with a stick.

ROBBER-FLIES.

The robber-flies (see Bee-Keepers' Guide, page 415, for illustrations), are also very common in Southern California. These large, savage two-winged flies are rightly called "bee-killers" in some sections. They do not enter the hives, but hover about the entrance and, eagle-like, swoop down upon the unsuspecting bees, pierce them with the strong beak, and suck their blood. In some sections these great robber-flies are quite serious pests. Yet they kill so many injurious insects that they are not to be wholly condemned. It is strange that these flies can do such ferocious work. I have known one to attack, overpower, kill and suck bloodless a big, savage tiger-beetle.

We have found here that the king-bird, or bee-martin—a different species from the one common in the East—is not about the hives solely to capture the bees. We find more robber-flies than bees in their stomachs. Indeed, I have not found a bee as yet, but have taken several robber-flies from birds killed in the apiary, which were supposed to be killing bees. I have, however, pretty good evidence that they do sometimes kill and eat bees.

DRAGON-FLIES.

The only other insects in Southern California that I have known to kill bees are the beautiful dragon-flies, darning-needles, or lace-wings. While these mosquito hawks, as they are also called, are far less common than in the East, they are often seen, and claim not a few bees to make up for their vigilant search for injurious insects. Like the other species, they rarely do anything like the harm that they do good. On the whole, they are likewise friends.

Los Angeles Co., Calif.

Methods of Ventilating Bee-Hives.

BY WM. M. WHITNEY.

There seems to be no small degree of agitation lately among the wise heads in our bee-keeping fraternity, respecting ventilation of the bee-hive. Some advocate the use of front wedge-blocks; some, front and rear spaces; others, blocks under the four corners of the hive; and still others, raising the cover.

Now, all of these methods of ventilation, excepting the last mentioned, are applicable only to hives having loose bottoms, and every one of them, under certain circumstances, are subject to serious objections, which, it seems to me, will be suggested to any experienced bee-keeper.

My hives are what are known as the two-story Falconer chaff, having tight bottoms—have tried others, but like this better than any other I have seen for wintering out-of-doors, and for manipulation as I have learned to do.

My colonies are very strong—made so by careful building up as they need room, to two stories of 20 frames, as early as possible after the season opens; and when they show signs of "hanging out," I simply remove one or two frames from the brood-chamber, according to circumstances, and re-space the others, which settles the difficulty with my bees. I also remove the super of frames from the upper story of such as I wish to run for comb honey, and substitute section-cases. The wider spaces in the brood-chamber gives freer access to the upper story, and I find my bees occupy it very fully as soon as the change is made; and when I raise the enamel cloth, they

poke their little heads up through the bee-space and say, "Thank you."

It must be quite a difficult task for a bee to make its way up through a mass of bees to the surplus chamber, when spaced close as we usually put the frames, when brood-rearing is started in the spring.

But, it may be objected to my practice, that the bees will thicken the comb in the brood-chamber so as to reduce the spacing. I think not, if there is a prolific queen to occupy the frames with brood; and especially so if the bees are working in the surplus chamber; at least this is my experience. My hives have an entrance of $\frac{1}{2}$ x 8 inches, and by practicing as above described, I have no lounging outside by the strongest colonies I can create. If bees need so much ventilation, why do they carefully stop up with propolis every crack and crevice they possibly can? It is more room in which to move about that mine seem to want, and I think my method of ventilation subject to less objection than any other with which I am acquainted.

Of course, any manipulation of a colony of bees must be done at the proper time and in the proper manner to secure the desired results; which means that the successful bee-keeper is one who has his eyes wide open all the time, and sees and appreciates what is going on in his apiary from day to day, and from what he sees, and from what he reads, is prepared to take advantage of circumstances.

The more I study my bees (and that is pretty nearly all the time), watching their various operations, their changing conditions, caused by changes of weather, varying seasons, as well as difference in methods of handling them, the more I am convinced that bee-keeping is not only the most complex but the most interesting of all rural pursuits.

Will some one of our scientific students of the fraternity tell us why the bees always before leaving the hive for their journey, wipe their eyes with their "forepaws?" You may ask, Do they? Yes, they invariably do so. It is done as they approach the exit where the light strikes the eye, or as soon as they reach the alighting-board.

Kankakee Co., Ill., Aug. 12.

Extracting-Supers—Italians Gather Better Honey.

BY C. P. DADANT.

In the last few weeks I have had several inquiries from bee-keepers who use extracting-supers of the same depth as the pound-section supers, with a request for an opinion in the matter.

We use an extracting-super that takes a frame 6 inches deep, and after trying both this and the full-frame super on a large scale, that is, on hundreds of colonies, we have a very decided preference for the former.

As for the shallow 4-inch extracting-super, we can see no benefit in its use. In the producing of extracted honey we may very confidently expect a yield of honey about double of that harvested in the comb, that is, after the comb has been once built and can be returned to the bees to be refilled at the beginning of each honey crop. An extracting-super only four inches deep gives too little room to the bees, and if two supers have to be used instead of one, there are too many combs to handle to expedite matters and enable us to handle our hives economically.

On the other hand, a full-depth super very often gives the bees more room at one time than they can readily occupy. If the colony is not strong, and the super is put on the hive early, such a large amount of space is difficult to keep warm, and breeding is delayed. If the bees begin work in the deep super it often happens that the queen ascends to it and begins laying, and the colony sometimes forsakes the lower story and transports its entire force to this upper story. With 8-frame Langstroth hives the additional room given by the adding of a second full story may very often be welcome to a prolific queen that finds herself cramped for room in the lower apartment, but as the queen is usually unable to entirely fill the whole 16 frames with brood, the result is that a part of this upper story may be occupied with honey and the other with brood, and honey has to be extracted from combs containing brood. We found the same circumstances with two-story 10-frame Langstroth hives, and after several years of trial finally fix on the 6-inch super as the most practical. With a super of this depth extracting is more rapid than with either the shallow or the deep story, for the combs are more regularly filled with honey, and breeding in these combs is more exceptional. The outlay in cases for extracting-combs is but a trifle, and, in my opinion it is out of the question to

use the same cases for both comb and extracted honey, for the very good reason that after our extracting-combs are once built they must be preserved if we wish to derive all the benefits that are expected from the production of extracted honey, and nothing is better to contain these combs while not in use than the very cases in which they have been built.

I do not see where Mr. Deacon (page 563) found instructions from us to make the top-bar of the extracting-frames $1\frac{1}{2}$ square. We do not make them this heavy, and if we have ever recommended any such top-bar it must have been by some error. Our book, "Langstroth Revised," gives the thickness as $\frac{3}{4}$ inch, which is rather light for brood-frames, but all right for an extracting-frame 6 inches deep. As to the bottom-bar, we make them $\frac{1}{2}$ inch thick, for two reasons: In the first place, we make our end-bar only $\frac{1}{4}$ inch thick and nail it into the bottom-bar, instead of nailing the bottom-bar into the end-bar, as usual with the Langstroth hive. On the other hand, we have found, and probably many others have noticed also that it very often happens that the bees build more or less brace-combs and bridges between the brood-chamber and the super, or between the several supers, and when they make these braces very strong it sometimes happens that a thin bottom-bar will bend and yield when the super is taken off. This is our reason for making the heavier bar. This is a very unimportant matter, anyhow, as we have plenty of room in our hives and supers for what wood is needed, and the cost is very nearly the same.

DO ITALIAN BEES GATHER BETTER HONEY?

I notice that there has been quite a discussion in the American Bee Journal as to whether, and why, the Italian bees gather better honey than other bees. I have noticed this peculiarity myself a number of times, more especially when honey-dew and clover honey are to be found at the same time. I have also noticed in August black bees on buckwheat bloom while no Italians could be found on it. Evidently the Italians were finding something better, for they were working as faithfully and as successfully as the others, and, in fact, the honey crop of the Italians was in many instances of greater quantity as well as of better quality.

To me, there is but one explanation of this fact. The Italians have more developed olfactory nerves than the others, and are better fitted to select their food. It would also appear that their taste and likings are similar to ours, and that what suits their palate best is also our choice. In the choice between clover honey and honey-dew the contrast is so great that there is nothing apparently extraordinary in a market preference for the former product; but in discerning between buckwheat honey and knot-weed, the Italians undoubtedly show a very notable ability and good taste. Hancock Co., Ill.

Bee-Chat, or Various Notes and Comments.

BY HERMAN F. MOORE.

RED-CLOVER ITALIANS.—As to pure Italian bees, or certain selected strains of them, working on the big red clover, why can't we have a general experience-meeting from all the readers of the American Bee Journal? If we can lengthen the tongues of bees by selected breeding, let us know it. If they (the long-tongued bees) come from some particular district in Italy, let us know that. In a year like this the possession of such bees would mean thousands of dollars to apiculturists all over the United States.

SECTION-CLEANERS.—In the midst of all this talk about machines for cleaning sections, let me make a discordant note. The people don't want the sections so clean. They don't eat the wood. They cut it off and throw it away at once. More than that, the mere presence of the wax and bee-glue or propolis on the wood of the section is to them a badge of purity and honor. Again and again have these expressions been used to me: "No bee ever made that." "It's too pretty." "That's the way a man makes honey." Just hand them a comb well smeared with propolis, and they say: "Ah, that looks right." "That reminds me of the honey my father used to get on the farm." "That is real bee-honey," etc.

The people have it in their heads that comb honey is made without bees, and they don't want any of it. Argument is useless—they have just made up their minds, and immovable as an oak they stand. Let me tell you, if you want to sell them any of *your* honey, don't dwell too strongly on the fallacy of this belief, for you only antagonize them to no purpose. Only when you become well acquainted with them, and have won their confidence by fair dealing and good stuff, can

you use your heavy arguments and deal sledge-hammer blows, and do good in so doing.

A LITTLE BEE-EXPERIENCE.—Tho my mother began keeping bees over 30 years ago, and I have been more or less associated with bees ever since, this is my first year to have my own bees at my own home. I have increased from one colony to 8, and intend to winter 10. Next year I shall try to produce the maximum of honey from 10 colonies, and prevent all swarming over one from each colony. My better half is intensely interested. We find the sting of a bee is not serious for either of us, when promptly removed with the fingers. I purpose to undertake a campaign of education among the near-by farmers; distribute Alsike clover leaflets among them, try if we can't crowd out the cockle-bur with sweet clover, etc.

SPRAYING CROSS BEES.—I want to ask J. A. Golden whether he thinks it would be all right to spray the bees with ether or chloroform when they are a little cross. That is just what he was doing, when he used sunflower to smoke them. No wonder they were easily quieted. Mrs. Moore had a sort of asthmatic cough as a finale to her la grippe. To relieve her a pipe full of stramonium leaves—sunflower leaves—and salt-peter was advised. "The only objection," the doctor said, "was that all these were narcotics."

Try well-dried rotten wood, and see if that does just as well, Mr. Golden.

TWO-STORY BROOD-CHAMBERS.—The more I think over and experiment on it, the more I am convinced that two stories for brood in early spring is necessary to the greatest success, viz.: greatest number of pounds of surplus honey, when honey comes. Now, can't Editor York get a show of hands, somehow? Number of pounds of surplus (comb or extracted) for the last five years in one-story brood and in two-story brood-chambers. I think it would be largely in favor of two-story brood-chambers. The only objection to this plan for general adoption is the undue booming of supply dealers' business, but, "the greatest good to the greatest number."

DRAWN COMB.—I see that L. Stachelhausen thinks that just as much comb honey as extracted can be produced by the use of drawn comb foundation. I think not; in extracted honey production the same combs can be returned and refilled several times in the same season, and the work of finishing the sides and corners of the comb is greatly in favor of large frames, from which every bee-keeper knows our liquid honey is taken.

This is a question of interest to all bee-keepers, for if as much comb honey as extracted can be produced by any known process, that will result in removing hundreds of tons of extracted honey from the market; or rather, it will go to the market as comb, and the price of extracted honey in the wholesale markets might in case of a general production of comb instead of extracted, be doubled.

Suppose, Mr. S., you try three colonies for comb and three for extracted honey under the very best conditions, and report results.

FENCE-SECTIONS.—I am trying fence-sections, and shall reserve my final verdict until a crop of honey produced in them shall declare. But there is no question that if we can, by their use, prevent air-holes around the edges, they will be much more popular with the consumer. He thinks of nothing else than the loss of the wood and wax, and, doo little to the contrary notwithstanding, prefers a section fastened to the wood all around. He doesn't have in mind the more or less convenience of using the section on the table, but solely of the two or three extra ounces of honey he thinks he is getting.

My trade has always been nine-tenths liquid honey. People say, "Comb has too much wood," "too little honey," "they're too dry," etc.; and in a lot of pound sections they have a quick eye for those sealed along the edge.

FACING HONEY.—Don't you ever face your honey or your apples. No consumer ever demands it, no matter what the commission merchant or the grocer wants. Every consumer calls it "lying and stealing," and I think so, too. It is no answer to say people expect to be fooled; they don't; they are constantly trying to guard themselves against it; they don't expect it any more than Richardson expected to pay Sheridan's bill. Sheridan had been driving out three or four hours in a hackney coach, when, seeing Richardson pass, he hailed him and made him get in. He instantly contrived to introduce a topic upon which Richardson (who was the very soul of disputatiousness) always differed from him; and at last affecting to be mortified at Richardson's arguments, said: "You really are too bad; I cannot bear to listen to such

things; I will not stay in the same coach with you." And accordingly got down and left him, Richardson hallooing out triumphantly, "Ah, you're beat, you're beat!" Nor was it till the heat of his victory had a little cooled, that he found out he was "left in the lurch" to pay for Sheridan's three hours' coaching!"

MAKING ONE'S OWN HIVES—I suppose it is perfectly in order to criticise the critic. Mr. R. L. Taylor is promulgating some rank heresies, and must be "called down." He says: "One cannot afford to keep many bees unless he is skillful enough workman to make his own hives," etc. I think a show of hands will prove that 95 percent of the bee-keepers don't agree with him. And how can the individual compete with steam and high-priced special machinery, especially as hot competition has given us one-fourth the prices of former days? I think the enormous demand for bee-hives and supplies there has been for two or more years past, proves that the majority know they can't afford to make their own hives, etc. No man can make one dollar a day at the factory prices making his own supplies, making no mention of workmanship, either, which must of necessity be greatly in favor of machine-made hives.

STIMULATIVE FEEDING.—Again, Mr. Taylor says: "I am satisfied stimulative feeding does not pay." Now, Mr. Taylor, you're certainly dead wrong. I started with one strong colony last spring, having 10 to 15 pounds of stores left over from winter. I wanted to increase largely—to 10 colonies, if possible. I fed small amounts of honey and water every evening for weeks, and the result—I have now seven more colonies, all with young laying queens, and all the progeny of the one colony on which I practiced stimulative feeding. Now is not this the aim in all stimulative feeding? I can rear bees for less than \$2.00 a colony by this means, not including the hives, of course.

GRAMMAR AND RHETORIC.—As for Mr. Taylor's criticisms of certain bee-keepers' grammar and rhetoric, all will agree that they are entirely out of place in a bee-paper. But of course it is nice to understand Michigan rhetoric, and know wherein it differs from that of the settled portions of the country.

Cook Co., Ill.

Is Bee-Poison an Antidote for Snake-Poison?

BY D. D. BLAKEMAN.

On page 393 is the following paragraph:

"**IMMUNITY FROM SNAKE-POISON.**—Th. Weippl, editor of *Blauen-Vater*, quotes from an Austrian paper, without vouching for its truth, the statement that a French chemist inoculated dogs with poison extracted from bees, and the dogs were then unharmed by the bite of deadly snakes."

May 31 of this year, on picking up a hive-cover lying flat on the ground, I was bitten by a rattler a foot and a half long, coiled under the board. The sensation was like having needles driven deeply into the flesh of the end of the middle finger, not like bee or mosquito stings.

Now, I have 70 colonies of bees, and I attend to them alone, and am almost immune to bee-stings. Does this immunity extend to snake-poison? I will give an account of the case:

The swelling did not extend to the second joint, altho I expected that it would at least reach to the shoulder. About four hours after the bite, I had very considerable pain in the wound, but not more than one would expect from needles (fangs) driven nearly or quite to the bone of the finger. This pain ceased so that I was able to sleep after five hours—no further pain nor unnatural feeling in the finger. All that was left of the injury was a very black spot one-fourth inch in diameter, which faded out in two weeks.

Now for treatment: I have always understood that any treatment of a rattlesnake-bite is merely palliative. First, I sucked vigorously at the wound for perhaps two minutes. Second, I tied a tight ligature of twine about the finger. Third, I used aqua ammonia upon the wound. After three hours I took off the ligature and dressed the wound in turpentine.

Now, altho I have killed another rattlesnake since my first encounter above described, I was not such an enthusiast in science as to give it an opportunity to strike me in order to test this immunity theory more thoroughly; but there may be persons among the readers of the *American Bee Journal* thoroughly saturated with bee-poison, who might give additional information to establish or disprove any such theory.

San Bernardino Co., Calif.

Kreutzinger Apiaries and "Honey Harvest."

BY J. T. HANMERSMARK.

My first acquaintance with Mr. Leo Kreutzinger, who owns the most extensive apiaries in Cook Co., Ill., was in 1897, and in August of that year I received an invitation from him to attend a "honey harvest." Of course I was ready for all such fun, and at the appointed time appeared with smoker and veil, and thus armed we (Dr. Peiro and myself) made for the bee-hives, and got the honey, of course, but something else besides—stings, till we could not rest. One fellow visitor got so many that he had to go off and rest, but then he couldn't rest.

But now it is of this year's doings that I wish to speak. Tuesday, April 12, was a warm day, so I put the bees out on the stands, as I commenced working for Mr. Kreutzinger April 1, 1898. After spring dwindling was over, he had 58 colonies of bees to start with. A great many nuclei, and some full colonies, were bought last spring, and now, with the in-

L. Kreutzinger.

crease of this season, he has 211 colonies of bees—114 being in his home yard, 85 in the out-yard, and 12 at his place of residence.

The "bee-palace," with observatory, which you see in the picture, was built last spring. It is two stories high, and contains four rooms down stairs—shop, honey-room, fumigating-room, and a dwelling or sleeping room for the apiarist.

The second story is one large room used for a storage-room, etc. Above this is the cupola, wherein are at present located four colonies of different strains of bees in glass observatory hives: common Italian, golden Italian, Holy Land, and Adel bees. These were bought for the purpose of finding out which was the best bee, as well as for observation, but it will take a few seasons to settle that question properly. So far our common Italians from our own yard have done the best.

August 27 (last month) Mr. Kreutzinger had another "honey harvest." Amongst those present we had a Japanese gentleman. He had just arrived from Japan, where he labors as a missionary in the Presbyterian church.

Mr. K., scarcely distinguishable, is standing near the entrance of the door at the left. (See illustration on first page.) The young man in white, standing among the hives, is myself. I wear light-colored clothing, as I am convinced that it is more agreeable to the bees than black or dark clothes. You see very few if any of the people present have on veils. Well, there were none needed, as the visitors, after a trial of 10 or 15 minutes with veils on laid them aside, for they see that the army of bees about them are almost as gentle as flies. I do not think that any one got stung, altho the visitors were roaming amongst the hives the greater part of the afternoon.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Pollen in Super Honey—Ripening Honey.

1. I have a number of colonies of bees in larger hives, perhaps nearly twice as large, some of them, as the Langstroth hive. As I am not able to transfer them, how would you work them to prevent them from carrying pollen up into the early super honey, which they did?

2. What can I do with those that have pollen in them here and there?

3. How do you ripen honey after it is removed? and what supports its weight?

ANSWERS.—1. I don't know why there should be any more trouble with a larger hive about pollen going up, and if it's the size that makes the difference I don't know of any remedy. To tell the truth, I don't know why it is that there are some cases in which bees carry up pollen. It is possible that there is more likely to be trouble when hives are shallow. The natural instinct of the bee seems to be to put pollen around the brood-nest, and with the sections sufficiently far above there is seldom any trouble. But I don't know for sure any way to prevent the trouble in all cases. If any one does, I'll be glad to hear from him.

2. Use them on the table at home, or else sell them by themselves at a lower price. But those that have only a cell or two of pollen are not much hurt by it. Sometimes, however, a section may have a good many cells containing pollen, but as the cells are all sealed over they don't show. If such a section were sold for a perfect one, a customer might be disgusted with it. Hold it up so the light can shine through it, and the pollen will show.

3. A room of the house was built specially for it, with floor so strong there is no trouble about the weight. The sections are brought in, super and all, stacked up in piles, four blocks being placed under the first super to raise it $\frac{1}{2}$ inch from the floor, and the same blocks are used between the supers in the pile, so the air can pass freely through. The piles are placed something like 8 inches apart for passage of air. A screened window and door on the south side of the room, with the same on the north side, gives pretty good chance for ventilation, and they are left thus till about time to put them in shipping-cases.

Robbing—Water-Melons for Bees—Transferring—Introducing Queens, Etc.

1. I have some trouble with my bees robbing each other, and some stray bees are robbing mine. An old bee-keeper told me to close up part of the entrances on the hives, and then break some of their combs, that is, some of the robbers' combs. Since I have done that with my bees, they have stopt robbing, but the stray bees I do not know what to do with.

2. Would it be any harm to the bees to cut up a load of dead-ripe water-melons, once a week, for 40 colonies.

3. When is the best time to transfer bees? I have a colony in a log that I found in the timber. I would like to get it into a hive.

4. When is the best time to introduce queens?

5. Which kind is the better—three or five-band Italians?

ANSWERS.—1. Breaking out the combs is hardly advisable. It may start a bigger case of robbing than you had before. In the case of robbing, an ounce of prevention is better than a pound of cure. Don't expose combs of brood or honey, or bits of honey, to start robbing. Don't keep queenless colonies. If a colony has a good queen it ought to defend itself if you close the entrance so that only a single bee can pass at a time. If the colony is queenless, put it in the cellar and give it a queen. Next evening set it on its stand, contracting the entrance, and it will have life enough to repulse the robbers. But in many cases it may be just as well to break up the queenless colony. But if you do, don't take the *hive* away, for if the hive is still there the robbers will be less likely to attack the nearest colony. A plan given in one of the foreign journals seems to answer pretty well. Attach something like

a cigar-box to the entrance, having no chance for bees to get in or out except through a hole an inch long and a quarter of an inch wide at the middle of the box, on top as the box lies before the hive. The robbers are wary about going down, while the bees belonging to the colony don't mind it. In a bad case of robbing you may come out ahead by piling loose hay or straw as high as the hive, then keeping it thoroughly sprinkled with water.

2. If they have no other stores for winter, I don't know just what would be the result of filling them up with melon-juice. I think some one at one time reported something of the kind, but I don't remember the outcome. Possibly some one with experience will help us out.

3. They will probably winter better where they are than to be transferred so late in the season. During fruit-bloom is the usual time for transferring.

4. Queens may be introduced almost any time during the flying season. During the honey harvest and fall is as good as any, because the loss of a queen doesn't mean so much then, and the interruption of laying doesn't make so much difference.

5. You can't lay down a hard and fast rule and say that all five-banders are better or worse than any three-banders. There are some excellent ones in both classes, as well as some poor ones. The colony that does the best work is the one to breed from, no matter how many bands, providing you have a fixt strain.

Keeping Bees on Shares—Double-Walled Hives.

1. I have had quite a considerable experience in bee-keeping for the last 30 years, but not to make an exclusive business of it. I started here with three light colonies in boxes, transferred them to movable frames, increased to nine, buying extra Italian queens, and took 75 pounds of comb honey. Several others within a radius of five miles seeing my success are anxious to put some money into bees, and have me manage and care for them on shares, from 5 to 20 hives in a place. They can buy box hives with bees for about \$2.00 each. If I furnish the hives, transfer, Italianize, furnish surplus boxes or extract, what share should I receive for one or for two years? Or, what would be an equitable division of expense and profit, I doing all of the handling of the bees?

2. I can get cypress boards $\frac{1}{4}$ -inch by 4 inches wide, and 20 inches long, for about \$2.50 per 1,000. From timber $\frac{1}{4}$ -inch or 1 inch by $1\frac{1}{4}$ or $1\frac{1}{2}$ at about the same, my idea is to make a double-walled hive, upper and lower stories, the same filled with sawdust. Would it be cooler in summer and warmer in winter, enough to justify the extra expense of making up?

FLORIDA.

ANSWERS.—1. As a rule, anything in the line of partnership operations in bee-keeping is not very satisfactory. As you put it, you furnish all the care and labor, and all the supplies, the other party merely furnishing a hive of bees valued at \$2.00 and a place to keep them. One way to look at it is to say how much he should have for interest on his investment and rent for the land occupied. If money is worth from 6 to 10 percent interest, 25 cents apiece ought to pay him annually for the number of colonies started with, he to have that same number back at the close of the arrangement. If he gets his share in honey or bees, instead of money, then put a fair price accordingly. A more satisfactory way, probably, would be for you to own the whole outfit, and if you can buy for \$2.00 a colony it will not need a very big capital.

2. From general reports in that line, I doubt if you will be very well pleased with such hives, but you might try it on a small scale along side of other hives.

Preventing After-Swarms.

Suppose I act on the Heddon principle, that is, move the old stand and set the new swarm in its place, setting the old one beside the new for about six days. Then how would it do to put a bee-guard on the old hive and keep it on through the daytime, removing it at night, to prevent the after-swarming? Could the young queen get through the guard? I am very anxious to prevent so much swarming.

IDAHO.

ANSWER.—If your experience is like mine, you'll not like the plan at all. Taking off the guard at night will hardly make any difference. The queen and drones will stay in at night anyhow, so it will not help to take off the guard. When I tried it, the bees would swarm out day after day, even if the queen couldn't get out, and sometimes she would get out. The bees from three or more colonies would cluster together on a tree, and then perhaps all go back to one hive, leaving the

other two depleted. But if you set the old colony close beside the prime swarm, and then six or eight days later set the mother colony in a new place, will you have any after-swarming?

Possibly you may like Doolittle's favorite plan. On the eighth day after the prime swarm, just before bed-time, put your ear to the hive and listen for piping of the queen. If she doesn't pipe, listen every night till 16 days after swarming, and if there's no piping by that time there will be no more swarming. If you hear piping any night (generally you'll hear it, if at all, 8 or 10 days after the prime swarm), next morning cut out every last queen-cell, shaking off all bees from the combs in front of the hive, so you can more readily see the queen-cells. Then you've got a sure thing of it, for you know there's a live queen at liberty in the hive, and you know there's no chance for any more. The only trouble is that unless you're very careful you may miss a cell.

Introducing Queens—Swarming.

1. When is the best time to introduce queens, in the spring, summer or fall? And what is the best way to introduce?

2. What causes bees to swarm in some years more than others?

ANSWERS.—1. It is probably a little easier to introduce them in the height of the honey-flow. It interferes with egg-laying to introduce a queen in spring—a time when it is important to have breeding advance as rapidly as possible. In the fall is perhaps the best time so far as concerns the interruption of egg-laying. If you buy queens, you will receive them in shipping-cages with instructions for introducing by means of these cages, which are introducing-cages as well as shipping-cages. If you have a queen of your own rearing in a nucleus, a good plan is to take a frame of brood from the nucleus, bees and all, with the queen on it, giving it to the queenless colony.

2. The difference in seasons makes the difference in swarming. If a season is so poor that the bees hardly get enough to live on, there will be little or no swarming. If they get enough for their own use and just a little more, the season continuing this way a long time, there will be a great deal of swarming. If the honey-harvest comes on with a rush, continuing heavy while it lasts, the bees will give their attention less to swarming, and more to securing the harvest.

Queen Failed or Lost in Mating.

I have a colony of bees that superseded its queen about the first of August. They had built but two queen-cells; a swarm came off when the first one that hatched was 48 hours old, but about one-half of the swarm returned to the old stand. I hived those that clustered, as I wanted to save the queen—she was a golden Italian. I put an empty super on the old stand, and did not molest the hive again until to-day (Sept. 5) when I thought I would see how the queen had mated. I found the super and brood-combs solid full of honey, with the exception of one center comb which contained a path of drone-cells three inches in diameter; they contained larvæ, and some just sealed up, and eggs in a few worker-cells adjoining. What is the trouble, and what am I to do? NEW YORK.

ANSWER.—Either the queen failed in mating or was lost. Probably the best thing you can do is to unite the two colonies. The one with the queen is not likely to be very strong, as part of its bees went back, and the one without the queen will rapidly shrink in numbers from this time, if it has not already done so. Unite the two, and you will probably have a good, strong colony for winter. Some of the combs of honey can be saved out, and you will probably find plenty of use for them next spring, if no other colony needs them now.

Swarms Returning to Wrong Hive, Etc.

I put into winter quarters last winter eight colonies and three 3-frame nuclei, and came through the winter, by feeding, all right, only losing one nucleus. Four of the colonies were in 8-frame and four in 10-frame hives. Swarming commenced June 6, but it was so windy that the bees had to watch their chance to swarm out, none hanging out before it started. I managed my swarms after the Heddon method, with clipped queens, and find it works perfectly. The last swarm that issued, June 25, came back in about 10 minutes, but entered a

wrong hive, that is about eight yards from the old stand, and which had swarmed four days before. All the swarms (8) were managed exactly alike, on frames with starters and on frames with built combs. The 8-frame hives gave better returns than the 10-frame.

The honey-flow here is mostly from white and Alsike clover; there are some wild weeds but they don't amount to much.

My experiment with sweet clover is a failure. It came up all right and then dried out.

1. Why did that swarm enter the wrong hive, as the clipped queen was put back on the old stand?

2. To winter bees on the summer stands in a wet country like this, is wheat chaff the best to be used to be put into the supers and beside the brood-chamber, so as not to have the bees too damp?

3. What has the temperature to be outside, so the bees can build combs in the supers in a single-walled hive?

4. Is it necessary to have it air-tight between the super and brood-chamber?

A good many colonies in this county died last winter for the want of food.

WASHINGTON.

ANSWERS.—With clipped queens you will frequently have swarms return to the wrong hive. Especially if a swarm has returned to a hive a short time before and there is excitement at the entrance, a swarm will rather go there than go back to its own hive. And sometimes they will go to some other hive than their own when you can see no reason for it.

2. Timothy is perhaps preferred. Of late years much has been said in favor of dry planer-shavings.

3. A strong colony will build comb when it's down near freezing, if there is sufficient need for building, that is, if they are crowded for room to hold the honey.

4. No, not absolutely air-tight, but the closer the better when it's cool. When the weather is hot enough, they don't seem to mind big cracks.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Bee-Keeping for Beginners is the title of a 110-page book just out, from the pen of that expert bee-keeper of the South, Dr. J. P. H. Brown, of Georgia. It claims to be "a practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit." Price of the book, postpaid, 50 cents. Or, we will club it with the Bee Journal for one year—both together for \$1.40; or, we will mail it as a premium to any of our present subscribers for sending us one new subscriber to the Bee Journal for a year (at \$1.00), and 10 cents extra.

The Alsike Clover Leaflet consists of 2 pages, with illustrations, showing the value of Alsike clover, and telling how to grow it. This Leaflet is just the thing to hand to every farmer in your neighborhood. Send to the Bee Journal office for a quantity of them, and see that they are distributed where they will do the most good. Prices, postpaid, are as follows: 50 for 20 cents; 100 for 35 cents; or 200 for 60 cents.

The Wood Binder for holding a year's numbers of American Bee Journal, we propose to mail, postpaid, to every subscriber who sends to us 20 cents. It is a very simple arrangement. Full printed directions accompany each Binder. Every reader should get it, and preserve the copies of the Bee Journal as fast as they are received. They are invaluable for reference, and at the low price of the Binder you can afford to get it yearly.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY
118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. SEPTEMBER 22, 1898. NO. 38.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The New Officers of the United States Bee-Keepers' Union, forming the Executive Committee, elected at Omaha last week are as follows:

President—Hon. E. Whitcomb, of Friend, Nebr.
Vice-President—C. A. Hatch, of Ithaca, Wis.
Secretary—Dr. A. B. Mason, of Toledo, Ohio.

It is more than likely that the meeting next year will be held in Philadelphia, Pa.

The Omaha meeting was one of the very best and most harmonious ever held by the national organization of bee-keepers. We expect to begin the publication of the full report of the proceedings in the first number of the Bee Journal for October—week after next. In the meantime prepare for a rich treat.

Distributing Honey-Leaflets or booklets is one of the best ways to create an interest in honey and its uses. Referring to this in Gleanings for Sept. 1, Editor Root gave this paragraph:

"Now is the time to distribute the honey-leaflets. They were written with special reference to the consumer who has been persistently educated to the notion that all comb honey is "manufactured stuff," and the extracted is always adulterated. Among other things they show that honey is more palatable and wholesome than any other sweet in the world, and how it may be used in cookery. The leaflets are sold on the basis of cost, as it is to our interest, as well as to that of bee-keepers in general, that they be scattered broadcast over the country."

Our little 24-page pamphlet on "Honey as Food" is one of the neatest and best things to be used in the line suggested. Prices will be found in the book-list in this number, top of second column. Send stamp for a sample, anyway.

A Source of "Red Honey" Explained.—

Mr. Geo. Thompson, of Kane Co., Ill., wrote this amusing paragraph for Gleanings, its heading reading "How the Bees Stole Currant Jelly:"

"A few years ago Mr. James Marvin, of St. Charles, Ill., who will be remembered by some of our old-time bee-keepers, had a curious incident in this direction. In looking through his hives one day he saw his bees had been gathering some red honey, and it puzzled him to tell where they were getting it. A few days afterward he overheard some of the women telling about one of their neighbors who had been making some currant jelly, and she had put it out on the window-sill to cool, and then went visiting that afternoon. When she came home she found all her jelly gone, and the tumblers licked clean. 'Oh, the plaguey boys!' said she. This, of course, was a clew for Mr. Marvin, and upon further examination he found it was the old lady's currant jelly the bees had stored away for winter use. Of course, he kept that to himself; but we had a good laugh over it."

Bees Don't Like Black.—Dr. Miller, in Gleanings, sometime ago, suggested that bees had a strong aversion for black, and since then testimony corroborating that statement has been coming in. One man who has very black hair says the bees "fairly go crazy to get into said hair."

Several weeks ago we invited a neighbor's 7-year-old boy to come over and watch us work with the bees, take off some honey, etc. He came, and almost immediately upon opening the first hive the bees made a dash for his black stockings and black knee-trousers. Oh, but they did sting the poor little fellow terribly. We were surprised at the sudden charge of the bees, and now believe it was the blackness of the boy's clothing that so angered them.

So the lesson to be learned is, to be dressed in light-colored clothing when working with bees, and thus avoid unnecessarily irritating them, causing them to sting much worse than they otherwise might.

The Season of 1898 has probably been one of the poorest ever known for bee-keepers, and perhaps the best ever known for supply manufacturers and dealers. The general failure of the honey crop is not confined to this country, for walls come from Great Britain and Europe as well. The manufacturers' crop is estimated by the A. I. Root Co. to be double that of any previous year, that company alone having disposed of 70,000 hives, with a chance at 10,000 to 30,000 more if they could have supplied them promptly.

The Illinois State Fair, at Springfield, begins Sept. 26 and ends Oct. 1. A grand program of special attractions has been arranged for each day of the fair. We hope that the apiarian exhibit will be even larger and better than last year, if that is possible in this year of short honey crop. In order to prevent a further reduction in the list of premiums offered, bee-keepers must put up a show that will encourage an increase of premiums rather than a further decrease.

Montana as a Bee-Field.—The senior editor of Gleanings in his wanderings in Montana found large tracts of alfalfa at Miles City and Billings, and at Forsythe large tracts of Rocky Mountain bee-plant, the ground covered with it and looking at a distance like pink snow-banks, but on neither of these plants nor on any of the wild flowers did he find a single bee. He found one subscriber to Gleanings, but he had no bees as yet, and didn't know of one within a hundred miles in any direction.

Another Unfortunate Bee-Keeper.—Some time ago we announced the misfortune that befell Thomas McDonald, a bee-keeper at Shawneetown, Ill., who lost his all in the great flood that swept that town last spring. Many

generous-hearted bee-keepers responded, and doubtless Mr. McDonald was enabled to get started again with bees.

This time the unfortunate one lives in Florida, and he wrote thus to Editor Hill, of the American Bee-Keeper:

STUART, DADE Co., Fla., Aug. 4, 1898.

FRIEND HILL:—Our home, which is no more, was the scene of a sad event on July 31. My 10-year-old boy was burned to death; my house, with all its contents, was destroyed by fire. My wife, myself, and one small child barely escaped with our lives, and as a result of my burns and exhaustion I am now in bed. We had not time to save a thing but ourselves from the flames. The neighbors have kindly given us some things in the way of bedding, dishes and provisions. But I must close, as I cannot write more at present.

Yours,

J. P. LEES.

Editor Hill says that Mr. Lees is a bee-keeper who but recently settled at Stuart, "with naught but a large family of small children and a determination to carve out a home in the wilds of Dade county, with but one hand, having lost the fingers of his left hand by accidental contact with a saw. In addition to the loss of a honey crop as a result of forest fires in this locality this year, the above pathetic note tells of greater trouble."

Now, it would be a nice thing if each of our readers who can afford to do so, would just mail Mr. Lees a dollar or so to help him "get on his feet" again. You would never miss the amount, and all together it would be such a help to him. Let all who feel like it, send at once, so that Mr. L. may the sooner recover from his sore loss.

AN OWNER of a thousand colony bee-ranch in Los Angeles county is said to be about to purchase a home for himself and family near Oakland, Calif. We have not learned the gentleman's name.

MR. M. F. REEVE, in the American Bee-Keeper, writes thus:

"The eagle and the bee figure prominently among the decorative emblems of the Napoleonic period. Golden bees decorated the imperial mantle and the throne."

W. S. HART, of Volusia Co., Fla., wrote us recently:

FRIEND YORK:—The Moore articles on marketing honey are valuable. Don't give up the reform in spelling. People will get used to it after awhile, and there are but few who will not value the time and space saved, and the getting of more matter to the page."

TOMMY, aged 4, had discarded his shoes and stockings one warm afternoon, and while playing encountered a bee. He ran into the house crying, and his mother asked what the trouble was. "I j-just klickt a f-fly," sobbed the little fellow. "Well, that's nothing to cry for," said his mother. "But t-this one had a ss-splinter in its tail," was the rejoinder.—Newspaper.

MR. HARRY S. HOWE, of New York State, gives this sage advice in the September American Bee-Keeper:

"Go slow and take a few years to consider before you change the style of your hives. I am working yards having six entirely different hives, and can't see much difference in the results. Of course, only one kind is allowed in a yard. It is confusion worse confounded to have two styles of hives in one yard."

THE APIARY on the Levering estate in Siskiyou county, in the extreme northern end of California, will yield about four tons of honey this year. It contains some 250 colonies in Harbison hives. The season did not begin until July 1. This is not bad for a dry year. Under favorable conditions it

is said it should yield 10 tons. The same number of colonies in the southern portion of the State, in a good year, would far exceed this last amount. There nectar verily flows from the flowers in some years.

MR. WALTER C. LYMAN is a bee-keeper having some 80 colonies in Dupage county, Ill., about 20 miles west of Chicago. In the spring he had about 60 colonies. The editor of the Bee Journal, with his wife, spent the larger part of the day Saturday, Sept. 10, at Mr. Lyman's. His mother, who will be 77 years old in December, is still well and as lively as a girl of 20. We had a most delightful time. Mr. Lyman's crop will be only about 900 pounds of comb honey this year, and many of his colonies will need feeding to carry them through the winter.

THE HIVE STATISTICS of the A. I. Root Co., for the season just past are interesting. They were published in Gleanings for Sept. 1, as follows:

"We find, on footing up our tally-books, where we keep a record of the different styles of hives packed for shipment, on orders we have sent out this past season, nearly 3,000 Danzenbaker hives; about 3,000 dovetailed chaff hives; about 7,000 10-frame dovetailed hives, and over 50,000 8-frame dovetailed hives, besides a great many of other styles for other people, so that, all together, we have disposed of at least 70,000 hives the past season, or about double the record of any previous year. It is also safe to say that we could have disposed of from 10,000 to 30,000 more if we could have supplied them promptly. We do not anticipate such a record next year, as there are, without doubt, a large number of the hives sold this year in the hands of bee-keepers, unused. In view of the outlook we have decided not to build the large addition to our factory, for which we had plans prepared two months ago. We do intend, however, to put in the larger engine, and extend our factory building 20 feet, adding some new machines, and changing others, so as to increase our capacity when needed."

The popularity of different hives may be judged to some extent by those sent out as noted above. Out of 70,000, 1 out of every 23 was a Danzenbaker; 1 out of 23 a chaff hive; 1 out of 10 a 10-frame dovetail; and 5 out of every 7 an 8-frame dovetail. The 8-frame seems to be far in the lead.

MR. A. I. ROOT, who recently visited the famous Yellowstone Park, sent a letter to his Sunday-school class of boys, in which he gave the following "bear story," which may interest some of the boys who read the American Bee Journal:

"The United States government protects the bears and all other animals here, so they are very tame. Well, a few days ago a large, fine bear climbed into the meat-man's wagon and picked a large piece of beef out of one of the barrels while the man had gone into the hotel. The piece was so large the bear had to hold it with his forepaws while he walked off on his hind feet. The man came out and caught him at it, and pounded him over the head with a club; but he wouldn't let go his meat, and got away; but he grunted and growled a good deal at the pounding he got.

"Well, when I heard them telling about it I wanted to see the bear, and a party of us went about half a mile and found him just about sundown, up in a big pine tree. I rather think somebody chased him up the tree. Well, we wanted to see him get down, and so a man climbed a slender pine-tree near him and began punching him with a pole. As soon as he saw the man coming up he pricked up his ears and began to growl and show his teeth. I tell you, he is a great beauty. His fur is soft and shiny, and he is just as soft and handsome as any kitten you ever saw.

"Well, the bear climbed as high as he dared on the slender top; but as the man kept poking him he kept growling at a fearful rate, and got awfully mad; but he went slowly still higher; finally, the slender limbs broke beneath his great weight, and down he slid with a great crash to the larger limbs, and then he began climbing down with a rush, for he was mad. At the same time the man began to get down lively, for he feared the bear might try to climb his tree after he got down. By this time a crowd of people had collected; and just for fun, while we were all laughing and yelling, some called out, 'Three to one on the bear!' others, 'I put my money on the man.' The man got down first, however, and then the bear wouldn't come down any more.

"A bear can go up a tree very fast, but he is awkward and slow in coming down, for he has to prick up his soft velvety ears that look so cute and cunning, and see where to put his great feet."—Gleanings.

Moisture in Bee-Hives in Winter is avoided by Ed. Freyhoff, editor *Praktischer Wegweiser*, by the use of cushions filled with powdered or slaked lime placed over the frames.

Self-Uniting.—In *Le Progres Apicole* a case is reported in which an Italian swarm with a young queen entered the hive of a black colony with an old queen. The old queen was killed and cast out, leaving the young stranger on the throne!

Elevated Lands for Honey are best, according to Val. Wuest in *Deutschen Bienenzucht*; and that explains why red clover—whose blossom-tubes must be a third or a half filled before the bee can reach the nectar—yields so much oftener in elevated than in low situations.

Drone-Combs for Extracting are Undesirable, says Lehrer Schunke, in *Leipzig. Bztz.* The bees cannot be made to understand that the queen will not occupy them for brood, no matter how much excluders are used, so except in a time of very heavy flow they will be left more or less unoccupied.

To Prevent Mould in Hives, the editor of *Revue Internationale* says a plan that has proved satisfactory to all who have tried it is to have an opening at the back as well as front under the hive, allowing the air to pass through. In this country the same object is attained by those who cellar their bees, by having a front entrance two inches deep, or by removing the floor entirely.

Milkweed Honey.—From a limited experience, the editor of *American Bee-Keeper* had formed the opinion that milkweed honey was of a dark, rather reddish color, good body, with pronounced but not unpleasant flavor. J. F. Eggleston, who has lots of milkweed within range, is positive it can only be told from white clover by its sulphur-colored cappings. Editor Hill is now on the fence watching for daylight.

Red Clover with Short Flower-Tubes is a desideratum for bee-keepers, and the "Societe d'Apiculture de la Haute Savoie" has recommended that the State Agricultural Society offer a prize of several thousand francs for a fix variety of red clover having along with desirable qualities as a forage-plant flower-tubes short enough to be easily reached by the honeybee. Whether such prize will actually be offered is another story.—*Revue Int.*

"Emerge" vs. "Hatch."—Editor Hill quotes Doolittle in *American Bee Journal*, saying "Emerge, not hatch; the larvæ hatch," when speaking of a queen leaving a cell; agrees that "emerge" is the better word, but says there's no lack of authorities to justify the use of "hatch," among others the author of "Scientific Queen-Rearing." But Editor Hill ought to know that Doolittle has more age and experience than the man that wrote "Scientific Queen-Rearing," hence should have a better command of proper bee-terms.

Objections to Hives Raised on Blocks.—The editor of *Gleanings* thinks that when a hive is raised on four blocks, the operator will be in the way of the bees' flight, assuming that they will fly out all around. Dr. Miller says one might think they would do so, but as a matter of fact they don't. They seem to have settled upon the front as the right place for the entrance before the hive is raised, and they continue their entrance at that part after the hive is blockt up. But he says it's troublesome at swarming-time with clipt queens, for the queen is just as likely to come out at the side or back as at the front.

The Answers to Query 75, page 427, have secured the attention of the critic of the *Bee-Keepers' Review*, being given as an example of "careless reading of a question," and the *American Bee-Keeper* quotes in full the query and replies, saying between the lines, "You bee-keepers that are afraid to write for print, just look at this. Here's the work of some of the veterans in the business, and you may easily write as well as this with one hand tied behind your back." Several of the

repliers make out that a queen is not usually fertilized till after she begins to lay, and Critic Taylor lets them down softly by saying it is a curious instance of failing to catch the meaning of a question, but aside from that there's a somewhat radical difference in the views held, making it appear that some of them have given the matter no attention, or else it's one of those things that vary according to "locality."

Are Clipt Queens Superseded Sooner than Others?— "A common notion seems to be that clipt queens are superseded sooner than others. Isn't that because you can always tell when a clipt queen is superseded, and with whole wings you can't easily tell whether there has been any change? If the average age of queens is three years, then a third of the queens are superseded every year. [That 'common notion,' like many other common notions, is not founded on facts. Queens clipt or not clipt live out their best usefulness in three years, and some think in two.—Ed.]"—Stray Straw, in *Gleanings*.

Working on the Two-Story Plan.—Dr. Miller says he uses only one hive-story in winter, on account of convenience in cellaring, but if he wintered his bees out-doors he would use two stories in winter. In the spring the extra story is given when convenient, usually some little time before the extra room is actually needed. He takes away the extra story at the time of putting on supers, as with the two stories on at that time comb honey is not a success. Editor Root, however, seems to favor keeping the two stories running throughout the season, even for comb honey, providing the two stories are crammed full of bees from bottom-board to cover.—*Gleanings*.

The Essential Points in a Hive-Cover are thus given by the editor of the *American Bee-Keeper*:

"It must be a 'lawful' roof—one that is in fact a protection from storm—a roof that will shed all the rain, all the time. It should be close-fitting, in direct contact with the hive all around, and yet so constructed that it may be adjusted without force or jar. It should be a non-conductor of heat, and afford a ready means of providing ventilation through the hive when desired. As with all else about the apiary, it should offer no secluded harbor to vermin. When used over sections, it is of importance that an accurate bee-space be maintained, hence the necessity of a rigid and substantial cover, one that will not spring and warp out of shape, inviting propolis at this time, and at other times tempting robbers as well.

Starters vs. Full Sheets.—Editor Root has been paying especial attention to different lots of honey from various quarters, and he thinks that when a small starter is used in a section at least one-third of the sections will be filled out with drone-comb. Regarding the appearance of this he says: "I have just been looking over several lots of comb honey that have come in. Quite a number of the sections are built out with drone-comb, and are in every way inferior in looks and whiteness to the worker. I do not see how anybody can think one looks as well as the other. I askt one of our men, who did not know what I was driving at, to point out those boxes that, in his estimation, looked the prettier. He placed his finger on the worker-cell comb every time. I askt him why. 'Why,' said he, 'I do not like the looks of those great big cells.' There is another thing that may have something to do with the matter. Cappings of worker-comb are apt to be a little thicker, and therefore whiter. The capping of drone-comb is quite liable to be water-soakt or thinner.

Cultivating the Home Market.—In a very sensible article in *Gleanings*, R. C. Aikin explains why he prefers to sell at a low price in the home market rather than to ship off his honey. In the first place, he lives in a community where the people are in very moderate circumstances, and if the price of honey is high they can afford to use very little. That has decided him to produce extracted rather than comb. The custom of the locality leading in that direction, he trades honey for any article he needs. If he ships to Denver, his honey will net him about 5 cents. So he sells in the home market at 6 cents, strictly net weight, charging extra for the package when customers don't bring their own packages. He had bills printed and scattered broadcast, and used a lot of honey-leaflets. His crop of 5,500 pounds of extracted was all sold at home and he had to buy more. He feels sure of regular customers at 6 cents who have previously been using syrups at 3 cents, and many who have not previously used honey now say they cannot do without it. He favors the idea of educating the people to know what to do with granulated honey so as not to object to it.

BEST
EXTRACTED HONEY FOR SALE

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY :

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 7½ cents a pound; 2 cans, 7¼ cents per pound; 4 or more cans, 7 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, "HONEY AS FOOD," will be a great help in creating customers for honey. See prices on another page.

A SERMONETTE.

[This week there happens to be a scarcity of "General Items," so we concluded to reprint an article appearing in "Our Homes" department in Gleanings for August 1, written by the senior editor of that paper. It will repay careful reading by every one, no matter what your religion, or whether you have any religion. Especially will its wise admonitions prove helpful to the younger people, if heeded. We think we need beg nobody's pardon for copying it, but believe we will receive the thanks of many who will profit greatly by its sage advice, drawn from long experience. Here is the "sermonette:"—EDITOR.]

And be sure your sin will find you out.—NUM. 32:23.

Sin is folly, and our text-book explains why sin is folly. It is folly because, sooner or later, it is going to be found out. Oh! why is it that humanity, with all the examples that are strewn before it at every turn, cannot learn that it *pays* to be honest? Now, dear old friend, do not think that I mean to commence this tirade by taking it for granted that I am honest, and that all the rest, or the greater part of them, are dishonest, for it is not true. I can truthfully and honestly say, "Why in the world can I not learn through all the examples that are round about me, that dishonesty and deceit do not pay? You ask if I really own up that I am dishonest? In one sense. There is a constant temptation running all through my life to keep things out of sight that do not look well—to keep on doing selfish things, and to try to cover them up or to make it appear that my motives were good ones instead of selfish ones. I do not believe, however, that these wrong things go on very long. The presence of the Holy Spirit I am praying for every day (and I hope I may say *feeling* every day), is con-

stantly prompting me to repent and reform, and make good my shortcomings. The great difference between the Christian and the unbeliever is, in my opinion, this: The Christian is being constantly prompted to repent, and fight down these selfish tendencies. The unbeliever may be prompted to a certain extent in the same way by public opinion and things of a like nature; but he is not looking constantly to the great Father above, and asking him to reprove and rebuke him whenever he is going wrong. A beautiful passage in the 139th Psalm, verses 23 and 24, brings this with wonderful vividness before us:

"Search me, O God, and know my heart; try me, and know my thoughts; and see if there be any wicked way in me, and lead me in the way everlasting."

The matter alluded to in the above has been brought vividly to my mind at this season of the year, because, as usual, we have been obliged to decide what help we shall keep and what we shall let go. Our board of managers have consulted with the foremen of the different departments, and considered which ones we should keep. As a rule, the newer hands are expected to lie off and give place to the older ones; and other things being equal, this is the rule; but where one of the new hands shows unusual proficiency, or what is better still, a clean-cut, honest, and conscientious spirit, we often keep such and let the older ones go. In fact there is something inexpressibly sad to me, when we are dismissing help in the fall of the year. It comes along in the line of the homely adage, "A new broom sweeps clean."

With the younger ones we can make allowances. I remember one quite small boy who came to help us early in the spring, among the plants. He was so faithful, and did so well, and accomplished so much work in a short time, that I really felt proud of him; but after a few weeks he seemed to get tired of the monotony of setting plants, and did not accomplish as much as he did the first week. So I decided I would have to let him go, because he would be looking around to the right or to the left, seeing what somebody else was doing, and paying no attention, comparatively, to his own work. Finally the boy was wanted in one of the buildings. I told the foreman that the boy had much ability, but he seemed to get tired of his work after a little; but he concluded to try him. For about a week the boy did tip-top. In fact, he was better than some of the older boys. But his zeal seemed to decrease as before, until he was of little use anywhere. Of course, I talk with him and remonstrated but the good effect was only temporary. Now, this case we can excuse, because it was only a boy; but I think that that boy's mother had better watch carefully, and see to it that this trait does not follow him through life.

As I have said, we can excuse such things in a child, and many children outgrow them. I know this, for some of the most faithful and capable men and women I have around me had this very fault when they were small. Do you know, friends, it has been a rare pleasure for me through all these years of "work and wages" to see boys and girls grow from childhood into manhood and womanhood, and while they grow physically to know that they have grown in grace and wisdom, and in the knowledge of the Lord? But, even tho it is not a pleasant thing, I must go back.

I have seen those who seemed to be so sure their sins of this kind would not find them out that I have been obliged to let them go. Physicians have a list of diseases that are said to be, as a rule, incurable. Now, may God forbid that I should say that there are sins that are incurable; but sometimes I have been led to feel that it is almost that way. There are people who have been so habituated to cheating their employer that it seems almost as if they never could get over it. My first sad experience in this line happened so long ago that I think I can mention it without hurting anybody's feelings.

When I was in the jewelry business I had

GEORGE W. YORK & CO.,
CHICAGO, ILLS.

a sort of craze to manufacture gold and silver jewelry. I wanted to do this, because then I could give honest goods according to my notion. I applied to one of the down-east jewelry factories for a good man who could work solid gold and silver. Somewhat to my surprise they agreed to let me have a man who, they said, was capable, and the price he wanted was less than I expected. He proved to be all I wished, and I often wondered why his employers let him go.

After he became pretty well acquainted, however, and settled down to a certain routine, I discovered why they were willing to let him go, and why he worked for low wages. First, he would get the daily paper under his bench, and, when no one was around, he would read the war news, getting 25 cents an hour for so doing. He had things planned and arranged so he could slip his paper out of sight when anybody came around who might report. Finally I found out he was making work for himself at odd hours. By playing detective a little I was finally able to prove that he received pay for all the time he spent on work of his own. As he was a good sort of man, and had done me quite a favor by leaving his home in the East, I good-naturedly let these things pass. Finally he solicited work from other people at lower prices than my own, doing said work on the sly while he was drawing pay from me. I felt that something had to be done. But even then for a time I put it off; but when it came to appropriating gold and silver, as well as precious hours of my time, for these outside jobs, I told him I thought we could not give him employment any longer.

There are several things I want to say right here in regard to cases of this kind. The first is, that investigating and proving charges like the above is, to my mind, the most wearing and exhaustive work that any one ever did. If any one thing will break down a person's health, it is being obliged to follow up and prove things of this kind. Again, with a life-long experience, I am not yet prepared to say that it is always the best way, to tell a man plainly and squarely that you have found him out. First, there is a difficulty in proving conclusively things that are clear enough in your own mind; and, finally, you make a man a lifelong enemy by telling him the truth, whereas, if you simply tell him you do not need him any longer, you and he may be on tolerably friendly terms if you happen to be near each other. Sometimes, by the grace of God assisting you, you can tell a man faults of this kind in a way that will make him a better man; but it almost always requires a great amount of grace to say just enough, especially when you are provoked, and not say too much or exaggerate the state of affairs.

Dear friends, I started out in this Home Paper today to say something that would help you—at least a great part of you; and may God give me grace and wisdom to say it as the Holy Spirit shall direct.

This thing I have spoken about is widespread. Men and women are complaining because they are out of employment. Some of them say that they cannot get work because they are "not in the ring." But when I hear such speeches I feel almost sure there is no "ring" about it. More people are out of work because they are not conscientious and honest than for any other reason. Yes, even women are dishonest. God knows how it pains my heart to say it. Even women, mothers of families, those whom we have a right to expect to be all that is good and pure, seem to have either never heard our little text at the head of this talk or else they have such an opinion of their own shrewdness that they think themselves exceptions, and that their peculiar "sins" will never "find them out." Let me say to such, you may think your employer does not know of the things you are concealing; but let me repeat with emphasis the words of our text, "Be sure your sin will find you out."

No doubt many people think us needlessly particular in our establishment. During these war times everybody wants to see a daily paper, and the newsboys are pushing

Cash Paid for Beeswax!

For all the **Good, Pure Yellow Beeswax** delivered to our office till further notice, we will pay 25 cents per pound, **CASH**. No commission. Now if you want **cash, promptly**, for your Beeswax, send it on at once. Impure wax not taken at any price. Address as follows, very plainly,

them everywhere—that is, when they are allowed. We have forbidden the delivery of papers to our people while at work. I speak of this because I know how strong the temptation is to take "just a minute or two;" and if one does it, another will. We have also been obliged to forbid peddlers, book agents, and agents for everything else, coming on to our premises. Now, if these agents were conscientious and honest, we might, perhaps, permit them to come in before or after working hours; but I have learned by sad experience that it is not best to do even this.

Do you say we make a fuss about little things? My friend, this fuss is made for your own good. The person who keeps his mind and his hands busy on the work he is employed to do right along through the working hours may be worth 25 cents an hour or more; but if he is stopping his work to notice everything that is going on, to go over to his neighboring workmen to talk about things not pertaining to the business, he will be worth to his employer only 15 or 20 cents an hour, or even less. Why, I have had men (and women, too) in my employ who finally became so demoralized in this very way that I made up my mind that they hindered business more than they helped, and that we should get along better if we paid them their wages to have them stay at home and not come near us, and they had to stay at home finally without any wages at all. One reason why we have had such extreme cases is because we dislike to make a fuss about things that look on the face of them to be small and unimportant, and so we good-naturedly let the things pass until there has to be a sudden reform.

I want to say a word more about doing work for yourself when you have hired out to somebody else. If I wanted to get good pay in any establishment I would be very careful about small matters. If I wanted to write a letter in regard to my own affairs while in the employ of somebody else, I would speak to my employer about it, and take out the time it occupied, even if it did not take me more than five minutes. You may say this is a small matter; but small matters help to make up solid character. The man who is known to be scrupulously honest in details will very soon get to be trusted, and will get large pay accordingly. I can often measure a man's worth the first day he works. A boy may be excused for running to the clock every little while to see what time it is; but a grown-up man should be ashamed to do things of this kind. There are people who are constantly hunting up pretexts and excuses to leave their work and to go off after something. I have had men who always wanted a different tool from the one I gave them, and who would spend more time in going after a tool they pretended they wanted than it would have taken to finish the work with the tool they had.

In regard to the old adage, "A new broom sweeps clean," this ought to be exactly the other way when applied to reasonable beings. The man who has charge of a certain line of business for several years has learned many crooks and turns. He has learned by long experience, and sometimes by sad experience, how to avoid mishaps. There are many departments where it really takes years to become proficient in all the details. The old hand at the business should be worth two or three times as much as a new hand. Now, this is all true; but it is too often the case that, instead of trying to keep up with the times, and improve still more in his vocation, he gets to shirking, and finally to cheating; and then the adage becomes true. The old broom must be replaced by a new one, not because the new one is any better, but because the old one absolutely will not do that which he knows very well how to do.

During the dull season of the year we have always been more or less annoyed by gossip during working hours. Now, this habit of gossiping with a fellow-workman is one of the diseases that I have learned to fear is incurable. One who is addicted to

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,
Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—is beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarist's library is complete without this standard work by Rev. J. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth. Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 176 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers, \$1.00.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principles' portion of the book entitled BEES OF HONEY. 10 page pamphlet. Price, 40 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping, in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 p., illustrated. 25c.

Convention Hand-Book, for Bee-Keepers. by Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25c.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents.

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them postpaid, at these prices: A sample for 1 stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 80 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by C. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2 in fine artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st, How We Made the Old Farm Pay; 2nd, Fesck Culture; 3rd, How to Propagate Fruit-Plants, Vines and Trees; 4th, General Fruit In-structor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for casting up the price of grain, produce, hay, etc. Price, 25 cts.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Turkeys for Market and Turkeys for Profit, by Fanny Field.—All about Turkey-Raising. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters, 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

it will certainly get very small pay. Another thing, these sins always grow upon us. A person who succeeds in taking a few pennies out of the money-drawer without being discovered, will, in a few days, take more; and you all know where it ends. Our text tells it exactly. Now, the person who begins to work at something belonging to himself while his employer is away is exactly like the one who puts his hand into the money-drawer. His sin will grow upon him unless his employer's reproof (or the influence of the Holy Spirit) stops him in his career. The man who takes money out of the drawer is called a *thief*; but the man who takes a few minutes several times a day, and succeeds in skillfully concealing the fact from his employer, will keep on taking more and more. Yet such a person would blush to be called a thief. But what is the difference? If you are receiving 30 cents an hour for your work, and you succeed in getting in ten minutes for yourself without being discovered, you have taken a nickel from your employer. And what is the difference whether it be taken that way or from the money-drawer? You may suggest that we are oversuspicious; that a good many take out the time, or work at some other time enough to make it up. This is true. Before condemning a person he is generally watch for quite a period of time; he is almost always greatly astonished to know that anybody has been watching him.

Let me make a suggestion: If you take a little of your employer's time, and afterward work enough or more to make it up, be careful to speak of it to your employer, or, in a large establishment, to the time-clerk, for he is very likely to be questioned in regard to this matter; and it will be worth a great deal to you for him to be able to say, "That is all right. This person spoke to me about it at the time." The Bible exhorts us to "shun even the appearance of evil," and good business common-sense should teach us the same thing. Let all our acts be such that they will at any time bear investigation without embarrassment or quibbling.

I have said some pretty severe things in regard to humanity, and it has pained me to say them. Now let me say this: There are many boys and girls in my employ who are as honest as the day is long. Sometimes things have come up that seemed to reflect on these—I almost wanted to say "my jewels." Well, they are jewels, indeed; and when anybody hints at anything that is crooked or dishonest, or that even looks bad, you do not know how it rejoices my heart to say, "Why, that boy is as honest as the day is long. I will guarantee that, whatever the grievance is, if you will let me take hold of it I will bring out the facts showing that he is clear and straight as the light of day." Sometimes I can add, "He is in my Sunday-school class, and I know him through and through." Oh, how I do delight to get hold of such boys! I rejoice to take them by the hand, and look them square in the eye. Whenever an opportunity occurs I like to introduce them to my friends, and speak an encouraging word in regard to them. As a general thing, such boys and girls are Christians. They belong to the Sunday-school, and, of late, generally to the Endeavor Society also, or some similar organization among the young people. I often predict that such boys and girls will fill high places of honor in time to come; and it delights my heart to say in after years, when I hear that some one of them is a college professor, or has gone to the missionary field, or is filling some other important post, "There, I told you so!"

Now, dear friends, whoever you may be, please believe I am right when I tell you that no one thing can contribute more toward getting better pay, no matter for whom you are working, than to keep in mind this little text—"Be sure your sin will find you out." And when old age comes on, and grim Death calls, besides the better pay here in this world you will find eternal life beyond, amid the companionship for ever and ever of the good, the honest, and the pure in heart. A. I. Root.

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us Two New Subscribers to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Page & Lyon Mfg. Co. New London, Wisconsin,

Operates two sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of

Bee-Keeper's Supplies.

They have also one **One of the Largest Factories** and the latest and most-improved machinery for the manufacture of

Bee-Hives, Sections, Etc.,

that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the **clearest and whitest Basswood** is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equipment with best machinery, all combine to enable this firm to furnish the

Best Goods at the Lowest Prices.

Send for Circular and see the Prices on a Full Line of Supplies.

Mr. Abbott sells our Hives and Sections at factory prices.

Please mention Bee Journal when writing.

Ho, for Omaha!

AS we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St. Omaha, Neb., where we will keep a complete line of all Apian supplies, the same as we do at Higginville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polish, snowy-white Sections, beautiful straw-colored to transparent Foundation, improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing are our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, **Leahy Manufacturing Company,** Higginville, Mo., or 1730 South 13th St., Omaha, Neb.

Please mention Bee Journal when writing.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Sept. 10.—Honey has sold well for past few days, and all of the best white comb that is in proper shape sells at 12c. Off grades of white, 10 to 11c; amber, 9 to 10c; dark grades, 7 to 8c. Extracted, white, 5 to 7c; amber, 5 to 6c; and dark, 4½ to 5c. Beeswax, 27c. R. A. BURNETT & Co.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax, prime, 24c; choice, 24½c. At present there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c; amber, 10@11c. Extracted, white, 5½@6c; amber, 5@5½c; dark, 4½@5c. Beeswax, 22@25c.

The receipts of comb honey are larger. C. U. CLEMONS & Co.

Columbus, O., Sept. 15.—Fancy white comb, 14 to 15c; No. 1 white, 12 to 13c; No. 2 white, 10 to 11c; fancy amber, 10 to 11c.

Fancy white continues scarce and wanted. Those having any to market will please correspond with us.

COLUMBUS COM. AND STORAGE CO.

New York, Sept. 1.—We have a good demand for new crop comb honey, and it is beginning to arrive. Have sold some shipments at 14 to 15c for fancy white, 12 to 13c for No. 1 white, and 10 to 11c for fair white. We think these will be about the ruling prices this fall; exceptional fine lots may sell at a little more. Extracted is in good demand at unchanged prices. Beeswax dull at 26 to 27c. HILDRETH BROS. & SEIGELKEN.

Boston, Sept. 16.—Fancy white in cartons, 14c; A No. 1, 12½ to 13c; No. 1, 11 to 12c; No. 2, 10 to 12c. California extracted is practically out of the market. Florida in barrels is selling from 6 to 7 cts., according to quality. Beeswax, 26 to 27c. Very light stock; only fair demand.

The fall demand for honey is now opening, and from present indications we look for good prices right through the season.

BLAKE, SCOTT & LEE.

Indianapolis, Sept. 1.—Fancy white comb honey, 12@12½c; No. 1, 10@11c. Extracted, white, 6@7c. Beeswax, 25@27c.

Only a few arrivals of fancy white comb; market almost bare, and demand good. Quite a little comb honey from honey-dew is being offered, but there is simply no demand for the stuff. WALTER S. POWDER.

Milwaukee, Sept. 1.—Fancy comb, 11 to 12c; A No. 1, 10 to 11c; No. 1, 9 to 10c; amber, 7 to 8c; old and dark, 5 to 6c. Extracted, white, in barrels or kegs, 5 to 6c; dark, 4 to 5c. Beeswax, 25 to 26c.

The market for honey is in very good condition; while there is yet a little of the old crop on hand, it is in very good order, and some demand, which will clear off everything before the new crop will arrive, very plentifully. There is already some receipts of new, but mostly extracted, and some very good quality, yet we fear the danger is in extracting too early, before the honey is fairly ripened. We anticipate a good demand a little later, and think values will remain about the same as present quotations. A. V. BISHOP & Co.

Buffalo, Sept. 16.—There is quite an improved demand for honey at present, and moderate amounts can be sold of strictly fancy 1 pound comb at 11 to 12c; lower grades range from 10c downward. We advise but moderate shipments for a while yet. Extracted—average grades could be sold at 4 to 5c. Fancy beeswax, 27 to 28c; common, 20 to 25c. BATTERSON & Co.

San Francisco, Aug. 24.—White comb, 9 to 10c; amber, 7 to 8½c. Extracted, white, 6@6½c; light amber, 5½ to 6c. Beeswax, 24@26c.

Stocks are of very moderate volume, both of comb and extracted, and market remains firm at ruling rates, especially for water white or light amber of desirable flavor. There is a fair local demand and some business on foreign account. The bark J. C. Glade, clearing Monday for Europe, took 808 cases, valued at \$8,250.

Cleveland, Sept. 1.—Fancy white, 13@14c; No. 1, white, 12@12½c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c; light amber, 6c.

The demand for honey is exceptionally good, owing to the crop in this vicinity being very light. A. B. WILLIAMS & Co.

See Honey Offer on page 603.

THIS
Wood Binder

will hold one year's numbers of the AMERICAN BEE JOURNAL and will be sent by mail for **20 cents**. Full directions accompany each Binder. The issues of the JOURNAL can be inserted as soon as they are read, and preserved for reference in book form.

By paying for a year's subscription STRICTLY IN ADVANCE this Binder will be sent, post-paid, for 10 cents extra.

ADDRESS,
GEO. W. YORK & CO.
118 Mich. St., Chicago, Ill.

THE 'WOOD' BINDER. PATENTED SEPT. 24 TH. 1895

CARLOADS

Of Bee-Hives, Sections, Shipping-Cases, Comb Foundation, and **Everything** used in the Bee-Industry.

We want the name and address of every Bee-Keeper in America. We supply Dealers as well as consumers. We have Dry Kiln, Improved Machinery, 40,000 feet of floor space, and all modern appliances. We make prompt shipment.

Write for Catalogs, Quotations, etc.

Inter-State Manufacturing Co.,
HUDSON, St. Croix Co., WIS.

3 ITALIAN QUEENS ONE DOLLAR....

For the balance of the season I will sell untested Queens, 45c each, or 3 for \$1.00. I still have a few tested at 50c each. Safe arrival.

Address, **W. J. FOREHAND,**
38A1t FORT DEPOSIT, ALA.

21st Year **Dadant's Foundation.** 21st Year

Why does it sell so Well?

Because it has always given better satisfaction than any other. Because **IN 21 YEARS** there have not been any complaints, but thousands of compliments.

We Guarantee Satisfaction.

What more can anybody do? **Beauty, Purity, Firmness, No Sagging, No Loss. PATENT WEED PROCESS SHEETING.**

Send Name for our Catalog, Samples of Foundation and Vell Material. We sell the best **VEILS**, cotton or silk.

BEE-KEEPERS' SUPPLIES OF ALL KINDS.

LANGSTROTH ON THE HONEY-BEE, Revised.
The Classic in Bee-Culture—Price, \$1.25, by mail.

BEE SWAX WANTED AT ALL TIMES.

CHAS. DADANT & SON,

Please mention the Am. Bee Journal.

HAMILTON, Hancock Co., ILL.

OUR MOTTO—"Well Manufactured Stock! Quick Shipments!"

SECTIONS, SHIPPING-CASES, AND BEE-KEEPERS' SUPPLIES.

We make a specialty of making the very best Sections on the market. The **BASSWOOD** in this part of Wisconsin is acknowledged by all to be the best for making the **One-Piece Honey-Sections**—selected, young, and thrifty timber is used.

AMERICAN BEE JOURNAL.

ESTABLISHED IN 1861 OLDEST BEE-PAPER IN AMERICA

DEVOTED EXCLUSIVELY TO THE INTERESTS OF HONEY-PRODUCERS.

Published Weekly at 118 Michigan St.

GEORGE W. YORK, EDITOR.

\$1.00 a Year—Sample Copy Free.

38th Year.

CHICAGO, ILL., SEPTEMBER 29, 1898.

No. 39.

Now for New Subscribers!

Every Bee-Keeper Can Get in Now!

10 WEEKS FOR 10 CENTS!

For ten cents the American Bee Journal will be sent for ten weeks on trial to any bee-keeper not now a subscriber. (Or for \$1.00 we will send the weekly American Bee Journal to a new subscriber from Oct. 1, 1898, to Jan. 1, 1900—15 months—less than 7 cents a month). This is a splendid chance to become acquainted with the weekly Bee Journal. Getting it 10 weeks regularly will show pretty well what may be expected when it comes to a bee-keeper's home week after week for years.

These Special Articles will Appear....

With Others, During the Next Ten Weeks....

Bee-Keeping in Cuba and Porto Rico—
By O. O. POPPLETON, of Florida.

Recent Progress in Apiculture—
By ERNEST R. ROOT, Editor Gleanings in Bee-Culture.

Bee-Keepers and Supply Manufacturers—
By DR. C. C. MILLER.

Foul Brood in the Apiary—
By WM. McEVROY, Foul Brood Inspector of Ont., Canada

Advanced Methods of Comb Honey Production—
By S. T. PETTIT, of Canada.

Migratory Bee-Keeping—
By H. E. HILL, Editor American Bee-Keeper.

The Scientific Side of Apiculture—
By C. P. DADANT.

Experiences and Suggestions in Marketing Honey—
By S. A. NIVER, of New York.

Best Method for Creating and Maintaining a Market for Honey—
By HERMAN F. MOORE.

First Half Century of Bee-Keeping in America—

By HON. EUGENE SECOR, General Manager United States Bee-Keepers' Union.

The Apiary on the Farm and in the Orchard—

By HON. E. WHITCOMB, Supt. Apiary Department Trans-Mississippi Exposition.

Needs of Bee-Culture in the South—
By DR. J. P. H. BROWN, of Georgia.

General Advice to Bee-Keepers—
By REV. E. T. ABBOTT, of Missouri.

The Relation Existing between the Apiary and the Successful Production of Fruit—
By G. M. WHITFORD, of Nebraska.

The foregoing List of Special Articles represents a part of the program at the Omaha Convention. Many of the subjects will be followed by much helpful discussion. Of course, many other interesting and valuable contributions will be found in the American Bee Journal during the 10 weeks' "trial trip," besides the other regular departments. But in order to secure all the above articles, the trial subscriptions should be sent in promptly.

Every Bee-keeper in America ought to have the old American Bee Journal for 10 weeks from Oct. 1, 1898, and right along thereafter. It will be worth to any one of them many times its full year's subscription price. Send 10 cents now, anyway, and get it for the next 10 weeks.

Invitation to Our Regular Readers: We trust that our present subscribers will send the names and dimes of their neighbor bee-keepers, or get them to do it. Show them this liberal trial-trip offer. They should jump at such an opportunity to get 160 large pages of the best bee-literature for only 10 cents!

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, ILL.

CONTRIBUTED ARTICLES

City Bee-Keeping Pleasurable and Profitable.

BY JOHN R. SCHMIDT.

The thought of keeping bees in a city naturally makes one think it is only an experiment, and that no profit can be derived from it. It has been proven, nevertheless, that it is no longer an experiment, but can be made a source of pleasure and profit. Just as poultry-keeping is taken up by some city people as a source of recreation and a means of relieving their minds from the business cares, bee-keeping is also rapidly finding favor among a large class of people who find

A City Roof-Apiary.

pleasure in spending their holidays and idle time among their bees.

What a source of pleasure and recreation it is, after returning from the busy city at the close of a hot summer's day, and as one passes among the white hives, sees the bees standing thickly at the entrances busily engaged in evaporating the new honey which they have gathered during the day. What could please the bee-keeper more than to find, on turning back the cover of one of the supers, there exposed to view so many completed sections filled with snow-white comb honey, which he knows will find a ready sale at 15 to 20 cents a pound? This is the pleasure and profit which a city bee-keeper derives from his bees, and the chief source of making city bee-keeping so popular.

THE LOCATION.

Almost all bee-keepers of Cincinnati are located in the Ohio valley on the outskirts of the city and on the hilltops, but some of the enthusiastic bee-keepers actually keep bees on housetops in the very heart of the city. A photograph of this curious way of keeping bees is here shown. It was taken from the roof of Chas. F. Muth & Son's store, and this apiary once numbered 40 colonies, but at present there is only one full colony.

Mr. Muth said: "These bees yielded a surplus of about 60 pounds of comb honey during a good season, and always wintered without any loss." This apiary is located on a tin roof about a hundred feet from the ground, and is protected from the hot sun by a small roof which is not shown in the photo-

graph. The bees can only forage in one direction, and to reach this they are compelled to cross many housetops.

There are some apiaries which contain about 50 colonies a few miles from the city, but these cannot be classed among our city apiaries, so I will not describe them.

The apiaries located in the valley and on the hills are small, the number of colonies rarely exceeding 12; these small apiaries are quite numerous, there being about 75 colonies within one mile of my apiary.

The hive almost universally used by the bee-keepers here is the 10-frame Langstroth, the 8-frame hive having been tested by some, and found to be too small, as the bees almost invariably swarm during the latter part of April, just when the strength of the colony should be kept together as they are about to enter a period of about three weeks during which no honey can be gathered.

The hives are arranged in a long row generally running parallel with some fence or wall, and have from one to three feet of space between each hive; but this all depends upon the amount of space which can be given the bees, as often they are crowded together with no space between the hives, all manipulations being done from the rear. The picture will convey the idea. (See next page).

SOURCES FROM WHICH BEES GET HONEY.

The first honey brought in by the bees is from the fruit-bloom; this stimulates them to active brood-rearing, and where small hives are used the bees often swarm. Then comes a period during which the bees gather no honey at all, which lasts about three weeks, then white clover begins to bloom, followed closely by the sweet clover, which is the chief honey-plant in this locality, and the only one from which surplus honey is derived.

The colonies are by this time very strong, having been stimulated by the fruit-bloom, and now prevented from swarming by the lack of honey coming in between the fruit-bloom and the main flow. When the season is fairly started, the bees are given an abundance of room, and the way they go to work in the supers is astonishing. They gather about 65 pounds of comb honey per colony during a good season, and several times I have had a few colonies which doubled the amount. All of this honey is gathered during the short period of about four weeks, after which there is just enough honey coming in to fill the hives nicely for winter.

Comb honey is the chief product of the city apiculturists. It can be produced as one of the very best articles, or one of the very worst, just by the length of time it is left on the hive. If the bees are closely watched, and the sections taken out as soon as they are finished, the combs have the most beautiful, snow-white appearance, but if they are left on until the end of the season, the combs almost rival the appearance of some old brood-combs.

Extracted honey is produced by some, but the honey in this form is generally dark, and does not find as ready sale as that in the comb. The only advantage of producing the honey in this form is the increase in the surplus, and that the bees can be kept from swarming by transferring all the combs except the one with the queen to the upper story, and filling the lower story with empty combs or foundation. This is a very good plan when one is compelled to be absent from home all day, which is generally the case with many city bee-keepers. This plan certainly does avoid having many swarms which would otherwise stray away before they could be hived.

The city bee-keeper has no trouble in selling his surplus honey. The people are suspicious of all honey sold at the groceries, and often come to me and say: "I like your honey because I know it is pure, and it tastes different from that which I get at the store." I suppose they like it, and know it is pure because they see me remove it from the hives. This is one of the best ways to advertise your honey when you live in a densely populated section. I find it works every time.

Extracted and comb honey sells for the same price. Some would rather pay more for the extracted honey, but I am satisfied to sell it at the same as the comb.

The bees are all wintered on the summer stands, and have very little protection, which consists chiefly in a piece of bur-

lap and a straw mat, or 3 or 4 inches of carpet placed over the brood-frame. This is prevented from coming in contact with the frames by pieces of wood placed crosswise so there will be a space of about 3 inches in which the bees cluster, and also use as a means of access to the other combs.

One bee-keeper gives his bees no protection whatever. He winters them on 10 Langstroth frames, which contain about $\frac{3}{8}$ sealed honey, and covers these with three $\frac{1}{4}$ -inch covers, which often do not fit, leaving large openings through which the warmth may escape. Strange to say, these bees go through the winter without any loss, and many colonies are just as strong in the spring as those which received the best of care. Last winter one of the colonies wintered without the three $\frac{1}{4}$ -inch covers, the combs being entirely exposed on the top, the rain and snow being kept out by an ordinary empty extracting-super upon which was placed a ventilated cover raised about two inches to let the moisture escape. I think this proves beyond a doubt that bees do not freeze, but starve to death, as the thermometer several times registered below zero, and for weeks it was almost as cold.

Hamilton Co., Ohio.

Peddling Honey—Not Favored by All.

BY ADRIAN GETAZ.

Mr. Thompson, some time ago, related his experience in peddling honey from house to house, and attributed his failure to his lack of ability. Well, I am not sure that his lack of ability was the cause of his failure—too many other circumstances have a bearing upon the question. A good deal depends upon the class of people living in the city. Workingmen and employes generally have little money at home, buy on credit, and pay when pay-day comes. The time of the year has a great deal to do with the selling. During the fair season so much fruit and vegetables of all kinds are on the market that there is but little demand for something else. In the winter, when nothing but meat and potatoes, almost, so to speak, are to be had, then honey for a change is welcomed. Again, during the latter part of the summer the farmers bring all their honey and sell it for whatever they can get. Many families buy what they think they will need during the year,

Thompson did. On the other hand, if I started in the winter, say after the middle of January, I would not have any trouble in selling any amount of honey that way.

Most of my peddling, however, has been done by the lady who owns the place where one of my apiaries is. As she peddles her farm products all the time, and has a number of regular customers, it is easier for her to dispose of it than it would be for me, that is, when the peddling is done regularly all the year around. Besides, the cost of time is reduced considerably, as she would have to go anyhow to dispose of her own farm products.

Taking all into consideration, I am not much in favor of peddling. It takes too much time compared to the amount sold, and the difference between the price obtained and the price paid by the grocers is too small to make up for the time lost. As I have said before, I prefer to sell directly to the grocers, either on commission or straight sales, whichever they like the best.

Knox Co., Tenn.

Bee-Chat, or Various Notes and Comments.

BY HERMAN F. MOORE.

BEE-KEEPING IN CUBA.—I notice that O. O. Poppleton makes some references to his bee-keeping experiences in Cuba that are intensely interesting. Among other things, that he kept 400 colonies, etc. Now, Mr. Poppleton, take this for a subject, "Bee-Keeping in Cuba as Seen by One of the Bees," and open wide up and give us all the details, such as you know will interest all bee-keepers, and especially now when Cuba and her possibilities as an American State are in the world's eye.

HONEY-PRICES COMPARED.—It will be interesting at this time to compare the prices of honey that obtained in 1890 with the current prices of the last two years. In June, 1890, Mr. Burnett said there was less honey on the market than any time for seven years, and quotes "choice at 13 to 14 cents."

In July, a Kansas City commission merchant prices "very nice white one-pound sections put up in handsome 12-pound white wood packages at 15 to 16 cents."

An Apiary in the City of Cincinnati, Ohio.

and thus take advantage of the low prices. Many times, however, their calculations are short, and they are "out" before the winter is over.

If I were to start peddling at this time of the year, right here at home in competition with all the good things that are on the market, and the tubfuls of masht combs brought by the mountaineers, I would meet with a worse failure than Mr.

The latter part of July a Columbus, Ohio, dealer said: "Honey is scarce, and selling at 17c. for choice white clover."

In September, an Albany, N. Y., commission merchant quoted, "white, selected, 18 to 20 cents."

In September, Mr. Burnett said: "Comb is now held firmly, and sales are now being made at 17 to 18 cents for best grades of white."

In an October number of a bee-paper I see this advertisement: "For sale, 25,000 pounds of the finest honey in scant one-pound sections in 12-pound cases, a very fancy lot. The price is 20 cents a pound on board cars here. Who wants the lot?"

In November the Columbus, Ohio, dealer said: "Honey is scarce and in demand at 18 to 20 cents for nice white clover."

December 15, 1890, the Roots quote as follows: "White sage, one to three 60-pound cans, 11 cents a pound. Choice white comb 1-pound, one to three cases, 20 cents a pound."

Can we draw a moral from these prices that prevailed in 1890, nearly twice as much as producers obtained in 1896 and 1897, when they dumped their crops wholesale on the market? Doesn't it seem as if a better distribution of honey was the answer to all, or nearly all, of the apiarists' troubles? Isn't personal work with the consumer, by as many of the producers as possible, the way to get a big price for our product?

Look at the prices that prevailed in the wholesale trade all over the country in 1890. Didn't a large proportion of the consumers pay 25 cents a pound for their honey?

By a certain statistical table I am informed that there are 300,000 bee-keepers in the United States, and a total production of 100,000,000 pounds of honey. Suppose our population is 75,000,000 persons, and half the people never eat honey at all, this only gives 2 $\frac{3}{4}$ pounds of honey per year to each eater of honey on an average. Doesn't this seem like a demonstration that we should get 30 cents a pound for our honey when properly distributed, if it is as scarce as that? Is there any impossibility in getting at least 20 cents a pound for all the good table honey in the country, if properly sold to the consumer?

NON-SWARMING BEES.—Why can't we get down to some hard work along the line of a non-swarming strain of bees? All seem to agree that to give lots of room and prevent swarming will give the largest amount of surplus honey. I think Mr. Doolittle has written some along this line. Can't we breed by selection, and practice dividing for increase, and in a few years have strains of bees and queens that have almost no desire to swarm, if given abundant storage-room? It would not be well to breed the swarming impulse entirely out, for then the rearing of queens might go with it, except for supersedure.

FOUL BROOD.—The question of foul brood and ways and means of spreading it is becoming a matter of very great interest. Will Mr. McEvoy and Mr. France arise and tell us how to assure ourselves that when buying queens or bees we are not also buying a bad case of foul brood? If it is true, as a certain writer claims, that fully 40 percent of the colonies of the country are infected, it is the most serious matter that confronts us at present. Can we write to the foul brood inspector of a certain State and enquire if he can or will give a clean bill of health to the particular bee-keeper of whom we wish to purchase? One colony or one queen may be the means of ruining an entire apiary. We might require a written guarantee or certificate from any one dealing in bees and queens that they had no foul brood in their colonies. Then in case of a loss there would be a legal remedy if the seller is financially responsible.

SELLING ADULTERATED HONEY.—Should wholesale grocers and honey-bottlers all over this country be allowed to sell adulterated honey with "pure honey" on the label? Of course not; but how to prevent them—ah, there's the rub! In many of the States all that is necessary is to prosecute them under the laws as they exist. In many of the States the only lack is in the enforcement of the law, and not in the law itself.

The associations of bee-keepers, to which must naturally fall the duty of seeing to the enforcement of pure food laws as they relate to honey, may well learn a lesson from the maple sugar associations of Vermont and Ohio in these matters. These associations have been seeing to the amending of the laws and the enforcing of them for years with good effect. In Ohio a pure food commissioner has been selected who gives his whole time for a salary to the work of prosecuting adulterators and examining samples of suspected foods.

The Illinois law is an ironclad law, and yet Chicago is the great hotbed of impure foods of every kind and character on the face of the earth. Look at the law as the Chicagoans have it laid down to them in the statutes:

CRIMINAL CODE OF ILLINOIS.

"SEC. 473.—No person shall mix, color, stain or powder any article of food, drink or medicine, or any article which enters into

the composition of food, drink or medicine, with any other ingredient or material, whether injurious to health or not, for the purpose of gain or profit, or sell or offer the same for sale, or order or permit any other person to sell or offer for sale any article so mixt, colored, stained or powdered, unless the same be so manufactured, used or sold, or offered for sale under its true and appropriate name, and notice that the same is mixt or impure is marked, printed or stamped upon each package, roll, parcel or vessel containing the same, so as to be and remain at all times readily visible, or unless the person purchasing the same is fully informed by the seller of the true name and ingredients (if other than such as are known by the common name thereof) of such article of food, drink or medicine at the time of making sale thereof or offering to sell the same."

"SEC. 475.—Any person convicted of violating any provision of any of the foregoing sections of this Act shall, for the first offense, be fined not less than twenty-five (\$25) nor more than two hundred dollars (\$200); for the second offense he shall be fined not less than one hundred dollars (\$100), or more than two hundred dollars (\$200), or confined in the county jail not less than one month, nor more than six months, or both, at the discretion of the court; and for the third and all subsequent offences, he shall be fined not less than five hundred (\$500), nor more than two thousand dollars (\$2,000), and imprisoned in the penitentiary not less than one year, nor more than five years."

What a rattling of dry bones would there be, my countrymen, if an organization with grit and money should take up the prosecution of adulterators under such a law as that!

Some think a National law is the only thing that will fill the bill. The way to get a National law, and get Uncle Sam to enforce it, is to enforce the local laws, and so educate public sentiment that a general law covering the whole country will be demanded.

This is "the land of the free and the home of the brave," and I for one demand the freedom to know absolutely what is in everything I buy out of the store or elsewhere. If salicylic acid is used in my corn and tomatoes, I want to know how many grains to the quart. If oats is in my pepper, I, who pay the bill, have a right to know what percent. If my honey is part glucose, I the consumer have a right to know whether one-fourth or three-fourths, and so on through the list.

If the names of all the ingredients are printed on the outside of a package I can spend my money for it or not, as I choose; but to label a can "pure pepper" when half is something else, or "pure honey" when part is glucose, is a fraud, and is a lie and a theft, if I part with my money for them supposing them to be pure.

The one great reason why those interested in bees move so slowly toward any given point is that so few of them realize the importance of association and combination. Suppose 300,000 are keeping bees in the United States. Not more than 25,000 of them take a bee-paper, and not more than 2,000 are members of an organization to forward bee-keepers' interests. Let the apiarists combine, as do the brewers, the dairymen, the grocers, and others, and there is hardly any result that cannot be attained, that is for their interests.

Cook Co., Ill.

Boiling Foul-Broody Honey for Feeding.

BY DR. C. C. MILLER.

The following paragraph appears in the Bee-Keepers' Review for September:

"Dr. Miller, to the question, Could I safely feed it [honey from a colony having foul brood] by boiling? replies: 'Put water with it, bring it to a boil [sic], then after it comes to a boil [sic] keep it boiling for two hours and a half.' The Italics are his. Was the Doctor in a playful mood? That would be hard on the bacilli unless plenty of water were added. I consider 15 minutes boiling sufficient; having first added an equal amount of water."

I wish I knew what Mr. Taylor means by that word "sic." Coming as it does twice after the word "boil," it looks as if he might be objecting to the use of that word, but as I know of nothing incorrect in the word, or the way in which it is used, I shall be obliged to him if he will tell what he means by saying "sic."

Mr. Taylor says: "I consider 15 minutes boiling sufficient." I might reply, "I do not consider 15 minutes boiling sufficient." Pitting one statement against the other, the first has by far the greater weight, for Mr. Taylor knows vastly more than I do about foul brood, and it is right that I should give some reason for insisting on more than 15 minutes boiling.

Dr. Wm. R. Howard, in his pamphlet on "Foul Brood," reports some experiments upon the point in question. Tubes of liquid gelatine containing spores of bacillus alvei were placed in an open vessel of boiling water. The contents of a tube thrust in boiling water would of course come very nearly to a

boil. The spores were not all killed until after 45 minutes. Dr. Howard's concluding words on this point are "that boiling for an hour would destroy their vitality."

Still later I saw a report of experiments upon the same point. I am sorry to say I cannot say where, but I think they were experiments made under the auspices of the Canadian government, and reported in the Canadian Bee Journal. If my memory does not play me false, spores grew after being kept at the boiling-point nearly two hours and a half.

Under the circumstances I would not feel justified in advising less than 2½ hours boiling. Even if 15 minutes is sufficient, 2½ hours is still safe, and Dr. Howard's experiments lead to the belief that in at least some cases 15 minutes time is not sufficient.

McHenry Co., Ill.

The Queen-Excluder and Its Inventor.

BY F. GREINER.

In his Straws for July 15, Dr. Miller makes mention of the inventor of the queen-excluder, Fr. A. Hannemann (wrongly spelled Hahnemann). This brings to my mind vividly what Mr. H. wrote in the German papers during the years 1875, '78, '79, about this invention and the general management of his bees; and altho about 20 years have past since then, what he said may still be of interest to the readers.

If my memory serves me aright, nothing has ever appeared in relation to the subject in our bee-literature here, so I will speak of Mr. Hannemann, try to give the essentials of his management, and mingle with it some facts and the experiences of others as opportunity may present.

When Mr. Hannemann wrote his last report for the *Bienen-Zeitung*, in 1879, he was then a bee-keeper of 30 years' experience. He had made a specialty of apiculture for 26 years in the extreme southern part of Brazil; had introduced our common honey-bee into that land, and was the originator of modern bee-keeping there.

I did not know that, according to Dr. Miller, Hannemann was a tailor by trade; but it is very evident that he could not have had very much leisure to follow his profession, for he was so extensively engaged in bee-keeping and honey-production that his breeding-stock numbered over 300 colonies, which were allowed to swarm at will. From what I have read on and between the lines it would seem to me that all these colonies were kept in stationary hives, perhaps box-hives, as we call the hives without frames. Hannemann's aim was, in the first place, to have his colonies swarm all they would, and that was all he expected or asked of them. He called them his stock capital. The young swarms were the interest, so to speak, to be exchanged for honey during the honey season. The *how* will be shown later on.

Southern Brazil must be well adapted to bee-culture. Hannemann spoke of his honey season as lasting from two and a half to three months. For six weeks the secretion is so plethoric that bees will not work on any honey offered them in the open air. I think we might be able to show something with such a honey-flow. I have not seen a day like that here in several years, even when I secured a fair yield.

The queen-excluder was invented or gotten up for a different purpose from what we use it for now. Hannemann may have been led to make his invention on account of many young swarms often going together when swarming at the same time, and he wanting to make a sure thing of it to catch all the queens. At any rate, he constructed a sieve with the view of sifting his bees before hiving them, and so the appliance has been named "Hannemann's bee-sieve." In sifting his bees he probably encountered the difficulty of getting the drones and queens mixt together in a heap; and the gain by using just the queen-excluding plate proved insufficient for the accomplishment of his object, so he added another sieve having wider passages, with space between the two. This worked well. It separated and secured queens and drones, allowing the workers to pass through. The latter were hived in the peculiar mammoth hives to be described further on, the drones destroyed, and the queens confined in cages of his own construction.

This brings us to the second use of the queen-excluding metal, for these cages were made of *such* (I wonder that the excluding metal has not been used for this purpose by some of our bee-keepers who practice caging during the honey season). Hannemann wanted his queens caged so as to allow the bees to communicate with them unhampered, hence he made the cages of perforated metal. The unique manner of his management of the young swarms made it strictly necessary to have *every* queen secured. If possible, all the swarms coming in one day were placed in *one* single mammoth hive. Mr.

Hannemann speaks particularly of one day in 1879, when he had 79 swarms issue, to be taken care of by himself with the help of his three young children, to be sifted, queens caged, and the bees weighed and hived. One giant hive and two barrels accommodated this enormous "pile" of bees. They gave at the end of the season, net, about 1,600 pounds of honey.

Mr. Hannemann speaks at another time of his "Boss Giant hive" of 50,000 cubic inches, made four stories high, cupboard fashion, with eight hinged doors in the rear, to give access—a hive that harmoniously accommodated 54 kilograms of bees (about 119½ pounds) from which he harvested, at the close of his 2½ months' honey season, 448 kilograms of honey (equal to about 987 pounds), and 38 pounds of wax, reckoning a kilogram as 2 1/5 pounds. In other words, one or each kilogram of bees was exchanged for 3¼ kilograms of honey. Of the 14 caged queens but 9 were alive when the honey was *cut* out.

In 1879 Mr. Hannemann had to take care of 700 swarms (young) in two months. His entire crop amounted to 15,428 pounds of honey, and 1,212 pounds of wax. He stored his honey largely in cemented vats or cisterns. It is astonishing, so adds Mr. Hannemann to his report, to think that so much honey could be produced in one locality, especially when taking into consideration the fact that over 300 breeding colonies used large but (of course) unknown quantities for breeding besides, and storing their winter supplies at the same time. I would add, it goes to prove that Hannemann has a splendid location, perhaps like California or Cuba, altho he says that the *slipshod* bee-keepers complain that bees do not pay any more.

The publication of Hannemann's system created a great stir among the German bee-keepers at the time—probably more on account of the novelty of it than for any other reason, altho, of course, we all appreciate the queen-excluder. I have not heard of any one in Germany who practices the Hannemann system as he did. Mr. H. Guehler, after several years of trial, thinks but little of the excluder for his locality, but values highly the queen-cage constructed *a la* Hannemann. He works out this system: When the honey season is nicely begun he confines the queens in Hannemann cages, and places them on top of the brood-frames with super, or, as they call it, "honey-chamber," above. The bees, he says, immediately take possession of the super, providing honey is coming in.

When we cage a queen in the brood-nest in an ordinary wirecloth cage, the bees behave but little differently from what they do when the queen is entirely removed. They almost always construct queen-cells over larvae, and the progress in the sections is slow, if, indeed, any work is done at all. This is according to my experience. But when a queen-cage of the Hannemann order is used, and the bees can communicate freely with the queen, they do not seem to be aware that she is caged at all, and Mr. Guehler finds that everything moves along in the hive normally. Queen-cells are not constructed. The combs become heavier and heavier, and the work in the super—that is, comb-building and honey storing—goes right on unless the honey-flow ceases. Guehler thinks it is best to release the queen again after two weeks of confinement, removing at the same time a few of the heavy combs from the center of the brood-nest, inserting comb foundation in their stead. Empty comb does not prove to be a success, as the bees will fill in honey too soon. The bees will draw the foundation into comb just about as fast as the queen can utilize it, and she will at once be ready to enter upon her maternal duties as if she had not been obliged to suspend her work. The bees very readily accept their queen, for in reality they have never been separated from her. Guehler finds that queens come out uninjured by this confinement, prove to be just as fertile, productive, and long-lived as if they had always had their freedom. When carrying the caging plan to excess—that is, confining the queen for an unreasonably long time (in this one case he speaks of, it was five weeks), laying workers made their appearance.

It seems, then, that some German bee-keepers modified the Hannemann system to suit their own environments, or pickt out the valuable features according to their own judgment. I noticed, also, that after the publication of Hannemann's invention queen-cages like this were offered for sale. They consisted simply of a little wooden frame covered with the perforated metal on each side.

Right here I want to add that some of our German friends across the water have adopted at least some features of *our* methods, our hives and appliances, owing in a great measure, probably, to the efforts made by Mr. Stachelhausen, of Texas, and myself, to enlighten them on the subject of American bee-hives and our general management of bees. Of course,

progress is slow. It seems very hard to give up old methods and adopt new ones. But progress is there. My private correspondence with bee-keepers of Germany establishes that fact beyond a doubt.—Gleanings. Ontario Co., N. Y.

[Concluded next week].

A Little Experience with Bees.

BY CHARLES HOOKSTRA.

I have had quite an experience with bees lately. I went southwest of my home about six miles, and got acquainted with three or four persons who keep about 50 colonies of bees. They are not readers of the bee-papers, and are somewhat behind the times in the latest improvements.

A man came along there about five or six years ago and sold them some newly invented hives, charging them \$5.00 apiece, and they have made no improvements since then. They keep most of their bees in dry-goods boxes, or any box that is convenient when they swarm. A great many go to the woods and are lost.

In the fall, about Oct. 1, they dig a hole in the ground, build a fire and put sulphur on it, then place the hive over the fire to kill the bees in order to get the honey away. I persuaded them this year to let me have the bees and take them away without killing them. I now have two colonies at my home which I took away from the honey they had gathered all summer. I first bored some holes in the box they were in, enough to put the nose of the smoker in; then I turned the dry-goods box bottom side up, and put my hive on top of that, with foundation in, and a cake of honey. I then rapt on the dry-goods box to get them started going up, and I gave them a puff of smoke. I kept this up for about 25 minutes, until I had them pretty well up. Then I placed the hive in the place where the dry-goods box stood, and moved the box away about 50 feet, and the remaining bees I drove out with the smoker, when they flew to the new hive where the queen was, and the work was done.

I let them stand there the next night and day, and the evening of the next day they had started to work. That evening I fastened the hive to the bottom-board, and put mosquito-netting around it and brought them home on the street-cars. I put a paper on the box, and the passengers wanted to know if I had pigeons. I told them I didn't know how many "pigeons" were in the box. I had only to change cars three times with my "pigeons."

I have had the bees at my home two weeks, and they have gathered 30 pounds of honey in the brood-chamber already, and I consider them one of my best colonies. This was a new idea to the bee-smotherers.

Another person gave me a third swarm that was very small. It issued Aug. 21. I took them out of their dry-goods box or "bee-catcher," as the man called it, as it had a handle. They had made quite a bit of comb, being in there three days. I took a wire hive made of screening, and took the little piece of comb that the queen was on and put it into my hive. The other bees I shook into my hive, and brought them home on the street-cars. When I got them home I put them into one of my hives with foundation with a little honey in. The next day I saw they were not strong enough to gather enough honey to keep them this winter, so I took one of my strong colonies and put it beside the weak one, and put peppermint on both hives so as to kill the scent, so they would not kill the queen in the weak colony. I then took a frame of bees out of the strong colony and shook them into the weak one. This worked all right. The next morning I fed the new colony honey so they would get a little acquainted with their new home. It is now the third day I have had them, and they are gathering their winter stores. I now have a pretty strong colony of bees. I believe in saving the last swarms if increase in numbers is wanted.

About two weeks ago I visited Mr. Watson's home, in this (Cook) county, alongside the Desplaines river. It is a beautiful home, surrounded by a natural growth of trees. I had quite a talk with Mrs. Watson about bees. She said they had some "tenants" in the upper part of their house that had not paid any rent, nor had they received any benefit from them for the last four years. The "tenants" are a swarm of bees. They came in between the stone wall and the window-frame in the upper story at the front of the house. They came in a small crack that the builders had left. They then found their way to the inside of the house between the plastering and the stone wall, in a space about 3 inches wide and 10 feet square, which is their hive. When the lady of the house opens the window in the room below the bees come down the pulley holes, and act as if they would like to take possession of the

whole house. The people considered the bees quite a curiosity at first, but they do not think so now.

These bees swarm regularly every year, but the people have not been able to catch any of the swarms. The bees have made the corner of the window-sill black by traveling in and out. There are about 50 colonies in that vicinity, and the bees in the house are supposed to be some of the run-aways. Cook Co., Ill., Aug. 28.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. O. O. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Keeping Combs Filled with Honey.

I have a few extracting-combs filled with honey, and want to keep them for the bees in early spring. How can I keep them away from the bees? In what kind of a room, and what temperature is required? NEW YORK.

ANSWER.—Very likely a warm cellar is the best place you can conveniently have. If you can have a warmer place, all the better. But a cellar that never freezes is better than a room that is much warmer than the cellar in daytime and then freezes at night. The best thing would be a room that never goes below summer heat. It would not hurt the honey to be kept at 90° or 100°.

Sources of Pollen.

Where do the bees get their pollen and bee-bread—from what flowers or shrubs, and what kind of trees and flowers? The reason this question is asked, I would like to plant them, and it would be of interest to me as a beginner. GEORGIA.

ANSWER.—Bees get pollen from white clover, burdock, sweet clover, plantain, buckwheat, maple, pumpkin, apple, muskmellon, poppy, plum, corn, linden, dandelion, mignonette, pear—I think you'll have to excuse me from giving the whole list, for it would take up a great deal of space to give all I know, and very likely your bees get pollen from something I don't know anything about. It is not likely that it would be worth while for you to plant anything specially for pollen. While it is a very important item in Mistress Bee's bill of fare, the probability is that your bees will easily find all they want on the plants already growing.

Work of Wax-Worms—Queenless Colony.

1. Three weeks ago I had a strong colony of bees to abscond, leaving plenty of sealed brood. After the young bees gnawed through, they could not get out, as they were held in by a web at the bottom of the cell where there was a small white worm. The hive was well shaded, and the bees were bringing in nectar. Ants have been between the quilt and cover for some time. I put them into a new hive on full sheets of foundation, and they are doing nicely. What caused them to leave? How can I prevent it, and get rid of the small worms?

2. I notice white dust, or what seems to be chewed wax, on the sections of honey that I have stored away in a warm, dry place. What is the cause, and how can I prevent it?

3. I have a colony of queenless bees. I gave them a frame of eggs and larvæ, and instead of starting queen-cells on it, they build queen-cells on the comb where there are no eggs or larvæ. If they adopt a worker-bee as a queen, will she lay eggs? What must I do with them? TENNESSEE.

ANSWERS.—As you report the case, it seems to have been a case of swarming, in which the worms and ants had no part. The best remedy for the wax-worm is a strong colony of Italians. Italians seem to be very much better than common bees for keeping out worms. The ants probably do little damage, making their nests about the hive more for warmth than anything else. If no place is allowed about the hive to shelter them where the bees cannot go themselves they will not trouble. I discarded quilts and adopted a plain board cover.

Since then ants don't bother at all, for they have no chance to find a hiding-place from the bees.

2. The white dust is the work of wax-worms that are very small and young. Give them time enough and they'll grow into big, fat worms. Better fumigate the sections with sulphur.

3. Your colony has probably been queenless for a long time, and by this time laying workers may be at work. It is so late in the season that your wise course will be to break up the colony. Indeed, that is the best way at any season, after they have been queenless a long time. If you have a weak colony that has a good queen, you can give it to the queenless colony to strengthen it. If you have a very weak colony, divide the combs and bees around among several colonies that are among your weakest.

How Bees Get Home Again.

I would like to know what Dr. Miller thinks of the following paragraph, taken from a newspaper:

"Bees are said to see an enormous distance. When absent from their hive they go up in the air till they see their home, and then fly toward it in a straight line."

MICHIGAN.

ANSWER.—I don't know anything about it, but I don't believe it. I have a dim suspicion that a bee, bird or animal may have some sense that a man doesn't have. Take a cat and put it in a bag, carry it by a circuitous route farther from home than it has ever been, liberate it, and when you get home you may find it smilingly waiting to greet you at the door. With any sense that you have, you couldn't do a thing of that kind. Hasn't the cat some special sense that you haven't? A carrier-pigeon will find its way home a hundred miles, in a place where it couldn't see half way home. I have some doubt whether a bee is as good as a cat or a pigeon at finding its way home, and it's possible that it finds its way home only as you do. At any rate, if you take a bee five miles from home, in a direction it has never before gone more than a mile, I doubt whether it would find its way home, even if its home is so plainly seen at that distance that you can see it with the naked eye. So I don't have so very great faith in the extra sense belonging to a bee, after all; and when you come right down to it I don't know anything about it.

Cellar-Wintering—Ventilation—Extracting-Frames—Quilt or Board Covers.

1. Can I winter my bees in a storm-cellar? It is 8x12 feet, depth 6 feet, and 1½ feet of earth on top.

2. What is the best way to fix ventilation?

3. Which is the better frame for extracting, 9½ or a half-depth?

4. Which is the better, a quilt or a board over the frames? I use boards, but the bees glue it.

MINNESOTA.

ANSWERS.—1. Very likely it will be a good place to winter, but you can hardly be sure about it till you try. The lay of the land makes a difference about its being damp, etc.

2. For only a few colonies it may need no attention as to ventilation. You can secure ventilation by having a pipe run from near the bottom up through the top, covering so no rain can get in, but still leaving free passage at the top for air. You can make the pipe by nailing together four fence boards, altho very likely a smaller pipe, say three inches square, will be probably as large as is needed. If there is a pipe running up high enough to act like a chimney, there will probably be no need of any special provision for letting in air. Enough will work in through the cracks and the soil.

3. In a late number that question was pretty fully answered. The shallower frames are considered better for extracting, but the deeper frames have the advantage that you can afterward use them for brood-frames if you wish.

4. The tendency nowadays seems to be in favor of board covers without quilts. The bees glue the covers down, but by using a sharp screw-driver or some other hive-tool you can easily pry them up.

Will they Winter?—Refuse to Work in Supers.

1. In June I hived a small swarm in a frame hive, giving them four frames. They went to work all right but did not breed up fast. In August I put in another swarm, and the four additional frames, and now these frames are full of honey and very little brood—virtually none. Still they have never

stored any honey in the super. Will they winter all right without any young bees? or ought I to take away the frames filled with honey and give them empties?

2. I have four or five colonies that have refused to work in supers. Do you know a remedy?

TEXAS.

ANSWERS.—1. Very likely it will be just as well to leave them as they are. Of course, if the frames are so full of honey that the queen has no room to lay, then it might be well to exchange one of them for an empty one. But if you find any empty cells in the hive, or if you find brood in two or three frames, better let them alone. Queens do not generally lay a great deal after this time of year.

2. It may be that the harvest is poor. In that case it is hard to apply a remedy. If, however, other colonies are working well in supers, and these colonies have their brood-nests entirely filled, you may get them to working in supers by using bait combs. Put in the center of the super a section that has been partly drawn out. One good way is to take from a super in which bees are working well a section ¼, ½, or ¾ filled, bees and all, and put it in the super in which you want the bees to work.

Unfortunate Jumble—Drones and Egg-Fertilization.

Referring to page 438, Hon. R. L. Taylor says this in the Bee-Keepers' Review:

"There is apparently an unfortunate jumble either of the questions or of the answers, but that is not entirely clear, as one of the questions is evaded. Will the doctor please straighten out these things?"

I read over the questions and answers on page 438, until I came to the last one, "Drones and Egg-Fertilization." When I came to that I didn't wonder Mr. Taylor wanted it straightened out. But after trying it for some time I concluded I must be excused from the task. I will now, however, give the information called for in the questions, thanking Mr. Taylor for calling attention to the jumble:

Dzierzon taught that the eggs that produce drones are unfertilized. This teaching, bitterly assailed at first, has come to be generally accepted the world over. Lately, however, a small school across the water holds that all eggs are fertilized.

A difference of opinion prevails as to whether the fertilization of the egg is voluntary or involuntary on the part of the queen, the prevailing belief, perhaps, being that it is involuntary.

C. C. MILLER.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Bee-Keeping for Beginners is the title of a 110-page book just out, from the pen of that expert bee-keeper of the South, Dr. J. P. H. Brown, of Georgia. It claims to be "a practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit." Price of the book, postpaid, 50 cents. Or, we will club it with the Bee Journal for one year—both together for \$1.40; or, we will mail it as a premium to any of our present subscribers for sending us one new subscriber to the Bee Journal for a year (at \$1.00), and 10 cents extra.

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. SEPTEMBER 29, 1898. NO. 39.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Omaha Convention Report we expect to begin next week—with the first number of the Bee Journal for October. We are expecting a good report. The convention papers we think were exceptionally interesting and valuable. We presume there will be sufficient convention material to run in our columns almost the whole of the next three months. Every member of the United States Bee-Keepers' Union will receive the Bee Journal containing the convention report in full. The Board of Directors of the Union arranged for that before leaving Omaha. There were four of the six Directors present.

City Bee-Keeping is the subject of the first article in this week's number. Mr. Schmidt refers mainly to the keeping of bees in or near the city of Cincinnati, Ohio. Within the city limits of Chicago are found many apiaries, some quite large, but of course the majority are small. They range, perhaps, from one colony up to a few having over 100 colonies.

Some fairly good yields have been secured from colonies kept in cities. Last year one colony in our own small apiary here in Chicago, produced 150 well-filled sections of honey—gathered from sweet clover. Colonies in other apiaries here may have done better, possibly.

If bees are properly handled, there need be no fear that they will molest near neighbors. Of course the inevitable mischievous boy will find the bees if any are around, and then usually the trouble begins. But it will likely also end right there, if said boy experiences fully the sitting-down qualities of a healthy worker-bee. Such an impression is generally lasting. A boy may forget many things, but ever after being

successfully pierced by a bee-sting he remembers it with great vividness whenever he finds himself again near any bees.

While it would not be well to encourage city bee-keeping to a great extent, still if kept within reasonable bounds much good will result therefrom to those who manage their bees in a proper manner.

Who is Responsible?—Referring to an item in the department of "Beedom Boiled Down," which mentioned that the Department of Criticism in the Bee-Keepers' Review was almost entirely given up to controversy between the critic and Dr. Miller, Critic Taylor says:

"I wonder who is responsible for 'Beedom Boiled Down.' The style seems strangely familiar. The writer ought to stand out squarely and meet the result of his statements. Anonymous publications are never looked upon with much favor."

Mr. Taylor is too intelligent a man to admit the thought that he is not familiar with current journalism, and it is only through mere thoughtlessness that he could have made such a remark. If he would stop to think, he would know that in his favorite daily newspaper he reads many things without signature, written by the editor, or by some one employed by him, and if he calls such writings "anonymous," then the ablest part of our ablest journals is anonymous.

The American Bee Journal stands just as responsible for "Beedom Boiled Down" as for any other editorial matter.

The Department of Criticism, in the Bee-Keepers' Review, the editor says, has been praised by some and condemned by others. One subscriber thinks the critic should be a critic in the fuller sense of the word, giving praise as well as blame. The editor says what he wanted in the department was to have errors and fallacious ideas pointed out, and where possible better plans to be given in place of the ones condemned. He now asks advice of the friends of the Review as to whether the department should be continued as at present or changed.

Shall We Grow Sweet Clover?—This question is the heading of a contribution in the Orange Judd Farmer, by Prof. L. H. Pammel, of Iowa, written in response to a sample of sweet clover sent to him. He replied as follows:

The specimen is of common sweet or Bokhara clover (*Melilotus alba*). This weedy annual is a native of Europe, and has become widely naturalized in portions of the United States, especially so in the States of Ohio, Michigan, Wisconsin, Illinois, Minnesota, Iowa and eastward. It resembles alfalfa, but is easily distinguished by its taller habit and larger leaves, growing from three to eight feet high. Its flowers are small and white. This plant is a nitrogen-gatherer, produces a long and deep taproot, and hence is very valuable as a soil renovator, especially in the South. It thrives admirably upon the thin calcareous soils of the Southern States, but it is especially valuable on the old wornout prairie soils of the Cotton States.

It is equally valuable as a soil renovator in the North, but the question arises, Should it be cultivated in lieu of better forage plants? A soil in the North on which this weed grows is not only rendered fertile, but is made very porous. The strong odor of this grass renders it objectionable to cattle and stock, but they later become accustomed to it. J. G. Smith says: "But if they are turned into a field of sweet clover in the early spring, before the other clovers come up, they will quickly learn to eat it." To obtain best results in this latitude, the seed should be sown in February or March at the rate of about one-half bushel to the acre. A crop can be cut the first season.

This plant is very valuable as a honey-producer, and where it is abundant bees collect large quantities of honey. In all probability no other plant in this latitude yields as abundantly as this since the basswood and other native plants are rapidly diminishing. It is able to resist the drouth to a remarkable degree. Another point in its favor as a honey-producer is that the plant blossoms from June to frost. If

your soil is sandy your sweet clover will thrive upon it. If the soil is heavy it is also suited to this splendid plant. If the season be wet sweet clover will blossom and grow freely, and if dry its bountiful and continuous yield of honey will well repay the slight trouble incurred in planting, and your bees will be kept busy and happy all the season. The point to determine is whether it is desirable as a forage plant in the northern latitudes. If its forage qualities outweigh its woodiness then it should be tolerated. Does the farmer need it as a bee-pasturage plant? He must determine all these points largely for himself. It has undoubted virtues in several directions.

We are glad to note in the foregoing that Prof. Pammel is becoming less severe than awhile ago when he condemned sweet clover so strongly. We see, however, that he still calls it a "weed." Well, some day he'll get over even that, we think.

His recommendation of sweet clover as a honey-plant is all that could be desired, and is also entirely just and right. But we believe many advise sowing the seed in the fall as well as in early spring. We should be pleased to have some advice about fall sowing, from those having experience.

Death of Miles Morton.—We learned at the Omaha convention that Mr. Miles Morton had past away on Sept. 1. Upon our return we received the following from the Secretary of the local bee-keepers' association, of which Mr. Morton had been a member:

The Cortland Bee-Keepers' Association, at a regular meeting held at Freeville, N. Y., Sept. 8, past the following resolutions:

WHEREAS, It has pleased God in his wisdom to remove from our midst our brother, Miles Morton; therefore, be it

Resolved, That we, the Cortland Union Bee-Keepers' Association, do extend our most heartfelt sympathy to the bereaved family in their hour of sorrow; and that we express our appreciation of his help and counsel in the past, as well as our sense of the loss to the Association in his demise; and be it further

Resolved, That a copy of these resolutions be published in the American Bee Journal. J. L. KINNEY, Sec.

We remember Mr. Morton very well, as we met him at the Buffalo convention last year, and it is with sincere regret that we learned of his death. Our sympathy is hereby extended to the bereaved ones, who are left to mourn his departure.

Chiefly from Mr. Morton was the idea of the fence separator obtained, he having had fences in use for 12 years past. He was an intelligent, unobtrusive sort of man, highly respected by those who knew him. We hope soon to be able to publish more about him, and also his picture.

Northern Michigan as a Honey-Field, Editor Hutchinson thinks will be an ideal location for years to come, largely on account of the willow-herb or fire-weed that grows on places where the timber has been burnt off. He cautions, however, any one who may think of locating there, and has been accustomed to the advantages of civilization, to remember that it is a new country.

BARON BELA AMBROZY reported at the big German convention last year that, by feeding honey with 50 percent water, and afterward with 30 percent, he got no satisfactory results; but using pure honey he got 3 pounds of comb for every 4 pounds fed. Doesn't that differ from reports in this country?—Gleanings.

MR. R. H. LEE, of Ashland Co., Ohio, writing us Sept. 11, said:

"Go ahead with your spelling reform. I am a little old to adopt it myself, but I like to read it. To quiet some of your critics, you might print the Lord's Prayer in a number of versions, from the earliest translation to the present, showing the changes in spelling. And, by the way, please be careful to print that grand old prayer according to the authorized version, for very few seem to know it, particularly preachers, and those who lead in religious exercises. . . . This has been a very poor honey-year in this part of the country."

Why, Mr. Lee, if we should print one of the earliest versions of the Lord's Prayer, scarcely any of our present subscribers could read it. There has been great progress made in reforming the spelling of the English language the past two centuries, and yet there is much more to be done in the same line. We are only aiding a good cause.

RICHARD WAGNER AS HE WAS.—The widow of Richard Wagner, some time ago, authorized her husband's lifelong friend, Houston Stewart Chamberlain, to write, with her assistance, two articles on "The Personal Side of Richard Wagner." Mr. Chamberlain undertook the work, and *The Ladies' Home Journal* secured the material. The articles are singularly valuable in that they give a complete picture of the man in his home and daily life, and contain much new matter, while many of the illustrations and portraits have never been printed. There will be two articles, "His Personal Side" and "How He Wrote His Operas," and the first one will appear in the October number of the magazine. Music-loving people will be pleased to know more about Wagner—one of the great composers.

MISS ADA PICKARD, of Richland Co., Wis., is perhaps the "sweetest" girl in all Wisconsin, in more ways than one. A local newspaper gave over a column account of her bee-keeping experience this year. In May, Miss Pickard took 100 colonies to form an out-apiary several miles away, and in seven weeks returned with 126 colonies and 16,000 pounds of extracted basswood honey. She cared for them all alone until the time of extracting. Miss Pickard's mother is perhaps the most extensive feminine bee-keeper in the State, having about 400 colonies. As stated in a previous number of the *Bee Journal*, their total crop of extracted honey this year is about 50,000 pounds.

MR. C. THEILMANN, of Wabasha Co., Minn., wrote us Sept. 19, as follows:

"If Minnesota is counted among the favorite States for this year's honey crop, then honey should bring good prices. I have about one-fourth of a mixed crop, and that was the report from all bee-keepers except two at our State fair, and the adjourned meeting on the fair grounds. One of the two reported 50 pounds, and the other 60 pounds per colony, spring count. Both have only small apiaries."

DR. GALLUP, of Orange Co., Calif., wrote us Sept. 19, that he had sold his bees, as his time is devoted entirely to his business of healing people. Altho the Doctor is nearing 80 years of age, we are sure bee-keepers will regret to have him leave their ranks again. But let us hope he'll return again soon, for we all need the presence and help of the older heads with their rich experiences.

EDITOR ERNEST R. ROOT, of *Gleanings in Bee-Culture*, gave us a short call Monday evening, Sept. 19, when on his way home from the Omaha convention. He was feeling well, and seemed to be enjoying life immensely. He is chairman of Board of Directors of the United States Bee-Keepers' Union, and in every way worthy of all the honors and success attending him.

C. J. H. GRAVENHORST, editor of the *Illustrierte Bienen-Zeltung*, died at his home in Wilsnack, Germany, Aug. 21, at the age of 75 years. He was one of the very foremost practical bee-keepers and writers on the subject of apiculture among all the Germans. It is a great loss to the bee-keeping interests across the water.

MR. WM. BROBYN, of Weld Co., Colo., wrote us as follows Sept. 12:

"I have taken the 'Old Reliable' for three years, and will not try to get along without it as long as I can raise the necessary \$\$. It comes regularly every Friday afternoon."

Bees Robbing—P. Pingrenon reports in *Revue Electique* that he stopt a bad case by placing vessels of honey well thinned with water a short distance from the apiary. All was quiet in a short time.

To Keep Ants from Hives—Stuff cotton-batting in the cracks through which they enter, and the ants become entangled in it. Renew occasionally. Scatter chopt garlic in their runways.—Prakt. Wegweiser.

Breeding for Improvement should be not by crossing bees of different varieties, but by careful and scientific selection among bees of one variety, according to E. A. Daggitt, in *Bee-Keepers' Review*. He thloks prominence should be given to color and temper in breeding for better stock.

Longevity and Quality of Queens.—The question is raised whether a queen sent through the mails will be as good and live as long as one that has not thus traveled. If travel hurts a queen, will it not be better for each one to rear his own queens? On the other hand, will the average bee-keeper rear as good queens as the experienced queen-breeder?—Gleanings.

Giving Back Combs After Extracting hinders gathering for a day or two, because cleaning and mending the combs costs time and labor, says McIntyre, in California. The reverse is true in our experience. The combs are licked up in a night, and mending the injured cells is excellent employment for the home bees. Nothing stimulates the bees more to increast activity.—Praktischer Wegweiser.

Doolittle Plan of Queen-Rearing.—The editor of *Gleanings* is very enthusiastic over rearlog queens according to the plan given in Doolittle's book. The plan was tried by their apiarist some years ago and failed. A late trial by the same man was no more successful, but a new man tried it and secured queens of the finest quality. The secret of success seems to be slow feeding all the time cell-building is going on.

Large vs. Small Hives.—"While I believe that for the bee-keeper who has a single apiary under his care, and that at home where it is constantly under his eye, a brood-nest of at least moderate capacity is best, I will admit that possibly for out-apiaries, or under any condition where neglect is likely to play a prominent part in the management, large brood-nests may be better than small ones."—*Bee-Keepers' Review* Editorial.

Prevention of Swarming—L. A. Aspinwall has entirely prevented swarming in about 50 colonies, the main feature of his plan being that of separating the combs with dummies of peculiar construction. He has taken colonies that have swarmed under the old management, cut out the queen-cells, spread the combs with dummies, returned the bees, and there was no more swarming—the bees going promptly to work in the sections.—*Bee-Keepers' Review*.

A New Hive is described in *Gleanings* by W. K. Morrison. The description is not entirely clear, but the hive seems to have no frames, separators, section-holders, or anything of that kind, only plain sections $6 \times 4 \frac{1}{2} \times 1 \frac{1}{4}$, the sections lying longwise, 33 in the brood-chamber and 33 in the super, the brood-chamber and super being exactly alike. The editor thinks such hives would cost very little, but doubts whether any one would be satisfied to extract from frames $6 \times 4 \frac{1}{2}$.

Grading Honey.—The *Bee-Keepers' Review* quotes H. R. Boardman as opposed to grading honey into fancy and No. 1. After the "fancy" is sold, No. 1 is hard to sell and must be sold at a low figure, and no more can be had for fancy alone than for fancy and No. 1 together. Editor Hutchinson says, "I must admit that I have never practiced these Washington rules for grading. I put the 'fancy' and 'No. 1' all together, and what is lower than these grades I sell to private customers at a reduced price.

Selling-Qualities of Plain Sections.—Messrs. Niver, Aspinwall, and others, have claimed that plain sections would sell better than others. *Gleanings* gives a case in which the testimony was especially disinterested. The A. I. Root Co. sent a lot of honey to a commission house, one case of plain sections being in the lot. The commission men didn't seem to know what the honey was, but said they had taken an order for two or three cases from every one of their customers who had seen it, and they could use anywhere from 100 to 1,000 cases of honey in plain sections.

Large Hives Aid Prolificness.—C. P. Dadant thinks the size of the hive has something to do with prolificness of the queen. R. L. Taylor, who uses Heddon hives, says not one queen in a hundred will lay 2,500 eggs daily, continuously, for a certain period. Abbe Colin, who used still smaller hives, and who called a hive of the capacity of an 8-frame Langstroth "a hive of great dimensions," says a queen in a strong colony cannot lay more than 600 eggs a day in the good season. In keeping with that, he thinks it useless to use a super of more than 15 pounds capacity.—*Gleanings*.

Development of Bees.—Dubini gives the following table of days for the different stages:

| | Queen. | Worker. | Drone. |
|---|--------|---------|-----------------|
| Egg..... | 3 | 3 | 3 |
| Growth of larva..... | 5 | 6 | 6 $\frac{1}{2}$ |
| Spinning cocoon..... | 1 | 2 | 1 $\frac{1}{2}$ |
| Period of repose..... | 2 | 2 | 3 |
| Metamorphosis into chrysalis..... | 1 | 1 | 1 |
| Duration of perfecting..... | 3 | 7 | 9 |
| Average from time egg is laid until bee emerges..... | 15 | 21 | 24 |

Dangerous to be a Foul Brood Inspector.—F. Boomhower, foul brood inspector of Schoharie County, N. Y., thinks it about as dangerous to be inspector as to go to battle in war. He says the farmers who keep a few bees are ignorant and careless, and the regular bee-keeper suffers for their slipshod ways. They will insist they have no foul brood when their colonies are rotten with it, and when the inspector comes around they think it is only a scheme of leading bee-keepers to clear out the smaller bee-keepers so as to have a clear field. He has been threatened with clubs, fence-stakes, and shot-guns, thinks county inspection doesn't amount to much, the thing needed being a State inspector backt by a good law.—*Gleanings*.

The Laying of Laying-Workers.—There seems to be considerable variation in observations made as to the laylog of laying-workers. Critic Taylor, in the *Bee-Keepers' Review*, quotes Devauchelle as saying laying-workers deposit eggs only in drone-cells; Dr. Miller as saying in drone-cells by preference, and in their absence in worker-cells so the work cannot be distinguished from that of a queen; Editor Hill as saying that a worker rarely lays an egg on the base of a worker-cell; while in Mr. Taylor's experience a worker generally lays in worker-cells, placing the eggs on the bottom of the cells, but so irregularly that he can distinguish the work always from that of a fertile queen in good condition. Altho neither of them mentions it, possibly all four would agree that a common practice of laying-workers is to lay a plurality of eggs in a queen-cell.

Prevention of After-Swarming.—Critic Taylor, speaking of Doolittle's plan of preventing after-swarms, said:

"Perhaps Doolittle is led to practice his method from the fact that he is largely using the Gallup hive and wishes to engage others toward a favorable opinion of that hive. In the absence of some such reason I would never follow the method he gives; because it is a laborious, time-consuming operation, at a season of the year when it is especially wise to economize both time and labor, without any corresponding advantage."

Doolittle makes a change of two words in this passage, putting "Taylor" for "Doolittle," and "Heddon" for "Gallup," and turns it upon Taylor in the September *Bee-Keepers' Review*. Says he tried for three years the Heddon-Taylor plan of moving, gradually turning the hive, and it took double the time of cutting out cells, besides the extra expense of the queen-trap. Says the term "laborious" applies particularly to the Taylor plan, even with the Heddon hive, and notes the fact that for every Heddon hive in use there are 50 to 100 of other kinds. Thinks Mrs. Harrison or Mrs. Axtell would have a hard time moving Langstroth hives; York would have trouble with chaff hives, and Taylor with tenements holding four to eight colonies, and with house-apiaries.

BEST
EXTRACTED HONEY FOR SALE

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY :

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 7½ cents a pound; 2 cans, 7¼ cents per pound; 4 or more cans, 7 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, "HONEY AS FOOD," will be a great help in creating customers for honey. See prices on another page.

GENERAL ITEMS

Honey Crop a Failure.

The honey crop is a failure in this part of the State. There is not over 10 percent of an ordinary crop. I have not seen a bee on a white clover blossom this season, and not one linden tree in five that yielded any honey, or that the bees worked on, at all.

Long live the American Bee Journal. I have found it a very great help to me.
J. C. BERGEN.
Humboldt Co., Iowa, Sept. 21.

The "Golden" Comb-Honey Method.

I believe that the older and more experienced bee-keepers should have the first say in the bee-papers, and also at the bee-keepers' conventions, and I have always been anxious and willing to listen to men of more experience than myself, but there might be a line drawn somewhere, I am thinking. For instance, on page 483, S. A. Deacon got after J. A. Golden about his management of the bees in the production of comb honey. I knew as soon as I read the article that he (Deacon) was trying to get Mr. Golden to go on and explain the whole method over again. Mr. Deacon must have known that every practical bee-keeper had tried, or knew all about, the Golden system of producing honey. It might be all right to get a man up to talk at a bee-keepers' convention, for instance,

just for the fun of hearing him talk; but I don't know what to say to Mr. Deacon for trying such a trick. It is out of place in print. Give us something more practical. Mr. D.

The honey-flow has been very light in this vicinity. I got probably 20 pounds per colony, spring count, and lots of the sections are filled with honey of different colors, but I could do no better, as it took some of my best colonies all summer to fill one super, and no swarms to amount to anything, either.

WM. KERNAN.

Sullivan Co., Pa., Sept. 15.

[Mr. Kernan, aren't you a trifle hard on Mr. Deacon? There are quite a number of bee-keepers who are asking for information regarding Mr. Golden's method of producing comb honey. We didn't think Mr. Deacon was too rough on Mr. Golden, and hardly think that the latter felt so, either. There is a deal of good-natured fun in that S(outh) A(frican) Deacon mix up with his sound sense, and it will bubble over sometimes. But we are sure he intends no harm at all, only to draw people out, sometimes. —EDITOR.]

A Wheel-Ride Among Bee-Keepers.

I got home last evening from a trip on a bicycle to Minnesota. I rode something over 300 miles north of here, and saw a fine country, fine people, and had a fine time. I made the round trip in 12 days, and ate like a hired man. I got as far north as central Todd county. The basswood in Todd county is immense, but there was a worm which worked on the blossom, and so there was no nectar. One bee-keeper who had 30 or more colonies said he might have 30 pounds surplus. All complained of a poor season.

J. P. BLUNCK.

Webster Co., Iowa, Sept. 18.

Keeping Worms Out of Honey.

In the Bee Journal of February 10, 1898, was a letter from Wm. C. Wolcott, telling how to keep worms out of honey, and how to get rid of laying workers. I have tried both and find they work well, the knowledge of which is worth the price of the Bee Journal for one year or more, to any bee-keeper.

I had two colonies that had become queenless, and became badly infested with worms. I removed the worms with a knife, and by exchanging frames with other hives I placed a queen in one on Sept. 5, but she did not lay. I attributed it to the weakness of the colony, and went to feeding them. In opening the hive Sept. 16, I found the queen, bees, honey and all gone. In looking for them, I found all in the other queenless colony, doing well, and no fighting. How did they find out that that colony was queenless, and would accept them, if they do not have a language of signs?

L. W. McRAE.

Washington Co., Ala., Sept. 17.

Late Swarming—An Aster.

In answer to the inquiry "What is the latest time that bees swarm?" I would say that one year, between 1861 and 1865, I had a swarm issue Sept. 21, and another the next day, and they filled their boxes in two weeks. At that time I had square boxes, 12 inches inside measure, and eight inches

deep, with slats between for tiering up, and had two of them together. If we could have a honey-flow like that, I presume they would do the same again.

Bees have done poorly here this year. Swarms that issued in May, some of them, will have to be fed unless they increase their stores yet.

I enclose a plant which I found growing quite plentifully on the river bottom, on which bees are working very strongly. What is it? If there is any considerable amount of it they ought to gather considerable honey from it. **J. C. ARMSTRONG,**
Marshall Co., Iowa, Sept. 16.

[The plant that Mr. Armstrong sends is an aster, of which there are very many varieties that bloom in September. The one in question is exceedingly common on river bottoms, and is known by some bee-keepers in central Illinois as "whiteweed." Cook says (pages 380-382): "But the numerous species of asters so widespread... are replete with precious nectar, and with favorable seasons make the apiarist, who dwells in their midst, jubilant, as he watches the bees which fairly flood the hives with the rich and delicious honey." — H. S. PEPOON, Botanist.]

Bees at Home on a Tree.

On page 213 of "Langstroth on the Honey-Bee," is a description of how bees sometimes cluster on the limbs of trees and in other places and build their homes there. I have just discovered a case of this kind while hunting bees. I hived the bees from several different directions, and the lines all crost at the same point, but I could find nothing large enough for bees to make their homes in, but on closer investigation I discovered them hanging on the underside of a hemlock top. The tree was down, being turned out by the roots, and lay about three feet from the ground. The bees had been there for months, and had about 25 pounds of honey and some brood, but no eggs and no unsealed brood. I transferred them into a hive, and as soon as they get the combs fastened well in the frames I will move them home. **E. C. NOLAN,**
Midland Co., Mich., Sept. 17.

An Experience with Bees—Figwort.

I have 10 colonies of bees, three of them in box-hives and seven in a hive with movable frames of my own design and manufacture. I honestly believe that I think more of bees than any one on earth. I am a bee-man (in my way) from "away back." My grandfather Carroll, one of the first settlers in Shelby Co., Mo., kept from 10 to 100 colonies all the time, and it was no unusual thing for him to go into the woods in the fall and find enough bee-trees to fill a barrel or two with honey. From him my father learned to like bees, and he kept bees for a long time, but finally lost all he had and quit.

From my earliest days I have had a fondness for bees. We still have some wild bees in the woods, and there is nothing I enjoy so much as to hunt them. Father, brother and myself found 19 bee-trees last fall, and we must have gotten close to 1,000 pounds of honey from them. I don't think we will find any this fall, as there seem to be none in the woods.

Bees are doing poorly here, or have been.

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us **Two New Subscribers** to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it. Will you have one?

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellence. Polished, snowy-white Sections, beautiful, straw-colored transparent Foundation, improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

See Honey Offer on page 619.

They seem to be storing some honey now from Spanish-needle and corn-tassel. It has been very dry, but we had a fine rain last night, and it will prolong the fall bloom. I had one swarm in July and it is doing nicely.

I would like so well to have my bees in the modern hives, but can't, as I am not able to buy them. I have tried to get them by working in the factory, or selling for some company, but have been unsuccessful so far. However, I am going to have five or 10 modern hives next spring, sure. If I can't get them any other way I will sell half my bees, and then I won't need so many hives. See? "Where there's a will there's a way," and I am sure I have the "will."

I enclose a leaf and flower of a wild weed that grows around here, and I believe the bees like it better than anything else that grows in this locality, as I have frequently seen from 25 to 50 on a single stalk. What is it?
H. S. CARROLL.

Shelby Co., Mo., Aug. 24.

[The plant sent by Mr. Carroll is commonly known by the name of "figwort," and is a plant distributed everywhere over the northern United States. It is the type of a great family of plants bearing the same title, "the Figwort family." Without question, this is one of the very best plants for the bee-keeper, and its period of blooming extends over probably two months of the summer, when honey flowers are often scarce. As I before have said of other plants, it would well repay extensive cultivation as a bee-food, and as it is perennial, once established it would largely take care of itself. Cook praises it highly as a honey-plant.—H. S. PEPON, Botanist.]

Bees Did Fairly Well.

Bees did fairly well this season, in this part of the country. Last May I took 39 colonies on shares, and increased them to 80, by natural swarming. I have taken off 2,349 pounds of comb honey, and could have done a little better if I could have given them better attention, but I could be with them only Sundays, and each forenoon during the swarming season. Comb honey sells here for 10 cents; extracted, 6 to 8 cents.

WM. BROBYN.

Weld Co., Colo., Sept. 12.

Secured About Half a Crop.

I have not taken off all of my honey yet, but as nearly as I can estimate it, I will have about half a crop—about 20 or 25 pounds per colony, spring count; and as far as I can learn, the yield will be about the same throughout this section, some a little more and some not any.

SCOTT LAMONT.

Wabasha Co. Minn., Sept. 10.

Well Satisfied With His Bees.

My bees have been a source of pleasure and encouragement to me this year, having done better than ever I have had bees do before. I had four colonies of pure Italians in the spring, and have increased them to 14 colonies. As to the amount of honey taken, I have lost calculation, but I began taking off sections the third week in May, and continued doing so weekly up to August, and I have some of the finest

honey any one could wish to see. I ran one colony for extracted honey, and it filled 24 Hoffman frames above the brood-chamber; from the latter I would not extract.

E. L. ETHERIDGE.

British Columbia, Sept. 12.

Had a Good Season.

I am just getting started in the bee-business. We have had a good season. From 20 colonies in the spring I have taken about 1,500 pounds of honey.

G. L. VOORHEES.

Greene Co., N. Y., Sept. 14.

Clark Co., Wis., Convention.

Some of the bee-keepers of Clark county, Wis., met in Greenwood, Sept. 10, for the purpose of organizing an association to be known as the "Clark County Bee-Keepers' Association."

The following officers were elected: President, L. Allen; Vice-President, P. Kline; 2nd Vice-President, Geo. Drinkwine; Secretary, Chas. Pratt, of Greenwood; Treasurer, C. T. Haskins.

It was decided to hold the next meeting in Greenwood, Oct. 20, 1898, at which time we shall adopt a constitution, fix the annual dues of members, and transact such other business as may be necessary. All who feel interested are invited to attend.

CHAS. PRATT, Sec.

Endorses Plain Sections and Fences.

I want to speak a good word for the plain sections and fence separators. This is my first year's trial, and the result is very encouraging. I get $2\frac{1}{2}$ cents a pound more for my comb honey put in the plain sections than I do for the others. The plain are filled out much better, and are more attractive. I can get $12\frac{1}{4}$ cents a pound for these readily when the $4\frac{1}{4} \times 4\frac{1}{4}$ go begging at 10 cents a pound; in the use of these tall sections and separators I have obtained at least one-third more honey. I propose another year to use none other than the plain sections and fence separators.

L. ALLEN.

Clark Co., Wis., Sept. 13.

Light Honey Crop.

The honey crop is very light in this section—not more than one-half that of last year, but prices are a little better.

W. W. WHIPPLE.

Arapahoe Co., Colo., Sept. 14.

Thumb-Tacks Made from Dies.

I am a beginner in bee-keeping, and so have not been troubled by the record problem yet, but I was very much interested in John Atkinson's article on page 562. From past experience in another line it occurred to me that Mr. Atkinson could make his own thumb-tacks by the use of a set of steel dies. By the use of a steel die, numbers, letters, or words, can be stamped on pieces of sheet copper. For use inside the hive the numbers could be on little strips of copper long enough to bend over the top of a frame with the fingers. For outside work the corners could be turned at right angles and prest into the wood. Where rough usage was expected the little

400 Young Golden Queens...

Warranted purely mated, just started to lay. **MUST BE SOLD SOON, so order QUICK.** 50 cents each; 6 for \$2.75, or \$5.00 per dozen. Ten years' experience with the best of breeders, and the best of methods enables me to furnish the **BEST OF QUEENS.** Safe arrival and satisfaction guaranteed.

metal tabs could be nailed on. Sheet copper can be procured from the nearest tinner. I forgot where I bought my dies, or stamps, as they are sometimes called, but the Root Co. will get them for you.

Asbland Co., Ohio.

R. H. LEE.

Best Crop in Six Years.

I will get the best crop of honey this year that I have had for six years, and I am selling it for $12\frac{1}{2}$ cents per section, by the case. I took 84 sections of honey from one colony, and have one with 105 sections about ready to come off. The bees work strong on the heart's-ease, and will until frost kills it.

SAMPSON STOUT.

Sumner Co., Kan., Sept. 16.

Short Honey-Flows.

The spring and summer flow of honey was very short, and of very poor quality. The fall flow is better, and of good quality. White clover seemed to yield no honey at all, or not enough to be noticed in the dark honey.

EDW. SMITH.

Madison Co., Ill., Sept. 16.

Report for the Past Season.

I have taken only 268 nice, finish sections of honey from 24 colonies, and sold them for \$67 cash. Now, I have 39 colonies with plenty of honey for winter. I sell my honey in the home market, by peddling it.

E. B. KAUFFMAN.

Lancaster Co., Pa., Sept. 9.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,
Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit. by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—is beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth. Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full definition of the anatomy and physiology of bees. 460 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 176 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers, \$1.00.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called BEES OF HONEY. 10 page pamphlet. Price, 40 cts.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping, in an essay, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 p., illustrated, 25c.

Convention Hand-Book, for Bee-Keepers. Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheehire.—Its Cause and Prevention. Price, 10 cts

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forefront of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by C. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2, in fine artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st, How We Made the Old Farm Pay; 2nd, Peach Culture; 3rd, How to Propagate Fruit-Plants, Vines and Trees; 4th, General Fruit Instructor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Pruning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive and Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for casting up the price of grain, produce, hay, etc. Price, 25 cts.

Caponing and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Turkeys for Market and Turkeys for Profit, by Fanny Field.—All about Turkey-Raising. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters. 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Sept. 20.—Honey of all kinds is selling well, with the best grades of white steady at 12c; a little fancy white clover has brought 13c. Off grades of white to amber, 10 to 11c; the dark shades, 8 to 9c. Extracted, 6 to 7c for white; ambers, 5 to 6c; and dark, 5c. Beeswax steady at 27c.

R. A. BURNETT & Co.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax, prime, 24c; choice, 24½c. At present there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12 to 13c; No. 1, 11 to 12c; amber, 10 to 11c. Extracted, white, 5½ to 6c; amber, 5 to 5½c; dark, 4½ to 5c. Beeswax, 22 to 25c. The receipts of comb honey are larger. C. C. CLEMONS & Co.

Columbus, O., Sept. 23.—Fancy white comb, 14 to 15c; No. 1 white, 12 to 13c; No. 2 white, 10 to 11c; fancy amber, 10 to 11c. Fancy white continues scarce and wanted. Those having any to market will please correspond with us.

COLUMBUS COM. AND STORAGE CO.

New York, Sept. 1.—We have a good demand for new crop comb honey, and it is beginning to arrive. Have sold some shipments at 14 to 15c for fancy white, 12 to 13c for No. 1 white, and 10 to 11c for fair white. We think these will be about the ruling prices this fall; exceptional fine lots may sell at a little more. Extracted is in good demand at unchanged prices. Beeswax dull at 26 to 37c. HILDRETH BROS. & SEGELKEN.

Boston, Sept. 16.—Fancy white in cartons, 14c; A No. 1, 12½ to 13c; No. 1, 11 to 12c; No. 2, 10 to 12c. California extracted is practically all out of the market. Florida in barrels is selling from 6 to 7 cts., according to quality. Beeswax, 26 to 27c. Very light stock; only fair demand.

The fall demand for honey is now opening, and from present indications we look for good prices right through the season. BLAKE, SCOTT & LEE.

Indianapolis, Sept. 1.—Fancy white comb honey, 12 to 12½c; No. 1, 10 to 11c. Extracted, white, 6 to 7c. Beeswax, 25 to 27c. Only a few arrivals of fancy white comb; market almost bare, and demand good. Quite a little comb honey from honey-dew is being offered, but there is simply no demand for the stuff. WALTER S. POWDER.

Milwaukee, Sept. 20.—Fancy comb, 12 to 12½c; A No. 1, 11 to 12c; No. 1, 10 to 11c; dark and amber, 8 to 10c. Extracted, in barrels and kegs, white, 5½ to 6c; dark, 5 to 5½c. Beeswax, 25 to 26c.

The condition of this market for honey is favorable for shippers of good quality either in comb or extracted, and the receipts, while they are with us very fair, are not as liberal as may be, while the demand is very fair at our quotations. We advise liberal shipments of 1-pound sections and extracted. A. V. BISHOP & Co.

Buffalo, Sept. 16.—There is quite an improved demand for honey at present, and moderate amounts can be sold of strictly fancy 1 pound comb at 11 to 12c; lower grades range from 10c downward. We advise but moderate shipments for awhile yet. Extracted—average grades could be sold at 4 to 5c. Fancy beeswax, 27 to 28c; common, 20 to 25c. BATTERSON & Co.

San Francisco, Sept. 14.—White comb, 9 to 9½c; amber, 7 to 8½c. Extracted, white, 6½ to 6¾c; light amber, 5½ to 6c. Beeswax, 24 to 27c. Stocks are light of both comb and extracted, but more especially so of choice extracted, the latter being in most active request. Market is firm at the quotations, with holders disposed in most instances to ask somewhat higher figures.

Cleveland, Sept. 1.—Fancy white, 13 to 14c; No. 1, white, 12 to 12½c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c; light amber, 6c. The demand for honey is exceptionally good, owing to the crop in this vicinity being very light. A. B. WILLIAMS & Co.

Detroit, Sept. 24.—Fancy white, 11 to 12c; A No. 1, 10 to 11c; No. 1, 10c; fancy dark or amber, 9 to 10c; other grades, 8 to 9c. Extracted, white, 6 to 6½c; dark or amber, 5 to 5½c. Beeswax, 25 to 26c. M. I. HUNT.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

The 29th annual meeting of the United States Bee-Keepers' Union was called to order at 10:30 a.m., Sept. 13, in the Commercial Club Room at Omaha, Nebr., by the President, George W. York, of Illinois.

Prayer was offered by A. I. Root, of Ohio, after which, in the absence of O. O. Poppleton, of Florida, the following paper, written by him, was read by the Secretary:

Honey-Production in Our New West Indian Possessions—Cuba and Porto Rico.

The coming Americanization of Cuba and Porto Rico presents many interesting problems to us as a people. This is especially true with bee-keepers. With some, because of a contemplated removal to one of those islands; and to all, because of the inevitable effect on our business. It is possible my two years' experience in Cuba enables me to give some idea of the good and bad features to be found there, but I understand better than almost any one else, that the subject can only be skimmed in an essay like this.

Cuba is without doubt one of the finest honey countries in the world. I consider it as fully the equal of California, and in some respects superior. Should Cuba be annexed to the United States, thus not only doing away with all duties on honey shipped to this country, and duties on hives and implements from this country, but in time improve facilities for transportation all over the island itself, it will, I think, affect the honey markets of this country far more than the great crops from California have yet done. It is well for us to look these facts squarely in the face.

At present there is a Cuban export duty of 6 cents, and an American import duty of 20 cents per gallon—over 2 cents per pound—on honey from there. These duties and the wretched government of the island itself, are what has kept our markets from being flooded with Cuban honey. Remove these two conditions and the result is plain.

There are but few movable-comb apiaries in Cuba—so far as I know, less than a dozen in all. Nearly all of them are managed, if not owned, by Americans. It is exceedingly difficult to get reliable statistics of the amount of honey annually produced at these apiaries, but from such facts and figures as I did get while there, and since, I judge that any well managed apiary of 300 or more colonies is safe for a yield of from 40,000 to 70,000 pounds of honey each season. As there are chances for locating such apiaries all over the island, it can be easily seen what an enormous harvest can be obtained. One great advantage Cuba has over any other place I

know of, is that an entire failure to secure a fair crop is almost if not quite unknown. As well as I can learn, the poorest crops will be fully as much as 50 percent of the largest crops. All bee-keepers can fully understand the advantage of these conditions.

The principal disadvantages are, the duties already mentioned, and the bad roads, making it so costly and difficult getting honey to a shipping port. The last difficulty is so great that many owners of bee-gum apiaries in the interior of the island—so I have been repeatedly informed—practice saving only the wax for sale, pouring large amounts of honey on the ground to waste.

While there are scores of trees and plants yielding some honey, the great bulk of the crop comes from a plant, or rather vine, known to American readers of our bee-periodicals as bell-flower or companea. Its Cuban name is Aguineldo (literally, "a Christmas present," so-called because of its being in full bloom at Christmas time). Scientifically it is a *Convolvulus* (not a *Campanula*, as was figured in one of our periodicals several years ago); genus, *Ipomœa*; species, *Sidwfolia*. The few species of the genus found in the United States are known as "morning-glories," only one of which,

O. O. Poppleton.

Ipomœa Batatas (sweet potato) is of material value to the human race. All the species of the genus I know of are vines with heart-shaped leaves, and bell-shaped flowers, the one which furnishes so much honey in the West India islands being the most profuse bloomer of them all. At times the bloom is so abundant that hedges and stone fences look like snow-banks from a distance. It commences to bloom late in November, continuing until in February, January being the month of greatest bloom, with December a close second. The quality of its honey is good, color white, with good body and rather

mild and pleasant flavor. It is the equal of white clover honey in color and body, and in flavor I would rank it as next to that best of all honeys.

Other plants and trees furnish some honey, but the royal palm is of the most value, I think; not because it gives any surplus honey, but because it yields every day in the year, and seems to be the only source of honey from May to September. Many colonies, unless fed, will starve to death during the summer, and many more would but for this tree.

Large apiaries have been the rule in Cuba, all movable-comb apiaries I know of having 300 to 600 colonies in one locality. I think this is a mistake, but I had no chance to learn whether smaller apiaries would be better.

I think it will readily be seen from what I have written that the main points one needs to look well to, when deciding on a location in those islands, are:

1st. A locality with plenty of aguinaldo and royal palms.
2nd. Nearness to a port from which honey can be shipped to a market.

3rd. Very close proximity to a railroad or a good macadamized road leading to a port.

While there are other desirable conditions that should be secured in a location if possible, these three I have given are the most important.

My personal experience was in the country a few miles west of Havana, but, as well as I can learn, conditions are very similar in the other parts of Cuba, and also in Porto Rico.

I have not attempted to go into details of bee-keeping in Cuba, as it would be useless to attempt it in a paper like this. Many of the details it would be well for any one who expects to go there to know, can be found in an article commencing on page 539 of *Gleanings* for 1889. O. O. POPPLETON.

H. Lathrop (Wis.)—Mr. Poppleton says nothing about foul brood, of which I understand there is a great deal in Cuba.

F. Danzenbaker (D. C.)—A great drawback to bee-keeping in Cuba, to one not accustomed to a residence there, is the large number of mosquitoes, they being so numerous at times as to literally cover the sides of houses.

Dr. C. C. Miller (Ill.) spoke of the duties on honey and the price of it, and thought if the duty was removed entirely, altho much more honey would be sent to the United States, it would not make more than half a cent a pound in the price of our honey, but thought it not likely that the duty would be removed.

E. Whitcomb (Nebr.) thought it would not take much patriotism to receive what honey might be sent from Cuba, and doubted if it would affect the price of our honey at all. Climate has much to do with the flavor of honey; a warm climate producing that of inferior quality, and a colder climate producing honey of a much better flavor.

L. D. Stilson (Nebr.)—A soldier with the army in Cuba recently told me that we had no reason to fear Cuban honey, for it is much inferior to that produced in this country.

E. R. Root (Ohio)—I like the flavor of alfalfa honey; Southern honey has a strong flavor which is liked by some.

Mr. Stilson thought that perhaps the strong flavor of Southern honey comes from honey-dew.

A. I. Root (Ohio)—I have sampled honey, and did not find it insipid, but strong. Some Cuban honey I like. Some Southern honey has a peculiar flavor that I like. Most localities yield both good and poor honey.

Mr. Danzenbaker—Children like strong-flavored honey, but older people usually like the light-colored honeys the best. I have sold a great deal of honey in Washington that came from North Carolina and Virginia, and it was as white and good as any honey.

Joshua Terry (Utah)—We don't find alfalfa honey insipid as some seem to think it is. We think it is good, and prefer it to any other kind of honey.

J. S. Scott (Utah)—My chief experience with bees has been in Utah, where there is an abundance of alfalfa. We do not think the honey is either insipid or strong. Sweet clover blooms at the same time that many other honey-plants bloom, so we don't get any distinctive sweet clover honey. I like the sweet clover flavor, and all in our region prefer it to alfalfa.

Dr. A. B. Mason (Ohio)—Last season I had about 1,500 pounds of extracted sweet clover honey. It was not extracted until the combs were well sealed. It weighed only 11½ pounds to the gallon, and I didn't call it first-class honey altho it was even whiter than white clover honey. Having a few hundred pounds of it left over to this season, and being candied, I melted it in a sun wax-extractor. Its flavor was much improved by the process, and the weight was increased to 12 pounds to the gallon. I used to think with Mr. Muth, that

extracted honey could be ripened in cans so as to be of as good quality as if ripened on the hive, but I quit that belief some time ago, but with this season's experience I am led to believe that it can be ripened, and its flavor improved by giving it a good heating in a solar extractor.

Dr. H. L. Miller (Nebr.)—I have on hand now perhaps 1,500 pounds of extracted sweet clover honey. It was green when extracted. I thought it was ready for extracting, but it was green, and I would not offer it to my customers. I have put the most of that through the sun wax-extractor this summer, and it is nice. I know it is sweet clover honey, for I could smell it through the side of the hive, as you can basswood honey. It has a peculiar, disagreeable smell. I think Mr. Root is probably right when he says it was not ripe. I put it through the sun wax-extractor, as I say, and it weighs about 12½ pounds to the gallon; it would weigh only about 11½ pounds to the gallon before.

HONEY SAMPLES AND QUESTIONS.

Mr. Stilson—If it is the wish of this convention I think it would be advisable to have samples of the various kinds of honey placed on our table for discussion. I do not think it would be a very great trouble to get it. Some of us are connected with the Exposition here, and we can get samples of everything.

Dr. C. C. Miller—I move that it be expressed as the wish of this convention that we have samples of as many kinds of honey as possible placed upon our table for examination and discussion.

The motion was seconded and carried, and Mr. Stilson was appointed by the President as a committee of one to secure such samples.

Dr. Mason—In regard to the work of the convention on questions, I move that a committee be appointed to whom all questions shall be referred, and that they select some one person to answer each question.

The motion was carried, and the committee appointed later on consisted of Dr. Mason, Ernest R. Root and Harry Lathrop.

DISCUSSION ON HONEY CONTINUED.

A. I. Root—When I was in Salt Lake City I tasted samples of sweet clover honey, and I think I publish in my report that it was equal in looks and flavor to any honey in the world. If they have some of that sweet clover comb honey here to-day I predict that the majority will agree with me that it is equal to any honey. The taste and smell will decide whether it is sweet clover honey or not. The taste is very much like chewing the dried plant, or chewing the seeds, and when taken out is apt to be so rank as to be offensive. Basswood and sweet clover honey is disagreeable when it is taken out, but after it has been thoroughly ripened most people think it very good. It is the same with sweet clover as with almost any other kind of honey. Well ripened honey, both sweet clover and alfalfa, I should say was equal to any white clover honey.

Dr. Mason—I have taken but little comb honey this year. One of our boys is a splendid judge of honey—eats it at every meal. I took some sweet clover honey this year, but it is mixt with honey-dew and looks dark, and when I offered him some in sections he didn't want it, but I told him to taste it. He did so, and then said I could give him all of that I had a mind to. It was just discolored with honey-dew. It was thoroughly ripened and really rich.

Mr. Danzenbaker—In the city of Washington, where I sell honey, I have a chance to notice the tastes of different people from different parts of the country. A person will come from the State of New York and ask if I have any buckwheat honey; if from Virginia, he wants blue thistle; if from Ohio, white clover. It seems they like the kind of honey they had when they were children at home, as the German likes his sauer-kraut and his beer. I have been up to New York and found that they could sell buckwheat honey to a good many people. Where we live buckwheat doesn't produce any honey. I have kept bees a good many years, and I could not say that I ever saw any buckwheat honey that they put into the sections. Other things bloom at the same time and yield honey, but the buckwheat produces no honey. We could smell it sometimes outside the hives, but we could not find it inside. I don't like it at all, but New York people all relish it. I think sometimes it is a good thing that the people have a relish for the thing that grows where they live, and where they are brought up. This matter of taste for a particular honey depends a great deal upon whether they had it from childhood or not.

Mr. Cameron—I offered some honey to a person last fall, and he couldn't eat it; said it made him sick. That has suggested to me a question: Is it the honey that makes people

sick, or what is it? I want to ask these doctors what it is about honey that makes people sick? Is it some peculiar kind of honey?

Dr. C. C. Miller—There is peculiar honey and there are peculiar people. Sometimes it is the honey and sometimes the patient.

Pres. York—When I first met Dr. Pelro he told me could not eat honey; that it made him sick. I gave him some honey, and he could eat it all right. He had been getting the glucosed article, and of course it made him sick.

A Member—Doesn't pure honey sometimes make people sick?

Mr. Cameron—I have noticed that comb honey sometimes makes people sick. I didn't know but it might have been poisoned by bee-poison—by the bees crawling over it and depositing the poison from their stings. Will that make people sick? I notice in opening hives sometimes, especially if it is a little cold, that the bees run around with their stings out, and the poison will no doubt be deposited on the combs. It may be it is that which makes people sick. It might not make all people sick, but I presume it will some.

A. I. Root—There were some boys who cut a bee-tree in our county and they ate all they possibly could, and the honey made them all sick. I ate a lot of the honey—rather more than I do usually, and it didn't make me sick at all. I was familiar with it, and knew how much to eat; it didn't hurt me. A person that has not eaten any honey for a good while—a good many years—might be made sick if he would go to work and eat as those boys did, even pure honey.

Mr. Whitcomb—You will find people who are not able to eat honey at all.

Dr. Mason—There is no doubt but that eating too much honey will make people sick. There are some people who can't eat any without being made sick. But some of us know that there is a very simple remedy for that. When the children of Israel were going into the Land of Promise, they were told that it would be a land flowing with milk and honey. If persons who are made sick by honey will take milk with it, it won't affect them that way.

E. S. Miles (Iowa)—I would like to give my experience. My two brothers cut a bee-tree one time when they were not used to honey, and of course they ate too much—they ate all they wanted, and my mother also ate of it, and it made them all so sick they thought they were going to die. They drank milk with it, and they thought it was the milk that did it. Since I have been producing honey it agrees with them whether they drink milk or whether they don't. It looks to me as if in that case they simply ate too much. If they ate too much no doubt the milk wouldn't save them. I think a person should be temperate in using honey when he isn't used to it, the same as with everything else. Persons who are used to honey could eat a good deal more than those who are not.

Dr. C. C. Miller—The question was asked whether it is not the poison of the bee-stings on the honey that makes people sick. The latest investigations I think show that the poison of the bee-sting is something separate and distinct from the formic acid. There is formic acid in honey, but I am not so sure that there is any real bee-poison in honey. The statement is made that the bees in crawling over the combs when they are disturbed will thrust out their stings with drops of poison on them. I very much doubt whether those drops of poison are ever deposited on the combs; and if it were, I think it would evaporate. The formic acid that is in honey gets there through the blood of the bee. I doubt whether anything gets into the honey through the sting of the bee; I think that an utter and entire mistake. The formic acid gets into the honey through the blood of the bee; we find it there, and it is a useful part of the honey. One of the good things about honey is the formic acid in it. Don't let us make a mistake by saying that the honey is poisoned by the bee-stings.

Dr. Mason—Is there formic acid in the poison that comes from the sting?

Dr. C. C. Miller—As I understand it the latest investigations show that the poison in the bee-sting is entirely separate from the formic acid. Formerly it was said that the formic acid was the poison; but that is not so understood now.

Mr. Whitcomb—Perhaps there is an explanation as to why honey taken from bee-trees makes people sick. When the tree is cut open and the bees aroused, their first instinct is to save everything they can, and they run around over the combs with the stings thrust out, and little drops of poison may fall upon the combs and get into the honey. Honey taken by the old-fashioned robbing process, where the bees are allowed to run over the combs and the poison runs off of the sting, will make people sick. I don't know but that sometimes a single drop of the poison might kill a person, taken either into the stomach or into the circulation. We ought to be careful to

keep it out of the honey. I have had cases under my observation where people could not take a teaspoonful of honey without making them sick, if it were taken by the robbing process, while honey taken by the bee-escape process would not affect them. There was a case of a lady in Chicago who had been from a child unable to eat any honey. I took some honey up to the house at night and she ate of it—ate as much as any of us. There was also another case at our State fair where a man who had not been able to eat honey before, ate of it several times there, and reported that it hadn't made him sick. In the robbing process, or in cutting bee-trees, the bees rush over the honey and run the sting out, and small particles of poison may drop on the combs.

Dr. C. C. Miller—Whilst not desiring to contradict that, I want to add an interrogation point. It is not settled that the poison does not get into the honey, but it is possible that Mr. Root's explanation should go along with that—that when honey is taken from a bee-tree by the robbing process people may take an unusual amount of it, and that unusual amount is enough to account for their being made sick, without any poison in the case.

Mr. Whitcomb—If I find that honey taken by the robbing process makes people sick, while honey taken by the bee-escape process does not, I don't see how to account for it in any other way than by supposing that honey has been poisoned.

Dr. Mason—I want to take Dr. Miller's interrogation point away. That matter, so far as I am concerned, is settled. I have sometimes eaten of this poison. I have been stung several times on the tongue, and have felt the sickness coming on without any doubt. In uncapping, I have the habit of chewing on the cappings, and sometimes I have unconsciously put a bee into my mouth. I have often felt the sickness coming over me, without any doubt from the effects of the poison. I know what it is.

The convention then adjourned until 1:30 p.m.

[Continued next week.]

Using Two-Story Brood-Chambers—Division-Boards.

BY DR. C. C. MILLER.

The editor of the Bee-Keepers' Review quotes the question and answer about using two-story brood-chambers (American Bee Journal, page 486), and comments as follows:

"It seems to me that some of us are not looking at this matter in the right light. Dr. Miller's idea, if I understand him, is something like this: In order to get honey we must have bees. The more bees the more honey. If the queen has filled all the available cells in eight frames, give her more in an additional story; then you will get more bees, and, consequently, more honey. I think this is correct reasoning. I agree with it. But, Doctor, let's go a little farther. A queen that has eight combs well filled with brood just at the approach of the honey harvest, will not fill eight more so full as another queen would have filled them if she had had them early in the spring.

"To put it in a different shape, if a man is going to put his capital into an extra hive and set of combs for each of his colonies, he will get more bees, and, consequently, more honey, if he has a queen for each of these new hives; in short, if he has them occupied by regular colonies. The profitable keeping of bees does not depend so much upon having each queen occupied to her full capacity, as it does in having the combs and hives occupied to their full capacity."

Editor Hutchinson is one of those men so eminently fair in discussion that it is almost a pleasure to disagree with him. I'm not certain, however, that we can get up any disagreement in the present case. He agrees with me up to a certain point, and then says, "But let's go a little farther." Very well, Mr. Hutchinson, I've gone a little farther with you, and think your reasoning correct. I agree with it.

Now, "let's go a little farther." After going over the ground you have gone, the time comes that has come with very many of us—perhaps with the majority of us—when we desire no more increase, have all the bees we think our pasturage will stand, and want all the honey we can get with a given amount of bees and a given amount of labor. We want

to reduce labor to a minimum, and produce honey to a maximum.

I think it is agreed that a large colony produces more honey in proportion to the number of bees than a small one. It will also consume less honey in a year in proportion to the number of bees than a small one. Suppose my field is such that its limit will be reached if I have 5,000,000 bees in the season. I may give extra stories, and have 75 colonies with 66,666 bees in each, or I may take the plan you suggest, and have 100 colonies with 50,000 bees in each. The 75 stronger colonies will consume less and store more than the 100 weaker ones, and the 75 will take less labor than the 100. So when you have all your field will bear, the profitable keeping of bees does not depend so much upon having the combs and hives occupied to their full capacity as it does on having each queen occupied to her full capacity; in other words, having as strong colonies as possible.

IS THERE DANGER OF MISUNDERSTANDING?

On page 437 of this journal, "Illinois" says: "I have the dovetail hive, and have put the division-board in the middle of the frames. Is that the right place for it? If not, where does it belong?" I replied: "Put in all the frames, crowd them all close to one side, then put the dummy close up against the last frame." Critic Taylor refers to this in the Bee-Keepers' Review, heading the item, "Instruction that might possibly be misunderstood by a novice," and says:

"With such frames as the Doctor uses that advice would no doubt be sufficient, even for one as wanting in experience as 'Illinois' is, but with the common hanging frame used by most of the beginners who read the Doctor's replies, one can imagine what a deplorable mess would be made in carrying out these instructions."

Allow me to correct a wrong impression on your part, Mr. Taylor, by saying that most of the frames now in use in my hives are "common hanging frames," and I am familiar with them through many years' use, and know very well what a mess would be made by crowding them close to one side. But there was no common hanging frame in the question. "Illinois" specially mentions a dovetail hive with a division-board. I very much doubt whether most of the beginners who read my replies use common hanging frames, as you suppose, and still more do I doubt whether any beginner during the present year has received a dovetail hive with division-board and common hanging frames. Even supposing common hanging frames were in the case, the danger of being misled would be largely averted by the remark following, which reads:

"If the hive were made just wide enough to take in the frames. . . . But there will be a space between the dummy and the side of the hive. . . . That gives play enough for the dummy so it can be easily be taken out."

Mr. Taylor, let me give a hypothetical case: On page 281 of the Review, speaking of boiling foul-broody honey, you say: "I consider 15 minutes boiling sufficient; having first added an equal amount of water." Now, suppose I should say, "That is 'instruction that might possibly be misunderstood by a novice.' 'An equal amount' in the place in which it stands might be understood as meaning 15 minutes. 'Imagine what a deplorable mess would be made' if the novice should pour water into the honey at any ordinary rate, for the space of 15 minutes. If I should say that, you would probably call me hypercritical. I think the danger of misunderstanding in the case of my advice is just as remote as in that of yours. I don't say you are hypercritical. But if any one else does, I make no promise to defend you.

McHenry Co., Ill.

The Queen-Excluder and Its Inventor.

BY F. GREINER.

[Continued from page 614.]

Now to return to Mr. Hannemann again. He was so taken up with the superiority of his system and management that he could see but little good in any other; and, being ignorant as to the conditions in other lands, notably North America, he showed mistrust of everything that was reported from here. He says, for instance, at the close of the article of his, written in 1879:

"And while my results, as shown, seem meager by the side of such yields as are reported by an Adam Grimm, I am satisfied with them because mine really exist. Grimm's are only on paper."

Our older readers will remember who Adam Grimm was. He was a pioneer in American apiculture; he made more money with bees than any one else—at least in his time. His

writings always had the mark of honesty upon them, and I never heard a word against his character. I took it upon myself to make a reply in the Bienen-Zeltung (this must have been in 1880), explaining to the German bee-keepers Hannemann's alleged mysteries of American bee-keeping. Hannemann, for instance, couldn't comprehend how there could be room for 27 boxes weighing 130 pounds, on a hive having 24x15 inches of top surface. Grimm had reported such a yield from a single 10-frame Langstroth hive, such as was then commonly used. Hannemann had evidently never heard of tiering up nor of removing full boxes and replacing with empty ones, so he could not understand how the thing was possible, and at once jumped at the conclusion, "It is all a lie, a great humbug," and, worst of all, says so before the thousands of German readers. He reasoned thus:

"One hundred and thirty pounds of comb honey would occupy a space of 3,500 cubic inches. To give this amount of room to a colony occupying a hive of 2,500 capacity is an impossibility, as every one can see. Furthermore, it is impossible for one colony of bees to fill such a space with combs and honey outside of the hive. It would require, with a six-weeks continuous honey-flow, 9 kilograms (19 4/5 pounds) of worker-bees. No queen is capable of producing this amount of bees in so small a hive, nor, for that matter, if ever so large a hive."

Well, a good many of us who have been long in the business have now and then had these phenomenal years and yields. We know from experience that it is possible for a colony to fill a space of 3,500 cubic inches with combs and honey. We have had these cases under our own hand, and what we have seen with our own eyes can by no theory be reasoned out of existence. Facts are stubborn things.

Another point Mr. Hannemann was trying to make out of Grimm's reports was, that the climate must be unsuitable for bee-keeping here, for a neighbor of Grimm had 99 colonies out of 100 frozen to death one winter. Here Mr. Hannemann overlooks the fact that, altho a country may have very severe winters, and actually freeze the bees (a condition I cannot imagine, however), yet the summers may be warm, flowers may be plentiful, and the meteorological conditions very favorable for the secretion of nectar. There is no doubt that a mild climate is favorable for the wintering of bees, and most of us wish we had that; but what of the hard winters? Are we helpless? Why has God given us our intelligence? Have we no means to combat the zero weather? Why! if necessary we would bring about a condition of 90° in the shade every day in the year, as Herr Weygandt has proven with his heated bee-house. If only the summers are conducive to the welfare of our bees, and the honey-producing blossoms are present, the winter is no objection. Why, I believe we could keep bees away up at the north pole if we could only get there.

Mr. Hannemann expresses his opinion of the North American and his surroundings like this:

"I esteem him highly as a man of progress; but to carry on apiculture successfully there are obstacles in his way that, with all his intelligence and ingenuity, he can never [?] hope to overcome. With steam and machinery he may be able to make very accurately his hives, etc.; but to stock them up requires a good deal of money, so it seems; and, after being stocked up, it requires the right kind of man who must be possessed with love for and knowledge of the bees; he must have an extensive experience, etc. The climate must be suitable for bee-keeping so the colonies will send out a goodly number of swarms; and when these are on hand they must be massed together by forming giant colonies in order to obtain the best results. This is the only way."

The reader may ask here, "Why bring up this after 20 years have past?" Does it not show that even the wise are blind sometimes, and that half of the people do not know what the other half are doing? I write the above principally in the hope of entertaining, perhaps amusing, my bee-keeping friends, and to bring out some good points that may be of value to some of them.

I have no old grudge against Mr. Hannemann, altho I admit I felt somewhat indignant at first. That has all past. I now feel only my indebtedness to him. He was probably excusable for holding an adverse opinion of us American bee-keepers.

In criticising the Hannemann system, and in comparing it with our method, I wish to say this: The methods he pursued were probably all right for his particular environments, and much ahead of anything else known to him then; but, after all, the Yankee could and would greatly improve upon them. We would not only use the extractor, but also furnish the bees much if not all the combs needed. I am sure it would be impracticable to use the giant hives and the cages *a la* Hannemann for the production of section honey, on account

of the pollen that would probably be stored in many of them. But should we pursue the Hannemann method to the letter we should probably make an article of commerce of the pollen harvested, and find a way to preserve it. I think I should sell some of it to Messrs. Perry, Olmstead, and others, who are in need of it for spring feeding.

A further improvement of the Hannemann system would be the liberal use of comb foundation, particularly with the view of preventing the rearing of the millions of useless drones that have to be sifted out and disposed of. Of course, they would make a splendid food for ducks, and I would certainly make use of them in this way if I reared them at all. Finally, I would adopt the Langstroth or Berlepsch frame instead of the bar, *a la* Dzierzon, thus preventing the messy, disagreeable work of cutting out the honey, etc. All these are improvements of the Hannemann system, which suggest themselves to the thinking mind; with them, I believe, Hannemann might double the yield that he has been able to obtain.

I wonder what he would think of such yields as Mr. Lovesy reports in the American Bee Journal, page 452, of a bee-keeper in Salt Lake county, Utah—an average of 363 pounds of extracted; or the yield of J. P. Israel, the champion comb-honey producer of the world, reported to be 662 pounds of comb honey per colony. Such yields are phenomenal indeed. Are they true, or only "on paper?" If Mr. Hannemann has seen the photos of our honey exhibits at the Centennial, or their reproductions, he may now conclude that the North American, with his intelligence and proverbial ingenuity, can well overcome obstacles that seem unconquerable to him, which, however, existed largely in his imagination. If that does not convince him I am afraid nothing will.—Gleanings in Bee-Culture. Ontario Co., N. Y.

The Evolution of the Bee-Keeping Author.

BY M. O. PANYARD.

The bee-keeping fraternity has within its ranks more authors, contributors and literary people generally to the square inch than can be found among any other class of people in the wide world. There are in the United States 300,000 bee-keepers, and 297,327 (spring count) are contributors and authors.

If a person has no literary aspirations, and does not wish to have, he should refrain from keeping bees. If he has no literary aspirations, and yet would like to have a "few thousand," more or less, he should not neglect to procure a colony to start him off. One colony is sufficient, altho if he desires more they will be of no disadvantage. After obtaining the bees he is now on the broad highway to undying fame. The bee-keeping, would-be author carefully feels his way at first, like a child learning to walk. His first effort is usually addressed to the "Question and Answer" department of some bee-publication, and the following letter is a fair sample:

BEEDOM, Minn., May 29, 1893.

MR. EDITOR—i hav got too swarms of bees. i thot i wood rite a few lines to the Stinger as i think you hav no correspondunt hear. i expeck my bees to swarm eny minnit. how can I tak off hunny an not git stung. if you want to winter 200 swarms of bees How big a suller will it tak. if a man hed 20 tuns of hunny what is the Best way to git the cash fur it.

Yours truely,

ALLIS LOVELY.

He now waits before again trying his hand until he has shed his milk-teeth. In the meantime he has been reading the bee-papers occasionally, and has acquired considerable confidence. He now writes thusly:

BEEDOM, Minn., Sept. 20, 1893.

EDITOR BEE-STINGER—I didn't hav eny succes with my bees this sumer. i think the reports sum mak about big yields is exaggerated. i live hear in the best part of the united staits fur bees and i didnt git eny hunny. i think one reson why i faled to git hunny was becaus i didnt put on eny supers till the trifolium was gon. i forgot it. and when the tilia Americana was in blum we had a long wet spell so the bees cudn't fly. the solidago, coreopsis, varioloid and erysipelas didnt do a thing this fall. i hav got a chance to swarp a dubble-barrel shot-gun, laminated barrels, 12 boar, for 10 skips of bees. i think i shal do it, as the gun was a good one *once*.

Yours truely,

ALLIS LOVELY.

Two years have now past. He has brusht some of the cobwebs from his orthography, chirography and entomology, and has become full-fledged. He now jumps upon the edge of the nest, gaps, spreads his broad wings, and soars away as follows:

BEEDOM, Minn., July 9, 1895.

EDITOR "BEE-STINGER:"—I am much gratified at the remarkable advancement that has been made during the past two years

by the bee-keeping fraternity. There is room, however, for still further progress. If the gross ignorance that is manifested by a certain class of would-be bee-keepers could be eliminated from the bee-periodicals, there would be universal rejoicing. How much longer must an already long-suffering public be inflicted with the contributions of ignoramuses who are not familiar with even the rudiments of bee-keeping. I notice in the last issue of the "Stinger" that Spriggins, of Ohio, says, that, "in order to secure straight combs, when using the no-wall comb foundation, the frames must be wired perpendicularly, horizontally, diagonally and considerably." Now, what vile rot that is! He may be able to make novices swallow that, but he can't stuff it down an old experienced bee-keeper like me. Every person that has a grain of common sense, and upon whom Nature has bestowed any favors whatever, knows that if the hives are placed so that the frames extend north and south, straight combs will be the result.

Another idiot, whose name I disdain to mention, asks the following fool question: "I want to winter my bees in the cellar. What shall I do?" I would like to say to him that one of the essential things to do in that case, is to *place the bees in the cellar*. You can't winter bees successfully in the cellar unless you do this.

I would like to gratify you by dwelling longer upon this subject, but other duties are pressing, so I must forbear until some future time.

Yours truly,

ALLIS LOVELY.

About three years later he writes a book, entitled, "The Apis Mellifica; or a Quick Way to Amass a Fortune," which will be sent to any address, postpaid, upon receipt of 75 cents.

Something About the "Notre Dame Hive."

BY JOHN CHRYSOSTOM.

The "Notre Dame hive" is the only hive now in use in our apiary. It has given entire satisfaction. This hive will, in all probability, supersede all our loose-hanging frame hives on its own merits. It combines all the qualities of the box-hive for safe wintering and breeding up in early spring, and all the facilities of the loose-hanging frame hive for easy and safe manipulation of the frames. Moreover, nearly all loose-hanging frame hives may, by our simple device, which costs but a few cents per hive, be converted into the Notre Dame hive—even those that have bees in them.

As a closed-end or box-hive, when the frames are put in and properly spaced, the hive is contracted, holding the frames so firmly fixt in place that it may be laid on the side, or stood on end, or even inverted, and the frames will not move. Besides, not a particle of air can pass around the ends of the frames.

What about propolis and the sticking of the frames? To avoid this nuisance, to a great extent, the ends of the hive are smeared with tallow before putting in the frames. This may be done by using a thin knife much after the fashion of spreading butter on bread. The spaces between the ends of the frames, on the supports, may also be filled with tallow. All this, however, is not necessary; yet it has proven to be an advantage to the bee-masters.

It requires but about ten seconds of time to expand or contract the Notre Dame hive as desired. When expanding it, tho, it is advisable to expand it just enough to let the frames lift out easily and smoothly; so that in replacing them the bees may not get between the end of the frame and the hive. This hive is always ready to be put on the wagon or cars, because the frames cannot jar out of place. The entrance to the hive is very large when entirely open; but it can, by means of a little slide, be contracted at will to one bee-space.

What about swarming? Are not the bees more liable to swarm from box or closed-end hives? Probably, if confined to eight or ten frames. All the colonies here have a brood-chamber of 16 frames in two stories. Last spring, at fruit blooming, many colonies required 24 frames. Our bees have been watcht closely the last three summers, but during all that time we have failed to get so much as one prime swarm. The only swarms we have had were from nuclei, and colonies that had lost their queens.

We have excellent queens from various first-class breeders. The non-swarming of our bees cannot be attributed to inferior stock. It may be accounted for thus: The hives are made larger by adding frames to accommodate the bees in proportion as they multiply. In this way they always have excellent quarters. They are loath to leave such a fine hive. No swarm has ever been seen to leave our yard. About the first of July many of the colonies are on 40 frames. About this time the *Asilus acstians*, called in English the *hornet-fly*, or vulgarly, the hawk-fly or robber-fly, makes its appearance. This species of bee-eaters abounds here. The result is, that in July and August, bees are killed by the mill-

ions. Only the most prolific queens can keep up a strong, fresh force or workers during this season.

The Notre Dame hive is not manufactured here for sale; nor do we keep any other bee-supplies for sale. We want this well understood.

I wish to take advantage of the present opportunity to thank the author of the article headed, "That Detestable Bee-Space," for the valuable hints therein given. The reading of that article set me a-thinking. I work accordingly, and the result of my experimental labor is the Notre Dame hive—a hive in which bees can be wintered without loss, and with more real satisfaction than in any other way I know of.

[Mr. Chrysostom has written quite a good deal about his hive in the foregoing article, and yet hasn't given many particulars. If he will send a photograph of its parts and a full description, we will be pleased to publish them.—EDITOR.]

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. O. O. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Nine Interesting Questions and Answers.

1. Do bees require the same amount of syrup to build comb, as they use of honey?

2. When shall I fumigate my comb honey? and how long at a time shall I smoke it?

3. Must I melt down combs any before using again in the sections if they are neither fully built out nor capped?

4. Do you know if the great willow-herb, that Mr. Hutchinson speaks about, will grow around here?

5. Will worms bother sheets of foundation, or cakes of wax?

6. The bees have made some honey that was yellowish in color, and while bringing it into the hive they turned the wax all quite yellow. They have been working on heart's-ease and sneezeweed principally. Can you tell me what it comes from?

7. When do you put the second 8-frame story on in the spring? and what do you do with it at super time?

8. I work for comb honey this year, and cannot decide which to run for in the future. Can you give me a few suggestions?

9. Would you use 10-frame hives for extracting? or two 8-frame hives until super-time?

ANSWERS.—1. Probably in building a given amount of comb they would require about the same amount of syrup as they would of honey, if the syrup is thick.

2. Fumigate it just as soon as you see little bits of white dust (the work of worms that are yet exceedingly small) on any of the sections. You will find this dust around the edges of the sections, particularly at the lower part, and on the edges of unsealed cells that have little or no honey in them. Sometimes, however, you may find the work begun right on the face of the comb. If a dead bee is present, you may find a worm on it. If you set the brimstone to burning, you may leave it closed up for 24 hours. It isn't a matter of very great exactness. It's a little difficult to know without experience just how much sulphur to use. If you use too little, and find little worms not killed, you can give a heavier dose, but if you use too much it may make the white comb look green.

3. If they are white and clean and the combs entirely empty, use them over again. But to have the combs entirely empty and fit to use again, they must be thoroughly cleaned out dry by the bees before any granulation has taken place. If they are left the least bit sticky, the small quantity of honey left will granulate, and that will affect the new honey that is stored in them. So if you expect to use next year any sections that are now unfilled, better let the bees have access to them right away. If you set them out so the bees can rob them out freely, they'll tear the combs all to pieces. Have the entrance to them so small that only one bee can enter at a time, then you will find them very little torn. If, however, you have a large quantity to be cleaned out, say as many as five or ten sections for each colony in the apiary, then you may expose them fully.

4. Probably not. It seems to require a soil such as is found where large forest fires have been.

5. They are not likely to do so.

6. I don't know. I don't know enough about heart's-ease and sneezeweed to know whether they would account for it. Possibly the bees may be working on goldenrod.

7. The second story is put under, not on, as soon as, or before, there is any need for more room for the queen to occupy. At time of putting on supers, the extra combs are disposed of in various ways. If there are any nuclei or colonies too weak to do good work in supers, they are called on to take care of a lot of combs. If there is no other use for them, combs containing no brood may be piled up at one end of the apiary, the bees being allowed to rob out what little honey is in them. Possibly that might not be a good plan for you if you are likely to get into trouble with robbing. Of course such combs must be watched for worms, but generally a use is found for them before the worms can harm them much.

8. It's hard to give any suggestions, as each man must be a law unto himself. The main question is, which will bring you the most money? No one can answer that without knowing all the circumstances, and perhaps not then without an actual trial. One way is to run half for comb, half for extracted, keep close account of both, then decide which is the more profitable. Familiarity with the whole subject, and familiarity with a good text-book, will help.

9. I'm not entirely sure whether I understand fully the bearing of your question, and will be glad to have you ask again if I don't get your idea correctly. It is desirable to have only one kind of frame in the apiary, and while 8-frame hives and 10-frame hives may be used in the same apiary, so long as the frames are alike, it is better to endure some little inconvenience rather than have the two kinds. If 8-frame hives are used for comb honey, and you want to run some colonies for extracted, then for the sake of uniformity I think I should use the 8-framers also for extracting. If I cared nothing about the matter of size and weight, and the hives were not to be carried or hauled, then I might prefer the 10-framers—pretty certainly if for extracted honey only.

Phacelia—Gerstung's Theories, Etc.

1. In one of the German bee-papers, of which I can assume you are a reader, I saw a short time ago phacelia recommended as an excellent honey-plant. Do you know whether this plant has been grown in this country, and by what name?

2. Isn't the "Boiler" trylog hard to make propaganda for Gerstung's theories in this country?

3. I observed an occurrence in the apiary, the like I have not seen before, and as I don't know whether I trace it to its right cause I am going to tell it to you, so that if you please you may give me your opinion about it. I was taking off supers, as no more honey was coming in, and I came to a colony which had been taken from a bee-tree about July 1; at the time of hiving them I put an empty super on to feed them a little first; but when I discovered that they commenced building comb on the cover, I placed a super with sections on instead, tho the honey-flow was about at an end. Now I found the super empty, but two of the sections were closed up with wax; no propolis on the top. I first could not think for what purpose, but after I had gotten most of the bees out and inspected more closely, I found a small cluster of bees inside of the two sections. I shook them out in front of the hive where they acted quite strange. As soon as the cluster had parted, one of them ran through the crowd and into the hive—from all appearances I judge a young virgin queen. No sooner had she entered when all the bees outside on the alighting-board placed themselves facing the hive-entrance, standing still as when hypnotized, the tail-end high up, and, I think, trembling all over, and sounding the hum of contentment.

Now, I wish to know whether I am right in claiming that the bees had a young queen in hiding up there to supersede the old one as soon as they were ready for such action, and I may have hastened the matter? or do you think there was another cause?

CALIFORNIA.

ANSWERS.—1. I cannot give you any positive answer, but I have an impression that the phacelia in question is a plant that grows in California, and from there was introduced into Europe. The only phacelia I ever saw is a plant cultivated in the flower-garden in the North, and rarely as a house-plant, the flower somewhat resembling the heliotrope. I should be glad to know if the California phacelia is the same or anything like it. Who will tell us? I might add that the phacelia that I know is much visited by bees, and I have seen it recommended as a honey-plant in price-lists of flower-seeds.

2. Hardly. The department of "Beedom Boiled Down" I believe is intended to keep the readers informed of at least some of the things going on in all parts of the bee-keeping

world, and the mention of any new theory is by no means an endorsement thereof. I doubt whether Gerstung's theory will get any very serious following in this country.

3. Your question is not very easily answered, and one can only make a guess. It is possible you are correct in your surmise. Usually, however, when a young queen is about to supersede an old one, the young one does not seem to keep in an out-of-the-way place, but is more inclined to drive the old queen. If the old queen has a clipped wing, you can easily tell whether she has been superseded. But I think it quite probable that your old queen is still present. Young queens have a way of appearing in almost all sorts of places, even to fleeing into a neighboring hive to get away from persecution.

Comb Honey Shipt at "Owner's Risk."

Are shippers of comb honey required by the railroad companies to ship entirely at their own risk? Our station agent stamps upon the face of the bill of lading, "Owner's risk," etc., claiming that is the rule of the railroad companies in regard to honey. I crate my honey with convenient handles for carrying, and use every precaution for safety in shipping, and it seems as if I should be entitled to the same protection as shippers of other produce. PENNSYLVANIA.

ANSWER.—I think you will find it the general rule that comb honey is shipped at owner's risk. If you think you are not rightly informed as to the matter, you could get some friend at a neighboring station to inquire of his station agent.

A Number of Questions.

1. Why is it that a division-board is needed in S-frame hives and not in the 10-frame?
2. To increase and improve stock I formed 10 small nuclei in July and August, and gave them Italian queens. If I keep them up by feeding will they be as good as new swarms next spring? and do you think it will pay?
3. Will four frames of comb be enough to winter them on if fed through the winter?
4. Bees get a flight once a week through the winter in this State. Is there anything cheaper to feed than granulated sugar? If so, what is it?
5. If bees are fed with candy, will the flavors do any harm?
6. How do queen-excluders prevent burr-comb?
7. Suppose I make hives with 10 frames 5x12 inches, and use as many stories as needed, don't you think it will be a good hive to run for extracted honey? also for a non-swarm, if the bottom and top stories are exchanged? VIRGINIA.

ANSWERS.—1. I don't know. If the frames are of the same kind, the probability is that they are needed just as much in one as the other. If fixt frames are used, certainly division-boards should be used in either. If loose-hanging frames are used, then division-boards may or may not be used in either kind, depending on the room at the side of the hive when the frames are properly spaced.

2. Doubtful. Better double them up to make fair colonies. You can, however, keep strong nuclei or weak colonies over by having two or more in the same hive, using thin wooden division-boards to separate them.
3. Four Langstroth frames will do very well, and a colony that will cover them in winter is by no means a small nucleus. If the four combs are filled with honey the bees will hardly need feeding.
4. Perhaps not. The darker grades cost less a pound, but it is claimed that the granulated is enough stronger to make up for the difference. It might not be a bad idea for you to try one colony with cheaper sugar, and if you do please report the result.
5. I think not.
6. I don't know. Possibly by making the sections farther from the brood-combs.
7. Some like a hive of that kind. You can only tell by trying how it will suit you. As a non-swarm it might not be better than a hive with a deeper frame?

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

Drawn Foundation.—At the Texas Convention, L. Stachelhausen showed a sample of comb honey built on drawn foundation, and all who sampled it said they could tell no difference between it and the natural product.—Southland Queen.

Queen-Rearing.—In the Southland Queen, Wille Atchley reports that he prefers for queen-rearing larvæ not more than two days old. When he used larvæ three and four days old many of the queens were drone-layers. G. F. Davidson prefers larvæ 18 to 24 hours old.

Purifying Wax.—F. L. Thompson reports in the Bee-Keepers' Review the plan of Rauchfuss Bros., with solar extractors. The pan receiving the wax below is divided into compartments with flaring sides, holding a pound each. When one compartment is full it overflows into the next. No impurities are found in any but the first.

Keeping a Record.—J. E. Crane keeps a record of 70 colonies of bees on a board 20x4x¼ inch. It has the advantage over a book that the wind doesn't blow the leaves when you are writing, and the leaves are not stuck together with bee-glue. Space is economized by using arbitrary characters to express a whole sentence by a single character. For example, a single dash means "Eggs in queen-cells."

One or More Supers for Extracting.—At the South Texas Convention, W. A. McPhall said he used only one super on extracting-colonies, as the bees filled and sealed the honey sooner. F. L. Aten uses from two to five extracting-supers, finds it keeps down swarming, and he gets more honey. Some honey will do to extract sooner than others. Cotton honey may be extracted as soon as it is gathered, in hot, dry weather, while horsemint must be half sealed.—Southland Queen.

Length of Time Larvæ are Fed.—G. M. Doolittle thinks not less than about six days, and challenges Dr. Miller, in Gleanings, to prove that five days (the time given by T. W. Cowan and some others) is correct. In moderately cool weather he found larvæ hatch from the egg in about two hours less than three days, and sealed over in six days and three hours, then emerging from the cell at 21 days from the laying of the egg. In extremely hot weather, it was nearly three days in the egg, 5¼ days in the larval, and 11¼ days in the pupa state.

Feeding Syrup.—Vernon Burt and others are reported in Gleanings as filling the brood-nest with sugar syrup, so that when the harvest came the new honey was at once carried into the super. E. E. Hasty, in Bee-Keepers' Review, thinks this practically the same thing as the thing that made him and others so bitterly assailed a few years ago. He thinks that instead of thinning the honey in the brood-combs and feeding it to the brood, the bees will take the cheaper plan of carrying up the thick "honey" from the brood-combs into the super, and use the thinner nectar for feeding brood.

Bulging of Honey in Sections.—Some difference of opinion is shown in Gleanings as to whether bees will bulge out the upper part of the comb in sections if the separator does not come clear to the top of the section. The editor is of the belief that in some places and seasons, at least, there will be bulging, so the fence separators are made in all cases to come to the top of the section. Dr. Miller insists that he has no trouble, having used the old-style section with top-bar the same as the plain section, and having no trouble about bulging. He uses little sticks ¼x¼ to go between the ends of sections at the top, and that doesn't allow the fence to come any nearer than ¼-inch from the top of the section. The editor cites a lot of honey with edge of separator ¼-inch below the top of the section, with resultant bulging. G. M. Doolittle has for 25 years used separators coming ¼ inch below the inside of the topbar of the section, and finds it satisfactory. E. W. Brown reports no bulging with plain sections, and the fence coming ¼ inch below the top of the section.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. OCTOBER 6, 1898. NO. 40.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Report of the Omaha Convention is begun this week. Every member of the United States Bee-Keepers' Union will receive a copy of this journal containing the full report. It promises to be very interesting, and no doubt will be read with great profit.

Question for Queen-Breeders.—A subscriber in Jamaica sends us the following question which he desires to have queen-breeders answer in the Bee Journal:

"With what method of introducing virgin queens to nuclei are you the most successful? Also give the age of the queens."

Now if the professional queen-breeders who read this journal will kindly forward their replies promptly we will publish them all in the same issue soon.

Misleading Description of Foul Brood.—Under this heading appears the following paragraph by Critic Taylor in the Bee-Keepers' Review for September:

"In the American Bee Journal, page 502, is a description of foul brood in which I find the statement that it 'is a disease that kills the young bee in the larva [larval] state after it has been capt over.' Italics mine. This is a mistake that may lead some astray. To be sure, much of the brood lives till it is capt, but sometimes a large proportion dies before it is ready for that operation, and never is capt."

A glaring error, and one that never should have been allowed in the columns of this journal. Mr. McEvoy says that "in all and every case where once fairly started more brood dies of foul brood at the ages of 6, 7, 8, and 9 days than at any other age." This is in answer to the question

whether he has ever known unsealed brood to die of foul brood.

The item in the Review is misleading in another sense. It makes no mention of the fact that instead of being original matter, the article containing the error was a clipping from the Pacific Rural Press.

The word "larval" in brackets shows that Mr. Taylor would use it instead of "larva." "Larval" is the better word. But there is a bare possibility that some might raise the question whether it is really an error to use the word "larva" in the place referred to. It is a noun used as an adjective. The noun "egg" is used in the same way when speaking of the egg state. Would it not be as well to say "larva or egg state" as to say "larval or egg state?" Or should one say "larval or egg state?"

Self-Selling of Honey.—Editor Hutchinson, in the Bee-Keepers' Review, when speaking of marketing honey, had this to say:

"The most of my honey has been sold by commission-men; for the reason that sold in this manner it would net me more than sold direct to grocers near home. Of late the price of honey in the large cities has fallen, while in our local markets it has remained about the same, hence I now find it profitable to be my own salesman; and I really enjoy it, so much so in fact that I often feel as tho I would like the business of being a 'drummer.'"

We have never had much time to spend in an attempt to sell honey, but we think we would like it very much; and were we to be suddenly "out of a job," we believe we could do well at selling honey—make a good, honest living, anyway.

An Uncapping Apparatus is described and illustrated in Praktischer Wegwaiser by A. Janello. A strong tin dish 20 inches long, 12 inches wide, and 6 inches high has resting in it, supported at proper distance from bottom a piece of wire-cloth with meshes 5 to the inch. On this rests a sort of roof of the same wire-cloth, the two sides of the roof allow-

ing two operators to uncup at the same time. The slanting surface of the roof allows the combs to rest with little or no holding, and all the honey that drips is caught in the pan below. Of course the size could be varied according to the size of combs used. A larger size would do better for frames in general use in this country.

The Trans-Mississippi Exposition is another World's Fair, but on a smaller scale. All industries are well represented in the exhibits, including bee-keeping, and in this latter the Exposition authorities have succeeded admirably in placing before the world a vast object lesson.

The Exposition managers acceded to the request of the bee-keepers, and erected a fine building to be devoted entirely to this work. The building is a substantial frame structure, shingle roof, with sky-lights, plastered inside and staff-coated outside; is 75x140 feet, and 16 feet high at the eaves; whitewashed ceiling, and woodwork painted white. It is nicely

decorated with flags and bunting, and has glass cases on each side 4x130 feet, and 8 feet high, with glass ceiling, giving wonderful effects in the light on the honey exhibits inside.

The building is in charge of Hon. E. Whitcomb, Superintendent of Bee-Industries, who knows how.

On entering the building, to the right is found the honey exhibit of E. Kretchmer, of Iowa. In this exhibit is found some fine honey, both comb and extracted, light and dark; alfalfa, white clover, sweet clover, heart's-ease, granulated honey—anything you could wish.

By the side of Mr. Kretchmer's exhibit is the exhibit from Kansas, under the management of ex-Governor Glick. Here are products from different apiaries, all, however, showing the same styles of both comb and extracted alfalfa honey.

By the card overhead, we notice that the next exhibit is from the apiary of L. G. Clute, of Iowa. This is simply a mass of honey, put up without style or decoration. There are several kinds of both comb and extracted, but the style of putting up does not do justice to the honey itself.

L. D. Stilson.

Next in line in this case is an exhibit of comb and extracted water-white alfalfa honey, by Hon. G. W. Swink, of Colorado. This is from the celebrated melon county, and Mr. Swink tells of the wonderful increase in melon-raising since the introduction of honey-bees.

Next comes an overflow exhibit from Nebraska; then honey from Minnesota, for want of room in their regular exhibit; while Utah covers the remaining 200 square feet of the north case, with alfalfa honey, extracted and comb. It is in small jars, in large jars, and in medium-sized jars, built in pyramid forms, so as to show to fine advantage.

The central floor space of the apiary building is occupied by exhibits of apiarian goods and "bee-fix'n's" to suit the most fastidious. The Leahy Manufacturing Co., of Missouri; G. B. Lewis Co., of Wisconsin; E. Kretchmer, of Iowa; and the A. I. Root Co., of Ohio, have exhibits of everything used in the practical apiarist's work. Some of these are very complete in the goods shown, and do great credit to the enterprise of the companies in keeping abreast of the times in supplying what is needed for practical work.

Minnesota has a fine glass case in the floor space, well filled with Minnesota's "best" of honey. This is shown in large glass jars, giving to all an idea of the "immensity" of their products. Dr. Jacques had charge of putting this display in place, and the whole shows the skill of his handiwork.

Douglas county, Nebr., shows its honey by itself in the east end of the south glass case, and is separate from the State display. It is in charge of Aug. Davidson, with Mrs. Price as assistant, and contains fine samples of comb and extracted honey from the various honey-resources of the county, with basswood, white and sweet clover in the lead. They also have a glass case showing honey-plants of the county, mounted, while live bees in glass hives are a constant source of amusement upstairs.

Last, but by no means least, is the display by the State of Nebraska Commission, with L. D. Stilson as Superintendent, and G. M. Whitford as assistant. This display has over 200 feet of floor space, and nearly 700 feet floor space of glass case room. Anything found in other exhibits is duplicated here, and more, too. Machinery, implements and appliances are here, and attendants to explain their uses. Honey, ex-

tracted and comb, of various colors, kinds and sizes. Good honey, better honey, of other exhibitions is duplicated in this one. The Nebraska "bees" rustled to show their products, and they have done it to perfection. Live bees in nuclei form; sweet cake, beeswax work in flowers and waxen images, vinegar, and—well, above in the cases they show about 500 specimens of common honey-plants, mounted, giving common and botanical names, with time of blossoming.

As a whole, this is without doubt the most complete and finest exhibit of the apiarian industry ever made, and shows what can be done by the hustling rustlers of the Trans-Mississippi States when they are fairly awakened.

Superintendents E. Whitcomb and L. D. Stilson are constantly in the building, and are models of kindness and accommodation to all visitors—particularly to bee-keepers.

But the whole Exposition must be seen to be fully appreciated. This is notably true of the exhibits in the apiary building. We expect soon to give in the Bee Journal some pictures of the building and contents, which we feel certain will be greatly appreciated by all.

EDITOR A. I. ROOT, of Gleanings in Bee-Culture, past through Chicago on his way home, Saturday, Sept. 24. He visited South Dakota after attending the Omaha convention, and on his return trip gave the Bee Journal office a short call.

DR. C. C. MILLER reports as follows in Gleanings for Sept. 15:

"I'm exceedingly thankful to say that altho the harvest was a failure, the bees are filling up nicely for winter—on cucumber, I think."

MR. J. H. ROGERS, of Carmarthanshire, England, a bee-keeper of over 40 years' experience, made us a very pleasant call Sept. 28. Mr. Rogers is acquainted with Mr. Cowan—England's best known bee-keeper—of whom he speaks in words of highest praise.

HON. EUGENE SECOR, the able General Manager of the United States Bee-Keepers' Union, was selected as judge of the apiarian exhibits at the Trans-Mississippi Exposition at Omaha. He past on over 100 entries, and recommended about 90 awards. That's a big percentage. But then, they are wonderfully fine exhibits.

PRES. E. S. LOVESY, of the Utah State Bee-Keepers' Association, wrote us Sept. 23:

"As a rule this season, the flow of nectar was good while it lasted, but it continued only about half as long as in some other years. The 'old reliable' American Bee Journal is still a regular and welcome visitor."

MR. CHAS. DADANT, of the firm of Chas. Dadant & Son, spent about an hour with us when returning home Sept. 24, from a nearly seven weeks' stay in Wisconsin, where he went to get away from an attack of hay fever which "gets" him if he should remain at home in Hancock Co., Ill., during the time of ragweed blooming. □

CHAS. F. MUTH & SON.—The following is a clipping taken from the Cincinnati Times, for Sept. 20:

"A sensational suit was filed Friday by Matilda Schauler against Charles F. Muth & Son, August Muth, and the administratrix of the late Charles F. Muth, of the Board of Control, whose peculiar death in Indiana is recalled. Plaintiff sues on notes for money loaned as follows: For \$1,500 May 4, 1897; \$1,970, Sept. 1, 1897, and \$2,000, Dec. 22, 1897. The money was loaned by Jacob Pistor, whose widow she is. The first note was all paid except \$226, so that the amount sued for is \$4,196.62, with interest. It is alleged that the firm of

Muth & Son is insolvent, that the assets are only about \$5,000, and the liabilities \$20,000, and that the assets are constantly depreciating in value. A receiver is therefore asked toward disposing of the stock and applying the proceeds to the payment of this and other debts of the firm."

It hardly seems possible that the above can be true. But if so, it is a very striking instance of what great changes a few years or months may make in a man's or firm's financial standing. We had been led to think for years that Muth & Son were independently wealthy.

MR. HOWARD REYNOLDS, of the firm of Reynolds & Davison, in San Diego Co., Calif., spent an hour or so in our office last week. They own 410 colonies of bees, in two apiaries, but did not get a drop of honey this year; they even have had to feed to keep their bees over winter. Last year they had a good crop. One apiary of 56 colonies was increased to 150, and averaged 325 pounds of extracted honey a colony; the other contained 85 colonies, was increased to 110, and averaged 254 pounds.

MR. AUG. WEISS, of Outagamie Co., Wis., spent several days in Chicago last week. He is one of the rising comb-foundation manufacturers, as well as a dealer in bee-supplies of all kinds. Mr. Weiss is an upright, straight-forward man. We have had considerable very satisfactory dealing with him the past two years, and, after meeting him, we are satisfied that our confidence has been well placed. We like to encourage those who are striving to do an honest business, especially those who, like Mr. Weiss, are just starting to build up a mutually safe and good business among bee-keepers.

RAMBLER JOHN H. MARTIN, of California, we understand has recently purchased a "Cleveland" bicycle, and is making good progress in learning to ride it. By this time we suppose he is able to "navigate" pretty well with it. We believe he expects "to soar" over the plains and mountains of northern California on his "bike," and ere he returns southward make a prospective trip through the gold-bearing counties of the northern part of the State in company with an old prospector, and possibly strike a rich lead yet. Just think of the Rambler becoming one of the rich men of the world, all through having discovered a bonanza in the way of a gold mine! And yet it may be his luck to do so. During this trip we are informed

that he hopes to do some big shooting and fishing, as he will take his rifle, camera and fishing outfit with him. There are plenty of deer and fish up there, it is reported. The honey season of 1898 is over with him.

G. M. DOOLITTLE, of Onondaga Co., N. Y., wrote us Sept. 23:

"My crop of comb honey at the out-apiary will be not far from 3,500 pounds from 30 colonies. How is that for a poor year, when others get nothing?"

Well, it's only another evidence that Doo-little is wrongly named. Doo-more or Doo-most would be more appropriate, we think. Mr. D. might tell the readers of the Bee Journal just how he managed that apiary in order to get such a yield. It would be an interesting story, and doubtless a helpful one to all.

MR. D. W. HEISE, of Ontario, Canada, writing us Sept. 24, said:

"While the American bee-papers are reporting honey crop failures, and higher prices, we Canadians are experiencing great difficulty in disposing of our crop at a fair price, as compared with former years. Never has honey been known to be quoted so low in the city markets, which, of course, has its effect upon the home markets. Another thing which has a tendency to lower the price is the fact of there being quite an amount of inferior honey this year to dispose of, that is, basswood and thistle mixt with honey-dew. This has quite an appreciable effect on the price of good honey."

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

BEST EXTRACTED HONEY FOR SALE

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 7½ cents a pound; 2 cans, 7¼ cents per pound; 4 or more cans, 7 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, "HONEY AS FOOD," will be a great help in creating customers for honey. See prices on another page.

GENERAL ITEMS

Pretty Good Year with Bees.

I have had a pretty good year with the bees, my honey is all sold, and my bees will be all ready for the cellar in a few days; so I am going visiting for a while. The roads are good, the weather fine, and I shall enjoy a trip on my wheel among friends, relatives and bee-keepers. **S. T. PETTIT,** Ontario, Canada, Sept. 22.

Plain Sections and Fences a Success.

I started in last spring with four colonies (having sold out my bees before in another place) and I have taken over 200 pounds of honey from them, and increased to 17 colonies. I gave the plain sections and fences a trial and they proved to be a perfect success with me. **C. H. PETTENGELL,** Phillips Co., Kan., Sept. 20.

Feeder for Fall Feeding.

The feeder I use for feeding in the fall is made as follows: Make a box the width of the hive, and 3 inches longer by 3 inches deep. Coat the inside with paraffine so that it will not absorb the syrup or leak. Make a float of thin strips with 1/4-inch spaces between the strips. Put it on level, and fill with syrup slightly warm. Lay on the float, remove the bottom-board, and put the hive on it. Such a box will hold 20 pounds, and if fed warm the bees will take it all up in one night. The float prevents any bees getting daubed. I fed a colony 18 pounds last night, and it was all cleaned out this morning, with only one dead bee in the box. This may not be new, but I never heard of one like it.

The honey crop has been a total failure for two years; everything was destroyed by caterpillars in 1897, and partly so in 1898; bad weather did the rest.

J. M. DOUDNA,

Douglass Co., Minn., Sept. 23.

Average Crop of Dark Honey.

There is not over half a crop of light honey throughout this section. The yield from buckwheat and fall flowers is somewhat better, and will probably reach nearly an average crop of dark honey.

A. D. WATSON,

Tioga Co., Pa., Sept. 12.

A Beginner's Experience.

In July, 1898, I decided to go into the bee-business. I bought 7 colonies (but didn't move them), and as I knew nothing about their management I put on my "studying cap." I remembered receiving a price-list of bee-keepers' supplies some years ago, so I began searching for it, and found it, and in that little pamphlet I saw the name of a bee-paper; I sent for a sample copy, and just kept on sending for sample copies until I had six different bee-papers. I read them all, and re-read them. It was a task to decide which one to subscribe for, because I realized I needed a bee-paper. Among them all I finally decided, and subscribed for the American Bee Journal, which I think is a grand paper. I intend to subscribe for another bee-paper as soon as I feel able.

Last Friday (Sept. 23) I moved my bees home, a distance of three miles. All work well until we went to unload. One of the hives was old and decayed at one corner, and in setting it down I managed to make an opening in the hive, and out came the bees. They seemed to have a liking for me, as they covered me from head to foot and stung me by the thousands. I was interested in keeping them out of my eyes, but the fun continued (that is, if you could call it "fun") until I got a blanket and

Sweet & Clover

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us **Two New Subscribers** to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Ho, for Omaha!

AS we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful, straw-

colored transparent Foundation, Improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, **Leamy Manufacturing Company, Higginsville, Mo., or 1730 South 13th St., Omaha, Neb.**

Please mention Bee Journal when writing.

threw it over me; then I went to killing those under cover, and when I got through murdering bees you couldn't see my face or hands for bee-stings. My flesh swelled considerably, and I felt a little unpleasant for a few days.

I finished unloading after the angry bees had settled down a little, and got them all in good shape. The next day I concluded I wanted some honey, so wife and I, after dinner, prepared to take it. Of course I put on the bee-veil, and my wife had on an old bonnet. You see, I knew the bees couldn't hurt that old bonnet, and I knew my face wasn't bee-proof, for I had it tried the day before. (I had a veil but didn't think to put it on when I commenced to unload the bees.)

Well, you ought to have seen us marching out to take our first honey. From the first hive we got 27 sections, well filled and capped over, and one partly filled; from the second hive 24 sections, well filled; the third hive 28 sections; the fourth hive, 24; the fifth hive, no honey above; sixth hive, 28 sections; seventh, filled but not capped over. This last one we left on.

This is more honey than we ever had seen at one time. It is as nice and as white or light as can be produced. I think my experience as a bee-keeper has been very pleasant so far—except the unloading, which might have been a little cooler for me, but I am not discouraged one bit.

H. C. KUYKENDALL.

Clark Co., Ill., Sept. 26.

Crop Better than Expected.

The honey crop here is better than I thought it would be. I have taken off, up to date, about four tons of comb and extracted honey from 70 colonies.

DAN CLUBB.

Tulare Co., Calif., Sept. 19.

Not Half a Crop of Honey.

This county has shipped out over 30 carloads of honey in one season, but this year we won't have half a crop. My bees averaged only 30 pounds per colony. The yellow butterfly is taking the honey as fast as it is secreted in the alfalfa, leaving only wild flowers for the bees to feed and breed on.

B. A. HODSELL.

Maricopa Co., Ariz., Sept. 19.

Report for Two Seasons.

Last year my bees would do nothing but swarm. I started with one colony, which cast three swarms, without storing a pound of surplus, and in about seven weeks the first swarm cast one without working any, leaving me pretty nearly disgusted with bee-keeping. From the four colonies I got 18 pounds of comb honey, but this year, with three colonies and not a single swarm, I have harvested, up to date, 135 pounds of comb honey. I attribute the difference to two reasons: 1st. better management; 2nd. the fruit-bloom was all killed this season so the bees did not get started until late in the season. The flow began suddenly after a rain, June 28. I have sold 40 pounds in town here for 15 and 20 cents a pound, and will keep the rest for home use.

E. BRASEL.

Creek Nation, Ind. T., Sept. 27.

Rather Hard on Queen-Breeders.

I started with 17 colonies in the spring, and all seemed to be in good condition when I took them out of the cellar. A cold spell came in April, and they dwindled considerably and six lost their queens, but they did fairly well after all. Considering the dry summer we have had here, they stored quite a lot of honey, but hardly any swarmed.

There is one thing practiced by a number of queen-breeders in the States that bee-keepers should expose through the American Bee Journal, and give their names. That is, advertising something wonderful, and then sending queens that are entirely worthless. One man says he is

See Honey Offer on page 634.

The Biggest Offer Yet!

Last year only about one percent—only one subscriber in 100—ordered his Review discontinued. If the Review could secure 1,000 new subscribers the present year, there is an almost absolute certainty that at least 900 of them would remain; not only next year, but for several years—as long as they are interested in bees. Once a really good bee-journal visits a bee-keeper a whole year it usually becomes a permanent member of his family.

I would have no difficulty whatever in getting twice 1,000 new subscribers this year, if all of the bee-keepers in this country had read the Review the past year. I have sometimes thought that it might pay a publisher to give away his journal one year, simply for the sake of getting it into new hands. There are, of course, decided objections to such a course; but I am going to come as near to it as I dare. Here is my offer:

If you are not a subscriber to the Review, send me \$1.00, and I will send you twelve back numbers, the Review the rest of this year and all of next year.

Each issue of the Review, especially if devoted to the discussion of some special topic, is really a pamphlet containing the best thoughts and experience of the best men upon the topic under discussion. Twelve back numbers of the Review are, to a certain extent, so many little books devoted to as many different phases of bee-keeping. Some issues of the Review are now out of print; of others only a few are left; while of others there are several hundred. Of course, I shall send those of which I have the most, but no two alike.

Most people subscribe for a journal at the beginning of the year. In this case there is no use of waiting, as you will get the Review for next year just the same as the you waited until next January to subscribe, and you get all the rest of the numbers for this year FREE. The sooner you subscribe, the more free issues will you receive.

Let me tell it over once more. For \$1.00 you get twelve back numbers, the Review the rest of this year, and for all of 1899.

FOR SALE CHEAP!

My property here, consisting of one block of land, new residence, a house-aplary with or without bees, a wagon and blacksmith shop—the only one in town; also an out-aplary 3 1/2 miles away with four acres of land; ideal locations for bees; have averaged the past 5 years 105 pounds of comb honey per colony, spring count. Good pasturage for 200 or 300 colonies. **All the above MUST BE SOLD regardless of cost.** For particulars and prices address,

W. J. STAHMANN,
40AIt WEAVER, MINN.

The Ram's Horn...

Is an Independent Weekly Paper of 20 pages—

each page somewhat larger than those of the Bee Journal. The subscription price is \$1.50 a year. It is one of the brightest and best publications of the present day. Its "Platform" is: 1. The Primitive Gospel. 2. The Union of Christendom. 3. Equal Purity—Equal Suffrage. 4. The Sabbath for Man. 5. The Saloon Must Go. Motto: "Have Faith in God."

We will mail you a sample copy of the Ram's Horn upon receipt of a two-cent stamp.

OUR LIBERAL OFFER:

We wish to make our PRESENT subscribers to the Bee Journal a generous offer in connection with the Ram's Horn, viz: Send us **TWO NEW** subscribers for the American Bee Journal for one year (with \$2.00), and we will see that the Ram's Horn is mailed you free for one year as a premium.

Or, send us \$2.00 and we will mail to you the Ram's Horn and the American Bee Journal, both for one year.

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

always fooling his customers by giving them more than they expect. Well, he failed to fool me on that line. He fooled me the other way, by sending me a worthless queen. I put her in a strong colony, and she let the colony dwindle to nothing, and die. And there are a lot of other breeders doing the same. I sent to five different States this season for queens, and was deceived in nearly every one. One man in New York sent me his circular, in which he guarantees satisfaction. I sent to him for a queen, and paid a good price for her. She was no good, and I wrote and told him so. He replied: "Well, if the queen did not prove good, I will send you another at half price." I would not have taken another like her as a gift, if I knew what she was like. I got good queens from some breeders.

J. HAMBLY,
Ontario, Canada.

A Peculiar Swarm.

I send you a sketch of a swarm of bees I found Nov. 13, 1897, as I was going through a piece of woods. It was about seven feet from the ground, on a limb. I got a box, cut combs and bees off, took them home,

Swarm on a Limb.

and transferred them into a four-frame nucleus hive. There was plenty of comb and bees, but not much honey. They did well in their new hive.

A swarm like this is seldom seen in this part of the country, so I thought I would write about it, H. L. PRIMROSE.
Tompkins Co., N. Y.

Has Been a Bad Season.

The season here has been a bad one—no white clover, and cold weather now is killing goldenrod, our great fall source.

J. E. POND,
Bristol Co., Mass., Sept. 21.

Very Poor Honey Season.

It has been a very poor season for honey here. We had a frost in June that killed all the clover, and then it set in very dry, and there did not seem to be any honey in the flowers. I commenced the season with 34 colonies, increased to 84 by natural swarming; they seemed just crazy, for some of them swarmed as many as six or seven times; then I commenced to cut out queen-cells, leaving but two. Some of them did not swarm any more, and some kept on until they were queenless. I had two colonies that swarmed but once, and neither of them reared a queen.

Our main crop of honey is what we call

here cottonweed or wild cotton, which is the same some call willowherb elsewhere.

I winter my bees in large boxes packt with chaff. I shall put in 50 colonies this fall; I think that is plenty for the location. I am 60 years old, and am not able to do any work except tend to the bees, being troubled with paralysis of the nerves.

EDWARD KNOLL,
Grey Co., Ont., Sept. 26.

Honey Crop a Failure.

The honey crop in this county was a failure this year, and unless there is feeding done there will be plenty of empty hives next spring.

CHAUNCEY REYNOLDS,
Sandusky Co., Ohio, Sept. 23.

Early Honey Season a Failure.

The early honey season was a failure here. The drouth of last fall, followed by dry spring weather, so weakened the white clover crop that very little honey was gathered by the bees during the clover season; so poor was the season that the bees were ready to rob at any time. There was a smatter of honey-dew in many localities. The bees are now working actively in the forenoon on the large smartweed (heart's-ease), and all the day long on the little white aster. The odor of the aster nectar floats in the air about the apiary.

G. W. DEMAREE,
Shelby Co., Ky., Sept. 22.

Poor Honey and Cotton Crop.

The honey crop was very poor in this locality, and the little secured cannot be sold at home, as the cotton crop is very bad here and the price still worse. There is no money to buy honey with even at the lowest possible prices.

J. R. JASEK,
Fayette Co., Tex., Sept. 13.

Very Poor Season for Bees.

It has been a very poor season for bees here. We will get scarcely one-third of a crop.

J. Z. RHODES,
Wadena Co., Minn., Sept. 24.

Fair Honey Season.

The honey season here has been fair, with but little fall honey, which was mostly put in the brood-chamber, with little or no surplus.

F. E. WYMAN,
Kewaunee Co., Wis., Sept. 26.

Care of Corn Fodder.—Every man of experience knows that the value of corn fodder as a stock food depends very largely upon storing it away in good condition. There is no other product of the farm that suffers more or deteriorates more rapidly from being wet—rained upon—than corn fodder. It therefore becomes a necessity to handle fodder with great speed and promptness when it is in condition to stack or mow away.

The wise farmer will leave the shuckt corn lie on the ground for days at a time, knowing that ripened grain will suffer but little, if indeed at all, while he immediately hauls in the fodder and stores it away when it is in good condition, thus avoiding the time and expense of reshocking it, to say nothing of probable later loss in food value. Anything that will facilitate in this labor is of positive advantage to the farmer. The Electric Handy Wagon, manufactured by the Electric Wheel Co., of Quincy, Ill., would help out amazingly. In the first place, it is so low and so easy to load that a load of fodder may be placed upon it from the ground; in the second place, the whole operation may be performed by one man, thus saving the expense of another hand. Their book, "Farm Savings," illustrates how it may be done, and tells all about this and other things you should know. Send for a copy before you begin to haul in your corn fodder, not forgetting to mention the American Bee Journal when writing them.

PRINTED Envelopes and Letter-Heads.

We have put in a new small Job Printing Press on which to print our own stationery, circulars, etc., and while being able to do this we may as well do some work for our read-ers, if they will favor us with their orders. If you want Envelopes or Letter-Heads, send 2-cent stamp for samples and prices. We will make right prices for neat, good work. All orders can be filled by express, at small charge, has the weight would not be great.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,
Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—is beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dandant.—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth. Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 400 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 175 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers, \$1.00.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called BEES OF HONEY, 103 page pamphlet. Price, 40 cts.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping, in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tucker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey," 80 p., illustrated, 25c.

Convention Hand-Book, for Bee-Keepers.—By Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The lorepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by C. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2 in the artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st, How We Made the Old Farm Pay; 2nd, Peach Culture; 3rd, How to Propagate Fruit-Plants, Vines and Trees; 4th, General Fruit Instructor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for casting up the price of grain, produce, hay, etc. Price, 25 cts.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Turkeys for Market and Turkeys for Profit, by Fanny Field.—All about Turkey-Raising. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters, 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Sept. 20.—Honey of all kinds is selling well, with the best grades of white steady at 12c; a little fancy white clover has brought 15c. Off grades of white to amber, 10 to 11c; the dark shades, 8 to 9c. Extracted, 6 to 7c for white; ambers, 5 to 6c; and dark, 5c. Beeswax steady at 27c.

R. A. BURNETT & Co.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially-filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax, prime, 24c; choice, 24½c. At present there is a good demand for honey.

WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c; amber, 10@11c. Extracted, white, 5½@6c; amber, 5@5½c; dark, 4½@5c. Beeswax, 22@25c.

The receipts of comb honey are larger.

C. C. CLEMONS & Co.

Boston, Sept. 30.—Our honey market shows a decided firmer tone since our last. A few sales have been made at 15c for an extra fancy lot, while almost all sales ranging from A No. 1 to fancy now are made at 14c, while occasionally, something a little off, will bring as low as 12½ to 13c. We do not look to see any lower prices.

Extracted, Florida, in barrels, mostly 6c to 7c, with a good demand. Beeswax, slow sale at 26c for best.

BLAKE, SCOTT & LEE.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12½c; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6½ to 7c. Beeswax 25 to 27c.

WALTER S. POWDER.

Milwaukee, Sept. 20.—Fancy comb, 12 to 12½c; A No. 1, 11 to 12c; No. 1, 10 to 11c; dark and amber, 8 to 10c. Extracted, in barrels and kegs, white, 5½ to 6c; dark, 5 to 5½c. Beeswax, 25 to 26c.

The condition of this market for honey is favorable for shippers of good quality either in comb or extracted, and the receipts, while they are with us very fair, are not as liberal as may be, while the demand is very fair at our quotations. We advise liberal shipments of 1-pound sections and extracted.

A. V. BISHOP & Co.

Buffalo, Sept. 16.—There is quite an improved demand for honey at present, and moderate amounts can be sold of strictly fancy 1 pound comb at 11 to 12c; lower grades range from 10c downward. We advise but moderate shipments for awhile yet. Extracted—average grades could be sold at 4 to 5c. Fancy beeswax, 27 to 28c; common, 20 to 25c.

BATTERSON & Co.

Columbus, O., Sept. 23.—Fancy white comb, 14 to 15c; No. 1 white, 12 to 13c; No. 2 white, 10 to 11c; amber, 8 to 10c. Extracted, 5½ to 7c.

There still exists a scarcity of white comb, and holders who contemplate using this market should do so early.

COLUMBUS COM. AND STORAGE CO.

New York, Sept. 26.—Comb honey continues to arrive freely. Demand is good for nearly all grades at following prices; Fancy white, 14c; No. 1, 13c; amber, 10c; buckwheat, 8 to 9c; an exceptional quality at 9½c. There is a good demand for extracted, all kinds, at 6½c for white, and 5½c for light amber in cans; Southern, in barrels, 55 to 58c a gallon. Beeswax dull at 26c.

HILDRETH BROS. & SOELKEN.

San Francisco, Sept. 14.—White comb, 9 to 9½c; amber, 7 to 8½c. Extracted, white, 6½@6¾c; light amber, 5½ to 6c. Beeswax, 24@27c.

Stocks are light of both comb and extracted, but more especially so of choice extracted, the latter being in most active request. Market is firm at the quotations, with holders disposed in most instances to ask somewhat higher figures.

Cleveland, Sept. 1.—Fancy white, 13@14c; No. 1, white, 12@12½c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c; light amber, 6c.

The demand for honey is exceptionally good, owing to the crop in this vicinity being very light.

A. B. WILLIAMS & Co.

Detroit, Sept. 24.—Fancy white, 11@12c; A No. 1, 10@11c; No. 1, 10c; fancy dark or amber, 9@10c; other grades, 8@9c. Extracted, white, 6@6½c; dark or amber, 5@5½c. Beeswax, 25@26c.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

[Continued from page 627.]

FIRST DAY—AFTERNOON SESSION.

The convention was called to order at 1:30 p.m., the session being opened with the singing of "Bee-Keepers' Convention Song."

In the absence of Mr. W. F. Marks, of New York, the Secretary read his paper, entitled,

Organization Among Bee-Keepers.

Your humble servant can in no wise add to the many excellent articles that have appeared on this subject from time to time; no one realizes that more than himself, but the subject is an important one.

The bee-keepers of the United States should aim to have the best organization in the country, and unless I am very much mistaken there is no good reason why they should not succeed. You may say, "Easier said than done;" to be sure, but "nothing without labor." The first questions then are: How shall we proceed? How can we get the bee-keepers interested? We cannot hope to succeed unless we first get them interested. I would not advise any new or untried plan. Neither would I advise any plan that has been tried in the past and failed. We can look around us and see many successful organizations; let us profit by their experience and adopt a system of organization that has proven successful.

We should look around us, take the most successful organization we can find for a pattern, adopt its plan, and just go to work and excel it.

There is a prevailing idea that what we need is a fat treasury; it is not necessary to a good organization. I would rather enter a battle for our pursuit with one hundred thousand bee-keepers at my back than with as many dollars in the treasury, backt perhaps by one-tenth that number of bee-keepers. Money alone cuts a poor figure in such an organization, unless backt by commanding influence. With one hundred thousand—aye, one-half that number of interested bee-keepers behind us there would be powerful influence, and no lack of funds.

You will observe that all successful organizations extend their order into nearly every town, village and hamlet; so must we, if we would succeed. We must get the bee-keepers interested in the work, by forming, or encouraging the formation, of local societies; such a course will give them a personal interest in the undertaking. A little reflection will convince you that the interest in our organization at the present

time is strongest in those localities where there are local organizations.

In conclusion, I will repeat, we must profit by the experience of others, adopt some popular and successful plan of organization, and go to work systematically, determined to succeed.

W. F. MARKS.

There was then a discussion of the subjects of co-operation and organization among bee-keepers; both subjects being considered together as follows:

Dr. C. C. Miller—In order to have the procession move I will give one thought, and that is, that I believe the one thing we ought to do above all others is to press for membership in the Union, independent of attendance at the conventions. There is our weak point. We have in the past had many good conventions, but our membership has always been a fleeting one. The rule has been that only those who attended the conventions became members. We have gotten out of that

Mr. C. N. White, of England—See page 647.

track a little; but we want to get out of it entirely. Every one who becomes a member once should be a member continuously, year after year. And then we should urge persistently and continuously that all bee-keepers become members of the Union. That is the one thing more than anything else, perhaps, that we need now.

Pres. York—Perhaps methods of securing membership might be suggested.

E. R. Root—The paper speaks about local organizations. There is no State that has so many local organizations as New

York. I was greatly surprised to see how many local organizations they had. There is one of them in Seneca county that has a membership of something like 75, and they meet once a month during the honey season. In the county adjoining that they had an organization with something like 60 members. In Otsego county and Tompkins county they have local organizations. Tompkins county has a local membership of something like a hundred. I think there are something like a dozen counties well organized. Mr. Marks speaks about local organizations affiliating with parent organizations. I doubt whether that could be done in States where bee-keeping is not so extensively practiced as in New York. There is scarcely a farmer in those counties that does not keep some bees. In each one of those organizations they recommend bee-keepers to take some bee-paper, or to become members of the United States Bee-Keepers' Union. I think you will find the membership from that State is greater than from any other, probably due to that one fact.

Mr. Lathrop—We have several bee-keepers' organizations in Wisconsin, some of them quite prosperous, and I understand that there are some more being organized this year. A good many of our bee-keepers in southern Wisconsin have been members of the National Bee-Keepers' Union, and we voted to recommend that the two organizations should be combined, but our members are slow to join the United States Bee-Keepers' Union while they are members in the other, and while they have paid their dues. I never joined this Union until to-day because I was a member of the other organization, and I believe that up to the present time the work has been all right, and I had the protection I needed in that organization. I would like to see the membership in the National Bee-Keepers' Union come into this, so that we could all be together. I think that would be a good step towards what you are talking about now.

Dr. Mason—You say that the old Union has furnished you all the protection you needed. What do you mean by that? What protection does it furnish?

Mr. Lathrop—Well, it is like life insurance. It never did anything for me, but I always felt that I had something to fall back upon in case of emergency.

Dr. Mason—What would the emergency be?

Mr. Lathrop—There might be an emergency. I have one apiary that I have had 13 years in a certain place, adjoining another man's property. It is not near a public highway, but the man who owns the land cultivates corn there. He said the bees bothered his horses, but that he would try to work, and if he couldn't work then he would do something else—he would try to have the bees removed as a nuisance, or something of that kind. I put up a high board fence, and took all the precautions I could. I expected to have a lawsuit, and I understood that if I did the Union would fight it for me. I was speaking of the National Bee-Keepers' Union.

Pres. York—I should like to ask Mr. Lathrop why he would not receive the same protection by being a member of the United States Bee-Keepers' Union?

Mr. Lathrop—I think I would. As I had membership in the other I thought it would be all right for the time being, because it had always done good work and been successful.

Dr. Miller—I am not going to give anything new at all, but I want to say that I think one of the greatest things to help increase the membership is the influence of the bee-papers. They have done good work, and I believe that a continuance of that same work, and possibly a little more work on that same line, will do great good. Possibly they need a little encouragement by knowing that we recognize their work. Then it might be a good thing for those who write to the papers to mention the matter and urge that all should become members of this Union. I very much doubt whether there is any one thing that will do as much to increase the membership as that. I believe the bee-papers could do more than they have done. They have, of course, done more than they are paid for doing; but I believe that if they will do a little more yet it will do good.

Dr. Mason—The editors of nearly all the bee-papers have said to me, "Whenever you have anything in the line of the work of the United States Bee-Keepers' Union, let us have it." I think we all feel under obligations to the bee-periodicals. If Mr. Root wasn't here I would say that we are a little more indebted to the American Bee Journal than we are to Gleanings. Editor Merrill, former editor of the American Bee-Keeper, pitched into Mr. York and myself rough-shod when this Union was first started, for the part we took in its organization, but the new editor, Mr. H. E. Hill, is doing all he can for the Union, and is ready to do more. On the first page of our program is a cut that Editor Hill got up and loaned to us for use in printing the program. I for one feel very grateful to him. Dr. Miller talks about the papers doing

more than they are paid for. We don't pay them anything. Editor Hutchinson, of the Bee-Keepers' Review, does all he can to aid the Union, and Editor Hultermann, of the Canadian Bee Journal, speaks a good word for us whenever he can.

Dr. Miller—I do think they can do a little more if they want to, and I don't think we ought to do anything to stop them.

Pres. York—Perhaps it would be all right if I asked Dr. Miller to tell the publishers in what way they can be more useful. There are some things that publishers "don't know," the same as with Dr. Miller. (Laughter.)

Dr. Miller—In reply to that I would say that they might do a little more of what they have been doing, or perhaps do it a little oftener. The quality has been good, but the quantity might be increased a little. Not that I am finding fault at all, but a little more of the same kind would do more good. I am only saying this in order to encourage them by making them feel that their work is not without result. They certainly have done more than ought reasonably to be expected of them. I believe that the lack is rather on the part of those who write for the journals. We ought ourselves to give them something oftener, and not depend upon them to furnish the material and the place to publish it.

Pres. York—I think one great help to the publishers would be this: Let the Union do some real, active work, and we will report it. That, I think, would help more than anything else to increase the membership.

Dr. Mason—I might say that Mr. Marks, at my suggestion two years ago, when we were trying to organize this Union, sent me a constitution, and in it he embodied these thoughts of his in detail about starting up local organizations. But it seems that it is not feasible; so many of our people are selfish. I may feel that I do not need to pay a dollar to be protected, because I can take care of my own affairs better than the Union can; but I feel that I am under obligations to the fraternity in helping to do away with the adulteration of foods. That is the reason I gave my dollar a year.

Frank Rauchfuss (Colo.)—I am of the same opinion as Mr. Marks, that we should organize county and State organizations; they should be the center, and the national organization should be the head. That is the way I have been talking at home. I really think it is feasible, because I have seen what has been accomplished in Germany. It is done there, and I don't see any reason why it should not be done here.

Dr. Mason—Are there not a great many more bee-keepers in Germany than there are here in proportion to the inhabitants? and aren't they closer together?

Mr. Rauchfuss—Yes, sir; and they are a different class of people; they are mostly teachers, preachers, and wealthy farmers, who can afford to spend a little money in going to meetings, and things like that.

Dr. Miller—Mr. Rauchfuss will remember that there are dozens and dozens of those who never attend the meetings and yet are members. There is where the Germans have got the start of us. With us it is too often the case that only those are members who attend the conventions; but those plodding Germans stick to it, year after year, and if they never go to the conventions in their lives but once or twice, all the rest of the time they are members. They have large societies and large meetings, but the meetings only take in a small part of the membership. While I am willing to have the Germans come in here with us, I would like to beat them in some things. If we could only beat them in that respect, I would like it very much.

Mr. Rauchfuss—Our Colorado association has worked under the same serious difficulties. We have a small membership, and I have been trying to get the membership up. I had some help from the American Bee Journal, and we appreciated it very much. We have done this much: Every one that is a member of the State organization derives some benefit in buying his bee-supplies. That is what gets them. If they see that by paying 50 cents for membership they can save \$5, they will come in every time. We have 150 members, and more coming.

Dr. Mason—Last year the Secretary of the Salt River Valley Bee-Keepers' Association (in Arizona) sent me 17 names and \$17. This year he sent 14 names and \$14, and some names had been sent before that. None of them have attended our conventions. They are too far away to make it convenient to attend. I don't know but it would be a good plan if your next Secretary would write this matter up and put it in the papers. I believe that we can organize as the Colorado folks are doing.

Mr. Rauchfuss—There is another way: Start a case—prosecute somebody for adulteration, and show the bee-keepers that we are doing something with the money that has been

paid in, and that will induce others to get sufficient courage to join.

Dr. Mason—We don't have any need for that in Ohio, so far as adulterated honey is concerned. We have a first-class State law, and a first-class man as Commissioner to see that it is carried out. I have been watching for the last two years for some one to prosecute, so as to get the glory for the Union, but I can't find any one dealing in adulterated honey except such as is labeled as required by our excellent "Pure Food" law.

Mr. Whitcomb—The best plan for getting members for the Union that I have found, is, when you go out and meet your brother bee-keepers, talk to them. Every member that is here to-day can get two or three of his bee-keeping friends who are not members to come in. We must have a fund before we can commence prosecutions. It takes money to conduct a prosecution, and we need to have a good fund first. That is what we have been waiting for, to get the membership strong, and to get a fund before commencing that work. We must not make a failure of the first prosecution. When we get a good membership and get money in the treasury, then we can go ahead and prosecute and do some good work. I know of no better way than for every brother and sister who is a member of the organization to go home and get some of their bee-keeping friends to join—send in their dollars, and have them become members. That would swell the treasury and the membership admirably.

Questions were then taken up for discussion as follows:

BEE-KEEPING, PUBLISHING OR MANUFACTURING.

"Which is the most profitable, keeping bees for honey, publishing a bee-paper, or manufacturing bee-supplies?"

A. I. Root—Whether you are going to keep bees for honey, or publish a journal, or manufacture supplies, you can't succeed in any one of them unless you put brains and muscle into it. When I look back over the years that I have been engaged in the work—and I believe I have made a success in all three departments—I would say that I succeeded because I put brains, hard work and energy into each. If the rest of the world don't know how many hours I put in, Mrs. Root does. She said again and again that I would work myself out, and kill myself. But it is better to wear out than to rust out. I kept bees for honey, and had lots of hardship and worry. My early experience was a series of blunders, but little by little I began to get the upper hand. When a man goes into a certain business and puts his whole life and energy into it, he will sooner or later get his reward. Whatever you are doing, you want to do it with all your might. I don't think publishing a bee-paper would have been profitable if I hadn't put energy and soul into it. But I made a success of it. We had to make a success of honey-production and of bee-papers before there was any field for the manufacturing business. Years ago, when I first started, and when the people were all feeling sorry for me because I had let this new craze run away with me, I said, "Look here, gentlemen, the time is coming when the bee-keeping industry is going to rank fairly with the butter and egg business." I had some pretty lofty aspirations. I had faith in strength and energy, and I had faith in the great God above. Faith is a great thing. The one who has faith in God, and faith in his own brain and muscle, is the one who is going to succeed. It seems to me it doesn't make so much difference what you are working at if you are working at it with all your might. And in regard to wearing one's self out, I don't believe I have felt so young and spry as I have in the last four or five months.

There is another point I want to make. There was one time in bee-keeping when I had made a fair success, and then we had seasons like the past. We had all sorts of discouragements and mishaps, and I had about decided to give it up. I piled away my books and papers, and sort of felt that I would quit. Mrs. Root rather remonstrated with me, saying, "You don't want to throw away what you have done. I would just go on, and may be you will have a better honey season." There were only 11 colonies left. I thought it was a good time to "wind up," but she didn't like the idea of my giving up. The next year I increased those 11 colonies to 44, and the next year with those 44 I got that big crop of honey—over 6,000 pounds. Don't turn your back and show the white feather. If I had quit I would have lost faith in myself, and may be lost faith in God. Then I would have started in some other kind of business kind of half-hearted, and likely made a failure of it, too. Don't give up on account of a few failures, or a succession of failures. I have known some who have been at it four or five years, and said they were ready to quit, whereas if they held on a little longer it would have been like the man who was sinking the oil-well. He had gone down a

good ways and hadn't struck any oil yet, and he was getting discouraged; and then some one bought the well and sent it down only another foot, and struck oil. That is just the way with bee-keeping. When you get ready to say it doesn't pay, and lose faith in man and God, it is a bad place to be. Stick to your trade, stick to your religion, and stick to your faith in God, and to your faith in your neighbors. What is that old text? "Be not weary in well doing, and in due time you will reap if you faint not."

Pres. York—I presume that Mr. Root is the only one that can answer the whole question. He has been through all of it. But he has not answered it yet, as to which is the most profitable.

A. I. Root—They all have their ups and downs, and I might say that it is not an easy matter to make a success in any one of them.

E. R. Root—I don't know that I can answer the question, but I will say this: I wrote to Mr. John H. Martin, of California, and asked him why there wasn't a bee-paper published on the Pacific Coast, and he said they told him it was more profitable to produce honey. I presume that was the fact. I don't think that in our locality in Ohio we could produce honey and make a big thing out of it. Perhaps it is more profitable to produce supplies.

A. I. Root—But there is a young bee-keeper only a couple of miles from us that has produced profitable crops of honey year after year.

Pres. York—Last year in Chicago I averaged 100 pounds of honey to the colony. As to the second part of the question, I am publishing a bee-paper, but I have not found that there is so very much money in it. Perhaps when I get to the third part of the question I will make some money! I think as Mr. Root says, it depends a great deal upon the man in any case.

Dr. Miller—With regard to one point brought out: I am not so sure that it is right to throw your whole soul and might into it. There are some things, perhaps only a few, where it is wise to throw your whole might into them, but I very much doubt whether bee-keeping is one of the things. I have in mind a case that I knew years ago, of a man who was very enthusiastic about bee-keeping. He went into it all over; he worked so hard at it that his soul was worn out in course of time. Then he almost abandoned it entirely, instead of going on and making use of the advantage of his experience. He practically deserted the brotherhood, and then went into publishing a paper. He threw his whole soul into that, and made one of the best papers that could be published; yet if it had not been for the new generation following him, in course of time that would have been deserted utterly. Fortunately the rising generation took that off of his hands and continued it successfully. Then he went into the business of producing supplies, and he made a big success of that—went into it with his whole soul; but if it had not been for the rising generation that would have been deserted entirely. Then he went running off after cabbages, and I don't know but he has made a success of that. If instead of throwing his whole soul into bee-keeping and allowing the hobby to run away with him—throwing the reins to the wind, instead of controlling it as he might have done—I believe to-day we might have gotten a great deal more from him than we have. I believe the Lord gave to him ability that He did not give to the ordinary members of the human family. I believe one thing we are to do is to hold a firm grip on the reins of the hobby that starts with us. When I find that bee-keeping occupies the whole of my time, then I want to let it go to a certain extent and take something else with it.

DEPENDENT ENTIRELY UPON BEE-CULTURE.

"How many of the members present depend entirely upon bees and honey to make their living?"

On a call for a showing of hands, two responded in the affirmative.

Dr. Miller—My living is all made by what I know about bees, but it is not all made by working directly with bees.

J. S. Scott—I understand that does not mean the production of honey from the bee. I buy and sell honey as well as produce it. I don't produce honey to the extent of making my entire living out of it.

Dr. Miller—In a certain sense that would allow Mr. Scott to hold up his hand as well as myself—that is, we depend entirely upon bees and honey for our living. Wipe away all bees and honey and we are dropt to the ground.

ACTUAL COST OF A POUND OF HONEY.

"What does it cost to produce comb honey; also extracted honey?"

Pres. York—Perhaps the question should include the words "per pound" in order to enable us to get at it.

Mr. Danzenbaker—I don't see that there is much difference, in my experience. Years ago I had an extractor and used it seven or eight years and then sold it. Then I bought another after five years, and I had it for four years without unpacking it, for the reason that I was getting all the comb honey that I thought the bees should store. The year before this I produced perhaps 120 pounds of honey that I didn't succeed in getting into comb honey; this year none—all comb honey. What it costs I cannot say; it depends on the number of bees in one place. Some say that 100 colonies can be kept in one place. I think 10 will do much better. This year there were 14 colonies in box-hives only two miles from where I had 90. I made a bargain with a man that I would give him the hives if he would let me have all the honey I could produce to May 20. I transferred the bees, having a man to help. That took two days. I got a sugar-barrel full of honey. I put on sections and got 900 finished sections from the 14 colonies. I think I went but once a week to that yard—perhaps six times in all. I can't say what it cost. I don't think I could have got more honey if I had extracted. I bought the foundation; that is all paid out. I got \$135 for the honey from the 14 colonies. I did better with them than in the yard where I was working with the bees every day, where there were 90 colonies. That is the result of a few hives in a place. I had a few bees in a place that paid \$15 to \$20 a colony. This year there was a man that had 100 colonies and he got a fair crop. I had a yard about two miles from it, and I got four times as much, but I hadn't so many bees. I have been at Medina. Look at the number of colonies in that yard for queen-rearing. I don't think a neighbor could succeed there if he had only one colony. It takes all the honey there is to keep breeding bees. The cost of honey depends upon the situation. I know some places there is no profit in it. In the case I spoke about, with the 14 colonies, the hives were worth \$1 apiece. It took us three days to transfer, and six days work in getting the honey. That was nine days altogether. I got \$135 worth of honey.

Mr. Cameron—Suppose you have a case where you spend \$40 for supplies and don't get any honey; then how much does it cost a pound? (Laughter.)

Mr. Whitcomb—It takes 15 pounds of honey to produce a pound of comb. In this locality I doubt whether we can produce comb honey profitably for less than 15 cents per pound, while we can produce extracted honey for 5 cents. The bees haven't time to put up comb in the fall, when the heart's-ease is yielding. We are compelled to produce more extracted honey than comb honey here, because there isn't time to build the comb when the honey is flowing. The 15 pounds of honey it takes to build a pound of comb is certainly worth something. Honey-comb isn't gathered, it must be built. It takes the time of the bees, and it takes material. I doubt whether a pound of comb honey can be produced profitably in this section for less than 15 cents. I would rather produce extracted honey at 5 cents, so far as profit goes, than comb honey at 15 cents. Of course, a great many out here produce comb honey, but very little of it. I doubt whether in the great alfalfa districts of the West, where the honey comes in at times very rapidly, it is not more profitable to produce extracted honey than comb honey. Here we sell more extracted honey than we do of comb, because here our customers take a gallon of the extracted honey at a time, where perhaps otherwise we would sell them a pound. They buy it cheaper, of course. They know it is as pure as the honey they buy in their comb.

A. I. Root—In Arizona, where they have those great alfalfa regions, immense quantities of honey are produced. There was one apiary of 300 colonies in one spot that produced 200 pounds to the colony. The man told me that if somebody would take the honey off of his hands at 3 cents a pound, he would go ahead. He figured that he could produce it at 3 cents a pound and make a success of it—that is, extracting. All he got over the 3 cents he counted as profit.

Mr. Cameron—I remember that a long time ago Dr. Gallup published the statement that he got out of one colony 50 pounds per day. You can't get 50 pounds of comb honey in a day. I don't believe it.

Dr. Mason—If there is one honey-producer that we feel we can rely upon in his statements it is Dr. Gallup. Dr. Gallup got in 30 days 600 pounds from one colony. Dr. Gallup don't lie.

Mr. Cameron—He couldn't get comb honey at that rate.

Mr. Rauchfuss—In regard to the cost of producing comb and extracted honey, we had some discussion at one of our State meetings four or five years ago, and it was estimated then—and those estimates were given by specialists—that it

costs 4 cents to produce extracted honey, and 7 to 8 cents for comb honey.

KEEPING BEES NEAR CULTIVATED CROPS.

"Can a bee-keeper be forced to remove an apiary because the land adjoining is used for cultivated crops, provided the bees are on his own land, are not near a public highway, nor any dwelling, and also separated from the adjoining property by a high, tight board fence, the claim being that the bees sting men and horses?"

Dr. C. C. Miller—That is a question of law. It might be answered very differently in different States. I do not believe that we are competent authority to answer that question. We may waste time by discussing questions that do not properly belong here. There are things that can be better discussed in the bee-papers, and there are things that we can better discuss here face to face. I think our time can be better occupied than in discussing this. If any one knows the answer of course we will be glad to hear it, but I do not think we are wise in spending time to say what we *think* ought to be the answer.

HOW MUCH EXTRACTED TO PRODUCE A POUND OF COMB HONEY—FEEDING BACK.

"How many pounds of extracted honey does it take to produce one pound of comb honey?"

Mr. Danzenbaker—I suppose that means the relative quantity that the colony will produce of each. In June and July, in the warm weather, I think the bees will make the wax they need to put the honey in. In the fall they do not generate so much wax. A man who is producing extracted honey in the cool weather would have the advantage. In my experience in June and July I claim I can make more money on comb honey than on extracted. The young bees in the hive are elaborating the wax and molding it into the comb to put the honey in that the field-workers bring in. It depends on the season.

Pres. York—The person who asks the question may have been thinking of feeding back: how many pounds of extracted honey must be fed to produce a pound of comb honey?

Mr. Danzenbaker—I don't think it would pay to do it.

A. I. Root—The question about feeding sugar to make honey comes in here. I believe we are all decided that it does not pay, even if it is honest.

E. R. Root—It has been stated in the books that it takes 20 pounds of extracted honey to produce one pound of honey-comb.

Dr. Mason—If I had completed an experiment I had begun, I could have said something about this. I do know this, that within the last 15 days I fed about 35 pounds of extracted honey, and I have taken about 40 pounds of comb honey from it. Saturday evening I raised up two supers of plain sections I had on the hive—24 sections in each one, 48 sections in all—and they felt as if they weighed 50 pounds. I put on a bee-escape, hoping to get time to find out something about it, but I didn't. I am quite sure those 48 sections are well filled. Other colonies were by the side of that, and gaining some, but not very much. They got more honey than I fed to them. I am going to look at it when I get home, and then I will report.

TEST TO DETECT GLUCOSE ADULTERATION.

H. L. Miller—I should like to ask if there is any way of testing honey to know if there is glucose in it.

E. R. Root—Certainly, there are several ways known now. Mr. Selzer, of Philadelphia, has made a specialty of it. He says he can tell without doubt whether a sample of honey contains glucose, and very nearly the percentage, by chemical means.

H. L. Miller—People generally don't have those means to use. I understand that by putting the glucose into tea, it will turn the tea dark. If that is true, I should think that would be as good a way as any.

Eugene Secor—I don't know of any way of testing except chemically—analytically.

An Attendant—Does glucose candy like honey?

Dr. Mason—It will candy, but not like honey. I have got two gallons candied.

[Continued next week.]

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

CONTRIBUTED ARTICLES

Best Hive for Farmers—Box or Frame?

G. M. DOOLITTLE.

A correspondent writes that he has been induced to take the American Bee Journal, and after reading some of my articles, and those of others, he has become interested in bees. He says he is a farmer and wishes me to write an article on the best style of hive, with the management of the same, for the farmers who may keep a few colonies of bees, for he thinks there may be many other farmer bee-keepers among the readers of the Bee Journal besides himself.

In complying with this request, I would say that all depends upon how "the farmer" intends to keep his bees, and what time he expects to spend on them. If he intends only to give the swarms when they issue, and put on the surplus arrangement when the white clover commences to bloom, paying little or no attention to them otherwise (which is the way the average farmer tends to the bees), then I would say that the box-hive, formerly known as the "Miner hive," is as good for such an one as any hive in existence.

Why I single out this hive from the hundreds of other box-hives or log-gums of the past, is, that the top was so arranged that by the removal of a "honey-board" the surplus arrangement could be set immediately over the combs, thus placing no more barrier in the way of the bees in entering the sections than there is with the best hive ever invented; and should our farmer ever want to sell his bees, they will bring from 50 cents to \$1.00 more per hive than they would in any of the others, on account of the provision Mr. Miner made of slats standing with the knife-like edge down, so that the bees nearly, if not quite always, build their combs straight and true, so that, when they come into the possession of the practical bee-master, they are easily transferred to any of the movable-frame hives.

If, on the other hand, the farmer is willing to give the bees the attention which they require—which is far less than he would give one of his horses or cows—then I would say that nothing short of a good movable-frame hive will be good enough for him. As to which of the frame hives is best, I would say, much depends on the locality in which we live. If in the South, then the Langstroth or even shallower frames will do as well as any; but if north of latitude 42° to 45°, then I would prefer a deeper frame, if the bees are to be wintered on the summer stands. Of course, chaff-packing will help the shallow frame hive; but I believe it is something conceded by all, that a deep frame is preferable for the extreme North, where bees are to be wintered out-of-doors.

A hive which will bring the colonies out strong in the spring is something worth looking after, where the crop of white honey comes early in the season, as it always does where white clover is the chief source of supply, and the hive which accomplishes this item the most perfectly, is the one the farmer, or any other person keeping bees, should look after. Lots of bees in time for the honey harvest, without contracting the swarming-fever, means success to their keeper, while few bees at that time means a failure, no matter how many there may be at all other times.

The early management of any hive consists in knowing that the bees have a good queen, plenty of stores, and that they are tucked up warm and secure at the top of the hive. Bees will build up even if the top of the hive has cracks in it; but all will see that the heat which passes out of these cracks takes so much warmth away from around the cluster, and causes the bees to burn just so much more fuel (honey) to replace the same, only to be carried away again. Therefore, it pays well to see that the top of the hive is tight in early spring.

Plenty of stores are needed, for if the bees have to scrimp on account of fear of starvation, not nearly so many bees will be reared as there would be were there so much honey in the hives that the bees could use it lavishly. A hive that has 20 pounds of honey in it on the first day of April will, as a rule, give double the bees at the commencement of the clover harvest, than the one that has only five pounds, providing the latter does not starve altogether. A good queen is an actual necessity; for, tuck up the hive as well as we may, and give the bees a surplus of stores, to such an extent that they feel

rich, yet if the queen is poor or falling there will be only enough bees reared to keep up the dying population of the hive, resulting in little or no honey to the owner.

Seeing that the bees have the three requisites named above, little more will be needed from the farmer till swarming-time arrives. When the first swarm issues he will mark the date on the hive, so that in eight days he can go in the evening and listen for the piping of the first young queen, which usually emerges from her cell sometime during the seventh day, where the swarm issues on the sealing of the first queen-cell, as it generally does. If he hears the queen piping, he may know that, if the weather is pleasant, a second swarm will issue the next day, unless thwarted in some way, and also that there is a queen hatch and at liberty in the hive. If he hears this piping the hive should be opened quite early the next morning and every queen-cell cut off, which will surely prevent any after-swarm issuing from that hive.

To be sure no queen-cells are mist, it is well to shake the bees off each frame, in front of the hive so that none are hidden by the bees being so thickly clustered upon them.

The surplus arrangement should be put on each hive as soon as its combs are filled with brood and there is honey coming in from the fields, no matter whether they have swarmed or not, and upon all others as soon as there are bees enough in them so they can keep up the necessary warmth for brood-rearing, with the surplus arrangement on.

As soon as the sections are filled they are taken off, and more put in their places to the end of the harvest, when no new ones should be put on to become travel-stained and stuck up with propolis, and also so that the bees will be more likely to finish what are already on.

Any farmer can do as much as is here outlined, and I have sometimes seriously questioned whether this will not give any of us as good results as the more frequent manipulation of each hive, which I and others have insisted on in the past, where natural swarming is to be the order and method of increase.

Onondaga Co., N. Y.

Should Hive Bottom-Boards be Nailed?

BY C. P. DADANT.

The above subject is suggested to me by reading the article by Wm. M. Whitney, on page 594, who urges that there are serious objections to the use of loose bottom-boards, and thinks they should be nailed to the hive. We have tried both the fast and the loose bottom-boards in the same apiaries for years, and I will now give my reason for the preference I entertain in a very decided way for the free, removable bottom-board.

Take the hive at the beginning of spring, when the bees are just going out of winter quarters. There are often thousands of dead bees on the bottom-board, and they are sometimes so packed into a solid, rotten, moldy mass that it is very difficult for the bees to remove them. With a movable bottom-board all that is required is to pry the hive from it with a chisel, breaking the propolis fastening that holds the two together, and with a small, straight block of wood in ten seconds you can scrape all dead bees, debris, and dirt from the bottom that it would have taken weeks for the bees to carry away. It is true you can remove this dirt with a tight bottom as well, by transferring the bees and combs into another hive, but the latter method is too slow for me.

In the spring, if by some accident or through some manipulation, it happens that some comb has been broken, either by transferring or straightening, and some honey has been made to run down to the bottom-board at a time when robbers are wide-awake, if you use a loose bottom you can, in one or two minutes, bring out a fresh bottom-board and transfer the hive from one on to the other. You thus avoid having to run some risk of your colony being robbed owing to the leaking honey.

Again, of all the parts of the hive the bottom-board is the first to get out of shape, to rot, to warp, to become worthless. With a loose bottom-board it takes but a minute to renovate the foundation of the abode of your bees, doing away in a twinkling with a defective piece which may have been damaged by unexpected causes, such as the gnawing of mice, or by a loose knot.

Then in hot weather it is surely a very satisfactory thing to be able to increase the ventilating space at will. Mr. Whitney favors re-spacing the combs by removing one or two from the brood-chamber for ventilation. I will agree that this looks very nice at first sight, but I doubt whether Mr. Whitney has done this more than one season, for when he finds that the bees have thickened the combs so as to leave only the usual bee-space, and that they have perhaps built an

additional comb between the others, and that he has a lot of cutting down to do before he can again place 10 frames in his hive, he will not be likely to want to try this experiment again. We have occasionally had to handle hives of bees in which an inexperienced person had placed 8 frames only where 10 really belonged, and we have always found that the bees managed to fill all the space according to their natural habits. I had almost as lief handle a hive in which there were too many frames as one that contained too few. This reminds me of a bee-keeper who filled his hives entirely full with frames $\frac{3}{8}$ inches thick, putting 13 of them in an 8-frame hive. It was a nice job to remove them, and I would rather have box-hives than hives arranged in this way.

Ever since we have begun using loose bottom-boards and raising the hives in front in hot weather, we have avoided the breaking down of combs by heat. I must say, however, that the straw mat inside of the cap over the combs or the supers is a very good adjunct as a preventive of the action of the sun's rays.

We can see no advantages whatever in the tight bottom. If one wants to transport hives they can easily be fastened by a cleat on the side which will fasten the cap or the cover at the same time as the bottom; or if for transporting them about the apiary, one can resort to the Van Deuzen clamp, which makes a tight or a loose bottom at will.

The only purpose for which we have seen any use for bottoms nailed fast to the hive is in shipping or transporting. We have transported thousands of hives from one apiary to another, and have sometimes nailed the bottoms to the hive for that purpose, but we have never hesitated in taking the nails out afterwards, and we usually leave them to project a little for that purpose when they are driven.

If there are advantages to the tight bottom which counter-balance the disadvantages, I for one have surely not found them.

Hancock Co., Ill.

Do Italian Bees Produce Better Honey?

BY A. W. HART.

Mr. Bevins, on page 518, says he is sorry I took his "squib" so seriously. Well, I am not feeling very badly over the matter, but how would he have me take it? I should have made no reply had there not been criticism and ridicule, and an effort to disparage and impugn my motive in asking the question.

The first sentence, in my first communication, reads: "We sometimes see the statement made," etc., and I have shown that prominent bee-men do entertain and promulgate the doctrine that Italian bees produce better honey than others, etc. I asked the question as to how it is, when all have access to the same sources of supply, and this, as Shakespeare says, is the whole "head and front of my offending;" and for this I am called in question, my motive ridiculed, and I made to appear as "putting up a job on the bee-keepers."

Mr. Bevins says: "I would like, as well as Mr. Hart, to know why Italian bees store a better honey than others," etc. That is what I wanted to know, and why I asked the question of those supposed to know, and why did not he, or was he afraid some other sharp critic would arise and accuse him of "putting up a job on the bee-keepers?"

He says what he said was not an answer to my question, was not intended to be. Then why was it written? Surely, my question was fair, and sought a fair answer, and not the ridicule he gave it in trying to make me pose as fooling with the bee-keepers. I have proven my position, given my authority for the "opinions and statements," and yet Mr. Bevins must fire a parting shot, saying, "'Tis still my belief..... that Mr. Hart has started the bee-keepers in pursuit of an ignis fatuus." I may be afflicted with a little mental obtuseness, unable to comprehend the logic of things, but I fail to fathom the motive of such flings, unless it be for "distinction," or, may be, a challenge to cross swords. If it be the former, he is welcome to all there is on both sides; if the latter, I shall not dodge, tho it would doubtless be uninteresting and unprofitable to the readers, and of necessity lead beyond the limits of apian literature, and consequently inadmissible to the columns of the American Bee Journal. Nevertheless, the legend "At Home" may be found on the "Jintel."

Mr. B. says: "Mr. Hart mistakes." Now, I might use the boy's argument, and say, "You're another." He says he did "not say, or intimate, that his [my] question was entitled to no consideration." Mr. Hart did not say he did. Mr. B. mistakes. How does he read? Let me quote from Mr. Hart, page 457: "Mr. B. says I came at them with another 'if,' which is entitled to no more consideration than the other." Is it not clear that it is the two hypotheses to which he

alludes—the aforesaid "ifs"—of which I said he intimated they were entitled to no consideration, and not of the "question."

Mr. B. is right when he thinks I thought so, too, nor did I use them as my reasons, for did I not say "if as some say," showing they were quotations? Then, why attack me on that line? I have shown that men do have the opinions, and state them, that Italians produce better honey. Maybe they are right. I did not see it, and asked for light. I think a man ought to always be "able to give a reason for the faith that is in him." I asked a question touching that faith, and for this question Mr. B. tells you his belief still is, that Mr. Hart has started the bee-keepers on a "jack-o'-lantern" chase, then meekly and cheekily says, "Let us have peace." It seems to me there was peace till he made war. Who "puts up a job?" The one who states or affirms or erects a structure, or the one who merely interrogates, Why doest thou thus?

Mr. B. may have thought that after the explosion of the 14-inch shell from his big gun I would be demolisht, and placed hors du combat, hence the "Let us have peace." Yes, by all means, let there be peace, and when the terms are arranged on the basis of fairness, right and justice, I am ready at any time to sign the "protocol;" but I shall "yield no territory," and Mr. B. must pay his own "transportation."

Stephenson Co., Ill.

MR. CHAS. N. WHITE.

This week we have the pleasure of introducing to our readers, by pictures of himself and apiary, Mr. Chas. N. White, of England, whose series of nine articles on bee-keeping appeared in this journal during July, August and September. The picture of his apiary we use by the courtesy of Gleanings, that paper having copied it from the British Bee Journal, from which we take the following paragraphs concerning it and its scholarly owner:

Our bee-garden picture shows the apiary of Mr. C. N. White, and is situated in the village of Somersham, Hunts., in which place he has resided for the past 18 years. In response to our request for a few particulars regarding himself and his work to go along with the picture, Mr. White says:

"My first lessons in bee-keeping were taken from my old friend and schoolmaster, Mr. Winter, of Caistor, Lincs., with whom I lived while apprenticed as pupil teacher. Here, 28 years ago, I first saw bees kept on a humane principle, for my *bee-master* (tho hardly progressive or scientific enough to fairly give him a claim to that distinctive title) preferred an economical as well as humane system of bee-keeping. From 1875, when I left college, to 1879, when I settled at Somersham, I was gleanng information on bees, and learned much from Mr. W. B. Jevons, of Market Rasen, who was then an expert bee-keeper. Here, then, I formed the nucleus of an apiary that eventually became my pride, and did not lack the admiration of friends. The work and worry inseparable from scholastic duties in a rural school of 250 children at first prevented me from doing very much with the bees; but since I have been able to turn to the hobby in grim earnest, I have by practical work, and by the use of my pen, endeavored to show other rurals that bee-keeping is a source of interest and profit, and tends to promote good health and the power to work hard. For myself and the benefits it has conferred in this line, the multiplicity of duties I have performed and still attend to, fairly well shows."

Few will dispute Mr. White's claim to be called a worker when we learn that he is Hon. Sec. Hunts. and Cambs. Teachers' Association, and in this capacity has been representative at annual conferences of teachers in London and elsewhere. He is Hon. Sec. Hunts. B. K. A., and of the Cambs. and Isle of Ely B. K. A., while locally he is secretary to trustees of local charity, Hon. Sec. Technical Education Committee, collector of taxes, church choirmaster, conductor of con-

certs, is correspondent of five local weekly papers, and writes bee-articles for ever so many other papers besides.

Bee-keepers also know that Mr. White has done a very great amount of bee-tent lecturing during his annual holiday from school duties; and when he coolly tells us that "the above are my means of recreation from school work," it almost makes one wonder when or during what hours he lies down to rest. Solid testimony to the value of the disinterested services he has for many years past rendered to his neighbors is found in the public recognition of his labors on several occasions, when testimonials have been presented to him by the leading residents of his neighborhood.

In concluding this brief notice we may mention one event, viz.: the public presentation to Mr. White of a gold watch and illuminated address in 1895, on his 40th birthday, to mark his 16 years' services to the locality. On this occasion, when returning thanks for the honor done him, he alluded to the fact that in all his work much of the success he had been able to achieve was due to his good wife, and the possession of a happy home—sentiments in which we are sure our readers will cordially agree.

Mr. White holds the first-class certificate of the British Bee-Keepers' Association, and frequently officiates as judge at bee and honey shows. Indeed, he may be very fairly classed as one of the public men of the bee-keeping craft.

We learn further that Mr. White has been a school teacher for twenty-two years, but last December he made a change in his vocation for one where tho there is less responsibility there is less work and worry. In taking the mastership with his wife as matron of the Union House, at St. Neots, he has leisure to spend with the bees. He has given up lecturing, as he could not leave the house in the evening frequently, but he can very conveniently attend the council meetings of the British Bee-Keepers' Association in Loudon, and judge for that organization when required.

Mr. White informs us that he "has a good wife and three bonny boys, two of them standing six feet high."

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Transferring Now or in Spring.

I sent for a sample copy of the American Bee Journal and got it, lookt it over, and of course subscribed for the balauce of the year. I read Mr. White's third chapter, got the bee-fever, and bought a colony of bees; read more, and got more fever, and more bees. I have four colonies now, and am looking for more. I have two swarms in boxes 11x20½ inches inside, the frames running across the box, are all full. I want to put them into a standard hive. Should I better shift them now, or put a super on and wait until spring? They are getting plenty of honey and pollen, so I will have to do something to give them more room.

FLORIDA.

ANSWER.—Probably the safe thing will be to leave them where they are now till winter is over, giving them additional room if needed.

A "Red Clover" Queen, Etc.

1. In April, 1897, I had one colony of bees that was queenless, and I sent for one of those red clover Italian queens, introduced her, and the colony built up strong, but they gave only six or eight pounds of honey, and the combs had more than twice the wax in them that were in those built in other

Apiary of C. N. White—From British Bee Journal.

colonies. The bees wintered well and built up very strong last spring, but they would not store any honey, and would hang out, do all that I could. When they had a case of sections on top and a brood-chamber with foundation in the middle (I use the Heddon hive), they would hang out. While those along side gave me from 60 to 75 pounds of surplus honey, they gave me none this year, and appeared to be the strongest. The queen seemed to be very prolific, but the bees would do nothing but sting, for they were little terrors to handle. What was the trouble?

2. Will queens mating with drones from a colony like the above be likely to be much better honey-gatherers than this colony?
PENNSYLVANIA.

ANSWERS.—1. If the bees had the same chance in every way as the neighboring colonies, it is to be feared that the trouble was in the character of the bees themselves.

2. They might be a good deal better. The workers partake of the characteristics of both father and mother, and sometimes there is a decided advantage in the introduction of new blood, even if that blood be no better than the old.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it.

See "Bee-Keeper's Guide" offer on page 653.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY
118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. OCTOBER 13, 1898. NO. 41.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Ten Weeks for Ten Cents.—On page 651 we renew our offer made to new subscribers in the last number of the Bee Journal for September. Now it seems to us that nearly all of our regular readers have neighbor bee-keepers whom they could secure on that liberal offer. With last week's issue we began printing an extra-large edition weekly so that we might be able to accommodate all the new ten-weeks-for-ten-cents subscriptions that might be sent in. We hope all who can do so will help in this fall campaign for new subscribers. The Bee Journal should have at least double its present list of regular subscribers.

Honey at the Paris Exposition.—A local California newspaper reports that recently the Secretary of the Chamber of Commerce at Los Angeles, wrote to the California Bee-Keepers' Exchange in regard to an exhibit of honey at the Paris Exposition, in 1900. In reply to this, C. H. Clayton, secretary and manager of the Exchange, wrote as follows:

"Your favor of Sept. 19, relative to a prospective exhibit at the Paris Exposition is at hand. There can be no question but that it would be to our advantage to have an exhibit there, and the matter has already been discussed in an informal way among our members. The whole subject will come up for final action at our annual meeting, which occurs early in January, 1899. One great disadvantage under which we labor is the apparently growing uncertainty of crops, this year being a complete failure, and about every other year for the last ten years being a partial failure, making it difficult, if not impossible, to hold trade secured. During 1897 we secured quite a foreign trade, sending honey to all the principal European points, including South Africa; but this year we have

absolutely no honey to fill orders from there, and we have now on file orders in our office for more than 600 tons for export, with not a ton in sight to fill them.

"Central California will produce a little honey, but as a rule it is not acceptable to any of the foreign markets except Germany, almost all the markets demanding Southern California honey. Even central and northern California will not produce much more than 120 tons—one-fifth of the amount for which we already have orders—and the local demand will take most of that. So you see the question with us is whether we should be exhibiting, or hold out inducements to trade which we may not be able to fill.

"Whatever action is taken in the matter we will promptly notify you."

From the foregoing it appears that the California Bee-Keepers' Exchange has been doing some great work. Having on hand orders to the amount of 600 tons of honey is no small thing. We trust that the Exchange may soon be able to fill all its present orders, and many more yet to come.

The Price of Honey has an upward tendency, so those who are favored with a crop will at least have some benefit from the scarcity. The advice to hold for a fair price was never more seasonable. Gleanings reports that it is not an easy thing to find sufficient choice honey to supply the demand they have for it.

The Season in California.—W. A. Pryal says in Gleanings that the season was in general so bad throughout California that it was a question with some whether it was better to feed the bees or let them starve. The northern coast and mountain counties gave a medium crop. But there has been no rise in price to correspond with the scarcity of the crop. Honey is granulating earlier than usual, owing perhaps to the large amount of alfalree nectar gathered in that region.

The "Bare" and The Bees.—The New York Sun received a number of original compositions on animals, from a Boston school-teacher, which show several different characteristics from what we have been led to suppose belonged to the literary productions of even the childish Bostonese. Here are two samples:

THE BARE.—Bares are of many sishes and all big. The chief kluds are the grizzly bare which is black; the sinner-mon bare which is good and gentle; the white bare which bleaches its skin to hide in the snow and make a rug, and the black bare which is common and is careful of its cubs. Bares fight bees for honey, which is mean because the bees are little. Once a bare found some currant-jelly sitting on a garden-bench to dry, and he ate it, and the lady hadn't any more, which was greedy. Bares are pigs. J. C. C.

BEES.—Bees are always busy because the idle ones are killed. They make honey and wax, but parafeen candles are cheaper or else candles made out of whales. The bees build cells and combs and some times fill trees and bears smell the honey and eat it. They suck the juice out of flowers and the flower dies. Bees are meaner than mosquitoes, and you can tell them by the yellow bands on their abdomen. A. C.

The Old Union Victorious Again.—General Manager Thomas G. Newman, of the National Bee-Keepers' Union, has sent us the following concerning a case at law in which all bee-keepers will be interested:

The enemies of the pursuit of bee-keeping have again been defeated. It will be remembered that about one year ago Mr. Frank S. Buchheim, of Santa Ana, Calif., was arrested under Sec. 370 of the Penal Code of California, for keeping 100 colonies of bees on his premises, charging him with maintaining a nuisance in the neighborhood, averring that the bees ate and destroyed the fruit belonging to the neighbors, and interfered with laborers who were engaged in caring for the fruit, etc. His apiary and premises cover 7½ acres. He built a fence 6 feet high to enclose 24x32 feet, in which he kept the hives of bees during the fruit-drying season, thus controlling the bees and preventing annoyance to the neighbors. But they were not satisfied with these pre-

cautions, and demanded that the bees be moved out of the locality.

Suit was brought against Mr. Buchheim for maintaining a public nuisance, and he was fined \$50 and costs. As he was a poor man with a large family to support, he did not pay the fine, and was committed to jail for 25 days.

After 10 days had elapsed an appeal was taken to the Supreme court, and he was released pending appeal.

In the Superior court Judge Ballard ruled on the appeal that the complaint was insufficient to constitute a public offense, and entered a judgment discharging the defendant and exonerating his bail.

The enemies of bee-keeping not being satisfied with this, instituted another suit against Mr. Buchheim, and through the efforts of the National Bee-Keepers' Union assisting the attorneys for Mr. Buchheim, and paying a portion of the court fees necessary for the defense, they have failed to obtain a verdict against him, tho the jury wrestled all night long with the case. At first they stood 7 for acquittal and 5 for conviction, in a community led by a Justice of the Peace, and organized to persecute Mr. Buchheim because of his keeping bees successfully and profitably.

This is another victory for the National Bee-Keepers' Union, and bee-keepers all over the continent will be delighted to learn the facts in the case.

THOMAS G. NEWMAN,

General Manager National Bee-Keepers' Union.

The Old Union deserves congratulations upon this victory. It shows again that the only thing bee-keepers need to do to secure their rights, is to be united in an organization the duties of whose officers are to see that such rights are respected, or secured by putting up a good fight in the courts of the land. Often an innocent bee-keeper is financially unable to wage his battles alone, and bee-keepers owe it to themselves, to the pursuit which they represent—yes, to the fellow bee-keeper who is persecuted—to help carry on the war until victory is won for the right.

General Manager Secor's next annual report—to be issued in a little less than two months—will also show much good work done by the United States Bee-Keepers' Union the past year. The partial report that he gave at the Omaha convention was very bracing, and made each member feel that he belonged to a grand organization. But where there are hundreds of members now, there should be thousands.

Apiarian Exhibit at the Illinois Fair.—

Mr. F. Grabbe, the judge of the apiarian exhibit at the Illinois State Fair, which closed Oct. 1, called on us last week and kindly furnished us with a list of the exhibitors with the premiums awarded. They are as follows:

Display of comb honey—W. Z. Hutchinson, 1st premium, \$25; M. J. Becker, 2nd, \$15; J. Q. Smith, 3rd, \$5.

Collection of labeled cases containing 12 or more pounds of white honey from different flowers—W. Z. Hutchinson, 1st, \$10; M. J. Becker, 2nd, \$5.

Collection of labeled cases containing 12 or more pounds of amber or dark honey from different flowers—J. Q. Smith, 1st, \$10; M. J. Becker, 2nd, \$5.

Case of white clover comb honey, 12 to 24 pounds—W. Z. Hutchinson, 1st, \$5; M. J. Becker, 2nd, \$3.

Case of basswood comb honey, 12 to 24 pounds—W. Z. Hutchinson, 1st, \$5.

Display of extracted honey—M. J. Becker, 1st, \$25; W. Z. Hutchinson, 2nd, \$15; Jas. A. Stone & Son, 3rd, \$5.

Display of samples of extracted honey, named—M. J. Becker, 1st, \$5; W. Z. Hutchinson, 2nd, \$3.

Display of candied honey—Jas. A. Stone & Son, 1st, \$15; M. J. Becker, 2nd, \$10.

Display of beeswax—Jas. A. Stone & Son, 1st, \$15; W. Z. Hutchinson, 2nd, \$10.

One-frame observatory hive of dark Italian bees—W. Z. Hutchinson, 1st, \$5; Chas. E. Shank, 2nd, \$3.

One-frame observatory hive of Golden Italian bees—Chas. E. Shank, 1st, \$5; W. Z. Hutchinson, 2nd, \$3.

One-frame observatory hive of Carniolan bees—M. J. Becker, 1st, \$5; W. Z. Hutchinson, 2nd, \$3.

One-frame observatory hive of albino bees—W. Z. Hutchinson, 1st, \$5.

One-frame observatory hive of Cyprian bees—W. Z. Hutchinson, 1st, \$5.

One-frame observatory hive of Holy Land bees—W. Z. Hutchinson, 1st, \$5.

One-frame observatory hive of black bees—M. J. Becker, 1st, \$5.

Group of queen-bees comprising 2 dark Italian, 2 Golden Italian, 1 each Carniolan, albino, Cyprian, Holy Land and black—W. Z. Hutchinson, 1st, \$10.

Display of honey-plants, pressed, mounted and labeled—W. Z. Hutchinson, 1st, \$5; M. J. Becker, 2nd, \$3.

"Judge" Grabbe made several excellent suggestions looking toward a revision of the present Illinois premium list. He would make the full score quantity of honey, both comb and extracted, 300 pounds instead of 500 pounds. He would also omit all the awards on one-frame observatory-hive exhibits of albino, Cyprian, Holy Land and black bees; and would substitute some other things, among them honey-vinegar, with recipe for making the same.

Mr. Grabbe's reasons for omitting the premiums on the bees mentioned, are that the albino is a freak, there are no genuine Cyprian and Holy Land bees in this country, and the breeding of blacks should be discouraged rather than encouraged by offering premiums on them at fairs.

Doubtless by next year's fair the list will be revised along the lines suggested by Mr. Grabbe. By that time we hope that a good honey season will be enjoyed, and that there will be more exhibitors in the apiarian section of the Illinois fair.

Horseshoe Leaves crushed are among the latest remedies for bee-stings. So says a "stray straw" in Gleanings.

MR. HARRY S. HOWE now has under contemplation a special course in entomology at Cornell.—American Bee-Keeper.

THE LANGSTROTH FUND has received lately 50 cents each from Messrs. W. G. Secor and A. I. Emmons, of Greene Co., Ill. There is plenty of room for more.

MR. W. A. PRYAL of Alameda Co., Calif., writing us Sept. 22, said his bees were storing honey right along, so that he had no fears of their not having plenty of stores to carry them through the winter.

MR. OSCAR KERNS, of Caldwell Co., Mo., was in to see us Oct. 4. He deals in bee-supplies to some extent, besides keeping a few bees. The honey crop was practically nothing this year in his locality.

MR. W. M. BARNUM, once an occasional contributor to the American Bee Journal, has lately become the editor and publisher of "Barnum's Midland Farmer," published in Missouri. We wish him success in his venture.

MR. F. GRABBE, of Lake Co., Ill., who was judge of the apiarian exhibits at the Illinois State Fair this year, dropt in to see us last week. There were four exhibitors of honey, bees, etc., at the Fair this year, as will be noticed by the list of premiums mentioned on this page.

MR. C. B. HOWARD, the secretary of the Seneca County Bee-Keepers' Association, is pictured in the October American Bee-Keeper, and also one of his four apiaries. In a short biographical sketch, Editor Hill pays a deserved tribute to Mr. Howard's abilities and success as a bee-keeper.

MR. W. T. RICHARDSON, of Ventura Co., is called the "leading honey-producer in Southern California," and both himself and one of his numerous apiaries are shown in Gleanings for Oct. 1. Mr. R. has about 1,200 colonies in four api-

aries, located in the Simi Valley. His bees have something like 15,000 acres to roam over, to 12,000 of which he has the exclusive right. In the next issue of Gleanings will be given some "idea of the magnitude of Mr. Richardson's honey-yields." His chief honey source is purple sage. We presume his yields have been simply immense, for when they have a good honey-season in that part of the country, it seems to just pour in. "Rambler" Martin has been visiting Mr. R., hence the pictures and write-up.

MR. F. A. CROWELL, a queen-breeder in Fillmore Co., Minn., has just recently taken unto himself a life-long "queen." Our hearty congratulations are hereby extended to the happy couple. Altho Mr. C. has doubtless always been able heretofore to "Cro-well," he will now "Cro"-better—having such "queenly" help. (We beg our New Jersey friend's pardon. We just couldn't help it that time—it punned itself.)

A NEW JERSEY SUBSCRIBER wrote us as follows last week:

"Your new system of spelling is a good thing; push it along. If you would strangle at their birth some of those horrible puns you let loose once in awhile, there would soon be a New York in Illinois."

We are very sorry that our so-called puns have offended anyone. They are the last things that we would suppose could be objected to. "Those horrible puns!" Well, we'll have to fix them—"strangle at their birth," or else not get them started at all.

MR. FRANK McNAY, of Wisconsin, was in Chicago last week, and of course called to see us. He had 700 colonies this year, in several apiaries, and they averaged about 70 pounds to the colony, of extracted honey, thus making about two carloads. It is all sold. Mr. Pickard, of the same State, who had some 50,000 pounds of extracted honey this year, has also sold his crop. Judging from the way these large amounts have been taken, there is a fear on the part of some buyers that the short crop this year would cause a greater rise in the price later on, and they would better buy promptly. In this we think they are wise.

MR. HERMAN F. MOORE, who recently wrote a series of seven articles on "The A B C of Marketing Honey" for our columns, is thus referred to editorially in the American Bee-Keeper for October:

"To the apicultural firmament an exceedingly bright star has recently ascended. This is the impression we have received from a series of excellent articles in the American Bee Journal, on the subject of building up and maintaining a market for honey, contributed by Herman F. Moore, Esq. His style is pointed, and rings with a vim and business enterprise, backed by bee-keeping knowledge, that will not be without lasting effect along the line of his travels in the interest of his honey-trade. More Moores! is the crying need of American bee-keeping interests."

HON. G. W. SWINK, of Otero Co., Colo., is not only a bee-keeper but a successful melon-grower. He generously treated the whole convention at Omaha, in the Apiary Building on the Exposition grounds. Mr. A. I. Root, in Gleanings for Oct. 1, had this to say about Mr. Swink and his famous cantaloupes:

"I had been eating a good deal of trash about that time, and I concluded I would not dare to even taste of the melons; but when I saw the rest having such a 'picnic,' I concluded I would just 'sample' them, sick or no sick; and they were so exceedingly delicious that I really could not find a stopping-place, and, to my great and agreeable surprise, I was not sick a bit. Well, we made the melon-grower 'stand up' and answer questions. We were especially interested in hearing him tell that he never succeeded in growing nice melons until he put bees enough in his melon-patch to fertilize all the blossoms. Now, may be I have made right here an awful mistake. If so, somebody will correct me; but, if I remember correctly, he said he had 400 acres of melons, and that it takes at least 400 colonies of bees to fertilize them properly, and that it is now pretty clearly settled that you could not grow a large crop of nice melons without having bees in the melon-patch, say a good colony to every acre of melons. I do not know why somebody did not think to get a Kodak view of the convention while the members were all having 'rest and refreshment' with those crates of melons. After we had had all we wanted, the remuats were given to the Indians, who held forth just back of the Apiary Building."

Look Out for Foul Brood.—A note of warning is sounded in Gleanings against feeding honey got from other bee-keepers. The safe thing is to feed no honey unless you *know* it's all right.

Hand-Holes or Cleats.—Editor Root, having heretofore advocated hand-holes because neater and not in the way, acknowledges himself now a convert to cleats because it is so much easier to lift hives with cleats. He is now hunting for a combined cleat and hand-hole, neat and good.

To Fasten Foundation in Frames.—Put the frames on top of a stove, top-bar down, putting on as many as the stove will hold. When the frame is heated, put the foundation on it, and as soon as it melts dip it in a large vessel of cold water. It makes a solid job.—Leipziger Bienenzeitung.

The Wee Bee-Moth.—This little moth is getting to be very troublesome in the region of Alameda Co., Cal., says W. A. Pryal, in Gleanings. It doesn't work so much in the hives, but is harder to dislodge than the larger sort, and destroys combs left out of the hives, especially those containing pollen.

Thieves Spotted by Wires in Frames.—Three colonies of bees were destroyed for Benj. Passage. The deputy sheriff got some clew, sifted the ashes and found the wires that had been in brood-frames, the thieves plead guilty and got 90 days in the workhouse, the heaviest penalty a Michigan justice could inflict.—Gleanings.

Painting with Propolis.—Prof. Henry, arguing that bees are eager to propolize the entire inside of their hives, advocates doing this in advance for them. He dissolves propolis in alcohol, applies to the hive with a brush, and the alcohol immediately evaporating leaves a coat of fine yellow. He thinks the bees like the odor of such a coating on the inside of hives and feeders.—Le Progres Apicole.

Honigkuchen.—Bring one pound of extracted honey and a $\frac{1}{4}$ pound of butter to a boil. Let cool for 10 minutes. Add one pound of flour, $\frac{1}{4}$ pound of ground almonds, $\frac{1}{8}$ teaspoonful of cloves, the grated peel of a lemon, and a scant teaspoonful of soda dissolved in a little hot water. Mix and set aside over night. Next morning roll out $\frac{1}{2}$ -inch thick, cut in small squares, press an almond in each corner and in the center, and bake in a moderate oven.—Chicago Record.

Time of Larvæ.—Challenged by G. M. Doolittle to prove that a young bee remains a larva only five days, Dr. Miller replies in Gleanings: "Among those who say five days for the larval state stands Dubini. T. W. Cowan, in the 14th edition of British Bee-Keepers' Guide-Book, page 10, gives 'Time of feeding the larvæ' as five days for queen and worker, and six for drone. Years ago 17 to 18 days was considered the time for development of queen. Nowadays it is brought down to 15."

Report of the Omaha Convention.—A competent court stenographer was engaged to take down the whole proceedings of the convention, and very fortunately this stenographer was also a bee-keeper; so it is fair to assume that there will be an accurate report of all the proceedings. These will be given in the American Bee Journal. Gleanings will give only a condensed report, as usual, and this report will be in the nature of editorial snap-shots given from time to time.—Gleanings.

To Prevent Swarming, and at the same time to get the bees started in supers, a correspondent of Revue Internationale says he closed the entrance and let them have in its place for 18 days an entrance to the super. Six colonies thus treated filled their supers, while the other colonies of the apiary preferred to swarm. Editor Bertrand thinks the plan worth trying, but cautions against danger of the queen laying in the super, as the bees like to rear brood in the best ventilated part of the hive.

Now for New Subscribers

Every Bee-Keeper Can Get in Now!

10 WEEKS FOR 10 CENTS!

For **ten cents** the American Bee Journal will be sent **for ten weeks on trial** to any bee-keeper not now a subscriber. (Or for \$1.00 we will send the weekly American Bee Journal to a **new** subscriber from Oct. 1, 1898, to Jan. 1, 1900—15 months—less than 7 cents a month). This is a splendid chance to become acquainted with the weekly Bee Journal. Getting it 10 weeks **regularly** will show pretty well what may be expected when it comes to a bee-keeper's home week after week for years.

These Special Articles will Appear... With Others, During the 10 Weeks following Oct. 1:

Bee-Keeping in Cuba and Porto Rico—
By O. O. POPPLETON, of Florida.

Recent Progress in Apiculture—
By ERNEST R. ROOT, Editor Gleanings in Bee-Culture.

Bee-Keepers and Supply Manufacturers—
By DR. C. C. MILLER.

Foul Brood in the Apiary—
By WM. McEVoy, Foul Brood Inspector of Ont., Canada

Advanced Methods of Comb Honey Production—
By S. T. PETTIT, of Canada.

Migratory Bee-Keeping—
By H. E. HILL, Editor American Bee-Keeper.

The Scientific Side of Apiculture—
By C. P. DADANT.

Experiences and Suggestions in Marketing Honey—
By S. A. NIVER, of New York.

Best Method for Creating and Maintaining a Market for Honey—
By HERMAN F. MOORE.

First Half Century of Bee-Keeping in America—

By HON. EUGENE SECOR, General Manager United States Bee-Keepers' Union.

The Apiary on the Farm and in the Orchard—

By HON. E. WHITCOMB, Supt. Apiary Department Trans-Mississippi Exposition.

Needs of Bee-Culture in the South—
By DR. J. P. H. BROWN, of Georgia.

General Advice to Bee-Keepers—
By REV. E. T. ABBOTT, of Missouri.

The Relation Existing between the Apiary and the Successful Production of Fruit—

By G. M. WHITFORD, of Nebraska.

The foregoing List of Special Articles represents a part of the program at the Omaha Convention. Many of the subjects will be followed by much helpful discussion. Of course, many other interesting and valuable contributions will be found in the American Bee Journal during the 10 weeks' "trial trip," besides the other regular departments. But in order to secure all the above articles, the trial subscriptions should be sent in **promptly**, as we may soon run out of back numbers from October 1.

Every Bee-Keeper in America ought to have the old American Bee Journal for 10 weeks from Oct. 1, 1898, and right along thereafter. It will be worth to any one of them **many times** its full year's subscription price. **Send 10 cents Now, anyway,** and get it for the next 10 weeks.

Invitation to Our Regular Readers: We trust that our present subscribers will send the names and dimes of their neighbor bee-keepers, or get them to do it. Show them this liberal trial-trip offer. They should jump at such an opportunity to get 160 large pages of the best bee-literature for only 10 cents!

BEST
EXTRACTED HONEY FOR SALE

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY :

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 7½ cents a pound; 2 cans, 7¼ cents per pound; 4 or more cans, 7 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, "HONEY AS FOOD," will be a great help in creating customers for honey. See prices on another page.

flow from goldenrod and asters. We have had fine weather, altho it has been pretty dry. We have had no killing frosts yet, and the bees are well supplied with winter stores. The farmers around here are talking of spraying their apple trees when in blossom next spring, and if they do I am afraid it will be good-bye bees.

C. H. FIELD.

Cumberland Co., Maine, Oct. 4.

Getting Started with Bees.

We have had our bees a little over a year. In July, 1897, a swarm of bees came to us, and we cared for them. Last May they swarmed three times. During the past summer another swarm came to us. They are doing well. My husband bought six colonies, so now we have 10.

We live in the woods, and they seem to like it here. MRS. LORINA F. CALKINS.

Martin Co., Minn., Oct. 5.

Bees Did Reasonably Well.

We have 13 colonies of Italian bees, and they did fairly well the past season. The honey-flow was not so good here this year as it has been in former years. We do not let our bees swarm; if we want increase we divide them. We sell all our honey in the home market. MARY J. BEIGHTS.

Beuna Vista Co., Iowa.

A Rieing Honey Specialist.

I left Chicago over two years ago to seek my fortune as a specialist. I am very happy to be able to say that, so far, I do not regret my venture. From 50 colonies I have taken three tons of honey, as nearly as I can estimate it. I am working for a moderate increase. I increase from 40 to 60. If my hopes are realized, some day I shall number my colonies by the hundred. I started with 22 when I first came here, bringing them with me. I took only three barrels of extracted this season (and it is fast disappearing), the balance being comb honey. I shipped part of my comb honey to a distant city and a good portion of it was damaged in transit, and the comb was well attached to all sides of the section, too.

Well, I have finally sold enough around here to pay for a horse and market wagon, and soon I shall start out to sell the balance of my crop. I know my extracted honey will soon be exhausted. I have been selling buckwheat extracted at 5 cents a pound, white clover at 8 cents, and basswood at 10 cents. The reason I charge more for basswood is because I got only about 70 pounds of it. It was only black bees that work on basswood here, and as I keep mostly Italians, my crop was mostly from clover. Isn't it strange that my Italians should continue to work upon clover after basswood opens, while the black bees leave clover and go for basswood? The above prices were for quantities of three pounds and over. As soon as I get away with my horse I shall ask 10 cents for clover extracted and 6 cents for buckwheat.

I have come to be known for miles around as "Honey Brown," and many are the stories I hear about how "Honey Brown" must adulterate his honey and feed his bees, "for why should he get so much

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published today. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us Two New Subscribers to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Page & Lyon Mfg. Co. New London, Wisconsin,

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful straw-colored transparent Foundation, Improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c., postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, **Leamy Manufacturing Company, Higginsville, Mo.,** or **1730 South 13th St., Omaha, Neb.**

Please mention Bee Journal when writing.

See Honey Offer on page 652.

honey while the farmers get nothing?" it is said. It is not the people I sell to who talk this way, but the people who hear of my success but do not buy any honey. I find that after I have once sold to a man I sell to him again and again, and he only laughs when he hears these adulteration yarns, for he is satisfied that my honey is honey. Why, somebody actually convinced a grocer (who bought a case of comb honey of me), that that honey never came from the inside of a bee-bive. (It was in plain sections). He lookt at me with much suspicion the next time he saw me, and askt me some sharp questions. I askt him if his informant tasted the honey, and he said no. I askt him if he himself had tasted it, and he said no. Well, I gave him a lecture on the non-existence of artificial comb honey, and when I saw him a few days later his face was all smiles—he had eaten a cake of my honey and he wanted some more like it.

I am satisfied that it is for my interest to sell my own honey direct to consumers and grocers, for every person sold to this year will be my customer next year, and he becomes a living advertisement.

Another year I expect to go a little heavier into extracted honey. I workt only a few weak colonies for it this season.

I take great pains in breeding my stock. My breeding colony this season gave me 163 sections and 130 pounds of extracted honey.

I think I could get along without the "Old Reliable," but I would rather have it, just the same.

E. W. BROWN.

Erie Co., N. Y., Sept. 29.

Keeping Bees from Swarming.

I am only a beginner at bee-keeping, this being my second year with the bees. But for the American Bee Journal I would not be able to get along with my bees, and I think that we cannot appreciate its efforts too highly.

I was much interested in an article by Herman F. Moore, on page 612, in which he refers to non-swarming bees, and so I will relate a little of my limited experience with mine.

I began the past season with three colonies of Italians; had only one natural swarm, which absconded while I was away from home, with a virgin queen—at least there were no eggs and very little brood, a queen-cell from which a young queen had hatched, and as the old queen was clipped she must have died.

I workt only one colony for comb honey, giving them empty brood-combs when the queen needed room, and forming new colonies with the brood I took away. This colony produced 125 full sections of honey, 100 of which were as white as snow, from the sweet clover, with which the fields, and roadsides here are covered. This colony at one time had three supers, more or less filled with honey. The queen in this colony I purchast last summer (1897).

Another colony, which did not swarm, produced 200 pounds of extracted honey; this colony at one time had four full-size brood-chambers tiered up.

I sold all of the comb honey to my neighbors, and all of my extracted that I cared to sell. I get 15 cents for comb and 10

The Biggest Offer Yet!

Last year only about one per cent—only one subscriber in 100—ordered his Review discontinued. If the Review could secure 1,000 new subscribers the present year, there is an almost absolute certainty that at least 900 of them would remain; not only next year, but for several years—as long as they are interested in bees. Once a really good bee-journal visits a bee-keeper a whole year it usually becomes a permanent member of his family.

I would have no difficulty whatever in getting twice 1,000 new subscribers this year, if all of the bee-keepers in this country had read the Review the past year. I have sometimes thought that it might pay a publisher to give away his journal one year, simply for the sake of getting it into new hands. There are, of course, decided objections to such a course; but I am going to come as near to it as I dare. Here is my offer:

If you are not a subscriber to the Review, send me \$1.00, and I will send you twelve back numbers, the Review the rest of this year and all of next year.

Each Issue of the Review, especially if devoted to the discussion of some special topic, is really a pamphlet containing the best thoughts and experience of the best men upon the topic under discussion. Twelve back numbers of the Review are, to a certain extent, so many little books devoted to as many different phases of bee-keeping. Some issues of the Review are now out of print; of others only a few are left; while of others there are several hundred. Of course, I shall send those of which I have the most, but no two alike.

Most people subscribe for a journal at the beginning of the year. In this case there is no use of waiting, as you will get the Review for next year just the same as tho you waited until next January to subscribe, and you get all the rest of the numbers for this year FREE. The sooner you subscribe, the more free issues will you receive.

Let me tell it over once more. For \$1.00 you get twelve back numbers, the Review the rest of this year, and for all of 1899.

Queen-Clipping Device Free

The Monette Queen-Clipping device is a fine thing for use in catching and clipping queens' wings. We mail it for 25 cents; or will send it FREE as a premium for sending us ONE NEW subscriber to the Bee Journal for a year at \$1.00; or for \$1.10 we will mail the Bee Journal one year and the Clipping Device.

GEORGE W. YORK & CO.,

CHICAGO, ILLS.

The Ram's Horn...

Is an Independent Weekly Paper of 20 pages—

each page somewhat larger than those of the Bee Journal. The subscription price is \$1.50 a year. It is one of the brightest and best publications of the present day. Its "Platform" is: 1. The Primitive Gospel. 2. The Union of Christendom. 3. Equal Purity—Equal Suffrage. 4. The Sabbath for Man. 5. The Saloon Must Go. Motto: "Have Faith in God."

We will mail you a sample copy of the Ram's Horn upon receipt of a two-cent stamp.

OUR LIBERAL OFFER:

We wish to make our PRESENT subscribers to the Bee Journal a generous offer in connection with the Ram's Horn, viz: Send us **TWO NEW** subscribers for the American Bee Journal for one year (with \$2.00), and we will see that the Ram's Horn is mailed you free for one year as a premium.

Or, send us \$2.00 and we will mail to you the Ram's Horn and the American Bee Journal, both for one year.

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

cents for extracted, and they come to the house for it.

I think that bees can be kept from swarming by giving them enough room and keeping the brood-chamber from getting crowded, and I think I shall take a great deal of interest in trying to keep my queens from coming out next season, and if I am successful next year I can find out by my young queens whether it is possible to breed out the swarming instinct.

Cook Co., Ill., Oct. 3. CHAS. W. FORD.

He That Overcometh.

BY WM. E. SHEFFIELD.

Every pathway hath some brambles,
Every rose hides some sharp thorn,
Every sunbeam creates shadows,
Every heart sometimes is torn.
Every joy will have an ending,
Every soul have some regret,
There would never be tomorrow
If to-day had no sunset.

You will find the grandest rivers
Never flow straight to the sea.
Many mountains rise before them,
Yet they sling on merrily.
Mountains cannot stop the rivers;
They but turn and onward go,
Winding through the verdant lowlands,
In a ceaseless overflow.

Heed the lesson Nature teaches—
Pain and pleasure brothers are.
He that hath abiding courage
Finds the gates of joy ajar.
Only in the world celestial
Can we hope for perfect bliss,
And he only will attain it
Who acts manfully in this.

—The Busy Bee.

Convention Notices.

Connecticut.—The fall meeting of the Connecticut Bee-Keepers' Association will be held at the Capitol at Hartford, Wednesday, Nov. 2, 1898, commencing at 10:30 a. m. Every member should make an extra effort to be present at this meeting.
Waterbury, Conn. MRS. W. E. RILEY, Sec.

Minnesota.—There will be held the annual meeting of the Southern Minnesota Bee-Keepers' Association at Winona, in the Court House, in the County Commissioner's Room, Thursday and Friday, Oct. 20 and 21, 1898.
Winona, Minn. CHAS. A. GILE, Sec.

Illinois.—The Illinois State Bee-Keepers' Association will hold its 8th annual meeting at the State House in Springfield, Nov. 16 and 17, 1898. We will have the advantage of one fare and a third for the round trip—open rate—along with the Odd Fellows, whose meeting is the third Tuesday of November. Our Association has been petitioned by the Northern Illinois Bee-Keepers' Association to take the proper steps to secure the same foul brood law for our State as that of Wisconsin. Other matters of importance will come before the meeting, and we expect to have the usual good time that bee-keepers always have when they get together. Excellent board is secured at 25 cents per meal and lodgings just as reasonable. All bee-keepers are invited. The one dollar for membership fee also entitles you to the American Bee Journal for one year.
Bradfordton, Ill. JAS. A. STONE, Sec.

FOR SALE CHEAP!

My property consisting of 3 acres of land with 57 fruit trees ready to bear; new shop, 20x40, with reversible windows, basement under all, 6-foot wall, good water, up stairs used as a dwelling. Best location in the country for bees; have 75 colonies. Will sell with or without bees. Am located one mile from county seat; good fishing within 80 rods of place. Good reasons given for selling. For particulars and prices address,

S. D. KAUFFMAN,
BELLAIRE, MICH.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Oct. 7.—Fancy white clover brings 13c, with best grades of white comb about 12c; off grades with more or less empty cells, 10 to 11c; ambers 8 to 9c, according to grade, with fancy at 10c. Extracted, white, 6 to 7c; ambers, 5 to 6c; dark, 4 1/4 to 5c. Beeswax, 26 to 27c. R. A. BURNETT & CO.

San Francisco, Sept. 28.—White comb, 9 to 9 1/4c; amber, 7 to 8 1/4c. Extracted, white, 6 1/2 to 6 3/4c.; light amber, 5 1/2 to 6c. Beeswax, 24 to 27c.

There were large shipments this week of extracted honey by sea, one ship taking 787 cases for New York and another carrying 535 cases for London. The entire crop this season of both extracted and comb will likely not exceed 12 000 cases. Market is firm at the quotations, more especially so for choice extracted, which is relatively lighter supply than comb.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12 1/2c.; A No. 1 white, 10 to 11c.; No. 1 white, 9 to 10c.; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6 1/4c.; No. 2, 5 1/2c.; amber, 5c.; in barrels, No. 1 white, 5 1/2c.; amber, 4 1/2 to 5c.; dark, 4 to 4 1/2c. Choice Beeswax, prime, 24c.; choice, 24 1/2c. At present there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12 to 13c.; No. 1, 11 to 12c.; amber, 10 to 11c. Extracted, white, 5 1/2 to 6c.; amber, 5 to 5 1/2c.; dark, 4 1/2 to 5c. Beeswax, 22 to 25c.

The receipts of comb honey are larger. C. C. CLEMONS & CO.

Boston, Sept. 30.—Our honey market shows a decided firmer tone since our last. A few sales have been made at 15c for an extra fancy lot, while almost all sales ranging from A No. 1 to fancy now are made at 14c, while occasionally, something a little off, will bring as low as 12 1/2 to 13c. We do not look to see any lower prices.

Extracted, Florida, in barrels, mostly 6c to 7c, with a good demand. Beeswax, slow sale at 26c for best. BLAKE, SCOTT & LEE.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12 1/2c.; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6 1/2 to 7c. Beeswax, 25 to 27c. WALTER S. POWDER.

Milwaukee, Sept. 20.—Fancy comb, 12 to 12 1/2c.; A No. 1, 10 to 12c.; No. 1, 10 to 11c.; dark and amber, 8 to 10c. Extracted, in barrels and kegs, white, 5 1/2 to 6c.; dark, 5 to 5 1/2c. Beeswax, 25 to 26c.

The condition of this market for honey is favorable for shippers of good quality either in comb or extracted, and the receipts, while they are with us very fair, are not as liberal as may be, while the demand is very fair at our quotations. We advise liberal shipments of 1-pound sections and extracted. A. V. BISHOP & CO.

Buffalo, Sept. 16.—There is quite an improved demand for honey at present, and moderate amounts can be sold of strictly fancy 1 pound comb at 11 to 12c; lower grades range from 10c downward. We advise but moderate shipments for awhile yet. Extracted—average grades could be sold at 4 to 5c. Fancy beeswax, 27 to 28c; common, 20 to 25c. BATTERSON & CO.

Columbus, Ohio, Oct. 8.—Fancy white comb, 14 to 15c; No. 1 white, 12 to 13c; No. 2 white, 10 to 11c; amber, 9 to 11c. Extracted, 5 1/2 to 7c. COLUMBUS COM. AND STORAGE CO.

New York, Sept. 26.—Comb honey continues to arrive freely. Demand is good for nearly all grades at following prices; Fancy white, 14c; No. 1, 12c; amber, 10c; buckwheat, 8 to 9c; an exceptional quality at 9 1/2c. There is a good demand for extracted, all kinds, at 6 1/2c for white, and 5 1/2c for light amber in cans; Southern, in barrels, 55 to 58c a gallon. Beeswax dull at 26c. HILDBRETH BROS. & SEGELKEN.

Cleveland, Sept. 1.—Fancy white, 13 to 14c; No. 1, white, 12 to 12 1/2c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c.; light amber, 6c.

The demand for honey is exceptionally good, owing to the crop in this vicinity being very light. A. B. WILLIAMS & CO.

Detroit, Sept. 24.—Fancy white, 11 to 12c; A No. 1, 10 to 11c; No. 1, 10c; fancy dark or amber, 9 to 10c; other grades, 8 to 9c. Extracted, white, 6 to 6 1/2c.; dark or amber, 5 to 5 1/2c. Beeswax, 25 to 26c. M. H. HUNT.

CONTRIBUTED ARTICLES

“Golden” Method of Comb Honey Production.

BY J. S. HARTZELL.

As the season for the production of honey in these parts has closed, and the product stored in supers removed and assorted and cleaned ready for shipment, I wish to apprise our “Doubting Thomas” (Mr. S. A. Deacon), and any others, of the results obtained from my apyary of 61 colonies, 40 of

yielded 1,866 completed sections. The 21 colonies on the general plan, 489 completed sections. Average per colony on the Golden plan, of 46 13/20 sections; on general plan, 23 2/7 sections. Now, I hope this is plain enough for Mr. Deacon, or any one who may be interested enough to read this article, to understand.

It may be well enough, also, to state that of the 40 colonies on the Golden plan 10 re-cast swarms, six of which were from superseding queens, the remainder (four), with the exception of one dissatisfied with results, and as soon as the queen was liberated and began to deposit eggs, renewed their efforts and prepared in the regular order for swarming. The one exception was a colony in a 10-frame hive, and the second day after liberating the queen swarmed twice (forenoon and afternoon) with not a sign of queen-cell as I made a thorough examination while the swarm was out each time, and after returning the second time began work and have behaved nicely since.

Interior View of the Aptary Building at the Trans-Mississippi Exposition.

which, as stated in the former article, were worked on the Golden plan, and the remainder, 21 colonies, on the general, or, as I termed it, “orthodox” plan, for the season now closed.

First, then, for results in completed sections of honey which stand as follows: The 40 colonies on the Golden plan

Will some of our experts—Dr. C. C. Miller, Doolittle, or any other little or big man—explain the cause, or will all plead as Dr. Miller often does—“don't know?” My own idea in regard to this colony is, it was simply “pure cussedness.” I was entirely too busy at the time to make a thorough inves-

tigation as I would like to have done, and whether or not any other conclusion would have been formed than indicated above, "I don't know."

Several of the colonies on the general plan also re-swarmed, but I haven't a list of the number; however, all were kept within bounds of increase, and the results are so much in favor of the Golden plan that should I continue bee-keeping another season I will have all things in readiness to fully adopt the Golden method, as I consider, from the experience of the season now closed, that the "Golden" opportunity was offered, and I am glad, indeed, it was accepted by me, as it has certainly been the means of gladdening me for my efforts, and causing the expansion of the purse-strings which otherwise would not have occurred; and I feel confident, let the season be good or bad, Golden's plan will be "Gold," without the "en," in my pocket every time; and why?

First, lessening of general expenses; the buying and preparing of hives for swarms, which increases with the size of the apiary, and which cannot be very well avoided on the old or general plan. Second, increase amount of honey secured per colony, which is the great stimulator to the apiarist.

And now I wish to say a little more to Mr. Deacon on hiving a swarm on starters, which he thinks would equal the Golden method. I have never undertaken to make a test, but accept the testimony of others on the matter, that to produce one pound of wax or comb (which is wax) a colony of bees will consume from 10 to 20 pounds of honey. If this be true, then to fill out an 8-frame hive with completed comb when using starters would be about as follows:

It requires $1\frac{1}{2}$ pounds of medium brood foundation, if using full sheets, to fill eight frames, Langstroth or standard size. In using starters one sheet is generally the amount used to fill eight frames, which would leave in actual amount $17\frac{1}{2}$ ounces of wax or comb to be supplied by the bees, counting that a full sheet of foundation, when drawn out, will make a complete comb. Therefore, Mr. Deacon would lose in honey alone to produce the full quota of combs 11 to 22 pounds of honey. Does Mr. Deacon realize this, or any part of it, to be a fact?

Golden's method—no comb to be built, sufficient stores in the brood-nest of all kinds to supply hatching brood, and that in progress of rearing from the egg to sealed larvae in the cells. All these are factors in keeping up the strength of a colony, and causing honey to go upstairs when we want it.

Mr. Deacon was very much worried about pollen in sections, and its preventive, on the Golden plan. Let me say that when I came to assort and clean the sections for market, I failed to find a single trace of any in the sections. Mr. Deacon, don't worry about pollen in sections, and I will tell you to a certainty how to avoid it, if you can keep the secret: Use drone foundation in sections, and fill the sections from the top to $\frac{3}{8}$ of an inch of the bottom, and I will guarantee no pollen stored in drone-comb, either in the sections or brood-nest.

I will venture the assertion without fear of being successfully contradicted, that the primary cause of drone-comb being built is for the express purpose of storing or the reception of honey, and from careful observation of the season for building it by the bees has caused me to adopt the theory as stated. I am aware, too, that as bees build drone-comb it may be, and often is, occupied by the queen, especially if prolific, as a good queen, when the season gets productive, will improve every opportunity afforded to strengthen the colony, and as no room appears in worker-comb for the reception of eggs, the occupying of drone-comb results. This, however, does not prove the intent of its production. If it was the intent to rear bees from drone-comb, then the necessary supplies would be stored in it for the purpose, but one of the main factors, viz.: pollen, is always absent.

Whilst reasoning on this subject let me request that Mr. Deacon, or any expert in apiculture, try the following experiment:

At the opening of spring, and prior to nectar coming in from the fields, or at the close of the honey season when colonies are most populous, take the strongest colony, take out one or more frames, insert instead frames with only starters; now stimulate by moderate feeding, and see how much drone-comb you can induce bees to build; but once nectar comes from Nature's resources then is the beginning, and during the season of obtaining nectar from the fields so long will drone-comb be built if the opportunity affords and necessity requires, and the colony is in prime condition. But under no condition or circumstance can a weak colony be induced to build drone-comb, for the reason that no surplus honey is collected, therefore no occasion for the production of drone-comb by the bees.

If I have formed a wrong conception of the cause for the production of drone-comb, as stated, I hope that some of the brighter lights in apiculture will direct me in the straight and

right way. Let the right prevail, and the wrong be condemned.

I feel now that I have fully filled my promise to Mr. Deacon, made in my former article, and even wandered from my promise and purpose, which, in the beginning, was only intended to cover a report of my honey crop; but I will ask pardon, and promise to hold my peace for some time to come, after closing with what little I wish yet to add.

I hope Mr. Deacon and many others may be influenced to try Golden's plan next season, and thereby be convinced of its merits over other methods in vogue.

I desire now, in conclusion, to return my hearty thanks to Mr. J. A. Golden and the editor of the American Bee Journal—first, to Mr. Golden for writing and setting forth a treatise on his system, free and untrammelled by patents, to the world; second, to the editor of the American Bee Journal for the prominence he gave the article that the bee-fraternity might have an opportunity of learning of the Golden method, and, if desiring, might put it to the test; and also for the courtesy extended to me in allowing me space to reply to Mr. Deacon. May both live to be honored for their interest in endeavoring to advance the art and science of apiculture.

Somerset Co., Pa.

Answer to Questions on the Golden Method.

BY J. A. GOLDEN.

The following questions have been sent me for answer in the American Bee Journal:

I wish to ask Mr. J. A. Golden, through the American Bee Journal, in regard to his plan of working for comb honey, as to the passage-ways or space between sections. In using 10-frame hives as made at the factory, and in preparing them with the side entrance he speaks of, I believe he says, to place a strip of thin wood under the ends of the brood-frames, to raise them on a level with the top of the brood-chamber proper. Would this make too great a space under the bottom of the frames? If so, what does he do with so much space?

And in using two single supers prepared in the same way, and put together to hive the swarm in, would not the space be too great between tiers of sections? Also between sections tiered up, when the proper space has been provided before the outside wall has been put on, which would make the space $\frac{3}{8}$ -inch more.

After hiving a swarm in the double super, and placing the parent colony on top, how soon does he cut queen-cells to prevent after-swarms?

As I am thinking of trying the Golden plan next year, I should be glad for answers to the above. I think I understand the rest of his plan all right, as I have read his articles with much interest. From what little I have learned, I like the Golden plan the best of all the plans I have read about.

R. L. HASTIN.

I am glad to give Mr. Hastin and all readers of the American Bee Journal the information desired, namely, how to arrange the bee-space of hives as made by the factory.

Take, we will say, a 10-frame dovetail hive to illustrate. Take a gauge set to $\frac{1}{4}$ inch, and mark each top side of the body, then saw down at each end, and with a draw-knife shave off the $\frac{1}{4}$ inch. This brings the side body level with the top of the brood-frames. Now lay on the $\frac{3}{8}$ cleats on the side body, and tack on the side-board flush with the bottom of the hive, and flush with the top of the end-board, or just as wide as the side board before you cut off the $\frac{1}{4}$ inch strip. There, now, you see you have $\frac{3}{8}$ inch side entrance and a $\frac{1}{4}$ -inch bee-space from the side entrance over the brood-frames.

Now take the supers, and if you use a bee-space above the sections just shave that space from the side body, lay on the $\frac{3}{8}$ cleats, and tack on the side-board flush at the bottom, and as high as the end board. Now you have a $\frac{3}{8}$ -inch side space and a $\frac{1}{4}$ inch bee-space from the side over the top of the sections.

To make the cleats or rim for the hive to set on take strips $\frac{3}{8}$ inch thick, and as wide as the side-board space and outside board is thick, say it is $1\frac{1}{4}$ inches wide, and with a plane level one side, leaving a space wide enough for the outside board of the hive to set on when placed on the bottom-board. Now you have a $\frac{3}{8}$ space under the brood-frames or double super, and into the $\frac{3}{8}$ side entrance up and entering into the supers. See?

Now you can change backward and forward, and always have $\frac{1}{4}$ inch bee-space, but if you use the bee-space at the bottom just reverse the work and raise the brood-frames by a strip under the end of the brood-frames, taking the same width from the bottom of the hive-body. If you winter your bees on the summer stands, set the hive from the stand, turn the beveled strips upside down, and replace the hive, and the side entrances are closed, making a dead-air chamber or space. Do you want any better winter ventilator? I guess not.

I now have some 10-frame hive-bodies in use by taking

out one frame, using the nine, making the bee-space inside, letting the thin, tight-fitting adjusting board come up even with the top of the frames.

I hope I have made my answer plain, and as all apiarists of experience know, ample and free ventilation is very essential, not only for the comfort of the bees, but a great factor in curing honey as well. This being so, I want to say to all, that there is no arrangement or method and hive that will compare with my method in this one feature alone, so far as I am acquainted; and by the use of the slatted separators there cannot be improvement in this direction.

While I was writing the above paragraph, a bee-keeper came a long distance to see my hive and method in operation, retiring for the night at a late hour, but to arise at the dawn of day declaring there is no system of manipulation on earth could supersede the Golden method for simplicity and profit; and that he would journey home and subscribe for the American Bee Journal, and by 1899 be fully convinced to change to the Golden method.

As to Mr. Hastin's second question, five to six days after hiving shake or brush the bees from the combs, destroy all queen-cells, and anything that looks like a queen-cell, replace and set the parent hive on the stand, and supers on top. Now remove the cage and queen, and insert a section, put on the cover, and let the queen run in with two or three puffs of smoke. It is a good idea to place a queen-excluding zinc guard at the entrance for two or three days, as some have reported that some colonies swarmed out, but nearly every case proved that a cell was overlooked.

In conclusion, see to it that plenty of room is provided, for there are lots of bees, and more hatching.

Morgan Co., Ohio.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

[Continued from page 644.]

FIRST DAY—AFTERNOON SESSION.

FACING COMB HONEY FOR MARKET.

"Is it advisable to face comb honey for market?"

Mr. Cameron—Yes; and then I think it would be advisable to make all just like the face.

Dr. Mason—I suppose it is meant putting the best on the outside. Farmers that are going by our house face their loads of potatoes, apples and tomatoes, and so forth. I should say no, it is not advisable. I am rather "at sea" on this thing, because we have been putting so much faith in some of our great lights, and they have failed us. Here Doolittle has gone to advising facing comb honey—that is, by implication. Mr. Root recommends certain courses of action to be right. It is a question in my mind whether I had better place any confidence in anybody. It is not a question with me as to whether it is right to deceive people by putting the best outside. Mr. Hutchinson, I believe, says that you don't deceive anybody—that they expect it. If he is right, then it is right to face comb honey, or anything else. A gentleman came along by our house yesterday morning with potatoes—very nice on top. I said to him, "Are they the same all through?" He said, "Yes, sir." I took his word for it—thought it was perfectly good. I turned the potatoes into a basket bottom side up, and they weren't half as good. That was deception, and he mist a sale. Is there any question as to whether it is right or not? I think not. I lived on a farm once myself, and sold a good deal of produce, and I found it to be a bad practice to "face," whether it was potatoes, or onions, or anything else.

Mr. Cameron—How would it do to put the best in the bottom?

Dr. Mason—That pays. Among those who patronize you, you get the name of being a square dealer. It does not pay to put the best on top, besides being absolutely dishonest. I

don't say that that is my opinion; I say it is so, and I can prove it.

J. H. Masters—In packing apples it is usual to face the bottoms of the barrels—and then reverse the barrels.

Mr. Danzenbaker—Facing is universally practiced with apples. You open a barrel of apples that has the brand on it—Baldwins, or Greenings, or whatever it may be—and you take the head out and you find the barrel faced. If you don't find any good ones on top you can conclude that there are no good ones there. There are, of course, packers whose name on the barrels is a guaranty. I sort my honey before it goes into the case. I pick out four for the front, and then say to the merchant, "If there is any in there that you can't sell for 20 cents, put it aside for me. They want it to look as nice as possible, because they pile it up to make a show. If I had some that was travel-stained I would put some travel-stained at the front. That kind of facing is honest. I have never had a case come back to me on a complaint. I do not face with white honey at the front and put dark behind. We face just as we paint a house or hang up window-curtains to make it look nice. If there is good honey in the case it must be shown. If they don't see it they conclude that there is no good in it.

E. R. Root—I would say that I at first sided with Mr. Doolittle, and when I found I had made a mistake I got off of the fence. I might say that there is perhaps a species of facing that is not dishonest, and there is a kind of facing that is certainly dishonest. I don't believe there is any one here who would think it proper to put buckwheat honey into the case and have it faced with white honey. I don't know that I would do it myself, but if some one sold me a case of honey with the best sections in front, I don't know that I would say he intended to deceive me. It would depend on how far he intended to pick out the best sections. I believe that nearly all honey that goes on the market is faced somewhat. It is so easy to put one or two of the best sections in front. I never think that the best sections will be in the rear or in the center, and for that reason when we buy honey from the dealer's standpoint we generally take off the cover and pull out a section or two from the body of the case. We go rather by the inside of the case than by the face. That would seem to argue that all honey is faced to a certain extent; for that reason we prefer to see what is on the inside.

Dr. Mason—Why do you look in the center of the case?

E. R. Root—Because we want to know exactly what the honey is all the way through.

Dr. Mason—Then you are afraid it is faced?

E. R. Root—We are afraid it is faced.

Dr. Mason—The question is, "Is it advisable to face comb honey?"

E. R. Root—I don't think it is.

A. I. Root—This question has been up quite extensively in the fruit papers. They make a certain compromise, that there is no harm in fixing a case of strawberries or peaches or other fruit so that the best side of the red cheek is uppermost. There might be a difference of opinion in regard to that. Some say it is like exhorting the members of a family to "put their best foot forward." I think it pays to take pains to make things look nice and attractive, but I don't think it pays to cheat in any shape or manner. Making a good appearance has everything to do with selling your stuff. For instance, Mr. Selser has the handsomest honey-wagons I ever saw in my life. I believe that his wagons have a great deal to do with his sales in the city markets. You ought to make everything look as well as possible without cheating anybody.

Dr. Miller—This is one of the topics that has been pretty thoroughly discussed, and yet I think it can be profitably discussed here. Whilst there has been some feeling about the matter, I think if we would all look at it from the same standpoint, we would all see it about alike. I don't believe there is a more honest man than G. M. Doolittle. He doesn't look at the matter exactly as some of the rest of us do. I am not sure that he looks at it from the right standpoint. He looks at it in this way: When you send honey to a commission man you send it with the understanding that he has the whole thing before him, and it is his business to look and find out what there is in it, and with that understanding he says facing is entirely right—that it is right that I shall put buckwheat honey in the middle of the case and my best honey in front. If that argument is all right, then Mr. Doolittle is entirely right. But I don't believe it is straight. I think when you send honey to a commission man he expects the honey outside to be the same—to be a representation of the whole thing. Mr. Ernest Root tells us they look on the inside of the cases; but they do not look on the inside because they think the outside ought to be a fair representation of the whole. The feeling in their minds when they open the case is that the outside

ought to be a fair representation. There is a certain way in which I believe it is right to put the best side out. The cloth on the inside of my coat is all right for where it is; but it does not cost as much as the cloth on the outside, and is not as good. I want to have the best side out. There is no deception about it. You do not expect that the inside is the same as the outside. When you put a section of honey on the table you put the best side uppermost. It looks better that way. In the same way I believe it is right—alho W. Z. Hutchinson "called me down" on it—I believe it is right to put the best side of the sections out. I want them to be a fair representation of what is in the case. I have had a great deal of quarrelling about that in having my honey packt—more than about anything else connected with the whole business. When I say that I want the front to be a fair representation of the whole case, I mean that when those three sections are taken out they shall be as good as any other three in the case, but no better, taking the sections at random. I want the packers to put three sections in front that will be a fair representation of the whole, but I want them to put the best side of the sections out. That is not deception at all. I think when I put better sections next the glass than I put in the middle I am hurting my trade. I am in this business to make money, and I avoid doing some things because that will help me in making money, not entirely because they are dishonest. I like to have my honey so that men will buy of me year after year and not want to look at it at all. I remember that I sold a great deal to a certain man. The first time he lookt over the honey; the second time he did not. I happened to meet him in company with others, and he said, "I buy honey every year from him. No trouble. Every box just alike." It is not advisable to do anything that deceives. I think the failure to agree with Mr. Doolittle comes entirely from this: He takes the ground that when he sends honey to a commission man the commission man does not expect that the outside, next the glass, is intended to represent the whole case. I know that as honey is generally sold there is more or less of such an expectation that the outside will be representation of the whole; and so long as there is that expectation I think we ought to gratify it by making the outside a fair representation of the entire case. Failure to do that loses us money in the long run.

Mr. Danzenbaker—I grade my honey in three grades; the first grade I sell for 15 cents; the second grade for 13 cents, and then I have a third grade that I sell for 10 and 11 cents that is not all filled. I believe in making things look nice. I produced honey with a man once, and he took part of the honey for home use. He would save the sections and want those sections used over again the next year, but I said I wasn't willing to take those sections, and if he wanted to use them over he must take them himself. If white honey is in dark sections that are a year old, it would take 5 cents off the price. Stained and discolored sections make a difference of 5 cents in the retail price. That same thing applies to fancy honey. A clean shipping-case will make it sell in a commission-man's hands, while an old case will detract from the selling price.

Dr. Miller—The hardest thing I have to contend with in that matter is this: Here is a lot of honey that is set off to one side as fancy, and in another place is No. 1. Out of that fancy I pick out 12 sections to be put into a case, and out of those 12 sections I pick out the three best and put them next the glass—it is all fancy honey; there is nothing but fancy honey shown there, and yet it is "faced." That is the hard thing to me. They say there is no deception in that because it is all fancy honey, so the front represents what it is. Then I ask the one who says that, "Isn't that honey next the glass a little better than the rest of the case?" "Certainly it is." "Doesn't the buyer expect it to be all just as good as what is next the glass? Won't he be deceived when he comes to open it and finds that the inside is not quite as good as the outside?" When it comes down to that we must admit that he will be. When it has been sorted out in piles and the best pickt out and put next the glass there is where the deception comes in. Then suppose you have hired packers; they take delight in having things look well, and you have got to watch them to prevent their deceiving. You will cheat more in that way than in almost any other if you don't watch. You must watch the packers.

Pres. York—I don't think it is a question of deceiving the commission men; it is a question of deceiving the final purchaser of the goods.

Mr. Miles—I would like to offer a thought about No. 1 and fancy. I find in selling honey that there is hardly any one that knows the difference between what we pack as No. 1 and what we pack as fancy; so they would never know they were deceived; they wouldn't recognize that it was faced,

and there would be no deception as there would be if we put buckwheat in.

IS COMB HONEY ADULTERATED?

"Is comb honey adulterated, or has it ever been?"

H. L. Miller—I have heard it reported that they have machines at the glucose factories for producing comb and making honey.

E. H. Bridenstine—I heard that it was manufactured here in Omaha, and I wish to find out.

J. F. Spaulding—If we can find such a place I move that we move on it in a body.

Mr. Whitcomb—We have several grocers who say they sell comb honey that is adulterated. I doubt it. I don't believe it can be done. The idea has got out, and it is sold to their customers as manufactured comb honey, mainly, I believe, to get rid of a poor sample. I doubt if anybody has ever been able to manufacture comb honey.

Mr. Spaulding—I would like a showing of hands here if there is any one who believes that comb honey has been manufactured.

On a call for a showing of hands no hands were raised in the affirmative.

Dr. Miller—As to the answer to that question, we must be a little careful. I am not *sure* but there is such a thing as adulterated comb honey, but if the question read, "Have you ever seen a pound of comb honey made without the interposition of the bee?" then we could say that no man has ever seen it or ever will see it; but whether comb honey is adulterated is a different thing. It is not on the market to any extent because there is no money in it.

E. R. Root—We have made an offer of \$1,000 that we will pay to any person who will produce a single sample of comb honey that cannot be detected from the genuine. One or two have been foolish enough to try to take up that offer. We received one sample where a cake of wax had had numerous holes bored through it, and the holes were filled and the comb sealed. Of course it did not get the reward, because it could be detected from the genuine. We are trying every year to feed pure glucose to bees. I learned this summer that you could dilute it down with water and they would take it, provided there was nothing else that was coming in. But I don't believe there is any adulterated comb honey on the market.

Pres. York—I am very tired of having people come to my office who have some story to tell of comb honey being manufactured in Chicago. I have often said to them that if they will take the time I will, and we will go and find it. It cannot be done. I have simply laught at such people as believe that comb honey has been manufactured or can be. I think it is utterly impossible.

Mr. Danzenbaker—I don't think that bees will take glucose and put it into comb. Some years ago the secretary of a glucose manufactory boarded with me. There were bees in the yard, and he took great interest in them. It was a hobby with him. In the early mornings he would be out there and have the hives open, and I found out that he was experimenting with the glucose. He brought glucose and put it into the tops of the hives. I wondered what he was doing, and I found the glucose there. The bees would not take it. Then he took the best glucose sugar and put it in, and the bees wouldn't take it. It was during the honey season, and he thought the bees would mix it with the honey that was coming in from the field. He meant to keep bees. He imported a lot of Italian queens, and was thinking of making honey out of glucose, but the bees wouldn't touch it. I believe that the acid in the glucose would finally kill the bees. They have an instinct of sense that enables them to detect it.

Pres. York—I would like to give one instance of feeding glucose to bees that I know of. Mr. Grabbe, some years ago, was interested in bees with Mr. Perrine, in Chicago, who was one of the biggest adulterators in the State at that time. They moved two or three hundred colonies to Mississippi and began feeding glucose, and it was scarcely any time at all until they had killed all their bees.

A Member—What is the best way of combating the idea that comb honey can be made without the aid of bees?

Dr. Mason—Subsidize the press.

Mr. Whitcomb—Kill off the fools.

Mr. Danzenbaker—Last year at Buffalo this question was raised and talkt about. I remember mentioning a story that was publisht in Washington about the manufacture of comb honey. I had a great deal of trouble with that story in the market. People would say my honey was manufactured. I presented them with the argument that has been made here, but I made it a little stronger: I said if there is a man in the United States that can produce one square inch of comb honey

by manufacturing it, there is a chance for him to make a thousand dollars. I went to the editor of the Washington Star with an article and asked him to publish it. He said he didn't want to do it. I said, "You are bound to do it because you have published a lie here, and there are storekeepers here who are tired of answering questions about the matter. Do it or say you won't do it, and I will go and tell them that you refuse." He did publish quite a long article. I went to the Post editor, and he said he would have to refer me to the advertising editor. He wanted to charge advertising rates to publish that article. I said that in his Sunday edition (which is the largest edition in the city) he had published that lie to deceive the people, and I thought it was due to the people that he should publish the truth. But he wouldn't tell the truth without being paid advertising rates.

Dr. Mason—I believe just as I answered at first—subsidize the press. Most of us live in localities where papers are published. We can take the editor a sample of honey and illustrate to him how it is produced, and he will become interested. The Toledo Blade has a large circulation, and I do not have any trouble in getting into the paper anything I want in that line. They are anxious that the articles shall be brief and to the point, and I show to the editor some comb honey and tell him how it is produced, and all about it. If I can, I take along some bees.

Mr. Danzenbaker—I took a box of honey with me—six pounds, and I left a box of honey with the editor of the Star. I took another box to the editor of the Post, and showed it to him, and told him I would like him to have that—if he had a family, I would like him to take it home and test it—that I would make him a present of it. He took it as an offense. He acted as if he thought I was trying to bribe him. I have found Dr. Miller's article on the food value of honey, or honey as food, to be a great help. I have scattered it among the people, and I would leave in the stores a hundred or two and tell them to give them to their customers. I gave one of those pamphlets to a lady on the market, and the next day she came to me and said she had read it, and she wanted a box of honey. Three weeks afterward she came to me and told me her son had had la grippe, and that the honey I had sold her had cured him. She turned to three or four ladies there and told them about it, and they all bought honey.

Mr. Whitcomb—Dr. Mason insinuates that the press of Nebraska has not been subsidized. Not very long ago a gentleman here in the room undertook to get a write-up into one of our Omaha papers. The person who undertook to do the writing carried away the honey all regular, and then as a return he wrote that the gentleman who gave him the honey said that the Nebraska bee-keepers were using a new system—that they put into the hive sheets of glass so that when the bees were making the comb they could back up against the glass, and so get the comb all straight and nice. [Laughter.] You will often find that you will do better to write the articles yourself.

THE FOOD VALUE OF HONEY.

Mr. Whitcomb—I think we entirely underrate the food value of honey. I think one pound of honey contains more nutriment than two pounds of pork. I don't believe there is any family that uses honey to any extent that has any use for a doctor. I don't believe there is anything in pure honey that is not assimilated by the system. I believe it is the only thing we eat or drink in which there is not something left to be thrown off. In my institute work over this State I have made inquiries concerning unhealthy children in families where honey has entered into their diet every day. I don't believe unhealthy children can be found in those families which use honey as an every-day diet.

Dr. Miller—I have heard Mr. Whitcomb go over that story time after time—

Mr. Whitcomb—I have told it so many times that I believe it to be a fact. [Laughter.]

Dr. Miller—I want to say that if the rest of you will do that same thing the people will soon know more about honey than they do. I don't believe you know anything about the medicinal value of honey as you should; I don't believe you know the food value of honey as you should; I don't believe you know the difference between honey and sugar as you should. We have people dying all about us because of the over-use of sugar. Does more than one out of every half-dozen use honey in his coffee in place of sugar, with the knowledge that he is going to prolong his life by it?

Mr. Danzenbaker—There is one point in regard to the natural craving of all children for sweets. Every parent knows how they long for sweets. People look upon honey as too much of a luxury. I have seen people go by in the market with children, and the children would stop and come back to look at the honey, and I would say to the mother that the

natural craving of that child was for sweets, and that she ought to give him honey. I would hand her one of those leaflets, and probably the next time she came along I would sell to her. The reason there is not more honey used to-day is because grown-up people didn't have it when they were children. Children desire it. We want to teach parents their duty to buy it for their children.

Dr. Mason—We used considerable honey in our family during the time of la grippe, and we discovered one thing—I think I have already said something about it: Those of our family who used plenty of honey didn't have la grippe, and those who hadn't used it did.

D. A. McGregor—I have the la grippe pretty nearly every winter, and I use more honey than almost any one else.

Mr. Danzenbaker—I have never had the la grippe in my life.

Mr. Cameron—How much longer would a man live who used honey instead of sugar?

Dr. Miller—I don't know, but I do know that there are men dead to-day who would be living if they had used honey in the place of sugar. Sugar affects the kidneys.

EXTRACTED VS. COMB HONEY FOR HEALTH.

"Do you think that extracted honey is more healthful than comb honey? Is the wax in comb honey a detriment to health?"

Dr. Miller—It depends on the character of the honey. I don't know any reason why extracted honey might not be just as good as comb honey. As a matter of fact, I believe the average sample of comb honey as you find it on the market is better than the average sample of extracted honey. It is better ripened, because the honey is left until it is sealed. Sometimes the bees may seal unripened honey, but as a rule they do not; and while those who extract honey might always leave it until it is ripened, as a rule they do not. So you may have a sample of extracted honey that is just as good as the best comb honey, but the average sample is not so good as the average sample of comb honey. As to the matter of the wax, it is indigestible, but I don't think it makes much difference. It is simply that there are particles of foreign matter there. I think at one time Mr. Bingham stated that the particles of wax help to flavor the honey; but I don't believe they do, as the wax itself has scarcely any flavor.

Mr. Whitcomb—The honey is not to blame because we take it unripened. Because the bee-keeper takes the honey before it is ripened, that ought not to be charged as a fault of the honey.

Dr. Miller—Take it as it is found on the market, and the best extracted honey is just as good as the best comb honey. If I were to take it for my own use I would rather have the extracted, because the wax is indigestible, and while it may not do any harm it doesn't do any good. There is a possibility that it may do an infinitesimal amount of harm.

Mr. Cameron—How do you know that wax is indigestible?

Dr. Miller—Practically I don't know it, but I feel confident of it. I do not know it so well that I could give you positive proof of it, but I think I could by taking time for it. Some of you may remember that your grandmothers used corks of beeswax to close bottles of sulphuric acid. The wax was not affected by the strongest sulphuric acid, and I doubt if it can be affected by the weaker hydrochloric acid of the human stomach. I think that is pretty good proof.

Mr. Cameron—I know that bee-keepers hold that view of it, but I have never seen any proofs. There is a worm that lives on beeswax, and it seems if the worm can digest it a man ought to.

Dr. Miller—Because a worm can digest it is no proof that a man can.

(Continued next week.)

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

A Robbed Colony.

I have a colony of bees that the rest got to robbing, and I moved it away about 30 yards and shut it up so that only one bee could get in at a time, and yet they came and robbed, so I shut them up tight, and the robbers would come yet and fly around the hive. When I would open it, the rest would begin to rob. What am I to do with it? and what is the trouble? It is in a box-hive.

NEW JERSEY.

ANSWER.—Moving the hive to a new place was hardly the right thing. It only made matters worse. For when you moved them to a new place, the colony would be just that much weaker to defend itself, for when the field-bees went out to forage, instead of coming back to their hive in its new place they would go back to the old stand, and then join the colony that stood nearest. It would have done more good if you had left them right on the old stand, shutting the entrance as you did, then piling loose straw or hay as high as the top of the hive and keeping it wet. Possibly that treatment may do yet. But don't move the hive back to its old stand now, for by this time they have become so used to the new place that moving would cause more loss. If you will look carefully through late numbers of this paper you will see several plans for fighting against robbers. One of the latest, and one which is worth trying, is to put naphthaline or moth-balls at the entrance. The odor is so disagreeable that it is said the robbers will not pass by it, while it does not hinder the bees that belong to the hive.

But a good deal depends on the condition of the colony. If it is queenless, it's hardly worth while to do anything but just to let it stand and let the robbers finish their work.

A Beginner's Seven Questions.

1. What is the best way to bring a small colony of bees through the winter?
2. I have six colonies with young queens which were hatched late in August and began to lay eggs the beginning of September. Will these colonies swarm next year in May or June, if they get through the winter, if the season is a good one for swarming?
3. How many times does a queen swarm in her life?
4. I have a queen in one of my hives which has her wings clipped, and as I thought that colony would not swarm, I was trying to run it for comb honey, but unexpectedly a swarm came out and went into one of my other hives. What gave them the swarming-fever, as their queen could not fly? Is there a way to prevent swarming in colonies that have wing-clipped queens?
5. On the other hand, I have three colonies with good queens, and they did not swarm, even not the one into which the queenless swarm went. Why did they not swarm?
6. Is there any way to force bees of a colony to send out two or three swarms?
7. What are hybrid bees?

NEW YORK.

ANSWERS.—1. A colony too weak to be brought through alone, may come through all right by having the benefit of the heat from a stronger colony. Even two weaklings may come through together when they would not do so alone. Put both into the same hive with a division-board between them, the board being not more than $\frac{3}{4}$ of an inch thick and made bee-tight, so that no bee can pass from one side to the other. A weak colony will do better in the cellar than on the summer stand.

2. Very likely they will, altho not so sure to swarm as if the queens were older.

3. There is no rule about it. She may never swarm, and she may swarm half a dozen times.

4. Clipping the queen's wings doesn't have the least effect to stop the bees from wanting to swarm. They'll try to swarm just as much as if the queen had never been clipped. How to prevent swarming in a satisfactory manner, either with queens clipped or unclipped, is and has been a question that has puzzled

the brains of many, and I don't know any one in the world that can answer it.

5. The difference may have been in the character of the bees themselves. Some bees are five times as much given to swarming as others. The difference may have been in conditions. One colony may be stronger than another, may be more crowded for room, or there may be differences in other respects. Sometimes one colony will swarm and another beside it will not, and you can't see a shadow of difference in the character or condition of each; the only thing you know for sure is that one swarmed and the other didn't.

6. Perhaps there is no sure way to make a colony send out a second swarm if you leave it on its own stand. But you may accomplish it by moving. When the colony sends out a swarm, put the swarm on the old stand and put the old hive in place of a strong colony, putting the latter in a new place. When the next swarm issues, do the same thing again, and repeat as often as a swarm issues, each time leaving the swarm on the stand where it came from and putting the old hive in place of another strong colony. In that way you may have a half dozen or more strong colonies from the same hive. There is some advantage in the plan if the swarming colony is of superior blood, for in that case you have good blood in each swarm.

7. The word "hybrid" is perhaps not the word that ought to be used, "cross" being a better word, but "hybrid" has been used so much that it will not easily be given up. Let bees cross in breeding, as when an Italian queen meets a black drone, and the bees from that queen will be called hybrids.

Difference in Color of Honey Cappings.

A few days ago I took two supers off of two hives which stand next to each other. Both supers had been put on the hives the same day, and both were filled well, and all sections were well capped with the exception of the two outside rows, which had some sections not fully capped. The bees in both hives were very dark hybrids, mostly black. Everything in the two hives seems to be as much alike as can be, but there is this difference: While the cappings of the cells in one super are perfectly white, the cappings in the other super are a golden yellow. The honey in both supers is of light yellow color. What is the cause of the different color of cappings in these two supers?

These were the only supers I took off this year, the others being still on the hives. Bees have not done well. I had 33 colonies last spring and increased to 38. I had to unite two colonies with others, which were queenless, making seven new swarms, but as my bees commenced to swarm April 28, and the last swarm which I caught came out Sept. 2, I have lost a number of swarms not being able to be at home all the time. I have some colonies working in second supers, but most will not fill more than one super, and some will have them only partly filled, so that 24 pounds per hive will probably be the yield. The weather is favorable now, and bees work well on fall flowers.

MISSOURI.

ANSWER.—It is possible that notwithstanding the honey appears alike, the bees of the two colonies were gathering from different sources. It is also possible that they gathered from the same source, but that one colony was much given to painting with propolis, and so put a thin coating over the cappings, a very thin coating sufficing to color the comb.

Bees on Shares—Wooden Combs.

1. What share of honey and new swarms should each have provided the one that takes the bees furnishes the hives for new swarms, sections, supers, etc., and does all the work attending to them and marketing the honey? Is it customary to divide up the new swarms every year, or to keep them for a specified number of years, say five, then for the first party to take out the number of colonies he gave the second party, and divide the balance.

2. What is the modus operandi of L. A. Aspivall's dum-mies to keep bees from swarming?

PENNSYLVANIA.

ANSWERS.—1. Share business in bee-keeping is one of the hardest things to tell anything about in the whole range of bee-keeping. There is no rule to go by. Each case is a law unto itself. In the case you mention, A furnishes the bees and B does all the rest. Now it depends altogether on the kind of bee-keeper B is, as to what he should have. If he merely gives the swarms and takes off the honey, his share need not be so large as if he were a thoroughly informed bee-keeper, and gave the bees the fullest and best care. Suppose

B is an up-to-date bee-keeper. A furnishes 10 colonies of bees. If there is no swarming, and A gets one-third of the pay for the honey, he ought to be satisfied. Perhaps one-fourth would be enough, for he still has the 10 colonies left, and all that he needs pay for is the interest on the money invested in the bees and the wear and tear of the hives and contents. If there are swarms, he should have a share of them, or its equivalent in the honey. But it's all as you make the bargain, and everything should be put down in black and white, so there can be no possible misunderstanding, for the chances are that if you go into the share business and are the best friends in the world, you may not be on speaking terms when the dicker is over. You can settle up and begin over again every year, or you can make an arrangement for a given number of years.

2. The dummies are practically wooden combs with holes bored for cells, only there are no bottoms to the cells, the holes being bored clear through the wood. The idea seems to be that the bees think they have a lot of empty combs, but as there are no cell bottoms they can't fill them, and so long as they find lots of empty cells they hardly think it necessary to swarm.

How and When to Transfer.

What is the best plan, and when, to change a colony of bees from a box-hive into a Langstroth hive? I placed the Langstroth hive on top of the box-hive the past summer, and as there is about 40 pounds of honey in it, I thought I would move them into it this fall.

ILLINOIS.

ANSWER.—With 40 pounds of honey in the Langstroth hive, there ought to be little trouble. You can drum all the bees out of the box-hive, letting them run into the frame hive, then set the hives back as they were, putting a queen-excluder between, so that the queen will be fastened in the upper or frame hive. Possibly, however, the queen is already in the upper hive, in which case there will be no need of drumming. Perhaps you will do well to attend to it right away, altho it could be left till spring.

Finding the Queen in a Large Colony.

I have great difficulty in finding the queen in a moderately large colony, or in telling with certainty when a colony is queenless. Is there no invention that would aid us in catching the queen when it is desired to do so? If so, what is it, and where can I buy it? Is the Hanneemann bee-sieve used for this purpose?

TEXAS.

ANSWERS.—Finding a queen readily is largely a matter of practice. In back numbers of the present volume of this journal you will find some hints that will be useful, and as you will probably not want to do a great deal more in the way of finding queens till next spring, it will be a good plan to load up with information through the winter. Often a second reading at one's leisure will be of more benefit than the first reading, which is perhaps somewhat hurried.

But you can generally tell whether a colony is queenless without seeing the queen. Indeed, it is more satisfactory to see the brood than to see the queen. For you may find a beautiful queen present and yet the colony may be worse off than if they had no queen at all. For the finest looking queen in the world may be a drone-layer, and the colony is better off after you've killed her. So whether you see the queen or not, look at the brood. If eggs are present, brood in all stages, and the brood sealed in worker-cells has a flat surface and doesn't look like a lot of little marbles laid together, you may know that they have a queen that is all right.

Yes, you can have something to help catch the queen, and it's probably what you mean by a "Hanneemann sieve." Plan any way you like to have the bees pass through queen-excluding perforated zinc, and the workers will pass and the queen be left. You may arrange this at the entrance, or otherwise. One way is this: Fasten on the bottom of a hive-body a queen-excluder, and call it your "sieve." Lift the hive from its stand and set an empty hive in its place. Take out a frame of brood, brush all the bees from it in the old hive with the rest of the bees, and then put this frame of brood in the empty hive on the stand. Set your sieve on top of this hive on the stand. Now brush off each comb, one after another, brushing the bees into the sieve. As fast as you brush off a comb, put it into another hive, for if you put it back where the bees are, the queen may crawl upon it and your work will be to do over again. Sometimes the bees will all run promptly down, leaving the queen alone in the sieve, and sometimes you will need to use a little smoke to drive them down.

Heather Swarms are cheap in Germany. C. Burgdorff advertises them in Gravenhorst's Bztg. at 63 cents to \$1.00 each, and laying queens at 38 cents each.

Facing Honey-Cases is discussed by Sonnambulist in the Progressive Bee-Keeper, who mentions two cents a pound difference in honey caused by the manner of packing, as also 15 to 20 cents a basket on peaches. He doesn't leave it entirely clear whether the goods with the better facing got the higher price or not, but closes by saying that "honest facing is not an impossibility."

The "Changing" Cure for Bee-Paralysis.—A colony of bees had paralysis so badly, says W. A. Pryal, in Gleanings, that the bees were dwindling rapidly, hundreds crawling from the hive each morning, and a quart of dead bees being sometimes in front of the hive. He made the diseased colony exchange places with a healthy one, and the effect was magical; no more dead bees in front of either hive.

Bee-Space Between Combs.—The question has been somewhat discussed as to whether $\frac{1}{4}$ or $\frac{3}{16}$ was the space left by the bees between two combs of honey sealed over. Some testimony seemed to show that blacks left a smaller space than Italians. T. H. Kloer says in Gleanings that his Italians average $\frac{3}{16}$, and he thinks that where they leave a space of $\frac{1}{4}$ that the bees had too much room, or else the honey-flow was too scant. The editor now calls for more reports, for the thickness of the cleats of fences depends on the space that the bees favor.

The Honey Crop.—Taking the whole world at large on both sides the ocean, 1898 will be remembered as a year of failure for bee-keepers. The Canadian Bee Journal reports Canada as an exception. "In a few localities of limited areas it has been light; in others a good crop, and in a very large portion of the honey-producing districts the crop has been very heavy." But the journal complains that honey has been rushed on the market at too low prices, stores having filled up at as low as 5 and $5\frac{1}{2}$ cents for first-class extracted, and $4\frac{1}{2} \times 4\frac{1}{2}$ sections being sold as low as $7\frac{1}{2}$ cents a section.

"Grading Honey; Doolittle's position again defined; does not recommend or practice facing." Such is the heading of an article in Gleanings by G. M. Doolittle. He says no one can carry "in his eye" the difference between fancy and No. 1 ten rods. More than that, if one side of a case is faced with No. 1, and the other side with fancy, he can hardly tell the difference, but if the two kinds are placed side by side the difference is easily told. He disapproves of putting No. 1 and fancy in same case, and even of sending to same place. He ships fancy to one man and No. 1 to another, and thus gets as much for No. 1 as for fancy. He thinks Messrs. York, Hasty and Miller have been attributing to him something he neither did nor even recommended, saying: "Just what I do do, and just what I recommend, is an honest sorting of honey by the X plan as given above, then pick the 'prettiest faces' out of each lot and place them on the outside."

The Right Hive is discussed in the Progressive Bee-Keeper by Messrs. Aikin and Doolittle. Both agree that movable frames are of no use to the bees, and of no use to the bee-keeper who never lifts them out of the hive. Aikin thinks the best size and shape to suit the bees is $16 \times 16 \times 24$ inches, 24 being the height, altho a little variation from this might be made to suit the bee-keeper; he hints that 15×17 might be a good size, but wants the height greater than the length, and the brood-chamber in sections five or six inches deep. The $16 \times 16 \times 24$ size calls from Doolittle the exclamation, "Shades of Huber! whether are we drifting?" He figures the contents of such a hive at 6,144, when Quinby gave 2,000 to 2,500, and prophesies that no comb honey would ever be taken with the large size. The suggestion of hive-sections five or six inches deep makes Doolittle "fighting mad," and he says he has some "chunks of logic regarding how the bees will be brooding sticks and vacant space during the time they should be brooding queen eggs and larval and pupa bees, etc."

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of beekeepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. OCTOBER 20, 1898. NO. 42.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Selling Honey by Sample.—One of our agricultural exchanges contained the following advice to those who have honey to sell:

"The best way to advertise honey is to give samples to those whose patronage the producer may desire. The way to advertise is to secure small sections, those that will hold a half pound, or even less, if one does not feel that he can afford to give pound or half-pound samples away. Get enough such sections to answer the need of samples, and place them on the hives at the opening of the honey-gathering season. When they are filled, label them, and distribute them. Following such samples within a week, the farmer will find purchasers, providing the samples were of fine quality.

"This sample system of advertising is largely carried on by merchants in the villages, towns and cities, and it is considered a highly successful system. When once a customer has taken honey from the farmer, he is likely to become a regular customer. The farmers in some sections take their honey to grocery stores in the villages and cities and leave it on sale, periodically collecting from the grocerymen for all that is sold, and allowing the store men a commission on the sales. In many sections of New York and Pennsylvania both these methods are pronounced economical and successful."

No doubt, like almost everything else, the best way to work up a demand for honey among consumers, is first to hand to them free samples. People usually prefer to taste of the good things they are asked to buy; then if they like them they will be more apt to purchase.

We wonder that more honey-producers, when they run out of their own honey, do not buy elsewhere, and keep their customers supplied. They would thus not only be doing a good turn to the one they purchase from, but would also benefit their customers and themselves at the same time. In

the whole transaction three or more persons would be helped. It seems a pity that when once a bee-keeper has regular customers, he should neglect to supply them with honey.

Quality of Sweet Clover Honey.—The great range of opinion regarding sweet clover honey, some calling it disagreeable and some the finest, according to light brought out at Omaha, seems to be due to the fact that sweet clover honey must be thoroughly ripened to bring out its fine flavor. The editor of Gleanings says:

"The honey that Mr. York, editor of the American Bee Journal, produced has been pronounced as being of very fine quality, and he was of the opinion that it was largely sweet clover. When I first tasted some of his honey a couple of years ago, I remember I thought it had the most delightful flavor of anything I had ever tried; but at that time neither Mr. York nor myself knew its source; but on my last visit he was quite certain that it was from sweet clover. That same delightful minty taste was present. At the convention some thought that sweet clover honey was a little better when mixed with something else. Perhaps this is true, for Mr. York's honey, besides the sweet clover, has evidently a mixture of other flora that abounds in his vicinity."

Dishonest Facing of Comb Honey.—In this number of the Bee Journal will be found several references to the subject of facing comb honey—in the Omaha convention report, and in the departments of "Question-Box" and "Bee-dom Boiled Down."

Of course there is an honest facing of honey and a dishonest one. The former needs encouraging, but the latter needs not only discouraging, but a sudden death and speedy burial.

About two weeks ago R. A. Burnett & Co., the leading and oldest honey-dealing specialists in this city, sent us this note:

"MR. YORK:—If you have a chance to-day, drop in and see honey packed *a la Doolittle*."

We were glad to call, as suggested, as we thought it might furnish a good text for an editorial.

The honey in question had come from a Granton, Wis., bee-keeper, accompanied by the following letter:

"I made a shipment of honey this day—16 cases of fancy white comb honey—521½ pounds, net weight. . . . If you do well on this shipment I will make you another."

Upon receipt of the honey, Messrs. Burnett & Co. wrote Mr. Man thus:

"DEAR SIR:—Honey has come, and it is hurt a little in transit, but that would not matter much if it had been honestly packed. We opened a case that was leaking, to see how badly it was injured, and our surprise was great to find combs with cells nearly all empty; others with center filled and the rest empty; others one side of comb fairly well filled and other side nearly empty; others with dark honey and all stages of filled cells. To protect your interests we are obliged to assort it or sell for a low price; we have decided to assort.

"P. S.—Since writing the foregoing, one of the former lot has been returned to us, and we don't know how many will be, as it all appears to have been mixed."

Well, we saw several cases of the above lot of "fancy white comb honey" opened up, and must say that we never had seen anything like it before. The front row of sections, next to the glass, were beautiful—white, well filled and sealed. But back of them—well, we could scarcely believe a sane man would case honey for market in that way; and also call it "fancy white!"

We believe there were some sections of simply empty comb—not a drop of honey in it! Then there were half-filled sections, uncapped sections, dark combs, light combs, etc. And the whole was put up in 24-pound double-tier shipping-cases, which no up-to-date bee-keeper should think of using.

As the shipper of the above honey does not read the Bee

Journal, he of course had not seen the rather warm discussion in the bee-papers on facing comb honey, about two months ago. He simply fixt it up to sult his dishonest pleasure.

One case of the honey we saw opened had been taken by a customer of Burnett & Co. without opening, and of course was returned at once.

It is just as we said some time ago, it is *wrong* to face up cases of honey for market, no matter to whom or where they are sold. In this case, the commission man received the blame, when the deception was entirely on the side of the shipper. Goodness knows, the city dealers have enough sins of their own to answer for without the producers trying to unload their shortcomings also upon them.

As will be seen by Mr. Doolittle's answer in the "Question Box," he does not now, if he ever did, endorse the foregoing method of packing comb honey for market, altho a couple of months ago he seemed to think it would be all right provided the honey was sold on *commission*, and the *shipper thought it to his interest to do so*. We doubt if Mr. D. still holds such views. We surely do not, for we are free to say we don't believe that, because a man may *think* it is right to follow a certain procedure, that makes it right. Not by any means. A man may think, or believe, that it's *right* to whip his wife, or swear, or get drunk, or do anything else that is morally *wrong* in the eyes of those who have educated consciences. But his believing it right, or to his interest to do so, doesn't make it so, by a long shot.

Our advice to bee-keepers, when putting up honey for market, is to pack it *honestly*, so that no matter who buys it, they will not feel that they have been swindled, or deceived.

Two Departments in Gleanings in Bee-Culture that have been somewhat conspicuous by their absence, are beginning to appear more regularly. They are "Reports Encouraging" and "Reports Discouraging," the former taking up the most space.

The Critic Criticised.—The Review critic, Hon. R. L. Taylor, has given considerable attention to the literary character of Gleanings, and the editor of Gleanings makes some reply in his number for Oct. 1. He seems to think it would be better for Mr. Taylor to stick to his legitimate work, which Mr. Root considers to be to criticise theories and practices of bee-keepers, rather than infelicities of expression. Mr. Root confesses he (Root) makes "slips" in writing, is thankful to have them pointed out, and thinks the appreciation would be more, and the profit as much, if they were pointed out privately.

Mr. Taylor having said that "helpful criticism is more than meat and drink" to himself, Mr. Root thinks such things out of place in a bee-paper, but since Mr. Taylor thrives on that sort of diet, he gives him some, instancing Mr. Taylor's saying "would" for "should," and "earliest" for "earlier." He thinks if Mr. T. had a late dictionary he would not object to "boil" in the phrase "bring to a boil;" thinks the crimson fluid from Mr. Taylor's sympathetic heart would not have suffused his cheeks at the use of "canine" for "dog" if he had consulted the Standard dictionary; hints that Mr. Taylor has been naming words slang that are only colloquialisms; and greatly enjoys Mr. Taylor's criticisms when confined to theories and practices of bee-keepers, but doesn't like being taken to task for opinions he doesn't hold.

We, also, enjoy reading Mr. Taylor's writings on practical bee-keeping, but fully agree with Mr. Root's idea, that criticisms of the language used by correspondents properly belong to a purely literary periodical, and not to a bee-paper. While we endeavor to have the English language used correctly in this journal, we do not hold it up as a model, or expect any reader so to regard it. Our aim is to have everything in it so

plainly exprest, that even the youngest or dullest reader may understand it. Then we are certain the oldest and most learned will comprehend it all.

Putting Comb Honey in Tumblers.—This matter was brought up at the Omaha convention, and Editor Root refers to it in the following paragraph from Gleanings for Oct. 1:

During one of the discussions at Omaha, the practice of putting up broken comb honey in tumblers by bee-keepers was most severely condemned, for the reason that glucose-mixers put a little chunk of comb honey into a tumbler of glucose, and then labeled it "Pure Honey." This latter, going out into the markets, disgusted consumers, and they naturally think that, if honey tastes that way, they want no more of it. It was urged that some good bee-keepers practiced putting up broken comb honey in tumblers. But that made no difference; they should be severely scored by the bee-keepers. They could put up their broken comb honey in tin pails; but even then it was urged that they sell it around home. I think, myself, that no bee-keeper should put up his broken comb in tumblers, for the very reason that such a package is at once suggestive of glucose.

As we desire to emphasize the importance of the above suggestion, we have reproduced this paragraph. Invariably, in the Chicago market, when we find a tumbler or other glass package with a piece of comb honey in it, the liquid part is glucose, pure and simple. And it is most villainous stuff to eat. Just the smallest taste is enough to sicken us. No wonder civilized people, who purchase such a vile thing, at once decide that "if honey tastes that way they want no more of it." And then of course they fear trying again, when they are offered the purest honey. So it goes; and so it will continue to go until pure food laws are everywhere enacted and vigorously enforced.

MR. J. KERR, in the Australian Bee Bulletin, strongly maintains that bees recognize and distinguish members of their own colony from intruders by sight, and not by sense of smell as generally believed.—American Bee-Keeper.

MR. G. G. WICKSON, of the firm of G. G. Wickson & Co., of California, called on us last week. Mr. Wickson's firm deals in bee-supplies as well as goods in other lines, especially farm and dairy implements. They have stores in three cities on the Pacific Coast. Mr. W. has 150 colonies of bees in a new house-apiary made to hold 300 colonies. He is a pleasant, business-like gentleman, and evidently is "cutting a wide swath" in the lines he represents.

DR. A. B. MASON, Secretary of the United States Bee-Keepers' Union, wrote us Oct. 11:

"I have been so busy since I got home [from the Omaha convention] that I am behind with everything but my mental work. I have not lookt at my bees, except one colony, since a week before going to Omaha, and don't know whether they have plenty of stores or are starving. The supers are all on yet, there being so much honey-dew that I don't care if I don't get time to extract it."

EDITOR W. Z. HUTCHINSON, of the Bee-Keepers' Review, made us a very pleasant call, Tuesday, Oct. 11, when on his homeward journey from the fair at St. Louis, where he made the final exhibit for the year. He went there from the Illinois State Fair at Springfield, where he secured a number of cash premiums, as noted in these columns last week. At St. Louis he also captured a goodly lot of the premiums offered in the aparian department of the fair. Mr. Hutchinson thought perhaps this might be his last year exhibiting at the fairs, as the Review is getting in such condition financially as not to necessitate his making the rounds of the fairs in order to win

a share of the cash premiums offered. But we should regret to learn that he had ceased making his annual exhibits at the fairs, for there are very few bee-keepers in this country that can equal him in putting up a honey-show. Instead of any good exhibitor dropping out of the list, there should be more added to it, for it is an effective means of calling the public's attention to honey and its great food value.

MR. W. K. MORRISON, in Gleanings, says of Porto Rico: "It is a very fine bee-country. It is the only part of the Spanish colonies worth owning." While referring to the same country a current newspaper item reads: "A peculiarity of the island is that neither snakes nor flowers are found, as in other tropical countries.—American Bee-Keeper.

HON. EUGENE SECOR, the General Manager of the United States Bee-Keepers' Union, is interested in fruit-growing as well as bee-keeping. At his late Winnebago County (Iowa) Fair, the local newspaper reported that "Mr. Secor showed 36 varieties grown on his place inside the city limits. Many of these were Russians that would give the reporter the lock-jaw to pronounce. These new candidates for public favor are only on trial and will not be recommended by Mr. Secor for general planting until they prove to be more valuable than those kinds already known and accepted."

YE EDITOR AND WIFE had the pleasure of spending nearly a whole day—Oct. 6—with Mr. and Mrs. F. Grabbe, at their place in Libertyville, Lake Co., Ill. Mr. G., while still keeping some 30 colonies of bees, and securing about 1,000 pounds of honey the past season, has been getting into the spring and mineral water business the past year or more. He owns a spring that flows at a rate of five gallons a minute, of the purest, clearest water imaginable. It is intended to be used as a table water, for general drinking purposes. A careful chemical analysis of this water reveals unmistakable medicinal properties.

Mr. Grabbe also has connection with another spring about one mile from his own home spring, that is equal if not superior to the famous springs at West Baden, Ind. Years ago the Indians knew of this latter spring, whose life-giving water Mr. Grabbe ships all over the country, and they once

used the surrounding land as a camping-ground. The water tastes strongly of sulphur, and in many cases has proven an absolute cure for consumption, kidney diseases, etc.

Mr. G. will be pleased to mail a circular describing the curative qualities of these waters to all who make application therefor.

Mr. Grabbe, some 25 years ago, owned a half interest in the American Bee Journal, with W. F. Clarke, of Canada. They soon sold their interests to Thomas G. Newman, from whom we purchased it in 1892.

MR. N. STAININGER, of Cedar Co., Iowa, wrote us as follows, Oct. 8:

DEAR FRIEND YORK:—It is with very much grief that I have to tell you of the death of my oldest son, Harry. He joined the army June 21, died at Jacksonville, Oct. 5, and was sent home to us on the 8th. He was sick only about 12 days with typhoid fever, and as the telegraph wires were all down, we did not know it till they were on the way home with his body.

Yours in sorrow,

N. STAININGER.

This is sad, indeed; and our sincerest sympathy is extended to our friend and family in their deep sorrow, and in this expression we feel that all our readers will unite.

KLONDIKE BONANZA SCHEMES, we note, are creeping into the advertising pages of some of the bee-papers—at least one of them. We have been offered several of them, but felt that all were too "schemy" for us to touch, or admit into our advertising columns. People that expect to get rich in a hurry are just the dupes that such glittering schemes generally catch. Understand, we do not say they are frauds, but we do say that any one with even a little sense will think four times before investing. See here. Do you suppose that the rich capitalists of this country are going to be so generous as to offer a good thing to the rest of the people, or to let it get away from them? Not much. They are continually looking for "gold mine" investments that assure certain returns, and they are not going to let bee-keepers and others get a good thing away from them. The very fact that such "bonanzas" are advertised, look to us that they are worthless as investments, else those with large idle capital would snap them up too quickly.

BEST EXTRACTED HONEY FOR SALE

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 7½ cents a pound; 2 cans, 7¼ cents per pound; 4 or more cans, 7 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey.....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, "HONEY AS FOOD," will be a great help in creating customers for honey. See prices on another page.

Casing Comb Honey for Market.

Query 83.—In casing comb honey for shipment to market, what would be your rule as to the row of sections next to the glass? —N. Y.

R. C. Aikin—A fair sample of the whole case.

E. France—The same as the case would average.

D. W. Helse—A fair sample of the contents of the entire case.

Chas. Dadant & Son—Let it be a fully fair average of the contents.

Prof. A. J. Cook—They should never mislead as to grade of honey.

A. F. Brown—Just an average sample of what the whole case contains.

Emerson T. Abbott—They should represent the grade of honey in the case.

C. H. Dibbern—Use the whitest and best, but the inner rows should be very nearly equal to it.

Rev. M. Mahin—I would put in sections that would fairly represent the average of the lot.

Eugene Secor—I put nice ones next the glass, but all honey in the case to be of the same grade.

G. M. Doolittle—That they be as good as the average of those in the case, then turn "face" side out.

O. O. Poppleton—What is the object of having sections show at all, if they are not fair samples of what the case contains?

Mrs. L. Harrison—I would have the row next the glass a fair sample of the interior. Wouldn't you, if you were the purchaser?

Dr. C. C. Miller—They should be a fair average of all the sections in the case, and the best side of each section should be next the glass.

W. G. Larrabee—I put all of my honey in cartons, but if I were to put it in glass I would put just as good sections next to the glass as are in the case.

Dr. J. P. H. Brown—Place the best next to the glass, taking care to have all the rest of the same quality. Place the bad, if any, in a case by themselves.

E. S. Lovesy—For color and quality our honey has the reputation of being first-class. In filling shipping-cases we aim to avoid facing, and fill up with a fair average.

R. L. Taylor—I should put fine looking ones next the glass on the same principle that I would use a clean, nice looking box to put the honey in. Of course, the other sections should be of the same grade.

J. A. Green—My honey is first carefully graded. Then out of sections enough to fill a case, I select three or four, as the case may be, that are smooth and uniform in appearance to place next the glass. Very often there are nicer sections back of them, and I

Sweet & Clover

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

| | 5lb | 10lb | 25lb | 50lb |
|----------------|-----|--------|--------|--------|
| Sweet Clover | .80 | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover | .70 | 1.25 | 3.00 | 5.75 |
| White Clover | .80 | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover | .60 | 1.00 | 2.25 | 4.00 |
| Crimson Clover | .55 | .90 | 2.00 | 3.50 |

Prices subject to market changes.

Add 25 cents to your order, for cartage, wanted by freight.

HONEY

If you want Colorado Alfalfa, Sweet Clover and Cleome honey—comb or extracted—correspond with the Secretary of the Colorado State Bee-Keepers' Association. Our Honey ranks high in quality. Car lots a specialty.

Address **F. RAUCHFUSS, Elyria, Colo.**

31A6t Please mention the Bee Journal!

am always careful to avoid having the front combs distinctly superior to the rest. I do not consider that it makes any difference how or by whom the honey is sold.

J. E. Pond—My rule would be to case all honey as nearly alike as possible. Of course, the best is to be expected to show, but, like apples, we don't want a few good ones on top, and the rest all small. Case honey honestly, and thus get up a reputation.

G. W. Demaree—I presume you mean to ask how I case comb honey for market. As a general thing some sections will be a little plumper than others—in casing I place them so that there will be an air-space between the combs, and I select sections with straight surface to go next to the glass to insure air-space between the combs and the glass, because it secures the combs from the effects of possible moisture by being set back from the glass, and makes the case look at its best. The fronting sections are no better in quality than the average, and often they are lighter in weight than some of the rest.

P. H. Elwood—Our honey is separated into grades exactly as the Albany grading called for. Then the most attractive face is usually put out. Where there are yellow cappings, occasionally a yellow face is put out. A thick, smooth capping is best outside; a thin, rough capping looks darker than the honey really is. When a buyer finds a case of honey of exactly the grade he bought, he has no reason for complaint, even if the most attractive face is put out, and as it is impossible to pack honey so as to have the face show the exact quality (the darkest buckwheat often having a very white capping), the buyer, unless acquainted with the brand, usually opens up a few cases before making his purchase.

Bees Did Well.

My bees have done very well for this season. I think I will get over 1,000 pounds of comb honey. I had 8 colonies, spring count, and increased to 15. The last swarm issued Aug. 16. I gave them full sheets of foundation, put them on the old stand, and gave them two supers of 24 sections each; they have filled 72 sections. The old colony has filled 24 sections, and they are both in good condition for winter, so I think the experiment worked all right. I have not taken all the honey off yet.

C. W. HARRIS.

Pawnee Co., Nebr., Oct. 10.

His First Summer's Experience.

This is my first summer's experience with bees, and I am greatly interested in them. I started with four colonies in box-hives, and had four swarms from them. I transferred two colonies to frame hives with complete success. I harvested about 100 pounds of honey this summer. I intend to get my bees all into up-to-date hives, and next summer I want to run them on modern methods. There are only a few bee-keepers in this county, and nearly all are on the old

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us Two New Subscribers to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

Ho, for Omaha!

AS we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St. Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful straw-colored transparent Foundation, improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

plan. I think that bee-keeping could be made profitable here if managed rightly. Honey of any quality and in almost any shape sold here for 15 cents per pound the past summer. I want to learn all I can of the business, and aim to see what there is in it here.

WILL C. GRUBER.

Martin Co., Ind., Oct. 7.

Fine Flow from Goldenrod.

Bees wintered very poorly in this section last winter. I started in last fall with six colonies, came out in the spring with only three, and one of those very weak. Apple and other fruit-bloom was a total failure here, being rainy for nine days. White clover was plentiful and yielded a small amount of nectar, from which bees gathered enough to live on till Aug. 20; from July 12 till Aug. 20 there was no honey at all—no surplus up to that time. Since Aug. 20 there has been a fine flow from goldenrod and wild asters. All three colonies cast swarms about July 1. Oct. 1st I took off 100 pounds of fall honey, well filled and in fine shape. The hives are well filled, almost to the last cell.

W. D. BUELL.

Litchfield Co., Conn., Oct. 3.

Report for the Past Season.

I started last spring with 65 colonies; five of them didn't breed up well, so I gave them new swarms, but not soon enough to do much. I increased to 77 colonies, and took 2,270 pounds of comb honey, about 1,500 pounds of which was basswood and clover, the balance buckwheat, and 300 pounds of extracted. I introduced 12 young queens last week. My bees are all in good condition for winter.

G. W. BELL.

Clearfield Co., Pa., Oct. 10.

Not so Well as Last Year.

Last week's American Bee Journal I failed to get. This, I think, is the first time I did not get it regularly on Thursday in three years, and I can't afford to lose a single copy, for I get a great deal of information out of it. I save every number and get them bound, which makes a valuable addition to any bee-library.

My bees have not done as well this year as last, and what honey there was is not as nice, as it is quite dark. I have 50 colonies which are all in good condition for winter.

R. RODENBERGER.

Waukesha Co., Wis., Oct. 11.

Wants to Know Frame and Country.

About the "Notre Dame hive"—well, if Mr. Chrysostom had given the size of frame of the hive he describes on page 629, and if the country in which he, the inventor, resides and keeps bees had been given, what he claims for his hive would be much more comprehensible to us. For example: Should he use a half-depth Langstroth frame, or one still smaller, there would be nothing remarkable in his colonies being on 40 frames by July 1; but should he use a frame even not much larger than the Langstroth frame, a colony occupying 40 frames by July 1 would be incredible. Why, what might we expect by Sept. 1? The bees perhaps would be on 100 or more frames, to judge from

what we do here. In a country like Cuba or California it may be nothing wonderful—yes, a thing to be expected—to find colonies occupying 40 Langstroth frames by July 1.

Don't you see, Mr. Chrysostom's article would have been clearer if frame and country had been given.

F. GREINER.

Ontario Co., N. Y.

[Well, Mr. Greiner, we don't know anything about the size of frame Mr. Chrysostom uses in his new hive, but we can say that he lives in St. Joseph Co., Indiana.

Another correspondent, referring to the same hive, has this to say:—EDITOR.]

That hive on page 629, that "will, in all probability, supersede all our loose-hanging frame hives," I venture to say is one that you could not get practical bee-keepers to take as a gift. A man that will write about close-fitting frames combining the safe qualities of a box-hive for safe wintering, and all the facilities of the loose-hanging frame for easy and safe handling, can hardly be worthy of much notice."

A Report from New Hampshire.

Our spring crop was hardly an average one, white clover failing prematurely on account of the drouth. As a consequence, we had less swarms than usual. This fall we had a good flow from goldenrod. I think all my colonies have sufficient stores for winter without feeding.

J. P. SMITH.

Sullivan Co., N. H., Oct. 8.

About the Phacelia.

In reply to the question asked on page 630, I can say there are two kinds: Phacelia congesta, growing in Texas; and Phacelia lancetifolia, growing in California (1½ feet high). The seed can be had from Carl Fabst, Erfurt, Germany. JOS. KUHLES. McHenry Co., Ill., Sept. 12.

Victory for the National Union.

Mr. J. C. Kubias, of Redlands, Calif., has been sued by Mr. W. F. Whittier for damages, and he prays for an injunction restraining Mr. Kubias from keeping bees within one mile of his land, claiming that the bees befoul the water used for irrigating and domestic purposes, and also sting men who work in the fields adjoining the apiary. Mr. Kubias' apiary was located there before Mr. Whittier planted his orchard, and should have prior right to the location—if there is to be any preference.

The National Bee-Keepers' Union assisted the defendant with "points of law" and money to help defray the expenses of a lawsuit. When it was known that the Union was interested in the defense, the plaintiffs weakened and bought out the defendant's homestead. Mr. Kubias returned the money to the Union and wrote thus:

"Whittier acknowledges, through his attorneys, the correctness of our position and bought my rights to the homestead entry on which my bees are located. The fact that the National Bee-Keepers' Union was back of me was the most potent factor in not allowing the case to come to trial.—J. C. KUBIAS."

As soon as the enemies of the pursuit of bee-keeping understand that the National Bee-Keepers' Union is interested in the defense, they generally waste no time in

Large New Maps of KLONDIKE—ALASKA—CUBA **FREE**

To all who order the *People's Atlas* of us now we will send free maps of Cuba and Alaska, newly engraved from the latest governmental surveys and official information. Size of each map, 14 by 22 inches. The Alaska map accurately locates the Klondike country and other great gold-fields in that far-off land, and the routes by which they are reached. A brief history of each country accompanies the maps. See our offer below:

OVER 200 MAPS AND ILLUSTRATIONS

THE PEOPLE'S ATLAS contains over 200 large Maps and Illustrations, and 132 Pages, each page 11 by 14 inches. It gives the Population of each State and Territory, of All Counties of the United States, of American Cities, by Last U.S. Census.

HANDSOME MAPS.—The handsome Maps of all the States and Territories in the Union are large, full page, with a number of double-page maps to represent the most important states of our own country. All Countries on the Face of the Earth are shown. Rivers and Lakes, the Large Cities of the World, the Railroads, Towns and Villages of the United States are accurately located.

SPLENDID PICTURES embellish nearly every page of the reading matter, and faithfully depict scenes in almost every part of the world. It contains a vast amount of historical, physical, educational, political and statistical matters, comprising a General Description of the World.

EACH STATE.—This Atlas gives about each State the Population for the Past 50 Years, History, Miles of Railroad, Soil, Climate, Productions, Industries, Educational and Religious Interests, Interest Laws, Etc., Etc.

THE UNITED STATES.—This Atlas gives the Popular and Electoral Votes for President in the years 1892 and 1896, by States. List of All the Presidents, Agricultural Productions, Mineral Products, Homestead Laws and Civil Service Rules, Statistics of Immigration, Public Debt for the Past 100 Years, Gold and Silver Statistics, Postal Information, and Other Information that should be in every Home, Store, Office and School-room.

Miniature Cut of Atlas. Actual Size, 11 by 14 inches.

OUR BARGAIN PREMIUM OFFER

We will mail this great Atlas for only 50 cts.: or for \$1.40 we will send it with the BEE JOURNAL for one year; or we will mail the Atlas FREE as a premium for sending us **one new subscriber** (at \$1.00) to the BEE JOURNAL for 1 year.

either trying to settle the matter by compromise or letting it drop entirely. This shows the value of organization, in maintaining their rights and demanding their privileges. "In Union there is strength." Bee-keepers should remember this, and lose no time in becoming members of the National Bee-Keepers' Union.

THOMAS G. NEWMAN,
San Francisco, Calif. Gen'l Manager.

Blest with a Good Season.

We have been blest with another good season in this part of the country, and bees are in good condition to winter well.

JOHN UPHOUSE.
Skagit Co., Wash., Oct. 4.

Bees Did Nothing.

Bees have done nothing here this season. I have to feed mine. But we must not lose heart. We hope to have better times next year.

J. LAIDLAW.
Ontario, Canada, Oct. 6.

Member of the Mint Family.

I enclose a sprig of a weed that is growing in my yard. It commences blooming Sept. 1, and is still blooming. My bees have been working on it almost incessantly since it commenced blooming. Is it anything of a honey-plant? What is its common or botanical name? Any information will be gladly received, for I am thinking of propagating the plant next spring.

H. H. BIGGERSTAFF.
Cleveland Co., N. C.

[The plant sent by Mr. Biggerstaff is a member of the mint family, to which belong a large number of valuable honey-plants. The one sent is probably a collinsonia or horse-balm, but it is so small and fragmentary that actual determination of the species is almost impossible. If Mr. B. will send me a larger specimen, with color and size of flowers noted, I can tell him the exact name. Nearly all of this great family are fine honey-yielders, and doubtless the one in question is, and well worth a trial in cultivation.—H. S. PEROON, Botanist].

Convention Notices.

Connecticut.—The fall meeting of the Connecticut Bee-Keepers' Association will be held at the Capitol at Hartford, Wednesday, Nov. 2, 1898, commencing at 10:30 a. m. Every member should make an extra effort to be present at this meeting.
Waterbury, Conn. MRS. W. E. RILEY, Sec.

Minnesota.—There will be held the annual meeting of the Southern Minnesota Bee-Keepers' Association at Winona, in the Court House, in the County Commissioner's Room, Thursday and Friday, Oct. 30 and 31, 1898.
Winona, Minn. CHAS. A. GILE, Sec.

Illinois.—The Illinois State Bee-Keepers' Association will hold its 8th annual meeting at the State House in Springfield Nov. 16 and 17, 1898. We will have the advantage of one fare and a third for the round trip—open rate—along with the Odd Fellows whose meeting is the third Tuesday of November. Our Association has been petitioned by the Northern Illinois Bee-Keepers' Association to take the proper steps to secure the same foul brood law for our state as that of Wisconsin. Other matters of importance will come before the meeting, and we expect to have the usual good time that bee-keepers always have when they get together. Excellent board is secured at 2 cents per meal and lodgings just as reasonable. All bee-keepers are invited. The one dollar for membership fee also entitles you to the American Bee Journal for one year.
Bradfordton, Ill. JAS. A. STONE, Sec.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,

Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of an apiary, and at the same time produce the most money in an attractive condition. It contains 250 pages, and 245 illustrations—is beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dadant—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth. Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full description of the anatomy and physiology of bees. 460 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 176 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers. \$1.00.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called BEES OF HONEY. 10-page pamphlet. Price, 40 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 p., illustrated, 25c.

Convention Hand-Book, for Bee-Keepers. Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents.

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheahire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 80 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by C. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2, in fine artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st. How We Made the Old Farm Pay; 2nd. Peach Culture; 3rd. How to Propagate Fruit-Plants, Vines and Trees; 4th. General Fruit Instructor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for casting up the price of grain, produce, hay, etc. Price, 25 cts.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Turkeys for Market and Turkeys for Profit, by Fanny Field.—All about Turkey-Raising. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters. 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

Book Clubbing Offers.

(Read Carefully.)

The following clubbing prices include the American Bee Journal one year with each book named. Remember, that only ONE book can be taken in each case with the Bee Journal a year at the prices named. If more books are wanted see postpaid prices given with the description of the books on this page. Following is the clubbing-list:

1. Langstroth on the Honey-Bee..... \$2.00
2. A B C of Bee-Culture..... 2.00
3. Bee-Keepers' Guide..... 1.75
4. Bees and Honey [Cloth bound]..... 1.65
5. Doolittle's Scientific Queen-Rearing..... 1.75
6. Dr. Howard's Foul Brood Book..... 1.10
7. Advanced Bee-Culture..... 1.30
9. Bienen-Kultur [German]..... 1.20
11. Rational Bee-Keeping [Paper bound]..... 1.75
13. Bee-Keeping for Profit..... 1.10
14. Convention Hand-Book..... 1.15
15. Poultry for Market and Profit..... 1.10
16. Turkeys for Market and Profit..... 1.10
17. Capons and Caponizing..... 1.10
18. Our Poultry Doctor..... 1.10
19. Green's Four Books..... 1.15
21. Garden and Orchard..... 1.15
23. Rural Life..... 1.10
25. Commercial Calculator, No. 1..... 1.25
26. Commercial Calculator, No. 2..... 1.40
27. Kendall's Horse-Book, No. 2..... 1.10
30. Potato Culture..... 1.20
32. Hand-Book of Health..... 1.10
34. Maple Sugar and the Sugar Bush..... 1.20
35. Silo and Silage..... 1.10
36. Winter Problem in Bee-Keeping..... 1.30
37. Apiary Register (for 50 colonies)..... 1.75
38. Apiary Register (for 100 colonies)..... 2.00

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Oct. 7.—Fancy white clover brings 13c, with best grades of white comb about 12c; off grades with more or less empty cells, 10 to 11c; ambers, 8 to 9c, according to grade, with fancy at 10c. Extracted, white, 6 to 7c; ambers, 5 to 6c; dark, 4½ to 5c. Beeswax, 26 to 27c. R. A. BURNETT & Co.

San Francisco, Sept. 28.—White comb, 9 to 9½c; amber, 7 to 8½c. Extracted, white, 6½@6¾c; light amber, 5½ to 6c. Beeswax, 24@27c

There were large shipments this week of extracted honey by sea, one ship taking 787 cases for N.-w York and another carrying 535 cases for London. The entire crop this season of both extracted and comb will likely not exceed 12 000 cases. Market is firm at the quotations, more especially so for choice extracted which is relatively lighter supply than comb.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax prime, 40c; choice, 24½c. At present there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c, amber, 10@11c. Extracted, white, 5½@6c; amber, 5@5½c; dark, 4½@5c. Beeswax 22@25c.

The receipts of comb honey are larger. C. C. ULEMONS & Co.

Boston, Sept. 30.—Our honey market shows a decided firmer tone since our last. A few sales have been made at 15c for an extra fancy lot, while almost all sales ranging from A No 1 to fancy now are made at 14c, while occasionally, something a little off, will bring as low as 12½ to 13c. We do not look to see any lower prices.

Extracted Florida, in barrels, mostly 6c to 7c, with a good demand. Beeswax, slow sale at 26c for best. BLAKE SCOTT & LEE.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12½c; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6½@7c. Beeswax, 25 to 27c. WALTER S. POWDER.

Milwaukee, Sept. 20.—Fancy comb, 12 to 12½c; A No. 1, 11 to 12c; No. 1, 10 to 11c; dark and amber, 8 to 10c. Extracted, in barrels and kegs, white, 5 to 6c; dark, 5 to 5½c. Beeswax, 25 to 26c.

The condition of this market for honey is favorable for shippers of good quality either in comb or extracted, and the receipts, while they are with us very fair, are not as liberal as may be, while the demand is very fair at our quotations. We advise liberal shipments of 1-pound sections and extracted. A. V. BISHOP & Co.

Buffalo, Sept. 16.—There is quite an improved demand for honey at present, and moderate amounts can be sold of strictly fancy 1 pound comb at 11 to 12c; lower grades range from 10c downward. We advise but moderate shipments for awhile yet. Extracted—average grades could be sold at 4 to 5c. Fancy beeswax, 27 to 28c; common, 20 to 25c. BATTERSON & Co.

Columbus, Ohio, Oct. 12.—Fancy white comb, 14 to 15c; No. 1 white, 12 to 13c; No. 2 white, 10 to 11c; amber, 9 to 11c. Extracted, 5½ to 7c. COLUMBUS COM. AND STORAGE CO.

New York, Sept. 26.—Comb honey continues to arrive freely. Demand is good for nearly all grades at following prices: Fancy white, 14c; No. 1, 12c; amber, 10c; buckwheat, 8 to 9c; an exceptional quality at 9½c. There is a good demand for extracted, all kinds, at 6½c for white, and 5½c for light amber in cans; Southern, in barrels, 55 to 58c a gallon. Beeswax dull at 26c. HILDRETH BROS. & SEGLKEN.

Cleveland, Sept. 1.—Fancy white, 13@ 4c; No. 1, white, 12@12½c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c; light amber, 6c.

The demand for honey is exceptionally good, owing to the crop in this vicinity being very light. A. B. WILLIAMS & Co.

Detroit, Sept. 24.—Fancy white, 11@12c; A No. 1, 10@11c; No. 1, 10c; fancy dark or amber, 9@ 0c; other grades, 8@9c. Extracted, white, 6@6½c; dark or amber, 5@5½c. Beeswax, 25@26c. M. H. HUNT.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

[Continued from page 661.]

FIRST DAY—AFTERNOON SESSION.

WHITE OR CREAM-COLORED SECTIONS—WHICH ?

"Is it better to use white or cream-colored sections, or does it make any difference which you use?"

Mr. Masters—I believe that in my market I can sell comb honey in white sections for one cent more per section than in cream-colored sections. I have tried it time and again. In the cream-colored sections it doesn't sell well.

Mr. Lathrop—I have tried both, and I find that the material in the cream-colored sections is very much poorer than that in the white sections. There is more breakage in the cream-colored. I do not use them either for myself or for my customers. I buy nothing but the snow-white, and I feel better satisfied.

Mr. Scott—I have sold more or less honey with both white and cream-colored sections to the merchants in Chicago, Omaha and Kansas City, and I do not know that there is any difference. We have made no difference.

Mr. Danzenbaker—I have recommended in my book the best sections, No. 1. I think if the honey I was getting was dark I would use dark sections, but if I produced white honey I believe I would like white sections.

Mr. Raufuss—The past season we sold about 100,000 No. 2 sections, and pretty nearly every one of the bee-keepers who bought them because they were forced to buy them would come back and say they wouldn't take any more at any price. We have concluded that next year we will not sell them. The dark sections don't show off the honey so well.

Mr. Dauzenbaker—That remark has paid me for coming here. I was almost ready to recommend that for home use or for dark honey they might use No. 2 sections. For my own use I always feel that No. 1 is the thing. I guess I will let it stand.

Dr. Miller—I do not feel that we have had any topic before us as good as this. It has been one of the questions in my mind that I wanted to have settled. I have not used anything but the white sections, but I have felt uneasy and have had an idea of trying the cream-colored. Some say that dark honey in white sections is made to look darker by the contrast; but oughtn't that to be an argument the other way, too? If I put white honey into white sections, the white wood is whiter than the white honey. The testimony of those who have tried the cream-colored will not try them again shows

me that it is perhaps a wise thing for me to make no experiments. I hope if there are any more here who have used both they will give the results of their experience.

Mr. Miles—I have used some of both kinds, not altogether because I desired to experiment, but I happened to get some No. 2. I think white honey in white sections looks most attractive; but the main saving to me would be in the fact that there is better wood in the white sections. In the cream-colored you lose so many sections.

Dr. Miller—You pay a lower price for the cream-colored.

Mr. Miles—That would not make up the difference. I do not like to bother with them unless it would pay. It is the inferior wood in the cream sections. The white wood is from the young, sound trees. I think the looks of cream sections is a good deal like having bee-glue on the sections. If the cream sections make the honey look whiter and more attractive I should think the bee-glue would, too; but we know it would not.

Dr. Miller—There is a point in favor of the cream sections—they do not show the bee-glue as bad as the white ones do.

Mr. Cameron—I bought a few as an experiment. I didn't know what they were. They ought to have been thrown away by the manufacturers. They were very bad. If you simply opened the box they would fall apart. If all cream sections were like those, I wouldn't take them as a gift.

E. R. Root—It doesn't make any difference to the manufacturer which kind are sold. The cream-colored sections are cream-colored because the wood is dried in the summer time.

Miles Morton.—See page 679.

The white wood is dried in cold weather. If the logs are cut in the summer time and sawn into planks, they would be almost invariably dark or cream-colored. There are two classes of cream-colored sections; there are some that are defective in the wood, and there are some that are made of good sound wood. You can tell when you have a strong, sound section by looking at the edges of the V cut. In the poor wood this cut will have its edges ragged and more or less torn. If

the V cut is nice and clean and good, you can make up your mind that the wood is tough.

A. I. Root—"Seconds" are a little different from the cream-colored sections. If we have a lot of sections that are of faulty wood, or don't work up as they ought to, we say they will have to go into the "seconds." If there happens to be a knotty place in the wood, or the wood is faulty, they have to be sorted out and are called "seconds." That kind of seconds should close up as well as "firsts." The kind that is made from lumber that is not sound should be "second" and not cream. We throw into the "seconds" those that show some fault in the lumber or workmanship. In the past season we were unable to fill orders for "firsts," and we got some of the other manufacturers to help us out. I do not remember where we got some of the sections; but in some cases we paid for "firsts" and they did not give satisfaction, and the suggestion was made that we throw them into the "seconds." We are going to try hard another season so that we won't have to do that.

Mr. Terry—I use sections for my honey almost entirely, and a few years ago I could not get the white sections, and had to take the cream-colored. I found them so poor that I have not bought any since, and I wouldn't advise any man to buy cream sections. Nobody could give them to me, if I could buy snow-white sections.

FLAVORS OF HONEY—WILLOW-HERB.

Mrs. H. G. Acklin—We were talking about the different flavors of honey this morning, and I was going to speak of the willow-herb. I think it is as mild a flavored honey as you can find. Willow-herb honey is almost water-white, and I do not think there is any time in the year when it is gathered that it is strong. It really is a fall plant. It does not commence blossoming until after the first of July. The honey-flow from it is very great—almost as much as basswood.

Mr. Stillson—This morning, when we were discussing the different flavors of honey, there was a request that I should get different samples of honey from the exhibit at the Exposition. I have brought 13 samples, which are numbered consecutively from 1 to 13, and whenever the tasting or guessing committee has got through with the samples we would like to have their report on the various kinds that are there represented.

Mr. Masters—I would like to ask a question in reference to this willow-herb. I do not know anything about it. If it is a good honey-plant I want to find out about it.

Dr. Miller—That question can be answered pretty well here. It is a weed that grows in places that have been burnt off—fireweed, it is also called—and, as a rule, you will not find it growing elsewhere. It is not worth while to get the seed of the plant, as it will not flourish unless you have a timbered place that has been burnt off. Don't fool away your time trying to cultivate the willow-herb. It flourishes only on the burnt districts. In regard to these samples of honey, I confess I do not believe I could be sure about them. Cleome and alfalfa are there, but I do not believe I could tell the difference. If you want a committee to examine them and test them it will be of service to us if they will do that soon, and then let us have these samples identified so that we can learn something about them. I have very little knowledge about these different kinds of honey.

Dr. Mason—Does the willow-herb grow more than one year on the same ground?

Dr. Miller—I think it does; but after a time that ground will not produce the willow-herb. It does not grow continuously. It grows only for a time on the burnt districts.

Mr. Danzenbaker—In Michigan there are hundreds of thousands of acres that have been burnt off where the plant grows. The seed ripens in August and comes up in September, and next year it blooms. It begins about the first of July to produce honey, and it will keep on until frost. It grows from the seed, but it takes two years to bloom and produce honey.

Mrs. Acklin—I think Mr. Danzenbaker has about covered the ground. I was going to say that it does not last on the same land more than five or six years. Last year, on certain land that had borne it before, there was only about half a crop, and this year none at all. It begins to blossom at the bottom of the stalk, and will continue to blossom from there toward the top until the bottom has gone to seed. I certainly think it is the finest honey there is produced. Of course, the same plant does not grow for five or six years; I mean that the same land will produce it for that same length of time by re-seeding.

ADULTERATION OF HONEY—DETECTING IT, ETC.

Mr. Rauchfuss—In regard to this question of adulteration I would say that in our State we have a law in regard to adulteration of syrups and honey.

It is not carried out, but that is no fault of ours because we haven't got the necessary capital to go after them. A certain packing company complies with the law in our State; that is, they will put a small label on saying that it is 80 percent corn syrup and 20 percent clover honey. That is the way they put it on the market and we can't touch them. They have a label which says "Honey Compound" in large letters.

Dr. Mason—We have the same thing for sale in Toledo, and it is labeled the same way. They comply with the law, and we can't touch them.

Mr. Rauchfuss—Several years ago we had a tasting committee at our convention. Prof. Gillett, from the Agricultural College, brought some samples of honey markt with the numbers, and with a little glass rod in each for sampling it. Then he gave us printed slips with the numbers on, and after the numbers there was a blank space for us to fill out the name. The blanks were handed to the president to report. It was something very instructive, and it should be carried out here if it is possible.

Mr. Stillson—In regard to adulterated honey that has been placed on the market in this city and State, there was one firm here in the city that was putting up two grades of glucose. One was put up in glasses and was markt "California Honey." It didn't show a bit of honey in it; it was absolutely pure glucose. The other grade, put up by the same firm, had a piece of comb honey in it, and was markt "Pure California Honey," and it was one part honey and five parts glucose, but a better grade of glucose than the first was. We had some cases that we thought we could make stick here, and we were expecting to try to prosecute him for obtaining money under false pretenses; but before the case was brought before the courts the man who was doing the adulterating went to the other world, and we haven't got his address, and are afraid the sheriff couldn't find him to serve him with process, and so the proceedings have been dropt. In our institute work the people have been pretty thoroughly worked up on the matter of adulterations. The way most customary has been to go into the groceries in the different towns. We go into a grocery and buy the articles there, and if we can get the merchants to wrap up the packages which we buy in a parcel markt with their grocery firm name, so that they cannot dispute its being purchast in their town, and then hold the package up to the audience at the proper time and show them the articles we have purchast in their town, and give the manner of adulterating; it works well. Last winter at one time in one of the meetings there was a man got up and undertook to deny that there was anything of the kind sold in their town, and I reacht back and pickt up two samples I had lying on the table, wrapt up in a grocer's paper, and come to find out the grocer was the man who had got up in the back part of the room and denied the sale of the adulterated article. Pretty quick a man jumpt up in the back part of the room and said, "Mr. Chairman, I know that is correct; I have done the mixing," and he gave the formula by which it was prepared.

E. R. Root—There are three ways of detecting when honey is adulterated with glucose. One way is to take what you know to be glucose and taste it—take enough until you get sick. From that time on I believe it can be detected every time. That sample of glucose there on the table has a brassy taste, and you can recognize it every time; I don't care how much honey you put with it. Mr. York sent me a sample a few years ago that didn't have that brassy taste. It was nice in color, thick in body, but vile in flavor. Another way to make the test is to mix the sample with alcohol and stir it up; if it gets cloudy in 15 or 20 minutes it is glucose. Mix the sample and alcohol about half and half. Mr. Whitcomb has got a simpler test than any I have heard of yet.

Mr. Whitcomb—Glucose will turn tea black at once; honey won't.

Isaac E. Pierce—I should like to ask Mr. Whitcomb if all grades of tea will do that?

Mr. Whitcomb—All tea contains tannin; it is the tannin in the tea acting on the glucose that turns it black.

E. R. Root—Some years ago the president of a glucose factory wrote me in regard to adulterating honey with glucose. Of course, I encouraged him all I could, to find out all I could about it. He sent me some samples, one of which was very nice to eat; it was pleasaut, and had none of that brassy taste. But he said they could not furnish that unless we paid a price away above the price of honey—out of the question. The grades that could be bought for three or four cents a pound were very poor indeed—vile stuff. All glucose that is used for adulterating honey has more or less of chemicals left in it—sulphuric acid—and this test in tea shows the presence of the acid in the glucose. If you could get a chemically pure article of glucose I don't know that it would be particularly

harmful for food. It reminds me of the gum that comes off of the peach-tree; it is rich, and perhaps to a certain extent nutritious. The way the factories are run now there is no method of producing a low-priced glucose that is fit for food. It is a cheat and a swindle, and a danger to human health and human life. Prof. Cook once said there was no legitimate use for the product of the glucose factory—that it was only used to swindle.

Mr. Stilson—I would like to say one word in regard to the tests. I saw a test made at our State University a couple of years ago upon some samples that I took there for analysis. The professor took a glass and poured the glucose into it and then mixt it with alcohol. Whether he mixt anything else with it I can't say. He stirred it up for about half its depth until it became milky, leaving the lower part without stirring, and then poured more alcohol on top, and in a few minutes it began to turn as if there was a cyclone in it. When it began to settle and clear that milky part didn't settle. It simply showed a fermentation. Whether there was anything else mixt with the alcohol or not I have forgotten.

E. R. Root—Pure alcohol will do that. Alcohol won't touch pure honey at all.

Mr. Danzenbaker—There is a good deal of glucose sold as "Silver Drip." I noticed in a family where I was once that the children preferred Porto Rico molasses; when they wanted molasses they would ask for black molasses. Any one who would eat that "Silver Drip" for a week would have his taste for honey destroyed; I don't believe he would ever want any honey. The greatest harm that comes to the honey-producer from it is that it weans people away from pure honey. They think they have been using honey, and never want to buy any more of it.

T. R. DeLong (Nebr.)—I would like to give an experience that I had about 20 years ago with glucose. I live in the southwestern part of this State, and I think it, was the first glucose brought into that part of the country. I bought a jug of it and took it home and kept it a few days when it turned thick. I thought it was equal to about two gallons of fine molasses, and that I would just reduce it and make about two gallons of it. In a few minutes, oh, my! what a smell there was there! A horrible smell. It turned everything black. I couldn't eat it at all. I am naturally a honey-eater, so it never destroyed the taste of honey for me. I have tried glucose in tea, and coffee, and water, and it will spoil anything you put it into. It is no trouble to test glucose in water, or tea, or coffee.

Dr. Mason—I move that a committee of three be appointed to test the samples that have been produced, and report upon them and upon all exhibits, to the convention as soon as possible.

The motion was seconded and carried. Messrs. Stilson, Secor and Whitcomb were named as the members of said committee.

TOOL FOR MOVING FRAMES, SUPERS, ETC.

"What is the best tool for moving frames, raising supers, etc.?"

Mr. Whitcomb—Dynamite. [Laughter.]

Dr. Mason—This tool that I have here (exhibiting an implement of steel made somewhat in the form of a stovellid-lifter, but with a broad, chisel-like blade in front) I have had for 30 years. I can raise the corner of a house with it—if the house is not too heavy. It is also good for cleaning the frames and supers of burr-combs.

Dr. Miller—One point—or rather two points—against that tool are the two sharp corners in front. When you are thrusting it in to raise a super, the two sharp corners will cut into the wood. If the corners were rounding they would not cut into the wood at all. I am inclined to believe that the best tool for raising a super is not the best tool for moving the frames; because the tool for raising the super should be rather sharp, while the tool for raising the frame should not be sharp. I would like an implement with a blade something like this of the Doctor's at one end, and the other end arranged with a tool for moving the frames. I don't know what that will be. I believe that is a thing that bee-keepers should talk over. I have been using a screw-driver, but I believe it is a very poor tool. When we have used a real good tool we will wonder that we were satisfied so long with using a screw-driver. Mr. E. R. Root has been getting several sample tools, and Mr. York has had one or two samples. Perhaps out of the lot we may strike something that will be all right.

Dr. Mason—I do not want an instrument with a tool at each end. You can't work with it satisfactorily, having to use one end and then the other, taking hold of the soiled and sticky end when it is reverst. Nor do I like the corners round. I made one of the corners round and then I unmade it.

Dr. Miller—I find difficulty with sharp corners marring

the wood. But let us be careful not try to get one tool to do too much. I doubt whether one tool can do all those things, but by using opposite ends of the tool we may get one that will work all right. In using a tool with sharp corners for moving frames, the sharp corners will sometimes mar the wood.

E. R. Root—I have been experimenting with a number of different tools, mostly of this character, but there was no crook or bend in the handle. I see a very good reason for that crook now; when cleaning frames it would be very handy. For my purpose I wanted a tool with rounded corners; the square edge left a mark on the supers. Then I think I would want a double-ended tool. One end may be used in prying apart the frames. Sometimes in pulling out a frame you will pull out the division-board. Having started the frame once you can reach down and pull it out. That tool strikes me as being very nearly all right, except that I would have rounded corners, and on the other end a little hook. That seems to be as nearly perfect as anything.

Dr. Mason—When I cannot get hold of the frames readily I just drop that tool under the end of the frame, and then I can get hold of it without any trouble. I would not take all the tools I have seen for this one.

Mr. Danzenbaker—I have used a steel scraper, such as paper-hangers use, for cleaning frames. I have a mason's plastering-trowel, squared at both ends. The metal protects the hands. It is a good cleaning tool. I use a screw-driver for separating the frames and pushing them up.

Dr. Miller—The best tool I ever found for raising frames I sent to Mr. Root; it is nothing more nor less than a common stove-lifter. It has a curve in it, and when it is put under the frames for prying the end will come against the side of the top-bar. In using it the curved part stays against the part of the frame that you use as a fulcrum, and it will move the frame easily. It has a round edge about one-eighth of an inch thick at the end, perfectly round, so it will not mar the wood. It would be of no use for separating or raising the supers, or anything of that kind; it has no sharp edge to it. With the same motion of the hand it will move the frame much farther away from its neighbor than a straight tool would. If you will get a tool with that stove-lifter at one end and the chisel-blade at the other end, I think you will have a pretty good tool. There are others who have used a screw-driver; but I would a great deal rather have that tool because I have used one and know that it is a great deal better.

Dr. Mason—I do not bruise the wood with this. Being square-cornered it gives more surface to pry with. I would not have a tool with an implement at both ends; it is too hard on the hands.

The convention then adjourned until 7:30 p.m.

[Continued next week.]

Advice About Adopting New Inventions.

BY C. P. DADANT.

I have several times been asked for advice regarding new methods, new inventions, which are, from time to time, recommended by a number of leading men, and which sometimes necessitate, for the bee-keeper who wishes to follow them quite a change in his apiary outfit, hives, supers, frames, etc.

I would strongly urge the novice to be very cautious in accepting and putting in practice new things, even if they have been put forward by men of merit. In the work of progress steps are very often taken in the wrong direction, which appear at first to have been properly guided.

A very notable instance of how men of ability may be drawn to things that are of but little practical value simply because they look inviting at the outset and appear with outward advantages, was to be seen in the inventions concerning inverting bee-hives and frames, which were the rage some 12 or 13 years ago, and for a year or two bid fair to overthrow all other styles of hives.

When a hive of bees is inverted, that is, turned bottom side up, and allowed to remain in that condition for some time the bees find themselves compelled to change the place of their honey, which they always keep above their brood and as far from the entrance as possible. If this is done at the

time of the honey crop, and a super is put on when the hive is inverted, the result is that all the honey thus moved is put into the super. This is sufficient to make a very nice argument in favor of this method, and at the time of which I speak the bee-papers were full of the inverting theory of the great advantages of that method which some thought new, altho it had been in use in Europe as early as the beginning of this century.

Dozens of different hives and a number of inverting frames were devised, some were patented, and it even looks as if there might have been two or three infringement suits begun to make the matter still more interesting. Where are the inverting folks now? Where are their methods followed? They had evidently looked at only one side of the picture, and had failed to see the disadvantages of their method until a more thorough and lasting experience had taken away their enthusiasm.

Progress is still coming, and we do not have the last useful discovery in bee-culture, in my opinion, any more than the last improvement in farming, or the last word of electricity. But what if a man should invest his money in all the supposed valuable discoveries of electrical appliances? How would the farmer succeed who invested in every new corn-planter, who bought every latest binder, because it had one point of superiority over some previous and already practical invention?

If you have a good, practical, movable-frame hive do not leave it for another just because that other seems to have a few points of advantage, for these may be more fancied than real. Do not drop your section-case because another one has lately been devised. Remember that there is nothing so discommoding to the apiarist as two different styles of hives, or of frames, in one apiary. If some new method strikes you as decidedly preferable, which requires a different outfit, give it a slow trial, and do not make the change until you are absolutely sure, by some practical experience, that it will prove actually preferable, either in convenience or in results. We can often build very bright theories, based upon isolated facts, which prove fallacious when put to the test, because something was overlooked at the start which had an unexpected bearing upon the result, or because the reasoning was based upon an error.

Yet, it is out of the question to reject everything and remain stationary, for the world keeps revolving, and those who stop on the way will soon be left far behind.

Hancock Co., Ill.

Bees and Fruit—Insect Jaws.

BY PROF. A. J. COOK.

I am led to take this subject from a statement made by Mr. Thos. W. Cowan, in his admirable address made before the last California Bee-Keepers' Association in Los Angeles, on the relation of bees to fruit. While I agree with him in all his conclusions—that bees do not even pierce or injure sound fruit, and that the bees are of far more value to the pomologist than are the flowers of the orchard to the apiarist—yet I have never thought that bees could not bite into the skin of ripe peaches or other fruit. Every bee-keeper knows that bees can even tear splinters from the hive and cut the cloth and foundation which he may place above or within the frames. That they can do this has always argued to me, convincingly, that they could tear into any fruit, and especially through the soft rind of the ripe peach, apricot or pear. Yet, while I believe it is possible for the bee to make such abrasion, I am very positive that they never do. From a study of anatomy of the jaw and observation of what bees do do, I believe bees can wound fruit; from a long, close study of the bees in the field I am sure they never cut through the skin. The first is opinion, to which I have no better right than has Mr. Cowan, until I witness the act, which I never have; the second is knowledge, gained from wide observation.

(a) The grapes in a vineyard are wholly free from bee visits—not a bee is seen upon or among them—when lo! on some hot, sultry morning, all at once the bees swarm on the grapes in force. Yet for days the bees have been idlers, because the harvests were not. Does it stand to reason that the bees have all at once, with one accord, rushed to the vineyard and commenced to cut into the fruit and suck the oozing juice? No! Reason and observation alike show that the juice is oozing, and the bees rush to gather the wasting juice. Had the juice remained sealed by the unbroken peel no bee would have touched it. But let the bird, wasp, or Nature through fermentation induced by wet or heat, cause but a tiny droplet of the juice to ooze from the grapes, and at once

the odor attracts the bees, and they at once fix their suction-pumps, and commence the rapid work of juice-abstraction.

(b) I have repeatedly tried this experiment: I have placed sound grapes at the entrance, and even within hives at times when bees were in enforced idleness, and they remained sound, and were untouched. All observers know how ravenous bees are at such times, and know that were their habits and Nature in accord with attack, no grape would remain for an hour.

I then pierced certain grapes with pin or needle, that the juice might exude, when, presto! the bees rushed to the bleeding fruit, and quickly sucked it juiceless. Yet no unpierced grape was disturbed.

Thus I have become convinced that bees do not delve for sealed sweets, but must be attracted by escaping odors. The wasp or bird may mine for the coveted nectar drop—the bee, never. The flowers that most woo the bees ever hang out open-mouthed nectaries advertised by aid of bright, gorgeous petals, whose life service is to attract the bees. They also fling forth the penetrating odors, that the bees may be lured to the useful service of pollinating the flowers. Thus, the whole life experience of the bees is to go to exposed receptacles, not to those sealed and, so, odorless. Thus we understand why the bees are developed as they are, to seek not for hidden treasures, but for those only that are exposed for the very purpose of enticing the bees to valuable service.

It is suggestive that in Europe, and in the older sections of our own country, the idea that bees are enemies and not friends of the fruit-grower is never broached. The fruit-men know that the bees are necessary agents and factors to full fruitage, and so the insects are ever welcome in the orchard and vineyard. Such sentiment is fast growing in Southern California. Soon the cry will not be against the bees, but the question will be, How can we manage so as to keep our fruit sound, that bees may not be attracted? and how can we fence against their injury and annoyance in the driers and canneries? Already improvements in these lines are being made. Soon they will, we believe, become perfected, so that the valuable services of the bees will be secured, with no count against these invaluable aids to fruit-growing.

THE JAWS OF INSECTS.

Apropos to the above, a word regarding the jaws or mandibles of insects may be of interest. These organs are often called the first jaws, as insects possess two pairs of jaws—these mandibles and a second less strong pair—the maxillæ. Often these second jaws, which are always just below the mandibles, are so jaw-like in form that they may be very effective in biting and crushing. In bees they are modified, and are elongated and grooved, and may be, on occasion, converted into a colossal sucking-tube. Both pairs of jaws are appended to the lower end of the side pieces, genæ or cheeks, and instead of moving up and down as they crunch, they move sidewise. In some cases they are very large, as seen in the stag beetles, and in the elephant beetle they have branches, and look not unlike the antlers of the deer or elk.

While the mandibles are always of one piece, and thus simple, they are variously roughened or touched, as their functional needs require. In the locust they are roughened rasps, and can strip off the bark from the hardest twig. In the tiger beetle and wasp they are armed with sharp teeth, so that they can pierce and destroy the insect foe, or, in case of the wasp, can easily break into the pulp of grape or peach. These jaws are found strong and effective in wasps, bees, ants, slugs (larvæ of saw-flies), caterpillars, beetles, and the larvæ or grubs of the same, locusts and lace-wings and their larvæ.

Organs much used, and for a variety of purposes, are certain to be much modified. Thus, in the evolution of life, such organs have changed most, and so are most used in classification. Thus as teeth are of first importance in systematic zoology, so the jaws are much used in classifying insects.

Los Angeles Co., Calif.

Transferring Bees in Florida—Eating Honey.

BY MRS. L. HARRISON.

On page 647 the question is asked from Florida, whether to transfer bees now or wait until spring. The time specified for transferring at the North is just before fruit-bloom, as at that time there are fewer bees, less brood and honey, and a flow is expected that will stimulate brood-rearing and furnish the bees with the means of repairing and building combs. Are these conditions the same in all colonies, all over this great land of ours, at the advent of fruit-bloom?

I have spent seven winters in West Florida, and during that time I have not owned any bees there, but I have watch

their flying at every opportunity, and there was never a time, when they were on the wing, that they were not carrying either pollen or nectar. They did not appear to gather a great deal, but enough to keep them slowly rearing brood. They were, with one exception, the little black bees, and very irritable. The hives would be full to overflowing with bees in March, and swarms issuing; some seasons earlier or later.

I should think the best conditions for transferring would be after the close of the long drouth, soon after the summer rains had commenced, as there would be fewer bees, less honey and brood, than at any other season; the rains would bring forth bloom for the bees to work upon during the winter. As an example of the difference in time of blooming of golden-rod in Illinois and Florida, here we find it in September; in Florida I gathered beautiful bloom on Black's Island, in St. Joseph's Bay, in April.

HONEY CAUSING SICKNESS.

I think that we need to do a little missionary work along this line. When we hear of persons who cannot eat honey without being sick, take them some pure white clover or other honey, and induce them to try it. I think, with few exceptions, they will find out that honey no longer makes them sick. It was pollen and bee-bread mixt with honey that disagreed with them.

Frost has not killed the bloom up to date.

Peoria Co., Ill., Oct. 17.

Importing Apis Dorsata from the Philippines.

(Reported in the Chicago Tribune of Oct. 19, 1898.)

There is one race inhabiting the Philippines which will be a welcome addition to American citizenship, and will be afforded every facility and inducement to immigrate to the United States and engage in the skilled labor in which it has no peer. This is the giant East India honey-bee, and an investigation of its work and immense capacity for producing honey and wax has interested the Department of Agriculture in the consideration of an early effort to introduce it into the United States.

Secretary Wilson said in connection with the proposed importation of these bees to the United States, that a special appropriation would be asked in his coming report to Congress for the investigation of the bees of the world, and a colony of the big Philippine "honey-makers" would be brought to America as soon as the question of their value and the possibility of their acclimatization has been fully determined. There will also be an appropriation requested for the study of the agricultural and kindred products of the newly acquired territory of the United States, and even under this head the great honey-bees of the East could be introduced by the department to this country.

To scientists this bee is known as *Apis dorsata*, a species common throughout the tropical regions of the East, and in the Philippine Islands the largest variety of this species is found. It is nearly one-half larger than our native honey-bee, and builds a comb, heavy with wax and honey, five or six times as large as the ones that are found in American orchards and forests.

In addition to the enormous manufacturing capacity of this particular bee, its introduction will have the important effect of securing from some of the richest honey-bearing plants of the United States the sweet juices which now remain ungathered. The propagation and increase of these plants will also be immeasurably assisted by other services the big bees will render. These extraordinary results will be brought about for the reason that the giant of the East has a tongue nearly twice as long as our native bees. All these little workers get at the honey in the flowers with their tongues; but many blossoms have such deep wells that our native bees cannot reach it, and, knowing this through inherited tradition, never try. The principal honey-bearing flower which our native bees find too hard a problem for their limited honey-pumps is red clover. The long tongues of the big Philippine bee would find these clover blossoms a mine of sweetness, and thousands of tons of honey would be yielded up that is now practically a loss to the world. In return for the honey these bees would find in the red clover their introduction to that plant would prove an inestimable assistance to its reproduction. Bees play a most important part in this operation, carrying as they do the pollen of one flower to another, the fertilizing powder clinging to the limbs and body of the little insect.

The question of the possibility of acclimatizing these in-

habitants of the Philippines in the colder latitudes of America is not discouraging. The giant bees are found in the mountain regions all through India, and have been seen busily at work at altitudes of 5,000 feet. In the Philippine Islands their colonies are most numerous in the mountains, as the indefatigable quest of the natives for their honey-combs has driven them to the less thickly inhabited regions. The Filipinos find their daily bread a rather easy proposition, but they are fond of honey on the staff of life, and wax is next to gold in its attractions for fortune seekers.

In the East wax is a principal article of staple commerce, due to the manner in which the clothes worn by the natives are dyed. These cloths, when fresh woven, are covered with a thin layer of wax, leaving exposed the portions which it is desired to dye. The cloth is then soaked in the dye, and the wax which covers and protects the fiber where it has been spread prevents any of the wax parts from taking up the color. This manner of dying is so general in the East that there is a tremendous demand for wax at all times. The wax also is exported in large quantities to Europe for making candles.

The commercial probabilities of the introduction and increase of the giant bees to the United States would principally affect the production of wax. This commodity has risen so greatly in price through the invention of the graphophone, that the manufacturers of wax-goods often have been without material for their product.

The big bees build their hives on tall forest trees, or on the overhanging ledges of inaccessible cliffs. Branch swarms build near the parent colony, so that in a few years an immense bee-settlement often grows up in the forest. To discover one of these is almost certain fortune to a Filipino. In appearance the giant bee is a smoky, glittering, iridescent black, of wasplike figure, with orange bands encircling its body. There have been reports that this bee is most ferocious, and on account of its great size is extremely dangerous, but one of the bee-experts has seen and handled them in their jungle haunts, and he tells a different story. They are such busy and persevering workers, according to his account, that they have lost dexterity with their stinging apparatus, and tho they may alight full of wrath, and with evil intent on human hand or neck, they do not handle their offensive weapon with skill, and it takes them 20 or 30 seconds to get their sting in working order.

The manufacture of wax by the bees is an interesting commercial problem. Bees secrete wax by eating honey, and as it takes about 15 pounds of honey, worth 10 cents a pound, to make one pound of wax, which will seldom bring more than 25 cents a pound, bee-keepers do not encourage the manufacture of wax by their bees.

Petitions have been coming in to the Department of Agriculture for years asking that the Government introduce these giant bees into the United States. Many years ago several individuals tried to get the bees for themselves by sending to the United States Consuls in the East and asking that queen-bees of the desired race be obtained and forwarded to them. No attempt at bringing them here has ever been successful, tho one was prevented only by illness that deprived the bees of the proper care, which he alone could give them, from bringing to the United States a colony of these bees which he captured in the jungle. While he was sick in bed en route to the United States with these bees no one else on the vessel would attend to them, and so they all died.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Spelling Reform—The T Super.

B. F. Onderdonk, referring to page 547, and the spelling reform, writes that of course Editor York "will not strike his flag when a fight is in sight, but all his cohorts would be mast around the mast to defend his colors. Doubtless reform in some words is necessary, and tho I would not like to go back to the orthography of two centuries ago, still I think it hardly fair to make the charge of prejudice against me if I do think much of Editor York's reform spelling looks incongruous. I won't stop the paper, tho."

Well, Mr. Onderdonk, I'll not insist too strongly on the

matter of prejudice, but there may be nothing unfair in my saying that 200 years from now it is quite possible people will consider "massed" just as strange spelling for "mast" as the spelling of 200 years ago now looks to you. If you are right in saying, "Doubtless reform in some words is necessary," I'd like to know what needs reforming more than using "ed" for the sound of "t."

Mr. Onderdook writes further: "Now I trust you will excuse me, but I am going to criticise another thing I never tried, that is, the T super. You say regarding the tall sections and peep-holes in the lower corners, you don't find but they are just the same as the 4¼. If, as I fancy, you used the T super, this must be expected; because the T makes each section entirely isolated. To get the bottoms finisht clear across, communication from end to end of the section-holder must be complete." To which I may reply that the tall sections to which I referred were in Danzenbaker supers, fence and all, and the square sections in T supers.

C. C. MILLER.

Properly Cleaned Sections of Honey.

How is it that honey you see in store windows is so clean, and the sections look as if they never had any bee-glue on them? How do bee-keepers get them this way? I use the Root hive and the sections fit as tight as they could without breaking when putting them in the frames. MARYLAND.

ANSWER.—The answer is easy. Every section that is not perfectly clean when taken from the bees is thoroughly cleaned by scraping with a knife, or cleaned by one of the section-cleaners about which so much has been said within the last year or so. In some regions the bees gather more propolis than in others. There is also a great difference in the time of the season. Early in the season and while honey is coming in with a rush, sections may be taken off so clean that they need scarcely any scraping. If left on till late in the season they will be badly daubed with glue, and elbow-grease must not be spared if the best price is to be obtained.

Moving Bees a Short Distance.

□ I am a young bee-keeper, having about 20 colonies. I wish to move them about 20 rods. When is the best time? NEW YORK.

ANSWER.—You will be pretty safe to move them after they have not flown for a month or so. The only trouble is that they may not have a flight again for a few weeks after being moved, and the disturbance of moving will be bad for them. If you are prophet enough to know when they are going to fly, and then move them the evening before the day of their flight, you will hit it just right. Possibly you can move them so carefully and quietly as not to stir them up enough to do any harm.

Transferring, Bee-Paralysis, Etc.

1. I have a colony of bees in an old hive that I want to transfer into a chaff hive in about three weeks, when all the brood is hatcht. Could I transfer them safely if I give them five frames of honey, and, besides, feed them?

2. What is the right way to put chaff over the brood-frames? Could I put the board over the brood-frames first, then chaff in a bag on the top?

3. One of my colonies has so many shiny, black, hairless bees. I can take them in my hands and handle them roughly, and they don't sting. What are they? Robbers? And how is best to get rid of them?

4. Two weeks ago I bought an Italian queen from Texas; I introduced her and it took four days from the time I introduced her before she started to lay. Was she not mated because she did not start to lay sooner?

5. How can you tell a mated queen from a virgin queen? NEW JERSEY.

ANSWERS.—1. With five Langstroth frames filled full of honey there ought to be no trouble about the bees wintering without any additional feeding.

2. It doesn't matter much how the chaff is put in, so it is not allowed to sift down between the combs among the bees. Your plan is all right, only the board between the frames and the cushion of chaff should be thin, better not more than ⅜ of an inch.

3. The probability is that the colony has bee-paralysis. In the North it is not likely to become very serious, altho in the South it leads to very heavy losses. Many cures have been

given, but none that seem to be always successful. One of the latest has been reported in every case successful where tried, but it is possible that the next time it is tried it may prove a failure. It is, however, very easily tried. The plan is simple. Let the diseased colony exchange places with a healthy one, putting the sick one in place of the well one, and the well one in place of the sick one. It isn't a hard matter to try it. But the probability is that if you don't do a single thing the disease will disappear of itself. That is generally the case in the North.

4. It is not an unusual thing for a queen to be some time starting to lay after she has been stopt for a few days. Indeed, it would be a rather strange thing if she had started in to lay at once; for it was a long journey from Texas to New Jersey, and at this time of year queens are less inclined to lay than earlier.

5. You can only tell after they begin to lay, altho if you are experienced you can tell something by their looks. After the queen lays and her brood is sealed, if the sealing is flat, as the sealing of worker-brood always is, you may count that the queen has mated. On the other hand, if her brood that is in worker-cells has round cappings, something like little bullets, she is not fertilized and is worthless. Take off her head at once.

Thinks His Bees Have Paralysis.

Some weeks ago I wrote to you about two colonies of bees that I thought something was wrong with. From your reply I am certain they had bee-paralysis. One seems to have recovered, and the other is about the same. I have tried the salt cure, on this one, but can see no benefit from it. They are still driving out sleek, shiny, half-starved looking bees. There is a peculiar trembling motion among all the bees at the entrance, not seen about the other hives. At the same time the bees seem to be in good condition, plenty of stores for winter, and at present are working with a vim on iron weed; not a colony in the yard is working any better; hundreds of acres of iron weed in full bloom on all sides, and if the weather will keep warm I am in hopes of getting a fine surplus. Is there any danger of this disease spreading? Would it be best to destroy the colony and take no chances? VIRGINIA.

ANSWER.—I'm not sure that there's anything contagious about the disease. As you probably know, it is much worse in the far South. In my own case, in Northern Illinois, it has made its appearance at different times for a number of years. Without any attention being paid to it, it disappeared each time of its own accord. If I had tried any of the various remedies, I might have given credit to them, and I think it very likely that many who have attributed its disappearance to this or that remedy would have had equal success if they had allowed the disease to run its own course. I never destroyed but one colony on account of it. That colony was so bad that there was no profit in keeping it, altho it is possible that if I had tried it another year it might have done better. I don't remember that I've had a single case this year. So you see that in my case there's no cause for alarm, but at the same time it may be well to keep in mind that in some places it is a terrible scourge. If your colony is doing well, it may be as well to let it alone.

Golden Method of Producing Honey—Using Two S-frame Hive Bodies.

1. Where can the "Golden method" of producing honey be obtained? When and where was it published?

2. Which text-book on apiculture, if any, contains explanations as to using two S-frame hive-bodies to accommodate the queen? I am at a loss to know if the second brood-chamber is to go on top or below, and if excluding-zinc is used? OHIO.

ANSWERS.—1. See American Bee Journal for July 30, 1896, page 481; also page 834, of same volume. [We are unable to supply the copies of this paper containing the pages named, but will try to republish the method before another season is here.—EDITOR.]

2. I doubt your finding it in any of the text-books. Probably all do not follow exactly the same plans, but I can tell what is my own practice, premising that I cellar my bees and work for comb honey. Before the queen becomes crowded in the one story, I put the second story *under*. If more convenient to do so, I may give the second story much earlier than it seems to be really needed, and believe it to be rather advantageous to do so, as the bees will keep the extra combs in better condition than they will be kept in if left away from

them. Moreover, there may be some honey in the combs given with the second story, and it's a good thing for the bees to have the honey. I think some put the second story above, in which case it should not be given a day before actually needed, as it costs something to keep so much extra room heated. When the extra story is given below, it puts no extra labor upon the bees in the way of heating idle room, for heat ascends, and the bees can work down into the lower story just as fast as the room is needed. No perforated zinc is used between the two stories, for that would defeat the very thing desired—the enlargement of the brood-nest. When it comes time to put on supers, one story is taken away, leaving the best eight frames of brood, no matter in which story they are found. The frames taken away are used wherever they are needed, and if not needed anywhere in particular, they are piled up, three or four stories high, on some colony that is perhaps not strong enough to do good work in supers. I think some leave the two stories throughout the harvest time, but for some reason I could never get as much honey by so doing. When the section-supers are taken off, the second story is placed on top, an excluder being placed between the two stories. If there is a fall flow of dark honey, the bees are in no danger of being crowded for room. When it gets so late in the season that bees will gather no more than to supply their daily needs, the extra story is taken away, so the bees can glue up for winter.

Cleaning the Solar Extractor Glass.

The underside of the glass in my sun wax extractor gets covered with a waxy film, which obstructs the light and heat. How can this film be removed? CALIFORNIA.

ANSWER.—Try rubbing off with newspaper when the glass is very hot. Gasoline may help if the paper alone doesn't answer.

Old, Black Brood-Combs.

When the comb in the brood-chamber becomes old and black, what should be done? If it should be broken out, what would be the best time of year? BEGINNER.

ANSWER.—Let it alone. If you give the bees their choice, they will use old, black combs in preference to nice white ones, either for brood or honey. The old combs have silk linings in the cells that make them warmer for winter. I know the objection is sometimes made that the cells become filled up with the silk cocoons and are thus made smaller, consequently the bees reared in them will be smaller. But the deposit is largely at the bottom of the cell, and the bees lengthen out the cells to make up for it. If you will measure, you will find that a piece of old black comb taken right out of the middle of the brood-nest will be—if it is old enough—an eighth of an inch thicker than a piece from the same place that has not been used more than two or three times for rearing brood. So of course those cells have been lengthened out. I have combs more than 25 years old, and so long as they have no other fault than age and black color, I wouldn't think of discarding them.

MILES MORTON.

The subject of the following sketch was one of New York's best bee-keepers. We had the pleasure of meeting him at the Buffalo Convention of the United States Bee-Keepers' Union in 1897. He passed away Sept. 1—last month. His brother-in-law, Mr. S. A. Niver, has kindly furnished the following biographical notes:

Miles Morton was born in Groton, Tompkins Co., N. Y., 62 years ago, making it his home during his entire life time,

which terminated Sept. 1, 1898. His education was obtained at the "little red school house" and Groton Academy.

At an early age he commenced work in his father's carriage manufactory as helper in the blacksmith shop, soon graduating as an expert carriage-ironer, wood-worker and painter. Upon reaching his majority he manufactured carriages in his own shop for a time, and then engaged in the grocery business in company with his brother-in-law, which partnership continued eight years, when he sold out his interest to enter the field of his pet hobby—the bees. For 20 years his careful, skillful labors was devoted to this his favorite pursuit; experimenting with new methods in management and supplies, without regard to cost or trouble, until his shop-chamber is a veritable "old curiosity shop;" adding machinery from time to time until his little supply factory is as nicely equipped, and turned out as fine work, as could be found anywhere. It was headquarters for the bee-keepers to gather and talk over the business generally; and it was commonly remarked that when a bee-keeper got into a snarl—that condition of not knowing what to do with 'em—it was the best thing to carry his trouble to Morton, who invariably knew just what to do, and was as certain to cheerfully give the advice.

Speaking of his mania for experimenting, his brother Harvey told me an incident in his earlier life as a bee-keeper, in trying a new scheme for transferring a swarm from an old box-hive to a movable-frame one. He put the box-hive in a tub and slowly poured in water to drive the bees into the frame hive above—and drowned every bee!

In politics, Mr. Morton was a prohibitionist, was a member of the Baptist church, a sterling, conscientious, honorable American gentleman. And what prouder title could any one wish for?

Naturally of a cheerful, sunny disposition, he drew all classes and ages to him, and the beautiful simplicity and earnestness of his life kept them as warm friends. His shop was the favorite play-ground of the children, to whom he was always "Uncle Miles"—the one person never too busy or too weary to examine the wounded pet, or mend the broken toy over which the childish heart was grieving.

Possessed of great depth and tenderness of feeling, he entered into the joys and sorrows of other lives in an unusual degree, and his home was ever the refuge for the suffering and the tempted, a shelter and home for the homeless.

Upon that home the shadow of his death rests most heavily, and the party of his choice, the church that he loved, the brotherhood of bee-keepers, and the community at large, mourn the loss of that noblest work of God—a truly good man. S. A. NIVER.

The editor of Gleanings, who so kindly loaned us the half-tone engraving of Mr. Morton on the first page, had this to say of our friend when announcing his departure, in his paper:

Mr. Morton was one of the keenest, brightest bee-keepers in New York. He was a fine mechanic of the Dr. Tinker order; and back of his beautiful home he had a nicely equipped little shop where he loved to work, and make things for his bee-keeping friends. He was a natural-born mechanic, as could be easily seen from the exact workmanship and beautiful finish of all he did; and bee-keepers for miles around used to go to Mr. Morton for their supplies.

I have traveled pretty well around that section of country, and everywhere Mr. Morton was spoken of in the highest terms, not only as a successful bee-keeper, but as one who made the best supplies in the world.

Well, it was this same Morton who has been using fences for the last 12 years, and in his quiet way has been supplying his friends and neighbors, not only with fences, but with everything else in the line of bee-keepers' supplies.

Not having an extended personal acquaintance with Mr. Morton, we feel that we cannot add much to what is expressed in the foregoing. But we are certain, from the sincerely generous terms in which those who knew him best have spoken of him, Mr. Morton will be greatly missed in every walk in life; the influence of his devoted and unselfish daily living will exist long in the memories of those who fortunately enjoyed a close personal acquaintance.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. OCTOBER 27, 1898. NO. 43.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Telling Your Experiences of the past season—writing them out—will not only do you good, but will also be helpful to others. So we wish here and now to invite our readers to send in whatever they think will be of value along the line of their experiences with the bees this year.

Do the best you can in writing all out as clearly as possible, and we will see to the rest. Of course, we may not be able to publish everything that is sent us, but we will promise to do what we can.

The long fall and winter evenings will soon be at hand—a splendid time to write. Use pencil, if you like, and write only on one side of the paper.

Adopting New Things.—While Progress is the watchword of the present age, let each satisfy himself that a new departure is really progressive before rushing headlong after it. We are led to this remark, upon reading the article on another page, by that eminently practical and far-sighted bee-keeper—Mr. C. P. Dadant. For over a third of a century in this country, and before that in France, the Dadants made a distinct success of honey-production; and we know no one whose advice we would sooner unquestionably follow along many lines in bee-keeping than these same Frenchmen—Chas. Dadant & Son.

Many bee-keepers—and particularly the younger element in the ranks of beedom—seem to think that every new thing or invention that is announced is "just the ticket"—will revolutionize bee-culture. Ordinarily, it hardly pays the bee-keeper to experiment very much. Whatever is done in that way should be carried on to a very limited extent, unless

one can easily afford to invest the necessary time and means to conduct such experiments. For that reason our Government has wisely established agricultural experiment stations whose expenses are borne by the Government, and not left to individual farmers who might wish to make experiments and yet could ill afford the cost.

Of course, no one would discourage experimentation in bee-keeping. New things will often arise that are really valuable, and will prove a boon to the whole bee-keeping fraternity. Note the honey-section, foundation, bee-escape, etc. But when it comes to the adoption of a certain kind of hive, requiring a certain sort of management, then it is certainly a wise thing to "go slow" in adopting it. What may be a perfect success in one bee-keeper's hands may be a perfect failure in another's, and especially in cases where locality has much to do with it.

But if you feel disposed to try new things, go at it gradually. In adopting changes "make haste slowly," unless there is no doubt whatever as to the gain to be made by changing.

Beginners and Bee-Books.—We feel that about once every month or two we ought to say something on this subject. Especially do we feel that just now is a good time to offer a little advice to those beginning in bee-keeping.

There are many people who have bought a colony or two of bees, or who feel the "bee-fever" coming on them, who think that all they have to do is to call on some busy man that has studied out the subject, and ask him simply to tell all he knows about it, never stopping to think that in so doing a great injustice is being done. In the first place, the busy man can't afford thus to waste his time, and, secondly, the "feverish" would-be beginner couldn't remember a tenth part that is told him. What he should do, is to get at least one of the best and most complete books on the subject, and then read for himself. A thousand and one of his simple questions can thus be answered by his own effort, and he will get a more definite and comprehensive idea of the whole subject of bee-keeping. If we did not have a bee-book for sale, we would offer the same advice, if afforded the opportunity of doing so.

"Langstroth on the Honey-Bee" is the oldest of the leading books treating fully on bees. It has been thoroughly revised by those practical and successful bee-keepers—Chas. Dadant & Son. This book contains over 500 pages, is neatly and substantially bound in cloth, and is mailed for \$1.25, or is regularly clubbed with the American Bee Journal for a year for \$2.00. But we are going to make this very liberal special offer for the next two weeks—or ending Nov. 15: To all who will before that date pay their subscription to the end of next year (1899), we will mail a copy of the Langstroth book for only 70 cents. This offer does not apply to any subscriptions sent in before the date of this number of the Bee Journal.

Now, how many will accept the above offer before Nov. 15? Remember, it ends then, and will not be renewed.

Apis Dorsata Again.—From the article on page 677 it will be seen that evidently another attempt is to be made to import the once famous "giant bees of India"—but now transferred to the Philippine Island, perhaps soon to pass to the possession of the United States. We see that Secretary Wilson is reported as saying that these bees "would be brought to America as soon as the question of their value and the possibility of their acclimatization has been fully determined." We are in favor of this method of procedure. First, thoroughly test them in their native land, and if found to be as represented by those who are so anxious to have them imported, then bring them in.

But we wonder what certain honey-producers will say when they read that if *Apis dorsata* proves a success in this

country they will be able to draw from the now unworked flora "thousands of tons of honey that is now practically a loss to the world." What would be the effect upon the already somewhat low price of honey, to have "thousands of tons" more thrown upon the market? As for ourselves, we would not be alarmed, but we shouldn't wonder if a good many bee-keeping specialists would hesitate before lending their influence toward the introduction of what they would think might tend to lessen their own chances of success.

As to the increase of wax-production, by the *Apis dorsata*, we do not see that the demand is yet so greatly exceeded by the supply. The very best yellow beeswax will net scarcely 25 cents a pound in the open market, which is not an exceedingly high price. But even at the present price of beeswax, there is no fortune in its production; and to greatly increase the supply will hardly make wax-production more profitable. If bee-keepers could be assured of a uniform price of beeswax at 28 to 30 cents a pound, they might feel that it would pay to increase its production with the bees they now have; but often beeswax does not command so good a price as mentioned.

We shall be interested in watching how the Department of Agriculture progresses in its experiment with *Apis dorsata* in the Philippines, when once it is authorized to proceed with the investigation. Even if it is decided never to bring this bee to the United States, it will be of scientific interest to have its value, or worthlessness, established.

Healthful Honey.—Under this heading, and with the sub-head, "Used Instead of Sugar, It is Economical and Palatable," appears a quarter-column in the Baltimore American, in which it is shown that a pound of good honey will go as far as a pound of good butter, and costs much less; will keep indefinitely, while butter must be eaten fresh; it is more wholesome in hot drinks than sugar; together with some useful information as to the qualities and kinds of honey. It is a good thing to have such information put before the public, and when such papers as the Baltimore American take the pains to copy it from such a paper as the Philadelphia Times, it ought not to be difficult for bee-keepers to secure its insertion in their local papers. They will find the article in question, word for word, together with much more equally interesting matter in the little pamphlet "Honey as Food," which can be had at such low rates for free distribution, at the office of the American Bee Journal. That the Philadelphia Times failed to give the proper credit is a small matter, only so the truth may be widely published.

To Exterminate Weeds or Grass, Editor Root says in Gleanings, "is to apply a sprinkling of salt around the place where you wish it killed out. It does not usually pay to try to kill out the grass or weeds except in front of the entrance to the hives."

Colonies Short of Winter Stores.—Editor Root, in Gleanings for Oct. 15, gives this timely note of warning:

There is every reason to believe that, owing to the poor honey crop this year, there will be a scarcity of stores in the hives for winter. Many bee-keepers, whenever a failure of honey occurs, will philosophize something after this fashion:

"Them bees didn't get me no honey this year. If they can't pay for themselves, I guess I'll let 'em go Gallagher."

And they do. Another class, also forgetting the big crop of last season, and being too busy with their other work on the farm, will just simply neglect the bees. It did no harm to let them go last season, because there was plenty of honey in the hives; so in a half-hearted way they "guess" there is enough in them this fall. At all events, they are too busy; and if the bees die—well, perhaps they will buy more next season.

The careful, provident bee-keeper knows perfectly well that it is very unwise to let bees shift for themselves at any

time; and there is scarcely one who looks back over the past, who will begrudge sugar fed that the bees did not earn that season, but perhaps may earn next year, or some time in the future.

There are quite a number of bee-keepers—so-called—who simply neglect their bees, and then are surprised that they die in winter. No doubt a great many colonies simply starve before spring—all because their owners failed to provide food enough to carry them through. No farmer would treat his horses and cows in that fashion, and expect to succeed. Neither can the bee-keeper.

MR. H. W. McCOMB, of Washington Co., Iowa, called on us last week, when on his way to visit friends in Pennsylvania. He reports that white clover is just everywhere this fall in his locality, which he thinks promises a great stand of it next year.

MR. C. W. MCKOWN, of Knox Co., Ill., dropt in to see us Oct. 20. He has about 100 colonies of bees, and secured only about 1,000 pounds of honey the past season. One year he had about 13,000 pounds, and sold all in near-by towns. Mr. McKown has taken the Bee Journal almost continuously since 1872.

DR. C. C. MILLER, of McHenry Co., Ill., writing us Oct. 15, had this to say about his nearly 300 colonies of bees:

"I got the bees home from the out-apiaries this week, and will hope now for one good day for a flight, and then they can go into the cellar any time when it looks as if cold weather had come to stay, which time may be any time within the next six weeks."

THE DES MOINES INCUBATOR Co., of Des Moines, Iowa, are among our annual and reliable advertisers. We understand their incubators take front rank among machines of that class. If any of our readers are expecting to adopt the artificial or incubator method of raising poultry, it might be to their interest to correspond with the above firm, not forgetting to mention having seen their advertisement in the American Bee Journal.

MISS NORA HUTCHINSON is the 20-year-old twin daughter of W. Z. Hutchinson, editor of the Bee-Keepers' Review. She is a violinist, and last week we received a splendid photograph of herself with violin in hand, taken by her father. Miss Nora and her twin sister, Cora (who plays the piano) are great helpers at home—one does the housework and the other sets the type on the Review. How's that for a "team?" Success to them all.

MR. A. W. HART, of Stephenson Co., Ill., gave us a short call Oct. 20. He is the man that has had a little good-natured controversy with Mr. Bevin, of Iowa, on the question as to Italian bees gathering better honey than blacks. Mr. Hart is 69 years of age, and has 31 colonies of bees, but got very little honey this year—so he was quite "in style" with many other bee-keepers. Last year he had 11 colonies in the spring, increased to 22, and harvested about 800 pounds of honey.

DR. C. C. MILLER, referring to something Mr. Root said in Gleanings, wrote this "straw" for that paper:

"I may say that, after more than 30 years being 'dry,' Marengo now has saloons. I think it a moderate statement to say that I've seen more drunken men on the streets in the past three months than in 10 years before."

That's perfectly natural, Doctor. If a "drunkard factory" didn't turn out drunken men, pray what else would it do? That's its business. The thing that surprises us is, the fact that some people are so willing to furnish their boys to keep up the supply of drunken men these "drunkard factories" turn out. What a pity that so many people value the almighty dollar more highly than a man's soul. But some glad day it will be different. "When will that be?" did you ask. Why, when all the righteous people of these United States decide to stand together against the awful saloon curse.

Uniting Weak Colonies is made easier, says Editor Root, by bringing them from an out-apiary, for then they will not go back to their old places.—Gleanings.

Honey-Dew for Winter Stores.—The editor of Gleanings has advised leaving honey-dew in the hives for winter. But it seems all honey-dew is not the same as at Medina. M. V. Facey says that in Minnesota it is fatal as winter food. One winter he had in the same cellar a lot of colonies filled up with honey-dew, and another lot that had been fed sugar syrup. Only one with sugar died, and only one of the others lived.

“**Whither are we Drifting?**” is the question asked in the Progressive Bee-Keeper by H. H. Hyde, in view of the many inventions and changes made in bee-keeping appliances (but before he gets through he advocates a new separator of his own invention), especially mentioning the change to smaller sections, and the “cut-off top-bar broad-frame,” with a hint against the plain section and fence separator. The editor is emphatic upon this last point, favoring slotted separators “instead of catering to certain supply dealers’ pocket-books by buying their glued-up clap-traps.”

Why Fruit Does Not Set.—A bulletin of the Kansas Experiment Station gives four important reasons why fruit may fail to set:

1. The pollen may be insufficient in quantity. This applies particularly to the strawberry, the remedy being to plant pollen-producing sorts, the so-called staminate sorts, along with the so-called pistillate sorts.
2. “Insects may be prevented from visiting the flowers during the receptive period. If bees are kept from fruit-blossoms by netting or other artificial means, the amount of fruit set is little or none. It not infrequently happens that inclement weather prevents, or hinders the flying of bees during the period when the flowers are receptive. A fruit-tree,

half of which was subjected to a continuous spray of water during the flowering period, produced no fruit upon the sprayed portion, but an abundance upon the other. A failure due to the above-mentioned cause cannot well be prevented, but may be modified by having bees near at hand to utilize the short favorable periods which do occur.”

3. In some varieties of fruits the flowers are self-sterile, and the remedy is to plant with them other varieties, as Seckel with Bartlett pears, and Concord with Brighton grapes.

4. An insufficient supply of bees will hinder the setting of fruit. While other insects may take part in the carrying of pollen, the fruit-raiser must rely chiefly upon honey-bees. Experience shows that the hungry bees may fly two or three miles, hives should be within half a mile of the orchard or small-fruit patch.

Sugar Syrup for Feeding Bees.—G. M. Doolittle gives in Gleanings the following plan for making syrup that will not crystallize: Stir 30 pounds of granulated sugar into 15 pounds of boiling water. Keep stirring till the sugar is nearly all dissolved; then let come again to a boil and skim off the scum. Take from the fire, put in five pounds of good extracted honey, stir a minute or two till well mixed, and you have 50 pounds of feed that will never crystallize. Editor Root thinks it simpler to take sugar and water, equal parts. Fill a honey-extractor half full of water, start the reel going, add sugar gradually, and turn vigorously till all is dissolved. Given thin to the bees, it will not crystallize. He says Dr. Miller does not even dissolve the sugar, but pours it in the feeder and then pours cold water on top. It may be well to remember that when fed thus thin, it should be given early.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

BEST EXTRACTED HONEY FOR SALE

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 7½ cents a pound; 2 cans, 7¼ cents per pound; 4 or more cans, 7 cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, “HONEY AS FOOD,” will be a great help in creating customers for honey. See prices on another page.

GENERAL ITEMS

A Beginner's Report.

I have taken the American Bee Journal nearly a year, and think I have learnt enough to pay for the paper for some time to come. I started last spring with four colonies, and one of them queenless. I increased to 11, and lost several swarms because I could not be with them on account of other work. I took off 500 full sections of honey this fall. **H. A. MARTIN,** Phillips Co., Kans.

Bee Journal a Revelation.

The sample copy of the American Bee Journal is received, and it has been a revelation to me. I never saw an up-to-date bee-paper before, nor heard of many things that this one contains. It has given me a glimpse of a new world, so far as bees are concerned. I have been keeping bees for 15 years, have about 20 colonies now, and am sorry that I do not know more about them than I do. **J. R. PINHAM,** Halifax Co., N. C., Oct. 10.

Poor Year for Bees.

This has been a very poor year for bees. I got only about 50 pounds of honey per colony. In 1897 I got about 150 pounds per colony, spring count. There is not much interest taken in bee-culture around here. The American Bee Journal's reform in spelling is all right. Keep on in the good work. I could not get along without the American Bee Journal. **S. J. MAGUIRE,** Benton Co., Iowa, Oct. 15.

Visited Mr. Doolittle.

I visited Mr. G. M. Doolittle the last week in September, and found a paradise—a nice large house and barn in a pleasant nook; a large man with a large heart and pleasant manner; and a nice lot of bee-hives kept in neat order. I have always wanted to see Mr. D. and his apiary, as I have read so much of his writings. I wish for a camera to take pictures for the "Old Reliable." It was a great treat to go through the shop and see the appliances and systematic manner of handling bees. And O, the nice comb honey was a great sight! And to see Mr. D. pick out the queens. What beauties they were!

The bee-cellar is very simple and nice. I wish I could have one like it. I think every bee-keeper would if he saw it. **J. MUNROE QUICK,** Onondaga Co., N. Y., Oct. 5.

Only a Quarter Crop—The Union.

After all, I failed to meet with the bee-keepers at Omaha. On Monday of the week before the meeting I was taken sick and for two weeks was under the doctor's care every day, and not able to be off from the bed. I am now able to get around and do a little work.

I have re-queened a few colonies of bees and fed all that seemed to be short of enough honey in the brood-chambers to carry the bees through the winter safely. Happily, only a few colonies needed feeding, and I had enough unfinished sections to give to these.

The white honey harvest bore a strong resemblance to a failure here. I got what I considered about one-fourth of a crop. There was no surplus from fall flowers, but the brood-chambers seemed to get heavy in September.

It was my intention, last spring, to let the bees swarm once, if they would, and then work the swarm for surplus; but honey was so scant at swarming-time that I had

only five or six swarms; and as the season continued unfavorable, I did not desire to have any more. Having now about as many colonies as I wish to keep at home, I shall soon have to choose between the prevention of increase, and the establishment of that out-apiary which was the subject of one of my dreams in my early bee-keeping days. I am inclined to think, on the whole, that I will let the bees swarm and shove them out into pastures new, in hives so big that they will feel a little discouraged about filling them, when swarming-time comes around.

I will send the dollar pretty soon to keep me in touch with the United States Bee-keepers' Union. What a preposterous idea for a bee-keeper to entertain—the idea that he will not join the Union because he does not, or cannot, attend its meetings. The prevalence of this idea will do much to make and keep the Union a weak and inefficient thing. I have no expectation that I shall ever derive any pecuniary advantage or benefit from my connection with the Union. At the same time I believe it is a good thing for a man to keep his property insured.

EDWIN BEVINS.

Decatur Co., Iowa, Oct. 19.

Short Honey Crop in Utah.

The honey crop of Utah has fallen short of last year by at least one-third. The prices for honey have run from $8\frac{1}{2}$ to $9\frac{1}{2}$ cents per pound for comb, and $4\frac{1}{2}$ to 5 cents for extracted. I have been in the mining camps of Northern Idaho the past summer, and have done nothing myself with the honey. But next year I will look after the business as usual.

The American Bee Journal merits high praise for its interesting articles, and ability displayed in its editorial department.

GEORGE E. DUDLEY.

Salt Lake City, Utah, Oct. 12.

About Half a Crop in Minnesota.

We had a good time at the Winona State Fair, lately. The bee-keepers had a good exhibit, and the fair was a success in every respect, altho the bee-keepers report only about half a crop of honey in Minnesota. Tho our crop of honey was not up to the standard, there is one consolation that our bees seem in fine condition for winter, and we all feel encouraged for next year.

E. B. HUFFMAN.

Winona Co., Minn., Oct. 15.

An Idea of a Good House.

“Would you like to hear my idea of a good house to live in for farmers of moderate means? One essential, in a comfortable house, is to have the chambers over the living-rooms, with stove-pipes going up through the floor to the chimney. A common stove-pipe will keep a room warm enough to sleep in, or, if wanted warmer, a radiator in the pipe is as good as a stove.

Again, every home ought to have a bedroom on the first floor, large enough for two beds, for convenience in sickness. Another thing is a cupboard in the wall between dining-room and kitchen, with doors opening each way. Drawers beneath are nice.—Emma Pierce, in Livestock Indicator.

A Correction—Selling Honey.

On page 654 I am made to say that one colony gave me 163 sections and 130 pounds of extracted honey. This is a mistake. It should read 163 sections and 30 pounds of extracted honey. I think I am safe in saying that this colony gave me 185 pounds of honey. Some unfinished sections were taken off that were not couched. A number of colonies gave me 150 pounds, mostly comb honey.

Since writing last I have made three long-distant trips with my horse, and sold over \$65 worth of comb and extracted honey. I can get better prices and sell more out of my immediate territory, it seems. These

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published today. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us Two New Subscribers to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Page & Lyon Mfg. Co. New London, Wisconsin,

Our 1898 Catalog

Send us your name and address and we will take pleasure in mailing you a copy!

G. B. LEWIS CO., WATERTOWN, WIS.

Special Agent for the Southwest—

E. T. ABBOTT, St. Joseph, Mo.

Mr. Abbott sells our Hives and Sections at factory prices.

Please mention Bee Journal when writing.

Ho, for Omaha!

AS we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apiarian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful, straw-colored transparent Foundation, improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c, postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, Leamy Manufacturing Company, Higginsville, Mo., or 1730 South 13th St., Omaha, Neb.

Please mention Bee Journal when writing.

See Honey Offer on page 682.

three trips represent 4½ days' work away from home. I was away three nights, or one night for each trip. I expect to start out every Friday and get home Saturday. I sell my comb honey by the section at wholesale, and not by the pound. So far I have found but one man who objected to buy this way. I am careful to have each section in a case of practically the same weight. For my best grade I get 12½ cents a section, sections weighing 15 to 15½ ounces. For 14-ounce buckwheat sections, in 24-section cases, I have succeeded in getting 7 cents each. For 15-ounce buckwheat sections I don't seem to be able to get any more than that. I have come to the conclusion that it is more profitable to take my fall crop in the extracted form. I get 6 cents a pound for extracted buckwheat, and 8 cents a pound, or 30 cents a quart, including Mason jar, for light amber clover honey. E. W. BROWN.

Erie Co., N. Y., Oct. 19.

Bees Did Fairly Well.

My bees did fairly well for surplus this year, but are rather light for winter. I am feeding some now. H. E. MILLER.

Waldo Co., Me., Oct. 10.

The Requisite for True Success.

To make money is not the greatest requisite for true success in business. But to gain a reputation for honorable business methods, to have the confidence of business men, and the respect of employes, coupled with successful business management, should be the aim of all young men who enter upon a business career. I believe that the majority of successful men are of this type, and that few ever succeed in making money who have no higher purpose than gain.—Success.

In the multitude of counsellors there is safety.—Prov. 11-14.

Characteristics of the Ideal Bee.

Query 54.—What are the characteristics to be looked for in the ideal bee—1, as regards honey-gathering; 2, prolificness; 3, color; 4, disposition; 5, size; 6, swarming propensities; 7, hardiness; 8, any other desirable qualities?—Iowa.

Emerson T. Abbott—I am not posted on "ideal bees."

E. France—There is more difference in location than there is in bees.

D. W. Heise—Too much for a youngster. Let the veterans answer this.

A. F. Brown—You have named them all. Prolificness and honey-gathering are the most desirable.

G. M. Doolittle—The ideal bee will never be obtained. The practical bee is here already in the shape of the Italian.

W. G. Larrabee—The ideal bee for me is the one that will produce the most and best honey with the least labor for the bee-keeper.

Jas. A. Stone—1. Only one answer to this—a good, industrious worker. 2. But one answer to this—if you do not have the bees you do not get the honey. 3. Like what is called the leather-colored Italian best. 4. Quiet to handle. 5. Large. 6. I do not believe the swarm-

Sweet Clover
And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

| | 5lb | 10lb | 25lb | 50lb |
|----------------|-----|--------|--------|--------|
| Sweet Clover | .60 | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover | .70 | 1.25 | 3.00 | 5.75 |
| White Clover | .80 | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover | .60 | 1.00 | 2.25 | 4.00 |
| Crimson Clover | .55 | .90 | 2.00 | 3.50 |

Prices subject to market changes. Add 25 cents to your order, for cartage, wanted by freight.

Your orders are solicited.

HONEY ***

If you want Colorado Alfalfa, Sweet Clover and Cleomee honey—comb or extracted—correspond with the Secretary of the Colorado State Bee-Keepers' Association. Our Honey ranks high in quality. Car lots a specialty.

Address **F. RAUCHFUSS, Elyria, Colo.**
31Atf Please mention the Bee Journal,

ing disposition belongs to a particular race. The better the honey-flow the more they swarm. 7. To be sure, we want hardiness.

Dr. C. C. Miller—1. Greatest possible. 2. Possibly not the greatest. 3. Yellow. 4. Gentle. 5. Perhaps present size. 6. None. 7. Very hardy.

Mrs. L. Harrison—Yes; that of clinging to the combs, and of being able to defend themselves against their enemies, whether pilfering boys, bees, or moths.

Dr. A. B. Mason—Not worth while to take time and room to answer most of these questions. 3. Leather-colored Italians have been the most satisfactory with me.

C. H. Dibbern—It seems to me that you have answered your own question. All these traits are desirable, but the main thing is to get a bee that will "just roll in the honey."

Dr. J. P. H. Brown—This question can be answered by applying the adjectives: 1. "Great." 2. "Great." 3. "Good." 4. "Gentle." 5. "Good." 6. Prefix "Non." 7. "Great." 8. Already summed up.

R. C. Alkin—1. Industry. 2. The most prolific. 3. Bright desirable. 4. Mild tempered. 5. Quality before size. 6. Non-swarming desirable, but very improbable except in limited degree. 7. The answer is patent to all. 8. Your questions are too big for proper answering here.

Prof. A. J. Cook—1. Long tongue and energy. 2. Great breeders in time of harvest, and before. 3. Immaterial, tho color of Italian is good, as it is convenient. 4. Gentle, tho not so important. 5. Present average. 6. Moderate. 7. Good resistance. 8. Vigor and prolificness the great desideratum.

G. W. Demaree—Is there an "ideal bee" fixt in the minds of a considerable number of persons? How many would agree on the bee of the future, if a given number of bee-men had the power to legislate her into a "bee-ing." I have tried all the varieties of bees brought to notice, and I have found nothing I prefer to the carefully selected Italian.

R. L. Taylor—Well, well! Of course the ideal bee must be a good honey-gatherer, prolific at the right time, of good size and hardy. Color is immaterial, but in disposition she must be controllable, and she must not be given too much to swarming; and above and beyond all she must have a tongue long enough to reach the bottom particle of honey in red clover bloom.

O. O. Poppleton—1, 2 and 3. Answers to these questions depend much on locality. In Iowa, the habits of the pure Italians, as regards breeding, honey-storing, etc., are much the best. In Cuba, and here in South Florida, high-grade hybrids do the best. An article would be required to cover these points. I prefer not trying to answer the other questions.

J. E. Pond—1. Early and late work, near enough to hive to give ample results. 2. A long article on queens is needed to answer understandingly. 3. Color is of no importance. 4. As stingless bees are desirable, the best dispositioned are desirable. 5. Bees are so nearly alike in size that but little can be done in that direction. 6. For myself, I should not wish to see the non-swarming variety. 7. Most of the varieties

are hardy enough? 8. I have found the Italian, as a whole, to fill the bill better than any other variety, race or cross.

E. S. Lovesy—1 and 2. I select mainly for the first two qualifications. 3. The leather-color with me comes the nearest to the above requirements. 4, 5 and 7. Again the leather color suits me the best. 6. I run my bees by division in a way so that I am not troubled by any swarming propensities.

Eugene Secor—The ideal bee must be able to gather more honey from the same field than the present one, and if she does that I don't care whether she be black or yellow, large as a bumble-bee or small as house-fly. If she does what is required of her, of course she'll be hardy and prolific. She'll not swarm herself into poverty, or forget her proper functions.

J. A. Green—The ability to gather a large amount of honey, and if comb honey is the object, to store it in salable form, are by far the most important. I would place disposition next. After that, I would want bees that did not make swarming their chief aim. Hardiness and prolificness are very desirable. Color and size have little value in themselves, tho the former is of considerable use to the breeder.

Rev. M. Mahn—1. "Nothing succeeds like success." The ideal bee should be a successful honey-gatherer. 2. The ideal bee should be prolific, but prolificness can be excessive. 3. I like a bright golden color, if other good qualities are present. 4. Gentleness is a very desirable quality. 5. Size is a matter of little importance. Some colonies of small bees store more honey than some large ones. 6. The ideal bee does not swarm excessively. 7. This question answers itself.

P. H. Elwood—I prefer to breed from those colonies producing year after year the largest quantities of good quality honey. The prolificness, color, size, swarming propensity and hardiness, suit me if the first qualification is all right. If not hardy they will not be strong enough to gather a large quantity of honey. The swarming propensity can be controlled. The disposition of such bees, as a rule, is no worse than the average. Extra-cross colonies can be blotted out.

S. T. Pettit—1. Generally one that does its best, but in the fall quits entirely when it cannot gather enough to meet current expenses. 2. I want a good layer, that knows enough to quit in the fall when there is not enough honey coming in to meet present demands. 3. The color that she happens to have when the good qualities are well developed. 4. To keep very quiet in winter, to fight moth-millers, to guard against robbers, to keep self-possessed and quiet while under manipulation. 5. The Italian is, in my opinion, the ideal size for this country, except the length of its tongue. 6. The ideal bee will not swarm except under great pressure. 7. Most of our bees are hardy enough if handled rightly. Temperament helps. 8. A bee with a longer tongue—long enough so as to gather red clover honey.

Convention Notices.

Connecticut.—The fall meeting of the Connecticut Bee-Keepers' Association will be held at the Capitol at Hartford, Wednesday, Nov. 2, 1898, commencing at 10:30 a. m. Every member should make an extra effort to be present at this meeting.
Waterbury, Conn. Mrs. W. E. RILEY, Sec.

Colorado.—The Colorado State Bee-Keepers' Association will hold their next annual convention probably some time in November, the exact date given later.
R. C. ATKIN, Pres., Loveland, Colo.
F. RAUCHFUSS, Sec., Elyria, Colo.

Ontario.—The annual meeting of the Ontario Bee-Keepers' Association will be held in Guelph, Dec. 6, 7 and 8, 1898. Owing to the Guelph Fat Stock Show, the Guelph Poultry and Pet Stock Show, and the Experimental Union meeting on the same dates, there will be a large meeting of bee-keepers, and each association will be a help to the other, as many are interested in all the different meetings. All are cordially invited to attend the meetings.
W. COUSE, Sec.
Streetsville, Ont.

Illinois.—The Illinois State Bee-Keepers' Association will hold its 8th annual meeting at the State House in Springfield, Nov. 16 and 17, 1898. We will have the advantage of one fare and a third for the round trip—open rate—along with the Odd Fellows, whose meeting is the third Tuesday of November. Our Association has been petitioned by the Northern Illinois Bee-Keepers' Association to take the proper steps to secure the same foul brood law for our State as that of Wisconsin. Other matters of importance will come before the meeting, and we expect to have the usual good time that bee-keepers always have when they get together. Excellent board is secured at 25 cents per meal, and lodgings just as reasonable. All bee-keepers are invited. The one dollar for membership fee also entitles you to the American Bee Journal for one year.
Bradfordton, Ill. JAS. A. STONE, Sec.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,
Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiculturist with everything that can aid in the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—is beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dadant—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiculturist library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth.

Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages; bound in cloth and fully illustrated.

Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 175 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers, \$1.00.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called BEES OF HONEY. 102 page pamphlet. Price, 40 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping, in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 50 p., illustrated. 25c.

Convention Hand-Book, for Bee-Keepers. — Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents.

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by C. Ropp.—A Ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2 in fine artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st, How We Made the Old Farm Pay; 2nd, Peach Culture; 3rd, How to Propagate Fruit-Plants, Vines and Trees; 4th, General Fruit Instructor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for casting up the price of grain, produce, hay, etc. Price, 25 cts.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Turkeys for Market and Turkeys for Profit, by Fanny Field.—All about Turkey-Raising. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters, 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

Book Clubbing Offers.

(Read Carefully.)

The following clubbing prices include the American Bee Journal one year with each book named. Remember that only ONE book can be taken in each case with the Bee Journal a year at the prices named. If more books are wanted, see postpaid prices given with the description of the books on this page. Following is the clubbing-list:

- 1. Langstroth on the Honey-Bee.....\$2.00
- 2. A B C of Bee-Culture.....2.00
- 3. Bee-Keepers' Guide.....1.75
- 4. Bees and Honey [Cloth bound].....1.65
- 5. Doolittle's Scientific Queen-Rearing.....1.75
- 6. Dr. Howard's Foul Brood Book.....1.10
- 7. Advanced Bee-Culture.....1.30
- 8. Bienen-Kultur [German].....1.20
- 11. Rational Bee-Keeping [Paper bound].....1.75
- 13. Bee-Keeping for Profit.....1.15
- 14. Convention Hand-Book.....1.15
- 15. Poultry for Market and Profit.....1.10
- 16. Turkeys for Market and Profit.....1.10
- 17. Capons and Caponizing.....1.10
- 18. Our Poultry Doctor.....1.10
- 19. Green's Four Books.....1.15
- 21. Garden and Orchard.....1.15
- 23. Rural Life.....1.10
- 25. Commercial Calculator, No. 1.....1.25
- 26. Commercial Calculator, No. 2.....1.40
- 27. Kendall's Horse-Book.....1.10
- 30. Potato Culture.....1.20
- 32. Hand-Book of Health.....1.10
- 34. Maple Sugar and the Sugar Bush.....1.20
- 35. Silo and Silage.....1.10
- 36. Winter Problem in Bee-Keeping.....1.30
- 37. Apiary Register (for 50 colonies).....1.75
- 38. Apiary Register (for 100 colonies).....2.00

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Oct. 18.—Fancy grades of white comb honey sell freely at 13c, with good grades from 11 to 12½c, according to finish; ambers bring 8 to 10c, with dark mixt and unclean, 7 to 8c. Extracted, white, 6 to 7c; ambers, 5 to 6c; buckwheat, 5c. Beeswax, 26 to 27c.

The market is active and nearly all consignments are sold soon after arrival.
R. A. BURNETT & Co.

San Francisco, Oct. 12.—White comb, 9½ to 10½c; amber, 7½ to 9c. Extracted, white, 6½ to 7½c; light amber, 6 to 6½c. Beeswax, 24 to 27c.

Stocks and offerings continue of very light volume, both of comb and extracted, and the market is showing firmness. Some comb of very superior quality has been lately landed on the market. Water white extracted is scarce.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially-filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax, prime, 24c; choice, 24½c. At present there is a good demand for honey.
WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12 to 13c; No. 1, 11 to 12c; amber, 10 to 11c. Extracted, white, 5½ to 6c; amber, 5 to 5½c; dark, 4½ to 5c. Beeswax, 22 to 25c.

The receipts of comb honey are larger.
C. C. CLEMONS & Co.

Boston, Sept. 30.—Our honey market shows a decided firmer tone since our last. A few sales have been made at 15c for an extra fancy lot, while almost all sales ranging from A No. 1 to fancy now are made at 14c, while occasionally, something a little off, will bring as low as 12½ to 13c. We do not look to see any lower prices.

Extracted, Florida, in barrels, mostly 6c to 7c, with a good demand. Beeswax, slow sale at 26c for best.
BLAKE, SCOTT & LEE.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12½c; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6½ to 7c. Beeswax, 25 to 27c.
WALTER S. POWDER.

Milwaukee, Oct. 18.—Fancy 1 pounds, 12½ to 13c; A No. 1, 12 to 12½c; No. 1, 11 to 12c; No. 2, 10 to 10½c; mixt, amber and dark, 8 to 9c. Extracted, white, in barrels, kegs and pails, 6½ to 7c; dark, 5 to 5½c. Beeswax, 26 to 27c.

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing.
A. V. BISHOP & Co.

Buffalo, Oct. 20.—This market is much improved in demand on all grades. Strictly fancy 1-pound comb, 13 to 14c; No. 1, 11 to 12c; dark, etc., 7 to 9c. Fancy extracted, 5 to 6c; dark, 4 to 4½c. Fancy beeswax, 27 to 28c; poor, etc., 20 to 25c.
BATTERSON & Co.

Columbus, O., Oct. 18.—Receipts of comb honey are still very light and market is firm. Fancy white, 14 to 15c; No. 1, 12½ to 13c; No. 2, 10 to 12c; amber, 9 to 11c.
COLUMBUS COM. AND STORAGE CO.

New York, Oct. 22.—Receipts of comb honey are large, and there is quite a stock now on the market. While white is in good demand, buckwheat and mixt seem to be somewhat neglected, and quotation prices have to be shaded in order to sell in quantity lots. We quote:

Fancy white, 13 to 14c; No. 1 white, 11 to 12c; amber, 10c; mixt and buckwheat, 8 to 9c. Stocks of extracted are light of all kinds. Demand is good at following prices: White, 6 to 6½c; amber, 5½c; dark, 5c. Southern, in half barrels and barrels at from 55c to 60c a gallon. Beeswax dull at 26c.
HILDRETH BROS. & SEIGLEN.

Detroit, Oct. 20.—Honey in better demand and better prices as follows: Fancy white, 13 to 14c; No. 1, 12 to 13c; fancy dark and amber, 10 to 11c. Extracted, white, 6 to 7c; dark, 5 to 5½c. Beeswax, 25 to 26c.

CONTRIBUTED ARTICLES

Loose or Tight Bottom-Boards—The Union.

BY W. M. WHITNEY.

I have read Mr. C. P. Dadant's contribution on page 645, on the subject of tight and loose bottom-boards, purporting to be a criticism of something attributed to me in an item on page 544. While I would not presume to offer instruction or advice to any bee-keeper having the knowledge and experience which is well known to every novice in the business, who reads at all, that Mr. Dadant possesses, yet his article is based upon an assumption so far removed from the actual facts, that I feel constrained to defend myself by way of an explanation.

I made no issue between loose and tight bottom-boards,

in forming my judgment respecting the hive, entirely independent of the matter of construction of the bottom-board. Were it left to me to choose, and were it practicable to make a double-walled hive thus, it might be that a loose bottom would be selected, mainly because the hive, as Mr. Dadant suggests, might be more readily cleared of dead bees, as well as of any foreign matter; yet, there has not been the least difficulty during the four years of my bee-experience in cleaning my hives, without the trouble of transferring.

My hives are double-walled to the top of the brood-chamber, having the air-space filled with some light, dry, porous substance, and having the second story single wall of thin stuff, and protected by a gable cover having plenty of air-space. They are not more cumbersome to handle than the two-story Langstroth; in fact, I find no difficulty in handling them during swarming-time. Queens being all clipped, when a swarm emerges, the parent hive is removed on a sled, and an empty one placed on the old stand.

Several of my hives stand in the sun, without a particle of protection from its rays, and while these colonies are among the strongest in the apiary, there has been scarcely a day during the heat of the summer that they have shown the least uneasiness because of the heat, or manifested a desire to hang

Exhibits of E. Kretzmer and Douglas County, Nebr., in the Apiary Building at the Omaha Exposition.

but simply stated that the methods of ventilation described were not applicable to the hives I use; and that for out-of-door wintering and for manipulation, as I have learned to do, I preferred them to any other with which I have become acquainted. There are other factors that enter into the calcu-

out; which condition, I believe, is due to the fact that the inside hive-body is protected from the heat of the sun by the outer wall, and a circulation is kept up by ventilators in the gable of the covers.

In regard to removing frames from the brood-chamber, re-

ferred to by Mr. Dadant, I have to say that I am using, largely, thick top-bar frames, which are spaced quite closely in early spring—not more than a flush $1\frac{1}{4}$ inches—and the removal of one frame in a 10-frame hive adds $1\frac{1}{4}$ inch space to be distributed among the remaining frames, which makes simply a wide bee-space, but will not cause the bees to thicken the comb, as I said in my former statement, providing they have a prolific queen, and there is surplus room given in the story above if needed. At least this is my experience.

This, and a chaff hive, are used almost exclusively in northern Ohio for out-of-door wintering, and are universally liked. Mine are the only hives of the kind in this locality, and while the season has been an extremely unfavorable one—one of the poorest known in this part of Illinois—my bees have not only most bountifully supplied themselves with winter stores, but have given me nearly 700 pounds of surplus, about equally divided between extracted and comb honey, while a neighbor, about 80 rods from me, theoretically "way up" in bee-keeping, with more colonies than I have, but in another kind of hive, has secured less than 30 pounds of surplus. But he does not take the "old reliable" American Bee Journal.

But it matters not what kind of hive one uses: as I said before, the time and manner of manipulation has a wonderful effect upon results, and no person should attempt to keep bees who is walking about asleep.

UNITED STATES BEE-KEEPERS' UNION—A SUGGESTION.

One other matter, which perhaps may seem presumptuous in me to refer to, as I am not a member of the United States Bee-Keepers' Union is, What is the surest method of increasing its membership? It has occurred to me that, if all county associations were made branches of the United States Union, and were governed by its constitution, contributing to its maintenance by the payment of dues or assessments, and were represented at its conventions by delegates, as many other organizations are conducted and supported, it would soon become a wonderful power for good to the bee-keepers of the United States. This is simply a suggestion, perhaps impracticable.

Kankakee Co., Ill.

Introducing Virgin Queens to Nuclei.

On page 632, a Jamaica bee-keeper suggested that queen-breeders be requested to answer this question in the American Bee Journal:

"With what method of introducing virgin queens to nuclei are you the most successful? Also give the age of the queens."

The following responses have been received up to this time:

In reply to the question for queen-breeders, I will say this is about as good a plan as I have ever tried:

I have my queens hatched in the West spiral cage. When the queen has been hatched from one to 10 days, I roll in a piece of tissue or other paper sufficient "Good" candy to fill about one inch of the cage, and place the cage in the hive in such a way that the candy can't fall on the queen when nearly eaten out. By this plan the nucleus has been queenless 3 days or more. With this plan I have been very successful.

I might succeed better with the tobacco plan, but in the hand of a novice there would be danger of robbing; and then, I don't use tobacco, and of course don't allow my bees to indulge.

W. J. FOREHAND.

Lowndes Co., Ark.

I have been very successful in introducing virgin queens to nuclei as follows: I use the introducing-cage, consisting of a wire cage $\frac{3}{8} \times \frac{1}{2} \times 3\frac{1}{4}$ inches, and a tin cap $\frac{1}{8}$ of an inch long that just fits inside the open end of the cage. This cap has a $\frac{1}{4}$ -inch hole in the bottom, and is filled with candy that will take the bees about two days to eat out, when the queen will be liberated. The nucleus should be queenless at least a day before the virgin queen is caged, and if many days destroy the cells.

This method differs only from introducing laying queens in having the nucleus queenless a day or two while the laying queens are caged, as soon as the undesirable queen is removed.

I have used this cage successfully since 1883, and have introduced hundreds of virgin queens with little loss. I have no trouble introducing a queen a week old, but prefer one from 24 to 48 hours old.

JAMES F. WOOD.

Worcester Co., Mass.

I will here outline the method, or several methods, which I have used quite successfully during the past season, for introducing virgin queens. It is not possible to give in a nutshell all the little kinks and hooks that are necessary to the best of success, but these will soon be acquired by the practical apiarist.

One method with which I have been especially pleased is Dr. Miller's "pulled queen method," as I call it. During the past season I have introduced somewhere around five or six hundred pulled queens, and have lost but very few when certain rules were observed. The rules are these:

The queens must be not be more than a few hours old, and the nucleus must be at least three days queenless. At all times, and when honey is not coming in very briskly, the nucleus should be queenless one or two days more, or the queen is liable to be balled as she grows older. It is a fact, the bees will accept one of these pulled queens when they have been queenless but a few hours, but the idea is not only to have them accept the queen, but to have the queen become a laying one. My experience says when the queen is given to the bees too soon they will invariably ball and kill her after the first two or three days.

For introducing virgin queens not more than three or four days old, I follow the same rules as for a laying queen. A colony that will accept a laying queen will accept a young virgin. To introduce a virgin 5 or 10 days old is quite another thing, and, to prove this for yourself, take a pulled queen and one of these oldish virgins and place them on the same comb at the same time, and you will find that the bees will promptly attack the older queen while the pulled queen will receive no attention whatever. To get the above results use bees which have been queenless for but three days.

To introduce these oldish virgin queens, I usually wait until the bees have capt queen-cells, then run a queen right in at the top of the hive. It is a good idea to roll her in honey first. *This work should be done in the evening, towards sundown.*

Another plan for introducing these queens is to wait until the nucleus is queenless for three or four days, and then proceed to introduce as you would a laying queen to a colony that has been queenless for a few hours, or whose queen has been just removed.

All the above directions are for colonies or nuclei in a normal condition, except that they are queenless, of course.

Huron Co., Ohio.

H. G. QUIRIN.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

[Continued from page 675.]

FIRST DAY—EVENING SESSION.

The evening session was called to order by Pres. York, and opened with the singing of the "Bee-Keepers' Reunion Song."

Pres. York—The first paper is one by Mr. E. R. Root, of Ohio, on

Recent Progress in Apiculture.

E. R. Root—I have no regularly prepared paper. Not having had the time to prepare one, I thought I would simply give you some of my old rehash. I want to say in this connection that I was in hopes I should not be put on the program for any paper. I was rather of the opinion that a publisher should not come before the convention to discuss a subject. We want to have an opportunity of hearing from those who do not so often have the opportunity of being heard from.

At the meeting held in Lincoln, Nebr., I had a subject very similar to this; but I suppose Dr. Mason thought that the times had changed so much that we could discuss the same subject again.

THE PLAIN SECTION AND FENCE.

Some of you know what we have been doing in reference to plain sections. I wish to explain what the plain section is: It is simply a section which has the sides made of the same width throughout; in other words, it is a section without bee-ways. We called it the "no-bee-way" section for a time. I saw those sections in use in New York State a year or so ago, when I was through it. They were getting more money for honey in those sections, and those who were using them were very enthusiastic concerning them.

In order to make the use of these sections practicable, we have put something in to take the place of the bee-ways. If separators are used, then the separators have to have cleats upon them. I have a section here that I have tried to make into the form of a plain section, and you can see that it is perfectly straight around the edges, with no bee-ways. I have here a fence to illustrate what I mean by the separator having cleats upon it. The fence is made something after this nature, with cleats on both sides $2/12$ inch thick, or it may be $3/8$ inch thick. We put cleats on each side. That is supposed to be made up of slats placed about $3/16$ inch apart. A series of these sections set down in the case, and then one of these fences, with cleats running down on either

Ernest R. Root.

side, is put in. The sides of the section come opposite the cleats on the separator. If you nail a piece of wood on either side you make a perfectly tight box of it.

In this way we get rid of about 25 percent of the wood in the sections—making the separator that is a little more expensive, and putting the cleat on the separator. We have overcome the difficulty of having such a large case. We save about 25 percent of the room in the shipping-case; yet the sections hold as much honey as they did before. We also have the honey closer to the face of the box. When the honey is put in, the capping appears almost even with the box, and the section itself seems to be fuller.

I found in New York State that these sections would sell better. This year we happened to send to a commission house in Columbus about 1,500 pounds of comb honey, and in that was a case of the plain sections. We thought nothing about it until we got a letter from them saying that they had that case of sections, and had taken it around to their customers, supposing they were all the same, had taken a great many orders, and that they were very much disappointed when they found they were not all alike; that they would like to get a thousand cases of plain sections, as they would sell more readily. You understand that they did not know anything about the plain sections; it was simply that they were better looking, and they wanted a thousand cases of them. That is one of the recent developments that came up for this year. The advantages are that there is less wood and less weight in the shipping-case; the surplus wood is put on the separator itself.

Dr. Miller—Was that case of plain sections you speak of, square or oblong sections?

E. R. Root—Square. If it had been sent with oblong sections we would not have known whether the advantage was in the shape or in the style of the section. It must have been the appearance of the section itself that made the difference. Mr. S. T. Pettit, of Canada, has something similar, and he finds that with this freer communication he gets better-filled sections. The object is to get the sections filled on the outside row—to get them as well filled as those on the inside row of the super. With the fence we attempt to accomplish that, and I think the honey is going to be whiter, too. I shall show in the next number of our journal a photograph showing the honey in the ordinary plain section and also in the old style section, and you will note that that in the plain section is a good deal whiter.

Mr. Stilson—In regard to the shipment of those sections built on that style, is it necessary to put in a fence between the rows of sections in shipping?

E. R. Root—No, sir; we have had thousands of pounds shipped without anything between them whatever.

Mr. Stilson—About two weeks ago I saw a shipment of 2,000 pounds of honey, and about half of it was ruined by being shipped in that manner. When the cases were handled it broke the capping and ruined nearly the whole shipment.

E. R. Root—Was that in plain sections?

Mr. Stilson—Yes, sir.

E. R. Root—I have not found any cases where there was that trouble. The thickness of the cleats has quite a good deal to do with it. There is a possibility that it might in some instances do that. Did they put fences in the shipping-cases?

Mr. Stilson—No, sir; there was no separation whatever; it was just put in close together, and it masht down. It was just simply one mess of mush.

E. R. Root—I have been watching for things of that kind, but haven't found anything yet. If there is more than $2/12$ inch of thickness, then I think there is almost sure to be the trouble you speak of.

Mr. Masters—Are the cases filled full of those sections?

E. R. Root—Yes, sir.

Mr. Masters—How do you get hold of the sections to get them out?

E. R. Root—Usually shipping-cases are made so that there is a "follower" in them at the back of the case. The cases are made so as to take several different sizes of sections. If there is any space left in the case it is taken up by means of the follower. Back of that, if there is any space, pieces of newspaper may be folded and placed to fill the space and act as a sort of cushion. The newspaper is rolled up and put down behind the follower in the shipping-case. That protects the honey from getting jammed.

Dr. Miller—Do you consider it necessary to have separators in shipping-cases?

E. R. Root—No. We thought at one time it was necessary; but now I do not think it is. They can be put in or not, as one sees fit.

Mr. Stilson—Have you ever used the plain sections with a fence or separator, shut tight both top and bottom, and a hole in the bottom of the section for the bees to enter?

E. R. Root—I never have; no, sir.

Mr. Stilson—I saw some a little while ago. It was a surprise to me, the manner in which they were filled. I had never seen them used until this year. They were filled clear down to the bottom, and every corner was filled all the way through. The auger-hole was filled and capt clear down.

Mr. Stilson exhibited some of the sections filled with honey, which showed the conditions he spoke of.

E. R. Root—Speaking about getting the sections full—the claim was made earlier in the season that the plain sections would be filled out better than the ordinary. So far as I have seen they are. I am inclined to think that the greatest point in that is to get the sheets of foundation large enough. It is very necessary to have the starters go clear across. I am told by Mr. Danzenbaker that that is the reason he gets his sections filled out so nicely. I have also been consulting with quite a number of others, and I find that the matter of having the foundation go clear out to the sides of the section does away with pop-holes.

Dr. Miller—Mr. Danzenbaker insists it is better not to have the foundation go clear to the bottom.

E. R. Root—I meant to say that the foundation does not go clear to the bottom, but clear to the sides.

Dr. Miller—Will you please tell us what you use where Mr. Pettit has his divider?

E. R. Root—We have a fence.

Dr. Miller—And of course you have a wedge in there.

E. R. Root—Yes, sir.

Mr. Masters—With a 1/6-inch bee-space?

E. R. Root—The wedge increases it, so it makes very nearly 1/4 inch.

Dr. Miller—Is it not possible to have both sides wedged?

E. R. Root—It would be possible, perhaps; only in the ordinary 8-frame hive there is not enough room for the rows of sections and the fences. The wedges are about as thin as they can be now.

Dr. Miller—Mr. Pettit's idea is to have the outside filled with bees. There is another point that just came to me that may be of some advantage—that point is this: With this extra number of bees, if Mr. Aspinwall's idea is correct, that swarming may be prevented, there may be some advantage in having the extra bees on the outside.

E. R. Root—The idea was to get the outside rows as nicely filled as the center. He does it by having a great number of bees on the outside.

Dr. Miller—Another advantage that I happened to learn is that of putting the wedges in along with the fence. I do not know yet whether I like the fences, but I do like that one point, that the wedge can be more easily put in with the fence than it can with the plain follower, and very much more easily pulled out.

THE DEEP CELL OR DRAWN FOUNDATION.

E. R. Root—I have here in my hand a piece of what we call drawn foundation. The base of natural comb is 3/1000 of an inch thick. We have got this down now so that it is pretty near the same thing. It is a very expensive article to make; it has to be made very slowly. The sample that we made last season had flat bases—flat bottoms, like the ordinary flat-bottomed foundation, but we found that the bees would take it, and in their effort to make the base natural would plug in a lot of wax in the corners. They would thicken the foundation and make it heavy. Sometimes in the rush of the season they would not do it. Then Mr. Weed went to work and made the bases natural, and that seemed to eliminate the trouble. Some seasons the bees will enter that immediately and draw it out into comb and fill it; and other seasons they will take the ordinary foundation as quickly as they will this.

Dr. Miller—In what seasons do they make the discrimination?

E. R. Root—If the honey-flow was coming in rapidly they would take the ordinary foundation as readily as they would this. If the honey was coming in slowly they would take the drawn foundation in preference.

The third stage that Mr. Weed is working on now is something in the nature of a cross between drawn foundation and common foundation. His idea is to make the foundation as thin as the bees make it, 3/1000-inch thick. That is about the thickness of the ordinary bee-journal paper. We want to approach that thickness as nearly as possible, because we learn that the bees very rarely thin the base of the foundation. Whatever surplus wax you put in there goes for naught. If the foundation can be made as thin as the bees make it, we have accomplished considerable. [Mr. Root then exhibited specimens of the foundation referred to.] The walls are made in this way to stiffen the foundation, and also to give the bees a surplus of wax. It can be made thus more rapidly, and can approximate in price the price of ordinary foundation. When we accomplish that it will be a long step in advance. If we can give the bees a little encouragement by deepening the walls of the foundation, it will often start them going.

I have here a specimen of foundation with very shallow walls. The foundation, while it might be sold for a little more per pound, would be cheaper per square foot, and it would be less liable to sag, because the walls would keep it from sagging. It is also an advantage in pulling the foundation off the rolls. In pulling ordinary foundation off of the rolls, it has a tendency to stretch it. This foundation pulls off much more easily.

This foundation runs about 12 feet to the pound. Ordinary foundation runs about 7 or 8 feet to the pound. You can see the saving there; it will be much cheaper. And I believe that to make foundation with deeper walls is going to induce the bees to go into it more readily than with ordinary foundation.

QUEEN-REARING—THE DOOLITTLE METHOD.

E. R. Root—I will now pass to the subject of queen-rearing. Nearly all queen-breeders are using the Doolittle method, or something like it. If you know what the Doolittle process of producing cell-cups is, you know it is simply to take a round piece of wood and dip it in wax several times until the wax comes off in the form of a queen-cell. A row of those is fastened on a stick, and that is put in the center of

a brood-frame; then the cells are grafted with larvæ and filled with royal jelly—I should say the royal jelly is put in and then the larvæ, and then the cells are put into a hive that is going to supersede the queen. The larvæ are one or two days old. After the cell-cups are put on the stick and fastened to a brood-frame, it is put into the hive of a colony that is going to supersede the queen.

How do we know that they are going to supersede the queen? As we go through the apiary we find a colony that has an old queen and has some queen cells started. That indicates that the bees are probably going to supersede the queen. We destroy all cells in that hive and put in one of these Doolittle artificial cell cup frames. If it is left in there during the honey season the bees will fill it out; if it is not during the honey season we gradually feed until the cells are filled clear down. That seems like a great deal of work, but it is a very short process, and the result is far superior queens. Just a little while ago I went through the apiary and look at some of the "peanut" queens, and I was surprised to find how large and how prolific they were. It seems to me that they must be queens of long life. The thought is this, that queens that have been on a journey for a time are shorter-lived than those which one rears. Suppose that is true, does it not stand to reason that bee-keepers should learn the art of queen-rearing? A great deal depends on good queens. With a good queen you can get a good, strong colony.

Mr. Rauchfuss—Won't you be so kind as to explain the system of rearing queens when you produce extracted honey? There is a difference under the Doolittle plan.

E. R. Root—I do not know that I understand your question.

Mr. Rauchfuss—I mean the method of rearing queens when you are producing extracted honey. Instead of looking up colonies that are going to supersede their queens, we simply hang a couple frames of brood up above. That will make the bees start queen-cells on those two frames. After they have started those queen-cells then we are getting ready to have our cell-cups on hand and put them right on those frames, breaking out the cells that have been naturally started. In that way we get about six cells, on the average, out of the 12. We leave them in there until the proper time comes to take them out and put them in the cages. We put them on a strong colony until they are hatched; then go to work with your pocket-knife and cut a hole in the extracting-case or super, making a hole for the queen to go out and get mated. She will commence laying, and whenever we feel disposed to change the queen we can take out the queen-excluder and the new queen will go down, and finally the old queen will disappear. That is a very easy and convenient way of requeening your apiary. It is a very satisfactory and a very cheap way of rearing queens. It doesn't interfere with the work of the colony—they keep right on filling the frames.

E. R. Root—That is an adaptation of the Doolittle method. I was stating a few minutes ago that good, prolific queens are a very important thing. We want queens that can produce a large number of eggs and get a strong colony. Some of you know something about the methods by which swarming may be controlled. Some time ago I went through Mr. Cogshall's apiaries in New York. He has 13 apiaries. He does not keep men at the out-yards; he lets the swarms go. The neighbors said he lost about half of his bees there. I spoke to him about it, and he said he could produce bees at a cost of 50 cents a colony. Suppose he can do that and then produce big crops of honey; isn't there a better way by which he can keep those colonies? I have been misunderstood a great deal in regard to large colonies. At our out-yard we have no men at all. I take care of those bees myself, and I do not give them very much time, either. There is no one there at all to look after them, but when they are managed properly they have no swarms, or so few that it doesn't amount to anything. Those colonies are tiered up one and two stories high. We want queens that are going to fill those brood-chambers full of brood; there will often be 12 to 16 frames of brood. We have had a good many with 12 to 15 frames. We put on the super as the honey season draws on, the brood will hatch out, and the probabilities are they will fill the upper story with extracted honey, and that will be captured; the comb honey super will also be filled out. I have had as many as two or three stories filled out on top of that. If they were to swarm out, the colony would be reduced and the whole thing left weak. Honey is low enough in its price. We should do something if we can to control the swarming propensities and keep the colonies strong and full. There are other methods by which swarming can be controlled, but that is the most practicable method. Mr. Dadant has very little swarming—I think about 2 percent; and sometimes he doesn't have even that. He gets more honey, and it is less trouble to manage

the bees than in the ordinary way. I don't say that all localities will stand such procedure, but in a good many localities it will work very nicely. I presented this method at the convention at Philadelphia about ten days ago, and a good many said they had tried it and had got good crops of honey when their neighbors didn't get any. The plan is simply to have large colonies, very large colonies.

Mr. Rauchfuss—Doesn't a good deal depend upon the strain of bees?

E. R. Root—We have a good many strains of bees; some imported, and a good many hybrids.

A. I. Root—Mrs. Acklin has had good success in rearing queens by the Doolittle method. We would like to hear what she has to say about it.

Mrs. Acklin—We have been rearing queens by the Doolittle method for four or five years; in fact, we have always reared our queens in that way ever since we commenced queen-rearing. I take a queen out of the colony and leave it three or four days, and then build a string of cups and put in. This summer one time I made a string of 17 cups, and 15 of them were accepted. Another time Mr. Root was up there, and then I think I made 14 cups and 13 of them were accepted. That is the way we have run all summer. I have been using the same colony all summer for rearing queens. We have put in fresh brood all the time, taking the frames of brood and larvæ and putting them in some other colony until they are sealed over, and then putting them into the queen-rearing colony, and in that way we have kept the colony stocked with young bees. We have reared a good many queens in that way. We have just kept that colony rearing queens all the time. Some bee-keepers might not think it advisable to do that. We have had queen-cells half a finger length long. I agree with Mr. Root in saying that they are very prolific queens.

A. I. Root—Have you tried rearing queens above with the old queen left in the hive?

Mrs. Acklin—Not this summer—not for the last two seasons. I prefer to have them in the lower story, as I think it is more satisfactory.

A. I. Root—When I started the idea of queens for a dollar, how the bee-journals pitched into me and abused me! They bore down on me hard, some of them seeming to think I ought to be in the insane asylum. I almost felt guilty myself, they came down on me so hard. I began to think I had made a big blunder. We advertised the names of those who agreed to furnish untested queens for a dollar, and kept on until by and by people began to discover that dollar queens were not altogether "Cheap John," after all; and at some of the conventions people began to speak of the big crops of honey they had got with dollar queens. The end of my story is this: Our good friend W. Z. Hutchinson suggested in a recent journal that he didn't know but good queens could be reared for 25 cents. I haven't heard anybody abuse him at all.

Dr. Miller—Wasn't that virgin queens?

A. I. Root—I don't think it was. Queens used to sell for \$4 or \$5. Our advocating queens for a dollar rather spoiled the trade of those who had been getting high prices. I don't know but that was why we were abused. I remember some one said for my encouragement when I was getting it on every side: "Mr. Root, when you want to find the best apple-tree in an orchard, when there isn't an apple on it, look for the tree that has the most clubs lodged in the top." But I am glad that the "clubbing system" is not so much in style any more. We are getting a little more charity and a little more respect for each other. Now I hardly expect that good queens will be reared for 25 cents; but good queens can be reared cheaply. I wish Mr. Doolittle could be here to hear these expressions of approval. Our apiculturists have shown me some of the finest queens I ever saw in my life that have been reared by that method. It is going to produce just as good queens as we ever got by any process, and a good deal cheaper than they were reared before.

Mr. Stilson—Before this thing of new ideas in the ap'ary is past entirely, I wish to say this: Out at the Exposition grounds you will find many of these very appliances that Mr. E. R. Root has been describing in his talk. You will have many object lessons there, and you can learn a great deal from them.

Dr. Miller—It may not be out of place to mention at least one of the principles that I think very largely controls this matter of rearing queens under certain circumstances, with the plan that Mr. Rauchfuss speaks of as being the better. That plan I believe can be applied also in the plan that Mr. Root gives. Here I think is the fact: If no eggs are being laid for brood, there seems to be a general impression on the part of the bees that there is something in the line of queenlessness. In many cases they will start to rearing queens,

especially if they have an old queen. This summer I had cases in which to put the brood into the second story, and in the first story I put the queen with some combs. The queen was shut off from the second story. I did that with six colonies. In two of the six colonies I found queen-cells started in the upper story, and eggs in them, showing their feeling of queenlessness. Even if there is a first-class laying queen below, the bees will go on and complete the queen-cells above. The more they are isolated the more in earnest they will be about completing the queen-cells. It is not necessary to have extracting-combs; you may take sections and put the cells in them, with your Doolittle cups. If you take two stories of brood and lay a cloth between them with no excluder, so the queen would not feel comfortable about going up above, the queen-cells will be started there. Wherever there is brood with no queen, there is where the queen cells would be started. One year I had a number of combs that I wanted to keep away from the moths, and I put three stories of those empty combs over a colony of bees. I thought perhaps the bees would not go up to take care of the upper story, and thought I would give them an inducement. I put a frame with brood in the fourth story—one story at the bottom holding the colony, then three stories with empty combs, and in the upper story one frame with brood. I left them a month or more, paying no attention to them at all, and then was surprised to find that there was a queen laying in the upper story. There was an opening in the hive, and the young queen had gone out and been fertilized, and had started business on her own account. There was an old colony down below, and the new colony above. Mr. Doolittle refers to that in his book. Whether he had thought of it before I do not know; but the incident, related, I think, in *Gleanings*, was the first reported case of a queen being reared in the same hive with an old queen. The point is this, that you want the bees to be separated enough from the old queen to feel that they have no queen.

BEES SWARMING OUT.

Mr. Masters—Why should a colony of bees swarm out when they have no queen-cells started? I have had that happen more than once, in cases where there were no queen-cells for three or four days.

Dr. Miller—They had no queen-cell for three or four days? Had you destroyed the cells?

Mr. Masters—No; they swarmed without having any queen-cells.

A. I. Root—Italians will do that.

Dr. Miller—When the swarm came was that the first time they had swarmed?

Mr. Masters—The first time.

Dr. Miller—There was no start toward queen-cells, at all?

Mr. Masters—No start toward queen-cells, at all.

Dr. Miller—Such cases have been reported. I have always been just a little skeptical as to whether in those cases the bees had not made some attempt to swarm and been thwarted in it.

Mr. Masters—I hadn't known of it. I didn't want them to swarm.

Dr. Miller—If bees start to swarm and are thwarted in it, the more they are thwarted the more in earnest they become in trying to swarm. I had one colony that wanted to swarm, and I took away two or three frames of brood and gave them foundation, so as to stop their inclination to swarm, but they swarmed again. Then I took away all their brood, and left them nothing but foundation. They put one queen-cell with an egg in it on the empty foundation—that was the only brood there was in the hive, and then they swarmed again and laid down on the ground in front of the hive (the queen was clipped), and they wouldn't go into the hive. They would swarm; they wouldn't be thwarted, and I gave it up. I can't explain it. Bees will do a hundred and one things that nobody can explain. One colony will do one thing and another colony will do another thing.

Mr. Masters—In this colony the hive was full of brood and eggs. There were several frames that were full of eggs and young larvæ. There were about four frames that had capped brood, and the other four frames I should say had brood and eggs on one side. I never could see why they swarmed. When they swarmed I concluded I would open the hive and go in and destroy all the cells but one, but I couldn't find a cell. I went through it the next day and couldn't find a cell. I went through the hive on the fourth day and found quite a number of cells, and they reared two or three queens and swarmed twice more afterwards. They were black bees.

Mr. DeLong—I have had a number of colonies myself that would swarm under those circumstances, and I believe I have solved the problem of why they swarmed; and it was simply this: I think they just wanted to swarm. [Laughter.]

Dr. Mason—I have had a great many colonies swarm without making any preparation whatever for rearing queens. This year about 20 percent of my colonies swarmed. The first one was a strong, pure Italian colony that made no preparation whatever for rearing a queen. Dr. Miller speaks of workers laying eggs above. Mr. Taylor says the same, too, and that it is not a fertile egg that is laid above. I do not know how it happened, but I reared two queens in the second story when there was no queen there and no comb there that had had eggs in it. There were only those two eggs that I found in the upper story; they both reared queens.

Mrs. Acklin—We have had cases this summer of that kind, with no eggs in the hive at all.

Mr. Danzenbaker—People think that bees can't be controlled in swarming. I hold that the natural reason for their swarming is to increase. It is as natural for them to swarm as it is for a grape-vine to run, or for anything to increase. Can the swarming be controlled? I think we can do it. The way I have managed bees I have furnished the hives and taken all the honey they could store in a certain time, for the hives. I do not want swarms. I have managed 110 colonies, and have had only two swarms out of them, and I think those two swarmed because I did not quite keep up with them. I put on supers and got them to start work as quick as I could, gave them plenty of ventilation, and watcht to see if they started queen-cells. As soon as I saw the cups with eggs in them I didn't wait any longer, but went to work to change the condition of the hive. I contend that a colony will not swarm without there is brood there—hatching brood and larvæ—brood in all stages, and plenty of bees. I would leave one comb of brood and put in only starters in the brood-frames, and take the sections that were already on the hive, and that were half full, and shake off the bees that were there and put them to work on starters, and give them plenty of room. They don't swarm; no danger of it at all. Some times, if I had two colonies standing together I would double them up; sometimes I would make three into two, and take a super from one that was very strong and put it over one that was not so strong. In that way I have managed to control swarming. I have stackt three tiers over one hive, and after awhile take and shake the bees down in front of the hive—add bees to one hive or another, as many as I wanted. I have had them working two and three tiers high in the supers. I have had some correspondence with Mr. Mendieson, of California, who said he had supers built up 5, 6 or 7 high. I feel that I can safely control swarming.

Dr. Miller—Will you tell us what you think the advantages of that plan are over natural swarming?

Mr. Danzenbaker—When I have bees two miles away I don't want them to swarm. The old bees are the field-workers, and I didn't want them to swarm. I was to have all the honey they produced by May 20. I had 14 hives in one place, and from them I got 900 pounds of section honey. They didn't swarm. I didn't have anybody there to watch them at all. I knew by the condition of the hives that they hadn't swarmed. The queens were clipped; and I changed all those queens and gave them new, young queens.

Mr. Rauchfuss—Didn't you get considerable drone-comb?

Mr. Danzenbaker—No, sir. I advocate the idea that if you give the bees some drone-comb to start with that they have sense enough to know that they have enough. They want about 800 cubic inches for workers; they must have it. Give them one drone-comb to start, and they will hardly build any more. Drone-combs that have honey in them do just as well. I don't give full sheets of foundation in the brood-nests; the bees will bring it down.

E. R. Root—Isn't that method the same as Mr. Hutchinson's—that is, the idea of putting the bees on mere starters?

Mr. Danzenbaker—Yes, sir. I got the idea first from Mr. Hutchinson's book, "Advanced Bee-Culture." If you will take it and read it, and practice it, I think you will like it. I am more indebted to Mr. Hutchinson for that book than to any other source, and I succeed with it.

Dr. Mason—What do you do with brood-combs when you take them away?

Mr. Danzenbaker—I want to rear all the bees I can until the white honey-flow is ready. I swap and exchange from one hive to another until I get them all strong. Some will be stronger than others. The first one I discover starting queen-cells I take the brood away from it, making it weaker, and dividing it around. And I may say I never use an excluder unless I am going to catch a queen. I think I have found it makes a difference of 50 percent in comb honey to use an excluder, and I don't do it.

Dr. Mason—I believe it makes a difference of 50 percent in favor of extracted honey to use an excluder.

"Feeding Bees for Best Results" was the title of a paper

that was to have been presented by W. Z. Hutchinson; but the Secretary read a letter from Mr. Hutchinson, excusing himself from the preparation of his paper on account of sickness.

The convention then adjourned until 9:30 a.m. the next day—Sept. 14.

[Continued next week.]

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Weight of Bees and Comb in 10-Frame Hives.

What is the weight of the bees and comb in a 10-frame dovetail hive? I have empty hives I can weigh, but no combs. I wish to weigh my colonies now to see if they have the 30 pounds of honey. S. C.

I don't know. I have at different times weighed combs, but I don't remember what they weighed, and I don't know that it would serve your purpose very well if I could tell you. When the honey is all eaten out of combs there's a big difference in their weight. Some will weigh four times as much as others and yet both be free of honey. A comb may owe its weight largely to the pollen that's in it. While that pollen is of much more value than most bee-keepers' suppose, it cannot take the place of honey for wintering, and bees will starve, leaving plenty of pollen in the hive. An old comb is much heavier than a new one. Taking all these things into consideration, it is not hard to see that two hives with their contents may weigh exactly the same, and yet one have enough honey for wintering while the other will allow the bees to starve.

Perhaps, however, I can help you out to some extent. Taking into account the possibility of old combs and much pollen, I hardly feel safe to have an 8-frame hive with its contents weigh less than about 50 pounds. If there is a little pollen in the hive and the combs are new, that will allow the bees more honey than they need, but it will not be wasted, and in the spring there seems a real advantage in having a good supply of honey. That means 50 pounds for hive, cover, bottom-board and all. A 10-frame hive should probably weigh somewhere from 55 to 60 pounds.

Feeding Bees for Winter, Etc.

1. In feeding bees which would you prefer, sugar or extracted honey, for the benefit of the bees?
2. Count the sugar at five cents a pound, at what price would it bring the honey to be about equal in price for feeding?
3. In this locality the mercury goes down to 36°, which is about the lowest. Would it make any difference in feeding sugar or honey in warm or cold climates? I mean for those who winter their bees in double-walled hives on the summer stands, well packed.
4. Will you describe the Hill's device? What is the length of the cross pieces, how far are they put apart, and are they straight pieces? What is the size of each piece? Do you recommend it, or have you something better?
5. Will a colony of bees winter as well on as many combs as they occupy, as they will if the hive is full of comb? Ought each hive to be full of combs and bees to winter well?

MICHIGAN.

ANSWERS.—1. If it's a question between sugar and honey of best quality stored by the bees sufficiently early in the season, I think I'd take the honey.

2. I think five pounds of sugar and two pounds of water will make a syrup about equal to honey for feeding. At five cents a pound for sugar that would make the syrup cost 3 4/7 cents a pound.

3. I don't know that there would be any difference.

4. I never used a Hill's device, and can only describe it from memory, so I'll not warrant an accurate description. Take four pieces of wood eight inches long, 3/4 inch wide, and 3/8 inch thick. Let them be sawed curving, say having the curve of the staves in a miniature barrel. Lay the four pieces on a table with the hollow side up, each piece 3/4 inches from its neighbor, and nail upon them a piece 12x3/4x3/4. Lay this

on top of the frames with the hollow side next the bees and put the quilt over it.

When using quilts, as I did years ago, the bees always built bur-combs enough over the combs to allow free passage without the Hill's device. Since using flat board covers, there is no need of anything of the kind, for there is a bee-space between the frames and cover.

5. If the bees occupy a certain number of combs, say six, there is no need of any more combs in the hive through the winter, unless it be to hold honey. But if the hive is large enough to hold more than six combs, it is better to have the empty space filled with something, or else shut off by a division-board. At one time it was recommended to take out some of the combs for winter. At present I think nearly every one leaves the same number of frames in winter as in summer, that is, 8 frames in an 8-frame hive, 10 frames in a 10-frame hive.

A Beginner's Questions.

I bought a colony of Italian bees in a 9-frame hive. They have done very well so far. I took out 60 sections of honey up to Aug. 8. So far I have found no queen-cells so I divided the bees, putting three frames and the queen in a new hive with four frames of foundation. They went to work at once.

1. Did I do right in dividing them?
2. Had I better put the two other frames in the new hive and feed them so that they can fill the frames?
3. Is a warm barn a good place to put bees for winter? They are in double-walled hives.
4. Are 80 sections, 15 pounds of extracted, and enough to winter on, good work for one colony?
5. Is it well to diminish the size of hive-entrances in winter?
6. Once in a while I see a bumble-bee enter the hive. Sometimes the bees interfere with it, and sometimes they allow it to enter. Will this be any harm to the bees? If so, how can I prevent it?

NEW YORK.

ANSWERS.—1. That depends on circumstances, the season, etc. If you were anxious for increase perhaps it was the best thing.

2. You should manage in some way to make sure they have enough stores for winter, if they have not made full provision themselves.

3. It is not generally considered a very good place. The trouble is that when a warm spell comes the bees don't get warmed up enough to fly before the warm spell is over.

4. Yes, indeed. Don't expect to average anything like that amount when you get to 50 or 100 colonies, or you may be sorely disappointed.

5. That depends on the size in summer. If you have the entrance as large as some do in summer, better bring it down to $\frac{3}{8}$ or $\frac{1}{2}$ inch the whole width of the hive.

6. Don't worry about the matter. The bumble-bee will get the worst of it.

Salt on Cellar Floor—Survival of Fittest.

1. Would you advise putting salt on the floor of the beecellar? If so, how much? It has a purifying effect on the air if sprinkled on a carpet in a room.

2. W. A. Varian says on page 564 that by uniting swarms the best queen survives. Now, what I want to know is this: When a colony swarms, can I cut out queen-cells and hatch them in a queen-nursery, *a la* Alley, and when they are hatched turn them all in together and give the survivor to the colony? If you read the article you will know better what I mean. You see I am trying to go Varian "one better."

WISCONSIN.

ANSWERS.—1. I wouldn't advise salt on cellar floor. If it is an earth floor, it will be muddy, and I don't know any good to sprinkle it on a board floor. I would rather use lime.

2. I'd rather not answer. Still, rather than to be sent to my seat in disgrace, I'll try to make some kind of an answer. Mr. Varian is on the right track. He is not entirely correct, however, in one respect. He thinks when two virgins or two laying queens get into the same hive by the uniting of the two colonies, the stronger and more active will survive in all cases, but if a virgin and a laying queen are thus thrown together, the laying queen will survive. In both of the cases mentioned he will probably find exceptions. If a strong colony should be united with a weak one having a stronger queen, the stronger queen might be killed, and there might be other exceptions with no apparent reason. With a laying and a virgin queen thrown together, the exceptions might be still more frequent.

If the laying queen should be pretty old, especially at the close or near the close of the harvest, she would stand a fair chance of being set aside for the younger one. Still the general rule will hold.

Yes, I'm inclined to think your plan would work all right, and you would have a more severe selection than by merely throwing two queens together. But it would be a good deal of trouble. Possibly you'd like to try the plan I follow, which I think does fairly well, and is little trouble. Instead of giving a single cell to a nucleus or a colony, I give four, five or more, if good cells are plenty (and my cells are always reared in strong colonies.) If the first one of these that emerges is allowed to go around and destroy all the rest in their cells, then there is little choice in the matter; but quite commonly a plurality of queens is allowed to emerge, and the survival of the fittest follows. Besides, if only a single cell is given, it too often happens that it may contain a dead larva, or one in some way defective.

Cellar-Wintering with Bottomless Hives.

I have run against a problem too thick for me to extract. My cellar is overrun with mice; they have holes running down from the outside of the walls, and when snow comes the field-mice flock to the premises and are a nuisance in spite of cats and traps. I have been searching my "ABC" and fail to find what I want. If I remove the bottom from the hive when putting the bees into the cellar, would the mice bother them? I could leave the bottoms on, and leave a large entrance open, but then the mice could get in if the bees allowed them to. I'd like to cellar them with no hive-bottoms if it were safe.

"IOWA JOE."

ANSWER.—I doubt if you can manage to leave the bottoms all off with plenty of mice in the cellar. Of course you might hang up the hives, but that would be much trouble. You might put them on benches or boards, having these resting on posts surmounted with reversed milk-pans, but that would also be troublesome. Perhaps you might like the plan I follow: The floors are on the hives, the entrance being 12x2 inches, and the entrance is closed by wire-cloth with meshes three to the inch. That allows plenty of room for bees to pass through, but keeps out mice.

Using this Year's Sections with Foundation Next Year—Supers on Hives in Winter.

1. I have five supers that are on the hives. The bees have glued the sections together and didn't work in them at all. There is foundation in them. Can I keep them as they come off, and put them on next year? The honey-flow has stopped.

2. When you use cushions or quilts, do you leave a super on in winter?

KANSAS.

ANSWERS.—1. That depends on the condition of the foundation. In some places, when foundation in sections is left in the care of the bees till very late in the season, they will put so much propolis on it that it is not fit to use again. If thus varnished over with propolis, you better not use it again, but if it looks nice and fresh, it will be all right to use it next season. Some bee-keepers make the mistake of leaving sections on all the season when bees are not storing anything. It may be all right to put sections on in advance of the white honey harvest, for you may not know exactly when it will begin, and it is better for the bees to have it a little in advance of their actual needs, but when you find that you are to have no surplus from the white honey harvest, don't leave the sections thinking they will be all ready for a later flow that may come in a few weeks, but take off all sections, and then if a later flow comes that you want to catch in the sections, put them on again.

2. Any way so there is room for the cushion. If the hive has a cover deep enough to contain the cushion, that's all that is necessary. If you use flat covers, then you must have a super, hive-body, or something of the kind to contain the cushion. But don't think of leaving on the hive over winter a super containing sections, if you intend using the sections again.

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. NOVEMBER 3, 1898. NO. 44.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

"Golden" Comb Honey Method.—Quite a number of our readers are asking for the first articles by Mr. J. A. Golden, describing his method of comb honey production, which were published in 1896. We were out of those numbers of the Bee Journal long ago, but we will republish the articles sometime during the winter—after Jan. 1—in good time so they can be used by those who so desire, another season.

Newspaper Clippings referring to bees or honey we are always glad to get, even if we do not make use of them or acknowledge their receipt. Sometimes we find among them something that we can use in our columns. At any rate we will consider it a favor if our readers will be on the lookout for anything in their newspapers on the subject of bees or honey, and when found send us only the clipping, or a marked copy of the paper itself.

Six Great Premium Offers will be found on page 699 of this number. This month and next will be a good time to work for new subscribers, especially as we will throw in the Bee Journal for the last three months of this year to all new one-dollar subscribers for 1899. This will be a great help to those who work to get the new readers. When you tell them they will get the American Bee Journal every week for 15 months, and all for only \$1.00, they surely will accept. It ought to make soliciting for new readers very easy. That means 65 copies to the new subscriber for his dollar, and a choice of one of the six big premiums to you for your trouble.

"Discussion" is the subject of a discussion by F. L. Thompson in the October Bee-Keepers' Review, and he hopes the discussion may be continued by others. He doubts the moral right of an editor to cut off any discussion he pleases, as it may be cut off at a point which will give one disputant an unfair advantage over the other. He says a discussion may run into a dispute, and a dispute into personalities, and the farther it goes the more delicate the task of the conscientious editor to bring it to a close, hence he may wish to do so as soon as possible; and suggests that instead of stopping short the discussion, the editor might suggest private argument first of all, and then condense and combined last words.

It might be replied that private argument is still left to the controversialists, no matter when the discussion is stopped, and that it is somewhat doubtful whether last words can be so "combined" that neither one feels advantage is taken of him; and not very doubtful that the editor who shrinks the responsibility of deciding when a discussion shall cease will have in his columns a good deal of matter that his readers will not patiently endure.

Editor Hutchinson says, "So long as the original subject is kept in view, and each 'round' brings out new facts and ideas, and argument takes the place of dispute and personalities, I see no reason for closing a discussion." Probably no one will disagree with him in that, always providing the facts and ideas brought out are worth the room they are to occupy.

Mr. Thompson says that the immediate cause of his Review article was our "shutting off a discussion" in the American Bee Journal some months ago—a discussion on evolution, in which he apparently wished to engage also.

We might say right here, whenever we think that to continue a discussion in this paper is simply to waste space and disgust our readers, we will very likely chop it off—that is, so long as we wield the "chopper" and pay for setting up the type. When some other chap has our job he can do as he pleases about this—just as we do.

You see, we are trying to run the American Bee Journal in the interest of all who wish to get practical information on bee-keeping—those who pay their money for that purpose; and if in so doing a few get offended at our way of doing things, they'll simply have to seek other channels in which to empty their useless discussions.

Reading the Bee-Papers.—Mr. R. C. Aikin, in his series of articles on "Experience and Its Lessons," in the Progressive Bee-Keeper, wrote this paragraph:

"Why will even men who take and read one or more of the journals, buy frame hives and then put bees in, and neither see that the combs are built so as to be movable, nor ever try to move them? I can understand why an intelligent and practical apiarist will use some hive or other appliance because he has come into possession of such, and is just doing the best he can until a proper time comes to make a change; but it seems almost past comprehension that intelligent people would buy hives and then simply disregard every feature of the hive that made it better than a box costing a few cents."

Mr. G. M. Doolittle, referring to this paragraph in the same number, commented as follows:

"Mr. A. I am skeptical regarding those whom you say read bee-journals and yet have their bees without having an eye as to the proper spacing of the frames, or even putting starters in either the frames or sections; then cutting the honey-combs out of the sections and putting it in crocks, etc. The part I am skeptical about lies in the assertion you make that they take and read one or more bee-journals. They may take one or more bee-papers, and treat their bees as you say they do, but I have never yet seen the man who is interested enough to read up on bees who uses hives and sections as you say they do. Why, bless your old heart, you can tell a man or woman who reads the bee-paper from one who does not, before you have had conversation with them five minutes, for all of the

old fogysm has vanisht as soon as they read a little, and intelligent bee-culture is stamp on them at once.

"And yet there are those who have kept bees for years who are opposed to you and me trying to extend the circulation of our bee-literature for fear we may raise up a new crop of bee-keepers to increase the supply of honey on the market, thus ruining the prices through an over production. My word for it, no ruining of our markets by an over-production of *intelligent* bee-keepers. Just what our bee-keeping industry is curst with to-day, is an over-production of would-be bee-keepers, who are as ignorant of the first principles of bee-keeping as a plg is of history. Educate this class, and then they will know what a frame hive is for, and that honey stored in nice sections is of more value in those sections than it can possibly be cut out and stored in crocks.

"Don't get discouraged Mr. A., but keep right on agitating and educating until all of the old fogysm has become a thing of the past."

Mr. Doofittle never wrote truer words than the foregoing. What is needed is more intelligence on the part of those who keep bees—more information regarding the profitable management of bees. And the way to get a large share of it is to read the bee-papers, and then practice the methods and suggestions given.

Sloppy Apicultural Literature.—Editor Hutchinson, of the Bee-Keepers' Review, called for expressions of opinion on his "Department of Criticism," as conducted by Hon. R. L. Taylor. In the October issue a few of those sent in are published, all but one being unsigned. In one of the signatureless opinions we find these words:

"Apicultural literature is very sloppy and needing a tonic. . . . we need an antidote for the _____ slush."

Well, now that's too bad. We never would have thought that the Bee-Keepers' Review was "sloppy" or "slushy." But perhaps that particular critic doesn't consider the Review "apicultural literature." We had supposed all along that it was, and especially when we read the following advertising paragraph written by its editor:

"If you wish a bright, clean, clear-cut, sprightly, beautifully illustrated, go-ahead, up-to-date, really helpful, useful bee-journal, subscribe for the Bee-Keepers' Review."

Now, that sentence *might* be called "sloppy" with adjectives, but if "American Bee Journal" were substituted for "Bee-Keepers' Review" in it, we should say it was exactly right.

But then, we may be prejudiced in favor of our paper, even if it is thought to be "sloppy!"

Sealing Jelly-Glasses.—J. W. Bannehr, in Gleanings, says: "In putting covers on jelly-glasses last year, some of which did not fit perfectly tight, we dip a small brush in melted beeswax, wax the edge of the glass, and put the cover on at once. This makes it perfectly air-tight."

White Comb Honey Wanted.—We are in the market for best white comb honey put up in 12 or 24 pound single-tier shipping-cases. We would like it to run about 11 and 22 pounds, respectively. If you have what you think will suit us, please write, saying how much you have, and at what price you will deliver it in Chicago. Address, George W. York & Co., 118 Michigan St., Chicago, Ill.

Bee-Keeping for Beginners is the title of a 110-page book just out, from the pen of that expert bee-keeper of the South, Dr. J. P. H. Brown, of Georgia. It claims to be "a practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit." Price of the book, postpaid, 50 cents. Or, we will club it with the Bee Journal for one year—both together for \$1.40; or, we will mail it as a premium to any of our present subscribers for sending us one new subscriber to the Bee Journal for a year (at \$1.00, and 10 cents extra.

DR. C. C. MILLER says in Gleanings: "A new kink I saw at Omaha was tumblers of jelly with a coating of paraffine on top to keep it from molding. Beeswax will answer the same purpose."

MESSRS. STRATTON & OSBORNE, of Erie, Pa., are now advertising in this journal their Dandy Green Bone Cutters. We are informed that they manufacture the most extended line of bone cutters now offered to the public. Their machines range in capacity from a few pounds to 200 pounds an hour. Write for their new illustrated catalog which contains prices, etc. Please say that you saw their name in the American Bee Journal, when writing them.

THE MASCOTTE INCUBATOR AND LUMBER Co., of Bedford, Ohio, who are the manufacturers of the Mascotte incubators and brooders, are seeking a share of the public patronage on this line of machinery. To that end they place their advertisement in this issue of the American Bee Journal. These people come to us well recommended; they guarantee their machines to work exactly as recommended or they will refund the purchase price of the machines. This seems a very fair proposition. Please say you saw their name and address in this journal, when writing them.

EDITOR HUTCHINSON, of the Bee-Keepers' Review, gives this paragraph in his October number:

"Bro. York gave me a warm welcome during the hour or two that I could stop while on my way home from the fair. We went out and took dinner together at a restaurant, and he told me about the Omaha convention, and made me wish I had been there. In one thing he was disappointed, and that was in the number present. He thinks now that the best thing we can do is to meet when the G. A. R. folks have their annual encampment. We are then sure of low rates. Philadelphia will probably be the next place of meeting. The American Bee Journal is giving a very full report of the Omaha meeting."

HON. R. L. TAYLOR, the Bee-Keepers' Review critic—in replying to Mr. Moore's little pleasantries on page 596 of this paper, gives this equally witty paragraph:

"Tho I have no remembrance of criticising any one's rhetoric, he says that all will agree that my criticism of grammar and rhetoric are entirely out of place in a bee-paper; but he seems to be in a measure reconciled to it, for he says 'it is nice to understand Michigan rhetoric and know wherein it differs from that of the settled portions of the country.' I have a copy of an old Gazetteer which describes Michigan as lying largely under water the greater part of the year. Mr. Moore, no doubt, has drawn his geographical knowledge from some equally ancient source. I'll write some railroad office to have some modern literature sent him."

MR. J. P. LEES, of Florida, we mentioned some time ago as having met with great misfortune, losing his all. Since then we have received this letter from him:

STUART, Fla., Oct. 21, 1898.

DEAR FRIEND:—I wish to thank you most sincerely for your contribution toward my assistance. I also wish you to thank Messrs. Judd & Manson, of North Dakota, for \$2.00; and Blackburn Bros., of Iowa, for \$1.00. These are all the donations I have received through any of the bee-papers. The fire left me in a sad plight. I have not been able to get a house nor furniture yet of any kind, but by the help of God, and with good health, I hope to soon.

Thanking you again for your kindness, I am,

Yours respectfully, J. P. LEES.

We hope there may be others that will, from their abundance, send something to Mr. Lees. If you can, do so at once, and thus help him "to get on his feet again."

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it. See 6 big offers on page 699.

Badly Discouraged.—L'Abelle et sa Culture relates that the season has been so discouraging that some bee-keepers are destroying their bees rather than to feed them. One man having 29 colonies saved two of them that were good and took up the rest. From the 27 murdered colonies he obtained 47 pounds of honey, all told! \$1.60 per colony invested for feed would have taken them through to another year with a chance of double that amount in one harvest.

Facing Comb Honey.—"Friend Doolittle thinks some of us, when we throw bricks at his honey-facing doctrines, do not take space enough in saying that he neither advises nor practices facing cases with sections of higher quality than the body of the case. Thought I made that clear enough at the outset; but, as a comrade desires it, I will cheerfully say so some more. Mr. Doolittle is an honest man, and acts accordingly—only in this particular case he doesn't talk accordingly. And having tried our best to reconstruct him in that one particular, we have to give reconstruction up in despair. Mind you, nothing herein contained shall admit, in the least degree, that the man who faces honey with higher grades has done other than a wicked act, as well as an unwise act."—E. E. Hasty, in Bee-Keepers' Review.

Large vs. Small Hive-Entrances.—Dr. Miller continues the controversy on this subject in Gleanings, G. M. Doolittle replying in the same number. The Doctor made tests with a thermometer to find out whether the heat was greater in the hive with a large or small entrance, but with no definite result, excepting to disprove the assertion of Mr. Doolittle that it was cooler in the hive than out, in a hot day.

Challenged to prove his assertion that bees can ventilate best with an entrance not more than $\frac{1}{2}$ inch deep, Mr. Doolittle replies: "I don't know that I can prove any such thing, consequently I am not going to try; but from the hours I have

lain beside hives with swinging bottom-boards and those with large entrances, and seen the lack of 'fanners' at work, unless those fanners were away up in the hive, I have formed the opinion that the fanners could do more effectual work at the $\frac{1}{2}$ inch entrance than they could where they had all outdoors to send a 'current of air through.'

The two men fail to come to any agreement as to what is Nature's plan for the queen to follow in laying eggs. Dr. Miller says: "It's Nature's plan to lay the first eggs of the season in the center, and it's just as much her plan to lay the next further out, and then further still as the brood-nest increases in size." But Mr. Doolittle insists that Nature tells the queen to lay her eggs in the center, "and when it comes about, by an expansion of the brood, that just the right thing cannot be done, then do just as nearly right as circumstances will allow."

Northern Michigan has been much spoken of as an El Dorado for bee-keepers. Byron Walker has been there for six years, and in the Bee-Keepers' Review he gives the advantages and disadvantages of that region, premising that the advantages have been set forth heretofore in rather glowing colors. He left Southern Michigan because altho he got good crops the character of the honey in his particular locality was such that $\frac{3}{4}$ of his colonies were lost in wintering. One advantage in the North is the great variety of flora, extending in the most favorable locations and seasons from early in May till late in September. Wild red-raspberry exists in large areas, yielding with certainty for three weeks a fine amber honey. Basswood, not so reliable, has yielded two out of six seasons. Willow-herb gives a superb white honey the chief part of a month. In best locations it yields three out of six seasons. Last season it failed in most locations. A fair yield from fall flowers three seasons out of six.

A disadvantage is that the best locations near towns and schools are taken up. To get much from willow-herb, the forests must be burned every two or three years, a thing that cannot be depended on, and when the fires do come they're likely to destroy the raspberry. Roads are sandy, stony, and hilly to get around to out-yards. He has 500 colonies in nine different yards, mostly in care of men who have a share, but conscientious, competent men are hard to find. Cool nights and cold winds are a drawback.

BEST EXTRACTED HONEY FOR SALE

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY :

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 8 cents a pound; 2 cans, $7\frac{1}{4}$ cents per pound; 4 or more cans, $7\frac{1}{2}$ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey.....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, "HONEY AS FOOD," will be a great help in creating customers for honey. See prices on another page.

GEORGE W. YORK & CO., - 118 Michigan St., CHICAGO, ILL.

To Our Regular Subscribers—Now for New Readers!

6 Great 50-cent Offers—Each One Free!!

On this page you will find six splendid premium offers, and we will mail your choice of any one of them for sending us \$1.00 for **just one New subscriber** for 1899—and we will throw in the last three months of this year's Bee Journal free besides to each new subscriber you send on these offers. That makes 15 months of the Bee Journal to the new subscriber. Or, for sending us **4 New subscribers**, as above, we will mail the sender all of the 6 great 50-cent offers.

JUST READ WHAT THEY ARE:

Offer No. 1.—Samantha at Saratoga.

100,000 Sold at \$2.50 per copy.

This is indeed a feast of fun, by the only peer of Mark Twain's humor—**JOSIAH ALLEN'S WIFE** (Marietta Holley.)

Read this Extract from the Book:

And right here, let me insert this one word of wisdom for the special comfort of my sect, and yet it is one that may well be laid to heart by the more opposite one: If your pardner gets restless and oneasy and middlin' cross, as pardners will be anon or even oftener—start them off on a tower. A tower will in 9 cases out of 10 lift 'em out of their oneasiness, their restlessness and their crossness.

Why I have known a short tower to Slab City or Looztown act like a charm on my pardner, when crossness wuz in his mean and snappishness wuz present with him. I have known him to set off with the meen of a lion and come back with the liniment of a lamb.

And jest the prospect of a tower ahead is a great help to a woman in rulin' and keepin' a pardner straight. Somehow jest the thought of a tower sort of lifts him up in mind, and happifys him, and makes him easier to quell, and pardners must be quelled at times, else there would be no livin' with 'em.

She takes off FOLLIES, FLIRTATIONS, LOW-NECKED DRESSING, DUDES' PUO DOGS, TOBAGOANING, ETC.

Opinions of Noted Critics:

"Exceedingly amusing."—Rose E. Cleveland. "Delicious Humor."—Will Carleton. "So exaricatingly funny, we had to sit back and laugh until the tears came."—Witnes. "Unquestionably her best."—Detroit Free Press. "Bitterest satire, coated with the sweetest of exhilarating fun."—Bishop Newman.

Nicely bound in paper, fully illustrated, printed from new type and on fine paper. 370 pages. Postpaid, 50 cents.

Offer No. 2.—New Waldorf Cook-Book.

Over 1,000 of the very best up-to-date recipes for every conceivable variety required in the kitchen and other departments of house-keeping, by **Mrs. Anne Clarke**, the distinguished student and instructor in culinary science, assisted by many of the most successful house-keepers in various parts of Europe and America. It gives the latest and best methods for economy and luxury at home. Just the book for the housewife or daughter. Has had an enormous sale at \$2.00 a copy. 380 pages; paper bound; postpaid, 50 cents.

Offer No. 3.—Cattle, Sheep and Swine Book.

Fully Illustrated—300,000 sold at \$3.00 a copy.

This great work gives all the information concerning the various Breeds and their Characteristics, Breaking, Training, Sheltering, Buying, Selling, Profitable Use, and General Care; embracing all the Diseases to which they are subject—the Causes, How to Know and What to Do given in plain, simple language, but scientifically correct; and with Directions that are Easily Understood, Easily Applied, and Remedies that are within the Reach of the People; giving also the Most Approved and Humane Methods for the Care of Stock, the Prevention of Disease, and Restoration to Health. Written by Dr. Manning.

Every farmer wants this great book. 390 pages, paper bound. Postpaid, 50 cents.

Offer No. 4.—Gleason's Horse-Book.

By Prof. Oscar R. Gleason.

This is the only complete and authorized work by America's king of horse-trainers, renowned throughout America and recognized by the United States Government as the most expert and successful horseman of the age. The whole work comprising His-

tory, Breeding, Training, Breaking, Buying, Feeding, Grooming, Shoeing, Doctoring, Telling Age, and General Care of the Horse. You will know all about a horse after you have read it. No one can fool you on the age of a horse when you have this book. 416 pages, bound in paper, with 173 striking illustrations produced under the direction of the United States Government Veterinary Surgeon. In this book Prof. Gleason has given to the world for the first time his most wonderful methods of training and treating horses. 100,000 sold at \$3.00 each. Our price, postpaid, 50 cents.

Offer No. 5.—Music, \$5 for 50 cents.

Four pieces New Sheet Music, which sell at music stores at 50 cents each—\$2.00; Three years' membership in the World's Musical Association (regular price \$1.00 a year), \$3.00. Total, \$5.00. We offer the whole thing at 50 cents.

The four new pieces of sheet music are the very latest hits of this year; are regular sheet music size and quality, but the title pages are a new style of art, viz: Illuminated Chromatic designs in five brilliant colors.

THE SONG TITLES ARE:

"**Do Your Honey Do**," by THEO. METZ, author of "A Hot time in the Old Town To-night." This latter piece, said to be his best, is creating a great stir, and becoming immensely popular everywhere.

"**Queen of the Bicycle Girls**," by the celebrated composer, OTTO LANOBY, by far the most charming Bicycle Song yet issued.

"**Blossoms from Over the Sea**," by the distinguished composer, J. P. SKELLY, a very beautiful Sentimental Song.

"**He's Just Like All the Men**," by the renowned composer, EASTBURN. Wonderfully pleasing to the Ladies.

The World's Musical Association is an organization having special advantageous relations with the leading music publishers of this country and Europe, and being an enormous purchaser, it is enabled to supply to its members (and will do so) any music desired (at any time within the term of their membership), at such wholesale prices as are usually granted only to very large dealers.

Offer No. 6.—The Poultry-Keeper Illustrators.

The four "Poultry-Keeper Illustrators" are the greatest books on poultry subjects ever issued, and are a veritable poultry dictionary, covering the ground so completely that, having these four books, one needs scarcely anything more except "grit" to become a successful poultry-raiser. You cannot get such other books in the whole world, not even for \$50 each, for they do not exist. Were they given in another form and elaborate binding and colored cuts you might think them easily worth \$5 each, but what you want is not elegant printing, and in these we give you the value in information that you can make use of. They have cost much in labor and cash, but you get all this value for almost nothing. We mail the 4 Illustrators for 50 cents.

Illustrator No. 1.—Poultry Houses, Incubators, Brooders, Coops, etc., 25 cents.

Illustrator No. 2.—Artificial Incubation, Raising Chicks, Testing Eggs, etc., 25 cents.

Illustrator No. 3.—Poultry Diseases, Lice, Grapes, Moulting, Egg Eating, etc., 25 cents.

Illustrator No. 4.—Judging Fowls, Description of Breeds, Mating, etc., 25 cents.

Those offers ought to bring us in at least 2,000 new readers during this month and next. You could send in your own renewal for 1899 at the same time you send in a new subscriber, if you wish. If you do, you can select any one of the above offers free for yourself, provided you send at least **two New subscribers** at the same time. That would give you your choice of **three** of the offers—by sending your own renewal for 1899, and two new subscribers (\$3.00 in all).

Address, **GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, ILL.**

Good Place for Bee-Keeping.

I am a new bee-keeper, starting four years ago with one weak colony, and now I have 12. They are the little brown bees. I am going to Italianize them in the spring. Bees do very well here. This is a fruit country, the land being cut up into 10 acre tracts. There is lots of fruit, alfalfa and sweet clover for the bees to work on.

G. W. WHARTON.

Umatilla Co., Oreg., Oct. 16.

Bees Did Fairly Well.

Bees have done fairly well in this section of the country. We did not get very much surplus from white clover, as there was not much clover the past season. We had no swarms to amount to anything. We had a good flow in July and August, and there was considerable surplus taken. Aster was a failure this fall. Bees are in fair condition for wintering. There is plenty of white clover for next season. **J. L. ODEN, Rutherford Co., Tenn., Oct. 17.**

Bees on a Limb.

A man came to me Oct. 18, and said he had found some bees that had built their nest on the limb of a tree. I took my box and bee-kit, and went with him. Sure enough, there was a fairly good colony of bees with several combs of white honey, and more or less brood. Inside of two hours the man had the honey, and I the bees in a hive where there is plenty of honey to winter them.

This is the third colony of bees I have found under similar circumstances. Of course the bees could not have continued their existence long in such a place. The combs were so built that they shed all the rain, but when zero weather struck them the bees would soon perish.

HENRY ALLEY.

Essex Co., Mass., Oct. 19.

Smoker Fuel—Purifying Wax.

Tell the readers of the Bee Journal if they mix some of the refuse of the wax extractor with their rotten wood for smoker fuel, I think they will be able to kick up a fog that will surprise the crossbest bees they have.

I saw an article in the Bee Journal on purifying wax with the solar extractor. Did any one ever try to have a little dam across the lower edge of the comb-basket or pan, so as to retain a portion of the melted wax? The impure is at the bottom—the best is running off at the top.

C. A. HUFF.

Lenawee Co., Mich., Oct. 17.

Did Well for an Off Year.

My bees did very well for an off year like this. The white clover bloom didn't seem to have much if any honey, and the linden seemed to yield honey only a week or so; but the bees made good use of the time it lasted. This is good proof that one strong colony is worth a dozen weak ones. I keep my hives as full of bees as I can, summer and winter. **JOSEPH HENTRICH, Grant Co., Wis., Oct. 22.**

An Enthusiastic Beginner.

About a year ago I became acquainted with the old stand-by—the American Bee Journal—and almost immediately took the bee-fever, and am now an ardent devotee of the honey-bee.

Last fall I purchast 47 colonies of hybrids in common box-hives, and undertook to transfer them to dovetailed hives, and

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white sections, beautiful straw-

colored transparent Foundation, Improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

See Honey Offer on page 698.

found this a pleasing task by using the Heddon method of transferring. In the operation I increased to 53 colonies.

Wishing to Italianize, and also to test the merits of the leading strains of Italians, I introduced queens in the poorer colonies from 12 of the leading queen breeders of the United States. Next year I intend to continue to Italianize from the strain selected as the best in the points that go to make up a superior strain of Italians.

I find the apirey furnishes a pleasant occupation and a fascinating study. I intend to be a constant reader of the American Bee Journal.

DAVID M. KITE.

Ray Co., Mo., Oct. 21.

Poor Honey Crop.

The honey crop here has been a poor one. Clover was very plentiful, but the bees did not work on it. The fall flow from aster was very good for about two weeks, then bad weather set in. But the bees gathered enough for winter stores.

C. H. MAY.

Page Co., Va., Oct. 21.

Fairly Good Year for Bees.

This has been a fairly good year regardless of the backward spring. Some colonies stored 125 pounds of comb honey; my 28 colonies averaged over 70 pounds of nice comb honey.

W. H. POTTS.

Mason Co., Ill., Oct. 22.

Pretty Light Honey Crop.

I know that I should feel lost without the American Bee Journal. I have 105 colonies in fine condition for winter quarters. I am building a new cellar for them. My honey crop was pretty light this season, with quite a batch of dark, but no light to speak of, as the white clover and basswood failed here.

G. H. LINCOLN.

Clark Co., Wis., Oct. 20.

Another Poor Year.

The past season was a very poor one for honey in this county. I have 25 very strong colonies of three banded Italians, and they are well stored with honey for winter, gathered from the fall flow, but not one pound of super honey did I take during the whole season. Another poor year. The cause of it was too much rain in blossoming time.

ELISHA CAREY.

Bucks Co., Pa., Oct. 14.

Success of an Amateur.

The past was not such a very bad season, for with two colonies I have taken 106 pounds of comb honey and 27 pounds of extracted, besides increasing to four colonies, which I think is pretty well for an amateur who had only the help of the American Bee Journal.

GEO. P. PRANKARD.

Bergeu Co., N. J., Oct. 15.

Clover Looks Well.

We are having lots of rain, and clover looks well, so we may have a good season next year. Our honey crop was a very small one this year—about 100 pounds from about 200 colonies.

ARTHUR STANLEY.

Lee Co., Ill., Oct. 25.

Tall Plain Sections and Fences.

The honey crop in this section of the State was only about $\frac{3}{4}$ of a crop, and that of a very dark and inferior grade. Bees are generally in good condition for wintering. The young white clover is looking very promising.

We tried four supers of the plain section and fence separators 4x5x $\frac{3}{4}$, and are highly pleased with them. The sections were well filled out, even and beautiful. We will use more in the future. There has been some doubts about them bearing transportation, but I find they are less likely to get injured

in shipping than the common sections. They are much more easily manipulated.

I have 16 colonies, very strong (and from 40 to 50 pounds of honey in each hive,) all packed away on the summer stands for winter.

R. B. WOODWARD, M. D.
Perry Co., Ohio, Oct. 20.

About One-Third of a Crop.

The early part of the past season was very poor for bees—rainy and cool weather—and bees starving just before white clover came into bloom. Some of my colonies did not recover in time to store any in the sections. The strong colonies did very well, and my average was about one-third of a crop of fall honey. I sell all of my honey in the home market.

I could not get along without the bee-papers. I often find one article worth the year's subscription.
JAMES IVES.
Burlington Co., N. J., Oct. 24.

Bees Did Very Well.

My bees did very well this year, as they averaged 50 pounds a colony.

D. B. ABBOTT.
Osage Co., Kan., Oct. 24.

A Good Report.

Last spring I had left 17 colonies, and increased to 34. The honey crop in this part of the country was very good. I got 1,000 pounds of extracted honey, making an average of nearly 60 pounds per colony, spring count, which I sold in the home market readily at 10 cents a pound. I think that is pretty good for a second year's trial of selling honey.

A neighbor of mine, who is an experienced bee-keeper, started with 115 colonies last spring, and at the close of the harvest told me he harvested 10,000 pounds, which he is also trying to dispose of in the home market, at 10 cents a pound. Now if every bee-keeper would try to do that, the large city markets would not be crowded with honey.
C. H. VOIGT.
Kewaunee Co., Wis., Oct. 17.

Poor Season for Bees.

This has been a poor season for bees here. Early in the season they laid by stores in the brood-chamber; dry weather commenced in July, and has continued until October. I started with 28 colonies, and doubled the number during swarming season. The new swarms did not all store honey enough for winter, and most of them will die unless fed. My neighbors have fared no better.
A. J. CUSHING.
Dunn Co., Wis., Oct. 12.

Anti-Bee Space Again.

Good for Doolittle and Aikin. When they agreed in their discussion that the movable frames in bee-hives "are of no use to the bees, and are of no use to the bee-keeper who never lifts them out of the hives," they hit the truth exactly. And I esteem it as virtually saying the same thing of the bee-space. I have admitted its convenience first, last, and all the time for the bee-master in a warm climate where the winters are mild, and the bees are kept in cellars till warm weather comes again; but I should consider that the large bee-keepers who count their colonies by the hundred or thousand, are of a number that would make a very small percentage of the vast army who leave their bees on the summer stands through the severe season. And why should we labor, and indulge in ill humors to keep the multitude in ignorance of what would be better for them, because a few others have a right to prefer a more costly convenience? That invective fellow who said that Mr. Chrysostom "could hardly be worthy of much notice" because he praised the anti-bee-space hive should be informed by some cool-headed friend that resorting to insult never gives weight to argument with the sensible reader. The box-hive, and the frames with close-fitting

Sweet Clover

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

| | 5lb | 10lb | 25lb | 50lb |

ends in the common-sense hive (from which Mr. Chrysostom says he copied) both contain the snug principle of the hollow tree, where the All-wise God made the bees to live; and while we may modify and improve the receptacle, we can never do so safely by eliminating the principle of compactness in a cold climate.

If Mr. Chrysostom has worked wonders the past season with the common-sense principle, which he honors, while the world at large reports failure with the bees, is he not worthy of a respectful hearing? and the principle worthy of a fair investigation? "A word to the wise is sufficient."

"COMMON-SENSE BEE-KEEPING."

Pennsylvania.

Testing Honey—Apis Dorsata, Etc.

Mr. H. L. Miller asks if there is any way of testing honey to know if there is glucose in it? Well, my friend Vitzgall says there is a way. Put one tablespoonful of honey and three tablespoonfuls of alcohol in a glass, and shake it well. After awhile all will be dissolved, if it is pure honey; otherwise honey shows something not dissolved, but honey adulterated with glucose shows a muddy, whitish sediment. Now please try and report.

I notice that Secretary Wilson expects to make an effort to introduce the giant East Indian honey-bee—*Apis dorsata*—from the Philippines to gather all the sweet juices in our red clover field. These bees are said to build combs five or six feet long (wired?) and four feet wide. Our standard is $\frac{1}{4}$ inches. Manufacturers of bee-keepers' supplies may be a little puzzled about a handy 10-frame hive with such *dorsata* dimensions; but the bees are not here yet.

We ought to have the red clover with or without *Apis dorsata*. Let me suggest how without: Pastor Weygandt discovered that a strong queen can be secured by taking out the larvæ from a queen-cell and putting in a larvæ from a worker-bee a few days younger. An older larvæ would give a weaker or feebler queen; a younger one will improve the whole development, and should also improve the tongue. I would like to see Mr. Doolittle report on this question. Queen-rearing for red clover honey would mean an increased quantity, if not a better quality of honey. The finest honey is imported from Greece; it is honey gathered from roses. Why can we not have those roses here? Let somebody go for *Apis dorsata* and somebody else for roses. About sweetness and aroma there is nothing like "Rodomel;" it is the finest honey in the old part of our globe, and the new should have it.
J. VOLKERT.

Chesterfield Co., Va.

Colorado.—The Colorado State Bee Keepers' Association will hold their annual convention Nov. 30 and Dec. 1 and 2, 1898, in the State Capitol Building, Denver. The Horticulturists meet Nov. 28, 29 and 30, our first day being their last. This arrangement will give members of both a chance to attend the other's meeting and discuss common interests. R. C. ATKIN, Pres., Loveland, Col. F. RAUCHFUSS, Sec., Elyria, Col.

Ontario.—The annual meeting of the Ontario Bee-keepers' Association will be held in Guelph, Dec. 6, 7 and 8, 1898, owing to the Guelph Fat Stock Show, the Guelph Poultry and Pet Stock Show, and the Experimental Union meeting on the same dates, there will be a large meeting of bee-keepers, and each association will be a help to the other, as many are interested in all the different meetings. All are cordially invited to attend the meetings.
W. COUSE, Sec.
Streetsville, Ont.

Illinois.—The Illinois State Bee-keepers' Association will hold its 8th annual meeting at the State House in Springfield, Nov. 16 and 17, 1898. We will have the advantage of one fare and a third for the round trip—open rate—along with the Odd Fellows, whose meeting is the third Tuesday of November. Our Association has been petitioned by the Northern Illinois Bee-keepers' Association to take the proper steps to secure the same foul brood law for our State as that of Wisconsin. Excellent board is secured at 25 cents per meal and lodgings just as reasonable. The one dollar for membership fee also entitles you to the American Bee Journal for one year.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,
Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—is beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarist's library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth. Price, postpaid, \$1.25

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 400 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 176 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers, \$1.00

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called BEES OF HONEY. 10 page pamphlet. Price, 40 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 p., illustrated. 25c.

Conventions Hand-Book, for Bee-Keepers, by Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts

Foul Brood, by A. R. Kohne.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by C. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2 in fine artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st. How We Made the Old Farm Pay; 2nd. Peach Culture; 3rd. How to Propagate Fruit-Plants, Vines and Trees; 4th. General Fruit Instructor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for casting up the price of grain, produce, hay, etc. Price, 25 cts.

Capon and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Oct. 18.—Fancy grades of white comb honey sell freely at 13c, with good grades from 11 to 12½c, according to finish; ambers bring 8 to 10c, with dark, mixt and unclean, 7 to 8c. Extracted, white, 6 to 7c; ambers, 5 to 6c; buckwheat, 5c. Beeswax, 26 to 27c.

The market is active and nearly all consignments are sold soon after arrival.

R. A. BURNETT & CO.

San Francisco, Oct. 19.—White comb, 9½ to 10½c; amber, 7½ to 9c. Extracted, white, 6½ to 7½c; light amber, 6 to 6½c. Beeswax, 24@27c.

There are no changes to record in quotations, but market is firm at the ruling figures. Stocks are light, particularly of choice extracted. A shipment of 309 cases went forward the past week by sailing vessel for Liverpool.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax, prime, 24c; choice, 24½c. At present there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c; amber, 10@11c. Extracted, white, 5½@6c; amber, 5@5½c; dark, 4½@5c. Beeswax, 22@25c.

The receipts of comb honey are larger. C. O. OLEMONS & CO.

Boston, Sept. 30.—Our honey market shows a decided firmer tone since our last. A few sales have been made at 15c for an extra fancy lot, while almost all sales ranging from A No. 1 to fancy now are made at 14c, while occasionally, something a little off, will bring as low as 12½ to 13c. We do not look to see any lower prices.

Extracted, Florida, in barrels, mostly 6c to 7c, with a good demand. Beeswax, slow sale at 26c for best. BLAKE, SCOTT & LEE.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 13c; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and baswood extracted honey, 6½ to 7c. Beeswax, 25 to 27c. WALTER S. POWDER.

Milwaukee, Oct. 18.—Fancy 1 pounds, 12½ to 13c; A No. 1, 12 to 12½c; No. 1, 11 to 12c; No. 2, 10 to 10½c; mixt, amber and dark, 8 to 9c. Extracted, white, in barrels, kegs and pails, 6½ to 7c; dark, 5 to 5½c. Beeswax, 26 to 27c.

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing. A. V. BISHOP & CO.

Buffalo, Oct. 20.—This market is much improved in demand on all grades. Strictly fancy 1-pound comb, 13 to 14c; No. 1, 11 to 12c; dark, etc., 7 to 9c. Fancy extracted, 5 to 6c; dark, 4 to 4½c. Fancy beeswax, 27 to 28c; poor, etc., 20 to 25c. BATTERSON & CO.

Columbus, O., Oct. 29.—Fancy, 14 to 15c; No. 1, 12 to 13c; No. 2, 10 to 11c; amber, 9 to 10c. Receipts somewhat heavier, but demand improves as weather gets colder. COLUMBUS COM. AND STORAGE CO.

New York, Oct. 22.—Receipts of comb honey are large, and there is quite a stock now on the market. While whites are in good demand, buckwheat and mixt seem to be somewhat neglected, and quotation prices have to be shaded in order to sell in quantity lots. We quote:

Fancy white, 13 to 14c; No. 1 white, 11 to 12c; amber, 10c; mixt and buckwheat, 8 to 9c. Stocks of extracted are light of all kinds. Demand is good at following prices: White, 6 to 6½c; amber, 5½c; dark, 5c. Southern, in half barrels and barrels at from 55c to 60c a gallon. Beeswax dull at 26c. HILDRETH BROS. & SEGELKEN.

Detroit, Oct. 20.—Honey in better demand and better prices as follows: Fancy white, 13@14c; No. 1, 12@13c; fancy dark and amber, 10@11c. Extracted, white, 6@7c; dark, 5@5½c. Beeswax, 25@26c. M. H. HUNT.

Cleveland, Oct. 27.—Fancy white, 13@ 4c; No. 1, white, 12@12½c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c; light amber, 6c. A. B. WILLIAMS & CO.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

[Continued from page 694.]

SECOND DAY—FORENOON SESSION.

The forenoon session of the second day was called to order by Pres. York at 9:30 o'clock. The members sang the "Country Song," after which Dr. Miller offered prayer. Pres. George W. York then delivered the following

President's Annual Address.

Fellow Bee-Keepers and Friends:—

Once more we meet in annual convention; and once more west of the great "Father of Waters." Much of importance has transpired within the short year since last we assembled. Another honey season has come and gone. The year's record can soon be completed. Judging from reports received, in many regions of our country the season has been a very poor one; in a few localities it has been one of abundant yields of honey. In view of this condition, it would seem that the ruling price of honey should be higher than last year. Whether or not it will be, will depend much upon those who have the honey to sell. If like many who rush their honey to the large city markets last year, the price this year will not be high. But if it is kept out of the large centers as much as possible, and sold more in the local or home markets, there should be no difficulty experienced in securing a good price.

But my address to-day is not intended to be an exhaustive discussion of the proper methods of marketing honey—that may well be left to this convention, the members of which have had much more experience in that line than have I.

If we may judge from the general and almost overwhelming increase in the business of manufacturing bee-keepers' supplies, and the demand for them, this year, there has been an unprecedentedly large growth the past year or two in the industry which we all have the honor to represent. It seems that many of the apiarian manufactories have never had in succession two such large seasons' business as the past two have been. This of itself indicates a development quite beyond the ordinary expectation. It means, I think, that those who were in the business heretofore have been enlarging their apiaries, and that many new recruits have come into our ranks, to begin the business of honey-production.

On account of the smallness of the bee itself many of our new friends might be led to the conclusion that there is little to be learned concerning its management, and not much financial profit to be obtained. But not so. Some of the wisest men of the centuries gone by have devoted much of their lives to a study of the habits and management of the little, busy bee. The apiarian galaxy of Immortals includes the names of Huber the blind, Dzierzon, Quinby and Langstroth, who completed their labors and are now entered into well-merited reward. Of the present time leaders who have gained enviable notoriety, may be named, Doolittle, Miller, the Dadants, Root and Cook. Of course there are many others almost equally prominent, both of the past and of the present, who might be included did time permit to name them all.

By patient and painstaking investigation much has been discovered in relation to the usefulness of bees and their profitable care. But who shall say that the end of knowledge concerning them has been reached? Verily, there is neither beginning nor ending to the study of this wonderful insect. He who created it gave a most valuable gift to mankind. Not alone for the delicious honey it stores for man's use, but as an aid to the greatest success of the horticulturist the bee should be most highly valued. This is a feature of the bee's important work that cannot be too frequently mentioned, or too highly estimated. Often it has been very clearly shown that had it not been for the multitudinous visits of bees during the blossoming period, but little fruit would have resulted. Intel-

ligent horticulturists of to-day encourage the keeping of bees in close proximity to their fruit orchards and groves.

Now, let me call your attention from a contemplation of the bee and its lofty place in the economy of Nature, down to a consideration of this organization, which is maintained in the interest of the producers of honey. It has noble and far-reaching objects to carry out, which are sufficiently important to easily justify its existence. But what we need to do at this convention, it seems to me, is to devise plans by which we shall be able to cause the bee-keepers of this land to see the need of their being active members in this organization. While some good work has been done during the past two years, there remains much that needs to be accomplished, and very soon. The question is, How can it be done?

In the first place, I have contended all along that we need a large membership. And that will mean a full treasury—a consummation devoutly to be wished. War is expensive. It costs in cash and energy to fight the battles against wrong. But it pays in the end. The one stupendous evil that needs the aid of every bee-keeper in this land in order to its overthrow, is the giant of adulteration. Not only the adulteration of honey in the city markets, but the adulteration of almost every food product known to-day. In order to a successful suppression of this great evil, all organizations must unite, and bring to bear upon those in authority all the influence possible, so that laws already enacted for the suppression of adulteration shall be rigidly enforced; and that new laws shall be past where such are not now upon the statute books.

Some one has said that the way to secure a national enactment against adulteration of food products is, first, to enforce the State or local laws against this growing evil. I think there is sound sense in this suggestion. In Illinois we have a strong law against the adulteration of foods and medicines. But so far I have heard of no attempt at its enforcement. Now, had we sufficient funds at our command, in the treasury of the United States Bee-Keepers' Union, I should suggest that we at once begin the prosecution of one of the leading adulterators of honey in Chicago. Could a single clear conviction be secured, with the subsequent heavy fines and term of imprisonment imposed, I have no doubt it would have a most wholesome effect not only upon the price and demand of pure honey in Chicago, but throughout the surrounding country as well. And thus, no doubt, other States might be encouraged to begin the enforcement or passage of similar laws, the result of which would be appreciated by a pure-food loving people—a people who are daily suffering from the evil effects of the consumption of the deleterious and disease-producing substances used in forming the miserable compounds put upon the market to-day.

Then, it seems to me that this Union should devise and carry out some scheme by which the public may become better acquainted with the merits of the product of the apiary. Too few people are aware of the real value of honey as a food. Too many look upon it as a medicine, and to be taken in homeopathic doses. Outside of the overthrow of adulteration, I believe there is no other subject that equals in importance to bee-keepers the widening of the demand, or the table use, of honey. For years I have been satisfied that were the honey product properly distributed the price realized by the producer would be more satisfactory—more proportionate to the cost of production.

This, of course, will naturally lead to a discussion of co-operation in marketing—a *great subject!* It has been very plainly hinted to me that I am one who opposed this Union taking up that line of work. Fellow bee-keepers, co-operation in the marketing of honey means much more than most of us have yet thought. If we seemingly are unable to secure a large membership in our Union, when the fee is only \$1.00 annually, how could we expect that very many would unite and hold out in an agreement to dispose of their whole crops of honey through this or any other organization? The great trouble would be, I fear, that just enough would remain out to so weaken the effect of the Union's effort along the line of co-operative marketing that failure would be the result. But perhaps by a thorough system of grading, and the establishment of a high standard of purity and quality of the product put on the market through the Union, a demand could be developed sufficiently large so as to take all the best honey that the Union could control or obtain. In that case, success could be assured.

But I am quite willing to leave this whole subject to the wise counsels of the Union's membership—it is too difficult for one small brain to solve satisfactorily.

In conclusion, I desire to express my sincere appreciation of the confidence reposed in me, and of the honor conferred upon me, by my re-election to the presidency of this Union at its meeting in Buffalo last year. With a full realization of

my inability to do justice to the requirements of the office, yet I have ever endeavored to do what I could to hold up the Union in its grand mission in the interest of bee-keepers; and I trust that I may soon be permitted to welcome my worthy successor, into whose strong hands I will gladly place the work and responsibility that accompanies the presidential office.

Faithfully yours,

GEORGE W. YORK.

The address of Pres. York was then discuss as follows:

Dr. Miller—The great quantity of supplies sold this year seems to be ground for the deduction that a large number of persons are going into the bee-business this year. I am not so sure of that. The large quantity of supplies sold this year means that the business was very good last year; it seems to me that is the most there is of it. The man who did a good business last year and used up all his supplies wanted more for this year. It doesn't mean that this is a good year, for it has not been a good year. The quantity of supplies sold is generally an index of what was done the previous year. Of course, there might be a good many new men who have gone into the business, but I rather think the increase in the supply business is largely because the old supplies have been used up and the bee-keepers had to have new supplies for this year.

PROSECUTING ADULTERATORS OF HONEY.

Dr. Miller—As to the advisability of securing a conviction for adulteration, if there is enough money in the treasury, and that can be done, it is one of the biggest things that the Union has to do, or can do. I suppose that our silence might be construed as consenting to the adulteration, or endorsing it. Perhaps there ought to be some expressions of opinion about the matter.

E. R. Root—I would like to inquire of Mr. Secor how much it would probably cost to bring one of these fellows to justice.

Mr. Secor—I don't think that question can be answered now, because we haven't tried yet. The cost depends a great deal upon the case itself—upon its location, and upon many other things. It may cost us \$200 to get a proper attorney to prosecute one of those cases. We cannot tell until we have gotten into it. Good attorneys aren't lying around loose working for nothing and paying their own board. When we commence a case of that kind we want as good an attorney as we can get, and we want to prosecute the case successfully. We do not want to attempt the prosecution of a case in which there is much possibility of failure; we want to be sure we have a good case, and then we want to make a success of it. I cannot tell what it will cost.

A. I. Root—Won't the State help in the prosecution? Isn't there a pure food commission in Illinois?

Mr. Secor—I don't think there is. While they have a law on the statute books, I think it is in the hands of any one to look after its enforcement. They have no pure food commissioners, as I understand. We have none in Iowa, and I think they have none in Illinois. In those States where there are pure food commissioners, whose business it is to look after the adulteration of foods, prosecution is a very easy matter, compared with prosecutions in those States where we have none of those advantages.

Pres. York—I had something to say in the American Bee Journal along this line, and Mr. Taylor, of the Bee-Keepers' Review, had this to say in reply:

"Then the editor forgets that in such cases the information is criminal, and the people of the State prosecute, or furnish a prosecutor, and all the machinery necessary for a fair trial. In this State, and I presume the same is the case in Illinois, the Union would not be permitted to secure the services of an additional attorney to assist at the trial."

I suggested in the Bee Journal that we did not have any money to begin a prosecution, and Mr. Taylor replied as I have read. He simply says that we would furnish the evidence, and the State would do the prosecuting.

Mr. Acklin—The time this matter came up in St. Paul, the commissioners were willing that we should have our own counsel.

Dr. Mason—If it is true that there is a law in Illinois that makes the adulteration of honey, as well as of other foods, a criminal offense, I cannot see any reason why it is not the business of the prosecuting attorney of the county, or of the locality where the work is being done, to prosecute the adulterators for the offense. It is his duty under the law in Ohio. If we find a man stealing or robbing it is the business of whoever finds him doing it to see that the prosecuting attorney knows something about it, and he then conducts the trial. I cannot see why the Union should not be permitted to employ counsel to advise with the prosecutor. We all know that it

takes considerable pushing and urging sometimes to get an official to discharge the duties that he is sworn to perform. I do not see why we should not try our hands at pushing the man who has this business to attend to in Chicago. I do not know why he cannot be seen by somebody in authority in this Union, and consulted in regard to the matter and advised with as to some of the steps to be taken to secure a conviction of some one. Let the Union look up the matter—do the real work of preparing the case, and let the prosecutor know that we are willing to do our best to help him.

E. R. Root—If I understand Mr. Taylor correctly, all we have to do is to bring up the evidence and then the State will take care of the matter and prosecute and bear the expense. If I am correct in that, the Union could go to work this month, or any time. I ask for information.

Dr. Mason—I have been watching, in Ohio, for a chance to catch somebody carrying on adulteration. But we have a good, strong law there, and we have a Pure Food Commissioner, Mr. Blackburn, who attends to his business, and people dare not violate the law. If I could catch somebody violating the law I would go to Mr. Blackburn, and he would be my right hand man in seeing that they were successfully prosecuted.

Dr. Peiro—I have heard a good deal about this subject, and one question I want to ask is this: Is there anybody in Chicago or elsewhere that does this thing on a scale that would justify prosecution? or is it done by some of these little fly-by-nights that just put up a little adulterated stuff and sell it? If you can find a man who is responsible in the event of a judgment, and who puts up enough of that kind of "honey" to have its impression upon the market, then I say let us prosecute; and if we find more than one such man, I would suggest that Dr. Mason be gratified, and that we send somebody from Chicago over into Ohio, and let them prosecute him there.

Dr. Mason—If you will send one of them over to Ohio, we will throw out the American flag and help you. It seems a little strange that with such men as Dr. Peiro and Mr. York living in Chicago, that city should have such a reputation for adulteration! What are you doing?

Pres. York—There is no doubt that there is plenty of such work in Chicago. I secured some samples last winter from one of the largest adulterating firms, and sent the samples to General Manager Secor. I do not know whether he went any further, or had them analyzed, but I was satisfied from the price and from the flavor that the samples were adulterated. That firm ships it all over the State, to suburban towns, and have traveling men out all the time, and they carry those samples as one of their commodities to furnish to grocers. There are plenty of adulterators in Chicago. One of the honey commission men there is one of the largest adulterators. He buys honey from bee-keepers. I used to advertise for him, but I don't any more.

Dr. Mason—If our President thinks there is no doubt about it why don't he find out and let us know. If it is true, let us know it; and if it is not true, let us know it. We are contributing our money for the purpose of securing the conviction of such men. I would be willing to submit to an assessment to carry on the work. If Mr. York and Dr. Peiro can't look after it themselves let us hire somebody to do it.

Pres. York—I would like to suggest that we have General Manager Secor go to Chicago and spend a month, or as long a time as may be necessary, and secure samples of whatever the adulterators are putting on the market there, have them analyzed, and meet the State's attorney or prosecutor there, and begin to do something active along this line. Of course we would not ask Mr. Secor to do that for nothing. I think it would be better to have him do it than to have any one else. His word would count for more, as he is the General Manager of the Union. I think he is the man who should do this work.

E. R. Root—I move that General Manager Secor be requested to take such action as he sees fit in regard to those Chicago adulterators. I believe he will take the right course.

Mr. Secor—I move to amend so as to include the words, "The General Manager, acting under the advice of the Board of Directors"—that the General Manager, acting under the advice of the Board of Directors, proceed to attack the adulterators of honey in Chicago.

E. R. Root—Chicago seems to be the headquarters of the adulterators.

Mr. Whitcomb—It seems to me that to name the place where the attack is to be named would be ill-advised, as it gives them warning in advance.

Dr. Mason—I think we should not confine the attack to any place. It may be found advisable to choose some other place for the attack. And I do not just fall in with the idea of our worthy President, that Mr. Secor is the best man to

hunt the matter up. He has a good many other things to do. He might find another man who could do the work better than he could himself.

Pres. York—The reason why I put it that way was because I think the General Manager should purchase the samples himself, not through some one else, and that he should keep them in his possession until they are analyzed, so that there could be no doubt about it.

Dr. Mason—I do not agree with that idea. Just a few weeks ago I was on a jury before which a prosecution for selling medicines with poisonous ingredients contrary to law was on trial in Ohio. I had some conference afterward with our commissioner, who was prosecuting the matter, and I found that he thought it was much better to have some one buy those articles directly, and find out that they were not right, and then let the authorities get after the adulterators. It seemed to work much better than to have the authorities themselves buy them. The purchasers were then called as witnesses before the court, and it had ever so much more weight. It would be lots better if I would go and make the purchase and have Mr. Secor use me as a witness.

Mr. Secor—That matter should be in the hands of the Board of Directors.

The motion as amended by Mr. Secor was then seconded and carried.

Mr. Stilson—I would like to ask a question in regard to whether the General Manager or the Board of Directors could in any way aid parties in different States in preparing and presenting before the different State legislatures bills looking toward the punishment of adulterators of honey or other foods in the different States. Before our legislature this winter I would like to present something of that kind. Will the Union aid us by helping to prepare something of that kind that will stand a test?

Mr. Masters—As Mr. Whitcomb has investigated the laws of Nebraska in reference to adulterated foods, I would like to have him tell us something of what he knows about it.

Mr. Whitcomb—We have no pure food law here. The only thing we could do would be to prosecute a man under the law for obtaining money under false pretenses. We have no pure food law. Such laws have always failed somewhere. The only thing we can do is to prosecute under the law—which is very strict—for obtaining money under false pretenses—selling something for honey which was not honey, but glucose.

Pres. York—Mr. Stilson askt a question as to whether the Board of Directors could aid the bee-keepers in any State to secure the passage of laws against the adulteration of honey and other foods.

Dr. Mason—Our constitution provides for that, I think. In the first place, the objects of this Union are stated in Article II—"to promote the interests of bee-keepers, to protect its members, to prevent the adulteration of honey, and to prosecute dishonest honey commission men." I think the constitution covers that, without any doubt.

Mr. Stilson—My idea in asking this question was, that I knew the Union was organized to promote the advancement of bee-culture; but in this State we have met with this one obstacle every time we have presented this matter before our legislature: There were many of our legislators who thought we were working in the interest of a single industry, while we should ask for a general pure food law covering all products. I wish to ask whether the Union would aid us in securing the passage of a general law in preference to a law for this one industry.

A. I. Root—It seems to be time that other States were following the State of Ohio. This matter of obtaining money under false pretenses is a small thing—a trifling matter. Bee-keepers are made a kind of a side-issue. These fellows are not only swindling by their adulterations, but they are endangering human life. You will see that throughout the whole world human life is coming to be held at a higher value than it used to be. We all rejoice over that. The progress of the present time seems to be in defending human life and health. This matter wants to come now with emphasis. It is not because bee-keepers are being hindered or cramped in their industry, but because human life and human health is being endangered. Medical men will tell us that they are becoming more and more convinced that the greater number of stubborn chronic diseases are caused by impure food. We want the right kind of food. The great point in presenting this matter of getting better laws is that human health and life are in danger; it is not that bee-keepers are suffering by the frauds, or that somebody is getting swindled.

Mr. Hatch—Colorado has a law especially against the adulteration of honey. If any one is looking for an easy case

for prosecution, I think they would find it right in Denver, and without looking very hard, either.

Dr. Miller—I believe that the one thing in which we have made more mistakes than any other has been in considering our own interests alone, and trying to push things with reference to bee-keepers alone. If we are going to do anything, we must try to go in along with others and make a big thing of it, and make a big strike all together. I think Mr. Secor is right in his idea; unless we are pretty sure of carrying a case to a successful issue, we ought not to touch it at all.

Mr. Secor—I was going to suggest that I regard it as one of the legitimate purposes of this Union to secure pure food legislation in the States where there are no pure food laws. I would suggest that if it is possible we should get a general pure food law, saying nothing about honey especially, and if possible getting a pure food commissioner. I think that is a great point.

(Continued next week.)

Report of the Utah Bee-Keepers' Convention.

The Utah Bee-Keepers' Association held an interesting meeting in Salt Lake City, Oct. 6, the merits of the industry being pretty thoroughly discust.

The first question presented was the purchase of sections and other supplies. Remarks were made by Vice-Pres. Hone, Messrs. Dudley, Swanuer, Terry, Schach, and others. As a result it is expected that the bee-keepers will club together and get them at the lowest rates.

Foul brood, pickled brood, and kindred diseases, were discust. A general discussion as to the best methods to be adopted for the production, putting up and marketing of bee-products, showed pretty clearly that by acquiring a practical knowledge of the business, and by adopting the best approved methods, as a rule the bee-keepers were usually more successful than those pursuing other industries of the State.

THE PAST A PECULIAR SEASON.

President Lovesy said that as far as the bee-industry is concerned, this has been a peculiar season. While the honey-flow in some localities has been excellent, from the best information obtainable as a rule the flow seems to have been either short or rather poor. The spring in some localities was wet and cold; then when the fine weather came it cleared up for good. This made the flow all right for awhile. Then later, as a rule, where the supply of water for irrigation was abundant the honey-flow was all right, but where the supply of water gave out, the honey-flow also fell off.

BEE-DISEASES—IN UNION IS STRENGTH.

While many have been successful others have been unfortunate with bee-diseases. There seems to have been a lack of interest in getting the bee-law in force in some counties. Disease has broken out in some instances, and no one having any authority to look after the matter, it has caused some distress and loss. This, and also a lack of interest among bee-keepers in purchasing their supplies and disposing of their products, has demoralized prices, while under proper conditions the shortness of the crop should have had a tendency to have advanced prices materially.

Some bee-keepers ask if it is to their interest to join an association. It should be plain to all that if the bee-keepers and other societies would unite for their own benefit they could accomplish almost any desired reform. They could prevent unscrupulous dealers from buying glucose for two cents and selling it as honey for 10 cents; they could at least procure laws that would cause all packages to be plainly marked as to what they contained. Again, many of our practical bee-keepers credit much of their knowledge of the industry to attending the bee-meetings. In union is strength, and without it little if any reform can be accomplisht.

GOOD REPORT FROM OMAHA.

A number of our bee-keepers furnisht honey for the Trans-Mississippi Exposition at Omaha, and we have sent a creditable exhibit. We have kept up the reputation of the State as a honey-producer. The report of our exhibit is 95, as follows: Flavor, 45, on a scale of 50; clearness, perfect, 10; ripeness, perfect, 20; color, 10; general appearance, 10; total, 95; perfect, 100. This is considered an excellent showing, as flavor is more or less a matter of taste.

YIELDS OF HONEY, ETC.

W. E. Smith reported an excellent flow of beautiful white honey in Keysville, Hooper, and vicinity. Mr. Jacobson, of

San Pete, gave some good reports of large yields of honey this season in different counties in the State.

Joshua Terry, of Draper, reported that the Utah honey exhibit at the Trans-Mississippi Exposition at Omaha was a credit to the State and to the bee-industry.

Many of our good-natured bee-keepers promise to attend the bee-meetings, but they too often forget it.

CONTRIBUTED ARTICLES

No. 1.—The Care of Bees for Wintering.

BY C. P. DADANT.

For a number of years past we have had very good winters for bees, and the losses have been small. This success is likely to cause us to be less particular about putting the bees in proper condition to go safely through the period of cold weather that may usually be expected in this latitude.

What are the necessary requirements to safely winter a colony of bees? In my mind I divide these requirements under five heads:

- 1st. A sufficient number of bees.
- 2nd. A sufficient quantity of food.
- 3rd. Food of the proper quality.
- 4th. An occasional flight during cold weather.
- 5th. A certain amount of shelter.

The first and main requirement is the number of bees. It matters but little how well the other four requirements may be fulfilled, a handful of bees, in this latitude, cannot be safely wintered, and in hard winters it requires a very strong colony to safely go through the almost polar extremes of cold, which are so often experienced, and which make us compare our winters with those of Siberia.

The number of bees which forms the colony at the beginning of winter often depends upon circumstances entirely independent of the will or the management of the apiarist, and we can therefore give but little advice on this point. Probably the only time when the bee-keeper can be of any help to his bees, to secure a sufficient amount of strength, is after a short crop, when the bees have gathered so small an amount of honey that they have been unable, tho probably willing, to rear a sufficient supply of brood. By judicious feeding in time, that is, before the opening of cold weather, quite an amount of brood-rearing may be induced, and the strength of the colony materially increased by this means.

To obtain this end, the feeding must be slow and regular, for bees will breed mostly when they find food; while if the colony is strong, and the supply of honey only is needed, the feeding should be as speedy as possible. It is very easy to understand why breeding depends somewhat upon feeding. The queen needs to be copiously fed, in order to lay a liberal number of eggs daily. When the bees are at rest, and no honey is harvested, she is not induced to eat much, for none of the bees are loaded. But when honey is coming in, either by artificial feeding or by natural sources, the queen incessantly meets bees with a full honey-sac, that offer food to her, and the egg-laying propensity is increased in her thereby. To be sure, there are natural circumstances—weather and season conditions—which will tend to prevent a ready production of eggs at this season; while the reverse of these conditions in the spring would have the opposite effect; but aside from the circumstances that are beyond the control of man, it is not to be doubted that much may be achieved towards increasing the number of bees in a hive, previous to winter.

Yet, there are seasons in which the coucourse of circumstances have created peculiar conditions, and the hive is depleted of its bees tho the harvest has been sufficiently plentiful to fill the brood-combs with even more honey than is needed for winter. As an instance of this I will cite one fall, in which our bees had to travel about two miles in order to harvest a good supply of honey, and during which a number of quick and unexpected day-swarms destroyed many of the little harvesters on the way to and from the field. Their numbers diminished so that there were not enough bees left in the hive to help keep the brood warm, and the winter loss was tremendous.

I remember, also, buying a box-hive full of honey, years ago, from an old-time bee-keeper. It appeared that a swarm

was put in this hive during a good flow of clover, and the crop was so plentiful that they filled the box from top to bottom. As there was no room worth mentioning for brood, and the queen was perhaps old, the colony had dwindled so that the remaining bees died at the opening of winter, and it had some 60 or 70 pounds of honey, very white and nice, with not to exceed six square inches of empty comb at the bottom. Such occurrences are not altogether unavoidable, especially to the apiarist who keeps a close watch over his bees; but they are possible, and when the conditions are discovered too late no help can be given.

Then there are other circumstances, some of which are not yet fully understood by us, to cause colonies to dwindle and become weak. Not more than two days ago (Oct. 26) I was helping the boys to remove the supers preparatory to packing the hives for winter, when we came to a colony of bees—fine Italians—in which perhaps two handfuls of bees were scattered about away from the cluster, in the super, as well as in the body of the hive. This circumstance is unintelligible to me. The morning was cold and frosty, and, in normal conditions, these bees should have been united to the cluster at the bottom of the hive; but as they were scattered about they had become chilled and were likely to perish.

We can therefore say that the quantity of bees necessary to a good wintering is not always dependent upon the will or care of the apiarist, but can only be improved by him to a certain extent.

In another article I will examine the other propositions laid down at the beginning of this article.

Hancock Co., Ill.

An Old-Time Large Yield—Historical.

BY DR. E. GALLUP.

On page 644, Mr. Cameron says he remembered long ago that Dr. Gallup said that he (Gallup) got from one colony 50 pounds of honey per day. Mr. Cameron made a mistake of 30 pounds, thanks to Dr. Mason for correcting him.

Now I propose to get in some of my notions that crawled through my noddle at that time. I had received my first honey-extractor the season before, and of course had large ideas. I was then using the Gallup 12-frame hive, and my idea was to get up a large hive all on the ground floor, as I did not wish to be compelled to take off a top hive or super to examine the breeding department, etc. So I built a hive to hold 48 frames, 24 in each end. The division between each apartment had an inch wide slot the whole length for the bees to pass through, with a large portico (*a la* Langstroth) at each end; a half-inch entrance the whole width of the hive at each end, a separate honey-board over each apartment, and a movable roof over all. Of course, the entrances were managed to suit the size of the colony.

Early in May I hived my first swarm in that hive, and it was a very large swarm, from my Adam Grimm stock of Italians. I inserted a division-board so as to conform the size of hive to the capacity of the swarm, and confined them to one apartment. My first intention was to hive two swarms in the hive, but that queen turned out so prolific that she knocked my intentions in the head.

As soon as they commenced building drone-comb, I filled out that apartment with full sheets of ready-made worker-comb (for we had no foundation at that time), and alternated empty combs between full combs of brood. The season happened to be just right, so the bees gathered sufficient to keep up all operations in the hive, and still not sufficient for them to store any amount in the way of the queen; and she occupied the whole 24 *fully*, with brood and eggs, in short order. I then removed the opening between the two apartments, set 12 combs of brood in the other apartment, and filled all up with ready-made worker-comb, mixt in promiscuously with the brood.

Now, understand what I have heretofore said, that my Grimm stock of bees were longer-lived than ordinary bees. I do not now recollect at what time the basswood bloomed that season, but this I do recollect, that at the time I had the largest and most numerous colony of bees that I ever had in a movable-comb hive. At night, when they quit work, there would be a fair-sized swarm clustered in each portico, and both entrances open to their full capacity, each one-half inch wide or deep, and 36 inches long.

I had upland and very lowland basswood, any quantity of it, near my apiary, and one variety blossomed two weeks later than the other, which prolonged the basswood season; and the weather could not possibly be better for 30 days in succession. I extracted from one apartment one day, and from the other the next; did not extract from any combs that had

brood, and the honey was all well ripened and matured. I put it in oak barrels or kegs; I sent one keg to Mr. Langstroth, and he pronounced it first-class in every respect. He said in a letter to me that he had a couple of gentlemen from Boston to dinner, and they made the remark that if they could get such honey in Boston it would be worth 30 cents a pound. It was candled hard, and as white as the driven snow.

That was the season that my bees gathered honey by moonlight. I had four large basswood trees right in the apiary, and the secretion of nectar was as profuse as it is here in Southern California in a favorable season.

I made some six or seven other hives on the same plan, containing 36 combs each, and made two long-idea hives on the Adair principle; used Gallup frames in all. The Adair principle did not work satisfactorily in any respect. That was the time I hurrahed that I had a non-swarmer hive. The colonies did not swarm the second season, but all superseded their queens, and the third season they were the first hives to cast swarms in the apiary, some 10 days ahead of the 12-frame hives, and the swarms were so large that I had to use two and three story standard hives to put them in.

Well, that was the season that I took 600 pounds from that large colony in 30 days. It was the best continuous flow of basswood honey I ever saw—I mean the first season I used the large hives. I took 150 pounds of fall honey from that same hive that season—750 pounds in all. Do you wonder that Gallup hurrahed? It was all gathered by bees produced by one single queen.

Now, Mr. Cameron, what are you going to do about it, anyway?

If I get the time I shall give my ideas about rearing large, prolific, and long-lived queens and bees. Orange Co., Calif.

Do Italians Bees Produce Better Honey?

BY EDWIN BEVINS.

On page 646, Mr. Hart again gives me "Hail Columbia." I wish here to reiterate that what I have said was not said with any feeling of disrespect towards Mr. Hart, nor have I said anything that was designed to do him any injustice. If I was so unfortunate in my choice and arrangement of words as to leave the impression on his mind that I intended him any wrong, I humbly beg his pardon.

I will go farther, and say that I now believe that Mr. Hart's question was asked in all honesty and sincerity, and without any thought of "putting up a job" on the bee-keepers. I did say in the beginning that it "looked" as if Mr. Hart might be doing this. This seems to be the head and front of my offending. I will take that all back, and say that I am satisfied that Mr. Hart asked this question solely with a desire for information.

Well, how much has he got up to date?

Let us look over the ground and see what has been brought out since Mr. Volkert ventured the opinion that the better quality of Italian honey is due to the greater activity of Italian bees.

But, first, let us have a restatement of Mr. Hart's question. Mr. Hart wanted to know why Italian bees store a better quality of honey than blacks and other bees, when all have access to the same sources of supply. As I understood the question, he wanted to know why Italians store a better quality of honey than other bees when all have access to, and all store from, the same sources of supply, all would gather from these same sources in about equal proportions according to the number of bees engaged in the work. This I think was Mr. Hart's idea, but I am not certain. On this point, and a good many others, he seems able to speak for himself.

Now for the new light which has dawned on the question.

On page 595, C. P. Dadant expresses the opinion that the better quality of the honey is due to the fact that the Italian bees have "better developed olfactory nerves, and are therefore better able to select their food." In other words, the honey of Italians is better because the bees gather from a better class of flowers. If Mr. Hart's question did not have the extended meaning which I supposed it had, then what Mr. Dadant says is a fair answer to the question. If it did have this extended meaning, then what Mr. Dadant says is no answer at all. No one ever doubted or denied that Italian bees would store a better quality of honey from white clover than other bees would store from honey-dew and basswood and buckwheat. But suppose that only one source of supply is available at one time, or that bees gather from all sources alike, what will be the difference then?

The closing sentences of Mr. Hart's last article betray the fact that he is brimful of belligerency. It is therefore to be supposed that he will continue the warfare until, Spaniard-

like, his "honor" is satisfied. Then, perhaps, will come the peace for which I plead in a former communication. In the meantime let somebody come to the front and tell us why Italian bees store better honey than other bees when all have access to, and *all store* from, the same sources of supply. I do not yet believe there is any difference that is discoverable. Decatur Co., Iowa.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

The "Boil" that made Mr. Taylor "Sic."

A correspondent writes: "'Sic' is a Latin adverb, meaning 'so; thus; in like manner;' but on page 612 of the American Bee Journal for Sept. 29, it seems to me to have been used as many now use 'See?'"

I think Mr. Taylor is too accurate a writer to have used the word "sic" with an unusual and really incorrect meaning. In general, if not always, when used by English writers in brackets, the word is used to call particular attention to an inaccuracy of some kind. If, for example, I say that a man of great literary pretensions wrote to me, "I will meet you at the cars," the spelling of the third word in the quotation might be corrected by the printer, or, if not corrected, the hasty reader might not notice it, and the careful reader might think it a mistake of the printer. To avoid anything of this kind, it is given, "I will meet [sic] you at the cars." That's as much as to say, the word was written "thus," just as here spelled.

When I wrote, "I wish I knew what Mr. Taylor means by that word 'sic,'" I did not refer to the meaning of the word, but I wanted to know what there was wrong in what I had said. If he referred to the word "boil," I think *he* was in error, and if to something else, I'd like to know where I was in error.

I have faith in Mr. Taylor's desire to be an honest critic, and when he has time for it he will say where my error was; and if the error was his, he will be more anxious to point it out than to point out the errors of others. C. C. MILLER.

Making Nuclei and Moving to Colorado.

I lately moved here with the intention of engaging in the bee-business, but find it a poor country for bees. I have 20 colonies, and can't sell here for more than \$1.00 a colony. I wish to remove to Colorado. Would it pay to purchase queens and divide each colony into four or six nuclei, discarding all the old bees and shipping about 10 nuclei boxes with say 40 or 60 nuclei, in the spring, and build them up in Colorado? I have the dovetailed hive with Hoffman frames. There are but a few days that bees are confined here during winter. There are millions of flowers, but they don't appear to secrete nectar, and the bees won't work in the sections, as the flow is not continuous. VIRGINIA.

ANSWER.—I don't know. It might be a good investment, and it might not. Perhaps it might be better to ship the colonies, and then increase after reaching destination. If you break up all into nuclei, you'll find it slow work building up. When you have bees and brood for only one or two frames they seem to stand still for a long time, but when they get up to about four frames of brood they push right along. So if you want to go fast it's well to go a little slow at the start. Instead of forming all your nuclei at the start, have only a few at first, and then as fast as you get them built up start more.

Cellar Temperature—Putting in Bees.

1. Would a temperature of 65° be too warm for a cellar to winter bees in?
2. Do you smoke the bees at the entrance a little when you put them into the cellar?

MICHIGAN.

ANSWERS.—I. I'm afraid it would. Possibly it might be all right if you could have it perfectly dark and the air con-

stantly pure, the latter being perhaps the more important of the two.

2. No, the desirable thing is to get them into the cellar with the least disturbance possible. Smoking them, or jarring the hives, would have about the same effect as a longer confinement. The best thing is to get them into the cellar at a time when they are not easily stirred up, and so quietly that they will not notice that they are being carried. A good time for this is the next day after they have had flight. If they are very troublesome about flying out, take a big cloth, make it pretty wet, then lay it against the entrance so no bees can get out.

Growing Sweet Clover in Texas.

I would like to keep a few colonies of bees for my own use, but will have to plant something for them.

1. Will sweet clover grow here?
2. Does it come from the root, or is it planted every year?
3. How much would I need for five or six colonies?
4. What time should it be sown? TEXAS.

ANSWERS.—1. Mrs. Harrison reports that it will not grow in the part of Florida where she has been. I don't remember that any other place has been reported where it would not grow.

2. It comes from the seed this year, but doesn't blossom this year. It lives over winter, grows big next year and blossoms, then dies root and branch, having lived only through the one winter.

3. I don't know. At a rough guess I should say two acres would keep them busy when at its best, and perhaps half as much. But mind you, it doesn't yield honey throughout the entire season, commencing not till after white clover begins, but after it does begin it continues till frost to yield more or less.

4. It may be sown in the spring, but perhaps it will be better to sow in the fall. It seems to catch best if sown on tolerably hard ground where cattle or other stock may tramp the seed in.

Transferring and Italianizing—Packing Bees for Winter, Etc.

1. Next spring I want to transfer my bees from box-hives into S-frame dovetailed hives, and I would like to transfer and Italianize at the same time, as it is such trouble to find the black queens on the combs. Would it work all right to place entrance-guards on the dovetailed hives at the time of transferring, thereby keeping out all black drones and queens, and giving each colony an Italian queen in a cage, using a little peppermint to give all one scent? Or, could I transfer one colony when they are working well on ash-leaved and hard maple, give them an Italian queen, then transfer the others, giving each colony a frame of eggs from the Italian queen and let them rear their own queens?

2. How long should I wait after transferring the first colony and introducing the queen, before I transfer the others in order that the young queens may meet Italian drones?

3. I would like to follow the last-named plan if it would work all right. Would I be apt to get any surplus honey, or increase by swarms, by so doing?

4. What constitutes "No. 1" and "fancy honey"?

5. Can you name a good, reliable firm to ship honey to?

6. In packing my bees for winter, I put on a super, then on the frames I place a Hill's device, on which I put cloth that is partly woolen, the thickness of an old quilt, on which I place a chaff cushion, then another thickness of quilt. Should I then put on the regular hive-cover before putting on the winter-case roof?

7. I had an experience with one colony the past summer that I do not understand. I introduced an Italian queen in a rather weak colony which had been queenless some time, and about three weeks after, one evening just at dusk, I saw bees coming out of the hive; some climbed up the hive as when a swarm is issuing, then they would fly away. It was so dark I could not see them after they left the hive. Afterward, when I opened the hive, I found the combs full of moth-worms, but no bees. Do you think the bees went to the woods so late?

8. I put unfinished sections on a strong colony to clean out, but they did not do it. What was the reason? They were on nearly two weeks. NEW YORK.

ANSWERS.—1. I very much doubt whether you will find it a satisfactory thing to Italianize at the time of transferring. The bees will have enough on hand to repair damages and keep things straight at time of transferring, without the extra

strain of changing queens. When you get your bees in hives with movable frames, you will probably not have as much trouble as you anticipate in finding the queens. And if you depend on the use of perforated zinc to strain out the queens, you can do that more easily after the bees are settled in the frame hives than at time of transferring.

2. If the colony that receives the Italian queen is strong, and if the season is favorable, so that she lays some eggs in drone-cells almost as soon as introduced, you will be pretty safe to start queen-cells about two weeks after the introduction of the Italian queen. But if you are not fond of disappointment, don't count too strongly on having all your young queens mated with drones from the Italian colony. If honey is your main object, you will probably get as much by having the young queens of Italian stock meet drones not related, even if they are black.

3. You might get both surplus and swarms by the plan outlined, but very likely your performance would hinder somewhat. Better study up from the text-books the matter of rearing queens, perhaps obtaining Doolittle's book on queen-rearing; get one of your colonies Italianized as early as convenient, let the bees in the box-hives swarm, giving the swarms in frame hives, and transferring from the old hives three weeks after swarming. Then having queens ready in nuclei, you can Italianize at your leisure. [Doolittle's "Scientific Queen-Rearing" book, bound in cloth, we mail for \$1.00.—EDITOR.]

4. According to the rules of grading adopted at the Washington meeting of the North American Bee-Keepers' Association, the two grades were as follows:

FANCY.—All sections to be well filled; combs straight, of even thickness, and firmly attached to all four sides; both wood and comb unsoiled by travel-stain or otherwise.

No. 1.—All sections well filled, but combs uneven or crooked, detach at the bottom, or with but few cells unsealed; both wood and combs unsoiled by travel-stain or otherwise.

In addition to this the honey is to be classified according to color, using the terms white, amber and dark. That is, there will be "fancy white," "No. 1 dark," etc.

5. [All the firms named in the column of "Honey and Beeswax Market Quotations" in this journal are supposed to be reliable. If any of them treat any reader of the American Bee Journal unfairly, we would be thankful to know it.—EDITOR.]

6. If there is room for it you may as well put it on.

7. The bees that you saw flying away from the hive late in the evening were probably robbers, the colony having been overcome before that time by the robbers.

8. I don't know. My bees act exactly the same way, and I don't know any satisfactory way to get sections emptied out by any particular colony.

Questions on Cellar-Wintering.

I have 23 colonies and will winter them in the cellar under my house. The cellar is 18x29 feet, and 8½ feet deep.

1. How should I ventilate this cellar?

2. How many colonies is it advisable to put into such a cellar?

3. How high should I keep the hives from the ground? WISCONSIN.

ANSWERS.—1. Any way that will get fresh air into the cellar without cooling it off too much. And that's pretty much the same as saying, any way that will get the foul air out of the cellar without cooling it off too much. If there's a chimney running down into the cellar, a stove-pipe run from the cellar into that will be, in most cases, all that's necessary. For the cracks in the cellar wall will be enough to let in fresh air to supply the place of that drawn out by the draft of the chimney. Where the chimney does not run down into the cellar, connection may be made with it by means of a two-inch pipe running up through the floor and running into the pipe of a stove in the room above. If the number of colonies is not more than 23, it is possible that your cellar may winter all right without any special attention. At least you could try it. As long as the bees are tolerably quiet, and the air in the cellar smells sweet, there is not likely to be much danger as to the ventilation.

2. 100 colonies or more ought to be comfortable in it.

3. Some think a foot high, altho some of mine are only raised three or four inches, and winter well.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it. See 6 big offers on page 715.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. NOVEMBER 10, 1898. NO. 45.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the Joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Care of Bees for Wintering is a subject on which Mr. C. P. Dadant will write a series of articles for the American Bee Journal, the first of which appears in this number. Every bee-keeper at all acquainted with bee-literature knows that there is no more competent authority in this country to write on any phase of practical bee-keeping than the Dadants. So these articles will be a treat, especially to the newer bee-keepers. Read them, and heed them.

Our Front Page Illustration this week will be recognized at once by all who saw a copy of the Omaha convention program, as it appeared on its first page. It is the result of an idea incubated in the versatile brain of Mr. H. E. Hill, editor of the American Bee-keeper, and we think all will agree that it is a very neat and appropriate design. Mr. Hill was kind enough to loan us the engraving, so that all our readers might have an opportunity to see it. When granting its use he wrote:

DEAR MR. YORK:—As an advertisement for the Union, I would like to see the cut you request given a place in all the bee-papers, so that its object—that of calling particular attention to the Union, generally—might be accomplished. As the matter stands at present, I am by no means sure that my plan was a success, since the expense of the advertisement so far would have given me over 20 memberships in the Union, and that, perhaps, might have been better for the "cause" than the advertisement; but I hope it may have some beneficial effect.

H. E. HILL.

Now, why can't at least 100 of our readers send in their membership dues to the Union this month, and make Mr. Hill feel fully five times glad he got up that illustration?

Good Honey-Year in Canada.—Editor Root, in Gleanings for Oct. 15, thus refers to a visit from Editor Holtermann, of the Canadian Bee Journal, and tries to account for the good honey season in Canada, and the almost total failure in the United States:

Mr. R. F. Holtermann, who made us a short visit on the 7th inst., reports that the bee-keepers of Canada have had a most excellent season. The year throughout the United States (excepting Colorado, Florida, Vermont, Michigan and Northern California) has been a most signal failure. Now, why should Canada, so near us, have a good honey-flow, when we here in the United States have had almost the opposite? I remember last summer, when clover ought to begin to yield, we had been having quite a spell of dry weather. Day after day went by, but no rain. Finally, when it did come, and copiously, too, we hoped, but hoped in vain, that the long-expected nectar would come. While these copious rains seemed to be general over the United States, and while they came in time to stimulate general farm crops, it was evident they were *too late* to have any decided effect on the honey crop of the United States—too late, perhaps, by two weeks. Now, why did the bee-keepers of Canada enjoy a good season? This strikes me as a possible explanation:

The honey-flows in Canada are anywhere from ten days to two weeks later than in the United States. Assuming those same rains that we did, and at the *same time*, then those same rains came just in time to stimulate nectar secretion in the blossom, but just too late for the United States.

Tin vs. Wood for Honey.—A short time ago we were again thoroughly convinced of the great superiority of tin over wood for making honey-receptacles. We saw some barrels of honey emptied, which, before the honey was put in, weighed 28 pounds each. After the honey was removed those same barrels weighed 40 pounds.

We are surprised that any bee-keeper will persist in using barrels for holding extracted honey. He certainly would not if he had to *buy* honey in them. Besides the large amount of honey which they soak up, they are hard to handle, and when once the honey is granulated, it is a big job to dig it out.

How different are the 60-pound tin cans. They don't soak up any honey, and the honey they contain can be rellequified so easily, in case it has granulated.

We do hope the time will soon come when wooden barrels for holding honey will be generally condemned, and that the much lighter, handier, and ever so much better tin cans will take their place.

Apiarian Awards at the Trans-Mississippi
—The following premiums were awarded in the Apiary Department of the Trans-Mississippi Exposition at Omaha, by Hon. Eugene Secor, of Forest City, Iowa, who was the judge:

BEE-HIVES.—Emerson T. Abbott, of Missouri, St. Joe hive, bronze medal; Douglas County, Nebraska, Improved Langstroth hive, bronze medal; E. Kretschmer, of Iowa, collection of hives, gold medal; G. B. Lewis Co., of Wisconsin, collection of hives, gold medal; Leahy Mfg. Co., of Missouri, collection of hives, silver medal; The A. I. Root Co., of Ohio, collection of hives, gold medal.

APIARIAN IMPLEMENTS AND SUPPLIES.—E. Kretschmer, gold medal; G. B. Lewis Co., gold medal; Leahy Mfg. Co., silver medal; The A. I. Root Co., gold medal.

BEE BOOKS AND BEE-LITERATURE.—E. Kretschmer, honorable mention.

ALSIKE CLOVER COMB HONEY.—L. G. Clute, of Iowa, bronze medal.

HEART'S-EASE COMB HONEY.—L. D. Stilson, of Nebraska, silver medal; L. G. Clute, bronze medal.

DANDELION COMB HONEY.—L. G. Clute, honorable mention.

ALFALFA COMB HONEY.—E. Kretschmer, silver medal; Hon. G. W. Swink, of Colorado, silver medal; Lovesy & Bouck, of Utah, bronze medal; Bennett & Diesem, of Kansas, bronze medal; I. L. Diesem, of Kansas, bronze medal.

LINDEN COMB HONEY.—Nebraska Commission, silver medal; Douglas County, silver medal; E. Kretschmer, silver medal; L. G. Clute, bronze medal.

SWEET CLOVER COMB HONEY.—Wm. Stolley, of Nebraska, silver medal.

WHITE CLOVER COMB HONEY.—Dr. E. K. Jacques, of Minnesota, silver medal; D. A. Freeman, of Minnesota, silver medal;

Mrs. H. G. Acklin, of Minnesota, silver medal; L. G. Clute, silver medal; E. Kretschmer, silver medal; Lovesy & Bouck, honorable mention.

HONEY IN DIFFERENT STAGES OF GRANULATION.—L. D. Stilson, honorable mention; E. Kretschmer, honorable mention.

SAMPLES OF HONEY.—Aug. C. Davidson, of Nebraska, silver medal; L. D. Stilson, gold medal; State of Minnesota, silver medal.

HEART'S-EASE EXTRACTED HONEY.—Douglas County, silver medal; L. D. Stilson, silver medal.

SWEET CLOVER EXTRACTED HONEY.—Douglas County, silver medal; Wm. Stolley, bronze medal; Nebraska Commission, bronze medal; E. Kretschmer, bronze medal.

WHITE CLOVER EXTRACTED HONEY.—Lovesy & Bouck, bronze medal; G. M. Whitford, of Nebraska, silver medal; E. Kretschmer, silver medal; L. G. Clute, silver medal; Dr. E. K. Jacques, silver medal; J. B. Jardine, of Minnesota, silver medal; H. L. F. Witte, of Minnesota, silver medal; D. A. Freeman, silver medal; Mrs. H. G. Acklin, silver medal; W. J. Stahmann, of Minnesota, bronze medal; Scott LaMont, of Minnesota, bronze medal.

EXTRACTED BUCKWHEAT HONEY.—Douglas County, no recommendation.

ALFALFA EXTRACTED HONEY.—G. W. Swink, silver medal; Lovesy & Bouck, bronze medal; E. Kretschmer, bronze medal; A. G. Forney, of Kansas, honorable mention; Fred H. Glick, of Kansas, bronze medal; Bennett & Diesem, honorable mention; I. L. Diesem, bronze medal; Nebraska Commission, honorable mention.

LINDEN EXTRACTED HONEY.—Nebraska Commission, silver medal; Aug. C. Davidson, bronze medal; L. G. Clute, silver medal; Douglas County, silver medal; Nathan Jones, of Minnesota, bronze medal.

RASPBERRY EXTRACTED HONEY.—Mate Williams, of Minnesota, silver medal.

HONEY IN MARKETABLE SHAPE.—Aug. C. Davidson, bronze medal; Nebraska Commission, bronze medal.

HONEY-SUGAR.—L. D. Stilson, silver medal.

HONEY PRODUCING PLANTS PREPARED AND MOUNTED.—Winnie L. Stilson, of Nebraska, gold medal; Douglas County, bronze medal; Cleveland Cross, of Nebraska, bronze medal; Clark E. Bell, of Nebraska, bronze medal.

UNREFINED BEESWAX.—E. Kretschmer, silver medal; Douglas County, honorable mention; L. D. Stilson, bronze medal.

DESIGNS IN BEESWAX.—Mrs. E. Whitcomb, of Nebraska, gold medal; Douglas County, silver medal; Mrs. Mary Segar, of Nebraska, silver medal; Mrs. Della Benson, of Nebraska, silver medal.

REPRODUCTION OF BEE-CULTURE 50 YEARS AGO.—Douglas County, silver medal.

SWEETS IN WHICH HONEY IS MADE TO TAKE THE PLACE OF SUGAR.—Mrs. E. Whitcomb, silver medal; Mrs. Frank J. Preiss, of Nebraska, silver medal.

EXHIBIT OF BEES AND QUEENS IN CAGES.—Nebraska Commission, silver medal; Douglas County, silver medal.

EXHIBIT OF QUEEN-BEES IN CAGES.—E. Kretschmer, honorable mention.

EXPERIMENTAL TEST OF FULL COLONIES OF BEES.—Douglas County, silver medal.

HONEY-VINEGAR.—G. M. Whitford, honorable mention; Douglas County, honorable mention.

METHEOLIN.—Aug. C. Davidson, bronze medal.

NEBRASKA FARMER SPECIAL PREMIUMS.

Display of Culinary Products with Honey Instead of Sugar.—Mrs. E. Whitcomb, 1st.

Display of Honey, Supplies, Bees and Queens.—Nebraska Commission, 1st.

Display of Designs in Beeswax.—Mrs. E. Whitcomb, 1st.
Largest and Best Display of Designs in Beeswax.—E. Kretschmer, 1st.

Largest and Best Display of Bees and Queens.—L. D. Stilson, 1st.

Best and Largest Display of Extracted Honey.—Nebraska Commission, 1st.

Best and Largest Display of Comb Honey.—Nebraska Commission, 1st.

Honey-Producing Plants.—Winnie L. Stilson, 1st.

Display of Apiarian Goods and Implements.—A. J. Root Co., 1st.

Display of Honey, Bee-Supplies and Queens.—E. Kretschmer, 1st.

A Correction.—In Mr. Whitney's article on page 690 in the third line from the top of the first column, read "a flush $\frac{1}{4}$ inch" instead of $1\frac{1}{4}$.

MR. S. T. PETTIT, of Ontario, Canada, wrote us Oct. 29:

"DEAR BRO. YORK:—The 'Old Reliable' has slipt a cog somehow. The last two numbers have failed to reach me, and I am all out of joint. It seems like only last week since I put my bees into the cellar last year, and now in a few days more they go in again. How time flies!"

THE MODERN FARMER AND BUSY BEE is what Editor Emerson Taylor Abbott now calls his paper. He has also changed it to a weekly, size $11 \times 15\frac{1}{2}$ inches, and 16 pages, raising the subscription price to \$1.00 a year. It is a fine-looking, general agricultural newspaper now, and deserves great success. Address for free sample copy, The Modern Farmer and Busy Bee, 319 Felix St., St. Joseph, Mo.

MR. O. O. POPPLETON, of Dade Co., Fla., who has lived in Cuba, and for years in Florida, had a long article in the Florida Farmer and Fruit-Grower, for Sept. 10, entitled, "Influence of the Coming Americanization of Cuba on Orange Growing and Trucking in Florida." The farm paper named is published in Jacksonville, Fla. Those interested can perhaps get a copy of it by sending say two 2-cent stamps to the name and address as given.

MR. N. E. FRANCE, State Inspector of Apiaries in Wisconsin, has written Secretary Stone that he expects to be at the meeting of the Illinois State Bee-Keepers' Association in Springfield next week—Nov. 16 and 17—in the State House. Mr. France will help in securing, or advise how to secure, a foul brood law in Illinois similar to that in Wisconsin. There should be a large attendance at the Springfield meeting. One and a third fare for round trip on all railroads.

EDITOR LEAHY, in his October Progressive Bee-Keeper, speaks thus of the fall season and future prospects:

"Owing to the prevalence of fall rains and continuous warm weather, vegetation has a strong growth, and the fall bloom is immense. Bees will go into winter quarters with plenty of stores, and of a good quality. All this bespeaks for successful wintering of the bees in this locality, and points to a good crop for 1899."

MR. AND MRS. THOS. W. COWAN, of England, will have the sympathy of all the bee-keepers in the world when the latter learn of the great affliction that our friends across the Atlantic have met with. Our first intimation of their irreparable loss we received from reading this paragraph in the British Bee Journal for Oct. 20, which is just received:

"With the most profound sorrow we have to announce the sad news that Miss H. M. Cowan, the eldest daughter, and Mr. Herbert F. Cowan, the second son, of our senior editor, were passengers on board the ill-fated Atlantic Liner, 'Mohegan,' wrecked off the Cornish coast on Friday last, and that the lives of both were lost."

HON. E. WHITCOMB, Superintendent of the Apiarian Department of the Trans-Mississippi Exposition, wrote us Nov. 3:

FRIEND YORK:—To-day I am in receipt of a fine chair, to which was attached a note reading as follows:

Please accept this chair as a mark of esteem which we hold for your many kind favors while Superintendent of the Apiary Building.

L. D. STILSON. E. KRETCHMER,
G. M. WHITFORD. AUG. C. DAVIDSON,
MRS. F. J. PREISS.

Of course, I value this chair on account of the circumstances under which it was presented, as well as the particular friends and co-workers who presented it.

We are getting the Apiary Building pretty well cleared out, and I will be away and at home early next week.

Your friend, E. WHITCOMB.

As all know, the Trans-Mississippi Exposition closed Nov. 1, after a five months' run. Mr. Whitcomb can now rest at home in that nice, new chair, and think about his summer's work. He deserves an opportunity to sit down, and also a good chair to sit in.

White Comb Honey Wanted.—We are in the market for best white comb honey put up in 12 or 24 pound single-tier shipping-cases. We would like it to run about 11 and 22 pounds, respectively. If you have what you think will suit us, please write, saying how much you have, and at what price you will deliver it in Chicago. Address, George W. York & Co., 118 Michigan St., Chicago, Ill.

First Bees Imported into Australia, according to information given in Australian Bee-Bulletin, were brought from England to Sydney in 1824.

Weight of Bees.—Berlepsch estimated 5,600 bees to the pound, when the bees were not filled with honey. Franz Ebster gives in Leipz. Bztg. as a result of his counting, 3,030 as the number of bees in a pound when the bees are filled for swarming.

A Proposed Remedy for Stings.—A woman was stung in the throat by a wasp which she had swallowed with some jam. Salt was promptly applied inwardly both alone and in mixture with vinegar, and also rubbed on outwardly, and this in all probability saved her life.—Gardeners' Chronicle.

Long-Ideal Hives are discussed in the Australian Bee-Bulletin. Evidently they are the same as the long-idea hives on this side the globe. In this country they were named long-idea hives because the long idea was involved in their construction. In Australia the letter "l" was added to the name either through a mistake, or else because they were considered the ideal hive, and long as well.

Accuracy, especially for beginners, is the theme of J. E. Crane in the Bee-Keepers' Review. If you have hives made at mills near by, make out a bill of pieces, and make an agreement that every piece shall be of well-seasoned lumber without the variation of $\frac{1}{8}$ inch, or better still, $\frac{1}{16}$. Make frames square, not even a little diamond shape. Top-bars not light enough to sag. Spaces around the frames exact. Foundation in the center of the frame, and hives accurately leveled so the combs will be in the center of frame when finished. Sections, cartons, and packing-cases, especially if made by differ-

ent firms, must be exact, otherwise sections may not go into cartons, or else cartons may not go into shipping-cases. Be accurate also in your knowledge, and do not think that bees will not use brood four days old to rear poor queens, or that a colony will never rear a queen in ten days after being made queenless.

Two Communities with One Queen.—A weak and a strong colony were united. A subsequent visit showed two distinct clusters, one having brood in all stages but no eggs, the other having brood, eggs and queen. A few days later the conditions were changed, the queen and eggs being in the other cluster. A distinct separation between the two clusters was formed by a quantity of freshly-stored pollen.—Schweiz. Bztg.

Strong vs. Weak Colonies for Honey.—Editor Hutchinson, in the Bee-Keepers' Review, agrees to the possibility of Dr. Miller's correctness when he says a large colony consumes less honey in a year in proportion to the number of bees than a small one, but refuses to believe that a large colony stores more in proportion to the number of bees than a small one, and calls for testimony on both sides. If that subject gets a thorough shaking up, both men will probably get some new light. Good topic to discuss.

Shirking the Tariff on Honey.—A tariff on imported honey helps to protect German bee-keepers. Living bees are admitted free. Thousands of colonies are ostensibly sent in from Holland free. A very few bees in a hive heavy with honey will serve to secure free admission, and thus much honey crosses the border without being taxed. Herr Reepen proposes that an effort be made to have a ruling that living bees be admitted free only when hives, bees and all do not exceed in weight 33 pounds.

Section-Cleaners.—J. A. Golden having said that L. A. Aspinwall's objection to belt cleaners was probably without having tried them, Mr. Aspinwall replies in the Bee-Keepers' Review that the failure of a disk, through whirling small particles of propolis into the honey, was sufficient to convince him the belt would not do. He thinks it may do by holding one edge of the section at a time on the belt, but that would be too slow work. With his improved cleaner he cleans more than 150 sections an hour.

BEST EXTRACTED HONEY FOR SALE

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is greatly preferred by those who like a distinct flavor in their honey.

PRICES OF EITHER ALFALFA OR BASSWOOD HONEY :

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—One 60-pound can, 8 cents a pound; 2 cans, $7\frac{1}{2}$ cents per pound; 4 or more cans, $7\frac{1}{2}$ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This honey is all

Absolutely Pure Bees' Honey....

the finest of their kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The pamphlet, "HONEY AS FOOD," will be a great help in creating customers for honey. See prices on another page.

GEORGE W. YORK & CO., - 118 Michigan St., CHICAGO, ILL.

To Our Regular Subscribers—Now for New Readers!

6 Great 50-cent Offers—Each One Free!!

On this page you will find six splendid premium offers, and we will mail your choice of any one of them for sending us \$1.00 for **just one New subscriber** for 1899—and we will throw in the last three months of this year's Bee Journal free besides to each new subscriber you send on these offers. That makes 15 months of the Bee Journal to the new subscriber. Or, for sending us **4 New subscribers**, as above, we will mail the sender all of the 6 great 50-cent offers.

JUST READ WHAT THEY ARE:

Offer No. 1.—Samantha at Saratoga.

100,000 Sold at \$2.50 per copy.

This is indeed a feast of fun, by the only peer of Mark Twain's humor—**JOSIAH ALLEN'S WIFE** (Marietta Holley.)

Read this Extract from the Book:

And right here, let me insert this new word of wisdom for the special comfort of my sect, and yet it is one that may well be laid to heart by the more opposite one. If your pardner gets restless and oneasy and muddlin' cross, as pardners will be anon or even oftener—start them off on a tower. A tower will in 9 cases out of 10 lift 'em out of their oneasiness, their restlessness and their crossness.

Why I have known a short tower to Slab City or Loontown act like a charm on my pardner, when crossness wuz in his mean and snappishness wuz present with him. I have known him to set off with the mean of a lion and come back with the limment of a lamb.

And jest the prospect of a tower ahead is a great help to a woman in rulin' and keepin' a pardner straight. Somehow jest the thought of a tower sort of lifts him up in mind, and happifys him, and makes him easier to quell, and pardners must be quelled at times, else there would be no livin' with 'em.

She takes off **FOLLIES, FLIRTATIONS, LOW-NECKED DRESSING, DUDES, PUG DOGS, TOBOGGANING, ETC.**

Opinions of Noted Critics:

"Exceedingly amusing."—Rose E. Cleveland. "Delicious Humor."—Will Carleton. "So exorcruatingly funny, we had to sit back and laugh until the tears came."—Witness. "Unquestionably her best."—Detroit Free Press. "Bitterest satire, coated with the sweetest of exhilarating fun."—Bishop Newman.

Nicely bound in paper, fully illustrated, printed from new type and on fine paper. 370 pages. Postpaid, 50 cents.

Offer No. 2.—New Waldorf Cook-Book.

Over 1,000 of the very best up-to-date recipes for every conceivable variety required in the kitchen and other departments of house-keeping, by **Mrs. Anne Clarke**, the distinguished student and instructor in culinary science, assisted by many of the most successful house-keepers in various parts of Europe and America. It gives the latest and best methods for economy and luxury at home. Just the book for the housewife or daughter. Has had an enormous sale at \$2.00 a copy. 350 pages; paper bound; postpaid, 50 cents.

Offer No. 3.—Cattle, Sheep and Swine Book.

Fully Illustrated—300,000 sold at \$3.00 a copy.

This great work gives all the information concerning the various Breeds and their Characteristics, Breaking, Training, Sheltering, Buying, Selling, Profitable Use, and General Care; embracing all the Diseases to which they are subject—the Causes, How to Know and What to Do given in plain, simple language, but scientifically correct; and with Directions that are Easily Understood, Easily Applied, and Remedies that are within the Reach of the People; giving also the Most Approved and Humane Methods for the Care of Stock, the Prevention of Disease, and Restoration to Health. Written by Dr. Manning.

Every farmer wants this great book. 390 pages, paper bound. Postpaid, 50 cents.

Offer No. 4.—Gleason's Horse-Book.

By Prof. Oscar R. Gleason.

This is the only complete and authorized work by America's king of horse trainers, renowned throughout America and recognized by the United States Government as the most expert and successful horseman of the age. The whole work comprising His-

tory, Breeding, Training, Breaking, Buying, Feeding, Grooming, Shoeing, Doctoring, Telling Age, and General Care of the Horse. You will know all about a horse after you have read it. No one can fool you on the age of a horse when you have this book. 416 pages, bound in paper, with 173 striking illustrations produced under the direction of the United States Government Veterinary Surgeon. In this book Prof. Gleason has given to the world for the first time his most wonderful methods of training and treating horses. 100,000 sold at \$3.00 each. Our price, postpaid, 50 cents.

Offer No. 5.—Music, \$5 for 50 cents.

Four pieces New Sheet Music, which sell at music stores at 50 cents each—\$2.00; Three years' membership in the World's Musical Association (regular price \$1.00 a year), \$3.00. Total, \$5.00. We offer the whole thing at 50 cents.

The four new pieces of sheet music are the very latest hits of this year; are regular sheet music size and quality, but the title pages are a new style of art, viz: Illuminated Chromatic designs in five brilliant colors.

THE SONG TITLES ARE:

"Do Your Honey Do," by THEO. METZ, author of "A Hot time in the Old Town To-night." This latter piece, said to be his best, is creating a great stir, and becoming immensely popular every where.

"Queen of the Bicycle Girls," by the celebrated composer, ORTO LANGEY, by far the most charming Bicycle Song yet issued.

"Blossoms from Over the Sea," by the distinguished composer, J. P. SKELLY, a very beautiful Sentimental Song.

"He's Just Like All the Men," by the renowned composer, EASTBURN. Wonderfully pleasing to the Ladies.

The World's Musical Association is an organization having special advantageous relations with the leading music publishers of this country and Europe, and being an enormous purchaser, it is enabled to supply to its members (and will do so) any music desired (at any time within the term of their membership), at such wholesale prices as are usually granted only to very large dealers.

Offer No. 6.—The Poultry-Keeper Illustrators.

The four "Poultry-Keeper Illustrators" are the greatest books on poultry subjects ever issued, and are a veritable poultry dictionary, covering the ground so completely that, having these four books, one needs scarcely anything more except "grit" to become a successful poultry-raiser. You cannot get such other books in the whole world, not even for \$50 each, for they do not exist. Were they given in another form and elaborate binding and colored cuts you might think them easily worth \$5 each, but what you want is not elegant printing, and in these we give you the value in information that you can make use of. They have cost much in labor and cash, but you get all this value for almost nothing. We mail the 4 Illustrators for 50 cents.

Illustrator No. 1.—Poultry Houses, Incubators, Brooders, Coops, etc., 25 cents.

Illustrator No. 2.—Artificial Incubation, Raising Chicks, Testing Eggs, etc., 25 cents.

Illustrator No. 3.—Poultry Diseases, Lice, Grapes, Moulting, Egg Eating, etc., 25 cents.

Illustrator No. 4.—Judging Fowls, Description of Breeds, Mating, etc., 25 cents.

Those offers ought to bring us in at least 2,000 new readers during this month and next. You could send in your own renewal for 1899 at the same time you send in a new subscriber, if you wish. If you do, you can select any one of the above offers free for yourself, provided you send at least **two New subscribers** at the same time. That would give you your choice of **three** of the offers—by sending your own renewal for 1899, and two new subscribers (\$3.00 in all).

Address, **GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, ILL.**

GENERAL ITEMS

Keeping Bees in Idaho.

I started a year ago June 10, then buying one swarm of bees—natural one—which I put into a new hive. That season I took 135 pounds of honey from it, and made two more colonies by dividing. I thought that pretty good, so I bought three more colonies in the fall, and took them through the winter all right. They were doing well in the spring, so I divided them, and out of the five colonies I increased to 12. After they were all filled up with comb and honey, I extracted, and up to Aug. 12 I took 975 pounds of honey. They have all done well since except two, which were rather weak from some cause or other, and in the latter part of September the yellow jackets worked on them so extensively that I don't think those two will live through the winter.

This section is excellent for bee-keeping, if attended to properly, but the only objection I have is, the season is so short. I have given this part of the country a genuine trial on bee-culture, and have concluded to go into it pretty extensively.

JOSEPH E. MORGAN.

Fremont Co., Idaho, Oct. 27.

From One Nucleus.

Starting with one nucleus (the freshet having taken away a small apiary a year or two previous), I had increased them the second year to three colonies, and obtained 170 pounds of section honey; the next year, to nine colonies and 275 pounds of section honey; the next year 12 colonies and 500 pounds of section honey; this year 13 colonies and 200 pounds of section honey. With the exception of one queen and a little foundation there has been no outside help given them.

This apiary is situated in the city surrounded mostly by commons, with Presque Isle Bay on the North. Nearly the whole crop of honey has been from sweet clover.

Commencing at the time the American Bee Journal was made into a weekly (1881), I have been a subscriber the greater portion of the time since. **IRWIN THOMPSON,** Erie Co., Pa., Oct. 31.

Bees Did Fairly Well.

My bees did fairly well the past season, and have from 30 to 40 pounds each, to the colony, to go into the cellar with.

The American Bee Journal is well worth the price of subscription, and has been a great help to me. **ALBERT G. PALMER,** Otsego Co., N. Y., Oct. 31.

Bees Did Reasonably Well.

Bees in Southeastern Nebraska did reasonably well the past season—much better than we anticipated after the season commenced. While we have not secured a large yield of honey, it is of fine quality, and the bees go into winter quarters in much better condition than for many years. We will have no honey to ship, but plenty for our home markets. **J. L. GANDY,** Richardson Co., Neb., Oct. 27.

Three Seasons' Reports.

I purchast about 12 colonies of bees (mostly hybrids, but a few being the native blacks), in the spring of 1896. I moved them nine miles to my home at night. They swarmed that season, and in the fall, after losing about two colonies by death of the queens, I had 25 colonies left, 24 being quite strong, and one only four combs of bees, which lived until April and then died. This is the only one I lost, and I took off 435 pounds of comb and extracted honey. In 1897, from 24 colonies I had an increase

Sweet Clover

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

| | 5lb | 10lb | 25lb | 50lb |
|---------------------|-----|--------|--------|--------|
| Sweet Clover | .60 | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover..... | .70 | 1.25 | 3.00 | 5.75 |
| White Clover..... | .80 | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover..... | .60 | 1.00 | 2.25 | 4.00 |
| Crimson Clover..... | .55 | .90 | 2.00 | 3.50 |

Prices subject to market changes.

Add 25 cents to your order, for cartage, wanted by freight.

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published today. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us **Two New Subscribers** to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

SAVE MONEY AND FEED BY BUYING AND USING OUR **\$5.00 FARMER'S FEED COOKERS**

It is low priced, not cheap. Made from the best of cast gray iron with 14 oz. galvanized steel boiler to hold 20 gals. Just the thing for cooking feed for stock, pigs or poultry and heat water for scalding hogs. **Reliable Stock Food Cookers** are equally good but of much larger capacity, 25 to 100 gals. We will be glad to quote prices on inquiry. Do not buy until you get our free descriptive circulars. Better write for them at once.

The Ram's Horn...

Is an Independent Weekly Paper of 20 pages—

each page somewhat larger than those of the Bee Journal. The subscription price is \$1.50 a year. It is one of the brightest and best publications of the present day. Its "Platform" is: 1. The Primitive Gospel. 2. The Union of Christendom. 3. Equal Purity—Equal Suffrage. 4. The Sabbath for Man. 5. The Saloon Must Go. Motto: "Have Faith in God."

We will mail you a sample copy of the Ram's Horn upon receipt of a two-cent stamp.

OUR LIBERAL OFFER:

We wish to make our PRESENT subscribers to the Bee Journal a generous offer in connection with the Ram's Horn, viz: Send us **TWO NEW** subscribers for the American Bee Journal for one year (with \$2.00), and we will see that the Ram's Horn is mailed you free for one year as a premium.

Or, send us \$2.00 and we will mail to you the Ram's Horn and the American Bee Journal, both for one year.

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL

See Honey Offer on page 714.

of seven colonies, 1,400 pounds of comb honey, and 300 pounds of extracted,

In the spring of 1898 I rented 31 colonies of bees for the half, and moved them a half mile. In April seven colonies died, so we had only 24 left—the same as last year. We have taken from the hives about 1,000 pounds of honey this year, mostly comb, and have 36 colonies in good condition for winter.

I use nothing but the 10-frame chaff hive, and think these are good, as I winter my bees on the summer stands.

I lost four queens in July, so I purchased Italians to replace them, and then thinking my bees were "running out," I bought in all 15 Italian queens, which I introduced, and I am very much pleased with them.

We get 20 cents a pound for comb honey, or \$1.00 for six pounds. It sells as well as other farm produce.

S. D. BARDIN.
Berkshire Co., Mass., Oct. 31.

Worst Year of All.

I started with 25 colonies last spring, and bought \$40 worth of hives and fixtures, and got about 100 pounds of comb honey this season, which is dark and not fit to put on the market. I have kept bees a good many years, and this is the worst year of all. I will take good care of my bees this winter, and will not let them starve. I hope they will pay next year.

F. MCBRIDE.
Hardin Co., Ohio, Oct. 31.

Dark Honey Crop.

We had a good crop of dark honey this year, but no white honey. The linden bloomed full but secreted no nectar. Bees are in good condition for winter. I have 83 colonies, and will winter them on the summer stands. There is not much risk to run here in wintering bees, if they have plenty of stores. I never saw so much honey-dew as there was here the past summer, and the bees gathered lots of it; it was pleasant to taste, and thick, but dark.

A. J. MCBRIDE.
Watauga Co., N. C., Oct. 24.

A Queen-Breeder's Reply.

Being one of the American Bee Journal's advertisers, I hope it will allow me space to make some remarks concerning a communication from J. Hambly, beginning on page 636. It is not with the intention of getting free advertising, for it is not worth much at this season of the year, and will be forgotten ere the next season opens, but in justice to myself, as every reader who noticed my advertisement could say, as did Mr. Henry Swarting, Jr., of New York, in a communication sent as soon as Mr. Hambly's letter appeared: "It looks to me as if he sent that job at you."

During my whole experience in selling queens I have had to contend with only a few of the pessimistic class, and I guess every queen-breeder occasionally gets an order that brings forth a smile, and enables him to read the man as well as the order. The majority leave it to one's honor in filling their orders, knowing that the success of the breeder depends upon his sending out what is advertised; while others will try to secure a special selection by stating that they have ordered sample queens from a certain number of noted breeders and will patronize the one sending the best. No one expects to hear from such a person again, unless it is in the shape of a complaint.

Like Mr. Hambly, some will ask before ordering, whether one's queens are reared to sell or for business, and invariably get the reply, "for both."

For the close observer, Mr. Hambly tells too much in his letter of complaint. He says:

"A cold spell came in April, and they dwindled considerably, and six lost their queens... I sent to five different States this season for queens, and was deceived in nearly every one... I got good queens from some breeders."

Mr. Hambly should have said, in justice

26c Cash Paid for Beeswax.

This is a good time to send in your Beeswax. We are paying **26 cents a pound — CASH** — upon its receipt. Now, if you want the money **PROMPTLY**, send us your Beeswax. Impure wax not taken at any price. Address as follows, very plainly,

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

- I**f you would like to see a picture and description of the finest honey-plant in the world, get the Bee-Keepers' Review for July and September.
- I**f you would like to know where to find the best honey-location, to see it described with pen and picture, read the September Review.
- I**f you are interested in knowing the methods of our best queen-breeders, and would enjoy seeing some fine engravings upon the subject of queen rearing, one of them a double-page picture, get the Review for August.
- I**f you would like to learn how to so group and arrange your hives that they will occupy but little space, and yet give to each hive a dis-inclive location, see the article and diagram on this subject in the August Review.
- I**f you are interested in knowing what is going on among bee-keepers across the ocean, read "Notes from Foreign Bee Journals," in the Bee-keepers' Review.
- I**f you wish to see pointed out the errors and fallacious ideas that creep into current apicultural literature, get the Review and note the courage and ability with which Mr. R. L. Taylor conducts the Department of Criticism.
- I**f you wish a bright, clean, clear-cut, sprightly, beautiful, illustrated, go-a-head, up-to-date, really helpful, useful bee journal, subscribe for the Bee-keepers' Review.
- I**f you are not now a subscriber, send me \$1.00, and I will send you 12 back numbers, the Review from the time your subscription is received to the end of 1898, and then for all of 1899. The sooner you subscribe the more you get.

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polish, snowy-white Sections, beautiful straw-

colored transparent Foundation, Improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, **Leahy Manufacturing Company, Higginville, Mo., or**
1730 South 13th St., Omaha, Neb.

to the breeders of "five different States," whether the one sent by me on May 18, soon after the considerable dwindling, was the only one that merited the honor of being put "in a strong colony" which necessitated the dethroning of one of his very best, as all had dwindled, and the others introduced to those so reduced in numbers as to become queenless; or, whether all were put in strong colonies after the freeze and dwindling. A man that cannot buy queens in "five different States" without being "deceived in nearly every one," but has stock that will build up after spring dwindling, and store quite a lot of honey considering the dry summer, should offer queens for sale.

If he bought queens for his dwindled queenless colonies in May, expecting them to build up and give a surplus, he should have said so, and no breeder of sufficient intelligence to be worthy of the name would have promised him satisfaction.

I am in sympathy with Mr. Hambly, and will return to him the price paid for the queen, if he will ask for it. He did not give me the chance to right matters, that he did the breeder of New York.

Furthermore, if any of my patrons think I failed to "toe the mark," and will state the facts in a gentlemanly, business-like manner, satisfaction will be given.

The difference in the price of tested and untested queens would indicate that no breeder would claim that every untested queen is first-class; and I have not learned how to tell about a tested one kept in a small nucleus, except in size of queen and color of progeny, as one has to be kept in a full, strong colony to be able to judge of her prolificness; and all practical apiarists know that some fine-looking queens reared in the natural way are worthless.

I am ready to join the American Bee Journal in exposing all frauds, and it can get assistance from the National Queen-Breeders' Union in exposing all crookedness obtainable concerning both queen-breeder and buyer.

W. H. PRIDGEN,
Warren Co., N. C., Oct. 17.

Very Good Season.

The past year has been very good with me, but not quite so good as last year, but I think it is partly my fault, as I transferred all my bees (32 colonies) in the spring to 10-frame hives, then increased them to 58, and extracted 7,200 pounds this season. In September I tried rearing queens, *a la* Doolittle, with splendid success, for I got 10 out of 12, and increased to 72 good colonies. I attended to 22 colonies for another man for the half, and got 2,200 pounds comb honey, or 1,100 pounds for my share.

Without any bragging, the American Bee Journal has been worth \$25.00 a year to me.

W. A. MOORE,
Salt Lake Co., Utah, Oct. 26.

Why Do Italians Store Best Honey?

On page 646, appears the discussion between Mr. Hart and Mr. Bevins again. The matter in question, if I do not mistake, is, Why do Italian bees store a better quality of honey than do the blacks, both having access to the same source? To me this seems to be an important question, and should not be ignored, for with me it is a settled question that the Italians do store better honey than do the blacks, both having access to the same sources—not to the same source only, for in this locality bees seldom work on only the one source at one time, and under such conditions the Italians store better honey than do the blacks. Now, is not that alone interesting enough to cause the question Why?

I do not know why, but would like to ask Mr. Bevins if he is able to tell why. Is it because the lighter honey they gather is not so sweet as is the darker? or, is it the blacks are more fond of pollen than the Italians, hence gather the darker honey which has more floating pollen in it? or, is it because the blacks have longer tongues than the Italians, and after the light honey which was easy to get has been taken by

both the Italians and blacks, the blacks keep on gathering the darker, which is now at the very bottom of flower-cups, and mix it with the lighter already stored, hence makes the whole look darker?

Still more interesting would be the case should the Italian bees gather lighter honey from one and the same source only, than do the blacks. This of course I do not know, but suppose there is some one who does know, and is willing to tell us all about it; then let us who do not know listen to him awhile, and if he gives sufficient proof that what he says is true, let us thank him for his kindness; and if he gives us theories based on sound reasoning, let us criticise his theories in such a manner that we may be benefited by them.

AUGUST C. F. BARTZ.

Chippewa Co., Wis.

Busy Extracting.

Bees have done well here this season, which has been the best for surplus honey since 1895. I am too busy extracting to write more this time. T. H. WAALE. Clarke Co., Wash., Oct. 24.

Prefers T Tins.

My honey crop was about 25 pounds to the colony. I am using T tins, and would not have pattern-slats, or section-holders. J. LESLIE DUNHAM. Marshall Co., Ill., Oct. 28.

Convention Notices.

Colorado.—The Colorado State Bee Keepers' Association will hold their annual convention Nov. 30 and Dec. 1 and 2, 1898, in the State Capitol Building, Denver. The Horticulturists meet Nov. 28, 29 and 30, our first day being their last. This arrangement will give members of both a chance to attend the other's meeting and discuss common interests. R. M. AIKIN, Pres., Loveland, Col. F. RAUCHFUSS, Sec., Elyria, Col.

Ontario.—The annual meeting of the Ontario Bee-Keepers' Association will be held in Guelph, Dec. 6, 7 and 8, 1898. Owing to the Guelph Fat Stock Show, the Guelph Poultry and Pet Stock Show, and the Experimental Union meeting on the same dates, there will be a large meeting of beekeepers, and each association will be a help to the other, as many are interested in all the different meetings. All are cordially invited to attend the meetings. W. COUSE, Sec. Streetsville, Ont.

Illinois.—The Illinois State Bee-Keepers' Association will hold its 8th annual meeting at the State House in Springfield, Nov. 16 and 17, 1898. We will have the advantage of one fare and a third for the round trip—open rate—along with the Odd Fellows, whose meeting is the third Tuesday of November. Our Association has been petitioned by the Northern Illinois Bee-Keepers' Association to take the proper steps to secure the same foul brood law for our State as that of Wisconsin. Excellent board is secured at 25 cents per meal and lodgings just as reasonable. The one dollar for membership fee also entitles you to the American Bee Journal for one year. JAS. A. STONE, Sec. Bradfordton, Ill.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Oct. 18.—Fancy grades of white comb honey sell freely at 15c, with good grades from 11 to 12½c, according to finish; ambers bring 8 to 10c, with dark mixt and unclean, 7 to 8c. Extracted, white, 6 to 7c; ambers, 5 to 6c; buckwheat, 5c. Beeswax, 26 to 27c.

The market is active and nearly all consignments are sold soon after arrival. R. A. BURNETT & Co.

San Francisco, Oct. 26.—White comb, 9½ to 10½c; amber, 7½ to 9c. Extracted, white, 6½ to 7½c; light amber, 6 to 6½c. Beeswax, 24 to 27c.

There are no changes to record in quotations, but market is firm at the ruling figures. Stocks are light, particularly of choice extracted. A shipment of 309 cases went forward the past week by sailing vessel for Liverpool.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax, prime, 24c; choice, 24½c. At present there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12 to 13c; No. 1, 11 to 12c; amber, 10 to 11c. Extracted, white, 5½ to 6c; amber, 5 to 5½c; dark, 4½ to 5c. Beeswax, 22 to 25c. The receipts of comb honey are larger. C. O. OLEMONS & Co.

Boston, Sept. 30.—Our honey market shows a decided firmer tone since our last. A few sales have been made at 15c for an extra fancy lot, while almost all sales ranging from A No. 1 to fancy now are made at 14c, while occasionally, something a little off, will bring as low as 12½ to 13c. We do not look to see any lower prices.

Extracted, Florida, in barrels, mostly 6c to 7c, with a good demand. Beeswax, slow sale at 26c for best. BLAKE, SCOTT & LEE.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12½c; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6½ to 7c. Beeswax, 25 to 27c. WALTER S. POWDER.

Milwaukee, Oct. 18.—Fancy 1 pounds, 12½ to 13c; A No. 1, 12 to 12½c; No. 1, 11 to 12c; No. 2, 10 to 10½c; mixt, amber and dark, 8 to 9c. Extracted, white, in barrels, kegs and pails, 6½ to 7c; dark, 5 to 5½c. Beeswax, 26 to 27c.

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing. A. V. BISHOP & Co.

Buffalo, Oct. 20.—This market is much improved in demand on all grades. Strictly fancy 1-pound comb, 13 to 14c; No. 1, 11 to 12c; dark, etc., 7 to 9c. Fancy extracted, 5 to 6c; dark, 4 to 4½c. Fancy beeswax, 27 to 28c; poor, etc., 20 to 25c. BATTERSON & Co.

Columbus, O., Oct. 29.—Fancy, 14 to 15c; No. 1, 12 to 13c; No. 2, 10 to 11c; amber, 9 to 10c. Receipts somewhat heavier, but demand improves as weather gets colder. COLUMBUS COM. AND STORAGE CO.

New York, Oct. 22.—Receipts of comb honey are large, and there is quite a stock now on the market. While whites is in good demand, buckwheat and mixt seem to be somewhat neglected, and quotation prices have to be shaded in order to sell in quantity lots. We quote: Fancy white, 13 to 14c; No. 1 white, 11 to 12c; amber, 10c; mixt and buckwheat, 8 to 9c. Stocks of extracted are light of all kinds. Demand is good at following prices: White, 6 to 6½c; amber, 5½c; dark, 5c. Southern, in half barrels and barrels at from 55c to 60c a gallon. Beeswax dull at 26c. HILDRETH BROS. & SEGELKEN.

Detroit, Oct. 20.—Honey in better demand and better prices as follows: Fancy white, 13 to 14c; No. 1, 12 to 13c; fancy dark and amber, 10 to 11c. Extracted, white, 6 to 7c; dark, 5 to 5½c. Beeswax, 25 to 26c. M. H. HUNT.

Cleveland, Oct. 27.—Fancy white, 13 to 14c; No. 1 white, 12 to 12½c; light amber, 11c; buckwheat, 9c. Extracted, white, 7c; light amber, 6c. A. B. WILLIAMS & Co.

The Domestic Sheep—Its Culture and General Management.
BY HENRY STEWART.
AN UP-TO-DATE BOOK ON SHEEP.

The Most Scientific, Practical and Useful Book ever published on this subject. Endorsed by the World's Highest Authorities, Press and Sheep Public everywhere. It contains 372 pages of "boiled down" knowledge and 165 plates illustrating the recognized breeds and every department of sheep life. Price \$1.50, post paid.

HON. JAMES WILSON, SECRETARY OF AGRICULTURE, SAYS:

"I do not know that we have anything on sheep as good. This book should be in the hands of every sheep man in the country. The more I look through it the more I am pleased with it. I shall certainly recommend it to correspondents of the United States Agricultural Department asking for works on sheep feeding, sheep-breeding, etc."

TABLE OF CONTENTS.

CHAPTER I.
The Natural History of the Sheep. Antiquity of the Sheep; Husbandry—Lessons to be Learned from Ancient Sheep-herds—The Anatomy of the Sheep: Its Mouth and Teeth; Its Stomach; Its Intestines and their functions. Pages 7-21.

CHAPTER II.
The Varieties and Breeds of Sheep. The American Merino—Points of Excellence in a Merino—Sub Breeds of the Merino; The Dickinson, The Standard Delaine, The National Delaine, The Improved Delaine, The Black Top, The Improved Black Top—The Saxony Merino—The Rambouillet Merino—The French Breeds—The British Breeds—Short-wools: The Southdown, Shropshire, Hampshire, Suffolk, Oxford, Dorset. Long wools: The Lincoln, Cotswold, Leicester, Romney Marsh and Wensleydale. Mountain Breeds: The Cheviot, The Black-Faced Highland, Welsh—Other Varieties of Sheep: The Tunis, etc. Pages 22-102.

CHAPTER III.
The Science and Art of Breeding. Breeding an Art Based on Strictly Scientific Principles—What is a Breed?—Breeding by Ancient Shepherds—Hereditiy a Special Function—Selection a Special Feature—Climate Influences—Cross Breeding—Influence of Soil on Health of Sheep. Pages 103-126.

CHAPTER IV.
The Science and Art of Feeding. Feeding the Most Important Part of Agriculture—Character of Food and Composition of Animal—The Nutritive Ratio—Feeding for Lambs—Table Nutritive Value of Foods—Rules for Winter Feeding—Feeding Crops for Sheep—Feeding Roots—Ensilage—Filling the Silo—Feeding Lambs—Feeding Lambs in a Corp Field—Rearing House Lambs—Feeding Grass Lambs—Experiments in Feeding Lambs, and Possible Gain in a Year's Growth—Winter Feeding for Wool—Scientific Experiments in Feeding Lambs for Market. Pages 127-200.

CHAPTER V.
Barns and Stables. Best Arrangement of Buildings—Octagonal, Square and Round Bars—Shed for Soiling Sheep with Floor Plan—Handling Sheep—A Texas Catch Pen for Sorting and Dipping—A Manitoba Sheep House—J. E. Wing's Barn—Mr. Vestal's Barn—Shepherd Dogs. Pages 201-225.

CHAPTER VI.
Wool: Its History, Uses, Etc. On the Difference in Wools—Wool Growing a Science—The Nature of Wool—Cross Breeding for Wool—The Culture of Wool—Uniformity in Wool—Washing Sheep—Sheep Dips and Dipping Slaughter; By Machine and Hand—Sorting Wool—Pilled Wool—Care of the Sheared Sheep. Pages 226-291.

CHAPTER VII.

Gleanings at Half Price,

—or, Two Papers for the Price of One.

We have made arrangements whereby, for a limited time, we can send either the Farm
Journal, published at Philadelphia or the Poultry Keeper, published at Parkesburg, Pa., both
fifty-cent monthlies, and the very best in their line, with **Gleanings in Bee-Culture**, to a
new or old subscriber, both for one year. But the conditions of this offer are that the money
[\$1.00] shall be sent in advance, and that all arrearages to Gleanings, if any, shall be squared
up.

The Ohio Farmer and Gleanings in Bee-Culture
both for One Year for \$1 10.

We will send the Ohio Farmer, a dollar weekly, one of the leading agricultural papers of
the United States, and Gleanings in Bee Culture, both for one year, to a new or old subscriber,
for \$1.10, paid in advance, and all arrearages to Gleanings, if any, squared up.

The Farm Journal is now in its 21st year, and takes the lead among all the low-priced
agricultural papers. It is packed full of practical hints and suggestions; puffs no swindles, and
inserts no humbug advertisements.

The Ohio Farmer is a larger paper, and is issued weekly, and is one out of a few really
good farm papers.

The Poultry-Keeper is monthly, edited by P. H. Jacobs, and published at Parkes-
burg, Pa. It has a tinted cover in two colors, and is beautifully gotten up.

Remember that, in order to secure any one of these three papers, in combination with
Gleanings, the money must be paid in advance, and arrears to Gleanings, if any, squared up.
These offers are very low, and will be withdrawn soon.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at
Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

[Continued from page 708.]

SECOND DAY—FORENOON SESSION.

The next on the program was a paper from Dr. C. C. Miller, which he read as follows:

Bee-Keepers and Supply Manufacturers.

Supply manufacturers and dealers cannot exist without bee-keepers, and bee-keepers would have a good deal harder

time without those who make and sell bee-supplies. So there should be the most cordial understanding between them. What better place to encourage such understanding than at a convention like this, where both meet face to face? I believe manufacturers are anxious to know just what will best meet the needs of bee-keepers, that being to their own interest, so let each bee-keeper make known what he desires different, and if his desire cannot be met he may at least have the satisfaction of knowing why it cannot be met. On the other hand, it is possible that manufacturers and dealers may make some suggestions for the benefit of those who order from them.

By way of introducing the subject, and with no thought of covering any great part of the ground, I may be allowed to say a little as to what I might like, or dislike, from a bee-keeper's standpoint.

I remember a time when I received—I think five was the number—large, heavy boxes filled with material to be put together. I opened one, finding part of the pieces I wanted, but not all. There was no means of knowing whether the parts wanted might not be in the bottom of the box, so almost the entire contents had to be emptied. Not until the fifth box was opened were the proper parts found. Understanding that there was scarcely room for the boxes in the room where they were, and that it was heavy work moving them around, you may appreciate the situation. The moral of it is, that it will be well in sending out goods to have in

Exhibit of the Nebraska Commission in the Apiary Building at the Trans-Mississippi Exposition at Omaha.

mind not merely the convenience of packing, but to have some regard for the convenience of those at the other end of the line.

It would be unfair not to make grateful mention of great advance in this direction. The last considerable shipment of supplies I received was a lot of shipping-cases. It wasn't this year! Each package was complete in itself, containing all the parts needed for so many shipping-cases, there was no need to open another package till all in that had been used up, just the right amount of each kind of pieces, the right number and the right kind of nails—I tell you, it was a real pleasure to know that some one had been studying, not how to get through with his job in the easiest way possible, but to make my job as pleasant as possible.

One of the great evils is the trying to have everything at as low a price as possible, without regard to lasting quality or permanent value. Just so the price is low. I don't know whether bee-keepers or manufacturers are most to blame for this. The result is some tendency toward sham and shoddy.

Another evil running parallel with this is, going to extremes with the matter of uniformity.

It's a good thing to have goods at low prices, and it helps toward this to have only one variety of an article for all, but it's carrying the thing a little too far when a standard article is so cheapened in price that it becomes flimsy, and thus dear in the long run, so that those who want a good article, and are willing to pay for it a fair price are obliged to pay an extra price because of having goods made to order. Instead of catering to the desire for extremely low prices with little regard to real value, it might be to the interest of all concerned if manufacturers would do their pushing in the direction of better goods at fair prices.

I want a good frame with metal spacers, and I am told such a frame cannot be on the regular list because such spacers would be in the way of the uncapping-knife, and altho I work entirely for comb honey, and altho frames in the brood-chamber are less and less used for extracting, yet for the remote possibility that some time I may change my plans and want to use brood-combs for extracting, I am told that such frames as I want would break in on entire uniformity, so I must fall in line and use frames I don't want and don't like, or else pay an extra price as a penalty for varying from the standard. I submit that's carrying uniformity a little too far.

A good many believe—and perhaps no one disputes it—that the most satisfactory hive-cover, and the cheapest in the long run, is one covered with tin. Will you show me such a cover listed in any catalog? Those who want them and will have them must pay the extra price for varying. Would it not be a wise thing for manufacturers to encourage, rather than to discourage, what they must believe for the best good of bee-keepers, by putting such goods on their lists, even if the price must be high? Give us the chance, at least, for getting the best goods, if we are willing to pay the price, and encourage beginners to get what will be the cheapest in the long run.

Now that's enough to start on, and I'll listen to what others desire, and especially to what manufacturers and dealers desire on the part of bee-keepers. C. C. MILLER.

A. I. Root—In regard to the idea of marking on the outside of packages what is on the inside, I know that I did a good deal of scolding about that a couple of years ago. Almost all kinds of our supplies now have a list on the outside of the package, indicating what is inside. The modern way of putting up goods is to put a printed slip on the outside indicating what is inside. That can be done very easily by having a printed slip for regular goods. Certain things we put up in regular packages so they can be put up in quantity, and then these goods are marked on a printed list and the printed list can be gummed on the outside of the package. We can easily do that when the goods are regular, but when somebody orders something special, or orders goods modified in a special way, it is harder. During this last season, when there was such a rush, I am afraid our folks were not so exact about that, to stick to that plan of marking the goods on the outside of the cases.

Mr. Masters—I would like to give the supply dealers an idea or two. I have been buying supplies for the last ten or a dozen years, and there is one thing I have always objected to, and that is putting the heart side of a board inside. I want the heart side of a board outside. I often have covers come to me with the heart side below.

A. I. Root—From our place?

Mr. Masters—Yes, sir; from your place. It is almost impossible to keep them from springing. I have thought that I would write to the manufacturers in regard to the matter, but I have not done it. I think this is just the place to speak of

it. That is the main complaint I have to make. I hope you will reform and not do it again.

Dr. Miller—There is one little item that I want to speak about—I think all bee-keepers will appreciate it: I mean the item of nails. I get some goods and I don't know, to begin with, the kind of nails I should have. When I have found out the kind of nails I should have, when I go to the hardware store perhaps I can't find the right kind there. And if I do find them, I don't know how many I want, and I will likely get more or less than I want, and may be I will get the goods partly made up and then have to wait until the next time I go to town, or else make a special trip. When you can be sure of getting just the right kind of nails, and just the right number, and all ready to be used, it is a big thing. It is that sort of thing that I am glad to see the manufacturers are looking after. They are doing these things, as I said in my paper, and as I thoroughly believe, not because they are good men, but because they want to make money out of us fellows who are buying, and they are trying to do the best they can for us. They are wise in their generation. If any of you can think of something you want them to do for us, just tell them. They are not doing as much as they ought toward making a demand for better goods. They are rather catering to the demand for low-priced goods, and that is too apt to mean shoddy goods.

Mr. Westcott—I have no kick to make at all on the manufacturers, excepting once in awhile. That is, as a general thing I receive good goods whenever I order; but once in awhile when I write for a half dozen or a dozen hives, I find there will be an end that is not good, while the rest will be perfectly good. It is a good deal of work for a man to go to work and make a hive end or a side. So far as the nail question is concerned, I don't think that amounts to anything. I think all of us can buy nails enough to have plenty on hand.

Dr. Miller—About those bad pieces of wood: Sometimes I have a package of stuff for 500 frames, and I go to work making them up. Here is a bad piece, here another bad piece. I lay them all aside, and by and by I have enough bad pieces to make a bad frame, and I don't make it. [Laughter.]

A. I. Root—We have an inspector who is a very careful man. If he has any fault, he throws out stuff that is too good to throw away. I have enjoined the boys to keep the quality of the goods up; if other manufacturers want to make cheap goods, let them do it. The boys sometimes think it is a pretty hard state of affairs to let other parties cut below our prices and take orders out of our hands. What shall we do? Shall we put in poor stuff in order to meet competitors' prices, or shall we hold up the quality of the goods? If there is anything that I insist upon more than another it is that we want to keep up the quality of "the goods." Cheap John goods don't pay. If I was ever on the other side of the question, I beg pardon.

Mr. Danzenbaker—I would like to say a word about No. 2 sections. There are a few dealers in the country who are buying these sections and selling them as No. 1, and the people who buy them think they are buying No. 1. That reflects upon the manufacturer. The dealer buys them from the manufacturer as No. 2, and then sells them for No. 1, and charges No. 1 price. I know several men who are doing it. Then there was something said about nails. I agree with Dr. Miller about the nails. I think that is one of the greatest favors the manufacturers do us. I live in a large city, where there are large hardware stores, and sometimes I have gone to half a dozen stores without finding the size and kind of nails I wanted. Where I did find them, I would find that I must buy a whole pound, when I only wanted a few. Out in the country towns where there are only one, two or three stores, you might not be able to find nails at all of the right size. And if you undertake to nail up the hives or frames with nails that are not of the right size, you are apt to split and ruin your stuff. Only sometimes the nails sent are a little scant. In putting up ten hives, I have lacked just enough for one hive.

Dr. Miller—My experience is rather the reverse of that. I am getting ready to set up a hardware store of my own with the extra nails I have accumulated. They always send me a great many. I think very likely Mr. Danzenbaker enjoys driving nails pretty well.

Mr. Acklin—In St. Paul and Minneapolis it is almost impossible to get nails of the right size. The nails we get there would split any kind of hive-stuff. A great many of our customers have spoken of what a great satisfaction it was to have the nails sent with the goods. Some have spoken of a shortage, and we would find out that they had put in more nails than were called for on the printed slips of directions.

Mr. DeLong—I want to ask if there is any difference be-

tween the ordinary commercial nails that are purchast at the hardware stores, and the nails that the manufacturers of supplies send out?

Dr. Miller—Yes, sir.

Mr. DeLong—A neighbor of mine said the nails were galvanized, or had gone through some process that prevented them from rusting. Nails that will rust in the hive lose their efficacy in holding the hive together, and of course a bee-keeper who puts up a good hive out of good material should put in good nails so as to keep the good things all together. I think the bee supply companies would be a good place for the bee-man to buy his nails. I want to say in regard to the supply men, that I think they are a blessing to the fraternity. They are helping to make bee-keeping more easy, and are helping to elevate the business.

Dr. Miller—I want to make an apology. Not so very long ago there was put before us what I think Mr. DeLong has referred to—that is, what were called cement nails, with a covering of cement to make them hold tighter. I said there was no need for them—that we could get the same effect cheaper—just rust your nails and they will hold tight. After getting some of the cement nails, I wanted to take that back. They are away ahead of ordinary nails. You can put in a nail so small that it won't split the wood at all, as an ordinary smooth nail would, and the cement nails will hold much tighter. It is cheaper in the end to use the cement nails; they cost a little more per pound, but you get more to the pound, as you can use a smaller nail. I have gone through the wholesale and retail hardware stores in Chicago for the right kind of nails without finding them; then I sent to the manufacturers of bee-supplies and I would get the right kind. You cannot get the right nails in the large places, let alone the small places. It is a big thing to get the right kind of nails. If you have never tried the cement nails, try them and you will be convinced.

E. R. Root—I want to say a word in regard to the use of wire nails and cut nails. Wire nails won't draw the boards up together; cut nails will. Wire nails won't hug the boards close, but cement wire nails will draw them up tight. Sometime ago the thought occurred to us that we wanted to make a better hive, and we put the price up, as we also did the quality of the material. The growth of our business has shown us that the people appreciate that we want to make better goods, even if we have to charge higher prices. Last season we had more business than we could possibly take care of. We endeavor not to put knotty or shaky boards in our hives. We are endeavoring to give the bee-keepers what they want. We are anxious to see what changes and what improvements can be made. Last year I traveled a great deal, and nearly every year I go around among the bee-keepers and see what they want. We want to know how we can improve our goods. Words of intelligent criticism are what help us supply dealers. In regard to marking packages, we have a rubber stamp for marking, but in the rush of the busy season we leave that stamp off of some of the packages, probably. I presume that some get goods without being stamped. We intend to put stamps on all packages, indicating the contents of the packages.

Mr. Masters—There is one thing in reference to the nail question that I wish to say, that has not been said yet. I find that the nails that I get from Mr. Root—and I presume I would probably find the same thing with those furnished by other manufacturers—have points. They are sharp-pointed, and will stick in. You stick in a nail and it will stay where you put it until you strike it. If a man has to hold a nail while he gets it started, it is a great inconvenience. These pointed nails I have found to be a great advantage in putting hives together, especially with the smaller nails. I consider cement nails a great advantage. I have found out that the nails hold much better. I have sometimes had to drive boards apart that had been nailed together, and with the cement nails I have found that sometimes the head of the nail would pull through the wood rather than let the nail draw out. It is a great advantage to have nails that will hold, and sharp-pointed nails.

A. I. Root—Some one has said that the cement nails are cheaper, and they are cheaper for this reason: A smaller nail of this kind will hold better than a larger nail that is not cemented.

Mr. Lathrop—Perhaps I am the only man in the room who ever thought of such a thing, but I wish the supply dealers would use different nails for nailing up cases and boxes. They nail them up as if they never expected them to be opened again. I would like them to use short, smooth nails for nailing up shipping-boxes—any boxes that contain supplies. Sometimes the bee-keeper has to tear the cover of the box all to pieces, for the packers have used too many nails, or the

nails are so long they won't pull out. An ordinary amount of nails will hold a box together while it is going from the factory to the bee-keeper, and he can open it without destroying the boards.

Dr. Miller—I think the manufacturers should, when they send out a case of goods, nail it securely. Sometimes I think there are not fastened up tight enough.

Mr. Danzenbaker—Stuff shipped to our part of the country can hardly be nailed too tight. The boxes get handled very roughly by many of the colored freight-handlers. I have several times had goods lost by their not being nailed up strongly enough. I would rather have ten boxes nailed up too strongly than one that is not nailed strongly enough, and is broken apart.

Dr. Miller—I believe I have had the same feeling that Mr. Lathrop has. I suppose it is a hard matter to know how to fasten up packages. It makes me feel badly to have to split a nice cover all to pieces, but I suppose it is a difficult thing to do to strike just the right medium.

Mr. Danzenbaker—I use a nail-puller, such as dry-goods men use in opening boxes. I can draw the nails out and save the covers without breaking them.

Mr. Spaulding—I went into several hardware stores hunting for them, and the hardware men said they didn't keep cement nails at all. The traveling men on the road wanted to sell them to them, but couldn't. The hardware men said carpenters wanted nails that they could hold in their mouths, and that the taste of the cement nails was objectionable.

E. R. Root—The ordinary hardware dealers do not seem to know of the cement nails, but they will after awhile.

Dr. Miller—Is there anything in the covering of those cement nails that is injurious?

E. R. Root—It is only a preparation of tar.

Mr. Rauchfuss—As the supply manufacturers seem willing to hear a little criticism, I believe this is a good time to say something about the way hive-bottoms are made. We get bottoms frequently that are in two pieces, and in our dry climate they shrink apart and leave quite a big crack. I would like to have the bottoms always in one piece. With the bodies of the dovetailed hives, if they are made of lumber that is not thoroughly seasoned, and if they lie in our locality for a few months without being made up, it is almost impossible to put them together without splitting. The dovetails will not fit any more.

Mr. Hatch—I would like to say one word against poplar shipping-cases. They do not look good; they do not ship good, and I do not think they are good. They split, and don't present a good appearance. I would rather have pine than poplar any time.

At this point it was moved, seconded and carried that the regular business of the convention be closed with to-night's session.

Ex-Gov. Alvin Saunders, of Nebraska, an old-time bee-keeper, and the only war governor of Nebraska now living, was then introduced to the convention by Pres. York, and spoke briefly as follows:

SHORT ADDRESS BY EX-GOV. SAUNDERS.

I did not come here to teach anybody. I want you to understand that I am here as a scholar myself, and a pretty new one at that. I take a great interest in this work that is in the minds of those who are here. I should have liked to be with you from the beginning of your proceedings, but I regret that I have been busy with some other matters which made it impossible.

I have never attended a meeting of persons connected with this kind of work that I did not find some pretty good citizens, and I feel myself honored to be associated with this class of people. I have a little farm and have some bees on it, and produce a little honey for our own use, and may be for the use of my neighbors, sometimes; but I don't boast of that at all. I know very little about the business. I am only a scholar myself, as I say, and am here to be taught by others, rather than to try to teach you; therefore, I shall not try to teach you, but shall just simply try to thank you for the good your visit has done me. We are glad to see you. Many States are represented in this meeting, and we of Omaha are proud of that, and we are proud of the character of the men who represent our own State. You have never seen a Nebraskan who was not proud of his State.

Dr. Mason—Nor an Ohioan, either.

Mr. Saunders—No, nor an Ohioan. When we Nebraskans want to get office, we go back to Ohio for it. [Laughter.]

Dr. Mason—W. J. Bryan didn't go to Ohio, and he got left.

Mr. Saunders—Now I came here, as I say, to gather information from you. When I go home, my folks will say that

I have been at the convention, and that I ought to be able to teach them. But I have nothing to say to you beyond thanking you for being here, and for giving me an opportunity of making your acquaintance, as I hope I shall do with some of you who are in this line of business, which I know is honorable, and which dates back thousands of years, when they tell us that honey was good, and when the comb was as sweet as it is now, I suppose. It is a business which is probably as long in the hands of the people as any other business on earth; so we feel now that we have got nothing new—that we are not experimenting with something that is entirely new, and belonging to this century, but something that is old, and that has been brought down to us from antiquity. And this business seems as much the women's business as it is the men's. I think the women do more to cultivate and help it along than the men do, and therefore I say it is a woman's business rather more than a man's. I say to our people, "It is your business, not mine. I will take the honey, but taking care of the bees is your business." [Laughter.]

Well, I must say again that I am gratified to be here, and gratified to see so many of you here at this convention. I hope you will enjoy yourselves while you are here. We have some good men connected with this business in our own State, and I hope you have made their acquaintance, too. You can rely upon it that they will do all they can to make your visit pleasant, and the rest of us will try to do the same thing. [Applause.]

Pres. York—I am sure we all appreciate the kind words of Gov. Saunders. He is the only war governor of Nebraska now living, and a man whom it does us good to meet and to have speak to us.

[Continued next week.]

Fertilization of Flowers—Should Bee-Keepers Pay for It?

BY G. M. DOOLITTLE.

A short time ago, when at our country store purchasing supplies for household use, a somewhat miserly farmer abruptly stepped up to me and said:

"Mr. Doolittle, I want you to bring me up 10 boxes of honey to pay for what your bees got from my buckwheat field when it was in blossom. There were thousands of your bees there at work on that field, and I think it no more than right that you bring me 10 boxes, and 100 would be more nearly the amount it would take to make me good."

While he was thus saying, the reply I should make was telegraphed to my brain like a flash, so as soon as he had done speaking I said:

"See here, Mr. P., I have charged to you on my book account \$25.00 for the use of my bees in fertilizing the flowers upon that buckwheat field, and when you come down to pay me what you rightfully owe me, I will make you a present of 10 boxes of buckwheat honey."

It would have done any apiarist good to have seen him open his eyes and mouth at the same time, and after his astonishment had somewhat subsided, he asked, "Do you really think that your bees helped my buckwheat field any?"

"Most assuredly I do," was my reply; "and I wish to tell you that there is not a particle of doubt that the great and first purpose for which bees were created was for aiding in the fertilization of flowers of different kinds; the honey part as a food and as a delicacy for man, coming in as secondary, altho but few think of the matter in this way.

I saw at once that I had created an impression on his mind which would be twice as lasting as would have been the 10 boxes of honey had I given them to him; and I advise every bee-keeper, when they see some one who appears to be a little jealous regarding bees working on the flowers on their land, to preach this truthful doctrine to them. Yea, preach it every time you get a chance, as I did a few years ago while riding on a crowded stage-coach some distance from home.

One of the passengers began a tirade against the bees of a certain bee-keeper who lived in his vicinity, telling how they were injuring the fruit in his section, and how the farmers about him could not secure a large yield of buckwheat, very often, on account of the bees kept by this man sucking out all

of the honey nature provided for the maturing of this grain while the berry was in the embryo form in the blossom.

When he had finished speaking he showed by his countenance that he thought his wisdom along these lines much superior to that of the other passengers; and from different remarks it appeared that the most of those about him endorsed what he said. There was no one in the stage whom I knew or who knew me, so I saw that I had a chance to correct a wrong impression without being accused of selfishness on my part; consequently, in substance, I said that I did not consider the ideas advanced by the gentleman as sound; that I believed the honey was placed in flowers for the express purpose of enticing them to plants whose flowers needed the bees for fertilization purposes. To this end, I continued, we find honey, or nectar, secreted only in such flowers as are incapable of self-fertilization; while those capable of being fertilized through the agency of the wind, etc., secrete no nectar to entice the bees.

As an example, we see wheat, oats, barley, corn, and certain grasses, all capable of being fertilized by the rustling of their stalks by the gentle breeze, and none of these secrete honey, as all of you know, altho there are a few who claim that bees secure honey from corn. Then there are all of the clovers, all of the squash and other vine family, buckwheat, and nearly all fruit-bloom, none of which are capable of being fertilized through the process applicable to the first. All these last named, secrete honey for the sole purpose of enticing bees, flies, etc., for their fertilization, so that they may mature seed that the species may be perpetuated. And the same thing holds good with the trees of the forest, hence the claim put forth by some, that the bees injure fruit by taking nectar out of the blossoms, is a false one.

I then told them of the law a few jealous persons succeeded in getting past in a township in Massachusetts, banishing bees from that town; how the result was that little or no fruit developed in the interior of that township, while all along the boundary fruit was as plentiful as ever; and that, after this experience regarding their folly, they were glad to welcome the bees back again, when they again had fruit as formerly.

I also told them of the importation of bumble-bees into Australia so that the seed of red clover might be raised there—a thing which was impossible to do till after these bees were imported; of the noted squash culturist, Gregory's experiments, by tying netting over the blossoms, when not a squash would mature, unless hand-fertilization was resorted to. I also gave other illustrations, when I had all (except the man who hated his neighbor so badly, and through him his bees) converted to my side of the question, and him looking very sheepish in the matter, without even a word of reply to what I had said.

When men plead that bees injure fruit and grain by taking away the saccharine matter secreted for and needed by the fruit and grain in its development, they show their ignorance, and it is the duty, as well as privilege, of every bee-keeper to dispel this mist of ignorance which is generally begotten of jealousy. And unless we look well to this matter and educate in every place, and as often as we can, the day may yet dawn when we may be obliged to pay in honey for the part our bees play in the fertilization of flowers, as was demanded of me by the farmer.

Onondaga Co., N. Y.

Preparing Bees for Winter—Sunflower Smoke.

BY J. A. GOLDEN.

Our fall honey-flow has just closed, and all lived bees are well provided with winter stores, but it requires vigilance to keep the wood's bees from cleaning out whole apiaries. There are quite a number of trees within a few hundred yards from us, containing bees, which cannot be secured, tho a number have been cut by our sports.

I am now preparing my bees for winter, and will give the method I use, and if there is any better wintering method I would like to read it through the American Bee Journal.

At the close of the fall flow all supers and fixtures are removed and stored away, and each colony examined to see that it has a queen. Then I properly equalize the stores by exchanging frames, or a quick feed of thick syrup of white A coffee sugar, after cleaning the bottom-board and placing a 1½-inch high rim on the bottom-board wide enough to close the side-entrances of the hive, when the hive is set on, giving a dead-air space.

I scatter a teacupful of slacked lime on the bottom-board, which absorbs all dampness of the hive and bees during the cold season. This item alone is worth many dollars to the apiarist, if observed. Bees and combs are well sprayed with

a mild solution of salt-water with an atomizer; the combined cover and feed receptacle is placed on the hive, then a half-body rim in which packing is placed; then I place on the outside cover. Thus my bees go through our coldest winters, dry-shod, and come out in the spring clean and bright—no diarrhea nor dwindling from a foul or turbid hive.

In this method the bees, first, are insured against dampness; second, they have sufficient space for old bees that die; third, bees and combs are treated with a cleansing bath of salt-water; fourth, have ample ventilation; fifth, can be fed at any time without molestation—nothing equal to it for stimulating the queen for early breeding.

SMOKING BEES WITH SUNFLOWER.

Yes, Mr. Moore (page 595), I was aware that stramonium was of a narcotic nature, and that's why I was led to try its effect on those high-toned bees. But, say, Mr. M., your good wife didn't propose to smoke the stramonium to her injury or death? Of course not, unless she wished to commit suicide. Likewise bee-keepers don't propose to smoke their bees to death. A little smoke properly applied is humane; a great cloud of smoke blasted upon bees carelessly is inhuman; therefore, a little puff or two of sunflower or stramonium smoke has the greatest controlling power on bees of any smoke I have ever known. Try it, Mr. Moore.

Morgan Co., Ohio.

No. 2.—The Care of Bees for Wintering.

BY C. P. DADANT.

In a previous article, I stated, as a *sine qua non*, that a colony, to winter well, should contain a sufficient number of bees. I am now reminded that I did not say what this number should be. It surely would be very difficult to state this in thousands or tens of thousands, and if I could do this it would be no better than so many hieroglyphics to most of my readers—I might say to all of them, for no one can make even an approximate guess at the number of bees a hive contains.

It will be much easier to say that I would have bees on not less than five combs when they are clustered, or imbricated together, on a frosty morning, and the clusters should extend for over one-half of the length of the combs. A strong colony, in a very good season, often covers the greater part of its combs below the honey, and it is a very good sign when you raise the super, or the cloth, or the honey-board, from the body, to see the bees clustered a little way down from the top of the combs. At the bottom they will, if healthy, reach clear down to the alighting-board, and will be on the alert at a minute's notice.

The hive had best be reduced to the size of the colony, for it is worse than useless to have a lot of empty comb, perhaps containing neither bees nor honey, at one side or the other. For this reason, with the large hives that we use, we always have a division-board, or dummy, which may be moved up when the useless combs are removed, so as to reduce the size of the hive, if needed, to a proportionate size to the strength of the colony. The dry combs are removed to the honey-house and put away for future use, and the empty space on the side is filled with warmth-retaining and moisture-absorbing materials. If we cannot increase the strength of our colony, it is at least a good plan to reduce the size of the hive to fit it, in such a way as this. But the strong colonies, covering every comb, are much to be preferred.

Now comes the question of food. If a sufficient number of bees is absolutely necessary to a safe wintering, it is equally evident that enough food must be had, and in an available position, in reach of the bees. Twenty-five pounds of honey is considered sufficient, in an ordinary winter, for the needs of a colony. With large hives we would place this amount as a minimum, and would say 25 to 40 pounds. A much smaller amount may suffice, and we have reliable reports from experts showing that a colony, wintered in the cellar, may be brought through with as little as five or six pounds; but I would counsel no one to try

First, the trials that have been made, resulted in so light a consumption were only for the time which the bees past in the cellar. The hives and bees were weighed at the moment of cellaring, and again weighed when removed, but they had more honey than the quantity mentioned as consumed, and if it had been otherwise, some of the bees might have been out of the reach of the scant supply, and their loss would have entailed the loss of the colony. Besides, these colonies have already past through a couple of months of fall weather, when put away, which necessitated some food, and

this amount should be computed as well as the amount which they would consume when taken out of the cellar, between that and the time of the honey-flow, and this amount would be very much greater than either the fall consumption or even the cellar consumption, for in the spring they need food, not only for the adult bees that consume but little, but mainly for the young brood which requires a very great amount of food to reach the adult stage, and this brood-rearing must not be restrained under penalty of having but a weak colony at the opening of the harvest and a consequent light flow of nectar.

So, even if we winter bees in the cellar, it is well to have plenty of stores. But I cannot help saying that it is most advisable, if either the number of bees, or the quantity of honey, is scant, or if both are short, to winter in the cellar, if a good cellar is at hand. But more of this by and by.

The third question I have in view, and which I consider as third in importance, is the quality of the honey. Perhaps this has more weight than many would imagine. The experienced apiarist who has seen his bees die by the hundreds of colonies by the foul and filthy disease—diarrhea—is very eager on this point, and dreads above all things the harvesting of fruit-juices, or unripe honey, in late falls. Fruit-juices, grape-juice and apple-juice, principally, are the worst supplies that the bees may gather, and the horticulturist, whose grapes have been sucked dry by the bees of his neighbor, is very much mistaken when he thinks that the apiarist is getting rich at his expense. It is just the other way, and the damaged grapes, or the cider-mill, have caused more loss of bees than almost any other single mishap that bees may encounter.

So the horticulturist and the apiarist should go hand in hand, for their interests are identical, and the loss of one is balanced by the loss of the other, both in the fall and in the spring, for it is well known that when the weather is ugly and the bees cannot visit the apple-bloom in May, the prospect of an apple crop is very poor. We are glad to see that, as people become more enlightened, they become aware of these facts, and the strife that used to exist between these two branches of farming is fast becoming a thing of the past. No one can appreciate this better than ourselves, for we are grape-growers here, now, on a large scale, and it is because we found it necessary to convince our neighbors that they were mistaken in imagining the existence of antagonism between fruit-growing and bee-culture, through the imaginary depredations of the bees.

But I have deviated from my subject in such a way that I am now compelled to leave further consideration of the question of honey for wintering for a later article.

Hancock Co., Ill.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. O. O. MILLER, MARENGO, ILL.

(Questions may be mailed to the Bee Journal, or to Dr. Miller direct.)

Wax-Rendering Arrangement—Wax-Press.

1. For a large apiary of say 200 colonies, what method of rendering cappings into wax would you recommend?
2. I have used both the Doolittle and Boardman solar extractors. The former is too small and the latter not altogether satisfactory. With the Boardman, after a day's exposure to the sun, the honey in the cappings gets almost black. The contents of the extractor cannot be removed, on account of the multitude of bees that would get killed, until bees have ceased flying. It is not convenient for me to take the Boardman into the honey-house. The wax and black refuse are so mixed that it is always necessary to remelt the wax so obtained. Can you recommend a solar extractor that is so constructed that it will in one operation effectually separate wax, honey and refuse?
3. What is a wax-press, and how made and worked?

JAMAICA.

ANSWERS.—1. Probably nothing would suit you better than a large solar extractor.

2. I don't know of any particular extractor that would exactly meet your wants, but you would do well to try the sort of receptacle used by Rauefuss Brothers. Instead of there being one single place for the honey and wax to go, the receptacle is divided into apartments so as to make a series of receptacles. Everything goes into the first receptacle until it

is filled, then it overflows into the second receptacle, that into the third, and so on. That gives a chance for impurities to settle, much as they do when a large body of wax is allowed to cool very slowly, this latter being the plan used to cleanse wax very largely. It appears that you have more heat from the sun than is desirable. Can you not reduce the heat, and thus save the honey from being darkened? A coating of some kind of whitewash on the glass might help (what do saloon-keepers use on their windows?), or some cloth laid over. If that does not work satisfactorily, you might allow the sun its full force and reduce the heat in the receptacle by giving air to it by means of one or more screened openings directly near the receptacle.

3. Perhaps the wax-press is one used across the water, the exact construction of which I cannot give, but the principle is to have a press inside another vessel, the latter or larger vessel containing water and steam, thus keeping the press and its contents constantly warm.

Packing Bees for Winter.

I keep my bees in the "Champion" chaff hive. Do you think they will be too warm if I put them in a dry-goods box and fill up the space with straw? MICHIGAN.

ANSWER.—No danger of their being too warm. The danger of too much packing is hardly that it makes bees too warm, but that they will be too cold when it comes a warm day. When a warm day comes, it takes longer for the heat to work through thick packing than through a thin wall.

What to Do with Partly-Filled Sections.

Those sections or one-pound boxes that are from $\frac{1}{8}$ to $\frac{3}{8}$ filled, and capt, and the remainder uncapt—what should be done with them to bring in the greatest returns?

SUBSCRIBER.

ANSWER.—In most cases the best thing is to sell them for table use at a reduced price. For home use, if you are careful, you can melt them. Melt them very, very slowly (if it takes several days to melt them all the better), then when all melted and cold, lift off the cake of wax, and the honey will be even better than when it was in the comb, for it will be a little thicker.

Preserving Fruit in Honey—Shiny Black Bees.

1. How can I preserve fruit in honey, and still retain the flavor of the honey?

2. What is the cause of the black on all strains of bees, shining as if polished (only since cool weather has started)? My bees continue to gather pollen every day.

SOUTH ALABAMA.

ANSWERS.—1. I'm sorry to say I don't know very much about it. I have read of keeping fruit simply by putting it raw in honey, but have had no practical experience. You cannot heat honey enough to cook the fruit without spoiling the flavor of the honey, and I confess I'm just a little skeptical about raw fruit keeping in honey. Possibly there might be such a thing as cooking the fruit, putting it in cans, and then filling up with honey. If any of the friends have had any practical experience in preserving fruit in honey, successful or unsuccessful, by all means let us have it. We know as yet too few ways of using honey.

2. It is because the plumage of the bees has been removed. A bee that has followed a long course of robbing is likely to be thus black and shiny, and also bees affected with paralysis.

What to Do with Combs of Honey.

I just commenced to keep bees the past summer, and have about 30 pounds of honey in brood-combs, after leaving 25 pounds in each hive for winter. I have no extractor, and would like to know if there is any way to get the honey out of the combs without an extractor? If not, what is the best thing to do with the combs? PENNSYLVANIA.

ANSWER.—I don't know of any way to get out the honey and leave the combs sound and whole without an extractor. But don't you want to keep those combs with the 30 pounds of honey to give the bees next spring? Each colony that has 25 pounds for winter will probably be able to use to very great advantage another 5 or 10 pounds next spring. An enormous quantity of stores are consumed in rearing brood, and the

likelihood is that every bit of that 25 pounds will be all used up before clover-bloom, and the bees will be going more or less on short rations. A frame or two of honey will encourage them to greater brood-rearing, and every ounce you give them in that way will be returned with interest in the surplus crop. By all means save those combs for the bees next spring.

Drone-Comb Foundation.

Is there such a thing manufactured as "drone foundation?" Mr. J. S. Hartzell speaks of it in his article on the "Golden Method," on page 658. INDIANA.

ANSWER.—Yes, I believe it has been made to a limited extent, and also a compromise sort about half way between drone and worker.

Feeding Bees in a Room.

I have a few colonies of bees which I transferred about one month ago, and have them in a small room. I gave them plenty of honey in the brood-chamber, and put a box in front made of screen-wire to keep them in; I do not let them out on account of other bees coming in to rob them. I feed them all the extracted honey they will eat, and keep them warm, and they work very nicely. The screen boxes in front are 6x6x12 inches. What will be the effect on the colony by spring? (They are putting honey in the sections now, some of them?) Will it weaken or strengthen the colony? IOWA.

ANSWER.—I don't know, but should guess that a continuance of the treatment might result in death by spring. Feeding and confinement in a light place don't go very well together. Possibly they may pull through, but if they have enough to take them through the winter it might be better to stop feeding, and perhaps put them in the cellar. If they are in danger from robbers, instead of shutting them up entirely, allow a passage for just one bee at a time, and they can protect themselves, especially if the entrance is not directly into the cluster but through some kind of a front or side chamber.

A Dozen Questions.

1. I bought three Italian queens, introduced them to three colonies of black bees July 2, and the bees killed them all. I waited for them to rear their queens, and learned that laying workers had set up business. The sealed brood is not flat, it stands up round-like, like little marbles. I have no weak colonies to unite them with. What can I do with them?

2. Do you really think that it was laying workers?

3. Will laying workers cause colonies to dwindle down to nothing?

4. Are there ever a queen and a laying worker in the same hive?

5. Which are the best bees, Carniolans or Italians?

6. What clover do you think would be the best honey-producer in this climate?

7. What is the best way for introducing a queen?

8. How much comb honey should one colony of bees average per year?

9. What kind of a cellar should bees be wintered in?

10. What is the best way to winter bees?

11. How far from the house should bees be?

12. Does a bee die when it loses its sting?

SOUTH CAROLINA.

ANSWERS.—1. If there continues to be nothing but drone-brood up to this time, probably you can do nothing better than to brimstone them. That will save the honey they would eat before dying. They are all three or four months old, some of them older, and would be of little value even if you had weak colonies with which to unite them?

2. It is hard to say whether laying workers or drone-laying queens, as the appearance would be much the same in either case, and one would be about as bad as the other.

3. Sure.

4. Sometimes. But if a queen has begun to lay, you may pretty safely count on the laying workers closing up business, unless in rare cases where frames of brood are barred from the queen by a queen-excluder, and in that case there will be only a single egg or a few eggs in queen-cells.

5. Probably the great majority would say Italians?

6. I'd rather take the word of some one living in your part of South Carolina. If I could get no satisfactory information in that way, I should give a good trial to sweet clover and crimson clover.

7. If you follow out to the letter any of the ways given in

the printed directions sent out with queens by queen-breeders, you will be pretty safe. Your text-book on bee-keeping will give you information on the subject, and on many others that will many times over pay the cost of the book if you study it faithfully.

With almost any way of introducing queens there will be occasional failures, but I'll tell you a plan you may follow that will make a sure thing of it, if you are willing to be to the trouble. Take two or more frames of sealed brood, no unsealed brood, some of it just hatching out, be sure to brush off every last bee, put in an empty hive and add a comb or two containing some honey. Shut the hive up bee-tight, and open it in about five days, making the entrance only large enough for a single bee if there's the least danger of robbers. If the weather is not warm enough during the five days the hive is shut up, take the hive into some place where it will be warm enough.

8. I don't know. In some places the average will be much more than in others. In most places 50 pounds is probably a good average, and that's a good deal too much in some places. On the other hand, some places may go considerably beyond that.

9. The best cellar for you is probably out-doors. Farther North almost any cellar will answer that is well aired, that can be kept dark, and that has a temperature that will keep bees most nearly dormant, that temperature generally being somewhere near 45°.

10. Probably out-doors in South Carolina.

11. That's a matter of convenience, circumstances and taste. Under ordinary circumstances, perhaps eight rods is a good distance. In some cases eight feet would be enough, and in some cases 16 rods would be better.

12. If a considerable portion of its intestines come away with the sting it will die before long. If nothing but the sting and the poison-sac is lost, it will live perhaps some days, but I'm not entirely sure about that. It's doubtful that it will live in any case as long as if it had not lost its sting.

Wax-Worms.—Gravenhorst advises to take the frames from the hive one after another, shake off the bees, knock on the wood of the frame with a knife-handle, and this will make the worms crawl out of their hiding-places, when they can be dispatched.

Greenhill's Non-Swarming Hive is pictured in the British Bee Journal. A space below the brood-nest allows a super of shallow frames. When these are partly worked out, they are put above and replaced by another set of empty ones. It is practically the Stimmins non-swarming plan.

Propolis in Different Localities.—Editor Root, of Gleanings, has been observing in his travels the difference in the kind and amount of propolis in different localities, and accounts thereby for the fact that "one bee-keeper thinks the Hoffmao frame an intolerable nuisance, and another regards it as the *ne plus ultra* of perfection." He finds propolis much worse in Northern Illinois than in Ohio or New York.

A Novel Method of Wintering was reported across the water some time ago, a weak colony having placed over it a loaf of sugar covered with a common flower-pot, the whole carefully covered over. The attendant success induced another man, reported in a French bee-journal, to try the same thing on two weak colonies, and they came through in fine condition. The moisture from the bees was sufficient to enable them to supply themselves from the dry sugar.

Full Sheets vs. Starters in Sections.—It pays to use full sheets of foundation in sections in order to get the combs well attached to the wood, and sealed all around, and also to get a larger yield generally, but for tenderness and fine edible qualities only a starter should be used, according to F. Greiner, in Gleanings. The editor replies that with starters more than half the combs will be fuisht drone, and these will be more "gobby" eating than comb honey from full sheets of worker foundation.

Large vs. Small Hives.—Editor Hutchinson, of the Bee-Keepers' Review, thinks the articles written in Gleanings by C. P. Dadant are not entirely relevant, as the discussion as to size of hives has been almost wholly with reference to comb honey production, and the Dadants run for extracted, for which the size of hive matters little if it's big enough, while for comb honey the line must be sharply drawn between brood and surplus, and to get the right proportion of fine, white honey stored above this line requires skillful and peculiar management.

A Simple Swarm-Catcher.—Besides a spray-pump, Franz Henkel says his apparatus for securing swarms is a birch-broom tied to the end of a long pole, a piece of comb the size of the hand being fastened among the splints of the broom. When a swarm is about to settle, the broom is held close to it, and the invitation is generally promptly accepted by the bees. If the swarm has already settled, it will move upon the broom if the latter is held steadily against the swarm. If the lower end of the pole is sharpened, it may be thrust into the soft ground of the garden, and thus save holding so long. When the swarm is clustered on the broom, it is lightly sprayed, and it can then be carried to the desired place.—Leipziger Bztg.

Brown's Honey-Strainer.—A very ingenious method of separating from extracted honey bits of wax and other matters is given by F. E. Brown, in Gleanings, by means of what he calls a strainer. "This is made of wood or metal, a box 14x22 inches, and 10 inches deep. It has two partitions which serve as a separator. The first partition is within four inches of the end nearest to the extractor. It is made fast to the bottom, but it lacks two inches of coming to the top of the box. The honey falls down into this small compartment, and then it will rise up to the top and run over into the middle room of the strainer. The second partition is placed within four inches of the other end of the box, and it will lack one inch of coming down to the bottom. Thus the honey, in coming from the extractor, will plunge down with force into the first part, and it will then rise and bring all the wax with it to the top in order to get over into the second space. The wax and all foreign substances will remain to float on top in this large or middle space, while the honey will be compelled to run into the third or last space through under the second partition, and then up to the level of the honey in the middle space, where it will find an exit into the tank."

The Names and Addresses of all your bee-friends, who are not now taking the Bee Journal, are wanted at this office. Send them in, please, when sample copies will be mailed to them. Then you can secure their subscriptions, and earn some of the premiums we are offering. The next few months will be just the time to easily get new subscribers. Try it earnestly, at least.

White Comb Honey Wanted.—We are in the market for best white comb honey put up in 12 or 24 pound single-tier shipping-cases. We would like it to run about 11 and 22 pounds, respectively. If you have what you think will suit us, please write, saying how much you have, and at what price you will deliver it in Chicago. Address, George W. York & Co., 118 Michigan St., Chicago, Ill.

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

GEORGE W. YORK, EDITOR.

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of beekeepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. NOVEMBER 17, 1898. NO. 46.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England.—Change "v" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Northwestern Convention It is thought best to postpone until low rates are in effect on the railroads, as such are essential for attendance. It has been found over and over that unless reduced rates can be secured very few feel that they can afford to attend a bee-convention. As soon as we learn that general excursion rates to Chicago obtain, we will try to arrange for the next meeting of the Northwestern Bee-Keepers' Association.

That New Bee-Book Offer on page 732 ought to "make your mouth water," if you haven't already one of the standard books on bee-keeping. Remember, that liberal offer will be withdrawn Dec. 10, and no mistake about it. We couldn't afford to hold it open longer than that, as we expect that the edition may be exhausted before that time. Better write quick if you want Prof. Cook's 450-page, cloth-bound bee-book for only 50 cents! Turn to the offer now, and read it—on page 732.

Attention, Colorado Bee-Keepers.—Pres. Aikin, of the Colorado State Bee-Keepers' Association, wants every Colorado bee-keeper to read this notice;

TO ALL COLORADO APIARISTS.

The Bee-Keepers' Association will meet in the Capitol Building, Denver, room 33, second floor, Nov. 30 and Dec. 1 and 2. Never in the history of the Association have we had so large a membership and so much work done as during this year. There is important work to be done at this meeting. Your Marketing Committee will have a report of the season's work. Last winter we revised our constitution and by-laws, and there are yet some more changes to be acted upon at this meeting. We will discuss Marketing, Grading, Foul Brood,

Experiments, Solar Wax Extractors, Improved Appliances, Legislation for Bee-Keepers, etc. We expect help from the Agricultural College and Senator Swink. Let every Colorado bee-keeper who reads this come if possible, and if you cannot come, write of what most interests you, and tell us what you want done. Write either to myself or to Secretary F. Rauffuss, Elyria, Colo.

Loveland, Colo.

R. C. AIKIN, Pres.

We believe that the officers of the Colorado State Bee-Keepers' Association have worked harder the past year for their organization than any set of aparian officers we know. If the membership, or bee-keepers, in that State would take as much interest in their society and its objects, as do the officers, it could easily lead this whole country in apicultural affairs. Let every Colorado bee-keeper attend that meeting.

The Union and Comb Honey Lies.—Lately we received a clipping from one of our readers—a Mr. Irving—taken from the New York Evening Post, who enquired if we couldn't do something about it, as it was one of the common lies that certain newspapers seem to delight in keeping alive to the injury of all honest producers of comb honey.

We conceived the idea of forwarding Mr. Irving's letter and the clipping to General Manager Secor of the United States Bee-Keepers' Union, with the suggestion that he write the editor of the Post, calling attention to the untruthfulness of the statements, and pointing out the injurious results that would follow the publication of such misleading statements in an influential newspaper.

Well, Mr. Secor acted promptly upon our suggestions, and here is his able letter of correction:

FOREST CITY, IOWA, Oct. 29, 1898.

To the Editor of the New York Evening Post.—

DEAR SIR:—A friend from New York has sent a clipping which he says he cut from your paper of Oct. 22. It is as follows:

"It is a blow to learn that the honey of commerce is not above reproach. Its adulteration is, it seems, quite common. Glucose is one of the ingredients used for the purpose. Even honey in the comb is not to be accepted with absolute confidence, as the cells can be imitated in paraffine. An occasional diet of honey is an excellent thing for children. Its qualities are searching, and it is cleansing and stimulating to the system. It is a curious thing, that children will crave it and eat it ravenously for a short time; then turn from it entirely. When the period of rejection sets in, it is an evidence that the system has had enough."

I am sure you do not wish to injure any honest industry, and that you endeavor to publish the truth on all subjects. Your past record for fairness, and the high position the Post holds among journals, convinces me that it aims to be just and reliable.

But that fact only increases the danger if an error by any chance creeps into its columns.

I wish to comment on that sentence relating to comb honey, which says: "Even honey in the comb is not to be accepted with absolute confidence, as the cells can be imitated in paraffine."

There is a sort of "thus saith the Lord" positiveness about that statement which will prejudice lovers of honey who have never investigated the subject, and it is that sentence which I especially wish to explain, and, if possible, elucidate. While the writer does not say positively that artificial honey is placed in the cells "imitated in paraffine," a reasonable construction would warrant that inference, and I have no doubt the general reader would so understand it.

This is not the first publication of such a misleading statement. Others have asserted that comb, in imitation of that made by bees, is made by machinery, filled with glucose syrup and sealed over by a hot iron. But such statements are usually founded on ignorance of the subject, or wrong motive, or a desire to startle the public mind by marvelous revelations. It is of the same credibility as that other wonderful statement, that eggs are actually manufactured, shell and all, so perfectly that no one can tell the difference except by trying to hatch them!

When we realize the delicate texture and fragile nature of honey-comb as made by bees, it will be easy to understand that it is a mechanical impossibility to make an article in imitation of it that cannot be readily detected.

The limit of mechanical ingenuity up to the present time seems to have been reached when the septum, or base of cells,

is made of wax, on which the bees will construct cells and complete the comb. This is called "foundation" by the trade, and is made so thin that it can scarcely be detected from the natural septum made by the bees. Paraffine, however, is never used for this purpose, because this wax melts at a lower temperature than beeswax, and cannot be utilized for that purpose. The heat of the colony will melt it, and therefore ruin not only the "foundation" but the product as well.

Paraffine wax, therefore, is of no value to bee-keepers for this purpose.

If your correspondent knows of any factory where comb honey is produced without the aid of bees I should be glad to be informed as to the exact place. There has been published, in an influential and responsible journal, for years, an offer of \$1,000 for one pound of comb honey made by machinery that cannot readily be detected from the genuine article. No one has attempted to claim that prize. It is safe to say the thing cannot be done.

But, some one says, glucose syrup may be fed to bees and by them stored in the comb. That is also impractical, because bees will not touch glucose syrup unless starving, and then, of course, they are not in proper condition to store honey.

So please tell your readers that when they buy honey in the comb they may reasonably expect to get something gathered from flowers by bees. Also tell them that such honey has nutritive and medicinal qualities not found in cane-sugar or glucose.

If children were brought up on honey instead of cane-sugar and candy, the intestinal and kidney diseases common to our civilization would be greatly lessened, if not entirely avoided.

Yours truly, EUGENE SECOR.

We await with much interest the next action of the Post. Will they do the only honorable thing, and publish Mr. Secor's plain and truthful letter, or will they ignore it, and continue to slander bee-keepers and misinform their readers concerning the best sweet known—pure honey?

Why wouldn't it be a good thing for bee-keepers everywhere to try to have published in their local papers, Mr. Secor's most excellent letter to the Post? It would do untold good, we believe.

The Next Ontario Convention will be held at Guelph, Dec. 6, 7 and 8, 1898. As reduced railroad rates will be in force at that time, there should be a large attendance, and a good meeting. On the program we find these subjects and those who are to write and speak on them, after which general discussion will follow:

The President's Address, by M. B. Holmes; J. B. Hall to open discussion on the address.

"Spring Management," by H. G. Sibbald; D. W. Heise to open discussion.

"Summer Management," by W. J. Brown; Jas. Armstrong to open the discussion.

"Some Experiments on Wintering Bees," by Jas. Fixture, of the Experimental Farm at Ottawa; W. J. Brown to open the discussion.

"Rational Methods of Extracting Wax," by F. A. Gemmill; W. A. Chrysler to open the discussion.

"Management in the Swarming Season," by W. Z. Hutchinson; A. E. Hoshal to open the discussion.

"Honey for Market," by R. F. Holtermann; Mr. Gemmill to open the discussion.

"Making Our Association More Useful," by J. K. Darling; Jas. E. Frith to open the discussion.

"The Rascally Supply Man," by J. D. Evans; John Newton to open the discussion.

"Thoughts by a Novice," by Dr. A. B. Mason; C. W. Post to open the discussion.

"Management of Comb Honey," by R. H. Smith; J. Sparling to open the discussion.

For any further information, address, the Secretary, Wm. Couse, Streetsville, Ont.

The McEvoy Foul Brood Treatment is given in Dr. Howard's pamphlet on "Foul Brood; Its Natural History and Rational Treatment." It is the latest publication on the subject, and should be in the hands of every bee-keeper. Price, 25 cents; or clubbed with the Bee Journal for one year—both for \$1.10.

JOSEPH E. MORGAN, of Fremont Co., Idaho, writing us Oct. 27, said:

"I have been taking the American Bee Journal for 18 months, and have been very well pleased with it. I have found that it has not lost any of its merits."

MR. G. W. FASSETT, of Addison Co., Vt., wrote us Nov. 7:

"I often find a single item in the American Bee Journal that is worth all it costs for a year; and I think there were new ideas enough in Mr. Moore's series of articles on marketing honey to pay any one the price of a year's subscription."

MR. FRED S. THORINGTON, of Missouri, offers this good advice in the Progressive Bee-Keeper, on selling the honey crop:

"There should be as much care used in disposing of a crop of honey as there is used in producing it; and we should not give it away after it is produced, for the want of a little energy being used in its sale on the part of the bee-keeper."

MR. A. O. SUTTON, of Shiawassee Co., Mich., wrote us Oct. 26, as follows:

"We had the misfortune to lose our store and stock of groceries and hardware by fire, Saturday morning, Oct. 22. It is a total loss to me. I am getting my cellar ready to-day to put my bees in."

While it seemingly may never pay to "lock the barn after the horse is stolen," still it's a good habit to get into—to "lock the barn." It pays to keep things insured.

THE SOUTHLAND QUEEN, of Texas, had these editorial paragraphs in the October issue:

"We need a good rain in this 'neck of the woods,' and we must have it this fall or early winter, or our cakes will be dough for 1899, sure."

"We are still having it hot and dry, and we have been robbing the other way lately. We have just fed one of our out-apiaries of 100 colonies 1,000 pounds of sugar syrup and honey mixt; this is robbing from the pocket to help the bees, instead of robbing from the bees to help the pocket."

JOHN H. MARTIN (Gleanings' Rambler), writing us Oct. 26, reported thus:

"I have finished up a fair honey season, and for a sort of holiday outing I have just started for a tour through Oregon and Washington. I don't know but the Alaska fever will strike me when I reach Seattle!

"P. S.—Please don't allow that —— man to get off any more of his jokes about my discovering gold-mines."

Why, Rambler, we don't see what wrong there is in "discovering gold-mines." We hope you will "strike it rich" somewhere, and then—well, send us some of it, if you feel like it.

MR. W. BROUGHTON CARR, co-editor of the British Bee Journal, wrote us as follows, Oct. 29:

GEORGE W. YORK, Esq., Chicago, Ill.—

Dear Sir:—You will, on perusing the British Bee Journal of Oct. 27, gather all that can be said of the sad bereavement which has befallen our Mr. Cowan and his family in the wreck of the "Mohegan," so I need say no more here on the sorrowful topic.

I was, however, requested by Mr. Cowan, just before he left England for California, to say that you would no doubt understand why he was under the circumstances unable to call on you on his way South, but would go direct through from New York to California.

If you are able to convey this intelligence to some of Mr. Cowan's friends, who might wonder why he did not call on them according to promise, you will much oblige.

Yours faithfully,

W. BROUGHTON CARR.

To Our Regular Subscribers—Now for New Readers!

6 Great 50-cent Offers—Each One Free!!

On this page you will find six splendid premium offers, and we will mail your choice of any one of them for sending us \$1.00 for **just one New subscriber** for 1899—and we will throw in the last three months of this year's Bee Journal free besides to each new subscriber you send on these offers. That makes 15 months of the Bee Journal to the new subscriber. Or, for sending us **4 New subscribers**, as above, we will mail the sender all of the 6 great 50-cent offers.

JUST READ WHAT THEY ARE:

Offer No. 1.—Samantha at Saratoga.

100,000 Sold at \$2.50 per copy.

This is indeed a feast of fun, by the only peer of Mark Twain's humor—**JOSIAH ALLEN'S WIFE** (Marietta Holley.)

Read this Extract from the Book:

And right here, let me insert this one word of wisdom for the special comfort of my sect, and yet it is one that may well be laid to heart by the more opposite one. If your pardner gets restless and oneasy and middlin' cross, as pardners will be anon or even oftener—start them off on a tower. A tower will in 9 cases out of 10 lift 'em out of their oneasiness, their restlessness and their crossness.

Why I have known a short tower to Slab City or Loontown act like a charm on my pardner, when crossness wuz in his mean and snappishness wuz present with him. I have known him to set off with the mean of a lion and come back with the liniment of a lamb.

And jest the prospect of a tower ahead is a great help to a woman in rulin' and keepin' a pardner straight. Somehow jest the thought of a tower sort of lifts him up in mind, and happy's him, and makes him easier to quell, and pardners must be quelled at times, else there would be no livin' with 'em.

She takes off **FOLLIES, FLIRTATIONS, LOW-NECKED DRESSING, DUDES, PUG DOGS, TOBACCOANING, ETC.**

Opinions of Noted Critics:

"Exceedingly amusing."—Rose E. Cleveland. "Delicious Humor."—Will Carleton. "So exorcinatingly funny, we had to sit back and laugh until the tears came."—Witness. "Unquestionably her best."—Detroit Free Press. "Bitterest satire, coated with the sweetest of exhilarating fun."—Bishop Newman.

Nicely bound in paper, fully illustrated, printed from new type and on fine paper. 370 pages. Postpaid, 50 cents.

Offer No. 2.—New Waldorf Cook-Book.

Over 1,000 of the very best up-to-date recipes for every conceivable variety required in the kitchen and other departments of house-keeping, by **Mrs. Anne Clarke**, the distinguished student and instructor in culinary science, assisted by many of the most successful house-keepers in various parts of Europe and America. It gives the latest and best methods for economy and luxury at home. Just the book for the housewife or daughter. Has had an enormous sale at \$2.00 a copy. 380 pages; paper bound; postpaid, 50 cents.

Offer No. 3.—Cattle, Sheep and Swine Book.

Fully Illustrated—300,000 sold at \$3.00 a copy.

This great work gives all the information concerning the various Breeds and their Characteristics, Breaking, Training, Sheltering, Buying, Selling, Profitable Use, and General Care; embracing all the Diseases to which they are subject—the Causes, How to Know and What to Do given in plain, simple language, but scientifically correct; and with Directions that are Easily Understood, Easily Applied, and Remedies that are within the Reach of the People; giving also the Most Approved and Humane Methods for the Care of Stock, the Prevention of Disease, and Restoration to Health. Written by Dr. Manning.

Every farmer wants this great book. 390 pages, paper bound. Postpaid, 50 cents.

Offer No. 4.—Gleason's Horse-Book.

By Prof. Oscar R. Gleason.

This is the only complete and authorized work by America's king of horse-trainers, renowned throughout America and recognized by the United States Government as the most expert and successful horseman of the age. The whole work comprising His-

tory, Breeding, Training, Breaking, Buying, Feeding, Grooming, Shoeing, Doctoring, Telling Age, and General Care of the Horse. You will know all about a horse after you have read it. No one can fool you on the age of a horse when you have this book. 416 pages, bound in paper, with 173 striking illustrations produced under the direction of the United States Government Veterinary Surgeon. In this book Prof. Gleason has given to the world for the first time his most wonderful methods of training and treating horses. 100,000 sold at \$3.00 each. Our price, postpaid, 50 cents.

Offer No. 5.—Music, \$5 for 50 cents.

Four pieces New Sheet Music, which sell at music stores at 50 cents each—\$2.00; Three years' membership in the World's Musical Association (regular price \$1.00 a year), \$3.00. Total, \$5.00. We offer the whole thing at 50 cents.

The four new pieces of sheet music are the very latest hits of this year; are regular sheet music size and quality, but the title pages are a new style of art. viz; Illuminated Chromatic designs in five brilliant colors.

THE SONG TITLES ARE:

"Do Your Honey Do," by THEO. METZ, author of "A Hot time in the Old Town To-night." This latter piece, said to be his best, is creating a great stir, and becoming immensely popular everywhere.

"Queen of the Bicycle Girls," by the celebrated composer, OTTO LANGEY, by far the most charming Bicycle Song yet issued.

"Blossoms from Over the Sea," by the distinguished composer, J. P. SKELLY, a very beautiful Sentimental Song.

"He's Just Like All the Men," by the renowned composer, EASTBURN. Wonderfully pleasing to the Ladies.

The World's Musical Association is an organization having special advantageous relations with the leading music publishers of this country and Europe, and being an enormous purchaser, it is enabled to supply to its members (and will do so) any music desired (at any time within the term of their membership), at such wholesale prices as are usually granted only to very large dealers.

Offer No. 6.—The Poultry-Keeper Illustrators.

The four "Poultry-Keeper Illustrators" are the greatest books on poultry subjects ever issued, and are a veritable poultry dictionary, covering the ground so completely that, having these four books, one needs scarcely anything more except "grit" to become a successful poultry-raiser. You cannot get such other books in the whole world, not even for \$50 each, for they do not exist. Were they given in another form and elaborate binding and colored cuts you might think them easily worth \$5 each, but what you want is not elegant printing, and in these we give you the value in information that you can make use of. They have cost much in labor and cash, but you get all this value for almost nothing. We mail the 4 Illustrators for 50 cents.

Illustrator No. 1.—Poultry Houses Incubators, Brooders, Coops, etc., 25 cents.

Illustrator No. 2.—Artificial Incubation, Raising Chicks, Testing Eggs, etc., 25 cents.

Illustrator No. 3.—Poultry Diseases, Lice, Grapes, Moulting, Egg Eating, etc., 25 cents.

Illustrator No. 4.—Judging Fowls, Description of Breeds, Mating, etc., 25 cents.

Those offers ought to bring us in at least 2,000 new readers during this month and next. You could send in your own renewal for 1899 at the same time you send in a new subscriber, if you wish. If you do, you can select any one of the above offers free for yourself, provided you send at least **two New subscribers** at the same time. That would give you your choice of **three** of the offers—by sending your own renewal for 1899, and two new subscribers (\$3.00 in all).

Address, **GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, ILL.**

In the multitude of counsellors there is safety.—Prov. 11-14.

Extracting-Frame Preferred.

Query 85.—Please give the dimensions of super frame for extracting, to which you accord the preference, giving measurements of each of its parts.—S. A. D.

E. France (Wis.)—The Langstroth frame.

Emerson T. Abbott (Mo.)—The Langstroth frame.

R. L. Taylor (Mich.)—The frame used in the Heddon hive.

G. M. Doolittle (N. Y.)—The same frame as used in the hive below.

Prof. A. J. Cook (Calif.)—Size of brood-frames, Langstroth or Heddon.

D. W. Heise (Ont., Can.)—The Standard Langstroth, if for extracting only.

Eugene Secor (Iowa)—Half the depth of the Langstroth frame, or a little more.

C. H. Dibbern (Ill.)—As I extract very little honey I will leave this for others to answer.

Dr. C. C. Miller (Ill.)—The same as frame of brood-chamber, except perhaps shallower.

W. G. Larrabee (Vt.)—I use the Langstroth frame for extracting, the same as for the brood-nest.

Dr. J. P. H. Brown (Ga.)—I prefer a frame the size of the Langstroth. For supers, a half-frame.

Mrs. L. Harrison (Ill.)—The regular Langstroth frame. I have had no experience with any other.

J. M. Hambaugh (Calif.)—I use the regular Langstroth 10-frame hive supers and hive, interchangeably.

P. H. Elwood (N. Y.)—I have no very decided preference, but think a half-story frame preferable—6 to 8 inches deep.

Jas. A. Stone (Ill.)—I have never used any but the Langstroth frame in an upper story, with queen-excluder between.

Rev. M. Mahin (Ind.)—My brood-frames are 12x10 inches, outside measure. My frames for extracting are 12x6 inches, and they exactly suit me.

R. C. Aikin (Colo.)—I must say I do not know, but probably a 5x16 frame, top and bottom 3/8 x 1 inch, ends 3/8 x 1 3/8 x 5 — a standing, closed-end, close-fitting frame.

J. E. Pond (Mass.)—I use the regular Simplicity-Langstroth frame. Others may be better in some localities, but for all around work I don't think it can be excelled.

A. F. Brown (Fla.)—A hanging frame, 17 3/4 x 9 3/4; top-bar one inch wide and 3/4 inch thick; bottom-bar 3/4 inch wide and 1/2 inch thick; end pieces 1/4 inch thick and one inch wide.

Dr. A. B. Mason (Ohio)—In the early part of the season, before the colony becomes strong enough to occupy a full story as a super, I use frames the same

Sweet Clover

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

| | 5lb | 10lb | 25lb | 50lb |

A GREAT ***** COMBINATION OFFER

COOK'S "BEE-KEEPERS' GUIDE"
FOR ONLY FIFTY CENTS.

You ought to have a good bee-book, if you haven't one already. Prof. A. J. Cook's Manual, or "Bee-Keepers' Guide," is one of the very best published to-day. It is bound substantially and neatly in cloth, contains over 450 pages, and retails at \$1.25 a copy, postpaid. But we are going to make you an offer, for the next three weeks (positively ending Dec. 10), that will open your eyes. Here it is:

To every subscriber who before Dec. 10 will pay his subscription to the American Bee Journal to the end of next year (1899) we will mail a copy of Prof. Cook's "Bee-Keepers' Guide" for only 50 cents extra. That is really getting a dollar-and-a-quarter bee-book for only 50 cents. Can you afford to miss such a chance as that? Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellence. Polished, snowy-white Sections, beautiful straw-colored transparent Foundation, Improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

See Honey Offer on page 733.

length as the Langstroth, and 4¼ inches between top and bottom bar. When populous enough, I use the full size Langstroth frame.

O. O. Poppleton (Fla.)—I use and prefer my regular brood-frames. Dimensions are: Top-bar, 14 inches; end-bars, 12; bottom-bar, 13¼; these latter projecting ¼ inch outside of the end-bars.

S. T. Pettit (Ont., Can.)—The super frames to be put on in early spring should be about 5 inches deep. The super comb I use for extracting contains about 180 square inches. It would take an article to explain why I use so large a frame.

Chas. Dadant & Son (Ill.)—For the Langstroth hive we would use regular frame top and bottom bars and a 6-inch end-bar. In our hives we use a frame 1¼ inches longer than the above, and of the same depth.

E. S. Lovesy (Utah)—I prefer the 10-frame standard short Langstroth hive, about 16x16 inches square frame, 9¼ deep over all. It is easy to manipulate, and if run three stories with a good honey-flow it is always a success with strong colonies.

J. A. Green (Ill.)—The frame which I use for extracting is 17½x5½, 7 in a space 11 inches wide—about 1½ inches from center to center. Eight brood-frames go in the same space. The end-bars are close fitting, held together by a wooden screw in the side of the hive; 7 of them prest together measure just 11 inches. Tops are ¾x1¼; bottoms, ¾x1¼.

G. W. Demaree (Ky.)—For general use I prefer and use the standard Langstroth frame, 17½ inches in length, and 9½ in depth. As "helpers" in the honey storing season, I use shallow supers, frames 17½ inches in length, and 5 inches in depth. These shallow supers are sometimes given to weak colonies at the beginning of the honey season; but generally they are employed to give the bees storing-room for the freshly-gathered nectar, while the honey in the regular supers is being ripened and sealed by the hive workers.

Report—Facing Honey—Queens.

In 1897 I had no swarms and every queen in the spring of 1898 was two years old or more. I started with 27 colonies, wintered on the summer stands, which consists of a bee-shed 80 feet long, 8 feet high, and 8 feet wide, covered with iron roofing, in one end of which I have an extracting and honey-room, 12 feet long. I had 23 prime natural swarms, and three of the parent colonies petered out. My honey crop consists of 658 finished sections, and 1,313 pounds of extracted honey, making an average of 73 pounds to the colony, spring count, and 30 pounds of wax. With the experience gained the past season, I believe I can double this, next year, under similar conditions, but there are hardly ever two seasons alike.

I notice a great amount of controversy over the propriety of facing cases of comb honey. I nearly always find all colonies of bees that I work for comb honey and use division-boards will make every section of the same grade or quality of honey, either

HONEY * FOR * SALE.

Best White Alfalfa Extracted...

ALL IN 60-POUND TIN CANS.

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can hardly get enough of the Alfalfa extracted.

Prices are as Follows:

A sample by mail, 8 cents in stamps, to pay for package and postage. By freight—One 60-pound can, 8 cents per pound; 2 cans, 7 1/2 cents per pound; 4 or more cans, 7 1/4 cents per pound. Cash must accompany each order.

This honey is **ABSOLUTELY PURE BEES' HONEY**, the finest of the kind produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand the past season, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The Circular, "HONEY AS FOOD," will be a great help in creating customers for honey. Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

We want

EVERY BEE-KEEPER

.....To have a copy of.....

Our 1898 Catalog

Send us your name and address and we will take pleasure in mailing you a copy.

G. B. LEWIS CO., WATERTOWN, WIS.

Special Agent for the Southwest—

E. T. ABBOTT, St. Joseph, Mo.

Mr. Abbott sells our Hives and Sections at factory prices.

Please mention Bee Journal when writing.

INCUBATORS & BROODERS ...All about them. How to make and how to use successfully. Fully illustrated in Poultry Keeper Illustrator No. 2, 25 cts. Send for free sample copy of **POULTRY KEEPER** with particulars about other valuable poultry knowledge. Address, Poultry Keeper Co., box 10, Parkersburg, Pa. Ctf Please mention the American Bee Journal.

WONDERFUL DOGS It is simply marvelous how the Scotch Collie dog will learn to do your work for you, as well as protect your children and your home. Everybody pleased with ours and the prices. They are secured as fast as we can produce them. Write at once for particulars to **POTTS BROS., box 10, Parkersburg, Pa.** Ctf Please mention the American Bee Journal.

The Ram's Horn...

Is an Independent Weekly Paper of 20 pages—

each page somewhat larger than those of the Bee Journal. The subscription price is \$1.50 a year. It is one of the brightest and best publications of the present day. Its "Platform" is: 1. The Primitive Gospel. 2. The Union of Christendom. 3. Equal Purity—Equal Suffrage. 4. The Sabbath for Man. 5. The Saloon Must Go. Motto: "Have Faith in God."

We will mail you a sample copy of the Ram's Horn upon receipt of a two-cent stamp.

OUR LIBERAL OFFER:

We wish to make our **PRESENT** subscribers to the Bee Journal a generous offer in connection with the Ram's Horn, viz: Send us **TWO NEW** subscribers for the American Bee Journal for one year (with \$2.00), and we will see that the Ram's Horn is mailed you free for one year as a premium.

Or, send us \$2.00 and we will mail to you the Ram's Horn and the American Bee Journal, both for one year.

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL

white or amber, and the only honest way I can find is to put the 24 sections, when completed, in one case, and place some of the smoothest sides next the glass. It is decidedly dishonest to put two colors of honey in the same case—if commission men do expect it, the consumer does not. Were I to go to a grocery to purchase a few pounds of comb honey, and be handed me some that did not compare with the sample next the glass, in color, I should demand, if I purchast at all, the ones in front, or I should walk out. What think you of this?

I had this fall, after there were no drones, two colonies queenless, so I sent to a queen-breeder for two golden queens advertised in the Bee Journal as being purely mated, and neither of them ever laid an egg; and during the time (about eight weeks) the colonies had dwindled beyond reclamation, and both queens have died. Honesty is the best policy, especially with the brotherhood of bee-keepers when unions are advocated. Queen-breeders especially should send out what they represent. I might have saved the most of the young bees in the colony by uniting with others.

There are about 800 colonies of bees in this county, kept in a ship-shod way, and I believe I have harvested 2/3 of the honey.

T. R. G. WELCH.

Morgan Co., Utah, Oct. 24.

More Honey than in Previous Years.

I see a great deal said of the light honey crop from all over the country. I have on my farm only a few colonies, but I got more honey than in any previous year from the same number of colonies. I took notice of the three best colonies, and got 120 pounds of comb honey.

I started out a few years ago with Italian bees, but most of the bees in this part of the country are black, and now mine are all hybrids, and are bad tempered.

Here in the hills of Eastern Kentucky bees are generally wintered out-doors, but every severe winter there is more or less loss.

MILTON McDOWELL.

Johnson Co., Ky., Nov. 4.

Bees Didn't Do Well.

Bees did not do very well in this part of the county this year, storing only some late honey, which was yellow, gathered mostly from dogfennel and hoarhound. We took off 250 pounds of surplus honey from eight hives.

HERBERT PRUNER.

Douglas Co., Oreg., Nov. 3.

A Report from Connecticut.

Myself and brothers have bees in the same apiary. We had 19 colonies last spring, all in good condition, all having wintered on the summer stands, part of them in a bee-shed open to the South, the rest exposed to the wind and storms of old Connecticut, her damp and foggy days in mid-winter, with the mercury up to 60 or 65 degrees, and in 36 hours or less down to zero or five or six degrees below.

Part of the bees are in the Langstroth hives, and some in the Simplicity-Cary. We had but five swarms the past season. Bees did not gather honey enough to live on all through the season up to Sept. 1, and had to fall back on what was left in the hive from winter stores, altho white clover was never so plenty, but the dry weather kept it from yielding nectar. I had two or three of the deep hives that had 40 pounds of honey on May 1. They gave me about 45 one-pound sections to the hive, but some of the Langstroth hives, that had fully 15 to 20 pounds May 1, did not even swarm or give us one box of comb honey—they barely lived. Lots of others in this section are crying the same story, within a radius of 10 miles in diameter, for I am so interested in the bee-business that I talk bees and handle bees for miles around.

Aug. 20 or 21, I examined some of my bees that I thought were good and strong, and behold, not one cell of honey could I see or find. Others did not have more than

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,
Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—is beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dadant—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth. Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 175 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers, \$1.00.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called BEES OF HONEY. 100 page pamphlet. Price, 40 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping, in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 p., illustrated, 25c.

Convention Hand-Book, for Bee-Keepers, by Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents.

Bee-Pasturage a Necessity.—This book ang gets what and how to plan. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by G. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2 in fine artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st, How We Made the Old Farm Pay; 2nd, Peach Culture; 3rd, How to Propagate Fruit Plants, Vines and Trees; 4th, General Fruit Instructor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for casting up the price of grain, produce, hay, etc. Price, 25 cts.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters. 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

Book Clubbing Offers.

(Read Carefully.)

The following clubbing prices include the American Bee Journal one year with each book named. Remember, that only ONE book can be taken in each case with the Bee Journal a year at the prices named. If more books are wanted, see postpaid prices given with the description of the books on this page. Following is the clubbing-list:

| 38. Apiary Register (for 100 colonies)..... | 2.00 |

one pound, all told; others a little patch here or there, as large as a 50-cent silver piece. I opened them again Aug. 27, and all were in the same condition as the time before—lots of brood and bees, but no honey. The weakest ones I fed a little syrup. Some of the hives have 8 frames, some 9 Langstroth frames, closed ends; the Cary hives 10 and 11 frames. Golden-rod began to bloom and yield honey well on Sept. 17. I opened the hives again, and found all completely filled and cap over; brood all hatch, except a little in the center of the hive, and queen completely crowded out. I took five frames away from the nine, and three and four away from the eight-frame hives, extracted it, and gave them back some empty combs, and now they have from 20 to 40 pounds to winter on, all others the same in this section. So far as I have heard from, old box-hives that were as light as a feather are like lead now.

Now as regards casing honey: Have each and every case alike from face to back, be it 10 pounds, 100 pounds, or 10,000 pounds. When sent off to be sold, whether it be on commission or straight sale, do not represent one thing in front, another at the back and out of sight. All dealers are not fools if the bee-keepers do think so, or at least some of them. FRANK L. GILBERT. Litchfield Co., Conn., Oct. 26.

An Old Reader Drops Out.

I am going away for treatment, and have just sold my little apiary of 24 colonies of good grade Italian bees. I very much regret giving up them and the American Bee Journal, as I have been a constant reader almost ever since Mr. Wagner was its editor. Perhaps, if I can regain my health, and can find somewhere in the South a suitable place for an apiary, I might resume the business. JOHN S. SLEETH. Livingston Co., Ill., Nov. 6.

Rather Short Honey Harvest.

I am a beginner in bee-culture, the present being my first season at the business. The harvest was rather short in this locality, owing to the dry weather. We averaged about 50 pounds to the colony.

I think that any one interested in bees cannot afford to be without the American Bee Journal. There *may* be others as good (I have not seen them), but I do not think there is any better. A. E. MARLOW. Jefferson Co., N. Y., Oct. 25.

Whole Graveyard of Blasted Hopes.

Nearly three years ago I sold out at Canon City, Colo., and went to California. I purchased a ranch of 164 acres of land about 10 miles east of San Diego, at the foot of the San Miguel mountains. My principal aim was to engage in the bee-business, keeping poultry in connection with that business. I considered my location a good one. North, east and south the mountains stood with a hundred thousand acres of alfalfa, sage, and a hundred other honey-plants, near by the Sweet-Water reservoir, three miles long and $\frac{3}{4}$ wide; this not only furnishes abundance of water at all times, but also, on its margin, produces abundance of flowering plants during the dry season of the year. To the west are numerous eucalyptus trees and extensive orange and lemon orchards, with considerable deciduous fruit trees. I had bought, begged and captured bees till I had 100 colonies that were in good condition at the beginning of last winter. I also had a good start of poultry that was already yielding a profit; all together my prospects were encouraging.

But in January an old enemy—the asthma—seized me after a suspension of some years. Now began a fight that lasted for months. I would only get able to be up and walk about the house a little when a new attack would drive me to my chair, where I sat day and night for weeks gasping for breath. As the winter and spring past I saw there would be no honey crop in that region; and if it was the best season Cali-

fornia ever saw I should not be able to give any attention to my bees. In April, when all hope of rain enough to give us a honey crop had disappeared, a man came along wanting to buy my bees. I told him he was the man I wanted to see badly, as I was sure we should not have enough honey gathered to keep the bees over till another year. But he was sanguine, and I sold out to him at \$1.50 per colony. I then sold off all I had except my ranch and went to Pasadena, where I had a son-in-law. Here I spent two months without any improvement. I then went out to the mountains and spent a month; but still my trouble held on with a choking grip. I then pulled out for Fremont Co., Colo., leaving buried in the beautiful climate of California a whole graveyard of blasted hopes. And here I am, poorer and leaner—but not yet cured of the bee-fever. L. J. TEMPLIN.
Fremont Co., Colo., Nov. 5.

Report for Past Season.

Our report for the season of 1898 is as follows: Increased from 87 to 95 colonies, and harvested 2,150 pounds of amber extracted honey. Bees are in good condition for wintering. INMAN BROS.
Midland Co., Mich., Nov. 9.

Not Bad for an Off Year.

I got 1,724 pounds of honey from 50 colonies the past season. Not so bad for an off year. I like the American Bee Journal very much. HENRY K. GRESH.
Elk Co., Pa., Nov. 7.

Very Poor Season.

It has been a very poor season here for bees. I got less than 75 pounds of comb honey from eight colonies, spring count, and increased to 12. Early flowers seemed to have no honey, but the fall flow has been very good. The bees seem to have plenty for winter stores; so here is hopes for better success next year. F. D. KEYES.
Hampshire Co., Mass., Nov. 8.

Using Tests for Glucose.

I have used the tests for glucose on page 674, as mentioned at the Omaha convention, to good advantage in the short time I have known them. Grocers here are retailing so-called honey at 10 cents a pint. The dissemination of these simple tests will, in my opinion, do as much as anything in putting down adulteration. It is surprising the startling effect produced upon people by the tea test. It would be laughable if it were not so serious. I would advise bee-keepers to print these tests on their honey-labels. H. AUSTIN.
Mercer Co., N. J., Nov. 1.

Southwestern Wisconsin Convention.

The Southwestern Wisconsin Bee-Keepers' Society met at Lone Rock, Oct. 5 and 6. There was not so large an attendance, as was expected, but there was an interesting meeting. There were several good papers read, including an excellent one on the Omaha convention of the United States Bee-Keepers' Union, by H. Lathrop. The election of officers resulted as follows: President, N. E. France; Vice-President, M. M. Rice; Secretary and Treasurer, F. L. Murray, of Calamine. The following resolutions were read and approved:

The Southwestern Wisconsin Bee-Keepers' Association at its annual meeting Oct. 5 and 6, at Lone Rock, feel grateful for the benefits derived from the State foul brood law, in the suppression of foul brood in the State of Wisconsin; and as there is still need of its continuance, this Society recommends N. E. France, of Platteville, for appointment by the Governor for State foul brood inspector.

These memorial resolutions relating to the death of Thomas Evans, was adopted:

WHEREAS, the intimate relations held by

the deceased with the Southwestern Wisconsin Bee-Keepers' Society as its Vice-President, renders it proper that we place upon record our appreciation of his services; therefore be it

Resolved, That we deplore the loss of Thos. Evans, of Lansing, Iowa, with deep feelings of regret; that we tender his wife our earnest sympathy in her affliction, and the loss of a faithful partner.

Resolved, That a copy of the foregoing resolutions signed by the officers of the Society be given to the wife of the deceased.

The convention closed with music by resident ladies and N. E. France.

F. L. MURRAY, Sec.
Lafayette Co., Wis.

Poor Year for Bees.

The past was a poor year here—hardly any swarms or honey, altho the bees are strong for winter. We had surplus honey from only one colony out of nine—I took 43 well-filled sections. J. M. HARRING.
Knox Co., Maine, Oct. 25.

Exhibiting at Fairs.

During September and first week of October I exhibited bees, bee-appliances, and honey, at several fairs. Of course it is not necessary to say that a glass hive and super showing the methods used to get comb honey was a great attraction, and brought me in touch with a large number of bee-keepers. Strange to say, there were quite a number who did not know there was such a paper as the American Bee Journal, and still a great many keeping bees in box hives. Of course, the premiums received for making an exhibit for the interests of apiculturists did not cover expenses and time, but I did it more to advertise my honey, which I am putting out myself from a door-to-door canvass. JOHN H. DENYER.
Northampton Co., Pa., Oct. 31.

Colorado.—The Colorado State Bee-keepers' Association will hold their annual convention Nov. 30 and Dec. 1 and 2, 1898, in the State Capitol Building, Denver. The Horticulturists meet Nov. 28, 29 and 30, our first day being their last. This arrangement will give members of both a chance to attend the other's meeting and discuss common interests. R. C. ATKIN, Pres., Loveland, Col.
F. RACHFUSS, Sec., Elyria, Col.

Ontario.—The annual meeting of the Ontario Bee-Keepers' Association will be held in Guelph, Dec. 6, 7 and 8, 1898. Owing to the Guelph Fat Stock Show, the Guelph Poultry and Pet Stock Show, and the Experimental Union meeting on the same dates, there will be a large meeting of bee-keepers, and each association will be a help to the other, as many are interested in all the different meetings. All are cordially invited to attend the meetings. W. COUSE, Sec.
Streetville, Ont.

FARM BEE-KEEPING

Is one of the leading departments in the **Modern Farmer and Busy Bee**, the best general **FARM and BEE** paper in existence. Write for sample copy to-day, and for clubbing rates with any paper you want. Address,

Emerson T. Abbott, St. Joseph, Mo.

A LOW CLUBBING RATE:

Send \$1.50 to the American Bee Journal office, and get both the Modern Farmer and the Bee Journal for a year. G. W. Y. & CO.

WE TRUST THE PUBLIC

and send them our incubator on trial. No man should buy an incubator and pay for it before giving it a trial. You pay not a cent for ours until you have given it a thorough trial. It's made so that nobody can fail with it. A child can run it with 5 minutes attention daily. It beats all others at World's Fair, Nashville and Omaha Expositions. The best catalogue and treatise on incubation published, sent for 5 cts. Plans for Brooders, Poultry Houses, etc., sent upon receipt of 25 cts. VonCulin Incubator Co. 5 Adams St. Delaware City, Del.

Please mention Bee Journal when writing.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Nov. 8.—There is no change in this market since last quoted, honey of all kinds meets with good sale at prices then given. As this is the time of year when sales are most active, receipts are quickly disposed of. R. A. BURNETT & CO.

San Francisco, Nov. 2.—White comb, 9½ to 10¼c; amber, 7¼ to 9c. Extracted, white, 7 to 7¼c; light amber, 6¼ to 6¾c. Beeswax, 24@27c.

There is so little extracted now offering that it is hardly quotable in a wholesale way. Comb is in fair supply and is being very steadily held, altho with the demand for same almost wholly local, the movement is not very rapid.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12¼c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6¾c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5¼c; amber, 4½ to 5c; dark, 4 to 4¼c. Choice Beeswax, prime, 24c; choice, 24½c. At present there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c; amber, 10@11c. Extracted, white, 5¼@6c; amber, 5@5½c; dark, 4¼@5c. Beeswax, 22@25c.

The receipts of comb honey are larger. C. O. ULEMONS & CO.

Boston, Sept. 30.—Our honey market shows a decided firmer tone since our last. A few sales have been made at 15c for an extra fancy lot, while almost all sales ranging from A No. 1 to fancy now are made at 14c, while occasionally, something a little off, will bring as low as 12½ to 13c. We do not look to see any lower prices.

Extracted, Florida, in barrels, mostly 6c to 7c, with a good demand. Beeswax, slow sale at 26c for best. BLAKE SCOTT & LEE.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12¼c; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6¼ to 7c. Beeswax, 25 to 27c. WALTER S. POWDER.

Milwaukee, Oct. 13.—Fancy 1 pounds, 12¼ to 13c; A No. 1, 12 to 12¼c; No. 1, 11 to 12c; No. 2, 10 to 10½c; mixt, amber and dark, 8 to 9c. Extracted, white, in barrels, kegs and pails, 6¼ to 7c; dark, 5 to 5¼c. Beeswax, 26 to 27c.

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing. A. V. BISHOP & CO.

Columbus, O., Oct. 29.—Fancy, 14 to 15c; No. 1, 12 to 13c; No. 2, 10 to 11c; amber, 9 to 10c. Receipts somewhat heavier, but demand improves as weather gets colder.

COLUMBUS COM. AND STORAGE CO.

New York, Oct. 22.—Receipts of comb honey are large, and there is quite a stock now on the market. While white is in good demand, buckwheat and mixt seem to be somewhat neglected, and quotation prices have to be shaded in order to sell in quantity lots. We quote:

Fancy white, 13 to 14c; No. 1 white, 11 to 12c; amber, 10c; mixt and buckwheat, 8 to 9c. Stocks of extracted are light of all kinds. Demand is good at following prices: White, 6 to 6¼c; amber, 5¼c; dark, 5c. Southern, in half barrels and barrels at from 55c to 60c a gallon. Beeswax dull at 26c.

HILDRETH BROS. & SEGLKEN.

Detroit, Oct. 20.—Honey in better demand and better prices as follows: Fancy white, 13@14c; No. 1, 12@13c; fancy dark and amber, 10@11c. Extracted, white, 6@7c; dark, 5@5½c. Beeswax, 25@26c. M. H. HUNT.

Minneapolis, Oct. 20.—Fancy white clover comb is now selling at 11@12c; amber, 10¼c. Extracted fancy white clover, 5½c; amber, 4½@5c. Dark grades, both comb and extracted, not wanted at low prices.

S. H. HALL & CO.

Buffalo, Nov. 11.—Strictly fancy honey is very scarce and held at 13c; occasionally 14c; but it must be perfect goods; fair to good white, 11 to 12c; if much soiled, 9 to 10c; dark grades, 7 to 8c. Trade is good for all qualities and no large stocks in market. Extracted, 5 to 6c. Beeswax, 24 to 28c.

Gleanings at Half Price,

—or, Two Papers for the Price of One.

We have made arrangements whereby, for a limited time, we can send either the Farm Journal, published at Philadelphia, or the Poultry-Keeper, published at Parkersburg, Pa., both fifty-cent monthlies, and the very best in their line, with **Gleanings in Bee-Culture**, to a new or old subscriber, both for one year. But the conditions of this offer are that the money [\$1.00] shall be sent in advance, and that all arrearages to Gleanings, if any, shall be squared up.

The Ohio Farmer and Gleanings in Bee-Culture
both for One Year for \$1.10.

We will send the Ohio Farmer, a dollar weekly, one of the leading agricultural papers of the United States, and Gleanings in Bee-Culture, both for one year, to a new or old subscriber, for \$1.10, paid in advance, and all arrearages to Gleanings, if any, squared up.

The Farm Journal is now in its 21st year, and takes the lead among all the low-priced agricultural papers. It is packed full of practical hints and suggestions; puffs no swindles, and inserts no humbug advertisements.

The Ohio Farmer is a larger paper, and is issued weekly, and is one out of a few really good farm papers.

The Poultry-Keeper is monthly, edited by P. H. Jacobs, and published at Parkersburg, Pa. It has a tinted cover in two colors, and is beautifully gotten up.

Remember that, in order to secure any one of these three papers, in combination with Gleanings, the money must be paid in advance, and arrears to Gleanings, if any, squared up. These offers are very low, and will be withdrawn soon.

CONTRIBUTED ARTICLES

Dried-Up Foul Brood—Cocaine for Bee-Stings.

BY PROF. J. A. COOK.

I have a letter from a Los Angeles county bee-keeper, accompanied by a specimen of foul brood which has dried down in the corner of the cell. He asks if it is foul brood, and wishes to know how one can tell if the disease is present at such times, and if it can be positively told.

I should like Mr. Taylor to reply to this question. In this case it is not difficult at all to surely diagnose foul brood. The odor of the disease is unmistakable. The comb was in a close tin box, and, so, very favorable for such determination. As all know who have had any experience with this malady, the odor is very pronounced, very penetrating and unmistakable. When my children were small, I used to get many samples of diseased brood. The children would frequently bring me the mail, with the box containing the diseased brood still wrapt in paper, with the remark, "You have more foul brood." I found that a sample with very considerable amount of the brood—a score of cells, more or less—would very frequently be revealed before any of the wrappings were removed.

In the case of this sample before me, there are other signs. Cells with sunken caps, and with some of the caps perforated, would surely arouse suspicion. In Southern California, the bees can get some honey nearly, if not quite, every month of the year, and so brood-rearing has not that long quietus that is known in the East. So I think this question has not the practical importance that might be given it. In the East the bee-keeper is behind the times whose information and alertness does not enable him to know and detect this disease, while the bees are active. In case of buying bees in the fall, there might be occasion to make such examination.

The scale of dried matter is hardly sufficient for determination, at least by other than the expert. Of course, the bacteriologist could always make cultures and ascertain the presence or absence of the fungoid matter, but this would not be of use practically. I, for one, would be glad to hear from Mr. Taylor on this subject, as also on the matter of hives. The "Inspector" of Ontario says it is safe to use hives from which diseased colonies have been removed, at once, if I understand his position, without subjecting them to a boiling temperature. His long experience should make him an authority. If boiling the hives is needless, it would save much trouble. From the nature of the disease, we would fear to trust such a hive until it had been thoroughly disinfected. I am sure if Mr. Taylor will give his views in these matters, he will confer a favor.

I think foul brood is quicker to lose its grip in California, and sometimes at least is not so virulent as in the East. I know of more than one apiary where there were colonies badly affected, where no pains were taken to eradicate the disease, and yet it has entirely disappeared. This, however, should not quiet the apprehensions of any menaced bee-keeper, for I have known other cases where apiaries went all

to pieces the second year after the disease made its appearance.

BEE STINGS AND COCAINE.

In a recent number of "Nature," cocaine is given as a speedy remedy from the pain of bee-stings. It is stated that simply applying it will immediately relieve suffering. In succeeding numbers of the same journal it is urged that care should be exercised in the use of this drug. That the warning is timely, appears from the fact that in many cases its use is attended with quite serious consequences. I think all reputable physicians agree that we cannot be too cautious in the use of any of the narcotics, like cocaine, morphine, etc. In rare, exceptional cases they come as very angels of mercy; but one is very unfortunate who is called to use them with frequency.

Los Angeles Co., Calif., Oct. 31.

No. 3.—The Care of Bees for Wintering.

BY C. P. DADANT.

In my last, altho I called attention to the bad quality of fruit-juice as winter food, I have perhaps not laid enough stress upon it, for I consider, from actual experience, that the

Prof. A. J. Cook.

results of a supply of this food are deadly to the bees; the more so as they store a great deal of this kind of food when the real honey has failed. This fruit juice is not honey; it is neither more nor less than cider, which becomes more or less acid, and is positively sure to cause disease. The only way to

deal with this food, if one wishes to save the bees, is to extract it out of the combs, and furnish the bees with more wholesome supplies.

Of all the grades of honey for wintering, honey-dew is the worst; next comes dark fall honey, especially if thin and watery, or if uncap, as the moisture escaping from the bees will render it still worse. The hygrometric properties of honey are so marked that, during a damp season, unsealed honey will often accumulate moisture enough to overflow out of the cells, and will perhaps besmear the bees as they first bestir themselves after a period of constrained repose. Hence it is advisable to remove, in the fall, all unsealed honey; most especially if the bees have enough without this. If the quantity is limited, it is not so urgent to remove it, as they usually consume the unsealed honey first, and may get rid of it before the coldest weather, which confines them to the hive for weeks at a stretch.

There is another source of injury to the bees in fall honey which is heavily loaded with floating grains of pollen, and is the more dangerous that it is least easily detected by the apiarist. These floating grains of pollen are not discernible to the naked eye. The best bee-food for wintering is that which contains the purest saccharine matter, as it is most thoroughly digested by them, with the least production of discharges. Since the bees are often compelled to remain, for from three to six weeks, confined to the hive, and during that time are closely clustered together, it is out of the question for them to void their excrements, and when the food which they eat contains a great deal of pollen, or is too watery, they are often unable to retain their discharges, and must either go out and perish, or release their bowels in the hive, thus besmearing the combs and their sister bees, with the most foul and offensive excrements. In either case, it is death.

When the bees are in a cellar, the evenness of the temperature, under proper conditions, enables them to consume a minimum quantity of food, and they stand a much longer confinement with ease, if the food is right, than when out-of-doors. From the above statements, which are based upon over 40 years of wintering experience with large apiaries, the reader will readily see that the best winter food is to be found in the very best grades of honey. In a mild winter, as I will show farther, anything will do, for if the bees are not confined they have nothing to fear. When the crop is short, if good honey cannot be had in sufficient quantity, the artificial supply may be provided, by adding sugar syrup to a certain quantity of honey, and very good feed may be made by using a mixture composed in the following proportions: Sugar, 50; water, 25; honey, 25. The water is first heated to the boiling point, then the sugar is thrown in, and after it has slightly cooled the honey is added.

Feeders of all kinds are made, and it is not the purpose of this article to recommend that such a feeder be used as will enable the bees to take their food above the combs and as close to their brood-nest as possible, to avoid the depredation of heat.

I said that from 25 to 40 pounds were needed, but have given no way of ascertaining the quantity, short of weighing the hive, which is impractical in most instances. Those who are accustomed to handling bees usually judge of the amount by the space occupied with honey, and this is probably the best criterion. We would call a hive sufficiently supplied if the honey occupied about one-half of eight combs, the upper half of course, since bees always place their stores above and behind their brood. But we use hives with 10 combs, and like to see these 10 combs half filled, at least. Too much honey is better than too little, and if we would have success with bees, we should not begrudge them a little more than they are likely to need. But it is necessary for them to have a sufficient space of dry comb at the bottom to cluster on; for they fare much better, and keep warmer, if they can keep the bulk of their cluster below the honey, on empty cells.

We will next consider the advantage of winter flights, and of shelter.

Hancock Co., Ill.

Frame Spacing at Top and Bottom.

BY A. P. RAYMOND.

I am aware that frame spacing is an old, well-worn topic, having been thoroughly discussed many times, but I am also aware that many bee-keepers are not as yet giving this matter as much attention as its importance demands, consequently I trust I may be pardoned for again referring to the subject.

No feature connected with the use of loose-hanging frames should receive more careful consideration than that of spacing. Every practical bee-keeper is cognizant of the fact that frames of comb are of the greatest value when they are per-

fectly straight, the cells being of equal length upon either side, for they are then interchangeable and can then be placed in any part of any hive in the apiary without inconvenience to ourselves or the bees. They can also be readily turned end for end in a hive, which is often necessary.

Experience with loose-hanging frames has convinced me of two facts, viz.: If we are to obtain the best possible results from their use the combs must be built in them evenly and perfectly, as described above; also, if we secure such straight, even combs, the frames must be *accurately* spaced.

Now, what I mean by frame spacing includes not the tops only, but the bottom of the frames as well. If we take the trouble to space but one side of the frames let that be the bottom—the tops are where we can readily see them, and by using our eyes as guide we can space them quite accurately, the only difficulty being that they will not stay spaced while handling or moving the hive. We may construct our frames ever so carefully, having them perfectly true and entirely out of the wind, and still we are not relieved of the duty of bottom spacing, because however truly an empty frame may hang in a hive, when it is filled with comb, brood and honey, it may be found hanging out of plumb, caused by more brood or honey being placed upon one side of the comb than upon the other. Now, when a frame hangs out of plumb, the bees make the matter still worse by lengthening the cells upon the heavier side and putting in still more honey; if the opposite side contains brood the cells of course must remain only the proper length.

If we wish to remove a frame and place it in another hive, and we find it in the condition described above, it causes trouble to ourselves and extra work for the bees. The fact established, that the duty of frame spacing is imperative if we are to receive the best results, the question now arises, what method of spacing shall we adopt? For the benefit of those who wish to use it, I will give a method of top-spacing which I have recently devised, and which I think, without being egotistical, is superior to any other with which I am acquainted.

After removing the head from a six-penny wire finishing-nail drive it longitudinally into the end of the top-bar of the frame directly underneath and close to the projecting end. It should be placed directly in the center of the bar transversely, and driven in until the out end of the nail is flush with that of the bar. Now, with a three-cornered file I make small V-shaped depressions or notches upon the upper edges of the metal rabbets, which are used in the hives, $1\frac{3}{8}$ or $1\frac{1}{2}$ inches apart, as may be desired, and just deep enough to correspond with the diameter of the nail, which, being driven in, has now become apart of the projection of the top-bar. (Do not make the depressions too deep, about $\frac{1}{8}$ inch is sufficient.)

When the frame is placed, as now arranged, in the hive, the nails which have been driven underneath the projecting end of the bar rest at right angles upon the metal rabbets, and will quickly drop into the depressions as they strike them, and the entire width of the projection will rest upon the rabbet. The weight of the frame will hold itself in place. These depressions should in every case be V-shaped, as the frame may then be crowded upward and also to one side with only one motion. They may be more rapidly made by machinery, or possibly with a steel punch and a hammer; this applies of course to the construction of new rabbets. I think that by using a small file the depressions can be made in the rabbets of the hives already constructed without removing them from the hive; it may be rather slow work, but you will never regret the time spent, as it will save much valuable time in spacing frames during swarming, when one minute is sometimes worth more than are 10 minutes at some other seasons of the year.

This method may also be adopted by those who do not use metal rabbets; by using a chisel the V-shaped depressions may be made upon the wood rabbets of the hive; in such case the depression should extend across the entire width of the rabbet, and it would probably be better to use an 8-penny nail instead of a 6-penny underneath the projection of the top-bar, and consequently a little deeper depression in rabbet.

I believe this method has several advantages over the staple or nail methods of spacing. The nails underneath the projections of the top-bar are not in our way in the least while manipulating the frame; the frames can be readily and very easily moved to one side, allowing us to remove a central frame from the hive without first removing the dummy or division-board at the side.

Again if we wish to store a quantity of frames, either empty or otherwise, they occupy less room than if their sides contained nails or staples; the nails resting upon the metal rabbets prove an advantage in moving the frame from side to side in the hive, as they glide very easily along the edge of the rabbet.

The simplicity and cheapness of this method are also in its favor.

For a bottom spacer I have never seen anything I liked as well as the one made of wire, described in Langstroth Revised. Some may object to this spacer because it is old, but I would not discard it until a better one is invented to take its place. This spacer, however, is greatly improved and strengthened by taking a strip of firm, straight-grained pine or basswood $\frac{1}{4} \times \frac{1}{2}$ inch, and a little longer than the width of the hive, and cutting a saw-kerf the entire length directly in the center of the strip upon the widest or half-inch side $\frac{1}{8}$ inch deep. Now take the wire spacer after it is carefully made, and press it firmly into the saw-kerf; it requires no fastening to hold it in the kerf, providing the kerf is the proper width, that is, a trifle narrower than the diameter of the wire used. By using this strip we are enabled to use a smaller wire than we otherwise would, and still our spacer is very strong; the smaller wire is more easily and rapidly bent the required shape.

The strip can be placed in position in the hive by making a very shallow mortise upon each side about $1/16$ inch deep, and springing the strip into place.

We should place this spacer in the hive so there will be a $\frac{1}{4}$ inch space between it and the bottom-board.

It is a little trouble to arrange our hives with spacers, but we will be amply repaid by doing so.

Clark Co., Wis.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

SECOND DAY—FORENOON SESSION.

[Continued from page 724.]

PARAFFINED SEPARATORS AND FENCES.

"Who has had any experience with paraffined separators and fences? and what is your opinion of them?"

Mr. Danzenbaker—I can claim that I have had some experience. I believe I was the first one to mention the matter. Here is a sheet of paraffined paper. The intention was to use this in covering over the super, and you could put a covering over it—a piece of carpet, or a piece of enameled cloth. The intention was to keep the other clean. When you use enameled sheets, you always have to clean them off. Use them once, and if they get soiled they stain the sections wherever they touch. This paper is clean; you can use it once or twice and then throw it away. It is very cheap. The question is, how long will it last? Here is one piece that has been used several times. Some say the bees eat it. There is no hole in that piece: this sheet is cut along the edge. That was put on right in the height of the white clover honey-flow. The bees don't eat it for me, only where it is not pressed down tight. Where it is used with weight enough on it to hold it tight, they won't eat it out. When used for separators, without any pressure on the other side, they cut it, and I abandoned using it in that way. The bees will gnaw it if it is laid on the super without anything over it. For separators it will not do.

Mr. Hatch—I would like to say that I used paraffined paper last year, and I found it perfectly worthless. It was no better than so much newspaper laid over the combs. The bees will gnaw through it in no time. And if the wind is blowing, it takes three boys and a man to put the sheets back on the hives when they are taken off.

Mr. Danzenbaker—The intention in putting that on is to have it done in the shop, not in the yard. In examining the supers I don't take the sheets clear off: I just raise up one corner.

A paper written by S. T. Pettit, of Ontario, Canada, was then read by the Secretary, as follows:

Advanced Methods of Comb Honey Production.

The subject assigned me is an important one. The greatest difficulty in dealing with it consists in the large number of supposed-to-be superior systems, and every one wedded to his own. But for all that, the advancement recently made in the fine art of taking comb honey is marvelous indeed, and I often admire men and methods.

Presuming the object in view was that this paper shall be helpful rather than a delineation of many and conflicting methods, I shall in the main confine myself to my own system, believing it to be the best.

First of all, quality and reputation must be maintained, even if necessary at the expense of quantity. The comb foundation must be faultless. The filling of the brood-chamber at the approach of the clover flow or main crop with sugar syrup, I regard as a most pernicious practice. I state this with due respect for the views of others. Later on I will give a better way.

May I digress long enough to state that the statutes of Canada, when any such syrup reaches the supers and is offered for sale, make such practice a willful adulteration, and the Government, at its own charges, will do the prosecuting.

It is no digression to state that perfect wintering is a mighty factor in the production of comb honey.

It is not enough to bring 95 or even 100 percent of our colonies through the winter alive; we should see to it that they are practically in the same condition that they were at the approach of winter, with plenty of stores, healthy and strong, and able to rush out and catch the first and every honey-flow coming within reach.

And then the spring management must be such that the brood-chamber at the time of giving section supers is practically full of brood from side to side, and from front to rear. Briefly, then, to this end brood spreading, timely and judiciously, with some uncapping, generally must be practiced.

And now for the better way: When the spring flow sets in sharply, in order to leave the whole brood-chamber to the queen, and to provide against the practice of feeding sugar syrup, extracting-supers must be given. These, with their contents, are left on to keep up brood-rearing until clover yields freely. These supers are then removed and comb honey supers take their place.

Generally, at this time, if the work has been well done, the brood-chamber will be practically full of brood, which will be of far greater value than sugar syrup, and it costs nothing; and your comb honey will be pure, and your reputation unsullied. With this management no bait combs, half-supers, nor double brood-chambers will be wanted. The bees will go up for "standing-room," and go to work with a right good will.

I must not forget to state that at the time of changing supers the combs containing the most and youngest brood should be placed next to the sides of the brood-chamber. This will make more room for the queen, retard swarming, and force the honey into the sections; and then when swarms do issue their numerical strength will gladden your weary hearts, and cause you to rejoice in hope of a rich reward.

The large entrance has become an indispensable necessity in my practice. For that purpose I used the wedges so often referred to; and the dividers for creating a double bee-space at the outside of the sections, are also indispensable; the former distributes the bees, and the latter hold them just where wanted—so much so that sometimes the outside and rear sections actually get ahead of those near the entrance, but that is not the rule.

The habit of the young bees meeting the field-bees above the entrance near the center is so strong that a cluster is sometimes formed, and the field-bees continue to go up at the center; but a little cool weather will usually break that up, and proper distribution will follow.

Hive swarms on starters, in hives contracted to about two-thirds of the size by the use of dummies. Let them remain upon the old stands, and at once transfer the supers to the new swarms. A queen-bar or queen-excluder must be used. Give shade and a lot of top ventilation, which should be closed on the fourth or fifth day in the cool of the evening. We may yet learn how to continue top ventilation with much profit.

What seems to me the most difficult thing is to give the right amount of super-room. I would say, be careful to give enough, and be just as careful not to give too much. But what's enough and what's too much? How shall we know? Well, I reckon from existing conditions and prospects, years of careful observation and practice will guide us pretty well.

Want of space forbids giving many pointers. My experience with deep-cell foundation, fence separators and plain sec-

tions is too limited to be of value. But whatever changes we do make, I hope we will not depart from the standard $4\frac{1}{4} \times 4\frac{1}{4}$ section—the cost will be too great for an imaginary gain.

NOTE THESE FOUR POINTS:

1. Foundation should touch the sides of the sections and come to within one-sixth of an inch from the bottom-bar.
2. I have used thousands of bottom starters, and fail to find much benefit from them; but I have found this, that if they overlap a quarter of an inch or so no harm will result; the bees will cut them to fit, and unite them all right.
3. If holes are found in the septum of foundation the bees lose time, and add too much wax in mending.
4. Feeding back, on account of granulating in the sections, should be discouraged.

S. T. PETTIT.

Mr. Spaulding—I disagree with one point in regard to bottom starters. I find them a great benefit. I used to notice that the bottom pieces of the sections would be pulled away by adhering bur-combs, but since using the bottom starters the bees fasten them so securely that I rarely if ever pull off the bottom of the section in removing the honey from the hive. I use a starter about a half inch.

Mr. Hatch—What kind of super do you use?

Mr. Spaulding—I have used the plain sections and the super that goes with them.

Mr. Westcott—I would like to hear whether there is anything really gained by using full sheets of foundation, or whether there is enough gained to pay the cost of buying the foundation. I have tried both ways, and really the results have been about as good with a good, fair starter as with full sheets of foundation.

Dr. Miller—It might be instructive to ask the question, How many have tried both ways, and how many prefer only small starters?

On a showing of hands, 21 were found to have tried both plans, 17 of whom preferred full foundation, and 4 of whom preferred starters only.

Mr. Danzenbaker—I would like to say a word in regard to the matter of $4\frac{1}{4}$ inch sections. Here is a 4×5 section, and here is one $4\frac{1}{4} \times 4\frac{1}{4}$. I will stand them right up here together. Let me say another word, as it was printed in the journals—both in the American Bee Journal and Gleanings—that I use bottom starters, I think I am entitled to say that I do not. Some five years ago I bought some foundation that was intended to be used in certain sections, and it wasn't deep enough to reach as far as I wanted it to, and so I was forced to use bottom starters to piece it out. I didn't like the plan. In putting in foundation, I always leave a bee-space so the bees can pass under. They fasten it at the bottom as soon as they do at the sides. This little box of honey here, I will venture that I can put it in the express office and ship it to Washington, and that it will go all right. I shipped one from Washington to Gray Gables, to Mrs. Cleveland, and got a letter saying that it went through in good order. Again, about the size and shape of the sections. A pound of honey is just as heavy in the 4×5 sections as in the other form, and when you come to sell them, the 4×5 sections sell more readily. I can sell the 4×5 faster than I can the other. It makes a bigger show. When I sell honey to consumers, I tell them to take their choice, and one time I sold 48 of the 4×5 sections to two of the others. The 4×5 sections don't hold any more honey, but they look bigger; 48 of the 4×5 weighed 47 pounds; 100 of this other size, with cleated separators, weigh from 93 to 97 or 100 pounds, depending on the season. This year was the driest I have ever known, and the comb was not filled out quite so well. I cannot agree with the statement that it is so expensive to change from the $4\frac{1}{4}$ sections. There is no need of the sections costing any more, and the supers can be changed very easily, by nailing a $\frac{3}{4}$ inch cleat on. The expense of changing is almost trifling; the sections will cost no more, and the cost of nailing the cleat on the super will not exceed 5 cents to the super.

A. I. Root—Mr. Acklin has some figures in his memorandum book that he could give us in regard to the relative cost of producing comb and extracted honey.

Mr. Acklin—At our out-apiaries 3 cents a pound was the actual cost for extracted honey, and $6\frac{1}{2}$ cents a pound for comb honey.

A. I. Root—That agrees with Mr. Hatch's 3 cents a pound in Arizona.

Mr. Hatch—He says he figured the actual cost of extracted honey at 3 cents a pound. I sold my crop at $3\frac{1}{2}$ cents, and cleared up \$1,100 for the services of myself and family for the summer, excepting our board-bill.

Dr. Mason—How much did the honey cost per pound?

Mr. Hatch—I could not say. We paid all hired help and

all expenses, except our board-bill. I was an invalid, and did not do anything for six weeks. Mr. Acklin gave 3 cents a pound as the cost of production. If I could get 3 cents a pound in Arizona, I could make money.

Mr. Acklin—Don't you get larger crops in Arizona than we do in the northern part of the United States?

Mr. Hatch—My average, with 550 colonies, was 120 pounds of extracted honey.

Mr. Acklin—Do you keep those colonies in one apiary?

Mr. Hatch—No, sir; they are in three apiaries.

Dr. Miller—Here is something that is of very great interest to us, and that is as to the size and shape of the sections; and right here is the place where we can get information upon the subject that perhaps we cannot get anywhere else, as to the relative value of the two kinds of sections. I for one would like to know if there is really any advantage. If the 4×5 sections are worth more, I must change, but I want to be pretty sure of my ground. I don't want to pay out \$50 or so unless I am pretty sure there would be money coming back to me for it. The question is, whether those who have had experience with both kinds of sections can tell us whether the deep section is better than the square.

Mr. Westcott—I think there is a good deal in being used to them. A three-cornered section might look nice for a while, because it would be something new; but after I have looked at them for a while I like the looks of the square section as well as I do the other. I don't know why the honey won't sell just as well, either. If we change from one to the other, it will cost a great deal. The bee-men mostly have supers for square sections, and when we make these changes they add a great expense.

Pres. York—We are not considering the appearance of the honey that is now in these sections, but the shape of the sections themselves. The honey is not of the same grade in both sections. Will those who prefer the tall sections please stand and be counted?

Ten declared themselves in favor of the tall sections, while 15 declared in favor of the square sections.

Mr. Hatch—I ran 250 colonies for Mr. Mendleson last year. I like the Danzenbaker hive and section first rate, and always have. Mr. Mendleson took some of the honey in these sections and went into a store where they were paying 9 cents for just the same honey in other sections, and he got $11\frac{1}{2}$ cents for his. They had none of the tall sections, but they could get plenty of the other for 9 cents. They have a fancy trade at Los Angeles and Pasadena, where there are a great many wealthy people who don't care for cost. If a thing suits them they will take it and pay for it. To cater to that trade it is certainly desirable to have that kind of section.

Dr. Miller—Suppose there had been on the market the same number of square sections as of the tall ones, or suppose the tall sections had been in the majority and the square ones in the minority, would the same relative prices have held good then, do you think?

Mr. Hatch—Of course I could not answer that question, because I don't know. There was no shortage of the square sections; there was an over-supply, if anything.

Mr. Danzenbaker—I am sorry to see that the majority of the convention are in error on this matter. The expense of the change doesn't amount to anything. I have been in the business for a good many years, and have tried a good many changes; I am always changing where there seems to be anything to be gained by it. I met Capt. Hetherington, and in talking about the tall sections he said they sold better. I wanted to buy a case of his honey, and he said it was all sold. He produced 30 or 40 tons of honey, and it was all sold before it was produced. I said I wanted one case, at any rate, but he said it was all contracted for, and at that time he got 17 cents—about 2 cents above the market. I begged of him a half-dozen sections, and took them and put them on a hive, and I was surprised to find that in the same super they were the best filled and the best finish. Then I got a thousand, and took them to market to find how they would go with the people. I set the tall sections upright, and told my customers to take their choice. I sold 48 of the tall sections while I sold 2 of the others. Then I put 2 cents more onto the price, and that didn't stop it. Then I laid the tall sections down the other way, and I was lost! It depended on whether they were standing up or lying down. I was in stores where honey was sold in 2-pound sections, and they were the best finish I ever saw. They were finish at the top and bottom alike. Only an expert, who knew the pitch of the cells, could tell which was the top and which was the bottom. Those sections were selling at 15 cents, and the others were selling at 10 cents. I asked, "Don't you lose money selling 2 pounds for 15 cents when the other sells for 10 cents a pound?" He says, "I can make more money producing honey at 2 pounds for 15

cents in those sections than I can at 10 cents a pound in the others. I can get so much more of it. They go to work quicker, and finish it faster." I took this year 900 finish sections from 14 colonies, and it has been the driest year I have known since I have been keeping bees. One of my neighbors who had 300 colonies with the other sections didn't get a single super filled, and he was right in the same locality. This year I didn't get the honey quite as white as I wanted it, because the blue thistle was a failure. This honey that I have is a mixture of sumac and other flowers. I sell my honey in Washington, and I get 15 cents for all I grade as No. 1, and 13 cents for No. 2. I can go into Washington and buy the other for 11 cents, while I am getting 13 and 15 cents for mine, and I have a good market all the while. If you will try the change, you will find the difference. I would like to ask if there is a single man in the United States who has ever used the tall sections that was willing to go back to using the square sections.

A Member—I bought the Danzenbaker hive a couple of years ago, and 1,000 of the tall sections, and I went to work and got them filled and took them into the Salt Lake market. They looked well, but I couldn't sell them as I could the others. The convention then adjourned until 1:30.

[Continued next week.]

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. O. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

An Explanation of the Delayed Answers.

Some of the friends will find their questions answered in this number which they expected answered several weeks ago. Please don't lay the blame on any one in Chicago. It lies some 60 miles Northwest of that wicked city. The questions were promptly answered, put in the envelop to be taken to the office, and by some mysterious process hid themselves out of sight in the vehicle in which they were to be carried, only to come to light when a snow-storm made it necessary to shake out the carpet on the floor of the vehicle. I can only say I am exceedingly sorry for the delay, but ask that you will lay no blame on the shoulders of the already overburdened editor.

C. C. MILLER.

Two Hive-Stories for Wintering.

I have noticed in recent issues of the American Bee Journal that you speak favorably of the plan of wintering strong colonies of bees in two-story hives. Without knowing any thing about your practice in this matter, I venture to presume that you place a hive filled with frames of comb under the colony in the fall and leave it there until it is time to put on supers the following spring. In the absence of frames of comb, would you fill with frames of foundation? And in the absence of both frames of comb and foundation, would you venture on the use of frames having starters of foundation only?

I have a good many hives in which the bees seem to be too numerous to winter comfortably without more room. My stock of combs is used up, and I have no sheets of foundation on hand, but can procure them if necessary. I have some foundation cut into wide starters. What would you do under the circumstances?

IOWA.

ANSWER.—One of the reasons for having a second story in winter is to have more room for a strong colony. I don't believe, however, that this counts for such a great deal. The strongest colony you have will very likely have no difficulty getting inside the hive, come cold weather. Another object is to have combs below to contain extra stores, so there need be no sort of question as to whether the bees will need feeding before flowers yield. Still another object—and I'm not entirely sure just how much weight it should have—is to have the cluster of bees somewhat removed from the outer air, so that a cold blast of wind will not strike so directly on them. If I am correct in these views, the best thing is to have in the story that is below, combs containing more or less honey. If you have no combs containing honey, then empty combs will answer the purpose, only you may have to look out for feeding

in spring, altho not necessarily so. The empty combs will do to cluster on, and will serve as a wind-break. If you have no combs, it is quite possible the under story may still be of advantage, for the blast cannot blow so directly upon the cluster as with only one story. But I don't see any special object in having frames partly or wholly filled with foundation. With plenty of room below the frames, the bees will cluster as well upon air as upon starters. And you may be pretty sure that after the bees have wintered upon foundation it will not be so acceptable to the bees. The only good I can think of that would come from having starters or full sheets of foundation in the lower story would be in providing so much of a hindrance to the free force of the air, and you could secure this in some other way. A little board might be dropt inside that would prevent direct passage, but would provide plenty of room for the bees to pass around it. A man with your inventive turn may think of better ways, but certainly I don't believe you ought to let the bees have foundation over winter, either full sheets or starters. If you leave a lower story without combs or frames, you will in some cases have combs commenced on the bottom-bars, but this is a small matter, as the loss is small, and the bits of comb are easily cut off.

Oats Chaff for Winter Packing.

Will oats chaff be all right for packing around hives for winter? I see wheat chaff and planer-shavings are generally recommended, and as I cannot get either of these, I thought it possible oats chaff would do as well.

KANSAS.

ANSWER.—Oats chaff will do very well. Be sure to keep it dry.

Cellar Temperature for Bees.

Is there danger of getting a cellar too warm for bees? Suppose the temperature was up to 65° for any length of time, would it do any harm? Do you know of any case where the temperature was so high that the bees did not winter well?

MICHIGAN.

ANSWER—I doubt whether there is much danger of a cellar being too warm, *providing* the air in the cellar is all right. With good, pure air, 65° could be borne for a considerable time, and it might do good to have that temperature for a day or so when the bees become uneasy in winter. It is possible that 65° continued for a week or two might start bees to breeding—an undesirable thing in winter—but with pure air, darkness, and quiet, I should hardly expect it. I think there have been reports of bees being kept too warm in winter, but I cannot now say by whom. It is generally considered that somewhere about 45° is the best temperature for bees in a cellar. If you can control the temperature, keep it at that point where the bees appear to be in perfect quiet.

Hive-Entrance and Packing in Winter, Etc.

1. How large ought the entrance of a hive to be throughout the winter, when wintered on the summer stand?
2. I have a few colonies in a pear-orchard. How would it do to put up a wall on the north and the west sides of each hive, making it double, then pack with forest leaves, and also put a cover over them to keep the rain and snow off? Does it make any difference how far off the wall is?
3. I have a colony in a box-hive that did not swarm all summer; sometimes they hung out until it seemed as if there was no more in the hive, but the hive was yet full and they had plenty of honey. Once they were all in the hive and I could see nothing but drones on the alighting-board. What was the cause of all this?
4. Do ants stay in the hives through winter?
5. My bees have been carrying pollen all summer, and up to to-day (Sept. 22), they are still carrying it. Do they need so much to winter them?
6. How much ought the body of a Langstroth hive weigh with a strong colony and full of honey?

ILLINOIS.

ANSWERS.—1. The general practice favors an entrance the full width, and $\frac{3}{8}$ to $\frac{1}{2}$ -inch deep.
2. It ought to answer well. Yes, it makes a difference. Let the wall be as near as convenient.
3. It is nothing very strange that a strong colony should go through the season without swarming, and many a bee-keeper would give money if all his bees were of that kind. Very often you will find the drones clustered together on the bottom-board, especially when forage becomes scarce and the

workers have decided they don't care any more for the company of the drones.

4. If there is a place where the ants can get, and the bees cannot reach, as for instance when quilts are used, ants may stay all winter, the heat from the bees being agreeable to them. Nowadays very many use plain board covers, and these furnish no hiding-place for ants, either summer or winter.

5. It's hardly so much for winter that they're carrying it in as for daily use. They'll winter without any pollen, but they'll not rear brood without it.

6. If an 8-frame hive weighs 50 pounds, including plain cover and bottom-board, it is likely to have enough stores for winter, but it will not be a bad thing to have it heavier. Perhaps a 10-frame hive ought to weigh nearly 10 pounds more.

Dividing for Increase

Did I do right last spring in dividing my bees? There was a heavy colony from which I took three brood-frames that had eggs. I didn't know whether there was any queen-cells or not.

I have 22 colonies, and they have done very well this summer. I sell my honey at home for 8 and 10 cents a pound.

MICHIGAN.

ANSWER.—From the testimony you give in the case there is no evidence you did anything wrong. At the same time while one might take three frames with eggs and manage to perfection, one might also take three frames with eggs and manage pretty badly. One of the best investments you could possibly make would be to get a text-book on bee-keeping and study it thoroughly. Then, knowing fundamental principles, you might manage many different ways in making increase and be right in all of them.

Introducing Queens—Wintering.

1. When is the best time to introduce Italian queens?

2. Where the chaff hive is not in use, what is the best method for wintering bees?

KENTUCKY.

ANSWERS.—1. That's a matter that depends a good deal on one's own convenience. If it is a colony run for honey that is to have the stranger introduced, it will interfere less with the honey crop to introduce toward the middle or end of the honey harvest. But if you wish to rear other queens from the new stock, it will be better to introduce at or before the beginning of the harvest. The advantage of being able to rear queens from the new stock will more than counterbalance the disadvantage to the honey crop.

2. For some places cellar-wintering is best, and for some it is better to winter out-doors. As far south as Kentucky you will probably do better out-doors, providing some shelter against wintry blasts, unless the bees are in a location naturally sheltered from prevailing winds.

One or Two Stories in Winter—September vs. May Queens.

1. I have my bees in dovetail 8-frame hives. Is it preferable, in wintering on the summer stand, to use one or two stories?

2. Will queens reared in September be as prolific as queens reared in May, drones being present?

N. C.

ANSWERS.—1. If you have the hives on hand, you may as well use the two stories. I should rather have the two.

2. That depends on weather and pasturage. If the weather is cool in May, and there is little or no pasturage, queens will not be as good as those reared in good weather with good pasturage in September. If the weather is warm in May, and there is good pasturage, queens will be better than those reared in bad weather with poor pasturage in September. Take the average May and the average September, and in some places one will be better and in others the other. Because in one place the weather and pasturage will be better in May, and in others in September.

What Ailed the Bees?

I bought four colonies of Italian bees in the spring, and sold two of them to my neighbor, thinking two was enough for me to begin with. One of them did very well. I have four new colonies and the old one. I got about 200 pounds of honey from them. The other one didn't do much. It stored some honey, but did not put any in the super. It seemed to

have young bees and brood nearly all the time, but they were all the time dying. They would get weak and stupid, and die; hang around in the hive and drop down on the bottom dead in handfuls a day. They would drag out what they could, and finally they all died, leaving in the hive about 30 pounds of honey.

1. I would like to know what was the cause of their dying.

2. Is it safe to eat or feed the honey to bees?

3. Is it safe to give the frames with the honey and comb to new swarms in the spring?

KANSAS.

ANSWERS.—1. It's hard to say what the trouble was. It might be paralysis, it might be pickled brood, and there's a bare possibility it might be foul brood. If paralysis, a leading feature will be the trembling of the bees and the shiny black appearance. It will be worth your while to look up the matter of pickled brood in back numbers of the American Bee Journal, and to get Dr. Wm. R. Howard's little book on foul brood. Then you will be able to judge the case better than one who is not present.

2. It will be safe for you to eat the honey, but until you are sure there is no foul brood in the case, don't feed it to the bees.

3. Not unless you're sure there's no foul brood in the case.

Smoker-Fuel—Sowing for Bees—Propolizing.

1. What is the best thing to use to smoke bees? I have been using little pieces of wood such as I could pick up around the yard, but it just seems to set the bees to fighting, and they come right to the top as quick as I start to smoke them.

2. What do you think is the best thing to sow for the bees? Will buckwheat stand the frost? And what is the right time to sow it?

3. Is there any way to prevent the bees from sticking the sections in so tight that one cannot get them out? There are lots of balm or cottonwood trees here, and it seems to be the gum from the buds of these trees that they stick them with. There is also a great deal of it in the honey.

IDAHO.

ANSWERS.—1. Almost anything will do for smoker wood. Perhaps nothing is better than sound hard wood cut up into proper size to burn well, say pieces ¼-inch square, and as long as the smoker will take. But it's a good deal of work to prepare such fuel, and chips from the chip-yard, such as you are using, will answer just about as well. Something else besides the character of the fuel is at fault that makes your bees cross.

2. Buckwheat will not stand frost at all. Sweet clover will do as well in that way as perhaps anything else you can try. Buckwheat may be sown about the first of July.

3. Probably you'll never find any way to prevent the bees from bringing in propolis and filling up all cracks with it. It will do some good to have the sections so close together that there will be little in the way of cracks to fill. But where bees glue badly they will plaster the glue over the plain surface of the wood if there are no cracks to fill. Take off sections as soon as sealed. In that way you'll save some gluing.

Bee-Keeping for Beginners is the title of a 110-page book just out, from the pen of that expert bee-keeper of the South, Dr. J. P. H. Brown, of Georgia. It claims to be "a practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit." Price of the book, postpaid, 50 cents. Or, we will club it with the Bee Journal for one year—both together for \$1.40; or, we will mail it as a premium to any of our present subscribers for sending us one new subscriber to the Bee Journal for a year (at \$1.00), and 10 cents extra.

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

The Names and Addresses of all your bee-friends, who are not now taking the Bee Journal, are wanted at this office. Send them in, please, when sample copies will be mailed to them. Then you can secure their subscriptions, and earn some of the premiums we are offering. The next few months will be just the time to easily get new subscribers. Try it earnestly, at least.

Domestic Comb Foundation is thus made, as given in Southland Queen: Take a piece of cotton-cloth, dip it in bees-wax, lay it on a lot of peas, pile peas on top, press with a board, and you have your foundation!

Italians Working Where Blacks Don't.—L. B. Smith reports, in the Southland Queen, that his Italian bees work on a plant like Canada thistle, one variety of horsemint, and prickly pear, while blacks do not touch them.

Severe Effects of Stings, as nausea, palpitations, faintness, etc., the editor of Revue Internationale says investigations show to come only to those whose hearts are affected, and such persons should at any cost avoid being stung.

Foul Brood Smoked Out.—Alex. Astor reports in Revue Internationale that he cured foul brood by vigorously smoking every two or three days in the evening for two weeks. Editor Bertrand thinks a cure might be thus effected in the early stage of the disease before any spores are present.

A Warning is given by the Canadian Bee Journal. Last winter was very mild, and those who saw their own or their neighbor's bees come through safely on the summer stands without protection, may be tempted to leave all without protection this winter. But this winter may be severe, and the part of wisdom is to prepare for the worst.

Bees Defending Against Robbers.—F. A. Jacot says in Revue Internationale that Italian bees defend themselves best against robbers, Cyprians being close seconds, and Carniolans very poor unless crossed. When he finds a colony that will not defend itself against robbers, he unites with it a small number of bees from a colony known to be good fighters, and the robbers will have no quarter. The irritation caused by changing seems to redouble their combativeness.

Plain Sections as to Grading.—Byron Walker, who produces large crops of honey and buys and sells thousands of pounds besides, says in Gleanings that honey stored in plain sections enters into the fancy grade in much larger proportion than that in old-style sections. W. C. Gathright says in the same paper that there is no doubt about bees working faster in plain sections with cleated separators. But he insists that the top of the separator should be $\frac{1}{4}$ -inch below the top of the section.

Bee-Keeping on the Mississippi.—The American Bee-Keeper copies from the New York Herald the following: "It is said that the idea of moving bees to pasture is carried on to a large extent along the Mississippi, where the hives are taken from place to place down or up stream on flat boats, that anchor during the day and are moved on at night while the bees are all in the hives, thus keeping them in fresh pasture all the time." Isn't that something that was done years ago, but not now, Mr. Hill?

Honey Coloring in Wax Extractor.—Complaint is made by some that when cappings are put in a solar extractor the honey is spoiled by being heated and made dark. John Newton says, in the Canadian Bee Journal, that he shades the honey-receptacle by putting a small piece of board right under whatever the wax is run into, just leaving space enough for the drip to run into. Each day's cappings are put into the extractor and melted before night. Mr. Alpaugh says it is important to keep the screen and pan perfectly clean, else the sediment will warm up next time and color the honey.

Shallow vs. Deep Extracting-Frames.—These were discussed in a Texas convention reported in the Southland Queen. With shallow frames and bee-escapes bees can be got off the frames without handling each frame separately. A super of deep frames is too heavy to use the escape. Two shallow frames can be uncapt quicker than a Langstroth. Ten shallow frames are taken off in the super and put on again in less

time than a single deep frame is taken out, brushed of bees and returned. With shallow frames, less trouble with bur-combs. Shallow frames are lighter to handle and don't need wiring. Shallow frames are not interchangeable in the brood-chamber; takes more time to make shallow frames for an apiary, and to put in foundation; you have twice as many frames to space, twice as many frames to handle, but shallow frames don't melt down so readily as deep ones.

Warming Honey Before Extracting.—Before taking the combs for extracting, John Newton goes around to the hives and places the entrance-blocks on, giving a few puffs of smoke. This causes excitement which warms up the honey, making it easier to extract. After the combs are taken from a hive for extracting, the entrance-blocks are removed. He objects to removing extracting-supers from hives to let bees leave of their own accord, as it cools the honey too much, making it sticky and stringy to extract.—Canadian Bee Journal.

Price of Honey in Canada.—Editor Holtermann says honey is higher on this side of the line, but it doesn't pay to ship across on account of duty and other charges. Montreal papers quote comb honey right along at 7 cents a section. In Toronto it is quoted higher, altho Montreal has the wider, and therefore the heavier, sections. He thinks the inferior quality of some of the honey thrown on the market has the effect to lower the price, dragging down the good with the bad. On this side of the line poor honey on the market has the opposite effect, according to Editor Abbott.

Why Hybrids Are Preferred.—Hon. R. L. Taylor, in the Bee-Keepers' Review, says bee-keepers do not keep hybrids because it is too much trouble to keep pure Italians, but because the hybrids are better bees. "They are as good honey-gatherers, they go readily into the comb-honey supers—no fussing with bait sections—combs and comb honey supers are freed from them very much more readily; and as to the color, handsome is that handsome does." If that is true, those who hold the theory that pure Italians are better are on pretty safe ground, for in most cases the attempt to keep pure Italians results in the best grade of Italians.

Large Hives.—C. P. Dadant continues in Gleanings his discussion in favor of large hives. He says it is a mistake to think you can calculate just how many cells a queen needs, and furnish that number feeling sure she will use all of them. She works with a good deal of regularity till she gets to the edge of the comb, when "she quite often loses considerable time in regaining the thread of her work." In hunting for cells she wastes time and drops eggs which are wasted when much needed. With a larger number of cells these eggs would be saved, and an incentive to swarming removed. With large hives, the few swarms that do issue are larger and more profitable. The man with a small hive is not able to tell how much room his queens would fill.

Hive-Making and Stimulative Feeding.—Critic Taylor, in the Bee-Keepers' Review, doesn't advise bee-keepers to make their own hives with hand-saw and chisel. "If one has no saw-table of his own he can easily get the use of one by going not far from home." In reply to the intimation from H. F. Moore, on page 596, that said Taylor is heretical for holding the view that stimulative feeding does not pay, said Moore flanking his assertion by the statement that he can rear colonies by stimulative feeding for less than \$2.00 a colony, hives not included, Mr. Taylor thinks it would be safer for Mr. Moore to figure out his profits after he has sold his colonies, and thinks more money could be made making hives with a hand-saw.

Florida Bee-Shed.—John Craycraft is very enthusiastic over his bee-shed which he writes about in Gleanings. It is cheaply constructed, contains 112 hives, is octagonal, each side being $16\frac{1}{2}$ feet on the outside. "The posts are 3x4 inches, and rest on pine blocks. All the other timbers are $1\frac{1}{2}$ x3, using this size for rafters, ties, and roof-strips to nail the boards on, which are of cypress, 5 feet long, making the shed about 8 feet wide, so that my hives will lean back about a foot, leaving a walk 3 feet wide, as my hives are all 16 inches square, outside. But for the Langstroth hive the shed should be roofed about 10 feet wide, so that the hives could be placed back under the shed about a foot, leaving about a 3-foot passage. For ease of handling, the entrance to hives should be at the side, so that the operator can work from the side instead of from the end of frames."

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. NOVEMBER 24, 1898. NO. 47.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Chicago Bee-Keeper's Association

will hold its second quarterly meeting at 9 a.m. next Thursday, Dec. 1, 1898, at the Briggs House, northeast corner of Randolph St. and Fifth Ave. A fine program is being arranged by the Secretary, H. F. Moore. Dr. C. C. Miller and other leading bee-keepers are expected from outside this county. It is hoped that every bee-keeper in Cook county will be present, and help to make this new local organization of bee-keepers a great success.

An Experience with *Apis Dorsata*.

—In the British Bee Journal of recent date we find the following from Rev. T. J. L. Mayer, writing from Sheikbudin, Punjab, North India:

"I have written for the last Government Blue Book on Indian bees. I think your chance with *Apis dorsata* is nil. I had seven colonies hived and fed all winter, and in the spring the little brutes decamped by 20 and 30 a day, until each queen, in turn, got disgusted and left the hive. Your only chance is with the hill bee, Ghalozi. No uncomb bees will ever be domesticated unless put into hives whose entrance-board is at the top, *i. e.*, under the eaves of our modern hives."

And yet there are those who want our Government to go to great expense to import *Apis dorsata*. Here is a man who had seven colonies of these bees in hives, and all of them left. It seems to us that bee-keepers in this country would better be satisfied with the Italian bees. Of course if our present bees can be improved by careful selection and breeding, so much the better. But we don't believe that our bee-keepers want a foreign bee that won't be content to remain in hives without being padlocked in, and the key hid somewhere.

"Pussy-Cat Style" of Criticism.—Editor Holtermann, of the Canadian Bee Journal, quotes this editorial paragraph from the Bee-Keepers' Review in reference to the style of criticism that some think obtains in the bee-papers:

"Perhaps you have not noticed it, but our apicultural journalism has somewhat degenerated in the line of criticism. It has fallen into what Mr. Heddou calls the 'pussy-cat style.' Attempts at criticism are couched in language so apologetic and 'mealy-mouthed' as to nearly rob them of all force."

Whereupon Mr. Holtermann offers this sentence of endorsement:

"By all means let us have done with the 'pussy-cat style' which too often means that one has not the pluck to say openly what one would say in secret."

Now, the only "pussy-cat style" of criticism that we think needs to be "done with" is the kind that resembles the scratchlog, spitting and yowling that one hears occasionally at night in some back alley where two or more "pussy-cats" seem to be having a dark but exciting convention. We have no use for that kind of "pussy-cat style," and the sooner it is "done with" the better for all concerned, not only in the back alley but also in any bee-paper, should the editor so far forget himself as to let such "pussy-cats" get started.

What is needed is criticism offered in a kindly, considerate Christian spirit. It should require no "pluck" to offer that kind, and it should be received in the same spirit as given.

Yes, sir, the "pussy-cat" or Tom-cat style ought to be "done with"—before it's begun.

Descriptions of Hives.—A subscriber in Arizona suggests that we publish "a series of articles descriptive of each hive, with illustrations." Now, we like to receive suggestions, but when any one hints that we begin on the over 900 hives that have been patented in this country, we just feel like "throwing up the sponge."

Let us suggest to our good friend, and to others, just to send for the catalogs of all supply dealers that advertise in the bee-papers, and they will get the descriptions and illustrations of about all the hives that are of any value in this country.

California Laws on Bees.—Mr. Geo. H. Stipp, of San Francisco Co., Calif., wrote us as follows in reference to the statutes relating to bees in that State:

An inspection of the Index to the Laws of California, covering the period from 1853 to 1893, discloses the following named laws only, upon the statute books:

Penalty for keeping bees in San Bernardino Co.—Stats: 1877-8, p. 563.

Act for promotion of culture of bees.—Stats, 1883, p. 285.

Inspectors of bees and duties.—Idem.

I do not think any general laws have been passed since 1893, but there may be numerous local ordinances of record in the county or counties to which pertaining.

GEO. H. STIPP.

Importance of the Exchange.—Prof. Cook, of California, who is in an excellent position to judge of the advantages offered by the exchange or co-operation idea among producers, writes us as follows on the subject:

The Southern California Fruit Exchange is becoming more and more popular. Our producers on the farms and in the orchards are coming to see that "co-operation" is the motto of all successful business enterprise. The decline in farm values, and the absence of profits the last few years, might have been avoided, had farmers followed those of all other vocations—even down to the boot-blacks—and acted together.

The Citrus Fruit Exchange has had a struggle. It had to fight the commission men in solid phalanx, and the ignorance, suspicion and short-sightedness in its own ranks. Of course, the Fruit Exchange has made some mistakes. Every new enterprise must do so; but it has saved the fruit industry of Southern California from collapse, has grown steadily in pop-

ularity, and has demonstrated beyond question that co-operation is possible among farmers.

This year the Fruit Exchange has made very substantial progress. There is no doubt but that successful co-operation among all classes of farmers is to come in the near future, and will do more for the prosperity of the country than almost any other one thing. It is good that California can be a light in this respect.

The Bee-Keepers' Exchange here has had but one year, practically, to show its hand. The past season has been so great a honey failure that no work or progress was possible. Last year it made good progress. In all such enterprises it is the main thing—an absolute necessity—to secure a manager who is true, honest, competent, and withal a hustler. I believe we have all of these in Mr. Clayton. It is one of the greatest importance that few or no mistakes be made in this matter. It means more than benefaction to Southern California. Pronounced success will convince other sections, and the entire country will be blest. Let us all help all we can.

A. J. COOK.

We are certainly in great sympathy with the objects and work of the California Bee-Keepers' Exchange, and hold the columns of the old American Bee Journal ever open to its help. We wish it success, and want to do all in our power to make it a winner.

Keep Honey Customers Supplied.—Many bee-keepers this year find that they have not produced enough honey to supply their home demand. And some will think it scarcely worth while to send off for honey and thus furnish their regular customers with it. Right there is where a mistake is made. By all means, get honey elsewhere, if possible, and sell it to your old customers. Of course, they may have to pay you a little more for it than in other years when you had a crop of your own, but they will not object to that, any more than they would object to paying a little more for flour when the price of wheat is higher.

Now, we would say the above even if we had no honey to sell; but we feel that we are doing bee-keepers a good turn when we buy their honey, and then offer to sell it again to other bee-keepers. It helps all around, and we trust that many more of our readers will avail themselves of the opportunity to get honey (as we offer on page 749), and keep their customers supplied all winter, or until another honey harvest comes. One of our readers gets several 60-pound cans every week, and is doing well with it. He puts it into gallon cans, and gets \$1.75 a gallon for it in a city trade. But even at \$1.50 a gallon it wouldn't be bad. Try it.

"TELL ME HIS NAME AGAIN" is the expressive title of a new missionary song—duet and chorus—the music of which was written by Mrs. Mary E. Newlin—a sister of this editor. The words were written by Mrs. A. W. Gruber. It is a beautiful thing for any church missionary service. Send for it and sing it. A single copy is mailed for only 15 cents, two copies for 25 cents, or three or more for 10 cents each. Address, Mrs. Mary E. Newlin, Meadville, Pa.

MR. AND MRS. THOS. WM. COWAN'S GREAT LOSS.—Some two weeks ago we announced the sad news from the British Bee Journal of the loss by shipwreck of a daughter and son of Mr. and Mrs. Cowan. In a later number of that journal the junior editor, Mr. W. B. Carr, gives the following simple facts as they occurred regarding the senior editor's son and daughter on board the ill-fated steamer "Mohegan," which will be read with much interest by all bee-keepers on this side of the Atlantic:

Mr. and Mrs. Cowan had arranged to pay a lengthened visit—accompanied by their only two daughters and second

son—to America, where their eldest son owns a fruit-farm, in which his father is much interested, at Loomis, Calif. The voyagers thus included all the members of Mr. Cowan's family except the youngest son, who is a pupil at the engineering works of the Great Northern Railway, Doncaster. Probably all would have travelled from Liverpool in the Etruria, but the two young people who were passengers on the "Mohegan," being food of the sea, chose to take the longer voyage from London and meet their parents at Chicago, Mr. Cowan himself having arranged to pay a promist visit to some American and Canadian bee-keepers on his route to that city.

On Thursday, Oct. 13, he saw his children depart on board the "Mohegan" from the Tilbury dock in high spirits and full of happy anticipation of their next meeting at Chicago. It was his intention to join Mrs. Cowan at Doncaster on the following Saturday and spend the intervening few days there with their youngest son referred to above, the latter being the only member of the family thus left in England. But how true is it that "Man proposes but God disposes." Saturday brought news of the loss of the "Mohegan" off the coast of Cornwall, and the day was spent in anxious suspense by all who had relatives or friends on board. At 9:30 p.m. I received at my home a "wire" to say that Mr. Cowan and family had gone from Paddington to the scene of the wreck, and on Monday our worst fears were confirmed. I, of course, at once wrote to Mr. Cowan, but a note from himself crossed mine, in which I learned that the worst had happened, but that he had recovered the bodies of his children, not bruised, as so many were, but placid, as if sleeping peacefully, and he was thankful. I pass over what immediately followed, except to say that they were buried on the 19th inst., at the little village church of Budock, close to the scene of the disaster, the family returning to town the same day.

I saw Mr. and Mrs. Cowan at Hampstead on Thursday and found them full of gratitude for the many letters expressing sympathy with them in their bereavement. Not a few have reached this office conveying similar sentiments, and knowing how greatly Mr. Cowan regards the good wishes of bee-keepers, I ask them to accept, on his behalf, this acknowledgment of their kindness.

In conclusion, and as Mr. and Mrs. Cowan, with their only remaining daughter, are now on the Atlantic on their way to California, where they proceed direct from New York, I hope to be pardoned for quoting a few words from a note to myself, written by Mr. Cowan on board the "Etruria," after leaving Liverpool, and thus conclude. The extract reads thus:

"I can hardly realize that so much has happened since last Saturday, and that everything has been so ordered as not to prevent our joining Alec. as soon as possible. When we think of how others are suffering who have not found their friends, or have found them mutilated, how thankful we are that ours were spared all suffering, and that we were able to recover their precious remains so soon. Now we are on the sea, but in the hollow of His Hand, and trust in Him who doeth all things well."

The above words are more characteristic than any I could write of one for whom so many of us feel a love and esteem seldom given to a single individual in this world.

W. BROUGHTON CARR.

Mr. A. W. HART, of Stephenson Co., Ill., who called on us a few weeks ago, wrote as follows Nov. 3:

FRIEND YORK—The next morning after my return home my folks got me out at daylight, to take up, whip, clean and put down carpets, etc. "Well, now," I said, "this seems like falling from the sublime to the ridiculous, after being in Chicago midst its beauty, grandeur and glory, and being piloted about its illuminated streets by a sweet lady escort, to now get down to the vulgar duties of a common house-cleauer, in the dust and dirt." O well—

Such things need come into one's life.
If he keeps house, and has a wife
With talent to be clean and neat
Herself, and home keep nice and sweet.

So will her "king," if she's his queen,
Be gallant still, nor be afraid
To be the court(i)er! he has been,
And, cheerful, lend ungrudging aid.

And every nook, with smiling face,
He'll cheerful meet with domestic grace;
If still "he worships her very tracks,"
He'll on his knees—and pull the tacks!

A. W. HART.

We are glad to see that our 69-year-old friend is still a young H(e)art(ed) lover, and makes himself "useful as well as ornamental" around the house. But, then, that's a way most good bee-keepers have.

To Our Regular Subscribers—Now for New Readers!

6 Great 50-cent Offers—Each One Free!!

On this page you will find six splendid premium offers, and we will mail your choice of any one of them for sending us \$1.00 for **just one New subscriber** for 1899—and we will throw in the last three months of this year's Bee Journal free besides to each new subscriber you send on these offers. That makes 15 months of the Bee Journal to the new subscriber. Or, for sending us **4 New subscribers**, as above, we will mail the sender all of the 6 great 50-cent offers.

JUST READ WHAT THEY ARE:

Offer No. 1.—Samantha at Saratoga.

100,000 Sold at \$2.50 per copy.

This is indeed a feast of fun, by the only peer of Mark Twain's humor—**JOSIAH ALLEN'S WIFE** (Marietta Holley.)

Read this Extract from the Book:

And right here, let me insert this one word of wisdom for the special comfort of my sect, and yet it is one that may well be laid to heart by the more opposite one. If your pardner gets restless and oneasy and middlin' cross, as pardners will be anon or even oftener—start them off on a tower. A tower will in 9 cases out of 10 lift 'em out of their oneasiness, their restlessness and their crossness.

Why I have known a short tower to Slab City or Loontowa act like a charm on my pardner, when crossness wuz in his mean and snappishness wuz present with him. I have known him to set off with the mean of a lion and come back with the limment of a lamb.

And jest the prospect of a tower ahead is a great help to a woman in ruin' and keepin' a pardner straight. Somehow jest the thought of a tower sort of lifts him up in mind, and happifys him, and makes him easier to quell, and pardners must be quelled at times, else there would be no livin' with 'em.

She takes off FOLLIES, FLIRTATIONS, LOW-NECKED DRESSING, DUDES, PUG DOGS, TOBOGGANING, ETC.

Opinions of Noted Critics:

"Exceedingly amusing."—Rose E. Cleveland. "Delicious Humor."—Will Carleton. "So exuberantly funny, we had to sit back and laugh until the tears came."—Witness. "Unquestionably her best."—Detroit Free Press. "Bitterest satire, coated with the sweetest of exhilarating fun."—Bishop Newman.

Nicely bound in paper, fully illustrated, printed from new type and on fine paper. 370 pages. Postpaid, 50 cents.

Offer No. 2.—New Waldorf Cook-Book.

Over 1,000 of the very best up-to-date recipes for every conceivable variety required in the kitchen and other departments of house-keeping, by **Mrs. Anne Clarke**, the distinguished student and instructor in culinary science, assisted by many of the most successful house-keepers in various parts of Europe and America. It gives the latest and best methods for economy and luxury at home. Just the book for the housewife or daughter. Has had an enormous sale at \$2.00 a copy. 380 pages; paper bound; postpaid, 50 cents.

Offer No. 3.—Cattle, Sheep and Swine Book.

Fully Illustrated—300,000 sold at \$3.00 a copy.

This great work gives all the information concerning the various Breeds and their Characteristics, Breaking, Training, Sheltering, Buying, Selling, Profitable Use, and General Care; embracing all the Diseases to which they are subject—the Causes, How to Know and What to Do given in plain, simple language, but scientifically correct; and with Directions that are Easily Understood, Easily Applied, and Remedies that are within the Reach of the People; giving also the Most Approved and Humane Methods for the Care of Stock, the Prevention of Disease, and Restoration to Health. Written by Dr. Manning.

Every farmer wants this great book. 390 pages, paper bound. Postpaid, 50 cents.

Offer No. 4.—Gleason's Horse-Book.

By Prof. Oscar R. Gleason.

This is the only complete and authorized work by America's king of horse trainers, renowned throughout America and recognized by the United States Government as the most expert and successful horseman of the age. The whole work comprising His-

tory, Breeding, Training, Breaking, Buying, Feeding, Grooming, Shoeing, Doctoring, Telling Age, and General Care of the Horse. You will know all about a horse after you have read it. No one can fool you on the age of a horse when you have this book. 416 pages, bound in paper, with 173 striking illustrations produced under the direction of the United States Government Veterinary Surgeon. In this book Prof. Gleason has given to the world for the first time his most wonderful methods of training and treating horses. 100,000 sold at \$3.00 each. Our price, postpaid, 50 cents.

Offer No. 5.—Music, \$5 for 50 cents.

Four pieces New Sheet Music, which sell at music stores at 50 cents each—\$2.00; Three years' membership in the World's Musical Association (regular price \$1.00 a year), \$3.00. Total, \$5.00. We offer the whole thing at 50 cents.

The four new pieces of sheet music are the very latest bits of this year; are regular sheet music size and quality, but the title pages are a new style of art, viz: Illuminated Chromatic designs in five brilliant colors.

THE SONG TITLES ARE:

- **Do Your Honey Do.** by THEO. METZ, author of "A Hot time in the Old Town To-night." This latter piece, said to be his best, is creating a great stir, and becoming immensely popular everywhere.
- **Queen of the Bicycle Girls.** by the celebrated composer, OTTO LANGEY, by far the most charming Bicycle Song yet issued.
- **Blossoms from Over the Sea.** by the distinguished composer, J. P. SKELLY, a very beautiful Sentimental Song.
- **He's Just Like All the Men.** by the renowned composer, EASTBURN. Wonderfully pleasing to the Ladies.

The World's Musical Association is an organization having special advantageous relations with the leading music publishers of this country and Europe, and being an enormous purchaser, it is enabled to supply to its members (and will do so) any music desired (at any time within the term of their membership), at such wholesale prices as are usually granted only to very large dealers.

Offer No. 6.—The Poultry-Keeper Illustrators.

The four "Poultry-Keeper Illustrators" are the greatest books on poultry subjects ever issued, and are a veritable poultry dictionary, covering the ground so completely that, having these four books, one needs scarcely anything more except "grit" to become a successful poultry-raiser. You cannot get such other books in the whole world, not even for \$50 each, for they do not exist. Were they given in another form and elaborate binding and colored cuts you might think them easily worth \$5 each, but what you want is not elegant printing, and in these we give you the value in information that you can make use of. They have cost much in labor and cash, but you get all this value for almost nothing. We mail the 4 Illustrators for 50 cents.

- Illustrator No. 1.**—Poultry Houses, Incubators, Brooders, Coops, etc., 25 cents.
- Illustrator No. 2.**—Artificial Incubation, Raising Chicks, Testing Eggs, etc., 25 cents.
- Illustrator No. 3.**—Poultry Diseases, Lice, Grapes, Moulting, Egg Eating, etc., 25 cents.
- Illustrator No. 4.**—Judging Fowls, Description of Breeds, Mating, etc., 25 cents.

Those offers ought to bring us in at least 2,000 new readers during this month and next. You could send in your own renewal for 1899 at the same time you send in a new subscriber, if you wish. If you do, you can select any one of the above offers free for yourself, provided you send at least **two New subscribers** at the same time. That would give you your choice of **three** of the offers—by sending your own renewal for 1899, and two new subscribers (\$3.00 in all).

GENERAL ITEMS

Member of Waterleaf Family.

I send a plant that I may learn the name thereof. It is the first or among the first things in bloom in this section, and bees seem very fond of it, remaining with it throughout the day. It grows along marshy lands, and along the foothills near them. Bees build up rapidly in early spring when located near it, so it must secrete nectar profusely. **W. I. COPELAND, M. D.** Polk Co., Tenn., Nov. 3.

[The plant belongs to the order, Hydrophyllaceae, or waterleaf family; species, Phacelia purhii. Its limits are Pennsylvania west to the Mississippi river, and south to Alabama. The flowering season is April to June. The order to which it belongs is small, but has merkt nectariferous properties, as some of the species (not this one) are provided with nectariferous grooves to facilitate the extraction of the juice by the bee.—EDITOR].

The Langstroth Monument Fund.

EDITOR YORK:—I send two dollars, one of which is to renew my allegiance to the United States Bee-Keepers' Union, and the other to go into the fund for the erection of a monument to Mr. Langstroth.

It seems a little singular that after the great benefit that has accrued to the bee-keepers of this country through the ingenuity and perseverance of Mr. Langstroth, there should be so much apathy displayed by them in regard to this matter, and I am inclined to the belief that there are many hundreds of them, who, like myself, have been a little careless or negligent about it, but who, ever since the subject was first brought to their notice, have been intending to contribute their mite. There is an old saying, that what can be done at any time never gets done, but I hope there will be exceptions enough to this rule to provide a sufficient sum to erect a suitable monument to the memory of him who did so much for the bee-keepers of this country.

DAVID HALL,

Wyoming Co., N. Y., Nov. 2.

Rather Discouraging Report.

Last fall I put 14 colonies of bees into the cellar, and with three swarms this summer made 17. Before taking out of the cellar, three colonies starved; two of the new swarms arose and bade me good-bye, thinking they could find a better country. Two colonies the moths took possession of, and the rest were robbed of honey, bees, and all by stronger colonies; and I now have four colonies left, three being good for the winter, and one must be fed to winter at all. You may lay some of it to me, but, as the boy said, "I am not guilty of it all." I took 60 pounds of honey, and the bees had the rest. There will be less bees in Minnesota next spring than there are now. My bees are blacks. The Italians get honey from red clover, and the blacks cannot.

J. V. B. HERRICK,

Hennepin Co., Minn., Nov. 15.

A Very Dry Spell.

We are having a very dry spell, no rain having fallen for quite a while, and north winds have about dried up all the moisture there was in the ground. We had early rains and for a time everything lookt favorable for a fine season. The new grass soon grew sufficiently for the hills to be again deckt in verdure; but they are now almost as brown as they would be in July or August, when California is a dry country indeed. This is the time for seasonable rains; farmers and others rush their plowing at this season. Where grain has been sown and started it is getting a bad set-

Sweet Clover

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

| | 5lb | 10lb | 25lb | 50lb |
|----------------------|-----|--------|--------|--------|
| Sweet Clover | .60 | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover | .70 | 1.25 | 3.00 | 5.75 |
| White Clover | .80 | 1.40 | 3.00 | 5.00. |
| Alfalfa Clover | .60 | 1.00 | 2.25 | 4.00 |
| Crimson Clover | .55 | .90 | 2.00 | 3.50 |

Prices subject to market changes.

Add 25 cents to your order, for cartage, wanted by freight.

Your orders are solicited.

A GREAT ***** COMBINATION OFFER

COOK'S "BEE-KEEPERS' GUIDE"
FOR ONLY FIFTY CENTS.

You ought to have a good bee-book, if you haven't one already. Prof. A. J. Cook's Manual, or "Bee-Keepers' Guide," is one of the very best published to-day. It is bound substantially and neatly in cloth, contains over 450 pages, and retails at \$1.25 a copy, postpaid. But we are going to make you an offer, for the next three weeks (positively ending Dec. 10), that will open your eyes. Here it is:

To every subscriber who before Dec. 10 will pay his subscription to the American Bee Journal to the end of next year (1899) we will mail a copy of Prof. Cook's "Bee-Keepers' Guide" for only 50 cents extra. That is really getting a dollar-and-a-quarter bee-book for only 50 cents. Can you afford to miss such a chance as that?

Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellence. Polished, snowy-white Sections, beautiful straw-

colored transparent Foundation, Improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, **Lehay Manufacturing Company, Higginsville, Mo.,** or **1730 South 13th St., Omaha, Neb.**

Please mention Bee Journal when writing.

26c Cash Paid for Beeswax.

This is a good time to send in your Beeswax. We are paying **26 cents a pound — CASH** — upon its receipt. Now, if you want the money PROMPTLY, send us your Beeswax. Impure wax not taken at any price.

Address as follows, very plainly.

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

SAVE MONEY AND FEED BY BUYING AND USING **OUR**

It is low priced, not cheap. Made from the best of cast gray iron with 14 oz. galvanized steel boiler to hold 20 gals. Just the thing for cooking feed for stock, pigs or poultry and heat water for scalding hogs. **Reliable Stock Food Cookers** are equally good but of much larger capacity, 25 to 100 gals. We will be glad to quote prices on inquiry. Do not buy until you get our free descriptive circulars. Better write for them at once.

back, so much so that in places it is dying out. If it continues, the price of butter, hay, grain and other rural products will advance very materially. Those apiarists who are holding on to their honey will be apt to get a good price. There seems to be no reason why extracted honey should not go up to 7 cents and over. Some bee-keepers are already getting an advanced price for their honey. Mr. J. H. Martin writes me from the northern part of the State that he obtained 6 cents for his honey. It was shipped to the San Francisco market. This is ahead of what honey brought last year by double.

You may judge how bad the outlook is for rain when I state that prayers are being offered up in the churches for seasonable rain.

W. A. PRYAL.
Alameda Co., Calif., Nov. 14.

Tin vs. Wood for Honey.

The editorial on page 712 gives only one side of this matter. I wax all my barrels with paraffine at an expense of 10 cents each or less. This prevents soaking of honey into the barrel, of which is given an extreme case, as also all danger of flavoring the honey with any wood flavor the barrel might give.

The objection to tin cans, with us at least, who live so far from the general market, is the extra cost. The greater expense of tin, as well as the extra freight on honey in cans over honey in barrels, is very nearly or quite one cent a pound; while the increase price we may obtain for it may be one-fourth cent a pound. The question with us down here is simply one of dollars and cents, and barrels seem to have a decided advantage.

O. O. POPPLETON.
Dade Co., Fla., Nov. 14.

Very Good Season for Bees.

It has been a very good season here for bees this year. I got 1,600 pounds from my apiary, and have sold \$180 worth of honey. I got 12 cents a pound at our station. I don't know whether that is as well as other bee-keepers have done with their honey, but as to market reports, I think it will average with them. I have 65 colonies of bees which are in good condition for winter.

G. H. ADKINS.
Essex Co., N. Y., Nov. 14.

Honey Crop a Failure.

The honey crop is a failure here, but some colonies that I moved to the moist sunflower lands have filled up and are in excellent condition for winter; and if I had known the benefit to be derived from moving I should certainly have moved all I had; and I think if they had been moved early I could have extracted at least once, and they would also have filled up so as to winter in good condition.

L. L. ANDREWS.
Riverside Co., Calif., Nov. 7.

Does Chilling Injure a Queen?

Early in the past summer, I had a colony, started from a nucleus, which did not thrive, notwithstanding I had coaxed it by every means I knew, during the winter and spring. It had dwindled to a handful of bees, but as the queen was Italian and the producer of fine looking bees, I did not like to lose her, altho she seemed to be quite unprolific. I, therefore, placed in the hive several sheets of brood and adhering bees from a strong colony. Immediately there was a big battle. I concluded it would be best to look out for my queen and save her if possible, but could not find her anywhere. As she was clipped, she could not fly away, so I closed the hive reluctantly to await results.

Late in the afternoon, I went to the hive and there discovered my cherished queen on the flat of her back on the ground and dead (?). I took her to the house to show my brother-in-law and, as he held her in his

BABY BEEF AND PIG PORK

the kind that never stops growing a minute and which matures at an early age, is the kind that produces the greatest percentage of profit. This problem of quick maturity is solved by

The Electric Feed Cookers.

They cook all kinds of stock food, ground or unground, quickly, thoroughly and cheaply. Because of their peculiar construction they require less fuel than any cooker made. They have a dead-air space between the inner and outer plates, which conserves the heat, and thus they

REQUIRE LESS FUEL AND RETAIN THE HEAT LONGER.

Made of best gray iron castings and lined with plates of steel. Boilers of best galvanized steel. Three styles, five sizes—25 to 100 gallons. Free book on "Feed Cooking" sent to all interested parties on application.

ELECTRIC WHEEL CO., Box 16, Quincy, Illinois.

Please mention Bee Journal when writing.

warm palm, she slightly moved a leg. By blowing his breath upon her, she livened up and kicked some more. I told him to nurse her and see if she would not revive, while I went to prepare a cage. In a little time she was crawling all over his hand. I then put her in the cage, stopt up with candy, and placed her in the top of the hive. In a few days she was out and as contented as tho nothing had befallen her. She now has a large and growing family and plenty of brood.

This seems to combat the idea that chilling of the queen destroys or impairs her laying qualities. **GEO. H. STIPP.**
San Francisco Co., Calif., Nov. 10.

Very Poor Season.

Bees did very poorly here the past season. I have about 800 pounds of honey from 55 colonies. All seem to have plenty to carry them through the winter. We live in hopes for a better season next year.

WILLIAM M. DICK.

Ford Co., Ill., Nov. 10.

HONEY * FOR * SALE.

Best White Alfalfa Extracted...

ALL IN 60-POUND TIN CANS.

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can hardly get enough of the Alfalfa extracted.

Prices are as Follows:

A sample by mail, 8 cents in stamps, to pay for package and postage. By freight—One 60-pound can, 8 cents per pound; 2 cans, 7 1/4 cents per pound; 4 or more cans, 7 1/2 cents per pound. Cash must accompany each order.

This honey is **ABSOLUTELY PURE BEES' HONEY**, the finest of the kind produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand the past season, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The Circular, "HONEY AS FOOD," will be a great help in creatlog customers for honey. Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

HIGH- GRADE INCUBATORS

WE CAN SUIT YOU IN PRICE AND WE GUARANTEE TO PLEASE YOU IN QUALITY.

What more could we do? Our catalogue tells all, and is devoted largely to practical matters pertaining to poultry raising. Has 148 pages; mailed to any address for 6c. No wild and woolly statements, toy outfits, nor prize package lots to offer. Fair treatment, prompt service and full value are what we try to give our customers.

Bees Did Well.

Bees came through last winter better than ever before. I had 9 colonies, spring count, increase to 17, all strong with the exception of one. Some colonies stored 50 to 60 pounds of surplus honey; others very little. Take it throughout the county, bees have done very well.

My honey has been of first-class quality, and I had no trouble in selling it in the home market.

I use 8-frame dovetailed hives, but prefer the 10-frame, and will put my new swarms into them another year. **WILL HOWE.**
Saginaw Co., Mich., Nov. 10.

One of the Asters.

I send a sample of a flower that blooms here. It is a newcomer, first making its appearance three years ago. It is a great bloomer, beginning about Sept. 25, and continues to bloom up to about Oct. 25. Some will bloom later. Some of it is in bloom here now, but I speak of the full or general blooming period. Our hives filled right up when it was in bloom, and if it had not been for it we would have had to feed considerable. This has been a very poor honey season here, up to the time of the bloom of the flower I send you—a regular honey-drouth. **FRANK P. COOK.**
Wetzel Co., W. Va., Nov. 4.

[The flower belongs to the Composite family; species, aster ericoides; variety, villosus. All the asters seem to have a fine record as nectar-yielders.—EDITOR.]

No Surplus—Queens and Premiums.

We had a fine crop of white clover, also a fine crop of alsike, but not a pound of surplus honey did we get. This fall we had a good crop of yellow flowers called Spanish-needle, but were not that; also a large crop of smartweed, yet not one pound of honey for me. The most of the colonies have enough to winter on, but there are a few weak ones that I will have to feed. The Ruler of the universe withheld the nectar from the flowers, so then of course the bees could not get it. My bees work hard, and it seemed to make them angry because they could not get the honey; they were crosser at one time than I ever saw them before, but they have given it up now as a bad job, and concluded that it was not worth while to make a fuss about it.

I saw in the Bee Journal that Mr. Grabbe has suggested some good ideas in not offering premiums on Albino, Cyprian and Holy Land bees. I think very few people are breeding them in this country, and I don't know whether the Carniolans are any better.

I sent this season to a Texas queen-breeder for two queens, one golden Italian and one Carniolan. The golden Italian I wanted to change my stock, so as not to

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,
Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarist's library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth. Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 400 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 176 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers. \$1.00.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called BEES OF HONEY. 106 page pamphlet. Price, 40 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 p., illustrated. 25c.

Convention Hand-Book, for Bee-Keepers.—Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Apilary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents.

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by C. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2 in the artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st, How We Made the Old Farm Pay; 2nd, Peach Culture; 3rd, How to Propagate Fruit-Plants, Vines and Trees; 4th, General Fruit Instructor. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for casting up the price of grain, produce, hay, etc. Price, 25 cts.

Caponis and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters. 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

Book Clubbing Offers.

breed in and in, not that I expected to get any better or yellow bees, but to change or improve the stock. The Carniolan I thought I might take to the State Fair, but not so. The golden queen bred poor 3-banded bees; the so-called Carniolan breeds best just like 3-quarter blacks; a good many have one yellow band, the rest none.

I had two queens that were wrongly mated the past season, and their offspring were very much like the so-called Carniolan, the only difference being that my queens bred more yellow-banded bees than the Texas one did, but the bees that had no yellow on them had just as white rings as the others.

I had a queen from Texas a few years ago that bred as fine bees as one generally sees, but it was from a different breeder. I will not name any breeder, but if the one that I got the two queens from the past season sends out such queens for purely-mated queens, he surely will kill his reputation, if he has any. The guilty conscience needs no accuser.

I was not at the State Fair this fall, as my wife is in poor health, and it did not suit for me to leave home very well; and the premiums offered on bees and queens did not please me. It required too many kinds of bees and queens; I don't care to keep all these varieties of bees, and to send off and get them to make a display, it would cost more than it would amount to. I hope there will be some change between now and next season.

THOMAS S. WALLACE.

Adams Co., Ill., Oct. 17.

Ridding the Apiary of Ants.

I think I have solved successfully the problem of getting rid of ants in the apiary and here it is:

Shake a goodly supply of air-slackt lime around the hives, only, of course, keep it off the alighting-board, and if ants are under the cover, or in the supers, lift the cover and sprinkle along the edge of the super, inside. Of course, if it should rain the following night, the lime will harden and do no good, and you would have to apply again as soon as dry, for it is by the crawling through the fine, dry lime that the ants so much dislike. This will keep the yard sweet and free from bugs and ants, and costs but a trifle.

My bees did fairly well the past summer, producing about 70 pounds of comb honey a colony, spring count. J. H. TICHENOR.

Crawford Co., Wis., Oct. 20.

Honey-Dew.

Much has been published of late on this subject, and while no one praises it as being first-class honey, some think it from fair to middling, while others say it is worthless, or nearly so. But this depends on its source of production; with us it is produced almost entirely by the Aphidae family. When it is secreted by the white or green aphid a certain percent of it will pass, but when it is produced by the yellow, brown, or black aphid the most of it is practically worthless. I have been accused of calling this stuff "bug-juice;" it is known by that name here.

It is claimed by some that it falls as a real dew; this is a mistake. One person recently wrote that he found it on the poplar leaves, but said there were no insects on them at the time; but he did not tell us that they never had been on them. The eggs are often laid on the leaf or stem. After they hatch, the small insect crawls over the leaf, sucking the sap from it and leaving a sticky substance in its trail. In some varieties, if examined by a microscope, nearly the entire body looks like small particles of honey, or honey-dew.

I enclose samples of the green and brown aphid on the apple and poplar; also sample of a dark variety on the willow leaf; they are alive now, but they may not be when received. I send also samples of suctorial insects—the woolly aphid and scale. They work on the bark, and are injurious to the life of the tree. These insects and the

coddling-moth have caused much loss to bee-keepers through the useless practice of spraying trees, vines, etc., while in bloom. Sometimes the secretions of these insects will partly dry on the leaves; then if there is a light, drizzling rain or a heavy dew, it becomes softened. In any case there can be no such thing as a real honey-dew. We can account for storms of ashes, dust, salt, etc., because they are taken up and again deposited by natural cause. Could it be possible for such a thing as real honey-dew falling? Would it not be like the other storms referred to—cover other space or surface as well as leaves? So far, we have not been troubled with this honey-dew question here, as far as the bees are concerned. I investigated the insect question to some extent while the blossom-spraying excitement continued, and, like other things, it is simple when known or understood.

E. S. LOVEST.

Salt Lake Co., Utah, Nov. 4.

Transferring—Getting Bees in Supers.

I had a little experience in transferring, this year, that pleased me some. I purchased a few colonies this season that were in hives that had very crooked combs. I simply put under them hives with frames and starters, and in about six weeks found them moved down below on nice combs, with plenty of brood, and the top story full of honey. I then put a Porter escape under the top story, and a day or two after I took it off, and put the combs into the solar extractor, and had my bees in a new hive on nice combs. Whether this plan will work at all times or not I do not know, but so far it has worked all right with me.

I had some trouble the past season with swarms not working in the supers, and I separated the brood-chambers (I use the Heddon hive with two brood-chambers) and put another in between (tiered them, rather) with frames and starters; they then went to work in the brood-chamber with the frames and starters in, and filled the upper story with honey, and I worked them for extracted and they did very well for this poor year.

W. W. WHIPPLE.

Arapahoe Co., Colo.

New York.—The tenth annual meeting of the Ontario Co., N. Y., Bee-keepers' Association will be held in Canandaigua, N. Y., Dec. 8 and 9, 1898. An interesting program is in course of preparation. All interested in bees or bee-keeping are invited to attend.

Bellona, N. Y. RURN E. TAYLOR, Sec.

Colorado.—The Colorado State Bee-keepers' Association will hold their annual convention Nov. 30 and Dec. 1 and 2, 1898, in the State Capitol Building, Denver. The Horticulturists meet Nov. 28, 29 and 30, our first day being their last. This arrangement will give members of both a chance to attend the other's meeting and discuss common interests.

R. P. AIKIN, Pres., Loveland, Col.
F. RAUCHFUSS, Sec., Elyria, Col.

Ontario.—The annual meeting of the Ontario Bee-keepers' Association will be held in Guelph, Dec. 6, 7 and 8, 1898. Owing to the Guelph Fat Stock Show, and the Experimental Union meeting on the same dates, there will be a large meeting of bee-keepers, and each association will be a help to the other, as many are interested in all the different meetings. All are cordially invited to attend the meetings.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Nov. 19.—Our market is very strong at 13c for best grades of white comb honey, with good No. 1 at 11 to 12c; ambers range from 8 to 11c according to appearance, quality and flavor. Extra ted, white, 6 to 7c; amber, 5 to 6c; dark, 5c. Beeswax, 27c. All grades and kinds of honey are salable at this time.

R. A. BURNETT & Co.

San Francisco, Nov. 2.—White comb, 9 1/2 to 10 1/4c; amber, 7 1/4 to 9c. Extracted, white, 7 to 7 1/4c; light amber, 6 1/4 to 6 3/4c. Beeswax, 24 @ 27c.

There is so little extracted now offering that it is hardly quotable in a wholesale way. Comb is in fair supply and is being very steadily held, altho with the demand for same almost wholly local, the movement is not very rapid.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12 3/4c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6 1/2c; No. 2, 5 1/2c; amber, 5c; in barrels, No. 1 white, 5 1/2c; amber, 4 1/4 to 5c; dark, 4 to 4 1/2c. Choice Beeswax, prime, 24c; choice, 24 1/2c. At present there is a good demand for honey.

WESTCOTT COM. Co.

Kansas City, Sept. 9.—Fancy white comb, 12 @ 13c; No. 1, 11 @ 12c; amber, 10 @ 11c. Extracted, white, 5 1/2 @ 6c; amber, 5 @ 5 1/2c; dark, 4 1/2 @ 5c. Beeswax, 22 @ 25c.

The receipts of comb honey are larger.

C. O. CLEMONS & Co.

Boston, Sept. 30.—Our honey market shows a decided firmer tone since our last. A few sales have been made at 15c for an extra fancy lot, while almost all sales ranging from A No. 1 to fancy now are made at 14c, while occasionally, something a little off, will bring as low as 12 1/2 to 13c. We do not look to see any lower prices.

Extracted, Florida, in barrels, mostly 6c to 7c, with a good demand. Beeswax, slow sale at 26c for best.

BLAKE, SCOTT & LEE.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12 1/2c; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6 1/2 to 7c. Beeswax, 25 to 27c.

WALTER S. POWDER.

Milwaukee, Oct. 18.—Fancy 1 pounds, 12 1/2 to 13c; A No. 1, 12 to 12 1/2c; No. 1, 11 to 12c; No. 2, 10 to 10 1/2c; mixt. amber and dark, 8 to 9c. Extracted, white, in barrels, kegs and pails, 6 1/2 to 7c; dark, 5 to 5 1/2c. Beeswax, 26 to 27c.

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing.

A. V. BISHOP & Co.

Columbus, O., Nov. 18.—Market somewhat easier. Quote: Fancy, 14c; No. 1, 12c; No. 2, 10c; amber, 9c; buckwheat, 8c.

COLUMBUS COM. AND STORAGE CO.

New York, Oct. 22.—Receipts of comb honey are large, and there is quite a stock now on the market. While white is in good demand, buckwheat and mixt seem to be somewhat neglected, and quotation prices have to be shaded in order to sell in quantity lots. We quote:

Fancy white, 13 to 14c; No. 1 white, 11 to 12c; amber, 10c; mixt and buckwheat, 8 to 9c. Stocks of extracted are light of all kinds. Demand is good at following prices: White, 6 to 6 1/2c; amber, 5 1/2c; dark, 5c. Southern, in half barrels and barrels at from 55c to 60c a gallon. Beeswax dull at 26c.

HILDRETH BROS. & SEIGELKEN.

Detroit, Oct. 20.—Honey in better demand and better prices as follows: Fancy white, 13 @ 14c; No. 1, 12 @ 13c; fancy dark and amber, 10 @ 11c. Extracted, white, 6 @ 7c; dark, 5 @ 5 1/2c. Beeswax, 25 @ 26c.

M. H. HUNT.

Minneapolis, Oct. 20.—Fancy white clover comb is now selling at 11 @ 12c; amber, 10 1/2c. Extracted fancy white clover, 5 1/2c; amber, 4 1/2 @ 5c. Dark grades, both comb and extracted, not wanted at low prices.

S. H. HALL & Co.

Buffalo, Nov. 11.—Strictly fancy honey is very scarce and held at 13c; occasionally 14c; but it must be perfect goods; fair to good white, 11 to 12c; if much soiled, 9 to 10c; dark grades, 7 to 8c. Trade is good for all qualities and no large stocks in market. Extracted, 5 to 6c. Beeswax, 24 to 28c.

Gleanings at Half Price,

—or, Two Papers for the Price of One.

We have made arrangements whereby, for a limited time, we can send either the Farm Journal, published at Philadelphia, or the Poultry-Keeper, published at Parkesburg, Pa., both fifty-cent monthlies, and the very best in their line, with **Gleanings in Bee-Culture**, to a new or old subscriber, both for one year. But the conditions of this offer are that the money [\$1.00] shall be sent in advance, and that all arrearages to Gleanings, if any, shall be squared up.

The Ohio Farmer and Gleanings in Bee-Culture
both for One Year for \$1.10.

We will send the Ohio Farmer, a dollar weekly, one of the leading agricultural papers of the United States, and Gleanings in Bee-Culture, both for one year, to a new or old subscriber, for \$1.10, paid in advance, and all arrearages to Gleanings, if any, squared up.

The Farm Journal is now in its 21st year, and takes the lead among all the low-priced agricultural papers. It is packed full of practical hints and suggestions; puns no swindles, and inserts no humbug advertisements.

The Ohio Farmer is a larger paper, and is issued weekly, and is one out of a few really good farm papers.

The Poultry-Keeper is monthly, edited by P. H. Jacobs, and published at Parkesburg, Pa. It has a tinted cover in two colors, and is beautifully gotten up.

Remember that, in order to secure any one of these three papers, in combination with Gleanings, the money must be paid in advance, and arrears to Gleanings, if any, squared up. These offers are very low, and will be withdrawn soon.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at
Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

SECOND DAY—AFTERNOON SESSION.

[Continued from page 741.]

The afternoon session was called to order by Pres. York, and was opened by singing.

The following was written by Mr. S. A. Niver, of Tompkins Co., N. Y., and read to the convention by the Secretary in Mr. Niver's absence, entitled,

Experiences and Suggestions in Marketing Honey

After the honey harvest is over, we look proudly at the piles of nice white cases with such beautiful, clean looking combs showing through the glass, and realize that all that care and skill can do to make it attractive has been done, we come face to face with that momentous question—What shall we do with it? The old, time-honored method of bundling the whole crop off to some city commission house, selected by guess usually, to get returns for it perhaps, sometime, has proved so unsatisfactory that we have all been working at this vexing problem which has not kept pace with other improvements in apiculture.

Eliminating unnecessary charges and expenses, getting closer to the consumer, trying to educate the public to the knowledge of the beauties, healthfulness and desirability of honey as a food, and a medicine; airing the subject in bee-journals, even forming exchanges, and talking of combinations, trusts, or what not; some good has come of this agitation, doubtless, but the principal point impressed on my mind by the greater part of the sage counsels of the experts is—get your honey in nicer shape than the other fellow, and you can sell yours, and its none of your business what he does with his. This method is strictly in accord with the Golden Rule (Chicago edition)—“Do others or they'll do you.” But that other fellow cuts the price, and in these hard times the price is of more importance to the consumer than polish. The result is a constant strife to outshine your neighbor, and a more pronounced vacuum in the wallet, as well as a more exacting market.

“Competition is the life of trade,” and death of profits. Right here it might not be too badly out of order to quote some crumbs of concentrated wisdom from the ready pen of our General Manager, Mr. Secor:

“There was a time in the history of mankind when the individual seemed to be the more potent factor in society and business than at present, but the world is older than it was, almost everything is done differently from what it used to be. Business meth-

ods have so improved that a dollar goes farther in transacting the world's business than it did in the olden time. This has been brought about through organization and combination. A great many individual dollars brought together through associated effort, may be made to produce effects which never could have been brought about by the same individuals acting each for himself independently. Men interested in a common purpose are enabled to unite on a common plan of action, and work to some effect.”

That would seem to point to a combination of bee-keepers, to make the most possible out of their product, to do business at the minimum expense, and maximum profit—but few believe it possible for so large a body to hang together, and so all stumble along in the same old rut.

My first experience as a honey-salesman was pleasant enough, for I had an extra fancy crop to sell, and it was before sand-papering sections was fashionable. To set a white, clean sample beside a grimy, travel-stained one, was just fun.

One dealer in Scranton had a very large stock of comb honey conspicuously displayed, which made me doubt my

H. E. Hill, Editor American Bee-Keeper—See page 755.

ability to make a sale there. He came out of his office with the usual eye to business, and I remarkt, “You seem to be loaded for bear in the honey line. Sorry I did not get here earlier in the season, but just take a look at my samples, and perhaps you will wait for me next year.”

With this I laid a sample of “fancy white” before him. He picked it up, held it to the light, turned to me with a curious look and said, “Great Scott! how did you make that?”

It was his first sight of a "strictly fancy" section of honey, and the price was away above what he was accustomed to, but I wrote his order for 25 cases, 35 sections to the case.

On that trip a drug drummer showed me around the city (he was my cousin), and wanted to trade jobs with me, as he had to bore them to buy drugs, while they tumbled over their collars to buy honey.

It's different now. Last season I went into Johnson's, at Easton, Pa. (he is one of my old reliable customers), and found a case of "fancy white" which was just a little better than I could show. Basswood was a failure, and my best was only Alsike clover. He informed me that it was brought to his door for 8 cents a pound. That was like a jab in my solar plexus. I asked him faintly how much he had like that. Only one case—it was so cheap, he said, that we was afraid of it.

"Well, Johnson," said I, "have you any ice?"

"Of course I have," said he; "but what do you want of ice?"

"To put on your head, my dear man," I replied. "You are in danger of going crazy, to let a man get away with any honey like that at 8 cents per pound." And I trotted out quotations from New York and Philadelphia, at 13½ to 14 for such goods. "But," I continued, "you can't expect that man to find all your neighbors in a trance as you were, and you will not get another chance to buy from him, so you might as well give me your order"—which he did.

The season's reports say that the honey crop is a small one, but I expect to hear hard times and low prices just the same.

Every year finds fewer people with money to buy luxuries, and newspaper prosperity doesn't count in actual transactions. My idea of the best way to market our honey in this locality is to combine several crops, send our salesman to the grocery trade direct, take the orders from samples, giving time the same as is common custom with wholesale dealers, and make the second trip, when the time has expired, to collect the bills and take more orders. The expenses are proportionally less as amount of sales are increased.

I prefer to sell comb honey by count instead of weight, but that method requires careful, uniform grading and packing. The grocer nearly always sells by count, and it saves him time and annoyance to buy as he sells. To pack good and poor together in the same crate under the plea that it is worth as much per pound, if it is only of the same quality and color, regardless of finish (by which I mean full sections, well sealed), leaves half a dozen culls on the dealer's hands unsold, and his entire profit is in that same half dozen. If your crate is marked "fancy," let every section be up to that grade, and also No. 1 the same way. I begin to think that selling "culls" at all is bad practice. They are worth more to extract and use as bait sections next year; and it demoralizes some markets so that only cull prices go for any grade.

Is it too much to hope that the wisdom and experience of this convention of the United States Bee-Keepers' Union will point out some better method of selling our honey than to glut the market of a few large cities that fix the general quotations which govern nearly all prices everywhere?

S. A. NIVER.

As the foregoing and following papers were on nearly the same subject, discussion of Mr. Niver's was deferred till after reading by the Secretary of the next paper, by Herman F. Moore, of Cook Co., Ill., as follows:

Best Methods of Developing and Maintaining a Market for Honey.

On taking a second look at my subject, I confess my inability to fill the sum of its demand. Who can say what is the best method? The one that brings a fair degree of success in my hands may utterly fail with my neighbor's customers and conditions. So I will amend the title to "some of the methods I have tried and found good." I think all the good ideas on this subject as printed could not be contained in a volume the size of the "A B C of Bee-Culture." The territory is so various, the conditions are so different, that it is impossible in a short article, such as this must of necessity be, to even touch upon all the points of interest to the producer of honey who is seeking a market.

The first thing necessary to develop a market is to have good honey. You will never develop a market for honey that will amount to much if you supply your customers with buckwheat, or sweet clover, or any of the other three or four kinds of honey that have been tried and found wanting as far as family consumption goes.

Let me say right here, that I am only considering this subject from the standpoint of the producer selling direct to the consumer, the consumer being the person buying honey

for use on his own table. That very many things can be said, interesting and instructive, on marketing honey in other ways, there is no doubt, but I am convinced that the solution of the question of low prices for your honey lies most in the direction of selling more honey to families in your immediate vicinity, and thereby keeping vast amounts of honey from the city markets, and preventing them from being glutted with honey at any time.

The great business centers fix the price for all your products, and if you send them 1,000 pounds of honey where there is a market for 500 pounds, the price must suffer accordingly, and the price that honey brings there, 1,000 miles away from your home, tends to fix the price you can get even at home.

Without further argument we will conclude that one of the best ways to develop a market, is to develop a home market.

If you will take a little time and examine the business methods of successful men and firms, you will find that nearly every trade and profession depends upon personal influence and confidence. Many a man who travels for the great business houses is worth to them another \$3,000 a year above an ordinary salary, because of his personal acquaintance with a long line of customers, and their confidence in his fairness and judgment.

The first thing to do is to get acquainted with your prospective trade. You can't do much business until they know you personally, and have confidence in you as a man. To this end you must use cards and circulars freely, and see and talk personally with every one on your route.

I need not advocate here the necessity of fair dealing in every particular with everybody. This is axiomatic. You will never get far unless you are "all wool and a yard wide," and your goods are the same.

In your calls always have samples of your honey, and give every one a chance to taste it. Once my brother sent me a shipment carelessly, and a fourth of it was smashed (comb); I put it on a plate, and took a silver knife with me, and little slips of white paper for plates, and gave everybody a taste of comb honey—my, how it did sell! I believe it will pay you to take a section and cut it, in your family trade, and give the ladies a chance to eat a piece one-fourth inch square. Of course, you must charge retail prices to your family trade, and only offer it in case lots (12 pounds), and you must work hardest in the part of your territory where you can get the biggest price.

You can ordinarily get as much in small case lots to a family as the grocer gets for one-pound at a time. You may wonder why; I will tell you.

Nearly all householders are anxious to buy their supplies as fresh as possible from first hands—from the producer. This gives you an immense advantage over the ordinary dealer. People expect only ordinary stuff from a dealer, as he sells so many different things, and sells *at them* until they are all gone, if it takes a year. With the farmer it is different. He sells his potatoes right from the ground, his honey right from the hive.

As to price, the family ordinarily does not pay much attention to price. They want something good as gold, and are willing to pay well for it.

In writing your circular, it will be of advantage to give a short history of your family as bee-keepers, location and size of apiary, largest crop of honey in one season, queens sent to remote parts of the world, if a queen-breeder; and perhaps a general invitation to call at your home and see your bees, and how you take the honey away from them.

In distributing your printed matter, I think all general distribution is loss of material. I only give circulars and cards along with conversation, and when making calls on individuals, and to parties where I have address them on the general or special subjects. As to this you must decide by your own special circumstances and conditions. There are without doubt millions of circulars that are too promiscuously distributed and are a total loss to the one who pays for them.

When you say to a gentleman, "Are you fond of honey at your house?" he answers "No," being perhaps busy at the time, or just thinking "here is another peddler;" now leave him one of your circulars, illustrated perhaps with a honey-extractor, a queen-bee, or what not, and when you are gone he will read it, and next time you call you often have a customer even the months may intervene.

So I will sum up the first part by saying, get personally acquainted, if possible, with every person in your territory. Insist upon everybody tasting your samples. Tell them about your bees, and yourself as related to the bees. Sell them good honey first, last and all the time. Get the highest retail price in your locality. Give them full weight, full measure, and

use no deception of any kind at any time or place. Treat every one as you would treat your brother, or you would wish any one to treat you. Remember that developing a market for honey is a lifetime study, a lifetime work.

If you want some easy, pleasant work for six months, or a year or two, try pollies, but stay out of the bee-business.

As to maintaining a market after it is developed, I hardly know what to add to the above. I will say, however, continue to do the same for 20 years, and after that, if you are spared so long, for 20 years more.

You will find some families will tire of honey. To replace their loss, try constantly to get new customers. Try by every means in your power to keep all you get, and get more all the time.

My only fear is that the hearers will say, "It's just as if we had asked him how to succeed and he should answer, "Why, the way to succeed, of course, is to succeed." And it's true;

Herman F. Moore.

you must depend upon your own grit, and push, and originality. Think up new ways of reaching the people. Get out of the old ruts. Follow these lines if it takes all summer, and you will succeed.

HERMAN F. MOORE.

Dr. Miller—I think that is one of the subjects which we cannot very profitably discuss here. I think we can get as much from those who have written the papers, and who have had experience, as from those who are here.

Dr. Mason—I would like to say I think Mr. Moore knows what he is talking about. Several years ago he worked in Toledo selling honey, and he knows just how to do it, and he doesn't injure any bee-keeper who lives in the locality where he works, either; in fact, I believe he helped me every time he came.

Letters were then read to the convention from Messrs. R. F. Holtermann, E. S. Lovesy, William Stolley, M. B. Holmes, and others, regretting their inability to be present, and sending greetings and good wishes.

Secretary Mason then read a paper written by Editor H. E. Hill, of the American Bee-Keeper, on

Migratory Bee-Keeping.

I am a firm believer in the philosophy of Mr. Newman, who, with reference to convention papers, once said: "Small sticks will kindle a fire, but large ones will put it out." It is therefore unfortunate that our Secretary should have allotted to me a subject of such limitless proportions; and I earnestly hope he will not shun his obvious duty to assume full responsibility for whatever degree of disappointment that may be occasioned by the presentation of this feature of the program.

Perhaps no subject could have been chosen affording greater scope for elaborate discussion, or capable of more diversified application. If we should follow, in his preparatory rounds, the bee-keeper of our arid Southwest, who, after the bloom of the valley has been blighted by scorching desert-winds, seeks to gain another flow at greater altitude in the mountains; should we fall in with a French bee-caravan, in its nocturnal march to the fields and gardens of the peasants; go with our Scottish friends in their annual tours to the heather with bees; review the experience of Perrine, Baldridge, Flanagan, *et al*, on the Mississippi, and include the

floating apiaries of the Egyptians, by means of which it was sought to take advantage of the successive development of the flora in the valley of the Nile, more than 2,000 years ago, I fear the "fire" would be extinguished.

The title of our subject savors somewhat of romance and adventure, but there is also a very practical side, as many who have engaged in migratory bee-keeping stand ready, and qualified, to attest. It is this practical side in which we are more particularly interested; for of all the benign attributes of our cherished vocation—the beloved pursuit of bee-keeping—the dollar which may accrue is not the least fascinating to the specialist; if, indeed, it is to any, whether engaged in bee-culture for profit or pleasure.

As has been demonstrated by innumerable instances, bees may be transported with profit, under favorable conditions, to distant pastures; yet I believe heavy expense in moving for a special flow which is anticipated, is rarely warranted, and many cases might be cited to the discouragement of the practice. The advisability of the procedure in each case can better be determined by the apiarist in charge, whose portion it will be to abide the result. The uncertainty of nectar-secretion, even when an abundance of bloom is assured, renders the undertaking more or less hazardous, and especially so when the supply is anticipated from a variable and uncertain source; as, for example, the linden. With the mangrove of the South it is less uncertain, and in favorable seasons the flow is equal in extent to that of the linden under like conditions; hence, with the advantage of natural water-ways to facilitate moving, and where the apiary equipment includes a commodious transport, and where, as a result of earlier activity, a powerful force of workers has accumulated, which, by enforced idleness, through lack of forage, become consumers instead of producers of honey, all of which tend to lessen the possibility of loss and reduce the chances of failure, there is a strong incentive to action.

Impelled by visions of blooming fields known to exist 50, 100 or 200 miles up the coast, and a realization of the possible achievements of such an adequate force of workers, a move determined upon is very hopefully or confidently undertaken; and in many instances the results have justified the effort; occasionally the bee-keeper is handsomely rewarded for his enterprise. In the history of American bee-keeping, as chronicled in our journals, instances of such successful migration are now on record, to the credit of enterprising apiarists in their operations of 1898.

The minor details, with regard to the preparation for moving and handling the product need not be reiterated further. The importance of ample ventilation, pure air, restricted draft, water supply, subdued light, secure confinement, space for the cluster, careful handling, etc., is well known to every one competent to undertake the management of any apiary, whether permanent or portable. It might be well, however, to consider briefly the objects of migration and the conditions which determine its success or failure: First of the important requisites to success, is a thorough knowledge, not of the care and management of bees, alone, but of our fields of operation as well. With these, irrational moves, incurring heavy expense, will not be made; and with them, opportunities are occasionally offered to materially increase our product. Failure, to be sure, may, and sometimes will, through causes over which the apiarist has no control, meet the best of plans. But of what business enterprise may not the same be said?

From personal observation in various parts of the country, I recall but one place the advantages of which I regard as sufficient to warrant the expense which the undertaking involves; and while a continued practical test might disprove my faith in this field and its possibilities, I beg permission briefly to cite the circumstances and conditions upon which it is founded:

Permanently established in a certain locality of the South are apiaries which, for nearly a score of years prior to the freezes of 1894-95, have yielded annually (with but one or two exceptions) an average per colony of not less than 135 pounds of honey. Here the flow comes in May, June, and July. Distant 150 miles, and connected by navigable water-ways, good crops are usually harvested each year during the winter and spring months. Other localities, as easily accessible, not infrequently give a surplus flow through September and October.

If these "stationary" apiaries are a source of profit to their owners, as they evidently are, why may they not be made doubly so through the utilization of such natural advantages?

When, through the great primary cause, innate love of our pursuit, which has inspired its true followers in their noble work of founding the United States Bee-Keepers' Union

—a union that is obviously destined to become the greatest and most powerful organization of bee-keepers on earth—and when through its influence bee-keeping shall have been lifted to its rightful place among the industries of the nation; when our product has become a staple household commodity, and bee-keeping knowledge and methods are brought correspondingly to a higher state of perfection, these opportunities and neglected advantages will be embraced, and, under keen competition, migratory bee-keeping pursued with systematic diligence.

H. E. HILL.

Dr. Mason—In remitting his annual dues, Mr. L. L. Andrews, of California, wrote something about the subject of migratory bee-keeping, which I suppose can go into the report without being read here. [The letter is as follows:—Ed.]

Migratory Bee-Keeping in California.

I am located in the foothills of Riverside county, and am very well situated when we have plenty of rain, but in a season like the present, one is compelled to choose among feeding, moving, or losing his bees. I chose moving, altho a distance of from two to six miles to the sunflower and mustard fields.

There is a great deal of wind here in the summer season, that is very detrimental to the bees working later than 10 o'clock in the direction they would have to go to get to the flowers this year. My mountain range is mostly covered with annual flowers, flaree, black sage, dodder or love-vine, white sage, holly, and sumac, in about the order named, all of which were almost a total failure this season. The range I moved to is level, moist land, both pasture and agricultural.

The pasture land produces some flowers, but the cultivated land, as soon as the crops are off, grows up to sunflowers and mustard, besides there is considerable corn, sorghum and alfalfa grown.

When I decided to move I chose 50 of my weakest and lightest colonies, as it was mostly an experiment, and I was afraid to even them up with my stronger and more weighty ones, fearing I might be compelled to feed or lose them all.

I moved them about the middle of June, two months later than I should do another time. Those I left on the old stands had the supers all on (I run for extracted honey), and were in good fix when I moved the others away, and at present I can see no improvement, and some are in not nearly so good condition.

Those I moved have without an exception gone to work and filled up. Most of them were in one story when moved, and I have had to put on supers, and some (probably one-half of them) have filled both, and are now ready to extract, if I chose to do so.

The only mistake I made was in not moving early enough, and not moving all I had. Bees are not unlike people in many respects. For instance, take a colony that is apparently in good, healthy condition, doing very little if anything while the next one to it is storing honey; take it a few miles to new fields, and see how soon they will build up and begin to thrive and store something away for future use. It invigorates and encourages them, and from my experience this season I shall certainly follow migratory bee-keeping in the future.

L. L. ANDREWS.

Dr. Miller—I think the subject of migratory bee-keeping is one of the greatest interest to bee-keepers, and at the same time it is a subject of not the slightest interest. It is of deep interest to bee-keepers of Germany and other places in the old country, where in certain seasons of the year they can go to the heather and large buckwheat regions, and almost double their crops in that way; but it is a matter of not the slightest interest to me, because I do not know of a place where I could move my bees to advantage. It might be a matter of some interest to us to know how many there are here who are personally interested in migratory bee-keeping. There may be a good many, or there may be simply a few. It might be well to ask the question whether you have somewhere within 5 to 30 miles from you where you can move your bees and catch a honey-flow that will pay you for the trouble of moving.

Mr. Spaulding—Would you include out-aparies?

Dr. Miller—No, I would not, as that is not migratory bee-keeping; but if I take some colonies and move them to some other place to catch a honey-flow that I would not otherwise get, that I would call migratory bee-keeping. How many of those who are here are so situated that they think they could make anything by practicing migratory bee-keeping?

Five persons arose in response to the question.

Mr. Westcott—I think that hardly covers the ground. We do not know exactly whether we will be benefited by migratory bee-keeping or not until we hear something from those

who have had experience. It is this way: I would like to know whether I could move colonies 40 or 50 to 100 miles on the cars or on boats, etc., and make it profitable to move them. Here in Nebraska our honey-flow comes mostly in the fall of the year. This year it did not start until somewhere about the middle of August. Last year we had no honey-flow until September. If we could move our colonies somewhere in the spring, and keep them until heart's-ease comes into blossom, I think it would be a great advantage to us. I would like to know whether we could do it. I would like to have those who understand the matter explain it to us.

Mr. DeLong—I have never moved any bees on the migratory plan. I live in the south-central part of Nebraska, 160 miles from here. In 1894 and 1895 I lost my entire crop of honey, and almost lost faith in my bees also. I went out to investigate the matter, and within 40 to 60 miles of where I lived there was plenty of honey. I have concluded now that I shall never suffer another loss of stores for my bees, if not of surplus honey, for I can always obtain it by going as far east as the Missouri river. This year up to Aug. 15 I had no surplus honey-flow, and when I found a suitable location, the honey came to me also. I anticipated moving out a couple of hundred colonies of bees. I shall never suffer another total loss, for the reason that some part of Nebraska always has a good crop, and I find that when there are other good crops in any portion of Nebraska, the honey-flow is all right, too. I have never known the honey-flow to fall in Nebraska, when there is a reasonable crop-success. I have made my plans to make migratory work of it, whenever the honey-flow doesn't come to my place. This year I am in one of the driest parts of Nebraska, while the south and southeast parts of the State have good crops.

Mr. Hatch—I had some experience with Mr. Mendleson in moving 600 colonies 40 to 60 miles last year. It is customary in that part of the State to move in two directions. The sage is the big honey-plant of California, and all bee-keepers try to get as much of that as they can. Then they move in another direction, into the more arid part of the State, and get the wild buckwheat honey, or they can go down into the lima-bean fields and get the lima-bean honey. Mr. Mendleson moved his bees on very large wagons, furnished with racks, 8 by 16 feet, and then a fence around made of slats, 6 feet high all around, and we would hitch six horses or mules to each load. The wagons are those big California freight-wagons—7-ton wagons; the ordinary farm wagons, such as are used in this country, would not do at all. On those loads he has taken at one time as high as 150 colonies. We moved them in July, and the bees were very strong. They had just finished up on the sage, and the hives were crowded with bees. It was very hot weather; some days the mercury went up to 100°. The hives were fixed with screens over the top, and also one over the entrance; but he has concluded that the one over the entrance is worse than useless. The hives were common 9 and 10 frame Langstroth hives, with swinging frames, and we put spacers in between, something the shape of your fingers, with a slat across the top, so that the spacers shoved down between the frames. Then he puts a screen over the top that has a 2-inch rim around it, leaving a 2-inch space above the frame. If the colony is very strong, he extracts all the honey in the top of the hives and four frames from the lower part of the hives before he fastens the frames. Then he puts on this screen-cover with the 2-inch rim around it. At each end there is an end-piece projecting up $\frac{1}{2}$ inch. Then he fastens the cover on, leaving a half-inch space between the cover and the screen. In moving the 600 colonies, there were only 10 broken down. It took three days to make the trip, and on some of those days the mercury must have gone up to 100°. It happened to be extremely warm on some of those days. He got about four tons, I think, of lima-bean honey, but for all that it might be considered a financial failure. The direct loss did not amount to so much, but those colonies that seemed to be all right dwindled wonderfully in the next 10 days. The bees were literally worn out in the trip, so that they didn't survive but a short time, and there was a great loss of queens, also. Yet, considering the drought of this year, it was in one sense a success, because he got the brood-chambers full of the best kind of food. But if I lived in California 40 years, and had the same opportunity, I would not move bees, only to get winter stores. It is a great annoyance, and is very disagreeable work. It has to be done at night, and it is too much wear and tear on the bees. It just simply saps the life of the bees.

Dr. Miller—Why does Mr. Mendleson think the screen over the entrance is useless?

Mr. Hatch—The bees will crawl in there and die, and the screen over the top seems to work just as well and have the same results.

* Dr. Miller—How does he secure so many hives on the wagons? Is there some special provision for that?

Mr. Hatch—He fastens the hives together with what are known in Wisconsin as "butter-tub staples." If you have occasion to fasten your hives together, you will find those very convenient things. But I think we could take small loads on good farm-wagons with two horses, dividing the big load up into three lots, and save at least 12 hours in the trip. It took him three hours in one place to go a mile and a half, where with ordinary farm-wagons he could have driven over it in 20 minutes with 25 hives on the load. And then the wagons would cut through the road. I had been hauling honey and delivering it to the station over the same road, taking a ton at a load, or sometimes a ton and a half, and had gotten over the roads all right; but when those big wagons came to go over they would cut and sink down a foot where the ton-loads had gone over all right. There were some short turns to make, also, and the men would have to stop and dig away so that the big wagons and the long teams could get around. Then they were so tall they were liable to upset. The racks had to go away up above the wheels. They had to have large wheels, and they had to take at least three or four men on each load to balance them in the sliding places. If I was going to move bees, I would take ordinary farm wagons with two horses, and put on what they could haul, and they could get over almost any road.

Dr. Mason—Mr. H. R. Boardman was at our house a few days ago and was talking on this same subject—migratory bee-keeping. He had practiced it to some extent, moving his apiary about 12 miles to catch a honey-flow from buckwheat. He said it didn't pay. It was too much work, and too hard work. Several years ago we moved from the city to a farm, having 75 colonies of bees. It not being much of a honey region, I moved a portion of the bees back to the city, where there was an abundance of sweet clover. It didn't pay.

Mr. Hatch—Did you notice that dwindling of the colonies?

Dr. Mason—It seems to me I did, but it didn't impress itself upon me at the time. I don't think I would ever move my bees again, without some better reason than I had then.

Mr. Rauchfuss—I have had some little experience in this line. We have moved bees into the cleome fields, but only 12 or 15 miles. I did the way that has been described. We put about 40 colonies on a hay-rack load. It always paid us. The smallest average we had was 40 pounds, and we have had as much as 160 pounds. It is practically gathered in two or three weeks, and at a time when we could not get any honey where our bees were located. We are in the alfalfa region, and we moved to the cleome fields. It has paid us.

Mr. Danzenbaker—I had a little experience. In 1897 I moved 6 colonies of bees from North Carolina to Washington. I stopt in Washington 3 weeks, and the 6 colonies stored 200 pounds. Then I moved them 80 miles by cars into the mountains, and they stored 400 pounds more. I felt that that was a pretty good thing, and that I would this year buy a lot of bees in North Carolina and work them there and then move them direct to the mountains. I think it hardly paid me in Washington, for the reason that the honey was not of as good quality in the city. In moving from Washington to Virginia, it was a very hot day—from 95° to 96°—and while I succeeded in getting the bees safely to the mountains, they dwindled. In about two weeks I noticed that they had shrunk a good deal. I had lost a good many bees, the effect of the heat. Altho it didn't kill the bees outright, it weakened them so that it shortened their lives. This year I intended to move 40 colonies from North Carolina. If I had had a carload I could have gotten a good rate, but to move less than a carload would have cost \$2.25 a hundred pounds. I could buy the bees in Virginia for about \$1.50 a colony. If I had moved them this year, it would have been a failure. While the prospect in Virginia was promising early in the spring, it was the driest season there I have known in nine years. I have come to this conclusion, that if I were in a place where I could put my bees on a wagon and move them through the night, it wouldn't hurt them at all, and it would pay; but if I had to spend three or four days in making the trip, I wouldn't do it.

Honey from Cuba—Other Southern Honey.

BY O. O. POPPLETON.

I wish I could have been at the late convention in Omaha, so as to have helped in the discussion which followed the reading of my short paper on "Bee-Keeping in Cuba;" but I will join in it a little now with the pen.

No, I said nothing about foul brood; as there was none there when I was in the island, and I know no more about it now than do others who keep up with bee-literature.

What Mr. Danzenbaker said about the large number of mosquitoes in Cuba was news to me. I cannot imagine where he obtained such news, unless from the "yellow journals." I never saw while there any such numbers of mosquitoes as he speaks of. In fact, I should be heartily glad to trade what mosquitoes we have here on the East Coast of Florida, for what mosquitoes they had when I was in Cuba.

Mr. Whitcomb's idea that "it would not take much patriotism to receive what honey might be sent from Cuba," is, of course, of no force whatever. Hard business facts have more to do with commercial transactions than patriotism. I hardly think Mr. Whitcomb has much knowledge of our honey market, especially in our Eastern markets where most of the Cuban honey is sent, or he would not have hazarded the doubt that it would not affect the price of our honey at all. Cuba is without doubt able to send into our markets an immensely larger amount of honey every year than California has yet done in her best years; and every one who has ever disposed of many large crops of honey in our general markets knows just what that means. It means a shrinkage in price of much more than the half cent a pound Dr. Miller estimates. It is not wisdom to shut our eyes to such plain facts as these. Doing so only deceives ourselves. This is one reason—not all, by any means—why I have always opposed the idea of annexing Cuba to this country.

I am aware that the opinion is quite general among bee-keepers in our Northern States, that "climate has much to do with the flavor of honey," the best flavors coming from the North; also, that "Southern honey has a strong flavor." I doubt either of these opinions being correct.

I am very much within bounds when saying that I have produced over 50,000 pounds of honey in each of three widely different localities—northern Iowa, southern Florida and Cuba—and I have found the three extremes of strong, mild and best-flavored honey here in this semi-tropical central location of the three. The South—or, more accurately speaking from a bee-keeper's standpoint—the Southern honey-field, covers an enormously larger area than does the Northern honey-belt, and contains a very much larger variety of honey-yielding flora. Some of these flowers give us very strongly-flavored honey, some very mild, and some between the two extremes. As none of the species of flowers that give honey in the North yields anything down here, it is impossible to note with absolute accuracy whether climate has anything to do with the flavor of honey; but such white clover honey as I have tested from the extreme southern localities where such honey is obtained, was the same, neither better nor poorer than we got in northern Iowa. This tends to prove that climate is not a factor in determining the flavor of any honey.

We are all of us too apt to judge the entire product of any locality by such portions of that product as we ourselves have handled. There is such a large variety of kinds of honey from the South that very few, if any, of us can speak intelligently of Southern honey as a whole. Nearly all, at least five-sixths, of all Cuban honey that reaches the general markets, is from the bellflower, and is, as I said in my essay, a close second to white clover honey in flavor, and its equal in body and flavor. This all comes during the winter months, and is followed during the spring and summer by a light flow of very dark, strong-flavored honey, nearly all of which is used by the bees themselves.

That soldier that Mr. Stilson quotes as saying that Cuban honey is much inferior to our own, was in Cuba during the summer only, when hives contained this dark honey, and he probably saw nothing of such honey as the great bulk of honey that comes from Cuba is like. A person who sees such

That New Bee-Book Offer on page 765 ought to "make your mouth water," if you haven't already one of the standard books on bee-keeping. Remember, that liberal offer will be withdrawn Dec. 10, and no mistake about it. We couldn't afford to hold it open longer than that, as we expect that the edition may be exhausted before that time. Better write quick if you want Prof. Cook's 450-page, cloth-bound bee-book for only 50 cents! Turn to the offer now, and read it—on page 765.

honey as is in the hives between February and December has no idea of what the main Cuban crop is like.

Dade Co., Fla.

No. 4.—The Care of Bees for Wintering.

BY C. P. DADANT.

Some people are of the opinion that if we have a cold, steady winter, in which the bees remain confined to their hives for several months, there is less danger of winter losses; because less of the bees wander away and get lost. There would be a point in this, if it were not for the danger of the overloading of their bowels with fecal matter which they cannot discharge in the hive, as I mentioned in the previous article, without greatly endangering the life, or health, of the colony. In a very regular atmosphere, where the temperature is such that they are kept quiet naturally, and neither breed nor have the desire of moving about, as in a properly-regulated cellar, there is little danger of their bowels becoming distended; for they consume a minimum, and if the food be of the proper quality they may remain from three to six months without much danger. But we are now considering an out-door wintering, and, in a climate like that of Illinois, it is urgent that the bees be able to take a cleansing flight several times during the bad season.

For this reason we have to keep them in the best possible location as regards warmth, and the hives would best be facing south if possible. We have had much to do with apiaries exposed to all four of the cardinal points, and found great objections to either north, northeast, or northwest exposures. We once placed an apiary on the farm of a friend who had a few hives of his own, most of which faced north, and who had been most unlucky in wintering. He had it in his head that the bees should not be allowed to fly during the winter, and that was the reason of his placing the bees on the north side of his tool-shed. It took but one more winter to convince him of his error. We had a hundred hives located on his farm, and altho the winter was very unpleasant, our loss was small, while over half of his bees died.

The explanation is very easy. When a warm day came, the hives which were exposed to the rays of the sun began to warm up shortly after sunrise, and in the course of a couple hours the bees were ready for a flight, which they could enjoy while the sun was high. But his hives not being placed so as to have the benefit of the sun's rays, could not get sufficiently warm to stir up the bees, until the greater part of the day had been spent, and those bees which did take a flight were in many cases unable to return, owing to the coolness of the afternoon. Those bees, which enjoyed a good flight, were ready for another siege of cold and storm, and could cheerfully pass through some very rough weather; while the colonies which had no flight soon became restless, and lost their bees steadily till they were all gone.

Even when the snow is on the ground, and it looks as if it would be a pity for so many bees to fly and drop on this white sheet, we find that it is the colonies which take the most lively flight that winter best, and we have paid particular attention to this fact.

I would not, however, wish to be understood as desirous of having the bees to fly in spite of adverse conditions; and when snow is on the ground and the colonies comfortably buried in a deep snowpile, they are probably safer than when exposed to the weather; but if the snow is thawing, and the bees likely to be restless from the warmth of the air, I would allow them a flight every time.

Be the weather ever so cold for two, three, four weeks at a time, if your bees can have a good flight once a month, and if their honey is of fair quality, you need fear nothing of the results.

A few winter flights also have the advantage of inducing the bees to breed early, and altho this is sometimes dangerous, yet in most cases the early breeding is a favorable sign, for the possible spring losses are partly made up by the young, hatching bees.

Of all the exposures, I would prefer the south or southwest. Next would be southeast, and then east. But circumstances alter these rules, and the natural shape of the country must be considered. Where a good fence breaks the force of the winds, something is to be gained. The sole objection we have to the east exposure comes from the steady, drizzling, cold rains of early spring, which seem to do more damage than the dry and brisk west winds. Hancock Co., Ill.

See "Bee-Keeper's Guide" offer on page 765.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. O. MILLER, MARENGO, ILL.

(Questions may be mailed to the Bee Journal, or to Dr. Miller direct.)

Bottom-Boards in Winter—Hoffman Frames—Plain Sections and Fence Separators.

1. How do you manage about taking the hives off the bottom-boards when you put the bees into the cellar, without disturbing them? Of course you must take them off after you get them down cellar.

2. Have you ever had any experience with the Hoffman frame? and do you think a frame with staples for spacing is better?

3. Did you try no-bee-way sections and fence separators in your T supers the past season? If so, did they work well in them?

4. Will bees winter all right in a good cellar in tight-bottom hives? or will the honey-board have to be raised up a little?

WISCONSIN.

ANSWERS.—1. I don't take them off. The bottom-board is fastened to the hive by tobacco staples, and in the winter there is a good space under the hive, the bottom-board being a shallow box two inches deep, open only at the front end.

2. Yes, I have had Hoffman frames in use for a few years, and have more of them than I wish I had. In a place where propolis does not exist they may be all right, but in such a gluey location as I have they are very troublesome. I think staples as spacers are better, altho having had little experience with staples except as end-spacers. I have a great many frames with common nails as spacers, and like them. A common wire nail $1\frac{1}{8}$ inches long, with a head $\frac{1}{4}$ -inch across is driven in with a gauge that leaves it out just $\frac{1}{4}$ -inch. The ideal nail would be one with a head $\frac{1}{4}$ -inch thick, so that without any gauge it would drive in just the right distance. Possibly, however, $\frac{1}{4}$ -inch is not just the right space, for with that I get brace-combs between the top-bars.

3. I put them on, but the honey crop being a failure I can't tell anything about them.

4. They need too much attention to winter well with the usual summer entrance; get clogged up with dead bees, and they're better anyway with more chance for air. If the shallow summer entrance is left, raising the cover a little (why in the world have you a honey-board on in winter?) will help to make the ventilation all right.

One-Year-Old or Tested vs. Young Queens.

1. Is it true that every queen-breeder knows that tested queens—or, to be more exact—queens that are as much as a year old, do not bear shipment as well as young queens that have just commenced to lay?

2. Is it true that queens that are one year old are quite apt to turn out poorly?

My private opinion is, if the above statements are true, the majority of queen-breeders on this continent are guilty of a lot of deception and falsehood. B. C.

ANSWERS.—1. I don't know.

2. I don't believe it is true. I suppose, of course, you are speaking of queens that are shipped.

I don't know all about shipping queens, but I see no reason why a queen a year old may not stand a journey as well as a younger queen, providing both queens are in the same condition. If a queen a year old is taken out of a strong colony while she is busy laying 2,000 eggs a day or more, I don't think she will stand the journey so well as a young queen that has not yet reached 300 eggs in a day. On the other hand, I believe a queen a year old that is taken from a nucleus where she is laying 300 eggs a day will stand the journey better than a queen three weeks old that is laying 3,000 eggs a day.

I should be sorry to believe that a majority of queen-breeders are guilty of deception and falsehood. I feel very sure that a lot that I know are honest and honorable men. I confess, however, that I didn't know that a majority of them had expressed themselves as to the relative value of queens at different ages, and I may be wrong in my views, and will be glad if any of them will correct me if I am wrong.

My impression is that in the majority of cases a queen that has just commenced to lay is in good condition for shipping, and it will take some care to have an older queen in the same condition. Taking any queen at random, I'd give a good deal more for her when a week old than when a year old. If for no other reason, because I would have a year more of her life in one case than in the other. But that doesn't cover the case at all. I wouldn't object to paying five times as much for a queen a year, or even two years, old, in some cases, as I would for the same queen at a week old, even if I knew that at the greater age she would not live three months after I got her.

Let me explain: When a week old, there is little in a queen's record except that it is known she is of such and such a mother. But when she is a year old you can tell what has been the year's work of her worker progeny. Suppose the colony of which she is the mother has stored three times as much honey as the average, and you know of no way to account for it except the difference in blood. Don't you see that I'd be willing to give five times as much for her as I would have given for her a year earlier when no one knew yet what she would accomplish. And when she is two years old, and has made the same record as in the first year, I'd give more for her than when only a year old, because I would feel more sure that blood had made the difference. So the extra price paid for a tested queen is not because she will stand shipping better, but because she is *known* to be good by her performance. Of course, in most cases that testing goes no farther than to know that her worker progeny show her to have been purely mated.

Planting for Honey and to Revive Land— Hives and Supers.

1. As I have two acres of land near my residence in this city, where I keep bees, I would like to sow some honey-plant, which would at the same time tend to revive the land, which is run down by cropping. What would you recommend?

2. What kind of a hive and super arrangement do you use and recommend?

3. What are the advantages and disadvantages of T supers and the section-holder super? and which of the two supers do you recommend? WISCONSIN.

ANSWERS.—1. I doubt if anything will serve your purpose better than sweet clover. It will make a good growth on poor land, even if nothing but yellow clay, and its deep roots drying the second year will leave the soil well opened up. By training them to it, you can have your stock eat sweet clover, altho it seems easier to have them learn to eat the dry hay. I think no one has ever reported a failure to yield honey when sweet clover bloomed, while white clover and most other honey-plants sometimes fail to yield, altho blooming well.

2. I use the 8-frame dovetail to the extent of about 80 hives, and hope to get nearly all my bees into that kind of hive if I live another year. I use the T super. If I had no supers on hand, I might study whether to adopt the T or Ideal super.

3. A T super will take sections of any width. A section-holder made to take a 1½ section will take no other size. A few prefer to have open-side sections. For these the T super will not answer and the section-holder will. A section-holder allows the sections to fit close together, thus holding them square. The T tin holds the sections apart, making it necessary to have little separators at the top to hold the sections square and to avoid having a lot of propolis put between them. Some practice and advise shifting the outside rows of sections to the center when the center ones are sufficiently advanced. This can be done more easily with section-holders than with T supers. I don't think I should thus shift them if I had section-holders. The T tins are perfectly rigid and cannot sag. The bottom-bars of the section-holders may sag. I can fill and also empty T supers with less time and trouble than section-holders. Taken all in all, I decidedly prefer the T super. Whether the Ideal super may be still better is a question not yet decided.

Queenless Colonies.

In June I requeened several colonies, and just about this time the spring flow ended. All were accepted. These were untested queens that came through the mails. In August the fall flow began, and the bees stored the brood-chambers full, but no surplus—in fact, we rarely ever get any surplus from the fall flow in this State, and never get any swarms from this flow. Two of the colonies that had these young queens began

to rear great numbers of drones, queens being very prolific, and the hives were overflowing with bees. I began to think they were going to do the very uncommon thing for this section (swarm) in the fall. Late in September—I don't know the exact date—I saw in front of one of these hives a queen which had been dragged out. I now feared this colony was queenless, so I looked in and saw no queen, but plenty of eggs and brood in all stages, so lifted only a few frames, and know they were all right, queen or no queen, having plenty of drones on hand.

All went well until this morning (Nov. 7), when looking around in my bee-yard, on the alighting-board I found another queen, with six or eight bees gathered around her; she was dead. This was the same hive referred to above. It would be an awful job to find a queen in this hive now, for but few eggs are being laid, the frames being the Quinby size, and last season several were so heavy and large, and bulged badly, that I would be obliged to cut out in order to handle them.

1. Now, do you suppose these bees are queenless? If so, will they survive the winter and be any good if requeened in the spring? Fruit-bloom begins about March 10 to 15.

2. In fact, don't you believe I have been humbugged, and instead of getting young queens I got some that were two or three years old? Every one of the lot proved to be purely mated. GEORGIA.

ANSWERS.—1. Quite likely the colony is all right and has a young queen. (If your queens were clipped you could tell whether the old one was there or not.)

There were plenty of eggs late in September, so the colony will likely be strong in spring with bees not too old, and if it is queenless it might have a queen given to it with advantage.

2. The chances are that the queens were not old. For some reason, or perhaps whim, it is not such a very unusual thing for bees to supersede a queen when only a few weeks old, and a queen that has gone through the mail is more likely to be superseded on that account.

Colony Deserting—Peculiar Smelling Honey.

1. I had strong colony of black bees to abscond, leaving both sealed and hatching brood. On opening the hive I found uncapped cells of honey to be fermenting. The young had gnawed through the capping, but were held in by the web at the bottom of the cells where there was a small white worm. The hive was well shaded, and the bees bringing in some nectar. Between the quilt and cover was a large ant's nest. What caused the bees to leave? and what is the cause and how can I prevent the white worms at the base of the cells?

2. If a queen is caged and left on top of the brood-frames, will the bees act as if they were queenless?

3. During the honey-flow at this season of the year, my hives of bees emit a peculiar odor or a snur smell, something like old granulated basswood honey. Bees are working on heath-like aster. I can smell them when quite a distance away. What is the cause? TENNESSEE.

ANSWERS.—1. If there was no swarming in the case, and the bees simply deserted the hive, I can't tell you why. Honey fermenting in the cells would hardly cause it, neither would the annoyance of the ants nor of the worms. Possibly, however, the combination of the three may have been so bad that the bees became desperate. Black bees will not defend themselves against worms as will Italians. Get Italian blood and worms will hardly trouble strong colonies.

2. No, and yes. They will not show the distress that is shown by a queenless colony by running all over in search of the queen, but they will in many cases show a feeling of queenlessness by rearing young queens the same as when a queen is killed.

3. There are times when the bees are working on certain flowers (and I can't tell what they are), when an extremely offensive odor is present. I don't know why it smells so, but I suppose it's the odor that belongs to that particular kind of honey, just as buckwheat and other honeys have their peculiar odor.

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY
118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. DECEMBER 1, 1898. NO. 48.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

There is No Occasion for Jealousy among the bee-journals, says the editor of the Bee-Keepers' Review. The appetite grows by what it feeds upon, and the man who takes and reads a good bee-journal gets so much benefit from it that he is inclined to subscribe for another. Mr. Hutchinson then adds:

"Withholding deserved praise of a contemporary has never helped any journal in the race for fame and fortune.... Keep your journal bright, fresh, clean, newsy, helpful, and up-to-date—put some *life* into it, and it will live and prosper, tho there are complimentary notices of other journals in every issue."

And Editor Hutchinson's practice conforms to his preaching in this line, as witness the following item in the same issue:

"The American Bee Journal is giving a most excellently reported account of the Omaha convention. I think it is as good a report of a convention as I have ever read. If you are not a subscriber to the Journal, better take advantage of the offer on the first page of the Review and get this report."

Those Comb Honey Stories that appeared in the New York Evening Post, and which were corrected by Mr. Secor (see page 728), will not likely re-appear in that paper very soon. Mr. Secor has since received the following nice letter of explanation from the editor of the department in the Post, called "Home Thoughts," in which appeared the errors referred to:

BROOKLYN, N. Y., Nov. 12, 1898.

Mr. Eugene Secor, Esq., Forest City, Iowa.—

My Dear Sir:—As a writer of a paragraph concerning the adulteration of honey, your letter to the Evening Post has been referred to me. I made this statement on the strength

of an article on food adulteration duly signed and accredited which came under my notice. I did it conscientiously, because as a mother of four children I felt a regret to learn of this presumable fact. Your letter, however, is authoritative, and I have taken pleasure in making a retracting paragraph, as you will see per enclosed, embodying the main fact of your statement. I shall consider it a favor if you have any little pamphlet that relates to the production of honey which you could send me for my own reading. I agree with you as to the value of honey as food for children, and on my table it appears very often

Very truly yours,
MRS. MARGARET H. WELCH.

Here is the "retracting paragraph" which Mrs. Welch had published in a later issue of the Evening Post:

A statement which is going the rounds of the press, and which was commented on recently in this department, to the effect that even comb honey was not above suspicion of adulteration, is contradicted by those who are in a position to know. In the statement referred to, it was alleged that the cells were imitated in paraffine.

"When," says an expert, "the delicate texture and fragile nature of honey-comb, as made by bees, are realized, it will be easy to understand that it is a mechanical impossibility to make an article in imitation of it that cannot be readily detected. The limit of mechanical ingenuity up to the present time seems to have been reached when the septum, or base of cells, is made of wax on which the bees will construct cells and complete the comb. This is called 'foundation' by the trade, and it is made so thin that it can scarcely be detected from the natural septum made by the bees. Paraffine, however, is never used for this purpose, because this wax melts at a lower temperature than beeswax. The heat of the colony will melt it, and therefore ruin not only the 'foundation,' but the product as well. It is also impracticable to assert that glucose syrup is fed to bees and by them stored in the comb. Bees will not touch glucose syrup unless starving, and then, of course, they are not in proper condition to store honey."

This opinion is from an authority, and may reassure the housekeeper that when she buys honey in the comb she may reasonably expect to get something gathered from flowers by bees. Honey, it is well known, possesses nutritive and medicinal qualities, and it is the opinion of this same expert that if more honey and less cane sugar and candy were eaten by children, there would be fewer intestinal and kidney diseases.

Mrs. Welch has done well in the foregoing. We are very glad we suggested that General Manager Secor write the Evening Post in this case. Now let others who find untruthful statements about honey, just send a marked copy of the paper containing them to Mr. Secor, when he will do as he did in this instance—call for a retraction, and explain matters to those writers and publishers who have been misled by current errors regarding honey. It will go far toward killing many of the falsehoods that are "on the go" through the public press of to-day.

Pure Food Law for Illinois.—Prof. Davenport, Dean of the University of Illinois at Champaign, has sent letters to the Illinois State Bee-Keepers' Association, asking them to join in a call for a conference at the University, about Dec. 13, to ask the next legislature for a pure food law in this State. This is an important matter, and the State Bee-Keepers' Association ought to be represented. No doubt the Executive Committee will see to it.

Southern Honey and Feeding Glucose.—Editor E. R. Root, in Gleanings for Nov. 15, makes the following corrections in the proceedings of the Omaha convention as reported in this journal:

The stenographic report of the Omaha convention proceedings is unusually full and accurate. I have read nearly all of it, and see very few if any corrections to make. I note, however, in the American Bee Journal (page 660), in the report of this convention, where I speak of the adulteration of honey and the difficulty of feeding bees clear glucose, the reporter makes me say this: "We are trying every year to feed pure glucose to bees. I learned this summer that you could dilute it down with water, and they would take it provided there was nothing else that was coming in." What I meant to say, and what I probably did say, was that we tried

one year to feed pure glucose to bees, instead of our trying to do it every year. This last construction might imply that I had some sinister motive; and after all I have said against glucose honey and glucose in general, this would be rather a travesty on your humble servant.

The editor of the American Bee-Keeper protests (and rightly, too) against the statement wherein I am made to say in the report of the Omaha convention, that "Southern honey has a strong flavor which is liked by some." What I actually said, or at least thought I said, was that some Southern honey has a strong flavor. In the general discussion, we were talking about the peculiar flavors of different honeys, and why some preferred a kind of honey that another disliked. I mentioned the fact that buckwheat honey in New York is preferred by some to anything else, and that, in a similar way, there are certain flavors in Southern honeys that are liked by some and disliked by others. Mr. Hill says he would not for a moment attribute to me the "thought of a willful misrepresentation," and that he believes I am "utterly incapable of studied deception." I thank him most sincerely for such a statement; and while I may not deserve it, I try to be what the language implies.

I lay no blame to Mr. York, as it takes a pair of sharp eyes to catch every error that may creep through the stenographer's pencil.

Even if we had "a pair of sharp eyes," or several pairs, it would make no difference, for no one person could remember all that was said in discussion at a national convention. So of course we have to rely upon the stenographer's report. But we are very glad to have necessary corrections made, and would be pleased to receive them direct, so as to publish the corrections as soon as possible after the appearance of the errors.

Salt-peter Rags for Smokers.—Editor Root, in Gleanings, tells in the following how Dr. Miller uses salt-peter rags for lighting the bee-smoker:

While visiting at Dr. Miller's I saw him pull out a piece of rag from his tool-basket, light it with a match, or apparently attempt to light it, and put it down the smoker. There was no flame, and it seemed the rag had gone out.

"Here, that's gone out!" I exclaimed.

"Oh! that's all right," replied the Doctor; "it will go;" and then he proceeded to cram in some planer shavings.

"You will put it out now, I am sure," said I.

"I think not," he replied; and at this he began working the bellows, when it immediately began to send out quite a volume of smoke.

"The rags in our locality do not burn that way," I remarked.

"Perhaps not," returned the Doctor; "but we dip ours in salt-peter water, and then dry them. See? Just the moment the flame of a match touches the rag it will catch fire and stay lighted."

Dr. Miller formerly soaked his rotten wood in salt-peter water, and then after it was dry used it for lighting his smoker. But the rag lights instantly, and is then pushed into the smoker. No cramming in of other fuel will put it out. This saves much annoyance in lighting the smoker.

Ordinances Prohibiting Bee-Keeping.

For the benefit of bee-keepers who may be annoyed by their city officials attempting to pass ordinances against bee-keeping, we take the following from a local newspaper of Riverside, Calif., dated Oct. 1, 1898:

City Attorney Purlington rendered the following opinion:

To the Honorable Board of Trustees of the City of Riverside.

GENTLEMEN:—Some time ago you referred to me the question whether an ordinance prohibiting the keeping of bees within the city of Riverside would be valid.

I have been unable to find but one decision directly in point, and that is the case of the city of Arkadelphia vs. Clark, decided by the Supreme Court of the State of Arkansas, June 22, 1889. The court held that neither the keeping, owning nor raising is in itself a nuisance within a city, but whether they are so or not is a question to be judicially determined in each case. Such an ordinance undertakes to make each act a nuisance without regard to the fact whether it is so or not, or whether bees in general have become a nuisance in the city. Such an ordinance is therefore too broad, and invalid. From

the reasoning in the opinion, and from the authority cited in the brief submitted to the court, I am of the opinion that an ordinance of the kind would be held unconstitutional by the courts of this State.

It may be well to preserve the foregoing legal opinion for future use. It might come handy if at a time when some would-be-great "city fathers" make an attempt to destroy bee-keeping within their city limits. Bee-keeping is not a general nuisance just yet.

Honey and Health.—An eminent medical authority says honey should again occupy at least part of the empire unjustly wrested from it by sugar, says an exchange from Germany. Sugar is undigested, and taken pure is injurious, producing flatulency, acidity of stomach, and sick headache. Pastries prepared with much sugar, taken in large quantity, spoil the stomachs of children, and even of adults. Those who have stomach troubles can endure the least quantity of sugar. The small amount of muriatic acid in the healthy stomach can transform but a small amount of sugar, any surplus over this disturbs the entire alimentary canal for days. The sugar contained in honey is already transformed, so it may be taken in large quantities by children and invalids. Where children are fed with cow's milk, honey should be added, for cow's milk is not as sweet as human milk.

MR. JAS. A. STONE, of Sangamon Co., Ill., Secretary of the Illinois State Bee-keepers' Association, sent us a dollar for the Langstroth Monument Fund last week.

MR. J. A. PEARCE, of Kent Co., Mich., writes:

"I fully endorse the idea of putting bees out early in the spring, say from the first to the middle of March."

MR. T. R. JOSLIN, of Douglas Co., Nebr., wrote us Nov. 21:

"I have had a grand success with my bees this season, and I give the credit to the 'old reliable' American Bee Journal.

THE A. I. ROOT CO. had a fire scare at their factory the night of Oct. 29. But owing to their efficient automatic fire-equipment no great damage was done. We congratulate them upon their escape from a serious conflagration.

MR. W. W. WHIPPLE, of Arapahoe Colo., wrote us Nov. 7:

"I do not want to miss a single number of the American Bee Journal, as it is the one thing I rely upon for up-to-date information in bee-keeping, and I do not see how any one can get along without it."

MR. H. W. BUCKBEE, of Rockford, Ill., proprietor of the Rockford Seed Farms, is one of the leading florists and seedsmen in all the West. Nov. 19 he expressed us a large box of most beautiful flowers—roses and chrysanthemums of several varieties. We loaned them the next day for pulpit decoration, and they were greatly admired by the church people. Mr. Buckbee will soon be found among our most reliable advertisers again, and we trust our readers will remember him when in need of anything in his line.

MR. J. H. MARTIN (Rambler) has lately wheeled from California over into Oregon, in which State he hoped to do a good deal of wheeling, but it seems he encountered such wet weather that he had to do most of his traveling by rail. During his rail trip from Roseburg to Salem the railroad company sent his bicycle off in a direction that he intended it should not go. When he presented his check for it at Salem he was not able to get it. He had to proceed to Portland

mourning the loss of his wheel. But the wandering wheel was found later.

We understand that Mr. Martin expected to make a hurried trip among the bee-men of Oregon and Washington, and then take the steamer at Seattle for San Francisco. Owing to the continuous wet weather he will hardly be able to call on many of the northern apiarists.

MR. JOS. BEAUDRY, of Quebec, Canada, sent us \$1.00 Nov. 23, for the Langstroth Monument Fund. There is room for more dollars in this Fund, and we should think that all who can afford to do so would contribute their share promptly. All that is sent to us on that account will be forwarded at once upon receipt to the proper place.

EDITOR EMERSON T. ABBOTT, of the Modern Farmer and Busy Bee, is on the program for Thursday, Dec. 8, at 7:30 p.m., at the 41st annual meeting of the Missouri Horticultural Society, to be held at Columbia, Mo., beginning Dec. 6. His subject is "Bees in Relation to Horticulture." Mr. Abbott will interest those horticulturists, and they will ever afterward be better friends to bees and bee-keeping.

MR. J. H. TICKENOR, of Crawford Co., Wis., writing us Oct. 29, had this to say:

"I like the American Bee Journal very much. It is certainly a money-saver to everyone that 'bee-lieveth,' to the Jew first and also to the Gentile. I like the short method of spelling adopted by the Bee Journal. I also like criticisms, for they are educative, but I think the majority of the bee-keeping fraternity would be with me in saying: Let's not jangle through the Journal, or elsewhere. I have a six-months' boy whose name is Victor Joseph Langstroth."

MR. GEO. W. BLAIR, of Mason Co., Mich., when renewing his subscription for 1899, and also taking advantage of our \$1.50 offer for both the Bee Journal and Prof. Cook's "Bee-Keepers' Guide" (see page 765), wrote as follows:

"It makes me feel kind of guilty to get it so cheap. Couldn't do without the Bee Journal, you know."

Yes, that \$1.50 offer is enough to make a fellow "feel kind of guilty" when he accepts it, but that's all right—just come on with your orders until Dec. 10, when the offer will positively be withdrawn.

SOMNAMBULIST, in the Progressive Bee-Keeper, gives this comment on facing honey:

"Among the correspondents of the bee-journals one finds a good deal of tit for tat on facing honey. While we cannot be too scrupulous about having the different sections which constitute a case of honey, of equal merit, there are but few of us who can refrain from putting the most beautiful to the front. 'Tis simply human nature that, in displaying any of our belongings, either to a prospective buyer or the every-day family visitor, to bring out in bold relief the best we have. The people are few and far between who are anxious to bring defects into the glare of the searchlight, unless, indeed, it be those of an enemy."

The Value of Foundation in Sections lies chiefly, according to the belief of Editor Hutchinson, of the Bee-Keepers' Review, in the fact that "In a heavy flow the use of foundation enables the bees to furnish storage for honey that could not be stored if comb were built naturally." He does not agree with the belief that worker-comb looks better in sections than drone-comb.

Immunity to Stings.—In response to a circular sent out by Dr. Langer to German bee-keepers, 144 had become insensible to the effect of stings, nine claimed they had been so from infancy, and 26 declared that they had the same sensibility as at the beginning of their apicultural career. The number of stings required to reach immunity varied; some required only 30, and others 100 or more.—Prakt. Wegweiser.

Comparative Quantity of Comb and Extracted Honey.—In the discussion at the Ontario convention, last year, with 75 percent of the honey sealed before extracting, Mr. Hall thought little more extracted than comb honey could be secured; Mr. Post thought about 65 of comb to 100 extracted, Mr. Pickett 60 or 65 of comb to 100 extracted, and Mr. Darling thought less was secured in sections because bees disliked working in such small spaces.—Canadian Bee Journal.

Do Bees Move Eggs or Larvæ?—Referring to what Doolittle says about bees moving larvæ (American Bee Journal, page 578), Critic Taylor, of the Bee-Keepers' Review, thinks the testimony strong in favor of the belief that workers do move larvæ, and says he has been watching for just such cases for years, and in some cases thought he saw evidence in favor of such moving, but continued observation showed him his error. So he registers doubts as to Doolittle's correctness.

The Building of Drone-Comb.—I. W. Beckwith says, in the Bee-Keepers' Review, that his experience is at variance with the rule that queenless colonies build mainly drone-comb. He divides colonies and allows the queenless part to fill the hive with combs while the queen is maturing, and finds very little drone-comb built unless the bees are *hopelessly* queenless. He quotes Dadant as saying: "If all, or part, of the store-combs of a hive are removed, the bees will rebuild large cells, at least three times out of four." And says his experience is the reverse of this, for when he removes most of the combs from a populous colony it is always replaced with worker-comb. But are these last the "store-combs" that Dadant speaks of, Mr. Beckwith?

Improving Our Honey-Resources.—"If one-half the energy that is now expended in inventing new hives and other appliances," says Ed Jolly in American Bee-Keeper, "searching for new races of bees, breeding for beauty, etc., were turned to the betterment of the resources of the country, bee-keeping as a business would be a more lucrative one"—a proposition that is hard to gainsay. He advises sowing white clover seed along roadsides and streams, fence-corners, pasture fields, and through the woods. Also starting linden trees. In the fall, rake the old rotted leaves from the ground in the forest, stir the soil a little with a rake, then sow the seeds and cover lightly with well-rotted leaves or compost. A year later the seedlings may be transplanted. Slips may be cut in early spring, stuck in a marsh or wet ground, and the following spring they will be found rooted.

Boiled-Down Laziness.—Critic Taylor, in the November Bee-Keepers' Review, says he is sometimes discouraged in the work of a critic, because there is so much careless statement and careless editing that ought to be reformed. As a good example of both, he refers to page 618 of the American Bee Journal, and quotes as follows:

"Critic Taylor, speaking of Doolittle's plan of preventing after-swarms, said: 'Perhaps Doolittle is led to practice his method from the fact that he is largely using the Gallup hive and wishes to engage others toward a favorable opinion of that hive.'"

Mr. Taylor says he could never have written such absurd nonsense, and is somewhat at a loss to know whether to attribute the misrepresentation to carelessness or impotent malice. Neither, Mr. Taylor; it was laziness—pure, boiled-down laziness. On page 268 of the Review, Mr. Doolittle gave as a paraphrase of what Mr. Taylor had written: "Perhaps Taylor is led to practice his method from the fact that he is largely using the Heddon hive," etc.; and instead of turning back to see what Mr. Taylor had actually written, it was an easier, and a much lazier, way, to jump at the conclusion that, in paraphrasing, Mr. Doolittle had merely changed the proper names, and that conclusion was unfortunately acted upon. What Mr. Taylor actually did write was this:

"Perhaps Doolittle is led to practice this method from the fact that he is largely engaged in the production of queens, since by this process he gets plenty of good queen-cells almost ready to hatch."

Which goes to show that it is not always easy to look upon a paraphrase and construct therefrom the thing paraphrased. It was a case of unpardonable carelessness and laziness, for which a thousand apologies are hereby tendered to Mr. Taylor, with many thanks for being let off so easy, and a promise never again to work backward from a paraphrase.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it. See 6 big offers on page 746.

BEES, HONEY, MONEY

Queens for Business.

GENERAL ITEMS

Shallow Extracting-Frames, Etc.

In Mr. Deacon's article on extracting-frames, on page 563, he states that the Root shallow extracting-frames are 4 1/2 inches deep. If he will examine their catalogs of 1897 and 1898 he will find that the *only* shallow extracting-frames listed by the Roots are of the "sensible depth" of 5 3/8 inches; in fact, just the same depth as the Heddon frames.

My bees did fairly well this year. I wintered four colonies, lost none, and increased to nine, besides selling a number of queens and a few frames of bees. They averaged 75 pounds each of comb honey. There are about 100 colonies in all near here, and several bee-keepers report a poor crop, due, I think, to the "let them alone" policy.

E. F. ATWATER,
Yankton Co., S. D., Nov. 18.

Fair Season.

I got the bee-fever four years ago, and have at present 3 strong colonies of hybrids and one Italian. The past season was fair. Last year was extra good, which started many new bee-keepers this year. My bees are all in Cary-Simplicity hives, which seem to be the standard in this section. There were very few swarms this year.

ALBERT HEDLER,
New Haven Co., Conn., Nov. 18.

A Lady Bee-Keeper's Report.

I commenced the season of 1898 with 31 colonies in good condition, wintered on the summer stands. I kept them from swarming as much as I could, but they increased to 45 colonies. I have doubled some, and have now 36 good colonies. My honey crop this season, as nearly as I can estimate it, is about a ton. The early honey was very dark. The rain spoiled the early white clover, but when the basswood commenced it came very rapidly, and my sympathy was not with the busy bee, but with the busy bee-keeper. I had 1,000 pounds of basswood mix with a little white clover, but the last that I took off was yellowed a little with the early corn-blossoms.

The late honey crop was very light, owing to the drought in this part of the State.

I like the Bee Journal's reform in spelling ever so much; and I shall watch the Journal this winter very closely to learn all I can about managing the plain section and fence separator. So let all the lights shine on that subject, for I, for one, want my honey to look as well as any one's when it goes to market.

MRS. PAUL BARRETTE,
Crawford Co., Wis., Nov. 18.

Bees in Fair Condition.

Bees in this vicinity (Marion Co., Ind.) are in fair condition to go through the winter, altho the quality of the stores is not A No. 1. My bees in Vanderburgh county are in winter quarters, with an average of 40 pounds of stores per colony. The regiment of which I have been a member (159th Ind. Vol.) is to be mustered out Nov. 23, and we will all get home for a turkey on Thanksgiving. Pennsylvania seems to be about the best honey State I was in the East.

Nov. 18. J. C. WALLENMEYER.

Best Crop in Six Years.

Mr. Holtermann has not said too much of the honey-flow in this part of our country, if we can judge by our own locality. Indeed, it is the first crop I have had in six years, since I began, and we are near the 70th latitude north.

Last year I had 21 colonies in the spring, increased them to 29 in buckwheat time

A FREE BOOK on Feed Cooking.

We are sending out to all interested parties who ask for it, a very entertaining and instructive little book on this subject. It deals with all phases of the subject—the cost, advantages and profit of the practice. Incidentally it tells about the

ELECTRIC FEED COOKERS

which are made of best gray iron castings and lined with steel plates, with boilers of extra quality galvanized steel. So made they require less fuel and heat quicker than all others. Made in three styles and five sizes, from 25 to 100 gallons capacity. Heavy stock—can all orders instantly. Write.

Page Woven Wire Fence Co., Adrian, Mich.

(about Aug. 7), and had 150 pounds surplus of that dark stuff—not a drop of clover honey on account of it being killed by a big spring frost.

This year my bees were not very strong. I lost 5 colonies in springing, but there was so much dandelion bloom, that bees began to swarm May 31 till the middle of July. Clovers began to yield June 8, and it lasted until the middle of the next month. The strongest part of the honey-flow was in the beginning of that month.

I harvested 2,500 pounds of clover extracted honey, and 1,200 pounds of buckwheat; that source yielded 12 days, but was not good. My best colony gave me 215 pounds; the largest yield prior to that was 107 pounds of extracted honey. I have now 51 colonies in good wintering condition, which are in the cellar.

Extracted honey sells in Montreal at, white, 6 1/2 to 10 to 12 cents at retail; dark, 5 to 10 cents; comb honey, 8 to 12 1/2 cents.

Last year was your turn for a good honey year; this year it was ours.

JOS. BEAUDRY.

Quebec, Canada, Nov. 23.

Bees Did Fairly Well.

Bees in this section of the State did fairly well the past season, considering that we had a spell of rainy weather in the spring, in the time of fruit-bloom. We get our honey mainly from white clover, altho maple, greasebrush, fireweed, huckleberry bloom, etc., contribute their share of it, most seasons.

A number of bee-trees are found in the woods. Out of a dozen or more trees I have cut this year, I think one (a large hollow cedar) is worth mentioning. They had 6 combs from the ground up 8 feet high, the widest one (in center) being 11 inches, diminishing on both sides to 3 inches. They had about 175 pounds of honey stored.

I like the American Bee Journal first-rate; I think it is well worth the subscription price to any bee-keeper.

AND. OLSON.

Jefferson Co., Wash., Nov. 15.

Report for the Past Season.

I started in last spring with 20 colonies, increased to 45, and caught 6, making 51. I put on 1,500 one-pound sections, and got 200 pounds of honey, principally basswood and huckwheat. Bees are in good condition for winter.

I have wintered my bees in a shed for three years; I lost only one colony from starvation last winter. The dimensions of the shed are—length 64 feet, width 5 1/2 feet; front, 4 1/2 feet high; rear 3 1/2 feet high. I place hives in rows 8 inches high from the ground, and 3 inches apart, and one foot space back of the hives, and then put on chaff cushions and pack the hives in chaff, then nail boards 1/2 to 3/4 of the way down in front, so that the bees can fly out any time they see fit. I take the bees out of this shed about April 10. I use the S-frame Langstroth hive, and run for comb honey exclusively.

The American Bee Journal is a very welcome visitor. **ANDY SCRINGER,**
Floyd Co., Iowa, Nov. 23.

Good Season—Sweet Clover.

We have had a very good honey season. White clover was never so plentiful before as last summer, and was in bloom for three months, but it was too dry at the end of the season, so the bees had to work mostly on sweet clover, which was in bloom until the first part of November. The beginning of October I gave the bees extracted combs to clean out, and at the end of the month most of them were filled with fine honey. I think sweet clover is the only honey-plant we may depend on. But the city officers are keeping it down very close. Last summer when I came home at 9 o'clock in the morning, I found three men, armed with scythes, engaged in cutting down my sweet clover, which grew along the street. I

A GREAT ***** COMBINATION OFFER

COOK'S "BEE-KEEPERS' GUIDE" FOR ONLY FIFTY CENTS.

You ought to have a good bee-book, if you haven't one already. Prof. A. J. Cook's Manual, or "Bee-Keepers' Guide," is one of the very best published to-day. It is bound substantially and neatly in cloth, contains over 450 pages, and retails at \$1.25 a copy, postpaid. But we are going to make you an offer, **for the next three weeks** (positively ending Dec. 10), that will open your eyes. Here it is:

To every subscriber who before Dec. 10 will pay his subscription to the American Bee Journal to the end of next year (1899) we will mail a copy of Prof. Cook's "Bee-Keepers' Guide" for only 50 cents extra. That is really getting a dollar-and-a-quarter bee-book for only 50 cents. Can you afford to miss such a chance as that? Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful straw-colored transparent Foundation, improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

7Atf

askt them what authority they had in cutting down my clover? They answered, "The street commissioner," and that they were told to clean every street from weeds.

I live on a 5-acre farm surrounded by larger farms; our street leads into the country, and is not graded. Nearer town, on the main street, Canada thistles and milkweeds are found in great abundance, which they think are not so dangerous as sweet clover!

My bees are in their winter quarters on the summer stands since the first of November; boxes lined with coffee sacks and straw board are put around the hives. Nov. 2, 3, 5 and 8 I noticed them carrying in pollen, and on the 10th we had a severe snow-storm. To day (Nov. 21) the bees are carrying pollen again. CHAS. DUCLOS, Saginaw Co., Mich.

Against Importing Apis Dorsata.

I have read in the American Bee Journal and Gleanings so much about Apis dorsata. I never paid much attention to it, as I had an idea that the writers on that subject would find out sooner or later what a great mistake they make to entertain the idea of importing those bees to the United States. We have no State in the Union where this bee could live and prosper. It requires a very hot climate, say 75 degrees about the lowest.

Now you will be astonished at the reason why. This I will explain in a few words. The large bees of the Philippines, or Apis dorsata, will not stay in any box or hollow tree, but will build their combs in the woods on branches of trees, etc., sometimes 1 1/2 yards long by one yard wide. I saw some such 30 years ago when I was in the Philippines. I spoke to Manila men about it, altho I had no idea of keeping bees at that time, and they told me that they never will stay in a box; even if you put them in a box they will go to the woods and make their nest in the branches of trees. Now bring them to this country in a box, open it in the summer time and they will leave and go to the woods, and build combs on branches of trees; and as soon as the winter sets in they will perish, even here in Louisiana, where the mercury goes very seldom below 30 degrees.

I hope this explanation will be satisfactory, and that Apis dorsata will be let alone. Even Cuba, I think, is too cool for them, as the Philippines are a great deal warmer during the whole year.

J. H. HEMPEL.

St. John Parish, La., Nov. 22.

Illinois State Convention Report.

Our meeting of the Illinois State Bee-Keepers' Association is again a thing of the past. The attendance was not large, but we hope for much good to result from it. Hon. N. E. France, State Inspector of Apiaries, of Wisconsin, was with us, and we are sure he was of great use to the Association in the advice he gave as to the manner of procedure to secure a foul brood law in our State, such as they have in Wisconsin.

The election of officers took place on the first day, resulting the same as last year, viz.:

President, J. Q. Smith, of Lincoln; 1st Vice-President, C. P. Dadant; 2nd Vice-President, A. N. Draper; 3rd Vice-President, S. N. Black; 4th Vice-President, Geo. Poindexter; 5th Vice-President, Geo. W. York; Treasurer, Chas. Becker; Secretary, Jas. A. Stone, of Bradfordton.

On motion, the Executive Committee (which is by the constitution the President, Secretary and Treasurer) was made the committee on premium list, and later was also made the committee on legislature. It was voted that they be instructed to so frame the Act in the foul brood law, as to have the Governor appoint a State Inspector of apiaries, as recommended by the Illinois State Bee-Keepers' Association; whereupon the Association voted to recommend our President, J. Q. Smith, of Lincoln, in case a foul brood law is enacted.

If Illinois bee-keepers want a foul brood

Please mention the Bee Journal when writing Advertisers.

HONEY * FOR * SALE.

Best White Alfalfa Extracted...

ALL IN 60-POUND TIN CANS.

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can hardly get enough of the Alfalfa extracted.

Prices are as Follows:

A sample by mail, 8 cents in stamps, to pay for package and postage. By freight—One 60-pound can, 8 cents per pound; 2 cans, 7 1/4 cents per pound; 4 or more cans, 7 1/8 cents per pound. Cash must accompany each order.

This honey is **ABSOLUTELY PURE BEES' HONEY**, the finest of the kind produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand the past season, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The Circular, "HONEY AS FOOD," will be a great help in creating customers for honey. Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Mr. Abbott sells our Hives and Sections at factory prices.

THE "NOVELTY" POCKET-KNIFE

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The **NOVELTY KNIFE** is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed an **AMERICAN BEE JOURNAL** reminder, and on the other side, name and residence of the Subscriber.

The material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring steel, and the finish of handle as described above. It will last a lifetime, with proper usage.

Why purchase the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your pocket knife will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a Christmas, New Year or birthday present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, a lady to a gentleman, or vice versa, a son to a mother, a husband to a wife, a brother to a sister or a gentleman to a lady—the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid, for \$1.00, or give it as a Premium to the one sending us **three new Subscribers** to the **BEE JOURNAL** (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book "Bees and Honey." We club the Novelty Knife with the **BEE JOURNAL** for one year, both for \$1.90

Any Name and Address Put on the Knife.

GEORGE W. YORK & CO.,

CHICAGO, ILLS.

law they must, one and all, put their shoulders to the wheel, or it cannot be made to revolve.

Following the suggestions of our good friend, Hon. N. E. France, it is necessary that all bee-keepers of Illinois who are interested in the enactment of a foul brood law, address a letter on the subject to the Executive Committee of the Illinois State Bee-Keepers' Association (through the secretary at Bradfordton), stating the approximate number of colonies in their county; the amount of honey produced in a favorable year, and its value; how many persons are partly, and how many totally, dependent upon bee-keeping for a maintenance; what you know about foul brood and its ravages, etc.

Let every bee-keeper in the State pile up just such letters before the committee as will have the desired effect upon the legislature; and in addition let every bee-keeper make a special request of their Representatives that they favor such a law.

If bee-keepers throughout the State will follow this request, it will save the expense to an empty treasury of further postage, which we would be compelled to call on bee-keepers to furnish, and those who have had foul brood in their apiaries would be the first to respond. So do it immediately, and let's have the law. **JAS. A. STONE.**
Bradfordton, Ill.

Good Year and Honey Fine.

This has been a good year. The honey is fine. I am getting \$3.25 per case for No. 1 amber, and \$4.25 per case for fancy white comb. Congratulations and best wishes for the American Bee Journal.

ERNEST W. HALSTEAD.

Jackson Co., Miss., Nov. 22.

Poorest Season in Eight Years.

My report is a poor one. I had 10 colonies, spring count, and have four now. The neighbors sprayed their fruit-trees and killed my bees till I had six. I have been doubling them up, and have two colonies that I think will pull through, and two that are in poor condition. This has been the poorest honey-year since I have kept bees—eight years; I did not get a pound of honey this year. Prospects are good for next year.

W. M. DANIELS

Wood Co., Ohio, Nov. 22.

Convention Notices.

New York.—The tenth annual meeting of the Ontario Co., N. Y., Bee-Keepers' Association will be held in Canandaigua, N. Y., Dec. 8 and 9, 1898. An interesting program is in course of preparation. All interested in bees or bee-keeping are invited to attend.
Bellona, N. Y. RUTH E. TAYLOR, Sec.

Ontario.—The annual meeting of the Ontario Bee-Keepers' Association will be held in Guelph, Dec. 6, 7 and 8, 1898. Owing to the Guelph Fat Stock Show, the Guelph Poultry and Pet Stock Show, and the Experimental Union meeting on the same dates, there will be a large meeting of beekeepers, and each association will be a help to the other, as many are interested in all the different meetings. All are cordially invited to attend the meetings.
Streetville, Ont. W. COUSE, Sec.

GEORGE W. YORK & CO.,

118 Michigan Street, - CHICAGO, ILL.

What Others Think

Of the Bee-Keepers' Review.

MY BEE-KEEPING FRIEND:—If you really knew how good a journal the Bee-Keepers' Review has become, you would soon be one of its subscribers. It is my honest belief that in calling your attention to its merits, I am doing you (as well as myself) a *real benefit*. One way in which I can do this is by allowing you to see what others think of it. During the past year I have received hundreds of letters praising the Review; and from them I select the following:

The Review was never quite equal to what it is now. I was just glancing over a bundle of letters when my eye took in the last number of the Review that the clerk had laid on the desk. The letters were immediately put down and the Review taken up. After I had glanced through it pretty thoroughly the questions came to me, "What makes the Review so crisp, and why is it that I take it up so quickly when it comes? Is it because the editor quotes very largely from Gleanings in his Extracted Department? No, not exactly, altho that is a delicate compliment to Gleanings, it is because the editor throws his whole being into his paper. He loves it and his readers.—E. R. Root, editor of Gleanings.

Under the keen competition which now obtains among high-class periodicals, any marked degree of success comes only to the publisher of peculiar adaptability. The uninterrupted progress of the Review may be attributed to a rare combination of the qualifications possessed by its editor and publisher, so essential to up-building of a popular, bee-keepers' magazine. An active mind, ever vigilant in behalf of its patrons, backed by mechanical genius and mature experience in the apicary, together with a clear, pleasing style of expression; modest, yet unaffectedly dignified and business-like; with a most delicate conception of the beauties of Nature and harmony in art, cannot but be productive of a work most gratifying to the cultured tastes which spring from that sublime conception of Nature which is an inherent part of every true bee-master.—H. E. Hill, editor American Bee-Keeper.

I suppose publishers are like ordinary mortals in that they appreciate words of commendation from the reading public to which they cater; therefore, I beg to say, I like the Review, and here are some of the reasons why I like it:

Dear Hutchinison, I have been intending for some time to write you my appreciation of the Review, but this has been an exceptionally busy season with us, and the writing has been put off until now. Permit me to congratulate you on the splendid journal that you are making. When you started out with the eight extra pages I had my apprehensions as to your being able to keep them filled with the interesting matter for which the Review has been so generally noted, but I am pleased to notice that there has been no deterioration. Your correspondents are the best apiculturists of our land; and yearly all of the new thoughts and ideas in apiculture come to us now through the Review. With the best of wishes for your success, I am, yours truly, R. B. Leahy, editor of the Progressive Bee-Keeper.

First.—Because it is well edited.
Second.—Because it is well printed on good paper.
Third.—Because its contributors are among the best writers on bee-culture in America.
Fourth.—Because it has no fads.
Fifth.—Because it has high ideals of literary style and at the same time tries to be helpful to practical bee-keepers.
Sixth.—Because I like its editor and count him among my warm personal friends.—Eugene Secor, Manager U. S. Bee-Keepers' Union.

As I have said before, once a really good bee-journal visits a bee-keeper a whole year, it usually becomes a permanent member of his family; and, for the sake of getting the Review into the hands of new readers for this "first year," I am making the following offer:

Send me \$1.00 and I will send you twelve back numbers, the Review for the rest of this year and all of next year. The sooner you subscribe the more you get.

W. Z. HUTCHINSON, Flint, Mich.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Nov. 19.—Our market is very strong at 13c for best grades of white comb honey, with good No. 1 at 11 to 12c; ambers range from 8 to 11c, according to appearance, quality and flavor. Extra ted, white, 6 to 7c; amber, 5 to 6c; dark, 5c. Beeswax, 27c. All grades and kinds of honey are salable at this time.
R. A. BURNETT & CO.

San Francisco, Nov. 2.—White comb, 9½ to 10½c; amber, 7½ to 9c. Extracted, white, 7 to 7½c; light amber, 6½ to 6¾c. Beeswax, 24@27c.

There is so little extracted now offering that it is hardly quotable in a wholesale way. Comb is in fair supply and is being very steadily held, altho with the demand for same almost wholly local, the movement is not very rapid.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c.; A No. 1 white, 10 to 11c.; No. 1 white, 9 to 10c.; dark and partially-filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c.; No. 2, 5½c.; amber, 5c.; in barrels, No. 1 white, 5½c.; amber, 4½ to 5c.; dark, 4 to 4½c. Choice Beeswax, prime, 24c.; choice, 24½c. At present there is a good demand for honey.
WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12@13c.; No. 1, 11@12c.; amber, 10@11c. Extracted, white, 5½@6c.; amber, 5@5½c.; dark, 4½@5c. Beeswax, 22@25c.

The receipts of comb honey are larger.
C. C. CLEMENS & CO.

Boston, Sept. 30.—Our honey market shows a decided firmer tone since our last. A few sales have been made at 15c for an extra fancy lot, while almost all sales ranging from A No. 1 to fancy now are made at 14c, while occasionally, something a little off, will bring as low as 12½ to 13c. We do not look to see any lower prices.

Extracted, Florida, in barrels, mostly 6c to 7c, with a good demand. Beeswax, slow sale at 26c for best.
BLAKE, SCOTT & LEE.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12½c.; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6½ to 7c. Beeswax, 25 to 27c.
WALTER S. POWDER.

Milwaukee, Oct. 18.—Fancy 1 pounds, 12½ to 13c.; A No. 1, 12 to 12½c.; No. 1, 11 to 12c.; No. 2, 10 to 10½c.; mixt, amber and dark, 8 to 9c. Extracted, white, in barrels, kegs and pails, 6½ to 7c; dark, 5 to 5½c. Beeswax, 26 to 27c.

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing.
A. V. BISHOP & CO.

Columbus, O., Nov. 18.—Market somewhat easier. Quote: Fancy, 14c; No. 1, 12c; No. 2, 10c; amber, 9c; buckwheat, 8c.
COLUMBUS COM. AND STORAGE CO.

New York, Oct. 22.—Receipts of comb honey are large, and there is quite a stock now on the market. While white is in good demand, buckwheat and mixt seem to be somewhat neglected, and quotation prices have to be shaded in order to sell in quantity lots. We quote:

Fancy white, 13 to 14c; No. 1 white, 11 to 12c; amber, 10c; mixt and buckwheat, 8 to 9c. Stocks of extracted are light of all kinds. Demand is good at following prices: White, 6 to 6½c; amber, 5½c; dark, 5c. Southern, in half barrels and barrels at from 55c to 60c a gallon. Beeswax dull at 26c.
HILDRETH BROS. & SEGELKEN.

Detroit, Oct. 20.—Honey in better demand and better prices as follows: Fancy white, 13@14c; No. 1, 12@13c; fancy dark and amber, 10@11c. Extracted, white, 6@7c; dark, 5@5½c. Beeswax, 25@26c.
M. H. HUNT.

Minneapolis, Oct. 20.—Fancy white clover comb is now selling at 11@12c.; amber, 10½c. Extracted fancy white clover, 5½c.; amber, 4½@5c. Dark grades, both comb and extracted, not wanted at low prices.
S. H. HALL & CO.

Buffalo, Nov. 25.—A most excellent demand continues for strictly fancy 1-pound combs at 13 to 14c. The usual so-called No. 1, 11 to 12c; lower grades move well at from 9c down to 7c; stocks very light in our market. Extracted honey, 5 to 6c. Beeswax, 24 to 28c.

Gleanings at Half Price,

—or, Two Papers for the Price of One.

We have made arrangements whereby, for a limited time, we can send either the Farm Journal, published at Philadelphia, or the Poultry-Keeper, published at Parkesburg, Pa., both fifty-cent monthlies, and the very best in their line, with **Gleanings in Bee-Culture**, to a new or old subscriber, both for one year. But the conditions of this offer are that the money [\$1.00] shall be sent in advance, and that all arrearages to Gleanings, if any, shall be squared up.

The Ohio Farmer and Gleanings in Bee-Culture both for One Year for \$1.10.

We will send the Ohio Farmer, a dollar weekly, one of the leading agricultural papers of the United States, and Gleanings in Bee-Culture, both for one year, to a new or old subscriber, for \$1.10, paid in advance, and all arrearages to Gleanings, if any, squared up.

The Farm Journal is now in its 21st year, and takes the lead among all the low-priced agricultural papers. It is packed full of practical hints and suggestions; pulls no swindles, and inserts no humbug advertisements.

The Ohio Farmer is a larger paper, and is issued weekly, and is one out of a few really good farm papers.

The Poultry-Keeper is monthly, edited by P. H. Jacobs, and published at Parkesburg, Pa. It has a lined cover in two colors, and is beautifully gotten up.

Remember that, in order to secure any one of these three papers, in combination with Gleanings, the money must be paid in advance, and arrears to Gleanings, if any, squared up. These offers are very low, and will be withdrawn soon.

Moving Bees to the Basswood Bloom.

BY G. M. DOOLITTLE.

A correspondent writes me that he wishes to fix during the winter, for moving his bees some 10 or 12 miles to where there is plenty of basswood timber, he having none nearer than that to his bees, hoping thereby to receive a larger amount of honey from his apiary than he would by allowing it to remain in one place, as he has formerly done; and he wishes me to tell through the columns of the American Bee Journal what I think of the idea. He also wants to know if there are any seasons when basswood blossoms in profusion, when there is no nectar secreted in the blossoms; and finally asks if the blossom-buds are not formed on the trees a little previous to the time of their opening, so that he can tell whether there will be enough prospect of bloom to pay him for moving his bees.

I have often wondered why more people did not think of moving their bees to the basswood flow, when they were so situated that such flow was beyond the range of their bees' flight, for I can see nothing against such a course, except the expense. From the experience of the last 30 years, I believe basswood to be one of the greatest honey-producers in the world, if not the greatest. I have secured a yield of 22 pounds of honey a day from it for three days, and reports of 20, 15 and 10 pounds daily have frequently been reported from this source during a series of days, while this beautiful tree was in blossom. If I mistake not, no such yields have been reported for any length of time from any other honey-producing plant or tree, altho there may have been reports of 20 pounds from other sources for a single day.

Where bees can be moved to the basswood and returned, at an expense of \$1.00 per colony, it will be seen that 10 pounds of honey from each colony will pay the cost, counting honey at a reasonable figure, if they should secure that surplus in sections. By going back over my diary, kept during the time I have kept bees, beginning with the year 1869, I find that my average from basswood has been not far from 45 pounds of comb honey per colony each year. So if we call 45 pounds what we may expect one year with another from basswood, and if it costs 10 pounds of that for moving the bees to the basswood, we shall have 35 pounds left for profit; or calling the honey at 10 cents per pound, as above, it would give us \$3.50 per colony as clear money on each colony, over what we should have had if we had not moved them. Thus we see, if we move 100 colonies we shall have \$350 free of all expense for our undertaking, which is no small or mean sum.

Taking up the next part of the matter presented by our correspondent, I will say that I never knew a season when basswood did not furnish some honey. The shortest season that I ever knew gave a three days' yield, in which honey was so plentiful that the bees could not prepare room fast enough to store it, with a gradual tapering off of two days more,

making five days in all. The longest gave a yield of 25 days, with three of them so cold that the bees could not work, except a little in the middle of the day. The State of the atmosphere has much to do with the secretion of nectar in the basswood flowers. The most unfavorable weather is a cold, rainy, cloudy spell, with the wind from west to northeast. If basswood came at a time of year when we were liable to have much of such weather, there might be such a thing as an entire failure of honey from it. But, as a rule, we have very little such weather at this time of year.

The condition the most favorable for a large yield of nectar is when the weather is very warm and the air filled with electricity. At times when showers pass all around, with a great display of lightning, yet no rain falls in our immediate vicinity, the honey will almost drop from the blossoms; and even when light showers are present nearly every day, I have known bees to store honey very fast. At these times of greatest yield I have seen nectar in the blossoms after they have fallen to the ground, so that it sparkled in the morning sunshine.

Then, this nectar is nearly the consistency of honey, and not like sweetened water, as in clover, teasel, buckwheat, etc., which makes basswood doubly valuable over most other honey-secreting plants and trees. One bee-load of nectar from bass-

Prof. Lawrence Bruner.—See page 772.

wood in a dry, warm time is equal to three from white clover or buckwheat, or five from teasel, and some of the other honey-producing flowers. I have taken two or three stems of basswood blossoms, when the yield was great, and jarred them over the palm of my hand, when I could turn two or three drops of nice honey out of the hand.

All of these things point toward a success in moving bees to a basswood locality, above what it would be to try to do the same when other blossoms were to be the source from which honey was to be secured.

Replying to the last question, I will say that the fruit-buds and leaflets of all trees with which I am familiar are formed in June and July of the preceding year; so the result of next year's honey-yield, so far as buds and flowers are con-

cerned, is assured nearly or quite a year previous to their expanding. After being formed they remain dormant till the warmth of the next spring brings this dormant life into growth. As soon as the buds unfold, the latter part of May, then we can see and know whether we should move the bees or not.

By examining closely, as soon as the buds unfold so that we can see the miniature leaves, we can find the bunch of basswood buds at the base of each tiny leaf, curled up and looking very much like a small, fuzzy worm. With each week this bunch of buds grows, until at the end of about seven weeks from the time the trees put on their green in the spring, they open their flowers, filled with nectar to invite the bees to a sumptuous feast.

Of course, a cool season will retard the time of blossoming a little, and a hot season advance it; but the above is the rule.

Thus the practical eye can tell nearly two months in advance as to the promise for a yield of basswood honey, as far as blossoms are concerned; and no bee-keeper should consider that he has gone beyond the stage of "swaddling clothes" till he is familiar with all of these things, the knowledge of which goes to make up the "full statured" man or woman in this fascinating pursuit. Onondaga Co., N. Y.

Rendering Wax from Honey-Cappings.

BY J. K. DARLING.

I have read the question by "Jamaica," on page 725, also Dr. Miller's reply, and it appears to me that I might help a little with these difficulties. As Dr. Miller says, I believe a large solar extractor would suit better than anything else, but that is not quite enough to get *all* the wax, altho it will take out the wax as clean or cleaner than any other process I know of without applying pressure.

If "Jamaica" will get a properly-constructed solar extractor and manage it rightly, he will not be bothered very much with flying bees, and will obtain a good grade of honey that some of his customers will prefer to that taken with the honey extractor, for altho it may be perceptibly darker, it is very heavy in body, and of good flavor; and he will also obtain a grade of wax that he need not be afraid or ashamed to place in competition at any of the fairs, and no need to remelt or clarify it, either, as the extractor "is so constructed that it will at one operation effectually separate wax, honey and refuse," and there is no need for the honey and wax to go "into the first receptacle until it is filled, and overflows into the second, and that into the third, and so on," as there is only one pan for both honey and wax in which they separate themselves. The refuse never gets there. I have one that I made for myself, modified after the style of one known as the "Alpaugh Extractor," and I would not take \$25 for it, if I could not make or buy another.

I am not bothered with too much heat here on the 45th parallel, but on the contrary I am bothered at times because I do not have heat enough, altho the lid is double glass, $\frac{1}{2}$ inch space.

If one wishes to save *all* the wax, it will be necessary to have some kind of a press to take the wax out of the refuse, as I do not believe that any steam extractor, or solar extractor, or hot water process, will take the wax *all* out of the refuse without pressure. I believe that one of our most wide-awake and progressive bee-keepers, Mr. F. A. Gemmill, has constructed a press that as an adjunct to the solar extractor will leave little to be desired, and it does not work inside a vessel containing hot water, either, if I understand the description.

I may say that my first prize wax for the last two seasons was from the solar wax extractor without remelting, and I did not see any better at the Industrial Exposition at Toronto, or the Central Canada at Ottawa.

Lanark, Co., Ont., Canada.

No. 5.—The Care of Bees for Wintering.

BY C. P. DADANT.

I believe the question of shelter, in out-door wintering, is of more importance than generally believed. Tho it is true that in some instances, colonies have been known to winter safely, when exposed to the fierceness of the winds, these exceptions, instead of weakening the rule, can only strengthen it, for it will always be found that the circumstances otherwise were most favorable, where the results were so unexpectedly good.

In a natural state, the bees which are hived in hollow

trees can hardly be used as a safe criterion, for we have no manner of knowing how many or how few such colonies winter safely in this climate, but even if it could be proven that they generally succeed, the fact that their abode is usually at only a short distance from the ground, and in thick timber, where the force of the wind is lightly felt, and the additional fact that the body of the trunk which they inhabit is very thick, much thicker than our improved hives, would still indicate that some shelter is advisable. The straw hives formerly used by the old apiarists of Europe were certainly very good abodes, as far as winter protection was considered; for they were very thick, and the material used is one of the best non-conductors of heat or cold. But it is out of the question to make such hives to-day, or at least to put them in use in a practical way; so we must see what we can do with the ordinary movable-frame hives.

Double-wall hives are very good for winter, especially when they have a dead-air space between the two walls. They are exposed to two weighty objections. The first is that, in the warm days, or in early spring, they are not readily and quickly warmed by the first rays of sunshine, and the bees in them will be less readily induced to take a flight. The other defect is their cost. Few bee-keepers will adopt them because of the expense involved in the purchase of such hives. This objection should have no weight with a practical man, who will readily figure that the first cost of a hive is a trifle, when he considers the time of its usefulness, which may be reckoned, if the hive is well made and well painted, not less than 30 years. But, since most of our apiarists have only single-walled hives, it is useless to spend much time in the consideration of anything else.

A bee-house, if properly made, built as a shed, with a roof and three sides closed for winter, would be an ideal wintering-place, especially if the front could also be closed during stormy days, and the hives more or less packed in straw, leaves, etc. But a bee-house for a large apiary is almost out of the question, and it is only in small apiaries, or in cities, that they are used.

A tight board fence is a good shelter, as far as it goes, especially if on the north side of the apiary. A movable outer covering, made so as to fit over the hive, and arranged so it may be taken to pieces and piled away for summer is very good. It may be made of rough boards, or of thin lumber, to be more easily handled when removed. But it must be so arranged as to permit of the bees' flight during warm days, as said before.

It would be a big error to place the bees in any repository, or to cover them with any shelter which prevents their flight, unless the temperature of such repository is kept evenly at the point which would enable them to remain inactive with the smallest possible consumption of stores. That is why the placing of bees in garrets, or enclosed sheds, where they are certainly warmer than out-of-doors, but where the temperature nevertheless falls much below the freezing point, or rises, in warm days, so as to make them restless, has always been an entire failure.

Our method, which is perhaps not the best of all, but which has always given us very good results, is to place around each hive, on all sides but the front, a packing of forest leaves, held in place with a sort of lattice work made of plasterers' laths and strong twine. The laths are cut in two, so as to make about the height of the hive. The leaves used are found right in the apiary, and simply raked together; and when they are thus closely folded around the hive they give it a very cosy and comfortable appearance, especially when the cold winds blow. The front being left uncovered, the bees can take advantage of any sunshine to take flight, and no particular attention need be given them, except to see that the consecutive thawing and freezing of the snow does not close the entrance and prevent the circulation of air.

A shelter of loose snow, as I said before, is a very good shelter until it begins to thaw, when it is objectionable, especially if the thawing snow fastens to the hive, and refrigerates it, so to speak, by the natural absorption of heat to change to water.

In the hive, over the frames, we always use a straw-mat made of coarse straw, or slough-grass. This, with a cap full of leaves, allows the moisture arising from the bees to readily escape without any deprivation of heat; and places them in the very best possible condition at least possible cost.

The use of leaves as shelter was suggested to us by the oft-repeated remark that leaves are very good to keep the ground from freezing. Any one who has had to dig the ground in the timber in cold weather has noticed how little the ground freezes under a plentiful coat of leaves.

In another article I will examine the question of cellar-wintering. Hancock Co., Ill.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

SECOND DAY—AFTERNOON SESSION.

[Continued from page 757.]

SELECTING TIME AND PLACE OF NEXT MEETING.

"Wouldn't it be a good plan to have our next meeting in Philadelphia, at the time of the next G. A. R. meeting?"

Dr. Mason—The constitution puts the time and place of holding these meetings into the hands of the Executive Committee.

Dr. Miller—I move that we request the Executive Committee to appoint the next meeting in Philadelphia, during the G. A. R. meeting.

A letter was read, signed by Arthur Williams, Secretary of the Denver Chamber of Commerce, inviting the Union to hold its next meeting in Denver, Colo. Also, a letter was read from the Citizens' Business League of Milwaukee, Wis., requesting that the next meeting of the Union be held in that city.

Dr. Miller—I renew my motion that the Executive Committee be requested to appoint the place of the next meeting at Philadelphia, during the next G. A. R. meeting. I may say that I am more in favor of meeting at Denver than at any other place in the Union. There are personal reasons for my preference, but I don't believe it is the best thing for the Union. I believe that the one thing to be considered above all others in selecting our place of meeting is the question of railroad rates. I believe that the best thing we can do is to follow the Grand Army. We are then sure of getting low rates, and we cannot be sure of them in any other way.

Dr. Miller's motion was seconded by Dr. Mason.

Mr. Stilson—We have no written invitation from the people of Philadelphia to follow the Grand Army to that place. I don't like the idea of following around as a side-show with those big meetings; therefore, I move to substitute the word Denver instead of Philadelphia. I think with the aid of the Denver Chamber of Commerce we will get as good rates as we can East.

Dr. Miller—May I ask if as good rates were secured this year to the West as would have been secured to Cincinnati?

Dr. Mason—Not by a considerable. I do not see why we cannot hold the meeting in the East, and save bringing the members over all the roads they would have to travel in coming to the West.

Mr. Rauchfuss—We have a lot of bee-keepers in the West.

Dr. Mason—If you could see the letters I have received from those who could not be here because the railroad rates prohibited it, you would think seriously of this matter of reduced rates.

E. R. Root—They have a flourishing bee-keepers' association in Philadelphia. I will guarantee that we will receive a most royal welcome from those people.

Mr. Danzenbaker—If this meeting had been held at Cincinnati this year, we would have had a larger attendance than we had last year at Buffalo. I do not prefer Philadelphia over Denver, but if the Grand Army was to meet here next year, or at Denver, I would say go with it for the sake of the reduced fare. If you want a large attendance, that is the way to get it.

Mr. Scott—I second Mr. Stilson's amendment. I will say that I don't think any people in the United States can extend a more hearty invitation than the people of Denver.

Dr. Miller—These Westerners are aggressive, and they fight to the last minute to have things come their way; but if you simply wipe that all aside, they will take it in good part and come around all right. I don't believe in giving way to them on this matter—not an inch. If you follow the Grand Army, you get the rates and get the attendance, and that is the whole story.

Mr. Stilson—Since you went to Lincoln two years ago, I have heard no kicking about your hotel rates and the accommodations you received there; but ever since you went to Buffalo, following the Grand Army, I have heard every last man telling what poor accommodations he had and what he had to pay for them.

Dr. Miller—We were never treated better than we were in Lincoln; but that is not exactly the question now.

Mr. Rauchfuss—So far as rates are concerned for Denver, I could assure you low rates from the Missouri river; but I could not assure you anything beyond the Missouri. During the first part of October we have our Mountain and Plains festival, and from all Missouri river points we have very low rates.

E. R. Root—We have been in the West three times lately—once at St. Joseph, once at Lincoln, and here; and to go next year to Denver it seems to me would hardly be fair to the East. We haven't been in the extreme East since we were in Washington, in 1892. It would be nothing more than fair to show our appreciation of the Eastern bee-keepers. The matter of rates is an important thing. We had a very large convention, and a very good convention at Buffalo.

A vote upon the amendment of Mr. Stilson to the original motion, substituting Denver for Philadelphia, resulted: Yeas, 19; nays 15.

Pres. York—We will now proceed to vote upon the original motion, as amended.

Dr. Miller—The question now is on the original motion. You will understand very clearly that wherever the meetings are held, there will be a majority of the people of that region in attendance. At one time we had a very earnest discussion over the matter of the place of meeting. The matter was in very much the same condition as it is here, and I said at that time, "If you want to kill the association, and have it become merely a local organization, do just what you are doing; but if you want to have it continue as something that belongs to the United States, then you must treat other localities fairly." The majority of those who are here probably found it more convenient to come here than they would have found it to go somewhere else, but because you have the thing in your hands, if you vote to have the meeting held in the West again next year, you might as well kill it. As I said before, personally, I want to go to Denver, and I would give \$5 to have it at Denver to every dollar I would give to have it at Philadelphia, but I don't believe that is the thing for the Bee-keepers' Union to do.

Dr. Mason—This very thing was had in view when the constitution was gotten up. At that time we were partially pledged to go to Lincoln. At Toronto we had voted to go there, and the matter was left in the hands of the Executive Committee. If you propose to tie their hands in this way, the matter might just as well be taken out of their hands altogether. I move that this whole matter be laid upon the table.

The motion of Dr. Mason was seconded and carried.

FULL-GROWN LARVÆ IN COMBS ON TREES.

"Is it a common occurrence to find nearly full-grown larvæ in combs formed on limbs of trees?"

A Member—No.

Dr. Mason—I think it would depend on the limb—on its location and size, etc. I have had a comb built on the bottom of a hive, and it was filled with larvæ.

Prof. Bruner—This was a case where small combs were built on the limb of a tree out in the woods, and eggs had been laid and the eggs were hatched, and the larvæ were nearly full grown.

GRANULATION OF HONEY IN THE BROOD CHAMBER.

Mr. Whitcomb—Why does honey granulate in the brood-chamber, and how can it be prevented?

Dr. Mason—Last fall I was prevented from attending to my bees promptly, so that some of the surplus was left until October, too late to extract. I set the frames away and tried to extract some in the winter, but the honey had become so much granulated by that time that the extracting wasn't a success. Last spring the bees used a larger amount of honey than usual, and I thought I would try the experiment of feeding them this granulated honey. Out of about 300 pounds of honey that was mostly granulated in brood-frames, they didn't waste 5 pounds. Some way they used up all the granulated honey. I can't tell you how. The granulation was rather soft. Sometimes there would be a little that was exceedingly hard in places, but aside from that they used it up.

Prof. Lawrence Bruner, of the Nebraska State University, Lincoln, Nebr., then delivered the following address, on

The Bees in America.

I have been assigned a subject upon which, if I should follow it exactly as it reads, it would have been impossible for me to have said anything, for the simple reason that we are not equipt with sufficient literature in the library of the University of Nebraska to enable one to hunt out matter and write an historical paper on "Bees in America," if we confined ourselves to the honey-bee. While I have not prepared a paper on the lines that you probably expected, I would say that I have had considerable experience in squirming and still remaining where I was. I have been able to get some notes together on bees in America, and still not include all of America. Since meeting with you two years ago, in Lincoln, I have spent one year in South America. Now, I do not intend to speak about the bees of South America, still, South America is a part of America. Neither do I wish to include Central America or Mexico, but I shall confine myself to the bees of America north of the Mexican boundary. In speaking of the bees of America north of this boundary, I shall ignore the honey-bee entirely. I know that most of you are aware that we have other bees besides the honey-bee. As an entomologist—a student of bugs and other insects—I treat all alike. I try to know something about each kind and its mission in life.

Among the different kinds of insects that we find in America north of the Mexican boundary there are about 1,000 different kinds of bees, other than honey-bees, and on that line of bees I expect to say a few words this afternoon. These other bees visit blossoms just as the honey-bee does, and possibly for the same purpose. It is a part of their mission in life to visit flowers and select pollen from them. These 1,000 or more kinds of bees that are found in America north of the Mexican boundary are classed by entomologists into two distinct families. Those families differ one from the other in some minor characteristics which the ordinary person need not know. Suffice it to say that the members of both families are fond of sweets, and they find the best of those sweets in the blossoms of plants. It is a part of the mission of bees in life to visit the blossoms of plants, carrying pollen from one to the other, and in that manner fertilizing the blossoms.

I have often been asked as a teacher of natural history, what is the use of insects in this world? The ordinary person is apt to imagine that anything that is not directly useful to that particular person, has no use whatever in this world. There is not a thing that is created in vain, we are told, and I think that the naturalist knows this perhaps better than anybody else, for he makes it his business to follow out the life-habits and movements of these creatures in the world about him.

Some of these insects are equipt very much as the honey-bee is for gathering both nectar and pollen from the plant, and others are equipt for gathering the pollen solely, while still others are equipt for gathering the honey simply. Some of them use the pollen as food for themselves to a certain extent, but for food for their young almost entirely; some use honey and pollen combined as food for their young; some of them use honey exclusively as food for their young. These wild bees are some of them social, but most of them are solitary, or live in pairs. Some of these bees, like the bumble-bee, gather honey and store it. This honey is not used by the mature bee as food to any great extent. If we open a bumble-bee's nest, we find an aggregation of large leathery cells of which some are filled with honey and others with pollen, or a sort of yellowish, brownish paste. They use this food for their young, as the honey-bee does. They will take some pollen and mix it with honey, and have the proper food for their young. The bumble-bee is found with males and females; in some instances they have workers also, or those that do the office of workers. They are simply smaller females, perfect, and not like the workers of the honey-bee.

There is a great variation in the structure of the legs of these different bees. If you will notice these pictures [pointing to certain figures upon charts displayed before the convention] you will observe this variation. These pictures represent only a very small percentage of the variation that is found to exist in the hind legs of the bees. These variations are to serve the purpose of gathering and carrying pollen under different circumstances. Some, instead of having the legs fitted for carrying pollen, have the lower side of the abdomen furnished with a brush for carrying the pollen-grains. Some bees are without pollen-baskets. That would indicate to the entomologist that the bee is a parasite. We have parasites among bees, and they are useful in some ways. They are not useful to the bees upon which they are parasitic; neither are the parasites of the human being useful to men; still, the parasites among the bees are useful in other ways. Every one of these collects a certain amount of honey for itself in passing from one blossom to another, and carries a certain

amount of pollen with it, and therefore is engaged in the cross-fertilization of the plants.

Bees are the fertilizers of plants. As flowers are so varying in their structure, and so different in size, it becomes necessary to have insects adapted to carrying the pollen from one to another. The insects must have different forms and be of different sizes; for that reason we can see very easily why we have so many different species of bees. The genus *Andrina*—we have a representative of it here—that one genus in North America is represented by over 300 distinct species. We have one species of honey-bee in this country, and two in Asia. The species of the genus *Andrina* are usually found early in the year, when the honey-bee is not out, or in such blossoms as the honey-bee does not work. One will visit one blossom, another will visit another blossom; some visit the violet, some visit the blossoms of one tree and some another tree, and they have obtained their specific names from the plants they visit. Suppose one species works on the plum-tree; we call that *Andrina prunus*; the next would be named after the violet, on which it works, and so on. We know pretty nearly what bee fertilizes each of the wild trees. Some of these have exceedingly long tongues, and can work on clover and very deep blossoms; but few of that kind can ever work on alfalfa and red clover.

In this country we are not troubled as they were in Australia about getting the fertile seed of the clover, because we have a leaf-cutting bee. Some of the apiaries they make for themselves are made in the earth, others in wood, others in the stems of plants. Some make earthen cells and plaster them on the under sides of stones, and have them lined with leaves. If you unwrap those little bundles that are there, you will find the egg and the food, and a little later you will find the young grub or worm. These leaf-cutting bees cut out of the leaves of various kinds of plants little semi-circular pieces; hence they are called leaf-cutters. They do not gather honey, as I said before. There are probably 150 to 200 kinds of leaf-cutting bees found in America north of the Mexican boundary. Some are nearly as large as the worker bumble-bee, while others are so small that the house-fly would be large in comparison to them. All have the same general habit, but they visit different flowers. As a rule they have long tongues and visit deep blossoms. The thistle is one of the plants they visit. One genus of these leaf-cutting bees is possess of very bright colors. They have a bright, metallic, blue body, or green, or green and red, all bright metallic colors. A collection of those bees is very beautiful to look at; but to know something about their habits is much more delightful.

I cannot dwell upon each one of those genera, or each one of those groups, because we have over 50 different groups in which these wild bees are placed: some of the groups, like *Andrina*, contain 100 to 300 species each; others, like *Bombus*, contain 40 or 50 different species. Since the last talk I gave on this subject, there have been several species of bumble-bees found that are entirely new. It is a good thing that we as bee-keepers study the habits and know something about the wild bees, and know that if the honey-bee was not present in the region in which we are, nature would still be cared for and the work of nature would be carried on to a certain extent by the native bees of that region. And I want to say right here that none of our wild bees have learned to properly fertilize our fruit-trees. Our principal fruit-trees are an importation from the old world; the honey-bee is an importation from the old world, and the honey-bee has learned its work of fertilizing those fruit-trees in the old world, and knows how to do it in the new world; so we must have the honey-bee with us if we wish to have fruit.

Some of our bees are extraordinary in their make-up. The honey-bee is just an ordinary kind of a bee in its make-up, and in its general appearance. Studying these wild bees we find some in which the hind legs are excessively enlarged and much contorted. Some of those contortions might have been shown in these illustrations, but I don't happen to have them. In some the first joint of the foot is much larger than all of the leg put together, and is covered with hook spines, or long hooks or knobs of various kinds. They serve some special purpose, doubtless, which does not exist in the case of the others whose legs are not so specialized.

There is one thing concerning the wild bees that I may be wrong about: Some one visited me and said there was a wild bee that came to his apiary every year and robbed his own bees. I said it was probably the ordinary black bee, but he said it was not, because he had both the black and Italian bees in his apiary, and knew them well; he said that the robber was a much smaller bee. I told him I didn't think any of our wild bees would be guilty of doing any such thing, that it must have been some bee that had been associated with man

for a long time to learn the habit! Now I want to ask some of you who are here, and who have had more experience, whether any of you have seen wild bees of that kind—bees of that description that came to your apiaries and carried off honey.

Mr. DeLong—Out in my country I have observed groups of small, dark-striped bees that weren't any larger than a house-fly. They were along the hedge-fences, and were in numberless swarms—sometimes thousands in a swarm. I wondered where they came from, and when I got to work extracting my honey I found a considerable number of them dead in the hives; but I didn't find them carrying away honey. When I was extracting they came and lit on the combs as I was handling them. They were little, black, slim, long fellows, with stripes around the body.

A Member—Is the yellow-jacket a bee?

Prof. Bruner—It comes pretty close to being a bee; it is one of the wasps. I was going to speak of the cuckoo-bee. What is meant by the cuckoo-bee is a parasitic bee. We have certain species among our wild bees that live upon the labors of other bees. The other bees make nests and carry a supply of pollen and honey and fill the brood-cells ready for laying their own eggs, and perhaps when there is just one more trip necessary to be made before the cell is completed and ready for receiving the egg, one of these cuckoo-bees will slip in and deposit an egg in the cell and get away before the rightful owner gets back. The bee that has constructed the nest will come back and deposit the last load of pollen and lay her egg in the same place. The cuckoo-bee's egg hatches first into a small grub, and eats the egg or the young larvae of the bee that constructed the nest, and then goes on eating the food that was provided. We have probably 150 or 200 species of these cuckoo-bees.

The bees of the one genus are parasites upon the leaf-cutting bees; on the other hand there are certain other bees that live in the nests of the *Andrena*, and that are called *Nomada*, because of their habit of wandering around and laying their eggs in other bees' nests. This habit is much like the habit of the cow-bird, which lays its eggs in other birds' nests. Cow-bird eggs have been found in the nests of over 100 other kinds of birds. The other birds sit upon and hatch the strange eggs. In this same manner the cuckoo-bees are brought up by the industrious bees of other sorts that are willing to work. These cuckoo-bees have no pollen-brushes on their legs; they are not capable of carrying pollen themselves; if they wanted to carry pollen for nests of their own, they would not be able to do it, and so they must force other bees to bring up their young.

There are a great many other things in connection with the wild bees that I might bring up, and that would no doubt be interesting to you. If I were to carry the discussion of the subject into the tropical countries, I certainly could bring up something much more interesting than could be found in this country. But time does not permit. What I should like to impress upon you as bee-keepers is this: Try to devote just a little bit of time to the study of our native bees. I think you will find that study very beneficial in carrying on further work with the hive-bee. We find that there are a great many questions in connection with our work with the honey-bee that are not settled. Many of us who might take up this line of work are too busy in other directions. I am sorry sometimes that I have not confined my time to work upon the honey-bee; but I could not be a teacher of entomology if I had done that, because the teacher of entomology must know something about other insects as well as the honey-bee. Any one who has started out to study one particular branch of natural history has usually become so intensely interested in it that he has branched out and taken up other lines as well. The naturalist, whatever part of the country he falls into, always finds something to interest him.

As I stated in the beginning of my talk, I have visited South America since I met with you last, and during that time I can assure you that not every one of my experiences was pleasant. Out of every 200 people in the Argentine Republic whom I met, I found but one who was able to talk my language, and so I had to try to speak the language of the other 199. Those people I found were not friendly to the United States, because they said we had a "Bill Dingley" up here, and they made it very disagreeable for me in every way possible. Some of them carried long knives, and if I had not been on the watch constantly they might have taken advantage of me. Those things were of course a little bit out of the line of pleasure. Still, I got out with Nature and enjoyed myself as I have never enjoyed myself before, and as I never expect to again.

In South America, while I collected insects only a couple of weeks, I think I collected something like 350 or 400 dif-

ferent kinds of wild bees, and none of those are identical with those we find in North America. I found one that builds its nest on trees down there and gathers honey. I do not know what it is. The cells in which the honey is placed are of the size of a small straw, and the honey is sour. The bee is of about the size of the house-fly, or a little smaller, and they sometimes make nests as large as a bushel basket, and the material they make the comb of is something between wax and paper. I expect to try to work out this insect and find out what it is. It has a sting. I don't think that any bee that gathers honey is stingless.

A. I. Root—A couple of our soldiers who have returned from Cuba informed me that they saw the natives getting honey from a stingless bee. They had pailfuls. They said the honey was dark-colored, almost as dark as tar. The natives were in the habit of going out into the woods and bringing in considerable quantities. They said they saw the bees at work. The cells were very much like the cells of bumblebees. The bees alighted all over them, and they brushed them off. They didn't sting at all, but of course they fought for their honey; they would bite.

Prof. Bruner—It is a peculiar fact that naturalists never run across anything of that kind themselves, when they are out looking for just such things.

A. I. Root—The men rather admitted that they did not know that the pailfuls of honey came from the nests of the stingless bees. They saw the bees and the cells.

Prof. Bruner—There is an ant down in that country that we call the honey-ant that sometimes stores a very dark honey. It is the honey from plant-lice, and it is stored. Whether that would be the stingless bee or not, I don't know.

A. I. Root—We had some specimens of stingless bees in our apiary at one time. They did not gather honey. They came from Central America.

Prof. Bruner—While we have heard a great deal about things of that kind, it is peculiar that none of the naturalists who have collected in that region have ever run across the insects themselves.

PLANT LICE, HONEY-DEW, ANTS, ETC.

E. R. Root—I would like to ask a question in regard to plant-lice. Some six or seven years ago plant-lice seemed to be quite prevalent, and during the lapse of time since we have seen little of them. During this season the plant-lice have made their appearance again, and honey-dew is scattered through a good deal of the honey. Is there any reason why they should do that?

Prof. Bruner—There are reasons, but we haven't found out what the reasons are. Usually in a wet spring and during the summer following we have those very conditions. We have comparatively little honey-flow during a wet season. During that time, and during the dry season following, the plant-lice increase much more rapidly than ordinarily, and the bees gather whatever they find, owing to the scarcity of honey.

Mr. Westcott—In our locality we have always had the honey-dew every year, but the bees don't work on it except when there is no other honey.

Mr. Hatch—Is there such a thing as honey-dew without the aphid?

Prof. Bruner—I do not think there is. The relation between ants and honey-dew is one of the most interesting things we find in the study of natural history.

Mr. Masters—During the last summer I found ants following the aphid from one tree to another.

Prof. Bruner—They were probably trying to get new feeding-grounds, for their eggs. I have known ants to carry the eggs of the aphid and store them in their own nests, and to bring them up and put them in the galleries that are built a half inch or so below the surface of the ground, where the sun could hatch the aphid's eggs. If a cold day came, the ants would carry the eggs down into the recesses of their nests. After the eggs were hatched, the aphid would be carried up and placed along the roots of various kinds of plants, and take care of them in that way, all the time getting their reward in the honey-dew which the aphid yields. They are the ants' cows. The ants milk them. Some ants have certain kinds of plant-lice that always live underneath the ground, in the ants' nests; and the ants' nests are built along the roots of certain plants—some particular kind of aster, that the aphid prefers the sap of.

Dr. Miller—There is a certain ant that sometimes will burrow into the wood of hives and utterly honey-comb it. It is dangerous, because sometimes you don't know there is anything wrong, when the whole thing is utterly ruined and gone. Can you tell us any prevention or remedy?

Prof. Bruner—The best remedy would be to make your

hive-bottom of iron. That is the termite that is so much spoken of in our books.

Dr. Miller—It is a large black ant.

Prof. Bruner—Salt will keep the black fellows away partly, but not entirely. They don't work except in rotten wood, as far as I know.

Dr. Miller—These will take sound pine wood and make burrows all through it.

Prof. Bruner—That is some ant that I don't know.

Mr. Westcott—I think kerosene will drive them entirely away. I have used it around in the apiary, and the ants would leave.

By a unanimous rising vote, the thanks of the Union were extended to Prof. Bruner for his interesting address.

The Secretary then read a paper by Mr. C. P. Dadant, of Illinois, entitled,

The Scientific Side of Apiculture.

Science is often said to be "theory," while "labor" is "practice," and many of our successful, hard-working men look down upon those whose mind is entirely turned to the scientific study of a subject without much regard for the practical side of it. The scientist is said to be "lazy," because he wastes valuable time in apparent loafing, that might be successfully employed in money-producing labor. It is true that he is always experimenting, trying new things, which fail oftener than they succeed. He spends hours, and days, and weeks, watching his bees flying in and out; he tries all sorts of hives, and never has two of the same shape; he wantonly destroys entire colonies in costly experiments; in short, he makes a "botch" of everything that he undertakes. But, after all, it is he who makes the progress, of which we take the benefit.

It was the scientific apiarist who found out that the queen was not a "king," but a mother, and that the drones were not the females, but the male bees. He discovered how the queen was reared, and how she mated, and how we could help Nature and rear queens artificially. He has taught us why a queenless colony did not succeed, and what could be done to save it.

He has discovered that the bee-moth was not the enemy of man's interest to the extent that was believed popularly, and that it was not much more to be feared than the house-fly; and he promptly showed us how to avoid its ravages among the hives.

It was he who discovered that what the bees carry home on their legs is not wax, but pollen, and that this pollen is necessary to the rearing of brood; and he has taught us how to supply this needed pollen artificially in seasons of scarcity.

It was he who discovered that comb was made out of digested honey, and not out of pollen; and that this comb is, therefore, the most expensive part of the habitation of bees. He has sought for means of returning this expensive material to the bee, after it had been melted up in an undervalued article of commerce, and he has finally succeeded in pointing to us successful methods of doing this.

It was he who found out that success in bee-culture could not be achieved until the entire hive was under the control of the apiarist; and he invented the method of having each comb hung to a separate frame, so that we might take our hives to pieces—"like a puppet-show." In this one particular alone there has probably been as much study and as many inventions, and brain-worrying trials, as on all the rest of the scientific study of bees put together.

It was the scientist, also, who ascertained and taught us that the drone is fit only for the reproductive function, and that we should avoid rearing it in large quantities; that the surplus consumed by the drones, in a state of nature, should be the share of the hard-working apiarist.

Is the work of the bee-scientist over? No, not any more in bee-culture than in electricity, or in farming. We might as well say that we have reached perfection, and that nothing more remains to be learned. To increase production by new methods, to improve our bees by selection, to breed races with longer proboscis and greater prolificness, to produce red clover with a shorter corolla, so that our bees may derive profit from its plentifulness throughout the land, are a very few of the questions of the day.

But there are probably many improvements to be made, of which we do not dream any more than we dreamed of talking to our friends at the end of a wire, 40 years ago. Progress is so sudden and so unexpected in all things that it is quite probable that the next century will reveal as much novelty and as much advancement in our line as the past century has brought forth, and we may achieve in bee-culture as wonderful things, compared to the past, as have been achieved in other channels, through the discoveries of science.

C. P. DADANT.

[Continued next week.]

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. O. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Windbreak or Shelter for Bees.

I keep my bees in a yard near the kitchen where they are always in sight. But here is the trouble: Our house is on a small elevation, and the wind is blowing most of the time in the spring and summer, and I notice it interferes with their work a great deal. If I should move them to the foot of the hill they would be out of our sight most of the time, and within a few feet of the public road. I can move them 200 yards in shelter of some trees, or build a windbreak. Which is better? I have about 50 colonies. WASHINGTON.

ANSWER.—Without being on the ground so as fully to get the lay of the land, I should vote for the shelter of the trees. It's cheaper, more likely to stay in order, and will be a shelter not only for the bees, but the trees will be a fine shelter for the bee-keeper on hot days. Any windbreak that you make to be good for cold, windy times, will be likely to be uncomfortable hot for man and bees on still, hot days in summer.

Foundation in Extracting-Frames.

1. How shall I fasten the comb foundation in the shallow extracting-frames with a groove running in the center of the underside of the top-bar?

2. Which is preferable for such frames, starters or full sheets? SUBSCRIBER.

ANSWERS.—1. Slide the edge of the foundation into the groove. If it does not go in easily, flatten the edge a little with the flat side of a case-knife, or by running a little wheel over it. A few drops of melted beeswax dropped here and there along the joint will hold it in place. A drop every two inches will be enough, providing that drop is attached to both the wood and the foundation. A spoon with the end bent together will do to drop the melted wax, but the tin spoon described not long ago in the Bee Journal is better. You can use rosin and wax instead of pure wax for fastening the foundation, and it is perhaps a little better for that purpose, but it is not advisable to use it, for when the combs come to be melted up in future years it will be better to have no rosin present.

Sometimes no wax is used, the foundation being wedged in. Two grooves are made close together. Put the foundation in one, then put the little stick that acts as a wedge in the other, crowding it in pretty tight, and the foundation will be held firmly in place.

2. Most prefer full sheets. That secures worker-comb, and makes less temptation for the queen to go up and lay. Even if an excluder is over the brood-chamber, if drone-comb is above, the workers will often hold it empty for the queen to lay.

Reliquefying Granulated Honey—Queen-Rearing

I saw an article in the Bee Journal about reliquefying honey after it is granulated. How is it done? We have been handling bees only about 18 months, and we are anxious to get all the light on the subject that we can. My husband is a railroad conductor, and the bee-business is mine to attend to. I take a great interest in the bees. I hive swarms and handle them all the time. We have 18 colonies, and take quite a lot of bee-literature, and try to inform ourselves, but I think experience is a good thing to mix along with book-learning. Then, I like good advice, too. Let me hear from you about the granulated honey, and about queen-rearing, and any good points that beginners ought to know. TEXAS.

ANSWER.—If you want to liquefy your granulated honey, all you need to do is to heat it till it melts. But like most things, there's a wrong and a right way to melt it. Heat it till it boils and it's ruined. Better not let it get above 150°. But you may not be able to tell easily just how hot it is, so you may take some plan by which you are pretty sure it will not get too hot without using a thermometer. Set it on the reservoir on the back of the cook-stove, and let it stay there till it melts clear. All the better if it takes several days. Another

way is to set on the back of the stove a kettle or pan in which you can set the vessel that contains the honey. Set the outside vessel on the back of the stove and put on the bottom of it a bit of shingle or thin board and set on this the vessel of honey. Now fill up the outside vessel with hot water. The bit of board prevents the bottom of the honey from burning, and it will melt slowly.

The latter part of your question is one that it would take a great many pages to answer. Indeed, after an entire book has been written to try to give the points that a beginner ought to know, there are always enough questions to keep this department well filled. Even in the matter of queen-rearing alone a whole book has been written, and a most excellent one it is. If you are interested in queen-rearing by all means get the book on queen-rearing by that prince of queen-breeders, G. M. Doolittle.

Laying Workers.

I have two colonies of bees that I think have laying workers. The sealed brood looks like loaded pistol cartridges. What can I do with them? I want to save them. S. C.

ANSWER.—That's a hard question to answer, because you will probably not be willing to accept the best answer that can be given. The best thing is to destroy them. There isn't a ghost of a chance that they'll be worth anything next spring, and very little chance that any of the bees will be alive then. The probability is that no worker-brood has been present for a good while, and all the workers are aged. It may suit you better to unite them with another colony, for then you will seem to be saving their lives. But in either case, if you allow them to live, they will only consume a lot of honey and die after all.

Wants Increase Next Spring.

1. I have about 50 colonies and I want to increase my apiary in the spring about 30 colonies. Would it be better to buy Italians in nuclei and have them shipped to me, or buy black bees at home for \$2.50 to \$3.00 per colony, and transfer and Italianize at my own expense? The honey-flow commences here from sweet clover about July 10, but there is always plenty of honey coming in to keep them building up, before that time.

2. Would a 2-frame nucleus and queen be strong enough?

3. When would the best time be to purchase them so they would be ready for the harvest? WASHINGTON.

ANSWERS.—1. Probably you'll do better to buy the blacks and Italianize. You'll get ahead in increase faster in that way, and if you intend to keep Italian blood it will give you just so much more experience in introducing queens, for you'll find you will have considerable to do in that line if you try to keep anywhere near pure blood. You might combine the two plans, getting one or two nuclei, and the rest black bees.

2. A 2-frame nucleus, having a fair start in the season, will build up into a strong colony in a fair season, but you can hardly count on any surplus from it unless the season is extraordinary.

3. The year before.

Wintering—Queen's Laying—Uniting.

1. Will bees get along better through the winter in a hive that is perfectly air-tight all around (except the entrance) than in a hive that is slightly open, either around the cover or bottom-board?

2. How many months in a year should a good Italian queen be laying? and is it advantageous that she be laying late in the fall?

3. What is the advantage in uniting two fair colonies in the fall? WASHINGTON.

ANSWERS.—1. In ordinary cases, with ordinary entrance, they might be better off not to have all but the entrance perfectly air-tight. With a very large entrance, probably the closer the rest of the hive the better.

2. She may lay somewhere from 7 to 9 months. Under ordinary circumstances, the question as to whether it is advantageous to have a queen laying late in the fall should be answered in the affirmative. It is generally considered a desirable thing to have a goodly number of bees not too old to enter winter quarters, and late laying works toward this end. But if there is no yield of honey in the fall, it may be as well that she stop laying, as she generally does, earlier than if honey was yielding. For the period at which bees finish their

course does not depend so much upon the number of days they have lived as upon the number of days they have worked. So it may happen that a bee that emerged in August may be younger than one in a second locality emerging in September, providing the yield in the second locality continued 2 months' later than that in the first.

3. Probably none, generally speaking. If you have more bees than you want, and must unite to keep down increase, it may be better to unite in the fall than in the following spring, for the united colony will consume less honey than the two would if left separate.

Will It Winter?—Stimulative Feeding.

1. Will a colony winter that covers both sides of three frames half way down, packed in leaves with plenty of honey? They are on frames of standard size, and had little brood Oct. 4.

2. If feeding stimulates brood-rearing in spring, how early, and how much, would you feed? Fruit blooms here about May 20; clover blooms about June 10. MASS.

ANSWERS.—1. Can't say for certain. Doubtful. It would be safer in a good cellar.

2. Try it only on part, and find out whether stimulative feeding is a good thing for you. Feed only when warm enough for bees to fly. Don't feed when it is so cold that the bees will be chilled to death when the feeding starts them to flying out. A half pound a day will be enough, unless they are somewhat short of stores.

Stimulative Feeding in the Spring.

I have four colonies and wish to increase largely in the spring, by stimulative feeding. When will it be best to commence feeding? Also, how much honey and water would you feed one colony per day? Do you dilute the honey with water? How do you feed it? SUBSCRIBER.

ANSWER.—Stimulative feeding in spring is a little like handling edged tools. Some judgment and experience is needed, or you'll do a good deal more harm than good. Indeed, there are many good bee-keepers who do not consider it advisable to practice stimulative feeding. Don't feed until bees are flying freely, for when it is too cold for safe flight, feeding may cause the bees to fly out never to return. Possibly it might be a good plan for you to try stimulative feeding on part of your colonies and compare results. An equal quantity of water may be added to the honey, and half a pint to a pint of the mixture given daily to a colony. Use any kind of a feeder you have on hand. Look out, however, that you don't start robbing. As soon as you find there are flowers for the bees to work on, you may as well stop till there is again a scarcity. Such scarcity occurs in many places between fruit-bloom and white clover.

Bee-Keeping for Beginners is the title of a 110-page book just out, from the pen of that expert bee-keeper of the South, Dr. J. P. H. Brown, of Georgia. It claims to be "a practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit." Price of the book, postpaid, 50 cents. Or, we will club it with the Bee Journal for one year—both together for \$1.40; or, we will mail it as a premium to any of our present subscribers for sending us one new subscriber to the Bee Journal for a year (at \$1.00), and 10 cents extra.

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

The Names and Addresses of all your bee friends, who are not now taking the Bee Journal, are wanted at this office. Send them in, please, when sample copies will be mailed to them. Then you can secure their subscriptions, and earn some of the premiums we are offering. The next few months will be just the time to easily get new subscribers. Try it earnestly, at least.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitecomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. DECEMBER 8, 1898. NO. 49.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Chicago Bee-Keepers' Association

met Dec. 1, as was announced. There were present about 40 people interested in bee-keeping. Some 35 of them became members of the organization, which now quite rivals that of Philadelphia in numbers, tho the latter is perhaps 15 or 20 years older. It is thought by some that there are over 200 bee-keepers in this (Cook) county. We hope that all of them will send in their 50 cents, and become members. Their membership fee can be mailed or handed to us, and we will see that it gets to the Treasurer.

The officers elected for the ensuing year are: President, C. Beers; Vice-President, Mrs. N. L. Stow; and Secretary and Treasurer, Herman F. Moore.

As a shorthand report of the proceedings was taken for the American Bee Journal, our readers may look for it after the completion of the Omaha convention report, now appearing, which will be about the middle of next month.

Bee-Literature Without Bee-Knowledge.

—That scribblers who know nothing about bees should constantly appear in print with statements that bring a smile to the face of a practical bee-keeper is nothing strange, but it does seem strange that reputable publications that really care for the truth should allow in their columns matter about bees so crude that it would hardly be suffered in relation to any other topic. That very able and reliable paper, The Youth's Companion, has a serial in its September numbers called "The Story of a Bee-Farm," that is notable for the very little information about bees, and the remarkable character of much that is given. A few samples may be given:

Bees don't sting after you learn to handle them, but for

the first few seasons you must wear veil and thick gloves. Nuclei are called "nucleus swarms," and colonies are called "colony swarms." Italians gather honey from many flowers which native bees neglect. A good place to winter bees is a room above ground with an oil-stove to raise the temperature to 40° during cold snaps. "Never throw hot water at the robbers—that is barbarous and unscientific." (Probably that is the first time hot water for robbers was ever thought of.) A cloudy and damp afternoon, when most of the bees are in the hives, is especially favorable to begin Italianizing. Queens, not colonies, are "trausferred." The expert operator of the story workt every day of the season with her own bees with bare hands and arms, and was never stung once, but put on veil and gloves when essaying to handle bees away from home, because *the bees were strangers to her!* The story winds up by saying:

"At the present date of writing, January, we have 40 hives of bees in our dormitory. They are all wintering well, so far as can now be determined, and the outlook is that we can gain a comfortable livelihood keeping bees, even at the present low price for honey."

There ought to be a lively demand for a brand of bees, 40 "hives" of which would support a family!

What Credit Costs.—In the National Stockman and Farmer of recent date we found this paragraph:

"Did you ever think of how very expensive a luxury credit is? It doubles the expense of book-keeping, doubles correspondence, multiplies worry many times over, often destroys confidence, wrecks business galore, and makes mischief of all kinds without limit. More than all, many of these things enter into the cost of nearly everything which is bought and sold, and even the cash buyer, with all his discounts off, pays enhanced prices because of the cost of other people's credit. Imagine the world running a month without the credit system! Next to the millenium it would do more to create and maintain general happiness than any other condition that could be introduced."

Every word of it is true. And so is the advice of the man who said, "Pay as you go, or else don't go." How much more pleasant it would be to do business if every one would get cash and pay cash. If we could get all the money past due on subscriptions alone, we could not only pay cash promptly right along, but could get up a much better bee-paper than the American Bee Journal is now.

Why wouldn't it be a good plan for our subscribers to begin at once to keep their subscriptions paid in advance? It is a splendid feeling to have—the feeling that your financial obligations are all met. We'd like to enjoy that feeling once more, and might soon do so if all who owe us could see their way clear to send it in.

Killed by Eating Wax is the rather bold heading of this item, which appeared in a recent issue of the Minneapolis Tribune:

"Carl Maynard, son of M. M. Maynard, a fruit-grower, died Thursday morning of a very peculiar malady. The young man had been eating very heartily of honey in the comb, and the large amount of beeswax he ate clogged up his stomach and intestines to such an extent that sickness and death resulted in spite of all efforts of the doctors to save him. Mr. Maynard was about 26 years of age, and workt on his father's farm."

Mr. John M. Seller, one of our regular subscribers, sent us the foregoing, and added these words:

"I know the father, but did not know the son. Three of them ate a one-pound section of honey."

It is just possible that eating the honey had a little to do with the case, but the probability is that it had nothing whatever to do with it. For three men to swallow the wax contained in a pound section of honey is a matter not at all remarkable. One man might swallow that much wax any day,

or for that matter every day, and suffer no inconvenience from it. The wax would be in small pieces, and produce no bad effects. Suppose the worst possible case, that in eating the pound section one of the three men got more than his share and got all the wax, and suppose that by some means it got worked into a solid ball, it would be about an inch in diameter, and could pass through in that form without clogging either stomach or intestines.

We think no one need stop eating comb honey on account of the above instance, for in all probability there were other complications besides the little wax that conspired to cause the death of the young man.

We believe we never before heard of three persons eating a pound section of honey at one sitting. Of course it may be easily done, but why should any one want to fill up with so much sweetness all at once? People ought to use common-sense in eating as well as in anything else.

Large Hives Abroad.—In *Gleanings*, C. P. Dant gives an interesting sketch of the introduction of large hives into France, Switzerland, Italy, Belgium, etc. This was accomplished chiefly by the elder Dadant, altho he was living in America. Of course it was through writings in the bee-papers. L'Apiculteur, at that time the leading journal in the French language, was bitter in its opposition of large hives, and also of movable-frame hives. Mr. Dadant sent a translation of a report given by A. I. Root in the *American Bee Journal* for 1868, page 64. By giving extra stories and extracting frequently, Mr. Root had taken 203 pounds of honey up to July 21. The easy reply of the French editor was that the whole thing was a hoax. This will not be so hard to understand when it is remembered that the Europeans at that time used hives smaller than the S-frame Langstroth, and Bastian wrote that there was no necessity for a super containing more than 6 to 12 pounds of honey. Later, M. Bertrand started *Revue Internationale*, and slowly but surely new methods took the place of the old ones, and to-day large hives are the rule. The editor of *Gleanings* is strong in the belief that large hives and large colonies, the two together, are the things for producing honey.

MISS MATHILDA CANDLER, of Grant Co., Wis., called on us last week. She has had a fair honey crop this year, and has 60 colonies now, in good condition for winter.

MR. FRANK MCNAY and wife left last week for Southern California, where they expect to spend the winter. Mr. M. called to see us when passing through Chicago. We trust they will have a pleasant winter, and we commend them to the California bee-keepers.

MR. JOHN A. BLOCHER, of McLean Co., Ill., wrote us Nov. 25:

"The Bee Journal is all right, and I like to read it. It helps me out in a good many things. My bees did well this season, considering."

MR. GED. W. HUFSTEDLER, perhaps the most prominent queen-breeder in Bee Co., Tex., writing us Nov. 25, said:

"We are having some real winter weather here. My bees are in fine shape for next season—about 225 colonies after doubling up for winter."

DR. C. C. MILLER, of McHenry Co., Ill., attended the regular quarterly meeting of the Chicago Bee-Keepers' Association, Dec. 1. He was feeling fairly well, or as well as could

be expected at his age—67 years. But his heart is just as young as when it first began to "beat its way" in this world. Dr. M. is very hopeful that next year may be a good honey season. This year he harvested about 1,000 pounds of honey—good, bad and indifferent. He had nearly 300 colonies, run for comb honey.

MR. W. A. CRANDALL, of St. Lawrence Co., N. Y., writing Nov. 26, said:

"I can hardly wait until the *American Bee Journal* gets here each week. I feel like thanking all the correspondents for the many good things."

MR. M. H. MENDLESON, of Ventura Co., Calif., writing us Nov. 22, had this to say:

"It is still dry here, and some are crying 'dry year again.' I do not expect early rains, but I hope for a rainy winter. I wish you continued success."

MR. M. M. BALDRIDGE, of St. Charles Co., Ill., made us a pleasant call Tuesday, Nov. 29. Altho living only about 40 miles from Chicago, he has not been here for a year. Mr. B. still gets from consumers his old price of \$1.20 for a 5-pound pail of honey, as shown by his pocket order-book. His crop was about nothing the past year, in common with many other bee-keepers.

MR. A. P. RAYMOND, of Clark Co., Wis., called to see us last week. Years ago he was an extensive bee-keeper in New York State, but for some years he has been a traveling man. He expects very soon to engage in bee-keeping again. He will succeed. He is a fluent writer, and we trust we will have the pleasure of hearing from him frequently when he once more enters the field of bee-keeping.

MR. J. F. MOORE, of Seneca Co., Ohio (a brother of Mr. H. F. Moore, Secretary of the Chicago Bee-Keepers' Association), called last Friday. He has about 250 colonies of bees, but secured only a small crop the past season, like the great majority of bee-keepers this year. Mr. Moore is a very pleasant gentleman to meet. It would have been a fine thing if he could have attended the Chicago meeting of bee-keepers had he been here a day sooner.

Cotton as a Honey-Plant.—H. H. Hyde says, in the *Southland Queen*, that cotton is his main honey-plant in July and August, giving a long and continuous, slow flow, usually producing a good crop, of fine flavor.

Swarms Leaving with Strange Virgin Queens that unite with the swarms after issuing are spoken of sometimes as making trouble when queens are clipped. J. B. Hall says, in the *Canadian Bee Journal*, it is a mistake to suppose such a thing. A swarm that issues leaving its clipped queen may go off with a strange laying queen, but not with a strange virgin. In such supposed cases a virgin queen issues from the hive together with the laying queen.

Bee-Hives are discussed by W. Z. Hutchinson in the *Country Gentleman*. He advocates small hives, less rather than more than an ordinary queen will fill in the height of the breeding season, eight Langstroth frames being sufficient; prefers an outer case with temporary packing to chaff hives; thinks the Heddon the best hive and the dovetailed next; says closed-end frames can be handled more rapidly than open-end ones; and thinks the honey-board will hold its own against wide, deep top-bars.

Getting Bees Off Extracting-Combs.—Bees leave capped combs more readily than uncapped ones—an extra point in favor of leaving combs to be capped, according to J. R. Jasek, in *Southland Queen*. He takes off the super without taking out the frames, but he doesn't use bee-escapes. Too many bees remain, even if the escape is put on the evening before, sometimes ants take possession after bees are scarce in the super, and sometimes the combs melt down in the hot sun. He has a

good volume of smoke, doesn't blow any in the entrance, but blows under the cover as soon as raised, and keeps blowing over and between frames all the while he is putting the cover aside and loosening the super. Then he quickly sets the super on a wheelbarrow, covering with a robber-cloth. The whole operation is done in two minutes if the combs are all sealed, longer if the cells are unsealed. The combs are taken on the wheelbarrow to the honey-house, and the bees remaining on them fly to the escape window, a few young ones being brushed on some extracting-combs.

Experience on too Small or Large a Scale.—Editor Hutchinson has advised trying new things only on a small scale. Dadant and Heddon object that you can't tell much by too small experiments. Editor H. says there are two sides to the question, and gives the sensible rule: "It is not advisable to adopt a new plan or invention, about which there is any doubt, upon a larger scale than that upon which you can afford to meet with failure.—Bee-Keepers' Review.

Southern Honey.—The editor of the American Bee-Keeper enters a protest against some statements made at the Omaha convention relative to Southern honey. E. R. Root said: "Southern honey has a strong flavor which is liked by some." Mr. Hill thinks the elder Root was nearer the mark when he said, "Most localities yield both good and poor honey." Mr. Whitcomb is asked for proof of his assertion that a warm climate produces honey of inferior quality, and a colder climate honey of much better flavor. C. F. Muth is quoted as including in the three choicest varieties of American honey, two that are Southern.

Much Depends on How a Thing is Said.—The editor of the Bee-Keepers' Review says there are different ways of telling what one knows. "Knowledge, of the accuracy of which one is absolutely positive, if imparted with an air of superiority, often arouses resentment instead of gratitude. To be able to point out the ignorance or fallacious ideas of a friend with such tact that he seems to have discovered them himself; to start in his mind a train of reasoning that will lead him to a correct conclusion; to thus bring out the best that is in him, is an accomplishment worthy of great effort. One can be positive and outspoken, and yet courteous." True words, and well said.

Full Sheets of Foundation in Sections were discussed in the Canadian convention. Messrs. Best and Post thought full sheets secured twice as much honey as small starters. Mr. Sparling and Mr. Holtermann thought not so much as double,

and Mr. McEvoy thought three times as much. Messrs. Hall and Hoshall had tried, in the same super, sections filled with foundation and sections with a narrow strip. The former were solidly sealed while the latter were half full of comb with no sealing at all. Messrs. Holtermann and Newton argued a better price for the better appearance of sections as full of foundation as possible without bulging.—Canadian Bee Journal.

Are Separators Indispensable?—H. R. Boardman in his travels through Michigan, as he relates in the Bee-Keepers' Review, was surprised to find that so many progressive, practical men had dispensed with separators. He thinks thoughtful and careful apiarists may dispense with them, but the editor thinks it is more a matter of locality. Separators are needed where the flow is slow, or comes on slowly. In Michigan the flow from clover or linden comes suddenly, the bees commence on all sections, all grow alike and are like so many bricks. But he would use separators in a place where many bulged combs would be built without them.

From the Egg to the Bee.—Fr. Greiner reports some observations in Gleanings. He watched through a glass wall, a colony with four frames in very hot weather, and at no time in their history did the larvæ stretch out straight—always curled up. Part of the worker larvæ were sealed in 8 days and 14 hours, all within nine days. The shortest time from the egg to the perfect worker was 20 days and 2 hours. All emerged from the mark cells in less than 21 days, except one which he lost track of. In drone-cells the capping occurred in 10 days. The bees gnawed off the waxy surface of the drone-cappings to some extent, somewhat as they do with queen-cells. The shortest time for the drone was 24 days and 16 hours, the longest time just 25 days.

To Requeen Cheaply.—Delos Wood does it thus (Gleanings): One of his best colonies he sets apart for queen-cells. To another he gives a large amount of drone-comb. Stimulates the one to be used for cells and gets a strong swarm from it. This swarm is put in an empty single-story hive, and as soon as the queen has a circle of eggs and brood in several combs, the queen is taken away. The edges of the combs are cut away, thus removing the eggs, and having just-hatching eggs at the edges. Cells are built by wholesale, and of the best quality, the queens emerging at the same time. Many fine cells can also be saved from the old colony that swarmed. He never gets good queens by giving eggs. By the time the larvæ hatch out of the eggs the bees have lost their vim for brood-rearing.

The Emerson Binder

This Emerson stiff-cloth-board Binder for the American Bee Journal we mail for 60 cents; or will send it with the Journal for one year—both for \$1.50. It is a very fine thing to preserve the copies of the Bee Journal as fast as they are received. If you have the "Emerson," no further binding is necessary.

GEO. W. YORK & CO.

118 Michigan st., CHICAGO, ILL.

white, smooth surface is the least objectionable of anything, according to my experience.

J. M. Hambaugh—1. Yes. 2. They seem to dislike black.

Chas. Dadant & Son—1. Yes, they will sting black the quickest.

E. France—1. Yes. 2. An old, black wool-hat is the worst thing.

Rev. M. Mahin—1. I have never noticed any difference. 2. I think not.

R. L. Taylor—I. I do not think they are. 2. I have never noticed that they are.

Dr. J. P. H. Brown—1, 'Tis true. 2. Black or bright red are most objectionable.

J. A. Green—1. Yes. Bees frequently show an aversion to black clothing, especially if of a fuzzy nature.

Jas. A. Stone—1. I don't know. 2. They may be by any color they are not in the habit of seeing around the apiary.

C. H. Dibbern—1. Yes, perhaps because they do not see one so easily. 2. I do not think that any color tends to irritate bees.

R. C. Aikin—I. Yes. 2. I do not know that the color particularly irritates, but when angered it surely receives the attacks.

J. E. Pond—1. I have seen such statements, but they are not borne out by my own observation. 2. I do not think they are—why should they be?

E. S. Lovesy—1. It is claimed so, and to some extent I believe it is true, altho with the use of a good smoker I have never noticed any difference.

S. T. Pettit—1. Yes. For 15 years I have drest in white while handling bees. 2. They don't like any dark color, but black gives the most offence.

A. F. Brown—1. I think so; also that cotton clothing is less objectionable than wool. 2. Dark colors, when in markt contrast with light, seem to attract their ire.

O. O. Poppleton—1. I think so. 2. I doubt whether color of any kind irritates bees, but when they are on a lookout for a target they seem to see dark colors first.

D. W. Helse—I. It is. 2. Decidedly so; especially is this true of a black sateen shirt, which has the same effect on the bees' temper as the red flag has on the bull.

Mrs. L. Harrison—1. Yes. 2. I don't know so much about color as texture; they do not sting brown linen, starch; the sting slips over it. Woolly goods would irritate them.

G. W. Denaree—1. I would not wear white clothing in the apiary whether the bees liked it or not. 2. My experience is that bees will give less annoyance "fiddling" in your ears if you will wear a straw hat. They certainly do not like a wool hat.

Ridding the Apiary of Ants, Etc.

Three years ago I was troubled with ants, and to my dismay my son turned a litter of pigs among the hives. The following two years my apiary was exempt from ants. Last spring the ants appeared again, and

Send \$1.50 to the American Bee Journal office, and get both the Modern Farmer and the Bee Journal for a year. G. W. Y. & CO.

The Ram's Horn...

Is an Independent Weekly Paper of 20 pages—

each page somewhat larger than those of the Bee Journal. The subscription price is \$1.50 a year. It is one of the brightest and best publications of the present day. Its "Platform" is: 1. The Primitive Gospel. 2. The Union of Christendom. 3. Equal Purity—Equal Suffrage. 4. The Sabbath for Man. 5. The Saloon Must Go. Motto: "Have Faith in God."

We will mail you a sample copy of the Ram's Horn upon receipt of a two-cent stamp.

OUR LIBERAL OFFER:

We wish to make our PRESENT subscribers to the Bee Journal a generous offer in connection with the Ram's Horn, viz: Send us **TWO NEW** subscribers for the American Bee Journal for one year (with \$2.00), and we will see that the Ram's Horn is mailed you free for one year as a premium.

Or, send us \$2.00 and we will mail to you the Ram's Horn and the American Bee Journal, both for one year.

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginsville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polish, snowy-white Sections, beautiful straw-colored transparent Foundation, improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

Address, **Leahy Manufacturing Company, Higginsville, Mo., or**
1730 South 13th St., Omaha, Neb.

26c Cash Paid for Beeswax.

This is a good time to send in your Beeswax. We are paying **26 cents a pound — CASH** — upon its receipt. Now, if you want the money PROMPTLY, send us your Beeswax. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

Page & Lyon Mfg. Co. New London, Wisconsin,

Operates two sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of

Bee-Keepers' Supplies.

They have also one **One of the Largest Factories** and the latest and most-improved machinery for the manufacture of

Bee-Hives, Sections, Etc.,

that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the **clearest and whitest Basswood** is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equip with best machinery, all combine to enable this firm to furnish the

Best Goods at the Lowest Prices.

Send for Circular and see the Prices on a Full Line of Supplies.

Please mention the American Bee Journal.

7Atf

during summer in went a litter of pigs, being the less disagreeable of the two nuisances. I keep only from 10 to 12 colonies. An old dish-pan worn through in the bottom is good to gather pieces of comb and set out for the bees to nibble, and carry away something all the time. After the sun melted part of it, I saw them load their hind legs with wax, the same as pollen. Then after there was not much comb building and honey coming in freely, the bees were not much seen on it, and the hot sun melted it so the wax run through the cracks in the bottom of the pan. Then I took a little fish-pail, put water in it, and set the pan on top with contents, stirred it now and then, and covered it with a pane of glass, and as a result I had a nice lump of wax.

Take two hand-sled runners with slats nailed crosswise, to place by the side of an old colony to set the hive on to make room for the new swarm. It is far ahead of blocks, and when ready to move tie a rope to it and draw to its new place.

The Miller feeder is made half its size, and set crosswise over the frames, then with a 14-section super the other half of the hive is covered, and when the bees begin to work in the sections the feeder is taken off, and, after the honey harvest, put it on again. In cold weather, say at packing time for winter, fill the entrances with burlap.

MICHAEL HAAS.

St. Joseph, Mich.

Put the Bees in All Right.

After a two days' flight our bees were placed in the cellar Nov. 21. Rain set in just as we finish, and the next night came the blizzard and freeze-up. We are all right this time.

F. A. SNELL.

Carroll Co., Ill., Nov. 25.

Tall Sections, Etc.

I got an average crop of honey this year, tho more dark honey than usual, but from the fact that I used the Danzenbaker prize section, 4x5 inches, and being so much better filled and apt out to the wood, I'm getting better prices for it than I ever could get for the best white honey in the old, wide 4 1/4 sections. No more square sections for me.

I have just returned from quite an extended visit among bee-keepers, and while I am quite an enthusiast on the Golden method of producing comb honey, I was agreeably astonished to find so many bee-keepers talking about and preparing to try this method.

A. S. DALBET.

Montgomery Co., Md., Nov. 25.

A Young Bee-Keeper.

I have been interested in bees ever since I could know anything about them. The first bees that I owned I found in a tree when I was 11 years of age, but they died the following winter. Then I had no more bees. At 13 years of age my step-mother gave me a strong colony, and they swarmed twice this spring. I bought 2 other colonies the past summer from my cousin. Now I am 14 years of age, and have 5 colonies. It was a poor honey season in this section the past summer.

JULIAN HOLLMAN.

Lexington Co., S. C., Nov. 14.

Poor Country for Bees and Honey.

If I could report a great number of colonies, or a large amount of honey per colony, it would be a pleasure to write; but I must be content to report that I live in a very poor country for bees and honey. The first property I ever owned was a colony of bees in a box-hive; since then I have kept all the way from one to 40 colonies; and 20 pounds of surplus honey per colony is my average yield, except about every five years we have a good honey season; then if we are up and doing, and have our bees strong, we are pretty certain of 50 pounds of surplus honey per colony.

This certainly was an off year, both in

"SUGGESTFUL"

MONEY MAKERS ARE FOUND IN GOOD INCUBATORS AND BROODERS

We manufacture a greater variety of standard machines than any other incubator firm. Capacity, 50 to 800 eggs; price, \$8.50 to \$68. Over 1,000,000 chickens hatched by our incubators last season. Send 6c. for 148-page catalog. Tells how to raise poultry and contains designs for poultry houses and other useful hints to the poultryman.

HONEY * FOR * SALE.

Best White Alfalfa Extracted...

IN 60-POUND TIN CANS.

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can hardly get enough of the Alfalfa extracted.

Prices are as Follows:

A sample by mail, 8 cents in stamps, to pay for package and postage. By freight—One 60-pound can, 8 cents per pound; 2 cans, 7 1/2 cents per pound; 4 or more cans, 7 1/4 cents per pound. Cash must accompany each order.

Best Basswood Honey in Barrels.

We have a quantity of finest basswood honey in barrels, weighing 350 pounds and upward, which we will ship f. o. b. Chicago, at 7 1/2 cents a pound. Sample mailed for 8 cents. If desiring to purchase, let us know, and we will write you the exact number of pounds in the barrel or barrels, and hold same till you can send the cash for it by return mail.

Our honey is **ABSOLUTELY PURE BEES' HONEY**, the finest of the kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand the past season, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. The Circular, "HONEY AS FOOD," will be a great help in creating customers for honey.

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Please mention the Bee Journal when writing Advertisers.

bees and honey. Cane-mills are, I think, responsible for the loss of bees. When the mills were through work, I found my best colonies contained only enough bees to cover 3 or 4 combs, Langstroth size, and mostly young bees; so I went to work earnestly and got them strong enough for winter, by uniting. I got some partly-filled sections, and a few old combs well filled with honey. I got a nice lot of young bees, and all the brood they can care for these frosty nights.

H. B. LAMBERT.
Sampson Co., Ky., Nov. 15.

The Bee's Length of Vision.

On page 615, the inquiry concerning a bee's length of vision interests me from a scientific point of view. While I am not able to answer the question with authority, the suggestion occurs that this point can be determined somewhat accurately (if it has not already been the subject of investigation by entomologists or other scholars) by micrometric studies of the focal length of a bee's eye.

The eye is a natural lense and subject to certain mathematical laws so far as penetration and absorption of light may be concerned. I infer that bees have the power of vision at considerable distances. Bee-keepers testify that a bee can attack a man more successfully at a distance of 10 feet from the hive than if he stand in immediate juxtaposition. Indubitably every animal is fitted with senses co-ordinate with its needs for existence. Experiments have demonstrated the approximate length of vision in many animals. The cat family is known to see better at some distance than close at hand. Deprived of the sense of smell, a cat will be unable to find a mouse placed immediately under her nose, but she is well prepared to spring upon her prey from a distance and to see it in the dark by means of extraordinary powers of light absorption through dilation of the pupil.

Eagles are said to be very far-sighted, and, in confirmation, instances are cited where they have dropt upon their prey from elevations absolutely beyond the range of human vision. It is reported that tests of the sight of the Andes condor prove that he can see at the distance of 100 miles.

It may be, therefore, quite possible that an all-wise creator has furnisht the bee with power to discern objects within the range of its flight. We are all acquainted with her rapidity of flight, compared with her physical size, and we know how she will describe an upward curve to avoid obstacles. To bring into play the necessary muscular movements in doing this, must require considerable (fore)sight, or long-sight.

I would be glad to have some patient searcher after scientific truth tell us what he can find in nature or in the books concerning the sight of bees. **GEO. H. STIPP.**
San Francisco Co., Calif.

The Willowherb or Fireweed.

On page 674, the question is askt by Dr. Mason, "Does the willowherb grow more than one year on the same ground?" To which Dr. Miller answers, "I think it does, but after a time that ground will not produce the willowherb. It does not grow continuously. It grows only for a time on the burnt districts."

The willowherb or fireweed grows from seed scattered by the wind in August. In September the young seedlings make their appearance, which freeze down to the ground in winter. In early spring they start before the fern comes out and keep ahead of that so that in blooming time the fireweed overtops everything else. If the seedling stands in rich ground it blossoms and bears seed that year. If it grows in poor ground it will not bloom. I know of a steep mountain-side where the willowherb grew for three years without a flower, but last summer (the fourth year) it bloomed full, and was rich in nectar.

The plant dies every fall down to the roots. The roots send out in the spring several young shoots. The main root grows

The Domestic Sheep--Its Culture and General Management.

BY HENRY STEWART.

AN UP-TO-DATE BOOK ON SHEEP.

The Most Scientific, Practical and Useful Book ever published on this subject. Endorsed by the World's Highest Authorities. Press and Sheep Public everywhere. It contains 372 pages of "boiled down" knowledge and 165 plates illustrating the recognized breeds and every department of sheep life. Price \$1.50, post paid.

HON. JAMES WILSON, SECRETARY OF AGRICULTURE, SAYS:

"I do not know that we have anything on sheep as good. This book should be in the hands of every sheep man in the country. The more I look through it the more I am pleased with it. I shall certainly recommend it to correspondents of the United States Agricultural Department asking for works on sheep feeding, sheep-breeding, etc."

TABLE OF CONTENTS.

CHAPTER I.

The Natural History of the Sheep. Antiquity of the Sheep—Lessons to be Learned from Ancient Sheep-herds—The Anatomy of the Sheep: Its Mouth and Teeth; Its Stomach; Its Intestines and their functions. Pages 7-21.

CHAPTER II.

The Varieties and Breeds of Sheep. The American Merino—Points of Excellence in a Merino—Sub Breeds of the Merino; The Dickinson, The Standard Delaine, The National Delaine, The Improved Delaine, The Black Top, The Improved Black Top—The Saxony Merino—The Rambouillet Merino—The French Breeds—The British Breeds—Short-wools; The Southdown, Shropshire, Hampshire, Suffolk, Oxford, Dorset, Long-wools; The Lincoln, Cotswold, Leicester, Romney Marsh and Wensleydale. Mountain Breeds: The Cheviot, The Black-Faced Highland, Welsh—Other Varieties of Sheep: The Tunis, etc. Pages 22-102.

CHAPTER III.

The Science and Art of Breeding. Breeding an Art Based on Strictly Scientific Principles—What is a Breed?—Breeding by Ancient Shepherds—Hereditary Special Function—Selection a Special Feature—Climatic Influences—Cross Breeding—Influence of Soil on Health of Sheep. Pages 103-126.

CHAPTER IV.

The Science and Art of Feeding. Feeding the Most Important Part of Agriculture—Character of Food and Composition of Animal—The Nutritive Ratio—Feeding for Lambs—Table Nutritive Value of Foods—Rules for Winter Feeding—Feeding Crops for Sheep—Feeding Roots—Eosilage—Filling the Silo—Feeding Lambs—Feeding Lambs in a Cora Field—Rearing House—Lambs—Feeding Grass Lambs—Experiments in Feeding Lambs, and Possible Gain in a Year's Growth—Winter Feeding for Wool—Scientific Experiments in Feeding Lambs for Market. Pages 127-200.

CHAPTER V.

Barns and Stables. Best Arrangement of Buildings—Octagonal, Square and Round Barns—Shed for Soiling Sheep with Floor Plan—Handling Sheep—A Texas Catch Pen for Sorting and Dipping—A Manitoba Sheep House—J. E. Wing's Barn—Mr. Vestal's Barn—Shepherd Dogs. Pages 201-225.

CHAPTER VI.

Wool: Its History, Uses, Etc. On the Difference in Wools—Wool Growing a Science—The Nature of Wool—Cross Breeding for Wool—The Culture of Wool—Uniformity in Wool—Washing Sheep—Sheep Dips and Dipping—Shearing; By Machine and Hand—Sorting—Wool—Pulled Wool—Care of the Sheared Sheep. Pages 226-291.

CHAPTER VII.

Minor British Breeds of Sheep. The Herdwick—The Ryeland—The New Ryeland—The Lonk—The Roscommon—The Radnor—The Sheep of North Wales—The Exmoor—The Limestone or Crag Sheep—The Devon Long-Wool—The Dartmoor—The Glamorganshire Sheep—The Clun Forest Sheep. Pages 292-304.

CHAPTER VIII.

Diseases of Sheep: Prevention and Treatment. Parturition of the Sheep: Retention of the After-Birth: Bleeding from and Inversion of the Womb, Inflammation of the Vagina, Garget, Abortion—Internal Parasites: Throat Thread Worms (Anemia); Tape Worms (Tenia Marginata, Tenia Coeurus, Tenia Fimbriata, Tenia Expansa) Stomach Round Worms (Strongylus Contortus); Intestinal Round Worms; Nodular Disease of the Intestine (Esophagostoma Columbianum); Fluke Disease; The Sheep Bot-Fly (Estrus Ovis)—Albuminaria—Anthrax—Anasarca—Bronchitis—Carbuncular Erysipelas—Catarrh—Colic—Diarrhea—Foot Rot—Impaction of the Stomach—Inflammation of the Brain—Inflammation of the Spinal Cord (Myelitis)—Pleurisy—Inflammation of the Udder (Mammitis)—Inflammation of the Lungs (Pneumonia)—Inflammation of the Skin (Herespes)—Parturition Fever in Ewes—Poisoning—Potentilla Grass—Red Water—Redness of the Eyes—Small Pox of Sheep—Retention of the Dung in Lambs—Inflammation and Castration of Testicle—External Parasites: The Scab, the Maggot, The Louse, The Tick. Pages 305-368. A Most Valuable Chapter giving the Prominent Symptoms of Common Diseases and a List of Remedies and uses Especially for Sheep. Pages 369-370. Plan of Sheep Barn, Yards and Shed, adapted to the South. Canadian Sheep Fold, Pages 370-371.

Our Offers on the Above Great Sheep Book!

Bound in cloth, and printed on very fine paper, postpaid, \$1.50; or with the Bee Journal for one year—both for \$2.20; or we will mail a copy of the book as a premium for sending us **Four New Subscribers** to the Bee Journal for 1899 (at \$1.00 each), and will throw in the last three months' copies of this year free to the new subscribers. Now surely one of the foregoing offers you will accept if you are at all interested in sheep-raising.

Address, **GEORGE W. YORK & CO., 118 Michigan Street, CHICAGO, ILL.**

horizontally, from which grow the shoots, which in time make regular stumps, from which year after year the long stalks grow. The root adds one ring every year, just like a tree. The root also starts to decay in the center first.

The willowherb commences blooming in July; new buds form continually, while the blossoms give way to seed-pods, till a killing frost comes.

I know it grows on the same place for at least 12 years, and perhaps forever, if it is not choked out by other plants, like young trees. It tries its best to grow higher than other plants, as it needs sunshine. I measured one stalk 13 feet high. The evergreen trees, spruce and hemlock, will in length of time, aided by their shade, overtop and kill the fireweed.

To make the seed grow is as hard as to make the seed of sweet clover grow, but the root will grow with me every time.

The nectar gathered from that plant is thin, but quickly ripens in the hive to a good body. It is the mildest honey I know of; is clear white, not a shade of color if pure and very sweet.

I have kept bees for the last six years, and secured honey from the fireweed every year, 1897 excepted. **HERMAN ABLERS,** Clatsop Co., Oreg., Nov. 14.

[The roots which Mr. Ablers sent us prove his statements regarding the roots of the willowherb or fireweed. No doubt there

are many of our Michigan readers that could give considerable information concerning the rich nectar-yielding plant under consideration.—EDITOR.]

Honey as a Food.

I had expected to have heard something of an answer to the question I raised last spring, which was, To what particular extent can honey be called or classed as a food? I gave my belief, but my object was, and is, to draw out the best authority to elucidate this point. I stated then that if honey is to be considered or accepted a food it could only belong to hydro-carbon elements, but while I had formulated the question—Does honey or any saccharine matter produce fat in the animal system?

Now I know there are some authorities that hold to the positive, and I, as well as many more, hold to the negative side. I do not see why this question would not be a suitable one to write on, and valuable to everybody. While I admit honey is of very great use to the consumer as a health preserver, it needs no change by way of digestion, but enters the circulation and undergoes a fermentive process resolving itself into lactic acid and water, and while this process is going on, heat is evolved, which is of course the great boon involved.

I was much interested in the account given of the Omaha meeting, on page 661,

on the food value of honey, as per Mr. Whitcomb, as he says, "I think we entirely underrate the food value of honey." etc. I consider he is beside himself when he says that one pound of honey is of more value as nutriment than two pounds of pork. Of course, pork—that is, fat pork—is only for the same purpose, to produce heat, but not direct, but is stored up in the animal tissues as fat to be used when needed as a fuel, while honey is made available direct, and does not require the exhaustive powers of nature to change it somewhat and assimilate it. Honey is, therefore, of greater value as a heat-producer, because the process is accomplished with much less effort and taxation of the animal strength, but I would not go so far as to hold with Mr. W. that one pound of honey is more than equal to two pounds of pork.

But let that be as it may, I am surprised at Dr. Miller, that he didn't tell us more on the line I have pointed out. I would feel greatly obliged if he will write out a chapter and enlighten us; there is no doubt he can do it, and I am going to take the liberty to say that there shall be no peace till he redeems this pledge, and many will vote him all the thanks he could possibly ask.

I trust that we have not heard all of this, or the last of it, but will get the real gist of the matter as soon as possible.

C. WURSTER.

Ontario, Canada, Oct. 26.

Not a Big Crop.

Bees are in good winter quarters on the summer stands, with plenty of bees and plenty of ripe stores. My honey crop was 1,800 pounds of comb and extracted from 41 colonies, spring count. This is not a big crop, but it is ripe and of good flavor.

My Alsike clover seed crop is 34 bushels and 18 pounds, from 56 pounds of seed sowed. There was the most honey from Alsike this year.

C. G. MATTON.

Chisago Co., Minn., Nov. 29.

Frame-Spacing; Perforated Separators

I wish to thank Mr. A. P. Raymond for his splendid suggestion for spacing frames, found on page 738. The "wire nail, and V groove in the rabbet" beat staple spacing, or any other, of which I have any knowledge. It disposes of the objection to staples when uncepping, and, also, obviates the danger of marring the comb while lifting the frame from the hive.

I also wish to thank Mr. Pettit for the idea of $\frac{3}{8}$ -inch holes through the separators in the production of comb honey. I experimented the last season with over 100 separators thus perforated, using them on the standard "bee-way" sections, and finer, truer comb I never saw, and without a single exception. They are good enough for me.

WM. M. WHITNEY.

Kankakee Co., Ill.

Nuts for Dr. Miller to Crack.

As it seems there is an expert "nut-cracker" in the bee-fraternity, I wish to send a kernel or two for his hammer.

I had a queen-cell I was watching and waiting for, as it was in a hive of fine bees. I waited till the time for her to emerge had past some days, and she had not yet put in appearance. I opened the end of the cell and found a fully-matured queen, but dead, and some shrunken. I pulled her out, and hanging to her came another complete bee, but very small, like a dwarf.

At first I was somewhat entranced, and more surprised than I can tell; and wonder was greatly enhanced, to find two queens within one cell. But on closer inspection I found it did not look like a queen at all; the wings were as long as the body; just like a worker on a small scale.

Later, in a nucleus hive I had a frame with three nice queen-cells. I placed a wire-cloth cover over two to protect them from the first queen out; the oldest one, too, emerged all right. I took them out

and left the other with the cover over her. A day or so after, I took a look and found her (or it) out of the cell in the comb—not a queen, but a perfect worker, so far as I could see. I thought it strange, and left it a day or two more to see what would develop, but no change came. I then let it go with the bees—there were but few—and I could not tell it from the others, and could never find her (or it) again.

I wish to say right here, this is no "put up job," but facts. I showed the "twin queens" to my wife, and told her I never saw or heard of such a case before. I am sorry I did not send the "plural queens" to Editor York, but did not think of it till I had thrown them away, past finding.

This may sometimes happen, but it is new, and a mystery to me.

Now Dr. Miller may be able to turn the X rays of his experience and wisdom on those cells and solve the puzzle. Tell us "What's the matter with Hannah."

Stephenson Co., Ill. A. W. HART.

Canning Fruit with Honey.

On page 726 is an enquiry about canning fruit with honey. We have used it two seasons, and like it. We put the fruit into a tight-covered kettle in the oven of the stove, and cook until tender, then add the honey and bring to a boil on top of the stove, and put in cans and seal while boiling hot. Juicy fruit, like peaches, pears and berries, need no water added, as the honey makes enough syrup. Dry fruits, like quinces and apples, need a little water to cook them tender.

We use the best white clover honey for peaches and fruit that is not very sour, $\frac{1}{2}$ pound of honey to a pound of fruit is about right for us; but the best plan is to sweeten to taste. I think the fruit keeps better than that canned in sugar.

I had for my breakfast this morning peaches canned in September, 1897. They were as good as the day they were put in the jars, and we think them much better than fruit put up with sugar. We have put up in honey, apples, blackberries, peaches and quinces. All keep well, and are very fine. We drain the liquid out of the honey that granulates coarse, and use the dry sugared honey for making candy, and in various ways for cooking, etc.

Don't cook the honey in with the fruit.

The less you boil the honey the more of the honey flavor the fruit will have.

"Pa." asks what to do with comb honey. Tell him to keep it in a dry, warm place, the hotter the better, if it doesn't melt the comb; and he can keep it as long as he likes.

E. D. HOWELL.

Orange Co., N. Y., Nov. 23.

Poor Season for Honey.

The past season was a poor one for honey in this part of the State. I commenced with 31 colonies, increased to 58, and secured 1,200 pounds of comb honey. My bees are mostly Italians and hybrids. I know that they work on the red clover bloom, especially during August and September.

Neighbor Herrick should get Italian bees and smaller hives.

G. STOUT.

Hennepin Co., Minn., Nov. 28.

A Report.

I got 800 pounds of honey last year, and 500 this fall. It was mostly sold in the home market at 12 $\frac{1}{2}$ cents a pound. I have 27 colonies of bees.

MICHAEL LARINAN.

Rock Island Co., Ill., Nov. 23.

Stormy Weather.

The weather was so mild during the forepart of November that I delayed putting my bees into the cellar. Nov. 21 it rained and changed to sleet; the 22nd it snowed; the 23rd and 24th it was as low as six degrees below zero. During the middle of the day (yesterday) it thawed some and I dug the snow away from the hives and scraped off some of the ice from the covers, and intended to put the bees into the cellar to-day, but we are having another snow-storm, so I will wait. I have 25 colonies, and the most of them have an abundance of honey for winter.

JOHN RIDLEY.

Winneshek Co., Iowa, Nov. 25.

New York.—The tenth annual meeting of the Ontario Co., N. Y., Bee-Keepers' Association will be held in Canandaigua, N. Y., Dec. 8 and 9, 1898. An interesting program is in course of preparation. All interested in bees or bee-keeping are invited to attend.

Bellona, N. Y. RUTH E. TAYLOR, Sec.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Nov. 19.—Our market is very strong at 13c for best grades of white comb honey, with good No. 1 at 11 to 12c; ambers range from 8 to 11c, according to appearance, quality and flavor. Extra ted, white, 6 to 7c; amber, 5 to 6c; dark, 5c. Beeswax, 27c. All grades and kinds of honey are salable at this time.

R. A. BURNETT & Co.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12 $\frac{1}{2}$ c.; A No. 1 white, 10 to 11c.; No. 1 white, 9 to 10c.; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6 $\frac{1}{2}$ c.; No. 2, 5 $\frac{1}{2}$ c.; amber, 5c.; in barrels, No. 1 white, 5 $\frac{1}{2}$ c.; amber, 4 $\frac{1}{2}$ to 5c.; dark, 4 to 4 $\frac{1}{2}$ c. Choice Beeswax, prime, 24c; choice, 24 $\frac{1}{2}$ c. At present, there is a good demand for honey.

WESTCOTT COM. Co.

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c; amber, 10@11c. Extracted, white, 5 $\frac{1}{2}$ @6c; amber, 5@5 $\frac{1}{2}$ c.; dark, 4 $\frac{1}{2}$ @5c. Beeswax, 22@25c.

The receipts of comb honey are larger.

C. C. CLEMONS & Co.

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12 $\frac{1}{2}$ c.; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6 $\frac{1}{2}$ @7c. Beeswax, 25 to 27c.

WALTER S. POWDER.

Milwaukee, Oct. 18.—Fancy 1 pound, 13 $\frac{1}{2}$ to 14c; A No. 1, 12 to 12 $\frac{1}{2}$ c.; No. 1, 11 to 12c; No. 2, 10 to 10 $\frac{1}{2}$ c.; mixt, amber and dark, 8 to 9c. Extracted, white, in barrels, kegs and pails, 6 $\frac{1}{2}$ to 7c; dark, 5 to 5 $\frac{1}{2}$ c. Beeswax, 26 to 27c.

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing.

A. V. BISHOP & Co.

Columbus, O., Nov. 18.—Market somewhat easier. Quote: Fancy, 14c; No. 1, 12c; No. 2, 10c; amber, 9c; buckwheat, 8c.

COLUMBUS COM. AND STORAGE Co.

New York, Oct. 22.—Receipts of comb honey are large, and there is quite a stock now on the market. While white is in good demand, buckwheat and mixt seem to be somewhat neglected, and quotation prices have to be shaded in order to sell in quantity lots. We quote:

Fancy white, 13 to 14c; No. 1 white, 11 to 12c; amber, 10c; mixt and buckwheat, 8 to 9c. Stocks of extracted are light of all kinds. Demand is good at following prices: White, 6 to 6 $\frac{1}{2}$ c; amber, 5 $\frac{1}{2}$ c; dark, 5c. Southern, in half barrels and barrels at from 55c to 60c a gallon. Beeswax dull at 26c.

HILDRETH BROS. & SEELKEN.

Detroit, Oct. 20.—Honey in better demand and better prices as follows: Fancy white, 13@14c; No. 1, 12@13c; fancy dark and amber, 10@11c. Extracted, white, 6@7c; dark, 5@5 $\frac{1}{2}$ c. Beeswax, 25@26c.

M. H. HUNT.

Buffalo, Nov. 25.—A most excellent demand continues for strictly fancy 1-pound combs at 13 to 14c. The usual so-called No. 1, 11 to 12c; lower grades move well at from 9c down to 7c; stocks very light in our market. Extracted honey, 5 to 6c. Beeswax, 24 to 28c.

BATTERSON & Co.

San Francisco, Nov. 22.—White comb, 9 $\frac{1}{2}$ to 10 $\frac{1}{2}$ c; amber, 7 $\frac{1}{2}$ to 9c. Extracted, white, 7 to 7 $\frac{1}{2}$ c.; light amber, 6 $\frac{1}{2}$ to 6 $\frac{1}{2}$ c. Beeswax, 24@27c.

Stocks in this center are light and must so continue through the balance of the season. Choice extracted is especially in limited supply and is being held at comparatively fancy figures. Comb is meeting with very fair trade, considering that it has to depend mainly on local custom for an outlet. Values for all descriptions tend in favor of selling interest.

Boston, Nov. 23.—Liberal receipts with but a light demand during the holidays. As a result stocks have accumulated somewhat, and prices show a lowering tendency, still we hope for a better demand with prices at present as follows:

Fancy white, 14c; A No. 1 white, 12 $\frac{1}{2}$ to 13c; No. 1, 11 to 12c; light amber, 10c, with no call for dark. Extracted, fair demand, light supply: White, 7 to 7 $\frac{1}{2}$ c; light amber, 6 $\frac{1}{2}$ to 7c; Southern, 5 to 6c.

BLAKE, SCOTT & LEE.

Cleveland, Nov. 29.—Fancy white, 13@14c; No. 1 white, 12@13c; A No. 1 amber, 10@11c; No. 2 amber, 9@10c; buckwheat, 8c. Extracted, white, 7c; amber, 6c; buckwheat, 5c.

A. B. WILLIAMS & Co.

THE "NOVELTY" POCKET-KNIFE!

Your Name on the Knife.—When ordering, be sure to say just what Name and Address you wish put on the Knife.

The NOVELTY KNIFE is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed an AMERICAN BEE JOURNAL reminder, and on the other side, name and residence of the Subscriber.

The material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring steel, and the finish of handle as described above. It will last a lifetime, with proper usage.

Why purchase the Novelty Knife? In case a good knife is lost, the chances are, the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your pocket KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a Christmas, New Year or birthday present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, a lady to a gentleman, or vice versa, a son to a mother, a husband to a wife, a brother to a sister or a gentleman to a lady—the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid, for \$1.00, or give it as a Premium to the one sending us three new subscribers to the BEE JOURNAL (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book "Bees and Honey." We club the Novelty Knife with the BEE JOURNAL for one year, both for \$1.90.

Any Name and Address Put on the Knife.

Gleanings at Half Price,

—or, Two Papers for the Price of One.

We have made arrangements whereby, for a limited time, we can send either the Farm Journal, published at Philadelphia, or the Poultry-Keeper, published at Parkesburg, Pa., both fifty-cent monthlies, and the very best in their line, with **Gleanings in Bee-Culture**, to a new or old subscriber, both for one year. But the conditions of this offer are that the money [\$1.00] shall be sent in advance, and that all arrearages to Gleanings, if any, shall be squared up.

The Ohio Farmer and Gleanings in Bee-Culture
both for One Year for \$1.10.

We will send the Ohio Farmer, a dollar weekly, one of the leading agricultural papers of the United States, and Gleanings in Bee-Culture, both for one year, to a new or old subscriber, for \$1.10, paid in advance, and all arrearages to Gleanings, if any, squared up.

The Farm Journal is now in its 21st year, and takes the lead among all the low-priced agricultural papers. It is packed full of practical hints and suggestions; puffs no swindles, and inserts no humbug advertisements.

The Ohio Farmer is a larger paper, and is issued weekly, and is one out of a few really good farm papers.

The Poultry-Keeper is monthly, edited by P. H. Jacobs, and published at Parkesburg, Pa. It has a tinted cover in two colors, and is beautifully gotten up.

Remember that, in order to secure any one of these three papers, in combination with Gleanings, the money must be paid in advance, and arrearages to Gleanings, if any, squared up. These offers are very low, and will be withdrawn soon.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

SECOND DAY—AFTERNOON SESSION.

[Continued from page 774.]

After the reading of the above paper Mr. Eugene Secor read a paper, entitled

The First Half Century of Improved Bee-Keeping in America.

Growth is the law of the universe, but all growth is not continuous or uniform. The giant trees of the forest have not reached their maturity by well-balanced annual accretions. Their development has been dependent on moisture, sunshine and nourishment, which are varying quantities.

The evolution of society has not been constantly progressive. Civilization sometimes leaps forward by cycles over a lifeless and profitless condition which, for centuries, had obstructed the onward march of ideal government.

The recent occupation of the West Indies and Philippines by the Anglo-Saxon race may result in removing the cancerous growth of Spanish tyranny from the world's body politic, and in turning the dial of Eastern conservatism ahead 500 years. More history has been made in the last four months than in four centuries during some periods of the world's past.

In the fields of discovery and invention the same erratic, inconstant tendency is noticed.

Secrets which have been locked in the storehouse of Nature since the morning stars sang creation's birth have only been wrested from oblivion within the memory of some here present.

The modern gang-plow, so perfect and useful, is the slow out-growth of the first forked stick that tickled the bosom of Mother Earth; but the greatest improvements in this implement are not too old to be remembered by some persons now living. Thus it has been in many of the industries. It seems to have been reserved for these latter times to develop and perfect the appliances to relieve labor, to accelerate business and travel, to stimulate investigation, and to make it possible for everybody to attain to some degree of culture.

What was the condition of the industry which we represent, half a century ago? How many people in the world at that time understood the habits or natural history of the honey-bee? Of course mankind had learned long before that honey was good to eat. The sons of Jacob took honey with them as a peace-offering when they visited Egypt the second time to buy corn. Samson's riddle had been propounded to the young men of Timnath about 3,000 years. Aristotle and Virgil, Swammerdam and Huber, had all lived and died and

had left to the world the results of their investigations. Yet the pall of ignorance and superstitious mystery rested upon the mass of bee-keepers, whose tastes alone prompted them to appropriate the sweets which God had provided by means of this useful insect. Little progress had been made in the practical application of the knowledge gained by these observers and writers. The "king bee" was clothed, not only with kingly power, in the imagination of the common people, but seemed to be a dispenser of luck to a favored few. Not a journal in America or elsewhere was devoted to bee-culture, not a book had been issued by the American press on the subject, and no system of management was known save box-hives or hollow-log "gums," clumsy surplus boxes, and brimstoning the weak colonies in the fall. Increase of colonies was the measure of success; or, if increase was not desired they knew not how to prevent it. And when swarming-time came, many of the old-

Hon. Eugene Secor.

time bee-keepers believed that some sort of incantation was necessary to charm the bees, to prevent them from absconding.

With horn, tin pan, or old brass-kettle,
The children thundered with all their mettle—
The aim of which din was, no doubt, to settle
The frisky young swarm
By the ancient form
Of drowning a noise by making more rattle.

"Practical bee-keeping," says Langstroth, "was in a very deprect condition, being almost entirely neglected by those most favorably situated for its pursuit."

At this period there appeared in America a man whose genius for investigation was destined to establish the science and to revolutionize the art of apiculture. It is just 50 years since the Rev. L. L. Langstroth was obliged to lay aside the active work of the ministry on account of failing health, and began to devote his time more fully to the study and practice of apiarian pursuits.

It is by such strange providences that the world's great problems are sometimes worked out. Had Mr. Langstroth's strength been sufficient for a vigorous prosecution of his chosen work, the improvements which he inaugurated in bee-keeping might have been left for some other American genius to devise, or, what is more likely, had been accredited to the old world, where the germ-thought was already taking form, unknown to the patient and gifted experimenter in this country.

I said but for Langstroth's failing health it might have been reserved for some other genius to surprise the world with the same improvement in methods; but genius is nothing but hard work, patient plodding and constant endeavor to develop the ideal. What we call genius is the metal of the mind tried in the furnace of application. Langstroth did not wake up some fine morning when the birds were singing their sweetest songs in the the orchard, and the bees were making music among the hidden blossoms, and proceed at once to elaborate his new system of bee-keeping as tho it had come to him in a dream.

Morse did not flash upon the world in one brilliant moment his great achievement of conveying thought by the electric telegraph. It took years of study and barrels of midnight oil to develop the idea uppermost in his mind. Nevertheless the name of Morse is immortal. We call him a genius. Thus did Langstroth study, observe and experiment through years of patient waiting until he gave the people access to the interior economy of the hive, and to the industry an impetus never before attained. He left a legacy to the American bee-keeper that will never be exhausted. The dividends from the fund of practical knowledge which he brought to light by his system of management will continue to bless humanity beyond the stretch of our imagination. The invention of the Langstroth hive and the publication of his book on the Honey-Bee aroused interest in a subject which had been a sealed volume to the great masses of the people. It was a revelation of Nature, interesting as fiction, charming as poetry.

Nature-studies are always interesting. All we need to make them so is a teacher like Agassiz, or Huber, or Langstroth, to lead us out into the delightful fields of awakened observation.

The introduction of the Italian bee into this country soon after Langstroth's improvement in the hive gave a still greater momentum to the desire for advancement in the study and practice of this interesting and important adjunct of the farm. Since then we have weighed in the balance of utility nearly everything that gathers honey. The Syrian, the Cyprian, the Carniolan, have each contributed its blood to the building of a race adapted to the needs of this continent. That we shall finally succeed in breeding a bee better adapted to this country than anything yet imported is the confident hope and expectation of not a few persons who have given the subject consideration.

When the American Bee Journal was established, in 1861, another step was taken toward the dissemination of apicultural information. It was the beginning of an effort to popularize the science and art of bee-culture. At this present writing there are eight periodicals in the United States devoted almost exclusively to bee-keeping, many of them edited with market ability and enthusiasm; and hardly an agricultural journal is published that does not devote a portion of its space to the subject. Books both scientific and practical have been multiplied until apiculture need no longer be considered in the realm of mystery or on the borders of the domain of luck.

The extractor, the smoker, the section-box, the bee-escape, the queen-excluder, foundation, queen-rearing—all are products of the past 50 years, and all the outgrowth of the movable-frame, conceived and perfected by the Prince of American bee-keepers—the immortal Langstroth.

According to the census of 1870, which was the first statistics obtained by the government relating to the bee-industry that I regard as reliable, the apiarian products of the United States were—pounds of honey, 14,702,815; pounds of wax, 631,129. By the last National Census, 1890, the figures given are 63,897,327 pounds of honey, and 1,166,588 pounds of wax; showing an increase production in the 20 years, of nearly 350 percent of honey, and nearly 85 per-

cent of wax. That the latter product did not keep pace with the former is probably due to better methods, fewer colonies brimstoned, and consequently a less quantity obtained from the practice of melting combs and straining.

The population of the United States increased about 55 percent during the two decades before mentioned. By the last enumeration the total population was 52,622,250. It will be seen from the figures given showing the production of honey, that the best we have yet been able to do is a little more than one pound per capita per annum. If we deduct the quantity used in various manufactures and as medicine, and also the large quantity used in some families every year, it can readily be believed that one-half the people never taste honey, notwithstanding the modern facilities for producing it. In my own family, averaging about eight, we consume at least 400 pounds a year, or 50 pounds each. If that ratio were maintained by all families we could dispose of 50 times the quantity we now produce. Therefore, there is no immediate danger of over-production if the proper distribution can be accomplished; and with the facilities for distribution which we now possess compared with those of 50 years ago it would seem that there is yet a vast field for our activities.

But problems have been forced upon us which never racked the brains of the ancients. I have never read that in the olden time bee-keepers were compelled to flee to the mountains and forego civilized society in order to keep bees.

I wonder if in Babylon they had a city ordinance prohibiting Assyrian bees from flying over the walls into the celebrated hanging gardens? It probably never occurred to Nebuchadnezzar that a royal decree would have prevented every bee in the kingdom from sucking the flowers which he planted for his imported wife. It was reserved for some 2x4 "city fathers" of a 2x4 corporation to banish from the corporate limits of their 2x4 town every innocent bee that might be found on a honeysuckle or in the act of appropriating a drop of water from a reeking back alley!

Perhaps Nebuchadnezzar had some sort of heathenish idea that insects were a part of the great plan of the Creator to pollinate the blossoms and fructify the orchards and vineyards; but these modern smarties, who know about as much of science as the average Philistine insurgent does of the American Constitution, attempt to improve on God's plan of doing things. The "man in the moon" ought to hold his nose when he is compelled to look down on such decaying wisdom!

If some of the so-called horticulturists, and some of the small-calibre municipal authorities could have their way, and drive the industrious bee into retirement or bankruptcy, I imagine I see an army of two-legged pollinators going around the country with their camel's-hair brushes and a pot of yellow dust, endeavoring to restore the fertility to garden, farm and orchard that existed before the fall—of human greatness.

Another fact which we are obliged to face to-day, didn't trouble our forefathers. That fact is the adulteration of extracted honey, and the misbranding of fraudulent substitutes which are as innocent of flowers and bee-mediation as a baby is of the sins of its grandmother.

Our grandfathers knew nothing of that beautiful-looking, but unsatisfying, syrup, known as glucose. Their bees got honey from the flowers, and man-made honey was as much an undiscovered article as Chicago was an unknown city. Both seem, now, to flourish together. Those Chicago "bees" beat the world in turning out surplus! They work not only day and night, but just as well in winter as in summer. No winter problem to solve—no dull season with those city "bees!" Corn at 15 cents per bushel, and 15 pounds of "pure white clover honey" from every bushel is ahead of anything our grandfathers knew even in those "good old times!"

There is no use for us to say, among ourselves at least, that extracted honey isn't adulterated or counterfeited. Any bee-keeper with his eyes open and taste uncorrupted can easily satisfy himself to the contrary.

I have sometimes wondered if the invention of the extractor was a good thing. It cheapened the cost of production, it increased the output, but it has brought honey into disrepute. The opportunity was afforded dishonest people to put up something resembling the genuine article that is sometimes as far from being honest as the serpent that tempted Eve.

But I suppose the extractor has come to stay, as surely as some sins for which we are not personally responsible; and the only logical thing to do is to put a stop to it if we can. Unity, courage, discretion—these are the trinity that will bring victory to the cause of purity in foods.

There are also educational problems in our business yet unsolved. Modern bee-keepers have not the advantage of always being regarded as public benefactors (at least in America where the spirit of independence is abroad, and custom and precedent sit lightly on the public conscience).

A great deal of unwarranted prejudice exists against bees and bee-keepers which it is our business to overcome. Whether it arises from ignorance, or malice, it must be counteracted.

Among the objects of this organization are these: To assure to the pursuit the rights to which it is entitled under the law; to assist in educating the public as to the relation of bees to plant life and fertility, and to keep before the people the knowledge of the value of honey, both economically and as an unsurpassed article of food.

The last half century of our splendid accomplishments in the garden of apiculture may be but the hint of what the future has in store for us if we rise to the height of our privileges and advantages in this best of all lands for individual and industrial development. We must not rest on the laurels of past achievements when important responsibilities lie before us. The world is moving forward, not backward. The net results of all human effort are progress. Some obstacle may retard our advancement for awhile, but in God's good time right shall triumph over wrong, and happiness and prosperity shall perch upon the banners of earnest and faithful endeavor.

The yesterday of Bee-Keeping is in the charnal-house of History. I am able to bring out only a skeleton or two to remind you of its past. Its To-morrow is in the womb of Opportunity, from which shall come forth all the good which we merit through striving.

"O River of Yesterday, with current swift
Through chasms descending, and soon lost to sight,
I do not care to follow in their flight
The faded leaves, that on thy bosom drift!

"O River of To-morrow, I uplift
Mine eyes, and thee I follow, as the night
Wanes into morning, and the dawning light
Broadens, and all the shadows fade and shift!

"I follow, follow, where the waters run
Through unfrequented, unfamiliar fields,
Fragrant with flowers and musical with song;
Still follow, follow; sure to meet the sun,
And confident, that what the future yields
Will be the right, unless myself be wrong"—(Longfellow.)

EUGENE SECOR.

By a unanimous vote, the thanks of the Union were extended to Mr. Secor for his paper.

Dr. Miller—I would like to ask whether Mr. Secor meant to say that there were cases 50 years ago when increase was not desired?

Mr. Secor—I said, "If increase was not desired, they knew not how to prevent it."

Dr. Miller—Do you think there were cases 50 years ago when increase was not desired?

Mr. Secor—My grandfather had as many colonies as could be profitably kept in one locality. I do not think he knew how to prevent increase. I said "if."

Mr. Danzenbaker—My grandfather had 300 colonies of bees when I was born. He had more than he wanted, and when they would swarm he would let them stay on the trees until they flew away. He would get what bees he wanted, and let the rest go. He brimstoned the bees to get the honey. And he did another thing—he used to set a box alongside the hive, and the bees would fill it, and then he would take it away. But he resorted to brimstoning the bees, too.

The Secretary next read a paper by Mr. J. F. McIntyre, of California, entitled,

Best Size of Hive for Use in the Apiary.

I have been given an exceedingly broad and interesting subject, but as I and every one who cared to say anything on this subject have recently had our say, I will treat it as briefly and concisely as possible. "For use in the apiary"—this includes every locality in the world, every system of management, every kind of bees, comb and extracted honey; and you want to know the one "best size of hive" for all these localities and conditions. "I don't know." Guess yourself.

For several years I have been trying to find out the best size of hive for extracted honey in the Sespe apiary, with a very strong desire to prevent swarming, or any further increase of stock. My experiments lead me to believe that Dadant's hive and system would be the best for this purpose, but my apiary contains over 11,000 Langstroth combs, and to change these to the two sizes in the Dadant hive is out of the question. Large combs and plenty of them in the brood-chamber, with prolific queens to match, give the largest number of bees per colony, and with plenty of super room the larger the colony the more honey we get per hive—yes, I must say it if it paralyzes Mr. Hutchinson—it would be much more

profitable to get all the honey from a location with 200 large colonies, than it would be to get it all with the same number of bees in 300 smaller colonies. The 300 small hives would require more labor per hive to care for them than the 200 large hives, they require more care to prevent starving, more labor and annoyance to hive swarms, the first cost of the hives would be greater, and the expense of feeding them through a dry year in California would be greater.

Four years ago I deepened a few 10-frame Langstroth brood-chambers, making the frames 12 inches deep, and used a regular Langstroth super above to extract from, with a queen-excluder between. These hives produce fine, large colonies, and I would be satisfied with them if they would not swarm, but they do swarm with me nearly as badly as the regular 10-frame hive; and when this happens they are not so desirable, because the brood-chambers are too large for a divided colony or to have a swarm in without contracting with division-boards.

My apiary also contains 62 regular 12-frame Langstroth hives, which are open to the same objection—they are too small to prevent swarming, and too large to hive swarms in, and altogether do not average as much surplus honey per hive as the 10-comb hives. Dadant prevents swarming by tiering up those shallow extracting-supers, and always putting the

J. F. McIntyre.

empty combs next to the brood-chamber without a queen-excluder between; and if swarming is successfully prevented his brood-chamber is all right for size. I have been through the shallow-frame fad for comb honey, and am satisfied that any frame smaller than the Langstroth, or any hive smaller than an 8-comb Langstroth is unprofitable in this locality; and for extracted honey I am satisfied that any hive smaller than a 10-comb Langstroth is unprofitable.

The upper limits of size are not so well defined, as they depend entirely on the prolificness of our queens, the length of time that our bees have to breed up in the spring before the honey-flow commences, and our success in preventing swarms. One of my neighbors, Mr. Keene, keeps his bees in 8-comb Langstroth hives four stories high, without any queen-excluders or any one to watch for swarms, and his average yield per colony is just about the same as his neighbors, who put in their time during the swarming season watching for swarms and hiving them.

If next season is a good one I want to try a large number of 10 and 12 comb Langstroth hives three stories high. I will start with single brood-chambers in the spring, and when these are nearly full of brood I will raise them up and put another brood-chamber full of empty brood-combs under them, and a super full of empty store-combs above them; and if they do not swarm, and their average of surplus honey is as high as the balance of the apiary, I will put another brood-chamber under every hive.

J. F. MCINTYRE.

Mr. Westcott—I would like to hear from the members of the Union. In our locality the 8-frame hive for comb honey seems large enough. As I said before here, we have no honey-flow to amount to anything until fall; in August or September we get our honey-flow. The colonies have to be kept in condition to catch the flow when it comes. As a general thing along about the first of August I cut out the queen-cells, and it is quite a job to lift the supers and get into the hives; but of course if a person keeps that up, he has it to do every eight days until about the first of September, then they will hardly try to swarm any more. The 8-frame hive seems large enough for this locality; but perhaps California would need larger hives than we would in Nebraska.

Mr. Hatch—Some of you may remember that about four years ago I wrote an article for *Gleanings* in which I said I preferred the 10-frame hive. Dr. Miller, Ernest Root, G. M. Doolittle and all of them jumped on me rough-shod, and tho' I was very busy I had to write article after article, and fairly wrote myself out trying to defend the 10-frame hive. Since that time I have kept bees in Arizona, and have used five different styles of hives. I had some a foot square and a foot deep; some a foot square and 7 inches deep; some after the Gallup style of hive; and then 8 and 10 frame Langstroths. With the same management I could get more honey from the 10-frame than from the others, up until the last extracting; then the honey was stored below more. All were run with a queen-excluder between the extracting-frames and the brood-chambers. Since then I have operated in California with 9 and 10 frame Langstroths for extracting.

E. R. Root—How many stories?

Mr. Hatch—Two and three, according to the strength of the colony. Ernest Root has come over on my side of the fence gradually, and I hope that in three or four years there will be more. I do not recognize any essential difference between hives for comb and those for extracted honey. If you have a good hive for the one, it is a good hive for the other; I mean so far as the brood-chambers are concerned. Management is the whole story. If you have a system of management whereby you can make a success of the 8-frame hive, and reduce the work down to the minimum, stick to it. One man successfully uses a hive the brood-chamber of which is a foot square and 7 inches deep, and gets lots of honey; but my system of management is not adapted to it at all. It depends on whether you "catch on" to the right system of management; there is where the whole secret lies. I can handle a colony better with 10 frames side by side than with 10 frames one above the other. If I get more brood than I want in the hive, I can take some out and give it to a weaker colony. In that system I have less work than with the two-story system. When it comes to the extracting season, pile on as many as you want. In California we need a larger hive for stores than you do in this country, where the winters are more severe, for the reason that they eat more out there in the winter. It takes more stores to carry a colony through the winter in California than it does in Wisconsin, because out there the bee fly a great deal more through the winter, and they get comparatively little to eat at that time.

Dr. Mason—You say this man with the small hives gets large quantities of honey. Where does he get it? By piling up the stories?

Mr. Hatch—Yes, sir; five or six high. He uses a queen-excluder and confines the queen down where he wants her. And while I am up, I want to speak of a scheme that J. H. Martin has. He uses the Heddon hive. This year he put the queen-excluder on and put the queen down in the bottom section. He had lots of honey in his hives. When I visited him last fall he had four supers full on an average on his hives, probably 160 pounds to the colony. Last spring it was thought that there was going to be no honey season at all, but he put the queen in the bottom story and put the excluder above and then went off and left her.

Mr. Danzenbaker—I have spent about 25 years in studying hives. In visiting different fairs, the hives and the exhibitions of honey always attracted me, for I wanted to discover the best hive for my own use. Finally, I combined the good points of several and made my hive. I have settled upon a 10-frame hive, with a capacity equal to the 8-frame Langstroth. It gives more room for sections for comb honey. Take the same capacity in an 8-frame hive and you can put on 24 standard sections; put the same capacity in a 10-frame hive, with the frames $7\frac{1}{2}$ inches deep, and you can put on 32 sections. I put on 100 sections over a hive of the same brood capacity where I could put on but 75 on an 8-frame hive. In California the conditions are of course different. Such men as Mr. McIntyre and Mr. Mendleson, who produced honey by the carload, can judge of the conditions for themselves. They know what they are doing, and can judge what hive to use.

Captain Hetherington has 300 colonies of bees in Virginia this year. He didn't take off a single super of honey. I was in the same vicinity, and I got 2,000 sections of honey from half as many bees. His colonies were strong and hives full of bees, but there was capacity in the brood-chambers for storing honey, and they did it there. He put his supers on, but a man told me he hadn't one super of honey this year. I had a letter from a man in New York who bought one of these hives, and he says, "I have to confess that bees in your hive produced more honey than bees in any other hive in the yard." It is to the difference in the size of the brood-frames that I attribute it.

Dr. Mason—If what Mr. Hatch has said is true, that the system of management is the secret of securing honey, then Mr. Danzenbaker has been fooling away 25 years of his life in trying to find the best hive instead of the best system.

Mr. Danzenbaker—I have mentioned several men who have been using hives for 10 or 20 years, and who have made a success with mine. The only difference is in the depth of the brood-frames and in the sections.

Dr. Mason—Perhaps you throw in some of your enthusiasm with the hive. I use the 8-frame Langstroth hive, piling the stories one on top of the other. I have colonies with three and a half full stories. When I came away, I pulled up the cover and looked in and saw that the top frames were full of honey. I tried to lift some of the hives, but couldn't do it. It has frequently been the case in years past that when I was ready to get the bees prepared for their winter quarters, I found scarcely any honey in the brood-chambers, and then I had to take some and put it below. I am very much inclined to favor the idea that Mr. Hatch advances, that there is more in the system of management than in anything else.

Mr. Hatch—If you had a good 10-frame hive you would not have to bother to put any honey below.

Dr. Mason—I would suggest that Mr. Danzenbaker spend the next 25 years of his life in finding out the best system of management.

Dr. Miller—I have been trying to think when I "jump on" Mr. Hatch, as he says. If he knows what kind of a hive I want, and what size, he knows more than I do. There is one point, however, that I would like to ask about. He says there is no difference at all, except in the management, whether you are working for comb or extracted honey.

Mr. Hatch—I said there was no difference in the hive; that the hive would be adapted to both, so far as the brood-chamber is concerned.

Dr. Miller—Suppose we have a 10-frame hive, with a strong colony, and there comes a time when there is a fall flow; the brood-chamber is about full, and they get more than they would put in the brood-chamber. If I put on sections above, instead of working on the sections I have known times when they would simply crowd the brood-chamber; but if you put on an extracting-super, they would go up and put the surplus honey in the extracting-combs. There is a case where I should think there ought to be a little difference in the hives for one or the other.

E. R. Root—In reference to the 7-inch frame, I talked with Capt. Hetherington at the time of the Buffalo convention. He tried the $7\frac{1}{2}$ and 7 inch frames for several years, and he told me he gave it up. It is in the management. I don't think the 7-inch frame has anything to do with it.

Dr. Peiro—I am satisfied that you boys don't know anything about this business anyway. I once took a jack-knife and a saw and a hatchet and made a hive—a 20-frame hive. You may as well have them big enough while you are about it. I can prove to you by good, reliable authority, right here, that that 20-frame hive was chockfull of honey, and it had all the bees it could hold. I verily believe it weighed 150 pounds. Mr. York and Mr. Abbott tried to lift it, and couldn't. Now, I don't say that I am right always—not always; but I do say that that hive contained better honey and more of it than any hive I have had since. [Laughter.]

ELECTION OF OFFICERS FOR 1899.

Mr. Westcott—I move that we proceed now to the election of officers, and that we put off the balance of our program until that is completed.

The motion was seconded and carried. Nominations being declared in order, Messrs. E. R. Root and E. Whitcomb were placed in nomination. A ballot was then taken and Mr. Whitcomb having received the majority of votes cast was declared elected president for the next year.

Mr. Whitcomb—I thank you for the compliment, and I will try to merit your confidence.

Nominations for the vice-presidency being declared in order, Mr. C. A. Hatch was named and declared elected.

Nominations for the office of secretary were then declared

in order, and Mr. W. A. Selser and Dr. A. B. Mason were named.

Dr. Mason—I wish you would select somebody else. I have tried to work faithfully for you; I never accept any position without trying to do my level best in the work, but I wish you would select somebody else.

Nominations were then closed, and the members proceeded to balloting. Dr. Mason was found to have been almost unanimously re-elected.

Several called for a speech from Dr. Mason.

Dr. Mason—My friends, you know that I can't make a speech; you have had reason to know that in the past two days. But I can say to you that I am grateful for this evidence of your confidence—not for the ballots you have cast for me, nor because you have elected me again, altho I feel that it is an honor to serve you in any capacity. You have before this honored me for two terms with the presidency of the association—something that never happened before that time, except with Mr. Newman. So I feel that this is an expression of confidence that I cannot help but appreciate, and I do appreciate it. I live upon the good things my friends give me, more than I do upon what I do myself; and that is why I appreciate, I think, the good that may come to us all when we realize what He did for us who died to redeem our souls from death.

The convention then adjourned until 7:30 p.m.

[Continued next week.]

No. 6.—The Care of Bees for Wintering.

BY C. P. DADANT.

For eight or ten years past, we have personally abandoned the practice of cellar-wintering, owing to the better success we have achieved, of late, in out-door wintering. I do not know but it would perhaps be best to narrate our experience on this subject to the reader, an experience of 30 odd years, and let him draw his own conclusions.

We began experimenting on in-door wintering in 1865, on a small scale. We had then, perhaps in all, some 20 or 25 colonies, and as we had no cellar worthy of the name, but merely a "hole in the ground" under our log-house in the woods, we concluded the first year to try a clamp, such as had been recommended by German bee-masters, in the *Bienenzeitung*.

We therefore dug a trench of sufficient length to contain all our hives side by side, and deep enough so that the hives might be entirely hidden in it. In the bottom of this trench we laid two 4x4 timbers lengthwise, and on these we set our hives, removing the cap, or cover, and leaving only the honey-board. Over the top of the trench we laid boards that reach about 6 or 8 inches beyond the pit, and on these a layer of straw, roof-shaped, then a layer of earth and another layer of straw and earth; making such a covering as a farmer uses, in many parts of the country, for apples or potatoes. We had previously, however, made four light tubes, by nailing four plasterers' laths together for each tube, which had been placed perpendicularly, two of them reaching to the bottom, and the other two at the upper part of the silo, so as to make a light change of air for the breathing of the bees. The trench was drained by a short gravel drain at each end.

We had very good success, and, encouraged by this, we again put away our bees in this fashion, the following winter. But the winter was very wet this time, and through alternate thaws and freezes, accompanied with rain, the ground became soaked, our drains proved insufficient because they became stopped up by freezing, or for some other reason, and the extreme of moisture destroyed a great proportion of the colonies. I believe that during that winter we lost fully a third of the colonies. This discouraged us in any further attempts at silo-wintering. Yet, we know that the practice is good, and in localities where there is little or no danger of a thaw during the winter, I am sure this would be a very safe method for an apiarist who had no cellar.

In this part of the United States we have now more commodities than formerly, our log-houses have been replaced by convenient homes, the cellar ordinarily occupies the entire space under the house, and it is quite easy to partition off a

portion of it for the use of the bees; but I know there must yet be many parts where they still have to do as we did in the '60's, keep a family in two small rooms, where they cook, live and sleep; put the children in a trundle-bed, and the cows in a straw shed. Then the young fellow had to go a-courting in a wagon, and felt happy if he had only a good spring-seat to take his best girl to church, or to a ball. What would the boys of to-day say of this?

When our log-house was abandoned for a better home (we then used it for a bee-house till the rats compelled us to tear it down), we took special pains to build a large cellar, and partitioned off a portion of it, a space 10x20 feet, purposely for the bees. This special room has two windows, and the walls and ceiling are lined with a sawdust partition to keep the temperature more even. This was the more necessary because we have a furnace in the cellar to heat the house, and it would produce more warmth than needed. We had already wintered enough colonies, in the hole under the log-house, to make sure that a temperature of more than 45° was likely to make the bees restless, while a temperature of less than 40° had the same effect.

There had been some discussion among bee-keepers as to the proper degree, and a few men held that the bees could stand a great deal of heat, while in the cellar, without suffering; one man even went so far as to assert that they would winter in a cellar warmed to a temperature of 70° to 80°, and that he had tried it successfully. This shook the faith of some of our friends, until it was ascertained that this person had just been *guessing* at the temperature of his cellar, and had no thermometer upon which to base his assertions. A good thermometer costs only 25 to 50 cents, and we used one in the cellar, at all times, and my father visited the bee-room hundreds of times during the winter, and found uniformly that the bees were the quietest at 42° to 43°, and that below 40° or above 45° they began to stir.

We used this cellar very regularly for 12 or 15 years (it had been built in 1875), and it invariably happened that the bees wintered best in it during the coldest winters. This is easily understood, for it is much easier to warm up such a cellar than it is to cool it down, when once warmed up, when the temperature on the outside is still higher. In very cold days, if the thermometer registered a lower temperature than 40°, all we had to do was to open the door between the two cellars and a steady increase would at once take place. If too warm, during cold days, a little increase of ventilation through the windows would soon regulate that defect. But when the weather got mild, and remained so for several days, it always proved an impossible task to cool the air enough, with 100 colonies in such a small space, to keep them quiet. We tried a tubful of ice, but the difference made by it was not worth mentioning.

Of late years, we have had comparatively pleasant winters, and have found that, altho we lost but few colonies in cellar-wintering, it was usually preferable to leave the bees out-of-doors, as they breed earlier and run less risk of pillage or spring dwindling. We believe that we are, here, on the southern limit of safe cellar-wintering, and if we lived farther north we would invariably winter the bees in a cellar.

I see that I have not yet given instructions as to when and how to put the bees into the cellar, and will put this off until next week. Hancock Co., Ill.

Eight or 10 Frame Hives—Tall Sections.

BY H. LATHROP.

On page 727, reference is made to Editor Hutchinson's comments on Dadant's articles in *Gleanings* on the subject of large vs. small hives, in which Mr. Hutchinson calls attention to the fact that the Dadants run their apiaries for extracted honey, while it is the comb-honey producers, who, as a rule, advocate a smaller brood-chamber than the Dadants advise. The point is well taken.

I believe Mr. McIntire has also recently stated, on this subject, that "a 10-frame Langstroth brood-chamber is not large enough to prevent swarming, and too large to have a swarm in without contracting." That is the reason I use and prefer an 8-frame hive for comb honey production. I wish to dispense with contracting, so the 8-frame brood-chamber seems to be the best size. If I want a larger brood-chamber I add another story. In running my apiary for comb honey, even in good seasons, I usually have but 33 percent of my colonies cast swarms; this I think is not a bad showing for a comb honey yard.

In the future I do not expect to allow any more increase than enough to repair winter losses. I use the Haddon plan of hiving swarms on the old stand; and instead of allowing

increase of colonies I shall feed the hatching bees back into the working colony, and finally use the combs for hiving another swarm. However, the brood from colonies first casting swarms will be used in strengthening up light colonies until every one has all the brood they can hold.

The past season I tried to have a few colonies build their own brood-combs from starters an inch wide; but I do not like the plan—too much bother. I contracted to five frames, and let them work awhile, then I found they were building too much drone-comb; then I gave to each, one or two frames of drone-comb; this helped matters out, and, finally, when they had finished their combs I took away the drone-combs and filled up with full sheets of foundation.

But I found that colonies hived on full sheets of foundation were ready for work in the sections first, and there was so much less work about it that I decided that as a rule I shall hive on combs or full sheets of foundation. If I want combs built by the bees I will have it done by small colonies, as Mr. Doolittle advises, by crowding the bees on two or three combs. By this plan they build beautiful combs, and I think pay well for their keep and the labor expended on them.

My honey crop this year was about one-third of what it was last, the flow being short, and that only from basswood. I tried the new Ideal super with tall sections, but could not see any advantage in them. When I went to the convention of the Southwestern bee-keepers, I took a well-filled section of each size along, and placing them side by side askt a number of ladies which they would prefer at the same price, and they invariably chose the square section. It seems that in this part of the country the tall section does not take as it does farther east; but I will continue to experiment with it next year.

Monroe Co., Wis., Nov. 18.

Eating Honey and Cream—A Report.

BY A. F. FOOTE.

In the report of the convention at Omaha, I see there was considerable said about honey making some people sick, together with some suggestions as to the possible cause, etc. I used to think that there was only one way that honey could make me sick—that was for the want of it; but 20 or more years ago I learned that I could take no quicker or more certain emetic than to eat honey with *pork* or *pork* gravy; and to this day I will lose my dinner in five minutes if I do it. For a nice, delicate meal—supper for instance—there is nothing, to my notion, that quite equals honey and *cream*, with bread, instead of butter. It just "touches the spot," and, better yet, it stays there.

Do I hear some one say that this is extravagance? On the contrary, my wife says—and I am quite inclined to agree with her—that it is economy, for the same amount of cream churned into butter will not go as far; besides, it saves the churning.

I do not suppose every editor, even of a bee-paper, has an everyday supply of cream, but if "ye editor" will come up to our farm, which "flows with *cream* and honey," I will guarantee him at least one good, square meal of the mixture.*

My bees stored no surplus honey till the last week of June, and during the next three weeks I secured about 30 pounds of section honey to the colony, spring count, of fine quality white clover, Alsike and basswood. Then dry weather came on, and the bees never stored another pound of surplus—no buckwheat or fall honey of any kind. Cold and wet put them back the forepart of the season, and dry weather cut the crop short the latter part.

I secured 25 new swarms, which I put into 15 hives. Now, out of 53 colonies, I find about 25 with sufficient stores for winter, 10 doubtful, 3 dead—one devoured by worms—and the balance with very little honey.

For five weeks, at a critical time, my bees had no care, as Sept. 9 myself and wife went to our old home in Winnebago county, Wis., where we had a delightful visit with old friends and neighbors in that and Green Lake county.

Mitchell Co., Iowa, Nov. 7.

[*Thank you, Mr. Foote, for your kind invitation. We would like to accept, seeing you would furnish us with "a good, square meal," and also "Foote" the bill. If we were "Foote"-loose we would start right off. But as we are not, we will just ask you to be our "proxy," and fill up on that rich diet—honey, cream and bread.—EDITOR.]

See "Bee-Keeper's Guide" offer on page 797.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Using Frames of Granulated Honey.

I am an amateur, working for increase. Last spring my bees had two to three frames of honey left in each hive (some candied) when sprig flowers and fruit-bloom appeared, and the storing of new honey commenced. If the conditions are the same next spring, would I make a mistake to put these frames of honey in another story and fill the brood-chamber with frames of foundation (previous to any bloom)? If not, should the second story be above or below? and should they be uncapped to stimulate breeding? What can be done best with brood-frames filled with candied honey?

WASHINGTON.

ANSWER.—If given the chance, the bees will make closer work than you probably suppose in using up the candied honey. Put it right close to the brood, so that they will be obliged to empty the cells for the queen. It will be no harm to uncapp it. Of course this refers to next spring. If you put it in an empty upper story and fill the brood-chamber with foundation, the possibility is that it may be left over, only to be worse the next year. If there is much of the granulated honey, and it is badly granulated, it is possible that the bees may throw out some of the granules, letting them fall on the bottom-board. You may save these, melting them to feed to the bees. Put an empty story under the brood-chamber, having no entrance at the bottom of the empty chamber, but above, and the granules will be saved, more or less, in the empty story. Probably you can make no better use of brood-combs containing candied honey.

When a second story is added to increase the brood-nest, give it below. That saves heat.

Covering Knots—Quinby Frame.

1. Will you republish the recipe for covering up the knots in hives before painting, so the pitch will not show through?
2. What are the dimensions of the Quinby frames?
3. What size is the hive the Dadants use, and how many frames?

MINN.

ANSWERS.—1. I don't know where to turn to it, but I think it is shellac dissolved in alcohol.

2. The hanging Quinby frame is $18\frac{1}{2} \times 11\frac{1}{4}$. The closed-end or standing Quinby frame is $19\frac{1}{2} \times 11$.

3. The Dadants use the hanging Quinby, with hives to hold 11 frames.

Wants the Best Apiarian Fixtures.

I sold my large apiary last spring, and am now going to start anew. What is the best size hive to use? Also best frame, best frame-spacer, and best size of section? What do you think of the fence-separator and plain section?

Please tell me just what kind of a hive you would use if you were going to start in the bee-business again; just the frame you would use, the section, and all there is to a hive that would suit you best. I make my own hives and frames, and so don't care for standard sizes, nor any supply dealer. I just want your candid opinion.

MICHIGAN.

ANSWER.—If I could wave a magician's wand over all my hives and fixtures and have them changed so as just to suit me, I think I would settle upon the 8-frame dovetail hive. If I were making them myself, I would probably do without the dovetail corners, for I wouldn't have the proper machinery for it.

The frame should be the one I am now using, which, I am sorry to say, is not on the regular list of any hive manufacturer, but there is no regular frame that suits me. If it came somewhat near the mark, I should prefer a frame such as others use. The top-bar of my frame is $1\frac{1}{2} \times \frac{3}{4}$, with a saw-kerf to admit the foundation. The saw-kerf runs the length of the top-bar on the under side, and is $\frac{1}{4}$ inch deep and $5/32$ wide. End-bars are $1\frac{1}{2} \times \frac{3}{4}$. The bottom-bar is in two parts, each $17\frac{1}{2} \times \frac{1}{2} \times \frac{3}{4}$. The second part of the bottom-

bar is nailed on after the foundation is put in, the foundation being cut $\frac{1}{8}$ inch more than the inside depth of the frame. That allows $\frac{1}{4}$ inch to slide into the saw-kerf of the top-bar, and $\frac{1}{2}$ inch to be between the two parts of the bottom-bar. The outer dimensions of the frame are the regular $17\frac{1}{2} \times 9\frac{1}{2}$. The lug or projecting end of the top bar is $\frac{1}{2}$ inch, the frame being spaced endwise by a staple driven in the end-bar under the lug, the staple projecting $\frac{1}{4}$ inch.

For spacing the frames one from the other, a common wire nail is used as a spacer, the nail being $1\frac{1}{2}$ inches long, with a head $3/16$ to $\frac{1}{4}$ inch across. A nail specially made with a head $\frac{1}{4}$ inch thick, so that it could be driven automatically to just the right depth would probably be better, but such a nail cannot be had. Four such nails are driven in each frame as spacers, two on one side at one end, and two on the other side at the other end. As you hold up the frame before you with one side of the comb facing you, the two nails at the left end face you, and the two nails at the right end are from you. The upper nail is driven in the top-bar, about half an inch from its upper edge and half an inch from the end-bar. The lower nail is driven in the end-bar about $2\frac{1}{2}$ inches from the bottom of the frame. I do not recommend this frame as one that will suit every one, as I know of no one else using it, and I have been using it only two years. If my bees didn't use any propolis I might like the Hoffman as well.

I should want to do some experimenting with the Ideal super and deep section so as to decide whether to adopt that, or the T super with sections $4\frac{1}{4} \times 4\frac{1}{4}$.

The failure of the honey crop last season prevented a trial of the fence and plain section, so I have no practical knowledge of them.

It isn't a certain thing that what would suit me would most surely suit you. If I didn't have to haul bees back and forth to and from an out-apiary, I wouldn't care so much for a hive so small as the S-frame, and I don't think I should be willing to use so small a hive if I couldn't use two stories at least part of the time.

A Queen Experience—From 12 to 50 Colonies.

1. About 40 days ago I attempted to introduce an Italian queen (after killing the black one) in the shipping-cage. The other day I saw a floe black queen alight at this hive and march in. As there have been no drones for some time, what would be the outcome, or what is the best thing to do with this colony, considering the time of year (Nov. 25)?

2. With a good season, would it not be possible to increase a dozen good colonies to 50 by using foundation and laying queens for nuclei? KANSAS.

ANSWERS—1. Let it alone till next spring. You may find it with a laying black queen.

2. Yes, it's possible, but look out! It's also possible to have 50 colonies so weak that you'll not have 12 left the following spring.

Several Questions on Management.

1. Why should all uncap honey be extracted from the brood-chamber before packing for winter?

2. I want to try the double brood-chamber plan next season, as practiced by you. Can I use foundation in the added brood-chamber (as I have no extra combs) to good advantage, or will I have to procure combs?

3. When you wish to add but two or three frames in the lower story, how are they arranged? Do you fill the vacancy with dummies, or just leave the space vacant?

4. I have had bees but two seasons, and I find that both years they began to swarm in the latter part of April, and the prime or first swarm also; the old colony would swarm again about the middle of June, which is about the middle of the white honey-flow. Is this as it should be? If not, how am I to avoid it? Would not adding the extra brood-chamber keep back the first swarming till about the first of June, when they could be hived ready for the white honey-flow, which came the 5th to the 10th of June? I have no trouble with after-swarms, having had but one.

5. If you knew that the honey-flow that you wish to go into the sections would come on a certain day, how long before that day would you wish your bees to swarm?

6. Do you use queen-excluders on your newly-hived swarm? If so, how long do you let them remain on after hiving? TENN.

ANSWERS.—1. It is somewhat doubtful that many extract all unsealed honey before going into winter quarters. Those

who do so probably give as a reason that the unsealed honey is more inclined to become thin and sour than that which is sealed. It is probably thinner in the first place than that which is sealed, and has the chance to attract moisture from the air better than if sealed. Without question, the thick, sealed honey is better for wintering, but a large amount of it is not always, if often, present, and when only a small amount of honey is unsealed it may not pay for the trouble to remove it.

2. Foundation may do in the lower story, but the bees will be a little slower to work down in it. If the colony is strong, it might work well to put a frame of brood in the lower story and put a frame of foundation in its place in the upper story. Of course this should not be done till the queen has fully occupied all the room in the one story.

3. You may put two or three frames where you please in the lower story, having them together and under the combs fully occupied with brood, with a dummy next the frame on the vacant side, or if the frames are in the center putting a dummy next the vacancy on each side. There will be no immediate need of filling the vacancy with dummies, but after the frames or combs below are well occupied there is a likelihood that the bees will commence building in the vacancy.

4. It would be hard to say positively just what would be the result, but the thing is well worth trying.

5. I don't know. I'm inclined to think I should want all the swarms that issued to come just when the flood of honey came.

6. It is so seldom that I have a natural swarm that I can hardly tell what my practice would be, but I think I should prefer an excluder and the supers to be put on at once, the excluder to remain at least three or four days. If no excluders are used, it is better not to put on supers for two or three days after hiving.

Questions on Sweet Clover.

1. You recommend white sweet clover for honey and for impoverished land. I have a lawn of about 10 acres at my summer residence on Cape Cod, where, also, I have several colonies of bees. Two of these are in the roof of a building, and from one of these I take about 50 pounds of honey every fall, cutting it from the rafters. It is always very thick and rich, but quite dark-colored. There are quantities of milkweed and bouncing betts in the vicinity—do these account for the color?

2. The edges of my lawn, as well as my kitchen-garden, seem to be running out—the sod is sandy. In reading your remarks on the sweet clover, it occurred to me that I might improve my land and the color of my honey at the same time. Do you know how this clover does in this location and soil?

3. When ought it to be planted?

4. Ought the ground to be fertilized when the clover is planted?

5. How does the clover improve the land unless it is left uncut and plowed under?

6. Do you consider it better for the land and the bees than the white clover we have here?

7. How much seed would I require to the acre, and what is the price? MASS.

ANSWERS.—1. I don't know the color of honey obtained from milkweed or bouncing betts, but have an impression milkweed honey is amber. A patch of considerable size of bouncing betts is right beside my home apiary, but I have never seen a bee at work on it. The dark color may not be due to the source of the honey. It may be that it is only the comb that is dark. That might be because the comb is cut from below, where it becomes dark sooner than if stored above the brood-combs. If a comb is cut on a plate, and the honey that runs out on the plate is light, then the thing to do in order to have light honey is to take the surplus by some modern plan.

2. The fact that sweet clover flourishes over almost the whole United States points to the strong probability that it would do well with you.

3. It can be sown any time appropriate for sowing other clovers?

4. Yes, your understanding is correct.

5. It might make a stronger growth for being fertilized, but will succeed without.

6. Like all the clovers, it takes nourishment from the air.

7. Probably much better for the land than white clover, and it will probably produce a good deal more honey to the acre than white clover.

8. It will do to sow the same as your farmers sow red clover, or it will do to use half as much seed, as it will spread out. The price is shown on page 795.

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of beekeepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. DECEMBER 15, 1898. NO. 50.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The American Bee Journal for 1899.—

About this time of the year many high-class periodicals tell something of their plans for the coming year. Many of them issue special circulars calling attention to the principal attractions that are in store for their readers during the next twelve months. This is all very well for papers that have much competition to meet in their own field, but we think that bee-papers need hardly do that just yet.

We are inclined to feel that the readers of the American Bee Journal are well satisfied that they always get more than their dollar's worth each year they read it; and also, that they are fairly well assured that when they renew their subscriptions again they will get another year's copies filled with good things on the subject of bee-keeping.

We feel that the American Bee Journal recommends itself pretty well. Its correspondents are among the most successful bee-keepers in the world. With one possible exception its various departments are not excelled anywhere in the present-day literature of bee-keeping. Its editor does not ask beekeepers to subscribe for it because of his own superior personal attainments or qualifications, but because the contents of the American Bee Journal are just exactly suited to the needs of any one and every one who desires to make the greatest success of bee-keeping. Its editor does not claim to know as much as all the rest of the bee-keepers in Christendom put together, and never expects to do so; but he does claim to know at least a little about getting up a fairly good bee-paper *every week in the year*—something that no one else does in this country at the present time.

We do not want any one to continue to subscribe for the American Bee Journal unless he feels that it is worth all and

more than the bare subscription price of one dollar a year. As soon as it reaches the point where it is not worth the price asked for, it ought to die—just as have many other bee-papers that existed for awhile and then dropt down and out.

We hardly need to say that the past clean record of the old American Bee Journal is its best guaranty for the future. It will be our earnest endeavor hereafter, as heretofore, to publish a paper that no real bee-keeper can afford to do without. Thousands have found it to be invaluable, and we expect that thousands more will continue to find in its columns the very information necessary to the largest success in the care and management of bees.

Mr. P. H. Elwood, of Herkimer Co., N. Y., has been nominated as a candidate for election on the Board of Directors of the United States Bee-Keepers' Union. We most heartily second that nomination. Mr. Elwood is one of the very best men in all beedom, as well as one of the most extensive bee-keepers, and ought to be on the Board.

The "**Golden**" Method of producing comb honey will be fully described in the American Bee Journal in 1899. We have invited Mr. Golden to tell our readers all about it, and he has already sent in some of the manuscript on the subject. He is receiving many strong testimonials endorsing his methods. The articles will likely appear every other week until the "Golden" honey-story is told.

Bee-Notes in Agricultural Papers.—Reports from all over the country indicate a good crop of honey. Bees have done well, and the yield has been large." Reading thus far at the beginning of "Farm Bee-Keeping," in the Modern Farmer and Busy Bee, the question arose, "Has Editor Abbott lost his level head and gone clean daft?" Further reading showed, however, that he was only quoting from the "Bee-Notes" of a prominent agricultural paper to show how unreliable such notes too often are.

If the agricultural papers would read their apiarian exchanges they wouldn't make such "breaks" as the foregoing.

Dried-Up Foul Brood.—We have received the following from Mr. R. L. Taylor, of Lapeer Co., Mich., in response to Prof. Cook's request on page 737:

FRIEND YORK:—In your journal of Nov. 24, 1898, Prof. Cook wishes me to respond to a query about the dried remains of foul brood. You will find my reply in the Review for December, 1897, page 314, first paragraph.

As to the hives of diseased colonies, I have found it entirely safe to use them without boiling or other disinfecting, tho if one should be daubed with honey I should wash it off carefully. As ever yours, R. L. TAYLOR.

The Bee-Keepers' Review paragraph referred to by Mr. Taylor in the foregoing, reads thus:

"I just said there is no foul brood without ropiness, but this must not be taken too literally. That was said with reference to the stage during which the matter remains soft. After a few weeks the matter of each dead larva dries down and lies spread on the lower side—not the bottom—of the cell, a brownish black scale of the thickness of a man's thumb-nail. This peculiarity is of great use in making a diagnosis of the disease at some seasons of the year, as in the fall or in the spring, in the combs of a colony which has perished during the winter, as colonies affected with foul brood are very liable to do. Soon after the breeding season is over these scales are about the only evidence of the disease that remains in a strong colony, as the cappings of the diseased cells are apt to be cleared away, but in a weak colony the discolored, defective cappings largely remain. It seems to be beyond the power of the bees to remove these scales, so if foul brood has been present they remain to reveal it if one will take the proper course to discover them. This is best done in this way: Take the comb by the top-bar and hold it so that a good light falls into the cells at an angle of about 70° or 80° from the top of the comb, while the sight falls upon the cells at an angle of about

45. The scales if present will be readily discovered lying as already described, reaching almost to the margin of the lower side of the cell. I consider this a very sure method of diagnosis, tho in one or two cases I have seen similar scales where the death of the brood resulted from other causes."

A Pure Food and Seed Conference for Illinois was called to be held at Champaign, Dec. 13. Among the dozen persons signing the call we notice the name of Mr. J. Q. Smith, President of the Illinois State Bee-Keepers' Association. The call reads as follows:

The extent of adulteration of foods and seeds with cheaper, inferior, or worthless, and often with harmful ingredients challenges the attention of all classes of citizens.

The practice of substituting inferior articles in place of standard goods, or of introducing the same in packages and under names closely simulating those of well known excellence, not only works confusion of trade names and values, but results in gross injustice and loss, if not injury to the consumer; it embarrasses the retail dealer; it tends to drive honest goods out of the markets and to demoralize trade.

In general, the purchaser is unable to detect either the nature or the extent of the fraud, which, enjoying the advantage of name and brand of better goods, is able to sell at a price that will yield enormous gains and yet that will cancel the profits of the honest manufacturer of, and dealer in, standard goods.

The sale and use of wholesome food whether cheap or costly should not be discouraged or hampered, but the time seems ripe for such legislation as shall insure that things shall be sold for what they actually are, that the purchaser may know the exact nature of what he buys, and be protected against positively worthless or harmful ingredients.

The matter is one that touches the health and pocket of every citizen, and legislation looking toward control should not be in the interest, or at the instigation, of any one business or class of citizens, but for the benefit of all.

For the purpose of discussing the situation and of considering the step which should be taken to secure effective and reasonable legislation directed to this end, the undersigned unite in a call for a conference of all citizens and organizations interested, the same to be held at the University of Illinois, Dec. 13, 1898, commencing at 9 o'clock a.m.

Then follow the signatures referred to. Mr. Smith, representing Illinois bee-keepers, has appointed the following as delegates: Dr. C. C. Miller, C. P. Dadant, Jas. A. Stone, and the editor of the American Bee Journal. We regret very much that we were unable to attend. It is utterly impossible for us to leave our office at this time of the year. We trust that something of definite value was done. There is great need of pure food legislation in this as well as many other States.

MRS J. J. GLESSNER, of Chicago, has handed us \$2.00 to be placed in the Langstroth Monument Fund. Mrs. Glessner is a prominent society lady here, having her bees in New Hampshire, at her summer home. She is greatly interested in the subject of bee-keeping.

MR. G. M. DOOLITTLE, of Onondaga Co., N. Y., has met with a most painful accident, we regret to learn. When sending us his December article for the Bee Journal, on the 7th, he wrote as follows:

DEAR BRO. YORK:—I had expected to be prompt in sending this last article, sending on the first of the month, but through a fall I sustained one or two broken ribs, and I have found them the most painful, if not the most inconveniencing, of any injury sustained in my life, which has been full of accidents and broken bones. I have scarcely drawn a breath, during eight days, but what has been one of misery. I am now bound up so tight I can hardly draw a full breath, and

find that it gives some relief to the pain, caused by the rising and falling of the chest at every breath, which acts directly on the ribs. I was booked to address the Ontario bee-keepers at their convention Dec. 7 and 8, but had to cancel the engagement, and am staying in-doors the most of the time.

Painfully yours,
G. M. DOOLITTLE.

We hope Mr. Doolittle will speedily recover from his severe injuries, and be as sound as he was "before the fall"—of Doolittle.

MR. R. REYNOLD JONES, Secretary of the Vere Bee-Keepers' Association in Jamaica, W. I., wrote as follows Nov. 24:

"If we get some fair weather I suppose we shall have a good honey crop. Bees have commenced swarming in some localities."

MR. A. FRITCHMAN, of Cedar Co., Iowa, when renewing his subscription lately, wrote:

"I suppose I am one of the oldest subscribers to the American Bee Journal, as I have been taking it without interruption ever since Mr. Wagner's time."

Mr. Samuel Wagner was the founder of this journal, in 1861. He died in 1872.

MR. THOMAS G. NEWMAN, of San Francisco, Calif., General Manager of the National Bee-Keepers' Union, wrote us Dec. 3 that he was in quite ill-health, suffering from la grippe and malaria. He says the heavy fogs there give to nearly everybody colds and rheumatism—a hard climate. We trust Mr. Newman will soon be himself again. It surely is not pleasant to suffer so anywhere, and especially in a part of the country (California) that has been boomed so highly for its glorious climate!

W. C. Gathright thinks it more important to have separators come $\frac{1}{4}$ -inch below top of sections than to have passages in center of separators; has never seen sections bulged at top, and bees finish up honey and seal top row of cells better than with separators that come to top of sections. I'm anxious to believe he's right, and I think he is. [Notwithstanding I have been on the other side of the fence, and that very recently, enough testimony has come in to convert me to the belief that it is important to have the separators drop $\frac{1}{4}$ inch below the top of the sections. Our fences for 1899 will be narrow enough to allow this space above and below.—Ed.] Gleanings.

Honey the Best Food for Bees.—To every animal belongs its appropriate food, and for the bee, honey is the food destined by Nature, says W. Skarytka, in Deutsche Ill. Bztg. The bee-keeper deceives himself who thinks sugar is equally good. Honey, and good honey at that, is and always will be the most natural and the best for bees. In emergency, sugar may be used as a substitute, but bees wintered entirely on sugar will not accomplish as much the next season as those wintered on good honey. Honey is directly assimilated, and contains some matters not found in sugar, while the cane-sugar must be inverted by the bees, thus taking their strength at a time when the fullest repose is desirable.

Poor Queens Result from Simply Removing the Queen.—Dr. Miller having maintained that bees made queenless would not make the mistake of rearing a queen from larvæ too old for the purpose, Mr. Taylor, in the Bee-Keepers' Review, thinks his arguments unsound, and is confirmed in that view by his own experience. He says:

"Many a time have I seen the bees beginning attempts to make queens out of larvæ almost old enough to be capt over; and many a queen produced from such larvæ having one or more of the characteristics of the worker have I examined."

"Editor Hutchinson, who has had a large experience in rearing queens for market, says his experience has showed very clearly that poor queens usually result from simply removing a queen and allowing the bees to make their own selection of larvæ for queen-rearing. They are then placed in a

position in which nature has never placed them; and in their inexperience it is not surprising they should make mistakes. Henry W. Brice, who has devoted many years to queen-rearing, says in the *British Bee Journal* that he has proved beyond a doubt that if the bees are left to work their own sweet will in a case of deprivation of their queen, the successor will—saving accidents—be a queen of inferior quality.

Number of Worker-Cells to the Square Inch.—E. G. Money, in *Southland Queen*, pokes fun at L. Stachelhausen for carefully showing how to figure the exact number of cells to the square inch, intimating that the amount of honey in a square inch will be the same, no matter what the size of cell. Mr. Stachelhausen replies that the amount of bees reared will not be the same. It is a fact that for many years 50 worker-cells were counted to the square inch, just because no one took the pains to figure out carefully that about 57 cells would be in a square inch of comb, counting both sides. This would make a difference of about 1,000 in the number of brood that could be reared in a frame. It is a good thing to be somewhat exact in our knowledge.

Buckweed of South Africa.—“The peculiarity of this plant is that it only flowers at intervals of seven years, or thereabouts. Its scientific name, for which I am indebted to a botanist friend, is *Ecteinanthus origanoides*, order *Acanthaceae*, and it grows in the bush along the coast, and, under ordinary circumstances, serves as food for buck and cattle, and hence, no doubt, its name. The flower somewhat resembles the nettle in shape, and is white touched with purple, and is so plentiful that the brush has the appearance of being

covered with a slight fall of snow, extending for several hundred miles. The pollen is quite white; the bees, catching it in the head and thorax, pour in as white as millers, and the cappings of sections are very fine. The plant dies off completely after flowering, coming up the following spring as quite a small weed, and gradually enlarging until the seventh year, when it is a good-sized shrub, when the flowers again appear. The honey is of excellent quality, being a fine amber, very clear and thick.”—*British Bee Journal*.

Small Hives.—While Mr. Dadant is singing the praises of large hives in *Gleanings*, Mr. Doolittle comes to the defence of small hives in the same paper. The latter uses a Gallup hive with nine frames, these nine having the capacity of 6¼ Langstroth frames. With these he secured each year between 1872 and 1883 from each colony, spring count, an average of nearly 100 pounds of comb honey, a record that he thinks was never equaled by any of the large-hive advocates. While it takes more labor with the small hives, the extra yield pays well for it. He had no more swarming than with 10-frame Langstroth hives, and there was no material difference in the size of the swarms. Sections are put on as soon as any honey comes in from the field, and the combs are manipulated till the whole nine are solid full of brood and pollen. Thus the best queen is entertained to her full capacity, and no larger colonies could be obtained with 100 Langstroth frames. The editor suggests that locality makes a difference as to management, and quotes S. A. Niver, 17 miles distant from Doolittle, as saying, “Doolittle’s methods may be all right for his locality, but they would not answer at all in this vicinity.”

TO BE GIVEN TO OUR READERS

\$150.00 IN PRIZES

FOR GUESSING THE NUMBER OF DOTS BELOW:

To those who
Are in Arrears.

As an offer to you UNTIL JAN. 1, 1899, you may pay us what you owe on your back subscription, and add \$1.00 for next year (1899). This will entitle you to guess on the number of dots in the Puzzle Diagram and compete for the \$150.00.

COPYRIGHTED

To those
Who are Paid Up

To January 1, 1899,
or beyond.

As an offer to you, UNTIL JAN. 1, 1899, you may pay one year in advance on your subscription (send \$1.00). This will entitle each one of you to guess on the number of dots in the diagram, and thus compete for the \$150. NEW subscribers for 1899 can also come in on this offer, by sending the full subscription price for 1899—\$1.00.

In these days of Gifts and Bargains there is no reason why a bee-paper shouldn't be as liberal as other concerns, and the *American Bee Journal* has determined to show that it means just what it says. We are going in step right to the front with the biggest and best offer that we can make our subscribers. It means that we will give outright to those guessing the number of dots on the above diagram (as above noted) \$150 in cash and other prizes.

THE \$150.00 WILL BE DIVIDED AS FOLLOWS:

To the one guessing the exact, or nearest the exact, number of dots in the above diagram, we will give \$50. To the one making the next best guess we will give \$25.00; to the next, \$10.00; to the next, \$5.00. And to the next 60 we will give each a **Globe Bee-Veil**, valued at \$1.00. In case two or more guesses are exactly the same, we would divide the cash prizes between or among them. The names of the winners will be published in the *Bee Journal*, and receive their prizes, as soon after Jan. 1, 1899, as they can be determined.

Remember, the time Expires Jan. 1, 1899.

Sweet Clover

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

| | | | | |
|----------------|-----|--------|--------|--------|
| Sweet Clover | 5lb | 10lb | 25lb | 50lb |
| Alsike Clover | .60 | \$1.00 | \$2.25 | \$4.00 |
| White Clover | .70 | 1.25 | 3.00 | 5.75 |
| Alfalfa Clover | .80 | 1.40 | 3.00 | 5.00 |
| Crimson Clover | .60 | 1.00 | 2.25 | 4.00 |
| | .55 | .90 | 2.00 | 3.50 |

Prices subject to market changes.

Add 25 cents to your order, for cartage, wanted by freight.

Your orders are solicited.

GENERAL ITEMS

A Successful Beginner.

To me bee-keeping has proved a most pleasurable recreation and profitable investment. I commenced only last spring by buying some standard books on bee-keeping, and one colony of bees. Later on I subscribed for the American Bee Journal. The bees increased to three strong colonies, with ample stores for the winter—about 40 pounds of honey for each, after yielding 148 pounds of surplus honey, mostly basswood, with some goldenrod in the fall. I consider this a good showing for my bees and for a locality whose people are sometimes accused of using North Poles for firewood.

WILLIAM MUNCH.

Polk Co., Minn., Nov. 30.

An Old Bee-Keeper's Report.

From my boyhood days I have had a fondness for bees. I have owned and cared for them every year for 65 years, first in the straw skep, then came the box-hive, next the Week's chamber hive, then the 10-frame Langstroth hive. The last named is what I use, and will continue with until I find something better. I winter my bees in a dry cellar, and run for comb honey. I keep from 40 to 100 colonies. I let each colony swarm but once during the season. I am sure to keep them strong. I never have any to abscond. When I get more than I want I sell or double up. I am living in the city at this time, and have not room for more than 30 or 40 colonies. The past was not a good season for honey. My average was 40 pounds, spring count. I make my foundation, and keep out of the page of "blasted hopes." I am well pleased with the American Bee Journal.

JOHN CLINE.

Lafayette Co., Wis., Dec. 2.

Very Poor Season.

Bees did very poorly the past season in this part of the country. I have 39 colonies, and got only about 200 pounds of honey, and enough to winter on besides. There was plenty of white clover, but the bees didn't work on it much. The fall before, the old clover was all killed by the drouth, and I don't think the clover from the seed the first year has much nectar in it. We are looking for a better season next year. We had fall rains.

Darke Co., O., Dec. 1. NOAH THOMAS.

Getting All Sections Well Filled.

As soon as the honey harvest begins, I commence to put the supers on with nearly full sheets of foundation in the sections, with a few sections that have been left over from the previous year that were partly filled out, which I had fed back to weak colonies. With these the bees will go right to work.

As soon as the first super is two-thirds or about full, place the second super on top of the first one, not under, and so on, and you will get better filled sections and not quarter as many unfinished sections as you will by raising up the first super and placing the second one over the bees. One man can put on twice as many in an hour; besides, he doesn't need any veil or use any smoke. I had three supers on one hive, and they were on until fall, when I took them all off together, which were clean and nice, well ripened, and not traveled-stained a particle. My hives are the 9 frame Langstroth, which I prefer rather than the 8 or 10 frame.

"Why do swarms go west?" has been asked a number of times. Here they go southwest mostly, but sometimes north. I never lost but one swarm that went north. I have taken bees out of five trees this fall, and saw but one that the combs were across

MAKE 'EM LAY

double the eggs in the middle of the winter, when eggs are worth the most money. Hens do that when fed on green cut bane. It's best prepared by

DANDY GREEN BONE CUTTERS.

Made with or without gear. Cut clean, fine and easy. Can't be choked. Largest line made. Ask for what you want. Catalogue and prices free. Stratton & Osborne, Box 21 Erie, Pa

Please mention Bee Journal when writing.

Save Half Your Feed

by cooking the other half. Experienced feeders know that this problem works out to a surety. This is not the only gain in cooking feed however. **All cooked feed is digested** by the animal economy, and none of it passes through whole. Young things grow more rapidly and mature stock fatten more quickly on cooked feed.

The ELECTRIC FEED COOKERS

are undoubtedly the best for preparing the feed. Made from the best gray iron castings, lined with steel plates, with special enameled steel boilers. Three styles, five sizes, 25 to 100 gals. capacity. We publish a **FREE BOOK ON FEED COOKING** which tells all about these and deals extensively with the subject of stock feeding. Send for it.

HONEY * FOR * SALE.

Best White Alfalfa Extracted...

IN 60-POUND TIN CANS.

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can hardly get enough of the Alfalfa extracted.

Prices are as Follows:

A sample by mail, 8 cents in stamps, to pay for package and postage. By freight—One 60-pound can, 8 cents per pound; 2 cans, 7 $\frac{1}{4}$ cents per pound; 4 or more cans, 7 $\frac{1}{8}$ cents per pound. Cash must accompany each order.

Best Basswood Honey in Barrels.

We have a quantity of finest basswood honey in barrels, weighing 350 pounds and upward, which we will ship f. o. b. Chicago, at 7 $\frac{1}{2}$ cents a pound. Sample mailed for 8 cents. If desiring to purchase, let us know, and we will write you the exact number of pounds in the barrel or barrels, and hold same till you can send the cash for it by return mail.

Our honey is **ABSOLUTELY PURE BEES' HONEY**, the finest of the kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand the past season, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

the entrance; that was a large one of pure golden Italians, having about 80 pounds of liquid honey. In felling the tree it all smashed together—bees, comb and honey. That honey had no bad taste, or sickish, but was the best I ever tasted.

I put three small swarms into one hive, which were taken from the woods simply by smoking all together. Now they are a nice, strong colony, with stores enough for winter.

My bees are wintered on the summer stands, with a chaff cushion on top of the hives and set in a large box with fine hay or straw packed all around, excepting the front.

I will sell my honey at the stores, and what I can at the houses, for 20 cents a section. I have taken the premiums for the last three years at both town fairs here.

J. M. HARDING.

Knox Co., Maine, Nov. 30.

No Swarms and No Honey.

I started last spring with 31 colonies, got no swarms and no honey, but have bought 500 pounds of comb honey and two 60-pound cans of extracted, and have sold it all, and will sell a good deal more if I can get fancy comb at a fair price.

I like the American Bee Journal very much—can't do without it. If I don't get any honey, and have to feed my bees, I can sell honey all the same, even if I have to buy it.

GEORGE W. SHEARER.

Stark Co., Ohio, Nov. 21.

Only About Half a Crop.

I cannot keep bees without the American Bee Journal. I am wintering 130 colonies this winter—100 in chaff hives well packed with clover chaff, and 30 in the cellar. The bees did not store a pound of honey after the basswood stopt blooming. I got 6,000 pounds of basswood honey—only about half a crop. A total failure is something we have never had in this locality.

This part of the country is well stocked with bees now. I dare say there are at least 1,000 colonies within 10 miles of me. By the first of next June there will be about half that number, on account of the bees not breeding up this fall.

F. B. FARRINGTON.

Page Co., Iowa, Nov. 26.

Bees as Big as Turkeys.

The following story if nothing more is a true one, and I have seen worse ones published in bee-papers:

THE BEES OF EUROPE.

Mr. O'Flarety (viewing a modern apiary) — "Yes, but the bees in the old country are as big as—as—turkeys."

Bee-keeper—"As large as turkeys?"

Mr. O'Flarety—"Yes, as large as—as—turkeys."

Bee-keeper—"How large are the hives?"

Mr. O'Flarety—"Just the same as yours."

Bee-keeper—"But how do they get in?"

Mr. O'Flarety—"That is—is—the bees' business!"

A. L. THOMPSON.

Winnebago Co., Ill.

Taken a New Hold.

The "Old Reliable" is still coming, not once a month, but every week. What a volume for only \$1.00!

Now, as my bees are "put to bed" after a hard and busy season of work is over, and the "bed-quits" have been drawn snugly around their ears, I will tell what the bee-paper has done for me. Altho we do not hear anything from this part of the Sunflower State, don't imagine for a minute there are no bees here.

A year ago I concluded to make my second start with bees (as I had kept bees in Iowa and Nebraska when I was young). I purchased a colony of blacks in an old box; after transferring they swarmed, and the two gave me 100 pounds of comb honey. During the winter I found I had taken off

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us **Two New Subscribers** to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

one of the queens in a honey-box. Last spring I had one good colony, and another almost petered out, but a new queen and careful handling brought them out all right. This colony gave 72 full sections of comb honey. I bought four colonies, and now have 13, all strong, in regular Langstroth hives, and got 500 pounds of comb honey.

We winter bees on the summer stands. About 40 days ago I introduced an Italian queen in a black colony, and thought all was well until the other day, while watching that colony, a fine black queen alighted and marched in. I think she has been flying out in search of a mate for a good many days, and as there have been no drones for some time, somebody will get an order for a queen quite early in the spring.

We had quite a blizzard last Monday, with the mercury down to zero.

I think every bee-keeper in Kansas should take the "old reliable" American Bee Journal.

S. HARTER.
McPherson Co., Kans., Nov. 25.

Honey Crop Mostly a Failure.

The honey crop was mostly a failure in this part of Missouri. Bees are not in as good condition as they should be, as they are weak in numbers, and some will have to be fed. Clover prospect is good for another year.

P. P. COLLIER.
Audrain Co., Mo., Nov. 20.

A Report for 1898.

My report for 1898 is not encouraging. My apiary consists of 8 colonies, 3 of which stored 20 pounds of surplus honey, and the other 5 have enough to winter on. The 20 pounds of honey was gathered from the quaking-asp bud. It is black and bitter. Only one of my colonies cast a swarm, so I haven't had much fun living swarms.

My bees are hybrids, and all colonies are strong. I am just beginning in bee-keeping, but with the aid of my bees, a good text-book, and the "Old Reliable," I hope to make a bee-keeper, some time.

JOHN F. SAUTTER.
Stark Co., Ohio, Dec. 5.

Results of the Past Season.

I like the American Bee Journal ever so much. I could hardly get along without it. I also like the short method of spelling in it.

Bees came through last winter better than ever before. I had 9 colonies, spring count, increased to 14, all strong with the exception of 2. Some colonies stored 55 pounds of surplus honey; others not so much. I use the 8 and 10 frame Langstroth hives, and like them very much.

GEO. O. RENNER.
Carroll Co., Ill., Dec. 4.

No Surplus Honey.

I had 6 colonies of bees during the past season, but they did very poorly, giving no surplus, and part of them have not sufficient stores for winter.

Give us all the information you can on the bee and honey business of Cuba, as no doubt some of our apiarists will investigate if Cuba comes under United States control.

L. G. PURVIS.
Buchanan Co., Mo., Dec. 5.

Winter Cases.

I have constructed a cheap and durable winter-case of dry goods boxes, made of 1/2-inch pine lumber, costing about 10 cents each, or 70 cents for seven boxes, enough for 11 cases. The box material is cut into pieces 25x22x18 inches high, for a 10-frame hive, which makes 2 1/2 inches for the ends and 3 inches for the sides, with plenty of room for packing on top. The covers are gable, and shingled with shingles costing from \$2.00 to \$3.50 per thousand; one bunch of 250 shingles will cover six, by cutting the first layer in two, and using the top of

THE "NOVELTY" POCKET-KNIFE

GEO. W. YORK,
CHICAGO, ILLS.

Your Name on the Knife.—When ordering, be sure to say just what Name and Address you wish put on the Knife.

The **NOVELTY KNIFE** is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed an **AMERICAN BEE JOURNAL** reminder, and on the other side, name and residence of the Subscriber.

The material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring steel, and the finish of handle as described above. It will last a lifetime, with proper usage.

Why purchase the Novelty Knife? In case a good knife is lost, the chances are, the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your pocket KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a Christmas, New Year or birthday present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, a lady to a gentleman, or vice versa, a son to a mother, a husband to a wife, a brother to a sister or a gentleman to a lady—the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid, for \$1.00, or give it as a Premium to the one sending us three new Subscribers to the BEE JOURNAL (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book "Bees and Honey." We club the Novelty Knife with the BEE JOURNAL for one year, both for \$1.90

Any Name and Address Put on the Knife.

GEORGE W. YORK & CO.,
CHICAGO, ILLS.

the single first, and the butt for the last layer. This makes a cover that does not leak. The odd pieces cut from the sides and ends of course can be nailed to the cleats on the bottom-board (I use a loose bottom-board), and makes a packing for the bottom. I have wintered my bees thus for two winters with good results.

F. E. WHITMAN.

Cayuga Co., N. Y., Dec. 3.

A Beginner.

I am a beginner in bee-keeping, getting my first swarm last spring. I increased to 4 colonies, all by natural swarming.

IRA LUBBERS.

Sheboygan Co., Wis., Dec. 5.

Bees in Good Condition.

Bees were placed in the cellar for their 5 months' winter nap Nov. 22—about a week later than usual. Most of them were in good condition.

The best apparatus for liquefying candied honey, in my opinion, is a hot buckwheat cake.

JOHN ATKINSON.

Crow Wing Co., Minn., Dec. 5.

Report for 1898.

I wintered 18 colonies in good shape in a cellar. The spring was quite late, so I did not take the bees out until about the middle of April. I commenced feeding soon after taking them out, and fed every day until clover began to bloom. I used the Boardman entrance-feeder. I like it very well except that sometimes the feed will run right out, no matter how level you get it. I fed 100 pounds of sugar and 50 pounds of honey.

I got 400 pounds of extracted and 200 pounds of comb honey. Our honey is all white clover and basswood, there being no fall flow. I increased to 27 colonies, which I put into the cellar Nov. 30. Some were a little light, the ones I extracted from.

The honey crop here was very poor. There are quite a number of bee-keepers around me, and some of them didn't get a pound of surplus.

G. H. FREY.

Linn Co., Iowa, Dec. 6.

Convention Notice.

The 32nd semi-annual meeting of the Seneca County Bee-Keepers' Association will be held at K. O. T. M. Hall in Romulus, N. Y., Thursday, Dec. 22, 1898, at 10 a. m. The program is as follows:

President's Annual Address—Fred S. Emens.
"How to Preserve Unused Combs"—M. T. Williamson; discussion opened by Henry Manger.

"Packages for Honey"—Herbert McAllen; discussion opened by B. D. Scott.

Question-Box, conducted by Harry Howe.
"How to Extinguish Foul Brood from the State"—W. F. Marks; discussion opened by Shuman R. Kunes.

"Marking Honey"—Ira Wilson; discussion opened by J. C. Howard.

"Improved Appliances"—C. J. Baldrige; discussion opened by E. N. Van Ripper.

"Bees and Clover"—J. W. Spencer, of Cornell University.

"Best Method of Increase"—George V. Lamoreaux; discussion opened by Nat Sutton.

FRED S. EMENS, Pres., Fayette, N. Y.
C. B. HOWARD, Sec., Romulus, N. Y.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.,
Chicago, Ills.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—This edition has been largely re-written, thoroughly revised, and is "fully up with the times" in all the improvements and inventions in this rapidly-developing pursuit, and presents the apiarist with everything that can aid in the successful management of an apiary, and at the same time produce the most honey in an attractive condition. It contains 250 pages, and 245 illustrations—is beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, \$1.00.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture, has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages; bound in cloth. Price, postpaid, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages; bound in cloth and fully illustrated. Price, postpaid, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of Queen-Bees are reared in perfect accord with Nature's way. 176 pages, bound in cloth, and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. It contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is too well known to need further description of his book. He is a practical and entertaining writer. You should read his book. 90 pages, bound in paper, and illustrated. Price, 50 cts.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages; bound in paper covers, \$1.50.

Bienen-Kultur, by Thomas G. Newman.—This is a German translation of the principal portion of the book called BEES OF HONEY. 10 page pamphlet. Price, 40 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest, most approved methods of bee-keeping, in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50c.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 p., illustrated. 25c.

Convention Hand-Book, for Bee-Keepers, by Thomas G. Newman.—It contains the parliamentary law and rules of order for Bee-Conventions—also Constitution and By-Laws, with subjects for discussion, etc. Cloth, gold-lettered. Price, 25 cts.

Practical Hints to Bee-Keepers—by CHAS. F. MUTH. Also contains a Foul Brood Cure and How to Winter Bees. 40 p.; 10 cts.

Apiary Register, by Thos. G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Preparation of Honey for the Market, including the production and care of comb and extracted honey. A chapter from BEES AND HONEY. Price, 10 cents.

Bee-Pasturage a Necessity.—This book suggests what and how to plant. It is a chapter from BEES AND HONEY. Price, 10 cents.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cts.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price 10 cts.

Hand-Book of Health, by Dr. Foote.—Hints about eating, drinking, etc. Price, 25 cts.

Honey as Food is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey among should-be consumers. The forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Commercial Calculator, by C. Ropp.—A ready Calculator, Business Arithmetic and Account-Book combined in one. Every farmer and business man should have it. No. 1, bound in water proof leatherette, calf finish. Price, 40 cts. No. 2, in fine artificial leather, with pocket, silicate slate, and account-book. Price, 60 cts.

Green's Four Books, by Chas. A. Green.—Devoted to, 1st, How We Made the Old Farm Pay; 2nd, Peach Culture; 3rd, How to Propagate Fruit-Plants, Vines and Trees; 4th, General Fruit Instructer. Nearly 120 pages. Fully illustrated. 25 cts.

Garden and Orchard, by Chas. A. Green.—Gives full instructions in Thinning and Marketing Fruits; Pruning, Planting and Cultivating; Spraying, Evaporation, Cold Storage, Etc. 94 pages, illustrated. Price, 25 cts.

The Hive I Use, by G. M. Doolittle. It details his management of bees, and methods of producing comb honey. Price, 5 cents.

Kendall's Horse-Book.—35 pictures, showing positions of sick horses, and treats on all their diseases. English or German. Price, 25 cts.

Silo and Silage, by Prof. A. J. Cook.—It gives the method in operation at the Michigan Agricultural College. Price, 25 cts.

Lumber and Log-Book.—Gives measurements of lumber, logs, planks; wages, etc. 25c.

Maple Sugar and the Sugar Bush, by Prof. A. J. Cook.—Full instructions. Price, 35 cts.

Grain Tables, for stating up the price of grain, produce, hay, etc. Price, 25 cts.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 30 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 84 pages. Price, 30 cts.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about the Poultry Business. 64 pages. Price, 25 cts.

Rural Life.—Bees, Poultry, Fruits, Vegetables, and Household Matters. 100 pages. 25 cts.

Potato Culture, by T. B. Terry.—It tells how to grow them profitably. Price, 40 cts.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Dec. 8.—Our market is less active. There are now more offerings of comb honey than is absorbed, hence some accumulation of consignments without any special change in prices; yet receivers are granting concessions to move sales. Fancy white, 13c; off grades, 10@12c; amber, 9@10c; dark, 8@9c. Extracted, white, 6@7c; amber and dark, 5@6c. Beeswax, 27. R. A. BURNETT & CO.

Detroit, Dec. 8.—No change in supply of honey as to quality, but prices are somewhat lower than last quotations, viz.: Fancy white, 13c; No. 1, 12@12½c; fancy dark and amber 9@11c. Extracted, white, 6@7c; dark, 5@5½c. Beeswax, 25@26c. M. H. HUNT.

Columbus, O., Dec. 6.—Prices have been so high, movement has been so slow, and lower prices must prevail to move stock readily. Would not advise shippers to count on getting over 13c for fancy; No. 1, 12c; No. 2, 10c; amber, 9c; dark, 8c. COLUMBUS COM. AND STORAGE CO.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax, prime, 24c; choice, 24½c. At present there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c; amber, 10@11c. Extracted, white, 5½@6c; amber, 5@5½c; dark, 4½@5c. Beeswax, 22@25c.

The receipts of comb honey are larger. C. C. OLEMONS & CO.

Milwaukee, Oct. 13.—Fancy 1 pounda, 12½ to 13c; A No. 1, 12 to 12½c; No. 1, 11 to 12c; No. 2, 10 to 10½c; mixt. amber and dark, 8 to 9c. Extracted, white, in barrels, kegs and pails, 6½ to 7c; dark, 5 to 5½c. Beeswax, 26 to 27c.

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing. A. V. BISHOP & CO.

New York, Oct. 22.—Receipts of comb honey are large, and there is quite a stock now on the market. While white is in good demand, buckwheat and mixt seem to be somewhat neglected, and quotation prices have to be shaded in order to sell in quantity lots. We quote:

Fancy white, 13 to 14c; No. 1 white, 11 to 12c; amber, 10c; mixt and buckwheat, 8 to 9c. Stocks of extracted are light of all kinds. Demand is good at following prices: White, 6 to 6½c; amber, 5½c; dark, 5c. Southern, in half barrels and barrels at from 55c to 60c a gallon. Beeswax dull at 26c. HILDBRETH BROS. & SEGELKEN.

Buffalo, Nov. 25.—A most excellent demand continues for strictly fancy 1-pound combs at 13 to 14c. The usual so-called No. 1, 11 to 12c; lower grades move well at from 9c down to 7c; stocks very light in our market. Extracted honey, 5 to 6c. Beeswax, 24 to 28c. BATTERSON & CO.

San Francisco, Nov. 22.—White comb, 9½ to 10½c; amber, 7½ to 9c. Extracted, white, 7 to 7½c; light amber, 6½ to 6¾c. Beeswax, 24@27c.

Stocks in this center are light and must so continue through the balance of the season. Choice extracted is especially in limited supply and is being held at comparatively fancy figures. Comb is meeting with very fair trade, considering that it has to depend mainly on local custom for an outlet. Values for all descriptions tend in favor of selling interest.

Boston, Nov. 28.—Liberal receipts with but a light demand during the holidays. As a result stocks have accumulated somewhat, and prices show a lowering tendency, still we hope for a better demand with prices at present as follows:

Fancy white, 14c; A No. 1 white, 12½ to 13c; No. 1, 11 to 12c; light amber, 10c, with no call for dark. Extracted, fair demand, light supply: White, 7 to 7½c; light amber, 6½ to 7c; Southern, 5 to 6c. BLAKE, SCOTT & LEE.

Cleveland, Nov. 29.—Fancy white, 13@14c; No. 1 white, 12@13c; A No. 1 amber, 10@11c; No. 2 amber, 9@10c; buckwheat, 8c. Extracted, white, 7c; amber, 6c; buckwheat, 5c. A. B. WILLIAMS & CO.

Gleanings in Bee-Culture,
American Agriculturist (weekly),
Farmers' Almanac for 1899,

ALL ONE YEAR ONLY \$1.00.

By special arrangement with the publishers, we are enabled to offer the American Agriculturist in combination with Gleanings at the unparalleled low rate of \$1.00 for both papers one year including the Farmers' Almanac. The American Agriculturist is published in three editions: The New England Homestead, the American Agriculturist, and the Orange Judd Farmer. Each contains matter relating to its own locality, as well as the latest and most accurate market reports for the country in general. It has departments relating to all branches of farming, articles written by the most practical and successful farmers, supplemented with illustrations by able artists. Short stories, fashions, fancy work, cooking, young folks' page, etc., combine to make a magazine of as much value as most of the special family papers.

A sample copy will be mailed FREE by addressing American Agriculturist, New York, N. Y.

Taken separately these two papers and Almanac cost \$2.50, consequently every subscriber under this offer will get \$2.50 in value for \$1.00.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

SECOND DAY—EVENING SESSION.

[Continued from page 789.]

The evening session was called to order by Pres. York, and was opened by singing two songs, "The Busy Buzzing Bees," and the "Bee-Keepers' Reunion Song."

Pres. York—We have all read somewhere that the first shall be last and the last shall be first. The first thing upon our printed program is a paper by Rev. E. T. Abbott, on "General Advice to Bee-Keepers." He was not here at our opening session, but has arrived now, and I think we should hear his paper at this time. Mr. Abbott, of Missouri.

General Advice to Bee-Keepers.

I do not know how Secretary Mason came to assign me this topic, for it was none of my choosing. In fact, I did not have any idea that I was to be on the program until I received notice that I must be on hand with a paper on the above subject. As I make it a point to obey the orders of my superiors, I could not do better than prepare the paper. The truth of the matter is, however, that Dr. Mason has struck me just right, for if there is anything on which I am strong, and at my best, it is in giving advice. True, I am compelled many times to say, in the language of the traditional preacher, "Do as I say, and not as I do." However, let this be as it may, I am immense on advice. I am with advice as the doctor said he was with fits, when reminded that the drug he was using was likely to produce them. He responded, using a word which is usually written with an h, a dash and an l, that he was that on fits, and that was all right. He was safe if he could only throw his patient into fits, for he could cure them. Now, that is the way I am on advice.

Perhaps it was a little oversight in the Maker of all things that I was not brought into being early in the history of mankind, and made a sort of "director general of advice." Possibly I might have saved some people a good deal of trouble, even tho it should have been at the risk of getting myself into worse trouble. For I want to tell you, that giving advice is not always the safest thing in the world. Many times those who need advice the most are inclined to resent it, and get "hot," as we say, if it is given to them, and a "hot" man, or woman either, for that matter, is not always an agreeable person to deal with.

But, as the preacher would say, "To return to my subject."

The first advice I have to give is, not to wait until you get into some trouble with your neighbors, and want some one to

help you out, before you think of joining the United States Bee-Keepers' Union. For if you do, you may not always get the help you need. "In time of peace, prepare for war," for sometimes being "prepared for war" will enable you to keep the peace better than anything else.

Having joined the Union, never ask its General Manager to do anything for you which you can just as well do for yourself. Before you ask for help at all, read the constitution of the Union carefully, and be sure you understand its aim and purpose fully. Remember that it is no part of the Union's business to meddle with neighborhood or family difficulties, even tho there may be something about bees mixt up with them. Do not ask the Union to aid you against your neighbor simply because you have a purely personal spite at him, and you think this will afford you an opportunity to "bring him to time." Nearly all of these personal difficulties can, and should, be settled without any help from the Union.

Do not expect too much of the Union at the start, or because you have paid your dollar for a few years, and not needed or gotten any help, conclude that you will save your money and not continue your membership. Fire comes when you least expect it, and for that reason a wise business man

Rev. Emerson T. Abbott.

keeps his property insured all the time, and considers that the feeling of security which he has is abundant pay, even tho the fire may never come.

You should remember also that a strong Union is a benefit to the industry as a whole, and even tho you may not want direct personal aid, yet you will indirectly be benefited, for whatever benefits the whole works more or less benefit to each individual part.

Do not get the notion that the Union is a sort of trust to

force up the prices of honey, for when one man gets more for a thing, several men generally have to pay more for it. One trust is just as wicked as another. If it is wrong to corner wheat, flour, nails, oil, lumber, etc., it is just as wrong to form a pool on honey. It is all right to open new markets, create new demands, in various ways, or to aid in diverting the crop to other and more profitable markets, but no union should form itself into a trust to regulate the price of food products. This should be left to demand and supply, whether the food be honey or something else. Those who attempt anything of the kind are enemies of society. Do not join in the general hue and cry about the useless middle-man, and swear he lives off of other people's labor. Remember that whoever satisfies a desire is a producer, and that the man who opens a market is as much entitled to pay, for his labor, as the man who helps the bees produce a case of honey. There will be tradesmen as long as the world stands, and, according to the theory of the evolutionist, that which survives is the fittest.

Do not conclude that it is because something is out of joint politically that you get such a low price for your honey, or have such a hard time in the world. There has been something out of joint in this direction as long as I can remember. The "outs" have always laid all of the trials and tribulations of the people to the "ins," and the "outs" have wanted in, and the "ins" have wanted them to stay out. I presume this will be true until the "blowing of the last trumpet," if one ever blows, and then we will all want to get in, I presume. Some may be left out even then. I cannot say how that will be.

If you are a beginner in the bee-business, do not think you need everything you see advertised. Things are made to sell in this business just the same as in others, and sometimes the people who buy them "get sold." The more experience you have with bees the more you will discover that there are a lot of things you do not want. Go slow on the new things, and let the other fellow do the experimenting.

If you take a bee-paper—and you should if you ever want to find out how wise some of the fellows are who write for them—do not sit down and write the editor a long letter, the first time you see anything in the paper you like, and tell him what a smart fellow he is, and what a splendid paper he is making out of the "Apis Dissectum." He may say some things you do not like in the next issue, and then you will want to take it all back, but you can't. What is done is frequently harder to undo than it was to do. Then if you give a testimonial to every pillmaker, you may run out of new material in time.

Do not try to run the paper for the fellow who owns it. He may have had more experience than you have. If he has not, and you are real anxious to show what you can do, you would better start a paper of your own. "Always room at the top," they say; but I have noticed that some things are real shaky at the top—a tree, for illustration. It would be better to go a little slow until you get your hand in, and your nerves a little steady. Be very mild and gentle, especially with editors and cross bees. Do not provoke them to use their posterior extremities too much, as it might prove injurious to them, and uncomfortable to you. It is apt to create a sudden sensation of heat.

If you have a little success, don't brag or tell what big things you have done. It may bring you more competitors than will be good for the business. Let the supply dealers and the factory people do the bragging. They can tell, if they wish, of tons and tons of stuff they have sold, and how they started with a 10-cent knife and an old shoe-box, and have grown and grown until now they cover acres. It is true this may induce more fellows to try the factory business, but that will not hurt you. "Competition is the life of trade," but some fellows seem mighty dead at times who get too much of it.

Do not tell all you know, for if you do the other fellow will know just as much as you do, and it is not well to know too much. It makes one's head tired to carry so much wisdom, and, then, if people find out a fellow knows a lot, they are all the time wanting to have him tell it, and he cannot find time to do anything else.

In conclusion I would say, be contented with your lot, but not too contented—no progress in that. Be enthusiastic, but not too much so. One feels so badly when he gets all the enthusiasm knocked out of him, as he does at times. Be honest, but do not say too much about it. People may think you are "off" if you do. Be kind to the bees, for if you don't you may wish you had.

If you have not joined the Union do not discuss this paper, for only members can vote. Better give the Secretary a dollar and make him promise never again to ask me to give "general advice to bee-keepers."

EMERSON TAYLOR ABBOTT.

There was no discussion of Mr. Abbott's paper.

BEE-STINGS AND RHEUMATISM.

"Are bee-stings a cure for rheumatism?"

A. I. Root—For some kinds of rheumatism.

Mr. Whitcomb—I have never known a person to have rheumatism so badly but that he could get up and "git" if a bee stung him.

Dr. Peiro—I could tell you what I don't know about it a great deal easier than I can tell you what I do know. Bee-stings are said to be a cure for rheumatism; it is used in some cases. But I want to tell you a little personal history. This is no joke. When I get a little deprest, either from working or some other miserable thing, I go out and consult the bees. I fuss with them a little bit, and they come and give me a warm reception, and for several days after that I really feel a lot better. I would advise you, when you get a little deprest, and get to feeling sort of "off," go and consult the bees, and let them give you a few good, red-hot ones, and you will be all right.

Dr. Mastin—I have been troubled a little with rheumatism in the past, and have been stung a good many times in the last year or so, and have not felt any rheumatism since then. I don't know whether the bees had anything to do with it or not, but I suppose they had.

Mr. Danzenbaker—I have rheumatism. I think I came by it honestly; my grandfather died with it, and my father suffered with it all his life—it shortened his life. I can't remember the time when I haven't felt it, from childhood. I have been keeping bees a good many years. Last spring I felt the rheumatism. I went to work with the bees in March, and I got stung a little more than usual. I was with the bees from March until August; I think I got stung on an average three or four times a week. I got rid of the rheumatism. I have not done anything for it; if I have had any remedy, I think it is bee-stings. If I should not handle bees for two or three months I should feel the rheumatism again.

Dr. Mastin—Bee-stings are not commonly recommended in the text-books as a remedy for rheumatism. The patient might think the remedy worse than the disease.

Dr. Miller—About seven years ago a hive that I was holding slipt, and the bees got out, and I received the worst stinging I ever had in my life; and I have never had any rheumatism since.

A Member—Did you ever have it before?

Dr. Miller—No, sir. [Laughter.]

Dr. Mason—I have had rheumatism more or less for a great many years, until two years ago last April I had an attack in my hip which gradually went down the limb and got into my instep. I suffered intensely. I had to give up for three weeks, and then went around two weeks more with crutches, then with a crutch and a cane, scarcely daring to touch my foot to the ground. I had let my bees on shares because I was unable to take care of them myself while I was in that condition, and one day I was out in the yard sitting down when out came a swarm, and while watching for the queen I was stung two or three times on the instep; in five minutes I laid away my crutch and cane, and haven't had a particle of pain since—no pain in that foot at all, but it left a sensation of numbness, and for a whole year after that I would frequently stub my toe in walking, as a result of that sensation, and I feel confident that the use of electropoise cured the numbness; perhaps bee-stings would have cured it.

Dr. Miller—The testimony that has come from different sources has been so much that it cannot be overlooked. There must certainly be some cases in which bee-stings have helped rheumatism. But I will tell you what I think about these reports of cures: We will find reports here and there from some who has tried it and been successful, and another will report that he has tried it and received no benefit. I suspect that about every successful case will be reported; but if I try it and it is not successful, I am not so likely to report it. In the majority of cases I am inclined to believe it has no efficacy whatever; but in some cases it does have its effect. If I had a bad case of rheumatism, I certainly would try bee-stings.

Mr. Abbott—I belong to that class of people who inherit rheumatism. It has been in my family as long as I know anything about it; all have been crippled up with it more or less. Every brother and sister I have has been laid up with it at times for weeks, when every time they would move a limb they would scream with pain. I have myself suffered tortures enough to kill several big, fat men. But about 20 years ago I began to handle bees, and 15 years ago I began to handle them on a large scale, and I have had hardly a hint of rheumatism since. I have not been an absolutely well man, as I have had other troubles. I have never had a rheumatic pain that I know of since I began to handle bees. When I first began handling them, if I was working with them all the time I

would have no rheumatism, but if I would stop for awhile I would have the rheumatism again. For four or five years during the winter I would have it a great deal, but in the spring it would get well. I do not know whether it was the bee-stings or not; but the rest of my brothers and sisters who do not handle bees are still tussling with rheumatism. My elder brother has been disabled about half the time, and they all have trouble with it but myself. I do not know whether it is the bee-stings or not that work the cure.

Secretary—(Why doesn't Mr. Abbott manage somehow to get some bee-stings into those suffering brothers?)

A. I. Root—It might be well to mention the fact that we have sold bee-stings in the past to a medicine manufacturing institution—a considerable quantity of bee-sting poison.

The Annual Report of General Manager Secor was then read by him, as follows:

Report of the General Manager of the United States Bee-Keepers' Union.

It is considered one of the legitimate purposes of this society to promote legislation in the interest of bee-keepers.

Acting on that idea the Executive Committee appointed three delegates to attend the Pure Food Congress held in Washington, D. C., beginning March 2, 1898. The delegates consisted of E. T. Abbott, of Missouri, Dr. A. B. Mason, of Ohio, and your humble servant, the General Manager.

The object of the Pure Food Congress was to unite all the producers and all the manufacturers of food products, and all societies and people that believed in the necessity or desirability of protecting the public against adulteration and misbranding, on the common ground of honesty in the preparation and marketing of all articles intended for food, drink or medicine, consumed by man.

Believing that in no other way could this society speedily and effectually bring about the results it was seeking to achieve, Mr. Abbott and myself attended that convention.

We were greatly pleased, not only with the number of delegates present, but the representative character of the men: Scientists of national reputation, leading physicians and pharmacists, pure food commissioners from many of the States, intelligent and progressive farmers; representatives of wholesale and retail grocery and confectionery associations, and many other organizations and interests were represented by able and earnest delegates—solely in the interest of purity of all articles of human consumption.

What was accomplished at that Congress is more fully explained by Mr. Abbott in his paper, *The Busy Bee*, and copied in the *American Bee Journal* of March 31, page 200, and my own report published in the last-named paper on page 216.

I think the National Congress has not yet acted on the Bill which it has thought best to urge.

All acquainted with National legislation will understand that its Acts are seldom rushed through without a good deal of discussion, both useful and useless.

After the Brosius Pure Food Bill was amended and perfected by the Pure Food Congress, it was again introduced in the National House and referred to the Inter-State and Foreign Commerce Committee. As soon as I learned this fact I address the chairman of that committee, who happens to be from my own State, the following letter, using the printed letter head of the United States Bee-Keepers' Union:

HON. WILLIAM P. HEPBURN—

Chairman of Inter-State and Foreign Commerce Committee.

Dear Sir:—I believe the Pure Food and Drug Bill introduced by Mr. Brosius, March 15, 1898, was referred to your Committee. If so, may I be allowed to urge you to use your influence to enact it into law at the earliest opportunity?

I had the honor to be a delegate to the Pure Food Congress held in Washington, March 2 last, and the Bill now before the National Congress was gone over very carefully by a committee representing about every organization interested in the purity of our manufactured food products. Possibly there may be some crudities in the Bill, but I am persuaded that something of the nature and intent of this Bill ought to be on the Statute books.

I represent an industry that has suffered greatly from adulteration fraud. The purest and best sweet ever given to man—a sweet distilled in Nature's own laboratory—a sweet digested with less effort than any made by man—a sweet that may be counterfeited, but never successfully imitated—honey, has been degraded by glucose syrup until the bee, like Othello, finds her occupation gone.

If the waning of the honey industry, and the consequent loss of occupation to a worthy class of the rural population were the only consequences caused by the glucose flood of adulteration it would not be so bad; but it must be understood that bees play an important part in the economy of Nature aside from the honey stored, which we appropriate for our own use. The fruitfulness of the whole country depends largely on the pollinating assistance rendered by this useful insect, and if bees are allowed to perish for

want of encouragement to their keepers, the fruits and flowers, the vineyards and gardens, will suffer also.

But we can't produce honey in competition with liquid glucose sold under the guise of honey.

All we ask is honesty in branding and labeling packages; then if people prefer corn syrup with one-half the sweetening power of honey, to honey itself, all right.

We have no war to wage on any other industry, and only ask an open field and fair competition, protected against fraud.

We shall be glad of your influence. Yours truly,
EUGENE SECOR.

On behalf of bee-keepers producing nearly 100,000,000 pounds of honey annually.

I hope every bee-keeper who has not already done so, will write an appeal to his Congressman in behalf of the Brosius Bill, or in the interest of pure food legislation. A hundred letters by a hundred different persons will do a world of good.

Please don't expect me or any other representative of this society to write an appeal to your political representative that will be as effective as a letter from you. A line from one of his constituents will attract his attention at once.

In April last I got a letter from Frank Gilmore, Watertown, Conn., enclosing a letter from a law firm of his town in which Mr. Gilmore was notified to remove his bees within 15 days under a threat of prosecution and injunction. The complaint was, that the aforesaid bees destroyed the entire crop of peaches, raspberries and other fruits on the premises of a neighbor; that they stung horses and visitors. I gave Mr. Gilmore such advice as I thought best, and presume he escaped the clutches of the law, as I heard nothing further of the case.

During the same month, Mr. B. Baldwin, of Mexico, Mo., sent me an account against a Chicago commission-house, saying he could get no pay for honey billed to the firm. I at once began correspondence with the commission-men, and after a couple of letters got a draft in full. Mr. Baldwin expressed himself as entirely satisfied with the transaction, and donated to the Union two years' membership in advance.

Ed Gerould, of East Smithfield, Pa., was threatened trouble from a neighbor who was determined to spray his peach orchard while in full bloom, altho it had been explained to him that by so doing his neighbors' bees might be poisoned. Mr. Gerould wrote me for advice and help. I sent him some printed matter and advised him how to proceed, which was the last I heard of the matter.

Chas. Haise, a quiet, peaceable, unoffending person who lived in Atlanta, Ill., received from the marshal of the town the following notice in June, 1898:

"SIR:—You are hereby notified that your bees, situated and kept on the premises now occupied by you, have become and are a nuisance to the neighborhood and public, and you are hereby notified to abate, remedy, or remove the same immediately as provided by ordinance. A failure to do so will subject you to a penalty of not less than \$300.

The Union was appealed to by Mr. Haise and his neighbor bee-keepers. The trial had been already set, and only three days remained in which to get my advice to him regarding a plan of defence. But it proved sufficient. The case was dropped when the prosecutor found an organization with money, courage, and law behind the defendant. The bee-keepers interested expressed their gratitude for the prompt and efficient aid rendered by the Union, and said they believed the case was dismissed because of its assistance. An effort was made before the Western Classification Committee to rescind the rule instructing all railroad agents to refuse bees by freight less than car-lots. I put up the best argument I could think of by letter, but failed. The rule still stands, I believe. Mr. Aikin appeared before the committee by request of the President, for the same purpose. If the matter is of any importance to bee-keepers it can be taken up at another time; perhaps we may be more successful next time.

My correspondence with bee-keepers other than the ones mentioned above has been considerable. Appeals to the Union for help have not been confined to the cases cited. Advice and assistance have been given whenever in the judgment of the General Manager good could be accomplished thereby, and if the funds on hand warranted action.

Important matters have always been referred to the Board of Directors, if time permitted, and the nature of the case seemed to render it advisable. No money has been paid out except upon approval of the Board.

A full statement of the financial condition of the society will be mailed to all members at the close of the year.

EUGENE SECOR.

Mr. Whitcomb—I move that the report of the General Manager be accepted, and that the thanks of the Union be extended to Mr. Secor for his labors in our behalf.

The motion was seconded and carried by a unanimous vote.

Mr. Abbott—I do not exactly want to make a motion, but I will make a suggestion first. I want to suggest that it would be a good idea if the General Manager would prepare a form of such a letter as would be good for the members to send to their congressmen. There are a good many people who are not acquainted with the forms and methods of addressing public men, and they would shrink a little from sitting down and addressing their congressmen themselves, when if there was a form already prepared they could simply put their names to it and send it in. I have been informed by the vice-president of the Pure Food Congress that owing to the war the matter was crowded out of the last Congress. Doubtless there would have been favorable reports from the committee in both houses, but the excitement of the war came on, and it was crowded out. There is no question but what the next Congress will take the matter up. If we would take it up as individuals in connection with the efforts of the General Manager, I think that would aid materially in securing the passage of the law. The Busy Bee is perfectly willing to give the General Manager all the space he wants for the publication of such a letter, and I have no doubt the other bee-papers of the United States would be glad to do the same. I believe that would be very helpful. If it is considered worth while, I would move that the General Manager be requested to prepare such a letter.

The motion was then seconded.

Mr. Secor—My object in copying my letter to Mr. Hepburn, the chairman of that committee, was particularly to let you know how I address a congressman on the subject. You will also remember that in my report last spring to the Washington congress, I did give a copy of a letter that I had formulated, and suggested that those who could not do better should send to their congressman such a letter. Of course, I shall be willing to do what I can to aid in the matter.

Dr. Miller—It may be that a form of letter as long as our General Manager's is not likely to be copied by a great many. I think we should have something quite short and to the point; if it doesn't take a great deal of time to re-write it, the members would be more likely to do it. I believe that such a letter would be very useful, indeed. I have just tried to think of myself as trying to write a letter of that kind. The chances are that I would put it off from day to day, and that it would not get written at all. If Mr. Secor would fix one up that would cover the case, I think I would take the time to copy it. Some one near me suggests that the letters would be too much alike; but don't forget this, that instead of one man getting the whole lot, a whole lot of men will get one letter each, and the chances are that they are not going to compare their letters.

Mr. Danzenbaker—I do not fear the effect of their being all alike. If you were to clip a printed article out of a paper and write that you fully endorse it and that you desire your congressman's influence, and put your name to it, that is enough. He will read it and heed its contents as much as if you wrote it out yourself.

FREIGHT RATES ON BEES IN LESS THAN CAR-LOTS.

Pres. York—There is no doubt that such letters have great influence. I would like to ask how many knew some time ago that there was an effort going to be made to reduce freight-rates on bees in less than carloads. How many knew that, in time to write to the chairman of the Classification Committee?

Six hands were raised in answer to the President's question.

Pres. York—Now I would like to know how many of you wrote such letters.

Three hands were raised in answer to the last question.

Pres. York—I saw the private secretary of the chairman of the Classification Committee, and he told me that few bee-keepers had shown any interest at all in the matter. There would have been a good chance for its passage, but there were only a few letters that came in endorsing the change, and that was a very strong reason why nothing was done with it. There were some freight handlers on some northern road that said they were afraid of bees, and as the bee-keepers had shown so little interest the matter was simply pigeon-holed.

Mr. Lathrop—It was the Wisconsin Bee-Keepers' Association that first made an effort to get that change made, and we expected the meeting of the Committee to be held in Chicago. I believe they usually hold it in Chicago; but the meeting was held in Manitou, Colo. If it had been held at Chicago, we expected to have some bee-keepers prepare bees properly for shipment and take them to the committee rooms and show those men that bees could be put up in such a way that they

would be safe to handle and ship as any other freight; but the fact of the meeting being held in Colorado prevented our doing that. I think the bee-keepers believe it is important that we secure the change. My business has been for a good many years in handling freight, and I believe it would be all right to ship bees by freight if the bee-keepers used good judgment. Of course, if he shipped when it was too hot, he might lose all his bees; but they would be taken at owner's risk, and if the bee-keeper did not use good judgment there would be no loss to the railroad company.

Dr. Miller—I think as a matter of history Mr. Lathrop is mistaken in thinking that the Wisconsin Bee-Keepers' Association made the initial effort toward securing this change. The same effort had been made before.

Mr. Rauchfuss—In regard to the effort that was made toward getting the freight-rates reduced, I want to say that the Colorado bee-keepers were not aware of it; Mr. Aikln did not inform any one of us about it, and the first I knew of it was when he came into our store on his way to Manitou. We could have taken some steps toward getting some bees properly prepared and brought before the committee, and I am sure that that would have had some influence.

Mr. Danzeubaker—I had a little experience in trying to get a car for the shipment of some bees. I had 40 colonies that I wanted to ship from North Carolina to Virginia. They said I might put into the car 20,000 pounds, but I hadn't anything like that. I could have the car, but I must pay for 20,000 pounds. Then I asked if I could put in 4,000 or 5,000 pounds of honey and a couple thousand pounds of bee-hive material; but I couldn't do that. The whole weight of it would not make over 8,000 pounds, but they would not allow me to ship a car with 8,000 pounds if I paid for 20,000 if it was made up in that way. I considered that a great injustice. They had an agreement in their association that prevented their doing it. I think that is an outrage. I could have taken the car and shipped the 40 colonies of bees, if they had allowed me to put in the honey and supplies with them.

Mr. Abbott's motion, that the General Manager be requested to prepare a form of letter to be addressed by the members to their respective congressmen, and that the bee-papers of the country be requested to publish such letter, was then submitted to a vote and carried.

[Continued next week.]

No. 7.—The Care of Bees for Wintering.

BY C. P. DADANT.

When we began putting our bees into the cellar, we were more afraid than necessary, of leaving them in too long. So we often delayed the job too much. It is of great importance that they be taken in shortly after they have had a good cleansing flight, because if they go in with empty bowels it stands to reason that they can endure much longer confinement than if they have already been compelled by the cold to consume a certain amount of food. So we have been in the habit of taking them in after a mild spell, at the time when the wind turns and the mercury falls. We often waited till the middle of December, but later decided that a cold spell in November was much safer for the removal.

A number of apiculturists say that they pay no attention to the spot occupied by the bees when removed, and that when they take them out in the spring it does not matter much where they are placed, whether on the exact spot they occupied before winter, or in the place of one another. Once or twice we had considerable trouble from changing the location of hives, and have positively ascertained that many of the bees remember their former location, after three months of wintering, so we take particular pains to mark each hive's stand. To do this without trouble, we leave the cap, or cover, with the roof over it, in the exact spot occupied by the hive, and remove only the brood-chamber to the cellar. In this manner the hives occupy a much smaller space, and it is easier to give them good ventilation, which is absolutely necessary to keep the combs from molding, if the cellar is at all damp. The farther north one goes the less trouble there is on that score, and I have visited bee-keepers in Minnesota who told me that they had no trouble whatever of this description.

In those northern States, when the ground freezes it is for good, there is no chance for moisture to creep in, unless it is there already, but after our usual dry falls there is but little fear of that, and in a country where the sleighing is good from the first of December till the last of March, much less precaution need be taken than in our latitude, where we cannot be sure of good sleighing 24 hours ahead. We pile the hives in the cellar, two or three or even four tiers high, usually

Cellar-Blind to Give Air Without Light—Langstroth Revised.

putting the lower tier on timbers raised a foot or so from the ground. We have always noticed that the colonies nearest the ground were the ones that suffered, if any did.

After the hives are in, darkness, quietness, a proper temperature, and a sufficient amount of ventilation are all that is necessary. For these hives, as well as for those that are out in cold days, it is a great point to have everything perfectly quiet. The man who will disturb his bees every other day, just to see whether they are still alive, will be unsuccessful if the circumstances are at all unfavorable; for it is very easy to kill the bees with too much kindness of this sort.

To give air without light to our bee-cellar we have devised a sort of blind—a picture of which is here shown, taken from "Langstroth Revised."

The time of removal of the bees in the spring is of utmost importance to consider. If they are taken out too early, they

Cellar-Blind in Place—From Langstroth Revised.

may not have occasion to fly much, and their power of endurance during a late cold seems to have been taken away from them by their prolonged stay in the cellar. They are very much like a horse that is kept in a warm barn. He is more apt to be fretful of the cold and to suffer than one that stays all winter in a cold stable. Yet our sympathies are all in the direction of the softer treatment. With the bees, there was on our part, as in the fall, a tendency to be too much afraid of

a long confinement. I believe it was Dr. Miller who said the best time to remove the bees from the cellar was in March or April, at the opening of the first buds of soft maple bloom. This is a very good criterion.

But above all things, a warm day must be selected to remove the bees from their confinement. If you take them out on a cold day, their anxious desire to take a flight will induce them to venture when the temperature is too low for their safety, and many of them will perish. If the day is warm and pleasant, they will take a cleansing flight within a very few minutes after they have been brought out, and are thereafter ready for their habitual duties.

I have often been asked whether it is advisable to take the bees out on a warm day during the winter for a good flight, and put them back again. I have never tried this, but from all that I ever heard, I do not believe such a course is successful. The bees, after their flight, begin to rear some brood and remain less quiet than if they had been kept in-doors all winter.

Hancock Co., Ill.

Experience with Two-8-Frame Story Colonies.

BY FRANK COVERDALE.

The middle of May I tried placing underneath ten colonies an extra hive-body, each filled with worker-combs and an average of say about five pounds of honey. These bees received this with much favor, and set to work rearing an extra amount of brood, and by the time clover began to yield all seemed to be, and were, chock-full of brood and bees; or, in other words, were filled with brood, pollen and honey. On e thing I noticed, these colonies had stored a large quantity of pollen. However, I could see at once that this plan had brought forth a multitude of bees ready for the clover harvest, and now as to whether they would work or swarm—that was the question that so deeply interested me.

Supers were put on all around at the time, both on the double deckers and single deckers, and as the harvest came on swarming began, and, I must confess, to my surprise, these 16-frame colonies rather too badly. None of the 10 filled any section-cases with honey from clover; 80 single-story colonies produced my small crop (all the above in one yard); 8 of the latter filled and completed two cases of 22½ pounds each, or 45 pounds of comb honey; the next best 8 filled only one case, and so on down until many, even single bodies, yielded no surplus at all.

But to return: The 10 double-deck hives, I estimate, have for winter 25 pounds more than the 80, on an average. This certainly must be taken into consideration, besides 4½ pounds of comb honey must be added; this gives 29½ pounds as an average, while the 80 have a fraction over 8 pounds on the average, all comb, at 12 cents—96 cents.

For the 10, 25 pounds of extracted, at 7 cents, \$1.75; and 4½ pounds of comb honey, at 12 cents, 54 cents—total, \$2.29.

I think it would be safe to say that if the story having the least brood had been taken off and supers put in their place, at the beginning of the main flow, far better results would have been obtained in comb honey; and I think that the swarming-fever would have run at a lower ebb.

But more about this at the next writing.

Jackson Co., Iowa.

The "Notre Dame Hive"—Further Explanations and Replies to Comments.

BY B. J. CHRYSOSTOM.

The frame the inventor of the "Notre Dame hive" uses is the full-depth Langstroth.

"But should he use a frame even not much larger than the Langstroth frame, a colony occupying 40 frames by July 1 would be incredible." So says one writer. It may appear to be so at first sight, but perhaps not so after an explanation.

The bees in question are wintered on 16 full-depth Langstroth frames, having from 50 to 70 pounds of stores. This year they are lighter than usual. The average gross weight per colony is only 83 pounds; allowing 32 pounds for hive and frames, leaves a net weight of bees and stores of 51 pounds per colony. They are wintered in the summer stands in houses, packed in chaff to the depth of three feet. Thus wintered they fly out in the spring clean and frisky. The absence of dead bees, in some hives, is remarkable.

About the first of May these hives are full of bees and brood. To prevent swarming, a full-depth super is put on; then about the first of June another super is added, and if the

honey-flow is plentiful a third super will be necessary about the first of July, which completes the 40 frames. Nothing extraordinary for strong colonies wintered on 16 frames, without loss in bees!

Another correspondent, referring to the same hive, has this to say:

"That hive, on page 629, I venture to say, is one that you could not get practical bee-keepers to take as a gift."

If that nameless correspondent voices the sentiments of all practical bee-keepers, then the Notre Dame device will have to remain with the inventor, who is well contented to have it alone for his own use and benefit, and to let all practical bee-keepers have what suits them best. My appreciation of the American bee-keepers assures me that they are quite capable of thinking and judging for themselves.

In the near future I shall give them this opportunity by sending to the editor a photograph of the hive and device, with all the necessary information how to make and use it, etc.

The device consists of four pieces so small and light that it may be sent by mail. It may be placed in any box of a suitable length for the frames. When the frames are put in and spaced, turn the thumb screws and you have a tight box-hive; and, turn them back, and you have a loose-hanging frame hive. These desirable qualities combined in one and the same hive constitute what is known in this locality as the "Notre Dame Hive." If this invention does not prove to be beneficial it cannot occasion loss of bees, as the loose-hanging frame has done in thousands of cases.

"A man that will write about close-fitting frames combining the safe qualities of a box-hive for safe wintering, and all the facilities of the loose-hanging frame for easy and safe handling, can hardly be worthy of much notice." This is personal, and I accept it with thanks from the unknown correspondent as a free gift. Whether the man is worthy of much or little notice can in no way affect the utility of the invention.

The above-mentioned hive is prepared for safe wintering of bees in the following manner: Cover the frames with a cloth. Then put on a full-depth super, put in one or two little woolen blankets, and fill the super with chaff, covering it so the mice may not get in. For this purpose we use a cover made of four strips of boards and a piece of wire-cloth. This kind of cover affords ample ventilation for the moisture arising from the cluster to escape. Thus prepared, the bees will winter as safely as in a box of the same dimensions, all things being equal.

St. Joseph Co., Ind.

not go altogether by the degrees of the thermometer. There's a good deal of difference in thermometers, and there may be a difference in cellars at the same temperature. The thing is to find at what point the bees are most quiet, whether that be at 40° or more. If a cellar is too cold for them, the bees must consume more fuel (honey) to keep up the heat, and this will distend the bowels, making it harder to stand long confinement.

2. So far as reports have been made on the matter, there seems to be no difference as to hardiness between queens reared in the South and those reared in the North. Possibly there might be a difference if for many generations the North and South bees were kept separate, but queens from the North are all the time going to the South.

3. I think it is generally understood that there is hardly any difference between red and white clover honey. I have seen honey that appeared just like white clover, that the producer said he was sure came from red clover. It's a hard thing, however, for one to be sure what honey comes from, unless it comes in large quantity. It would be a good thing if those who have any knowledge in the matter would tell us what red clover is like.

4. No, I've not observed any regular order, and I'm sure it doesn't always come that way in northern Illinois. 1894 was so poor the bees didn't get enough for their own use. 1895 was a little better, the bees getting no surplus, but in the fall storing enough for winter. 1896 gave some surplus, and 1897 a flood. That makes a series of four years; but there's no telling how the next four years will be.

Cane-Mill Near Bees.

Would a cane-mill near bees be a detriment to them during the can-syrup making season? IOWA.

ANSWER.—I don't know. I'd rather not risk it if I could help myself, but perhaps some one with practical experience will answer.

Transferring—8 or 10-Frame Langstroth Hives.

1. When is the best time to transfer from box-hives to movable-frame hives? I use the Hoffman frame.

2. Which would be the better to use the old comb that is in the box-hive, or full sheets of foundation?

3. I thought of using 10-frame hives, thinking I could use them for winter hives by taking out two frames and using cushions at each side and over the brood-frames. Would that make a hive all right for winter? Or would an 8-frame hive with an outside wall be the best? I want to get some new hives and hardly know which would be the best, a 10-frame or the 8-frame. I want to use them mostly for comb honey. INDIANA.

ANSWERS.—1. The favorite time is during fruit-bloom.

2. Both. That is, use the nice, straight worker-combs, saving all worker-brood, and fill up the rest of the frames with foundation.

3. That's a very hard question to answer. It will take less care to run the 10-frame hives, and they will be safer for winter than the 8-framers if not much attention is paid to either, but the 8-framers have also advantages. So far as protection in winter is concerned, the 8-frame with an outside wall will give more than the 10-frame with cushions in place of the two outside combs. If the hives you now have are 8-frame hives, it would be a good plan to try two or three 10-frame hives before finally deciding. If you now have 10-frame hives, try two or three with eight frames.

Increase Without Swarming.

In the fall of 1897 I purchased five colonies of bees (blacks and hybrids) but lost all but one last winter with dysentery. I bought three more last spring, and increase by dividing till I have nine at present. They are in the regular 8-frame Langstroth hive, combs mostly built from full frames of foundation. Two of them have tested queens; four others have young Italian queens, reared from my tested queen, but I think they are impurely mated. The other three have hybrid queens.

1. I can't let them swarm naturally, as I am away from 6:30 a.m. till 6:30 p.m., except Sundays. I would like so to handle them that I could get a fair amount of increase, and also some surplus honey, if there is any the coming season. I am not satisfied with dividing them, for if it comes on a

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. C. C. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Cellar-Wintering—Southern Queens in the North—Red Clover Honey—Good and Poor Honey-Years.

1. I winter my bees in a 14x16 feet cellar, and no fire over the cellar. We have our produce in half of the cellar, and 25 colonies of bees in the west side. The thermometer registers about 40°, and in cold spells one or two degrees lower; it doesn't vary much. What effect will such low temperature have on the bees?

2. I want to get some queens in the spring to build up colonies. If I send to Florida will those Southern bees be hardy in our northern Illinois climate, or should I buy them reared near by?

3. Can you tell the taste and color of honey stored from red clover? Last summer I saw bees working strong on red clover, for the first time in my life. I took away honey that I believe was red clover honey; it was light color, yellow or amber, not pure white, with a taste without the distinct honey-flavor, but just a plain sweet, more like sugar syrup. Was it red clover honey?

4. I was told one year ago by a lady who kept bees many years, that bees generally do poorly one year, better the next, and best the third year. She said 1898 would consequently be a very poor year. Her prophecy proved true. Have you ever observed it so? ILLINOIS.

ANSWERS.—1. They ought to do pretty well, altho it might be better if the cellar was kept at about 45°. Still, one can

dearth of pasture, as it did the past season here, I would have a lot of bees to feed for weeks, as I did the past season.

2. Would it be best to clip all of the queens as soon as they are fertilized? Or try to use drone-traps to catch the queens? But that makes quite a bill of expense for the traps.

My bees are packed in winter-cases mostly, with granulated-sugar stores.

MICHIGAN.

ANSWERS.—1. I suppose what you want is some plan by which you may increase, and yet not be caught with a lot of colonies that need building up. Try the nucleus plan. Start a few nuclei in which you have young queens laying. Draw from each of your strong colonies two or three frames of brood with adhering bees, and use these as far as they will go in making full colonies of some of your nuclei. That will not seriously deplete your strong colonies, but will be enough to keep them from swarming. In giving this brood to the nuclei, fill up one, then another, and so on as long as your brood lasts. If now the season is brought up with a sharp turn, you will have no weak colonies on hand, and you need not increase any more. If, however, the season continues good, you may make a second draught on all strong colonies, building up as many into full colonies as you can, and this may be repeated as long as the season and the strength of the colonies warrant, leaving you always ready for a close of the season. Neither will this hinder a fair share of surplus.

2. Whether you use queen-traps or not, you will probably find it advisable to have all queens clipped if you are not on hand during swarming hours.

Separators—Extracting-Combs—3 or 5-Banders—Oak for Hives.

1. I use 3½-inch separators, and the bees bulge the comb out at the bottom of the sections. Is it because the separators don't rest on the tins in the super? Should they rest on the tins, or be level with the sections at the top?

2. How can I keep extracting-combs over winter?

3. For working quality, which do you consider the best, 3 or 5-banded Italians?

4. Will oak lumber make good bee-hives, such as is used for making furniture? C. H. M.

ANSWERS.—1. Yes, it is because the separators don't rest on the T tins, for I suppose you mean T tins, but come clear to the tops of the sections. That makes a space of half an inch at the bottom without any separator, and you may expect bad work. Let the separator down on the T tin, thus making a space at the bottom of only ¼ inch, and the same space at the top, and you'll have no trouble.

2. Outdoors. Cover so no rain can get in, and shut tight so no mice can get in. If any worms are present (and they are likely to be present) the freezing will kill them.

3. It's not a matter of bands, only as bands may be more or less a sign of other qualities. You may get 5-banders that don't come up to the average 3-banders, and you may get them better than the average. There are good and bad in both kinds.

4. No, oak wouldn't be used for furniture if the furniture was to stand outdoors, and it won't do for bee-hives.

White Clover Yields—A Queen Experience—Partnership Bee-Keeping.

1. How often in the course of 10 years would you expect white clover to fail to secrete nectar so as to be useless to the bee-keeper?

2. As bees are required to fertilize flowers, and as they rather avoided white clover this year in this section, can we look forward to as good a stand of clover in 1899 as this year, providing it does not winter-kill?

3. Colony No. 11 in September had a queen which deposited eggs on top of bee-bread and in empty cells, to the number of four or five. I suspected laying workers, but to make sure I looked up the queen. She was reared last summer. To what could be assigned the cause?

4. If A bought an old apiary of 30 colonies and furnishes new hives, fixtures, etc., in flat, B to do all the labor and care for the bees, what would be a fair division of the increase, and we will say 1,500 pounds of honey? The only thing I find in bee-books says bee-keeping partnership is usually unsatisfactory. A. HOTSPUR.

ANSWERS.—1. Perhaps five times or more, judging by late years. Sometimes the failure comes from the lack of bloom,

and sometimes, as the past season, there is plenty of bloom but no honey.

2. In spite of the fact that no crop of clover honey was obtained, probably the bees did enough work on the blossoms to make sure of a goodly quantity of seed. But the crop of next year hardly depends upon the seed matured this year, but rather upon the plants that have been growing this year and live over winter. In your part of the country (Northern Illinois) you will probably find there was a good stand of white clover in the fall, and unless it is killed out through the winter, there will probably be a good crop of white clover next year. But a good crop of white clover doesn't necessarily mean a good crop of white clover honey.

3. I don't know. I had a similar case last summer. I found, I think, 11 cells containing pollen with an egg laid therein. The queen was all right.

4. The books are rather wise not to give very specific instruction as to what division should be made. Each case is more or less a case by itself. A very skillful man should have a larger return than one who knows nothing about the care of bees. One way to approximate an answer is to make an estimate of the amount of time occupied by the apiarist, and allow him enough to pay him for his time, figuring on a per diem all the way from the price of common day labor up to twice that, according to the skill and ability of the apiarist.

Paralysis—Queens Lost—Giant Bees.

1. I have two colonies of bees that act very strangely. They run out of the hive, hop off the alighting-board, tremble a little, and die. What ails them?

2. If a colony of bees dies of paralysis, and I use the hive and combs, is there any danger of the next swarm taking it?

3. I introduced two Italian queens in two black colonies of bees, and they killed them. I then gave them brood and they reared five queens during the summer, and all disappeared. My hives are in a straight row, a foot space between them.

4. If Mr. Wilson introduces in the United States the giant bees of India, that build "wired" combs six feet long and four feet wide, won't such a comb with the lumber it will take to build the frame be a little heavy for a small man to handle? Or, will he also introduce a machine that will take the frames out of the hive and extract the sweetness, and replace them while the apiarist "sits in the old apple-tree shade?" CALIFORNIA.

ANSWERS.—1. Very likely paralysis.

2. Probably not.

3. They may have been killed by birds when on their wedding-flight, or they may have returned to the wrong hives. If 10 or more colonies stand in a straight row, with a space of four feet between each two hives, there may be great danger of young queens entering the wrong hives, or there may be no danger at all. If the place is level and open, with not a tree, shrub, or building near the hives, the bees have trouble locating their hives, and may easily go wrong. It will help matters very much if every alternate hive is moved close to its neighbor, thus making the hives in pairs, but occupying no more ground. If there are bushes, trees, or other objects in plenty about the hives, the bees will use these to mark the location, so as to find their own hives. Even in this case, moving the hives together in pairs will be a good thing.

4. I don't know.

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

The Names and Addresses of all your bee friends, who are not now taking the Bee Journal, are wanted at this office. Send them in, please, when sample copies will be mailed to them. Then you can secure their subscriptions, and earn some of the premiums we are offering. The next few months will be just the time to easily get new subscribers. Try it earnestly, at least.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it. See 6 big offers on page 810.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

118 Michigan Street, CHICAGO, ILL.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. DECEMBER 22, 1898. NO. 51.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

An Unusually Merry Christmas to each reader of the American Bee Journal is our sincerest wish.

Kind Words from our subscribers seem to be coming in this year with renewals of subscriptions as never before, or at least as never since we have been at the helm of the old American Bee Journal. It is indeed very gratifying and encouraging to us to know that our efforts to publish a good bee-paper are appreciated; tho many times we can hardly feel that we deserve the complimentary things that are said of our work. But we shall continue striving to merit them, and show our appreciation by getting out a still better bee-journal, as we shall be able to do with the help of our loyal subscribers and contributors.

Our great desire just now is, that *all* our present subscribers will remain with us during 1899. We cannot make any great promises for the future, only if existing plans can be successfully carried out, the American Bee Journal for 1899 will be far ahead of any previous year. Better stay with us and let the old American Bee Journal continue to "do you good."

Tin vs. Wood for Honey.—Taking for a text an editorial in this journal for Nov. 10, 1898, the editor of *Gleanings* discusses the matter of best package for extracted honey in bulk. Like so many other things in bee-keeping, the choice of tin or wood seems to be somewhat a matter of locality. New York men prefer wood, and have no trouble with shrinking, tainting of honey, etc. Pound for pound, they say wood is cheaper. Two cans in a case are back-breakers to lift, while a barrel can be rolled. O. O. Poppleton says it costs

nearly a cent a pound more for tin, and with barrels properly paraffined there is no trouble. Editor Root says:

"The truth seems to be about this: Barrels and kegs rarely give any trouble by leaking, *provided* they are well made, well seasoned, and the hoops driven up solidly *before* the honey is put into them. But there are many ignoramuses who have an idea that the barrels should be scalded out, or, if not scalded, water swished around inside until the staves swell tight. Well, when these chaps put their honey into these barrels, trouble is almost sure to follow; and this is why, in many markets, the cans are preferred. We always prefer to buy in square cans ourselves.

"Neither do the square cans give entire immunity from leakage. There are other ignoramuses who, in nailing on covers to the cases, drive a nail through the can. Of course, there is no leakage for the time being; but as soon as the can is turned upside down, or stood on end, then there is a 'muss.' Again, some freight handlers give the cases such severe dumping as to break the seams of the cans."

Editor Leahy, in the *Progressive Bee-Keeper*, has this to say on the subject:

"We buy considerable extracted honey every year. We used to buy in barrels and kegs, but with us the loss of honey by use of barrels would more than pay for cans; in fact, we were often compelled to empty contents of barrels into cans, after we received the shipment. We have no home consumers who will take a barrel of honey, nor yet a half-barrel; but we have many who buy a 5-gallon can from us every year.

"A can can be set in a warm place, and the honey be kept liquid, while a barrel or a keg cannot; 5 cents will furnish a nice 2-inch honey-gate, that you can give to a customer to draw the honey from a can with, while it would take 25 or 50 cents for a faucet with which to draw the honey from a barrel or keg. Our experience has been that panel cans will not crack while being roughly handled, and as they cost no more than cans with straight sides, we advise the use of cans, and panel cans at that.

"If you have any honey in barrels to sell, please don't let us know anything about it; but we want some good alfalfa honey, in cans."

Our own opinion has undergone no change since it was given Nov. 10. We prefer tin cans every time, and all the time. (Mr. Leahy will find alfalfa honey offered in cans, on page 812).

Writing for Publication is touched on by Editor Hill, of the *American Bee-Keeper*, in this very sensible paragraph:

"A point which some ambitious young writers would do well to remember, is, that correct spelling and grammar are not nearly so important as a subject. If you have something interesting to write about, tell it as best you can; it is the editor's business to see that it appears properly in print. The object in writing for publication is to say something that will be interesting or helpful to others; not merely to occupy space with an exhibition of faultless diction."

Right you are, Mr. Hill. We are with you in being willing to let some other bee-paper "merely occupy space with an exhibition of faultless diction." But, come to think of it, it isn't even "faultless diction," to say nothing of its coming far short of being "interesting or helpful to others."

The Colorado Convention, held at Denver Dec. 1, we understand was a very good one. Messrs. R. C. Alkin and Frank Rauchs were unanimously re-elected President and Secretary, respectively. They are both tireless workers for the best interests of their Association. We expect later on to publish the report of the late convention in the *Bee Journal*. Heretofore it has always been a rare treat, and we presume the forthcoming report will be no exception. Those Colorado bee-keepers invariably have a most excellent annual convention.

Honey Shows with Other Shows.—In the *British Bee Journal* a honey-show is noticed in connection with a fanciers' show, and another in connection with a chrysanthemum and fruit society's exhibition. Why not? Surely, honey is appropriate anywhere.

MR. M. C. BINGHAM, of Coos Co., Oreg., wrote us Dec. 9 :

"The American Bee Journal has been a great source of information, and as long as I keep bees I hope to be able to send in my dollar for it each year. The last season was not a favorable one for bees here."

REV. E. T. ABBOTT, of Missouri, will again represent the United States Bee-Keepers' Union at the second annual meeting of the National Pure Food Congress, to be held in Washington, D. C., in January, 1899. Bee-keepers may expect good work done by Mr. Abbott, and an interesting report at the close of the convention.

HON. E. WHITCOMB, the new and popular President of the United States Bee-Keepers' Union, will deliver an address before the Kansas State Board of Agriculture, at its meeting the second Wednesday in January, in Topeka. His subject is "Practical Lessons in Bee-Keeping." Bee-keepers near enough to attend, as well as all others, should be present if possible. Mr. Whitcomb is an interesting talker on bees and—we were going to say "Indians." Yes, he knows the red men pretty well, too. At least you would have thought so could you have seen him join in their war dances at the Omaha Exposition.

MR. H. E. MCGREGOR, of Outagamie Co., Wis., wrote us as follows, Dec. 13 :

"In sending my subscription for 1899 I find that I have taken the Bee Journal for 10 years. To say that it has been first-class is not putting the matter too strong. I am surprised that some of your readers can read the excellent articles of Dr. Miller, Dadant, Doolittle, and others, and then neglect to send in their dollar (in many cases overdue) to the editor to keep the Bee Journal financially intact. Come, friends, shell out that dollar, and make the editor happy; and if you can get an extra subscriber, why, that will make his wife happy, also."

MR. E. B. HUFFMAN, of Winona Co., Minn., writing Dec. 13, said :

"The price of the American Bee Journal is simply nothing as compared with the information a person receives from its pages. I could not entertain the idea of doing without it, as I often get more than the value of my subscription in one article; in fact, to a beginner it is very valuable. You may take the country at large, and where you find a man that makes a success of keeping bees you will find that generally he is a reader of the Bee Journal. I could refer you to some who will not take the Bee Journal, and their bee-business is a failure. But I want it as long as I keep bees. Our bees seem in good condition so far; they went into winter quarters all right."

MR. A. W. HART, of Stephenson Co., Ill., sends the following as a final reply to the controversy between himself and Mr. Bevins, whose last contribution appeared on page 710 :

"Mr. Bevins seems to think I have been giving him 'Hail Columbia.' I have felt no bitterness, have not felt hurt, and have nothing to pardon. He concedes now my question was fair, that I was honest, etc., and would take all back. Does not this admit he has been aggressive? How, then, is it fair to say I am brimful of belligerency? And that it is reasonable to suppose I will continue the war, etc., when from first to last I have been on the defensive?"

"I am aware of the unprofitableness of such a controversy, and that in our American Bee Journal it is out of place, and only have replied to Mr. B. as he seemed to be pursuing me. I have done, and will leave the matter on its merits, as Mr. B. has gotten around on the original question, and would like to know as I did—Why Italian bees store the best honey, etc."

As Mr. Bevins, we believe, on two occasions wrote that he meant no disrespect to Mr. Hart, we conclude that the foregoing will be the end of the personal part of the discussion. If there is anything more to be said, let it refer directly to the original question.

Adulteration in Germany.—In Centralblatt is reported the case of two men who were fined \$200 each for dealing in adulterated honey.

Apis Dorsata.—"May be I am wrong, but it seems to me *Apis dorsata* should be tried in its own climate, and that pretty thoroughly, before we can go to great expense in bringing them to this country."—Editor E. R. Root, in *Gleanings*.

Low Freights on Honey in England.—At a conversation of British bee-keepers, Miss Leigh said a spring crate made to carry two dozen sections would travel 50 miles on the Great Western Railway for 16 cents, and was returned empty to her from her customers.—*British Bee Journal*.

Consumption of Honey When Breeding.—R. C. Aikin thinks bees consume no more during the entire winter and spring up to May than they do in a month while breeding heavily in May and June, the consumption in Colorado being about 15 pounds of honey each month at that time.—*Progressive Bee-Keeper*.

Foul Brood 100 Years Ago.—About 1790, for the cure of the pest or foul brood, it was advised to put the diseased colony in the condition of a swarm, and this is the method counseled in one of the late numbers of the American Bee Journal, which method we will publish at an opportune moment.—*Le Rucher Belge*.

Extracting-Frames. C. P. Dadant thinks, should be of medium depth. He objects to "little, shallow, $4\frac{1}{4}$ -inch toy extracting-frames," which make too much hauling for the amount of honey harvested; but objects just as much to having them the same depth as the brood-frames, believing six inches about the right depth.—*Gleanings*.

"Apartment" and "Department" are words that continue to get mixed up in the bee-journals. Doesn't "apartment" refer to space and "department" to kind? The linen and the woolen departments of a store may be in the same apartment, and one of these departments may occupy two apartments. When a queen goes up into a super, she goes into another apartment.—*Stray Straw*, in *Gleanings*.

Santiago de Cuba as a Bee-Country.—L. F. Hiorns reports in *Gleanings* that he saw no colonies in hives except four at Siboney, 8 inches square inside, 2 feet long, open at each end, with a piece of burlap, having an inch hole for an entrance, hanging over the ends. He advises against locating apiaries there. W. W. Somerford is to make a trip through Cuba with wheel and camera, and report as to bee-keeping in Cuba, especially about Havana.

Don't Overstock.—"All my personal experience points to small apiaries for greatest profit," says that delightful dreamer, Somnambulst, in *Progressive Bee-Keeper*; "hence, the out-apiary question, with all appertaining thereto, is of most vital importance to the would-be financially successful bee-keeper. But a few territories will profitably employ large apiaries. No mistaking the prominent middle finger pointing to this fact." But have you lost the index finger, Sommy, that you don't use that for a pointer?

Large, Single-Story vs. Small Two-Story Hives.—C. P. Dadant cannot agree that it is as well to have the same amount of room in two stories as to have it all in one story with larger frames. He says in *Gleanings* that he thinks it better when two stories are used, to give the additional story below rather than above the one containing the early brood-nest, but he thinks it still better to have only one story, with frames $2\frac{1}{2}$ inches deeper than the Langstroth. A single story of eight Langstroth frames is too small, and two stories too large. If comb honey is the object, the bees will put 20 or more pounds of surplus below, that ought to go in sections, if two stories are given.

To Our Regular Subscribers—Now for New Readers!

6 Great 50-cent Offers—Each One Free!!

On this page you will find six splendid premium offers, and we will mail your choice of any one of them for sending us \$1.00 for **just one New subscriber** for 1899—and we will throw in the last three months of this year's Bee Journal free besides to each new subscriber you send on these offers. That makes 15 months of the Bee Journal to the new subscriber. Or, for sending us **4 New subscribers**, as above, we will mail the sender all of the 6 great 50-cent offers.

JUST READ WHAT THEY ARE:

Offer No. 1.—Samantha at Saratoga.

100,000 Sold at \$2.50 per copy.

This is indeed a feast of fun, by the only peer of Mark Twain's humor—**JOSIAH ALLEN'S WIFE** (Marietta Holley.)

Read this Extract from the Book:

And right here, let me insert this one word of wisdom for the special comfort of my sect, and yet it is one that may well be laid to heart by the more opposite one. If your pardner gets restless and oneasy and middin' cross, as pardners will be anon or even oftener—start them off on a tower. A tower will in 9 cases out of 10 lift 'em out of their oneasiness, their restlessness and their crossness.

Why I have known a short tower to Slab City or Loontown act like a charm on my pardner, when crossness wuz in his mean and snappishness wuz present with him, I have known him to set off with the mean of a lion and come back with the limment of a lamb.

And jest the prospect of a tower ahead is a great help to a woman in rulin' and keepin' a pardner straight. Somehow jest the thought of a tower sort of lifts him up in mind, and happifys him, and makes him easier to quell, and pardners must be quelled at times, else there would be no livin' with 'em.

She takes off FOLLIES, FLIRTATIONS, LOW-NECKED DRESSING, DUDES, PUG DOGS, TOBAGGANING, ETC.

Opinions of Noted Critics:

"Exceedingly amusing."—Rose E. Cleveland. "Delicious Humor."—Will Carleton. "So execratically funny, we had to sit back and laugh until the tears came."—Witness. "Unquestionably her best."—Detroit Free Press. "Biterest satire, coated with the sweetest of exhilarating fun."—Bishop Newman.

Nicely bound in paper, fully illustrated, printed from new type and on fine paper. 370 pages. Postpaid, 50 cents.

Offer No. 2.—New Waldorf Cook-Book.

Over 1,000 of the very best up-to-date recipes for every conceivable variety required in the kitchen and other departments of house-keeping, by **Mrs. Anne Clarke**, the distinguished student and instructor in culinary science, assisted by many of the most successful house-keepers in various parts of Europe and America. It gives the latest and best methods for economy and luxury at home. Just the book for the housewife or daughter. Has had an enormous sale at \$2.00 a copy. 350 pages; paper bound; postpaid, 50 cents.

Offer No. 3.—Cattle, Sheep and Swine Book.

Fully Illustrated—300,000 sold at \$3.00 a copy.

This great work gives all the information concerning the various Breeds and their Characteristics, Breaking, Training, Sheltering, Buying, Selling, Profitable Use, and General Care; embracing all the Diseases to which they are subject—the Causes, How to Know and What to Do given in plain, simple language, but scientifically correct; and with Directions that are Easily Understood, Easily Applied, and Remedies that are within the Reach of the People; giving also the Most Approved and Humane Methods for the Care of Stock, the Prevention of Disease, and Restoration to Health. Written by Dr. Manning.

Every farmer wants this great book. 390 pages, paper bound. Postpaid, 50 cents.

Offer No. 4.—Gleason's Horse-Book.

By Prof. Oscar R. Gleason.

This is the only complete and authorized work by America's king of horse-trainers, renowned throughout America and recognized by the United States Government as the most expert and successful horseman of the age. The whole work comprising His-

tory, Breeding, Training, Breaking, Buying, Feeding, Grooming, Shoeing, Doctoring, Telling Age, and General Care of the Horse. You will know all about a horse after you have read it. No one can fool you on the age of a horse when you have this book. 416 pages, bound in paper, with 173 striking illustrations produced under the direction of the United States Government Veterinary Surgeon. In this book Prof. Gleason has given to the world for the first time his most wonderful methods of training and treating horses. 100,000 sold at \$3.00 each. Our price, postpaid, 50 cents.

Offer No. 5.—Music, \$5 for 50 cents.

Four pieces New Sheet Music, which sell at music stores at 50 cents each—\$2.00; Three years' membership in the World's Musical Association (regular price \$1.00 a year), \$3.00. Total, \$5.00. We offer the whole thing at 50 cents.

The four new pieces of sheet music are the very latest hits of this year; are regular sheet music size and quality, but the title pages are a new style of art, viz: Illuminated Chromatic designs in five brilliant colors.

THE SONG TITLES ARE:

"**Do Your Honey Do.**" by THEO. METZ, author of "A Hot time in the Old Town To-night." This latter piece, said to be his best, is creating a great stir, and becoming immensely popular every where.

"**Queen of the Bicycle Girls.**" by the celebrated composer, OTTO LANGEY, by far the most charming Bicycle Song yet issued.

"**Blossoms from Over the Sea.**" by the distinguished composer, J. P. SKELLY, a very beautiful Sentimental Song.

"**He's Just Like All the Men.**" by the renowned composer, EASTBURN. Wonderfully pleasing to the Ladies.

The World's Musical Association is an organization having special advantageous relations with the leading music publishers of this country and Europe, and being an enormous purchaser, it is enabled to supply to its members (and will do so) any music desired (at any time within the term of their membership), at such wholesale prices as are usually granted only to very large dealers.

Offer No. 6.—The Poultry-Keeper Illustrators.

The four "Poultry-Keeper Illustrators" are the greatest books on poultry subjects ever issued, and are a veritable poultry dictionary, covering the ground so completely that, having these four books, one needs scarcely anything more except "grit" to become a successful poultry-raiser. You cannot get such other books in the whole world, not even for \$50 each, for they do not exist. Were they given in another form and elaborate binding and colored cuts you might think them easily worth \$5 each, but what you want is not elegant printing, and in these we give you the value in information that you can make use of. They have cost much in labor and cash, but you get all this value for almost nothing. We mail the 4 Illustrators for 50 cents.

Illustrator No. 1.—Poultry Houses Incubators, Brooders, Coops, etc., 25 cents.

Illustrator No. 2.—Artificial Incubation, Raising Chicks, Testing Eggs, etc., 25 cents.

Illustrator No. 3.—Poultry Diseases, Lice, Grapes, Moulting, Egg Eating, etc., 25 cents.

Illustrator No. 4.—Judging Fowls, Description of Breeds, Mating, etc., 25 cents.

Those offers ought to bring us in at least 2,000 new readers during this month and next. You could send in your own renewal for 1899 at the same time you send in a new subscriber, if you wish. If you do, you can select any one of the above offers free for yourself, provided you send at least **two New subscribers** at the same time. That would give you your choice of **three** of the offers—by sending your own renewal for 1899, and two new subscribers (\$3.00 in all).

GENERAL ITEMS

Bees Did Well—Bitter Honey.

I cannot get along very well without the "old reliable" American Bee Journal, and I think all bee-keepers should join the United States Bee-Keepers' Union; it is for our good, and all others concerned.

Bees did very well the past season, but our fall honey is so bitter that no one can eat it. It has a very sickening taste. It will be good to feed the bees to start breeding in early spring. **ROBT. WILLIAMSON,**
Choctaw Nation, Ind. T., Dec. 5.

Very Good Season.

The past season was a very good one in this locality. I started last spring with 45 colonies, increased 10, and took off 2,200 pounds of surplus honey. I think I could have done better, but I had other work to do, and had to neglect the bees somewhat. This was my first season's work among the bees. I can't get along without the American Bee Journal.

J. L. HAIGHT,
Delaware Co., N. Y., Dec. 5.

An Octogenarian's Report.

Altho 80 years old this month, I still keep a few colonies of bees, not so much for profit as for pleasure. I have about a dozen colonies, but my sight is so defective that I cannot give them the attention they require—too nearly blind to pick out a queen—but I manage always to get some honey.

This cannot be called a honey country; we have a great abundance of white clover, but it does not afford much nectar in many seasons. I sowed some sweet clover seed, and I think it will prove a great boon to bee-keepers here. In my garden it is still in bloom.

I very much enjoy looking over the Bee Journal, and would want it if I kept no bees. Last season my bees had a perfect mania for swarming. Some colonies swarmed four times, and one prime swarm sent out four. Finally I got tired, and dumped two or three into the same hive, and let them settle the matter for themselves. They were satisfied, and seemed to do well. Is this mode of procedure common? I will try to prevent so much swarming in the future.

N. OSTRANDER, M. D.
Thurston Co., Wash., Dec. 2.

Poor Honey Season.

It was a poor honey season here this year—only about one-fourth as much honey as last year, and not much increase in swarms. I put 45 colonies into winter quarters—29 in a shed open to the south, packed in straw, with Hill's device and two supers packed with cushions, etc.; 18 colonies in the cellar, and two on the summer stands, one of which is in a chaff hive, and one in a large hollow log. Some will need feeding in the spring.

I like the American Bee Journal.

NOAH MILLER,
Johnson Co., Iowa, Dec. 6.

Bees in Fair Condition.

I commenced the season of 1898 with 16 colonies, and did not get a new swarm, but took off some 600 pounds of comb honey. I have just purchased 50 colonies more, and got them home and in winter quarters, so I have, all told, 66 colonies. They are mostly in Simplicity and Langstroth hives; some are in chaff hives. It was a very poor swarming season in this (Erie) county; still the hives are well filled for winter.

I am an old soldier, and used to keep bees before and just after the Civil War, but for the last 25 or 30 years I have not had any.

Sweet Clover
And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

| | | | | |
|----------------|-----|--------|--------|--------|
| Sweet Clover | 5lb | 10lb | 25lb | 50lb |
| Alsike Clover | .60 | \$1.00 | \$2.25 | \$4.00 |
| White Clover | .70 | 1.25 | 3.00 | 5.75 |
| Alfalfa Clover | .80 | 1.40 | 3.00 | 5.00 |
| Crimson Clover | .60 | 1.00 | 2.25 | 4.00 |
| | .55 | .90 | 2.00 | 3.50 |

Prices subject to market changes.

Eastern Bee-Keepers!

Seven years ago we started an Apiarian Supply business in NEW YORK CITY, as we saw an opening here. That we made no mistake in this is shown by the large demand for Supplies and our constantly increasing trade. Our aim was to furnish Supplies promptly. In many cases bee-keepers find the freight on Supplies from the Western factories is as much as the cost of the goods. In buying near home you not only save freight, but get your goods much more promptly. We keep several carloads of

Hives, Sections, Foundation, Etc.,

always in stock ready to ship, and the prices will be found RIGHT. We also run two apiaries for honey and sell BEES AND QUEENS. If you expect to use anything in the Apiarian line the coming year, you will do well to send for our Catalogue. We would be pleased to quote you SPECIAL PRICES on what you want, as this is our only season, and we can afford to sell for small profits. Hives, Sections, etc., are made in Wisconsin, where lumber is low, and the best can be had.

Our Special Price on Foundation, Hives and Sections will make you Smile.

Write for it, stating the quantity you can use. DEALERS should write for our '99 discount sheet which is now ready to mail.

\$50.00 FOR A BEE-STORY

The PROGRESSIVE BEE-KEEPER wants a good bee-story. The story should not be less than 15,000 nor more than 20,000 words, and we will pay \$50.00 in cash as first prize for such a story. There will also be second and third prizes. No one financially interested in the company will be allowed to compete, or act as judges, and we guarantee that none but competent and impartial parties will decide the contest. For further particulars, address,

THE PROGRESSIVE BEE-KEEPER,
HIGGINSVILLE, MISSOURI.

HONEY * FOR * SALE.

Best White Alfalfa Extracted...

IN 60-POUND TIN CANS.

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can hardly get enough of the Alfalfa extracted.

Prices are as Follows:

A sample by mail, 8 cents in stamps, to pay for package and postage. By freight—One 60-pound can, 8 cents per pound; 2 cans, 7¼ cents per pound; 4 or more cans, 7½ cents per pound. Cash must accompany each order.

Best Basswood Honey in Barrels.

We have a quantity of finest basswood honey in barrels, weighing 625 pounds net, which we are ready to ship f. o. b. Chicago, at 7½ cents a pound. Sample mailed for 8 cents. If desiring to purchase, let us know, and we will write you the exact number of pounds in the barrel or barrels, and hold same till you can send the cash for it by return mail.

Our honey is **ABSOLUTELY PURE BEES' HONEY**, the finest of the kinds produced in this country.

☞ We would suggest that those bee-keepers who did not produce any honey for their home demand the past season, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,
GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

and owing to poor health I am now trying my hand once more, so I need to read up, and must say the American Bee Journal is a great help to me; you would be surprised to see how my wife is getting interested in reading it, as well as some of the children. I have read different bee-papers, and I must say, give me the American Bee Journal.

SPENCER S. BUXTON.

Eric Co., N. Y., Dec. 5.

Favor Foul Brood Law.

I have taken the Bee Journal but a short time, and consider it very interesting, especially the proceedings of the great convention at Omaha.

As I was one of the proposers of a foul brood law in our State, at the Northern Illinois Bee-Keepers' Convention, held at Freeport, Sept. 16 and 17, I earnestly hope it will be pushed for all it is worth by the committee appointed at the State Convention in Springfield, as I think it of great importance to bee-keepers. M. R. BLISS.

Winnebago Co., Ill., Dec. 3.

An Arizona Report.

I am a fledgling in the bee-business, and am in need of much information. I commenced last spring with 120 colonies, and increased to 180, mostly by division. I work for extracted honey entirely, and my bees gave a surplus of 120 pounds per colony, spring count. I did not use a pound of foundation for increasing or otherwise, except what the bees made themselves. August was a failure here this year. The last of July was my last extracting for this year. Bees have 50 to 60 pounds of honey per colony for winter. L. E. REDDEN.

Maricopa Co., Ariz., Nov. 29.

Basswood Light—Clover Injured.

I find the Journal a great help, and gain a better understanding, as its weekly visits are sure to come.

I began the bee-business last spring by purchasing 12 colonies; I have put 23 into the winter cellar in apparently fine condition. I took off 243 one-pound boxes of No. 1 honey, besides a quantity of "shell" honey, or partly-filled boxes. Basswood was very light here, owing to a late frost in July, the fifth day after the basswood began to blossom, and the extreme dry weather which prevailed here injured the clover crop. A. J. MCCOY.

St. Lawrence Co., N. Y., Dec. 5.

Hopeful for Next Year.

I am a beginner in bee-culture, starting with two colonies in February of this year, and, on account of the poor season, have had neither honey nor increase; but my bees are in good condition for winter, and I expect better success next year.

W. A. STUFF.

Philadelphia Co., Pa., Dec. 5.

Fair Season for Honey.

I see by the reports from the different States that some have had a fair season while others have had an entire failure of the honey crop. In this fair State we have been blest with a fair season for honey. When the fruit bloomed in the spring the bees started off in great shape; in about a week it began raining, and was cool for about two weeks, and the honey-flow stopt somewhat, so we did not get very much early honey. When the late honey-flow commenced we had good weather, so the bees gathered a fair crop of fall honey.

I started with 14 colonies, increased to 21, and lost some four or five swarms by being in the country, building a barn during the swarming season. My average per colony, spring count, was 36 pounds of honey.

I sell all my honey at home at good prices. I see by the Bee Journal a great many send their honey to the commission merchants. I think it is a great mistake,

26c Cash Paid for Beeswax.

This is a good time to send in your Beeswax. We are paying **26 cents a pound — CASH** — upon its receipt. Now, if you want the money **PROMPTLY**, send us your Beeswax. Impure wax not taken at any price. Address as follows, very plainly,

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

Ho, for Omaha!

As we have many customers in the Northwest, and believing they will appreciate the low freight rates obtained by purchasing goods from a railroad center nearer to them than we are, getting a direct through-freight rate, thus cutting the freight in half, we have established a branch house at 1730 South 13th St., Omaha, Neb., where we will keep a complete line of all Apian Supplies, the same as we do at Higginville, Mo. With the quality of our goods, we believe most bee-keepers in the West are already acquainted, but to those who are not, we will say that our goods are par excellent. Polished, snowy-white Sections, beautiful straw-colored transparent Foundation, improved Smokers and Honey Extractors, and all other first-class goods, are what we sell. Kind and courteous treatment and honorable dealing our motto. On these bases, we solicit an order, feeling sure that if we sell you one bill of goods you will be our customer in the future.

PROGRESSIVE BEE-KEEPER, 50c per year. "Amateur Bee-Keeper," 25c. Both for 65c. postpaid. Sample copy of the PROGRESSIVE free, and a beautiful Catalog for the asking.

for it gives the dishonest commission man a chance to adulterate and throw a great lot of spurious stuff on the market, and cut the prices. Let each one be his own salesman, and sell direct to the jobber and consumer, and when he has disposed of his honey crop he will find his purse will not be nearly so light. Let him see that his honey is strictly pure, and when his customers find that the honey they get from him is always pure, he will have control of the market where he sells his honey.

L. WAYMAN.
Labette Co., Kans., Dec. 4.

Suffering From Foul Brood.

I have at present about 65 colonies of bees. They did well here the past season, but foul brood is in our midst and is likely to remain, as many do not know what it is, and others conceal the fact that their bees have it. An inspector is certainly needed in Illinois. I lost, in two years, nearly 80 colonies with foul brood, and have been a subscriber to the American Bee Journal for 12 or 14 years. My mistake was in trying to cure with drugs, as formerly recommended. The McEvoy remedy is the only remedy, but many persons who keep bees read no bee-papers and know nothing of the disease or its treatment.

The American Bee Journal seems to become more interesting as we grow older, and if I did not keep bees I would still want it.

C. A. HAINES.
St. Clair Co., Ill., Dec. 16.

Beginner's Report—Hiving Swarms.

Last spring I started with 20 colonies in S-frame dovetail hives. Most of these had young queens, reared during the previous season, from Italian queens purchased from different breeders. The colonies were not all strong, as the honey-flow the fall before failed. By taking some of the combs of honey from the stronger and giving them to the weaker, all were soon strong and ready for the flow, which came about May 10.

Before this I clipped the wings of all the queens, as I did not care to run and climb after swarms. As soon as the flow began I put on supers, with starters in the sections. At the same time I put wedges, 1x3/8 inch at the entrance, tapered to a feather-edge at the other end, under the hives. It was just fun to watch the bees come home loaded and alight nearly half way back on the cluster or bottom-board.

With this arrangement the first swarm issued May 17, followed by others until about June 15, in all 15 prime swarms. It was a pleasure to hive them. The first thing was to cage the queen, then remove the old hive just back and to one side of the old stand. Place a new hive with starters in the frames on the old stand. Put a zinc-excluder over the frames, and take the super, bees and all, from the old hive and place it on the zinc-excluder. By this time the bees will be coming back, and as they rush into the new hive, let the queen run in with them. You dare not be very slow or they will be coming back before you are ready, or they may not return for 10 or 15 minutes.

In three or four days I place the old hive on a new stand. In this way the field-bees are thrown into the new hive, which gave me what I wanted to get—comb honey.

At the beginning of July I had 250 pounds of nicely-capt white clover comb honey, and 35 colonies.

The fall flow began about Aug. 15, and during the flow, which was short, the bees gave me a surplus of 500 pounds of nicely capt buckwheat comb honey; also about 250 pounds more of partly-capt, which I extracted and let the bees clean them out for next season's use. The partly-filled sections were due to the flow stopping suddenly. I sell my honey near home for 15 and 20 cents per section.

As I was the only one in this community who got any surplus honey to speak of, I attribute my success to equalizing in the spring, using wedges, and hiving on the old

Another Big Offer!

AS I have explained in previous advertisements, the publisher of a good journal can afford to make liberal offers for the sake of getting his journal into new hands. I have in the past made several such offers; but here is one that I consider especially liberal. If you are not a subscriber to the *Bee-Keepers' Review*, send me \$1.80, and I will have your subscription to the American Bee Journal renewed for one year, send you 12 back numbers of the Review, and then the Review for all of 1899! Remember two things: you must be a new subscriber to the Review, and the order must be sent to

W. Z. HUTCHINSON, Flint, Michigan.

Youths' Premium Company, 142 to 146 Monroe St., Dept. "B"
CHICAGO, ILL.

The publishers of the American Bee Journal do not hesitate to recommend the above company, and would suggest that the boys and girls in the families of our readers write at once.

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us Two New Subscribers to the Bee Journal (with \$2.00), and we will mail YOU a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

stands. It may encourage the farmers to use the movable-frame hive. I persuaded a few last summer to get the dovetail hive, but expect to do better next year.

I used mostly the 4 $\frac{1}{4}$ x 4 $\frac{1}{4}$ x 1 $\frac{1}{2}$ sections with separators: only a few of the 5x3 $\frac{3}{4}$ x1 $\frac{1}{2}$ with the fence. The latter gave excellent satisfaction. I intend to change to the tall section as fast as I use up the old ones during the coming season. The cost for the change will be small, as the tall section brings more in our market than the square.

At the close of the fall flow I removed the wedges and supers. After taking the sections out of the supers, I placed the supers on again so as to be ready for putting on winter packing. During the first week of October I put a Hill's device on the frames, over this a quilt, and on this a cushion of wheat chaff tucked down very nicely.

I can hardly wait for the weekly visits of the American Bee Journal. Some of the numbers have been worth to me the whole subscription for a year. I am very much interested in the report of the United States Bee-Keepers' Union, of which I am a member. Those papers and discussions on marketing honey are excellent. If more of the bee-keepers would work up a home trade, it would be better for the bee-keepers in general, and for themselves in particular. The experience one gains in that line of work pays well, besides the surplus in his purse.

Before I was a regular reader of bee papers, I had even very little honey to eat. Now, since I am the recipient of the three oldest bee-papers published in the United States, I have all the honey I care to eat, besides a little to sell. I don't see how any bee-keeper can do without a bee paper.

Long live the American Bee Journal to promote the interests of bee-keepers.

JOHN W. ALBERTSON.

Luzerne Co., Pa., Dec. 3.

Against the Credit System.

I don't know how I could get along without the American Bee Journal now; and I don't see how any man, if he represents himself as a man, can take the American Bee Journal any length of time without paying for it. The comments on "What Credit Costs," page 776, come as near my sentiments as I could express it. "Pay as you go, or else don't go," is a very good motto.

My opportunity for education when a boy was very limited, so my object has been to learn all I can in passing through this life. During the time between '61 and '65, I distinctly remember the smell of burnt powder. The fall and winter of '65-'66 I bull-whacked on the plains between Omaha and Denver, worked on the railroad, broke prairie with an ox-team in Missouri, ran an engine in a

saw mill, and for over 10 years ran a retail grocery, and now am settled down to farm life. During all that time I have noticed those that paid as they went were—or seemed to be—the most happy. "A contented mind is a continual feast."

Of all the different kinds of employment that I have followed, bee-keeping has been the most interesting. At one time my friends reported me crazy on the subject; but four years have past since then, and I have not been to the asylum. JAS. COE.
Van Buren Co., Iowa.

Bees Building Comb on Limbs.

In regard to bees building and rearing brood on limbs of trees, I may say that last summer I transferred a colony which had built their combs on the outer limbs of an apple-tree; they had eggs and brood in all stages to hatching bees, also honey. The combs were about 12 inches long; in fact it was a colony of bees in normal condition, except they had no protection from wind and rain, of which we had a great deal at that time. Bees here in Kansas often go into houses, graneries, chicken-houses, or almost any place where they can find shelter. But I have seen only this one instance where bees work without shelter. I send you sample of limbs on which the bees were living.

I should be glad to see the rule made and practiced, that everybody must pay in advance or get no paper. D. G. PARKER.
Brown Co., Kans., Dec. 13.

[Thank you, Mr. Parker, for sending the sample of comb built on a limb.—EDITOR.]

Sand Around Hives, Etc.

Last year I wrote about putting sand around the hive to keep a clipt queen within bounds, so I could put my finger on her. It works like a charm, as I have had another year to test it.

I winter my bees mostly in square boxes with flat covers and shingled. I raise up the rear to give pitch to the roof, and the water runs off and the dead bees fall out. I pack with sawdust on the sides and on top, by putting on an empty super without cover. I use heavy cotton next to the bees,

and they are there every spring. I let the snow cover them up completely, and all is well. C. CRANK.

Oscoda Co., Mich., Dec. 12.

Convention Notices.

California.—The California State Bee-Keepers' Association will hold its annual convention at the Chamber of Commerce, in Los Angeles, Jan. 11 and 12, 1898. Sespe, Calif. J. F. McINTYRE, Sec.

Michigan.—The Michigan State Bee-Keepers' Association will hold their next annual meeting in Reed City, at the Hotel King, Dec. 30 and 31. Flint, Mich. W. Z. HUTCHINSON, Sec.

N. E. Ohio, W. N. Y., N. W. Pa.—The 18th annual convention of the N. E. Ohio, Western New York, and N. W. Pennsylvania Bee-Keepers' Association will be held in the City Hall, Cor. 13th and Buffalo Sts., Franklin, Pa., Jan. 11 and 12, 1899. The following is the larger part of the program:

President's Annual Address—Geo. Spittler, of Pennsylvania.

"Spring Management of Bees"—L. K. Edgett, of Pennsylvania.

"Summer Management of Bees"—R. D. Reynolds, of Pennsylvania.

"How can the Conditions of the Local Market be Improved?"—B. W. Peck, of Ohio.

"The best means of Increasing the Local Honey-Resources"—H. S. Sutton, of Pennsylvania.

"Profitable Use of Comb Foundation"—J. T. Nichols, of Pennsylvania.

"Making our Association More Useful"—Geo. Spittler, of Pennsylvania.

"Preparing Bees for Winter"—N. T. Phelps, of Ohio.

"Experiences of the Past"—D. A. Dewey, of Pennsylvania.

NOTICE—It is hoped that all will make an effort to be at this convention, and take an active part in the discussions. Special rates of \$1.00 per day for those attending the convention have been secured at the United States Hotel, on Liberty Street.

Geo. SPITTLER, Pres., Mosiertown, Pa.
ED JOLLEY, Sec., Franklin, Pa.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Dec. 8.—Our market is less active. There are now more offerings of comb honey than is absorbed, hence some accumulation of consignments without any special change in prices; yet receivers are granting concessions to move sales. Fancy white, 13c; off grades, 10@12c; amber, 9@10c; dark, 8@9c. Extracted, white, 6@7c; amber and dark, 5@6c. Beeswax, 27. R. A. BURNETT & Co.

Detroit, Dec. 8.—No change in supply of honey as to quality, but prices are somewhat lower than last quotations, viz.: Fancy white, 13c; No. 1, 12@12½c; fancy dark and amber 9@11c. Extracted, white, 6@7c; dark, 5@5½c. Beeswax, 25@26c. M. H. HUNT.

Columbus, O., Dec. 15.—Honey arriving freely. There is quite an accumulation, and concessions in prices are necessary to move stock. Following prices are nominal: Fancy white, 12½c; No. 1, 11½c; No. 2, 10c; amber, 9c; dark, 8c. COLUMBUS COM. AND STORAGE CO.

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially-filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax, prime, 24c; choice, 24½c. At present there is a good demand for honey. WESTCOTT COM. CO.

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c; amber, 10@11c. Extracted, white, 5½@6c; amber, 5@5½c; dark, 4½@5c. Beeswax, 22@25c. The receipts of comb honey are larger. C. C. ULEMONS & Co.

Milwaukee, Oct. 13.—Fancy 1 pound, 12½ to 13c; A No. 1, 12 to 12½c; No. 1, 11 to 12c; No. 2, 10 to 10½c; mixt, amber and dark, 8 to 9c. Extracted, white, in barrels, kegs and pails, 6½ to 7c; dark, 5 to 5½c. Beeswax, 26 to 27c.

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing. A. V. BISHOP & Co.

New York, Oct. 22.—Receipts of comb honey are large, and there is quite a stock now on the market. While white is in good demand, buckwheat and mixt seem to be somewhat neglected, and quotation prices have to be shaded in order to sell in quantity lots: We quote:

Fancy white, 13 to 14c; No. 1 white, 11 to 12c; amber, 10c; mixt and buckwheat, 8 to 9c. Stocks of extracted are light of all kinds. Demand is good at following prices: White, 6 to 6½c; amber, 5½c; dark, 5c. Southern, in half barrels and barrels at from 55c to 60c a gallon. Beeswax dull at 26c. HILDRETH BROS. & SEGELKEN.

Buffalo, Dec. 16.—Our market has become somewhat quiet since the holiday trade set in, and we consider 12 and 13c an extreme quotation for best one-pound combs now; with other grades ranging from 7 to 10 cents, according to inspection. Very little demand for extracted at from 4 to 6c. We advise the marketing of honey as readily as it can be judiciously sold. BATTERSON & Co.

San Francisco, Nov. 22.—White comb, 9½ to 10½c; amber, 7½ to 9c. Extracted, white, 7 to 7½c; light amber, 6½ to 6¾c. Beeswax, 24@27c.

Stocks in this center are light and must so continue through the balance of the season. Choice extracted is especially in limited supply and is being held at comparatively fancy figures. Comb is meeting with very fair trade, considering that it has to depend mainly on local custom for an outlet. Values for all descriptions tend in favor of selling interest.

Boston, Nov. 23.—Liberal receipts with but a light demand during the holidays. As a result stocks have accumulated somewhat, and prices show a lowering tendency, still we hope for a better demand with prices at present as follows:

Fancy white, 14c; A No. 1 white, 12½ to 13c; No. 1, 11 to 12c; light amber, 10c, with no call for dark. Extracted, fair demand, light supply: White, 7 to 7½c; light amber, 6½ to 7c; Southern, 5 to 6c. BLAKE, SCOTT & LEE.

Cleveland, Nov. 29.—Fancy white, 13@14c; No. 1 white, 12@13c; A No. 1 amber, 10@11c; No. 2 amber, 9@10c; buckwheat, 8c. Extracted, white, 7c; amber, 6c; buckwheat, 5c. A. B. WILLIAMS & Co.

THE "NOVELTY" POCKET-KNIFE!

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The NOVELTY KNIFE is indeed a novelty. The novelty lies in the handle. It is made beautifully of industrially celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed an AMERICAN BEE JOURNAL reminder, and on the other side, name and residence of the Subscriber.

The material entering into this celebrated knife is of the very best quality; the blades are handforged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring steel, and the finish of handle as described above. It will last a lifetime, with proper usage.

Why purchase the Novelty Knife? In case a good knife is lost, the chances are, the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your pocket KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a Christmas, New Year or birthday present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, a lady to a gentleman, or vice versa, a son to a mother, a husband to a wife, a brother to a sister or a gentleman to a lady—the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid, for \$1.00, or give it as a Premium to the one sending us three new Subscribers to the BEE JOURNAL (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book "Bees and Honey." We club the Novelty Knife with the BEE JOURNAL for one year, both for \$1.90.

Any Name and Address Put on the Knife.

Gleanings in Bee-Culture, American Agriculturist (weekly), Farmers' Almanac for 1899, ALL ONE YEAR ONLY \$1.00.

By special arrangement with the publishers, we are enabled to offer the American Agriculturist in combination with Gleanings at the unparalleled low rate of \$1.00 for both papers one year including the Farmers' Almanac. The American Agriculturist is published in three editions: The New England Homestead, the American Agriculturist, and the Orange Judd Farmer. Each contains matter relating to its own locality, as well as the latest and most accurate market reports for the country in general. It has departments relating to all branches of farming, articles written by the most practical and successful farmers, supplemented with illustrations by able artists. Short stories, fashions, fancy work, cooking, young folks' page, etc., combine to make a magazine of as much value as most of the special family papers.

A sample copy will be mailed FREE by addressing American Agriculturist, New York, N. Y.

Taken separately these two papers and Almanac cost \$2.50, consequently every subscriber under this offer will get \$2.50 in value for \$1.00.

CONVENTION PROCEEDINGS

UNITED STATES BEE-KEEPERS' UNION.

Report of the 29th Annual Convention Held at Omaha, Nebr., Sept. 13-15, 1898.

DR. A. B. MASON, SEC.

SECOND DAY—EVENING SESSION.

[Continued from page 804.]

SUGGESTED REVISION OF THE CONSTITUTION.

Dr. Mason—When our present constitution was formulated the aim was to make it as much in accord with the constitution of the National Bee-Keepers' Union as possible. It seems, however, that there are a few matters in which it ought to be altered. Some have been talking the matter over, and have come to the conclusion that perhaps two or three amendments should be made. First, Article I, changing the name "Union" to "Association," so that the name shall read, "United States Bee-Keepers' Association." Also Article V, Sec. 1, adding to that section: "Their term of office shall begin on Jan. 1 following their election, and continue for one year." That is in regard to the President, Vice-President, and Secretary. Then, again, Article VI, Sec. 4, commencing at the end of the first sentence, where it says the General Manager shall be the treasurer of the Union, have it read: "He shall send notice to each member at least 30 days before the expiration of such membership of the time such membership will expire," so that each member will know when the time has come for paying his dues. Quite a number of members have remitted without knowing when their membership expired. We cannot act upon these amendments now. We can discuss them, but notice of the amendments is required to be given now. I found, in corresponding and talking with our member of Congress about the Pure Food Bill—he said he would do all he could. He caught the name "Union," and he wanted to know if we were of the sort of unions that are conducting or aiding strikes, and such things. I explained to him that we were not, and he said that he would have the name changed, as we would have more influence at Washington. We have labor unions of every class, and I have no objection to them in their place; but they don't carry with them the weight that they used to before they made so much trouble.

Dr. Miller—I move that the Union at this meeting express its approval of the proposed amendment, changing the name of the Union to "The United States Bee-Keepers' Association."

The motion was seconded and carried.

Article V, Sec. 1, as proposed to be amended, relating to the terms of office of President, Vice-President, and Secretary was then read again.

Dr. Miller—I move that we recommend that change.

The motion was seconded and carried.

Article VI, Sec. 4, relating to notice, to be given to members of the expiration of their membership, was then read as proposed to be amended.

Mr. Secor—Do you realize what work that is going to make? Members are coming in all the time, and consequently they are constantly expiring. I do not know that I could be at home every day in the year to look after the sending out of such notices.

Mrs. Acklin—I think there should be a certain day in the year when all memberships will expire.

Pres. York—We decided that point at Buffalo, that it would be better to have the memberships expire a year from the time they are received.

Mr. Whitcomb—Has it been customary to issue receipts for membership fees?

Mr. Secor—Yes, sir; and on that receipt I state when the membership will expire. The receipts show the date of the expiration of the membership.

Dr. Miller—It does not follow that the members will observe that date. In nine cases out of ten the member will not keep his receipt. This change will no doubt involve a good deal of extra work, and there should be some provision made for that, even if the General Manager has to hire some one to attend to that special part and pay for it. I believe that if these notices are sent out, as proposed, a good many will continue their memberships who would otherwise suffer them to

Hon. E. Whitcomb (see page 818).

lapse. I believe we will make more than we will lose by notifying every member of the date of expiration of his membership; otherwise they will forget about it and let their memberships lapse. The fact that they have a dated receipt I think is not going to count for anything.

Mr. Abbott—It seems to me that this is a fair business proposition. Every business man knows the efficacy of a drummer in his business. A postal card sent to a man notifying him that his membership will expire on a certain date is

simply a drummer, and shows that the Union is anxious to have him continue. If his membership is worth anything, it ought to be worth enough to pay for this postal-card drummer. You know how it is with newspaper people; when a subscription expires, the newspaper sends out notice of that fact, and every inducement is thrown out to get the subscriber to renew his subscription for the coming year. It seems to me that as a simple business proposition, we can afford to send out a little drummer of that kind, and I think the General Manager and the Board of Directors should make provision for that sort of thing. I believe that the General Manager can send out a postal that will make an excellent drummer.

Mr. Secor—The difficulty is that under our system of book-keeping, I keep the names of the members in alphabetical order, and not in the order of the receipt of their membership.

Dr. Mason—This provides that the notices are to be sent out at least 30 days in advance of expiration of memberships. That might mean 40 days or more, so that the General Manager need not send out each notice exactly 30 days before the expiration, but he can send out a batch of them at a time. If that is going to be too much work, I will volunteer to help him.

Mr. Secor—My impression is that a mistake was made in changing the constitution as it was before. Then when the General Manager sent out his report he could send out the whole thing together.

Dr. Mason—At Buffalo I got at least \$25 in membership fees that I would not have gotten if the memberships had expired at the end of December. A person who paid Jan. 1 would be entitled to protection for one whole year; if he paid Dec. 1 he would get protection for only 30 days. That is not just. This matter was all canvassed at Buffalo last year, by a committee who talked the matter over and decided that it was best to put it in this way, and the proposed amendment was almost unanimously adopted by the members of the Union when they voted on it in the December following.

Mrs. Acklin—Why not do as some of the newspapers do, and let them have an extra month?

Dr. Mason—That would not be just to the others, either.

Mr. Danzenbaker—I believe the members of this Union are liberal men. I think you have made a good change here, in providing that the terms of the officers shall run for the calendar year, beginning with the first of January, and I think it would be a good thing to have the membership the same way. I paid a dollar at Buffalo last year, and until yesterday I forgot that for several days I was not a member. I do not want it to be that way. I would like to have my membership expire on the first of January, and I would vote for that change.

Dr. Mason—If those postal cards were prepared beforehand and printed, and on the first of each month they were sent out to each member who would be delinquent in the next 45 days, that would not be much trouble.

E. R. Root—I would suggest that for this work a clerk be employed to send out the notices. I am sure that the Board of Directors would be willing to pay the expense. Then we would be sure that every member would be given notice from 30 to 45 days in advance of the date of the expiration of his membership, and every one could renew his membership if he wanted to.

Pres. York—I wonder if it would not have been a good plan if we had provided last year that the memberships should expire every three months. If I paid for membership to-day, that membership could begin on the first of next month—October. I believe that would have been a good thing, if we had thought of it. Then we would have memberships expiring on the first day of January, March, July, and October.

Dr. Mason—Even then the man who didn't pay until the second or third day of October would have no protection until the first of the following January.

Mr. Danzenbaker—You speak of the matter of protection. I didn't count that at all; I never expect to need any. I am opposed to adulteration, and I am willing to contribute my fee, and more, too, to help protect others in that regard. Adulteration is only practiced with extracted honey, but I am willing to use as much effort as the rest do in helping to fight the adulteration of extracted honey.

Dr. Mason—I move that we make this suggestion. The Board of Directors can pay the General Manager not to exceed 20 percent of the receipts for his services. If that is not going to be enough for his services, we can change it so as to give him a larger salary.

The motion of Dr. Mason was seconded and carried.

RESOLUTIONS ADOPTED.

Mr. Secor here offered the following resolutions:

Resolved, That the hearty thanks of this society be and are hereby extended to the local members of the Nebraska

Bee-Keepers' Society, Hon. E. Whitcomb and L. D. Stilson, for the time, labor, and expense by which they have contributed to the comfort and pleasure of this convention.

Resolved, That we appreciate the courtesy of the Commercial Club of the city of Omaha in providing our convention with these pleasant rooms.

The resolutions were approved by a rising vote.

Dr. Miller—I wish to speak of a matter which has impressed me and pleased me very much, and that is the perfect harmony that has prevailed in our sessions. Everything has gone harmoniously and smoothly, and that fact cannot but be gratefully acknowledged by every member. And another thing: I don't believe that many of you recognize how much hard work our General Manager has to do. I think we ought continually to bear that in mind, and let him feel that we are grateful to him and anxious to give him our best support.

Mr. G. M. Whitford, of Nebraska, then read the following paper, entitled,

The Relations Existing Between the Apiary and the Successful Production of Fruit.

The successful production of any crop depends upon certain conditions, some of which are easily controlled. To attain as nearly as possible to perfection in producing crops, we must not only know what these conditions are, but must learn how we can control them. Fruit-growers realize that a very important condition is the perfect fertilization of the blossoms of all kinds of fruit.

Nature has wisely provided for the pollenization of blossoms of the vegetable kingdom, in the creation of bees. Of the different agencies depended upon to do this important work the bee is the most thorough. We may plant our fruit-trees in such a way that those prolific in the production of pollen will be intermingled with other trees that are to be fertilized; or we may depend upon the winds to carry the life-giving dust from one plant or tree to another: but there are times when these will fail, while the bee would perform the work perfectly.

It is true that at times the bee is unable to fertilize the blossoms of some kinds of fruit perfectly, owing to unfavorable weather at the time the blossoms appear, and the pollen is ripe. The spring just past was such. We have an apple orchard of about 350 bearing trees, that bloomed abundantly; just as the blossoms were opening, cold, wet weather set in and continued during the entire time the trees were in bloom, consequently the apple crop will not exceed 25 bushels for the entire orchard. The same trees in 1896 yielded about 1,500 bushels. Plum and cherry trees blossomed before the wet weather began, and bore a full crop of fruit.

Our first cherry trees were set out in the spring of 1875; at that time there were no bees within four miles of the trees, which bore a very small quantity of fruit, some years failing entirely, until 1886, when we bought a colony of bees. Now we get a crop of cherries each year; at present the cherry is considered an annual cropper, and it is expected that the trees will commence bearing as soon as they are large enough. The same varieties are grown that were put out 10 or 12 years ago. The only way we can account for the increased yield of fruit is the fact that there are more bees in this locality.

The same facts hold true with all kinds of fruit—unless the blossom is fertilized no fruit will be developed.

Orchards that are visited by bees produce better and more uniform specimens of fruit, than those not visited, from the fact that the bee carries pollen from one tree to another, thus cross-fertilizing the blossoms. G. M. WHITFORD.

A discussion of the paper was dispensed with, in view of the lateness of the hour.

Hon. E. Whitcomb, of Nebraska, then read a paper, on

The Apiary on the Farm and in the Orchard.

The apiary is fast being recognized as one of the sources of profit on the farm, especially with the farmer who desires to carry on a system of diversified farming. The farmer, of all people, is perhaps the least dependent upon his fellow men, and on every fair-sized farm there annually goes to waste several hundred pounds of nectar, unless he has the means of gathering and storing for the use of himself and family. It is not necessary that the farmer bee-keeper become a competitor in the markets with the expert bee-keeper, and in most instances this would not be desirable or profitable, but I have earnestly advocated that the farmer should produce at least sufficient to supply his own table, if not more.

Honey is being recognized as so healthful a diet, especially for children, that not a family can be found where honey enters into the everyday diet who have any cause to call the

family physician. A single pound of well-ripened honey contains more nutriment than two pounds of pork, and more medicine than any druggist would put up for 50 cents.

As fertilizer on the farm the bee is of value, which will appear later on in this paper. By fertilizer we do not wish to be understood enriching the soil, but the clovers and fruits that form a great portion of the industries of the farm.

In the orchard, in the garden, and more especially among small fruits, the honey-bee is fast becoming recognized as a very important factor. Out on the treeless prairies where wild bees are almost entirely unknown, this is of more importance to the orchardist and horticulturist than in the localities farther east. Here the gentle zephyrs which often waft themselves into small hurricanes, cannot be depended upon to fertilize or pollinate the flowers of the fruit-tree, and the honey-bee must be relied upon to do the work.

Early this year, on talking with a gentleman from Colorado, who was largely engaged in growing melons, he remarked that when he first engaged in the business the crop was very unsatisfactory—melons ill-shaped, and inferior—when a friend suggested that the honey-bee would remedy the difficulty, and a few colonies were introduced in the melon-fields, and with the result of more than four times the former crop from year to year, and at this time Senator Swink, of Colorado, would not think of growing melons without bees beside them.

In my own experience, the spring of 1893 was wet and cold. The orchard showed a profusion of bloom. In the cherry-orchard there were two bright days which enabled the bees to work upon the cherry-bloom, and as a result I harvested 300 bushels of cherries; when my neighbors who had trees in equally good condition as mine, bought their fruit from my orchard. The apple-blossoms fell without giving the bee an opportunity for work upon them, and the result was no apples. A few deformed ones remained on the trees until partially grown and then fell off, and were counted among the crop of windfalls.

As farmers and orchardists I am confident that we do not attach sufficient importance to this one item of adding the honey-bee to these industries, and often score signal failures because of this neglect. It is not expected that every farmer or every orchardist should become an expert bee-keeper, or that he could come in competition with those who have made that a business and a lifetime study, but they should be combined sufficiently to make a success of the former, inasmuch as it has already been clearly demonstrated that the blossom must be pollinated in order to produce fruit, and that bees cannot be kept profitably without the blossoms from which to gather nectar.

A few years ago, while attending the State Horticultural Society meeting at Wymore, Nebr., we were shown a peach growing on an apricot tree. This showed too clearly the work of some busy bee flitting from the peach to the apricot, carrying the pollen from one to the other. Perhaps Nature may have stepped in finally to aid this work in a measure, but the lesson of the importance of the bee to the farm and orchard was left as clearly as if the historian had witnessed the whole transaction.

E. WHITCOMB.

A. I. Root—There is a very important fact, that melon-growers have been compelled to get bees—some of the larger growers getting them by the hundreds of colonies.

Mr. Whitcomb—In these States out here we have few of what are called wild bees, and if we are to make a success of growing small fruits we must introduce bees along with the fruits and other agricultural and horticultural interests. My apiary is in close proximity to the orchard, and the bees work on the bloom of the cherry-trees, and I have good crops of cherries, while my neighbors, who have just as good trees and as good bloom, get comparatively no cherries, because they have no bees. In our Institute work over the State, we find it to be the universal verdict that bees must be introduced along with the small fruits, or along with the orchards, in order to get any fruit. The horticulturist, instead of fighting the apiiculturist, should really regard him as a friend.

A. I. Root—The gentleman who spoke to me about using bees in connection with melon-growing says they have some 500 or 600 acres of melons, and 400 colonies of bees, and he told me this morning that they were going to put in 200 more colonies.

Mr. Danzeubaker—We have two men who are engaged in raising cucumbers under glass in winter, and they put two colonies of bees into the house to fertilize the blossoms. In Florida I visited a man who did the same thing there. They tried fertilizing by hand, but they say that plan did not succeed, compared with fertilizing with bees.

For the want of time the papers by Dr. J. P. H. Brown, of Georgia, on "Needs of Bee-Culture in the South," and by Mr.

Wm. McEvoy, of Ontario, Canada, on "Foul Brood," were past without reading, to be included in the published proceedings. They will appear at the end of the report.

[Continued next week.]

Journalistic Courtesy—Bumble-Bees and Andrena.

BY PROF. A. J. COOK.

As that day of all the year the best—Christmas—is right upon us, it is a good time to speak of peace or aught that makes for it.

No doubt most of the readers of the dear old American Bee Journal have heard the story of "Jim" and "Bill." They met after enlistment in the service to fight for their country. Bill says:

"Jim, why did you enlist?"

"You know," replied Jim, "that I was a single man, and always did like war, and so enlisted."

"And Bill, why did you enlist?"

Bill answered: "I am a married man, and always liked peace, and so I enlisted."

I am sure bee-keepers are like Bill. They like peace, and so are rejoiced at this very eve of the century to note the pleasant relations among the several bee-papers, and the kindly feeling in the whole fraternity. As of old it is a goodly thing for brethren to dwell together in unity, and I am sure that the whole fraternity are to be congratulated, in that our editors are agreed that peace, not war—concord, not discord—are what go to make up the most reputable journal.

It is 30 years since I first became interested in reading the bee-papers. As all will remember, who were then patrons of our art and readers of its literature, bitter quarrels, harsh invectives, and unseemly aspersions, too often showed their uncanny visage in the bee-papers of that day. The great wrongs of Mr. Langstroth embittered bee-keepers against each other. Those who knew of the injustice done the grand old man found it hard to keep denunciation back; while those who had done the wrong had their friends, who were as free to defend and to return harsh criticism.

For many years, now, the spirit of our bee-papers has been entirely different from that of the olden time. Mr. A. I. Root came into the ranks about the time I entered. He soon brought the Christian spirit with him, and worked with zeal, not only for the craft, but to bring amicable relations among all bee-keepers.

Not long after, such men as Drs. Mason and Miller were in the thick of the fraternity, and it is hard for quarrels or bitterness to exist wherever their genial influence is felt. Mr. Hutchinson was another who was too fair in his judgments and feelings to brook anything tainted with dissensions. The present editor of the "Old Reliable" is not a whit behind the chief in his love for peace, and works to keep it ever to the front. It is certainly a blessed change.

If, as has been suggested of late, some one does throw an apple of discord into our literature, or come with the proverbial chip on the shoulder, no one picks up the apple or knocks off the chip, and so no conflict occurs. The discouragements of poor honey seasons and no returns for hard labor may tend to make even the amiable man combative, but we are rejoiced that even that so seldom succeeds in bringing discord to the front.

I believe it is the grand province of our Christian civilization to make every pursuit in the highest degree successful, and, better than this, make all of each pursuit, and all pursuits, to work in fullest harmony each with the other, that all may joy most only when all are receiving most.

BUMBLE-BEES—ANDRENA.

The article from Prof. L. Bruner, contributed by him for the Omaha convention, was certainly very able and full of interest. It is good to have specialists speak on such occasions. There were two or three positions taken by him that I am led to question: He says that bumble-bees gather honey mostly for the brood. I am inclined to the opinion that with bumble-bees, as with the honey-bee, the honey is as important

for the mature as for the immature bees. Bumble-bees are so like the honey-bee in their habits, work, and life history, that I believe what is true of the one is largely so of the other. I think the main part of the pollen is for the brood, but that the honey is quite as much for the mature bees.

Again, I feel sure that the species of *Andrena* do at times take from the honey of the hive. There are many records of such pilfering on the part of the small black bees. I have often had such bees sent me.

I was glad Prof. Bruner spoke so well of the value of bees as pollinators, and said of a truth that honey-dew is exclusively the product of insects. There is little doubt but such is the truth. Los Angeles Co., Calif., Dec. 12.

Mosquitoes and Other Pests in Cuba and the South.

BY F. DANZENBAKER.

I went to the Omaha convention hoping to meet Mr. O. O. Poppleton, but I failed to see him. I was very greatly pleased with the valuable information given in his interesting paper on honey-production in Cuba, as I wanted to learn still more of the drawbacks, if any, that might be there.

Mr. Lathrop wisht to know if there was foul brood there, but no one present could answer the question. Mr. Poppleton now says there was none in Cuba.

I am under further obligation to Mr. Poppleton for his calling attention to what I askt about—other pests that might be there to make miserable the life of the bee-keeper. I did not say how many mosquitoes were in Cuba—I said I had askt returned soldiers, and others from there, about mosquitoes, gnats, fleas, and sandflies, but no one that I had met seemed able to answer, and I wisht to know if there were none there; perhaps those I met had not been outside of the cities enough to know.

Having spent the greater part of the past 22 years in the South, I am aware of the insects and creeping pests that infest that otherwise favored region. Take them away, and for me it would be an earthly Eden; and I have desired for years to learn if there is any place in an all-time summer-land free of insect pests. If so, I would like to go there to live, as I have no use for frost and snow. I have been on the east coast of Florida several seasons, and I know of no place in the United States where as much health and pleasure can be had for the outlay as on the Halifax and Indian rivers, and the region of Lake Worth and Biscayne Bay, on the east coast of Florida, from October till May. But I have been told by people that I met in their own homes on Key Largo, that during the summer months mosquitoes sometimes covered the sides of their houses till the color of the boards was hidden by them, and they were forced to shut themselves in-doors to escape the mosquitoes at certain hours of the day; but there were sandflies and gnats, fleas and jiggers or redbugs so small that but few people can see them without the aid of a glass; the poison of their bites lasts for days. I would rather endure a thousand mosquitoes that I can shut out, than one of these redbugs, as they threw me into a fever. I have scars that I have carried for 20 years resulting from their bites, before I learned how to destroy them, which can be done by heating the flesh at an open fire, hot enough to kill them, which also cures the terrible itching and swelling caused by their poisonous bites.

I would not suffer these things anywhere, even if I could produce 1,000 fancy sections of honey to the colony; and I would be very glad if Mr. Poppleton, or any one else, will tell what we can learn nowhere else of the dark side—what the bee-keeper must meet that makes his life miserable in Cuba.

District of Columbia.

A Reply to a Criticism on the Golden Method of Producing Comb Honey.

BY J. S. HARTZELL.

In presenting to the readers of the American Bee Journal the product of my apiary, etc., for 1898, on page 657, I had thought I would not write anything more for publication before the close of the season of 1899, if spared, and then make up my account; but through the kindness of an esteemed friend and fellow bee-keeper I have been introduced to another "Doubting Thomas"—Mr. R. L. Taylor—who has appeared on the arena, presenting in the columns of the Bee-keepers' Review his criticisms on my report and the Golden method of comb honey production.

Before replying to Mr. Taylor's criticisms, I wish to say I would esteem it but just and right that when any article is

criticised, the criticism should appear in the same journal the first article had been published. Otherwise it would necessitate the taking of all journals pertaining to apiculture to keep informed in relation to the articles written, which would be a costly expedient; for had it not been for the friend spoken of, sending me the November issue of the Review, I would not have known of the critic's criticism.

Mr. Taylor appears very much surprised that the 40 colonies on the Golden plan yielded 46 13/20 sections per colony, while the 21 colonies run on the ordinary plan yielded only 23 2/7 sections per colony, of completed honey. *These, however, are facts.*

Mr. Taylor says: "Mr. Hartzell seems to be impressed with the idea that this *naked statement* should be sufficient to convince any one of the *great superiority* of the new plan, but I [Mr. Taylor] *doubt* if any one will be convinced."

Now, fellow bee-keepers, is that surprising? Doubting Thomas saw the Lord after his resurrection, but would not be convinced that it was He, until the Lord requested him to reach hither his finger and behold His pierced hands, and reach hither his hand and thrust it into His side, and be not faithless (doubting) but believing. After which, in astonishment, Thomas cried, "My Lord and my God!" Doubters! yes, bless you, plenty of them. The antediluvian world doubted the admonitions and preaching of Noah, and perished after a lapse of 120 years, when the fullness of time had come; the Jews doubted the coming of the Christ, or Messiah, and are still in doubt. Three-fourths of the residents of the United States, and of the world, are doubters of Christianity, or, if not, would be identified with the Christian church. I will not, therefore, undertake to convert Mr. Taylor, for his doubting is so deeply implanted in him that I deem it would be a useless endeavor to try to get him to test the Golden plan.

The next quotation from Mr. Taylor's criticism reads thus: "In the first place, it is entirely too good to be true;" and follows by saying: "I am not questioning the truth of Mr. Hartzell's statement." This appears to me very strange logic—"too good to be true;" yet "not questioning the truth," etc. See how unjust Mr. Taylor is. It still remains, however, that "truth crushed to earth will rise again."

The statements made by me concerning the products of my apiary are true, and Mr. Taylor's references to exactness, scale tests, etc., are quibblings of his. I made no selections of colonies, and to fully satisfy myself I applied the Golden method promiscuously throughout my apiary. No feeding was done, no account taken of weight, or of young or old queens; the swarms on the Golden as well as on the ordinary plan were returned, and the entire apiary managed without increase.

Mr. Taylor, I presume, from his inquisitiveness, is in no sense competent to criticise the Golden method, else he would not make inquiries as to what was done with swarms from each class, weights of each brood-nest at the end of the season, etc. Bless you, Mr. Taylor, on the Golden plan we want all colonies to swarm, but the swarms are to be returned, and if you will turn to Mr. Golden's article published in the American Bee Journal of July 30, 1896, your eyes may behold the dawning of a new era in bee-keeping.

I tested six colonies on the Golden plan in 1897 (see my report on page 741 of that year). That experiment with the Golden plan satisfied me as to its worthiness, and the past season's experience doubly convinced me of the superiority of the Golden method over any other in vogue.

Has Mr. Taylor ever tested the Golden plan? If not, will he be manly enough to give it a fair trial in 1899? Or will he continue his criticisms without applying tests, and thus remain a *doubter*?

O, could we make those doubts remove—
Those gloomy doubts that rise.

Somerset Co., Pa.

Langstroth on the Honey-Bee, revised by The Dadants, is a standard, reliable and thoroughly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both together for only \$2.00.

The Names and Addresses of all your bee friends, who are not now taking the Bee Journal, are wanted at this office. Send them in, please, when sample copies will be mailed to them. Then you can secure their subscriptions, and earn some of the premiums we are offering. The next few months will be just the time to easily get new subscribers. Try it earnestly, at least.

BIOGRAPHICAL

MR. WUNG LUNG.

MRISTER LEDITOR MELICAN BLEE JURNL:—Plaps I tink you likee see my picture. Me velly fine man—that's what my flends say—sloime say me dlude and slom say me lady's man, all same Mlister Lamblor. I like tell you me no dlude and me no clare for ladies, except my wiffo. Me plain Wung Lung, one-time legetable man, now sugar-fly keeper and miner.

Lots Melican man get him plicture in blee-papers. He awso tell allee bout himself. I tink I like do awlasame Melican man.

I blorn near Plekin, so you see me glood Chinaman—no Coolie blout me. I go school to Plofessor Al Jung Kook, who kleep academy near my father's lice field. Whea sleventleen yers old me come Clalifornia, where my clousin come first, and like he make heep money washee and ironee. I tly wash-club little while and no likee him. I likee out-door belly muchee, so me go in plartnership with one Chinaman, and lalse legeta-

Residence of Capt. Wung Lung, in California.

ble in Alameda county. My plartner no good man; he too muchee cheatee me. I lose money.

Next me lun lanch of giarden tuck myself. I send you picture of my old home sometime ago. At this place me first commence to keep sugar-fly. Me do belly well with legetable and sugar-fly. Make heep much money. Me get another plartner; this time he belly good man.

Pretty sloon, blime bly, me go China see my old home. War come on and me go fight Japanese man. Near Plort Arthur me get belly bad shottee and long time hap die. Me no die, just slame, but long time get well. My clusin, Li Hung Chang, make me Claptain for blavery shown on the field of battle. War all over me cum back to Melica. Now me got heep nice wiffo in San Flancisco.

Last April I lite Mlister McKinley and offer my slerVICES as officer or plivate in Melican larmy to go and fight Splanish man. I tell him that I much plefer to go to Manilla, as heep Chinaman there, and belly muchee chance for me to make money there when the war is over. I tell him, Mlister McKinley, that heep lich Nu York man go to Manilla so as to grab land and money down there soon as no more fightee Splanish man. Mlister McKinley no answer my letter; I guess he think me too honest. So I next lite to Mlister Jim Bludd—you know Mlister Jim Bludd—him Glovloner Clalifornia. Well, he tell me too many Melican man want to go to fight Splanish man, so he had to give them a chance first. When I flind

I could no more be solger, I go to the mines. I tell you blout mines next time. As I take up muchee you splace allredy, I won't tell blout my blees.

Sloime one say, in one of the sugar-fly papers, that the only Chinaman in Melica that keeps sugar-fly's in Los Langles clounty; he make mistake, and if he had led the "Old Reliable" he would have seen that I kept sugar-fly near Sian Flancisco four year ago.

Me could tell you belly muchee more blout myself, but you might tink me legotstical.

Tell your leaders, Mlister Leditor, should you print my picture, that I do not dress every day as I appear in the photoglyph I send you. This is my best suit, and I wear it when I go to Slunday schlool, to a funeral, or to a wedding. I am slorry my queue is not shown at length; if you look close you will see that it is wound round the black of my head. You will note that it shows off my face to great advlantage. Still, I should like to have had it exhibited across the front of my jacket, as it is a beautiful queue, and I take heep muchee plide in it. I may tell you more about this and blees the next time I lite you. Gud Bly.

WUNG LUNG.

[It is with some degree of pride that we reproduce Captaln Wung Lung's photo' in the "Old Reliable." While we recognized from the letters we received from him in the past, that

Capt. Wung Lung.

he was quite an intelligent celestial, we did not know that he was such a distinguisht personage until we read the above modest, and, we feel sure, very incomplete autobiographical sketch. He shows commendable ambition—from a knight of the wash-board and flat-iron, he has become, we understand, a distinguisht apiarist, a brave soldier, and a gold-miner. We hope, later on, to give some racy letters from him about the mines and bees.—EDITOR]

The McEvoy Foul Brood Treatment is given in Dr. Howard's pamphlet on "Foul Brood; Its Natural History and Rational Treatment." It is the latest publication on the subject, and should be in the hands of every bee-keeper. Price, 25 cents; or clubbed with the Bee Journal for one year—both for \$1.10.

QUESTIONS AND ANSWERS

CONDUCTED BY

DR. O. O. MILLER, MARENGO, ILL.

[Questions may be mailed to the Bee Journal, or to Dr. Miller direct.]

Keeping Bees Near a Railroad.

I have moved to this place, and I will bring here about 36 colonies of my bees. I have plenty of room to put them, altho the most out-of-the-way place would be right along a pale fence, and right back of this fence is a cut about 12 feet deep—a railroad where a heavy freight train is pushed through from six to eight times a day (except Sunday). Would there be any harm to the bees or railroad men? The back of the hives are toward the railroad.

PENN.

ANSWER—Reports from those who have had bees close to trains seem to agree that the bees are not hurt by them. No anxiety need be felt about the bees disturbing the railroad men, for the cut being 12 feet deep would make the bees fly over the trains, and the pale fence would practically make the cut as much deeper as the height of the fence. Of course, the bees could fly through between the pales, but you'll find they will not do so.

Mismatched and Cross Bees.

I divided a colony of Italian bees, and the young queen they reared looks like her mother, but her bees are different altogether. They look browner, and the yellow stripes look whiter. What would you call them? They are good honey-gatherers, and like to rob whenever they get a chance. Would it be wise to breed from such stock?

NEBR.

ANSWER—The bees are hybrids. The queen has mismatched, and the bees are a cross. It may do to breed from them, but you will probably do better to breed from the pure stock from which they came. That will secure you more of the same kind very likely. As you say, they are good workers, tho likely to be cross, and if you breed from them the next generation may not be so good.

Feed for Bees in Spring.

Would not any sugar, or syrup, that we know to be made from the pure juice of the cane, be good for feeding bees in the spring, for increase, whether it is granulated, clarified, or not? I can get some that granulated after being made into molasses, if it will do to feed.

ALA.

ANSWER—Yes, any molasses, sugar, or anything of the sort may be fed to the bees when they are flying daily, providing it be not stored for winter. In the fall it would not do.

Doolittle's Method of Queen-Rearing.

1. I do not fully understand the Doolittle method of rearing queens. Are the cells that contain the young larvæ to be cut down so as to more easily transfer to the artificial queen-cups? How is the stick or tool made to transfer with?

2. How is the nursery made, and how is it placed in the hive? How soon after the bees finish the cells should they be placed in the nursery?

COLORADO.

ANSWERS—1. Mr. Doolittle shaves down with a sharp knife the cells containing the larvæ to within $\frac{1}{8}$ -inch of the septum. The tool used for transferring the larva is "a goose-quill tooth-pick, having its point broad and curved."

2. In "Doolittle on Queen-Rearing" you will find on page 76 the following: "I make the queen-nursery as follows: Sixteen blocks are gotten out, $2\frac{1}{4} \times 2\frac{1}{4} \times \frac{3}{8}$ of an inch, which exactly fill one of my frames. A $1\frac{1}{2}$ -inch hole is bored in the center of each of these blocks, over which is tacked a piece of wire-cloth having 12 to 16 meshes to the inch, and being two inches square. Before tacking on the wire-cloth, I bore in the edge of the block, (which is designated for the top after the block is put in the frame) a $\frac{3}{4}$ -inch hole, boring down to within $\frac{1}{8}$ of an inch of the $1\frac{1}{2}$ -inch hole. I now finish boring the hole with a $\frac{1}{8}$ -inch bit. This hole is for the queen-cell to be

placed in, and the reason for the two sizes of holes is to give a shoulder, so that the queen-cell can hang in the block, the same as it does on the comb, and still be in no danger of slipping through into the block. This hole is bored a little to one side of the center, so as to allow room for a $\frac{1}{2}$ -inch hole on the other side, which is to receive the candy; the latter hole is so bored that it comes out near one side of the $1\frac{1}{2}$ -inch hole, and when it is deep enough, so that a hole large enough for the queen to enter, is made, I stop boring, for a shoulder at the bottom is needed to keep the candy in place. Now fill the hole with caud, packing it in with a plunger made to fit the hole loosely, and tack on the wire-cloth. The blocks can be made so that a given number will fit any frame in use. I only give this description as the right size to use in the Gallup frame."

These blocks are put in a brood-frame and hung in the hive like any frame. The cells are put in the nursery when nearly ready to hatch.

Having answered these questions thus far directly from Mr. Doolittle's book, I confess to a very unsatisfied feeling, for there are so many more things that ought to be told to any one who thinks of rearing queens by Mr. Doolittle's method. But it will hardly do to go on and occupy page after page with quotations from the book, and I can hardly urge too strongly any one who thinks of rearing queens according to the teachings of the book to get the book for himself. I think I am about eight years older than Mr. Doolittle as a bee-keeper, and have had no little personal experience in rearing queens, but you couldn't get his book from me for a five-dollar bill if I couldn't get another one. When I got it I was so fascinated with it that I couldn't stop reading any more than the inveterate novel-reader. He has had an immense experience in queen-rearing, and has thrown his whole soul into it, and he has the rare knack of telling clearly and explicitly just what is desirable to be known, with many a little kink that others might not think of giving, but which are essential to complete success. If you have any idea of taking into your own hands any part of the rearing of queens, by all means get Doolittle's "Scientific Queen-Rearing." You'll like it, and you'll like the man that wrote it. [We mail the book, bound in cloth, for \$1.00; or for \$1.75 the Bee Journal one year and the book.—EDITOR.]

Bees Wintering in a Beer-Case.

Last May I captured a swarm of bees and put them into a beer-case, not having a hive handy. They began to gather honey, and so I was told not to change them until spring. I took a box four feet square, put a roof on it, covered the inside with building-paper, and the outside with felt tar-paper, then put a pipe in through the roof to the bottom of the box, and set the hive in the middle on a shelf. Then I put some straw between the hive and box, and covered the outside box with snow. Do you think they will live through the winter? I took no honey away, and I should judge the whole thing weighed 40 pounds or more.

MINN.

ANSWER.—It isn't entirely clear from your description just what provision there is for the bees to get air and to fly out on warm days. If that part is all right, your bees ought to stand a fair chance to winter through. If that pipe through the roof down to the bottom is the only entrance to the hive it will hardly do. There ought to be provision made for entrance and exit at the regular place where the entrance was before they were packed, and it is better for the entrance to be such as to allow the bees to enter horizontally.

Removing Winter-Cases—Stimulative Feeding—Transferring, Etc.

I am wintering 66 colonies of bees—47 in dovetailed single-walled hives, with winter-cases, 13 in the old-fashioned 10-frame Root chaff hives, and one in a single-walled hive packed in straw in a dry-goods box. Now then:

1. When should I remove the winter-cases in the spring—about what time?

2. I desire to transfer the others into single-walled dovetailed hives; what time in the spring should it be done?

3. I desire to feed them in the spring to stimulate brood-rearing. Should this be done before transferring?

4. In this locality we have no Alsike clover, and but very little basswood. Ten miles from here there are hundreds of acres of Alsike, and 1200 or 1500 basswood trees within a range of a mile. I desire to remove about 25 of my colonies there in the spring, the ground costing me little or nothing.

a, Will it pay? b, If so, should it be done before or after feeding? c, Will it be necessary to move winter-cases and all?

5. How can I use a Boardman feeder while the bees are still packed in chaff?

6. Would you advise starving bees upon warm days to give them a flight?

MICHIGAN.

ANSWERS.—1. Unless there is danger of starvation, it is not necessary to remove them till weather has fairly warmed up and bees are at work on fruit-bloom, if indeed there is need of it before time for putting on supers.

2. The favorite time is during fruit-bloom.

3. Try not more than two or three before fruit-bloom, some of them in the gap between fruit-bloom and clover, and leave the rest without feeding. If you hurt instead of help those fed before fruit-bloom, it won't matter much, because the number is small. By feeding part and leaving part without feeding after fruit-bloom, you will be able to judge somewhat whether it is wise for you to practice stimulative feeding in the future. For it is well to remember that it is not agreed that stimulative feeding is a universally good thing.

4. a, It seems that it ought to pay big. b, Just in time to catch the first clover. c, No.

5. Probably you can't very conveniently.

6. Some pooh-pooh the idea, but on a day when other colonies were having a good flight, if I saw one not flying, I'd kick it.

Distance Bees kept from a Street—Queenless Colonies.

1. Is there any law in the city of Chicago, as to how far an apiary has to be located from a highway or street, whether it must be fenced in, etc.?

2. At what time in the spring do queens commence to lay, if the colony be in good condition?

3. What will be the result of a colony that loses its queen during the winter months?

4. What is to be done with such a queenless colony in spring?

ILLINOIS.

ANSWERS.—1. I don't know, but I doubt there being any specific law on the subject. Any Chicago lawyer can tell you, or you can find out for sure if you put your bees where they will sting passers-by. Your wise course is to take it for granted that the law does not allow you to endanger your neighbors, for if you do you will probably find there is law enough against you. This is one of the cases in which it pays well to keep on the safe side. A little injudiciousness on the part of one bee-keeper may make it warm for every bee-keeper in the whole city.

2. Wintered out-doors, you may find eggs in February. If all goes well in a cellar, the queen is not likely to lay till the bees are brought out.

3. Death.

4. Unite with a weak colony that has a queen, or distribute among several colonies that need help. Of course, you can give it brood from another colony and let it rear another queen, and that's almost certainly the thing you'll insist on doing if you haven't had much experience, but after a little experience you'll find it doesn't pay.

Building Combs in Wired Frames.

Will bees hived or transferred on empty frames, pierced and wired horizontally, with inch starters, draw out their combs around the wires the same as if they had full sheets?

MICHIGAN.

ANSWER.—Not always, and probably not often. They will build down the combs just as they would if no wires were there, and wherever the wire happens to come it will be built into the comb. One would be likely to think that if the wires are stretch true in the center of the frame, and the hive is perfectly level from side to side, the comb being built down perpendicularly will have its septum correspond exactly with the wires. So it would if the combs were built entirely straight from one end to the other. But bees, when left to themselves, have a trick of building their combs corrugated or waving, which would allow the horizontal wires to correspond with the septum only a small part of the way.

Every Present Subscriber of the Bee Journal should be an agent for it, and get all other bee-keepers possible to subscribe for it. See 6 big offers on page 810.

Making Bees Immune to Foul Brood.—In the British Bee Journal J. H. S. suggests that altho it is highly optimistic and theoretical, yet considering the Pasteur treatment for hydrophobia and the antitoxin treatment for diphtheria, it is not impossible that bees might be made immune to foul brood by an artificially-produced foul-brood anti-toxin. He thinks the treatment would resolve itself into the rendering of the queen of each hive immune, a certain part of this immunity would be transmitted to her stock, drones included, and after some generations a race of immune bees might grow up.

Comb Honey, in the opinion of the editor of the Canadian Bee Journal, requires so much extra work in preparation, in looking after bees run for that kind of honey, and costs so much for sections, foundation and cases, that it raises the question whether it does not pay better to produce extracted honey. The skill, and the time required to apply the skill in producing comb honey for market, excludes, in his opinion, beginners and those devoting a large part of their time to other business. That last statement is a partial answer to the first. The limited field gives a better chance for remuneration to those who are in the field.

An Incomplete Experiment is what the Bee-Keepers' Review Critic calls the one given on page 657 of the American Bee Journal by Mr. Hartzell, in which the Golden method beat the common two to one. He thinks it is too good to be true, and before making any conclusion, all the conditions and all the results should be given with all the exactness that the closest scrutiny with the aid of scales can give. Mr. Taylor says:

"There are too many high claims made for new discoveries, which after a little time are given up as valueless, to warrant one in accepting with confidence any new plan whose results are proclaimed only in general and indefinite terms, unless there are inherent reasons to indubitably recommend it."

Boiling Fermenting Honey in Vacuo.—Mr. Hooker's experience in treating fermenting honey when in America, is given thus in British Bee Journal:

"He bought at a store a small quantity of honey; it was very thin, and had just commenced to ferment. His son, a chemist, employed in one of the sugar-refineries, proposed to thicken it without spoiling the aroma by boiling the honey *in vacuo*. A vacuum was accordingly created, and as soon as perfect a gas-stove was put underneath and the honey boiled. There was a certain amount of 'distil' as pure as water from it, while the honey became thicker and had remained thick ever since. The ferment was got rid of without damaging the aroma, and the honey was of a beautiful quality. The boiling was, of course, at a much lower temperature *in vacuo* than in atmospheric air."

Shall Bee-Keepers Make Their Own Hives and Fixtures?—Editor Hutchinson says he has made all his hives and fixtures, including sections when they were \$8.00 a thousand. At present prices he can't afford to make sections. For the past two years he could buy shipping-cases more cheaply than he could make them. He still makes his hives, as he lives where lumber is cheap, and near planing-mills with good machinery and competent workmen, so he can get the material cut out and delivered at his door for much less than he can buy it at a factory. His frames he buys away from home, because the bee-hive factories cut them more cheaply than he can get them cut at home. He concludes by saying:

"This is one of those questions that each man must solve for himself. He alone knows all of the circumstances. Let him figure it all out carefully, taking into consideration all of the points that will have a bearing on the subject, and then do what seems best."—Bee-Keepers' Review.

MR. S. H. STEPHENS, JR., of Ellis Co., Tex., reports that from three of his colonies he took 570 pounds of nice honey the past season. Whether comb or extracted, that surely was a good yield.

GEORGE W. YORK, EDITOR.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

UNITED STATES BEE-KEEPERS' UNION

Organized to advance the pursuit of Apiculture; to promote the interests of bee keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., George W. York; Vice-Pres., W. Z. Hutchinson; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GENERAL MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 38. DECEMBER 29, 1898. NO. 52.

NOTE.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

A Very Happy New Year we wish all our readers. We greatly desire that 1899 shall be the banner year for the old American Bee Journal—in the number of its regular subscribers, and in its general reading-matter. We have faith that it will be. This year we believe was the very best this journal every experienced—in the two lines referred to. But next year—the new year of 1899—ought to be still better. Why not? We hope to be able to do our part. Will you, esteemed subscriber, do yours? Let us join hands for 1899, and pull together.

The Last Number of the Year, we sometimes think, should contain only the index to the preceding 51 numbers. We believe our readers would be entirely satisfied if such were the case, for during the Holidays most people are too busy to think—that is, to think of anything but Christmas gifts and good wishes for their friends.

Doubtless something else besides a long, dry index will be appreciated, and so one-half of this number is devoted to reading-matter, as has been our custom for years and years.

Winter Time for Reading.—The longest evenings of the whole year are upon us. What a splendid time to "read up" on bees! Some bee-keepers think it is useless to take a bee-paper during the winter, when the bees are resting; and there is where they make a very large mistake. They miss perhaps the very things that might help them most in handling their bees the next season.

Some of our readers will receive this number of the Bee Journal as their final one. At least they have written us to

discontinue it after this week, and we always obey such orders, tho we often feel that such bee-keepers are making an error, unless it be those who have stopt keeping bees. But we have a very few readers who take the Bee Journal just because they like to read it, having no bees. Of course such are exceedingly rare.

Let us urge you, in this last number for 1898, to spend the winter evenings in reading bee-literature. If you have no standard book on bee-keeping, get one at once, and read it in connection with the American Bee Journal. By so doing you will find that by another bee-season you will be ever so much better equipt for your work. Try it, and see for yourself.

Journalistic Courtesy, as applied to bee-journalism, is a subject wisely touched on by Prof. Cook in his article on page 819. We think all the apiarian editors, not excepting ourselves, need to devote a little more thought to this matter than apparently has been given to it the past few months. We have been pretty severe several times the past year on some apiarian writers when doubtless milder words would have served our purpose as well, sounded better, and accomplished more.

While the bee-literature of recent years has improved greatly along the lines indicated by Prof. Cook, there is still room for more of the same kind of reform in every apiarian periodical now before the American people.

It will be our endeavor, hereafter, to avoid the discourtesies referred to, at least so far as this journal is concerned, and also try to refrain from noticing in our columns those found in the other bee-papers. We are quite willing that our competitors shall have a monopoly in that line if they desire it.

The Annual Index will be seen on the opposite page. We trust it may be found useful by all. It certainly will be invaluable to every one who has preserved the complete volume of the Bee Journal for this year.

Bees and Horticulture.—The value of the honey-bee to the horticulturist, says Green's Fruit Grower, is hardly realized by many who are engaged in fruit-growing. The setting of fruit that will stay on the tree depends chiefly upon proper pollination, and in this work the bee is largely instrumental. There are, of course, other instrumentalities, but perhaps none so effective.

Experiments at the Oregon station with the peach throw a good deal of light on this subject. A number of peach-trees were forced into bloom under glass in November, and a colony of bees was placed in the house with the trees as soon as the bloom began. For several days a heavy fog prevented the bees from working, but on the first bright day that came, the bees went to work and continued at it as long as there was anything on the trees to work on. The result was that at the stoning season, the time when unfertilized fruit drops, not a peach fell from the trees, and the crop was so heavy that it had to be severely thinned.

As a check test, one tree was so protected that the bees could not get at it, and from this tree all the fruit dropt at the stoning period. Insects, and especially bees, which have the nectar-secreting instinct as a motive for labor on bloom, are an aid to pollination, for which Nature seems to have provided no adequate substitute. Their office is to distribute pollen from flower to flower, and from tree to tree.

Much of the complaint about fruit falling would cease if horticulturists kept bees in the orchard. For the protection of bees the horticulturist should never spray while the trees are in bloom. He owes that much to these valuable assistants in his work.

California.—The California State Bee-Keepers' Association will hold its annual convention at the Chamber of Commerce, in Los Angeles, Jan. 11 and 12, 1898. Sespe, Calif. J. F. McINTYRE, Sec.

New York.—The New York State Association of Bee-Keepers' Societies will hold their annual meeting at the Kirkwood Hotel, Geneva, N. Y., Jan. 11, 1899. All interested are invited. Bee-keepers' societies are especially invited to send delegates. There will be an exhibit of microscopic preparations of foul brood (*Bacillus alvei*), and discussions relating to foul brood legislation. HARRY S. HOWE, Sec. Ithaca, N. Y.

Colorado.—A committee chosen by a special meeting of bee-keepers, hereby, in accordance with its instructions, calls a second meeting of Colorado bee-keepers interested in organized marketing, on Tuesday, Jan. 3, 1899, at 10 a. m., at the Western hotel, corner 12th and Larimer Streets, Denver, Colo., at which meeting it will present for discussion a Constitution and By-Laws for a marketing organization. W. L. PORTER, Chairman of Committee. F. L. THOMPSON, Sec. of Committee.

N. E. Ohio, W. N. Y., N. W. Pa.—The 18th annual convention of the N. E. Ohio, Western New York, and N. W. Pennsylvania Bee-Keepers' Association will be held in the City Hall, Cor. 13th and Buffalo Sts., Franklin, Pa., Jan. 11 and 12, 1899. The following is the larger part of the program:

- President's Annual Address—Geo. Spittler, of Pennsylvania.
- "Spring Management of Bees"—L. K. Edgett, of Pennsylvania.
- "Summer Management of Bees"—R. D. Reynolds, of Pennsylvania.
- "How can the Conditions of the Local Market be Improved?"—B. W. Peck, of Ohio.
- "The best means of Increasing the Local Honey-Resources"—H. S. Sutton, of Pennsylvania.
- "Profitable Use of Comb Foundation"—J. T. Nichols, of Pennsylvania.
- "Making our Association More Useful"—Geo. Spittler, of Pennsylvania.
- "Preparing Bees for Winter"—N. T. Phelps, of Ohio.
- "Experiences of the Past"—D. A. Dewey, of Pennsylvania.

NOTICE—It is hoped that all will make an effort to be at this convention, and take an active part in the discussions. Special rates of \$1.00 per day for those attending the convention have been secured at the United States Hotel, on Liberty Street.

GEO. SPITLER, Pres., Mosiertown, Pa.
 ED JOLLEY, Sec., Franklin, Pa.

FARM BEE-KEEPING

A LOW CLUBBING RATE:

Send \$1.50 to the American Bee Journal office, and get both the Modern Farmer and the Bee Journal for a year. G. W. Y. & CO.,

Eastern Bee-Keepers!

Seven years ago we started an Apiarian Supply business in NEW YORK CITY, as we saw an opening here. That we made no mistake in this is shown by the large demand for Supplies and our constantly increasing trade. Our aim was to furnish Supplies promptly. In many cases bee-keepers find the freight on Supplies from the Western factories is as much as the cost of the goods. In buying near home you not only save freight, but get your goods much more promptly. We keep several carloads of

Hives, Sections, Foundation, Etc.,

always in stock ready to ship, and the prices will be found RIGHT. We also run two apiaries for honey and sell BEES AND QUEENS. If you expect to use anything in the Apiarian line the coming year, you will do well to send for our Catalogue. We would be pleased to quote you SPECIAL PRICES on what you want, as this is our dull season, and we can afford to sell for small profits. Hives, Sections, etc., are made in Wisconsin, where lumber is low, and the best can be had.

Our Special Price on Foundation, Hives and Sections will make you Smile.

Write for it, stating the quantity you can use. DEALERS should write for our '99 discount sheet which is now ready to mail.

I. J. STRINGHAM, 105 Park Place, New York, N. Y.

Apiaries, Glen Cove, L. I.

Please mention Bee Journal when writing.

A Little Gold Dollar and Our Big Poultry Book

represent about equal value. This book contains everything that it is necessary to know to succeed in the poultry business. All about Incubators and Brooders, the best kind and the best way to handle them; thoroughbred poultry, with illustrations of each breed and a complete line of poultry supplies. We send it to all inquirers on receipt of 10 cents in stamps.

RELIABLE INCUBATOR AND BROODER COMPANY, BOX B 2, QUINCY, ILLINOIS.

\$50.00 FOR A BEE-STORY

The PROGRESSIVE BEE-KEEPER wants a good bee-story. The story should not be less than 15,000 nor more than 20,000 words, and we will pay \$50.00 in cash as first prize for such a story. There will also be second and third prizes. No one financially interested in the company will be allowed to compete, or act as judges, and we guarantee that none but competent and impartial parties will decide the contest. For further particulars, address,

THE PROGRESSIVE BEE-KEEPER, HIGGINSVILLE, MISSOURI.

HONEY * FOR * SALE.

Best White Alfalfa Extracted...

IN 60-POUND TIN CANS.

This is the famous white extracted honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can hardly get enough of the Alfalfa extracted.

Prices are as Follows:

A sample by mail, 8 cents in stamps, to pay for package and postage. By freight—One 60-pound can, 8 cents per pound; 2 cans, 7 1/4 cents per pound; 4 or more cans, 7 1/4 cents per pound. Cash must accompany each order.

Best Basswood Honey in Barrels.

We have a quantity of finest basswood honey in barrels, weighing 625 pounds net, which we are ready to ship f. o. b. Chicago, at 7 1/2 cents a pound. Sample mailed for 8 cents. If desiring to purchase, let us know, and we will write you the exact number of pounds in the barrel or barrels, and hold same till you can send the cash for it by return mail.

Our honey is **ABSOLUTELY PURE BEES' HONEY**, the finest of the kinds produced in this country.

We would suggest that those bee-keepers who did not produce any honey for their home demand the past season, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere. Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Sweet Clover

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with order:

| | 5lb | 10lb | 25lb | 50lb |
|----------------|-----|--------|--------|--------|
| Sweet Clover | .60 | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover | .70 | 1.25 | 3.00 | 5.75 |
| White Clover | .80 | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover | .60 | 1.00 | 2.25 | 4.00 |
| Crimson Clover | .55 | .90 | 2.00 | 3.50 |

Prices subject to market changes.

Add 25 cents to your order, for cartage, wanted by freight.

Your orders are solicited.

The Bee-Keeper's Guide

This 15th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting new subscribers for the American Bee Journal.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published today. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without "THE BEE-KEEPER'S GUIDE."

Given For 2 New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us **Two New Subscribers** to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both together for only \$1.75. But surely anybody can get only 2 new subscribers to the Bee Journal for a year, and thus get the book as a premium. Let everybody try for it! Will you have one?

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Page & Lyon Mfg. Co. New London, Wisconsin,

Operates two sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of

Bee-Keepers' Supplies.

They have also one **One of the Largest Factories** and the latest and most-improved machinery for the manufacture of

Bee-Hives, Sections, Etc.,

that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the **clearest and whitest Basswood** is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equip't with best machinery, all combine to enable this firm to furnish the

Best Goods at the Lowest Prices.

HONEY and BEESWAX

MARKET QUOTATIONS.

Chicago, Dec. 19.—Market is about as last quoted. Best white comb brings 13c, with off grades of white at 11@12c; amber, 9@10c. Some lots have come on the market and are being offered at prices that would be reduced if buyers could be found. Extracted steady at 6@7c for white and 5@6c for amber. **Beeswax, 27c.** **R. A. BURNETT & CO.**

Detroit, Dec. 8.—No change in supply of honey as to quality, but prices are somewhat lower than last quotations, viz: Fancy white, 13c; No. 1, 12@12½c; fancy dark and amber 9@11c. Extracted, white, 6@7c; dark, 5@5½c. **Beeswax, 25@26c.** **M. H. HUNT.**

Columbus, O., Dec. 15.—Honey arriving freely. There is quite an accumulation, and concessions in prices are necessary to move stock. Following prices are nominal: Fancy white, 12½c; No. 1, 11½c; No. 2, 10c; amber, 9c; dark, 8c. **CO LUMBUS COM. AND STORAGE CO.**

St. Louis, Sept. 9.—Fancy white comb, 12 to 12½c; A No. 1 white, 10 to 11c; No. 1 white, 9 to 10c; dark and partially filled from 5 to 8c, as to quality. Extracted in cases, No. 1 white, 6 to 6½c; No. 2, 5½c; amber, 5c; in barrels, No. 1 white, 5½c; amber, 4½ to 5c; dark, 4 to 4½c. Choice Beeswax prime, 24c; choice, 24½c. At present there is a good demand for honey. **WESTCOTT COM. CO.**

Kansas City, Sept. 9.—Fancy white comb, 12@13c; No. 1, 11@12c; amber, 10@11c. Extracted, white, 5½@6c; amber, 5@5½c; dark, 4½@5c. **Beeswax, 22@23c.**

The receipts of comb honey are larger. **C. U. ULEMONS & CO.**

Milwaukee, Oct. 18.—Fancy 1 pounds, 12½ to 13c; A No. 1, 12 to 12½c; No. 1, 11 to 12c; No. 2, 10 to 10½c; mixt, amber and dark, 8 to 9c. Extracted, white, in barrels, kogs and pails, 6½ to 7c; dark, 5 to 5½c. **Beeswax, 26 to 27c.**

This market is in good condition for the best grades of honey, either comb or extracted. The receipts of the new crop are very fair, and some of very nice quality. The demand has been and continues to be very good, and values are firm on fancy grades and straight, uniform packing. **A. V. BISHOP & CO.**

New York, Dec. 20.—The market is well supplied, especially with dark. Demand is but fair for white and dark and off grades are being neglected. We quote:

Fancy white, 12 to 13c; No. 1 white, 10 to 11c; amber, 9 to 10c; dark, 7 to 8c. Stocks of extracted of all kinds are light. White, 6½ to 7c; amber, 6c; dark, 5½ to 6c; Southern, in barrels, 60 to 65c a gallon. **Beeswax dull at 26 to 27c.** **HILDKRETH BROS. & SEGLKEN.**

Buffalo, Dec. 16.—Our market has become somewhat quiet since the holiday trade set in, and we consider 12 and 13c an extreme quotation for best one-pound combs now; with other grades ranging from 7 to 10 cents, according to inspection. Very little demand for extracted at from 4 to 6c. We advise the marketing of honey as readily as it can be judiciously sold. **BATTERSON & CO.**

San Francisco, Nov. 22.—White comb, 9½ to 10½c; amber, 7½ to 9c. Extracted, white, 7 to 7½c; light amber, 6½ to 6¾c. **Beeswax, 24@27c.**

Stocks in this center are light and must so continue through the balance of the season. Choice extracted is especially in limited supply and is being held at comparatively fancy figures. Comb is meeting with very fair trade, considering that it has to depend mainly on local custom for an outlet. Values for all descriptions tend in favor of selling interest.

Boston, Nov. 23.—Liberal receipts with but a light demand during the holidays. As a result stocks have accumulated somewhat, and prices show a lowering tendency, still we hope for a better demand with prices at present as follows:

Fancy white, 14c; A No. 1 white, 12½ to 13c; No. 1, 11 to 12c; light amber, 10c, with no call for dark. Extracted, fair demand, light supply: White, 7 to 7½c; light amber, 6½ to 7c; Southern, 5 to 6c. **BLAKE, SCOTT & LEE.**

Cleveland, Nov. 29.—Fancy white, 13@14c; No. 1 white, 12@13c; A No. 1 amber, 10@11c; No. 2 amber, 9@10c; buckwheat, 8c. Extracted, white, 7c; amber, 6c; buckwheat, 5c. **A. B. WILLIAMS & CO.**

Indianapolis, Oct. 3.—Fancy white comb honey, 12 to 12½c; No. 1, 10 to 11c. Demand fairly good. Tar-colored comb honey, 8 to 9c, with almost no demand. Clover and basswood extracted honey, 6½ to 7c. **Beeswax, 25 to 27c.** **WALTER S. POWDER.**

THE "NOVELTY" POCKET-KNIFE!

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The **NOVELTY KNIFE** is indeed a novelty. The novelty lies in the handle. It is made of beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed an **AMERICAN BEE JOURNAL** reminder, and on the other side, name and residence of the Subscriber.

The material entering into this celebrated knife is of the very best quality; the blades are handforged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring steel, and the finish of handle as described above. It will last a lifetime, with proper usage.

Why purchase the Novelty Knife? In case a good knife is lost, the chances are, the owner will never recover it; but if the Novelty is lost, having name and address of owner the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your pocket KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a Christmas, New Year or birthday present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, a lady to a gentleman, or vice versa, a son to a mother, a husband to a wife, a brother to a sister, or a gentleman to a lady—the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid, for \$1.00, or give it as a premium to the one sending us three new subscribers to the **BEE JOURNAL** (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book "Bees and Honey." We club the Novelty Knife with the **BEE JOURNAL** for one year, both for \$1.90.

Any Name and Address Put on the Knife. **GEORGE W. YORK & CO., CHICAGO, ILLS.**

Gleanings in Bee-Culture, American Agriculturist (weekly), Farmers' Almanac for 1899, ALL ONE YEAR ONLY \$1.00.

By special arrangement with the publishers, we are enabled to offer the American Agriculturist in combination with Gleanings at the unparalleled low rate of \$1.00 for both papers one year including the Farmers' Almanac. The American Agriculturist is published in three editions: The New England Homestead, the American Agriculturist, and the Orange Judd Farmer. Each contains matter relating to its own locality, as well as the latest and most accurate market reports for the country in general. It has departments relating to all branches of farming, articles written by the most practical and successful farmers, supplemented with illustrations by able artists. Short stories, fashions, fancy work, cooking, young folks' page, etc., combine to make a magazine of as much value as most of the special family papers.

A sample copy will be mailed FREE by addressing American Agriculturist, New York, N. Y.

Taken separately these two papers and Almanac cost \$2.50, consequently every subscriber under this offer will get \$2.50 in value for \$1.00.
