The plan I propose to adopt is, that in large or small towns the drainage should all be carried or conducted to depots or sewage works. Two or three might be erected (according to the levels and size of the town) in different outskirts. These works would be very inexpensive, and made to be worked on the same principle as earth closets. There would be no annoyance worth mentioning, either in its collection or distribution. Every purchaser of the manure should be compelled to bring a certain quantity of earth, so that the supply would cost nothing; and I have no doubt such manure would meet with a ready sale and pay well.

Northampton.

GEORGE SMITH.

CLOSED DOORS AT SOUTH KEN.
SINGTON.

Six.—Being interested in the description of the Kensington District Schools Competition in your journal last week, I went to the Horticultural Society's Buildings on Saturday last, hoping to see the drawings referred to. It was informed that it was necessary to have a ticket from a certain Mr. Brown; but that gentleman not being in the way at the time, I and a friend who had with me were refused permission to enter the Council-room, where I understood from your remarks the drawings were visible.

Having gone once before to South Kensington to see some asylum district drawings, but being also then unsuccessful, I desire to call attention to the exclusiveness which, as applied to the competition itself, you have already commented upon with effect.

Again, may I urge the hardship—and it really amounts to this—of closing the South Kensington Museum against the public at four o'clock on Saturdays?—a time when of all others it is most desirable to have it open. If Mr. Cole could have seen the troops of people of all sorts, old and young, interested in the museum and other things, when the bell was rung at four o'clock last Saturday, and heard the expressions of regret at such a bright opportunity (for the sun was shining brilliantly) being lost for seeing more of the treasures being then locked up, he would have relented, I am sure, and stuck up a notice at once to the effect that on the next Saturday the doors would remain open till six o'clock at least.

When it is remembered how few, even with their Saturday half-holiday, can reach South Kensington before four o'clock, even with the railway advantages now available, it seems simply absurd for a popular institution to close its doors at that hour.

ONE "DISAPPOINTED."

HARD A-STARBOARD.

Six.—Electricians inform me that they can communicate across a wide lake, water alone being the conductor, the electric current being received on a broad copper shield, with a wire attached, for further transmission. This has led me to think how collisions at sea might be avoided from fast-going steamers dashing into each other on foggy nights, thick weather, inattention, &c.

The "paths of the sea" are laid out and kept with exactitude; thus they often meet, "passengers' dread and owners' bane," with frightful results. My plan is to have a battery constantly sending forth currents of electricity from the cut, water, to be received, and fire a gun, on board of any high-speed steamer that may be direct in her path, to indicate danger, and for one to alter course instantly.

It is recorded of an American mail steamer that made a quick passage from New York, a dense fog prevailed during the whole of the passage; they kept most accurate reckoning. When they shut off steam they were only a few yards from the Forthby lightship, off Liverpool. Is not this pushing one's luck? If protection can be devised the inventor must look for his reward in peace from "Jack," and his kinsmen, for I well know the Government will not recognize nor pay for anything of the kind, if invented by a poor Samaritan, but it is reversed if it is one of their own Salamanders.

H. T.

BILLS OF QUANTITIES.

Six.—As the question of payment for quantities is being discussed in the Builder from week to week, I make no apology for asking you, in the interest of all concerned in the erection of buildings, to give publicity to the following statement:—

A few months ago I sent a well-known firm of London architects a tender prepared upon bills of quantities which they supplied at a charge of 2l. per cent., in addition to other charges all included in the estimate in the usual way. I was informed that my tender was the lowest, and asked to wait upon the architects, who said they could not take any responsibility upon themselves; but, if my tender was accepted, I must myself verify the quantities within a fortnight after signing the contract. To this I consented, and intimated my intention of making a full examination of the drawings and specifications. Next I did my tender was not accepted. Surely a builder has enough responsibility and risk, without having a surveyor's liability thrown upon his shoulders, to enable an architect to pocket an extra 2l. per cent.

A BUILDER.

BEHAVIOUR OF CEMENT.

Six.—Can any of your readers inform me the reason why brick piers, say 7 ft. by 4 ft., built with Portland cement, after completion, begin to open in the horizontal joints, as if laid with hot mortar? The piers were well weighted on top. If any reader will give me the information required, he will much oblige

B., Builder.

GAS METERS.

SIR.—A correspondent complained to you for having to pay for a quarter's gas that he did not consume. Your correspondent and others have themselves great blame for not looking after their own meters, and keep the quantities consumed, and not trust to the inspector altogether; for we know they are not a very well paid class of officials, and very often not the most intelligent. And since gas was first introduced for domestic use the principle has never altered, that is, of putting the gas meters under the kitchen sink, or some other filthy or out-of-the-way place.

Now, Mr. Editor, can you tell me why a gas meter should not be as ornamental as a timepiece in our lobby or rooms? It is not a matter of necessity to pack the works in the unmechanical and unsightly box they are now packed in. I see nothing to hinder them from being made ornaments for the finest houses, especially where there is plenty of accommodation. A tablet could be put up to show a timepiece, a gas meter, a barometer, and many other useful indicators. By having such arrangements in a house, the family would learn to read and know the use of the whole of them; whilst at the present time there are not ten out of every hundred can explain them. A. F.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

The second annual meeting of the members of this young and rising Society was held on Wednesday evening, the 24th ult., at the Offices, 14, Bedford-row. Mr. Charles Richardson was the chair. The attendance was small.

Mr. Richardson, the president of the year, opened the proceedings by calling upon Mr. Mullett, the secretary, to read the report. This document comprehended the subscribers on the advancing character of the institution, and stated that the annual meeting had been changed for the convenience of members from August to February. In alluding to the financial crisis of 1866 as being the past year, as compared with the previous one, it was stated that many donations were always given at the starting of a new society which would not be continued; and reference was also made to the financial crisis of 1866 as being injurious to the income of the succeeding years. Since the last meeting three healthy men, leading clerks in London, have been removed by death, and their loss is much regretted. There have been purchased 6000 stock in this 3 per Cents, an available balance at the bankers', and two widows have been placed on the pension list. In announcing the presidency of Mr. Richardson, the report passes a high eulogium on the retiring president, Mr. Honshaw, "for the very generous manner in which he has devoted both time, means, and influence towards advancing the interests of this young institution." Notwithstanding the discouraging aspect of the year, the results to the society have more than realised the expectations of the committee, and the continued support of friends and members is earnestly asked for.

The balance-sheet stands as follows:—To the 30th of July, 1867, 477. 11s. 5d. Subscriptions and donations, 250. 5s. Interest on banking accounts, 81. 0s. 3d. Total, 799. 15s. 8d. The expenditure for rent, stationery, printing, postage, secretary's salary, and all working costs, the sum of 367. 4s. 6d. Relief and pensions, 122. 15s. Purchase of 6000 3 per Cents, and broker's commission, 601. 15s. Available cash, 100. 1s. 3d. Total, 799. 15s. 8d.

The Chairman, in moving the adoption, printing, and circulation of the documents just read, took occasion to congratulate the meeting on their success. There was a young society, only just started, and started, too, at a very bad time, when trade and commerce were dull. He hoped that the last year was rolling over us, and that better times were to come, and that they would all put their shoulder to the wheel. Builders' clerks wanted something of that kind; they often worked in offices that were not always healthy, and they did not get enough of out-door exercise. The report having been adopted, resolutions were passed appointing the committee and officers for the year; and a special vote of thanks was passed to Mr. Haslam.

A conversation ensued as to the best means of inducing builders' clerks to take an interest in the society.

VITRUVIUS.

SIR.—As there is a disposition to afford a better professional training for those who pursue following the profession as architects, it has occurred to me that, supposing that any professor would take up Vitruvius as a basis, and deliver a course of lectures, using that book as a guide, commencing with the essentials of an excellent and good practical education in the first instance, and then follow the same course as laid down by the above talented and experienced great man, with all the improvements and changes which have taken place in nearly 2,000 years, the lectures or papers would form a most valuable nucleus for the young architect, laying down what system he should adopt, what works to study for theory or practice, the nature and improvement in all matters relating to building, their nature and properties, not confining himself to the mere routine of an architect's office, which he should never enter till he has been well grounded in drawing, &c., and as it is now proposed that he should, like the ancients masters, have a knowledge of the figure in drawing or modelling, and also in painting and sculpture, sufficient to be a guide to him in future life; and he would have much reason to be thankful to such a professor for his excellent advice in forming his mind, and rendering him in after-life an ornament to society.

I am merely throwing out these few hints as a stepping-stone for others to follow up in their better judgment. A SUBSCRIBER.

PROPOSED NEW BUILDINGS ACT.

SIR.—As it is proposed to revise or replace the existing Act, let us hope that it may be made applicable to the provinces, or that suitable clauses may be inserted for this object. I have no doubt that most architects in small towns will agree with me, as will any one who has witnessed what I have.

We can most of us remember the great fire in West-street, Gravesend, in 1846, when the whole of that weather-boarded substitute for a street was destroyed.

I was once offered a three-story house in a town of 20,000 inhabitants for 1600. The front wall was 9-in. brickwork, the back wall 6-in. brick on edge, the party walls represented by a quarter partition. No W.C. or privy. Sashes all single hung. I on another occasion designed a pair of cottages for a country builder, who insisted on a wood partition between the two houses; and not only this, but at one part a party floor, not fireproof. On my remonstrating, he merely replied, "That he was going to insure the houses."

If a general Act is carried out, I must suggest a word of caution against local officials; for experience tells me that unless our counties are treated—at least, in this instance—as departments, the Act would be useless. W. S.

The present Act is ill-defined and indeterminate in point of law. We have simply to revert to the Act of 1844 as a model Act, and one that can only be improved by the introduction of a "Metropolitan Buildings Court," with summary jurisdiction, three architectural referees, and a legal assessor. In substance it is a most shipy-drawn Act, and is singularly enough appealed to whenever a correct definition is required. This tribunal should be a final Court of Appeal, and independent of any other body. All these changes are productive of inconvenience. A. D. S.

THE DISCOVERIES AT GUILDFORD CASTLE.

At the risk of diminishing the romance which attaches to the discovery of the so-called "dungeons," I would suggest that the caverns now opened were once quarries, from which the supply of chalk was obtained for use in the various buildings, and notably in the interesting Church of St. Mary hard by, restored under my direction a few years since, in which the columns and arches and mullions and tracery of the windows were found to be of chalk, with Reigate fire-stone in parts. The harder chalk would be found at some depth—hence, probably, the extent of the excavation. There are three varieties of chalk in the neighbourhood of Guildford, viz., white chalk, grey chalk, and the beautiful veined chalk which has the aspect of veined marble when varnished. Chalk, however, is little used for building purposes in this Bath-stone age, but for interior use, especially above the line of wear, I think it is a very beautiful and tractable material, taking a good arsis and hardening with age. The lime burnt in the neighbourhood is justly celebrated. THOS. GOODCHILD.

Books Received.

Practical Remarks upon the Principle of Rating Railway, Gas, Water, and other Companies, Land, Buildings, &c. By CHAS. PENFOLD. Fifth Edition, rewritten by JOHN THOMAS KERSBOW. London: Knight & Co., Fleet-street, 1869.

A TIME is coming when a vast deal of valuation and re-valuation must be done, so that the appearance of this new edition of "Penfold on Rating" is opportune. Mr. Kersbow, who is one of a well-known firm of rating surveyors, and brings practical knowledge to the work, has extended the original book to make it include the effects of Acts of Parliament passed since the previous edition appeared. The present editor has a strong opinion as to the liabilities of companies, and has brought together cases that bear on this point. We can recommend the volume to all who are interested in the matter.

VARIORUM.

We need but announce the appearance, as usual, of "Debrett's Peerage for 1869," and "Debrett's Baronetage for 1869," now published by Dean & Son, Ludgate-hill. Great care is evidently taken to keep these works up to the time, and to maintain their ancient reputation. Mr. Hardwicke publishes a "Shilling Peerage," a "Shilling Baronetage," a "Shilling Knightage," and a "House of Commons 1869,"

also for a shilling. The fact that these are all edited by Mr. Edward Walford, M.A., sufficiently guarantees their correctness, so far as they go.

"The Railway, Banking, Insurance, and Commercial Almanac for 1869," edited by Mr. W. Page Smith, which reached us somewhat late in the year, contains its usual large amount of information connected with the interests it addresses.—*Fraser's Magazine* for March, contains "A Note on Paperism," by Florence Nightingale, which may be most usefully studied. Miss Nightingale's proposition as to the punishment of prisoners is less likely to meet with acceptance.—*Britannia*, a monthly magazine, has the advantage of being edited by Mr. Arthur A'Beckett, and illustrated by Mr. Mat. Morgan.

The current number of the *Broadway* contains an appreciative paper by Mr. William M. Rossetti, entitled "Ruskin as a Writer on Art."

The first Annual Report of the Amalgamated Society of House Decorators and Painters, from April, 1868, to December, 1868. Kenny, Printer, Camden-road. This society was established in April, 1868. The general secretary, Mr. G. Shipton, in his report, or remarks, says,—

"Our report for the quarter ending September showed there were 358 members in the society, fifteen of whom had joined under the full force of the rules; and after deducting the cost of sufficient property to start twenty-five branches, and the working expenses of the society, we were left with a balance in the general fund of 410s. 4s. 6d., or an average of 11. 1s. 5d. per member. Thus it will be seen that nearly the whole of the members became free to all benefits beginning with October, placing before us the worst period of the year. In addition to this, the sad depression on all branches of industry—of course including our own—made matters still more against us, and altogether likely to test the solidity of the society to the fullest possible extent.

Now, the lowest sum for which any member can join the society under the rules, before being free to all benefits, is 31. 0s. 10d.; this ranges, according to the age of the member, up to 41. 8s. 4d. Thus the many disadvantages under which the society was started will be evident, as upon the lowest payments the sum of 1,167. 6s. 8d. would have been realised.

"During our short period of existence, the total income of the society has been 544. 18s. 3d., and our expenditure for property, working expenses, and payment of benefits amounts to 653. 13s. 11d., leaving a balance of 291. 2s. 4d. in December. For funerals we have paid 100, or an average of 61d. per member; for sick benefit, 402. 18s. 2d., or an average of 2s. 11d. per member; and for the all-important object of providing assistance for our unemployed members, no less than 273l. 6s. 3d., or an average of 14s. 7d. per member."

Liverpool Institute: The forty-fourth Annual Report of the Directors, January, 1869. Marples, printer, Lord-street, Liverpool.—This report congratulates the members upon the prosperous condition of all departments of the Institute. Various suggestions as to technical education have been carried out practically in the classes of the Institute. The report says as to the Government School of Art:—

"Under the energetic management of Mr. E. F. M. the school is steadily advancing, and it is hoped that the more enlarged management of the Government Art Department will cause an increase, both in numbers and efficiency."

"At the Second-Grade Examination, held in March, 1869, students were examined, of whom 88 wrote, and 108 drew, for excellence. This shows an increase, as compared with 1867, of 23 students who sat for examination, and of 23 hour appointed for candidates still exists, and prevents the late members of the ladies' class competing.

Seventy students sent advanced drawings to London. Money awards were made upon 23; 7 received prizes of the Third-Grade, and 1 received honourable mention. Two drawings were also selected for exhibition at South Kensington."

The twenty-third Annual Report of the Council of the Crewe Mechanics' Institution. Crewe: Hardley, printer. The council give a satisfactory report of progress. There are science and art classes in connexion with the Government Science and Art Department. In the art division Mr. Turbull is the teacher of geometry and of perspective; and in the science division Mr. Gaister is the teacher of building construction.

Miscellanea.

Danger from Gaselier Brass Chains.—Correspondents of the *Times* have been drawing attention to the risk of the brass chains of gaseliers giving way, and the weights falling off. Brass is liable to become brittle, as indeed other alloys occasionally do; and it is recommended that chains of copper should be substituted. Brittle brass, it may be noted, can be made tough and flexible again by annealing; and all brass is not equally liable to become brittle. Brass wire submitted to occasional vibration, while stretched, will sometimes become tender and brittle in a few weeks. Copper, it seems, is far safer than brass for chains.

Street Tramways for South London.—A meeting in support of the attempt to obtain Acts of Parliament for laying down tramways, especially in the south of London, has been held at Kennington. Mr. G. Hopkins, C.E., explained the plan more particularly proposed, including lines to Westminster, Southwark, and other bridges, from different points in the south of London. It is proposed also to connect Lambeth with Battersea Park, and Pimlico with Peckham and Greenwich. The maximum charge by the bills in Parliament would be 1d. per mile. The plan under consideration was heartily approved of, and a petition in its favour resolved on.

Park-lane Improvements.—A communication was received at the last meeting of the Metropolitan Board of Works from the Hon. C. A. Gore, Commissioner of Woods and Forests, in reference to the proposed improvement of Park-lane, and for which a bill is now before Parliament. Mr. Gore said he had consulted the Lords of the Treasury, and had prepared clauses for insertion in the bill for securing that proper compensation should be paid to the Crown and to the lessees and tenants of the houses and buildings in Hamilton-place, not only for the property which may be taken, but also for the diminution in value of the houses in Hamilton-place in consequence of its being converted into a thoroughfare, whether compensation is or is not payable in this respect under the Lands Clauses Consolidation Act, 1845. This letter led to an animated discussion, in which it was strongly enforced that no exception should be made in favour of the owners of this property over what was given to any others whose property was required for public improvements, and especially so as Mr. Gore had thrown every obstacle in the way with respect to the formation of the Thames Embankment. The letter was referred to the Works and General Purposes Committee.

What is to be done with the Irish Church Surplus Fund?—The total charges on the Church, said Mr. Gladstone, while laying down his plan for the Irish Church disestablishment, will amount to about eight millions and a half, and leave to the State seven millions and a half. How are we to dispose of the surplus? The money must be applied to Irish purposes, but not to ecclesiastical purposes. The people must be the recipients. The proposal is to apply the surplus to charitable purposes. Lunatic Asylums cost Ireland about 40,000*l.* a year; Deaf and Dumb Asylums and Blind Asylums are expensive in proportion to the numbers that are relieved; and the maintenance of such asylums is a purpose specially marked out for the utilization of such a surplus as that of the ecclesiastical property. Besides asylums for lunatics, blind and deaf mutes, the training of nurses, the support of infirmaries, of reformatories, and industrial schools might be provided for.

Chambered Tumulus, Brittany.—At the last meeting of the Anthropological Society, Mr. A. L. Lewis, in the course of "Reminiscences of a Visit to Locmariaquer and Gavrinis," said that Locmariaquer, or "Virgin Mary's Town," stands on the site of the ancient Darioirgum, the capital of the Veneti, on the Mer de Morbihan, Brittany, and is surrounded by innumerable remains of its ancient inhabitants. One of these was a dolmen, nearly 70 ft. long, which the author believed to have been intended for sepulchral purposes. Gavrinis, or "Goat's Island," is situated in the Morbihan sea, and is celebrated for its chambered tumulus, the chamber and gallery of which are together about 70 ft. long, 6 ft. high, and 3 ft. wide at the entrance, increasing gradually to a height and width of from 10 to 8 ft. The floor and roof are formed of large flat stones, the latter being supported by twenty-seven upright stones, nearly all of which are covered with incised ornamentations, composed chiefly of segments of concentric circles, interspersed with wavy lines, and resembling somewhat the Northumbrian rock-inscriptions, and those of the tumulus at New Grange, Ireland.

Herculaneum.—The exploration of Herculaneum, one of the cities buried in the great eruption of Vesuvius in A.D. 79, is to be resumed, thanks to a grant of money from King Victor Emmanuel. The researches into the tombs of this city have been interrupted for above twenty years, partly owing to the fact that it is buried not more deeply than Pompeii, and in a material much less easily excavated.

New and Gigantic Plant.—Within the last few days living specimens have been forwarded to this country from Nicaragua of one of the most gigantic plants in the vegetable kingdom. It is closely allied to the Arums (or "Lords and Ladies") of our hedges, and, until the present time, has wholly escaped the notice of travelling botanists. It produces but one leaf, nearly 14 ft. in length, supported on a stalk 10 ft. long. The stem of the flower is a foot in circumference, the spathe or flower 2 ft. long, purplish blue in colour, with a powerful carrion-like odour. As this remarkable species of Aroidæ is quite new to science, it has not yet received a name.

Dwellings for the Industrial Classes.—A meeting of gentlemen interested in providing dwellings for the higher classes of artisans, merchants, commercial, and bankers' clerks, &c., and thus supplying the need created by the construction of railways through the heart of the metropolis, has been held at the residence of the Hon. Arthur Kinnaird, M.P., Pall-mall East. The Earl of Shaftesbury presided. Mr. Haherston, the chairman of the directors of the Suburban Village Company, laid before the meeting their plans, the chief characteristic of which is, that the company proposes to build houses, and then to allot them to working men, who are to be shareholders, whose rents are, in a given number of years, to defray the cost of the dwellings, which then become their own property. The rents thus imposed be stated do not exceed those now paid for houses of a like size and character. The company have obtained a large piece of land from the Ecclesiastical Commissioners at the south-eastern extremity of Loughborough Park, Brixton. After a long discussion, a motion was carried highly laudatory of the scheme as not only advantageous to working men, but as being founded on a safe basis for those who invest their money. In the course of the meeting Lord Shaftesbury consented to lay the foundation-stone of the first block of buildings on Easter Tuesday.

Something like a Rope.—Messrs. John and Edwin Wright, Universe Works, Garrison-street, Birmingham, have just made an extraordinary rope with hemp cord and wire strands, for shipment abroad. It is 11,000 yards long, measures 5½ in. in circumference, and weighs over 60 tons! The entire length of wire, in 60 threads, is 738,000 yards, or 412½ miles. The length of yarn used for the centre—namely, 27 threads, is 405,000 yards, or about 230 miles. Thus there is a grand total of 1,131,000 yards, or 635 miles of material—to make up a wire and hemp rope a little under six miles long.

A Bladder in the Chimney.—A correspondent, "W. B.," writes,—"In your last issue I see a correspondent refers to a bladder being suspended in a chimney. I know of a man who had a chimney that smoked past bearing, and he was advised to suspend a bladder in the chimney, about 3 ft. from the top, and he did so, and he told me yesterday that it had never smoked since. It was an old-fashioned chimney, the bladder was suspended in the chimney the winter before this last, and it has been there ever since."

Tower Subway.—The report of the engineer, Mr. P. W. Barlow, jun., to the directors of the Tower Subway Co., was read at their general meeting on the 26th ult. It stated that the land had been so recently placed in the hands of the contractors, that there was little progress to report in the excavation of the work, but the contractor, Mr. Greathead, had arranged with Mr. Thomas Tilley to sink the shafts, and that the principal portion of the cast-iron shaft cylinders had arrived in London. Mr. Greathead had arranged with Bells, Goodman, & Co., of Newcastle, engineers, &c., to supply the castings for the tunnel. The shield for the tower side is also in course of manufacture by them. It will be constructed almost entirely of wrought iron, and fits over the iron tunnel like the lid of a telescope. The front plate has two openings, 2 ft. square in front of which the heading will be driven; it is provided with sliding doors, which may be closed instantly on the least appearance of water, thus rendering the tunnel water-tight. The lifts, it seems, are to be made for the passengers, but not for the carriages.

Architects' Benevolent Society.—Some of our readers may be glad to be reminded that the annual meeting of the society will be held in the Rooms in Conduit-street, on Wednesday, the 10th instant, at three o'clock.

The Phototype.—In *Scientific Opinion* for 24th ult., an interesting engraving from a surface block, prepared by the phototype process, is given, together with some account of that process, the details of which, however, have not yet been published. By its means, drawings, engravings, or even print, can be copied in facsimile, and printed from, in the form of surface blocks, along with types, without the necessity for employing an engraver, whose place is taken, at considerably less cost, it is stated, by the photographer. The process is not yet completely developed; but if, as *Scientific Opinion* remarks, it can do such good work in its infancy, what may we not expect from it when more matured? The engraving is both elaborate and distinct. Its subject is a magnified representation of those beautiful little organisms, the diatoms of the Arachnoidicæ Japonicæ order, with their concentric-radiate and elaborate structure. The magnified photograph itself, it must be understood (if any such photograph was taken), was not used in the production of the surface block (that final stage of progress, we presume, has not yet been matured): the representation of the diatoms was drawn by the late Mr. Richard Beck; so that this is a phototype direct from a drawing.

The Holborn Valley Viaduct.—At a Court of Common Council, Mr. Deputy Fry, the chairman of the Improvement Committee, in reference to the Holborn Viaduct and the improvements that are proceeding in that locality, stated that there were good grounds for believing that the Holborn Viaduct would be opened to the public in June or July next. The committee had recently examined the works, and they found that one of the principal iron girders had been fixed in its place, and there was every reason to believe that the viaduct would be opened at the time he had stated.

Norfolk and Norwich Archaeological Society.—The annual meeting of the members of this society has been held at the Guildhall, Norwich, the chair being occupied by the Rev. H. Evans Lombe. On the table were some of Mr. Fitch's flints, and some engravings of the Barton turf screen, which was described by the Rev. J. Gunn. The Rev. C. R. Manning (one of the secretaries) read the report, which was adopted. Office bearers were then elected, or rather re-elected; and the skeleton of a paper prepared by the Rev. J. Bulwer and Mr. Rye on the ancient church, and on the port and trade of Cromer, was read. A little discussion took place, the Rev. J. Gunn taking the principal part in it, and afterwards reading a paper on the Barton Turf Road-screen. A letter having been read from Canon Greenwell on the excavations at Grimes Graves, in the parish of Westing, near Brandon, the proceedings closed.

The Rapidity and Cost of the Improvement of Paris.—In a debate of the French Legislative body on a measure by means of which Baron Hansmann wishes the Chambers to legalize what has been done, and is being done, for the improvement of Paris, M. Thiers has been exciting attention by his remarks. According to him, the improvements have been proceeding too fast, and attracting too many of the working classes to Paris; and he predicts that in 1870-71 there must be a crisis.

"Thirty years ago," said M. Thiers, "there was not a shop in Paris which was let at more than 15,000 fr., or 25,000 fr. Now there are some at 80,000 fr., or 90,000 fr. Fifteen years back a square metre of ground cost 500 fr., or 600 fr., now the price is raised to 1,000 fr., or 1,100 fr. And provisions? The increase is enormous. You say that the workman's wages have been augmented. Doubtless; but if he receives more, does he not spend more?" The indebtedness of the city of Paris was pretty generally known before the present debate took place. The *Debats* some time since published a statement of which the summary is, that the sums still due by the city of Paris to the various companies of contractors for the most recent works in opening new streets, and for those still in course of construction, and which payments are to be made out of the proposed loan, amount to 453,033,005 fr. To that sum must be added what has been already paid, which brings the whole up to the end of that year to 74,800,000 fr.

St. James's Tower, Taunton.—At a vestry meeting held for the purpose of considering the state of this tower, it was resolved that, provided funds can be obtained, the tower be taken down and rebuilt, and that a committee be formed to collect subscriptions. Resolutions for the repair of the tower, and for its restoration, were negatived. A committee was then appointed.

A New Fact in the Behaviour of Iron.—Mr. Gore has noticed a new fact in the behaviour of iron under the influence of heat and of strain. A strained iron wire was heated to redness by a current of voltaic electricity, and then, the current being discontinued, was allowed to cool. It was observed that there arrived a moment in the process of cooling at which the wire suddenly elongated, and then gradually shortened, until it became perfectly cold, remaining, however, permanently elongated. No other metal besides iron exhibited this peculiarity, which Mr. Gore attributes to a momentary molecular change, and he points out that this change would probably happen in large masses of wrought iron, and would come into operation in various cases where those matters are subjected to the conjoint influence of heat and strain, as in various engineering operations, the destruction of buildings by fire, and other cases. The phenomenon deserves a further investigation, since every fact relating to iron is of importance to us.—*Mechanics' Magazine.*

Making Mortar.—A correspondent from Syracuse, N.Y., sends us an account of an invention perfected in that city for mixing mortar, which is simply this:—The lime is first slacked in a vat with water enough to make it to a paste, and allowed to retain its heat for about twenty-four hours; it is next run off into a second vat, from which it is pumped by a chain pump to a revolving cylinder that has a large number of spikes on the inside. As it flows from the cylinder, it passes through a sieve of ten meshes to the inch, and every particle that is used has to go through these very fine holes no larger than a pin's head. From this machine it falls into a larger vat, from which it is pumped, as required, to a similar revolving machine, called the mixing machine, into which it flows in a continuous stream; and sand, previously sifted, is added at the rate of about eighty bushels per hour. The mortar made in this way is said to be of a very superior quality.—*Scientific American.*

Green Wood.—A new method for drying green wood in a very short time, it is said, consists in boiling it for some hours in water and leaving it then to cool, by which the soluble substances are removed. It is then boiled in an aqueous solution of borax, by which the insoluble albumen of the wood is rendered soluble, and escapes from the pores. The wood is then placed in drying-chambers, heated by steam, and allowed to remain three days. Wood thus treated is described as being more compact than it would be by ten years of ordinary exposure; as not shrinking, or warping, and as being secure against decay; on account of its greater density more easily polished; and better fitted for articles of furniture and musical instruments.

Restoration of Bath Abbey.—The graining of the nave and aisles has at length been completed, and the money required to pay for it has all been realized with the exception of about 50l. The committee at their last meeting gave directions for concreting the floor of the nave, and for the provision of the warming apparatus for the church. The contractor has been engaged in cleaning down and scraping the walls and pillars, and the other portions of the work will be proceeded with with convenient speed.

Public Works of Board of Works.—The Metropolitan Board of Works have issued a return showing that the following sums had been expended upon the various public works up to the 1st July, 1868:—For the main sewers and ordinary expenses, 3,178,716l.; Covent Garden Approach, 125,400l.; Southwark and Westminster Communication, 597,072l.; Victoria Park Approach, 43,615l.; Finsbury Park, 70,544l.; Southwark Park, 87,954l.; Fire Brigade, 172,482l.; Whitechapel Improvement, 128,520l.; Holborn Improvement, 67,379l.; Kensington Improvement, 112,632l.; Metropolis Main Drainage, 3,957,184l.; Thames Embankment (North), 1,595,052l.; Southern Embankment, 846,010l.; and for Mansion-House-street, 1,254,611l.

Williton Surveyor.—The office of highway surveyor for Williton having become vacant by the resignation of Mr. Williams, the Highway Board received no fewer than fifty applications for the vacancy. Out of that number two were selected, Messrs. A. Durie, surveyor, of Dunster; and Mr. Evans, assistant surveyor, Toldine, Worcester, the former of whom has been elected to fill the situation, at a salary of 200l. per annum.

Now English Church at Hyeres.—A correspondent, writing from Hyeres, says:—"On Wednesday last the new English church at this place was opened for public worship. There was a large congregation, and the Mayor of the town and the Juge de Paix were present. The building just opened is commodious and well-finished, and does great credit to all concerned in its erection."

Another Theatre Burnt.—The theatre of Cologne has been burnt to the ground. The man in charge of the building, with his wife and five children, perished in the flames.

Telegraphic Progress.—A telegram from Cuba states that Sir Charles Bright has succeeded in picking up the submarine cable lost during the last summer in the gulf-stream, between Florida and Havannah.

Timber under Hearth Stones.—Kendal Town-hall narrowly escaped being destroyed by fire a week ago. Under the hearth-stone of the news-room was a piece of timber, and the stone having cracked, the wood became ignited.

The Literary Fund.—Lord Stanley will preside at the ensuing anniversary dinner, Wednesday, May 5th. The general meeting for the election of officers will be held on Wednesday next, March 10th.

Bombay.—A time-ball tower has been erected here from the designs of Mr. W. J. Addis, who is the engineer to the Local Fund Works, Tanna. It has been erected under his superintendance at the cost of 17,000 rupees.

The Somerset Archaeological Society.—The first conversations of this society for the season has been held at Taunton, when several papers were read. There was a large attendance, including ladies. The meeting was held in the Museum, and Mr. J. Hamilton, of Fyne-court, presided.

United Service Institution.—On Friday, the 12th inst., Mr. W. Cave Thomas is to read a paper on County Military Training Schools, a suggestion for improving the recruiting system.

TENDERS.

Accepted for the erection of a chapel in Park-road, Batley, for the Christian Brethren Society. Messrs. Sheard & Hanstock, architects:—

Mason's Work	£120 0 0
Preston & Webster, Joiner's, &c. Work	519 10 0
Iberson, Slater's, &c. Work	47 16 0
Steers & Stocks, Plasterer's Work	78 10 0
Kitchingman, Plumber's Work	20 0 0
Lohley, Painter's Work	24 0 0
Kershaw	24 0 0

Accepted for the erection of a warehouse, houses, offices, &c., at Bulrush Mills, Batley, for Messrs. Talbot, Senior, & Talbot. Messrs. Sheard and Hanstock, architects:—

Mason's Work	£801 0 0
Riley, Joiner's, &c. Work	612 0 0
Jowett, Ironfounder's Work	40 0 0
Bageshaw, Plasterer's Work	28 10 0
Hey, Plumber's Work	26 0 0
Lohley, Slater's Work	120 0 0
Riley	120 0 0

For alterations and additions to Bowater House, Hampton Court. Mr. H. H. Collins, architect:—

Daves	£1,855 0 0
Stuart & Bennett	1,478 0 0
Albiston	1,880 0 0
Wheatley	1,369 0 0

For St. Philip's Church, Battersea. Mr. T. J. Knowles, jun., architect:—

Total, including Spire	Spire	
Beaver	£13,793 0 0	2794 0 0
Shaines & Son	17,750 0 0	765 0 0
Baker & Constable	12,750 0 0	700 0 0
Nightingale	12,385 0 0	750 0 0
Conder	12,290 0 0	689 0 0
Hopson	12,038 0 0	693 0 0
Cooke & Green	11,975 0 0	676 0 0
Bennett	11,418 0 0	705 0 0
Dave Brothers	11,393 0 0	593 0 0
Windsor	11,296 0 0	673 0 0
Manley & Rogers	10,970 0 0	670 0 0
Sawyer	10,826 0 0	780 0 0
Johnson	10,809 0 0	574 0 0
Carter & Sons	10,470 0 0	619 0 0
Colls & Son	10,340 0 0	570 0 0

Accepted for new infirmary and other additions at the Bedford Union, Nottingham. Mr. S. J. Barber, of East-wood, architect:—

Mr. G. Hopewell	£7,997 0 0
-----------------	------------

For the erection of a Wesleyan Chapel at Lewisham. Mr. John Tarring, architect:—

Bishop	£4,945 0 0
Frederic & Son	4,826 0 0
Simpson	4,700 0 0
Higgs	4,658 0 0
Killy	4,638 0 0
Scunders	4,455 0 0
Carter & Sons	4,235 0 0
Newman and Mann	4,100 0 0
Hill & Sons	4,100 0 0

For seven houses and shops in Duke-street, Brighton, forming part of the "Duke-street improvements," for Mr. John Hart. Mr. R. H. Nunn, Architect. Quantities supplied:—

Chappell	£5,984 0 0
Cheesman & Co.	3,950 0 0
Wilson	2,980 10 0
Palcking & Sons	6,750 0 0
S. & W. Daney	5,680 0 0
Druton	5,460 0 0
Lockyer	5,450 0 0
Parsons, jun. (accepted)	5,200 0 0

For building new coffee saloon and shops in Villiers-street, Strand, for Mr. C. Gatti. Mr. Bolton, architect:—

Hill & Son	2,875 0 0
Nixon	2,843 0 0
Sharplington & Cole	2,781 0 0
Carlow	2,788 0 0
Ward	2,297 0 0
Carter & Sons	2,200 0 0

For works at Hanningfold and Blaston. Mr. R. W. Johnson, architect:—

Herbert	£1,869 0 0
Neale & Sons	1,843 0 0
Lockyer	1,838 0 0
Halliday & Cane	1,824 0 0

For villa residences, West Cowes, Isle of Wight. Mr. R. W. Johnson, architect:—

Chinchai	£5,400 0 0
Ball	4,780 0 0
Wheeler	4,970 0 0
Thomas	4,597 0 0

For six cottages at Kettering, Northamptonshire. Mr. R. W. Johnson, architect:—

Bellamy	£912 0 0
Wilkinson	883 0 0
Hawthorn	890 0 0
Margetts	683 0 0
Starman	681 0 0
Girdle	651 0 0
J. & G. Henson	644 0 0

For five houses and shops in the Fulham-road, Chelsea, for Mr. H. G. Henshaw, Mr. Lay W. Ridge, architect. Quantities supplied by Mr. L. O. Riddett:—

Gannon & Sons	£7,204 0 0
Richardson	6,985 0 0
Williams & Son	6,967 0 0
Webb & Sons	6,750 0 0
Macey	6,744 0 0
Adams & Sout	6,423 0 0
Foster	6,469 0 0
Servicor & White	6,283 0 0

For new church of Webbhead, Bromsgrove, for the Right Hon. the Baroness Windsor. Stone principally given. Mr. Frederick Preedy, architect. Quantities furnished by Messrs. Goodman & Venn, architects:—

Girdle & Smallwood	£2,825 0 0
Wheatley	2,179 16 0
Espley	2,351 8 8
Jones	2,313 10 0
Field	2,217 0 0
Nelson	2,062 0 0
Mc'Ann & Everal (accepted)	2,019 10 0

For rebuilding chancel and restoring the parish church of Kestleton, Norfolk. Mr. Frederick Preedy, architect:—

Turner & Sons	£1,203 19 0
Brown	1,008 0 0
Cornish	1,008 7 0
Bardell & Son (accepted)	921 10 0

For building four shops, &c., at Hounslow. Mr. J. Holme, architect. Quantities not supplied:—

Westcombe	£2,170 0 0
Peatman	2,300 0 0
Hiscook	2,369 0 0
Brunden (accepted, subject to alterations)	2,265 0 0

For the erection of a house and shop, for Mr. A. Baker, Sudbury, Suffolk. Mr. T. F. Kay, architect. Quantities not supplied:—

Grubby & Son	£2,726 4 0	£72 0 0
Holland	2,743 6 0	—
Grinwood & Son	2,200 0 0	—
Halls	1,614 0 0	53 0 0

(next week). — T. J. H. (next week). We are compelled to decline publishing cut books and giving addresses. All statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the tender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

The Builder.

VOL. XXVII.—No. 1362.

The Conditions of Architectural Achievement.

OR the realization of high architectural as of other artistic achievements, there are conditions which are quite independent of the artist's endowment with original genius, energy, and culture. Of these we specify, first, the material basis—resources; the fund of available wealth is one such condition. Fine art—fine architecture especially—will not easily ever be very cheap. The co-operation of many hands, especially when time presses, is indispensable; and for best works, the best materials,—for largest works, the most ungrudged quantities,—are indispensable. Beauty, indeed, sometimes seems even a spontaneous outgrowth of superfluity; and art has appeared to thrive as by process of nature,—of evolution, in direct consequence of large resources being concentrated in few hands; when the rich and the powerful, after all lower and more vulgar needs have been satisfied to the full, have still found themselves encumbered with wealth, with means of enjoyment, of which they grudged the idleness, and appealed to the ingenuities to invent means of making practically fruitful of pleasurable excitement in some form or other. Such occasional instances of plethoric abundance furnish chances, at least, for abundant experiments, allow room for numerous and extensive failures; and out of the entire harvest of tares, and whatever else, all growing up together, posterity has not infrequently found that something has come down from a generally base, no doubt, but withal a very productive and prolific time, that is worth preserving, and for which the world may be thankful through all time.

The contingency of means being granted, opportunities come, in the second place, among the happy conditions of noble architecture. Inigo Jones fell upon evil days; and Wren, in this respect at least, upon more fortunate. It is not every architect who has a St. Paul's to rebuild, and not every general who has even a chance of a Waterloo reserved to crown his career. Coming at the very contact of transition, Whitehall was but half a chance for Inigo Jones: the half chance was not sufficient. In our own days we have probably nothing to complain of so far in respect of either head or conditions for architectural success—as little of opportunities as of resources. Fire has cleared large areas for an Exchange, a theatre, and for House of Parliament, and the mere growth of the Capital, and of its wealth, has been equivalent to the foundation of a new city, and the movement within the church has opened opportunities that even Wren might have envied.

But besides the occasion and the means, there are yet other conditions to be postulated before the eager energies of the architect can be released to have their full career. In every art the patron will control the artist; it is not only that "the drama's law the drama's patron give,"—such is the condition of the acted drama,—but because

"Those who live to please must please to live."

The predilection of patrons must and will be consulted in every art,—must be dealt with,

considered, conciliated. Only so in many cases can the commission be obtained at all; only so can the competition for employment of wealth be diverted to a fair extent in favour of architecture as against other arts or other artistic employments, as shows, parade, and retinue,—as horse-racing, gambling, and so forth.

It is the condition of truly fine art that we are here considering, and we postulate, therefore, for the happiest form of the condition now in question,—the sufficient taste of the patron,—the patron, who, whether private individual, inspirer of a committee of taste, or minister practically irresponsible, can give or withhold the commission to one art, or to one artist or another.

The good taste, or the sufficient taste exemplified by good sense and good judgment, of the patron is a most cardinal condition; for,—

"That without which a thing is not,
Is causa sine qua non."

It may seem the paradise of an architect that he should be independent of this condition entirely. Much, no doubt, of the worldly wise professional tact of every art is directed to compassing each independence. Lawyers have liked to take the suit out of the hands and control of clients to an end of unlimited detriment and damage; and doctors to stand upon a professional etiquette that will conserve engrossment of the patient even at the risk or the sacrifice of the patient's life. These are abuses that have no affinity to the ascription of worthy self-respect; in many cases, no doubt, the interest of art, and of the patron too—quite apart from the artist,—will be served by his assertion of independence, by daring, by emancipation from control, even control that should be most legitimate. The artist often knows better than the patron what will ultimately please him—even the patron, to say nothing of the rest of the world or posterity,—as the doctor than the patient what will ultimately be the best for him and cure him; but the fallibility of human judgment apart, the arbitrary power that an artist has the chance of grasping is sometimes too much for mortal virtue, and he himself in his best interests may be well pleased to be spared the opportunity of helping himself to any extension he pleases of an original scheme, of committing his employer—national or private—to enterprise that, having been commenced, must be completed; this is a temptation that accrues most alluringly when a work has been entrusted to him on lax or undefined conditions; and on occasion the terms on which it is entrusted may be virtually at his own command,—such being his exclusive power of executing the work,—such the prestige that impose him upon the world.

Well-cultivated taste on the part of the patron is a condition, then, that is most important and indispensable at the first stage of the design. The commission once given, bad taste in the patron may be overruled—ignored—neglected—evaded,—and the able at once and accomplished artist may, by cleverness, daring, energy, nay, impudence, get his own way, to the great advantage of all the world, and of the patron above all. But, then, ill taste on the part of the patron may throw the work at the beginning, by the exercise of his free arbitration, into hands that are quite as dexterous in escaping from control, but will use independence for making bad worse,—for not correcting, but exaggerating mischief.

The taste of the patron is exercised at the preliminary stage, partly upon the executed works of the master, and partly upon the drawings and plans—the designs—for the proposed work. The uncultured patron will always be liable to be misled by drawings—to take the best, the most taking drawing, for the best design—to be least susceptible of influence by expostulation—to be swayed by most transitory fashion. In fact, when patrons are extensively

destitute of culture, they are open to be tempted on by one taking extravagance after another, until a fashion is established, that has no more relation to good taste than crinolines and chignons, and that perpetuates itself by simulating a natural development, a fictitiously imposing harmony with the current of events—the tendency of opinion. How can even genius withstand such false conditions? Commissions must be obtained, and one must be so executed as to lead to others; but how, then, for the chances and the destinies of truly fine art?

Fine taste may pertain to a mere dilettante, if you will—that the most truly artistic genius may most truly and worthily respect. In all the arts, we know that fine appreciation is independent of faculty of original invention or execution; and the musician goes home from the opera-house depressed at the reception of a work, that is the verdict of those who never could invent—of many who could never execute—a har of music,—but that he knows too well is a true finding.

Hence cultured taste in the patron is a condition of fine works of art, by no means simply because it shuts out the chances of selection of wrong artist or wrong design. Sympathy in taste between artist and patron is a very powerful—not incentive alone, but something still more important—factor, let us rather say, in the case. The most ingenious lawyers have been known to admit that they have owed most important revelations of the bearings of a case to the sharpened and concentrated interest of the client, who had no unusual ingenuity or perspicacity of mind, and for knowledge of law or equity none at all. It is to the fortuitous concurrence of such elements—of the competent, the accomplished artist, and the worthy patron—that the best triumphs of art are due. What a concurrence of this kind is not implied in the Steine chapel,—in the combined literary knowledge, philosophical and historical insight, and artistic power in the Stanze of the Vatican! It was to such a bond as uniting sculptor, architect, statesman, Phidias, Ictinus, and Pericles, that we owe the Parthenon and Propylæa,—to such concentrated harmony, when laymen, like William of Sens, co-operated with ecclesiastics, that we must owe cathedrals elsewhere besides Canterbury. The buildings on the Acropolis might not have been so perfect but for the interest in architecture, which Pericles may have inherited from the Alcmæonidæ, who in their exile rebuilt the temple at Delphi, and with gratuitous liberality, with marble instead of stone. It was probably on account of his knowing so much as he did that he did not interfere more, while still giving the best artist the best aid. Of all the Homeric heroes, it is Paris who rejoices most conspicuously in the ornamental; whose equipment is as decorative in the field as might be expected from his being found polishing his arms in his retirement. We cannot doubt that the poet implies that the same sentiment for the ornate ruled in his palace—the beautiful palace, which was designed—by whom?—"by himself, along with the men who at that time were most excellent among the artificers of Troy." (*Iliad*, vi. 315.)

Finally, on this head, it is not to be dissembled, that artist, no less than scientific investigator, is apt to be encumbered with all the besetting Baconian idolatries. His special predilections—idols of the cave—have to be kept in check by conference, not to say conflict, with others; and his professional tendencies may themselves, as idols of the tribe, require, above all things, the corrective influence of one who, by his exemption from these, as non-professional, is naturally, and in no unimportant particular, in a position of actual advantage. It is a generously emphasized declaration of one who stands in the very front rank of his own intellectual study—of Sir John Herschell—that no art and no science can retain long a healthy condition in

which the professional students are not checked by the concurrent attention of a well-cultivated body of the non-professional.

There is one more most important condition of architectural achievement that still remains to be noted, and this is, the stimulus of *worthy contemporaries in art*, whether as competitive or in sympathy. Fine art will only be achieved when the artist sets value upon, and has a reasonable chance of receiving the finest appreciation. Something—much, no doubt—he will always do beyond the requirements of the moment, and of the general public, for the satisfaction of his own soul. No one can suppose that the best possible success upon the stage, secured by the actual supervision of the author, requires the full development and finish that has been given by Shakspeare to "King Lear." There is always the consciousness, moreover, that the present of the architecture is, after all, not a momentary present. There must, therefore, or there should be, a fund of reflection and a force of feeling embodied in the work,—a potential energy for development during continued contemplation, if only for the currency of a lifetime. Still, human nature is weak. The orator who prepares his invectives in his study, and practises his intonations in solitude, cannot, however much he may desire it, give them the ring that they will carry to the ears of his actually present and attentive rival; can no more do so than a racehorse could stretch over the two-mile course alone, in the same time as when another is straining forwards at his flank. Worthy rivalry is requisite to bring out all the powers; and, under this stimulus, work is put into work that may easily escape the detection of the best criticism of the amateur, but will tell, nevertheless, upon his sentiments more and more as time goes on,—will secure that continued power of pleasing, which is the last test of all excellence in art. Bitter enough has been apt to be the rivalry of artists. How should it be otherwise? How should contemporaries exactly measure themselves against each other? They can scarcely be called upon, how then expected, to do so, in the heat of the battle of life and struggle for existence; human endeavour has its limitation in human weakness. But the difficulty cannot in fairness be recognised as always one merely of candour. The point of view of one artist relatively to another must always be one of disadvantage, and if he can justly estimate his rival, he is often truly disabled from gauging his own qualifications. These are often, by their very nature, as progressive, to as great extent as much a mystery to himself as to others. He has a consciousness of power—of power that has yet to be developed—he may as yet not know quite in what direction; he cannot at all judge to what extent. When the life-work of both draws to a close, he may, having all the field of achievement before him, know, and may then admit, the truth. Even in the mean time, however, generous allowance of merit, if not of relative merit, is the due and the right. The effect of such generosity in emulation goes far to explain the phenomenon of the appearance of great geniuses in groups. The coincidence of a second noble career enhances the development of the first. Raffaele thanked God that he lived at the same time as Michelangelo, and with good reason; his best friends recognized how much his style was modified by observation of that of the Florentine, but emulation may be believed to have had as important an influence upon the development of his proper genius as the more instruction of imitation; telling, as it would, not only on what he derived, but also on all that he had of his own most independent and original. And even more emulation was still further heightened in effect by the confidences that he would be understood, he appreciated, by the very genius he was eager to rival, and who, more than all others, must be competent to appreciate him. That the rival did so there is little doubt, though the admission may have taken too much the form, in his own words or those of his friends, of ascribing excellences too exclusively or in too large proportion to what was borrowed rather than what was learnt,—to what was learnt rather than to what was suggested to a sensibility that was singularly apt to respond to such a stimulus.

As regards our own prospects of art in architecture, when we review these conditions of success, we are not disposed to anticipate,—to recognise a dearth of genius; we may trust to be on a par with, if not better than, our rivals. After this main condition, wealth and occasion are not likely to fail us; generous and stimulative emulation we would hope as little. As regards the culture of those with whom rests the con-

ferment of the commissions, and no little of the control of them, this also we may trust, at knowledge, as free discussion, and trained experience are extended, is not doomed to be entirely or for ever inauspicious.

HOW JOHN YE SON OF SMYTH BEAUTIFIED YE HOUSE OF YE LORDE.

It came to pass in old time that there dwelt in the north country a people which was great and powerful, and like them was none other nation under heaven.

And their merchandise was on all seas and in all lands; and they were wont continually to trade in great ships with the people of all kindreds, nations, and languages, in gold and in silver, and in silk and in woollen, and in whatsoever merchandise can be made for money; and they waxed exceedingly, and prospered, and no poor man was seen among them; for they kept them aloof in their cities, in desolate places and in miry streets, where the light of heaven came not, and where no comfort was.

And the people dwelt at ease, and governed their affairs with discretion; for they had in their chief city a talking-house, where chosen men were placed one against another, and they rest not day or night, but did continually talk for the good of the whole nation.

Nevertheless this people loved not that which is beautiful, neither comprehended it; seeing that the men among them wore upon their heads a thing after the likeness of a pot, and their women fashioned their heads like nothing in heaven or in earth; and their chairs and their tables, and whatsoever was for use in their dwellings, were fashioned after no order at all, but in scrolls and in curls, and in every manner of way that was to no good purpose, so as no man ever saw the like, and there was no sense in them.

Likewise, also, their dwellings were a marvel to look upon, for they made them of hurt clay, after the same manner, for many miles, one dwelling like unto his fellow, so that it was a weariness to look upon them; for if one looked this way, behold, clay walls with square holes in them; and if one looked the contrary way, behold clay walls with square holes in them; and they dwelt contentedly behind them.

Now, there arose among this people certain which said, "Behold now, all ye people, and consider the temples which were builded by our fathers aforetime, and which remain unto this day; how they he great and high, and cunningly wrought in all manner of ornament, and strange devices, right pleasant to behold; wherefore build we not them after this manner, that so our name may go forth among the nations, and our fame may endure under the sun among our posterity? For ye see that we he a hyword among the nations touching our buildings, forasmuch as there is no man among us that can build after this sort."

Then they stirred up the people, so that many men of them went forth throughout all the land, with measuring rods, and with tables, and with gravers, and with all manner of implements, to the end that they might measure the buildings of their forefathers; and the land was overrun with them. Also, there were among them that wrote hooks, and they put into the hooks all things whatsoever they had measured, and divers also which they had not measured, and there was no end of their hooks.

And it came to pass when they had measured every stone which was in their own land, that they were at their wits' end; howbeit, they girt up their loins, and went their way, each one with his tablet, and with his graver, and with all manner of implements, till they came unto the south country, and there also they measured all buildings whatsoever they could find, and they left not one stone upon another the which they did not measure. For they said, "Lo! these are fairer than the buildings of our forefathers." And they that were unlearned and ignorant gave credence unto them, and gave them fine gold for to build all manner of buildings such as had been built before. And if any man took upon him to build after his own heart, and so as had not been done aforetime, they said, "Lo! what is this?" And they were offended at him.

Howbeit some of their buildings fell down again. Now, when these things became known to the dwellers in the town that is called Muford, they came together with one consent—that is to say, the chief magistrate and the council, being two sons in all—and said, "Ye see, brethren, how

that, over all the land, there are built new temples, after the manner of our forefathers, and how also that the dwellers in the town of Muford, which are our enemies, have built unto them a temple on this wise, with large money; how also that our own temple is dirty and hattered, and is at the point to fall, and we are in case to be despised in the land; go to, then; let us build a temple even as others, after the manner of our forefathers, and our fame shall be known thereby." The council also spake concerning "the glory of God," but no man hearkened unto him.

Then they gave proclamation unto all such as were cunning to make buildings after the orthodox pattern, and promised to him who should send to them, by the first of the month of Ahih, the device of a temple graven on tablets, even to him whose should please them by his device, ten shekels of silver and two changes of raiment, and furthermore that he should be appointed chief artificer to erect the same. But they lied unto them.

And all the artificers, in the east and in the west, and in the north and in the south, when they heard the proclamation, laboured mightily unto the going down of the sun to deliver themselves of cunning devices for a temple, and all their servants and chief helpmeets sweat night and day over the work. And when the chief magistrate and the council arose in the morning, behold the devices of all the artificers lay upon the floor of the council-chamber, so that there was no room for a man to turn.

Then they hung them up, and they were of all shapes and devices which had ever been imagined by man; and behold they were very costly. And the chief magistrate and the council walked up and down amongst them, and they shook their heads and rent their clothes, and wist not what to do. Then they sent all the devices back to them who had sent them, with small thanks. Then all the artificers cursed the chief magistrate and the council with one voice.

For, moreover, they had also to pay the carriage.

Then there arose up one of the chief men in the town, and said, "Behold now, there is a man whose name is John, which is the son of Smyth, which was the son of Jones, which dwelleth in the chief city in that quarter which is called Myle-ende; seek ye now unto him; even he is cunning to devise such a temple as ye require." Then they went with one accord to the part of the chief city called Myle-ende, and inquired for the said John. And him they found in his habitation, where his name was written up in letters which no man could read, and all things whatsoever that were in his habitation were astonishing, for all his chairs and tables and whatsoever he had were full of angles and juttings and coigus and elbows, so that no man could use them with safety; furthermore, they were all painted with divers colours fit to knock a man down. And John the son of Smyth appeared unto them half-dressed and with his beard hanging down to his waist, and spake roughly unto them. And they told him their business, and covenanted to give him money. Then it came to pass that he knocked off a design in double-quick time; and it pleased them, and they appointed him chief artificer to oversee the work. And this was the fashion of it:—

It was seventy cubits long and forty cubits wide; and the walls were of hurt clay of all manner of colours, in stripes one over the other continually; and it was so. And forty cubits length was for them who worshipped, and thirty cubits length was divided therefrom for the priest; and it was railed off with a railing fearful to look upon, for it was all twisted and knotted and spiked, to the end the worshippers should not climb over into the holy of holies. And the windows were a cubit in width, and they were arched with arches four cubits in depth above. And the great arches were notched at the edge after the semblance of a carpenter's saw, and they rested on marble columns with chapters and hases; and the size of the columns was on this wise, namely, one cubit high and two cubits wide; and it was so. And as for the ceiling, there is no colour that was ever known of man but it was found thereon; and the beams of the ceiling were painted round in rings and stripes, after the likeness of a ring-tailed opossum, so that one knew not what to think. Moreover, John the son of Smyth contrived also a font to stand near the door of the temple, and a pulpit to stand near the opposite end; and they were supported on columns with chapters and hases howbeit, the columns had been for-

gotten, and every chapter stood upon its base; and he saw that it was good. And round about them were cunningly carved figures of apostles and saints after their kind; and their likeness was as the likeness of the small ape which hopped upon an instrument of music in the streets of the city, even hopped for balance; in this fashion they were carved. And in the windows be placed also images of saints and angels after their kind, fashioned in coloured glass, and this was the fashion of them; every of them stood upon tip-toe, and each of them held up two fingers after his kind; and their faces were long and thin, and they had no elbows or knees, but were fashioned after a wonderful manner like nothing that was ever seen on earth. And in every part of the building, whether it were in clay, or in stone, or in wood, did John the son of Smyth cause to be cut and sunk many round holes, so as that the whole building was full of round holes; divers of the windows also were of round holes, with lesser ones about them. And on the outer side of the temple he did cause to be carved many beasts and horrible monsters, such as never were seen since the creation of the world unto this day,—no, nor ever shall be; and all the world wondered after the beasts. And on the roofs of it, and at the height of the tower of it, he caused to be placed wonderful erections of iron of fantastic shapes, even as though a grove of plants were sprouting from the roofs; inasmuch that the people wondered.

Also beside the holy of holies he placed an instrument of music, even an organ, embellished after a marvellous manner, and painted about with paintings of angels, and their wings were red on the one side and green on the contrary side, and they bore every one a domestic utensil in his hand; also the pipes of the organ had suffered from an erysipelas. And over all the temples likewise he caused to be painted what he affirmed to be ancient religious texts; howbeit no soul did fructify by the same, for they were in unknown characters so as no man was able to make so much as a head or a taylor thereof.

And when John the son of Smyth had concluded the temple, all were of diverse minds concerning it. And some said that it was a thing of hearty and a joy for ever, and again some said profanely that it was hideous, and other some that it would not stand. But John the son of Smyth said to the chief magistrate, "Did I not covenant to erect a temple for thee, and have I not accomplished my covenant? If so be that it stand not, or thy people like it not, what is that to me? Pay me that thou owest!" And they gave him paper whereupon was graven "I promise to pay," and he went on his way rejoicing.

ARCHITECTURE AT THE ROYAL SCOTTISH ACADEMY.*

The display of architectural drawings this year is more than usually meagre.

The churches are all of small dimensions, and are thirteenth-century Gothic in style; (it is rarely that we see one designed in any other at the present time), and they only vary in the mode of applying the well-known features of the style, some of them having more or less of a leaning towards the French variety of it.

Mr. Robert Anderson exhibits an exterior and interior view of St. Andrew's Church, Kelso; it is a decided advance upon his former efforts, which, though correct enough, were heavy and ungraceful. We have here a well-proportioned, carefully-detailed little church, with aisles, chancel, and bell turret of purely English character. There is no effort at originality, but it is more satisfactory than some other designs where a strenuous endeavour has been made to attain that end.

The M'Cheyne Memorial Church at Dundee seems to have been the subject of a competition, the successful competitors being Messrs. Pilkington & Bell. The design is such as would be attractive to a building committee, and looks better on paper than it will do in execution. It has a spiky-looking spire, and the body of the church is broken up into parts in a manner that does not seem to be called for by the requirements of the interior. The doorway, with its square, angular label moulding and cusped pediment, is not in keeping with the other details, and the general effect is somewhat overstrained.

The second design in the competition, by Mr.

H. A. Nisbet, is much more simply treated. The exterior is an echo of the interior arrangements, and suitable for a Presbyterian place of worship, where galleries are required. To carry out the successful design in its entirety would evidently cost more than its rival, and without its spire the result would be lame and impotent.

The Free West Church, Perth, by Mr. J. Honyman, has a well-developed spire, the parts of which are happily combined. So far as appears from the drawing, the body of the church is greatly subordinated to the spire.

The church for the Rev. D. K. Guthrie, by Mr. J. W. Smith, is good in intention, but feeble in execution; it lacks emphasis in the detail, and the side porch and vestry are very unhappily combined.

It hardly requires a reference to the catalogue to ascertain that "Trinity Church, Irvine," is the work of Mr. F. T. Pilkington; his designs possess a peculiar character of their own, and they make effective and striking drawings. On analysing the detail, it will be found unusually large in proportion to the size of the buildings, so that every item of decoration claims attention; there is no reserve, the architect displays his whole forces at once, and thus it is that his designs, though out of the common run, begin to pall the appetite by excess of piquancy. One does not desire to have every dish highly spiced; an admixture of plainer food gives zest to the remainder, and is better for the constitution.

The introduction of railways has given rise to an unprecedented increase in the amount of hotel accommodation in Edinburgh, and that, probably, to a greater degree than in any other city in this country of similar dimensions. The additional accommodation so provided is, however, far from being satisfactory; the expedient adopted has (with one exception) been to extemporise two or three adjoining dwellings into a hotel, and of necessity the internal arrangements are very inconvenient. The one example of an entirely new building having been produced is called "The Edinburgh"; it occupies a convenient and conspicuous position in Princes-street, but it is far from being a model, either as regards internal arrangement or external effect. There are three designs for hotels exhibited; one of them is to be erected towards the west end of Princes-street, and is designed by Mr. Lessels: the ground floor is occupied by shops, presenting a field of glass uninterrupted by any visible supports for the superstructure. Above this are four stories, Italian in style, and the roof is broken into the form of a mansard in the centre. The whole elevation is flat, tame, and commonplace, and the combination of the parts (particularly the horizontal architraves over arched windows) is crude and unsatisfactory.

Mr. Dick Peddie exhibits a design for a hotel in connexion with the North British railway station, and, in the drawing, the space here formed into a market is represented as occupied by a bazaar, of two stories in height, with open court in the centre, and a promenade above on the level of Princes-street. The idea of forming the roofs of the market-stalls into a terrace walk is a happy one, and would go far towards remedying the error of placing the market on the site it now occupies. The hotel is a light and cheerful-looking building, of French character.

Mr. Robert Matheon exhibits a design for a "Grand National Hotel," on the same site, but he does not propose to interfere with the market. The elevation is a repetition of the General Post-office, with slight alterations in the fenestration, and the substitution of louvre for flat roofs on the pavilions.

The building of a hotel or other structure, if possessed of any architectural merit, on the site indicated, would be a manifest improvement to a conspicuous part of the city; it would hide the unsightly back and adjuncts of the northern division of Bridge-street, and produce a more harmonious combination of lines than exists at present.

Glengyle-terrace, now in course of erection, by B. D. McGregor, is an instance of a builder being his own architect, and the result is what might have been expected in the circumstances. The detail is weak and ineffective, and a long line of horizontal cornice breaks abruptly into an efflorescence of octagonal turrets at one end of it.

"Glenmayne House, Galashiels," by Mr. Dick Peddie, is not a very remarkable mansion in the Scottish baronial style.

More worthy of notice is "Craigend, near Liberton," by Messrs. Pilkington & Bell. The general outline is that of a Scotch baronial residence but the detail has a French Gothic

cast and is sparingly applied. The combination is happily effected, and the mansion is elegant yet homely, and comfortable-looking.

The villa by Mr. W. Richardson is large enough to be styled a mansion. It is one of the best examples of Gothic applied to domestic purposes that has been produced north of the Tweed. There is no exuberance of detail, and the proportion and distribution of the parts are well considered.

"Ballikinran House, Stirlingshire," is a dignified baronial residence, by Mr. David Bryce. The offices attached to it are carried out with such a degree of munificence as to make them as important a group as many a mansion.

"Blair-Drummond House," by Mr. J. C. Walker, is not satisfactory. Having an entirely new mansion, upon a large scale, to design, the architect should have sought for unity and dignity of effect; he has, however, cut up his facade into a multiplicity of parts that suggest the idea of patchwork and alterations upon an old fabric. As usual with most of the large mansions now erected in Scotland, it is in the Baronial style introduced into the country by French architects when it was a separate kingdom.

Mr. Walker also exhibits a view of the "Waverley Hydropathic Institution, near Melrose," which is well arranged and suitable for the purpose intended, and will at the same time be an ornament to the neighbourhood of this favourite summer resort.

BEHAVIOUR OF PORTLAND CEMENT.

Sir,—A Builder* in your last number asks for information as to the behaviour of Portland cement under somewhat vaguely described circumstances.

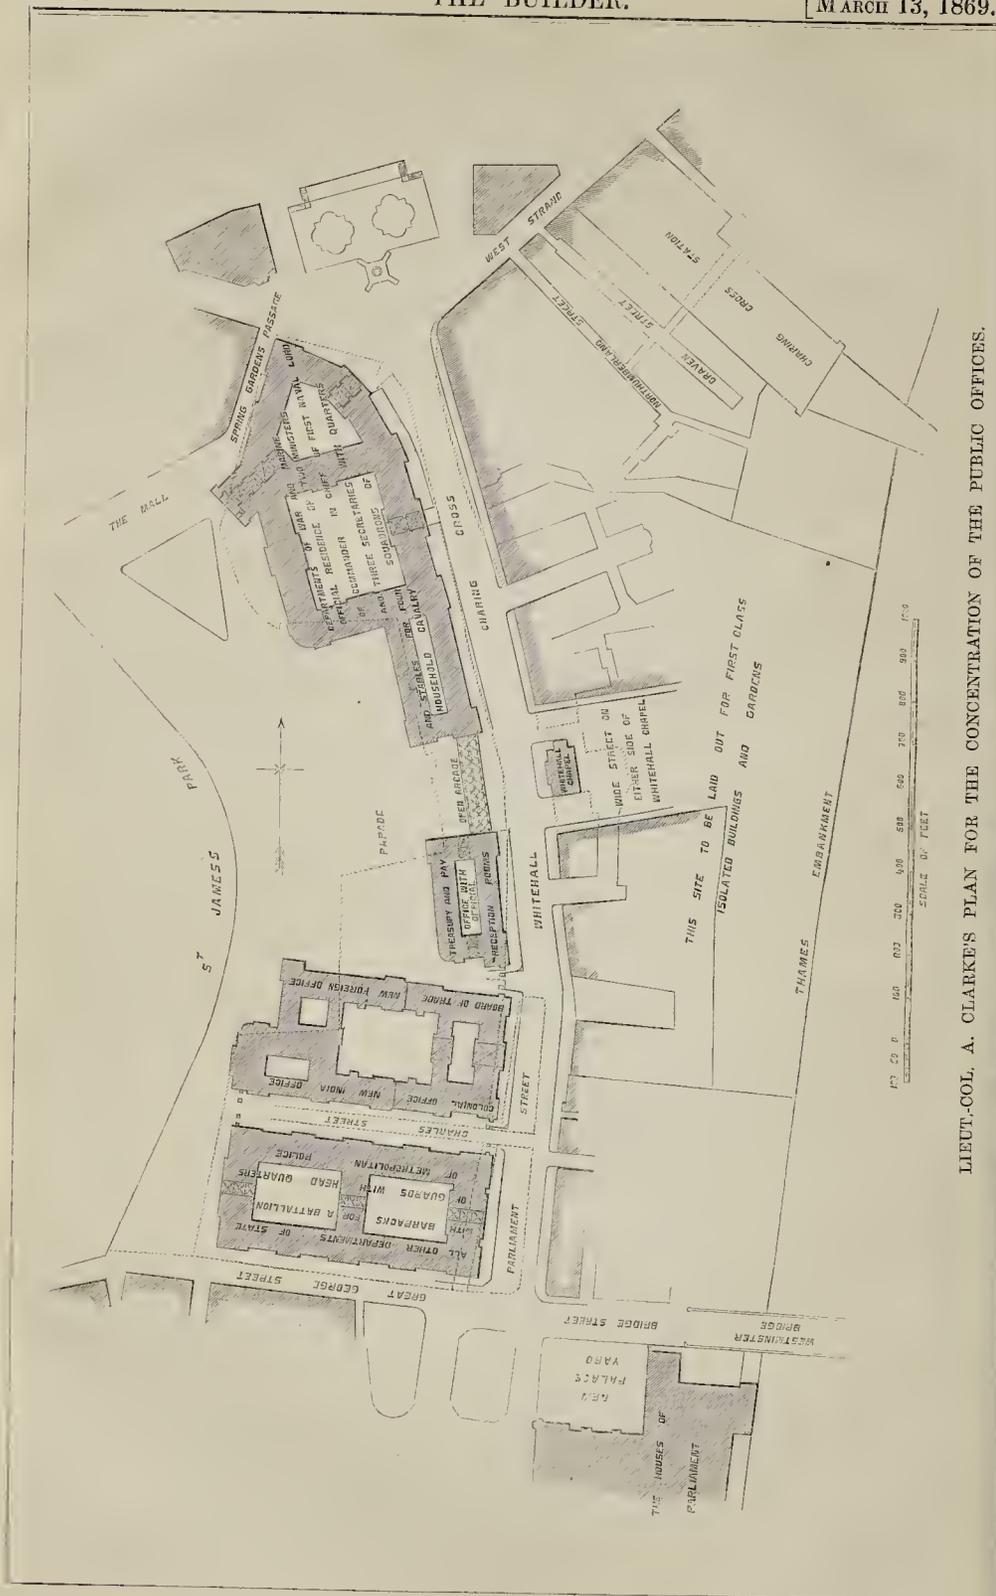

All dangerous developments of that cement arise generally from defective manufacture, the more frequent being that arising from an excess of carbonate of lime, which, when de-carbonized, has a strong affinity for moisture, and in the process of slaking exerts its inherent mechanical force in the displacement of the materials with which it may be in contact; hence cracks and upheavals, or other dislocations in brickwork and plastering. The peculiar effect of being confined to the horizontal joints is doubtless due to their containing a larger undivided amount of mortar than the vertical ones. In this case the cement must have been bad, and would have been rejected under more careful supervision. Although endeavouring thus to explain the course of the evil results in question, I do not wish it to be assumed that all similar defects are due to bad cement. On the contrary, many of a minor degree are brought about by bad or careless workmanship, such as those arising from imperfect wetting of the bricks, and the still more reprehensible practice of plastering a new coat of cement on an old one. In consequence of the former bad reputation of Portland cement many sins of omission and commission were laid to its charge of which it was entirely innocent. A case occurred in my own experience which, without investigation, would have materially increased the doubtful feeling as to its safety. I will shortly describe the circumstances.

Some years ago I was requested to examine a first-class engineering work, in the execution of which alarming results had arisen from the use of Portland cement and Suffolk bricks. The most careful examination failed to discover any cracks or flaws in the cement, notwithstanding the existence in the most aggravated forms of displaced and distorted brickwork. Further investigation proved that the mischief had been caused by the bricks, and from the materials of which they were made having been imperfectly washed; and I convinced those interested that to that cause alone was due the unfortunate waste of labour and materials. The work consisted of several hundred piers, on which were to have been built groined arches; and it was fortunate that the discovery was made before the arches were turned. As it was, the loss amounted to several hundred pounds. I should mention that the cement used was of first-rate quality, and had been severely tested by a system of testing which I had been instrumental in establishing. This lucky discovery led to an increased confidence in using the cement, and establishing the efficiency of the tests.

In my work on Portland cement I have fully described the best mode of testing, so as to avoid the danger of using faulty cement.

HENRY REID.

LIEUT.-COL. A. CLARKE'S PLAN FOR THE CONCENTRATION OF THE PUBLIC OFFICES.

ON THE ARRANGEMENT OF THE PUBLIC OFFICES, LONDON.*

THERE is a project by Colonel Clarke, R.E., Director of Works in the Admiralty, which is attached to the report, though it does not appear to have received much discussion from the Commissioners; but it seems to give a prospect of meeting necessary conditions. It occupies the whole of the Western site from Spring-gardens to Great George-street, bounded by the main street on one side, and by the Park on the other; thus affording the most important advantage of concentrating the whole of the public offices into one continuous block, well isolated from any other buildings. It is difficult to overrate the importance of this for the three points of convenience, health, and security; and as this area is greater than what is required for the public offices alone, Colonel Clarke utilizes it by providing accommodation for a regiment of cavalry and a battalion of infantry, thus taking the opportunity of effecting another great public improvement,—namely, the removal of two barracks from two sites confessed to be inconvenient and inappropriate for both civil and military reasons, and placing them in positions peculiarly suitable both for public convenience and for the benefit of the troops. It appears from the evidence of his Royal Highness the Duke of Cambridge, Commander-in-Chief, that if there are to be Guards at the Horse Guards, it is very desirable for the health of the troops that the regiments supplying them should be quartered nearer than they are at present.

The plan in the previous number of the *Builder* is virtually the same as Colonel Clarke's, being modified only in detail and not in principle. In Colonel Clarke's plan (which we now give), although the position of the Horse Guards is made the central feature of the whole, the existing building is proposed to be removed.

In the revised plan, in accordance with the ideas before suggested, it is retained, and raised a story, and otherwise made more important in character, and the square on its west side is completed by two flanking blocks of buildings of similar character, containing official houses for such of the great officers of State as should live on the spot, and for a suite of official reception-rooms common to all. The official houses are thus placed together in a central and agreeable position. The Horse Guards' parade is altogether altered by it, for to make a square at all well proportioned, it is necessary to bring the flanking buildings closer together than the existing flanking block of Kent's original design would allow; and as, moreover, the block interferes with the internal roadway of the whole mass, it is proposed to remove it. But there is plenty of room for the parade outside the square; a space can be formed between the new Foreign Office and the cavalry barracks proposed in this plan, 800 ft. long and 200 ft. broad, which is sufficient for an ordinary battalion to stand in line. The smaller square might thus be reserved as a site for national trophies and monuments.

On the north side of this central part of the whole site it is proposed to place the Admiralty and War-office, and a barrack for a regiment of cavalry, as proposed by Colonel Clarke. The space available is not more than is requisite for providing the accommodation stated in the report to be required for these two departments. The northern boundary is drawn so as to afford, by a street direct into the park, a view from Charing-cross along the Mall towards Buckingham Palace. The triangular space further north is reserved for general refreshment-rooms for the whole of the offices.

On the south side of the Horse Guards it is proposed to place the whole of the buildings connected with the Treasury, Pay, and Audit Offices, and also the Office of Works. South of this, again, that is, in line with the New Foreign and India Offices, are the Colonial Office and Board of Trade.

And at the extreme south of the whole site, abutting on Great George-street, are the Home Office, Poor Law Board, Council Offices, Civil Service, and other Royal Commission Offices; and also space for the head quarters of the metropolitan police, and barracks for a battalion of infantry.

The whole of this general arrangement is quite in accordance with Colonel Clarke's project. There is another plan with the report, bearing the name of the chief commissioner for public works, which proposes to occupy nearly the same

ground, but is wanting in the great characteristic of Colonel Clarke's, that of isolating them from other buildings and grouping them round the Horse Guards' aite, although the Horse Guards itself is retained in it. The details of the arrangement of the various offices in the plan from Colonel Clarke's. In his the Home Office, Poor-law Board, Council Offices—in fact, all those departments connected with the internal administration of Government at home—are grouped together, and placed nearest to the Houses of Parliament; these are the departments into the detail of whose duties Parliament enters more than of any others, and therefore if any are to be nearer Westminster than others, they are the ones.

Then the Colonial Office and the Board of Trade (which deals with the commerce of the country) should naturally be grouped together with the Indian and Foreign Offices. The Treasury (also the office of the Prime Minister), and the Pay Office, and Audit Office, and Office of Works, being more or less common to all the other departments, should naturally be placed together and near the centre of the group. And finally, all parties are agreed that the Commander-in-Chief's Office, the War Office, and the Admiralty should be in contiguous buildings. The troops are placed on the flanks of the whole group, on the Park side, so as to have easy access to the parade ground.

Another point of detail in which the first plan differs from Colonel Clarke's is that the blocks of buildings are placed as far as practicable in a north and south direction, so as to allow the sun to shine on both sides of them; a condition considered by hygienists and architects as essential in the climate of England to the good preservation both of the buildings themselves, as well as of the persons who inhabit them. It is a condition which has passed into a proverb even in Italy, how much more essential is it in the cold dull days of an English spring. It is further advantageous in this plan, that it facilitates the provision of a continuous street from end to end of the whole group of offices, which affords a means of quiet, secure internal communication without dependence upon either the main streets or the Park; and in a still growing country like Great Britain, and in the duties of the respective departments of which must vary and become sometimes interchanged with each other from time to time, it is desirable that the public buildings should be tolerably uniform in arrangement, and capable of such alterations without great difficulty.

The question of the reconstruction of the main street from Charing-cross to Westminster does not necessarily form part of this plan, but as it has been so much discussed in the report, and is projected in Colonel Clarke's plan, it seems necessary to mention it. The difficulty of dealing with it lies chiefly in the fact before mentioned, that it does not lead direct either to the Abbey or to the Houses of Parliament, but just between the two. The endeavour to meet this by a supplementary street leading direct to the Abbey would not do away with the defect in the main street: it would be better to acknowledge and provide for it by removing the Law Courts building, and so opening out the west side of Westminster Hall, and by improving Old Palace Yard.

As the Victoria Tower forms the really prominent termination to the view down the street,—if there was a building of somewhat corresponding bulk and character on the Westminster College side of the Yard, the two together would form a tolerably fitting architectural termination to the main approach to Westminster,—it would thus appear to do what it does in reality,—to lead to the two great national buildings. It will probably not be disputed that in such case the most effective arrangement would be to have one broad street throughout the whole length from Charing-cross to Westminster. Colonel Clarke's plan provides such a street of about 150 ft. in width from house to house. This is wider than necessary, even for the great traffic passing along it, and very wide for the convenience of foot passengers crossing, but it is not too wide for the effect of the proposed buildings on either hand; for the Government buildings on the west side will be at least 60 ft. high, and the buildings on the east side, if private, will not probably be less, considering the value of the ground. It might be practicable to divide it into three distinct roadways separated by lines of trees, which would afford shelter for the foot passengers in crossing and yet would

not interrupt the general view along the street, which it is essential should be preserved.

The mode of dealing with the site on the eastern side of the main street, so as to insure, as far as practicable, that the private buildings abutting on the street shall be of a character tolerably suitable to the site and also for providing suitable openings from it to the river embankment, is a question more for the Commissioners of Public Works and the Metropolitan Commissioners of Works than for the Public Offices project. The site would no doubt be occupied partly by private houses and partly by shops and offices connected with the Public Offices and with Parliament; the part towards the south end is particularly suitable for private offices, lying as it does between two great thoroughfares and close to a station on the Underground Railway.

Upon the whole, then, to the problem put forward in the beginning of this paper:—Given, a certain number of public departments, each requiring a certain area of ground for its accommodation, to provide for them in a manner that shall unite convenience, sentiment, and beauty in the highest practicable degree. The reply to the first point in the question seems to be to do that which would naturally occur to anybody as the first and plainest idea, namely, to extend the area already occupied by the existing Public Offices, utilizing the existing buildings as much as possible. It is what a great manufacturer would do if he were proposing to concentrate several scattered establishments into one whole; he would obtain an area round the most suitable one of them large enough to contain all his establishments artfully arranged, and to isolate them from other buildings. Very considerable sums have been spent by our manufacturers to gain this area and this isolation, and probably the only regret any one has felt in the matter has been at not having spent more money in gaining them more fully at first.

The Government have an area partly occupied by Public Offices, and very suitable for extension to contain all of them, arranged in proper symmetry and isolated. This is Colonel Clarke's proposition. The total cost of it appears more than that of any of the other projects; but besides its intrinsic merits, it provides for more than any of the other projects. It provides for two much-needed barracks, to obtain which independently would cost the country much more than in this manner; and for official houses for certain of the great officers of State which, though acknowledged to be an important part of the reconstruction of the Public Offices, is not definitely provided for in any of the other projects. Furthermore, against the total expense must be set off the occupation by public buildings of the site of King-street, which, though it must be paid for in some shape or other, is left unoccupied in the other projects; it is so much area saved in some other direction. The total area proposed to be occupied is not more than is reasonably necessary to afford sufficient light and air to the great mass of buildings; and the total expenditure may be spread over a great extent of years if desired, because, although new buildings are shown on the sites of the present Treasury and Admiralty Offices, the existing buildings can be occupied without interfering with other parts of the whole project.

In conclusion, we cannot do better than quote Colonel Clarke's own statement about his project, to show how he meets the general question of this great architectural problem.

"At a cost of 4,000,000, it effectually carries out consolidation. No thoroughfare of traffic separates one building from the other, whilst covered inter-communication gives easy access throughout the whole.

It provides for all the departments, with the addition not contemplated in the other proposals of state residences for certain ministers, offices for the head-quarters of the metropolitan police, quarters for detachments of Guards and household cavalry, thus leaving for other appropriation St. George's Barracks, and facilitating the removal of those at Knightsbridge.

Not interfering with the private property on the river side of Parliament-street, it leaves those sites free for occupation by the very large class of persons, such as parliamentary agents, railway engineers, &c., whose employment is in direct and intimate connexion with the business and proceedings of Parliament.

The alternative plans require a large amount to be expended in the purchase of land and demolition of houses previously to the commence-

* See p. 189, ante.

ment of any building operations. According to this plan, building can be at once begun without a material disturbance of the public departments, and a far less immediate outlay is necessary for the acquisition of land.

In the alternative plans the cost of widening Whitehall, &c., will be eventually a direct charge upon the public, while in this plan the State will secure this advantage without making it the subject of exceptional expenditure.

While by this plan a much larger area will be devoted to the public than under the other, the cost per acre will not exceed that of the least expensive of the alternative schemes.

This design interfering little with private property and interests, releases a larger amount of public property for future disposal.

Taken as a general design to be gradually carried out, it offers superior facilities for partial or continuous execution." I. E. C.

STRAINS IN GIRDERS.

The employment of wrought-iron in girders, bridges, and roofs, has increased greatly of late years; and it is, therefore, very desirable that every one who has the designing of such structures should be able to calculate readily the strains on the several parts. In some cases the determination of the strains by analytical methods becomes very laborious, and a method representing to the eye the relative proportions which the various strains on different parts of a structure bear to one another is extremely advantageous, as it enables the designer to see at a glance where the structure may be either too weak or unnecessarily strong.

Mr. Humber, who is the author of many standard books on engineering subjects, has rendered a great service to the architect and engineer by producing a small work,* especially treating on the methods of delineating the strains on iron beams, roofs, and bridges, by means of diagrams. The only figure required to be drawn besides straight lines, is the parabola, for the easy delineation of which several methods are given at the end of the book.

When a beam is subjected to a strain arising from a weight acting at any point, it is generally necessary to consider the effect of that weight upon some other point than the one at which it acts. This effect is proportional to the distance of that other point from the weight itself. Thus, if a beam as AB (fig. 1), is fixed at A, and loaded with W at B, the strain at A is proportional to the length AB, and is represented by the product of W multiplied by the length AB, which is called the moment of W about A.

So also W × BD, is the moment of W about D, and represents the strain produced by W upon the point D. Let AC represent the quantity W × AB; draw BC; then the moment of rupture at any point D is represented to the same scale by the vertical line DE.

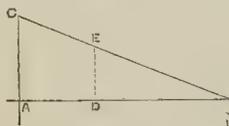

FIG. 1.

When the beam AB (fig. 2) is uniformly loaded along its entire length (l) with a weight, w, for every unit of length, then wl is the total weight supported by the beam. Let AC represent the quantity $\frac{1}{2}wl^2$, which is the moment of rupture at A; draw the parabola CEB; then the moment of rupture at any point D is represented by the vertical ordinate DE.

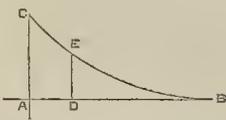

FIG. 2.

When a beam, AB (fig. 3), whose length is l, is supported at each end and loaded in the centre by a weight, W, the moment of rupture at the

middle is $\frac{1}{4}Wl$; let this quantity be represented by the vertical WC; join AC, BC; then the moment of rupture at D is represented by the vertical DE.

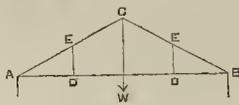

FIG. 3.

When the load is uniformly distributed over the entire beam AB (fig. 4), the moment of rupture at the centre, C, is $\frac{1}{8}wl^2$; let CD represent this quantity, and draw the parabola ADB; then the moment of rupture at D is represented by the ordinate DE.

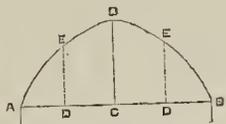

FIG. 4.

These four examples are the simplest that occur in practice, and all others are variations or combinations of them. In the work before us nearly all possible varieties of arrangement of load are discussed and the diagrams worked out. With practice the diagrams can generally be readily drawn for each particular case, although in some cases it would be easier to calculate the algebraical formulae than to construct the diagram.

Besides the moments of rupture there is the "shearing" force which acts upon a loaded beam, and is due to the transmission of the vertical pressure of the load to the points of support, tending to cause contiguous vertical sections in the beam to slide over each other. The resistance to shearing is proportional to the area of section subjected to that force. In the case of a beam fixed at one end and uniformly loaded, the shearing force at A (fig. 1) is wl; let this be represented by AC; join CB; then the ordinate DE represents the shearing force at any point D.

If a beam, AB, is supported at each end, and loaded in the centre by a weight, W, the shearing force at any point on the beam is equal to $\frac{1}{2}W$. When the beam AB is loaded uniformly throughout, the shearing force is 0 in the centre, and is represented by $\frac{1}{2}wl$ at each end. To show this on a diagram, draw at each end AC and BD vertical, and each equal to $\frac{1}{2}wl$; join C and D with the middle point, E, of the beam; then the ordinate drawn vertically from any point F on the beam to the inclined lines EC or ED will give the value of the shearing force at F.

In the case of a beam supported at both ends, and subject to a distributed load moving from A to B, the shearing force at B is $\frac{1}{2}wl = BD$ (BD being drawn vertical), and for any intermediate points is represented by the ordinates of a parabola drawn through A and D, and having its vertex at A. In the same way the value of this force can be determined in other arrangements of the load.

In applying the method of diagrams to flanged girders, arches, or suspension bridges, an outline sketch must be first drawn to scale; its cross-section and weight must then be determined. The central depth of straight independent girders should be about one-twelfth of the span, in order to secure the greatest economy of material. If they are fixed firmly at the ends the depth may be much less. Girders having curved flanges or "booms," as bowstring girders, arches, or suspension chains, should have their depth proportioned to the moments of rupture, which will give them the form of a parabola. In determining the moments of rupture of flanged girders, the resistance of the web being small is generally omitted from the investigation; for those having parallel straight flanges, the strains are equal on the two flanges, at any vertical section, but opposite in their nature, and will vary as the moments of rupture. The amount of the strain at any vertical section is found by dividing the moment of rupture by the distance apart of the centres of gravity of the sections of the two flanges. The strain which the web has to sustain at any vertical section is equal to the shearing force developed at that section.

In girders having curved flanges the strains

vary as the secants of the angles of inclination to the horizontal, and may be determined geometrically in the following manner. Let B be any point on the curved flange, FBE the tangent at B; draw ED horizontal, and of such length as to represent on scale the quantity,—

Moment of rupture at B.
Depth of girder at B.

Draw the vertical line DF, and the line FE will then represent the amount of strain on either flange at B; that is,—

Moment of rupture at B.
Depth of girder at B. × secant DEF.

Open-webbed or lattice girders are constructed with two flanges or "booms" connected by diagonal braces, which form the web, and divide the booms into bays. When any load is placed on the girder between the two extremities of a bay, that bay becomes a separate girder. The strains on the braces which constitute the web act in the direction of their length; those inclined down to the nearest support being in a state of compression, while those inclined down from the nearest support are in a state of tension; the girder being loaded symmetrically. The strains at the several points of a lattice girder can be shown by drawing the diagram as before described according to the method of distributing the load, when the vertical ordinates drawn from the points where the braces are united to the booms will give the relative values of the strains at those points.

A roof principal is a bent girder in which the lower boom consists of chords of one curve, and the upper boom of chords of another curve having a less radius than the former. The braces are alternately vertical and inclined. The moment of rupture at the centre is obtained from the formula, and gives the ordinate of the parabola at its vertex; and the ordinates drawn from the several points of junction on the girder will give the relative values of the strains.

Iron bridges are generally formed of flat segmental arches, with open spandrel bracing. When the arch is a flat segment of a circle it may be considered as very nearly a parabola; in which case the only strain on the spandrel is the vertical pressure of the load supported by the top horizontal member. If we call l the rise of the arch, or versine, l its span, and w its load per unit of length; the compression at the crown is

$$\frac{wl^2}{8r}$$

and the compression at any other point (at distance y from the centre) is

$$\sqrt{\left(\frac{wl^2}{8r}\right)^2 + (wy)^2}$$

This last expression also gives the value of the thrust at the abutments, where $y = \frac{1}{2}l$. In this case, the load is uniform throughout the entire length of the bridge. For a moving load the calculation is not so simple.

In suspension-bridges, with uniform horizontal load, the main chains will assume a curve which is very nearly a parabola, the tension on which at the centre is the same as that given above for the arch. The tension at any other point is found by multiplying the tension at the middle by the secant of the angle which a tangent to the chain, at that point, makes with the horizontal. The tension on the suspension-rods, if vertical, is of equal amount, and is found by dividing the weight which each chain supports by the number of rods. The pressure on the towers is determined by means of a simple diagram. When the load is a moving one, the chains are liable to disengagement, which may be prevented, either by an auxiliary girder from pier to pier, by fixing the chains to the top of the towers (when there are several spans), or by inserting diagonal bracing between the roadway and chains.

Mr. Humber has not attempted any investigation in his book, but only gives the results obtained in the treatises which have been written on the several subjects referred to; his object having been to facilitate the calculations that must be made, in order to secure the stability of a structure.

Mr. Simpson, C.E.—The death of Mr. Simpson, the engineer of the Carlisle and other Waterworks, is announced.

* "A Handy-book for the Calculation of Strains in Girders and similar Structures, &c." By W. Humber, Assoc. Inst. C. E. Lockwood & Co. London, 1868.

THE (ALBERT) MUSEUM, SOUTH KENSINGTON.

In continuation of my "Notes" on gemmed and enamelled art-objects now on loan at the Museum, I would draw attention to the spirited little harlequin, lent by Mr. Beresford Hope, the body formed of a baroque pearl with enamelled limbs and head, the face bearing a most mirth-provoking grin. The figure, which is enriched with gems, is planted firmly on one foot, the other extended in air, and rests upon a small octagonal base of white carnelian, in a setting of enamel, the whole being mounted on a larger slab of onyx, as if intended to serve as a paper-weight. To Mr. Hope we are also indebted for the Plasma* cup, on gilt metal tripod of terminal figures set with precious stones; the charming vinaigrette, in form of a book, with chain and ring for suspension, having on one side an enamelled Cupid among flowers on a ground of deep blue translucent enamel set round with pearls; and, in the barbaric grandeur style, the silver-gilt scent-bottle of peculiar form, incrustated with turquoises and garnets; the latter of a most rich, ruby-like hue. There is likewise a large ivory cup and cover, or tankard, carved on one side with an equestrian figure of an emperor piercing an enemy, both figures being fully clad in richly-chased armour: the lance entering above the breastplate of the fallen foe, makes one exclaim involuntarily, in the speech of the old Romans, "Habet!" On the other side of the tankard, the arms of Holland and motto, "Je maintiendrai," are carved in a free bold style; on the cover is a plumed helmet by way of decoration, the date is the seventeenth century.

To Mr. J. Heywood Hawkins belong the fingering of Indian manufacture, cut out of red carnelian, the centre set with diamonds and emeralds; the crystal spoon and fork, mounted in gold and set with rubies—another instance that formerly forks were treated merely as luxurious toys. We read in Knight's "Cyclopaedia," "the first mention of table or eating forks is found in the 'Chronicon Placentinum' of John de Mussis, a writer of the early part of the fifteenth century, who, when speaking of the injuries of the people of Piacenza recently introduced, says, 'they use cups and spoons and little forks of silver' . . . Even when Heylin published his 'Cosmography,' in 1652, forks for the table were still a novelty; having spoken of the ivory sticks used by the Chinese, he adds, 'the use of silver forks with us by some of our spruce gallants taken up of late, came from hence to Italy and thence into England.'" Chambers, in an interesting little notice of ancient forks in his "Book of Days," says they were in use in Italy in the seventeenth century, and were introduced into England by Coryate, the strange traveller. They were little forks, usually made of iron or steel, but occasionally also of silver. Coryate says he "thought good to imitate the Italian fashion by this forked cutting of meat," whereas on a facetious English friend, "in his merry humor, doubted not to call me *furellor*, only for using a fork at feeding." The notice goes on to say that, in 1534, some laborers found at Swington, in North Wiltshire, a number of Saxon pennies and sovereigns ranging from A.D. 795 to 890, and with them lay a spoon and fork, showing that the introduction of the fork into England dates from a very early period, though the use of it may not have been general.

The small oval silver watch, engraved with a flower on the outside, of English work, also belongs to Mr. Heywood Hawkins, and these various articles are to be seen in one of the table glass cases in the centre of the loan department. In another of these central cases is exhibited a rich collection of Hungarian jewelry, lent by the Countess Harley Tótki: rich, as regards the costly stones and enamel with which it is thickly encrusted; but, as works of art, I own myself unable to find much to admire in the various specimens. The mantle-clasp of rubies and diamonds set in enamelled gold, formerly belonging to Francis Rakoczey, Prince of Transylvania, Hungarian seventeenth century, is a grand cluster of rich colours; the cross of precious stones and enamel, Italian sixteenth century,

and a mantle-clasp with pendent pearls, Hungarian eighteenth century, are less "barbaric" in their grandeur; but the necklace, ear-rings, and bracelets of present century work, show so many instances of utter want of taste, that one can but regret the toil and care that have been bestowed upon them to so little good result. The enamelling is, in many portions, extremely delicate and judicious, hobb as to form and colour; but the continually repeated scroll of pearls strung on gold wire, is such a terribly primitive mode of ornamentation, and is quite out of keeping with the careful enamelling. All the pieces of necklace and ear-rings are made alike on both sides; now this is quite correct for the latter, but for the former it would seem to be a great mistake, as rendering it uncomfortable to wear, and preventing it from lying flat on the neck; and can anything be more dreadful in point of taste, than the gold and white-enamel curly little "Agnus Dei," which forms the pendant to the necklace? The lamb is hung up by its back, with the feet unsupported; has three square gems set in its side, a pearl hanging from beneath its body, and a thick curve of gold blood flowing from its chest into a sacrificial cup, which is fixed on to the end of the gold-blood stream. Compare this jewelry with the delicate work of the "enseigne," lent by Miss Wiid, which is placed in the glass case beside the Leicester violin. The centre is a turquoise cameo of Queen Elizabeth, mounted in gold and enamel frame, set with rubies and other stones, and pearl pendants. It hangs in front of a small looking-glass, so that the hack, which is also ornamented with enamel, may be seen likewise. The difference in execution of the two is worth several journeys from case to case to examine minutely. Another collection of jewelry of the barbaric-grandeur type, is that lent by Count Chas. Stuart D'Albanie. It is Hungarian also, and dates from the seventeenth or eighteenth century, and is studded with precious stones. I have heard it admired, but I infinitely prefer the hunting-knife likewise exhibited by the Count, which belonged formerly to the uncle of Frederic the Great. The knife—with six smaller instruments—fits into a sheath covered with crimson velvet, ornamented with hunting scenes in gilt metal,—the handle and mounts being also of gilt metal. Though the workmanship is coarse, there are a boldness and appropriateness in the whole thing that is satisfactory.

In a table glass case close by, lies an amethyst-spar and box given by Pope Pius V. to Mr. J. Cox Hippisley, and lent by Sir J. Hippisley. It has a red jasper cameo head on the lid; and there is another of petrified wood lent by Mr. Martin, which is thought to be French eighteenth century work. Returning to the high glass case near to the one containing Mr. Beresford Hope's art-objects, a steel key, French seventeenth century, merits attention. The head, or handle, is pierced with a cipher and coronet, the stem is fluted and engraved, and even the ward-holes are ornamented with engraving on the flat sides of the key. It is a choice production, and is lent by Mr. T. M. Whitehead. In the same case is a silver horn, such as is worn on the head by the Druse women. It is about 18 in. in height, of modern Syrian work, and is lent by the Messrs. Lambert & Rawlings. The wide end of the horn has three rings attached at a short distance from the edge, as a means, no doubt, of fixing it on to the head. The sight of this strange-looking ornament forcibly calls to mind the numerous allusions to wearing a horn in Scripture, such as "Their horn shall be exalted," "Set not up your horn on high."

I have already mentioned Mr. Farquhar Matheson's choice little octagonal crystal casket. This gentleman exhibits likewise a very fine vase and cover of silver gilt. The howl, which is ornamented with medallions representing the liberal arts, is supported on the bent head and neck of a youth, who holds a small cup in his right hand. The head leans to the left side, not forward, so that the admirable little face can be seen: the expression on it is one of anxiety as to his power of steadying the cup rather than of suffering on account of the distressing weight; so that the idea is not so painful to the beholder as it is usually the case in similar but less judiciously treated subjects. Nevertheless, I question if the effect produced be altogether a pleasing one, although from the beauty of the whole thing in this instance, one cannot fail to admire. The figure of the youth is excellently well modelled, the costume harmonious and appropriate; but the feeling of anxiety in the face communicates itself unpleasantly to the mind of the spectator,

for he appears so dangerously insecure; the right leg is bent and touches the small platform on tiptoe, while the left foot has slipped over the edge on to a lower portion of the cup's base, which is about 3 in. high, round, increasing in size as it descends, and is ornamented with bands of flowers. The cover of the cup bears an old man seated, holding a globe. This work is seventeenth century, and is thought to be Italian.

In a table glass case close by are several rich treasures lent by various owners. A gold and onyx-bead rosary, formed of ten oval heads about an inch long, alternated with eleven round ones, joined together by links of gold wire. The oval heads open in halves, are hollowed out, and each head contains two minute Scripture subjects in gold and enamel. It is lent by Colonel Cumming. Beside it lies a pendant in three strips—*Quere, a châteline?*—of early seventeenth century German work; it is formed of silver gilt openwork set with garnets and turquoises, and on each alternate link some small ornament of bronze or iron is introduced, a tiny head or piece of knot-work; while in the centre of the pendant there is a small figure of the same metal—a man wearing a short cloak, furred cap, and sword. The workmanship of the whole is extremely careful and minute; it is lent by Mrs. Charles Lucy. Below the pendant a pen-case and ink-case from Constantinople, lent by Mr. H. Vaughan, of silver-gilt, and ornamented with niello, are admirable both as to form and execution. Next lies a small mirror, with a frame of silver-gilt, incrustated with large square, polished, but uncut emeralds, rubies, and diamonds. The metal work is open between the pattern of scrolls and other forms in which the stones are set, and above the mirror they rise into a high ornament, the framework of gems occupying as much space as the mirror itself, which is only about 4 in. or 5 in. square. It was made for the Dey of Algiers as a wedding present to his daughter. It is Algerine work, early present century, and is lent by Mr. A. Elmore, R.A. The gold finger-ring, with a balas ruby bearing an Arabic inscription, and lent by M. le Comte B. Yliiski, is stated to have been found in a tomb near Babylon. A curious small scent-bottle, or perhaps vinaigrette, lent by Mr. H. Vaughan, gilt and jewelled, with filigree mount and cover, is ornamented with most singular figures that suggest "Masons' marks." The bottle is barely more than 1 1/4 in. high, and about three-quarters of an inch in diameter; the colour is dark red, or brown, and the figures, which occur three times each, are gilt.

Close to the above lies a white Sevres porcelain box in shape of a sealed letter: being "a sham," not a thing to be altogether admired, but curious in its way. On the outside is inscribed in italics:—

"A Madame,
Madame la Justice,
aux yeux éclairés."

and on the inside is painted a garden scene with figures. It is lent by Sir W. Fraser, bart. A small medallion in Hono stone, 1 in. square, lent by Sir W. C. Trevelyan, bart., and carved with minute scrolls and arabesque with asty, is excellent.

Very near to Mr. E. W. Cooke's Venetian glass is a case of choice porcelain. In one corner stands a tray of peculiar interest to Englishmen, being painted by the eldest daughter of their Queen as a present to her brother, the Prince of Wales, by whom it is lent. On the reverse, which is turned to the spectator, is the following device:—The feathers of the plume, which are separate, are stuck through a green chaplet bound with ribbons, on the ends of which is the motto, "Ich dien," on a label below is the inscription in large capitals, "FELIX—SIS," and on another hand below, "from Victoria, Nov. 21," below which again, on the rim, is "Michelangelo-Margherita. Caotani. Duca. e. Duchessa. di. Sermoneta. fecero." On the upper side of the tray is painted in Medieval characters, "Albert Edward—Romæ. A. M. DCCC. LXII," surmounted by a crown surrounded by a wreath of oak and acorns.

Near to this are two excellent small white glazed figures of Doccia ware, Ignatius Loyola and Luigi Gonzaga, early eighteenth century, lent by Mr. H. Gillett, who also shows a charming two-handled cup and saucer of Wedgwood-ware, pale form, cream-coloured, with leaf-pattern border in brown with green thread; the handles, which are very delicate, are twisted. This cup stands beside the elegant double pails already mentioned. The quaint little teapot,

* Plasma, sometimes written Prasma, whence the French name of the stone. *Prisme d'Emeraude*, is merely calcareous coloured green by some metallic oxide, probably copper or nickel, and is, in fact, a semi-transparent jasper, and although it often approximates to the finest emerald in colour, yet it is never pure, but always interspersed with black spots, and with patches of the dull yellow of the original species. . . . But of a pale green variety pieces do occur, quite free from flaws and spots; such, however, are probably rather to be considered as varieties of the chryoprase. — King, on *Antique Gems*.

Dresden early eighteenth century, white and painted with Chinese subject, is likewise Mr. Gillett's property.

Mr. J. Bond lends a very fine bowl, cover, and saucer, of old Chelsea porcelain, ornamented with compartments of dark blue and gold alternated with white; on the latter are painted birds and flowers. The somewhat similar-in-design luster-cooler close by, of old Worcester porcelain, looks very coarse in comparison. Bowl, cover, stand, and two trays of Leeds earthenware, late eighteenth-century, lent by Mr. H. Willett, cream-colored ground with birds and plants in dark brown or black, are admirable, as are also another tray and basket with open lattice border. There is a choice cup and saucer of Sèvres porcelain, painted with grisaille landscapes in medallions, by Rosset; on blue ground, the gilding and garlands by Prevost; lent by Mrs. Yorke. A fine pair of Chelsea porcelain candlesticks are lent by Mrs. Powke; the fables of "the jackdaw in peacock's feathers"—form the one, while the other is composed of domestic fowls in a cluster of hawthorn and daisies, representing the fable of "the cock and the jewel." What a pity it is that these fine Chelsea specimens always have such coarse, ugly "rococo" stands.

A coffee-like box of white porcelain, eighteenth century, thought to be Plymouth manufacture, painted with landscapes and birds, the handle on the cover formed of a cornucopia filled with flowers, is lent by Mrs. Freake; as is also a tureen and cover of earthenware, shaped like a double shell, on a foot of leaves, part openwork; on the cover, which has leaf forms impressed all over it, is painted a "Lent Lily" on one side, and it has for handle a bunch of most original green grapes in relief. The tureen is called "Modern British," but it looks anything but modern.

ART-WORKER.

ART WORKMANSHIP COMPETITION, SOCIETY OF ARTS.

The following is the report of the three gentlemen, to whom the Council referred the various works that were submitted:—

"In spite of the individual specimens of excellence, to which we shall presently allude, we are bound to confess that the response made by art-workmen to the Society's liberal invitation to compete for prizes offered during the last session, cannot, in our opinion, be regarded as satisfactory.

It will be remembered that the list of subjects proposed differed materially from those of previous years—it having been considered well, as an experiment, to test the workmen's powers in the combination of original design with skillful workmanship, and in novel directions, rather than to keep them in the groove of the reproduction of the best works of the past.

We deemed some change of this nature requisite, from our observation that, while a fair level of mechanical perfection had been attained by the workmen generally, no such marked progress was realized from season to season as to justify the continued application of the large annual outlay made by the Society, in the attempt to foster and effect the improvement desired, but which could scarcely be said to have manifested itself.

Whether it is that the task recently set to the art-workmen has been beyond their present powers, or, as is more probable, that they look with anxiety only to what affects their regular employment, possibly, in some cases, apprehending notoriety as a fault rather than merit in their masters' eyes, certain it is that the results of their labor, taken as a whole, are not such as we had hoped for, nor such, by any means, as we think would have been made by French, or even Belgian workmen, had a similar invitation been addressed to them.

We do not necessarily attribute this to incapacity on the part of our art-workmen as executors, but ascribe it rather to their want, in this case, of the directing and sustaining power which is supplied to them, in the course of ordinary business, by the superior education and attainments of their masters and the artists and designers, from whose drawings, models, or suggestions they may habitually work.

That it would be a national gain for British workmen to acquire that measure of facility in the application of skilled workmanship which distinguishes so highly the best class of foreign workmen no one would probably deny. It was to encourage development in this direction that

the modification, to which allusion has been made, was introduced into last year's programme.

Thereupon being, in our judgment, so cheering, we feel bound to recommend the Society of Arts either a return to former programmes, or such a change in the conditions of their invitation as should recognize and reward not only the skilled workmen, but the talent and energies also of the masters, through whose application of capital and knowledge such workmen might be brought to the production of the real excellence and novelty we had hoped to have seen united in the present exhibition. We are emboldened to make the above suggestion in the full conviction that no such radical change is likely to be adopted without receiving that careful consideration at the hands of the Council of the Society of Arts, possibly after conference with us, which its importance may justify.

In the first division, 'Specimens of Art-Workmanship in Prescribed Processes,' we have recommended such rewards to be given as we considered right under the circumstances, but we do not feel justified in dwelling at length upon any of the specimens so rewarded.

Mr. Thomas Godfrey's panel for a cabinet, consisting of six different woods, is skillfully carved in delicate relief, in a manner familiar enough to French, Italian, and Spanish workmen, but not, as yet, common in this country.

In the second division, 'Specimens of the Application to Ordinary Industry of Prescribed Art Processes,' we regard as by far the most hopeful product, 'the slah for insertion in the frieze of a chimney-piece, painted on a red tile, by Mr. J. B. Evans.

Considering the almost universal application of the process of enamelling on metal in France, and the strides made at Birmingham in the industrial application of the process, we had certainly expected more important contributions than those forwarded by Mr. Frederick Lowe. They being the best and—the ring-try in particular—being satisfactory both in design and execution, we have considered him entitled to a reward of 10*l.*, but we are certainly unable to regard either specimen as 'most beautiful.'

Some of the clock-dials exhibited by Mr. J. Thwaites are agreeable in design and pleasing in execution; the collection is, however, of singular inequality in point of merit in design.

Mr. W. H. Slater's blackware slah, painted with the subject of 'Pluto,' is of good average execution.

Among the subjects sent in for exhibition, but not wrought in accordance with prescribed processes, the most to be commended, by far, is the painting on china, 'Giving a Bite,' after W. Mulready, R.A., by Mr. W. P. Simpson. It is an admirable specimen, although not a very important one as to size, of painting on porcelain, and we have awarded to it 'The North London Exhibition' prize, in addition to a sum of 5*l.* from the Society of Arts.

We were particularly pleased with the delicacy of the modelling of the subjects 'St. Cecilia,' and the 'Virgin and Child,' after Donatello, by 'W. W.': we considered these to be admirable specimens of cabinet modelling.

We were much pleased with the steel die sunk by G. Morgan after the head of a female modelled from life by himself; we regarded this as a work of great promise in a branch of art too little practised or considered at the present date.

Mr. John Barker's bracket, carved in Caen stone, and his flowers, and some carvings in marble, executed by 'W. X. D.,' were satisfactory.

Mr. Robert Taw's embossing in copper of a yacht in full sail, showed both taste and skill, although we regarded the form in which they had been brought to bear on the present occasion to be rather a misapplication of both.

Mr. Thomas Will's alto-relief in boxwood, with an ebony border, of 'Venus Genitrix,' Mr. Deere's renaissance ornament in copper; Mr. Eyre's painting on porcelain of the 'Death of Goliath,' and Mr. Emme's wrought-iron-work for cabinet, were also commendable.

GEORGE GODWIN,
RICHARD REDGRAVE,
M. DIGBY WYATT.

The following is a list of the prizes awarded:

Works sent in in accordance with the Prescribed Processes.

FIRST DIVISION.

Earthenware vase, with painted ornament in enamel colours. By J. B. Evans, Shelton, Staffordshire Potteries. Price 5*l.*, ss. Prize of 2*l.*

Clock case, in amboyna and purplewood, with inlay of ivory. By Thomas Jacob, 4, Upper Charlton-street, Fitzroy-square, W. Price 5*l.*, ss. Prize of 2*l.*
Marquetrie panel. Designed and inlaid by F. Braun, 12, Star-street, Edgware-road, W. Price 9*l.*, Prize of 2*l.*
Centre of a chimney-piece, a combination of mosaic and inlay with carved stone. By John E. Daly, 93, Meckway-street, Westminster, S.W. Prize of 5*l.*
Panel for a cabinet, consisting of six different woods. Designed, carved, and inlaid by Thomas Godfrey, 21, Chatham-road, Wandsworth-common, S.W. Prize of 5*l.*
Panel for a cabinet. By Charles Lane, 41, Prince of Wales's-crescent, N.W. Price 12*l.*, Prize of 4*l.*

SECOND DIVISION.

Cases of specimen clock dials. Nos. 1 to 6 enamel painted; Nos. 7 and 8 dead surface suitable for public buildings; as not reflecting the light; Nos. 9 to 11 glass dials in imitation of engraved dials, and superior to them for durability in consequence of the work being at the back. By J. Thwaites, 35, Spencer-street, Clerkenwell, E.C. Prize of 5*l.*

Frame for a miniature, of strongly gilt gilding-metal and enamelled; solder of 18 carat gold. Designed, engraved, and enamelled by Frederick Lowe, 13, Wilder-new-row, E.C. Prize of 10*l.* for the exhibit of this and ring try, similar in material and process to the above.

Slah, for insertion in the frieze of a chimney-piece. By J. B. Evans, Wandsworth-common, Shelton, Staffordshire Potteries. Price 10*l.*, Prize of 10*l.*

'Pluto.' Painted on blackware, after the style of the Chinese. By Mr. W. H. Slater, of Jamess-street, London-road, Stoke-on-Trent. Prize of 5*l.*

Tablet for monumental or commemorative purposes (unpublished, but lent to show design). By James Griffiths, Field-place, Stoke-on-Trent. Price of 2*l.*

Book cover, enrichment in gold upon coloured ground. By C. Pander, 28, Bayham-street, N.W. Valued at 3*l.* 10*s.* Prize of 3*l.* for the exhibit of this and enrichment in cance this upon black and gold grounds.

Subjects sent in for Exhibition, but not in accordance with the Prescribed Processes.

CARVING IN STONE.

Bracket, carved in Caen stone. By John Barker, 2, Paradise-street, Lambeth, S.E. Prize of 5*l.* for the exhibit of this and other carvings.

CARVING IN MARBLE.

Boy's head, in relief, a portrait. By W. X. D. Price 2*l.*, Prize of 5*l.* for the exhibit of this and medallion head of Michelangelo.

Carving in relief. By Owen Thomas, 66, Hatfield-street, N.W. Prize of 1*l.*

MODELLING IN PLASTER.

Modellings, after Donatello, of St. Cecilia, and the Virgin and Child. By W. W. Price 10*l.*, Prize of 5*l.*
Head of a female, modelled from life. By G. Morgan, 41, Pelham-street, Brompton, S.W. Prize of 5*l.* for this in combination with the following:—

METAL WORK.

Reduced copy in steel of the abacus. By the same exhibitor.

Embossing in copper of a yacht in full sail. By Robert Taw, 8, Prince of Wales's-crescent, N.W. Prize of 2*l.*
Tough-iron work for cabinet. Designed by E. T. Talbot. Executed by G. Emme, 5, King-street, Old Kent-road, S.E. Prize of 1*l.*

Renaissance ornament in copper. By G. Deere, 23, Weston-street, Pentonville, N. Price 10*l.*, Prize of 2*l.*

CARVING IN WOOD.

Alto-relief in boxwood with ebony border. 'Venus Genitrix.' By Thomas Will, New-road, Hammersmith, W. Price 15*l.*, Prize of 3*l.*

PAINTING ON PORCELAIN.

'The Death of Goliath.' By John Eyre, 16, Newman-street, Oxford-street, W. Price 5*l.*, Prize of 2*l.*
'Giving a Bite,' after W. Mulready, R.A. By W. P. Simpson, 6, Queen's-road, Baywater, W. Price 26*l.*, 5*s.* Prize of 5*l.* Also the 'North London Exhibition Prize.'
Head of Our Saviour, from an engraving by Sharp, after Guido. By A. D. Price of 2*l.*

SCHOOLS OF ART.

The Halifax School.—The report of Mr. W. H. Stopford, the head master of this school, states that the classes, which were at a very low ebb from successive changes of masters, when he undertook the duties eighteen months ago, are now getting on successfully. The ladies' morning class, which numbered about four or five students, has increased to seventeen or eighteen, and will form (as it should) one of the most important classes in the school. The result of the examinations last year of the students in this school, and of their works, is as follows:—1 national prize of hooks; 13 second grade prizes; 10 third grade prizes; 8 free studentships; 11 certificates in free-hand; 10 ditto in model drawing; 1 ditto in perspective; 8 ditto in geometry; 2 ditto in mechanical; 4 full certificates. The committee's report, read at the annual meeting by Mr. C. J. Fox, the hon. secretary, points attention to the fact that the Science and Art Department have awarded a honours of 1*l.* to Mr. Stopford on account of the general results of the last examination. The prizes have been distributed by Lieut.-colonel Arkroyd.

The Nottingham School.—Mr. H. W. Foster (a student of this school) has been awarded a "Government Art Scholarship," and proceeds at once to South Kensington Museum to pursue his studies. The scholarships are granted for two years, at the rate of 52*l.* per annum for the first six months, and then increased to 104*l.*; they are granted to decorators, designers, and others.

THE RAILWAY SYSTEM AND ITS EFFECTS.

At the ordinary general meeting of the Institution of Surveyors on the 22nd ult., the president in the chair, the discussion on Mr. J. Bailey Denton's paper, to which we have already referred, was resumed by

Mr. Edward Ryde, member, who said that although extravagant claims had frequently been made against railway companies, and extravagant compensations had sometimes been paid, it did not follow that all landowners were extortionate. It was equally true that they had sometimes been awarded sums which were not compensations at all, while there were instances even in which railway companies had taken land and made their line, yet to this day the landowner had not been paid a farthing. He felt some anxiety that it should go forth to the world that, as a body of men, they would not look at the subject of view only; and that, while admitting fully the benefits conferred by railways upon land in common with other interests, they did not subscribe to the notion that, in future, railways should be formed, so to speak, at the expense of the landowners, who were to give up their land just where it was wanted, at an arbitrary price, without their convenience in the matter being consulted in any way. He thought Mr. Denton had overlooked the fact that land had in itself a large element of improvement; that, whether there were railways or not, the land of this country must of necessity become more valuable. The supply was absolutely limited, while the demand was daily increasing. They must, therefore, not attribute all the additional value to railways. No doubt, a large increased value was given to all kinds of agricultural land within reach of a railway station, by facilities for transport of produce, manure, and machinery; besides the development of its dormant or building value. Mr. Denton had given authorities for putting the increase in value of agricultural land at from 5 to 10 per cent., but he (Mr. Ryde) confessed he did not know what the per-centage really amounted to. He knew a light land farm, formerly, as arable land, worth 30s. per acre, which, since the making of railways, had become a dairy farm, and sent every gallon of milk proceed to the London market. That had increased the value of the land at least 40 per cent. He thought, taking the general average, the increase was in rental value, not in years' purchase; because that land at 30s. an acre would have fetched the same number of years' purchase as it would now at 50s. per acre. The development of the dormant building or accommodation value of land was in some instances enormous. Land at Redhill, purchased thirty years ago for 50l. an acre, had since been sold at 700l. per acre. At Tunbridge they did not find any remarkable increase; Tunbridge Wells gave a higher rate, but at Hastings, land that cost 300l. per acre twenty years ago had since been sold, some for 10,000l., some for 5,000l. per acre, and a considerable number of acres had realized 1,000l. per acre, or six times its former price. At Surbiton, on the South-Western, thirty years ago the whole of the land on which that place stands was in the office in which he was brought up for sale, at 50l. per acre, as farming land; now he was afraid to say what the value was. At Weybridge, land for which 15l. to 20l. per acre was considered a good price now fetched that sum per annum in ground-rent. But, granting that agricultural land could be so increased in value, and building land also, it did not follow that all landowners wanted railways to run through their property. Such, for instance, would be the case with a man through whose land the railway cut, but who was still left remote from a station. Again, it was no satisfaction to the purchaser of an estate for residential purposes to tell him the land was enhanced in value. He did not want to sell; he had bought the estate, and wished to keep it as it was. Matters of this sort must not be overlooked. Hard things had been said of solicitors and surveyors concerned in building estates taken by railways, but he thought they had some ground of grievance on their part. The solicitor would get a profit on every lease he granted and every mortgage he prepared if the land were not taken, and he sustained an injury by a railway going through that estate for which he obtained no compensation. It might be said he could take his skill and energy elsewhere; but his client might not be inclined to

invest his money in another estate. It was no wonder such a man should advise his client to oppose the railway Bill at every stage. He thought, again, that a case like that of the Surrey and Sussex Junction Railway, where some of the land had never been paid in an unfinished state,—did not much commend itself to landowners, who, he snid, would be certainly in a state of "aboriginal innocence" if they did not oppose such a scheme to the best of their ability. Passing on to the cost of the land, and sinking railways altogether for the moment, let them think how much more than the value had been given for five or six acres of adjoining land, for the mere purpose of adding them to an estate. Three times as much as the value he had known to be given. The cost of land for railways ought to be compared with such examples as that. Then, again, looking at what was to be the fair and proper cost of land for future railways, they must just consider that a railway might be laid out through two or three estates, and very near to the boundaries of others equally benefited. Now, it was said, a man should give his land; but there was this anomaly,—that those who did not give the land would derive the same amount of benefit as those who did. A hector scheme must therefore be devised than that of asking landowners to give their land for nothing. They must pay the particular landowners for the land, and then have a contribution from all in respect of the benefits which they all derived. While on the question of the cost of land, he would say that the verdicts given by juries, and, in some cases he might say the awards made by arbitrators, gave encouragement to many of the heavy claims which were subsequently made. It was a hard thing, they must admit, for one landowner to meet the railway company in the fair and equitable spirit Mr. Bailey Denton wished, and then to see the next landowner, by employing a "smart" man to make a claim before a jury, get double the amount for his land. Assuming the average price of land for railways, as set out in Mr. Denton's table, to be 240l. per acre, he thought one moiety of that sum might fairly be put as the cost of the land itself, and the other as due to severance and other causes. That left the price of the land at 120l. per acre, which he thought, looking at the forced sale, was not such an extravagant price after all, and he did not think the landowners had got so much the best of it.

Mr. W. R. Galbraith (visitor) said, that being a good deal concerned in railways made through agricultural districts, he had read Mr. Denton's paper with great interest, and he thought its discussion and treatment of the country would do good, not only for railways, but for landed interest generally. He thought landowners could hope for nothing better, as far as his experience went, than having a railway brought near them. He agreed with Mr. Denton that the parliamentary expenses of railways had been far too much, but he thought he did not quite fairly reflect the cases of railways in agricultural localities. The North Staffordshire and Manchester, Sheffield, and Lincolnshire could scarcely be placed in that category, as the estimate of 1,500l. per mile for Parliamentary expenses, was far beyond what they would see now for railways in agricultural districts. As an extreme case the reverse way, they found the Parliamentary expenses of the Great Central and Kentish line were only 124l. per mile. If that included the preparation of Parliamentary plans and legal expenses, it was probably the cheapest Bill that was ever carried. Then there was another matter which, he thought, required amendment; that was the Standing Orders, inasmuch as they were frequently an instrument in the hands of large companies for oppressing small projectors. He had himself assisted in throwing out schemes upon some very trivial points indeed; and he thought the policy of the House of Lords especially seemed to be rather to check railway enterprise than to encourage it. Two or three years ago, perhaps, a whole country was required, but at the present they required encouragement rather than opposition. It was, however, no use for engineers to talk about that. If they were to do any good in respect of future railways, they must undoubtedly be taken up by the landowners themselves, and this body of surveyors, who mainly represented the landed interest, must also take it up, and press it upon the landowners. As to the cost of land, he would mention one or two cases on a line constructed by him, which passed through a property for a length of 3½ miles. The plan was very poor indeed; he (Mr. Galbraith) should have thought 10l. per acre was about the proper price, but that surveyor valued it at 20l. The price actually paid for that land was 123l. per acre, or four times and a half its agricultural value. The tenants told him they had received no abatement of rent. The company bought about 33 acres of this land, and the result was, the owner put about 5,000l. into his pocket. In the centre of this property the company had to construct a station. He believed he was within the mark when he said that this property was raised in value by two years' purchase; if so, the rental value of the property being about 4,000l. a year, he would have paid for the land, the property itself being improved to the extent of 8,000l. After squandering this money out of the company, the gentleman took them before the justices in reference to accommodation works, the result of which was, in the 3½ miles, they constructed no less than fourteen crossings, or about one in every quarter of a mile, so that there could not be said to be much severance there. He was glad to say, for the much reverence there. He was glad to say, for the honour of this Institution, that the extortion was perpetrated by a solicitor, and not by a surveyor. He

(thought too much had been said about contractors' lines by those who did not understand the question. The very fact that the large majority of contractors who had dabbled in so-called contractors' lines had come to grief, showed that, as far as they were concerned, they had gained nothing by the business, and the state of the finance companies showed that the profits had not gone into their pockets. It might be that the small sum subscribed in the district was lost, but the landowners had the benefit of the railway, and they were amply repaid. Therefore, if more railways were to be made, they must be carried out in some such mode as Mr. Denton had suggested; and he was glad to hear Mr. Ryde, to a great extent, coincided with him. He would, in conclusion, give them a case in point, showing that lines could not be carried out now without some assistance other than they had. He was the engineer of a line called the Bude and Torrington, which ran forty miles through an agricultural district, but with a fair traffic. The railway could be made for 7,000l. per mile. There was a working agreement with the South-Western Company to work the line at 4½ per cent. of the receipts, and the Bude Company were to receive a rebate of 3,000l. a year for the traffic they threw upon the South-Western line. He had put the cost of the line at 200,000l.; he took the traffic at 10l. per mile per week, and adding the rebate of 3,000l., the net returns would be 15,000l. a year, which would pay 5 per cent. upon the capital expended. What had they got from the district itself? About half the landowners had given their land, and the district had subscribed about 20,000l. out of the 200,000l. The result was, if some further effort was not made, the Act would be lost, and that agreement would never be renewed by the South-Western Company.

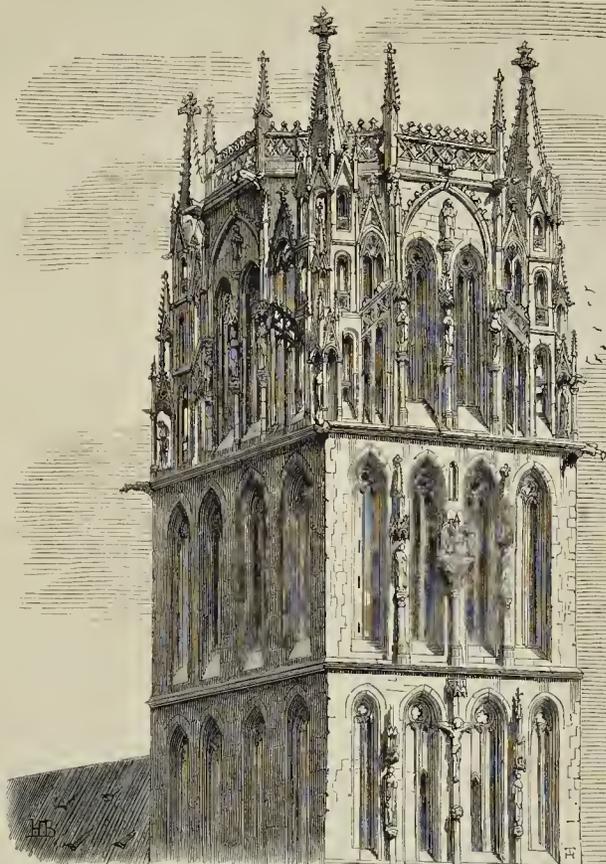

Mr. Charles Douglas Fox (visitor) would confirm the remarks of his brother engineer (Mr. Galbraith) with regard to the great importance, if railways were to be made economically, of obtaining some fresh powers for dealing with level crossings. A line to be not only economical, but serviceable to the land, must be a surface line, and it is very strong to take the ordinary rolling stock of the main line, except the locomotives, and to be worked at a speed of twenty or twenty-five miles an hour. If it was intended to serve farming interests, deep cuttings must be avoided, so that stopping-places may be put in for each large estate. He quite agreed with Mr. Ryde, that the value of a railway to a landowner was not much when his land was at a great distance from a station. As an example of the saving to be effected by a lighter form of construction, he would give the cost of an ordinary branch line, constructed by himself, through a purely agricultural country. The Act of Parliament was applied for in the usual way. The line was made by a contractor, part payment being in paper. The total cost of the line was 8,619l. per mile, of which Parliamentary expenses were 341l.; land, 930l.; works, 5,834l.; law expenses, 325l.; engineering, 370l.; management, interest on loans, &c., 940l.—making a total of 8,949l. The same description of railway could now be constructed for about 4,000l. per mile, made up in the following manner:—Preliminary expenses, 90l., including cost of application to the Board of Trade under the Railway Facilities Act; land, 600l. (the quantity of land per mile not exceeding five acres, at 120l. per acre); works, 3,910l.; law expenses, engineering, and management, 500l.—total, 4,100l. The result was this:—The gross revenue was 11l. per mile per week. The line was worked by the parent line at 50 per cent., and, deducting their expenses, it did not receive more than 2½ per cent.; but three-fourths of the money being borrowed at 5 per cent., the dividend was almost absorbed, and the shareholders got no returns. But if, on the other hand, the line had been made for 4,000l. per mile, the net receipts would, on the same traffic, be 5½ per cent. on the capital; and if three-sevenths of the money had, as before, been obtained at 5 per cent., the dividend on the ordinary stock would have been over 6 per cent. That, he repeated, was a fair average line, and he had taken the same prices for works in both cases. What they wanted was a similar plan to that which they had in America,—viz., surface lines, worked by accommodation trains; in other words, branch lines with more frequent stations than there were now or, what would be better, stopping-places or sidings for the more important farms or estates situate on the line; and this did not of necessity involve facing points. He brought this forward because he felt the members of the Institution, and those of the Institution of Civil Engineers, should combine together to carry out a necessity of the country; and, as they had already made the great trunk railways, they should now, upon a new system, make the branch lines, and not allow a large quantity of land to be comparatively unproductive. He believed the money would be readily obtained for the purpose, if only proper facilities for the making of these branch lines were afforded.

Mr. Charles Fox (visitor) called attention to what he considered a difficulty in "The Improvement of Land Act, 1861," viz., that the land could not be charged with the rate till the works were completed, and the funds necessary for carrying on works in progress could not, therefore, be readily collected.

Mr. J. H. Lloyd would just mention, that the provisions in "The Improvement of Land Act, 1861," referred to by the last speaker, originated with the Lands Improvement Company, who sought to introduce them into their own private Act. Lord Redesdale, who had a great objection to private Bills, suggested, that if such a measure was good for the country generally; and he (Mr. Lloyd) was, accordingly, instructed to prepare, and did prepare, the public Bill. He did not believe there was any difficulty in the working of the Act, and that it had not been availed of he thought must be chiefly owing to a want of combination on the part of the landowners.

After some other speeches, the discussion was adjourned, and was resumed on the 8th inst.

The London Labourers' Dwelling Society (Limited).—This society has just held its fifteenth half-yearly general meeting, Mr. Richard Foster in the chair, at which the report for the six months ending 31st December was presented. From this it appeared that the capital had increased to 347,000l.; and that the net revenue for the half-year was sufficient to pay the members a dividend at the rate of 5 per cent. per annum free of income-tax, which dividend was accordingly declared. The sinking fund of the society now amounts to 1,131l., and the reserve fund to 4,000l.

TOWER OF ST. MARY'S CHURCH, MÜNSTER, GERMANY.

Completed A.D. 1374.

THE CHURCHES OF MÜNSTER,
GERMANY.

In former numbers of the *Builder* we have had occasion to describe different buildings in the very ancient and interesting town of Münster, in Westphalia, and we have given illustrations of the Rood-screen in the Cathedral, and of the Rath-haus. We propose now to say a few words upon the churches of that city. The first which claims our attention, on account of its remarkable size and importance, is the church of St. Lambert. This very beautiful edifice is situated at the north end of the great market, and is a rich and noble example of late German Gothic. The plan is exceedingly simple, consisting of a nave and aisles under one external roof, a long chancel or choir, and an octagonal lady-chapel leading out of the east end of the south aisle. At the west end is a tower, the lower portions of which are Romanesque, and form the sole remains of a former church. The present building dates from the end of the fourteenth century. What is particularly striking in this church is its grand scale. Each bay of the nave is 28 ft. from centre to centre; the height to the vaulting is nearly 100 ft.; and the nave is over 40 ft. wide without the aisles. The tracery of the windows is very remarkable, and more wild than beautiful. There are three very rich doorways, one of which is ornamented with a "Jesse tree," carved in stone in its tympanum.

The church of St. Mary, or as it is more commonly called, the "Überwasser" Church, is a beautiful Gothic building, consisting of a nave

and aisles under one external roof, a spacious chancel, and a noble tower at the west end (of which we give a drawing). This church was erected between the years 1340 and 1348, but the tower was not completed until 1374. Like the chancel of St. Lambert, the dimensions of this building are grand for a mere parochial church. The nave and aisles are 120 ft. long, the choir 45 ft. long, and the tower 50 ft. square at the base. The internal width of the nave and aisles is 73 ft., and the height of the tower 180 ft. The style is simple geometric. Two side altars of remarkably good design have just been erected at the end of the south aisle.

The next church in point of size and importance is that of St. Ludgeri. It consists of a low Romanesque nave, aisles, and transepts, with an octagon central tower, the lower portion of which is Romanesque, and the upper forms a beautiful open lantern of Decorated work. The choir is very large and magnificent; its walls continue at right angles to the transepts, and in a line with the nave for two bays, but the third bay widens outwards in an oblique direction, the fourth bay is again straight, and then the apse starts, so that the eastern portion of the choir forms a large polygon. The choir was begun in 1383. This church has been well restored, and a new stone high altar of good design erected.

The church of St. Martin is in general plan similar to St. Mary's; it is, however, smaller, and not so rich in detail: like the latter church, it possesses a fine tower.

St. Servatius is a small but singular Romanesque church. It consists of a short nave and

aisles, and a small chancel. The vaulting of the nave is quadripartite, and each bay incloses two arches of the aisles.

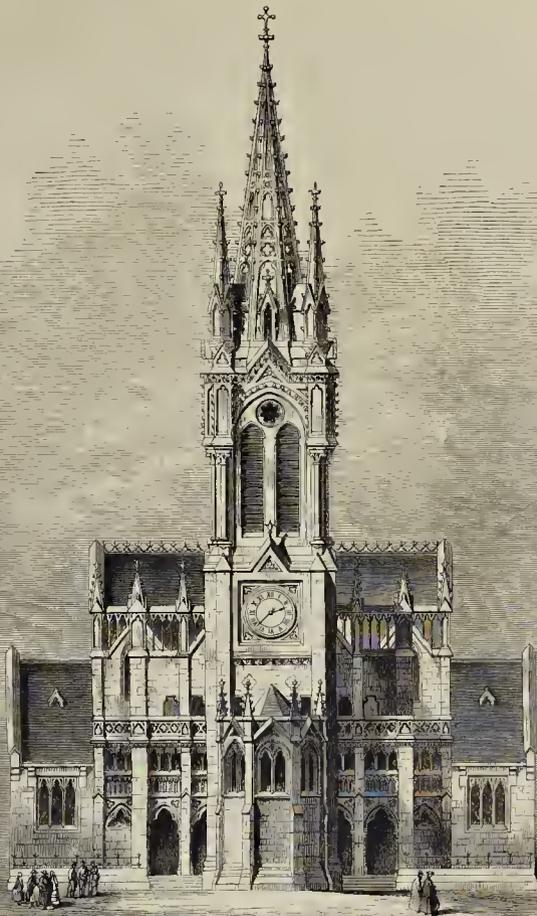

The Protestant church (originally the Minorite church) was built in the year 1270, but nearly rebuilt in the fourteenth century. It has a nave and aisles the same height, and a very long chancel. Over the chancel arch is a simple metal flèche.

St. Clement's and St. Giles's are modern Italian churches of no architectural interest. The latter has been charmingly decorated by Steinle and his pupils.

The Alnwersty church, formerly belonging to the Jesuits, was built in the year 1615, and is one of the latest Gothic churches built in Germany. It has galleries over the aisles, and the whole building is well vaulted in stone.

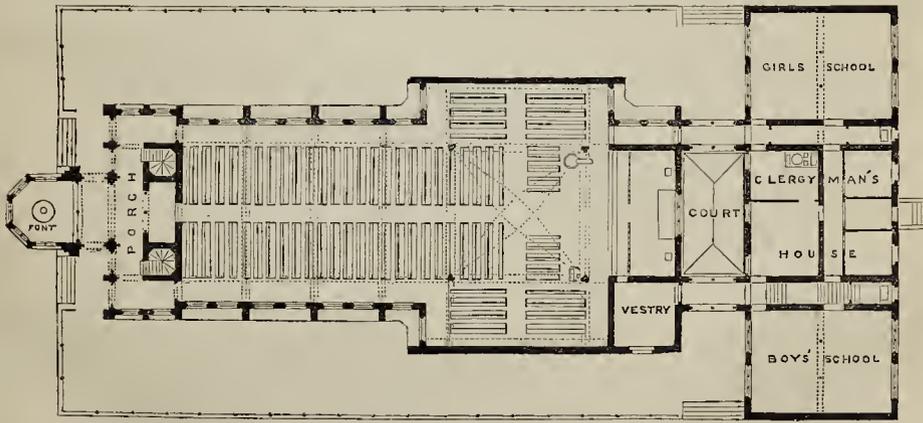

There are two new churches in Münster: one built for the Jesuits, and the other for the Franciscans. The former is rather too thin and wiry, but the latter is commendable.

The church of St. Maurice, in the suburb, is a most interesting building. It consists of a nave and aisles, and a long choir. There is a very solid tower at the west end, and, a kind of forehall or antechapel. There are two other towers flanking the chancel. The whole of the church is Romanesque, except the chancel, which is Decorated. The nave and towers were erected between the years 1084 and 1118, and the chancel in the year 1451. The church has been restored and decorated in a very costly manner. The high altar and choir fittings are worthy of notice.

B SLY DEL. 10 20 30 SPANISH FEET T WEDGWOOD.

SPANISH EVANGELICAL CHURCH, PROPOSED TO BE BUILT IN MADRID, SPAIN.
M. JUAN MADRAZO, ARCHITECT.

SCALE OF FEET

Plan.

**SPANISH EVANGELICAL CHURCH
PROPOSED TO BE BUILT IN MADRID.**

The ecclesiastical movements in Spain, a country heretofore so intolerant that half a dozen Protestants did not dare say their prayers together on a Sunday morning, must interest many of our readers, and they will doubtless be glad to know that a Protestant church is about to be built in Madrid. We engrave a view of the west end, and the plan of the intended building, which has been designed by M. Juan de Madrazo, architect, who has obligingly enabled us to give these illustrations.

Since the last revolution of September, several Protestant rooms for preaching the Gospel have been opened, and committees for promoting the Protestant religion have been organized in various provinces. To the Madrid committee the municipal corporation have granted gratuitously a piece of ground 17,000 square feet in extent, for the purpose of building this church.

The entrance to the building will be at the west front, through a sort of cloister or narthex, separating the baptistry from the body of the church, above which the clock and bell tower, with a perforated stone spire, will rise about 155 ft. high. Entering the church, there will be found accommodation for 500 persons in open seats. A small court will separate the chancel from the schools and organist's house, which both form a rear wing. These buildings will be of stone (a kind of Bath stone). Both nave and chancel will have an open timber roof, supported by arches built of brick, spanned across. In the centre of the transept a louvre in the roof will be provided for ventilation, taking externally the appearance of a spire. This and the roofs will be covered with slates and lead. The cost of the whole is estimated at 10,000*l.*

RAILINGS A PAINFUL NECESSITY.

I AM no advocate for having things railed in, but there are cases in which this undesirable treatment is absolutely necessary, however disagreeable it may be; and, I take it, the pretty sunk garden in Hyde Park, formed on the site of the old reservoir, is a case in point.

As I passed this afternoon, I was distressed to see how worn and shabby the grass on the sloping banks looks, although it has just been enjoying its winter respite from being trampled upon. If it is thus at the beginning of "the season," what will it be at the end! I was, I say, distressed; surprised I could not be when I saw the numbers of rough boys and girls who were amusing themselves by running up and down these slopes. Surely there are plenty of grassy stretches in Hyde Park where mischievous children may disport themselves, without allowing them to injure their neighbors, by wilfully damaging a spot that has been so tastefully laid out for the public delight, and paid for by the public money?

I am afraid there is no help for it, Mr. Commissioner Layard, but by ordering these pretty slopes to be railed in all round, even to the sides of the steps, and thus preserving them green and fresh for the visual enjoyment of the general loungers, as well as for that of

ONE OF THE PUBLIC.

BRICKWORK.

A CORRESPONDENT, E. Grimes, writes thus:—"While superintending the carrying out of an important building contract, in which the face of the walls is built of red pressed brick, set in Flemish bond, I have found that, just to save the difference of cost between the half of a pressed brick, and the half of a common brick, the headers have been broken in the middle, with only here and there one whole for bond, so that the facing has been only a 4-in. veneer, instead of an integral part of the wall.

I have taken counsel with other clerks of works and architects, and find it to be a common practice in these scamping times, and the thing is treated as a matter of course. I do not like this, and mean to prevent it as far as I am able, and in thinking the matter over, I have, I believe, hit upon a plan which will circumvent the evil. It will give us half bond, too, which is an advantage over either old English bond or Flemish bond, and it will also be a saving of the facing material. The plan is to lay all face bricks as stretchers, but to make the bricks in each alternate course, 3 in. and 4 in. wide, so that we always get 3 in. bond in the direction of the

thickness of the wall. I should like to hear how you and others like it.

I have heard it objected to the 5-in. bricks, that the bricklayers would find them too wide for their hand. I know that the old Italian workmen need such bricks, and what they could do we can do. An attempt to remedy this evil, as well as to be original, has been made by our American brethren, by uniting the bricks together, and goes by the name of 'Yankee bond.'"

Our correspondent is quite correct as to the scamping way in which much brickwork is done; no thought whatever is taken as to the result; the sole endeavour is to give it such an appearance as will deceive and pass. The utter disregard for truth on the part of a large number of operatives which has been induced by the system is painfully distressing to those who are thrown officially amongst them. As to the mode of building proposed, if the writer find it difficult to get ordinary bricks laid properly he would find the difficulty increased when bricks of different sizes were to be used. Many attempts have been made to introduce bricks that might be doweled, dovetailed, mitred, and so forth, but they have never been persevered in, such has been the difficulty of getting the work done, except by special men at increased cost. The bricks proposed by our present correspondent would not make such sound work as ordinary bricks properly laid.

**THE FIRE-PROOF PROPERTIES OF
ASPHALTE.**

APPRECIATING the importance of proper knowledge of the subject, we lately gave the pit in English of a communication recently addressed to the French Société des Ingénieurs Civils, by MM. Flachet and Noisetie.* This has brought to us other communications upon the same subject, the substance of which may be usefully noticed. One correspondent, however, cites a case in Norfolk, of a large rainwater tank that was lined with asphalt, and leaked. A workman, with a view to discover the defect, entered the manhole with a lighted candle, when an explosion immediately followed, causing much injury to him. This circumstance occurred some years since, and was recorded by us at the time, not as concerning an asphalt lining, but one of gas tar. From this material there escapes more or less at all times an unpleasant odour, especially noticeable when the tar has been recently applied. This odour is that of the highly combustible hydro-carbon gas, and it was this which, remaining without the means of escape from the tank, produced the explosion.

The memoir above referred to does not embrace artificial compounds, but rock asphaltic mastics, such as Sycsell,† and the following other cases, where asphalt has been exposed to the action of fire, seem to corroborate the opinion as to the value of this particular material as one applicable to all fire-proof constructions.

So long back as 1835 a fire took place at Bordeaux, when the burning materials fell upon a roof of asphalt, causing no material damage to it. The certificate of which we give a translation records the particulars.

TRANSLATION.

"We, the undersigned inhabitants of the city of Bordeaux, hereby certify and attest that, at the time of the conflagration of the Bazaar Bordelais, situated in the St. Catherine and Great and Little Canera streets, which happened on the night of the 28th December, 1835, a number of burning beams, rafters, and other bodies, in flames, fell on that part of the building covered with asphalt without causing it to melt; and we further attest that the said roof, so covered, has not been injured to any material degree."

Of the great fire in Hamburg in 1842, which destroyed, with other buildings, the Church of St. Nicholas, the Times of the 28th of May, 1842, said,—

"It was remarked as a singular circumstance during the conflagration, that roofs covered with asphalt, of which there are some here, opposed rather than encouraged the progress of the flames. It was imagined, on account of the substance of which these roofs were composed, that they would easily catch fire, and be the cause of great mischief; such, however, was not the case, for it appeared that the fire had little or no effect on them, and

* See p. 125, ante.

† Mr. F. W. Simms, C.E., in 1839, gave the analysis of this rock:—

Carbonate of lime pure	92
Dry bitumen	8
And Dr. Phipson, F.C.S., quite recently gives the analysis:—	
Bitumen	7.50
Carbonate of lime	92.50
To which when brought to a fine powder, from 2 to 6 per cent. of grit is added, and from 5 to 8 per cent. of bitumen, to reduce the whole to a state of mastic.	

when the roofs of the houses fell in, the asphalt, in which a sort of rubble is mixed up, was found to have resisted the effects of the heat, and, like a mass of dirt, served rather to smother the flames than to give them increased vitality."

A similar instance of extinguishing a fire is noticed in our first article, where an upper floor was covered with asphalt,—"fill at last the beams of the floor carbonized, gave way, and the floor sank, carrying with it the bed of asphalt, which extinguished the fire instantly."

Some few years back an extensive fire occurred at Messrs. Baker & Son's premises at Stangate. An engine-house, with a flat roof of Claridge's asphalt was exposed to the full force of the fire from the surrounding buildings; upon examination it seemed to have melted or softened only, as the surface of it was marked with corrugations, but these in no way affected the imperviousness of the asphalt.

We have already spoken of fires where the asphalt hardened again, and returned to its original condition, as in the instance of the engine-house roof. It may be as well to add to these notes a record of what was done at the time of the erection of the new reading-room at the British Museum:—

"Mr. Henry Fielder, the managing partner of the firm, arranged for an experiment, which was made on November 6th, 1855; there were present Sir Henry Ellis, Mr. Sydney Smirke, Mr. A. Panizzi, Mr. G. W. Baker, Mr. G. Baker, Mr. H. Fielder, Mr. Superintendent Braidwood, and two clerks of works.

A mass of fire, 3 ft. in diameter, formed by the combustion of thirty-four faggots of wood, with coal and coke, was maintained for the space of one hour upon a portion of the asphalt that had been laid down to form the roofing portion of the snow gutters. At the expiration of the above period the soffit of the arch beneath became too hot for the hand to be held upon it. It was observed that the fire did not spread further than the space above mentioned, and beyond fusing that part of the asphalt no damage was done to the adjoining portions of it, thereby satisfactorily proving to the minds of all present its perfect incomcombustibility."

The details of this experiment were taken by Mr. Farrell, from Mr. Fielder's notes made at the time.

**THE BELLS AND CHIMES OF ST. GILES'S,
CRIPPLEGATE.**

THE ancient and venerable church of St. Giles, Cripplegate, in which rest the remains of our immortal poet, John Milton, and several other distinguished worthies, possesses a peal of twelve bells in the key of D flat, weight of tenor 35 cwt. The tower of the church also contains a clock, put up by Langley Bradley, maker of the great clock at St. Paul's, in 1722, and a set of chimes constructed by George Harman, of High Wycombe, in the year 1792.

The bells are respectively inscribed as below:—

1. "John Briant, fecit, Hertford, 1732. Thomas Willats and Thomas Smith, churchwardens; William Staines, deputy; Robert Clark, Nathaniel Browning, and John Knight, common councilmen."
2. Same as the above.
3. The same.
4. "Pack & Chapman, fecit, London, 1772."
5. "Pack & Chapman, fecit, London, 1772."
6. "YE PEOPLE ALL WHO HEAR ME RING, BE FAITHFUL TO YOUR GOD AND KING. Pack & Chapman, fecit, London, 1772."
7. "WHAT THUS WE JOIN IN CHEERFUL SOUND, MAY LOVE AND LOYALTY ABOUND. Pack & Chapman, fecit, London, 1772."
8. "PEACE AND GOOD NEIGHBOURHOOD. Pack & Chapman, fecit, London, 1772."
9. "OUR VOICES SHALL IN CONCERT RING, TO HONOUR BOTH OF GOD AND KING. Pack & Chapman, fecit, London, 1772."
10. "IN WEDLOCK'S BANDS, ALL YE WHO JOIN WITH HANDS, YOUR HEARTS UNITE; SO SHALL OUR TUNEFUL TONGUES COME TO LAUD THE ACTUAL RITE. Pack & Chapman, fecit, London, 1772."
11. "YE RINGERS ALL THAT PRAISE YOUR HEALER AND FATHER, BE SOBER, MERRY, WISE, AND YOU'LL THE SAME POSSESS. Pack & Chapman, fecit, London, 1772."
12. "Robert Patrick, founder, London, 1737; John Warner, contractor; William Godfrey Bown and Richard Gouge, churchwardens; Sir James Esdaile, knight, alderman; John Bunner, deputy; William Staines, Robert Clark, and Robert French, common councilmen."

Robert Patrick, who recast the tenor in the year 1787, made but very few bells on his own account. He, like Pack & Chapman, resided in Whitechapel.

The present ringers are members of the "Cripplegate Society" and meet in the belfry for practice every alternate Tuesday evening.

It should be mentioned that the clock strikes the hours upon a small bell of wretched quality of tone, suspended in a wooden turret surmounting the tower. I undertake to say, however, as a hint for some worthy parishioner, that it could be at once replaced by a truly musical bell, the cost of which would be very moderate.

The chimes play daily at 3, 6, 9, and 12 o'clock in the following order:—

Sunday.—"Easter Hymn."
Monday.—"God Save the Queen."
Tuesday.—"See the Conquering Hero comes."
Wednesday.—"Martin's Lane."
Thursday.—"And Lang Synn."
Friday.—"Sicilian Hymn."
Saturday.—"Old 104th Psalm."

The tune is generally changed at noon, so that two different melodies may be heard every day.

Of the manner in which the tunes are performed I cannot speak in terms of praise. Possibly the machinery may have suffered from the wear and tear it has undergone.

A few years ago the interior of the church was in a lamentable condition, being disfigured by high pews and ponderous galleries, among other unsightly things. These have, however, all disappeared, while, by the liberality of many of the parishioners and others, the sanctuary has lately been restored and adorned with memorial windows of stained glass, Mr. Edmund Woodthorpe being the architect.

The best historical account of the parish, the ward, and the time-honoured edifice, brought down to the present time, will be found in a little work compiled by the respected organist of the church, Mr. William Miller, of H. M. India Office, THOMAS WALLEBY.

SEWERS IN LINE OF RIVER.

A CORRESPONDENT writes.—In the *Builder* of Feb. 6, "Engineer" requires to know "where a main sewer is carried down the bank of a river; or rather, where an embankment has been formed by a river side to contain the sewer."

No answer as yet appearing, I venture to submit one, through your kindness. Not, however, one that relates to a town of any magnitude; yet, in other respects, such as your correspondent is seeking to find. One, moreover, if he has time to spare, he may readily see for himself.

Bedford, about an hour's ride from London (or Leicester), is the town to which I would refer him. It is a place of progress and improvement, containing between three and four thousand houses. It has now (thanks to Mr. James Howard, M.P., and others) a complete system of modern sewers, which can be flushed from the water supply above the town, and which terminate at a pumping-station for "irrigating" purposes.

A CHEAP AND EFFICIENT MODE OF HEATING FUTURE HOUSES, WHETHER ON A LARGE OR SMALL SCALE.

SIR,—The plan I propose has been submitted to architects and builders, and, albeit it is but a theory to be tested by practical experiments, they all coincide in the likelihood of its proving a perfect success.

It is very simple and inexpensive. In constructing the building, allow a space of 4 in. or 5 in. between the outer and inner walls. This will be no source of weakness to the structure, if at suitable intervals building stones or bricks connect and stay the outer and inner shell. The same interval should be allowed between the floors. This is the chief extra expense. It will necessitate a light set of joists and lath and plaster for the ceiling of the rooms, as well as "densifying" for the floors. In the basement of the building there is a furnace precisely of the construction of those of the best Turkish baths in this country, i.e., the hot air passes over fire-brick, and therefore, if it should be let into the rooms in very cold weather, it is free of the injurious effects arising from air heated from iron fires. [The day, I predict, is not far distant when every gentleman's house will contain a Turkish bath in the basement.] The proposition I venture to lay before builders and architects is this, viz., that the heat from the furnace in question will circulate through the space between the walls and the floors, and may be increased to any extent, and let in, or shut off, at will. A house heated in this way (if the ventilation is perfectly attended to) will give us a Madeira

climate in our coldest and most ungenial weather, and at perhaps a 6d. per day for a house of a dozen rooms.

I have no doubt but that architects and builders will not upon the hint I give. It commends itself to common sense at least, and if found in effect what I predict it will be found, this simple warming expedient will revolutionize house building, from the model lodging-house and the almshouse, and the gentleman's villa, and the hospital, and asylum, up to the club-house, museum, picture-gallery, library, Government offices, law-courts, and palatial residences of whatever sort and size. If it be objected that there will be some difficulty in circulating this hot air through certain walls and floors, I reply that a Howarth's Ventilator, placed here and there on the roof in connexion with these cavities, will create a perfect draught through them.

I am, sir, one of your subscribers and readers, but neither an architect nor a builder.

J. BALBIRNIE, A.M., M.D.

MANUFACTURING STEEL.

A PAPER on this important subject was read on Thursday in last week, at the Inventors' Institute, by Dr. B. H. Paul. After describing the characteristics of steel as compared with ordinary malleable iron and cast iron, the author pointed out that all the known methods of producing steel were referable to one or other of three classes:—1. Carburization of malleable iron; 2. Decarburization of cast iron; and 3. The direct production of steel from iron ore by one operation. He showed, in describing the several new methods, that they involved the same principles as the older methods, and that the novelties which constituted the importance of these, like other improvements, consisted chiefly in the mode of applying those principles, suggested and rendered possible by a more thorough scientific knowledge of the subject to which they referred. Thus in one of the oldest methods of producing steel with the Syrian forge the principle is precisely the same as that of the Bessemer method,—burning out the surplus carbon of cast iron by atmospheric air. But while only a few hundredweight of iron could be worked at one time with the forge, and the product was obtained in small lumps, requiring much subsequent labour to bring it into a compact state, the Bessemer converter would turn out at once from five to ten tons of pure melted steel, which could be run into moulds as an ingot, a cannon, or any other form desired, this difference being entirely owing to the different mode of applying the principle involved. In speaking of the influence exercised upon the quality of steel by various impurities originating from the ore or the fuel used in smelting, the author dwelt upon the defective state of chemical knowledge in reference to this subject, and urged the necessity of scientific investigation of a nature commensurate with its importance, bearing on a manufacture which was first developed on a large scale in this kingdom, and in that respect has been until recently almost peculiarly British.

THE ROMAN ARUM.

It may interest some of your readers to know that a plant very similar to the gigantic arum from Nicaragua, described in your last number, exists in the Campagna of Rome. In the spring of 1852, a medical friend of mine, since deceased, found this plant growing among the roots of the canes (*Arundo Donax*), which are commonly planted as hedges round the few cultivated patches of that barren soil. It differs from the American plant, which latter would seem to show only one leaf. The Roman arum, on the contrary, bears deeply serrated leaves, about the size of a large human hand with the fingers spread out, somewhat similar to a horse-chestnut-leaf. But the lofty stem, the large purple spathe and pistil, and the carrion-like odour of the flower are all exactly similar to the Nicaraguan plant, as described by you. The *habitat* of the plant is, so far as I am aware, restricted to the immediate neighbourhood in which it was found, a gloomy lane of no good repute, called the Via Cupa, about five miles beyond the Porta Pia. My friend, who brought his fragrant burden to my house in the city, knowing how glad I should be to get a sketch of it, was almost overpowered by the stench. He found the Roman professors to

whom he spoke quite unaware of its existence the peasants to whom it was known stated that it had received its colour and odour from growing at the foot of the cross, and being drenched in the blood of the Saviour,—not a very complimentary legend.

The size of the flower was less than the one mentioned in your pages, the length of the spathe in my specimen not exceeding 18 in. My friend planted one of these weird monsters in a garden at Leghorn, where I saw it in flower a year or two later.

Possibly, indeed most probably, this plant is well known to our hotanists; but, as I have already stated, it was a novelty not only to our British community, but also to such learned Romans as my friend, a long resident, was able to consult. I remember that a young Scottish artist made good use of it in a fairy picture from the "Midsummer Night's Dream." S. F. D.

LIVERPOOL ARCHITECTURAL SOCIETY.

At the meeting of this society on the 10th inst., the discussion of the proposed form of building contract, adjourned from a former meeting, was resumed. The several clauses of the proposed form of contract (which was printed at length in the *Builder* for February 6th) having been separately gone through, the following resolution was finally carried unanimously:—

"That this meeting approves of and recommends for adoption among the members of this Society the form of building contract drawn up by the sub-committee chosen from this Society and from the Liverpool Master Builders' Association, as amended at this meeting, and at the meeting held on the 10th of February, 1868."

CHURCH RESTORATION.

SIR,—Will one of your enlightened readers tell a poor parishioner the best plan for preventing the repair of a gallery across the east end of the parish church of Braunton, North Devon?

A proposal to restore the church has produced no more money than would fairly pay for the plans and estimates.

This interesting relic of antiquity has escaped entire peeing owing to the noble carved seats; but some of the pews hide a large number of handsome bench-ends. By bringing these to light, and by sweeping away the east and west galleries, and those in the north transept, and the opposite tower arch, the number of seats would be materially reduced.

"Kick out all pews and galleries, and the seats would be reduced one half." This always sounds very heartless and wicked, and meets with the opposition of those who think that what was good enough for their respected and immediate ancestors is good enough for them. Is this a hopeless case? BRAUNTONIAN.

BRITISH ARCHAEOLOGICAL SOCIETY OF ROME.

SINCE our last notice they have had an excursion to the French part of the Palatine to see the ruins of the Palace of Therius and Caligula, with the subterranean passage made by Vespasian for the Emperor and his suite to go from the private apartments at the north end of the hill to the public State apartments in the centre. The day being open to the public by a general order, Signor Rosa could not have prevented the Society from going on that day had he wished to do so. He did not make his appearance nor send any apology for having shut his door in their faces on the previous Thursday. M. Lanciani, a young architect, was the guide, but as he did not speak English, Mr. Parker walked with him and interpreted. Mr. Parker was obliged in some instances to express dissent from his opinions, especially on the subject of the Intercolumnium, or valley across from east to west, dividing the hill into two parts, the southern part of which, according to Signor Rosa, is the Velia. M. Lanciani said that the proof of this was that there are houses of the time of the Republic in this valley hurried by the holdings of the Cæsars, and he pointed out the pit in which those houses were to be seen: but as there was room for not more than half a dozen persons at a time, and the party amounted to upwards of a hundred, he requested them to examine this detail afterwards.

After the lecture, Mr. Parker, with Mr. W. Cotton and others, went to examine the alleged remains of "houses of the Republic in the

valley." Instead of these remains, they found some small brick chambers of the third century without windows, and with fresco-painting on the vaults. These chambers are built in the great subterranean passage from the Palace of Augustus at the south end of the hill to the Public Chambers in the centre, in the same manner as that of Vespasian from the northern palace. The passage is vaulted and has no windows in it, having evidently always been subterranean, and this great passage runs north and south across the alleged valley. The small chambers were for the use of the Emperor in the hot summer months, as in the palaces.

SMOKY CHIMNEYS.

Your correspondent, "R. J.," asks if any of your readers can suggest a cause, or a cure, for the smoky chimneys in his house.

I have just completed the building of such a house as that named by "R. J.," and for some weeks after we moved into ours it was in quite as bad a condition with regard to smoke and down-draught as that with which your correspondent is troubled.

With your permission I will give, very briefly, the means I employed to ascertain the cause of the mischiefs, and say what was done to remedy the evil.

My object was to ascertain if the heated air and smoke were able to make their way into adjoining flues in which no fires were burning; because, if I found this to be the case, I felt sure that the contrary would also occur,—viz., that the cold air would enter the flue through which the heated air was ascending, and thus cause a down-draught whenever the wind was high, or when the fires were allowed to get low.

I first had a plate of lead out to fit on to the top of the chimney-pot (a bishop's cap), so that when the former was put into position, the smoke was completely prevented from issuing in the usual way. A fire was then made in one of the grates, so as to cause a dense volume of smoke to ascend, and a man was sent on to the roof to place the lead plate on the chimney-pot from which the smoke was issuing. Under these circumstances only one of two things could happen,—either that the smoke would pass into an adjoining flue, or come down into the room. In fourteen of the flues the smoke passed easily from one to the other, and the openings were found to be caused by an entire absence of pargeing, or, in some cases, to the fact of bricks having been left out here and there in the "midfothers."

The flues were laid open from the outside, one by one, and well pargeit with good hair mortar, and were then built up again.

The remedy has, on the whole, been very successful. Except during high winds, such as we have had for the last few days, we are not troubled with smoke in the rooms, and when it does come it is easily controlled. Of down-draught, when the fires get low, we have scarcely any at all. M. R. C. S. ENG.

SUN DIALS.

Sir,—As your correspondent, "E. L. G.," has taken upon himself to pronounce judgment upon the Highgate dial, which was projected by me for Mr. Cockerell, may I ask of him ("E. L. G.,"), how any shadow can be projected upon a sun-dial, parallel to the equator at the time of equinox? and still move, how when the sun is beyond the equator?

Quoting some of "E. L. G.'s" own words, I would suggest that, "In fact, the most natural, most obvious, and best thing to do," is to examine, carefully, our own work before venturing to criticize that of others. W. SCARBOLL.

CLOSED DOORS AT SOUTH KENSINGTON.

Sir,—A letter under the above heading in the last number of the *Builder*, p. 193, seemed to me to call for comment, as it is calculated to mislead. Your correspondent writes, "May I urge the hardship—and it really amounts to this—of closing the South Kensington Museum at four o'clock on Saturdays?"

Now, the museum proper is open until ten o'clock on Saturdays, as on Mondays and Tuesdays; but there is a portion of it, a sort of annex, where the models of ships are exhibited, that closes at four, and possibly there may be other outlying departments which, being under temporary regulations, are of necessity closed likewise; as the days lengthen, probably the time for keeping them open may be extended also, as was the case at the embryo museum, known as "the Brompton Boilers." It is a pity your correspondent did not inquire of one of the numerous policemen who are on duty whether there was anything else to be seen: he would then have received every information. It is impossible to find a more civil, well-behaved, intelligent, and obliging set of men anywhere in the public service, than are the policemen on duty in the Museum;

and I am quite glad to have this opportunity of recording my estimation of the manner in which they conduct themselves. My visits to the Museum have been neither few nor far between, so that I have had good experience of their great civility and patient attention: always at hand, never in the way; and so, I repeat, it was a pity your correspondent did not apply to one of the policemen and inquire if there was anything else to be seen; he would not then have had occasion to conclude his letter by saying, "It seems simply absurd for a popular institution to close its doors at" four o'clock on Saturdays. Undoubtedly it does, and therefore the Museum at South Kensington keeps its doors open until ten.

We are barely entered into March, and are only just emerging from dark evenings: so it is scarcely fair to begin grumbling yet; and, really, when we contemplate the amount of art-treasures collected at South Kensington in so few years, I think Mr. Cole deserves the highest commendation, not condemnation, for what he has done. I was myself at the Museum last Saturday until after 5 o'clock, and on the previous Saturday until 6:30; so I can vouch for the doors not being closed at 4. ART-LOVER.

INSECURITY OF SECURITIES.

Sir,—For the possessors of property in the stock of large companies and in other securities, a new danger has arisen separate even from the misvaluation of funds, of which the public has heard of late so much.

By a decision of the Judicial Committee of the Privy Council, given on the 13th ult., it appears that bankers are not answerable for such securities as debentures left in their care. Mr. Richard Lewis had left in the care of his bankers, debentures to the value of 10,450*l.*, which were stolen by one of the bank clerks; and it is now shown to the law of the land that bankers are not liable for the safe custody of such documents, unless through the grossest negligence; and that the public are consequently at the mercy of any trick on a pitiful scale of a slaver who may be in the banker's employment, and, having a taste for the extravagant living of the period, may be reduced into an ultimate indistinct appreciation of the difference between men and laws.

Moreover, documents duly secured in apparently safe boxes are deposited with bankers and left there for years, from which, under the present state of the law, there is no security that the most valuable documents may not be abstracted,—and years before such frauds may be discovered; and, consequently, detection of the criminal nearly impossible. It, therefore, appears essential that the public at large should take care of their own securities,—a step to which they are now driven.

In the interest of lock and safe engineers, we should be obliged by your giving publicity to this fact, which, if properly considered, must lead to the improvement of the trade, and the more general adoption of the approved safest methods of security for documents of this nature and other valuables. H. H. & Co.

CHILDS-HILL DRAINAGE.

Sir,—In the *Builder* of January 25, 1869, appeared an advertisement addressed to "Engineers," in which the Childs-hill Drainage Committee invited schemes for the best mode of draining the district of Childs-hill, Hendon (close to Hampstead). It stated that the engineer whose scheme was selected would be employed "upon terms to be arranged between the committee and such engineer."

The following talented engineers competed:—

Name	Estimate.	Commission.
J. Blenkarn	£5,308	£252
C. H. Bright	3,987	(not stated).
J. A. Ruge	3,927	203
J. P. Brossy	2,730	5 per cent.
Lucas & Wilkinson	2,490	10 "
P. Black	1,788	4 "
H. H. Fulton	1,730	140 "

A host of other gentlemen took a great deal of trouble in the matter; but the above seven, at considerable outlay and toil, surveyed the whole district, and prepared most elaborate plans, estimates, and specifications. Although Mr. Ruge was nominally selected, a year has elapsed, and the drainage has neither been done nor begun; and if it ever will seem doubtful, Mr. Ruge cannot yet set to work, nor has he received a shilling. Surely this is not quite fair and right! Would a private individual do so? Why does "a public body" thus act? Is it (to partly paraphrase a well-known quotation) because it has no soul to be saved, and no corporal part to be lost? FAIR PLAX.

CHURCH-BUILDING NEWS.

Lowestoft.—Christ Church, Lowestoft, has been opened for divine service. The edifice is in the Early English style, and consists of nave, aisles, chancel, organ chapel, tower, and spire, with porch and vestry. The nave is lighted by four double-light windows in the sides, and a fan-light window in the gable; also by a three-light window in the chancel. An arcade of moulded arches divides the nave from the aisles, supported upon ornamental cast-iron columns. The aisles are lighted by three double-light windows, and a three-light window in the gable. The tower is placed at the south-east angle of the nave, terminating in a spire, rising to a height of about 80 ft. There are two principal entrances, one under the tower into the nave, forming a porch, and the other into the aisle. The porch and chancel are paved with Maw's mosaic tiles, and the aisles with blue and red tiles to pattern. The roofs of nave and aisle are all open, and boarded on the upper side of the rafters; that of the chancel is divided by moulded ribs into panels. All the wood fittings and roofs are stained and varnished. The windows are glazed with cathedral glass, in lead quarries, and stained-glass margins. The walls

are faced with white brick, and relieved with light red bands and Bath stone dressings. The roofs are covered with blue and green slate, in alternate bands. The building is planned to seat about 500 persons, and was designed by Mr. H. Oldham Chambers, architect, Lowestoft. The contractors were Messrs. Jackson & Mounco, of Blandstone; and the sub-contractors, Messrs. J. G. Balls, Lay, and Skyles, of Lowestoft.

Reading.—The new reredos of St. Mary's Church is now complete. The centre group represents our Lord surrounded by his Apostles, addressing to the listening multitude the words, "Come unto Me, all ye that labour and are heavy laden, and I will give you rest." Mr. Earp, of London, was the carver. The arcade to the north of the centre group contains three figures in mosaic, signifying, "The Old Testament," viz., Moses—the Law; David—the Psalms; Daniel—the Prophets. The arcade on the South side also contains three figures signifying "The New Testament," viz., St. Luke—the Gospels and Acts; St. Paul—the Epistles; St. John—the Revelation.

Dis.—A reredos has been placed in the chancel of the parish church, at the expense of the Rev. C. R. Manning, the Rector. It is about 8 ft. 6 in. in length at the back of the communion table, and rises a few inches above the sill of the east window; the rest of the east wall on either side, and of the north and south walls, as far as the rails, being panelled in oak, with diapered patters in colour. Its material is Caen stone, of a uniform cream-white colour, inlaid with marble, and bosses of spar, gold, and crystal. A large panel forms the main design, and is filled with four quatrefoils sunk in the stone, each containing one of the well-known emblems of the four Evangelists, carved in alabaster, on a background of black marble. In the centre is a cross of black marble, and gold mosaic, the arms terminating in crystal bosses, and the front resting on a slab of red Devonshire marble. Between the evangelist symbols are floral patterns, in green and red marbles, gold mosaic, and bosses of Derbyshire spar. A band of grey marble, inlaid with black, runs below the panel, and a cornice of pierced trefoils and sculptured leaves extends along the whole length of the top, projecting in the centre, to form a three-sided canopy, which also is ornamented with marble and gold bosses. The whole design is supported at each end by a double buttress, rising from the ground, and inlaid like the rest. This part of the work was executed in London, by Messrs. Field. The oak panelling was executed in Dis, by Messrs. C. Bishop & Son. On the south side the panels form three "sedilia," or seats for clergy. Above the reredos, except where the line is broken by the windows, is carried a coved cornice, painted in the hollow part with a flowing pattern, the end next the windows being finished with a carved elbow, and those at the rails with a lofty standard, each surmounted by a figure of an angel, with uplifted wings. A plinth of oak supports the panels all round from the floor, in which are devices in sunk circles, but without any colour. All the painting has been executed, under the superintendance of the architect, by Mr. Herbert Orshourne, Stowmarket. The whole of this work was designed, after suggestions from the rector, by Mr. Augustus E. Browne, of Dis.

Lincoln.—The new church for the combined parishes of St. Peter-in-Eastgate and St. Margaret will, in all probability, be shortly commenced. At a recent meeting of the committee Mr. Blomfield, of London, architect (son of the late Bishop Blomfield), was selected to prepare the designs. The cost of the building is estimated at 2,500*l.*, and 2,120*l.* have been already subscribed.

Wickham Market.—Efforts are now being made to restore the church, which dates back to the year 1310, and has of late years been falling into decay. The tower, which is octagonal, is surmounted by a leaden spire, rising to a height of 135 ft., and is a conspicuous landmark for seagoing vessels. Plans for the complete restoration of the fabric, with the addition of a new aisle on the north side, and the substitution of benches for the present old-fashioned pews, have been made by Mr. E. C. Hakewell, and submitted to the bishop, who has expressed his approval. The total cost is estimated at 1,300*l.* The subscriptions in the town already amount to upwards of 185*l.*; the Rev. W. T. Image, the vicar, has in addition to this a sum of 57*l.* promised to him, and it is hoped that the neighbouring landowners, and all who have an interest in the town, will

liberally assist. At a vestry meeting a committee has been formed to co-operate with the vicar in soliciting subscriptions.

Warrington.—A new church at Warrington, dedicated to St. Ana, has been consecrated by the Bishop of Chester. The church is situated in a district taken out of that of St. Paul's, Warrington. An endowment has been provided by Mr. W. E. A. Beamoat, of Orford Hall, who has also given 2,500*l.* of the total cost of 5,200*l.*, the remainder having been contributed by the public.

Webbhead.—The plans of the new church have been prepared by Mr. Preedy. Messrs. McCann & Everal, of Malvern, are the contractors. The site is at the corner where the road from Foxlydiate to Bentley intersects the one running eastward to Hill Top, and was given by Mr. R. Hemming. The building is to be of stone externally, and internally from the gray and the red beds of the Waterstone formation, at Hewell and at Finstall. Bath stone is to be used for the decorations and dressings, and at the entrance of the porch a pair of polished marble shafts. The roof will be of Broseley tiles; inside roof, open timbered; seats, pine, stained and varnished. The style is Early English. The chief east window is a three-light one, surmounted by a wheel heading; with trefoil windows on each side. The plan is simply nave and chancel, with a south porch at the western end, a bell gable at the intersection of nave and chancel, and a vestry, and organ arch between it and the choir. The accommodation is for 200—164 adults and 24 children, with 12 in the choir. The total length, inside, is 88 ft.; width of nave, 22 ft.; width of chancel, 18 ft.; length of chancel, 24 ft.

DISSENTING CHURCH-BUILDING NEWS.

Halifax.—A new Congregational or Independent chapel has been opened here for divine service. The style of architecture is the Early Geometrical, and the chapel is built of North-west ramp-pitch-faced wallstones, with freestone dressings. The edifice is 113 ft. 6 in. long by 53 ft. wide, and 53 ft. high externally, exclusive of minister's and other vestries at the back. It is divided into nave and side aisles by cast-iron pillars supporting the galleries and roof, and five bays in length, the bay next the organ recess being much wider than the others, so as to allow of the church being enlarged at some future time by the addition of transepts, which are prepared for in the erection. At the north end of the building there is an octagonal recess for the organ, 22 ft. wide, and 6 ft. 6 in. deep, divided from the nave by a deeply moulded and enriched arch springing from granite columns, with carved freestone capitals. Over the pillars dividing the bays are moulded arches in brick-work and cement, between which and in the centre over each pillar are granite columns with carved capitals and moulded bases, supported upon carved corbels, upon which the roof principally rests. The internal wood-work, where exposed, is of pitch pine. The pews are 2 ft. 10 in. wide, and allow 20 in. for each person. On the ground floor there is accommodation for 568 persons, and in the gallery 364, making a total of 932 sittings. In Hopwood, the south front, are the entrance vestibules and staircases, and at the south-west angle there is a tower and spirelet 120 ft. high. The principal entrance is in the centre of the front, through a deeply-moulded and enriched doorway, with deeply-moulded windows on each side, over which there is a large five-light traceried window. On each side of the principal entrance, and in the same point, are the entrances to the galleries. On the side elevations, in each bay of building, the windows under the galleries are arranged in complets, over which are three-light traceried windows to light the galleries, with gables and ornamental finials over each. In the transept gables there are large four-light traceried windows, with column-d mullions and carved capitals. All the windows are glazed with tinted glass in quarries, and with ornamental borders. The grounds are inclosed with wrought-iron railings and gates. The masonry work has been executed by Messrs. Michael Firth & Co.; carpenters and joiners, by Messrs. John Dyson & Son; slating and plastering, by Messrs. Joseph Bancroft & Son; plumbing and glazing, Mr. George Walsh; ironfounders' work, Mr. James Farrar; and painters', Messrs. W. Lee & Sons. The works have been carried out under the directions of the architects, Messrs.

Roger, Ires, & Son, of Halifax; Mr. Powell being clerk of the works. The estimates amounted to 6,638*l.* 2s. 5d., and, with the lighting and heating apparatus, boundary rails, and cost of land, the whole cost will be about 9,000*l.*, exclusive of the cost of schools, which it is proposed to erect at some future time. The church is lighted by corona gaseliers, suspended above the galleri-s, and also by ornamental brackets affixed to the walls. The heating apparatus has been supplied by Mr. E. Lambay, of Halifax. No organ has yet been erected.

STAINED GLASS.

West Church, Stirling.—A stained glass window has just been set up in this church. It forms the central window on the south side, nearly opposite to the terrace of the bowling-green, and consists of nine divisions. The three principal designs, with the texts above of which they are illustrative, occupy the lower six compartments. The whole are Scriptural subjects—the representation of Christ being the principal in each of them. In the first illustration of the words "Come unto me, all ye that labour," &c., are the figures of a negro, fettered, and in the attitude of supplication, and also of a woman in the attitude of reverential homage. The second is "Christ with Martha and Mary at the tomb of Lazarus." The third, in which there are six figures—that of Christ, as in the others, being in the centre,—it is illustrative of the words "Him that cometh to me I will in nowise cast out." The window is in memory of the late Mr. John Dick, of Craigenfell, Provost of Stirling, who died 22nd April, 1865. Messrs. Ballantine, of Edinburgh, were the artists. It cost upwards of 100*l.* The glass is rough and crystalline in texture; none of the colours are ased, but all pot metal, and made in the glass. On the faces there is little or no shading, and the light and shadow in the draperies and accessories are mainly produced by the unequal thicknesses of the coloured pot metals. In this best specimens of early glass have been followed, and the brilliancy throughout is equal, and purely mosaic. There is no obscurity or semi-transparency. The groundworks are all broken up by little bits of glass of different intensities of colour. We understand Messrs. Ballantine have in this instance followed the advice and directions of the president of the Royal Scottish Academy, Sir George Hervey. While in this window the strongest colours predominate, the light which passes through and falls around is colourless. This was stated by Sir George Hervey, in a letter some time ago, to be characteristic of the best specimen of coloured glass.

Church of Westbury-upon-Trym.—The great east window in the Canyuge chapel of this church has just been filled in, as a memorial, with painted glass, by Messrs. Heaton, Butler, & Bayne, of London. The window is filled in with Perpendicular tracery, and is divided into six subjects taken from the miracles of our Lord, and forms a continuation of the story of His Life, illustrated in the four windows of the chancel apse. The first compartment of the new window represents the Marriage of Cana; the second, the Pool of Bethesda; the third, the Raising of Lazarus; the fourth, the Widow's Son restored to Life; the fifth, the Raising of Jarius's Daughter; the sixth, the two Blind Men receiving their Sight. Each subject occupies two lights, and the window is divided into two parts by ornamental canopy work, which is repeated again above the subjects in each light. These canopies give character to the window. The upper part of the tracery is filled in with figures of angels playing on various instruments.

Mariborough College Chapel.—A stained glass window has been erected in this chapel, to the memory of Dr. Cotton, the late bishop of Calcutta. The cost of the window will be defrayed by voluntary contributions. The artists are Messrs. Clayton & Bell, who were desired to erect the best window possible regardless of cost. The window is a two-light, each light being divided into two compartments. The subjects are:—Agabus binding the hands of Paul, symbolical of his going "bound in the spirit" to Jerusalem. Beneath is a north-east view of the College Chapel. The other light represents Paul preaching at Athens, with the Parthenon in the background; and, on the panel, the cathedral at Calcutta.

Durham Cathedral.—In the presence of the Dean and a considerable number of ladies and gentlemen, a stained glass window, in memory

of the late Archbishop Thorp, Warden of Durham University, has been uncovered in this cathedral. In the two centre lights are represented the chief events of our Lord's life. In the next light, on the left, are groups of the "Apostles;" on the right the "Prophets;" while on the extreme left are the "Martyrs;" and on the extreme right the "Holy Church." Above, in the tracery, are saints, angels, Cherubim, and Seraphim, and the Holy Spirit. Above each group is the legend, "Te Deum Laudamus," and the angels bear scrolls with "Alleluia, Alleluia."

Mossley Church.—The east end of this church has just been ornamented with a stained glass window, which has been erected as a memorial of the late Rev. John Hextall, who was incumbent of Mossley for thirty-three years. The space over the communion table has been divided into three compartments: the centre light contains a full-length figure of our Lord as the Good Shepherd, hearing on his right shoulder a lamb, and holding the pastoral crook in his left hand. To the right of the Good Shepherd stands Moses, with the tablets of the law. To the left, St. John the Baptist. Under the centre figure is the text, "I am the good Shepherd and know my sheep, and an know of mine," under the figure of Moses, "By the deeds of the law shall no man be justified," and under that of St. John the Baptist, "Repent ye, for the kingdom of Heaven is at hand." The figures stand out from a ground of parti-coloured quarries, which are again relieved by a coloured border. Messrs. Cox & Co., of London, supplied the work.

COMPETITIONS.

South Metropolitan Schools, Sutton.—The three premiums of 40*l.* each, offered in this competition, have been awarded to Mr. Wallen, London; Messrs. Wilson & Wilcox, Bath; and Messrs. C. J. Phipps & F. M. Harvey, London. There were thirty-eight competitors.

Public Hall, Exeter.—The committee have selected the plans of Mr. C. J. Phipps, London, who is appointed to carry out the works. There were twenty competitors.

Books Received.

The Elements of Plane Geometry for the use of Schools and Colleges. By RICHARD P. WRIGHT. With a Preface by T. ARCHER HIRST, F.R.S. London: Longmans & Co. 1868.

Outlines of Geometry; or, the Motion of a Point. An introductory Treatise. By W. MARSHAM ADAMS, B.A. Longmans & Co.

Cassell's Technical Manuals: Orthographic and Isometrical Projection; Development of Surfaces and Penetration of Solids. By ELLIS A. DAVIDSON, Cassell, Pater, & Galdip.

Right Lines in their Right Places; or, the First Principles of Drawing and Design without Instruments. By ELLIS A. DAVIDSON, Cassell & Co.

The geometrical basis of technical education is now being applied, in a variety of forms and degrees of simplicity or progress. "Right Lines in their Right Places" is the most primitive of those under notice. Wright's "Elements" is a volume on a larger scale than the others named above, and more thoroughly geometrical in its nature and scope: it is a sound and useful work. Adams's "Treatise" relates to the difficulties of elementary geometry, and the general principles of the higher plane curves, with special reference to Euclid's elements. Davidson's "Treatise on Projection" professes to contain the simplest methods of projecting solids, the curves formed where one solid penetrates another, and the shape metal must be cut so that on being rolled, bent, or folded, it may give the required form. The work also contains 100 questions for examination.

Miscellaneous.

Robbing a Foundation Stone.—The foundation stone of a Primitive Methodist chapel has been laid near Huddersfield; and since the ceremony some person has lifted the stone and taken from the cavity beneath a bottle containing a shilling, a sixpence, a penny, and a half-penny piece, all new coins, and a number of documents and papers.

Mr. Henry Leslie's Concerts.—At the concert on March 4th, which was mainly orchestral, the soloists were Madlle. Liebhart and Herr Joachim, who both delighted their audience beyond measure. The great event of the evening was the performance of Samuel Wesley's motet for double choir, "In exitu Israel." Mr. Leslie deserves well of the public for the admirable entertainment he provides. On the 18th Miss Edith Wynne and Mr. Sims Reeves will take part in the concert, and some fine things are promised.

Equalization of the Metropolitan Poor-rates.—Meeting of Parochial Delegates.—With a view of sifting the question of equalizing poor-rates all over the metropolis, and to gain as much information as could be furnished, a central meeting of delegates from the majority of the metropolitan vestries was held in the vestry of St. George the Martyr, Southwark, on Thursday in last week. About fifty gentlemen attended to state the special grievances which had befallen their respective parishes under the unequal and unjust system of rating. The chair was occupied by Mr. E. Collinson, of St. George the Martyr vestry, who called upon the vestry clerk to read a report furnished by the House of Commons a few years ago, showing that even at that time it was considered desirable to extend the area of rating. A table of extracts from returns ordered by the House of Commons showed the total area of the metropolis to be 77,944 acres, and the population in 1861 to have been 2,802,367. The average pauperism (indoor) was said to be 35,972, and the outdoor 100,397. The total cost of the relief given to the poor amounted to 1,316,089*l.*, out of a total rateable value of 16,818,768*l.*, the average rate being 1*s.* 6*d.* in the pound. Several speeches were made in support of the following resolution, proposed by Mr. Fowler (of Lambeth), and carried unanimously:—"That a deputation, consisting of representatives from all the parishes of the metropolis, should lay a memorial before the Right Hon. J. G. Goschen at the earliest possible period, and that a sub-committee be at once formed to prepare the memorial."

Edinburgh Workmen's Houses Improvement Company (Limited).—The seventh annual general meeting of this company has been held; Admiral Ramsay in the chair. The report stated that the affairs of the company continued in a sound condition. Although the directors were disappointed in their expectations of selling the houses to the extent they anticipated—only one of the houses having been sold during the past year, making a total of nine houses sold out of 132 houses built by the company at Dumbiedykes—yet they were gratified to find that a fair return on the capital invested was derived from letting them. The report stated that there was a great and increasing demand for the houses, and there was no loss what ever arising from vacant houses. The net revenue for the year enabled the directors to declare the usual dividend of 5 per cent. on the subscribed capital, and to add 8*l.* 9*s.* to the reserved fund. The report was unanimously adopted.

The Condition of Leicester-square.—Judgment was given on Saturday last in the case of Webb v. Wyld and Talk, in which the owner of a house in Leicester-square sought to compel Mr. Wyld and Mr. Talk to restore the garden of the square, and to put the railings in repair. The Master of the Rolls found he was unable to give any relief to the plaintiff, because a court of equity could not enforce specific performance of an agreement to repair; he, however, dismissed the bill without costs, as he considered the defendants were morally bound to do what Mr. Webb had required of them.

Hammersmith Bridge.—In the Commons, Lord Bury has directed the attention of the Home Secretary to a letter in a morning paper, signed by Mr. Lambton Young, secretary of the Royal Humane Society, which had been dictated by the fear that there might be an accident on Hammersmith Bridge in the forthcoming boat-race between the Universities of Oxford and Cambridge. This bridge was built fifty-two years ago, and was constructed rather with a view to lightness and elegance than to strength and durability. There is reason to believe that the iron has become weakened from the pressure put upon it. Mr. Bruce promised to communicate with the Board of Trade, and ask them to send an engineer to examine the bridge, who might report to the Board, and the report would be made public.

The Association for Prevention of Steam Boiler Explosions.—The following are portions of the report to the annual meeting of the members of this association. Number of members, 573; works, 747; boilers, 1,930; subscriptions, special service fees, &c., 3,944*l.* The committee have again the pleasure of submitting to the subscribers a satisfactory financial statement. The revenue of the association for the past year has attained to a higher point than during any previous one, and there is a balance in favour of the year's working of 305*l.* There were 59 boilers more under inspection at the close of 1868 than there were at the close of 1867, and a greater number upon the books of the association on the former date than ever before. The committee have again to note the increase in the number of entire examinations, 1,856 having been made during the past year, or, including the internal and the flue examinations, 2,060. This is the highest number ever made in one year. No explosion has happened to any boiler under the care of the association during the year, neither has any guaranteed boiler ever exploded. During the past year, 45 explosions have come to the knowledge of the association's officers as having occurred to boilers in the United Kingdom not under its inspection, by which 57 lives have been sacrificed, and 60 other persons injured. Almost every explosion is attributed to shortness of water through neglect of the attendants, and the verdict usually is accidental death.

The New Town Clock, Liverpool.—The finance committee of the town council accepted the tender of Messrs. Penlington & Hutton, for the supply of a clock for the new Municipal Buildings, at a cost of 575*l.* The clock has now been put up. Messrs. Warner, of London, furnished the bells for the sum of 51*l.* 10*s.* The hour-bell weighs 40 cwt. (and is in C)—two of the quarter bells are eight (G), and thirteen cwt. (C) respectively, and the other two 6 cwt. each (D and E),—and the Cambridge chimes are those which will be sounded. The clock goes eight days. It is of sufficient power to strike a bell of 40 cwt., and also to chime the quarters on four bells. The clock is made with a dead-beat escapement and adjusting pallets; all the wheels are made of hard gun-metal; the striking and quarter main-wheel are 28 in. in diameter, and 1½ in. thick; the watch or going main-wheel, 24 in. in diameter, and 1½ in. thick; the rest of the wheels in due proportion. From its elevated position the clock can be distinctly seen from a great distance in various directions.

Improvement of the State of the Agricultural Labourer.—A conference, attended by many influential gentlemen—Canon Girdlestone, Mr. Fawcett, Mr. Godfrey Lushington, Lord Lytton, the Earl of Shaftesbury, the Hon. Abernethy, and Sir John Bowring among the number—has been held at the Society of Arts, under the presidency of Earl Ducie, to consider the question of establishing a society for the improvement of the condition of the agricultural labourer. A long discussion took place, in which most things in turn were recommended as good for the labourer, except the proposed society, which it was resolved should not, for the present, at least, be called into existence.

Destruction of a Parish Church by Fire.—On Sunday week, during the celebration of divine service in Herringswell Church, the thatched roof was seen to be on fire. The congregation quickly dispersed. The flames, fanned by a strong wind, made rapid progress, and at length nothing but the bare walls of the church and tower remained. The fire is believed to have been caused by the stove-pipe getting red hot, in consequence of an accumulation of soot in that portion which came in contact with the roof. The church was not insured.

How to Prevent Fires.—The following is extracted from the *Japan Gazette*:—"One edict of the new Government, recently promulgated in Yedo, is of a character so extraordinary that we are not surprised to find all the Japanese thoroughly alarmed by it, especially as it has already had its penal clause carried into effect in one instance, and more are expecting the extreme vigour of the law. It is to the effect that 'every one with whom, or in whose house a fire originates, whether accidentally or not, shall be decapitated without any appeal.' (One man has been already beheaded under the statute. Few large fires occur in Japan in which some lives are not sacrificed."

South Kensington Museum.—The visitors during the week ending 6th March, numbered:—On Monday, Tuesday, and Saturday (free), from 10 a.m. to 10 p.m.—Museum, 12,598; Meyrick and other Galleries, 2,734. On Wednesday, Thursday, and Friday (admission 6*d.*), from 10 a.m. till 5 p.m.—Museum, 2,209; Meyrick and other Galleries, 205. Total, 17,736.

Manchester Academy of Fine Arts.—Supported by a large assembly of friends and those favourably disposed to local art, the annual exhibition of the Manchester Academy of Fine Arts, held in the rooms of the Royal Institution, on Tuesday, may be stated to have passed off with every success. Occupying two commodious and well-adapted rooms, the productions of the members completely covered all available wall space and the contributions were in every respect superior to any similar gathering.

The River Nene Improvement.—The principal portions of the work for the improvement of the navigation of the Nene from the sea to Peterborough are nearly complete, and it is only now necessary to carry out certain other works, which it is said could be executed at a comparatively small expense, but which would have the effect of improving the river to such an extent as would permit vessels drawing fourteen feet of water to reach Peterborough. It is understood that a careful survey of the present condition of the river has been in course of preparation, under the direction of Mr. Hamilton Fulton, Birmingham, Leicester, Nottingham, Northampton, Market Harborough, and other places, are all anxious, it appears, to have a seaport so near to them as Peterborough.

St. Andrew's, Hertford.—The committee for the rebuilding of this church have been obliged, from want of funds for rebuilding the whole edifice, to inform Messrs. Dove of their inability to accept their tender; and to pass the following resolution, proposed by the Right Hon. W. Cowper, M.P.:—"That the opinion of the architect, Mr. Johnson, be requested as to the feasibility and expediency of erecting the chancel and transepts at once, and postponing the erection of the remainder of the proposed church till the requisite funds have been collected; and also as to what increase of expenditure would be likely to be incurred by erecting the new church in two parts." The sum total collected and promised is between 2,000*l.* and 3,000*l.*

Proposed International Exhibition in Sydney, Australia.—A proposal for a Grand International Exhibition, to be held in Sydney in 1870, to celebrate the centenary of the discovery and taking possession of Australia in 1770, by Captain Cook, has been made in a letter, by Mr. Joseph Dyer, to the *Sydney Morning Herald*, of October 27th, 1868. Mr. Dyer proposes that the Exhibition should be held in a new central railway terminus which is said to be much wanted in Sydney, and which might as well be built now as in a year or two hence. He suggests Hyde Park, facing Elizabeth-street, as the site, but wherever placed in Sydney, of course the Exhibition could be held in it by way of inauguration.

"For three or four months of 1870," he remarks, "Sydney ought to be the Paris of the Southern Hemisphere." The first object of attraction would be the Grand Intercolonial Exhibition, to celebrate the 100th anniversary of the discovery of the colony. Here would be shown the highest efforts we are capable of in art and manufacture, in competition with the productions of the other colonies. Our engineers would show locomotive engines and railway carriages; our carriage builders, boat builders, tweed makers, boot and shoe makers, paper manufacturers, kerosene oil, glass, saddlery, tobacco, arrowroot, malzens, wine, and a vast variety of other arts, in which we can hold our own against foreign competition."

As the subject of a statue to Captain Cook, the discoverer of the colony, is now being agitated, the proposed Exhibition would form an excellent opportunity for its inauguration.

Closing Uninhabitable Houses in Liverpool.—Two houses in Brick-street have been ordered by the local authorities to be shut up till they be rendered habitable by the conversion of privies in them into water-closets, the provision of water supply to them, &c. They are inhabited by squatters, the proprietor being in a lunatic asylum.

South London Working Classes Industrial Exhibition.—This exposition has been crowded every night since its opening, the doors having to be closed frequently to allow of anything like a free passage for the people. The awards will be made known early in next week.

The Sanitary Condition of Birkenhead. The usual report of Dr. Baylis, the medical officer of health for Birkenhead, has just been published.

According to this report, the number of deaths in Birkenhead from all causes registered during the year was 1,074, which, computing the population at 52,233, gives the death-rate at 20.56 per 1,000, or but very slightly above 2 per cent. Since 1864 the death-rate has decreased from 24.39 per 1,000, being relatively a far greater improvement than has taken place in the health of the country generally.

After referring to the moderate decrease in the deaths from zymotic diseases, Dr. Baylis alludes to the "main poisoners of the atmosphere," upon which subject he says:—"The persistent abatement of the gigantic midden nuisance by conversion of the remaining privies into water-closets; the adoption of some scheme for the daily or weekly removal of ashes and other house refuse; the abolition of dung-pits; a more effectual surface cleansing, especially in hot weather, and the complete removal of street sweepings, which always contain much animal and organic refuse, are the remedies clearly indicated by the mortality lessons of the year."

Dr. Baylis further recommends the entire discontinuance of cellar dwellings. The number of births during the year amounted to 1,903, of which 953 were males, and 950 females; the natural increase of the population, i.e., the excess of births over deaths, was therefore 856. The usual majority of male births over females seems to have been very small.

Mr. Mark Firth's Almshouses, Sheffield. The corner stone of the almshouses at Ranmoor, the gift of the Master Cutler of Sheffield (Mr. Mark Firth), has been laid by the Earl of Shaftesbury, amidst a great concourse of people. The buildings are in course of erection, under the superintendance of Messrs. Hill & Swan, of Sheffield and Leeds, architects; and the structure is to be of such a character as will accord with the picturesqueness of the landscape skirting the romantic Porter Brook, near which it is placed.

Workmen and their Employers.—A conference has been held at Darlington between the ironmasters of the north of England and representatives of the workmen, to discuss the desirability of establishing courts of arbitration in the northern iron-trade district, and so prevent the periodical disputes and strikes which have been so disastrous to both masters and men. A joint committee of masters and men was appointed to draw up rules for establishing courts of arbitration and conciliation, and to report to a future meeting.

The Royal Academy Library.—Mr. John Leighton has addressed a printed letter to the Royal Academy of Arts upon the condition and future of their Library, in which he points out the extent to which it has been neglected, and the importance of now forming in the new building a special Library of Art that should be worthy of the Institution. The advice is well timed.

Local Government Act, 1858.—A parish which includes within its area a corporate borough, is a place "having a known or defined boundary," within the meaning of the Local Government Act, 1858, and may adopt the Act by resolution of the owners and ratepayers, although it is itself included in a Parliamentary borough. This was the holding of the Court of Queen's Bench, in the case of the Queen v. Hardy.

Big Sticks.—The vast timber resources to be found in the forests around the Cape Otway ranges, in Australia, are daily attracting more attention and likely soon to be publicly utilised. Mr. Barber, says the Geelong Advertiser, has erected a fine saw-mill in the vicinity of Gosling's Marsh, amongst giants of the forest, rising to a height of from 200 ft. to 225 ft., and promising a splendid supply, sufficient to keep the mill employed in its present position for three or four years.

Lichfield Cathedral.—There have lately been placed in three of the bays between the pillars near the reredos, metal screens, designed by Mr. G. Scott, and which have been manufactured by Mr. Atterton, of Lichfield. The screens are of wrought iron, and each is a separate floral design of a light and airy nature.

An English Brick House in America.—There is a house in the town of Greenland, New Hampshire, the bricks for which were brought from England in 1638. It is still in good repair.

Lowestoft.—A public hall capable of accommodating some 1,500 or 2,000 persons on public occasions, is about to be erected on the west side of Clapham-road, facing Surrey-street and the London-road. The ground, some 60 ft. by 157 ft., has been purchased of Mr. W. H. Thirite for the purpose. A company is forming, and the shares, 1l. each, are being taken up.

The Charterhouse.—We hear from the City Press that the ground, nearly two acres in extent, which was formerly the Charterhouse playground, has been let on a building lease, and tenders being now out, there is every prospect of its being shortly covered with warehouses and shops.

New Town-hall, Rochdale.—Several engineers having been invited to submit plans and tenders for warming and ventilating this Town-hall, we learn that the plans of Mr. Wilson W. Phipson, C.E., London, have been selected by the corporation.

TENDERS.

Table with 2 columns: Description and Amount. Includes tenders for residence near Kettering, cottages near Kettering, and pulling down and rebuilding a shop and warehouses.

Table with 2 columns: Description and Amount. Includes tenders for Mason's and Bricklayer's Work, Joiner's and Carpenter's Work, Plumber's and Ironfounder's Work, and Painter's and Glazier's Work.

Table with 2 columns: Description and Amount. Includes tenders for building a school at Pallion, building a house in Park-terrace, and Mason's and Bricklayer's Work.

Table with 2 columns: Description and Amount. Includes tenders for residence at Woodbridge, Suffolk, alterations and additions to 21, Coventry-street, and new shop and dwelling-house in the Whitechapel-road.

Table with 2 columns: Description and Amount. Includes tenders for alterations and additions to 21, Coventry-street, new shop and dwelling-house in the Whitechapel-road, and alterations and additions to 21, Coventry-street.

Table with 2 columns: Description and Amount. Includes tenders for alterations and additions to 21, Coventry-street, new shop and dwelling-house in the Whitechapel-road, and alterations and additions to 21, Coventry-street.

Table with 2 columns: Description and Amount. Includes tenders for alterations to 65, St. Martin's-lane, and Mr. W. E. Williams, architect.

Table with 2 columns: Description and Amount. Includes tenders for two chapels, lodge, boundary walls, and entrance-gates, to new cemetery, Pembroke Dock.

Table with 2 columns: Description and Amount. Includes tenders for alterations and improvements to Milton House, Farnborough, for Mr. Jas. Summers.

Table with 2 columns: Description and Amount. Includes tenders for erecting proposed Primitive Methodist Chapel at Ashford, Kent, and for reconstruction of premises, 15, Newgate-street, City.

Table with 2 columns: Description and Amount. Includes tenders for building St. Paul's Church, Upper Holloway, Messrs. Henry Jarvis & Son, architects.

TO SUBSCRIBERS.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES only should be sent. NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and not to the "Publisher."

BUENOS AYRES GOVERNMENT CERTIFICATE.—TRANSLATION.—We, the undersigned, at the request of Messrs. Jas. C. Thompson & Co., certify that the IRON SAFES of Messrs. CHUBB & SONS, London, of which these gentlemen are agents, were exposed for several hours to the fire that took place in the offices of the National Government on the evening of the 26th inst.; that in our presence they were easily opened with their respective keys; that the moneys and important documents they contained were found in perfect order; and that these safes are now in use in the National Treasury Office.—(Signed) J. M. DRAGO (Treasurer of the National Government), JOSE TOMAS ROJO, JOAN M. ALVAREZ. A true copy.—A. M. BELL.—Buenos Ayres, July 31, 1867.—A. M. BELL & SON, makers to the Queen and the Bank of England, 57, St. Paul's-church-yard, London; 68, Cross-street, Manchester; 28, Lord-street, Liverpool; and Horsley-fields, Wolverhampton.

The Builder.

VOL. XXVII.—No. 1363.

Islington of Old.*

THE northern suburbs of London, as Mr. Howitt remarks, are amongst the richest in historical and biographical reminiscences. Before the aristocratic class acquired the tendency to spread itself over the western flats, the higher grounds on the north, as well as the City itself, were the chief abodes of the nobles, as well as of the wealthy merchants of London. Hampstead and Highgate bear, even now, amid all the changes of the last two centuries, the traces of this former predilection of the affluent dwellers in, and frequenters of, the metropolis; and Islington, if possessing fewer of the residences

of the nobles of secular rank, is still more abounding in the memories of the intellectual heads of society. Its easy approach at all times from the City had made it at once the resort and the abode of a great number and a great variety of those who lived and worked there.

Many names and many derivations of name have been assigned to Islington. Isendune, Isendone, Iseltone, Hisselton, Hyseldone, Yseldon, and Eyseldon, are the various forms of the name which present themselves for Islington at various periods. Till almost a recent date it was a village standing isolated in open fields. Lysons says the parish is three miles one furlong in length, two miles one furlong in breadth, ten miles and one half in circumference, and contains, exclusive of houses, gardens, and wastes, 2,639 acres 37 perches of land, of which 22 acres only were arable, and about 10 acres nursery-grounds. When Doomsday Book was compiled, part of the parish was arable, part common pasture, and the rest consisted of woodland, oak, and beech, affording pannage for sixty swine. The population then consisted of only twenty-seven persons and their families, who were chiefly shepherds, herdsmen, and tillers of the ground.

From the earliest times Islington seems to have been amidst extensive open fields, the resort of shepherds and graziers. The church stood in a field on the highest part of the town, and not far from the woods. It was dedicated to St. Mary, and was considered to be of very ancient date; some imagining that there had been a church there from the Saxon times. When the old structure was pulled down to erect the present one, in 1751, it was in a very ruinous state, but the tower was so strongly cemented as to require gunpowder to rend it to pieces. We are enabled to reproduce a view of it given in Mr. Howitt's book.†

The fields about Islington have, from the earliest times, been a favourite resort of the Londoners for open-air exercise and sport. Distinguished archers here won the game-title of Marquis of Islington, as in other parts they won that of Earl of Pancras, or Duke of Shoreditch. King Henry VIII. himself conferred the title of Duke of Archers, or Duke of Shoreditch, on one of his guards, named Barlo. The distance at which a skilful archer could hit a mark is something wonderful. The longest distances between the marks in these fields were nineteen score, or 380 yards; the shortest nine score, or 180 yards. A curious fact is related of Topham, "the strong man of Islington," who could bend a stout poker round his neck, and do greater feats. He ridiculed the long-how in a public-house amongst archers as a plaything only fit for children. The archers waged him a howl of punch that he could not draw the arrow two-thirds of its length, and on trial he lamentably failed. Such are the marvels of practice. And though archery died out, pleasure continued to live, and sought its aliment at Islington. Thornton, in his "Conciseur," has described the Sunday excursions of the citizens to this village, to drink ale and smoke their pipes; and Goldsmith has celebrated the tea-parties, and the hot rolls and butter at White Conduit House. Nobody enjoyed such holiday trips into the country near London more than Goldsmith. In what he called his "Shoemaker's Holidays," he often turned his steps towards Islington. Three or four of his intimate friends, says the "European Magazine," rendezvoused at his chambers to breakfast about ten o'clock in the morning. At eleven they proceeded up the City-road, and through the fields to Highbury Barn to dinner. About six in the evening they adjourned to White Conduit House to drink tea; and they concluded the evening by supping at the Grecian or Temple Exchange Coffee-house, or at the Globe in Fleet-street.

The parish of Islington contains six districts, or liberties, named from the manner in which they are situated.—St. John of Jerusalem, Upper Barnshury, Lower Barnshury, Canonbury, The Prehend, and Highbury, or Nowington Barrow. It contains also the hamlets of Upper and Lower Holloway, Ball's Pond, Battle-bridge, the City Gardens, Kingsland-green, and the greater part of Nowington-green. It is also divided into eight ecclesiastical districts, namely,—St. Mary's, St. John's, St. Paul's, Holy Trinity, St. Peter's, St. James's, All Saints', and St. Stephen's.

One of the oldest establishments at the foot of Highgate-hill, just above Holloway, and near to where Whittington's stone is placed, was a Lazar-house, or hospital for lepers. This was one of four such hospitals erected at some distance out of London for the reception of people afflicted with the leprosy, or, as it was called, "the linenless disease."

Mr. Tomlin thinks that the old Whittington Stone was merely the basement of a cross once standing there, of which he gives a woodcut, and that this part of the story of Whittington is a myth. But why so? asks Mr. Howitt; the basement of a cross by the wayside, from which the cross itself was broken, is just the sort of seat of which a wayfarer would avail himself.

In Nelson's time there were some old houses which appeared to have belonged to persons of eminence on the north side of the road at Upper Holloway. In one of them, which became the Crown public-house, and which has long disappeared, there was a tradition that Cromwell had lived. Nelson doubts Cromwell ever having a house here, but thinks he might have visited his friend, Sir Arthur Haselrigge, who had a residence in Islington.

Highbury, famous for springs and conduits which used to supply part of the city before the making of the New River, has always been

noted for its elevated situation and its fine views over Stamford-hill, Epping Forest, Hornsey-wood, Muswell-hill, Crouch-end, Highgate, Caen-wood, Hampstead, and Primrose-hill. The water from the Highbury springs was conveyed as far as the White Conduit and St. Giles's, Cripplegate, and carried from the conduit to the private houses by men called water-bearers, in vessels called tankards, holding about three gallons each.

Of the New River we have often spoken, and we need not recur to its origin here; nor to the life and doings of Sir Hugh Middleton.

The dangers of the road between London and such suburban villages as Islington were extraordinary in old times. Nelson says that as late as 1770, and later, the roads were so dangerous betwixt London and Islington, that few ventured back to London in the evening, they stayed in the village all night at the Angel, the Lion, or the Pied Bull. Even in the heart of the villages robberies were committed; both carriages and foot passengers were frequently stopped in the most daring manner; and it was usual for people walking from the City in the evening to wait at the end of St. John-street till a sufficient party were collected, who were escorted to Islington by an armed patrol appointed for that purpose. The precincts of Islington were the haunts of such notorious robbers as Duval and Tarpin.

Canonbury Tower, or House, the chief part of which still remains, was possessed in the sixteenth century by Sir John Spencer, who was Lord Mayor of London in 1594, and was reputed to be the richest commoner of his time; his town residence was Crosby Hall, and Canonbury House was therefore a sort of country residence at that time. The greatness of Sir John drew upon him dangerous eyes, and a plot was laid by a Dunkirk pirate to waylay and kidnap him for the purpose of obtaining a ransom for him, which it was said would not have been less than 50,000*l.* Sir John, however, escaped accidentally by remaining in London all the selected night, and the pirate and his men had to fly and embark for Dunkirk in the morning. But a more successful pirate turned up in the lover of Sir John's daughter, who stole her away in a baker's basket. Sir John resolved to disinherit her in consequence, and on Queen Elizabeth asking him to stand sponsor along with herself to the first child of a young couple who had been abandoned by their father, he resolved to make this child his heir, but to his astonishment discovered that it was his own grandchild whom he had adopted. This is one of the best anecdotes extant of "good Queen Bess."

As London, under the names of Canonbury and Islington, came crowding up about Canonbury Tower and its ample gardens and fair lakes, the proprietors began to desert it for more distant resorts; it became the house of the steward, and the chambers were let as lodgings to gentlemen from London who sought suburban quiet. Newbery, the publisher, had rooms in it, and Goldsmith used to visit him there. As difficulties pressed on Goldsmith, he would remain hidden there for weeks, giving out that he was away in Yorkshire, or elsewhere. He came to like Canonbury House so much, that he had summer lodgings in it, and his literary friends used to visit him there. Sam. Johnson, no doubt, showed his ponderous figure there frequently. He and his associates would adjourn to the Crown Tavern in the Lower-road, and be very jolly. It is said that Goldsmith wrote the "Deserted Village," the "Traveller," and part of the "Vicar of Wakefield," in Canonbury Tower.

Washington Irving visited Canonbury Tower because Goldsmith had inhabited it. He says: "I was shown the very apartment. It was a relic of the original style of the castle, with panell'd wainscot and Gothic windows. I was pleased with its air of antiquity and its having been the residence of poor Goldy."

* "The Northern Heights of London; or, Historical Associations of Hampstead, Highgate, Muswell-hill, Hornsey, and Islington." By William Howitt. London: Longmans & Co. 1859.

† See p. 236.

Irving located his "Poor Devil Author" there, and described what he himself, no doubt, saw. The view given* is from a print in Mr. Gardner's Collection. The "tower" is now surrounded with houses. Within the last ten years some thousands of houses (we speak from personal knowledge) have been erected in Islington.

The Pied Bull, to which allusion has just been made, stands not far from Islington-green, and is said to have been the residence of Sir Walter Raleigh. It is now a public-house, as the name implies. It has undergone many alterations. The Queen's Head, another public-house, in Lower-street, is traditionally said to have been the residence of Lord Treasurer Burleigh, and to have even been occupied by the Queen herself occasionally. When Brower compiled his "Beauties of England and Wales," in 1816, the "Queen's Head" was one of the most perfect specimens of ancient domestic architecture remaining in the environs of London. It was a strong wood-and-plaster building of three stories, projecting over each other, and forming bay windows in front, supported by brackets and corved figures. The centre protruded several feet beyond the rest of the front, and formed a commodious porch, to which there was a descent of several steps. The superstructure was supported by figures of carved oak, crowned with Ionic scrolls, standing on each side of the entrance.† The interior was in the ancient style of oak panelled wainscot, stuccoed ceilings, and carved chimneypieces. The stone slab over the fireplace of a front room on the ground-floor had a classical design of Diana and Actæon in relief, with mutilated figures of Bacchus, Venus, &c. This ancient building was pulled down in 1829, and a new house, still called the old "Queen's Head," erected on the site. We may add to what Mr. Howitt says, that the bas-relief mentioned—a coarse work—and some other of the fittings, including one of the ceilings, are set up in the present house.

The ancient Angel Inn, which was pulled down in 1819 to make way for the present one, exhibited the usual features of a large old country inn, having a long front, with an overhanging tiled roof, and two rows of windows, twelve in each row, independent of those in the basement story. The principal entrance was beneath a projection, which extended along a portion of the front, and had a wooden gallery at the top. The inn yard (of which also we are enabled to give a view), approached by a gateway in the centre, was nearly a quadrangle, having double galleries, supported by plain columns and carved pilasters, with caryatides and other figures. These galleries had, doubtless, been often thronged with spectators of dramatic entertainments, at the period when inns were customarily employed for such purposes.

In Copenhagen-fields, where the Londoners sought amusement and the graver exercise of political agitation, is now placed the extensive New Cattle Market. The enormous inconvenience, cruelty, and public danger occasioned by driving the weekly hosts of cattle and sheep through the crowded streets of the metropolis, had long been a subject of discussion and serious reflection amongst the metropolitan public. A Mr. Perkins, of Bletchingley, in Surrey, seized the opportunity to remove the public difficulty by a bold speculation. He projected and built a new cattle market near Ball's-pond, at a cost of 100,000l. It was commenced in 1833, by sanction of an Act of Parliament, and completed in 1836. The object of Mr. Perkins was good, but it was destined not to be profitable, for he received determined opposition from the City authorities, and the site was too near London to obviate, for any considerable period, the mischief it was intended to remedy. It was soon surrounded by a dense population. It was extinguished by an Act of Parliament, to make way for the City scheme of a market in Copenhagen-fields. For this purpose, Copenhagen House and fields, to the extent of seventy-five acres, were purchased by the Corporation of London, and converted into the present New Cattle Market, which was opened June 13th, 1855. Commodions as is this site, it has also the fault of being too near London. It is already envied by houses, and must become more and more so. Eventually, the London abattoirs must be placed away in the country, and the meat sent up by railway.

Pentonville Prison was commenced in 1840,

as an experiment of a model prison, in which an improved discipline could be carried out. The first stone was laid on April 10th of that year by Lord Lansdowne, attended by several members of Parliament, and other gentlemen interested in the improvement of prison discipline. He also laid the foundation stone of the New City Prison, which superseded the Compter, at Hollo-way, and which was opened October 6, 1832.

In respect to the comparative substantiality of many old buildings, there is but too much truth in Mr. Howitt's remarks while describing those in the northern outskirts of London, but some allowance may perhaps be made for the influence of time in hardening and consolidating cements and mortar: he says:—

"The bricks and brickwork of hundreds of old mansions in town and country, show how far, in this burring and money-scraping age, we have gone backward in the quality of brick and bricklaying. And yet this is scarcely a correct expression, for we can go back to no period of our history in which the brick and bricklaying are not far superior to ours. Look at the fineness, the solid smoothness of the brick; at the nice and compact manner in which it is laid; and then turn to the coarse, often very unequally burnt brick of to-day, and the coarse mortar in which it is set, often in rude layers of nearly an inch thick, and the contrast is disgraceful to this age of boasted progress in the arts, but an age in which strength and beauty of building are sacrificed to the sordid calculations of the builder's profits. This was the case in the decline of Rome. No people in their best days built more magnificently than the Romans; none in their decline so shabbily and unsubstantially. Juvenal, describing the buildings of Rome, as well as its luxury and vices, astonishes us by his actual descriptions of London in Rome. In his third Satire he says, you were always having the houses tumbling about your ears, and burring to escape from fires:—

— incensis, lapsus
Tor torum assiduos, ac mille periculis aere
Urbs. —
And again,—
"Nos urbem colimus tenui tibicine fultam
Magnæ parte sui, &c."

The builders ran up their slim walls and daubed them with stucco to make them look decent, as ours do. Hence," says Juvenal, "the greater part of the houses are kept standing by frail props, which the agent erects to prevent their instant fall. He stops up the old cracks, and assures you you may sleep in peace! But next, your neighbour shouts for water—he is running to save his moveables—the flames are already in the third story, and we to them who live in the garrets!"

Mr. Howitt's volume is a very entertaining one; of course, it must needs be to some extent a compilation; but it is skilfully done, by one who well knows how to give old facts a fresh interest by presenting them in words of his own.

WHAT IS "CLASSIC"?

We owe to our Post-Laureate the recommendation not to

"Deal in watch-words overmuch;"

and perhaps the advice is no less applicable to those engaged in the practice of any important branch of art than it is in the wider sphere of political or social life. Many of the misapprehensions, misunderstandings, and cross-purposes which interfere so seriously with real intellectual or artistic progress, arise from imperfect apprehensions of the definite meaning of words, or from the current use of the same word under different significations, constituting what logicians designate as the fallacy of an "ambiguous middle term," through which different parties may arrive at nearly opposite conclusions from apparently the same premises. And such words especially as have been laid hold of as the watch-words and badges of a party, are apt to lose sometimes all trace of their genuine origin and meaning, or at least to be made to include meanings which do not rightly fall under them. And though the terms "Classic" and "Gothic" may be, as has been remarked, little better than a kind of "slang," their constant use as representing two schools of architectural art, supposed to be radically opposed to each other, has had considerable influence in narrowing and restricting the theory and practice of the most conscientious and earnest workers in each of said schools. Each of these words forms a concrete term under which an architect of one school may include all the defects as well as all the merits of the other; and in this manner the word "classic" is especially used by the adherents of the Gothic persuasion. The Classicists are mostly lenient towards Gothic, except to certain modern deformations parading under that name, referred to in a recent article in our columns; but the genuine Goth takes up his song against all buildings of the Classic school, shortly defining a Classic design as "a design with all the life taken

out of it," or in some such complimentary language. The Gothic man, however, is not in reality so bigoted in comparison with his Classic brother, as may seem at first sight; he has some reason for his "good hating;" but that reason is in fact mainly based on the ambiguous use of the word Classic, which has most unfairly been made to stand for two schools of architecture, which have in fact very little in common, so far at least as principles are concerned, although in some details they approximate. With the view of promoting the cause of catholicity in our Art, let us endeavour to discriminate between what we may call the true and the spurious application of the word Classic to architecture.

When the revived attention to, and recovery of, the ancient literature of Greece and Rome occupied the attention of the first minds of the period, afterwards to be known as that of the Renaissance, those newly-found treasures became naturally, by contrast with the Medieval literature which they supplanted, the select or "Classic" models of style, the preference for which was carried (as in most revivals) to such an extent as to render the whole of the new literature of the period but a weak and artificial imitation of the peculiar turns of thought and phrase of the originals; not, be it observed, of the spirit and feeling, but only of the details of the latter. Hence it is that the original literature of this period in Italy, and the productions of the corresponding era at a later date in our own country, have for the most part lost so much of their interest for any but professed students of literature. They are not the expression of genuine feeling; or if they are it is so hidden under a veil of artificial form as to be scarcely recognizable; and when we speak of "Classical literature," we pass over in our minds the reproductions of the antique style; we think, not of Pope or Politian, but of Homer or Horace. But it has not been sufficiently recognized that the architectural history of the period is precisely analogous to its literary history. The revived interest in Greek and Roman literature suggested also the return to the study of their architectural remains, when the fierce flame of Medieval inspiration had well-nigh burnt itself out; and this return, so far as it bore fruit in actual architectural reproduction, was marked by exactly the same character as distinguished the literary works of the Renaissance. Like the adopted and affected Ciceronian correspondence of the period, wherein the attention to minutiae of style completely superseded the free and heartfelt expression of genuine sentiments, the architecture of the day, and for a long time after, became a kind of artificial shell consisting of an agglomeration of details from various ancient buildings, of sections of antique architecture superimposed one upon another; the Roman corruption of Greek architecture being here made the starting-point for a still more unlicensed treatment,

whereby the external design became divorced from the internal plan, and from the actual construction, and was in fact in many instances an elaborate piece of scenery erected as a mask to the actualities of the building which it concealed rather than illustrated. Hence it was that the Renaissance architecture lost so much, we may perhaps say lost almost entirely, the architectonic expression, and assumed a sort of decorated furniture or cabinet appearance, endeavoring to compensate for the falsity and superficiality of the general treatment by the elegance of window-dressing, balustrades, terminal vases, and such like adjuncts. It is not surprising that the earnest minded architects, who initiated the Gothic revival, and who, from diligent study of Medieval remains, had become penetrated with the love for genuine building art, as distinguished from what Professor Kerr has well termed the "superficiality" of the Renaissance, should have learned to look with contempt on the latter as a false treatment of architecture, entirely degrading the art from its true form of expression. The same feeling has now spread from the professional ranks to those of educated people generally. Whilst writing this, we have an instance brought before us of the expression of this feeling, in the course of a story in the current number of the *Cornhill Magazine*: the heroine is sitting in a cathedral,—

"At the foot of one of the enormous stone masses of clustered columns, which looked almost as large as a house in itself, and she gazed up into the mighty labyrinth of arches and roofs above her head. Each part in a Gothic structure seems to grow out of each by a natural and ever-varying sequence,—there is something so living in it; while a Palladian or Italian building obtains height by simply piling a repetition of column and architrave and niche, one upon the other, again and again, in a more awkward and unartificial manner of accomplishing it."

* See p. 226.

† See p. 236.

By "inartificial" we presume the writer means "inartistic;" but the remark is a perfectly just one, and shows a better perception of what constitutes architecture than we commonly meet with in the popular works of fiction of the day. But to represent the Renaissance type of architecture as the emodiment of the Classic school, as the only alternative and opposing school to Gothic, shows a most strange misapprehension of the real relation of the Renaissance to the Antique. To lay claim for the Medieval style, as its votaries are wont to do, to be considered the constructively truthful and Architectonic style *par excellence*, as opposed to the constructively false and superficial Classic style, is perfectly unreasonable. If we are to admit, as the characteristic principle of Gothic, the genuine and truthful exhibition of construction and the correspondence of external design to internal plan, the Parthenon is on that view as Gothic a building as ever was erected: and to charge the vices of the Renaissance (compensated as they were by much beauty and elegance of detail) upon the Classic school generally as its recognised and inseparable characteristics, is about as reasonable as it would be to decry the value and truthfulness of Greek and Roman literature because pedantic scholars in the present day amuse themselves by the manufacture of half and coldly correct Greek and Latin verses—the shadow without the substance.

If, then, we take away the distinction between Gothic and Classic, vulgarly accepted by the adherents of the Gothic school, as representing respectively the truthful and the "sham" in architecture; if we refuse to identify "Classic" with wreathed and trussed window-dressings and interrupted pediments whose two halves flank the inevitable vase; if we cannot even consider that a building is properly "classicked" by the presence around it of rows of columns, "engaged" or otherwise, where do we draw the broad distinction between the two schools? Taking the widest view of the matter, and leaving details for a moment out of consideration, it may be said that Classic and Gothic are in architecture the representation of the two widely opposite spirits which in literature would be called the Classical and Romantic. And what these two schools, whose respective influence can be traced through all the productions of art and literature, really represent, is this:—the Classical is the spirit of repose in feeling and of self-restraint in execution; the Romantic (or Gothic, for we may just now use the terms interchangeably) is that of restlessness and aspiration in feeling, and of licence and freedom in execution. In the first, the thought and soul of the work, though always present, is to a great extent in subordination to the form and execution; or, at least, the conception and execution are precisely adjusted to one another, and there is no attempt to express more in the work than the form in which it is to be embodied will admit of—no attempt to hint at a meaning and feeling imaginable though inexpressible. In the romantic school, on the other hand, there is always manifest a struggle on the part of the artist to convey some indefinable feeling to the reader or spectator, something which he cannot adequately express, and for which all the materials at his command are insufficient. Consequent upon this comes an indifference to form and unity in art, and an attempt to get as near as possible to the feeling desired to be conveyed, by the aggregation of a multiplicity of expressions and forms, crowded one upon another, as Milton says of the verdure of Eden—

"Wild without rule or art, enormous bliss,"

the expressive word "enormous" being of course used in its original Latin sense. The first school expresses most clearly all that it is intended to express, but leaves little for the imagination; the second is more mysterious and suggestive, more stimulating to the imagination, but fails in unity, concentration, and distinctness. The first is pre-eminently the art of high civilization and of positive philosophy; the second, that of imperfect civilization and of metaphysical theology.

Not to theorise beyond the patience of our readers, however, and to return to our own branch of art, we cannot see this better exemplified than in contrasting two such buildings as St. Paul's Cathedral and York Minster, both being disposed in the same manner as to general mass, each having the principal and prominent feature in the centre of the composition. Of course in detail St. Paul's has a great deal of

what we have called the "spurious Classic" about it, and it suffers, moreover, from having no advantageous point of view near it. The best idea we have had of the real beauty of the dome was from a photograph taken from the roof of some one of the neighbouring buildings. But, without entering into the question of the intrinsic beauty of the two cathedrals, what strikes us in the aspect of St. Paul's dome along with its western towers, as seen from the most advantageous point of view, is the completeness and unity of the whole composition. As we look at it, the architect's whole idea is before us, carefully studied and worked out; we want nothing further to tell us his intention. In York Minster, on the other hand, there is by no means this finished appearance. Not only are there, as in nearly all Gothic cathedrals, divers irregularities and freaks of treatment in parts, but the central object itself,—the main tower,—conveys to us less the notion of a thoroughly conceived and finished design than the idea that the architect had here done all he could. Thus far he had got in expressing his feeling, when the shortcomings of material and means obliged him to leave the rest to our imagination. It is this uncompleted aspect of a great Gothic work, this hinting of we know not what remaining still to be expressed, which probably suggested to Coleridge the remark that a Medieval cathedral was "infinitely made conceivable." Perhaps there is no more striking instance of the Gothic spirit in its purity than is shown in the west front of Peterborough, called by a well-known eminent critic, "the finest portico in Europe." It may be admitted to be so; but there can be no doubt that it is in fact quite out of proportion to the building, and, if done on a small scale, would be condemned on that ground by every one. But the architect of Peterborough troubled not his mind about proportions; he would have as grand, as lofty a portico over his principal entrance as could possibly be obtained. If practical difficulties prevented his carrying up the rest of his building to a proportionate height, he must submit; but here, at least, was one element of grandeur secured, and there it will remain to be a joy for ever. The same theory explains, if it does not altogether justify, the disproportionate height of the French cathedrals, which rendered it impossible to crown them by a tower adequately proportioned to the substructure, and in which we trace the same effort to give the utmost possible effect to the part of the building which was first worked upon, leaving it an after-consideration whether it would be possible to carry out a complete design on the same scale.

From our present point of view, the rival constructive systems of trabeation and arcuation must be regarded rather as auxiliary than essential to the expression of the Classic and Gothic schools respectively; the latter constructive system growing up naturally when the romantic conceptions of the post-Christian architects went beyond what could be accomplished by the simpler trabeated construction. But it may be doubted whether the characteristics of horizontality and verticality of general design, so long identified with the Classic and Gothic schools respectively, are not in reality of the essence of the two schools. The spirit of repose, which we identified with the Classic school, finds its most natural expression in horizontal composition upon a widely-extended base, and carried to no such heights as render its construction or its permanence a mystery to the spectator. The spirit of unrest and aspiration which belongs peculiarly to the Romantic school, on the other hand, can only be fully embodied in those ascending lines and that restless, soaring growth of vault, and turret, and pinnacle, which the Medieval builders sent up into mid-air, and poised there by a *tour-de-force* of masonry. Then the distinction between the use of ornament in the Classic and Gothic school must not be passed over. The pure Classic school, whether in literature or art, is always sparing of ornament, and would prefer to sacrifice the most beautiful and elegant of detail rather than for a moment obscure or draw attention from the main composition. The Romantic school has always loved ornament for ornament's sake, and scattered it in very profusion over poem and cathedral, without caring to consider too curiously whether such profusion might not defeat its own end.

In endeavoring to draw a marked distinction between the true Classic school in architecture and its supposed antitype the Renaissance, we shall have done a good work if we may have

thereby suggested the removal from the former of the stigma which has been attached to it by so many Gothic practitioners, who have confounded it with the spirit of the Renaissance, and passed one sweeping judgment on both; a judgment partially just, no doubt, from their view of the subject, but founded (unless we are much mistaken) upon false premises. If the leaders of the modern Gothic faction (we take no account of the manufacturers of coloured-brick fireworks) claim that in all truthful architecture the constructive and æsthetic design should go hand-in-hand and illustrate one another, and that the external design should exhibit and grow out of the exigencies and requirements of the internal plan, and of the objects and ends of the building, they may see their principles illustrated in the noblest remains of the pure Classic school. Nor ought the great qualities which specially distinguish the Classic school of architecture to be ignored or disesteemed as they are at present. Granting all the elevating tendency of the aspiring vertical style, it may be doubted whether in the long run the horizontal style does not lend itself better to what can most rightly be termed architectural composition, and whether it is not in fact susceptible of the grander treatment of the two. The qualities of repose and majesty, which belong peculiarly to this style, have always been recognised by the best critics as the highest qualities which a work of art can boast; and in respect of architecture, we may add to these the invaluable attribute of stability, real and apparent, which unquestionably belongs more to buildings in the trabeated horizontal style than to any others; though a horizontal composition is by no means incompatible with the employment of arcuation in the subordinate features of a building, or even with domical roofing. Nor is it in the least to be supposed that a Classical style of design necessarily involves inconsistency between plan and design, and the halving a building into two corresponding sides, like the parterres of a Dutch garden. This misapprehension is unfortunately fostered by the practice of many of those who have called themselves Classical architects, and whose tame and weary productions have gone far to make the word Classic synonymous with Hamlet's three adjectives, "flat, stale, and unprofitable." But the notion of building a town-hall, for instance, with two wings identical in design, although one may be occupied by a grand public room and the other by small offices, belongs not to the Classic, but to the Renaissance. That which really gives the Classic tone to a building, viz., unity and completeness of design, horizontality and consequent repose and stability, and the sparing use of ornament refined and well-studied in character and carefully subordinated to the total effect—all this is just as compatible with the free treatment of ground-plan and grouping according to the dictates of convenience, as is the Gothic style which is supposed to monopolise all freedom of planning to itself. And those who think that to renounce the revived Gothic style in favour of one based on such principles of treatment as we have shown to belong peculiarly to the Classic school, would be to give up the opportunity for the greatest triumphs of their profession, may be reminded that when Martin, in his grand scenes illustrative of the Bible and of Milton, drew so largely on architecture in aid of his efforts, he obtained all his grandeur of effect by the employment of horizontal perspective in his imaginary buildings, without a single exception which we can call to mind. What might be made of such commissions as the Law Courts, were a sober and stately style of the Classic model substituted for the piquant and variegated groupings of towers and turrets which always form the main features in such designs at present, we should be curious to see. Our strong impression is that both in these and in smaller and more ordinary buildings, a return to Classic principles, as distinguished from Renaissance, and with due regard paid to peculiarities of climate, and so forth, in the treatment of detail, would result in a style far more suited to the real wants and feelings of the present day than the revived Gothic can be said to be; more especially as we hold that, whatever be the attraction of Gothic for those who love the romantic and picturesque in art beyond all other qualities, the Classic always has been, and when treated in its true spirit always will be, the style which pre-eminently recommends itself to intellectual minds, whether it be embodied in long-resounding verse, or in the silent outstretched perspective of cornice and colonnade.

HOW SHALL WE KEEP OUR HOUSES CLEAN?

WHEN we come to reap the fruits of an extended system of education,—say, in the next generation,—we shall find many matters in our houses will require alteration or re-adjustment, to suit the new order of things. When our domestic servants are sufficiently educated to know somewhat of the structure of the human frame, they will probably object to do very rough work that exposes them to the certainty of present colds and aches, and future rheumatism. We shall have to look thoughtfully at the various appliances and means with which domestic labours are effected, and consider whether they can be improved; whether different materials could be substituted in some cases, or plans contrived in others, by which much of the drudgery of house-cleaning could be done away with. We propose to briefly point out some of the existing domestic tasks that are unnecessarily oppressive upon such of the daughters of men as are maidservants. Just as some other occupations have their peculiar diseases, so are these persons especially liable to colds, sprains, and the complaint known as “the housemaid’s knee;” and when they come to be educated and able to choose employment, it is not likely they will prefer one that has the disadvantages of domestic service. And then how shall we keep our houses clean?

The first task of many maidservants after rising is to light fires, and remove the ashes left from those of the previous day. This is a dirty, sunnily operation. But it might be shorn of half its discomfort by the application to all fireplaces of the contrivance already used in some kitchens, viz.—a grated well sunk in the hearth for the ashes to fall into. It is, indeed, a matter of surprise that this plan is not in universal use, most especially in drawing-rooms, where the furniture is covered with velvet and satin, and articles of virtu are displayed, which must materially suffer from the multitudinal coating of fine ashes. A fireproof well, a few inches deep, furnished with a tray having sides to it as high as the depth of the well would permit, and handles, so that it could be drawn up and carried away conveniently, would very materially lessen the dirt of the fire-lighting business. The next disagreeable is the black-leading process. We are full of sympathy for the inconveniences suffered by the painter in the use of white-lead, but we only laugh at the victim of black-lead when a maid-servant answers a hell with a smudge of it on her brow. Nostrils, mouth, and throat get clothed with the fine powder flying from this soot-faced article. Can we not think of some pleasant-looking, suitable, and economical material for our fireplaces that would supersede the use of it?

Then look at the immense number of houses which have a flight of stone steps, and a huge landing-stone in front of them, in the streets and squares of London; in the crescents and terraces of fair, bright, inland watering-places, as Leamington and Cheltenham; in quiet country towns; in fine, in every direction. The beauty of these approaches, and, indeed, the character of the head of the horse, are supposed to depend on their whiteness; to secure which quality they must be daily scoured and hearth-stoned, in all weathers and all seasons. Surely here is a waste of time and service, which the choice of some other material for an approach to the street-door might diminish. But, besides the steps, there are the brass bell-handles and the brass knocker to polish. Unless these are well rubbed with some polishing paste or powder every morning, they have a dismal, slovenly appearance. Some ten minutes must, therefore, be wasted in thousands of houses by one of their most able-bodied inmates in this frivolous piece of labour, after the still longer process of “doing” the steps is accomplished. It will be seen that future improvements in choice of materials for the items enumerated may considerably alter for the better the nature of the toil demanded of the young working-woman. The scores of kneeling figures in blue gowns and tiny white caps scouring their masters’ door-steps, to be seen in the course of a morning’s walk, are not now above the task; but will they like it when they are as educated as our morning governesses? But we have not yet done. Inside the street-door there is another item open to improvement. This is the door-mat. Lift it up, and beneath it there is usually to be found a thick deposit of dust that has filtered through it, whether it be made of india-rubber, cocoa-nut fibre, oakum, or

matting. Those who carry it away to heat it are speedily lost to sight from more causes than one. The door-mat is evidently one of the principal deposits of dirt in a house, and requires a masterly management. Would not a well (sometimes now formed) the dirt of the mat only) similar to that we have described for the ashes, and of the same size as the mat, be of service here? Again, would not a couple of coats of paint on every floor of wood considerably lessen the labour of scouring it, and facilitate the sweeping of it free from the dust that filters through even the best carpets? And should not every wash-house in private houses, as in institutions, be furnished with an open-work wooden floor that would permit of the laundresses’ feet being kept dry?

The next difficult indoor operation is window cleaning. Owing to the exact division of sash windows into two equal portions it is next to impossible to clean parts of the panes in some large windows without standing outside; and to be able to sit on the window-sills and bring the process to a successful issue is considered such an improvement on this fearful danger, that we shall be probably thought to be over particular when we find fault with this alternative. But we do find fault with it, and believe that we shall yet contrive for windows to be cleaned as comfortably as swing-looking-glasses.

This generation has already done somewhat in our houses for the next. We have introduced self-acting cooking apparatus, lifts, washing, wringing, and drying machines, extended hose-drainage, water supply on our upper floors, and in various other ways lessened indoor labour. But we must not forget that there are those coming after us, and for whom it is in a great measure our duty to provide, as it should be our pleasure, who will look upon some of our appliances as we look upon the cumbersome mangle of our forefathers, or upon the spit that required turning, or upon the bucket of water that had to be lifted from the well and carried from the basement of the house to the topmost bedroom. We, as well as educating our successors, are not to forget to improve the appliances we are to put into their hands.

REMARKS UPON MILITARY REMAINS IN WALES.

THE country west of the Severn and the Dee, which, in a military point of view, may be regarded as Wales, is peculiarly rich in military remains, British, Roman, Saxon, Danish, and Norman. It would seem that in remote times, before the invader had stained the sacred soil, the several tribes were, as they long continued to be, at war with one another, and in consequence each had its own camps and strongholds. At least, this seems to be the only way of accounting for an almost infinite number of earthworks, of no great size and of irregular form, which are found in positions where they never could have been intended for the general security of the country. These are evidently of early date, and no doubt antecedent to any general invasion, either from England or from the sea.

Besides all these, are found a series of larger though less numerous earthworks, which crown the high grounds along the sea-coast, and those inland to the west of the Severn; and occur also along the straths and passes by which the country is laid open; such, for example, as the vale of Clwyd on the north, of the Yrwny in Mid-Wales, and of the Wye and Usk in South Wales. These are probably of later date, and certainly intended for defence against a more general enemy. On the east they are opposed to that long chain of camps of large area, and constructed with immense labour, which crown the heights and spurs of the Cotswold from the Bristol Avon northwards to Evesham, and which are generally regarded as the works of the advancing Saxons, who, having traversed the plains of England, looked down with delighted and greedy eyes upon the “virgin daughter of Lochness,” and her rich pastures of Gloucester, Hereford, and Worcester.

Some of these earthworks are known to be British, and others to be Saxon and Danish; but no certain rules of distinction between them have been established. They are either round or oval, or more commonly of irregular outline, and governed by the character of the ground. They are usually on the tops of hills or the crests of an encampment, so as to command a view, and be tolerably secure against surprise. The defences are commonly a succession of banks and

ditches, the earth from the latter being thrown inwards; and these defences are deeper and in greater number on the more accessible sides. There are seldom more than two entrances; often but one; and these wind obliquely through the defences, so as to check the force of a rush of men, and thus guard against a surprise. There is but seldom a supply of water. They seem to have been intended rather to resist a sudden attack than to hold out against a blockade. The banks are in some instances of broken stone, and occasionally, though very rarely, of rude dry stone walling. Some of these camps are of very large size. Dolebury, on the Mendips, is above 1,000 yards in length; and its banks, of broken stone, are from 10 ft. to 15 ft. high.

These camps, however extensive, all appear to be the work of barbarous or unscientific nations; but mixed up with them are found other works, commonly indeed of earth, but placed and designed by men who were evidently no novices in civilized wars, and were proficient in the arts of camouflaging. These were the Romans, whose camps are usually placed, not on the tops of hills or in inaccessible places, but in the plain and near a stream or source of water. They moved with wheel-carriages and cavalry in their train, and trusted to their discipline to guard against surprise, the favourite tactic of the savage.

The Roman camps, instead of being round or oval or of irregular form, are usually rectangular, constructed with great regularity, and provided with several openings, whence an assailant could be outflanked. They were also divided within, according to certain well-ascertained rules.

The Romans, moreover, coming not merely as invaders, but as future colonists, insisted themselves in making lines of high road, upon which their camps are posted, and by means of which their communications were kept open. At certain intervals they converted their camps into fixed stations, regularly walled in, many of which, like Caerwent, Caerleon, Neath, Cardiff, Gloucester, and Chester, became the nuclei of large villages, towns, and cities.

These earthworks, with occasional Roman defences in masonry, were the only military works that preceded the invasions of the Normans in the eleventh and twelfth centuries. There is no existing evidence that either Celt or Saxon in Wales ever built a military structure in brick or stone and mortar. The instances cited on Penmaen-maar, Carn-Goch, and elsewhere, only prove the poverty of the evidence adduced. These are enclosed with loose dry stone walling, of considerable thickness, and which at Carn-Goch contain certain cists or cavities in which the natives probably hid their valuables and possibly themselves. Of a regular wall still left of a tower or castle, no trace has been recognised.

The influence of the Norman conquest was speedily felt on the Welsh border. With the activity of all great generals, William at once saw the importance of securing the Severn and the Dee, with a view to the occupation of the marches in strength, and the conquest at some future time, of the rocky and impregnable country beyond.

He at once took possession of Gloucester, Hereford, Worcester, Ludlow, Bridgenorth, Shrewsbury, and Chester, and directly, or by the agency of his greater barons, fortified these Saxon towns, and placed a strong castle in each.

At the same time he,—and the policy was pursued by his son,—encouraged these barons to invade Wales, selecting the more open and weaker parts to the south and west, and the broad strath or vale of Clwyd, which forms a sort of approach to the great strongholds of Snowdon and Anglesea. Thus the Earls Palatine of Chester, second only to their sovereigns in rank, and sometimes their superior in force, established castles at Mold, Flint, Rhuddlan, and Diganwy, extending up to the Conwy river, and securing access from the north by sea. In like manner the De Clares, of the race of Strongbow, in the south, placed the base of their operations in their impregnable castle of Chepstow, upon the mouth of the Wye, and having married the heiress of Fitzhamon the conqueror of Glamorgan, established their power along the plain and fertile country between the hills and the Bristol Channel, and advancing along the old Roman *via maritima*, maintained a chain of fortresses, of which Newport, Cardiff, Neath, Kidwelly, Llanstephan, Caermerchen, and Llanharan, each commanded the mouth or passage of some considerable river or inlet, while Tenby, Pembroke,

Manorbear, Carew, and Haverford, secured the peninsula of Pembroke and the baven of Milford, and thus not only commanded all the approaches by the Bristol Channel, but laid the foundation of a secure connexion with Ireland.

Ludlow and Shrewsbury, like Chester and Gloucester, also served as bases for further conquests. Ludlow was the head-quarters of the lords of the Middle March, the Mortimers, De Lacys, Talbots, Dinans, and Fitz-Warines. Shrewsbury was the fortress of Robert de Belesme, of the great house of Montgomery, to whom belonged the proud distinction of giving name to a Welsh county, instead of, like other lords, deriving a title from it. From Shrewsbury issued those warriors who founded Pool Castle, Aberystwith and Cardigan, Kilgaran, Newport, and, indeed Pembroke, although that magnificent fortress owes its chief illustrations to its later lords of the houses of De Clare and Marchal.

In addition to these main lines of occupation, the open valleys of the Usk and the Middle Wye were occupied by the great barons Fitz-Osbert and Newmarch, who established their power about Brecknock, Abergavenny, and Usk, and whose estates ultimately vested in, and were augmented by, the Bohuns, whose earldoms of Hereford and Essex balanced even the enormous influence and royal connexion of their rivals, the De Clares, with their earldoms of Gloucester and Hertford.

The grasp thus taken upon Wales was held with variable strength, according as the Marchers were supported by or at variance with their sovereign; but, with some intervals, it was retained during the reigns of the two first Henrys, and was, on the whole, strengthened during that of Henry III. The castles, often taken, and sometimes ruined, by the Welsh, were regained and strengthened, and in South Wales one new castle of great magnitude (Caerphilly) was erected by the De Clares in the last year of the king.

But under Edward I. the English power was not only consolidated, but extended, and was wielded far more by the king than by the Marcher lords. North Wales and Anglesia were conquered, and the conquests were secured by the great castles of Bere, Harlech, Caernarvon, Beaumaris, and Conway, the ruins of which still attest the wealth and generosity of Edward, and the skill of the military engineers and masons of his day.

With these great works of Edward I., the military history of Wales is brought to a close. The Welsh fought valiantly in the English ranks at Agincourt, and, under the house of Tudor, became gradually incorporated into the British Empire, of which they have ever approved themselves, both in peace and war, very loyal and valuable constituents.

Such, then, very briefly related, are the circumstances under which the great fortresses of Wales were constructed. I now arrive at the consideration of the works themselves.

English, or rather Mediaeval, architecture, has only been scientifically studied during the last thirty years, and military architecture for a much shorter period. Rickman altogether declined to notice castles, and they have by no means shared in the flood of light which has been directed upon our cathedrals. What is wanted are good ground-plans, and scientific elevations and details. Gross gives few plans, and his plates are poor. Buck, though better, is out of perspective and inaccurate in detail. The plates in King's "Munimenta" are as excellent as his letterpress is worthless. The plates published by the Society of Antiquaries are also excellent; and recently Mr. Parker's valuable volumes have supplied much towards a complete study of the subject, and it is difficult to speak too highly of the abstract of the great work of Viollet-le-Duc, which has appeared under his care.

Much, however, remains to be done. Castles are usually in a ruined state. They are but seldom ornamented; and very commonly all the ashlar work has been removed, and nothing remains but the rubble and concrete of the interior of the walls, without regular form, and affording but little information as to age. A castle is essentially a defensive work. Its uses are to enable a small number of men to resist or beat off the attacks of a larger number, and to secure a safe place from under cover of which an army may retire, or from which it may advance.

The great point in the design of these works, is so to arrange them that those who are ap-

proaching a wall to breach it shall be open to the fire of as large an extent of rampart as possible; and as they reach the wall shall be exposed, not merely from the top of the point attacked, but from each side of it. In other words, the besiegers should be unable to attack without being exposed to a superior and concentrated fire from the besieged; and the besieged should be sheltered.

Now a round tower—supposed to be a very old form of castle—least of all forms fulfils these conditions; for it is clear that the besiegers, while approaching, can only be fired at from that part of the wall exactly in front of them; and when they reach its foot they are safe from all missiles except those thrown down from its top, while their supporters could, by a steady and sustained flight of arrows, prevent any one from appearing on the battlements.

The only advantage of the round tower is its passive strength and absence of all angles, so that it is not easily breached; and when mined, does not readily crack and fall.

The square tower is rather more defensible, since a broader part, that is a greater length of rampart, could be manned for the annoyance of the assailants; but the defendants, it will be observed, are quite unprotected from arrows from without; also, when the attacking party have reached the foot of the wall, they are safe from all but missiles from above.

From these considerations it will be evident—and it was evident to all the military nations even of remote antiquity—that every wall should have flanking defences, that is, towers or bastions projecting from the face of the wall, and capping its angles. In such an arrangement the curtain or wall intermediate between the flanking towers, which, being the weakest, would naturally be selected for breaching, is so protected as to be almost unapproachable; and even when reached, the assailants are exposed to the near and direct fires of the defenders, one on each side; and these defenders, as they shoot from a flank, are not at all exposed to arrows coming from the front. This is the system of flanking defences, well understood indeed by the Romans, and from them adopted by the Normans, but far more extensively put in practice by their descendants in the twelfth and thirteenth centuries, and only brought to perfection after the introduction of gunpowder.

The Norman castle usually consisted of a walled enclosure, the wall being flanked with towers, generally square, and in the enclosure a building of far greater strength than the outer part, and known as the keep. The Norman keep, from its great height and size, towered above and gave character to the whole fortress; and, from the immense thickness of its walls, it has in many cases descended to the present day entire or nearly so. Most commonly these keeps were quadrangular, with a door on the first story, and outside they are strengthened by pilaster strips, while all the angles become square turrets, though of very slight projection. The first-floor is generally a hall. There is often a chapel, and the access to the different floors is by winding stairs at the angles, and by galleries and small chambers in the thickness of the walls. The well is usually carried up through the wall, having an opening for the drawing of water, in each story. I need only name as generally known the keeps of Dover, London, Canterbury, Rochester, Guildford, Winchester, Colchester, Kenilworth, Richmond, Banborough, Prudhoe, Newcastle, and Carlisle. There are about thirty of them in England, and many in Normandy.

In Wales and the Marches they are rare. Those of Bristol and Gloucester have long been destroyed, as has that of Haverford. At Chester there is a square keep, and at Ludlow, though this latter is mixed up with later buildings. There are square Norman keeps at Goodrich and Chepstow, on the Wye, and a small one at Ogmere, on the river of that name. At Penlline, also in Glamorgan, is a fragment with herring-bone masonry.

The Normans did not, however, always build square keeps. Sometimes, within the enclosure, is a circular mound of earth, and upon this they placed a circular, or, more commonly, a polygonal shell of wall, of considerable thickness, against which, in the side, buildings were erected, leaving an open court in the centre. Where these mounds are seen it is unusual to find a square keep. Their origin is doubtful. Had the Normans thrown them up they could scarcely have built upon them, and yet most of the masonry they carry is Norman, of a very solid character. In Normandy there are about forty of these mottes

or mounds within seventy miles of Caen, and they are not uncommon in England. There is one at Arundel, carrying a polygonal shell of wall, and they occur at Oxford, York, Totnes, Bedford, Marlborough, Hincley, Tamworth, Warwick, and Christchurch, and there is a very fine one at Wallingford. It is now supposed that they were thrown up by the Saxons, and were intended to be fortified with palisades. In Wales they are very rare. There was one at Hereford, there is one at Caerleon; but the grandest military mound in Wales proper is at Cardiff, where, though crowned by a Norman wall, it is connected with earthworks of a Roman character.

There are, however, in many parts of Wales detached mounds, surrounded by a ditch, and which seem to have been thrown up to enable a small body of men to hold out with certainty for a limited period. They were, no doubt, stoutly palisaded at the summit, and probably outside the ditch. There is one at Gelligaer in Glamorgan, a fine one near Towyn, and one near Newport in Cardigan; but they are rather liable to be confounded with sepulchral mounds or barrows.

The north Welsh castles rarely present anything of the Norman type; and those in South Wales, though generally earlier, seldom, in their present form, are older than the times of Henry III. Some of the earliest, as, for example, Kenmore, and, to judge from its foundations, Sully, contain a variety of the square keep; but the general tendency of the Early English period in Wales was in favour of a large and often irregular enclosure with high curtains and round flanking towers, in which the peasants and the cattle could be received and sheltered during any sudden incursion of the Welsh. Manorbear and Dynevor, Penmark, Whitecastle, and Kilgaran, seem to have been such places, and Morlais, though of the reign of Edward I., illustrates this type.

During the post-Norman, or Early English, period, at the end of the twelfth or early in the thirteenth century, there seems to have been a tendency to build detached round towers, and sometimes castles with circular keeps, such as Conisborough. Without touching upon the vexed question of the Cornish keeps, I may mention the fine circular keep of Pembroke, the towers of Penrice and Caldecote, and that of Tretower, near Abergavenny. There are also the foundations of a large round tower, decidedly Early English, at Whitochurch, near Cardiff, and the tower of Bronllys, in Brecknockshire, has recently been illustrated in the pages of the "Archæologia Cambrensis."

This circular style, though employed largely in France, and long continued in the flanking towers of castles, and on town walls, was not much affected for detached castles in England, but the reign of Henry III. witnessed a great improvement in castle building, which was carried on and perfected in that of Edward I.

This new style, now known as the concentric or Edwardian type of castle, exhibits a great advance in military knowledge, no less than in architectural skill. Although the structures are more extensive, and on a far larger scale than in the Norman period, the walls are not so massive, and there is far more economy of material.

The keep, whether square or round, disappears, and in its stead is found a large central court, usually rectangular, with drum towers capping the angles, a hall and offices on one side, and at each end a gatehouse. Outside this inner ward or bailey is usually a second enclosure, also rectangular, capped with round towers at the angles, and sometimes with intermediate towers on the curtain wall, and also, like the inner ward, having two gatehouses. This is the middle ward.

The outer ward is seldom if ever complete. It usually consists of a sort of outwork, sometimes of earth, and often includes one or more barbicans, or defences outside the moat. The smaller specimens of these castles have only a tendency towards the concentric arrangement, but the larger examples, such as are found both in North and South Wales, exhibit it very strongly.

Moreover, most of these castles were intended to lodge some very great lord, the sovereign's deputy, and occasionally the sovereign himself, and although security was their first object, it was by no means, as formerly, their only one, and was combined with great architectural splendour, and with arrangements for the display of hospitality on a large scale.

Many of these concentric castles are not

original works, but are formed by the addition of exterior walls to an older keep. At Porechester is a large rectangular space, still enclosed within what are usually regarded as Roman walls and buttresses. In this stands a fine Norman church, probably on the site of the Roman *aeclium*; and at one angle is a very fine Norman rectangular keep, of unusual size and height. In the Edwardian times this keep has been isolated from the great court by a wall and buildings, converting the structure into a sort of concentric castle.

Chepstow in like manner has had Early English and Decorated wards added above and below the Norman keep. The castles of London and Dover are still finer and more perfect examples of the conversion of a Norman keep into a perfect concentric fortress.

Kidwelly, a very curious Welsh castle, is, in its present form, concentric. It is in plan almost a semicircle, the river *Gwendraeth* forming the chord, and a deep artificial fosse the arc. It has a celebrated chapel.

Perhaps, having regard to its size, its architectural detail, and the number and completeness of its defences, *Caerphilly* is the first concentric castle in Britain, as *Beaumaris* is the second.

Caerphilly covers about 30 acres of ground. It has three distinct wards, seven gatehouses, of which five are of large size, and about thirty portcullises in different parts of the work. Its hall and kitchen are on a grand scale, there is a grand guard-chamber or governor's hall in each of the two interior gatehouses, and within the walls are fish-stews and a water-mill. The north and west sides are covered by large earthworks, skilfully designed and placed; and the south side was protected, as at *Kenilworth* and *Leeds*, by a spacious lake, now drained, but which once filled the moats, and flooded also the low ground on the north. The grand front towards the *Rhymny* is 250 yards in length, and from 20 ft. to 60 ft. in height, with a grand central gatehouse, and large postern gatehouses at the end of each flank. The pier and foundations of the barbican of the grand entrance remain, and show that the drawbridges defending it must have been of unusual span and breadth.

Caerphilly was constructed towards the end of the reign of *Henry III.*, by one of the *De Clares*, Earls of Gloucester and Hertford, and large additions were made to it by *Hugh le Despenser* the younger, who garrisoned it for *Edward II.* in the last year of his reign.

Caerphilly is especially remarkable for the jealous care with which it is guarded against surprise. Each tower and each gatehouse is isolated both from the court and from the walls by regularly porticuled doorways.

Beaumaris is rather more regular in form than *Caerphilly*, though of less magnitude. Here the hall is in one of the gatehouses, and the chapel occupies, as at *Kidwelly*, a mural tower. The inner walls are of unusual height and thickness, and contain two very curious tiers of trifoliate galleries, of which the lower covers a magnificent series of sewers. There are but two concentric lines of wall. The outer line is represented by a sort of spur work, which extends towards the sea, and commanded the whole port. *Beaumaris* was built by *Edward I.*, and marked the establishment of his power in North Wales when he turned the flank of *Snowdon*.

Harlech is of the same class. *Caernarvon* and *Conway*, both works of great size and beauty, and also the work of *Edward*, are scarcely in plan concentric, but are rather grand examples of the curtained and towered inclosure introduced by *Henry III.*, and both combine the accommodations of a palace with the defences of a castle.

With the conquest of Wales by *Edward I.* terminates the history of Welsh military architecture. Many of the castles were subsequently altered, and some converted into dwelling-houses; but, with the brilliant exceptions of *Raglan* and *St. Donat's*, we have not much of purely military work of later date than the middle of the reign of *Edward I.*

To recapitulate, we have to observe, in Wales, the Norman castle of *Cardiff*, with its earlier mound; the rectangular keeps of *Goodrich*, *Chepstow*, *Landow*, *Ogmore*, and *Pentllyn*, and, rather later, of *Fomon*. The circular keep of *Pembroke*, and the towers of *Tretower*, *Caldecot*, *Bronllys*, and *Whitchurch*.

Next we have the fortified enclosures of *Kilgeran*, *Bere*, *Caldecot*, *Dynover*, *Whitecastle*, *Llanstephan*, *Tenby*, *Dinas-Bran*, *Manorbeer*, and some others.

Finally, and chiefly, we have the grand concentric structures of *Caerphilly*, *Beaumaris*, *Kidwelly*, *Harlech*, and their contemporary structures of *Caernarvon* and *Conway*, and in South Wales of *Morlais* and *Dinas* by *Talgarth*.

Besides those well-marked and, more or less, well-known examples, there are scores of castles in Wales of which parts, usually gatehouses, remain, and many of which having been originally founded by the alter Normans, and afterwards burned and destroyed, exhibit what the skilled antiquary will recognise as traces of the Early English, Decorated, and Perpendicular periods, down to the partial restoration in the Tudor manner, which followed upon the extensive devastations of *Owen Glendower*.

In the grand divisions of British military architecture, to Wales must be allotted, as peculiarly her own, the Edwardian period. The Norman keep, whether square or as a shell upon mounds, must be studied in England or in Normandy, and the circular tower keeps chiefly in France; but even *Windsor*, *Warwick*, *Dover*, and the Tower of *London*, though rich in historical association, and possessing individual parts of surpassing grandeur, can by no means, in military completeness and simplicity of plan, be compared to those noble fortresses which girdle the skirts of *Snowdon*, or rise out of the velvet meads of *Glamorgan*. C.

PROPOSED INFIRMARY FOR LAMBETH.

The guardians of *St. Mary's*, *Lambeth*, invited some twenty-two architects to send designs for the infirmary proposed to be erected near *Kennington-road*, offering three premiums, 150*l.*, 100*l.*, and 50*l.*, for the best, second best, and third best respectively: the successful competitor, if required, to carry out the works for 1,200*l.*, less the amount of premium, but not to be entitled to any premium or payment, unless a contractor would undertake the work at a sum not being more than 10 per cent. above the architect's estimate. The accommodation required is for 600 patients,—250 males and 350 females. In addition to the infirmary, the guardians asked for a block plan of a workhouse for 1,500 inmates, in order to show that the infirmary, as planned, would not render it impracticable to provide a workhouse on the site hereafter, and they offered a separate premium of 50*l.* for the block plan which should seem to them to be the best.

Twelve of the twenty-two, as we mentioned recently, have responded, and their designs have been hung for some time in *Lambeth* workhouse. The injurious farce has been played of covering up the names of the designers affixed to the various drawings, and substituting in each case a letter, from A. to K.; neither of the two under those letters, by the way, being without merit. One of the least important results of resorting to the pseudo-anonymity appears to be that the descriptive particulars sent by the architects are not appended to the designs, probably because the name of the designer in each case appears in them.

The architects have been left in doubt as to the desired mode of approach, and some (of which L. is a compact plan, may be taken as type) have thought it necessary to have the entrance front of their buildings on the narrow width of the land, next *Pleasant-place*; while others, of which we will point to G as an example (a plan well deserving attention), have availed themselves of a roadway newly acquired by the guardians, leading from *Renfrew-road* to the long side of the land, and placed their main front there.

The guardians unfortunately say in their Instructions, "Some of the wards may be provided to contain four rows of beds;" and this has betrayed many of the architects into submitting plans which ought on no account to be adopted. For bedridden patients and convalescents a double ward may be endured; but now to erect a double ward for the sick would be so entirely opposed to the teaching of experience and to the public opinion on the subject which we have aided to form, that we cannot for a moment suppose the *Lambeth* guardians contemplate such a step. Should they do so, an over-ruling power should be appealed to. In design H, as in some others, the double wards are confined to the bedridden cases; and in design K, on which much pains have been bestowed, an alternative plan avoids double wards altogether, and is commendable accordingly.

It may be noticed that some of the competitors have submitted complete designs for a workhouse, though asked for only a block plan.

ST. JAMES'S CHURCH, BOLTON.

St. James's Church, *Bolton*, has been opened by licence of the Bishop of *Manchester*. In 1864, the charitable trustees under the will of the late *John Barrow*, having at their disposal a considerable sum of money left by *Mr. Barrow*, towards the building fund, advertised for designs. A very large number were sent in under cipher. From amongst them, two were selected for consideration, which were found to be by the same architect, and ultimately one of them, with a central steeple (as now carried out), was adopted. In the first instance, it was proposed to build, at the cost of 5,000*l.*, a church to seat 1,000 people. But afterwards, in consequence of subscriptions not coming in as liberally as was hoped, it was decided to reduce the cost somewhat, and the accommodation to 800. However, before the builder's estimates were asked for the plans were again enlarged in various ways, so that the church as now built will accommodate nearly 900 persons on the ground floor, there being no galleries. The contract was taken by *Messrs. H. & S. Warburton*, of *Harpurhey*, *Manchester*. The ground plan is cruciform. There is a western porch, rather longer than the width of the nave, and so arranged as that one door may serve for entrance, while there are three to allow of speedy exit. At the north end of this western porch is the baptistery, which opens into the church with a couple of narrow arches resting on a central pillar. The nave is of more than ordinary breadth, and is marked off from the aisles by four arches on either side. The chancel, which terminates towards the east, with a semicircular apse, is 43 ft. long by 20 ft. wide, the steeple being built over the western half of it. The choir seats are under the steeple, and the flat boarded ceiling of this part is considered to be well adapted for sound. To the north of the choir is the transept, 34 ft. long, affording space for the organ as well as for large vestries. The south transept is not quite so long, but has an aisle on its east side opening out of it by a double arcade, and is also provided with a separate door. Here the school children will sit. The seats are low and open benches, the choir stalls being somewhat more ornate. The floors of the passages and chancel are all laid with red and black tiles, in pattern. There are wood floors under the pews. The heating apparatus is by *Haden & Co.*, of *Trowbridge*. The windows are all fitted with thick granulated glass of a warm amber tint. The tracery of the windows has the lead-work arranged in various devices. The apse windows, made by *Lavers & Barrand*, are filled with glass, having a floral ornament. The capitals of the two pillars of the nave nearest to the east have been carved by *Mr. Green*, of *Manchester*, with the rose of *Sharon* and the lily of the valley. The gas-fittings have been supplied by *Mr. Thomson*, of *Birmingham*, and consist of wall-brackets. The west end of the church has three arches in the lower part, the central one containing a doorway; the others will, it is hoped, ere long be occupied by medallions and other decorations. Above these arches is a four-light traceried window, about 20 ft. high. There are nineteen clerestory windows, arranged in pairs of alternate design. The style of the church is Early Geometric Decorated. The tower and spire rise from the centre of the building to a height of about 150 ft. The belfry is octagonal in shape, and each side has a window, fitted with slate louvres. It is capable of containing a full peal of eight large bells. The spire is also octagonal, but an angle comes over the centre of each face of the octagon below. There are traceried windows in the south aisle. The architects are *Messrs. Medland & Henry Taylor*, of *Manchester*.

GLASS IN BLANK SASHES.

Sir,—During the past six months I have removed a large number of old wood sashes from freestone window frames, and substituted the best British plate-glass in their stead. In the windows are a large proportion of "blanks." Some of these have been glazed with black enamelled glass and others with transparent glass, the plaster painted black behind it.

I shall be glad if any of your readers can inform me why these blank squares, both enamelled and transparent, are frequently "flying"? As it occurs only on the south side of the house, I can only attribute it to the great heat absorbed from the sun's rays. It is not caused by expansion of the heated air behind the glass, provision having been made for this by leaving small openings at the top edge of glass. The squares are all very carefully bedded, without wedges or pins, in elastic putty, made by mixing about half a pint of best olive oil with about 12 or 15 lb. of linseed oil putty. The transparent glass in the same windows, so bedded, never breaks. W. B.

THE NEED OF A NATIONAL ARMOURY.

At a time when so much money is about to be expended on public buildings of a character not underserving of the name Imperial, it may for a moment seem to be a step of questionable propriety to advocate the establishment of a new kind of public exhibition, that would demand either the large extension of existing, and even of projected edifices, or the erection of an entirely new structure.

But it must be borne in mind that occasions often occur, in the history of nations, no less than in that of individuals, which, once lost, never return. The lesson of the Sybilline books is one which no wise statesman can forget. Nor are we now so much entering into the purely architectural question of the erection of an armory, worthy of the nation and of the age, as anxious to insist upon the importance of not allowing a present opportunity to escape. But, in seizing that opportunity, it will be perilous merely to grasp at the materials of a fine collection without at the same time resolving to make a consistent and worthy use of the acquisition. The question of the purchase of the Meyrick collection of arms involves the more important question of the establishment of a national armory worthy of the name.

The purchase of the nation of the finest private collection of arms in Europe, and one of the finest in existence, is one entitled to receive the support of all advocates of artistic education. It is precisely one of those occasions which occur rarely, and which, when once neglected, still more rarely return.

But this purchase can be justified only upon the ground of its being made really available for educational purposes. It is not with the same object as that with which a country friend is taken to visit the famous chamber of horrors, that visitors should repair to a national armory. It is as an illustration of the history of the last eight hundred years, the change in social habits, the advance in mechanical skill, the application of decorative embellishment to warlike defences, that such an addition to our Art Museum is valuable. For this purpose the Meyrick collection forms but a single chapter, although a splendid and voluminous one, in the illustrated history of armory.

It will, no doubt, unavoidably happen, that in any series of illustrations of a long period of artistic labour, certain portions will afford fuller materials for the collector than he can hope to find for the remainder of his work. Of certain periods, and notably of the earliest periods, his specimens are likely to be few. But it is none the less true that to give the full value to these more richly illustrated portions, a general idea of the whole outline of the subject must be presented to the student. An admirably arranged display, for example, of the armour of the time of the Tudor dynasty, giving such abundant specimens as shall show the general changes of fashion that occurred, reign after reign, can only convey a distinctive lesson, either to the observer already acquainted with the general history of the weapons of offence and of defence, or to the special student of the events of the Tudor times.

But if a general collection be framed, showing by few, but well-selected examples, the transformation which the defensive array of the nobleman underwent, from the date of the Battle of Hastings to that of Marston Moor, the fuller details of that portion of the change which occurred between the Battle of Bosworth and the defeat of the Armada, will have a twofold significance.

For an armorial gallery, then, of which the Meyrick collection should form the fullest and most brilliant division, we must ransack other stores to obtain the requisite complementary information. In many instances it may be difficult to obtain actual arms. We shall be driven to have recourse to monuments, to illuminated tapestry, to brass rubbings, even to ancient missals and books of devotion. No period should be omitted from the historic series, however inadequate may be our present means of representing that period. In each we should distribute the best positive information at present within our reach. The mere fact of the existence of such a national collection, however bald and poor might be the outline which certain portions were in the first instance present, would be a great historic and artistic advantage. Contributions would flow in from all sides. New specimens would be collected by purchase, by gift, by exchange, by electro-type reproduction. Anomalous and ill understood weapons, or portions of armorial defence, would find their

natural places as illustrative of one another, and the gallery, thus organised, would have a growth almost like that of Nature herself.

Nor should our investigation be confined to English armour, or to the armour of the period of chivalry. The general progress of human skill as applied to offensive and defensive weapons should not be left out of sight. We may trace the regular development, for example, of the resistless thunder-bolts of our present warlike array, from the misshapen stones with which the giants were said to have assailed Olympus, to the Armstrong shell, and to the Whitworth bolt. The progress of mankind in the use of missiles had been long and rapid before the invention of gunpowder. Two thousand nine hundred years ago the use of the sling in battle appears to have been a novelty. Within a quarter of a century from that date we find reference to a national, or, at all events, to a military, practice in the use of the bow. In Egypt we find that weapon represented from the times of the earlier dynasties. The projection of large stones from the ballista, for purposes of battering, as well as for personal offences, was a marked feature of Roman warfare. The two methods of missile annoyance were long employed side by side, the powerful cross-bow, for which the Genoese were famous, being the last form of machine for the mechanical discharge of a bolt, while the cloth yard shafts which the English archers were taught to send, with such accurate aim, from their 6-ft. yew bows, made their trajectory on the principle of the rifled bullet of the present day; a rotatory motion being communicated to the arrow by a slight twist, or rather screw, in the insertion of the feather.

The relation between offence and defence is almost as close as the mechanical relation between action and reaction. A new missile, or a new weapon, rendered useless an old form of defence, or rendered advantageous a new one. An improvement in mail, suggested the employment of a new offensive weapon; such, for instance, as the long narrow pick designed for penetrating the joints of the armour, or the apertures in the visor, which one of the Meyrick horsemen holds in his hand. The same controversy that now rages between increasingly heavy ordnance, and increasingly solid armature, for ships or for forts, has been constantly brought to the arbitrament of the open field. The progress is distinctly intelligible. It has continually been that of the gradual perfection, or at all events increase in solidity and in weight, of the defensive panoply. Parallel with that increase has been the increase in the violence of the attack. So long as manual encounters decided the fate of battle, this increased force in the shock was partly due to that very increase in the weight of armour that was intended for resistance. The impact of the lance in the lists became so tremendous, towards the time when the accidental slaughter of King Henry II. of France gave the first grand discouragement to the practice of the tourney, that tilting armour was made of a solidity, and a peculiar one-sided form, altogether inappropriate for actual warfare. The pauldron that was forged to receive the blow of those ponderous lances, that always look so impossible in pictorial representations, weighted the left side of the corslet in a manner inconsistent with the activity of the *milite*; and the unprotected freedom left to the right arm, in suits of armour of this description, would have been equally disastrous in any combat not regulated by strict chivalrous rules.

The earliest European armour with which we are acquainted—that of the Roman soldier—was made of boiled leather. It took, in many instances, the form and the muscular markings of the body, being a simple, solid, hard tunic, with a square hole, protected by metal straps, through which the head was thrust. Recent discoveries at Pompeii have disintombed the Roman soldier from his repose. He died on his post, and the thickly drifting volcanic ashes closed around his form, and his arms, with the accuracy of a plaster mould. Thus the minutest detail of his array, even to the ligaments of his sandals, has been accurately preserved by the fatal tufa, which formed around him almost before life was extinct; and what appeared to be mere conventional representation, on ancient bas-relief, or coin, or statue, has now become distinctly intelligible.

The leathern tunic was first adorned and strengthened by straps, or plates of metal. Then parallel plates or scales were attached. By degrees these metal joints were framed so as to depend more on each other than on the leathern sub-structure. Rings were substituted

for plates or scales. The old tunic was replaced by the softer material of wash-leather, and the coat of mail became entirely distinct from the buff jerkin worn beneath it.

At the period of the Norman Conquest, when what may be called the armour of feudalism or of chivalry first becomes familiar to our knowledge, the use of mail had grown very prevalent. Mail shirts, greaves, shoes, gauntlets, hoods, appear on the Bayeux tapestry. A solid steel cap, at one period, seems to have been the only portion of the defence that was made of plate; and a mail hood was thrown over the steel cap. Play was given to the neck by a mail shirt or gorget, long after plate had spread over the rest of the person. This mail appears in distinct small pieces, to protect the arms, the elbows, the breast, the thighs; and then gradually displaces, or rather supplants, the mail fittings, until the whole figure is seen to be clad in one solid riveted panoply of plate-iron. The gradual disappearance of mail in certain parts of the figure dates the period of armour with considerable accuracy; the last improvement being that of the protection of the throat by overlapping plate-joints, and the total disappearance of mail.

What ultimate revolution might have occurred in the armature of the noble, it is now impossible to guess. The armour at the Tower of London, badly looked after as that collection has been, here offers a mute, but most instructive lesson. We have a long period in English history, during which no armed sovereign of our island took the field. Thus the armour made for Edward VI. crosses the series of royal panoplies. Elizabeth Tudor bore the heart of a king to the inspection of her troops at Tilbury, but not the iron clothing to which kings had long been accustomed to trust. With her unwearied successor the heavy weight of the plate panoply was thrown aside as useless. For the armour of the tilting field would not resist the bullet projected by gunpowder. The weapon of Guy Faux was more irresistible than that of the Comte de Montgommery.

Connected with this general transformation from the Norman mail to the plate of the Valois and the Tudor reigns, was a change in one portion of the defensive armour so gradual and so steady, that it might be reduced to definite metrical rule. An accurate study of a well-gronped series of armour would bring out very prominently the gradual diminution of the shield. We know that in Sparta the true military instinct of a people who were not only quarrelsome, but warlike, placed the point of military honour in the preservation of the shield. With mail armour was associated the use of a large, long shield, capable of protecting the person from head to foot from the flight of arrows. As plate superseded mail the size of the shield diminished, partly to save the weight which was added to the immovable parts of the defensive array, partly because the plate would resist the arrow which might penetrate the mail. Thus reign after reign, with the increase of the plated portions of the armour, the shield lost inch after inch of its size. At length it remained merely as the target intended to catch the blow of the tilting spear; and the curious form assumed by the heavy pauldrons leads to the speculation that, even had gunpowder not been invented, the shield might have ultimately disappeared. A scale of antiquity might be constructed from an accurate measurement of the successive forms and sizes of the shield. This subject assumes extreme interest in connexion with the authenticity and the date of monuments. In regarding questions of anachronism in this respect we should bear in mind that a genuine monument may represent costumes later than that worn by the person represented on the effigy; but earlier, never.

While the steady change of fashion which has taken place in the form of defensive armour, whether we regard the protection of the trunk and limbs, the helmet, or the shield, has thus followed a certain intelligible course, every freak of the most fantastic imagination seems to have been embodied in some quaint shape of offensive weapon. Halberds and hooks, and pikes and maces; swords, from the ponderous 6-ft. blade to the lady's stiletto; engines for discharging projectiles, which took in time the generic name of artillery, are represented by so many specimens as almost to resemble the creations of night-mare. The diabolical ingenuity attributed to the mysterious "Companion of Sintram," has been emulated by the armour smiths of the Tudor times. There is hardly one of the impossibly grotesque armed figures of the "Contes drolatiques," who might not have equipped himself at Goodrich Court. The different aspect

of a line of battle in which the soldiers are armed with regulation weapons, whether lance, or rifle, or bayoneted carbine, and of one in which each weapon suited the skill or the fancy of its possessor, must have been as wide as that between the fish of the old red sandstone and those of our present waters.

It is unworthy of our national dignity that we should be without a fit museum for the display and the preservation of these curious relics of the past. The citizen of Madrid, of Vienna, of St. Petersburg, even of gallant little Turin, would shrug his shoulders at the reply elicited by the question, which was our historic armoury?

We have, indeed, in the Tower of London a collection of arms which, if added to those now at South Kensington, and properly arranged, would form the basis for a very noble museum. The removal of artistic or archaeological objects from their local places of deposit, is not always a desirable proceeding. The axe, and the hook, of fatal memory, now exhibited in the Tower, would lose their associations of terror if put under a glass case at Bloomsbury or at Kensington. But it is otherwise with the suits of armour. They are at the Tower accidentally. An ancient place of strength has been converted, in failure of its old military and political importance, into a depot of arms. Among these weapons have been kept some that have gone out of use. There can be no good reason against removing such of these as possess historic value from an inaccessible place, in no way adapted for their proper preservation or exhibition, to a well-ordered national armoury. With them should be associated, in honourable safe-keeping and tendance, such famous relics of some of the noblest of our historic chieftains as now ignominiously moulder in neglected solitude. The helmet of the Black Prince, shorn of its Bohemian plume, gathers dust, and is gradually devoured by rust in Canterbury Cathedral. That of Harry V., the terror of France, lurks (or lurked) in similar disregard in Westminster Abbey. Our deans and chapters have not made it a part of their duty to tend reverently either the effigies of the great or the relics of the mighty.

Feudal armoury thus historically treated, would be well illustrated by specimens of the weapons, and of the defences, of other nations. In social phenomena, as in natural history, an acquaintance with widely-lying districts illustrates the succession of the most advanced condition of life. The British Museum could contribute specimens of savage clubs, and tomahawks, and poisoned arrows. South Kensington could contribute rich and curious Oriental arms. By bringing all our stores, from the flint knife or the bone arrow-head, of the times when our ancestors had to struggle with the cave bear and the woolly-haired rhinoceros, down to the small explosive shelled which a semi-barbaric power has suddenly discovered to be inhuman, into one focus, we shall add a most instructive and intelligible chapter, not only to the records of modern Europe, but to the physical history of mankind.

The idea has been suggested by some of those who are in the best position for forming an opinion on the subject, that the national armoury should form, not a mere portion of the museum of art, but a separate and independent institution. In that case it has been further suggested, there would be good reasons for building the edifice necessary for the reception and exhibition of the arms, in the vicinity of the Tower of London. That densely populated part of London is far removed from any museum or educational exhibition. There would thus be a local benefit conferred on a large district of the metropolis; while at the same time those historic associations, which the architect ever studies to maintain in active vigour, would be acknowledged and to some extent revived. The subject is one deserving careful attention. It is a detail, but an essential detail. The first thing to be regarded is, the removal of the national reproach that rests upon us in the matter. We have a history of which any people may be justly proud; but while even so small a state as Savoy was before it became merged in an Italian kingdom, had an armorial gallery of a description to which we could lay no claim, our only public armoury exists *pro accidens*. Nor is it a matter of decent self-respect alone. The knowledge of the actual history of defensive armour is essential to the education of the historian, the archaeologist, the sculptor, the painter, and the decorator. It is a subject on which no good architect, either, can afford to be ignorant.

EDUCATE; BUT RIGHTLY.

If we consider that of all the various subjects which at different times have occupied the minds of men, there is, perhaps, none which possesses a wider interest, a more universal importance, than education—none that has a more immediate and direct bearing, or is capable of exerting a more powerful influence, upon the moral and physical welfare of society at large—we shall not be surprised at the large share of public attention it still continues to attract, though so much has already been said and written about it from almost every possible point of view.

Various and conflicting have been the opinions enunciated, some of them obstinately defended and pertinaciously maintained, more especially those relating to religious, as against secular, instruction; but upon one part of the question the concord of opinions has been wonderfully unanimous, viz., the necessity of raising the standard of education, and of extending its benefits to all classes of the community. Yet this question, like every other, has two sides to it; and it is a point of policy, no less than a maxim of justice, to hear both of them: a course which would seem, in the present instance, in some danger of being lost sight of.

Into the religious part of the subject it is not proposed to enter here; our present business being merely with that portion of it which appertains to secular instruction, and especially with the inquiry in what direction is education to be extended?

There is no doubt that elementary education should be universal,—that every man, woman, and child in the kingdom should be taught reading, writing, and some knowledge of arithmetic and of common things. And not less emphatically I contend that means should be afforded to all who have to earn a living, to acquire a special technical knowledge of the subjects required for the calling, profession, or occupation which they may intend to embrace.

In speaking of the sort of education, termed here, simply from its principal characteristic, "classical," it is intended to refer to that kind which for centuries has been, and to this day still is, imparted at most of our public schools, and continued at our two chief universities, and which consists mainly of the dead languages, with more or less of mathematics, and, quite recently, a very small modicum of natural science; but the encouragement given to this study is so small and inadequate, that it is evidently considered of no importance as compared with that of the classics.

It is proposed here to consider this kind of education from a more general and less partial point of view than that of the schoolmaster, who naturally thinks there is nothing like Latin and Greek, just as the cobbler thought there was "nothing like leather;" and so considered, it will be found, I think, with comparatively few exceptions, so negative in its effects, so barren of useful or practical results, so unproductive of anything but disappointment to thousands of those who have made the greatest sacrifices of time and money to acquire it, that it is a question whether its use should not be confined within much narrower limits than it has hitherto been.

The object which we all more or less directly seek in life I take to be success—such success as leads to fame or fortune, or both. Now, let us examine to what extent this is likely to be furthered by the possession of a thorough classical and mathematical education. If in any considerable degree such an education were essential to the attainment of this object, should we not naturally expect to find that the most highly accomplished men would be those who draw the greatest prizes in life? Should we not have a right to suppose that university men in general, and especially the most erudite of them, would almost invariably succeed in attaining the very highest positions in their respective careers, and that, at all events in such as demand a high intellectual capacity, men who have not enjoyed the same advantages, would be totally unable to compete with them?

But is this the case? With the single exception of the Church, the natural and faithful ally of the University, is there any one calling in which success is to any appreciable extent dependent upon, or in any calculable ratio proportioned to, classical knowledge?

Let us first consider those careers, for emolument in which the very highest rewards of the State are usually reserved. Are our most skillful diplomatists, our most successful gene-

ral, our greatest admirals invariably classical scholars or first-rate mathematicians? Or if we look elsewhere, shall we not find numerous instances of men who have become eminent in physio, in the law—who have even attained to the woollenack—without being university men or classical scholars? Are there not many who have even risen to the highest distinction in the senate, and have left their mark in the history of their country, with no aid from Latin or from Greek? Look next at those who have achieved success in the pursuits of commerce, of finance, and of speculation—at our merchant princes, our wealthy bankers, our city magnates, our millionaire contractors! Are they usually remarkable for classical knowledge? If we turn even to the regions of science—the peculiar province, as one might imagine, of the schools—and look at the grand modern discoveries in chemistry, in electricity, in light, optics, physics, and mechanics—

"In the railway, in the steamship, in the thoughts that shake mankind,"—

what shall we find that the Universities have done for us there? Is it to them that we owe those magnificent inventions and improvements which have wrought more wondrous transformations than the wave of wizard's wand, annihilating Time and Space, and leading Master hand, like a captive of old, to the triumphal orb of Mind? No! their systems did not produce, nor their teachings foster, the Franklins, the Davys, the Watts, the Stephensons, the Fultons, the Faradays, the Wheatstones—those great thinkers and workers who are the boast and glory of these recent ages and the benefactors of all succeeding ones.

Let us turn lastly to literature; there surely, if anywhere, one might expect to find the triumph of scholarship assured, and its influence invincible. But is it so? As for the poet, he must be born, we are told, not made; which is at once a confession that for him, at all events, classical learning, and indeed book-learning in general, is by no means indispensable. And accordingly, although the universities have from their very foundation fostered and encouraged the study of the ancient poets, how small a proportion, among all the thousands who have spent years within their precincts in poring over the masterpieces of Homer, Virgil, and Horace, have produced poems which can compare with the works of those who, like Shakspeare, Burns, Hogg, and Keats, drew their inspiration not from books, but from Nature!

Nor, if we come to reflect upon the matter, will this result appear surprising or unexpected. The very essence of the true poet is originality; the most polished diction, the most elegant turns of expression, the nicest skill in the management of rhythm and rhyme can never atone for hack-nayed ideas and horrowed thoughts. Now, can originality be taught in the schools, or acquired by study? Is it not actually more difficult for the man who is steeped in the soul in the thoughts of others to be original, than for him who has thought only his own thoughts, not those of other people? Are we not more likely to tread in the footmarks of others if we travel a road which has been frequented for ages, than if we wander without a guide in the primeval forest, or over the trackless prairie? Will not the student of books be perpetually finding that the ancients have "stolen all his best thoughts" from him? While if once in a way an idea should occur to the unlettered poet which has already been used, it will be but a chance similarity, not a direct plagiarism; and at the worst it will be, in all probability, seen from a new point of view, and clothed in fresh colours.

And what has been said of the poet is almost equally applicable to writers in other branches of literature. Are not some of our very best modern works of prose fiction written by women, who certainly are not graduates of any university, and are for the most part entirely ignorant of the languages and the literature of the ancients?

Were it worth while to pursue the inquiry, I believe we should still arrive at the same results, and find that there is scarcely any branch of literature in which the greatest names will be found the highest on the list of Classics or Wranglers of the universities.

It is not necessary now to seek to account for these facts, or to ascertain why it is not among the most profound scholars that we must look for the most brilliant conversationalists, the most able writers, the greatest discoverers; why those who possess to a high degree the faculty of

acquiring knowledge, are, in so many instances, extremely deficient in that of imparting it to the world; but certain it is that very generally those who have most profoundly studied and most thoroughly mastered a subject, are less successful in teaching it than some who are less perfectly versed in it, yet have in a greater degree the gift of enabling others to understand it. It may be either that those faculties are by nature diverse and almost antagonistic, and therefore rarely combined in the same individual; or it may simply be that the undue encouragement and constant exercise of the one dwarfs the growth, and ultimately saps the very existence of the other. Probably it is with the mind as with the body, that an inordinate appetite by no means implies a good digestion, and that the habit of taking in food with great rapidity and in large quantities, prevents its assimilation, without which the food does no good, but, on the contrary, considerable mischief.

However this may be, it is certainly the case that it is one thing to absorb knowledge, and another to give it out; so that the lives of the most profound scholars have, more frequently than otherwise, been completely barren of useful results. They have locked up within their own brains the enormous stores of learning they have spent a lifetime in hoarding, and—worse even than other misers—have carried their treasures with them to the grave, instead of leaving them behind for the benefit of their immediate heirs and the enrichment of all future generations. Examples innumerable might be accumulated in proof of these assertions; but the names of Porson and Mezzofanti must be familiar to every one as instances of the most extraordinary acquirements and the most insignificant results.

But if we take a more extended horizon and a lower range, we shall perceive still more clearly the defects of the present system of considering a classical education the best possible preparation for nearly every one of the various pursuits of life. Let us look at the results in a few instances.

A young man of my acquaintance, who has lately taken his B.A. degree, is an excellent Latin scholar and a very fair Greek; yet he cannot hold a conversation in French, or write a Spanish letter for his father, the merchant. Another is well up in mathematics; he has the integral and the differential calculus at his fingers' ends, but it is ten to one he cannot calculate a sum in compound interest half as quickly as the junior clerk in his uncle's bank, whose entire schooling was comprised in four years at a cheap commercial academy in Peckham. A third actually knows something of Hebrew; yet the Civil Service examiners would not pass him for a junior clerkship in the Customs or the Post-office, because his English composition was slovenly, and his handwriting barely legible.

What, then, shall the young graduate do with his classical knowledge? To what market shall he carry his Homer and Horace, his Tuhunter and Newton? Of course he may get a fellowship or a college living, or even, if his luck be good and his connexions high, a bishopric; but these prizes are necessarily for the few;—and what of the many? What will society give them for their Greek and mathematics? Why, a curacy in Wales with 80*l.* a year, or an usher-ship at a school with 60*l.*

When a lad, then, is not born to independence, but has to earn his living in a lawyer's or merchant's office, in the army or navy, the civil service, or any other of the ordinary occupations and professions, is it, I ask, absolutely indispensable—nay, is it even desirable—that he should devote several years of his life to the acquisition of the dead languages? Does it not warp his ideas from a more practical and profitable channel, and waste precious time that might be employed in mastering such special branches of knowledge as would fit him not merely to preene creditably, but to excel and rise in his future career? If a lad is to become a merchant, why not rather teach him modern languages and book-keeping? If a sailor, let him study navigation and steam; if a farmer, agricultural chemistry. If he is to be an architect or builder, would it not be better for him to employ his time in acquiring the art of construction than in learning the Greek particles? Would not Tredgold's "Carpentry" be a more useful text-book for him than Ovid's *Metamorphoses*? If he is to earn his living as a telegraph clerk, should he not study telegraphy rather than Terence? Will Conic Sections make a clever contractor, or the writings of Euripides an engineer? Is the Binomial Theorem essential to a barrister, or Surds to a solicitor?

Some will reply that these studies are intended merely as the groundwork of a complete education—as the best substructure for technical instruction. But the length of time employed in them at once disposes of this objection; for in this busy, hand-to-mouth age, when time is money, and the struggle for existence is daily becoming fiercer and more desperate, we cannot afford to spend a third of our probable span of life in merely laying the foundation of education. No; when a youth passes from Eton or Westminster, Merchant Taylors' or Charterhouse, to the university, and comes away at the age of 22 or 23, he is practically presumed to be fit to make his way in the world in any capacity whatever. It is clear, therefore, that the studies which are commenced at a public school, and continued at the university, are intended as the sum-total—the be-all and end-all of education; and it is, I think, equally clear that in this sense they are woefully insufficient, and lamentably unserviceable, at least for nine out of ten of the various walks of life; and I would therefore ask whether a considerable portion of them might not with advantage be reinited in favour of other branches of knowledge which would exert a more direct and practical influence upon the active pursuits and real business of after-life.

Of course, it is not always true that "the real worth of anything is just as much as it will bring;" and no doubt learning has uses and advantages which cannot be precisely measured by the metre of £ s. d. Perhaps the most plausible mode of defending a classical training is that of considering it as synonymous and identical with the cultivation of the intellect; as if there were no other means possible of effecting that object, or, at least, none other worthy of consideration. But no satisfactory reason is ever vouchsafed why the dead languages should tend, more than natural science or any other branch of knowledge, to promote *thought*, which, after all, is a far higher exercise of the intellect than the more mechanical one of memory, which alone is necessary for the acquirement of languages. Nor, on the other hand, can facts be more successfully appealed to in support of the assumption; since, as we have already seen, the chief positions in diplomacy, finance, literature, science, and all those careers which require the very highest intellectual qualifications, are occupied by men devoid of classical training, at the very least as frequently as by those who have most enjoyed its advantages.

L.

TREE WORSHIP AND CONIFEROUS TREES.

It is very difficult to draw the line between the actual worship and the mere reverence of trees and plants. Incredible and romantic tales innumerable might be cited, similar to the legend attached to the Roman Arum (*Dracunculus communis*) referred to in last week's *Builder*. If some competent person would publish a catalogue of all plants that have been, or are, worshipped as gods, or that have sacred legends attached to them, it would prove a most instructive piece of work.

That trees were ever worshipped in consideration of their value to man, as suggested by Mr. Fergusson in his recent lecture, reported in your columns, or on account of their long life or imposing aspect, is quite fallacious; for amongst sacred plants we have objects the most worthless, insignificant, and short-lived. Mr. Fergusson also tells us that very few traces of tree worship are left in this country, and these traces are on the borders of Wales; but he omits altogether to say what the traces are, and what trees he refers to. Traces of tree-worship pure and simple may be very few, or they may be many, according to the views of the writer on the subject; traces of the reverence of trees as possessing sacred, occult, or mystical properties are common enough,—witness the singular beliefs regarding the mountain ash and the poplar. The foliage of the latter tree exactly resembles in shape the heart-like foliage of the sacred fig of the East (*Ficus religiosa*) and other hallowed plants; the poplar itself is even said, on good authority, to be worshipped by certain savages at the present day; and in this country we have the curious legend that the Cross of Christ was made from its wood.

But omitting for the present all reference to other trees but the fir tribe, the heliefs and legends connected with the *Conifera*, or cone-bearing trees, are most remarkable. In ancient writings, it is difficult always to precisely deter-

mine the special trees referred to, but under the term *Conifera* are understood the fir, cedar, yew, &c. The references to the cedar in the Bible, to the groves of "sacred pines" in Ovid, the representations of the mystic in the hands of the mystic figures on either side of the sacred trees in the Assyrian sculptures, the pine splints used in torches during sacred ceremonies, cedar ashes used as a purification from sin, the fir-cone fixed on the staff or thyrsus of Bacchus, and the fir-chaplets of the Isthmian games, are pretty familiar to us all. That conifers were worshipped for their value to man, but that cones were significant of "fire," as suggested by Lyard, or were merely used to flavour the wine of Bacchus, are thoughts quite unworthy of the subject; the real origin of the sacred attributes of trees has yet to be written.

Through the middle ages we find the *Conifera* regarded with the same reverence; pilgrimages were made to the ancient cedar-groves, with fasting, singing, dancing, and the celebration of religious rites. How far these notions have varied and been brought down to the present day it is not easy to say, but in ancient sculptures we find representations of these sacred trees, adorned with ribbons, medallions, statuettes, and neck-nacks, apparently as offerings to the gods on special occasions, just as in this nineteenth century at the greatest festival of the year we have one of the coniferous trees brought into our houses, illuminated and garnished with the same ribbons, medallions, toys, and neck-nacks, apparently in honour of the birth of Christ. Is it too much to say that the Christmas tree of northern nations is a mere relic of Pagan tree worship (so called), or is it only a curious and meaningless coincidence? Any reference to the veneration of the sacred bean (*Nelumbium*), the sacred fig (*Ficus*), the sacred cotton (*Gossypium*), the meaning of the sacred tree of the Assyrians, the thyrsus of Bacchus, trees held sacred by savages, sacred water-plants, the remarkable and well-known fungus (*Polyporus sacor*), worshipped as a god in West Africa, the plants grown upon roofs and eaves of houses as the houseleek (*Sempervivum*) in the most ancient times, and at the present day, to repel evil spirits and avert lightning, would prove too long for the present number of the *Builder*. W. G. S.

THE FALL OF ROADWAY, GREAT EASTERN RAILWAY.

On the 19th, Mr. Humphreys resumed the inquiry respecting the death of the four men who lost their lives through the fall of arches at the goods station of the Great Eastern Railway. Various witnesses said they had seen a crack in the stone early in February. Mr. Charles Provis, engineering agent in the employ of Messrs. Lucas, said three weeks before the accident his attention was called to the crack, and he had it filled with cement. He afterwards directed the girders to be shored. There was no other way to set things right but by putting up struts and removing the pillar and the stone. Mr. J. Tinkham, inspector of works to the Great Eastern Railway Company, said he had seen the stone since the accident. The bottom of it was hollow. The cause of the cracks in the stone was due to that. It could have been ascertained that the stone was hollow before it was placed in position.

Mr. James Edmeston, architect, produced a written report of an examination which he had made. He attributed the accident to the cracks in the stone. There was a hollow underneath the stone, in the stone itself. The weight which the iron pillar supported was 200 tons. The stone was from Bromley Moor, near Leeds, and was of a kind extensively used, and considered good.

The jury, after a long consultation in private, returned a verdict:—"That the deceased persons were killed accidentally by the falling in of a certain roadway, which was supported by an iron pillar, which rested on a hollow stone, and that fissures in the said stone caused the fall; and the jurors say that when the said fissures were first noticed the girders should have been shored up and a perfect stone substituted for the imperfect one."

Society of Engineers.—At the ordinary meeting of the Society of Engineers, held on the 15th instant, Mr. F. W. Bryant, president, in the chair, a paper was read "On Joints for the Prevention of Leakage in Gas and Water Mains," by Mr. C. M. Barker.

[See pp. 217 and 218, ante.]

THE SITE FOR THE LAW COURTS.

EVIDENCE and opinion accumulate in favour of retaining the site already obtained. Mr. F. W. Shields, C.E., in a report to the Chancellor of the Exchequer, just now printed by order of the House of Commons, arrives at the opinion we have already expressed, viz., that the Strand and Carey-street site has the advantage of the Embankment site in important particulars.

"Its adoption," the reporter says, "as appears from the estimates of Mr. Ryde, would save a further expenditure of 725,000*l.* of public money. Its level is better suited for external access. Its position is much more central and convenient, being midway between the Temple and Lincoln's-inn, and also midway between the great thoroughfares of Holborn and the Strand. Its great defect, which turns the balance against it, is the want of a leading thoroughfare on its northern or Holborn side. It appears to me, therefore, that if this deficiency were provided for, the Carey-street site would be the more advantageous both for the legal profession and for the public."

His plan for effecting this object is to carry a wide street, in continuation of Piccadilly and Long Acre, through Carey-street to Cheapside. This new street would be continued from Long Acre by Covent Garden and Drury-lane theatres, to pass along the northern front of the Carey-street site, and thence it would be extended (crossing the Farringdon-street valley by a viaduct) to the end of Cheapside at St. Paul's. It is proposed also to widen the passage called "The Turnstile," at the eastern end of Lincoln's-inn-fields, so as to give a direct communication for carriage traffic between the Law Courts and Holborn.

To meet part of the cost of the new street, Mr. Shields proposes that a company should be authorized to make an underground railway from the junction of the Fulham and Cromwell roads, near the South Kensington Museum, to the Mansion House, terminating in the new street now in course of construction from that point to Blackfriars Bridge. The tunnel could be formed without interference with private property; and the company, having no property to purchase and no compensations to pay, would be able to contribute a considerable sum towards the new street in return for the privilege. The remainder of the cost, he suggests, ought to be shared between the Government and the metropolis.

ST. PAUL'S CHURCH, ST. LEONARDS-ON-SEA.

The church, of which we here give a view, has been recently built at St. Leonards-on-Sea, adjoining Hastings, at the sole cost of the late Mr. William Gilliat, of East Hoathley, Sussex, from the designs of Mr. John Newton, of Salisbury-street, London. It has a commanding situation over the entrance to the Hastings tunnel, on the hill immediately above Warrior-square, and will have cost, when the spire is finished, about 16,000*l.* The contractors were Messrs. Jackson & Shaw, of Westminster, and Mr. George Walters was clerk of works.

The church, which will accommodate about

700 persons, is built of Local Blue stone, with Bath stone dressings, and is lined internally with Fareham bricks, tiles, and Bath stone hands. It consists, on plan, of nave and two side aisles, with north and south porches. The chancel terminates in a horse-shoe apse. South of the chancel is an aisle, and on the north the tower, containing a fine organ by Holdich. It was originally intended to place the tower on the south side, but the difficulties of foundation rendered an alteration desirable.

There are five arches on either side of the nave, supported by shafts, and clustered responds of Devonshire and Greek green marble. The clearstory consists of a succession of narrow lights surmounted by a roof of good proportions, covered with Broseley tiles. The chancel is groined, as also the apse, with incised stone and brick.

The pulpit and reredos are of Alabaster, the font is of Sienna marble, and the sedilia of Caen stone, all inlaid with panels of marble. Messrs. Field & Co. supplied the marble, and Messrs. Farmer & Brindley executed the carving.

Messrs. Minton & Co. executed the tiles for the pavement, which is elaborate, having subjects incised in marble. The working cartoons for these, as also those for the incised subject of the Lord's supper, in the reredos, were made by Messrs. Burlison & Grylls.

Messrs. Clayton & Bell executed the stained glass windows; Mr. Robinson, of Holborn, the stalls; and Mr. Leaver, the gas standards.

ST. PAUL'S CHURCH, ST. LEONARDS-ON-SEA, SUSSEX.—MR. JOHN NEWTON, ARCHITECT.

THE "SEPARATE SYSTEM" OF DRAINAGE.

"Sir,—Now that the natural streams and rivers in and near to towns are seen to be polluted, and their beds to be silted up, through being used as runfalls for sewage; and that large sewers, by receiving sewage as well as rainfall, cause filth to deposit and noxious gases to generate within them, which gases escape into and contaminate the atmosphere, people begin to perceive that a great mistake has been made in draining the metropolis and towns throughout the country by this "combined system." It is now, therefore, very evident that what is aptly termed the "separate system" should have been adopted instead of it, so far as circumstances would have permitted. The "separate system" consists in collecting the natural or subsoil and surface drainage of towns into channels separate from the artificial, or house and soil drainage, and discharging it into the natural streams and rivers, and in receiving the artificial drainage into channels separate from the natural drainage, and carrying it to convenient places for profitable distribution on the land. The growth of the "combined system" has been altogether accidental. It arose out of the necessity to rid ourselves of the foul drainage of our houses; and, without thinking or troubling ourselves about the error or mischief we might be doing, we must, forsooth, turn it into the nearest watercourse; or, if that was not at hand, we must carry a sewer or a drain up from it for that purpose. In this way the "combined system" came gradually into operation, without pre-arrangement of plan or principle, until it grew into the system as we see it developed in the works of the Metropolitan Board, and also, taking their cue from it, of the Local Boards throughout the country; and the inevitable result is the continual pollution, by the foul liquid, of every natural stream and river on the one hand, and by the noxious gases engendered of the atmosphere on the other. This great error in the drainage of towns cannot be gainsaid. It is palpable, not only in the foul state of the streams and rivers and the atmosphere, but in the high death-rate returns of the Registrar-General. Had the "separate system" been adopted twenty years ago, when it was first promulgated, it is fair to presume that the people living in towns would now be breathing a purer atmosphere, and that the death-rates would be much less than they are. It is not complimentary to the sagacity of those to whom the serious question of the drainage of the metropolis was referred at the time that they should have utterly ignored this system without due and calm inquiry into its merits. No doubt they acted according to their light, and that is all that can be said in mitigation of the monstrous evil that has been perpetuated in the drainage of towns. The "separate system" however, is beginning to be understood, and is gradually coming into action, as doubtless it is the proper principle to be adopted, and not only the present, but all future works of drainage should be made to conform to it as much as circumstances will permit. The following is an abridgement of the preliminary report of Mr. John Phillips on the drainage of the metropolis, July, 1849, wherein the "separate system" is advocated. Mr. Phillips, who was chief surveyor to the Metropolitan Commission of Sewers at the time, was led to recommend this principle for adoption from his thorough acquaintance with the working of the sewers under his care, and it is to be deplored that it was not then put into practice. The Metropolitan sewers are nearly as had now in regard to cleansing and ventilation as they were twenty years ago, when they were examined, and remedies were proposed embodying the "separate system." This yet remains to be done. The main drainage that has been carried out has in no way improved the general ramification of the sewers in these respects, but simply removed the foul condition of the river from one place to another.

"It is impossible to provide a perfectly innocuous system of town drainage while combining in one channel the house and surface drainage. They must be kept separate. Sewers which receive both kinds of drainage accumulate soil, and generate noxious gases, which escape into the houses and streets. The necessity for flushing to remove the soil, and for trapping to prevent the smell from escaping, proves that the combined system is eminently at fault. A general trapping would not remedy the evil, since foul air would be generated as freely, and would

pass up the drains into the houses instead of into the streets. The evil arising from house drains discharging into sewers which receive surface drainage, is not confined to the houses and streets, for such sewers constantly pour floods of filth into the river, which is polluted in consequence. It is impossible, therefore, to preserve the purity of the air we breathe, and of the river, on the banks of which we live, while the filth from the houses is allowed to pass into the sewers which communicate with the surface and empty into the river; and, therefore, it is a necessary condition of perfect drainage that separate channels should be provided for the house drainage having no connexion with the river.

In order to restore the atmosphere of the metropolis, and also the natural watercourses and the river, to their original purity, the following principles must be conformed to:—

1st. That two systems of sewers and outfalls, independently of each other, should be provided; one for the discharge of natural or surface drainage, and the other for the discharge of artificial or house drainage.

2nd. That as outfalls are already provided for natural drainage, it is only necessary to provide separate outfalls for artificial drainage, which should be conveyed to convenient depôts below the town.

3rd. That, in order to perfectly drain the subsoil and the surface, a system of permeable sewers should be provided to discharge into the natural watercourses and the river.

4th. That, in order to carry off the house drainage, without the escape of effluvia, a system of impermeable sewers should be provided separate from the permeable sewers, to discharge without intermixture into artificial outfalls, independently of the river.

5th. That on these outfalls depôts should be formed and works established for raising the sewage and distributing it for agricultural purposes.

As the river is the natural outfall for the drainage of the subsoil and the surface, it is proposed to lay down permeable sewers where none now exist, and to lower and improve those sewers which are inefficient. One of the evils of the combined system is that the sewers in the low districts are filled part of each tide with the drainage which comes chiefly from the high districts. By intercepting the island waters and conveying them into the streams and river, above the influence of the tide, this defect would be remedied, and the sewers in the low districts would be sufficient to accommodate the quantity of water falling thereon. In these arrangements the present sewers would be deepened and made efficient, and lines of catch-sewers would be constructed to serve as conduits for the surface water.

Having provided for the discharge of the subsoil and the surface drainage, the next consideration is to provide an outfall as a substitute for the river in respect of the sewage in the low districts. The extent of this outfall will depend on the quantity of sewers. This will consist chiefly of the water supplied to the houses for domestic use, and such rain falling thereon as cannot be conveniently carried into the sewers provided for the surface drainage. In this case only an exception must be made to the general principle of keeping the house and surface drainage separate.

The Thames is the common sewer of London. Its tributaries, both open and covered, should be purified the same as itself, namely, by providing separate channels for the reception of the sewage. The best method of doing this would be to lay pipes upon or under the inverts of the existing branch and main sewers, and to connect all the house drains with these pipes. Then the house drainage would be diverted from the sewers, which would only receive and carry off the surface drainage, and thus the metropolis would be perfectly drained.

It is not intended to discuss here the merits of liquid and solid manure, but to show how the metropolis and the river may be relieved of the sewage, which may be led and raised into reservoirs and filtering tanks in the Essex and Kentish marshes below London, and there disposed of for agricultural purposes. The sewage of the high grounds could be intercepted, and distributed over distant agricultural districts on a lower level by gravitation, and fitted for distribution on higher levels by mechanical power. To suffer the sewage to flow into the river when it cannot be put upon the land would be to pollute the river, and thus the first principles of sanitary improvement would be vitiated.

Main outfalls therefore should be provided to receive and discharge the house drainage of the metropolis at such times, independently of the river. By this system the metropolis and the river would be permanently relieved from sewage. Towns can only be properly drained by the adoption of these principles.

AN ENGINEER.

THE RAILWAY SYSTEM.

At the ordinary meeting of the Institution of Surveyors, held on Monday, March 8th, Mr. John Clutton, president, in the chair, the discussion on Mr. J. Bailey Denton's paper was resumed by Mr. J. W. Barry, who thought it could not be anticipated that owners would give their land for railways, or subscribe for the shares, as expected by Mr. Galbraith. He thought if expensive accommodation works were demanded the district should contribute in some way towards the cost. Light railways following the contour of the country would be impracticable in hilly districts, which would entail heavy gradients, and consequently heavy engines and costly permanent way.

Mr. J. H. Lloyd did not agree in the strictures passed on the landowners. No doubt, in earlier days the invasion of estates by railways was considered as something horrible, and large amounts were paid as compensation; but he thought Mr. Denton had gone a little too far, and no inflexible rule could be laid down. There would be a great deal of practical difficulty in applying the principles of the Land Drainage and Improvement Acts to such cases as these. He instanced the Land Clauses Consolidation Act for Ireland, under which an arbitrator was appointed by the Government, to whom was referred every question of accommodation works and compensation, as being a very convenient Act, and capable of easy application. Mr. Lloyd suggested that a committee might be usefully appointed to consider the whole question in conjunction with the Institution of Civil Engineers.

Mr. Francis Vigors thought something might be gained if the surveyor, in conjunction with the engineer, advised on the course of the line before the plans were made public, and thus be enabled to negotiate the compensation on better terms.

Mr. E. J. Smith thought the landowners and the existing railway companies should combine to make branch railways, the landowners undertaking to guarantee a certain moderate percentage on the capital.

Mr. T. Marr Johnson said that in laying out the Metropolitan Railway they were greatly indebted to surveyors for their assistance. He thought something must be conceded by the public if branch railways were to be constructed economically, and the first thing to be given up must be high speed, which involved heavy engines, costly permanent way, and excessive wear and tear. The branch lines must be of the same gauge as the main lines, and would probably resolve themselves into two classes; one adapted to flat countries, where the rolling stock of the main line could travel; and another for hilly countries with steep gradients, which would require special working plant, carriages as well as engines.

Mr. J. C. Driver mentioned an instance in which a proprietor, having received a large sum for damage to his estate, and the property afterwards realizing more than it was thought originally to be worth, returned the amount received to the railway company.

Mr. J. Bailey Denton expressed himself satisfied with the course the discussion had taken, and said the whole question resolved itself into this, that if railways were to be made at something like 5,000l. per mile some way of paying less than 240l. per acre for land must be devised; for with eight or ten acres per mile that would absorb at least 2,000l., and practically put a stop to further proceedings.

The President mentioned that on the purchase of land for a certain railway he had to pay 300l. per acre for land not worth 30l., because it was alleged the railway would frighten the nightingales out of the wood. Landowners were not the only plunderers. He had sold 2½ acres to a railway company for 900l. One acre was used for the railway, and the company demanded 1,250l. for the remaining 1½ acre, so that those who complained the loudest, when they became landowners themselves were equally exorbitant in their demands. He thought the question of giving land for railways depended in a great

measure on the size of the estate and a variety of circumstances which would prevent a general rule being laid down; besides, this sacrifice should not be expected exclusively of the landowners, as every class of society was benefited by their construction. He was sorry to hear so high an authority as Mr. Lloyd say that proceedings similar to those under the Inclosure and Drainage Acts could not well be applied to railways, and he quite agreed with the proposition to appoint a committee to consider the whole question.

After some further conversation on the subject, it was resolved—

“That it be left to the Council to nominate a Committee for the purpose of considering what steps, if any, can be taken to promote the extension of the railway system, especially in agricultural districts; and that the Council of the Institution of Civil Engineers be invited to co-operate in any way that may be thought desirable.”

DRAWING AND PAINTING IN RELATION TO MATERIAL AND IDEAL ART.

At a meeting of the Society for the Encouragement of the Fine Arts, on the 11th, Mr. T. R. S. Temple, the honorary secretary, in the chair, a paper was read by Mr. Henry Tidy on “Drawing and Painting in Relation to Material and Ideal Art.” He said,—With the differences of opinion about art, it was necessary to revert to nature. Man was a compound of spirit, mind, and matter, and became, as one or the other predominated, the man of genius, as the poet; the man of talent, as the scientific man; and the man of ordinary ability, who was inevitably subject to the other two. The vitality of works of genius was remarkable, Shakespeare himself being to us but a dream compared with the reality of his Falstaff. Poetry, music, and sculpture were in advance of painting; for in the word-pictures of Shakespeare or Shelley, in sound-pictures of Beethoven, and in the stone-pictures of the ancient Greeks, is to be found a more thorough realization of the ideal, a more complete supremacy of spirit and mind, than is presented in the works of any painter with whom we are acquainted.

The commonest of the commonplace in Rembrandt is redeemed only by the marvellous chiaro scuro and textural power. Rubens is gorgeous, but decorative, rather than spiritual. Raffaello, if spiritual, is often grotesque in drawing, hard in outline, and crude in colour. Murillo never attained the divine, at which he aimed. Mr. Tidy next turning to the consideration of colour, remarked that the pigments in use at present represented but imperfectly primitive colour—a defect that was not to be remedied, however, by the very common mistake of putting vermilion in the place of primitive red. He then, with the help of several diagrams, explained, first, Mr. Benson's system of the science of colour, and afterwards the ingenious theory of Mr. Hay, of Edinburgh, pointing out the close connexion as shown by him to exist between form, colour, and musical sounds; form being exemplified in the circle, triangle, and square; colour in the prismatic rays; and harmony in the different chords of music. He entered also into a minute examination, illustrated by diagrams of the perspective of the pre-Raphaelites, and into other technical matters, such as the agreeable effects produced by engraving, from black, comprising the three primitive colours, the balance of colour in pictures, &c. Ary Scheffer's he characterized as in a minor key of colour, and concluded a paper, which was greatly applauded, with the remark that the schoolboy now had more facilities for acquiring the true principles of art than artists formerly enjoyed.

The chairman said,—At a time when it was the custom to refer everything in art and science to first principles, it was most important that the practical as well as the theoretical man, as on the present occasion, should give as the result of his experience. The love of reality was a characteristic of the age, yet the imitation of material substance was but the first stepping-stone to fine art, the beautiful thought and expression being the life and soul of it. With respect to Greek art, it was no wonder that it flourished under the threefold influence of religion, climate, and the applause of a people who thoroughly appreciated and rewarded art. Mr. Fahey, whilst defending the pre-Raphaelite school of painting, remarked that a great authority had said an artist ought to be able to paint down as well as up to his public. Dr. Heinemann said such a principle as that suggested by Mr. Fahey could

not be too strongly condemned. Messrs. Sadler, Denton, Postlethwaite, and others addressed the meeting on the various topics of interest that had been raised. After a cordial vote of thanks proposed by Mr. Gilks to Mr. Tidy, who replied to some of the objections, and with a vote of thanks proposed by Capt. Brittan to the chairman, the proceedings terminated.

PARK LANE.

Will you grant a small space in the *Builder* to suggest a plan for the improvement of Park-lane, which, I think, has not yet been duly considered.

The Board of Works have announced their intention of purchasing the two houses at the north-east corner of Hamilton-place; if they also purchase the house at the corner of Piccadilly they will be able to continue Park-lane to Piccadilly at the same width throughout, and it will be possible to give up a narrow strip of ground in front of the houses on the west side of Hamilton-place, to be used, not as a garden, but for a private carriage-way. If this be done, the inhabitants of Hamilton-place will be in a great measure compensated for the loss of the privacy which they now enjoy; and as the carriages at their doors will not be in a crowded street the public will gain much.

A RATEPAYER.

THE MANAGEMENT OF ENGLAND'S ROADS.

REGARDING the management of England's roads, much interest has of late been manifested. Improvement being sought for, about four or five years ago an Act was passed for the amalgamation of parishes. Under its provisions the representatives of each parish in a petty sessional or union division form a district highway board, the board appointing a surveyor and clerk as its officers. Strange to say, these boards, though made up of such rude elements as compose boards of guardians (and, goodness knows, we have heard enough of boards of guardians lately to judge as to their capability for transacting business), are virtually irresponsible; they spend what money they wish, as they wish; their accounts may chance to be audited by a zealous member of their own board, or, as in other instances, the accounts may be regarded as a nuisance, interfering with the delight of fault-finding, and they may be never audited. As a vice-chairman of a highway board once said, when some one thought it was well that the accounts should be examined, “Augh! d— the items, it's the totals we want,—aw, aw, aw!” A mistake was made even in the Act itself, by making it permissive. The onus of introducing the Act was made to rest with the Court of Quarter Sessions, thus casting thereon unnecessary odium.

As was prognosticated from the first, those disorderly gatherings called highway boards are now found to be utterly incapable of the management of the duties thrown on them, and indeed the Legislature must have been sanguine to have otherwise anticipated. They began their errors by giving small salaries to their surveyors and by comparatively large salaries to their clerks. Now, the whole well-being of a highway district depends upon the surveyor; yet the office was in many cases put up by tender, to be obtained by him who bid the lowest sum, regardless of all qualifications for the office. Always accusing the magistrates of jobbery, they themselves have been guilty of the grossest jobbery; they have introduced as surveyors of England's roads farmers who could not make their farms pay, the son of an eating-house keeper, horse jobbers, tax collectors, and men of the like standing; but who or what the man, he has a salary which an educated gentleman, educated as an engineer, would not submit to, even supposing such a one allowing himself to serve a district highway board. The surveyor (some parts get better), people using the roads complain; the rates get higher, all complain; then the boards, not finding fault with themselves, do as they are now doing so markedly in Yorkshire, or out there, that the Legislature, through the magistrates, has hurt them,—not seeing that the hurt has been caused by their own short-sighted policy. But, supposing the surveyor chances to be a man who is capable of doing the work of the highway board, even then the Act does not work well: the board is ever seeking some cause of com-

plaint against him (not working with him): as one surveyor said some time ago, “Ob, I was told a farmer said, ‘We don't want fine gentlemen as surveyors, who come into our parish with fine gold chains.’” He happened to wear a gold chain to his watch. Or, as in the case of another surveyor, who at last resigned his office in disgust,—“My dear! he goes about the roads with a silver-handled whip, big as life, d—n his eyes!”

All this takes the spirit out of the very best officer, and at last he finds a clerkship in a merchant's office infinitely preferable. But though the Government may be aware of the ill-working of the Act, of the incapability of highway boards, they are, as rapidly as possible, giving them more work to do.

As fast as the debt is paid, the turnpikes throughout the kingdom are being abolished, and put under the care of these boards. They are not simultaneously abolished, but only as they pay off their liabilities.

Now, in every way, this is a great injustice. Adam Smith says, in his “Wealth of Nations,” that a “fairer way of raising a tax than the present toll system cannot be conceived.” But, admitting the inconvenience and injustice of the toll system, surely the parish through which the turnpike-road happens to run should not be made to maintain it.

Turnpike-roads are the main arteries of commerce (subsidiary, of course, to railways); they run from one town to another, being fed in a measure on their way by the parish roads. Turnpikes are as much for the accommodation of the town as of the country; and therefore it is a hardship of the country as against the town to maintain them. The parish, for its own benefit, maintains roads that thread through its most important parts, connecting those parts with the through turnpike-road. The town, for its own benefit, maintains a network of roads in connexion with the turnpike-roads branching from its borders.

Now for the remedy, for which a great cry is being made. The points to be held in view are the existing debts on the different trusts, and the incapacity of the highway Boards.

Is not the following suggestion worthy of thought? The highway boards should not have the care of the turnpike-roads.

The turnpikes should be regarded as imperial roads, and maintained as such by an imperial tax (whether on horses or carriages). They should be amalgamated; two, three, or four trusts, according to their size, should be collected under one management; the present trustees of the two, three, or four to be the trustees of the new one. There should be one staff for the amalgamated trusts, thus at once materially reducing the cost of management.* The cost of maintenance of these amalgamated trusts should be defrayed by an imperial tax; and in case one or more of the trusts should be in debt, the toll-gates on that part should be allowed to remain, until the whole of the debt was discharged, the entire receipts from the tolls being devoted to that purpose. As it is an injustice that these highway boards, who do not fairly represent the ratepayers (inasmuch as business-men really cannot afford the time; and even if they could, would decline to associate with such people), should have an irresponsible control, they should (as also the amalgamated trusts) be subject to a central government board of control, possessing similar powers to the Poor-Law Board. Each county, or two or three counties combined (dependent on their size), should have a surveyor-in-chief, who should also act as auditor. As it would be well that the chief surveyor should know something of the personal characteristics of the county or counties to be under his care, the Court of Quarter Sessions (or combined courts, as the case may be), should be directed to nominate the gentleman for the office, such nomination to be subject to the approval of the Secretary of State. But such chief surveyor should alone be responsible to the central board, who should name their salaries, and in fact be with the foregoing proviso, and under reference always to the Secretary of State, the servant of the central board. Thus the district under the chief surveyor would have all its accounts audited, it would have a gentleman at hand to direct and advise; it would have one system of roadmaking, and one system of account-keeping; unnecessary expense would be checked, a power

* It would not reduce the cost of management but a very little more by making the highway boards accept the management; as with increase of work, their officers would expect increase of pay.

to keep the district up to the work would be at hand (for again and again has been heard the remark from members of highway boards,—“We are not bound to make gentlemen’s carriage-roads of the parish roads”), the highway surveyors would be able to breathe, and would then perhaps find it unnecessary to touch their hats as much as they do now; and the clerks would find themselves simply clerks, and not clerks and the board too.

It has been suggested in influential quarters that the turnpikes should be abolished, thrown on the highway boards, and the whole maintained by an imperial tax; but that would be fair only when the town roads are allowed to join in the benefits of an imperial tax. The town maintains its own roads, the country should maintain its own roads—the roads joining the towns,—by the imperial tax.

As for the metropolitan roads, they should be treated something in the same way, one surveyor-in-chief acting also as auditor, subject to the central Board of Control; and dividing London into four or five districts, the representatives of each parish in a district should form a board, it appointing its staff. Pro.

FOUNDATIONS IN RIVERS.

THE INSTITUTION OF CIVIL ENGINEERS.

At the meeting on March 2nd, Mr. C. Hutton Gregory, president, in the chair, the first paper read was “On Sinking Wells for the Foundations of the Piers of the Bridge over the river Jumna, Delhi Railway,” by Mr. Imrie Bell.

After alluding to the native plans of sinking wells, built of masonry or brickwork, by excavating the sand from the interior, at first by means of a spade called a “phacra,” and after the first 5 ft. by an implement called a “jham,” reference was made to a modification in the use of the jham in constructing the railway bridge over the Jumna at Allahabad, where, instead of sending down a diver to force the spade into the ground, a pole was employed to strike the butt end of the jham, and so to drive it into the ground. This was, in the author’s opinion, a decided improvement; but the process was still tedious and slow, especially where clay or hard strata were met with.

The author then proceeded to describe the mode of forming the foundations of the bridge over the river Jumna, near Siranwa, on the Delhi Railway. It appeared that the bed of the river at this point consisted of coarse and fine gravel and sand, interspersed with layers of blue clay 3 ft. and 4 ft. thick, and covered with silt; but, during the rainy season, large boulders, weighing 14 lb. each and upwards, were brought down, and deposited by the scour of the river 30 ft. below the level of the bed. The bridge comprised twenty-four openings, each 99 ft. in the clear, and the superstructure was composed of two lines of lattice girders, resting on brick columns, or wells, each 12 ft. 6 in. external diameter, and 5 ft. 10 in. internal diameter; so that the wall of the well was 3 ft. 4 in. thick. In some instances the sites of the piers were got clear of water by diverting the river at different points during the dry season, while in other cases islands were formed, by driving a half-circle of piles on the up-stream side, then lowering sand-hags on the down-stream side, to the height of 4 ft. or 5 ft., and afterwards filling up with sand to 5 ft. above low water. The curb on which the steining of the well rested was formed of wrought-iron plates and angle-irons riveted together; and in cross section the curb was like an inverted right-angled triangle, of which the height was 4 ft., and the base 3 ft. 4 in. When each curb was complete, it was moved into position, and the compartments were then filled in with concrete. The curb was next sunk by men working with the phacra and basket, till the upper edge was within 3 in. of the level of the water, when a ring of brickwork was carried up for a height of 6 ft. The excavation of the interior was again proceeded with, by means of the jham and divers, in the old native style; afterwards a further height of 10 ft. of brickwork was added, but the material was now removed by a sand-pump (to be hereafter described) worked by a steam-hoist of four-horse power, as was the case after two additional lengths, each of 15 ft., were built, when the well was carried down to its full depth. In operations of this nature great care was necessary, especially at first, to insure the well, or cylinder, descending vertically. For this purpose the curb should invariably be sunk alone without any

building. The first height of brickwork should not exceed 5 ft. or 6 ft., the next 10 ft., and it was never advisable to build more than 15 ft. at a time. Before commencing any additional height, the top course of the brickwork already built ought to be removed, to insure a thoroughly clean surface for the mortar.

The well-sinking for the foundations of the piers and the abutments of this bridge was completed in little more than two years, which, without deducting any time for building up the brickwork, or for that unavoidably lost by the rise in the river during rains, gave an average rate of 159 ft. per month. The time occupied in the building of the steining of the wells, erecting, taking down, and re-erecting scaffolding and staging for sand pump, weighting the wells, &c., was equal to that employed in sinking. This would give the rate of sinking as a little over 300 ft. per month. If cast-iron cylinders had been used, the work could have been performed much more quickly, as the portions of the cylinders could have been put together more rapidly, and owing to the slight bearing surface exposed by the thickness of the iron, compared to the breadth of brickwork in the walls of the well. The total weight of the foundations and of the iron girder superstructure on each well was 420 tons, and the area of the bottom of each well was 117 ft., so that the weight was less than 4 tons per square foot.

The novelty in the sinking of the wells of this bridge was in the use of the Sand Pump. This was described to consist of a wrought-iron cylinder having a pump riveted to it at the top, in which was a piston fitting loosely, and pierced with small holes to allow of the escape of water. The piston rod terminated in an eye at the upper end, to which a chain could be attached. The bottom of the cylinder was movable, and in the centre there was an upright section-pipe, projecting outwards for a distance equal to its own diameter, and inwards nearly to the top of the cylinder. When the pump was lowered to the bottom of the well, the chain attached to the piston rod was worked up and down like a ringing engine. In this way water was first drawn through the upright pipe, followed by sand or other material, which fell over the pipe into the cylinder. This operation was continued until the cylinder was quite full, which was known by the piston working stiffly, when the machine was raised to the surface; the bottom of the cylinder was then detached, with the column of sand resting on it, and another cylinder bottom which had been cleared of its sand was substituted.

COMPETITIONS.

Newport.—Church of Scotland Chapel.—The committee of this chapel have selected the design of Mr. Alexander Johnston, architect, Dundee. There were five competitors. The design of Mr. Mackenzie, of Dundee, was second.

Yorkshire Investment Company, Leeds.—In the sale of sites forming part of the corporation scheme for the widening and improvement of Boar-lane, an important plot of ground was acquired by the Leeds and Yorkshire Land, Building, and Investment Company (Limited). It consists of the space occupied by the Railway Hotel and adjoining premises. To secure a structure worthy of the site, the directors invited architects to send in competing plans. Out of a number sent in they have selected the elevations and plans of Messrs. Mallinson & Bakewell, architects, East Parade, Leeds, the premium for the second best set of plans having been awarded to Mr. Harris, architect, East Parade, Leeds. The plans of Messrs. Mallinson & Bakewell provide for the erection of a hotel, embracing a restaurant, luncheon bar, &c., and two first-class shops. The new building is Renaissance in style. The main entrance to the hotel will be in Boar-lane. In each of the three stories above the doorway are oriel windows.

Rotherham Hospital and Dispensary.—About eighty designs had been received on Monday evening last, March 15th, by the hon. secretary of the building committee, in answer to his advertisement inviting architects to submit plans in competition for this hospital. The designs will be hung at once in the Mechanics’ Hall, and the sub-committee meet this week to decide on the further steps to be taken in order to secure a fair selection.

Baptist Chapel, Glossop-road, Sheffield.—Some time ago a movement was made amongst the members of the Townhead-street Baptist Chapel

for the erection of an additional chapel in another part of the town. A suitable site was found in Glossop-road, at the junction of Northumberland-road, and the new building was projected to cost from 5,000l. to 6,000l. The tender of designs for a suitable edifice was invited, and plans submitted by the following architects were exhibited in the Cutlers’ Hall. The mottoes attached with each design are subjoined with the name:—Messrs. Hill & Swan, “*Experientia docet*,” Messrs. Flockton & Abbott, “*Two triangles*,” Messrs. Blackmoor & Mitchell-Withers, “*Excelsior*,” Mr. J. P. Pritchett, Darlington, “*Labor et spes*,” Messrs. Lockwood & Mawson, Bradford, “*Experientia docet*,” Mr. J. C. Hine, Nottingham, “*Omnibus clectus*,” Messrs. Pavell & Robinson, Manchester, “*Q*,” Messrs. Innocent & Brown, Sheffield, “*Nota Bene*.” The last named were the successful competitors. The style of the building is Gothic. The spire is placed so that its full height of 140 ft. is seen. The school adjoining is 5½ ft. long, 24 ft. wide, and 17 ft. high, with accommodation for 250 children.

The Infant Schools at Sutton.—There were thirty-five designs sent in, and after consideration of their merits, the managers made the following selections for the prizes of 40l. each:—

1. Mr. W. Wallen, Greenwich £15,973 0 0
2. Messrs. Wilson & Willocks, King William-street, Strand 11,000 0 0
3. Mr. Chas. J. Phipps, and Mr. F. M. Harvey, Mecklenburg-square ... 14,500 0 0

SCHOOL-BUILDING NEWS.

Chester.—The foundation-stone of new Sunday schools for the Methodist new connexion has been laid. They are to be built at the rear of, and immediately behind, the chapel, a small space intervening. On the basement there will be two class-rooms, 11 ft. 6 in. by 22 ft. 10 in., and one larger, 20 ft. by 22 ft. 10 in., each room being entered by a separate door. Above these will be one large schoolroom, 44 ft. 6 in. by 22 ft. 10 in., lighted by five windows; each of the class-rooms being lighted by one window. These rooms it is expected will accommodate 300 scholars. Below the class-rooms there are boilers for heating water at tea-parties, store-rooms, &c. The building will be of brick, with stone facings, and will cost, when completed, about 350l. Mr. Walter Bodon, of Chester, is the architect; Mr. H. Pearson, the builder; Mr. J. Duckers doing the stonework.

Bilston.—The Wesleyan new schoolrooms, erected at a cost of 1,000l., have been opened. The school is a brick building, composed of a central room 58 ft. 6 in. long by 45 ft. wide, with a range of four class-rooms on each side 8 ft. square, and two class-rooms 15 ft. 6 in. by 8 ft. each. There is also a gallery for infants at the entrance. The walls are wainscoted to about 5 ft. high. A platform pulpit is erected on the east side of the schoolroom, which may be easily partitioned off to divide the boys from the girls. The school will accommodate about 600, and it is decided to have a day and infants’ as well as a Sunday school. Almost the entire cost of the erection has been already raised.

Birkenhead.—The new boys’ school, in connexion with St. Ann’s Church, Birkenhead, has been formally opened. The new buildings are erected from the designs of Mr. David Walker, of Liverpool, and provide accommodation for about 200 scholars, the plans being in accordance with the Committee of Council regulations, from whom a grant in aid is obtained. The schoolroom is 77 ft. long by 20 ft. in width, and there are two class-rooms, each 25 ft. 6 in. by 15 ft. in width, together with a cloak-room, lavatory, entrance porches, and all usual conveniences, a large playground being likewise provided. The roof timbers of the schoolroom are exposed to view, and varnished; and the walls are coloured a warm tint on the brickwork, finished with a skirting 4 ft. high, in oil paint, and capped with a stencil border. The class-rooms are fitted up with galleries. The style is Gothic, of an early character, and the building is constructed almost entirely of brick. The site of the new buildings, which adjoins the old, was presented by Mr. Thomas Brassey, who also gave a liberal donation towards the building fund. The cost of the works will be above 1,200l. Messrs. Booth & Richards, of Rock Ferry, were the contractors.

Doncaster.—The new building which has just been completed for the Doncaster Grammar-school, at a cost of something like 7,000l., was to

have been formally opened on Friday before last. At the last moment, however, circumstances arose which led to a difference of opinion between the charity trustees and the head master, and it was resolved that the pupils should re-assemble in the old building.

Carlton (Notes).—New day and Sunday schools have been opened at Carlton, in connexion with the church there. The schools are erected on a site which had been presented for the purpose by the Earl of Chesterfield, and are in the Tudor style of architecture. The cost incurred was about 1,900*l.*, including the site and alterations at Gedling Schools. The schoolrooms are sufficient to seat about 400 persons. The playgrounds for the children are asphalted, and provided with swings and other appurtenances.

Great Horton.—In addition to the large Sunday day schools which are being carried on by the friends of the Church, the Wesleyans, and the Primitive Methodists, the services in connexion with the opening of large and extensive school premises, which have recently been completed by the Congregationalists, have just been held. When the sum of nearly 2,000*l.* was raised, plans were prepared by Messrs. Paul & Robinson, of Manchester, and the different works were let to Messrs. Booth, Illingworth, & Son, contractors, Bradford, and the erection is now completed. The site is in a prominent position fronting the main road. A level street separates the building on the south-west side from the chapel premises, and the north-east side is also flanked by a street, but the ground here falls to the extent of 12 ft. Advantage has been taken of the difference of level, the class-rooms for infants and weak night scholars being placed on a lower ground story, with separate external entrances from the side street. The area of ground covered by the building is about 550 superficial yards, the dimensions being 120 ft. by 41 ft. The height from the floor to the ridge of the roof is 52 ft. On the ground-floor there is an assembly-room, which is 65 ft. by 38 ft. and 16 ft. high, having separate entrances from the front street, and communicating directly with the lobby at another entrance on the north-west side. This room is lighted with gas by means of six pendants suspended from the ceiling. In the rear of the assembly-room there is a lecture-hall, which is 36 ft. by 26 ft.; and the same height between the assembly-room and the lecture-hall, and ascending from the side entrance lobby, there is a staircase leading up to sixteen class-rooms above, which extend in double row with vertically lighted passage between them, the entire length of the building, and at the end of the passage a room is provided for the superintendent, who will have a view of the entire range. On the lower ground-floor and underneath the lecture-hall there is a class-room 25 ft. by 20 ft. and 14 ft. high, containing a raised gallery, which will accommodate 100 infants. This room is lighted by large windows from the street on the lower side. On the same level there are two class-rooms for adults, specially adapted for weak evening purposes.

Newmarket.—Much-needed school and church accommodation for All Saints parish will, through the exertions of the vicar, be probably very shortly provided. The site given by the Duke of Rutland for the new school is near the vicarage. The principal inhabitants of the town are contributing liberally towards the building funds. The school will be commenced early in April, and the enlargement of the church as soon after as convenient.

FROM AUSTRALIA.

Melbourne.—THE new bridge at Keilor, erected across the Saltwater River, has been opened. Messrs. Brown & Son, of Camberwell, were the engineers. The bridge was constructed on the site of the former one, which was a wooden frame bridge of the American style, and was erected at great cost in 1853. The contract for the present bridge was let in October, 1867, to Mr. Enoch Chambers, for 4,664*l.*, which included the masonry of the towers, the raising of the old piers 3 ft. 11 in., and the bits and platform of the bridge. Two new piers, however, have occasioned an additional outlay of from 900*l.* to 1,000*l.* The masonry was commenced in December last; the iron for the construction of the tubes arrived from England in June, and their erection commenced in July, and the whole of the work, excepting the approaches, was completed in October, without accident to life or limb. The cost of the entire work, including the service

bridge and the approaches, is upwards of 6,000*l.* The weight of each iron girder is about 50 tons, and the platform also about 50 tons, making a total weight of 150 tons. The bridge is 142 ft. in length, and 136 ft. between the points of support, and 20 ft. wide. 41,000 rivets have been used in its construction. It has been tested with a load of 142 tons placed equally on the girders, and with this weight it deflected 1 inch, and on the removal of the testing weight the girders rose to their original camber. The actual strength of the bridge, exclusive of its iron weight, is 980 tons, and the working power 326 tons.

Competitive designs are invited by the executive committee of the projected Prince Alfred Hospital. A premium of 50*l.* is offered for the first, and 25*l.* for the second best design.

The Victoria School of Design, in connexion with the Gallery of Art, has from thirty to forty students, but no master. One result is that not more than six or eight students attend with any steadiness or regularity. If the school (if we can call it a school) is to become useful, it must be provided with a competent master.

Sydney.—The new General Post Office, now in course of erection in Sydney, has a frontage to George-street of about 80 ft. and 170 ft. to a proposed lane which will connect George-street with Pitt-street. The business of the Money Order and Telegraph Departments will be transacted in the building as well as that of the Post Office. Sydney freestone is being used in the erection of the building principally, with the exception of such portions as the base-course, the columns, and capitals of the arcades, &c., requiring additional strength, where granite will be employed to resist the pressure. Of this an abundant supply of excellent quality and various colours can be obtained at several places along the coast between Sydney and Cape Howe. Internally, brickwork and wrought-iron will be used as far as practicable. The design is Italian, by Mr. James Barnett, Colonial Architect of N.S. Wales, and the contractor is Mr. John Young, of Melbourne.

DISSENTING CHURCH-BUILDING NEWS.

Bredgar.—The new Wesleyan chapel here has been opened for divine worship. Mr. R. Carey, of Coxheath, gave the bricks and the land, the cost of the labour and woodwork being about 1,000*l.* The building was designed by Mr. Carey, jun., of London, and carried out under the direction of Mr. C. Pillow, of Milton. Mr. Beaumont, of Milton, was the builder; the candleabrae were supplied by Mr. A. Buley, of Sittingbourne, who likewise did the staining and the glazing. The size of the chapel is 50 ft. by 30 ft. in the clear, and it will seat 300 persons. The style is Gothic. There are a school-room and vestry at the end. As the land upon which the chapel is built is at a considerable elevation, it is a prominent feature in the landscape for some distance.

Yeovil.—The foundation stone of a Wesleyan chapel has been laid here. The new edifice is intended to accommodate 700 people, the cost being 3,000*l.*, including site. The architect is Mr. Lander, of Barnstaple; and the builders are Messrs. Bartlett, of Coker.

Stratford.—The foundation-stone of a new Unitarian chapel has been laid here. The site is in Ham-lane, near the new Townhall, Stratford. The cost of the site and building is estimated at 1,200*l.* It is expected the building will be completed in June. Mr. Clark is the architect, and Mr. Thomas Horkon contractor.

Dundee.—A new Wesleyan chapel is being erected in Wellington-street, from the designs of Mr. Alexander Johnston, of Dundee.

METROPOLITAN ASSESSMENT BILL.

Sir,—Allow me to call attention to one provision in Mr. Goschen's Bill, which appears to me to perpetuate a fallacy which has long existed relative to deductions to be made from the gross estimated rental in respect of repairs and insurance.

For the purpose of this communication I have this morning inspected the rate-book of one of the city parishes, and subsequently a house, the gross estimated rental of which was there stated to be 500*l.*, and the rateable value 29 per cent. less, viz. 300*l.*; of this amount I venture to say the structural value is only 100*l.*, the remainder being the value of the land; 29 per cent. from the gross amount would therefore equal the total annual value of the structure to be repaired.

I would suggest the following plan, which I am adopting in the valuation of a union for poor-rate assessment, viz., to make the deduction a per-centage of the structural value only, and for this purpose discarding altogether the value of the land.

A carefully-prepared table on this basis, though working some inequalities, would, I venture to think, be far more just than the plan now adopted.

WM. EVE.

STAINED GLASS.

All Saints' Church, Souldrop, Bedfordshire.—Another window has just been filled with stained glass, by Messrs. O'Connor, of London, for the chancel of the church in this village. The window consists of one large circle and six small openings, and being above the organ, subjects from the Te Deum were thought to be suitable. Thus the centre light represents our Lord in majesty, with two angels in adoration, and the six other lights are filled with various subjects, such as the angels Michael, Gabriel, Raphael, and Uriel, with their respective emblems; the apostles Peter, John, James, and Paul; the prophets Isaiah, Jeremiah, Ezekiel, and Daniel; and the martyrs, John Baptist, Stephen, Matthew, and Andrew.

St. Peter's Collegiate Church, Wolverhampton. The three main lights of the Lonsdale window are intended to recall to the mind Bishop Lonsdale, as Bishop, Father in God, and Church Restorer, by the following figures:—Melchisedec, priest and king, bearing the bread and wine; St. John at Ephesus, with a long white beard, and having in his right hand a writing style, his left hand resting on the head of a child standing at his side; Ezra, the priest, holding three scrolls, representing the Law, Prophets, and Sacred Writings. In the panels beneath these figures are three scenes from the history of St. Chad, first Bishop of Lichfield, A.D. 659. 1st. His consecration. 2nd. St. Chad, as Bishop of Lichfield and founder of the Mother Church of the diocese. 3rd. The death of St. Chad announced to him. The tracery is a flowing Decorated composition, and contains emblems of the Sacramental Cup, with serpent issuing from it, the Seven-Branched Candlestick, the Seven Stars (Rev. i. 16), St. Chad's Branch, &c. Along the base of the window, on a brass, is the inscription, "John, Bishop of Lichfield; consecrated 1843; died 1867." The artists were Messrs. O'Connor, of London.

PORTLAND CEMENT.

Sir,—Your correspondent, Henry Bird, in answer as to behaviour of Portland cement, gives causes and effects, but he does not point to the remedy, which, in my humble opinion, lies with the manufacturers, as they grind and sieve too coarse, and send it out too fresh, more so in a busy time. These coarsely-ground particles of hard carbonate of lime take time to absorb the moisture, and, having done so, it swells; hence the upheaving of the joints in the brickwork, and what is termed, in plastering, the fire-cracking. Now the remedy would be for the manufacturer to grind and sift it finer,—pass it through a sieve, say twenty bolts to the inch,—and let it lie in a dry place or bin exposed to the air for twenty-one days before use. Some of your readers may probably say it would take a great time to set: I find by experience the longer it takes to set the harder it gets.

WILLIAM PULHAM.

THE "BUILDER'S" LAW NOTES.

Pollution of a River by Sewage.—A Local Board of Health directed that the sewage of a certain town should be by means of drainage conveyed to a river. The sewage, not having been completely deodorised before coming into contact with the river, polluted the stream passing through certain lands so much that the fish were killed, and a nuisance was caused. It was held by the Court of Chancery that the owner of the lands through which the river passed was entitled to an injunction to restrain the continuation of the pollution of the water.—*Bidler v. The Croydon Board of Health.*

Railway Works diverting subterranean Water.—A Railway Company having constructed a tunnel on their own land, thereby diverted the subterranean water from plaintiff's land contiguous to the tunnel. Proceedings having been taken against the company for such diversion of the underground water, it was decided that they were not liable, as the act had been in the exercise of the ownership of their own land.—*Galgoy v. The Great Southern and Western Railway Company of Ireland.*

Use of Public Fountain Water.—The Dartington Board of Health was empowered by statute to supply that town with water at certain rates for domestic purposes, and for other than domestic purposes upon such terms as might be agreed

upon between the Board and those desirous of having such supply. A public fountain having been presented to the town, the Board supplied it with water on market-days for the use of the cattle in the market, and for yoked horses passing to and fro. A person who kept horses, and was desirous to evade payment of the rate for the supply of water to his stable, took his horses to the fountain to drink. An information was laid against him under the Waterworks Clauses Act of 1847; but the magistrates, being of opinion that the Board had no right to limit the gratuitous use of the water at the fountain, refused to convict. The Court of Common Pleas set aside the decision of the magistrates, on the ground that it was quite competent for the Board to limit (as they had done) the supply of water to the fountain.—*Hildreth v. Adamson.*

Injury to a Stream by a Manufacture.—Certain calico-printers were for some years in the habit of using the water of a stream for the purposes of their works. Arsenite of soda is one of the substances used in the process of dying calico, and it was found that arsenic from the works above mentioned was traced in the mud of the reservoir of the Stockport Waterworks Company (some miles below the works), and also in the water supplied by that company to the town of Stockport. Proceedings were taken against the owners of the calico-printing works, and it was contended that the defendants might have prevented the arsenic from escaping, if they had constructed a large settling reservoir below the works. In defence it was alleged that such a course would have been very expensive; but no evidence was given as to the mode in which the works were carried on; but it was decided by the full Court that the verdict was not in pursuance of evidence; and also that, even if it were admitted that the trade were lawful, useful, and properly carried on, that would be no answer to the legal proceedings for being the cause of poison becoming mixed with the water.—*Stockport Waterworks Company v. Potter.*

DRAINAGE WORKS AT ARCAN, ROSS-SHIRE.

SOME improvements deserving of notice have just been completed on the Seafirth estate. The lands in question lie in the valley of the Conon, a few miles from the Muir of Ord Station on the Highland Railway. At this place the river Conon was sometimes so high for weeks, or even for months together, as to flood the fields to such an extent that they presented more the appearance of a loch than the fertile lands they really were. In order to remedy this state of matters, Mr. G. Cadell Bruce, C.E., of Edinburgh, was applied to, and he undertook to carry a tunnel all the way through the lands, passing below the river Orrin through part of the Highfield property, and discharging the water into the river on the Conon estate, immediately below the march between the Seafirth and Highfield properties. This work has been successfully accomplished, the result being that the flat of Arcan, extending over 800 acres, is now entirely free from water. From the surface of the ground at the inlet to the outlet there is about 14 ft. of fall. The tunnel is 2,142 yards in length—solid brick building—and there are also 500 yards of a large open watercourse, besides other drainage works. The work was begun in May last, and has been accomplished in the face of many difficulties, arising from the nature of the ground and the large gathering of water. The tunnel is constructed of radiating bricks, built with hydraulic lime, and partly laid in concrete. It is boxed in with piles of timber, and considerable difficulty was often experienced in conducting this work, owing to the shifting nature of the sand and gravel. The quantity of water which the tunnel will discharge, running half full, is about 100,000,000 gallons in twenty-four hours. The tunnel under the Orrin is 10 ft. below the bed of the river. These improvement works were carried out to a large extent on the lands of two proprietors, under the "Outfall Act" of 1847—one of the first instances, we believe, in which the conditions of this Act have been conformed to. One of the proprietors was averse to the execution of the drainage operations; but the Act was expressly intended to meet such a case. The contractor for the undertaking was Mr. George Hunter, Edinburgh.

THE VALUATION OF PROPERTY IN THE METROPOLIS.

THE text of the Bill to provide for uniformity in the assessment of rateable property in the metropolis, prepared by Mr. Goschen, Mr. Arthur Peel, and Mr. Ayrton, has been published. This measure provides for the establishment in the metropolis of a valuation board for the purpose of determining the per-centage of the rate of deductions to be made from the gross value in calculating the rateable value of hereditaments. The Board is to be composed of one representative from each assessment committee, and its proceedings are to be conducted in such manner and according to such regulations as the Poor-law Board may from time to time prescribe. The clerk of the Board is to be the clerk for the time being of the Metropolitan Asylum district. The right of appeal is to be given to any ratepayer and any surveyor of taxes who may feel aggrieved by the decision of the assessment committee. The same right is also accorded to the assessment committees, overseers, and any body of persons legally empowered to levy rates, if they feel aggrieved by reason of the gross or rateable value being too high or too low, or of there being no approved valuation list. The Poor-law Board is to be authorised to appoint commissioners for hearing appeals, subject to the consent of the Commissioners of the Treasury. One-half the remuneration of those officers and of their clerks is to be paid out of the Treasury funds, and the other half by the managers of the Metropolitan Asylum district, who are to be recouped out of the Common Poor Fund. If a commissioner should find, on appeal, that there is no approved valuation list in any parish, he may appoint a person to prepare one, the costs to be paid by the assessment committee failing to approve the list. The Bill contains seventy-three clauses and five schedules.

THE WORKS OF THE LATE E. H. WEHNER.

THE Institute of Painters in Water Colours have opened an exhibition in their Gallery, Pall-mall, of pictures and sketches by the late Mr. Wehner, "with the sole object of doing honour to the memory of an early and much-esteemed member,"—and a very praiseworthy and honourable step it is. The collection, including 150 works, is one of great interest, and shows the industry as well as the genius of the artist, who struggled against ill health in the latter part of his career, and was prematurely cut off. The earliest picture, of which the date is given in the catalogue, is 14, "The Dinner at Pegg's House, from the 'Merry Wives of Windsor,'" the property of Mr. James Godwin; and the last is 127, "Recantation by Galileo of his Heresies before the Tribunal of the Inquisition," on which Mr. Wehner was engaged at the time of his lamented death. The sketches and studies for pictures exhibited show well his manner of working, and the carefulness with which he prepared himself for the finished work.

ARCHITECTS' ACTIONS.

BREACH OF CONTRACT.
An action was brought by Mr. E. H. Lingen Barker, against the Rev. J. Ormiston, as chairman of the St. David's (Slington) Church Building Committee, for a breach of contract, in wrongfully dismissing him from the position of architect, to which he had been appointed by a resolution of the committee. There were also special claims for plans prepared and other services rendered, and for the use of the said plans after his dismissal. The case had been referred, by agreement, to the decision of Mr. Johnson, one of the Masters of the Court of Exchequer. The defendant paid 70*l.* into court, and submitted pleas denying the contract; alleging that the contract (if any) was conditional; that the plaintiff had failed to fulfil the condition; and that the amount paid into court was sufficient for the work done. The following is an outline of the chief facts, as disclosed by the correspondence:— In June, 1866, plaintiff received instructions from defendant to prepare plans for the above church, to seat 1,200 persons, the cost not being named. Ultimately the accommodation was reduced to 1,007, when plaintiff stated he thought the cost need not exceed 4,800*l.* (afterwards increased to 4,800*l.*), paying strict attention to economy in matters of detail, and using inexpensive materials only.

No guarantee, however, on this point was either asked for or given, and in November the plans were adopted by resolution, subject only to any future desired modifications. Funds having come in but slowly, it was decided, about October, 1867, to erect the nave of the church first; and plaintiff sent his plans to defendant, at his request, with the object, with estimates, showing the superior advantage of building the side aisles at the same time. Instead of noticing this suggestion, defendant showed the plans to Messrs. Dove, builders, who estimated the complete cost at 6,000*l.*; they, however, in answer to plaintiff's subsequent inquiries, admitted that this price was only approximately, as they had no specifications, and only a casual glance at the plans; they further said, that should the details might be simplified, so as to bring the cost down to about 5,000*l.*; and that, on receiving the plans and specifications, they should be able to say the lowest they could carry them out for. Plaintiff fully explained all this to defendant (who had himself previously stated to the secretary of the Bishop of London's fund that the cost would not doubt be 5,000*l.*), adding that his original estimate would now have to be raised to about that sum, owing to the increased cost of building since it was given, and for other reasons duly specified; he also alluded to the wide difference often existing between competition tenders, pointing out that defendant's mode of proceeding was such as to tempt the builders to name a high figure. And he finally reminded him of the original understanding, which was, that tenders were to be procured in competition; and that if the lowest was then found to exceed the available funds, the cost should be reduced by the omission of certain details principally ornamental. Notwithstanding these and further explanations, and an offer to modify the plans to suit the reduced state of the funds; and though he warned the defendant against involving his committee in the expense of two architects, plaintiff received, in April, 1868, a formal resolution terminating the engagement; and shortly afterwards a letter from defendant, referring him to his solicitor. An arbitration was then proposed, and acceded to at first by plaintiff, but afterwards declined, on hearing that, pending these negotiations, defendant had been using his plans and employing another architect, Mr. E. L. Blackburne. Indeed, under this gentleman's direction, plaintiff's repeated advice of building nave with side aisles has since been carried out by Messrs. Dove. After hearing the (admitted) correspondence, the Master stated that his impression was decidedly in favour of the plaintiff, and also that the amount paid into court was inadequate. He thought, however, a compromise might be effected at that stage, so as to spare funds collected for a charitable purpose; this hope being grounded upon the good feeling and moderation exhibited in plaintiff's letters. Ultimately it was arranged that the Master should certify for the defendant to pay the plaintiff's costs, and 80*l.* beyond the 70*l.* paid into court, and to return the plans.

HOUSE PAINTING.

Sir,—Can any of your readers inform me the reason why plain oil painting upon old work, when dry, has a flat and smeary appearance? If a light grey (for instance), the first coat will dry with a uniform gloss, but the second coat will be sure to be flat and smeary. I have inquired of many painters, but can get no satisfactory explanation. I use American turpentine, and have tried linseed oil from different houses, but with the same result each time; for the past few years it has been impossible, after the first coat, to make plain paint look well, with a decent gloss. Can the cause be in the white lead?
H. L. D.

FRENCH WORKMEN FOR THE TRINITY BOARD.

Sir,—I find this paragraph in the *Daily News*, and would call your attention to it:—
"New English Lighthouse.—The Trinity Board have entered into a contract with a French firm to supply and work the granite of a lighthouse, to be constructed on a rock near the present Longships, off Land's End. The new lighthouse will embrace all the modern improvements, and will, when completed, supersede the Longships. The Elder Brethren, it is said, have gone to France with the contract, in consequence of the high price asked by English firms. The work will be commenced immediately."
We have a very old proverb about carrying coals to Newcastle, but here is a job to be done in Cornwall, and the material is Cornish granite, and workmen there are as much unemployed as they are at this moment in other parts of England and as badly paid,—ay, and worse, for there is no district in England where wages rules as low as they do there; and yet, when a little job like the foundation of a lighthouse has to be done, our rulers must, forsooth, send the order to France. I must confess my disgust at the transaction. But I am told that the price asked by the English contractors who were applied to was too high, and the French asked less. I leave out altogether any question of patriotism. My reply is, take a wider circle. We English go abroad and compete there with all nations, and on their own soil, and shall it be said that we are beaten at home? These things are done in a corner, as the recent magisterial investigations prove. Let every job of this kind be well advertised in the journals devoted to the trade, so that contractors generally may be made aware that such work has to be done; and I am sure that, after that, they need not go to France or any other country for tenders of any kind of building.
A CLERK OF WORKS.

PERPETUAL MOTION.

In the *Gentleman's Magazine* for 1818, p. 156, vol. ii., appears the following curious account:—"John Spence, an ingenious individual, residing at Linnlithgow, in Scotland, has applied the magnetic power to the production of a perpetual motion. This person was in early life apprenticed to a shoemaker, but the natural bent of his genius for mechanics overcame every obstacle. He got to be keeper of a steam-engine, in a spinning factory at Glasgow, and after two years' study in this school, retired to his native place to pursue the shoemaking for bread; and wheels, levers, &c., for the gratification of his own taste. The perpetual motion was an object worthy of such a devotee, and we find that he has invented a piece of mechanism which is doubly curious, from its own powers, and from the extraordinary difficulties in whose despite it has been accomplished. It is not easy to convey an idea of it without plates. A wooden beam, poised by the centre, has a piece of steel attached to one end of it, which is alternately drawn up by a piece of magnet placed above it, and down by another placed below it: as the end of the beam approaches the magnet either above or below, the machine interjects a non-conducting substance, which suspends the attraction of the magnet approached, and allows the other to exert its powers. Thus the end of the beam continually ascends and descends betwixt the two magnets, without ever coming into contact with either, the attractive power of each being suspended precisely at the moment of nearest approach. And as the magnetic attraction is a permanently operating power, there appears to be no limit to the continuance of the motion but the endurance of the materials of the machine. The first machine made by Mr. Spence is very rude, and fashioned by his own hands; but he intends applying the principle to the motion of a timepiece. We trust this ingenious man will meet the encouragement he deserves; if not as the reward of his talents and perseverance, at least for the benefit of the community, for it is from such sources that great national improvements are often derived."

Such is the article *verbatim*, and an old correspondent would wish to ask, can the force of the magnet be made so strong as to be applied to a sewing-machine or to locomotion? and if you could procure an outline drawing, and give in the *Builder* a small wood engraving of this curious machine, no doubt it would much oblige your readers.

A BIG HAMMER.

A SEVENTY-TON cast-iron block being required for a steam hammer, and being undertaken with other works by Mr. Wm. Williams, ironfounder, St. Helen's Works, Swansea, was successfully cast on the 11th inst. Two ovens were specially erected at a suitable distance to enable the metal to run directly into the mould. Operations commenced at an early hour, and by a quarter to ten a.m. the first set of charges were ready and tapped. Successive charges followed each other at regular intervals of three-quarters of an hour up to nine p.m., at which time the block containing the full weight of 70 tons of solid iron was finished, thus successfully completing the largest casting ever made in Wales.

The dimensions are 11 ft. 6 in. by 9 ft. 6 in. at base, and 7 ft. 6 in. high. It will occupy from two to three weeks to cool sufficiently to allow it to be reversed, it having been cast base uppermost.

THE NEW EXCHANGE BUILDINGS, LIVERPOOL.

This extensive and important fabric is now far advanced towards completion. The present works, contract No. 2, include the whole of the east wing and the central portion, and are being carried out by Messrs. John Parker & Son. Mr. Wyatt is the architect. A portion of the quadrangle will very shortly be completed. The excavation through the hard red rock has proved a tedious and arduous process, but with the aid of Taylor's steam-hoist the labour has been materially reduced and the work expedited, as it has enabled Mr. Abraham Thomas, the contractor for this portion of the work, to remove blocks weighing from three to five tons each. This excavation has proved an exceedingly interesting and important portion of the whole work, and will provide for the construction of two tiers of vaults, well ventilated

The space at present left open in the centre of the north side of the quadrangle is for the central tower, the building of which will be proceeded with as soon as the temporary Stock Exchange and Telegraph-office have been removed. The upper part of this tower will be made available for a grand picture-gallery, lighted from the roof. It will be 62 ft. long by 34 ft. wide, and access to it will be afforded by a large passenger-lift. The circular tower at the north-east angle of the building will add to the apparent height of the edifice at this point. When completed, which it nearly is already, this tower will form a feature in the general aspect of the building. The whole of the fabric is under the superintendence of Mr. Jonathan Parsons.

CABINET-MAKERS IN LONDON.

I AM very glad to hear that there are now a great number of respectable firms who procure good drawings of cabinet-work and get the designs executed. That they look less to the quality of the work than to their full profit is, I think, a very bad sign; but permit me to ask, who supplies the designs,—architects or artists? and are they paid for? Are they not rather furnished by the workman as a condition on getting the order to execute, and that, too, without other fee or reward? And if a workman once gives evidence of his ability to devise something new, either in style or material, is he not continually pestered with, "So-and-so, can't you give us something fresh?" Sir, the present race of mere dealers must die out. The motto the public should adopt is "Buy of the maker." Let the man who wants a piece of furniture, or anything else, I care not what, if it is to be satisfactory either artistically or constructively, bring his mind in direct contact with the mind of the producer, and an advantage would ensue which is not to be measured by any money value.

E. G.

EQUATORIAL DIALS.

SIR,—As I said "the most natural, most obvious, and best" way to treat sun-dials was the ancient one of making all their surfaces "parallel or perpendicular to the equator." I do not see why it should be necessary to answer Mr. Scargill's inquiry about a "sun-dial parallel to the equator," a thing I never mentioned, but if he takes the trouble to make one on the "surfaces,"—I never said surface,—parallel thereto, he will find that not only does the southern face act exactly as well all the time the "sun is beyond the equator," as the northern while he is on this side, but "at the equinox," or any time within several hours thereof, both faces will receive shadows at once, half way, a quarter or a sixth of the sun's affording angle light for this purpose; just as the east and west walls of a building are, for two minutes, both shone upon, or as both poles of the earth may be proved, at the same equinox time, to be in sunshine for some three days together, in this case, indeed, not merely having half his disc, but (owing to refraction) the whole of it, well lifted above both their horizons. For the same reason, at our sunrise or sunset, there are at least four minutes, and often many more, during which we and our antipodes can both see his entire disc.

And this leads me to remark, it is a mistake to place dials where they can be shone upon till sunset, for refraction most greatly vitiates their time-keeping whenever the sun is no higher than a few times the degrees. Nor does this admit of any selecting correction like the other inequalities. Hence it is useless to graduate a dial beyond 16 hours for any part even of Scotland, or up to 16 for the south of England.

E. L. O.

"ROYD."

SIR,—The word "Royd" is of frequent occurrence in names of places in this district (Bradford, Yorkshire), as Abbot Royd, Brook Royd, Clay Royd, Hood Royd, How Royd, Raw Royd, Swan Royd, Lady Royd, Nun Royd, Stony Royd, and many others. Will you be so kind as to give me its meaning? R. C.

LOCAL BOARDS OF HEALTH AND THEIR CHOICE OF SURVEYORS.

SIR,—A friend of mine, a duly qualified civil engineer and surveyor of considerable practical experience, has, with great assiduity, for some time applied himself in trying to obtain an appointment above.

Strange to say, with respectability of character and excellent credentials as to ability, &c., no success has ever been made to his numerous attempts. This has led me to the inquiry, upon what principles do these bodies gauge the qualifications of their applicants?

It is within my knowledge that parties have been selected and sent for who know as little of the use of the level, taking and drawing a section, making a road, and other professional duties necessary to their efficiency, as a school-boy might be expected to do.

Are there no means that can be devised by which the competent and orthodox surveyor can be properly recognized, and have some guarantee against this haphazard election of one and the rejection of others with as little respect to their fitness as to their feelings?

I shall be glad if my brother professionals would give the subject consideration, and point out for the benefit of electing bodies means calculated to protect the interests of our fraternity.

OUT OF ADJUSTMENT.

A NICE LITTLE BILL.

SIR,—You are so frequently requested to give some portion of your space to inquiries as to the best mode of preventing damp penetrating through the walls of newly-built houses, that you will probably extend your good nature to this communication which will afford a certain cure, although many of your readers may fancy it has its drawbacks. Briefly, the method of proceeding, in a certain case, was as follows.—Miss J. requested a plumber to remedy a portion of a damp wall over a bay window in one of her lodges. The work was done, the damp stopped, and the account sent in; but as it was more than she thought such a thing ought to have cost, she sent for an architect, giving him an idea of the affected place in the lodge, and asking him what he supposed the cost of such work. His idea was from 30, to 40; the bill was produced of 50. The ingenious tradesman had fixed a framework of wood over the gable down to the bay window. On this he fixed his lead, one strip weathering the other. A small window in the gable, with stone jambs and mullion, did not escape, as the jambs and mullion were carefully caulked with lead, the poor little building presenting a more-behagone aspect. Should any of your non-professional readers be troubled with such damp walls, I should advise them to try my mixture of alum and asp before giving instructions to a plumber, or they may have to pay dearly for their whistle through his pipes. I enclose a copy of the bill.

A. S.

CLOSED DOORS, SOUTH KENSINGTON.

SIR,—I thank your correspondent "Art-Lover" for his explanation that the "museum in proper" is not closed at four o'clock on Saturdays; but—like an apologist often—he goes too far, and proves too much for his own purpose. First, he speaks slightly of "a portion of it" as "a mere amuse where the models of ships are exhibited." Would any one imagine that this meant the wonderful collection of armour so admirably arranged, and so interesting to the public, that when the doors were closed upon me and hundreds of others at four o'clock, there was a general undertone of disappointment? Again, would one suppose that the doors to the Museum "proper" in Exhibition-road were closed at the same time? I thank him for his advice to ask the very civil policemen; but I venture to think that I know at least as much as they do of what the Museum contains, and have visited it sufficiently often not to require to be told if there is anything more to be seen.

Your correspondent supposes I am condemning Mr. C. on the other side of the distinguished street; but that gentleman on behalf of the public, and his sympathy with all public works, that I felt sure—had he been there at the time to see—he would have regretted at the regulation to be closing this Armour Gallery on Saturday afternoons at four o'clock (even in March) as much as your correspondent, and would have altered them at once.

ONE DISAPPOINTED.

THE NEW STEAMBOAT PIERS.

SIR,—Great improvements are undoubtedly being made to the river side between Westminster Bridge and the Temple by the substitution of the new steamboat piers for the old rickety broken-down dummies of bygone times; but these piers lack one thing.

It was going up the river the other day from London Bridge to Westminster by boat, and during the passage was required by several people which was this pier and which was that. It struck me at the time what an advantage it would be to strangers and the public generally if the Thames Conservancy, or whoever have the management of these piers, would have the names of them painted on a board as at railway stations, and placed in positions where they may be seen by everybody on the arrival of the boats.

J. C. D.

Books Received.

"THE Year Book of Facts in Science and Art." By John Timbs. London: Lookwood & Co.—The present issue of this long-established and interesting annual is illustrated with an engraved likeness of Mr. Whitworth, the gun inventor, and scholar-ship founder. There is also a brief memoir of Mr. Whitworth.—"Thames Valley Drainage Outfall." Plan proposed by Sidney J. Hervon Herbage, C.E. Mr. Herbage is surveyor to the Surbiton Improvement Commissioners. He proposes to deal with the sewage of the following towns and villages:—Richmond, Petersham, Twickenham, Ham, Teddington, Kingston, Hampton, Long Ditton, Thames Ditton, Hampton Wick, Hampton Court, Hampton, Sunbury, Walton, Weybridge, Halford, Shepperton, Chertsey, Addlestone. This he would do by carrying the sewage back from Richmond, along the course of the river, or nearly so, by the aid of two lifts, one at Kingston and the other opposite Walton, to a pumping station near Chertsey, where it would be lifted 150 ft. from a reservoir containing six hours' flow of sewage and rainfall, and forced through a 36-inch cast-iron main under the Thames, to irrigation farms, which it appears would be available between Chertsey, Woking, and Egham. The total estimate for all the works comprised in this plan is, in round numbers, 167,000.—"British Railways as they are and as they might be: Suggestions as to Cheap and Uniform Fares, with Increased and Guaranteed Dividends." By John Imray, M.A., C.E. London: Spon. This is a modification of Mr. Raphael Brandon's plan. Mr. Imray proposes a division into short and long fares,—the short, for say twenty-five

miles less or more, at 1s. first class, 6d. second, and 3d. third; and the long, all above that distance, at 16s., 8s., and 4s.; luggage tickets for any distance, 1s. The management of railways to be in the hands of a Government department, and tickets to be issued, like postage-stamps, at any stamp or post office. Mr. Inray calculates that even on the present number of passengers there would by this system be a gain of more than 2,000,000l., exclusive of luggage and parcels. Travellers for short distances beyond twenty-five miles, he calculates, would take short-distance jorneys, and so save their money, as indeed they might do by repeating their short distances again and again. One defect of Mr. Brandon's plan, he urges, would be, that in jorneys of any considerable length, passengers generally would become first-class, preferring soft and comfortable seats for 1s. to inferior ones for 3d.; so that the distinctions of class would be negatory. The author's plan is further elaborated in the pamphlet under notice. "Engineering Facts and Figures for 1868." London and Edinburgh: Fullarton & Co.—The present issue of this annual compilation chiefly relates to boilers and boiler explosions, furnaces, engines, naval construction, &c.

Miscellaneous.

Hydrogenium—a Metal.—At the Royal Society's *conversazione*, Mr. W. C. Roberts (for Mr. Graham, the Master of the Mint), exhibited a curious example of the absorption of hydrogen by palladium, and consequent alloy and expansion of the metal. A coiled ribbon of palladium was attached to each pole of a small battery in a water bath. The current being turned on, the ribbon absorbs hydrogen, expands, uncoils, and stretches itself across the bath; then, on reversal of the current, shrinks, and reforms its coil, while the opposite ribbon goes through the opposite process. The appearance is that of two worms wriggling alternately to and fro across the bath. In another instance the expansion was shown by a red-tipped arrow making bold sweeps half round a circle. These experiments demonstrate the enormous capacity of palladium for absorption of hydrogen, and verify Mr. Graham's conclusions. It is a singular fact, that the true alchemists appear to have been aware not only of the existence, but of the metallic nature, of hydrogen, which they called their celestial mercury, and prime matter of metals. They speak, for example, of rotting or corrupting a "metallic sulphur" by means of distilled water, till the "mercury" enters into "companionship" with the sulphur, leaving the "stony crassitude" in the fumes; which, translated into modern chemical language, obviously just refers to the decomposition of a metallic sulphuret, such for example as sulphuret of iron, into sulphuretted hydrogen, on the one hand, and iron oxide, on the other; and it also clearly shows that they were well acquainted with oxygen as well as with hydrogen, and with the fact that water is composed of these two elements, the separation of which, by means of a metallic sulphuret, into sulphuretted hydrogen and metallic oxide, they thus distinctly although quaintly indicated.

Burlington House.—In the House of Commons on Monday, Lord R. Gower asked the Secretary of State for the Home Department whether the structure connecting Burlington House with Piccadilly was a temporary erection; also what was the proposed destination of the colonnade recently removed from the front of Burlington House. Mr. Knatchbull-Hugessen (in the absence of the Home Secretary) said that the structure referred to in the first part of the question was purely temporary; and with regard to the colonnade, its final destination, he believed, had not yet been determined upon.

The Asylum for Idiots.—The asylum at Earlswood was designed originally for 400 inmates. At present some additions have been made, and it is desired to enlarge the asylum so as to enable it to receive 800 inmates. This addition would cost 10,000l., and between 9,000l. and 10,000l. have been already subscribed, and about 1,500l. more promised. The Prince of Wales has consented to lay the first stone of the new building on his return from Egypt. A lady has also offered to give 100 guineas, provided nineteen others will give a similar sum each. She offers to consider any two gifts of 50 guineas as one of 100. Four sums of 100 guineas and five of 50 guineas have already been promised.

Royal Horticultural Society.—The first spring show of the Royal Horticultural Society of the present year was held in the Gardens on Saturday last, when there was a wonderful collection of hyacinths, cyclamens, roses, and other spring flowers. The Dutch growers gave supplemental prizes amounting to 45l., which caused a very keen competition among the various exhibitors. The attendance was large, and the whole affair a success.

Gas.—The Hastings Gas Company have declared a dividend at the rate of 8 per cent. per annum for the last half-year on old shares, and 7 on new, as at the two preceding half-yearly meetings, leaving a balance. There is a duty of 2s. 4d. a ton on coal at Hastings, which duty costs the company about 1,000l. a year.—The Minster Gas Company have declared a dividend of 5 per cent. for the last year. A dividend of 6 per cent. was proposed, but the chairman said he preferred reducing the price of gas.—Some alterations are about to be made at Carlisle Gas Works. The engine-house is to be enlarged; two new engines substituted for that which is now in use; and a new "washer-house" (in which the gas undergoes a purifying process) erected. The erection of a new chimney 150 ft. high is also in contemplation. The present chimney, which serves Messrs. T. & J. Nelson, Mr. Brockbank, and the Gas works, stands in the middle of the street, and is found to be inconvenient in that position. The corporation have the right to pull this chimney down, upon giving certain notice to the joint-proprietors, and paying them 200l.

Industrial Employment of Criminals.—The Howard Association has issued a printed note of desiderata in criminal treatment, with illustrations and suggestions. One especial point urged is the industrial training of criminals. It is a shame to the Legislature, and a gross injustice to tax-payers, that nothing is done in this respect. Criminals ought, for their own sakes, as well as for the sake of the public, to be trained in industrial employment while in prison. Tread-mills, which "grind the wind," are like a lunatic invention than one of sane origin. The objects of the Howard Association ought to be supported by the tax-paying public at large, and by all who have anything to lose or to suffer by the misconduct of criminals. The office of the Association is at 5, Bishopsgate-street Without, and the secretary is Mr. W. Tallack. Earl Russell and other influential persons are patrons of the Association.

Eton College.—On the 13th inst. the Provost of Eton delivered a lecture in the College Audit-chamber on the "Archæology of Eton." On the table of the apartment in which the assembly was held there was laid a collection of the most ancient and noteworthy documents relating to the foundation. Taking these for his subject, the Provost commenced by showing how amply they witnessed to the munificent intentions of the founder. In the handwriting of Henry VI. there were directions as to the dimensions of the chapel, which in all respects he desired should be superior to those of his Winchester rival, New College, Oxford. The misfortune of the King, however, frustrated the accomplishment of his designs, and his successor, Edward IV., so far from inheriting his partiality for the new creation, was anxious to transfer the entire property of Eton to the Dean and Canons of Windsor. One of the most remarkable, as one of the most tattered among the papers lying before the audience, was an inventory of the property which was ordered to be surrendered in this way. An appeal, however, was made to Rome, the hearing of which was remitted to England, and the result was that the College retained all that belonged to it, without giving any permanent annoyance to Edward, who subsequently appears as a benefactor. The Provost concluded at the date of Oliver Cromwell, who, he remarked, was the last to contribute the royal gifts of game and wine, which had previously been annual,—a neat hint.

A "Steeple Jack."—For some days Mr. Jason Goodchild, alias Steeple Jack, from Dundee, has been attaching lightning conductors to the tower and gables of the hydropathic establishment at Clief. The tower is about 100 ft. high, and the flags aff thereon is 40 ft. At this height—some 140 ft.—Jack thought proper to balance himself with one foot resting on the top of the flagstaff. Here he stood till his photograph was taken, and thereafter waved his cap while the flagstaff was swinging in the breeze.

The Durometer.—An instrument for testing the hardness of metals, by drilling, has been invented by M. Behrens, an engineer of Tarbes, in France. It is said that it has been thoroughly tried, and that many French contracts for rails now contain a condition that they are to be tested by this apparatus. It consists of an upright cast-iron standard with a table for supporting the rail or other article to be tested. The spindle of the drilling tool is capable of being raised and lowered in its bearings by turning a handle for that purpose, and the drill is held down to its mark by a weight fitted to the upper end of the drilling spindle. Its rotary motion is derived, through a pair of mitre wheels, from a driving shaft carrying the usual fast and loose pulleys. This shaft has a worm upon it which moves a train of mechanism, in connexion with a signal gong, for the purpose of indicating the number of revolutions made by the drill. The apparatus is exceedingly compact. Its use by French manufacturers has led to a gradual increase in the hardness of the rails they produce.

Royal Italian Opera, Covent-Garden.—Any doubt that existed as to the union of the two managements and the two companies, those of Covent-Garden and Her Majesty's, has been dispelled by the published programme, which sets forth the double company wonderfully strong on the lady side, but wanting on the other a great tenor, aside of Mongini and the return of Tamberik. But where is he to be found? Signor Arditi will be conductor, with a colleague not yet named, and the Covent-Garden orchestra remains intact. Only one opera new to London is spoken of, Ambroise Thomas's "Hamlet," with Mlle. Christine Nilson as Ophelia; but, on the other hand, some promising conjunctions in stock operas are promised; such, for example, as "Le Nozze di Figaro," with Patti as Susannah, Lucca as Cherubino, and Titiens, La Contessa. The subscription list can scarcely fail to be very large.

"Cleopatra's Needle."—The prostrate obelisk in Egypt that belongs to us has again turned up, and one more suggestion is made, that we ought to bring it to England. Our readers will remember the agitation of the question in our pages some years ago, when one of our correspondents, the late Mr. Nathaniel Gould, offered to fetch it to England for a certain stipulated sum. Nothing came of the proposition, then, however; nor will it now. Under ordinary circumstances we are not advocates for the removal of historical monuments from their original site.

Transplanting a Large Tree.—At Elveden Hall, the seat of the Maharajah Duleep Singh, considerable interest has been excited by the successful removal of a very large tree, under the superintendence of Mr. Barron, of the Elvaston Nurseries, Derby. The remarkably fine specimen of purple beech thus transplanted is nearly 50 ft. high, the diameter of the branches 58 ft., and the circumference of the stem at about a foot from the ground, 7 ft. 8 in. The mass of soil and undisturbed roots measured 16 ft. by 14 ft., the roots extending 6 ft. beyond, and the whole weighed considerably over twenty tons. A platform of strong timber was constructed underneath, and the tree was raised upon rollers laid on planks by means of powerful screw-jacks. This being done, the tree was drawn on to its new site with the aid of pulleys of unusual size, being maintained throughout in an upright position.

Frightful Explosion at Oldbury.—An explosion, by which two men instantly lost their lives and several others sustained serious if not fatal injuries, has occurred at the works of Messrs. Demuth & Co., at Oldbury, manufacturers of naphtha and other chemicals from gas tar, including, amongst other things, the celebrated aniline dyes. The cause of the accident does not appear. The retort is of enormous weight, and was blown through the air to a distance of about forty yards, "like a balloon." The amount of damage will amount, it is said, to 3,000l. or 4,000l.

Earthquake in Lancashire.—A shock of earthquake was felt on Monday evening in Manchester and the neighbourhood. At Newchurch a factory chimney was destroyed, and the shock was severely felt at Todmorden, Rawtenstall, and Haslingden. The wall of the railway station there was cracked.

The Drainage of Reading.—At a meeting of the Local Board it has been unanimously resolved, that a drainage scheme, involving an expense of 40,000l. shall be carried out. Mr. Lawson, C.E., and Mr. Woodman, the borough surveyor, have, for some time past, been engaged in maturing the plans for the work, and these plans will now be forwarded to the Home Secretary for approval before the money can be borrowed. According to a statement made by Mr. Simonds, a 6d. rate spread over a period of thirty years will pay both principal and interest. As the Thames Conservancy Board have determined to enforce the powers they possess by Act of Parliament, of compelling all towns in the valley of the Thames to divert their sewage from the river, no option is left but to convey the sewage to the land, and this plan will be adopted at Reading. Owners of property will be compelled to connect their drainage with the main sewer, but time will be given for payment for the work, which must be executed subject to the supervision of the borough surveyor.

Election of a Surveyor for Leominster. The town council, sitting as a Board of Health, met recently for the purposes of receiving applications, and of electing a person to fill the office of surveyor, at a salary of a "pound a week," the person undertaking the duties to be allowed to execute certain other work not to the detriment of his office. There were eleven applications, including seven local names, and the Board, having opened all the applications, ostensibly formed themselves into a committee, and proceeded to the election with closed doors, the result of their labours being the selection of Mr. John Edwards, of Stonbridge.

The Southampton Statue of Lord Palmerston.—A difference of opinion has arisen between the local Palmerston Memorial Committee and the Town Council as to the site for the statue. The Town Council, by a majority of 19 to 9, have refused to allow it to be put up on the place recommended by the committee, in the High-street, near Holy Rood Church. The editor of the local *Independent* says he regrets this decision, because he knows of no better place. As to any interested motives on either side, he discards the idea.

Destruction of Durham Theatre by Fire.—The Theatre Royal, in Saddler-street, Durham, has been totally destroyed by fire. The building had been used for some time as a music-hall. It contained a large quantity of dried timber. The cause of the fire is unknown. It appears that smoking was allowed in many parts of the house. The building has been in existence over 100 years.

Chatham.—The contract for the erection of the new Lock Hospital intended to be built by the Government, in Chatham, has been taken by Mr. P. Stiff, builder, of Dover, for the sum of 7,749l. The hospital will be built on the Government land adjoining the Maidstone-road.

The Adelaide Gallery, Strand, Destroyed by Fire.—The Adelaide Gallery, once known to fame, like the Polytechnic, as a seat of popular science, but latterly occupied by Messrs. Agostino Gatti & Monico as a *caf *, has been destroyed by fire. Adjoining houses were somewhat injured.

The Wages Question.—This question has presented itself at Preston in a somewhat singular form. A number of spinners, who have enjoyed parochial relief, have been deprived of that privilege on the ground that they could obtain work in the town. Their answer is, that they can only do so by accepting reduced wages. The guardians allege that this is not a point with which they have anything to do; while the employers justify the lower rates on the ground that the depressed condition of the cotton trade prevents them from giving more.

Railway Traffic Returns.—The traffic receipts of railways in the United Kingdom for the week ending February 29th amounted on 13,420 miles, to 703,183l., and for the corresponding week in 1868, on 13,216 miles, to 679,364l., showing an increase of 204 miles and of 23,819l.

The Thames Embankment Approaches. A petition has been presented to the House of Commons, by Mr. W. H. Smith, from the vestry of St. Paul, Covent-garden, for the provision of suitable approaches to the Embankment from the Strand, between Norfolk-street and Villiers-street.

The South Staffordshire Industrial and Fine Arts' Exhibition.—The various preliminary works, for the opening of this exhibition in May next, are rapidly approaching a state of completeness, and the matter is being now taken up by the manufacturers generally throughout the district with heartiness and zeal. The timber framework of the special building is completed, and a large portion of it covered in; the ground floor is laid, the galleries are erected, and the contractor (Mr. F. N. Clarke) expected to have the whole building completed by the time specified, the 15th instant. Notwithstanding the large dimensions of the building—150 ft. long by 80 ft. broad, and 43 ft. high, the committee will experience some difficulty to satisfy all the demands that are now being made upon them, and a suggestion has been generally agreed to that another temporary structure should be erected in the lower part of the grounds in which to exhibit machinery in motion: the exhibits in this department will include ribbon looms from Coventry, nailmaking machines, &c. The dimensions of the structure will be about 100 ft. by 90 ft. The arrangements for the fine art department, which are under the special management of the Earl of Darmouth, are likewise being carried out with success. Instructions have been given to Mr. Walsworth, of Manchester, for the erection of a grand orchestral organ, which is to be fixed in the gallery at the end of the main building.

National Educational League.—A league, having for object the establishment of a system which shall secure the education of every child in England and Wales (and why not Ireland also?), is in course of formation in Birmingham. Mr. George Dixon, M.P., is the chairman of the provisional committee.

For alterations to No. 24, Piccadilly, for Messrs. Unwin & Albert. Mr. Frederick Sullivan, architect:—

Cock	232 0 0
Drew	27 0 0
Saunders (accepted)	194 0 0

For alterations at 687 and 689, Old Kent-road, for Mr. W. Stark. Mr. E. Aidous, architect:—

Spelling	2385 19 0
Stark	285 0 0
Dennis	281 9 6
Croaker & Son (accepted)	239 0 0

For two houses, Keyham, exclusive of boundaries, &c. Mr. E. A. Lansdowne, architect:—

Eastbrook & Son (accepted)	£1,691 0 0
----------------------------	------------

For alterations and additions at West End, Hampstead, for Mr. T. E. Ripley. Messrs. Parr & Strong, architects:—

Cox	£870 14 11
Simpson	747 0 0
Yanson	734 0 0
Keansey	735 0 0
Tracey	733 0 0
Wheeler	720 0 0
Robinson	568 0 0

For new wing to the Baker and Basket Taverns, St. James's-street, Old Kent-road, for Mr. Langford. Mr. E. Aidous, architect:—

Morris (accepted)	£230 0 0

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

TENDERS.

For engine-sheds, &c., New Cross, for the London, Brighton, and South Coast Railway. Mr. F. D. Bannister, engineer:—

Blackmore	£17,500 0 0
Myers & Sons	16,363 0 0
Pickering	16,310 0 0
Firbank	16,300 0 0
Chappell	15,950 0 0
Jackson & Co.	15,827 0 0
Sherlata	15,000 0 0
Dickinson & Oliver	14,468 0 0
Perry, jun.	14,347 0 0

For finishing a house at Cremorne New-road, including additional rooms and vaults, for Mr. Cowley. Mr. J. S. Moye, architect. Quantities not supplied:—

Reed	£1,018 17 0
Sapwell	637 0 0
Stocks	567 14 0
Hoviet	351 0 0

[Who will explain this?]

For extensions to the Roman Catholic Institution for Deaf and Dumb Boys, Calus, near Dublin. Mr. Charles Geoghegan, architect:—

Murphy	£3,625 0 0
Nolan	4,568 0 0
Hammond	4,361 0 0

For the erection of house and shop, Peckham-grove, Camberwell. Mr. J. Coe, architect:—

Richardson	£779 10 0
Turner	759 0 0
King & Sons	751 10 0
Morier	746 10 0
Smith	733 0 0

For various works to premises, 107, Lendenhall-street. Mr. W. Eyo, architect:—

Lowe	£928 0 0
Le T.	861 0 0
Brown & Robinson	847 0 0
Brass	846 0 0
Newman & Mason	816 0 0
King & Sons	694 0 0
Turner	639 0 0
Turner, jun.	630 0 0

For a villa residence at Harbledown, near Canterbury, for Mr. J. Callaway. Mr. M. C. W. Horne, architect:—

Langford & Way	£2,810 0 0
Macey	2,639 0 0
Gaskin & Godden	2,750 0 0
Wilson	2,498 0 0
Cosans, Brothers	2,345 0 0

For erecting New Southern Hospital, Liverpool, to contain 300 beds. Messrs. Culshaw & Summers, architects. Quantities supplied:—

Callie	£3,059 0 0
Farker & Son	29,500 0 0
Black & Readley	27,835 0 0
Burroughs & Son	27,546 0 0

GOOD FRIDAY.

NOTICE.—"THE BUILDER," for the week ending MARCH 27th, will be published at TWO p.m. on THURSDAY, 25th inst. Advertisements for insertion in that Number must therefore reach the Office before THREE p.m. on WEDNESDAY, 24th.

TO SUBSCRIBERS.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

BUENOS AYRES GOVERNMENT CERTIFICATE.—TRANSLATION.—We, the undersigned, at the request of Messrs. Jas. C. Thompson & Co., certify that the IRON SAFES of Messrs. CHUBB & SONS, London, of which these gentlemen are agents, were exposed for several hours to the fire that took place in the office of the National Government on the evening of the 26th inst.; that in our presence they were easily opened with their respective keys; that the moneys and important documents they contained were found in perfect order; and that these safes are now in use in the National Treasury Office.—(Signed) J. M. DRAGO (Treasurer of the National Government), JOSE TOMAS ROJO, JUAN M. ALVAREZ. A true copy—A. M. BELL.—Buenos Ayres, July 31, 1867. CHUBB & SONS, makers to the Queen and the Bank of England, 57, St. Paul's-churchyard, London; 63, Cross-street, Manchester; 28, Lord-street, Liverpool; and Horsley-fields, Wolverhampton.

IMPROVED MACHINERY, combined with STEAM POWER, is employed by J. W. BENSON in the Manufacture of Church, Turret, Stable, and Tall-tale Clocks, Sun and Wind Dials, Perpetual Calendars, and every description of Clock and Watch Work. Architects, Builders, Committees, &c. can be promptly supplied with estimates. A descriptive Pamphlet on Church and other Clocks, post-free, 2d. J. W. BENSON, by special appointment, Watch and Clock Maker to His Royal Highness the Prince of Wales. Steam Factory for Clocks and Watches, 58 and 60, Ludgate-hill; Showrooms, 25, Old Bond-street, London.

The Builder.

VOL. XXVII.—No. 1364.

Something about Masons' Marks in Various Countries.*

IN early days I noticed the fact, now well known, but not so then, that the stones of many old churches bore peculiar marks, the work of the original builders; and, so long ago as 1841, I submitted a communication on the subject to the Society of Antiquaries. This, with a second memoir on the same subject, and transcripts of 158 of the marks from England, France, and Germany, was printed in the *Archæologia*, vol. xxx., p. 113. I believe I may take the credit, such as it is, of having first brought these signs under public observation, and for several years I never met any person

who had independently noticed them. It is curious how long a thing may remain unseen until it has been pointed out. I remember the observation of an old French priest to whom I had shown the marks with which the walls of his church in Poitiers were literally strewn:—"I have walked through this church four times a day, twenty-eight times a week, for nearly forty years, and never noticed one of them; and now I cannot look anywhere but they fit into my eyes." Since that time I have made very large collections in various quarters, and when at a recent meeting of the Institute a memoir was presented by the Chevalier J. P. N. da Silva, "Sur la véritable signification des Signes qu'on voit gravés sur les anciens Monuments du Portugal," it occurred to me that some account of that memoir, with such additional matter concerning masons' marks generally as I had collected, might not be uninteresting. I am sorry I cannot carry out this intention completely, and as I should desire. The mass of matter in my hands is so large that I find it impossible to do more than bring together a few disjointed observations, and a selection from the marks in my possession. These are now before you, and range over many countries.†

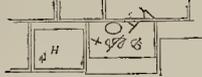

In the great Pyramid of Gizeh many of the stones present symbols, either quarry marks or masons' marks, in red ochre, apparently made before the stones were placed. Some of these are published in Vyse's book. Masons' marks have been found, too, on ancient buildings in Lycia and Mesopotamia, and in various parts of India. In 1846 some marks were accidentally discovered in St. Mary's Church, Leicester (on removing the great west window), one of which is almost identical with a mark found by Colonel Vyse on the walls of Lady Arbuthnot's Chamber in the Great Pyramid.

No. 1 shows marks found in Campbell's Chamber at Gizeh.

* By George Golvin. Read at the Royal Institute of British Architects, March 1st.
† See pp. 245 and 246.

The accompanying diagram represents the marks on stones recently discovered by Lieut.

FROM THE HARAM AREA JERUSALEM

Warren in an excavation at the south-east angle of the Haram area in Jerusalem. The H form, and the mark below it, and a cross + on an upper stone, are deeply cut in; the rest of the marks are in red paint.

No. 2 gives other marks from churches in the Holy Land,—Sehustiyeh (or Samaria), Bireh, Jerusalem, and elsewhere. These are unquestionable masons' marks of the Christian period, probably of the eleventh or twelfth century, (although I have no precise knowledge of the buildings from which they were taken), and, with two exceptions, have been widely used, as may be seen on reference to the other illustrations. These exceptions are, one at Samaria, somewhat like the Arabic numeral 3 (though it is not a numeral), and one at Kuryet el Enah, which is apparently the double of the last alluded to. The mark at Jerusalem like the broad arrow (the present mark of our own Govern-

ment)  occurs in St. Anselm's crypt (the earliest portion of), Canterbury Cathedral, in Furness Abbey, Bosworth Church, Lincoln Cathedral, and many other places.

Through the kindness of Miss Mary Eliza Rogers, I have obtained from the ruined buildings of deserted cities in the Bedouin-haunted districts beyond the river Jordan, a number of marks scratched on the stones (No. 1). Mr. E. T. Rogers, our Consul at Cairo, has copied many of these signs, and connects them with the Bedouin wanderers, who pitch their tents from time to time in the neighbourhood of these ruins. Each tribe has, he says, its distinctive mark; and tents and cloaks are embroidered, and camels are branded accordingly. Some of these forms, collected by Mr. Rogers from tents and camels, are like those on the ancient walls of which I have given representations; but I am inclined to consider the latter quarry or masons' marks.

In Price's "Journal of the British Embassy to Persia," with a Dissertation upon the antiquities of Persepolis (published by Kingsbury & Co., 1825), the author gives specimens of what he considers to be the Antediluvian character, and adds—"It is rather remarkable that signs resembling these should be used by stone masons, as distinguishing marks, in every part of the globe where I have had opportunities of observing; which signs, in all likelihood, have been used by stone-cutters ever since the confusion of tongues."—Vol. I., p. 32, of the Dissertation.

The trident-like mark on the stones of the wall in Pompeii is very curious (No. 3). Nearly every stone bears it. Dr. Barlow, who made the sketch for me, says, "The wall, if I remember rightly, is not very far distant from the Porta Romana, or the gate of Pompeii towards Rome. I have since drawn and measured much masonry of ancient structure, both in Greece and Italy, but have never noticed any marks on the stones like these, or indeed any marks at all."

No. 3 shows other marks from Pompeii, chiefly from the inner face of the town walls. With reference to marks found on these walls, there are half a dozen lines in the work on Pompeii, published by Chas. Knight, which may be worth quoting. The author says, "On many of the stones certain characters are found, intended, apparently, as directions to the workmen, which are said by M. Mazois to be either Oscan, or the

most ancient forms of the Greek alphabet." Various theories are propounded on this, very much antedating the build of the walls, which probably have not a very high antiquity. The characters are evidently masons' marks, carrying on the early forms which Mazois recognised. The Etruscan alphabet includes forms used as masons' marks to this day. So, too, the Lycian alphabet, as given by Sir Charles Fellows in his "Lycia," p. 442. Some of the letters will be found at No. 6. While speaking of Lycia, I may point to No. 5, which shows the marks on the stones of a Turkish ruin, called the Old Khan, not far from Adalia, on the road to the Gulelook Pass.* These marks are precisely similar to those found on Mediaeval buildings in other countries. Before quitting Italy, reference may be made to marks from the Doge's Palace, Venice (No. 4). These were found on the spandrels of the lower arcade (at the end nearest St. Mark's), usually dated about 1350.

No. 7 represents marks from some Roman altars found in England. The mark known as the Fylfot, seen on one now in Alnwick Castle, has been pointed to by Lord Broughton as denoting the hammer or mace of the Scandinavian god Thor. It is seen with Thor on various medals and on Runic monuments. It also occurs in the minster at Basle. With reference to the connexion of the Scandinavians with Italy, Sir William Betham ("Etruria Celioa") shows an Etruscan coin with this symbol on it. No. 7 includes also the cuttings, resembling masons' marks, which occasionally occur on the stones of the Roman wall in Northumberland (second century). Sometimes they consist of a single or double stroke; sometimes of a diagonal cross; sometimes a rectangular cross. The other marks which are represented are less frequently met with.† Search has been made on the Saxon portions of Monkwearmouth, Jarrow, Saunpiting, Worth, and some other churches of that period, but no masons' marks were detected.

No. 8 shows a mark on a stone containing an Anglo-Saxon inscription, Aldborough Church, Holderness, Yorkshire.

No. 9 gives marks from Kenilworth.

10.	"	Sussex.
11.	"	Lincoln Cathedral.
12.	"	Leicester, Gaddesly, York Minster (early English basement, now in crypt).
13.	"	Canterbury Cathedral (earliest, Anselm's crypt).
14.	"	Haddon Hall.

15. These marks, from the Church of St. Nicholas, Yarmouth, are from the stones of the pinnacles of the two outer turrets at the west front. The Rev. R. M. Musgrave, who sent them to me, says, "These pinnacles, erected about 1230, were taken down in consequence of being unsafe. The proportion of marked stones seems to be about one in four." As to the use of outlines of limbs and other objects of that kind, Mr. Musgrave suggests that they may be "referable to a lower class of labourers not entitled to use the more strictly masonic characters." I found the outline of a leg used as a mark in the spire tower of Strasburg Cathedral.

No. 16 shows some of the latest marks that I have met with in England on the face of stones. Goddard's Almshouses, Bray, 1625 to 1628; and Brambletye House, Sussex, 1631.

No. 17. Before dining with the Court of the Bricklayers' and Tylers' Company, some years ago, I was enabled by the then Master to glance through some of their old minute-books. In the year 1580, nearly all who attended and signed the book used a mark or initial, the name

* Spratt & Forbes's Travels in Lycia, 1847. Vol. I., p. 227.
† See Dr. Bruce's Book on the Roman Wall.

being written at the side of it. I give a few of these characters; some of them are known masons' marks.

- No. 18. England: Yorkshire.
 19. Scotland: Glasgow Cathedral, crypt, 1175 to 1233; Zetland Isles.
 20. Ireland: St. Mary's, Youghal, thirteenth century.
 21. France: Strasburg Cathedral.
 22. St. Michael's, Dijon.
 23. Notre Dame, Paris; Danish Island, Bornholm.
 24. The Tyrol: Botzen.
 25. Switzerland: Cathedral, Lansanne; and Cathedral, Geneva (part eleventh century).
 26. Sweden: Upsala Cathedral.
 27. Germany: Cathedral, Münster; and St. Lambert's, Münster.
 28. Austria: St. Stephen's, Vienna.
 29. Spain: San Ysidoro, Leon; Santiago de Compostella.
 30 & 31. Spain: Sta. Maria, Benavente, Segovia.
 32. Portugal: Church of St. Francis, Santarem.
 33. Portugal: St. Cross, Coimbra.
 34. Convent of Batalha.

I have drawn up with more pains, perhaps, than the end repays, lists of various places in different countries whereat the same mark, selecting those most widely used, may be found. I must content myself, however, with placing only a few of them before you.

 The hour-glass form has been found on stones on the site of Carthage. Postern, Hastings Castle, eleventh century. Cathedral, Geneva, eleventh and twelfth centuries. Lansanne Cathedral, eleventh to thirteenth century. Turkish ruin, "The Old Khan," not far from Adalia, in Lycia. Kirkstall Abbey, Roche Abbey, Furness Abbey (twelfth century, part). Gloucester Cathedral (inside nave). Malmesbury Abbey Church. The Church du Bon Dieu, Setubal, Portugal, 1489. Church of St. Francois, Santarem, Portugal, 1242. Lincoln Cathedral, thirteenth century. Kenilworth Gateway. York Cathedral, thirteenth century. Canterbury Cathedral, columns in nave. Salamanca, Old Cathedral (Spain), before twelfth century. Cathedral, Lérida, Spain, fourteenth century. Manresa Church, Spain, screen round coro, fifteenth century.

The **N** form, in Anselm's crypt, Canterbury Cathedral, end of the eleventh century. North aisle of nave, ditto. Church, Samaria, Holy Land. Norman Tower, Bury St. Edmunds. Crypt, York Minster. St. Mary's Abbey, York. Chapter House, twelfth century. Maison Dieu Brechin, Scotland, founded 1264. St. Pierre, Poitiers. Cathedral, Geneva, eleventh and twelfth centuries. Old Cathedral, Salamanca, Spain, before twelfth century. Kirkstall Abbey, Roche Abbey, twelfth century. Lincoln Cathedral, twelfth century. Fountains Abbey, twelfth century. Strasburg Cathedral, twelfth century part. Leon Cathedral, Spain, thirteenth century. Cathedral at Santiago de Compostella, Spain, before 1200. Eriburg Cathedral, fourteenth century. Sir John de Creke's Monastery, Westley Waterless, Cambridgeshire, about 1325.

The pentacle, at Kuryet el Enab, Holy Land. Church in Jerusalem. Malmesbury Abbey Church. Furness Abbey (twelfth century part, and thirteenth century). Dunstable Church (twelfth century). Steyning Church, Sussex, twelfth century. (A suit of armour in the Museum at Turin is powdered with this sign, coronet and letter F.) Cathedral, Geneva, eleventh and twelfth centuries. Gloucester Cathedral, eleventh and fourteenth centuries. Lincoln Cathedral, choir, twelfth century. St. Mary's Abbey, York (north aisle, nave), 1270. Ditto, Chapter House, eleventh century. Fountains Abbey. Strasburg Cathedral, twelfth century (portion). York Cathedral, twelfth and thirteenth centuries. Glasgow Cathedral. Brechin, Cathedral Tower, Scotland (supposed 1354 to 1373). Canterbury Cathedral, north transept, choir. Church of San Ysidoro, Leon, Spain, choir, fifteenth century. Santiago de Compostella Cathedral, Spain, before 1200. Lérida Cathedral, Spain, fourteenth century. (On a Saxon fibula, found at Harnham-hill, near Salisbury, date supposed 646 to 672.)

The topped **A** at Church in Samaria, Holy Land. Gloucester Cathedral, eleventh and twelfth centuries; also on later part. Fountains Abbey, twelfth century. York Cathedral, twelfth and thirteenth centuries. Church of St. Martin, Cintra, Portugal, 1147. Church of

St. Croix, Coimbra, Portugal, 1238. Church of the Convent of Belem, Lisbon, 1500. Cathedral, Leon, Spain, thirteenth century. Lérida Cathedral, Spain, fourteenth century. Cathedral, Segovia, Spain, fifteenth and sixteenth centuries.

The horizontal **W** form at—Canterbury Cathedral, north transept, choir. Fountains Abbey, Chapter House, 1165. Gloucester Cathedral, inside nave. St. Pierre Poitiers, outside. Freiro da Espada, Cintra, Portugal, 1214. The Convent at Thomas, Portugal, 1323. Several churches in Spain.

The **W** at — Church Samaria, Holy Land. Cathedral, Münster, Germany (south transept), 1500. Glasgow Cathedral. Canterbury Cathedral. Kenilworth, Caesar's Tower, York Cathedral, choir. Fountains Abbey, twelfth and fifteenth centuries. Bolton Abbey. Lincoln Cathedral, twelfth century. Roche Abbey. Soulbury Church, near Woburn (perpendicular nave).

The cross with stopped ends, at Furness Abbey, twelfth century.  Gloucester Cathedral, eleventh and fourteenth centuries. Fountains Abbey, cloisters, thirteenth century, and Chapter House, twelfth century. York Cathedral, twelfth and thirteenth centuries. Church du Bon Dieu, Setubal, Portugal, 1489. Freiro de Espada, Cintra, Portugal, 1214.

The length of the marks, it may be as well to mention, ranges from 1 in. to 5 in. or 6 in. The greater number, however, are from 2 in. to 3 in. long.

The majority of the marks I have given from Spain are taken from Mr. Street's "Account of Gothic Architecture in Spain." Speaking of the ancient buildings there, the author says:—"The masons seem to have worked together in large bodies, and the walls are marked in all directions with the signs which, then as now, distinguished the work of each mason from that of his neighbour; but I have been unable (save in one or two cases) to detect the mark of the same mason in more than one work; and from this it would seem to be probable that the masons were stationary rather than nomadic in their habits, a deduction which is fortified by the difference of general character which may, I think, be detected between the groups of marks in different buildings. Occasionally the number of men employed on one building seems to have been unusually large, and it is clear, therefore, that there were great numbers of masons in the country. In the small church of Sta. Maria, Benavente, there are the marks of at least 31 masons on the eastern wall; as many as 35 were at work on the lower part of the steeple at Lérida; whilst in one portion of Santiago Cathedral there appears to have been as many as 60."

Looking through the marks given in Mr. Street's excellent book, I find the same mark repeated a little oftener than might perhaps be inferred from the writer's observation. Thus the universal **N** form occurs in Lérida Cathedral, Leon Cathedral, the Cathedral of Santiago de Compostella, and the old Cathedral of Salamanca. The pentacle appears in Lérida Cathedral, the Cathedral of Santiago de Compostella, and the Church of San Ysidora at Leon. The hour-glass form is in San Ysidora, Leon; Lérida Cathedral, and elsewhere. The same form, without the bottom line, occurs in Lérida Cathedral, Cathedral of Santiago de Compostella, San Marcos at Salamanca, Tarragona Cathedral, Segovia Cathedral. The horizontal **W** form is in Lérida Cathedral and Segovia Cathedral. The topped **A** is in Lérida Cathedral, and the Cathedral of Segovia, and so with some others. I mention my impression in this respect, not by any means as seeking to contradict Mr. Street, but because the inference drawn, namely, that "the masons were stationary rather than nomadic in their habits" is of consequence, and it is desirable that those who may have to discuss it should be agreed as to the premises.

The marks from Portugal, to which reference has been made, are chiefly taken from the Chev. da Silva's Memoir, to which I will now briefly allude. It gives 508 marks from ancient buildings in Portugal, besides a supplementary plate containing fourteen marks from the great Aqueduct of Lisbon, built in 1738, and twenty-two "ancient Masonic Hieroglyphics" where used is not stated. They are, in fact, nothing more than a "secret alphabet" of our school days; and so transparent that no one would think of trusting a secret to it. The marks in Portugal are feebler and coarser than those of some other countries, but include many of the latter, as I have already pointed out, such as the

hour-glass form, the topped **A**, the **N** form, and many others. The earliest given are dated A.D. 1102.

In my second letter to the Society of Antiquaries on the subject, I said, "The marks, of which we are speaking, it can perhaps hardly be doubted, were made chiefly to distinguish the work of different individuals. At the present time the man who works a stone (being different from the man who sets it) makes his mark on the bed or other internal face of it, so that it may be identified. The fact, however, that in the ancient buildings it is only a certain number of the stones which bear symbols, and that the marks found in different countries (although the variety is great) are in many cases identical, and in all have a singular accordance in character, seems to show that the men who employed them did so by system, and that the system, if not the same, was closely analogous in one country to that of the others."

In Portugal, however, going farther than this, it would seem to have been urged that these signs were symbolical, and were used as means of recognition by the Freemasons, who, as some believe, travelled over central Europe exercising their art. The principal object of the Chevalier's Memoir is to show that the opinion of those who have believed that these marks have a Masonic signification, cannot, for a moment be admitted. Although English archaeologists may not need any argument to convince them that the marks are not symbolical, they may be willing to hear what he has to say on the point.

"Why should the Freemasons," he writes, "who travelled to execute their labours in a body, each accompanied by his family, have placed these signs upon the stones, since each one knew the other for his partner? For none but those initiated or affiliated to their lodges, were permitted to help in the construction of those beautiful edifices; thus enabling them to protect each other reciprocally as loyal brothers, and above all to keep amongst themselves the secrets of their art. Why then show these marks to all the world, if (as it was said) they were simply used with the intention of making themselves known as Freemasons, when every workman knew the other as a brother? And, besides, would they have been permitted to make public these signs, if they were really those of the order into which they had been admitted? Again, if these signs were really characteristic of the Masonic order, they ought, without doubt, to be identical on all buildings, because the hieroglyphic alphabet, or scale, being composed of a limited number of figures, and masonry having at the commencement but a single tier, the sign would have been reserved for the most urgent cases for recognition or correspondence, and never employed needlessly or exposed to the observation of the profane."

"An attentive consideration of these objections," the writer proceeds, "and the great diversity of the signs seem to us to afford tolerably convincing proof that they are by no means symbolical, and can have no perfect meaning; for, in order to attain this, it would have been necessary to use them with something like order, whilst in none of the buildings that we have examined, and of which we annex the marks, has this been observed. On the contrary, the marks are found on stones at various heights, totally void of connexion one with another, and many are placed in inverted positions, although similar in form."

After speaking of the religious feeling that prevailed during the Middle Ages, and the spirit that animated the builders, the writer goes on to say:—

"In order to execute such important works, it was necessary to have large numbers of workmen, the more so as similar buildings were in course of construction in more than one country, and even at the same time, for the execution of which preference was given to the cleverest workmen, and these, being always of the Society of Freemasons, were much sought after everywhere.

Although the number of adepts on the spot was considerable, still more were needed to complete the numerous structures then in course of execution, and they were therefore summoned from all parts to work at the buildings in Portugal before and during the construction of the church and convent of Batalha.

There is still another and stronger reason to confirm the opinion we are about to give on this question; which is, that the works progressed but slowly, not only on account of the enormous size of the edifices, but more especially because

cut stones of small dimensions were employed, and all buildings being constructed with stones faced on every side, the hand labour was greatly increased; the only means available to avoid this inconvenience, and hasten the works, and at the same time to benefit the workmen, was to make them cut the stones as *piecework*, according to dimensions given and designs drawn by the architect. To enable payments to be made to so large a number of workmen without mistake, to know exactly those who had done the various duties assigned to them, the workmen shaped their locks one after another, and, to avoid confusion in their work, were in the habit of marking each block with a given sign as representing their signaturæ, so as to show how much was due to them. This, in our opinion, is the reason why we find so many different marks, not only on the same building, but on others which exist in different provinces in Portugal, and why they are met with in different parts of the building.

"The use of these signs," continues M. da Silva, "passed from father to son; and as it was nasal (then, as in many families of the present day) for sons to follow the same profession as their fathers, from the similarity of marks seen on buildings in the provinces of Portugal, we may learn that the stone-cutters of a certain locality took part in the construction of other buildings in the same style in different places, and by the date of the construction we may even find out where the workman was first employed."

"Our supposition on this point carries us still farther, for it shows us how many workmen of the same family,—that is to say, hearing the same surname,—have worked together on the same building at the same time. To find this out, it is sufficient to observe, the second mark, added to the special sign used by them, which will always be the same for the whole family; those marks are usually a zero 0, a triangle Δ, a disc O, or a small +."

In the examples given from Portugal, this second mark is chiefly a circle (see 32 and 33); so it is also in Spain. In England, I have generally found the N form and the acute angle < so used (see No. 13, Canterbury; also Dijon, 22). My own opinion, expressed long ago, is, that the second mark probably belonged to the overseer; and I see no reason to change it; although this, like other points in connexion with the marks, is by no means certain. I have met with four stones in one wall, nearly close together, each bearing two marks, and the whole eight marks different. In the south transept of York Cathedral there is a stone with three marks on it, and so there is in Strasburg Cathedral (see 21).

M. da Silva finally asks how it can be that these signs are those of Freemasons, when we find them on the stones of several monuments erected before the organization of these fraternities. Here, however, he assumes two things; first, that the marks found on the earliest buildings are precisely similar in description to those of the Middle Ages; and, secondly, that the date of the initial organization of such fraternities is really known. Moreover, he leaves out of consideration the probability, or, I should rather say, the fact, that the guilds adopted existing forms and symbols. Without considering the marks symbolical, we may yet believe they owe their wide diffusion to the existence of associated guilds. The general similarity which they present all over Europe from, at any rate, the eleventh century to the sixteenth, and indeed to the present day, point to a common origin and continued transmission.

M. da Silva fully admits the existence of the building guilds, and his quotations go to affirm that they were maintained as an opposition to the monastic associations, which were depositaries of old theological traditions, and could he met only by other associations organized with sufficient strength to endure, and in time to become themselves guardians of traditions, and with enough mystery to avoid rousing dangerous resistance.

"Towards the end of the twelfth century, when their numbers had become considerable, a special corporation of intelligent architects, stone-cutters, and labourers was instituted, who, uniting together, formed a secular body, which acknowledged royal authority alone. Notwithstanding the absence of written proofs and historical documents, it is probable that societies of lay builders existed in Germany as far back as the thirteenth century. In the year 1275, the Emperor Rodolph granted a special charter to builders established in Strasburg, and in 1278,

the Pope Nicholas III. delivered them a brief of indulgence, renewed from time to time by his successors.*"

The precedence of the Freemasons of Strasburg came to be recognized by neighbouring states, and at a meeting of various lodges held in itation in 1459, the head of the lodge at the cathedral was acknowledged the head of the Freemasons in Germany. The statutes of this date of the Strasburg Lodge, from which lodges branched to many places, have been published. Two boards whereon are delineated the marks of the masons who were engaged are still preserved, or were so a few years ago, in the cathedral.

As to the earlier guilds, in classic countries, of which there are traces, I cannot now pretend to speak; nor will I do more, with reference to our own country, than briefly remind you that a College of Masons is mentioned in a Latin dedicatory inscription, dating from about A.D. 52, and which was found in Chichester, in 1725. A hull was issued prior to 1200, giving authority to heads of churches to build churches, and attaching to them a certain number of "liber mactores," or freemasons, to direct and execute the ornamental parts of the structure.†

Much might be, and something has been written on the actual origin of many of the marks. I have already pointed to some of them in the Lycian alphabet. Others are apparently Runic letters. In the later works several of the Roman capitals are used, and may or may not be the initial letter of the user's name. The alpha near the Roman wall is shaped thus Δ and has been in common use as a mark for centuries. It may be worth note, too, that the letter M in some Latin inscriptions found on the site of the Roman wall and figured by Dr. Bruce (one of them dated A.D. 216), is thus shaped M giving the hour-glass mark when set upright. The two side lines in M the letter are curved instead of straight, and I have seen the mark in more places than one (Malmshury Abbey Church, for example, as figured by me in the *Archæologia*), with the ends thus rounded.

The hour-glass form, however, has been found on stones much more ancient than the inscription referred to. I simply mention the similarity. The hexagonal, or double triangle, was a mystic mark in India centuries ago. The N formed symbol appears on the coins of the Artarathes, a series of Persian kings who lived before Christ; also on a coin of Amyntas, king of Galatia in the time of Strabo, 50 years B.C. The topped A, as I have shown, has been very widely used. Dr. Clarke mentions that in the walls of the Castle at Paros, butt ends of columns are seen marked with the letter A near the Lewis hole, and suggests that it may be a mark to adjust by, or the initial of the architect, not to be discovered until the building was in ruins.‡

Mr. J. E. Dove, in a series of papers published in the *Builder* some time ago,§ attributed recondite meanings originally to many of the forms used as marks, and supported his views with erudition and ingenuity. Some of them were in use amongst the Egyptians, and then, doubtless, had signification. The circle and triangle, later taken to symbolise eternity and the Trinity, had earlier a different significance. The acute angle or V form, as used by the Egyptians, he found reason to believe was a feminine symbol, and that the same form reversed A was a male symbol. Into this part of the inquiry, however, I am not now entering. Whatever may have been the original signification of the forms adopted, I find no evidence to lead me to believe they were viewed by masons other than as signatures, given to them, in some cases, on joining a lodge, or otherwise regulated. The Scottish lodges gave marks till very recently, if they do not do so now. In St. Nivina's Lodge, at Brechin, every member had to register his mark in a book kept for the purpose, and he could not change it without certain formalities.

I must now end. The subject is probably more curious than useful; but I hope you will consider it sufficiently interesting to justify me in again bringing it before you. In my first communication on the matter to the Society of Antiquaries, and afterwards to the Institute, I ventured to express my belief that "no circumstance

which promises to throw even the smallest additional light on the early history of these wonderful men to whom we are indebted for so many magnificent buildings can be deemed insignificant or unworthy of consideration," and I think so still.

THE LATER DISCOVERIES AT JERUSALEM.

THERE have been but few instances of lost cities so remarkable as that of the loss of Jerusalem. A city of which we have the most minute accounts from the earliest times of its history till the period of its capture by the Romans, and the size, magnificence, and beauty of which are familiar to all, has disappeared from the face of the earth, and left nothing to mark its site but a collection of gigantic mounds, on which a small, ill-built, and irregular modern town is perched.

Although the destruction which the city underwent was in its completeness and vindictiveness unparalleled in the history of the world, and, indeed, almost incredible, still the gigantic proportions of the masonry were such that it was only where the works were raised above the surface that they could be in any way disturbed, at a time when blasting and mines were unknown, and when a clumsy hammering with the huge rams in use was the greatest force to be resisted.

Thus, the appearance which we should naturally have expected the ruins of Jerusalem to have presented would have resembled that of the ruined cities of Greece, or of Central America, though there might have been less remaining of buildings, still standing, or their original sites. We should have expected to find the foundations of walls, towers, gates, palaces, and especially of the Temple, while gigantic piles of stones tumbled in heaps at the spots where they once stood, broken columns, friezes, and pediments, would show the characteristics of the architecture of the times, and enable us to restore, at least, the outline of the city; and not only above the ground would such ruins exist, but the entrances would be found to that extensive system of subterranean passages, and the temple and city, which was the refuge of so many after the taking by Titus, and in the time of Hadrian's oppression of the Jews.

Of the condition in which the city was left by the Romans we have a full description from Josephus; and although he states that "the buildings were razed to the foundations, so that no man should know that any had inhabited it," still, his general description gives the same impression that would naturally have been expected, and of the fortification he makes Titus to have said, that they were such, that without the special aid of God no human efforts could have effected their destruction.

From the doings of Time till the time of Constantine but little is known of the history of the city; but after that time descriptions are numerous and detailed.

In the fourth century we have Eusebius; in the seventh, Saint Arculphus; in the twelfth and later centuries, the Bordeaux Pilgrim, John of Wurtzburg, Widebraud of Oldenberg, Sæwulf, Antony of Piacenza, Guibert of Nogent, William of Tyre, Foucher of Chartres, James of Vitry, Albert of Aix, and a host of devout anonymous pilgrims who visited and described the Holy City. It is they, or at least their informers, who have to answer for the impenetrable forest of ill-founded and even absurd traditions through which later explorers have had to cut their way to the truth.

There is, perhaps, no instance in which the theories and prejudices of early writers have done so much to hinder and divert the progress of discovery as has been the case at Jerusalem. These writers laying down the true sites of ancient remains at spots where not a vestige of them appeared, according, it would seem, to their own fancies, or on the not more trustworthy authority of the monks and inhabitants of the then existing Jerusalem, content to take the condition of the city as it was in their time as having been the only one it ever knew, and being alike ignorant of history and architecture, conjured up for themselves and their successors a false notion of ancient Jerusalem, which being improved on by later writers according to theories of their own, has been generally received on all hands until quite of late years. Commenced in the time of Hadrian; added to and enlarged by Constantine, Julian, and Justinian; fortified and restored by the Crusaders and the Christian kings; and still more beautified by the

 ‡ Travels, part 2, sec. 2, ch. 10.
 § See vol. for 1863, April 4th, April 18th, June 6th, and July 11th.

noble works of the Moslems, which in their turn have been patched and repaired by the Arab-Turks, Franks, and Jews, modern Jerusalem with all its traditions, Christian and Mahomedan, has risen over the Jerusalem of the Jews, which, in consequence of the bigoted ignorance of earlier writers, it was fully believed to represent.

The Medieval chroniclers were followed by later travellers, who found the sites (though they were principally those interesting in the Christian history of the city) ready fixed, and accepted them as the true ones. Among these we may notice Sir John Maundeville, Irvy and Mangles, Richardson, Pococke, Brown, and Buckingham. These were in turn succeeded by those who established theories of their own, but took little or no trouble in verifying them; and these again are at last followed by real explorers, who are content to leave theory on one side, and to endeavor to restore, by excavation or otherwise, sufficient relics of the ancient city to make its restoration really possible.

Of the work of those who have preceded Lieut. Warren a *resumé* has been before given in these columns,* and it is needless to do more than mention them here. Tipping, Pierotti, and Barclay, have explored what remained above ground of the Temple; Mr. Catherwood furnished the first correct plan of the Haram; and M. De Vogüé describes what remains in the city itself, above the surface of the ground. But all these investigations were superficial, and it is to the Palestine Exploration Committee that we are indebted, for the opening up of an entirely new branch of the investigation, and the true rediscovery of the lost city buried under modern Jerusalem.

The great scarcity of the superficial remains which the careful investigations of many authors succeeded in discovering had given rise to a supposition that very little of the old city would be found, and indeed it was apparently supposed that not only was Jerusalem razed to the ground, but also that it had been cleared away from its site, and that no vestiges of it had been left.

A fact which has never been touched perhaps be considered to point to the existence beneath the surface of the foundations of the city, and this is that, whilst as far as can be compared with existing circumstances, the description given by Josephus of the masonry of the city, and of the disposition of the valleys, pools, and streams, is most correct and free from exaggeration; yet the appearance and comparative heights of the hills, and especially the height of the temple wall is totally different, and the last specially has often been quoted as showing the unreliability of Josephus's statements, whereas it might have pointed to the fact that only a portion of the temple wall was apparent above the surface, a fact which is now ascertained by Lieut. Warren.

The few and disconnected letters which have appeared from time to time in the papers have failed to give any idea of the magnitude or importance of the discoveries now made, and even the reports issued to the subscribers to the Palestine Exploration Society have been little noticed by the public.

The success that has attended these efforts, which have been cramped by want of time, money, and materials, as well as by opposition, passive or even active, of the authorities and inhabitants of the town, is considerable, and is the result of untiring energy and great skill, deserving to be better seconded than they have as yet been.

Lieut. Warren arrived at Jerusalem in the middle of February, 1867, and his work has been reported to the October of the same year by himself in his report, and up to February, 1869, in his letters.

The shafts sunk by his direction may be summed up as below.

For the investigation of the Temple,—

1. The south wall:—
 - A. South-east angle.
 - B. South-west angle.
 - C. Single gate (so called by Lieut. Warren), two shafts.
 - D. Between El Aksah and the Triple gate.
2. On the east wall:—
 - A. Gallery between south-east corner and Kedron, three shafts.
 - B. Golden gateway, 100 ft. to east of it.

For the investigation of the remainder of the city:—

1. Damascus gate, three shafts.

2. Marietan or Hospital of St. John, three shafts.

3. The Pool of the Virgin.

4. Shafts in the Tyropean, six.

5. Wall on Ophel, three shafts.

6. Ancient aqueduct.

7. Rock cleared at Siloam, stopped for want of wood.

8. Excavations at the Pool of Bethesda.

These are arranged in order of interest and importance, and not according to the time of their execution.

The first excavation was at the south-east corner of the Haram enclosure, a spot familiar to all who know Jerusalem, remarkable for the size of the stones in the wall, and the height of the same, which is about 70 ft. above the present surface.

The wall was first bared to a depth of 20 ft. below the present level, when the work, which was close to the wall, was stopped by the Pacha. The stones here found were small compared with the largest above ground. A second shaft was then commenced, 40 ft. to the south of the Haram, at the south-east corner, and a wall was struck, and a shaft driven 53 ft. Thus, in endeavouring to drive a gallery northward to the south-east corner, a wall was found running south from the Haram, but not flush with it, being set back 12½ ft. Further, a wall parallel to the south Haram wall, 15 ft. south of it, 4 ft. thick, was discovered with large stones, and had to be mined through. On reaching the Haram wall, large stones, rebated, and similar to those above the surface, were found, the faces being, however, left rusticated, and not dressed. The course of the wall joining the Temple will be described later.

In October another shaft was begun, 5 ft. south-east of the south-east corner, to bare the east face of the Temple wall, and of that joining it. This struck on the top of the wall of Ophel (that is the wall running south from the Temple) which was found to terminate within 5 ft. of the south Temple wall, but no signs of any gate were found, the wall simply abutting on the Haram.

The result is, therefore, the discovery of the true surface of the rock on which the Temple wall stands here, at a depth of 90 ft. below the present surface, or 133 ft. below the interior level of the platform of the Haram.

This discovery, when coupled with that of the true bed of the Kedron (not yet finished in a satisfactory manner) will at once vindicate Josephus from the charge of exaggeration in describing the dizzy height from the top of the southern cloister to the bottom of the Kedron valley; for, the wall being 133 ft. to the level of the floor of this cloister, which was according to the account in the "Antiquities," 90 ft. in height, and the present surface of the Kedron being more than 100 ft. below the base of the wall as now discovered, it requires only about 100 ft. (the depth of the bottom, according to Lieut. Warren, below the present surface) to make a total of 450 ft., or the greatest estimation of the height of 300 cubits given by Josephus.

The discovery at the opposite end of the south wall is hardly less interesting, though it does not clinch any fact as the other does. A shaft was sunk in September, 1867, about 40 ft. from the corner to a depth of 18 ft. At 12 ft. a rough pavement was found, the stones of the Haram proved to be like those above, but no rebating was found on them. This excavation was continued in October, and proved productive of important results. The depth was increased to 45 ft. without reaching rock, and the wall was exposed to its whole height, the pavement was then found to consist of stone about 1 ft. square, and polished by wear. Below the pavement was a concrete of stone, bricks, and mortar (16 ft.); beneath this, loose stone or shingles (5 ft.); then large stones 3 ft. by 2 ft., and a rubble wall running north and south, and abutting on the Haram.

The appearance of the whole Haram wall, when thus cleared, so as to make its total height more than 100 ft., was most interesting. The lower courses of stones were rusticated, but those above are finished on the face, though the uppermost courses are much worn. The rebating is about 4 in. to 6 in. wide, and set back about 3 in. in the upper or dressed stones, and 18 in. in those not dressed. The joints are beautifully worked, and hardly visible.

The work was continued by further sinking of the shaft, to a depth of 79 ft., when the ground gave way, and a ledge remaining, the workmen looked down into a dark abyss of unknown depth.

It was, however, only a depth of 6 ft., and at the bottom was a passage running north and south, 4 ft. high and 8 ft. wide. It was of rubble, with flat stones at the top, instead of arches. The mud made it impossible to explore this far; but, under the impression that it might have been the examining passage of the Temple aqueduct, Lieut. Warren caused the floor to be removed.

The foundation of the wall at the south-west corner is thus ascertained to be about 280 ft.

The gallery was explored for 380 ft., where a branch going east and west was found; but here the want of materials, and the mud, stopped the prosecution of the work.

The Single Gate, as Lieut. Warren has called it, though this name has never been given to a half-hidden gate on the west, discovered by Dr. Barclay, is situated at a distance of 83 ft. from the south-east corner of the south wall.

A complication in the investigation of this part of the wall exists in the appearance, above the level of the vaults discovered by Lieut. Warren, of a large series of vaults which have been, till of late, supposed ancient, and were known as the "Stables of Solomon." These are supported on piers of rebated stone, but only one face of each stone is properly rebated, the rest being rusticated; and there can be little doubt that these vaults, which occupy a space of about 12,000 square feet, were built by the Saracens from the stones of the east wall after a part of it had been destroyed by earthquake in the time of the building of the Kubbet es Sa'rah.

The first shaft was begun in September, at a distance of 37 ft. from the wall, and driven to a depth of 22 ft. (for the last 8 ft. through the kind of shingle formed by the disintegration of the ancient masonry, which is found in all parts of the excavations, and which runs, as Lieut. Warren informs us, like water) when the top stones of a supposed passage were found. This shaft was soon filled up, the supposed top being found to rest on pebbles, and the stones to be rebated on the lower side while a wall existed to the east. In October the shaft was driven, the few frames so long waited for having arrived; it was 14 ft. to the south, and sunk upwards of 30 ft., at first through rubbish and stones which had to be broken, when the shingle began immediately to run. Lower down a firm soil is found, and finally, a letter on the 17th of the month announces the discovery of the entrance into a series of vaults under the stables of Solomon. These probably have some connexion with the Cradle of Christ, a chamber described by M. De Vogüé at the south-east corner. The shaft had been covered up for some time, owing to the illness of the Lieutenant, and on being reopened after several accidents a passage was found running north, directly at right angles to the line of the wall. It is 3 ft. wide at its top, which is 13 ft. below the present surface of the ground; the floor has not been reached as yet, but there are, according to Lieut. Warren, two entrances, one at a depth of 25 ft. from the surface, the other at a depth of 16 ft. or 17 ft., and as the lowest of these two may be part of the real entrance, it is not improbable that the floor of the passage may be at the level at which the rock was found, namely, 30 ft. below the present surface. The interior is filled with rubbish, and is at present only about 5 ft. or 6 ft. high, but may, as is then shown, be from 12 ft. to 18 ft. The passage is choked up at the further end, and was explored to a distance of 70 ft.

At a distance of 45 ft. from the entrance is another passage unexplored running east, seeming to point to a connexion with the Cradle of Christ before mentioned.

The masonry of this passage is of the first order of Megalithic masonry, with stones upwards of 15 ft. in length, beautifully worked, and with the characteristic rebating. The roof is most interesting, consisting of large stones, many of which are rebated and laid flat across the passage, a construction similar to the flat lintels on some of the gates discovered above the surface of the ground, and to those of Mycenæ and Etruria, as also to the passage near the south-west corner. The upper course of stones in the wall is 4 ft. in height, and a small channel for water runs on each side of the passage at this height, made of dark cement, and projecting from the wall. At a distance of 6 ft. or 7 ft. within the wall, a check 10 in. cube is cut in the roof, and a mark made apparently by the grinding of a metal door, 13 in. swing, is visible. The passage runs concentric with one of the colonnades of the vaults above.

The next point explored is between El Aksah and the Triple gate,—the entrance to the stables

* See vol. xxvii, p. 105.

of Solomon,—here, however, the shaft has brought to light nothing of importance, although the rock is found immediately beneath the surface.

The excavations on the east wall are not of equal importance as yet, though they tend to clear up one of the most disputed points in the topography of Jerusalem, namely, the appearance of the eastern side of the city, and the existence or non-existence of a stream in the Kedron valley, now dry, and supposed by Robinson and other writers never to have been otherwise.

It has been previously noticed that the Kedron is supposed by Lieut. Warren, to have originally run upwards of 100 ft. below its present level. In order to ascertain this, and following out the indication given by the sound of running water heard beneath the surface at several points, three shafts were sunk near the south-east corner of the Haram wall, and one 100 ft. east of the Golden Gate, an entrance of the time of Julian, about two-thirds of the length of the east wall from the southern corner. The galleries at the south-east corner were driven under great difficulties, with little result. They were all sunk in the early part of 1867. The first was closed, in consequence of the danger caused by the running of the shingle, after being driven at a depth of 70 ft. The second was an oblique gallery at an angle of 60° (the shingle lying at 30° natural level), it only reached a length of 14 ft. The third was a perpendicular shaft not connected with the southern shaft as the first gallery was. This was sunk about 14 ft., but was again stopped by the running shingle.

Having failed to find rock in this part of the valley, the Golden Gateway shaft was next explored; though in November, 1867, a shaft was again sunk, 40 ft. deep, 70 ft. west of the present bed of the Kedron, and rock found, thus determining the slope of the valley here to be upwards of 30°. At this second point a shaft was sunk 27 ft. On first starting some large stones were found, and the shaft, unless closed for want of money, is still being driven to find the river bed.

On the west wall a shaft was attempted, at the arch known as Wilson's Arch,—a second bridge connecting the city and Temple, of which little is known, but which should be thoroughly investigated, as being a place most likely to yield discoveries. This was closed by the interference of the authorities.

Such, then, are the discoveries and explorations made on the Temple itself, and the results to be gathered from them are interesting. They show that the height of the temple wall was more than twice its present height at the south-east and south-west corners, and further that there was a natural slope of the ground down from the centre of the south wall, while four passages led from the priests' quarter to the vaults of the Temple, as mentioned in the Talmud, these being found at the level of the rock—1st, near the south-west corner; 2nd, at the Double gate, now shown to rest at the level of the rocky surface; 3rd, the so-called Triple gate, near the south-east corner; 4th, at the Single gate just described. Further, the existence of a deep valley on the east and west is proved, and the fact that the upper courses of masonry are still *in situ*, and are not, as some have supposed, the patchwork of later builders using the old materials, is clearly proved.

The discoveries in the city itself are quite as interesting, and have been more numerous; for though Lieut. Warren complains that in some places nothing but a confused mass of intersecting walls is found, still this and the discovery of a paved street in one part of the city only seem the more to point to the existence of the old under the modern Jerusalem. Of this, however, in our next.

SOMETHING ABOUT MELROSE.

MELROSE, as we have before now said, is one of the loveliest valleys of the Tweed. We have also explained that this quality is due, next to the value it derives from the beautiful river, to its curious geological structure. In point of fact, it is composed of the basin of an ancient lake, timbered with fine oaks and silver birches, with the River Tweed, now sadly polluted, and at the time of our visit much diminished in volume, flowing in its own placid and meandering way through its winding channel. Supposing the traveller to get his first view from the south, as he traverses the ridge, or rather the south-eastern skirt, of the Eildon Hills, crossing

the Bowden-burn, and passing under the land arches of the splendid railway viaduct, he will come suddenly upon a panorama such as we have seldom seen equalled. The grey ruins of the fine old abbey embowered in beautiful foliage, the noble sweep of the river, the spires of the parish churches, the undulating ground, the picturesque-looking villas in the suburbs, and, lastly, the irregular outlines of the ancient town itself, constitute a landscape which every painter of genius, from Turner to D. O. Hill, has loved to paint, and every poet from Scott to Leyden has loved to sing. One ceases, indeed, to be astonished at the wonderful web of enchantment which the great northern minstrel has contrived to throw over the district whenever we come in full sight of the valley of Melrose.

Such a romantic district has been the means of drawing together some of the oldest aristocracy of Scotland, and of evolving their highest efforts with regard to the architecture and embellishment of their country seats. At the foot of the southern slope of the Eildon Hills, for example, stands Eildon Hall, a large and rather heavy specimen of Scotch Baronial, the newly-acquired residence of Lord Henry Scott, son of his Grace the Duke of Buccleuch, who is of course the feudal superior of the whole country side. Eildon Hall was long the seat of the Honourable Major Baillie. Upon the slopes of the north-eastern hill, and nearest the town of Melrose, is a large and tasteful specimen of a country seat, the residence of Lady Russell. Sir George Leith has a very neat cottage at Drygrange; and, in fact, there are more of the ancient and hereditary aristocracy of Scotland domiciled in this beautiful neighbourhood than in any equal area we can call to memory in the whole of Scotland. Most of the architectural labour and expenditure has obviously been done by their immediate forefathers. At the same time, while acknowledging their efforts, we are bound to add that the present race of inhabitants near Melrose have not done their best to improve the natural beauty of their situation. The town itself—that is to say, the earlier portion of it—is poor and uninteresting, consisting mainly of two leading thoroughfares, the High-street and the Abbey Wynd, set at right angles, like a joiner's square. The modern suburb, on the Weir Hill, is rather more tastefully laid out; but we cannot speak in very high praise of the villa architecture. With the exception of one rather tasteful cottage on the Darnick-road, by Peddie & Kinnear, we saw nothing to lead us to suppose, even with Mr. Rhind's new Established Church manse in our eye, that the spirit of modern improvement had penetrated into the colony of retired merchants and half-pay officers who go to make up the west end of this ancient ecclesiastical borough. As to the modern churches, the less we say about them the better. There is, we must admit, a tolerably good specimen of an Early English design in the Free Church, which stands in proud defiance to its original Presbyterian mother, on a rising knoll on the opposite side of the Weir Hill-road. This is due, we believe, to the good taste of Mr. Charles Heath Wilson; and the proportions and details are good, although the stunted chancel somewhat spoils the design. There is also in Melrose a very small but rather neat and tasteful Early English Episcopal chapel, nearly opposite to the U. P. Church, erected from the design, we believe, of Mr. Gilbert Scott, but carried out under the direction of the clerk of works to the Duke of Buccleuch. The interior is very plainly finished, the pews awkwardly constructed, and the ventilation, as we found, defective; but the window above the altar and the stone pulpit are in excellent taste.

As to the ancient town of Melrose, which still clusters round the abbey, it is delightfully situated at the northern base of the Eildon Hills. On a closely contiguous elevation, near the grounds of Priorbank, stands the Melrose station of the Edinburgh and Hawick Railway, which is beyond question the best elevation it possesses. Melrose has partly the character of an antique diggy place, with narrow thoroughfares and ancient houses; and partly, as we have indicated, the appearance of a modern watering-place, with its suburban villas; and in both respects it looks somewhat out of harmony with the grand ecclesiastical antiquity beside it, which still asserts its original connexion and relation to the magnificent landscape around it. It has recently, we are told, undergone much improvement, in consequence of strangers being attracted to it for occasional or permanent residence. The body of the town consists of three

careful lines of houses arranged along the sides of a triangular open area. That leading to the abbey is obviously the more ancient of the two, as the low dingy thatched cottages will testify; but a modern little High-street leads out at the west corner towards Galashiels, in which are situated the principal inns and shops, and there are narrow short thoroughfares which lead off at the other corners toward Gattonside and Jedburgh. Some of the houses still display on their lintels, amid the general plainness and poverty of their walls, numerous sculptured stones, carved with the sacred monogram "I.H.S.," and other ecclesiastical devices,—all affording clear indications that at the time when these houses were erected building materials were largely and remorselessly abstracted from the pile of the adjacent abbey! In the centre of the open triangular town area stands the market-cross, a structure which has been already described in the *Builder* (see vol. xvi.). This cross bears marks of some antiquity. It is about 20 ft. high, and has on its apex a carving of the unicorn which pertains to the arms of Scotland. A Latin cross anciently surmounted the structure, and, according to the usage of the period, received homage from all pilgrims before entering the precincts of the monastery; but this was destroyed in the year 1604. The old-fashioned flight of steps was also removed, and an octagonal base substituted, which is anything but tasteful or appropriate. It is curious that about a road of land, called "the Corse-rig," in a field near the town, is still held by the proprietor on the condition of his keeping the cross in repair.*

We must now say a few words with regard to the social statistics and local Government. The population of the parish of Melrose has risen from about 4,300 in 1831, to about 7,700 in 1861; but, of the town proper, the population at last census was only 1,141. Many causes, we believe, have operated to retard the growth of the population of Melrose. In the first place, it is a purely agricultural and pastoral district, not distinguished in any way for manufactures like its neighbours, Galashiels or Selkirk; in fact, the only manufactory we could discover, and the only steam-engine in the valley of Melrose was that of a bobbin manufactory, which, however, had its *locus standi* on the opposite side of the Tweed at Gattonside, close to the northern terminus of the suspension-bridge, and within a few hundred yards of Allery, the classic retreat of the late Sir David Brewster. In the second place, it has no traders of any sort, if we except the hotels and the local purveyors of food and clothing. The attractions of Melrose are of that character which attract chiefly residents of the upper and middle classes who are retired from business and active life, and whose object is for the most part to combine as much outward show as possible with their limited means of independence. Thus there has been going on unperceived for a number of years an influx of the richer, and an efflux of the poorer classes, the latter of which it need not be mentioned, are at all times, and under any circumstances, the most prolific in producing population. For example, within the memory of the present generation of inhabitants, there existed a row of cottages where the present wall of St. Cathbert's garden extends. A similar line of houses extended down the east line of Abbey-street, where the wall of Priorbank Nursery is built; and a considerable street, known as Dingleton-wynd, occupied the site of the present railway-station and its approaches. Of course, these improvements necessitated clearings; and clearings in their turn have compelled many of the inhabitants to resort to the neighbouring villages to procure suitable house-accommodation. The villages of Darnick and Newstead are in this manner quite overstocked with a poor and disorderly population, which has been driven out of Melrose,—much to the annoyance and disgust of the original villagers.

There can be no doubt that Melrose is bound to provide for her poorer population; and although we are glad to understand that some

* There is a stone still preserved of the old goal on which the arms of Melrose are sculptured. These are a *mail*, or mallet, and a *rose*,—mell-rose. This, however, is well understood to be a mere pun, or at least a hieroglyphic version of the name of the town. The learned and accurate Irvine (v. "Nomenclature," p. 161), distinguishes the vocable into two epithets, *viz.* *mail* and *rose*; i.e., a bare promontory. Other etymologies have been given; but, speaking from recollection, we think the geological character of the Eildon Hills and the archaeological traditions of the district bear out this.—Comp. "A Description of the Parish of Melrose," by the Rev. A. Milne, Edinburgh: 1743.

steps have been taken in the proper direction, it seems to us that the authorities are something too indifferent to their true interests. They have permitted the land speculators to purchase too much of the only good fit for fencing; and accordingly plots for working-class houses are very difficult to procure at a price that would make this class of property remunerative.

We have mentioned the local authorities. These bodies, as far as we can find out, appear to be, first, the parochial board; second, the Kirk session; third, the road trustees; fourth, the county police; fifth, the trustees under the Act for conserving the river Tweed; and, lastly, the district justices of peace of the quorum of Roxburghshire, who hold a court when necessary in the burgh of Melrose. But all these legally constituted bodies would seem to be subordinate to a functionary known as the Baron Ballie, a gentleman of the name of Erskine, who bears the same relation to the present Duke of Buccleuch, that a certain Duncan of Knockdunder did to his grace and glory, John Duke of Argyll. That is to say, he is in a certain fashion the absolute sovereign, and the tutelary deity of the place. He lives in the duke's house; he occupies the duke's pew in the parish church; he collects the duke's rents, fees, tolls, mulctures, arriages, and carriages; he received her Majesty in the duke's name when she visited Melrose; and in general he conducts himself as the prior of the monastery might have done four or five hundred years ago. He has no constitutional check, that we could hear of, upon his doings. For he it is known to an incredulous public, that Melrose possesses neither burgh property, burgh revenues, nor burgh expenditure. No public meetings are held in this primitive place; no burgh courts dare sit within the jurisdiction of this Roxburghshire potentate; and we need hardly add there are no accounts published under his supervision or discharge, to show the arbitrary character of his administration, or the degree of skill with which it is conducted! Much as we dislike, and have on more than one occasion expressed our dislike to, the multifarious systems of police legislation which prevail in Scotland, we cannot help pointing out that the worst of those systems are constitutional and proper as compared with this. For let us just look for a moment at its results; always remembering that Melrose is a fashionable place of residence, as well as a shrine of modern pilgrimage. Let us ask how is it off in the matter of sanitary improvements and social reformation?

In the first place, the drainage is perceptibly defective. Although we understand that Melrose is, to a certain extent, properly enough drained with large clay drain-pipes—a process, by the way, which was curiously enough the result of a voluntary assessment on the part of the proprietors themselves—we cannot admit that it is thoroughly drained. The poorer quarters of the town, where it is by far the most desirable and necessary, do not seem to have been included in the system. And we speak from experience when we say that the best houses on the rising grounds are, during hot and dry weather especially, sometimes uninhabitable owing to the poisonous smella proceeding from the soil pipes. In fact, there seems to be no proper method of trapping the drains in use. All the heavy portion of the soil is retained in a cesspool in the very centre of the town, in connexion with which, it is proper to state, a sluice is so constructed as to admit what volume there is of a small watercourse, called Dingleton Burn, that flows past the town, and which is thus regularly applied to flush the sewers. But the soil which is suffered to collect in the cesspool is only cleared out twice a year! And considering that the whole domestic soil-pipe act as an escape vents to this receptacle, our readers may judge of its probable influence. After leaving this point, the drainage is carried partially by an iron pipe through the Mill Lade, and is finally discharged in a pure state, as it is supposed to be, the Tweed, near Friars' Hall, about half a mile below the abbey; and there its fertilising influence may be traced on the bed of the stream by the luxuriant growth of those slimy, rank river grasses which the geese so greedily gobble up, but which are so fatal to the health of the trout and to the spawning beds of the salmon.

Let us add that we have no wish to say anything against the mechanical construction and design of the Melrose drainage, for which, it is worth stating, clay pipes were for the first time introduced into Scotland. The main sewer is 15 in. diameter; and the arrangement of the

sluice, and of the cast-iron conduit through the mill dam, reflect much credit on the county surveyor, Mr. Mitchell, C.E., of Melrose. The cost was only about 400*l*. The sewage matter removed from the cesspool every six months amounts to about twenty cart-loads; and is sold for 2*s*. a load.

We have less grounds for criticising the water supply, although even that might suffer improvement. Melrose ought to possess a plentiful supply of water; for this is derived from a number of natural springs, which rise at the base of the Eldon Hills, and are collected in cast-iron pipes and accumulated in a reservoir capable of containing between 30,000 and 40,000 gallons. This reservoir is placed at an elevation above the highest levels of the town and suburbs, and accordingly the service is managed by simple gravitation. The water is very pure, containing only a very minute proportion of carbonates of lime and silicates, and is therefore not the least hard; indeed, if we except the Glasgow water, which is derived from Loch Katrine, we do not remember a softer water in Scotland. The assessment is 6*d*. in the pound on the rental, and the works are the property of a joint-stock company, under a free concession of the springs by the Duke of Buccleuch. The company's stock pays 5 per cent. interest. The superintendent is Mr. Walter Hogg, who is also manager of the gas-works.

We are sorry to have to speak about the gas-works, although it is unquestionably our duty; for there can be no mistake as to the fact that they are the most intolerable nuisance in the whole valley of Melrose. Of course, gasworks are at no time a savoury subject, and we do not say that these little gasworks are not as well managed as any others we have had occasion to inspect; but the sad mistake was in the selection of their site. If our readers have properly apprehended our brief topographical description, they will see that the older and newer districts of the town are separated by half a mile of the Abbotsford, or rather Galashiels, road. In the very centre of this otherwise agreeable valley the wise authorities have planted the gasworks on one side and the sludge-pool on the other; it is therefore impossible to avoid either of them excepting by going into the town by a back roundabout road, which, nevertheless, we most heartily recommend all strangers to pursue. Of course we were told that the modern town had chiefly sprung up since the gas-works were erected; but surely this might have been foreseen. As it is, the best houses of Melrose are invaded during certain hours of the day, and what is still worse, certain hours of the night, with that abominable compound of unconsumed carburated hydrogen, carbonic acid, and hydro-sulphuret of ammonia which plain people denominate coal gas! We need not dilate on the aerials evils which may spring from this cause. Some gas engineers, indeed, assert that the manufacture of gas is not unhealthy, but rather the opposite. We will not stay to enter on a technical dispute on the subject in this article. But we may again express the opinion we have long held that all bad smells had better be avoided; anything, in fact, which prevents the due quantity of fresh air entering the lungs must be bad; and we will not exclude coal-gas from the category on its real or supposed antiseptic properties. We cannot estimate the effects of these gas-works on the health of the boarding-schools with which they are surrounded; but we were informed of one significant fact, that the very strong and robust young men of the county constabulary who live in the station close beside them constantly complain of languor and depression of spirits, unrefreshing sleep, and other symptoms of nausea and low nervous fever. As in our previous remarks with regard to drainage, we must acquit the manager of all blame; since we can cheerfully hear testimony to his extreme care in the process of manufacture. But, on the whole, we must say that the quicker the Melrose gas-works are removed from their present site the better for the health of the community, including those strangers who every year come to pay devotion to its shrine.

One creditable feature of modern improvement Melrose possesses which we must not in fairness overlook: that is a small and secluded suburban cemetery. Up to a recent period the burial-ground of Melrose consisted of the greensward which surrounds the ancient abbey; and here we had pointed out to us a spot under the beautiful windows of the south aisle which contains the mortal remains of Sir David Brewster.

Such a distinguished philosopher had no doubt a clear title, irrespective of territorial right, to a final resting-place under the shadow of so magnificent a shrine; but this right, we understood, was equally shared by persons of a less deserving name. Accordingly, the cemetery in Melrose, as it appears to us, has provided at once for the extinction of two intolerable nuisances,—that is to say, the overcrowding of the abbey churchyard to the injury of the public health; and the blocking up of the foreground of that splendid historical pile by the commonplace gravestones of men who had no concern in its construction.*

All we wish to add, and we do so most emphatically, is, that some experience of this beautiful village as a place of residence leads us to desire much improvement and reform, both in a social and a sanitary point of view. We do not, of course, profess to interfere with local politics, nor are we the special advocates of this or that form of county or burgh police. But the time has come, we think, that the inhabitants of Melrose might with propriety adopt the sanitary clauses of the General Police Act for Scotland, even although this might have the apparent effect of transferring their allegiance from the seigniorial jurisdiction of the Duke of Buccleuch and his baron ballie to the statutory enactments of Mr. Provost Lindsay and the sheriff of the county.

THE (ALBERT) MUSEUM, SOUTH KENSINGTON.

HAVING closed my last "Notes" among the cases of porcelain in the east department of the Museum, I will resume my descriptive account in the same locality. In the corner of this department adjoining the centre alley, stands a small case of beautiful specimens of Wedgwood ware. Crowning the whole is a large vase 16 in. high, an oviform amphora, with Cupids and a car drawn by swans in the clouds, white on pale blue ground, serpents twisting round the handles. As no owner's name is attached, and from the similarity of the label to those used in the "Ceramic Gallery," I conclude this fine vase is the property of the Museum. Mr. Archibald Hume lends a small vase of old Wedgwood, twelve cups and saucers, sugar-basin and cover, a vase on pedestal, and a small teapot and cover; also a tall milking and cover, especially charming; subject, a female with feathers in her hair, seated, and teaching, from a book on her knee, a child who stands beside her. The design is kept low down on the jug, while a delicate, airy butterfly floats in the azure space above. Mr. Hume likewise lends two small vases with covers, ornamented with white festoons, medallions, and a border of conventional leaves alternated with large flowers, quaintly bent to one side, reminding one of the illustration to Christian Andersen's pretty tale called "Little Ida's Flowers," in which the flowers become animated in the night-time, and assemble at a grand flower-ball.

Sir John Hippisley lends a fine bowl of pale blue, ornamented with Cupids and festoons, and having on the under part a beautiful pattern of flame-like leaves; an amphora, white on black ground, with a frieze of figures of the Muses; two balloon-shaped vases and covers, on tripod of goats' heads and legs, ornamented with festoons and leaves; a tall cup, cover, and stand, white on blue ground; a pair of bottles, or small-necked vases with handles, white on lilac ground, having very delicate and graceful detached subjects ornamenting the sides: on one, a youth and young girl seem to have, for the first time, entered the presence of Cupid, who, as the god of Love, stands on a pedestal, and to him the pair are making a burnt offering, while a second winged Cupid urges the girl on; in another design the youth kisses the girl on the face of the girl, while he crowns Love with a wreath, and behind them Hymen, holding his flaming torch, stands with his finger on his lip; and in a third, a kneeling girl bathes, or anoints, the foot of a seated female, who covers her face with her drapery, which also envelops in graceful folds her whole figure. Sir John Hippisley likewise lends a pair of amphora, ornamented

* This new cemetery of Melrose, we may mention, contains a striking mortuary monument, a rectangular plinth in three stages of marble, resting upon a base of granite, the whole capped by a sculptured arch, also of marble, pointing to heaven. The whole was designed and executed by Mr. Currie, sculptor, of Edinburg, and was, we believe, erected to the memory of a young Australian lady who had died at one of the neighbouring boarding-schools two or three years ago.

with white honeysuckle on blue ground, and a band of scrollwork broken in the centre by the introduction of small medallion with mythological subject; they have handles terminating in masks.

A candlestick, lent by Dr. J. Braxton Hicks, pale blue and white jasper ware, by Turner, in imitation of Wedgwood, late eighteenth century, is admirable as to delicacy of execution; but there is a want of exactness in the manner in which the white ornamentation is placed on the blue ground, the intervals between the various members being irregular, and in some portions the leaf designs do not stand perfectly upright. Mr. Willett lends a square vase, with perforated cover for cut flowers, white figures of Shaksperian characters on blue ground, with side ornament of vases and foliage; it was made by Neale & Co., late in the eighteenth century, and is very charming; also a jardinière of old Wedgwood, white on chocolate ground, the corners being formed by terminal female figures, the exquisite little faces bent downwards, and the heads hooded by scallop-shells.

Two admirable statuettes of early Wedgwood, coloured like life, are lent by Mr. J. J. Swinson. One is a draped female figure, holding in the left hand what looks like the socket for a candlestick, and grasping a serpent in the right; the other represents an elderly man in the attitude of earnest declamation. He wears a loose robe, coloured green, fringed with yellow, and lined with ermine, which he confines with his left hand, while in the right he grasps a rolled-up scroll; he stands beside a square pedestal, on the top of which lies a closely-written scroll partly unrolled, and on the front is a bas-relief of Mercury flying in the clouds.

Close by this case of Wedgwood, going out into the centre alley, standing one on each side of the double archway that leads into the North Court, are the two noble vases made by Minton for the Paris Exhibition of 1867. I was much delighted with them at the Exhibition, and I think mentioned them in some notices that appeared in the *Builder* during the summer of that year; but as the picture-galleries were then my especial object, I could not enter so fully into the detail of these two exceedingly fine art works as their merits demand. They are called "A Modern Adaptation of Maiolica." The modelling is alike in both, the variations in the appearance of the vases—which are very great—being due to the difference in colouring, and to the design of the painted subject which encircles the body of each. These vases stand about 4 ft. high; on the cover, is Prometheus chained to the rock on Mount Caucasus, with the devouring vulture carrying on his perpetual torment. The handles are tall, straight up to the top, where they curl over, and they have a chain running down each, and terminating in three large balls; two shields bearing each a bas-relief and a plumed helmet, decorate the lower portion of the handles; while to the upper part two prisoners of war are tied up by the raised arms and hands: they rest on the top of the body of the vase, and are chained together by one foot. They wear buskins and body armour of chain, and a leaf-like mail. All these figures, with their earnest faces, are most admirable. The design round the body of one of the vases is in deep blue colour only, the subject, "The rape of the Sabine women;" on the foot is a wreath of green leaves and white berries, twined around by four excellently-well-modelled serpents, whose heads creep up the blue-purple stem; the neck and cover of the vase are purple-blue also, relieved by stone-colour and yellow. In the companion vase the stem is green, with berries, yellow; the foot, yellow-brown; cover and neck, green and brown, to correspond. The design on the body in this case is a very spirited hour-bunt, richly coloured like life, and very carefully painted. The chained warriors here have the eyes painted, which adds greatly to the effectiveness of the most excellently-modelled faces.

Immediately at the back of these vases, but not belonging to the loan department, are two admirable cast-iron gates, or rather doors, of Prussian manufacture, bought at the Paris Exhibition of 1867, and already mentioned in the *Builder*; they are nearly alike, having only a slight variation in the niched standing figure and in the seated receding angel.

Returning into the South Court, in the glass-case next beyond that containing the Wedgwood, is a large plateau of brass, damascened with steel made in Corfu, dated 1565, and lent by Mr. James Woodhouse; a tablet of Florentine

mosaic in relief of the seventeenth or eighteenth century; a plateau of earthenware, painted in oil, with the Virgin and Child, sixteenth century; several oval bronze medallions of Roman Emperors, Italian sixteenth century; a larger one, Pius V., inscribed "BEAT. PIVS V. P. O. M. GREATVS DIE I JANVAR 1565," with rays like glory around the head; and all this fused for a poor toothless old man—with a good profile, nevertheless. There is, too, a silver pomander, Dutch, seventeenth century, with only six compartments for scent; unlike Mr. J. Webb's, which has eight and a little sliding-lid to each, whereas in this one all the lids are "conspicuous by their absence." Mr. J. Webb has in this collection a large piece of early Majolica, a harrel-shaped vase drawn into a neck at the top, ornamented with Scripture subjects on ground of dark blue, divided horizontally by narrow bands of yellow; subjects, "The Adoration of the Magi," and "The Murder of the Innocents," and a row of masks and garlands. It is German (Nürnberg) early sixteenth century. Below this is a large plateau lent by Lady Havelock, of Iustred Maiolica, Italian (Dernta), about 1500 to 1520; it bears the profile bust of a lady with her hair inclosed in an ornamental bag which nearly covers her head, and hangs down the back of her neck. She has before her face a long twisted scroll bearing an inscription; and from her left hand, which is not seen, rises a large spray of huge single carnations and huds. On each side of this plateau stands a large vase, the two being very similar, but not seemingly intended for a pair. Each bears a design in grey tints, the one being Neptune in his car, attended by mermen, mermaids, and children; on this vase there is a strange ornamentation under the edge, of pairs of spouting dolphins resting on their heads; on the other, Minerva in her chariot drawn by winged horses, is accompanied by figures representing the arts and manufactures. Both vases have white and gilded handles, stems, and bases; are Dresden porcelain, eighteenth century; and are lent by Mr. H. Wagner.

On the shelf below are two charming "small plates," in broad gilt frames, Maiolica of Castelli in the Abruzzi; each is painted with a landscape in delicate colours, heightened with gold, and on the rim is a border composed of four pretty little Cupids with flowers, foliage, and two masks. They are in date about 1660 to 1670, and are lent by Sir Woodhine Parish. The bowl placed between these two plates, of silver—German, seventeenth century—is of excellent workmanship; the bowl part is small, and has a broad rim on which are twelve long, raised, pointed medallions,—they and the flat part between them being covered with richly and deeply-chased work of vases, scrolls, birds, and lions; it is lent by Mr. J. Woodhouse, to whom we are also indebted for the rich cup and stand of dark blue enamel on copper, ornamented with coloured flowers and leaves. To this is put "Italian, seventeenth century;" but some of the flower-forms are extremely Oriental in their design. On the same shelf is a pretty little bowl of silver-gilt, with figures in beaten-work, thought to be Portuguese sixteenth-century; also several rings, Etruscan, Roman, and Mediæval, and one earring formed of a bunch of grapes made of seed pearls; an inkstand of crystal, with gilt-metal mounts and large crystal foot, on metal stand, but by no means beautiful as to form, thought to be Italian sixteenth-century; and a cup covered with filigree foliage and scrolls, interspersed with birds and small animals in coloured enamel. It is of sixteenth or seventeenth century German work, and is very rich-looking. There is likewise an elegant bottle of white porcelain, with silver-gilt mounts, Venetian seventeenth-century, with ingenious knot ornament hinged to make it fit the shape of the bottle; also a long pipe of boxwood, richly carved and ornamented with groups of musicians, huntamen, warriors, and a battle-field; an elegantly-shaped cross of carved boxwood, Russo-Greek; and one leaf of a stained ivory triptych, carved with two sacred subjects in quatrefoil enclosures,—the Nativity and the Crucifixion,—German fourteenth-century.

The large plateau of Maiolica, painted in pale blue, with a masquerade supper scene, is chiefly remarkable for the original manner in which a woman, standing up, is aiming a thick stream of wine from the large flask she holds aloft into a shallow tazza at least 5 ft. distant from the mouth of the flask; and, for the deformed smallness of head of the lady who sits at the top of the table in the seat of honour, and who, from

having two attendants standing behind her high-backed chair, would seem to be the principal guest, or else the giver of the feast. This plateau is called Venetian eighteenth-century work; let us hope that in the nineteenth century, and with her chosen king to foster her art, Venice will now produce something more worthy of her former name and glorious antecedents.

The continuous glass case contains the beautiful modern specimens from the Worcester Porcelain Works, already noticed in the *Builder*; but since that notice was printed, the case has been crowded up with small articles in glazed porcelain, from the manufactory at Belleek, county Fermanagh, lent by Mr. Kerr. This is much to be regretted, for the specimens spoil each other, being utterly incongruous. Elsewhere the Irish porcelain might look very well; here it has a most paltry appearance, and its presence also detracts from the excellent artwork of the Worcester porcelain.

On my way out of the Museum, I must stop for a few minutes at the last upright glass case on the left hand. Here is to be seen a very excellent cabinet, inlaid with various woods and ivory, and enriched with numerous plaques of Wedgwood ware, of different sizes and sage-green ground. The cabinet has incised and gilded ornamentation, which, when on a black or dark ground, is very elegant; but when applied to the portions in white wood, it reminds one unpleasantly of stamped white leather blotting-pads and book-covers. The top of the cabinet is in three slabs of marble, the centre of red being raised above the end pieces, which are black, polished, and have an incised dull pattern on them. The cabinet was designed by W. J. Eastall, for Mr. J. Lamb, of Manchester, by whom it is lent: it is British manufacture, and was in the Paris Exhibition of 1867. To the left of the above stands a delicately-made steel chair, dated 1610, lent by Mr. H. G. Bohn. The seat and back are of red velvet, on which the arms of Anne of Denmark are embroidered; and above, on the back, is a round plaque of dark blue enamel, bearing a large H in white, intertwined by gilt laurel branches. To the right of the cabinet stands a Highland claymore, lent by Mr. Baden, the blade marked "Anrea Ferrara." It has a steel basket-hilt, in pattern of ovals, enclosing a double fleur-de-lis, and a sheath covered with black leather; the hilt is probably Scottish seventeenth-century work. A rapier, lent by Sir W. Fraser, stands beside the claymore; it has a long narrow blade, inscribed "Tomas Atala," and a cup-hilt, ornamented with engraved scrolls in steel, on gilt ground; the sheath is covered with purple velvet, and has steel rings and mounts.

ART-LOVER.

THE KING OF METALS.

A MANUFACTURER of "ring-taws" or "marble alleles," who suddenly glatted the market with an extraordinary supply of these necessities for the development of the youthful mind, would incline to the belief that their price in commercial circles would decline; but it seems that the excess of supply does not always produce this effect. That remarkable pyramid shown us in the 1851 Exhibition as the result of the "diggins" in Australia has had but a small effect on the marketable value of gold. The learned disciple of Galen still gets his antiquated fee, and a pound gets its twenty shillings in exchange. It will take a great commercial convulsion to upset to any extent this state of things; but it has been re-arranged many times and may be again. His majesty, the "sovereign," has not always been in the same position: in the old time he was a greater personage and of more "weight" in society than now; in Edward III.'s time (A.D. 1327), a pound weight (Troy) was made into but fifteen current pounds; now a pound is transformed into forty-six and three-quarters at the Mint; it has remained thus since George I. In the former reign, the reign of Edward II., gold had just been honoured with the patronage of the head of the nation, i.e., a gold currency was enacted, with the king's head on it: in a previous reign, Edward I., it was discovered that some cunning craftsmen had been making gold "a little farther" in manufactures by mixing it with base metals; he (the cunning craftsman) was engaged in the manufacture of drinking-cups, ornaments, &c., hitherto made of virgin gold; but now its purity was sacrificed at the shrine of pelf, and a "villainous" compound substituted: so the king enacted a law that, "Because of rogues who, &c." (sic), all vessels and articles purporting to be of gold should be

marked. Thus our Hall mark became established, and gold fixed at its present standard,—that is, twenty-two parts, called in this instance carats, to two of alloy, put to harden it, it was named at the time king's gold; lower qualities are now marked, but until a recent date England kept up "her standard" higher than her Continental neighbours.

Gold is with many reasons styled the king of metals. One was its great scarcity; in this it is now "topped" by some other metals, but fortunately it has more claim than one to the title. It is the most ductile and malleable of metals. One grain of gold beaten out may be extended to 75½ square inches of surface, the thickness of which will be $\frac{1}{100,000}$ of an inch. One ounce of gold, placed on a piece of copper and afterwards drawn into fine wire, can be extended 1,200 miles, being the gold wire used in lace-making; typifying the length to which a king's authority may extend. Another most kindly quality is that it shows a marked disinclination to mix as an equal with its inferiors, as those employed in gold-beating will testify. There is but one acid that it will yield to (Encyclo. Brit.), viz, selenic, and that a scarce one. It may be dissolved by boiling with hydro sulphate of potash and water, and chemists have proposed that this was the method adopted by Moses of dissolving the golden calf of the Israelites. The great have their weaknesses, and we cannot expect the greatest of metals to be without. These are the means by which it can be brought low. The most noble qualification it has is that it will not tarnish in common usage. Can a king have a fairer thing said of his name than that it is untarnished? although, if we are to be guided by one of our most respected poets, there are not many kings who leave an untarnished name behind them:—

"Quarold, as he tells his sober tale,
Ask'd, when in hell, to see the royal jail,
Approved their method in all other things;
"But where, good sir, do you confine your kings?"
"There," said his guide, "the group is full in view,"
"Indeed," replied the Don, "there are but few."
His black interpreter the charge disdain'd;
"Few, fellow? They are all that ever reign'd!"

In illustration of this we point to the ball and cross of St. Paul's Cathedral: this is double gilt with what is called fine gold, or gold with only a particle of alloy scarcely worth consideration; it has been done many years, but when the sun shines on it after a shower of rain it looks as bright as when first done, reminding one of the Temple that "within" and "without" Solomon caused to be "laid over with pure gold." This gold leaf, so wonderful in its tissue-like substance that it can be distinctly seen through, yet is of so independent a nature that when used for external purposes it seems to be protected by any varnish or size over it, braving the elements uncovered, and, like a British boxer, "comes no smiling" after severe punishment.

The art of gold-beating is a very ancient one. There seems great probability that, like some other arts, it has been known and practised and forgotten. Homer refers to it; Piny, more practical, states that gold can be beaten, 1 oz. making 550 leaves, each four fingers square,—about four times the thickness of the gold now used. This is most probably such gold as was used in the decoration of the Temple,—"it was covered with plates of burnished gold." The Peruvians had thin plates nailed together. It is possible that if decorations of this character were used in these parts their insecurity would so trouble some folk that they would have no rest until they were effectually "nailed." The Thebans have in their wall histories some gold characters done with leaf said to be as thin as the gold of the present day. Coming down with a jump from the long past to the present age, we find our country celebrated for its gold-leaf. Italy used to excel us; but Italy has been in a long sleep, and is only just awakened. It is one of the last things our over-grown offspring undertook to make for herself. Until very recently she imported all the gold-leaf she required from this country. The gold-beaters' skin made here is still the admiration of the world (of gold-beaters). This skin is gut-skin, stretched and dried on frames; after which each surface is very carefully levelled, a labour entrusted to the delicate hands of young girls. A mould (as the number of square pieces of skin beaten at one time in the gold-beating process is called) is an expensive article, costing from 8l. to 10l., and when needless for gold-beating is still of some value. Fifty or sixty years back a workman made 2,000 leaves of gold from 15 or 19 dwts. of gold; now by better skin and skill

he is enabled to produce the same number from 14 or 15 dwts., showing a considerable reduction in the cost of produce, and, as may be expected, a deterioration in the quality of the article. One grain of gold beaten between this skin can be extended to some 75 square inches of surface, the thickness of which will be $\frac{1}{100,000}$ part of an inch. These figures represent what may be done. What is done for the purposes of trade is somewhat less, viz., 56½ square inches per grain, $\frac{1}{200,000}$ of an inch in thickness. To give an idea of its thinness, it would take 120 to make the thickness of common printing paper; 367,650 sheets of which would make a column half as high as the Monument. An economist who strives to make a little money go a long way might have seen two sovereigns so extended that they would have decorated the '51 Exhibition Building with a gold border 1 in. in width all the way round. Gold in this form is transparent, with the peculiarity that when looked through it is green. Science does not seem to have accounted for this, unless it is that the blue of the atmosphere and the yellow of the metal produce the green. But silver, if beaten very thin, transmits a purple; and that upsets the theory. Gold, when beaten to extreme tenuity, has a very bad appearance on decorative work. The gold, as if indignant at being driven to such extremities, turns red, or blushes at being reduced to so poor a condition. Now this is another mystery: the thinner gold is beaten the redder it becomes; and plain surfaces that are gilt with poor gold show every leaf of gold as a distinct blot, instead of an unvaried and even-toned surface, the poor gold being usually yellow in the centre and red at the outside of the leaf. Gold leaf can be made absolutely pure, but is not, for this reason, that it has a strong tendency to solidify itself, so that when it gets creased or lapped over it will not flatten out, entailing a loss of labour in the beating. There are occasions when fine or pure gold is used. The noble reading-room at the British Museum is decorated with fine gold; the result being, that that rich yellow tone of the metal so much admired on all antique decoration is obtained, very durable, and easily restored, when covered by London smoke, to its first appearance. The popular substitute for gold, the washable gilding, is a delusion, inasmuch that whatever other recommendations it may have, it has not a particle of gold in its composition. The variations in the colour of gold leaf extend to twelve (more generally limited to three), deep, middling, and pale. The first has 12 to 16 grains of copper to 1 oz. of gold. When this quantity of copper is put, no silver can be added; it would destroy the malleability of the gold, it would heat into powder; with less copper a little silver may be added, producing a middle colour. Thus gold will only unite to a very limited extent. With silver alone it is more kindly disposed to unite, amalgamating with it to any extent, choosing it for its colour, and placing it on equality with itself. Should its consort not be pure, have any copper with it to heighten the colour of this pale gold to take the place of the deeper and more expensive colour, his majesty declares off the union, and ceases to be malleable. The gold is first melted in a crucible at an intense heat, cast into an ingot, and flattened at a flattening mill. First it becomes a brassy looking ribbon about 10 ft. long by 2½ in. wide; it is then annealed and cut into small squares, 6 grains each; these are placed between the leaves of what is termed a catch—160 leaves of tough paper made in France. Formerly vellum was used. It is then beaten with a 17 lb. hammer. This appears very laborious, and probably is so; but it must be remembered that the bulk operated on is very elastic, consequently the weight rebounds. In 20 minutes it is taken out, the gold is spread, and is cut into four parts, and put in what is called a shodder, or worn-out mould. The great difficulty is, that the alloy will not spread equally with the gold. Now it is beaten for two hours with a 9 lb. hammer. Should an inexperienced workman imagine he can, by putting more power and a heavier hammer on, produce his work quicker, he finds the leaves crumpled to dust at the edges. The gold is again opened and cut into four, and put into the "mould," about 900 leaves of the prepared skin. In each of these cuttings it must be remembered that there is a large amount of "waste" off the edges, called shruff, that is not wasted. This is the last and most delicate process, and the quality of the leaf depends on the judgment and skill of the workman. It must be beaten for four long hours

with a 7 lb. hammer: dull work, one would think but needing great care. The first hour the beating is done mainly in the centre, causing gaping cracks in the margins, which fill in without any trace, coalesce, and unite thoroughly. At the second hour the leaf is $\frac{1}{100,000}$ of an inch in thickness, and light passes through it. If pure, or nearly so, green,—if much silver, violet,—rays pass through. It is now opened, and cut rather over 3 in. square, and placed in the red books we often see in manufacturers'. The greatest care is necessary in dry and hot pressing the things used, except in frosty weather; and then they become too dry, and take off the brightness of the leaf. "But where is the giant steam that it does not step in and do the hammering for them?" exclaims young Archimedes. True, it looks as though it could be done, and that it would be worth while, seeing that a gold-beater spends one-third of his time hammering; but it cannot be done. In the year 1850, an American inventor brought out a steam hammer for the purpose in New York, by which he undertook to do it better and cheaper; it consisted of a small well (to hold the beat) in a square table, having an eccentric circle at each side, which gave it a peculiar rotary motion. The writer saw it in motion; but it did not provide for turning the beat so as to operate on both sides; neither for the continual opening of the mould that has to be done: consequently a man would have to attend to the heat all the time, and the hammer dare not come down heavier or quicker, or the leaf would be spoiled. The inventor sold his right for 300l. to a New York gold-beater, who sent it to the first great Exhibition; but the sure judgment, and what may be called the "intense" carefulness required, could not be supplied by steam, and so the gold-beater paid dearly for his "whistle."

THE WINDSOR THEATRE.

The old theatre here, scarcely worthy of the name, has been entirely remodelled under the direction of Mr. Somers Clarke, architect. The pit has been arranged so as to be available for use either as a pit or as stalls; and two entrances to the pit have been made to meet this arrangement. The old entrance to the boxes has from necessity been retained, though much improved, and it is now made into a small corridor, paved with encaustic tiles. A Royal box has been provided. The whole of the new approaches have been made fireproof as nearly as possible. The original proscenium being contracted in size and of the commonest character, a new proscenium front, with wings, has been executed. A new stage, too, has been laid down, the old one being totally unsuited to modern requirements for spectacle.

The decorations of the interior, based on Pompeian models, have been undertaken by Messrs. Harland & Fisher, whose representative, Mr. Campbell, has executed the whole of the figures and polychromy throughout under the supervision of the architect. The greater part of the decorative painting is in positive colour. Gold is sparingly used, and only to the frame of the proscenium next the act-drop, and to the iron columns carrying the front of the boxes. The building works have been executed by Messrs. Holden & Gray, of Windsor. The auditorium is lighted by a sunburner of sixty-three jets. The whole of the gas arrangements have been executed by Messrs. Verity & Son. New scenery is being painted by Mr. William Calcott, who also has painted a view of Windsor Long Walk from the George III. statue as an act-drop. Mr. W. Baker has been clerk of the works in charge during the whole of the alterations.

It is intended to open this theatre on Wednesday, the 31st instant, and on Friday, the 2nd of April, with performances by the "Windsor Strollers."

Fall of a Bridge near Edinburgh.—The inhabitants of Coatbridge were alarmed on Monday by the sudden fall of the iron girder bridge which spanned the Whifflet branch of the North British Railway, and formed a road way from Gray's Land to Sunnyside. A cart laden with manure was being driven across the bridge, when the whole affair came away, and driver, horse, cart, and bridge fell to the line of rails below. It is remarkable that neither the lad nor the horse seemed much the worse for the fall. The accident, it is supposed, was caused by the subsidence of the earth under a wall on which the iron girders of the bridge rested.

CHURCH, SCHOOLS, AND PARSONAGE, ST. ANDREW'S, PERTH, SCOTLAND.—MR. JOSEPH PRACOCK, ARCHITECT.

CHURCH, SCHOOLS, AND PARSONAGE, PERTH, SCOTLAND.

THE new group of Episcopal buildings recently commenced at Perth, in the diocese of St. Andrew's, will consist of the church, dedicated to St. Andrew, the parsonage-house, schools for boys, girls, and infants, with residence for master. The schools only are yet erected, and were opened in October last, the large room, 75 ft. in length and 21 ft. in width, being used for service until the church can be built. The east end is fitted as a chancel, with table, prayer-desk, credence, and pulpit, with dorsal hangings. Bishop Wordsworth's residence being at Perth, which is the most central and accessible town of importance in the united dioceses of St. Andrew's, Dunkeld, and Daubhane, the buildings are promoted by the bishop for the benefit of the inhabitants and visitors, and as a church at which to meet his clergy. The site is close to the railway-station, in a fine position. The buildings are from the design of Mr. Joseph Peacock, architect, of London, and are built of Huntingtower and Danmore stone, and faced internally with malm bricks, laced with black and red bricks in courses, the roofs, of open timber, being of pine, stained and varnished, and are covered with Ballahulish slates.

MAIN DRAINAGE AND DIARRHŒA.

THE remarkable inequalities in the fatality of diarrhœa during the unusually hot summer of 1868 in the different large English towns naturally attracted considerable local interest in various places. Leicester was one of the towns which suffered most severely. Diarrhœa was very fatal in London, and caused 3,145 deaths; but it was pointed out at the time that if the disease had been fatal to the same extent in the metropolis as in Leicester, instead of 3,145 deaths, 11,012 would have resulted. In short, diarrhœa was nearly four times more fatal in Leicester than in London. This statement led the Highway and Sewerage Committee of Leicester to form a sub-committee to inquire into the cause of this excessive mortality. This sub-committee has recently made its report, which in a great measure traces the extraordinary death-rate from diarrhœa to radical defects in the main sewer of the town.

The main drainage of Leicester was carried out at a very large outlay many years ago, when sanitary engineering was little understood. The sewers were laid down by contract, were brick built, and the lower courses of bricks were laid without cement or mortar. The report in question offers the choice of two explanations of this defect in the sewers. The first is a simple one, namely, that the contractor, finding his bargain unprofitable, adopted this method in order to lighten his loss; it is hard to believe that such a course, if not in accordance with his contract, should have escaped detection at the time. We are more inclined towards the second explanation, although one which offers a curious commentary upon the state of sanitary intelligence, at all events in Leicester, at the time the works were carried out. At the commencement of the sewerage contract there was, it appears, a growing deficiency in the water supply. Water-works were not in existence, and were scarcely contemplated; but the wells were failing, and manufacturers were engaged in deepening many. It is suggested that there prevailed a pretty general conviction that if a solid, water-tight sewer were constructed, a still more serious and continued scarcity of water might ensue, and that the main sewers of Leicester were, therefore, in the lower courses laid without mortar or cement, to prevent the wells from being robbed of that portion of their supply which they might derive therefrom through percolation. At the time sewage was little understood, and was looked upon merely as a system of drainage and a means of carrying off rain-floods. But the introduction of water-works and the pretty general substitution of water-closets for cesspools, has considerably altered the character of the contents of the sewers. The percolation, however, still goes on for the benefit of the wells; and as a large portion of the inhabitants of Leicester still use well-water for all purposes, we need scarcely look further for the cause of the fatality of diarrhœa last summer in that town.

The use of well-water in all large towns for drinking purposes should at once be discontinued: its fatal result last summer was conclusively shown in Birmingham and many other large towns; for, where the same radical defects

of sewerage do not exist as in Leicester, the drainage from cesspools and pits, and the inevitable defilement of the surface of the ground by decaying vegetable and animal matter produces its effect upon well-water to a dangerous extent, without mentioning the drainage from churchyards, although probably long since disused. Leicester will, it is hoped, not hesitate to remedy, as soon as possible, the evils of her present sewerage system, which have been conclusively shown to have caused a fatality from diarrhœa last year so far in excess of that in most of the large towns. In the meantime it may be expected that the now annual infantile mortality from this cause may in future be considerably reduced by the increasing intelligence of mothers in the treatment of their children; by a decrease of the too frequent neglect on the part of mothers, especially in those towns largely employing female labour in factories, or otherwise; and by a more general effort to preserve the air we breathe and the water we drink from becoming tainted by exhalations and percolations of noxious organic matters.

"MANAGEMENT" ON THE METROPOLITAN DISTRICT RAILWAY.

IN the interest of the working man, I beg to point out a system which seems acted on by the Metropolitan District Railway. Accident it cannot be, having with my own eyes seen the result occur often; besides, a somewhat similar case appeared in a police-court a few days ago.

Tickets are given for a station, sometimes two stations, short of that asked for, and full fare is taken. Upon arriving at one's destination, the extra fare between that and the station named on the ticket is demanded, sometimes with force. On March 20th, sixpence was paid for my second-class return ticket. Upon delivering up half, I was suddenly stopped on account of the ticket—unknown to me—being for two stations short, and I had to pay sevenpence extra before I again reached my starting-point. I must in justice say that, upon investigation, the ticket-clerk acknowledged a mistake. Still, many working men could not spare the time for inquiry, and to them such extra are of consequence. If public confidence is desired, such a system must be altered. No doubt, you will have many letters to confirm the above. S.

NEW TILE WORKS, STOKE-UPON-TRENT.

LAST year Mr. M. D. Hollins retired from the firm of Messrs. Minton & Co., retaining for his establishment the old title of "Minton, Hollins, & Co." At that time three distinct works—the Church-street, the Cliffe-hank, and the Boothon-lane—were occupied in the production of the Minton tiles, but Mr. Hollins resolved upon the erection of an entirely new site of works. To this end he purchased a plot of land having an area of between three and four acres, and lying between the Roman Catholic Convent and the Foulhay Brook, and employed Mr. Charles Lynam, architect, of Stoke, to prepare the plans and superintend the erection of the new establishment. The ground lying low and being exposed to floods after heavy rains, it was necessary in the first instance to erect a substantial boundary wall as a barrier to the inroads of the water, and then to raise the level of the entire area 6 ft. This latter would have been in almost any other part of the country a slow and expensive proceeding, but the extraordinary amount of waste material (technically called "schraf") produced in the manufacture of pottery enabled the proprietor to effect this elevation rapidly, and at a comparatively trifling cost. The plans having been prepared and the specifications issued, the tender of Messrs. Kirk & Parry, of London, was accepted for the erection of the major portion of the new buildings, their contract being 14,500*l.*; but this did not include the mill block, which has been erected by Mr. W. Sutton, of Newcastle, whose contract was 4,000*l.*, nor the sliphouse, which has been built independently, at a cost of 500*l.* The manufactory as a whole stands due north and south, and the various blocks of buildings are so arranged that, commencing with the mill and terminating with the packing-house, every part corresponds in order with the successive processes undergone in the production of the tiles. The mill block comes first: its machinery alone will cost 6,000*l.* Contiguous to this is the sliphouse, and next in

order the damping-places, two buildings in which a slight degree of dampness is imparted to the powdered clay from which tiles and tesserae are made by pressure, and having one an area of 80 ft. by 33 ft., and the other of 85 ft. by 33 ft. Then come the workshops, a pile of buildings three stories high, and measuring 176 ft. by 27 ft. The ground floor will be occupied by the makers of pressed tiles and mosaics, and the second floor by those engaged in the production of encaustic tiles, while under the ground floor are spacious cellars for the storage of plastic and powdered clay. The workshops are notable for height, light, and ventilation. They will be fitted with drying stoves heated by steam pipes and running down the centre of each room. In the "green" state the tiles will be taken from these workshops to the hothouse, and having been dried they will be placed in saggars in sheds adjoining, and thence removed to the ovens. Of these there are four, with one kiln for finishing purposes. The hovels inclosing the ovens are 60 ft. high, and each rests upon a layer of waterproof concrete composed of Barrow lime. The hothouses (with storage blockrooms over), the saggars-houses, and the ovens, form two separate blocks, each 180 ft. by 69 ft. The tiles having been drawn from the oven will be removed to the sorting-houses, and those which have to be decorated to the painters' shops above, whence the latter will pass to the finishing kiln adjoining. Lastly comes the front block, which is 300 ft. long by 48 ft. wide, and in some parts three stories high. It includes warehouses (there are several of these, of which one has a considerably larger area than Stoke Town-hall), packing and straw rooms, a platform room for the arrangement of tesserae; offices, studios, museum, lodges, and a spacious entrance. The architect, by arranging the various portions of the works in blocks, has secured external ventilation; and the roads thus formed will be kerbed, paved, and channelled, giving the entire establishment an air of neatness and finish. The material used is red brick, with blue brick dressings, and in two or three cases floors are supported by wrought-iron girders. The whole of the machinery, with the exception of the patent clay-presses of Messrs. Needham & Kite, has been designed and executed by Mr. George Kirk, of Rruria Ironworks. In addition to the buildings and machinery, a large outlay will be required for heating and lighting apparatus, fixtures, furniture, &c., so that the total cost of the works will not be much less than 30,000*l.*

CLOSING OF THE SOUTH LONDON WORKING CLASSES INDUSTRIAL EXHIBITION.

THE closing meeting was held on Saturday last, when Sir M. D. Wyatt, presided. The Rev. G. M. Murphy read a statement, which showed that about 50,000 persons had visited the building on payment. The receipts for the same have been about 370*l.* The expenses cannot as yet be precisely ascertained, but it is believed that somewhere about 200*l.* will meet all costs, the residue will then be devoted for the payment of prizes in proportionate amounts.

"The committee regret that no one article exhibited was deemed worthy of the higher class of reward they were prepared to bestow—viz., 10*l.*; and they are also bound to state that, while there is an improvement visible when the exhibition is compared with the former enterprises, the advance is by far less marked than they would like to have seen; under these circumstances they readily fell in with the views of the exhibitors in giving many rather than few prizes."

The Chairman having addressed the meeting, Mr. Godwin moved, and Mr. S. C. Hall seconded, the first resolution:—

"That this meeting, while rejoicing in the success of the present exhibition as shown by the statement just made, urge upon exhibitors and those who desire to become such in future displays, the determination to seek to excel in their own departments of labour; or, that in having their attention drawn to amateur productions, they should, so far as possible, copy the best models, use the best materials, and work with the best tools it is in their power to obtain; seeking to excel in the quality rather than in the size or quantity of the objects produced."

Mr. Passmore Edwards moved, and Mr. George Potter seconded, the second resolution:—

"That it is highly desirable to further the interests of the people, and eliminate their desire for technical studies, by the forming of museums supplied with the best models more accessible to them than the national institutions are; and that, pending this desirable change, the week ensuing opening of the National Gallery, British Museum, &c., should be arranged for. It is also the opinion of this meeting that the South Kensington Museum, the Schools of Art, and classes connected therewith, as well as all chartered institutions founded for educational purposes, should be popularized to the utmost extent possible."

Mr. T. B. Smithies (of the *British Workman*) then moved, and the Rev. R. Berry seconded, a further resolution:—

“That the best thanks of the committee and exhibitors are due, and are hereby given, to Sir Digby Wyatt and the adjudicators of the various classes for the time and attention bestowed in making the awards; and they would express the hope that the many labours put forth on behalf of the enterprise now so near its close, may result in true and lasting benefit to many who have been engaged in it, as well as to the honour and glory of Almighty God.”

The whole of these were carried unanimously. The following is a list of the exhibitors to whom 1st and 2nd class prizes have been awarded:—

1st CLASS.
 CLASS 1.—(Artistic).—J. Long, J. Taylor, C. Mescham, T. Hinchcliff, C. Atkins, W. Drake, and J. Boys.
 CLASS 2.—(Mechanical).—R. C. D. Davies, C. Rowlett, R. L. Foster, W. Baxter, J. Bartlett, J. Bailey, R. Carpenter, J. Steer, J. M. Gregor, J. Smith, J. Moseck, and T. Girling.

CLASS 3.—(General).—G. Hodden, W. Archer, Mrs. A. Muggenidge, and C. Willis.
 CLASS 4.—(Fabrics).—W. Laxton, Mrs. E. Costall, and N. A. Law.

2nd CLASS.
 CLASS 1.—(Artistic).—C. Hine, W. F. Poole, E. Pearson, J. S. Gill, R. W. Martin, H. Ferry, J. W. Narraway, C. L. Green, J. Hampson, G. Sandell, J. Dodds, J. A. Pitt, W. Care, R. Pembury, J. Mitchell, D. A. Winter, W. Morley, C. E. Jones, J. S. Gill, G. F. Thompson, F. G. Longhurst, C. T. Brasier, J. R. Harper, J. R. Thompson, A. F. W. Ebel, H. Bright, T. Byers, J. Morpeth, and A. W. Gregory.

CLASS 2.—(Mechanical).—J. Crook, C. Luckhurst, T. J. Satchell, W. Ford, P. Callier, H. C. Symons, J. Holmes, T. Winton, W. W. Crawford, C. Anderson, J. G. Calkin, K. Fuller, W. Mynot, T. Paice, G. W. Leeworthy, W. Marsh, H. Field, R. Kendrick, C. Driver, E. Horton, and F. Scott.

CLASS 3.—(General).—T. Sutton, J. Newill, J. P. Norris, and E. J. Broughton.
 CLASS 4.—(Fabrics).—E. Foster, W. Wilson, M. Williams, H. Layan, M. A. Tetley, E. Hadden, Mrs. Duff, Miss Duff, A. L. Lathrop, Z. A. Norris, and M. Shider.

The speaking was for the most part excellent, and might be usefully reported in full.

DOUBLE WARDS IN INFIRMARIES.

I AM glad to notice your remarks with respect to the construction of wards to contain four rows of beds. It is not generally known, however, that the fault does not in any instance lie with the architects, but that four-bedded wards are recommended and enforced by the Poor-law Board.

The plans of the Poplar and Stepney Sick Asylum have been altered under the direction of Dr. Markham, and Mr. Savage, the architect to the Poor-law Board; so that two-thirds of the beds will be in wards of this description; and I have reason to believe that the designs for all the infirmaries not actually commenced have been served in a similar manner. This is for the purpose of reducing the cost. AN ARCHITECT.

HOW KEEP THE BUILDINGS CLEAN.

Sir,—Artists, and especially architects, have long complained that the most elaborate products of their skill and genius are, in the course of a very few years, veiled and practically spoilt by the effects of the smoke-laden atmosphere of London. The complaint is forcibly urged by a correspondent of an evening contemporary in a recent number, who remarks, *apropos* of the memorial of the Prince Consort in Hyde Park, that in the lapse of a few seasons “the spire and all its elaborate tracery will have become obsolete and effaced for all artistic purposes. The atmosphere of London will have performed its inevitable function. Every ‘scroll work’ and ‘pinnacle’ will be a mere clot of soot” &c. And he concludes with the deduction that “all expenditure on highly decorated architecture is absolutely misapplied for out-of-door purposes in London. The result can only be in a few years a shapeless black frontage, reminding the observer at first of a heauty which has perished, and afterwards appealing to no taste or association at all.”

That this is only a melancholy truth no one can doubt. And it says little for our boasted “progress” that science, even when stimulated by Acts of Parliament, has effected little, if anything, towards curing the evil. The metropolitan public, though very willing to learn the lesson, have not been taught as yet how to consume their own smoke. But there is more than this. If to remove the cause of injury presents a problem too difficult for solution, it ought, at all events, to be possible to efface its effects;—in other words, to discover some detergent which shall cleanse the soot-deposit away from our metropolitan edifices. The result is attained in other departments, under much more difficult

circumstances. The most delicate textures of silk, of linen, or of leather, are cleansed over and over again. And surely it ought to be easy for the rising generation of Faradays to find some means of doing for the grimy surfaces of marble and granite, of oilite or bronze, which may be almost measured by acres in London alone, what soap and benzoin, and “scouring drops” of all sorts, accomplish for our curtains, carpets, and kid gloves,—viz., remove the dirt without damaging the material.

The problem ought not to be difficult to solve, and is worth any trouble in solution. Fancy the result, when our metropolitan edifices—public and private, ecclesiastical and lay—could pass through a process of illustration and emerge therefrom clean and tidy—spick and span—as on the day when the scaffolding first came down! The oldest Londoner would not know his own city again with all its features disclosed. Many of these features, as we know, would be artistically beautifully. And if many others would be much the reverse, at any rate it is better that they should be seen, such as they are. The noblest figure looks more comely when clean than when dirty.

THE BELLS AND CHIMES OF ST. CLEMENT DANES', IN THE STRAND.

The steeple of the church of St. Clement Danes is furnished with a peal of ten bells in the key of E, the tenor weighing 24 cwt.; a clock, and a set of chimes. There is also a saints' bell in the steeple.

As the bells have no epigraphs, I give a copy of the inscription on a brass plate, which may be seen in the porch under the tower:—

THE STEEPLE OF THIS CHURCH WAS THOROUGHLY REPAIRED IN THE YEAR 1859.
 W.^o MASON: T. BOULTON, CHURCHWARDENS.
 D
 S [Archer] C
 THE EIGHT BELLS IN THIS STEEPLE WERE CAST BY WILK & PHILLIPS WIGMORE MAN THEIR MASTER FOUNDER. ANO. DOMI. 1853. IN THE TIME OF W.^o DAVIS & CHURCH EDW.^o CLARKE AND CHURCH AND FINISHED WHEN EDW.^o CLARKE WARDENS: HUGH MILLSWAKE WARDENS T O L
 WEIGHT TOTAL: 4.13.2.8. THE GIFT OF EDW.^o CLARKE.

The first of the above peal of eight was re-cast in 1843, by Charles Oliver, who added two new trebles in 1845, made a new frame, and thus completed the present peal of ten bells; which the parochial ringers opened by ringing an excellent peal of Grand sire Caters, consisting of 5,093 changes, in three hours and thirty minutes, on Easter Monday in the same year. The peal was conducted by Mr. George Stockham, who has been steeple-keeper at this church upwards of thirty years.

Philip Wightman, whose name appears on the brass plate, was the founder who re-cast “Great Tom of Westminster.” See my notes on the Great Bell of St. Paul's Cathedral in the *Builder* of December 14th, 1867, and April 4th, 1868.

Charles Oliver, mentioned above, was employed for some years at the foundry of Messrs. Mears, in Whitechapel. He was a very skillful bell-hanger.

The Saints' Bell is inscribed “Roberts made me, 1588.”

In the belfry are fourteen tablets, on which are recorded certain remarkable performances of change-ringers from 1829 to 1869.

The present ringers are members of the St. James's Society, which was established about the year 1822, in the parish of St. James, Clerkenwell, and re-established A.D. 1827.

The clock was made by Langley Bradley in 1721, and now strikes the quarters on the first, second, third, and sixth bells, the hour being struck twice; first on the tenor, and then on the Saints' Bell.

“During the seventeenth century,” says Mr. A. Thomson, in his ‘Time and Time-keepers, 1842,’ many clocks struck the hours twice; so that had the first been miscounted, the second might be more correctly observed.”

The chimes play daily, at five, nine, and twelve o'clock, either the “Easter Hymn” or the “Old 104th Psalm.” But as to the setting of the tunes in the barrel, and the manner in which they are executed by the crazy old machine, the less said the better. I may, however, take occasion to say that it is to be hoped a fund may shortly be raised by subscription, for the purpose of procuring new and improved machinery, so that the music of the chimes of one of our most conspicuous metropolitan churches may be always pleasing to the ear. THOMAS WALESBY.

THE EDINBURGH ROYAL INFIRMARY.

SOME of our readers will be glad to learn that the subscribers to this medical charity have at length taken the proper view of the site—the one which we six weeks ago recommended,—and have resolved that the new hospital shall be built on the more healthful, spacious, and salubrious grounds of George Watson's Hospital. A meeting of the contributors was held last week, for the purpose of deciding the question, and the Lord Provost presided. Professor Syme moved that, (1) The new infirmary shall afford accommodation for surgical as well as medical patients; and (2) That the new infirmary shall be built on the grounds of George Watson's Hospital.” Mr. James Arnot, late surgeon of Middlesex Hospital, and President of the Royal College of Surgeons of England, seconded the motion. An amendment was then proposed by Councillor Millar, and seconded by Professor Spence, “That the present site be adhered to.” After a long discussion the motion was carried by a majority of 94, the numbers being, for Professor Syme's motion, 144; for Councillor Millar's, 50. The announcement of the vote was received with loud cheers.

Professor Syme then said it was very necessary for the meeting to consider what steps should be taken to carry out the resolution. His opinion was that they should have competitive plans from three or four eminent architects. These plans could be submitted to the public, and the contributors could thereafter decide which should be adopted.

After some conversation it was agreed that another meeting of the contributors should be called to receive the report of the scrutiny of the votes, and to consider what steps should be taken to carry the resolution into effect.

STREET AND OTHER IMPROVEMENTS IN LONDON.

THE report of works executed by the City Sewers Commission in 1868 has been made by Mr. Haywood, engineer and surveyor to the Commission, and printed for circulation.

The length of sewer constructed during the year was 1,507 ft. The deepening and extension of the sewerage, and the increasing volume of ground, are leading to the construction of double basements, one under the other, and these of a superior character to those heretofore constructed. These basements are frequently used as offices, and as warehouses for valuable goods.

Various improvements in the widening of streets have been made, as in Newgate-street, the whole line of which has now been widened, except at the west end, where fifteen houses, scheduled under the Holborn Valley Act, still stand. Widening of streets has also been going on in Ludgate-hill, Mansion-house-street, Paternoster-row, Fenchurch-street, &c.; and negotiations are still in hand for widening St. Paul's Churchyard at the west end, and for other and similar improvements.

In Duke-street, Smithfield, an experiment in paving has been made by laying a portion of the carriage-way with granite from Carnarvon, filling the joints with small pebbles and running in a composition of pitch and oil when in a heated state, instead of filling the joints with the ordinary grouting. This mode of grouting the joints is adopted at Manchester, and has been also employed at other towns in the North of England.

An experiment with Cooper's patent for watering the streets has been made, but the Commission have resolved to postpone adopting it till its value has been further demonstrated elsewhere.

Under the head of “Dangerous Structures,” Mr. Haywood says:—

“The business transacted by the Commission under the Metropolitan Buildings Act may be gathered from the following summary of cases:—

Number of structures reported on by the surveyors appointed by the commission	122
Buildings shored up	7
Number of cases heard before the magistrates	29
Number of cases certified by the district surveyors as being completed	82
	231

The total shows a very large increase over previous years; in fact, so large a number of cases have not been dealt with since the year 1862.”

The arrangements entered into with the London, Chatham, and Dover Railway Company in 1866, were completed by widening Ludgate-hill

on its southern side, between New Bridge-street and the railway, so as to make that thoroughfare 60 ft. wide, and by forming half of the circus at the junction of Ludgate-hill, New Bridge-street, and Farringdon-street; this improvement has been of great advantage to the public, and shows the necessity for its completion by forming the western half of the circus.

Nothing is said in the report as to the foot bridge across Ludgate, which was arranged for with the railway company, but of the completion of which there was no sign last time we passed that way.

NOTES ON NORTHCOOTE, THE PAINTER, BY BROCKEDON.

THESE notes respecting Northcoote were written by the late William Brockedon, author of "The Passes of the Alps," and are now first printed.

Northcoote was one day speaking in severe terms of reprobation of an artist as well known for his improvidence as for his perpetually trusting his pretensions and claims to patronage before the public. "And what are his merits as a painter?" said Northcoote. "What has he done to justify his claims? Why, certainly, painted some fine pictures. Not three pictures in four times the number of years; and those with some catching qualities full of defects. They were overrated by himself, and the world was hulled by the papers into the belief that his own estimation of them was just. He received and spent thousands more of money than any other artist in the same time; yet swore he was left to starve by an ungrateful world." "Why, sir, you cannot deny that such a picture," naming that artist's finest production, "possessed great merit." "At first it did, perhaps; but it got worse and worse from his busy idleness over it; and though at one time some fine ideas were seen in the work, he seemed to be the only person insensible of them, for they were rubbed out before the picture was finished; though he was not singular in not knowing how to appreciate the chief merit of his work. I remember Opie's doing the same thing. But, oh! what a different man was Opie. He was a painter. I will tell you the instance of Opie's mistake about his picture. When he was engaged to paint the Murder of James I. of Scotland, now in the Guildhall, I heard a good deal of his proceedings, and that he had begun what would be the finest picture ever painted in England. I did not like to hear this, and I got fidgety when anybody who came in spoke of it. At last they worried me so that I determined to go up to Hampstead, where he was painting it, and judge for myself; for I thought it might be a bit of spite to vex me. Well, I went up, and when I saw it I was astounded. The effect was the finest and most striking I ever saw. He had introduced the light from a trap-door in the chamber, and it gleamed up upon the murderers in the most appalling way. 'Oh!' said I to myself, 'it is all true; it is all over with you. Go home; go home! I did go home, where I was perfectly haunted by the fine effect. I could not paint; I was always thinking of Opie's picture; and I worried myself so that at the end of the week I was obliged to go, like an animal fascinated. Well, I went up, dreading to do what I could not help; but when I entered his room it was quite a relief to me; for I saw, to my great comfort, that he had rubbed all the glorious effect out."

This singular avowal of his feelings by Northcoote has been thought a mistake in the relation of them as to the picture, and that the subject was the Murder of David Rizzio; but Northcoote was right: the murderers of Rizzio entered by a private passage of the queen's chamber, and nothing is said about a vault; but in the murder of James, he escaped into a vault, to which there was a secret entrance from the floor of his chamber. The assassin, having discovered the place of the king's retreat, pursued him there, and slew him. It is highly probable that Opie began his picture from the mistaken impression that the murderers entered the chamber by that vault, and subsequently discarding his historical error, sacrificed his fine effect to truth, not from ignorance of its value. Northcoote, advertising again to the artist whose censure led to this anecdote of Opie, said,—"What has he done since? The picture you praise so was done many years ago, and was his best. He has painted worse and worse every year, and shown that a bad man cannot be a good painter, for his mind is too much occupied in

contriving to get out of scrapes to be bent with a becoming energy and power to his art. There is the thing which the king thought the other day. To be sure, it was a subject worthy of a king to buy, and an historical painter to execute. Lord bless us, why the world's gone mad, if only fancied that it was like Hogarth; it was the fable of the Frog and the Bull." But that picture was recommended to his majesty under peculiar circumstances. By whom? By Lawrence, who good-naturedly tried to serve the painter by hinting to his majesty that he was an unfortunate though an improvident man, and that the sale of the picture would probably restore him. Upon this the king ordered it to be sent to Windsor, and the picture was paid for. Northcoote here burst out indignantly with—"Did Lawrence do this? Why a worthier man and a better painter might have been left to starve. I wish to Christ the king had knighted 'em."

It is not improbable that Northcoote had had some affair of the heart in his earlier days: all his females bear the impress of some favourite image; it is a pretty English face of common life, but it is pretty, and all his ideal female heads are alike; and Northcoote had been heard to say that nothing commanded happiness like personal beauty: and if he had to live again, with the choice of being distinguished for wisdom or heauty, he would choose the latter. A sensible man like Northcoote could not have said this without some powerful recollections, probably of some love disappointment, which thus warped his judgment. His ideas of female purity and excellence were very high, and he always thought that Sir Joshua was the only painter of his time who treated it with the delicacy and dignity due to it. Lawrence's female portraits, he said, shocked him. Did you ever see one of Lawrence's females whom you would wish to be your wife? Not being immediately answered, he said,—"Ah! you would not have paused if the question had been put upon Sir Joshua's—his were so pure that you wished to love them. Of Lawrence's, you would ask yourself whether it would be prudent, for they looked as if they wished to love you. You would be afraid to do anything wrong before a female of Sir Joshua's; you thought only of wrong before a portrait by Lawrence—you only thought of her as a mistress." More cynicism has been charged to Northcoote than he deserved. Sometimes his remarks were excited by his hearers, who flattered him with approbation when he said a cross thing, and forgot its severity in the smile of his listeners. Once Northcoote lost a valued friend by a remark that had less of heartlessness in it than his friend supposed. Soon after the death of Miss Ann Plumtre, between whom and Northcoote a warm friendship existed for many years, an estimable lady and a mutual friend called to condole with Northcoote. The meeting was a painful and evidently an embarrassing one; for, after a long pause, Northcoote said, with a sigh, "Ah! poor Miss Plumtre!" The friend, with painful suspense, awaited his further remarks, as he had introduced her name. A pause followed, which was at last broken by Northcoote with the exclamation, "How ugly she was!" The lady, perfectly shocked, got away as soon as she could, and was so displeased that she broke a friendship of fifteen years, and never called upon Northcoote after. Her conclusions were too hasty that Northcoote was unfeeling. It was not an occasion in which Northcoote's conversational powers were likely to be displayed, and the embarrassment which arose from his evidently not knowing what to say whilst there appeared to be a necessity for saying something, produced a true but thoughtless remark which cost him a friend.

SMOKY CHIMNEYS.

ONE of the greatest causes of smoke nuisance in a house is the manner in which coals are thrown on to the fire. Large and small coal and dust, mixed together and thrown on by the shoveller, merely to save five seconds of time, will form a sort of concrete from which the fire underneath will distil the smoke, keeping the room cold, wasting inflammable gas, and depositing soot in the chimney, and sometimes issuing from the top, spoiling furniture and making every one cough.

In the early part of the day the coals should be put on, one piece at a time, with the tongs. An upright coal-sieve is the best, so that the largest pieces keep nearest and the dust falls to the bottom. When the coals have run, they should be turned in one piece with the tongs, and not smashed with the poker. When the fire has acquired its ordinary force, as it will towards evening, the dust and very small coal can be thrown on, and will be consumed readily.

By attending to these trifling matters, time will be saved, fuel economized, and but little smoke produced, and that little consumed, and the chimney require sweeping about once in five years. W. S.

BRICKWORK.

SIR,—Your correspondent "E. G." hits rather hard on the present building age when he says "these scamping times." The kind of scamping he particularly alludes to is not peculiar to our time, for if he ever had anything to do with many old buildings in London especially, he would be aware that our fathers and grandfathers knew how to veneer equally well, if not better than ourselves. I have heard, more than thirty years ago, of facing bricks being sawn down the middle lengthways, and so making two out of one. As to his 6 in. and 9 in. bricks, he forgets that his remedy is worse than the evil, as he might be treated to a 3 in. veneer instead of a 4 1/2 in., for the 6 in. being double the size, would be nearly double the cost; consequently a greater inducement to use the 3 in. I challenge him or any one else to find a better plan than the English bond, if it is carried out in its strict simplicity. Nothing is so simple or so perfect in brickwork, as old English bond; and yet in the inner sections of a true or walls nothing is so much neglected; it is the only true and perfect bond for bricks 9 by 4 1/2, and as long as walls are built of baked earth, no size or form is so convenient, or so uniform and pleasing to the eye, as the 9 by 4 1/2 by 2 1/2. As to the difficulty of 6 in. bricks being too wide for the bricklayer's hand, that is easily got over. He could have them made with holes through them to insert the fingers, and by a corresponding hole in the 3 in. he could skewer his courses together with a dowel as long as he pleased.

A word about scamping in brickwork. In my opinion the best plan to prevent it is first to be the most liberal in the estimates on that head, for the cost of brickwork, through so much competition, is got to be thought so lightly of, and employers expect it done at no price; and secondly, a thoroughly practical bricklayer to be carried out. It is truly lamentable to see the manner brickwork is done on many an important job through that very neglect. The idea of a carpenter from the bench, a mason from the banker, or perhaps an architect's clerk—albeit, clever men in their own branch—to superintend brickwork! Not a great while ago I heard of a broken-down draper acting as an inspector of brickwork on one of the recent large and important works of the metropolis, and he was spoken of by men who had worked under him as the best fellow on the whole length of the work, as they could scamp as much as they liked.

A BRICKLAYER.

CLOSED DOORS AT SOUTH KENSINGTON

SIR,—I beg to apologise to your "Disappointed" correspondent for having ventured to suppose there was any matter connected with the Museum at South Kensington upon which it was possible for him to receive information from the policemen on duty. In addition to his knowledge of the Museum, I presume he also lays claim to a knowledge of the meaning of English words, and therefore I think he must be willing to admit that the two following statements are not synonymous:—"Closing the South Kensington against the public at four o'clock on Saturdays," and "the regulations as to closing this Armour Gallery on Saturday afternoons at four o'clock." Had the latter sentence appeared in your correspondent's former letter, I should not have troubled you or him on the subject; but, as I said, the original statement "seems to me to call for comment as being calculated to mislead."

Allow me also to add that my words in reference to that portion of the Museum "where the models of ships are exhibited" were "a sort of annex," not "a mere annex," as quoted by "One Disappointed."

ART-LOVER.

* * With this the correspondence may end.

RE-BUILDING AND ENLARGEMENT OF POPLAR UNION WORKHOUSE.

AT a special committee meeting of the Poplar Union Board of Guardians, Mr. Barringer in the chair, tenders were opened for re-building and enlarging Poplar Workhouse. As far back as 1857, Mr. Farrall, Poor-law Inspector of Workhouses, reported this workhouse to the Poor-law Board, as "inadequate in size and inefficient in arrangement." At the present time it is overcrowded by 800 inmates, and for many months the guardians have been compelled to "farm out" more than 500 people, who, in addition to the first-mentioned, claimed admission to the house. The greater portion of the old workhouse is to be demolished, and the guardian having acquired additional land at the rear, a new house is to be erected, capable of accommodating 808 persons. It was originally intended by the Board to provide accommodation for 1,000 paupers, and plans were prepared in accordance with this intention; but upon the drawings being submitted for the Poor-law Board's approval, those gentlemen refused to sanction the carrying of them out, and, suggesting certain modifications, which brought the number to be accommodated down to 818, recommended the Poplar Board to prepare fresh drawings, embodying the views of the Poor-law Board. There was considerable dissatisfaction expressed by the guardians at this, but it was eventually resolved to accept the upper Board's dictum, and the architect, Mr. John W. Morris, was instructed to prepare a fresh set of drawings. Having done so, the Poor-law Board immediately approved them. The local Board then issued invitations to builders to send in tenders for the works. The architect's estimate for the cost of the works, as originally determined upon by the guardians (viz., for 1,000 paupers), was 47,700, but the extensive modification suggested by the Poor-law Board reduced this sum by 12,700; the estimate, therefore, for the building to accommodate 808 persons, stood at 35,000.

There were fifteen tenders for the work sent in, as follows:—

G. J. Watts	£36,689
Kilbey	36,118
John Kirk	36,993
Cooper & Callum	34,680
Serviner & White	34,854
Emor	34,793
Myers & Sons	34,694
Henshaw	34,350
Wicks, Bangs, & Co.	34,200
Atherton & Latta	33,838
Alraham	33,490
Sheffield	33,267
Webb & Son	33,203
Hill, Keddell, & Waldram ..	32,460
Ansonbe	32,200

The special meeting having discussed the tenders, and conferred with the architect in reference thereto, decided

to recommend to the Board's consideration the two lowest tenders, namely, Mr. Anson's and Messrs. Hill, Keddell, & Waldram's.

At the ordinary business meeting of the Board, held on Friday afternoon, the committee's recommendation was read by the clerk, and a very lengthy and animated discussion ensued. Numerous resolutions, counter resolutions, and amendments were proposed, some of which were seconded and put to the vote, while others could find no supporters, and consequently "fell through." One proposal advocated the addition of Mr. Sheffield's name to the recommended two, on the score that that gentleman was resident in the district, and would employ labour from the district; Messrs. Webb's tender was then proposed on the same grounds; a third proposition suggested that the committee's recommendations should be thrown over, and the fifteen tenders submitted to vote. After more than two hours had thus been spent, Mr. W. Nielson, superintendent of the West-India Dock Company, moved, and Mr. J. R. Ravenhill, engineer, seconded, "That Messrs. Hill, Keddell, & Waldram's tender be accepted, as Mr. Anson's whose tender is the lowest, has not complied with the Board's condition in regard to the provision of sureties." (It appeared that Mr. Anson had not supplied the addresses of the parties proposed as his sureties.) This resolution was carried by a majority of 6, and Mr. Waldram's tender was the contract. The Board's seal was then affixed to the contract, and the Guardians proceeded to the general business of the day.

BRACH OF CONTRACT WITH ARCHITECT IN CONNEXION WITH ST. DAVID'S CHURCH, ISLINGTON.

Sir,—Permit me to state, in reference to the above case reported in your columns of last week, that I was prepared with the evidence of several well-known contractors in confirmation of the accuracy of my estimate, in the event (probable, of course) of Messrs. Dove's remarkable admission on that point not being deemed sufficient; and that I was also prepared to show from a published statement that the fall cost of carrying out Mr. Blackburne's design as approved would have been actually far greater than mine.

I should thus have been able to dispose quickly of both the grounds alleged for my dismissal, viz, that my estimate was incorrect, and that my design was too expensive to carry out either wholly or in part.

I consented to a compromise solely from a desire to spare charitable funds, upon which it is unnecessary to expound the expense of a protracted suit would fall, and not from the slightest fear as to the result.

Trusting to your sense of justice to insert this explanation in your next impression,—
E. H. LINGEN BARBER.

"ROD," "RODE," "ROYD."

In local name-formation "Royd" means a clearing in a forest. Its derivation is probably rather from the Northern than the Saxon *Tentonic*, as in *Isl, rod; Dan, rod; SW, rod; Eng, rood, radix*; and the verbs formed from them—*rota, approder, roden, to rot up, grub up, rake up*, and, more remotely, to trench the ground. The combination of *Rod, Rode, Royd* is common in Yorkshire, Lancashire, and parts of the northern counties, where the Norsemen settled, sometimes with the name of a man, perhaps the original settler, as Ormrod, Ormroyd, Martinroyd, Margatroyd; or with an office, as Munkroyd, Bishoproyd, Nunroyd; or a descriptive word, as Blackeroyd, Osteroyd, Stonyroyd; or a tree, as the oak in Akeroyd, Oakenroyd, the holly in Hollinroyd, the rush in Holroyd.

In legal phrase, *terra rodata*, rode land, means land in tillage from immemorial times,—in contradistinction to *terra bovata*, pasture land.

There is a word used in a similar sense in the woody marches of Wales,—*moot* means a root. This may possibly be a dialectic change from the Anglo-Saxon *ort*, wort; and *mooted* land in Dean and Gwentwood means disforested land, cleared of the stumps. In heraldry *mooted* means plucked up by the roots. W. C. C.

In answer to the query of "R. C.," in your issue of the 20th inst., I beg to inform him that the word "Royd," in local names in England, as Abbotroyd, denotes land lately reclaimed and thrown into cultivation, and is derived from the provincial verb *rod*, to clear or grub up. *Terra rodata*, rode land, was so called in opposition to *terra bovata*, an ancient enclosure which had been from time immemorial under the plough, and was measured by the quantity which one ox could plough in a season. (Charnock's "Local Etymology.")

EDWARD J. WOOD.

SCHOOLS OF ART.

The Sheffield School.—The annual convocations of this school has been held at the school buildings, Arundel-street. There was a company numbering between 500 and 600 persons. The pictures and artistic objects with which the rooms were filled were inspected with much interest. The prizes were distributed by Mr. Roebuck, who delivered a speech in exposition of art, showing its effects on the happiness of the individual and of the community, and the necessity for meeting the rivalry of other nations, especially by improvements in design.

CHURCH-BUILDING NEWS.

Mansfield.—At a vestry meeting of the inhabitants to consider as to the restoration and enlargement of St. Peter's church, the following and other resolutions were passed:—"That for the seamliness of the House of God, and the comfort of worshippers, it is important that the fabric of St. Peter's Church should be restored, the galleries removed, and the interior re-seated with open sittings;" "that as the area of St. Peter's Church is insufficient for the spiritual wants of the parish, it is expedient, provided it can be done without sacrificing what is valuable in the present building, that the church be enlarged as well as restored;" "that Mr. William Smith, of the Adelphi Chambers, London, be instructed to prepare two reports, with estimates—one for the restoration of the church on its present scale; the other for enlargement as well as restoration, provided that the expenses of such advice of Mr. Smith, in case the parish is unable to accept his plans, do not exceed the sum of 20l.;" and "that the vicar and churchwardens be empowered to forward the resolutions of this meeting to the architect; and on receiving his reports to convene a public meeting of the inhabitants of Mansfield, to consider what action shall be taken on them."

Ipswich.—A vestry meeting has been held for the purpose of considering the plans of Mr. Hipson for enclosing the churchyard of St. Mary Tower Church, and making certain alterations in the west entrance. Mr. Bacon (who has already been very liberal in his expenditure upon this church) intimated that he was prepared to carry out the whole of the proposed plans at his own expense, and the works will be proceeded with forthwith.

Worth Matravers.—The parish church here has been renovated and repaired under the direction of Mr. R. Salvin, of London.

SCHOOL-BUILDING NEWS.

Stockport.—The new Wesleyan Schools, Wellington-road South, intended to supersede the old Brentnall-street Sunday school, approaches completion. Mr. T. H. Allen, of Stockport, is the architect; and Messrs. T. & W. Meadows, also of this town, are the contractors. The workmen employed in its erection, together with a number engaged, under Messrs. Meadows, in the erection of two first-class houses in Heaton Norris, numbering altogether about sixty, recently assembled at the Railway Hotel, opposite Heaton Norris Station, where they partook of a "rearing supper."

Wolstanton.—Following the erection of their new chapel in 1866, the Wesleyan body in this district have now completed their original plan of providing new schools. The schools are in architectural keeping with the Gothic chapel, and have been erected from the plans of Mr. T. Roberts, of Trentham, who rendered his gratuitous services. The contractor for the building was Mr. W. Sutton, of Newcastle. The premises are situated at the rear of the chapel, and contain a room 70 ft. by 50 ft., and capable of accommodating between 300 and 400 children. The building will also contain an infant school, several class rooms, and a room for the school library. The total cost of the schools, including the land (70l. 10s. 6d.), and the heating, furniture, &c., will amount to about 1,080l.

Tunbridge.—New schools are about to be built by the Wesleyans here, in Swan-lane, at a cost of 1,000l., including site, near the South-Eastern railway. The chief stone has been laid. The architect is Mr. Baker, of London; and Mr. Dove, of Tunbridge, is the builder.

MONUMENTAL.

A MEMBER of the Council of the Workmen's Club and Institute Union suggests that a fitting national memorial to Henry Brougham should be now set about. A monument in Westminster Abbey would be a matter of course; but he suggests the erection of a Central Hall and Free Library in London, with reading-rooms and meeting-places open at all times to all classes of men. Such an institution is much needed. The boon of a free library has been appreciated in some of our great cities already. Why should not London follow, though late, so good example? We know that attempts have already been made to induce the Londoners to do so, but it is only by reiterated endeavours that many good things are realized.

A meeting of London Scotchmen interested in the monument in course of erection to Sir William Wallace on the Abbey Craig, Stirling, has been held in the hall of the Scottish Corporation, Crane-court, Fleet-street; Dr. Ramsay, president of the Caledonian Society of London, in the chair. There was a very full attendance, and the proceedings were very enthusiastic and unanimous. Mr. Burns, of Glasgow, attended as a delegate from the building committee, and stated that the total amount subscribed up to the present time has been 12,120l., and the total expenditure has been 12,670l., so that the deficiency still existing is about 550l. Mr. Burns urged upon the meeting the necessity which existed for completing the monument. A resolution was carried to the effect that immediate action should be taken to finish the small remaining portion of the work necessary to complete the monument, and that in order to do this the Scotchmen in England should be appealed to for funds to aid in the good national cause. A committee was appointed to further the end in view.

At Bolton it has been determined to erect the statue of Dr. Chadwick in Nelson-square, immediately in front of the infirmary. A committee, consisting of the Mayor (Mr. Alderman Barlow), chairman of the committee; Mr. G. L. Taylor, vice-chairman; Mr. W. C. Williamson, hon. treasurer; Mr. R. G. Hinnall, town clerk, and Mr. J. Nightingale, hon. secretaries; together with Mr. John Hall and Mr. James Fogg, was appointed to procure designs from some half-dozen of the leading sculptors of the country, as well as an estimate of the cost of the statue, and submit the same to a future meeting.

PORTLAND CEMENT.

Your correspondents, William Pullam and Henry Reid, the author of a valuable work on the subject, have both given good and valid reasons for the behaviour of Portland cement as described by "A Builder" in your impression of the 6th inst. To show the great ignorance that exists amongst builders and others at the present time, we will give an instance that occurred only last week. We were requested to send some good cement by a large ship-building firm in Liverpool, and accordingly sent some that we had tested and found to break at 700 lb., being 200 lb. more than the Government test. The next day a complaint was lodged saying that the cement had been condemned because it would not set quick. We are constantly asked to send out the cement *fresh* as possible. As manufacturers who have experimented a great deal, we have always found the strongest cement to be the slowest in setting. It is very important for all users of this cement to be particular in ordering, to state whether it is wanted quick setting, which is more useful for plasterers or ship-cementers; or for *strength*, as most necessary for concrete building, or sea-work, or flooring purposes.

There is no doubt that all cement should be ground fine, and never used until it has been made over six weeks; and when used care should be taken that the sand or gravel used is well washed and sharp, and free from dirt.

MANUFACTURERS.

COMPETITIONS.

St. Philip's, Heigham, near Norwich.—The following gentlemen were invited to compete for this church, which is to seat 800 persons;—Messrs. Brown, Hipson, Bonest, Christopher, Warren, Hawkesley, and Power. The designs of Mr. Edward Power, of London, have been selected.

GLASS IN SHAM WINDOWS.

I SEE from a letter on the above subject in your last that one of your correspondents has, or supposes he has, experienced the results of a peculiar tendency of glass to break when placed in blank windows with a well behind, especially when exposed to the sun. If it be so, I can only regard with peculiar satisfaction such an indication of an opposition in Nature herself to the existence of such absurdities. The statement may be taken to be, as Sam Slick would have said, "a beautiful allegory;" but perhaps it never occurred to your correspondent that glass so placed may be broken by a blow from a stone or other missile, without those in the house

ing any the wiser, until a walk round the milling may reveal the fact of the glass having flown" under this very simple treatment.

Whether this be the explanation of the mystery, however, or whether it be due to more soundly causes, natural or supernatural, I do not undertake to say; but I hope that any one who does know the reason will keep it to himself, and that all glass in blank windows may exhibit the same alarming propensity, until jerry-architects shall no more dare to employ them to the discomfiture of all who love honest building, including yours,
H. H. S.

HOUSE PAINTING.

SIR,—If your correspondent "H. S. D." mix in the first coat of paint half turps and linseed-oil, or other more turps than oil, and in the second or at least nearly all linseed-oil, he will find it dry a nice glossy and even manner. Of course the above is for inside work.
S. GOCHER.

THE FRENCH WORKMEN IN CORNWALL.

SIR,—I hope that some one more learned than I am in granite matters, may think it worth while to say something in reply to "Clerk of the works" in your number of the 20th. I do not suppose there can be any doubt about the quantity or quality of the Cornish granite, the skill and powers of Cornish quarrymen, the capital and energy of quarry owners and contractors for granite work.

Are there any unions among Cornish quarrymen? If so, do these unions compel their members to demand a certain rate of wage, to work by day-work and not piecework, to strike for lower wages whenever they think their employer has got a remunerative contract, or is pressed for time? and thus force their employers in ordering for work to put on an extra price, to meet these too probable contingencies.

If these unions do exist, they may be one reason why Cornish men will see the foreigner trying their work, and at their own doors.

A LAYMAN.

Miscellaneous.

New British Telegraph direct to India and Australia.—A "Direct English, Indian, and Australian Submarine Telegraph Company, limited" is being formed; capital, 2,500,000l., 500,000 shares of 5l. each. The first issue of shares will be for the lines from Suez to Bombay and the Malta lines. The consulting electrician, Sir William Thomson, F.R.S., and the electrician and electrical engineer, Mr. Cromwell F. Harley, M.L.C.E. The object of the company is to lay and work submarine telegraphs between England, Gibraltar, Malta, Egypt, India, China, and Australia, which shall be in English hands from end to end. The telegraph will work by submarine cables, and will therefore be more accurate, reliable, and speedy than by land lines.

The Leeds Brigade Improvements.—In course of these improvements some landmarks are being removed, such as the old Corn Exchange. The demolition of buildings in widening Upperhead-row has commenced. They are amongst the oldest in the town, having stood nearly 400 years. One, a shop, once the property of St. Mary Magdalen, is traditionally supposed to have had a subterranean communication with Kirkstall Abbey; and in the cellars of the house and Trumpet there are some curious bones, which must at one time have been connected with an underground passage. The Commercial Buildings are to be cut into, a wedge-shaped portion having to come off the south side. Drawings have been prepared by Messrs. S. & A. J. Nelson, architects, for the reconstruction and rearrangement of the structure on a reduced site at a cost of 11,000l. to 12,000l.

Swimming-baths and Notting-hill Baths.—Swimming-baths, Notting-hill, and Shepherd's-bush are shortly to be provided, by means of a Limited Company, with public baths, similar to those which have so largely assisted the progress of sanitary reforms in other parts of the metropolis. It is estimated by the architect, Mr. E. Hewett, that the outlay upon the buildings and fittings will be fully met for 6,000l. There will be a total of swimming-baths, respectively 67 ft. by 44 ft., and 44 ft. 6 in. by 22 ft. 6 in.

Testing a New Assembly-Room.—The new assembly-room at Ryde has been tested by forming and drilling about forty volunteers in it. The quick march, says our authority, made it shiver, but the "double" made the floor wave like a sheet of tissue-paper in the wind. Something, it is thought, must be done to make it more stable and firm, and the only effective means, some of the examiners considered, would be to place stout timber or iron pillars under the middle part of the long beams. This would mar the drill-place for the volunteers, and is to be avoided if possible.

Ecclesiastical Dilapidations.—After the lapse of several sessions, the Archbishop of York has laid before the House of Lords another Bill upon this subject. The Bill proposes, like its predecessors, the appointment of official surveyors; they are to be chosen, not for a diocese, but for an archdeaconry, and by the archdeacon and rural deans, subject to the approval of the bishop. The surveyors are to be paid, not by salary, but according to a rate of charges to be fixed in each diocese by the bishop, the archdeacon, and the chancellor. An incumbent of a benefice may at any time, at his own expense, have the buildings belonging to his benefice inspected by an official surveyor; his report is to be subject to appeal to the bishop or archdeacon. On the incumbent executing the works, he and his estate are to be free for five years from all claims for dilapidations, unless the bishop, on a vacancy occurring within the five years, shall consider that wilful waste committed makes a fresh inspection proper. If the surveyor certifies that, in consideration of the antiquity of the premises, or for other reason to be specified, the cost of the repairs ought to be spread over several years, then with the consent of the bishop Queen Anne's Bounty Board may lend money for the execution of the repairs, to be repayable by instalments out of the proceeds of the living. On the avoidance of any benefice, the incumbent not being free from liability as above mentioned, the archdeacon is to order an inspection of the buildings. If the surveyor's report of dilapidations is objected to, the archdeacon may direct a fresh survey; and the order eventually made by the archdeacon will be subject to appeal to the bishop.

Cost of Garrick-street, Covent Garden.—The Metropolitan Board of Works having completed the sale of all the property in Garrick-street, formed under the Covent Garden Approach Act, 1857, have made out an account of the payments and receipts connected with the improvement, as follows:—Expenditure—Parliamentary expenses, 269l. 19s. 3d.; cost of freehold and other property, 105,940l. 2s. 2d.; professional and law charges, 4,912l. 4s. 3d.; works, 6,095l. 19s. 7d.; stamps and incidentals, 875l. 0s. 10d.; clerk of works' wages, 68l. 5s.; land-tax and redemption, 1,088l. 10s. 2d.; insurance, rent, &c., of houses, 751l. 1s. 4d.; proportion of expenses, salaries, &c., 3,200l.; interest on actual payments beyond receipts of each year from 1858 to date of sale of ground-rents, 19,086l. 4s. 8d.; total, 142,091l. 7s. 3d. Receipts—Advances from London Bridges Approaches Fund, 62,352l. 6s. 2d.; contribution from the Duke of Bedford (15,000l. less repurchase of property), 6,766l. 9s.; proceeds of sales of old materials, 2,436l. 18s. 2d.; rents, 10,895l. 18s. 5d.; received in respect of vaults, 1,229l.; interest on cash balances, 5,576l. 3s. 6d.; sale of ground-rents, 52,715l. 4s. 10d. There was a balance of 14,210l. 13s., which has been handed over to the Thames Embankment and Metropolitan Improvement Fund.

The recent Inflow of Water into a Coal-pit.—Extraordinary attempts have been persistently made to get at the men who have been buried alive by the inflow of water into the workings of the Nine Locks Pit at Brierley-hill, and these attempts have at last been crowned with unanticipated success. After 25,000 tons of water had been lifted from a depth of 200 yards, access to some part of the interior became possible, but was for a time delayed by the prevalence of carbonic acid gas. After ventilation had been improved, a party of picked men descended and succeeded in bringing to the surface four men and a boy, who, although they had been immured for four days and as many nights, and had nothing but candles to supply the place of food, were still alive. The other poor fellows who were in workings at a greater depth were soon reached, and all got out alive.

St. Peter's, Rome.—The Pope visited, on the 6th inst., the works now in progress in the transept of St. Peter's, according to the *Tablet*. His Holiness was accompanied by the four architects of the church, and by other officials. Some modifications have been made in the original plan for accommodating the General Council. There will be fourteen rows of stalls, arranged *en amphithéâtre*. Each bishop will have a desk before him. To prevent the dispersion of sound which would be caused by the great elevation of the roof of the transept, a thick curtain will be suspended above the assembly, stretching from one cornice to the other. The arcades, which form a communication between the transept and the two chapels adjoining it, will be entirely closed. The interior surface of the enclosure through which the prelates will enter the transept will be adorned with portraits of all the Popes who have held Oecumenical Councils.

New Central Branch Synagogue in St. Marylebone.—The first stone of a building henceforth to be known as the Central Branch Synagogue has been laid by Baron Lionel de Rothschild, on a piece of ground reaching from Great Portland-street westward to Charlotte-street. This will be occupied by a Moresque edifice of stately elevation and ample interior space, the ground area measuring 70 ft. by 60 ft., and the galleries, according to the plans, giving a considerable addition of space. The proposed building will cost 24,000l. The stone bears inscriptions in Hebrew and English, stating that it was laid in the year of the world 5629 and the 32nd year of the reign of Queen Victoria, and giving also the names of the principal officers.

Time Light with Gas and Air.—A brilliant and steady light, it is said, has been obtained by the Messrs. Darker from a mixture of common gas and atmospheric air. The air and gas are either mixed (which is a dangerous arrangement, and has already given rise to explosions), or are emitted singly, as in some forms of the oxy-hydrogen burner. Instead, however, of the intense heat thus obtained being employed to raise to a white heat a platinum gauze cap, as proposed two years ago by M. Bourhanze, Messrs. Darker cause the flame to impinge upon lime or magnesia, either singly or in combination with asbestos.

The Crystal Palace.—Amongst the Easter attractions, which are numerous, will be the exhibition in the concert-hall of a scene specially designed by Mr. Matt Morgan representing St. Peter's at Rome, as illuminated for Easter. This has been painted from drawings and designs taken specially for the company at Easter last year; and, considering the interest now taken by the many English who visit Rome annually at this period, it will no doubt prove attractive.

Lambeth School of Art.—The gold medal has been awarded to Edwin Mullins, for a model from the antique. Silver medals have been awarded to Cyrus Johnson, for a head from life; and Alexander Booker, for a design for wall decoration. Bronze medals were awarded to Richard Gates, for design for lace; and Walter Stacey, for a drawing from the antique.

Metropolitan Association of Medical Officers of Health.—At the last meeting, held on the 20th instant, Mr. Liddle introduced the subject of the class of houses desirable to place under the provisions of the Artisans' and Labourers' Dwellings Act; and Mr. Sharpe exhibited models of improved sanitary dwellings.

Royal Gallery of Illustration.—Mr. and Mrs. German Reed on Easter Monday will produce two novelties—one from the pen of W. S. Gilbert, entitled "No Cards;" and the other a triumpvretta, a musical adaptation, entitled "Cox and Box, or the Long Lost Brothers," by F. C. Burnand and Arthur Sullivan;—heretofore only heard in private.

Technical Education.—The Government have decided not to establish schools of technical education throughout the country, as the expense would be enormous. They have resolved, however, to give liberal support to local efforts made for this purpose.

An Ice Fire.—An American paper informs its readers it has been ascertained that the cause of a fire in a Western brewery was that "the ice heated in consequence of being packed too damp."

Discovery of Roman Remains at Snodland.—Some labourers engaged at Mr. Peter's lime and cement works, on the banks of the Medway at Snodland, whilst digging out the foundations for some new buildings on the river banks, have come upon a well-preserved piece of Roman tessellated pavement, formed of bright red bricks about an inch square. The extent of the pavement is probably about 6 ft. by 3 ft., and it is tolerably level throughout. Some fragments of Roman pottery and an ancient coin were also turned up. On the opposite side of the river bricks laid in regular order have been traced for some distance along the bank.

The Thames Bank at Wapping.—A public meeting was held last week in Wapping, to consider the propriety of petitioning Parliament to provide an embankment to prevent the frequent overflowings of the Thames into the property in the district. Mr. W. Creighton, who occupied the chair, in opening the proceedings, said that at present, whenever there was a high tide, the river overflowed, entered the houses, and but a very short time ago the whole of the inhabitants of one street were compelled to remove from their tenements. When the water subsided the floors and furniture of the inhabitants were coated with mud, which emitted a most disgusting odour. A number of statements were then made by sufferers. A committee having been formed to collect information, the proceedings were adjourned.

Proposed Foundation of a Gladstone Hospital in Liverpool.—The money which has been recently collected (for the most part in penny subscriptions) in Liverpool and the district, for the "Gladstone Testimonial," is to be expended, in compliance with the Premier's expressed wish, upon a convalescent hospital, the foundation stone of which will shortly be laid by Mrs. Gladstone.

Memorial Picture for the New Town-hall, Manchester.—A picture has been done for the new town-hall, by Mr. George E. Tason. It is of large dimensions, and represents the presentation of addresses by the corporation and the Cotton Supply Association of Manchester to the Sultan, when he visited this country some two years ago. The scene is laid in a room in Enckingham Palace. Altogether there are thirty-one persons represented. The portrait of the Sultan has been painted from a full-length forwarded to Mr. Tason by direction of the Sultan.

Strike of Plasterers in Sheffield.—The operative plasterers in Sheffield, a body of about a hundred men, are now on strike to enforce a demand for a reduction of hours. Their demand is for an alteration of the present arrangement—which is, from six a.m. to half-past five p.m., four days a week, from seven to half-past five on Monday, and from six to one on Saturday,—so as to make the hour for beginning work seven o'clock every morning. The masters refused to grant this demand, and estimate that the loss to them of agreeing to it would be 3s. per week per plasterer, and 2s. per week per laborer, making 5s. per week for every plasterer employed. The local trade-union gave six months' notice to the employers, according to rule, of their desire for an alteration of hours, and the association of employers refused to accede to the desire. The refusal was communicated to the trade about two months after the notice was given. One of the rules provides that questions in dispute shall be discussed by three delegates from each side, with an ultimate appeal to an umpire.

Laying Foundation Stone of Middle Class Schools of Whitgift's Hospital at Croydon.—The foundation or memorial stone of the intended Commercial or Middle Class Schools, at North-end, Croydon, has been laid by the Archbishop of Canterbury. The architect is Mr. Arthur William Blomfield. The position, in the building, of the memorial stone is over the centre of the arched doorway which will be the principal entrance on the west front of the school building. The doorway will be in the centre of the base of the tower, which will rise to the height of nearly 80 ft., and as this is the highest part of the town, the tower will be a conspicuous and ornamental object from every part of the town and immediate neighbourhood.

Nazareth.—A Christian ohnrch is about to be erected at Nazareth. The estimated cost is 2,000l., and towards that amount 1,320l. have been received.

Uppingham.—It is proposed to hold the next summer meeting of the Northamptonshire and Leicestershire Architectural and Archaeological Societies at this place, which is the centre of a very interesting district.

TENDERS.

For Wesleyan schools, Hightown-Crewe. Mr. George B. Ford, architect:—
 Bridley & Critchlow £1,240 0 0
 Elson 1,190 0 0
 Cotterill (accepted) 1,096 10 0

For Dover Harbour offices and shops. Mr. Rowland Rees, C.E., architect:—
 Reid 6972 10 0
 Eagd 968 0 0
 Pickford 895 0 0
 Nightingale & Bushell 879 11 0
 Tambridge & Deane 673 0 0
 Woodcock 869 0 0

The Builder.

VOL. XXVII.—No. 1365.

Masterpieces of the Industrial Arts.

I have just closed a volume we are sure most of our readers will open with pleasure. It is a translation of M. Burty's book, entitled "Chefs-d'œuvre de l'Industrie des Arts," edited by Mr. Chaffers.* With a graceful array of illustrations of some of the most delicate and elegant objects ever made, it gives us most of the leading facts in the history of ceramic wares, and some account of many of the artists who produced the choicest specimens; also valuable information relating to glass, enamels, jewelry, plate, and tapestry: not after a dry fashion, or with stilted talk, but with life, vigour, colour, and surprises thrown in with as much freedom as Palissy exhibited when he placed odd starting creatures on his most magnificent pieces. The originality and ardour of the author are not diluted with attempts at literary finish. Ceramic art evidently fills his heart, and in glowing praise and particularization of it he has poured out his soul, thinking more of need than manner. Something of his enthusiasm must grow upon those who turn over his pages. His palette is spread with such lustrous variegated colours, blue-greens, grey-blues, red-browns, milky whites, and delicate violets, prominently, that it must charm them. Those who are not concerned in the details of the various manufactures will find themselves brought to an enjoyable appreciation of many treasures in our museums that before had but little meaning for them: the circle of producers will find much more significance in Mr. Chaffers's labours.

The work is opened with an account of terra-cotta. Two specimens of ancient Gaelic pottery, found in La Vondée, precede a notice of the subjects and styles of the antifixes and bas-reliefs displayed on the façades of Roman houses. From the frequent repetition of the same subject, we may see that the old artists, when the power of choice was not strong in them, contented themselves with doing over again what had been done before, showing their individuality only in a modification of the details. Two specimens of Greek terra-cotta are given; the head of a shepherd from the cabinet of M. Thiers, and a girl at her toilet from the Pontal's collection. More is made of the Italian Renaissance, where we first come in contact with the bane of collectors, sham antiques. One of the chefs-d'œuvre of the Renaissance period mentioned in the original work by M. Burty has been suppressed in this translation, because, in the interval, the sculptor who was the author of it has come forward and owned the counterfeit. An illustration is given of a figure of this period which is pleasing. It is supposed to represent a

Florentine princess. She stands upright, in a robe of brocaded satin, singing from a sheet of music she holds in her hand. At this period, the Della Robbias step in; but as their process of applying enamel to the terra-cotta removed it from the category of works executed simply in this material, their works are not mentioned under this heading. The large medallions at Hampton Court, and in the Hôtel Scipio Sardini in Paris, are mentioned with delight as harmonizing better than anything else possibly could with brickwork; and modern architects are blamed for not introducing similar features more frequently than they are just now timidly beginning to do. The eighteenth century saw the result of an extravagant use of terra-cotta, when gentlemen's grounds presented the appearance that old-fashioned tea-gardens have handed down to us. Earthenware figures, life-size, met the eye at every turn. In France this absurdity seems to have been carried farther than with us. But the base use to which the material has been put should not blind us as to its value. Its moist and malleable qualities permit an artist to retouch it after it has come from the mould, and thus give every specimen a mark of originality. As M. Burty says, it has less rigidity than bronze, less uniformity than marble, and is in every way well fitted for the representation of objects of a familiar character. He continues, "Let our artists use bronze for heroic, marble for ideal statues, but take the clay and the modelling-tool more often in hand to reproduce the features of their contemporaries, or embody some pleasing fantasy." After this, we turn over a page as though it were a veil, and find ourselves in the beauteous presence of enamelled *faïence*.

In old times, in Italy, it was a general custom to make presents of plates and dishes; even lovers presented their mistresses with small dishes in preference to other objects; and on their own cups and bowls were inscribed the names of the dear ones with expressions of praise and affection. Hence it is, perhaps, that so many of the ancient specimens of this branch of industrial art seem to shine again with fire, tenderness, devotion, and self-abandonment. Pieces of ware in some hands were like pieces of music or poems in others,—the vehicles of great feeling. One of the princesses of the house of Medici is said to have spent ten years in perfecting a method of making porcelain, spoiling thousands of pieces before he was able to make the examples now so precious in the eyes of collectors. In France, in later times, a particular kind of ware, manufactured at Nevers, reflected the politics of the day. M. Champfleury, a French collector, has accumulated a series of plates and salad-bowls made during the storms that ushered in and succeeded the French Revolution, on which may be read most of the popular cries of those days. M. Burty says of this "speaking ware," that it is more eloquent than "the prose writings of many authors who contemptuously pass over these naive and robust records of French history." A collection of Roman ware reads, too, like a chapter on French heraldry. The old German families highly appreciated the artistic capabilities of their ceramic stoneware. On the occasions of a wedding or a birth they appear to have ordered vessels to be made recording those events, and these heirlooms placed on their sideboards, with their gourds and jugs bearing coats of arms, mottoes, and sacred subjects, must have largely contributed to the calm, substantial, stately cheer of the interior of their houses. Ceramic ware, both foreign and that of native manufacture, has long been held in esteem in cultivated circles in our own country. The *Spectator* tells us, when Sir Roger de Coverley sent him with a letter to the beautiful widow, he found her library to be nearly half full of chinaware; the folios were separated from the quartos by great jars, and a pile of smaller

vessels rose in a pyramid between these and the octavos; the last-mentioned were bonded by tea-dishes of various forms and hues, arranged on a wooden frame to look like a pillar, and the plays and pamphlets were enclosed in a square of grotesque works made up of scaramouches, lions, mandarins, trees, and shells, all in china; in other words, her library had more ceramic treasure in it than books. M. Burty ascribes the present revival of taste in this art in France to the reaction arising from the raptures of fashion over the so-called Etruscan vases in the days of the first empire. This classic terra-cotta at that time was the only kind that was tolerated by the learned; but after a season artists wandering in Normandy or in the forest of Fontainebleau for their holidays, possessed themselves of the radiant Roman dishes and Nevers plates then in the hands of the peasant, and bringing them home triumphantly, eventually reinstated them in the degree of estimation in which they had originally been held. A sixpenny *assiette à coq* rose in value to sixty francs. The further course of the revival is thus traced:—

"In the meanwhile, amateurs and traders of taste had brought from Italy dishes to which the potters of Majorca and Urbino had given the grand style of Oriental art, or of the fine periods of Italian art. People began to admire the changing hues of the metallic lustres, the free and bold attitudes of the figures, and became at last so enthusiastic as to pillage even the apothecaries' shops. Closer relations with China, Japan, and Persia brought into the market new food for the ever-increasing curiosity of the public. The success of these printed vessels with expressive outlines, those vases with long-clawed dragons twisting round their sides, those deep dishes with plains and carnations blowing in the hollow of them, began to disturb the souls of the disciples of the old Classic school, and it is from this return of taste to the Oriental porcelain that we may date all serious discussion concerning the principles of decorative art. At last, the eighteenth century having reconquered the ground it had lost, Dresden figures and Sèvres services were appreciated for their refined gallantry and elegance."

The history of the Oiron pottery well illustrates the enthusiasm expended upon articles of ceramic ware in these latter days. In 1839, attention was called by Willemain to a splendid ewer then in the collection of the Baron de Monville. It, with twenty-four pieces of similar ware, was supposed to form part of a service belonging to Henry II., on account, principally, of the initials C and H occurring upon it, placed back to back, and interlaced. Three of the pieces then ornamenting the Pontal's and Prémant collections were published by M. de Sommerard, when the public interest became intensified. We are told "The imagination of amateurs and critics became excited; much speculation went abroad on the subject; romances were composed with these for their theme; some insisted that they came from the studio of a sculptor named Asonio, the pupil of Benvenuto Cellini; others that they were modelled by Girolamo della Robbia, whom Francis I. summoned over from Italy to decorate the terra-cottas of the Château de Madrid; later on it was believed that the artist-printer Geoffrey Tory, whose sign was, 'The Broken Vessel,' had printed on the sides of the flagon some typographic ornaments which resembled niello; then that some Florentine prince had sent them as a present to the husband of Catharine de Medici." The prices the different pieces commanded were enormous. A bowl that Sanvaget left to the Louvre was bought by him for 200 francs. But after curiosity had been thus stimulated the prices ran up. The ewer of the Baron de Monville was sold, in 1835, for 2,500 francs; a salt-cellar, at the Rattier sale, 1859, sold for 12,500 francs; a candlestick at the sale of Lassayette, 1862, the ornamentation of which, we are told, was of the meanest kind; went for 16,000 francs, and was afterwards sold again in England for 18,000 francs before it was placed in the South Kensington Museum; and a biberon, at the Pontal's sale, brought 27,500 francs. The ware was analysed by M. Brongniart, and its mode of manufacture made out sufficiently well to admit of its reproduction by an able hand in the factory. He found that

* Chefs-d'œuvre de l'Industrie des Arts. By Philippe Burty. Pottery and Porcelain, Glass, Enamel, Metal, Goldsmiths' Work, Jewelry, and Tapestry. Illustrated, Edited by W. Chaffers, F.S.A. London: Chapman & Hall, Piccadilly, 1869.

the groundwork of the piece was first made without any relief or ornament, not turned, but thinly moulded and pressed, and this was afterwards covered with a thin coating of the same material, on which were placed the ornaments, and finally the glaze. The number of the pieces known to be in existence amounted to fifty-four. At last M. Benjamin Fillon found out the secret. An antiquary showed him two fly-leaves of an old Prayer Book that had been illuminated by Claude Gouffier, the grand equerry and friend of Henry II. In one of the miniatures in the ornamentation M. Fillon saw a gourd identical in its character to the mysterious ware, with the armorial bearings of Gouffier on it. With this clue he visited Oiron, the castle of the grand equerry, now in ruins, and in the architecture, ornament, and further pieces of the ware, he found confirmation of his belief that he had found the author of the much-admired pottery. He published his discovery, and it is now generally agreed that during the long widowhood of the mother of Claude Gouffier, she spent some of her time in presiding over the manufacture of this ware at her castle of Oiron. Francis I. entrusted her with the education of his second son, afterwards Henry II.; hence we may be assured she was a person of cultivated taste. Associated with her were Francis Charpentier, potter, and John Bonnard, her secretary; and, as death removed the members of this gifted triplet, a decline can be traced in the objects manufactured. The pieces are believed now never to have formed a set, but to have been made singly for the decoration of sideboards for presents, as some of them bear the arms of neighbouring families. The castle of the grand equerry was devastated in 1568, when we may presume the manufacture ceased. Though M. Burty quotes it that "Bernard bestowed on it his talent for ornamentation, Charpentier his neatness of touch in handling the clay, and Helen her exquisite but somewhat sadly-toned refinement of taste," he seems to think the Oiron faience has been overrated; but his editor thinks that hitherto it has proved inimitable.

We are next shown a Hispano-Moorish dish, on which is depicted a heraldic beast. This ware, with that of Persia, is considered the richest that can be displayed on a dining-room sideboard. Of it our author vaunts, "These basins of huge dimensions, which are flashed by metallic oxides with lightning like the jet of incandescent gas in a fire, and whereon are blazoned animals treading notices and labelled war-ories under their feet as they would, the brains of a heraldic forest; these rude and

delicate witnesses of war, and of the art and industry of the fifteenth century of Spain, open with unequalled force and gracefulness a wide world to the study of enamelled plates and dishes of enamelled faience." The chief seat of its production was Malaga, and the secrets of its metallic lustres are supposed to have been imported there either by Arabs or Moors. The Alhambra glitters with it. A vase from this storehouse, of white earthenware with ornaments of two shades of blue and a prismatic copper colour, interlaced knots of Arabic characters and a medallion, formed like a Moorish arcade, on which are two autoloops, has been imitated by a French firm often mentioned in the course of the work for their clever reproductions. Architects are recommended to turn to this Hispano-Moorish majolica as to a mine in which they may find the materials to build places outshining those of the "Arabian Nights." That the composition of metallic lustres is not lost we may be assured by the sight of it on modern productions at the exhibitions. The authorities of South Kensington, however, are in possession of a work on the process of metallic lustre which has never yet been published, which may throw some additional light on the subject. M. Burty remarks that it is curious such a liberal museum has not transcribed and edited this document.

When Italy commenced the manufacture of enamelled ware, her success surprised herself. Her chief craftsman, Luca della Robbia, was first a goldsmith, then a carver, before he was a modeller in clay. In endeavouring to trace his development from one to the other, our author thinks he may have been actuated by a desire to produce a work entirely with his own hands. Before his first work in this material was accomplished, he had been employed, in conjunction with Michelozzo and Mazo di Bartolomeo, in casting and chiselling the gates of the vestry of the church of San Maria del Fiore, for which his first Ascension in terra cotta was produced; and it is supposed that it may have been from a desire to be reassisted that he chose this new vehicle. The effect of his coloured bas-reliefs upon the black and white backgrounds of Florentine architecture was magical. His large medallions, lighted up the sombre façades, and his friezes gave life and youth. It is almost a wonder that, with these examples in existence, polychromy should have passed into the stage of disuse and ridicule in which the commencement of this century found it. One of the great Parisian attempts at a revival was a failure. It occurred at the theatres on the Place du Cha-

telet, where the architect introduced it in medallions of Musio and Poetry, inserted in the walls; but as no continuation of the ornamentation was made, these isolated objects stood out too glaringly, and had to be removed. Italy, as we have said, rejoiced in the happy colouring and pleasing forms taken by the new ware. "Sideboards were weighted down with gleaming sirens, or of twisted and knotted serpents." The Siege of Troy was depicted on plates, the Metamorphosis of Ovid on dinner-sets; even Raffaele did not disdain to make designs and colour cartoons for the workmen's guidance. Some idea of the amount manufactured comes to us when we read of the quantity destroyed. At a banquet given by Cardinal du Birague, Pierre de l'Estoile relates, "There were two large tables covered with 1,100 or 1,200 pieces of faience, full of dried fruits, sugar-plums, and confections of all kinds, built up into castles, pyramids, platforms, and other magnificent fashions, most of which were thrown down and broken by the pages and servants of the Court, who were of a wanton and insolent nature. And great was the loss, for all the service was excellently beautiful." Eighteen Italian manufactories are mentioned. That at Faenza is placed foremost, probably on account of its name being applied by the French to every kind of terra cotta and the French to every kind of terra cotta and the French to every kind of terra cotta and the French to every kind of terra cotta.

This irrepressible, irritable, versatile genius is allowed to tell much of his own story in quotations from his works. The author is proud of his countryman, and lingers over the details of his experiments, failures, perseverance, and success, from the day he was shown the enamelled cup of milky and brilliant white made after the process known only to the Dukes of Ferrara, so that, when after years of pounding and haking various materials in kiln after kiln made with his own hands, in the face of hardships and discouragements, he was at last rewarded by the ascertainment of the secret, and his ware, with its green lizards, brown serpents, marvellous cray-fish, tortoises, and crabs, became the wonder of the day. An illustration of one of the grotesques designed by him is given, besides specimens of his goblets, dishes, and plates. Around the walls of the grotto were niches, and between

THE WORKSHOP OF ÉTIENNE DELAULNE, A FRENCH GOLDSMITH OF THE YEAR 1576

them were medallions, with busts of heroes; in its centre was a fountain playing into a basin, in which disported fish and reptiles, all in ornamental ware. This rustic retreat was to be planted with trees, shrubs bearing berries, and mosses, and every inducement held out to the songsters of the grove to frequent it. Such a grotto as this he is known to have made for Catharine de Medici; and some moulds, two furnaces, and vitrified bricks, found in building the new State apartments adjoining the gallery of the Louvre, are believed to be the very ovens and moulds he used in its production. M. Burty suggests that portions of the grotto itself may yet be found in the gardens of the Tuileries, or it may have been filled in when it went out of fashion, and not altogether destroyed. As in the case of the Hispano-Moorish ware, a French potter has succeeded in reproducing the Palissy dishes so exactly as to perplex amateurs. Only when taken into the hand, and their lightness is observed, can any difference be perceived.

The Nevers ware was originated by Domenique Courade, whom Louis of Gouzaga summoned from Italy to his duchy when he took possession of it as his wife's wedding portion. An early specimen of it, a large basin for a fountain, with twisted serpents and maritime goods for decorations, is in the Hôtel de Cluny. It is considered to be more interesting after it began to imitate the Venetian ware that was founded upon Oriental models, and then proceeded to trace Chinese figures in manganese violet colour; but it never attained any great elegance. It was essentially a popular ware, as its reproduction of the songs and sayings of the day testified. The illustrations given of it consist of an enamelled square from the ruined castle of the Dukes of Nevers, one of the popular plates bearing patriotic emblems, date 1780, and a somewhat gaudy bannier, date 1764. We quote a recommendation to architects:—

"At the present day there is still one manufactory of great commercial importance at Nevers, that of Monsieur Signoret. Although but little of decorative art is baked there—for notwithstanding great encouragement from all sides, the architects but dare use it but very moderately—it was in that factory, which employs a considerable number of hands, that the entire ornamentation of a house at Bernay, in Normandy, was made of late years. We have seen and been over it, and we can assure the reader that nothing could be more cheerful or agreeable to the eye than those pavements bearing the initials or names of their owner; those encaustic plates on the frontages, the coloured balustrades and balconies which look out on the court-yard and gardens."

The chefs-d'œuvre of Persian ware are magnificent, telling, appealing, and satisfying. Though we do not see the colour in the examples given, it is impossible not to feel it. The graceful outlines and rich ornamentation suggest as much beauty and wealth in the hues, for those who could make the first could give the other. We read of fawn colour, brown, and bright blue, for the grounds of their porcelain, with manganese blue, bright yellow, green, turquoise-blue, bright red like unpolished jasper, for the decorations. Tulips, roses, hyacinths, honeysuckle, and Indian and dove pinks, are the favourite flowers depicted, and these are arranged with consummate taste. Birds and animals are also placed on Persian ware. The author calls upon French potters to study the forms and details of the flowers of the West, and taking those with brown and green enamel already in use on the "more vulgar pottery of the South," invent and produce original designs of like beauty. Chinese porcelain, although inexpressibly clever, does not convey to us so much of the poetical sentiment as the ware of Iran. Our classical education is blamed as having unfitted us for recognizing the purity and truth in Chinese figures. M. Burty, however, who is a ceramist of the world rather than of France, can see more than Greek beauty in many of the Chinese productions, more especially in the early examples. He has tired of the interminable variations upon the Medici vase, and the persistency of French artists in introducing the human figure either as a support or a relief, and sees much freshness and power in Chinese work. He finds excuse for the tendency of this ancient meditative people, whom he also characterizes as melancholy, towards the monstrous, in the suggestion that their winged dragons and other unknown beasts are probably traditions of extinct animals. Their sacred horse, Fou-hi, their regal bird Fong-hoang, the branched-headed Ki-hin, depicted so frequently in Chinese ornamentation, he thinks, are not less likely to be preservations of a knowledge of pre-historic creatures, than was the mention of the great roo in the "Arabian Nights," which bird was at one time judged to

have lived in the imagination, but is now known to have actually existed. Their love of nature prompting them to their superb colouring making them dissatisfied with less than the melongena violet, the scarlet-cranes red, the thick creamy white of the camellia; their attention to details; their faculty of imitation; and their patience, are all dwelt upon with appreciation. Like the Western barbarians, the mandarins have begun to be collectors, and the soldiers who sacked the incomparable Summer Palace are stated to have found in them rich and ready customers for even fragments of old porcelain. On the other hand, when the Japanese ambassadors who visited Europe a short time ago were shown the treasures of the Ceramic Museum of Sevres, they were unable to identify their own ware, or point out any distinction between it and that of China; and they declared that no one in their country troubled himself about the subject. But to this quick, fervent, artistic people is ascribed that family of designs in which a rose tint predominates on a field of black, and those gorgeous dishes on which peonies and chrysanthemums are blooming either after the natural manner or in squares. But the artists of Japan are in course of degradation to manufacturers. A merchant captain gives them an order for 10,000 vases of No. 12 pattern, and 15,000 dinner services of No. 25 pattern, to be executed in the shortest time at the lowest price; and asks our author, what is the result? "Modern Japan gives us nothing but flimsy decorations, and China trashy copies."

We are enabled to reproduce some of the samples of ceramic treasures of which Mr. Chaffers has thus extended the fame. Beautiful as are the Oiron faience, and that from some of the Italian manufactories, it will be seen that the Persian has not less charm.

In the chapter on table-glass there are three illustrations,—one of a Persian bottle and lamp from an Arah mosque, a group of Venetian glass, and another of German glass, all startlingly bright and beautiful to see. Persian glass is enriched with precious stones, enamel, and gilt. Two of the chefs-d'œuvre preserved in the Treasury at Vienna are described. "The first is a bottle, on the neck of which are two small handles; it is decorated with interlaced zones, alternated with a groundwork of little rosettes of gold, edged with red, and blue enamel. The other, which is still more singular, had a frieze composed of little draped figures, four separate medallions, and a cypress tree, which, for Zoroaster and his disciples, was an emblem of the soul's flight into heaven." These were in the Treasury when a catalogue of its contents was compiled in 1873, when they are called "duse amphore ex Damesco." A Byzantine bottle, now in the possession of M. Gustave de Rothschild, was sold at the Soltikoff sale for 5,500 francs. On this highly-valued specimen are medallions, on which are displayed the three-petaled flower that first gave the idea of the fleur-de-lis, a device found on some of the most ancient monuments of Asia. M. Burty keenly feels the sea and sun-like heauty of Murano glass, its tints of Mediterranean blue, milky white, veined sea-green, and delicate pinks, and calls special attention to a goblet now in the British Museum, on which early Murano glass-workers painted in the medallions the portraits of two affianced lovers, with the legend, "Amor vol exarctat fidelitatem." The German glass is heavy, quaint, and generally charged with heraldic devices, enamelled. Wheel-engraving on the surface of glass was much practised in France, especially in the days of Louis XVI., when some very delicate work was produced. Our modern discovery of the power of hydrofluoric acid to produce the effect known to us as ground-glass is treated at length, both as to the process and the purposes to which it can be advantageously applied. England is accredited with the first use of oxide of lead as a basis for glass. More than a hundred years elapsed before it was adopted in France, and then the glass made with it was called "the Queen's Crystals." Among the chefs-d'œuvre of stained window-glass, we are reminded of those in the Abbey of Tegernsee, in Bavaria, painted in the tenth century by the monk Werner (the most ancient known); those of the thirteenth in the apse of the Cathedral at Bourges; the three rose windows on the portals of the transepts of Notre Dame de Paris; the windows of the Sainte Chapelle; the fourteenth-century work at Chartres, full-length figures of apostles and prophets; and of the round window at Beau-

mont-le-Roger, Normandy, as a sample of the Renaissance. There are illustrations of the different periods as well as short accounts of the process of painting on glass, its revival, and modern workmanship.

The three kinds of enamel are also fully described; cloisonné is the oldest, *champlevé* being but a development of the Oriental art, though painted enamels, the third variety, are not so new but that they were known to the Greeks and Etruscans. An Egyptian bracelet, Etruscan ear-rings, Chinese and Romano-Gaulish vases, illustrate ancient enamels; and ewers, plaques, medallions of Limoges manufacture those of the Renaissance. This is an exceedingly ample chapter. Besides the processes, the styles of different masters are discussed, and brief biographies of the leading artists furnished; sufficient information, in line, is grouped together to give both artists and ordinary readers much to think over. The tomb of William of Valence, in Westminster Abbey, is rightly mentioned as a chef-d'œuvre. The enamels of Léonard Limosin are highly valued, both for their brilliancy and harmonious colouring, and for their exposition of the style of furniture and decoration in the time of the Valois. Then come those of Pierre Raymond, who wrought, in the middle of the sixteenth century, dinner and dessert services, for the leading noble families in England, Germany, and Holland. Jean Cour is another artist whose enamels are in great esteem. He made the beautiful cup presented by Francis II. to his affianced bride, Mary Stuart, which was sold at the Pontfaute sale for 35,000 francs. The cover of this love-gift is one of the chefs-d'œuvre illustrated. With the Valois passed away the taste for enamels. Bernard Palissy deplures that enamel buttons made for three francs a dozen were selling in his time for a halfpenny a dozen. In later days we read of Jean Petitot's enamels being pounded in the jeweller's mortar, for the sake of their gold plate, just as some of Jacques Callot's copperplates were bought by ironmongers to be made into awcepans. Nevertheless their time has come round again, and they are now held in the highest estimation. Petitot's portraits are scarcely larger than sixpence. It was he who painted under the superintendence of Van Dyck a portrait of Charles I., and afterwards, on the death of this patron, portraits of Louis XIV., the Queen-mother, and many members of the French court. The Chinese likewise excel in this art. Reviewing its career and prospects, our author, whose mind is eminently receptive, expansive, and longing for progress, says,—

"All, therefore, that enamel now has to do is to follow the lead of the modern world. It ornamented the reliquaries and snuff-boxes at a time when church furniture was of all importance in the mind of the age. Later on it produced the handsomest possible description of ware next to plates and dishes of embossed gold and silver. Later still it has endowed woman's ornaments and jewelry with an ever-varying charm and novelty of design. Now it must enter into the ornamentation of the furniture of palaces and great houses. It combines especially well with dark red, black, or dark brown, such as oak, ebony, and hard foreign woods, which modern good taste has consented to leave unvarnished."

We are enabled to give from the book a view* and description of an enameller's oven. The description is by M. Popelin, a distinguished enameller of our day, and we quote his own words:—

"The oven is composed of three principal compartments, placed one over another, but each one quite independent of the other: these are the laboratory, the dome or conical cover, and the chimney."

The laboratory, A, is a rectangular vessel, with a semi-circular aperture in front; a door, P, also in clay, with a perpendicular handle; a projecting horizontal tablet, D, little more than 2 in. thick, but extending the whole width of the laboratory, on which the earthen door rests; beneath it, I, the place for the reception of cinders, in which there is an opening, which may be closed by a movable button, to regulate the current of air; a grate of clay, Z, pierced like a skimmer, is placed inside the oven immediately above the cinder-box, and a stopper to fit it is placed on the perforated plate. This compartment contains the fuel, which, when set alight, quickly burns up, owing to the draught from the two circular air-holes situated at the sides of the oven. The chimney, C, needs no explanation. The dome or conical ceiling, B, which is the receptacle for the enamel, is simply a trapezoidal roof, without a base, perforated with holes at the top. It fits on to the laboratory, which it exactly resembles externally. The stand on which the enamel is placed is introduced by the door. The numbers 5 and 9 answer to the tongs and poker, the use of which is well known; No. 10 is a kind of iron puncher, or scissors, made flat, which are used to take hold of the plates 1 and 2 when in the oven and hot. These plates are of thin hard earth, on which the plate of enamel is placed."

The working of bronze and iron is treated in the same manner as is each art in succession. First is traced its infancy in the hands of Tubal Cain, and then its gradual Oriental perfection.

* See p. 266.

A chef-d'œuvre, of which early mention is made, is a dagger from the collection of Prince Soltikoff, now in the possession of the Marquis of Hertford, on the steel blade of which is engraved a hollow line, on the flattened sides of which is a number of small rubies, which give all the appearance of a streak of blood upon it. The handles of Oriental weapons are usually enriched with rubies, sapphires, pearls, and diamonds, but this illusion of blood on the blade is a rarity. Greek armour, the work of the gods, must have been exquisite. The account on the Iliad of Agamemnon's armour is quoted to show its perfection, but no relics of this period can be pointed out. The first specimen illustrated is an Italian sword of the sixteenth century. M. Burty is fired with ardour as he contemplates arms:—"Nothing is nobler than collections of arms," he declares. And then he enumerates the chefs-d'œuvre in the cabinets of the Count of Neuwackerk and the Marquis of Saint-Seine. Instead of a bronze statue to celebrate the bravery of a person of second-rate distinction, he would bestow upon him a sword of honour, which he could transmit to his descendants. We are shown, after the jewelled weapons, a series of bronze statuettes, medals, vases, candlesticks of the manufacture of different countries and all ages. We can do no more than indicate that those interested in this branch of the arts will find much to gratify them on the diversified pages to which we are referring. An iron gate of the twelfth century, of scroll-work branching right and left and clasped together with infinite grace (see p. 263), keys with open-work and entwined handles, a clasp and key of a fifteenth-century purse, a frame for a signboard, a knocker ornamented with interlaced crescents and monograms of the date of Henry II. of France, contrasted with specimens of modern work, such as the iron gates of the Parc Monceaux and Candelabra made in England, elaborate this chapter. There is a prophetic announcement that the electro process is sure to triumph over the ancient one of casting. Already it has been applied, we are told, to the outer covering of the Pope's wagon, the locksmith's work of the Empress's apartments at the Tuileries, and the doors of the church of St. Augustine.

In the next section there is this distinction made between the goldsmith and the jeweller:—"The goldsmith is the jeweller of the dressoir; and the jeweller is the goldsmith of the jewel-case." There is something very touching about old jewelry. It seems almost profane to examine lightly, for the mere curiosity of their workmanship, trinkets that were worn, and prized, and carefully guarded by beautiful women, who loved and were loved; even though it was ages ago men went down to their graves blessing them, and, perhaps, raving about them with their last breaths. Here we have the ear-rings, jewelled pins, and pendants that may have been worn by the "beautiful Shalambé," King Solomon's wife; and here is a bracelet that once decked the sleek olive-coloured arm of a slanting-faced Egyptian. Or, perhaps, we take from a tomb a trinket that has laid upon a faithful heart till it mouldered away, or was placed round the neck of a dead beauty with a burst of passionate grief by those who never smiled more; and we hold it up to the light, and only say the jewellers of those times must have used some process to fix these exquisitely minute intertwistings that we cannot trace. But in the present case there is too much sympathy for all human conditions, as well as for art, to admit of coldness. Phœnician, Greek, Byzantine, Jewish, Early French, and German work are all spread out in dazzling array. Of course, the contents of the jewel-rooms of the French monarchs furnish many examples. Froissart has recorded the presents made by the gentry of Paris on the coronation of Queen Isabeau, and carried to her on litters by men dressed as Moors with their faces blackened, and others disguised as a bear and unicorn, consisting of gold pots, ladles, and dishes; scent-bottles, bonbon-boxes, salt-cellars, pots, lamps, silver dishes and trays. The regal accumulations would have been enormous by this time if it had not been for rainy days when wars had to be paid for and prisoners ransomed, on which occasions heaps of such treasure was obliged to be melted down. The author quotes M. Léon de Lahorde:—"If children had to be settled in life and a dowry given them, it was the jewel-room which furnished the required sum. And more, in every day life scarcely a day passed without a die being made into one's treasure to make a present of jewelry, a golden drinking-cup, or a simple gilt dish, to some

favourite or relation, a foreign ambassador, a messenger bearing the tidings of some victory or defeat, or to the modest outsider, who came as fast as his horse would carry him to announce the birth of a son or a nephew." Drageoirs, bowls on which preserved fruits and sweetmeats were placed upon the dressoir, or handed round at table; agnières, or ewers for water, of fantastic forms, sometimes in the shape of men, sirens, lions, birds; hanaps, or drinking-cups; the small repository for spices, drinking-cups and spoons, intended to be placed on the table, and first made in the form of a ship and called a "nef," and salt-cellars with serpents entwined about them, to give warning of poison; are some of the articles upon which the goldsmith lavished his resources.

We reproduce a view of a reliquary of the thirteenth century brought from Basle (see p. 263). There are many noble names in the list of Italian goldsmiths; for most of the great sculptors and painters were first versed in the use of the hand-vice. They are all enumerated in their turn; and Benvenuto Cellini, like Bernard Palissy, is allowed to tell again his oft-told tale. Some of the papal coins and medals by this last-mentioned celebrity are illustrated. His gold enamelled salt-cellar, representing earth and ocean, described by him at great length; his bronze nymph of Fontainebleau; his Perseus, the casting of which he relates so minutely; a vase and cup of Oriental jasper, attributed to him, are also given. Etienne Delauné is another celebrated goldsmith, whose biography is entered into. He has left a view of the interior of his workshop (1575) here reproduced (p. 255). His busy workmen, hammering and blowing bellows, and grinding away in their slashed doublets and trunk hose, present a very picturesque appearance. Diamonds are touched upon. A pendant, after Gilles Légaré, seventeenth century, is illustrated, of which M. Paul Mantz has said, "This is the most reasonable, solid, and soberly French sort of jewel ever worn by the Montespans and Fontanges." M. Burty, too, gives the palm to precious stones over any other kind of jewels. The small enamelled figures of virtues and vices, or horses on ovals no bigger than nutshells, produce no effect at a little distance, he thinks; they become but as a blot; these should be left to the sculptor or statuary. On the other hand, he says, nothing can be more telling and beautiful than the intense brilliancy of a well-cut and well-mounted diamond. Here, as in other departments, he thinks much of English progress.

"Nowadays jewelry is still doing marvels. The English, who daily import workmen from us at enormous rates, the English, and the English only—can compete with our Parisian jewellers. They have the same superiority with regard to the freshness of polish and brightness of colour of their metals; ours, however, have pre-eminence in chasteness of mounting, lightness, and strength; producing twice as much effect with half the number of stones. Workmanship is now more perfect than ever it was."

When Louis XIV. sent all his plate, jewelry, and silver furniture to the mint—a sacrifice M. Burty compares to that a captain is obliged to make when he throws his cargo overboard—we read there were large orange-tree boxes and coils of solid silver, besides an immense heap of still more sumptuous articles of less startling dimensions. It is in this tragic melting-down that all Cellini's work is supposed to have disappeared. There have been imitations of these made even recently. The author refers to the sale of some shields made by a goldsmith of the present day to the King of Prussia as works by Cellini, who placed them in his museum, and enjoyed his possessions exceedingly till the fraud was discovered. In reference to the cups and vases now given as prizes at races and other competitions, our author declines to name their artists, and says sensibly:—

"Unfortunately, these chefs-d'œuvre are, for the most part, signed not by the artist who designed them, but by the maker who fabricated them; and we will not once establish a series of mistakes over which the future will not have spare time enough to hold an inquest. If, therefore, we hear that a trinket or statuette, a ring or a cup, comes from such and such a shop, well and good; but let not be said that it is the work of this or that master, for that is equivalent to saying that a particular book was written by the publisher or bookseller of whom one may chance to purchase it."

Concerning tapestry and carpets, the author says ever since man forfeited his natural liberty he has been endeavouring to disguise the walls of his prison-house, and these are his items in the sequence of his inventions. First there was mural painting, then mosaic ornamentation, then tapestry; this was supplanted successively by gilt leather, painted wood, and painted paper. He gives India the credit of the invention of tapestry in remote ages, before Homer made

I Hector desire his mother to bring out the specimen of it she loved best, and spread it on the knees of glorious-haired Minerva. The way the Smyrna maidens began to make carpets for their wedding dowry, whilst they are yet children, with the warp stretched between two trees, which gradually grow under their hands as the months and years elapse, is told. But the body of information consists of a notice of existing chefs-d'œuvre and a history of the Gobelins manufactory. We have a representation of a falcon chase on a piece of arras tapestry at the Castle of Aroné; the history of David and Bathsheba, worked in Flemish tapestry of the reign of Louis XII.; and a sporting specimen of the tapestry of Neuilly; but more beautiful than either of these is an illustration of a Persian carpet of the sixteenth century on silk, the dominating colour of which is a brilliant yellow, described as being as intense as the core of a ripe apricot, on which groundwork is a graceful variegated design worked in black, white, green, and grey, and different shades of blue and red. This is, of course, pointed out as the style which should have occupied the designers and colourists of our day, instead of the bouquets and scroll-work they have produced. For the future, it is thought likely the Jacquard loom will yield a carpet that will supply that first sought-for quality, cheapness. Some such appliances are already at work at Neuilly, where models are set out as if for enormous shawls on several thousand sheets of cardboard pierced with cylindrical holes. This is called "a democratic and social loom," for after the pattern is once set out on the pasteboards the groundwork rapidly decreases in value, and what was worth ten thousand francs at first, by the time it is reproduced for the tenth time is only worth a thousand. The subject of hand-tapestry is not gone into except so far as the gallant insertion of a pattern for hand-needlework, for the encouragement of fair renders, taken from a Venetian work by Giovanni Ortani, 1567.

To look carefully over this work brings an impression into the mind exactly like that which occupies it after a long day spent in the South Kensington Museum, or in the Louvre, or in the Vatican. And it also brings a desire to visit these courts and salons again, to see the lordly dishes and other triumphal specimens of the great ceramists, the clever, dainty, cunning enamels, the bronze and ironwork of departed countries, the sumptuous goldsmith's work and sparkling jewelry, with the now lights its pearly has conferred.

ART GLIMMERINGS.

AMONGST those who are considered the most barbarous people, when even the art of house-building was, and is now, but little practised or understood, there is a wish shown to produce certain kinds of ornamentation, which, although of a simple and rude character, still indicate the natural desire which exists in human nature for more than mere utility. The forms were made to assume something like geometrical symmetry, such as the zig-zag and other patterns. Then there is an intermingling of various kinds of lines which has produced the knotted work which is to be seen in the productions of the Anglo-Saxons and the Scandinavians. In this way parts of the weapons and implements of the New Zealanders are adorned, and also many of the intricate and often beautiful patterns which are made in India at the present day. In Lapland, where the people burrow in the snow, or live in the most miserable kind of huts, there is to be found on vessels, lamps, and implements an elaborate and well-executed kind of ornament.

When examining the earliest productions of ancient people, and of those who are now in a comparative state of barbarism, it is remarkable to notice the general resemblance which these bear to each other, and how, as progress is made, the varied lines in the first examples, as if it were by accident, assume a rude resemblance to the form of the human figure, animals, and flowers.

In primitive nations, not only is the desire shown to decorate arms, articles for general use, war vessels, and other objects, but even amongst the most uncivilised people there is the wish shown to decorate the person,—the unquenchable process of tattooing, the crowns of feathers, the teeth of wild beasts, choice skins, and furs, all indicate this natural instinct; and there can be no doubt that this feeling has been

to a considerable extent the means of advancing progress. Many instances might be given, but it may be sufficient to mention that this is to be especially marked in the history of the Anglo-Saxons, who, with the aid of the distaff, and quaintly-fashioned looms, assisted by various dyes, were enabled to manufacture articles of both male and female costume, which seem to have been remarkable for fineness of quality and picturesque elegance of appearance; and at a very remote date we learn that the Anglo-Saxon ladies were remarkable for their skill in embroidering parts of dresses and in making the tapestry hangings of beds and apartments. In this way they were important pioneers of English art.

As we have before said, it is curious to note when the power of drawing figures, as we see them in ancient illuminations, on the walls of churches, and the oldest examples of tapestry and embroidery, was acquired, how long a period elapsed before what we may call the elevational style of drawing became exchanged for works which exhibited the faintest indication of the knowledge of perspective; and the same result may be noticed in the efforts of children, who, by an instinctive feeling for pictorial art, are led to the attempt to make drawings of objects which they have constantly before their view. In these cases there is the same difficulty to be overcome which for so long puzzled the early limners.

The writer has frequently noticed the sketches of very young children which have been remarkable for a degree of feeling and a power of expression which would seem to show promise of future excellence; but great is the difficulty, and long the patience, required, to cause those drawings to assume a more finished and refined stage, to indicate the delicacies of outline, and the niceties and varieties of distance, which are needed for a complete picture or the representation of natural objects on a flat surface. How hard, during early years, to teach the practice and principles of art, when there is shown to be a natural facility for it, is not an easy matter to determine, especially when it has to be carried on in connexion with the usual school education. The practice of writing is an impediment to the teaching of drawing, and we have often noticed that it has required long care to get boys and girls who have been under the training of the writing-master to make a firm upright or horizontal line. In order to prevent the sloping of all perpendicular lines to the angle which is commonly used in writing, we have seen various means tried.

It would be interesting if we had more examples of the very earliest works of our most celebrated painters, and it would also be worth while to preserve with care the sketches made by men who have risen to literary eminence. Amongst those who have shown ability in this way may be mentioned the late Thomas Hood, some of whose pen-and-ink sketches were remarkable for both humour and intense feeling. They are, however, for the most part so slight that they are not likely to be rightly understood by those who have not had the advantage of art training or knowledge. Some of those designs are generally known in consequence of their having been engraved and printed with Hood's writings; but several of them were drawn on the wood from the sketches by an artist who was well practised in his description of work. And although this may have been the means of making the engravings more presentable to the public, in some instances the spirit and freedom of the originals have suffered. There are also some remarkable sketches by Thackeray, and others of much merit by Mr. G. A. Sala. The sketches of the two last-named writers are carried much further than those by Hood. We believe that there are some pen-and-ink scraps by Charles Lamb still left, and some of our readers will be reminded by these remarks of other works of a similar description.

It is a question on which there has been much difference of opinion as to whether or not men like Thackeray who have shown not only a certain degree of ability for art, would in that direction have arrived at the same extent of eminence that they have done in others. We think not; for it is requisite in addition to the teaching to have peculiar facilities to enable any one to become a great painter, a great sculptor or musician, or a famous architect or engineer. It has been urged that by industrious application success may be achieved in any of those professions. It is not, however, likely that Peter Nicholson, clever as he was as a

mathematician, and noted as he also was for constructive skill, would ever have become celebrated as an architect; or that Thackeray, or those others to whom we have referred, would, notwithstanding their marvellous skill in making wood pictures, have been able to produce finished delineations on the canvas.

We have briefly noticed the difficulties which there are in acquiring the right practice and mechanical practice of art; but when some progress has been made, it is pleasant to watch the results of fitting genius, aided by industry and right training. It is with proportionate pain that the decline of skill in artists who had risen to eminence is noticed. No more distressing instance of this is to be met with than that of the late Mr. Ewbank, whose picture of Edinburgh and other fine works are the pride of several collections, and which, when now occasionally offered for sale, produce large prices. In the prime years of his life the works of this artist, owing to his intemperate habits, declined in merit; and towards the end, the paintings produced were more dabs, and his sketches became utterly worthless.

Luke Clennell was another sad instance of the decline of artistic power, and a lapse into original conditions, after this artist had produced many water-colour drawings and oil paintings, which raised him to a foremost position. One of these was the picture of the famous charge of the "Horse Guards at the Battle of Waterloo." The success of this and other works was the means of obtaining for the artist the commission to paint a large picture of the meeting of the allied sovereigns, after the long European war, and it is believed that such was the extent of the worry and trouble in obtaining the needful sittings from various illustrious persons, that he was driven into a state of mind which rendered confinement in a lunatic asylum necessary. When there, notwithstanding the cloud which had come over the intellect, the hand was kept busy in the production of sketches and slight drawings; but few persons would have thought that those productions were by the master who had previously shown its cunning, and delineated in an excellent way the old Border castles, the animated scenes of country fairs, and the terrible rush and the strife of contending hosts.*

Ten or fifteen years ago the boys in the general schools for the middle classes, and even those of a higher rank, had less opportunity for producing any work of an artistic nature than even the young ladies; but few boys in the middle schools, and even persons who had received a very liberal education were able to delineate the most simple object in nature; some by rule and compass learned to draw geometrical figures; and there was also the ornamental penmanship, executed in the pieces which were shown at Christmas time, in which there were flourishing ornaments which imitated the forms of birds, fishes, and other creatures, which had some pretensions to artistic design; but beyond the matters mentioned there were but few opportunities of acquiring a knowledge of the principles of art or of forming that kind of taste which would be likely to produce a better description of articles required for general use, or to lead (even if they were made) to a proper demand for them.

As regards the girls, they had the advantage of the practice of embroidery and various kinds of hand-wrought lace, some of it very beautiful; we have also seen very creditable copies of pictures of a superior class, done with coloured lamb's wool upon white silk. The effect of some of those needlework pictures is good. The manner of executing those needlework illustrations, was to strain the silk and prepare it in a peculiar way, and an artist accustomed to the work drew in water-colours, and with all the needful tints, and light and shade, a good representation of the picture to be imitated. Then the young lady matched the colours of the drapery, foliage, rocks, foreground, and so on; the faces, hands, and limbs left without the wool, just as the artist had coloured them; the light tints of the sky were also kept in this way. There were also the samplers; an elaborate performance, one or more of which most young girls executed in their youthful days. Those once familiar objects are getting scarce, and the custom of working them has almost gone out of use. They are, however, interesting,

* The composition of the picture of the Charge of the Guards is worthy of study. Besides the excellence of the drawing, the effect of the motion or rush of the troops is wonderfully shown by the arrangement of the lines.

inasmuch as they are examples of a particular kind of art-work, and also show the gradual way in which the old style of ornament gives way to the new; and it may be observed that this is to be noticed not only in needlework, but also in ironwork, wood-carving, the fashion of earthenware vessels, and many other matters. For instance, in some rural districts there may be seen ale-mugs, and other implements of modern manufacture, which in colour, shape, and quality of material could not be readily distinguished by a practised antiquary from those of Elizabethan date; we may, in illustration of our meaning, mention the fashion of coffin-furnishing, which is still in partial use. The bright white devices, some of them grouped together; others bearing crowns, heraldic shields, &c., put together in a way similar to those which are so often to be met with on tombs of the reign of Charles II., and up to about the time of George I. Good examples of these are to be met with on the monument to the memory of the daughter of Sir Christopher Wren in the crypt of St. Paul's Cathedral, and in many other places. The devices are arranged in imitation panels (formed with nails) of lozenge, square, and oblong shapes. On referring to drawings of the coffin of Charles II., and comparing it with those at present in use, it is easily to be seen that the general shape has been altered for the worse; but, as regards the ornamentation, this will be found, especially on the coffins provided by the old-fashioned undertakers of London, to have an appearance of considerable antiquity. Some of the heads of the winged cherubs are worth attention in consequence of the artistic expression which has been given to them. These have probably been struck from moulds which have been in use about two centuries, or are facsimiles of such works. Even the shrouds provided by the undertakers are of such an antique appearance that the fashion may have remained unchanged since Queen Elizabeth's reign, and even from before that time.

MIRFIELD, YORKSHIRE.

The foundation-stone of the new parish church here was laid on the 23rd ult. by the Rev. R. Maude, M.A., vicar. The old church is not to be taken down until the new one, which will be situated on an adjoining site, is complete.

The style is Early English, and it was designed by Mr. G. C. Scott, R.A., under whose direction the works will be carried out. The plan consists of nave, aisles, chancel, and tower, with open porch on the south side, and two vestries at the north-east end of the north aisle, one of these being for the use of the choir. The apparatus room and coal-vault will be under these, and approached by steps from the outside.

The church will be entered westward through the tower, which will add considerably to the length of the building, it being 153 ft. long clear of the walls. The nave is 82 ft. long, divided into five bays, is 27 ft. across, and 64 ft. from the floor-line to the ridge of the roof. The aisles are each 13 ft. 6 in. wide in the clear, and the chancel, including the sanctuary, is 40 ft. long by 27 ft. wide. The tower at its base is 30 ft. square, exclusive of the buttresses, and rises 139 ft. from the ground-line to the top of the pinnacles, and will contain a clock and ten bells, the clock to be supplied by Mr. W. Potts, of Leeds, and the bells by Messrs. Taylor, of Loughborough.

Externally the church is to be built with Yorkshire stone, from St. Michael's Mount Quarry, the face to be diagonally toolled. Internally, the stone from a neighbouring quarry, having a light brown tint, will be rubbed to a smooth surface.

Mr. H. Roome is the clerk of the works, and Messrs. W. & J. Milners, of Miffield, are the contractors. Messrs. Banke & Clough are engaged to do the carpenters' and joiners' work. The cost will be about 20,000*l.*

Window-cleaning.—Glass panes, constantly exposed to the action of the sun and rain, are soon deteriorated, as the potash or soda they contain combines with the carbonic acid of the air. A whitish opaqueness is the consequence of this action; and in order to make the pane return to its pristine transparency, rubbing it with dilute hydrochloric acid is recommended, and then cleaning with moistened whiting. By this means, it is said, glass in an extreme state of decomposition may be completely restored.

ST. MATTHEW'S CHURCH, MOUNT PLEASANT LANE, UPPER CLAPTON.

This important church, a plan and south-east view of which we give,* has been during the last two years in progress of erection from the designs and under the superintendence throughout of the architect, Mr. F. T. Dollman, and will be consecrated on Monday next, the 5th of April, by the Lord Bishop of London. It occupies a very elevated site, overlooking the meadows of the river Lea, and will form a conspicuous landmark in every direction.

The plan consists of a nave and aisles; north and south porches; chancel, with north aisle; organ chamber on south side of chancel; tower, and lofty spire.

The nave has five bays longitudinally; the shafts supporting the arches being of red Mansfield stone, with foliated capitals in Bath stone, and moulded haes. Over the nave arches is a range of two-light clearstory windows, the bearing shafts of the roof trusses being of blue Pennant stone. At the west end of the church is a continuous arcading, over which are two lofty windows, of two lights each. At the west end of the south aisle of the nave stands an octangular font in Caen stone, with marble shafts at the angles. The chief panels are filled with the following subjects, referring to Holy Baptism, executed in high relief:—1. The entry into the Ark; 2. The Presentation of our Lord in the Temple; 3. The Baptism of our Lord; 4. Our Lord blessing little Children. The four angle panels are filled with varieties of sculptured lilies. The stem is of alabaster, surrounded by four coloured marble shafts; and the font is surmounted by an elaborate oak cover, on the top of which is the figure of an angel (the emblem of the patron saint of the church), with outspread wings.

The windows of the north and south aisles of the nave are eight in number—four two-light and four three-light, in which the design of the tracery differs in each instance. The whole of the seats in the nave and aisles are of oak.

* See p. 267.

On the north side of the chancel arch stands the pulpit, executed in Caen stone, the design of which consists of a series of arches, with coloured marble shafts and carved capitals and haes, the panels being left open to the floor. The stem is of red Mansfield stone, with four detached shafts in alabaster, and moulded caps and haes. Under the cornice around the pulpit are inscribed the words, "We preach Christ crucified."

The nave and aisles are paved with red and black tiles, laid diagonally, with figured tiles at the intersections of the pattern. Across the chancel arch is a richly-ornamented metal screen, with gates; and over the arch is the text, "I am He that liveth and was dead; and behold, I am alive for evermore. Amen." On the south side of the chancel arch stands the lectern, in oak and brass, the gift of the architect.

The west end of the chancel is elevated three steps above the floor of the nave, and towards the east end, including the foot-pace, are five more steps. The stalls are all of oak and richly carved, and the floor throughout the chancel is paved with encaustic tiles. The arch on the north side of the chancel has an ornamental metal screen, and over the arch is the text, "Thou art the King of Glory, O Christ." Over the corresponding arch on the south side are the words, "Thou art the Everlasting Son of the Father." The whole of this arch is filled with the organ front. At the east end of the chancel, the sanctuary, which is apsidal, has five lofty two-light windows, the whole filled with stained glass, the gifts of residents in the vicinity, the subjects illustrated in which are the principal incidents of interest recorded in the Old and New Testaments. Under the centre window is a reredos, canopied, with the Institution of the Eucharist sculptured in high relief. On the north side of the apse there is a credence, and on the south side three canopied sedilia, forming part of the arcading which is continued round the apse, the plain surfaces of which are filled with red and black diaper work.

On the south side of the chancel, and between it and the tower, is an entrance vestibule for the

clergy and choir. Above this is the organ chamber. The ground-floor of the tower is appropriated to a choristers' vestry, above it is the incumbent's vestry, over this the ringers' floor, and higher still the belfry, in which is a full pen of eight very melodious bells by Meare & Stainbank.

The style of architecture adopted throughout the church is that of the end of the thirteenth century. The core of the walls is of brick, faced externally with Kentish rag, and internally with Bath stone ashlar, the whole of the work being bonded together in cement. The spire is of Kentish rag, with Bath stone spire-lights, hands, quoins, and apex.

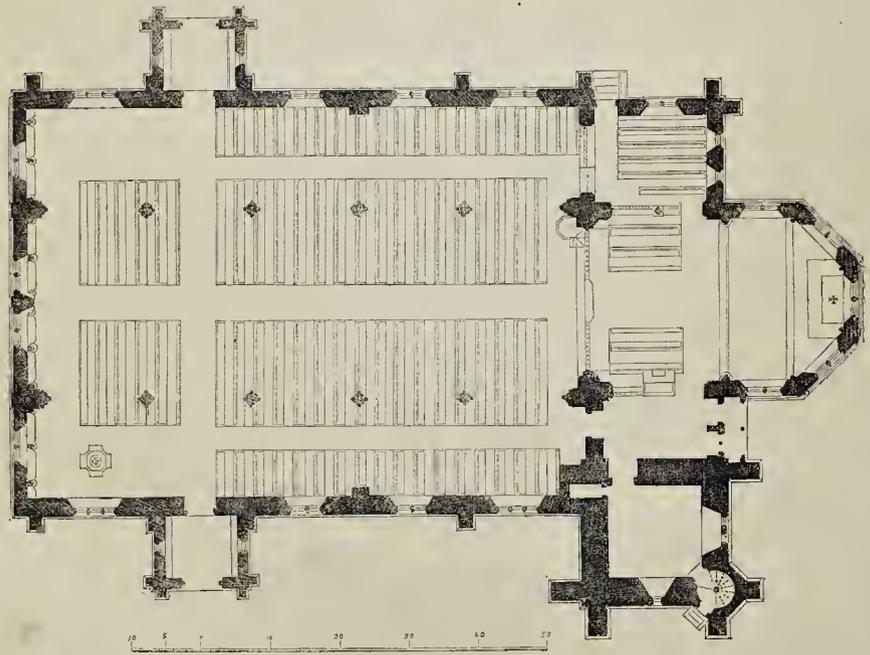

The contractors were Messrs. Myers & Sons. The ornamental sculpture of the nave and chancel, font, font-cover, pulpit, and reredos was executed, from the architect's designs, by Mr. James Forsyth; the metal work by Skidmore, of Coventry; the gas standards and communion railing by Messrs. Johnston, of Holborn; the tiles by Godwin, of Longwardine, near Hereford; the stained glass by Powell, of Whitefriars; the warming with hot water by Messrs. Weeks; and the organ by Messrs. Gray & Davison. The cost of the entire structure will be not less than 15,000.

The church has been erected entirely by subscription, aided by the personal munificence of residents in the immediate neighbourhood, and has been, from first to last entirely independent of pecuniary aid from any of the church societies, fortunately for the architect and the parish. The church will contain about 750 worshippers, and the whole of the seats will be entirely free and unappropriated.

The principal dimensions are as follow:—

	Ft. In.
Width of nave between columns	25 1
Width of aisles (each)	13 4
Total width of church	59 3
Length of nave	80 0
Height of do.	60 0
Height of aisles	33 0
Length of chancel	38 0
Height of do.	45 0
Square of tower on ground-floor	21 6
Height of tower to top of cornice	50 0
Total height of tower and spire	180 0

ST. MATTHEW'S CHURCH, UPPER CLAPTON, MIDDLESEX.

Plan.

THE LATER DISCOVERIES IN
JERUSALEM.*

THE Damascus Gate is situate in the present north wall of the city, about 1,400 ft. from the north-west corner of the Temple, and is a Sarcenic structure flanked by two square towers. Three shafts were sunk here without the gate, near which Dr. Barclay had discovered the superficial remains of a tower which have been previously described in these columns.

Two of the shafts were east, and the third west of the road, and without the gate. The result was the discovery of an ancient arch, to the north of this a flight of steps, north of this again the remains of a wall of related masonry of large size. These stones do not, however, appear to be *in situ*, as more modern masonry is visible.

The principal interest attaching to this investigation is the discovery that the ground is here at its ancient level, thus accounting for the finding of superficial remains; and this is proved by the foundations being about 3 ft. below the present surface.

The excavation at the Maristan or Hospital of St. John, on the west side of the city, south of the Church of the Holy Sepulchre, is a continuation of M. De Vogüé's discovery of a wall here, above the level of the ground, forming the east wall of part of the church. Three shafts were sunk in September, one 80 ft. west of the portion of wall above ground, where masonry was found 14 ft. below ground; the second 180 ft. west of same point, masonry found at the same depth; the third, 26 ft. north of the second, masonry being found at a depth of 8 ft. When investigated by trenches joining the shafts, two vaulted chambers were found, the vaults being rough, but the piers of apparently ancient masonry, with large stones and voussoirs. A large tank, 40 ft. by 17 ft., with twenty-five steps, was also found near, 28 ft. below the surface, connected with two other tanks,—the one 68 ft. by 17 ft., and containing a little water; the other not excavated, but in good preservation. These are the largest cisterns yet found outside the temple enclosure, and might be conjectured to belong to the foundations of one of the three towers on this side of the city, where cisterns are described by Josephus as being of large extent.

It is perhaps rather to be regretted that instead of endeavouring to trace the wall at this point to the west, it should not have been explored north or south, as the direction of the part above ground would seem to intimate that it ran in that direction.

The next discovery is one of great interest, being entirely unlooked for, and in a quarter where no previous discoveries have been made. It consists of an underground excavation near the Pool of the Virgin, well situated on the west side of the Kedron valley, to the south of the Haram enclosure, and at the bottom of the slope of the Temple Hill. Here there has been no trace above ground of ancient work, the wall being a late structure, and very rude, forming an entrance to a rock-hewn cave in which the water rises.

The existence of a communication between this Pool and the larger reservoir of the Pool of Siloam to the south, by means of a channel hewn in the rock, was made known by Dr. Barclay, who explored it from both ends, and it is supposed to explain the intermittent rising of the water in the lower pool, as being caused by the syphon-shaped termination of this passage. Lieut. Warren has now added to this discovery that of a larger and more important excavation.

The exploration was commenced under the lowest step of the pool, and with great difficulty, as the rising of the water threatened to drown the workmen already up to the neck in water. Another attempt was then made to explore the passage already mentioned, and at length, leading out of it towards the north-west, two passages were found, the largest being about 50 ft. south of the pool.

This was gradually cleared out to a distance of 17 ft., when a cave was reached, and a shaft, which proved to be 40 ft. in depth, leading upwards from this point.

On exploring this rock-hewn shaft, which has smooth sides, and cross section, of 6 ft. by 4 ft., to a height of 40 ft., a piece of loose masonry was discovered directly over the heads of the explorers, weighing about 8 cwt. The ascent was made by scaffolding, and at the heights of 20 ft., 27 ft., and 38 ft., landings were made

with frames, checks being cut in the rock on which they rested.

At the height of 44 ft. the shaft opened into a covering, with a sloping ascent, covered by small stones; being pursued about 30 ft. towards the west, it reached a landing, and the cave went from this point in two directions, one which was impassable towards the south-west, and the other north-west still sloping, following which at a distance of 15 ft. a level plateau was reached, and a passage 8 ft. high by 3 ft. broad. Still pursuing this, a wall was reached, and on creeping through it, the passage was found to rise again at an angle of 45°, for a distance of 50 ft., and as it was very low, it was easy to ascend. At the end of this was a vaulted chamber, 20 ft. long, still running north-west, having a well-cut arch, of semicircular form, the crown being 20 ft. from the ground, and built with large voussoirs. This terminated in a pit about 20 ft. deep, and at this point the passage was hocked up. Two or three curious glass lamps, and two of red pottery, were found here; an iron ring overhung the shaft, and a small pile of charcoal, near which was a dish for cooking food, was also found in the chamber last mentioned. This passage appears to have had some connexion with the ancient aqueduct, but owing to the unfortunate blocking up of the western end, this communication was not traced.

A good deal of importance has been given to the investigations which have been here placed next in order, namely, those in the Tyropean valley; and although the spot was one where exploration was difficult, as being within the city, still one discovery of extreme interest has here been made, although no one has as yet expressed an opinion as to the real name or use of the building explored.

Six shafts were sunk in this exploration, being all in a line running west from the arch on the west Temple wall. These number in order from the first to the sixth, the first being the most westerly. The sixth is situated between the fourth and fifth. Their object was to find the continuation of the bridge, of which only a fragment of one arch exists, and their result was the discovery that it consisted apparently of one great arch, to which an ascent from the city led with a gentle slope.

Each of the shafts led to the discovery of some ancient work. The first was sunk 21 ft., when the rock was reached, and a polished slab of marble, forming the top of a drain in which a current of water was flowing through the sewage with which it was filled. The sewer was 6 ft. deep by 3 ft. broad, and the stone 21 ft. by 6 ft. The second shaft, 250 ft. from the Temple wall and 35 ft. east of the first, was sunk about 5 ft. to a masonry pier, measuring 3 ft. by 4 ft., in which was discovered the entrance to a cistern beneath, which is, according to Lieut. Warren, of greater antiquity than the pier, and has its bottom on a level with the top of the first sewer. Passages were driven east and west from this shaft, and resulted in the discovery of similar piers at an interval of 12 ft. 6 in., the whole forming a colonnade. The stone was sandstone, well cut and dressed. The cistern is plastered, and has a slightly domed roof. The rock was here found at a depth of 18 ft. below the surface. The third shaft disclosed another portion of the colonnade, and the rock at a depth of 32 ft. Its distance was 216 ft. from the Temple wall. The fourth shaft, 182 ft. from the same, disclosed at a depth of 22 ft. a square rock-cut cistern, 7 ft. below the surface of the rock, as well as a pillar, 1 ft. diameter, and various fragments apparently belonging to the colonnade. The fifth shaft, at a distance of 82 ft. from Robinson's arch, and the sixth, 132 ft. from the same, were investigated with great eagerness, as tending to show the original width and depth of the Tyropean valley, and the form of the bridge. The fifth shaft discovered a large cistern, but was abandoned at the depth of 25 ft., and a second was sunk close to it, 87 ft. from the wall, which discovered a tank at the depth of 9 ft., measuring 18 ft. by 12 ft. The rock was here only found at a depth of 41 ft. It was proposed to run a gallery from this point to the wall, which would probably throw much light on the appearance of the valley. The sixth shaft disclosed rock at a depth of 30 ft., and an ancient wall of hammer-dressed stones running north and south, and another running east and west, of massive stones, the top at a depth of 26 ft. below the surface.

It is difficult to give an idea of the whole result of these isolated explorations, but it is well explained on paper by Lieut. Warren, and shows that the hill must have been crowded

with ancient buildings of large size, including the colonnade, which ran gradually from the west to the level of the great bridge. There can be surely but little doubt that in this we have the remains of the great Xystus, or covered gymnasium, which is distinctly stated by Josephus to have stood here, and the dimensions will fit with the scale to which the entrance to the Temple on this side was constructed.

The next exploration is a continuation of that at the south-east corner of the Temple wall, and is of extreme interest, as showing that the ancient city wall joined the Temple here, and not, as it is often supposed, at the south-west corner. There is as yet no connexion between the exploration in this part and that on the west of the Temple; but wherever a shaft has been commenced, ruins of some kind have been found throughout the whole space immediately south and south-west of the Temple; and there seems reason to suppose that a large amount of ancient building lies hidden beneath the ground in this part.

The city wall, which is here exposed, consists of large stones partly related, and runs in a line with that of the Temple for a distance of twenty yards, and afterwards bends towards the west, at an angle of about 45° with its first direction. Close to the Temple wall there appears to have been an entrance. Three shafts were sunk for this exploration, and at the corner of the wall a tower was found, having a face 23 ft. 6 in. in length, and projecting about 8 ft. beyond the wall. This was, no doubt, one of those towers which, according to Josephus, were placed along the wall. There were also discovered, 15 ft. south of the Temple, the remains of a wall running east and west, abutting on the city wall. Of these walls the courses remained entire to the height of some 40 ft.

It was in this investigation that the Lieutenant found the only remains of ancient writing yet discovered. On the corner stone of the second course (south-east corner of the Temple wall) three letters or marks were found painted in vermilion, apparently with a brush, and the largest some 5 in. in height. The paint when wetted rubs off easily.

There was also found a horseshoe mark on the east wall, about 2 ft. broad at the base of the shoe, and 2 ft. 8 in. deep (supposed to be used in working the tackle in the lowering of the stone) cut in the rock at the foot of the wall. A small earthenware jug was found in a hole in the rock further south. On the north wall also a deeply engraved letter H was found, and splashes of both red and black paint. These are supposed to be only masons' marks. The H may be a Phœnician "Cheth." A diagram of the stone with the markings will be found in our last number.

The explorations of the ancient aqueduct conveying water to Jerusalem from the sealed fountain and pools of Solomon at Bethlehem, are also of great interest.

A shaft was discovered, south-east of the south-east corner of the "Cœnaculum," in the convent of Mount Zion on the southern slope of that hill, 50 ft. above the present aqueduct. The shaft was of a square section, 2 ft. wide, and at a depth of 16 ft. opened into the ancient aqueduct, which was traced north-east for 300 ft. and 200 ft. west; its appearance was similar to the rock-cut passages of the Triple gate. It was traced to the English school, near which it crossed the modern aqueduct, where it was lost. The course is extremely zigzag. An attempt was made to find the other end of the line at Bethlehem, but without success, though there is little doubt that it led thence probably to the Temple area, which derived the greater part of its water supply from it.

There now only remains one other exploration to describe, that near the Pool of Bethesda or Birket Israel, a large tank to the north of the Haram enclosure, and immediately below the wall, measuring some 350 ft. from east to west, and 100 ft. from north to south.

The tank discovered was entered from a small garden, forming part of the northern end of the Haram enclosure, and entered by a narrow shaft leading into a little chamber 6 ft. square, through which it descends to the bottom of the so-called tank, a depth of 45 ft. in all.

This tank is situated under the Haram enclosure, and proved to be of large size, 63 ft. from north to south, and 57 ft. east and west; the interior of its north wall 24 ft. within the exterior of the north Haram wall, its height 28 ft. It is described by Lieutenant Warren as consisting of nine rectangular basins, formed by

* See p. 238, ante.

four piers; those arches springing from the northern piers are stilted, but the form of those from the southern is not ascertained. The dimensions are irregular. The piers and arches covered thickly with plaster. The arches support nothing, and are 14 ft. to the crown from the floor. The roof is vaulted, and intersects the piers with the sides of the vault have cut stone surface ribs. The appearance of the whole is dissimilar to any other of the Haram vaults, and this discovery is most interesting as being the first attempt at subterranean exploration on the north, hitherto entirely unexplored.

The construction is said to be similar to that of many Roman tanks at Naples and Bajæ, as well as at Constantinople.

Such, briefly described, are the discoveries which, in the two last years, with great perseverance and patience, under the most difficult circumstances, in want of men, materials, and money, aided by any European, except one sergeant of the Engineer corps, and with unskilled and stupid natives, Lieutenant Warren has made. They include the explanation of the true appearance and arrangement of the Temple enclosure. The discovery of a building outside its wall entirely lost, the probable rediscovery of one of the ancient towers, and of a large portion of the city wall, besides the exploration of the aqueduct, and of innumerable tanks, passages, vaults, and subterranean communications.

The work, instead of being regarded as scanty and desultory, thus appears, when summed up, to be as satisfactory as could have been expected when the circumstances of time and place are taken into account, and is interesting on its own account as well as in showing the immense amount of hitherto unsuspected and most valuable information which lies buried beneath modern Jerusalem.

It may not be out of place here to hint in what quarter the researches might with great advantage be pursued, and especially as it has never before been pointed out.

There can be no doubt, when we take into account the description by Josephus and other historians, that Jerusalem, in the time of its greatest prosperity, occupied a space nearly three times as great as that on which the modern town stands; and, as natural features prevented its growth east and west, this space must have extended north and south of the present city. Hence there must be on Mount Zion, to the south of the present city wall, and on the broad plateau on which the New Jerusalem or Russian town stands, a large field for exploration hitherto untouched.

The depth of *débris* on Zion, which is greater than that in any other part of the city, would seem to favour this supposition, as it extends far south of the modern wall. And to the north, remains have been discovered by the Russian consulate, which also intimates that much is here to be found. The advantage of exploration in these parts is, that as they are free of houses and other obstructions, there would be less difficulty and expense in conducting it in these parts; while there can be little doubt that some of the principal buildings of ancient Jerusalem lay without the walls of the city now existing.

It would be most interesting also, and most instructive, to follow the course of the city wall discovered at Ophel, and to trace its course on Zion, for the position and extent of the walls of the ancient city (a subject on which, owing to the entire absence of landmarks of any kind, much needless controversy has arisen) is one of the first and most important points in the rediscovery of Jerusalem, a fact which has been already noticed in these columns.

It is curious also, that while on the south and north so much has been done at the Haram enclosure by Lieut. Warren, still on the west he has not yet attempted any investigation besides that of the Tyropean bridge; but this is no doubt owing to the great difficulties arising from the number of houses and bazaars which lie against the wall. There was, however, discovered on this side by Dr. Barclay an ancient gateway, almost buried below the present level of the street, which was explored by M. De Vogüé, and has already been described, together with the passage walled up at its eastern end which leads from it. Would it not be possible to investigate this more fully, and even to pass that wall, behind which it is possible a communication with the southern vaults may exist, and perhaps a system of passages and halls buried in the heart of the mountain, of which we have at present no information? It may be remarked

that the line of this passage, the entrance to which was known as the Single Gate, before that name was given by the Lieutenant to the entrance discovered by him on the south, abuts on the end of the gallery from the Double Gate.

There is also another point which demands attention,—the discovery of the towers of Jerusalem. Of the great fortresses, Hippicus, Phasaelus, Mariamme, and Psephius, not a vestige remains above ground. It has been supposed that a small tower of utterly different and inferior dimensions, on the west side of Jerusalem, near the gate of Bethlehem, or Bab el Khalil, known as the Tower of David, is the ancient Hippicus; but of this there is no proof whatever, and the rebated stones of which it is built are greatly inferior in size to any found in any of the really ancient masonry, and perfectly different in character. To discover, therefore, the foundations at least, and probably more, of these great buildings is a work to which we look forward with interest. The towers stood on the west wall, where the ground was lowest, and one at least (Psephius) must have been considerably north of the present town.

In conclusion, it is to be hoped that the work left untouched for ages, and now at length commenced, will not be allowed to come to a stop, when so much has been done, and the promise of so much more been given, through the want of funds, and that thus the credit of this great discovery will be reserved for Englishmen. It is to be hoped that, while no time or money has been spared in bringing the small Roman city, which occupied no place in the history of its time, from under the ashes of Vesuvius to the light of day, a no less active interest and energetic support will be felt in, and given to, the re-discovery of a great city, which holds so unrivalled a position among the ancient capitals of the world.

ON THE ART OF VALUING AGRICULTURAL LAND, AND ON THE INDICATIONS OF THE VARIOUS QUALITIES OF SOILS.*

THERE are probably few subjects within the whole range of the profession which oblige the surveyor to rely so entirely upon his own judgment and knowledge, as the determination of the rental value of agricultural land.

When an estate is to be sold, it may be observed that almost every probable purchaser has his own opinion as to the number of years' purchase it is worth, whilst, for the great body of the public, the actual existing rental must necessarily be taken as the only available basis, until professional advice is obtained to test it.

Again, in valuing house property, it is often possible for those who have little previous acquaintance with a locality to form something like a fair estimate of the rental value of a house, by comparing it with other houses of which the rents can be ascertained; and similar comparisons can often be instituted in the case of building or accommodation land, or almost any description of property depending for its value mainly on position, whilst it is seldom difficult roughly to calculate the cost of any building.

Such aids to the judgment are not to be had when walking over a farm; for, as we all know, the variations in the qualities of the soil are far too sudden and uncertain in most districts, for the rental value of one estate or farm, or even field, to be deduced from that of those near it, whilst the indications of fertility or barrenness, though plain and reliable enough to those who know how to read them, are not usually apparent to the ordinary eye.

The principles on which the amount of rent should be arrived at, and the indications of rental value afforded by land, form therefore, I venture to think, one of the most interesting subjects for discussion by the members of our institution.

The rent of land, we are taught by Ricardo and the political economists, consists of the difference between its "net produce" and the net produce of the worst land which it is worth while to cultivate at all; the term "net produce" indicating what is left after deducting the tenant's interest on his capital, and remuneration for his own labour and superintendence, as well as the actual working expenses. That is to say, that if the produce of a piece of land will

barely cover such interest and tenant's profit and expenses, it is just worth cultivating, but only at a nominal rent; whilst, for a more fertile piece of land, the tenant can afford to pay the value of the whole of the increased net produce, though in estimating this it must be borne in mind that the more productive land will involve a larger deduction for interest on capital as well as for heavier rates and taxes, and some increase of expenses consequent on larger crops.

The late Robert Baker, in his edition of "Bayldon on Rents and Tillages," suggests that the rent is to be calculated by estimating the expenses incurred and the profits arising during the whole course of one rotation of crops on different soils; and he very justly observes, that the land valuer must be constantly alive to the changes in the market price of the various articles of produce, and, he might now have added, to the supply of agricultural labour in the various localities. He also remarks, that the cost of cultivating various soils differs so greatly in proportion to the gross produce obtained (especially in these days when, by high farming, the increase of the gross produce depends so greatly on the skill of the farmer and on the investment of capital), that the notion which seems to have formerly prevailed that a fourth or fifth of the money value of the produce will represent the rent, is fallacious in the highest degree. There can be no doubt of the truth of this last remark; the calculations suggested by Mr. Baker are, theoretically, the only sound basis for determining rent, although he has to admit that experienced valuers do not, in practice, rely entirely or even principally upon them. The truth is, that such calculations are liable to be seriously altered by such comparatively slight variations in the estimated produce and expenses, that although many intelligent farmers could apply them to their own farm or even parish, comparatively few men are able to carry them much farther, and the possession of accurate data for their general application implies a degree of experience which renders them almost superfluous.

I think the sound plan is to go carefully into these calculations as to the best and worst qualities of both light and heavy arable and pasture land, so as to form and keep a well settled scale of values, to be filled up on going over each estate.

An actual knowledge of the rates at which the various classes of land are freely hired by good tenants is also, I need hardly say, a most important practical test of the accuracy of such individual calculations, and is gradually acquired by the negotiations incident to the practice of a land agent; but whatever the method by which the valuer fixes in his mind his scale of rental value, what he has to do, in looking at any particular field or estate, is to obtain such indications of its quality as will enable him unhesitatingly to give it its true place in this scale.

The great majority of farmers, I believe, judge entirely, or almost entirely, by the crops, and they usually give surveyors the credit for doing the same. I have often been amused, in walking over a farm in company with the occupier, at being told incidentally, that he did not know what sort of field such a one was, because he had only had it four or five years, and he did not know yet what sort of crops it would bear. The same notion probably has something to do, along with many other causes, with the circumstance that instructions for such a large proportion of valuations are given about the time of year when the land begins to be so covered with crops that it is increasingly difficult and laborious to examine it. If the object be to advise a tenant whether to hire a farm or not, it may be very desirable to judge from the crops what condition it is in; but it may be safely asserted, that the valuer who allows them to influence his judgment in determining the permanent rental value, is very liable to fall into serious error—over-valuing poor land which has been highly farmed, but under some new tenant will some day return to its poverty, under-valuing mismanaged land, which possesses the power of producing good crops with proper treatment. The local knowledge, which is thought so much of in some quarters, and which is founded on the reputation of different farms according to their former crops, is not an affair of judgment at all, but of traditional knowledge, and is totally different in its very nature from the judgment of a surveyor founded on his own observation. The one is useless directly it passes out of its accustomed locality; the other is of general application. The one cramps the mind by accustoming it to trust to traditional reputa-

* By Mr. Philip D. Tuckett, read at the Ordinary General Meeting of the Institution of Surveyors, March 22nd. Mr. Henry Arthur Hunt, Vice-President, in the chair.

tion, which is only the general opinions of the casual observer; the other strengthens the judgment and prepares it for dealing with new subjects as they arise. Few things are so easily acquired with a little inquiry and trouble as such local information on any given point—few things are more difficult to obtain than a good sound independent judgment upon it.

But to return from this digression. Although it is exceedingly dangerous to attempt to judge of the quality of a soil from the crops grown upon it in one particular year only, still many most useful indications may be obtained from its more permanent products, especially from the trees and grasses. Most of our ordinary forest-trees have special proclivities for the various soils on which they flourish, and a careful observation of their growth, and of the hedge-row, affords information which will seldom mislead. A really thriving elm-tree or hazel cannot be found where there is not a good mixed soil; whilst an abundance of oak and blackthorn are indications of heavy land, and the growth of the trees will generally correspond with the depth and quality of the soil. The alder and the willow are only found in wet places, chiefly by the waterside, and the poplar usually in wet places. On the other hand, coniferous trees prefer the lighter soils, and the Scotch fir grows on thin lands which will produce nothing else except heather; and the beech, though it will grow elsewhere on good land, is usually indicative of a calcareous soil. The sycamore is partial to light or sandy soils, whilst the walnut, and I believe I may say the maple also, usually grow on good mixed loams. The ash is scarcely a sign of any particular kind of land; if it is of rapid growth, it indicates good land; if in poor stiff clay it is constantly met with, but is of slower growth and often stunted. The white thorn, if it grows rapidly, is a sure indication of good land; and one never sees a stinging-grown quick-fence on inferior soils.

The various permanent grasses which make up the swards of an old pasture, and even the weeds found in the land, and the character of the growth of both, form most valuable indications of the quality of the land.

This part of the subject is treated in great detail in a long and admirable essay by Mr. Bravender, published in the fifth volume of the "Royal Agricultural Society's Journal," to which I would refer those who desire a greater amount of botanical detail than I can afford space for in this paper.

It is estimated that the distinct species of natural grasses, natives of this country, are in number about 150 or 160, whilst those which are recognised as covering the surface of good old pasture land, number, I believe, only about 18. It is said that a square foot of old pasture or meadow land contains about 1,100 plants, a square foot of water meadow about 1,800, and a square foot of a crop of grass seeds on arable land only about 80. The species of the best permanent grasses being so moderate in number, it is worth while to learn their names, and also to recognize them at sight when in flower.

They are as follows:—

Daactylis Glomerata	Cook's-foot Grass
Allopecurus Pratensis	Meadow Fox-tail
Festuca Pratensis	Meadow Fescue
Festuca Durtuscula	Hard Fescue Grass
Phleum Pratense	{ Greater Meadow Cat's Tail Grass
Anthoxanthum Odoratum	{ Sweet-scented Vernal Grass (which gives its scent to Hay)
Avena Pratensis	Meadow Oat Grass
Avena Flavescens	Yellow Oat Grass
Cynosurus Cristatus	Crested Dog's Tail Grass
Holcus Avenaceus, or Arrhenatherum Avena- scum	Tall Oat-like Soft Grass
Hordeum Pratense	Meadow Barley Grass
Lolium Percenne	Rye Grass
Poa Annua	{ Annual Meadow or Suffolk Grass
Poa Trivialis	{ Rough Stalked Meadow Grass
Poa Pratensis	{ Smooth Stalked Meadow Grass
Trifolium Pratense Perenne	Perennial Red Clover
Trifolium Repens	White or Dutch Clover
Vicia Sepium	Creeeping Vetch.

All really good pastures are composed chiefly or almost entirely of the above grasses; leafy plants take up so much space in proportion to their produce, that they are necessarily wasteful, even when not otherwise injurious. The proportion in which these best grasses occupy the surface is a pretty sure indication of quality.

Mr. Bravender, in the paper above mentioned, gives several lists of flowering plants and natural grasses, with their several indications; but, with a view to condensation, I shall confine myself to

selecting only a few specimens and arranging them into two very important divisions—a few of the principal plants indicating cold wet land, and a few of those found on very dry soils; because, as the valuer visits the land in all sorts of weather and at different seasons, he may be principally dependent on vegetation to tell him whether a field is injured by excessive wet in its ordinary condition, or, on the other hand, whether light land is excessively dry and likely to burn, whilst of almost everything else he can always judge by other means; and because, if one attempts to extend such lists too far, the indications intended to be derived from them become less clear and simple. It is a very curious fact that the herbage of a wet grass field almost entirely changes when it is drained: this is the reason why people used to say that grass land could be easily over-drained, and was often injured by draining. The fact is, wet grass land is injured by draining for two or three years, the old grasses dying off and the better ones not having yet fully taken their place.

PLANTS INDICATING COLD WET LAND.

Agrostis Palustris	Marsh Bent Grass
Aira Aquatica	Water Hair Grass
Aira Cuspidata	Tufted Hair Grass
Allopecurus Geniculatus	Floating Fox-tail Grass
Carex	Carpet Grass
Centaurea Calcitrapa	{ Blue Bottle, or Star Tribble
Colpus Palustris	Marsh Plum Thistle
Hippuris Vulgaris	Marsh Maid
Potentilla Anserina	Srifer Weed
Primula Veris	Cowslip
Rhinanthus Cristif. Gallii	Yellow Rattle
Scabiosa Succisa	{ Devil's Bit Scabious, or Blue Button
Tussilago Farfara	Coltsfoot.

PLANTS INDICATING VERY DRY LIGHT SOILS.

Agrostis Vulgaris	{ Common or Fine Bent Grass
Aira Flexuosa	{ Wavy Mountain Hair Grass
Aira Cristata	Crested Hair Grass
Campanula Glomerata	Canterbury Bells
Campanula Rotundifolia	Heath Bell Flower
Erica Vulgaris	{ Common Heath, Ling, or Heather
Festuca Grina	Sheep's Fescue Grass
Galium Verum	Yellow Ladies' Bed Straw
Onobrychis Sativa	Wild Sainfoin
Thymus Serpyllum	Wild Thyme.

In addition to the species of grasses, a good deal may be learned by the character of their growth. On good land the blade grows full and broad; on poor wet land it often looks stunted; whilst on thin sandy soils it is apt to be thin and wiry.*

NOTES AND CIPHERS.

THE other day, for want of something better to do, or for the reason why a well-known young man in the poem "whistled as he went," namely, "for want of thought," we looked over a couple of hundred ordinary replies to an ordinary invitation, "So-and-so solicits the honour of So-and-so's company," and "So-and-so will be happy to come," or he won't be, according to circumstances, or she won't be, according to gender. Lazily turning over the glossy sheets, and almost sent into dreamland by the constantly-recurring formula, two things struck us, and one of these things was this thing,—that amongst the respondents there were forty educated men and women who said, "we will have the pleasure of accepting the polite invitation." Speaking from knowledge of those who thus write, one would say there surely must be some way of defending this mode of expression (a parson, a painter, a poet, a peer, and a parliament-man are amongst those who use it; and it is even printed on cards and sheets of paper in blank, to save the time of the overwhelmed, and sought for); but, for the life of us, we cannot find it. They do accept, they are accepting; invitation is the present act of inviting, and that present act they accept; they do not intend to do it to-morrow, they do it when they write. Quite properly they "will avail themselves of" an invite, "will have the pleasure of coming," or "will accept your hospitality;" but as to the invitation, they do then and there accept it; there is no "will" in the case; so, to misapply Longfellow's line,—

"Trust no future, however pleasant."

The other thought that forced itself upon us was one adverse to the present universal adoption, even by those who have historic crests, of what are called Monograms, but which are for the most part nothing more than idiotic and contorted groups of letters, often illegible, and oftener still wholly unsuggestive of the information intended to be conveyed. What

* To be continued.

is really a monogram? A *monotheist* believes in one God; a *monologue* is a speech uttered by one person; a *monodrama* is a dramatic performance by one actor only; a *monosyllable* is one syllable; and a *monogram* is one letter or a character done at one writing; that is, with a continuous line, though compounded of several letters—*monos*, one, and *gramma*, a letter. One might as well call three or four stones leaning against each other a *monolith* (*monos*, one, and *lithos*, a stone), as three or four distinct letters, because gloriously jumbled, a monogram. Still, what's in a name? A nose by any other name would smell as well; so pass by the name and look at the thing itself. The great majority of these ciphers are altogether unintelligible. There is a proper system which, if followed, would make them always understandable, at any rate, by those who know the system. But in practice, as a rule, there is no rule, and confusion worse confounded results.

Thus, on pious Mary Anne Dickon's envelope we get three letters, very blue (suggestive of "deep read"), lovingly entwined, but whether they are meant to suggest M. A. D., or say D. A. M., is no more easily to be divined without extraneous knowledge than you can understand from the so-called monogram of our wild friend Trimmer, christened Richard Andrew, whether he means it to convey R. A. T. or T. A. R. An astute doctor of our acquaintance, a strict monogramist, has twisted his R. and his T. and his D. about till they resemble nothing so much as the cipher of the Grand Turk; and one of the most refined and dignified of ladies, high in the social scale, assures every one at the top of her notes, and in violent tones (of colour), that she is L. O. W.

However, this is but a fashion, and we have the comfort, if it be one, of believing that long before people have left off saying they will have the pleasure of accepting what by that saying they do accept, they will return to their proper crest if they have one, and make their cipher intelligible if they have not.

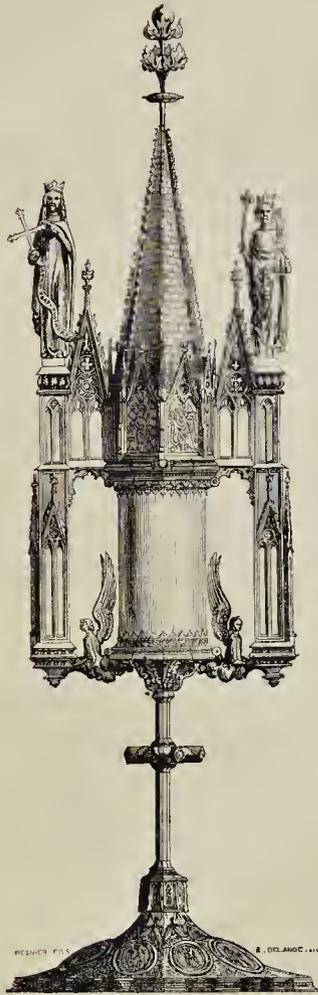

DEMOLITION OF HOUSES UNFIT FOR HUMAN HABITATION.

AT a meeting of the City Commissioners of Sewers a report was brought up from the Sanitary Committee condemning the premises Nos. 1, 2, 3, 5, 6, 9, 10, and 11, Sun-court, Golden-lane, as unfit for human habitation, and recommending that it be referred back to the committee to take steps under the "Arisians and Labourers' Dwellings Act, 1863," for their demolition. A discussion of some length took place upon the subject, and, in reply to Mr. Bedford, it was stated that the commissioners had no authority to erect new buildings in place of those proposed to be taken down, although that appeared to have been originally contemplated by the Act referred to in the report of the committee. The chairman stated that the materials of which the houses were composed would not cover the cost of demolition. The commissioners, however, had power to make a rate of 2d. in the pound for the purposes of the Act; but that would be equivalent to such a large sum that, unless they were engaged in very extensive alterations, it would be unnecessary. Mr. Baylis, the solicitor to the commissioners, stated that there was power given to charge the land with the expense incurred, and in reference to some observations made by hon. members that they could not understand the provisions of the Act, remarked that the measure had been so much altered in committee as to make it a jumble, and some local authorities had given up all idea of putting it in operation. Mr. Gove asked, "What was the meaning of a house being unfit for habitation—whether it was dangerous to the public, or simply in a filthy state owing to the habits of the inmates?" Replying to the question, Mr. Hayward, the surveyor, read his report upon the state of one of the houses. Its general condition was as follows:—

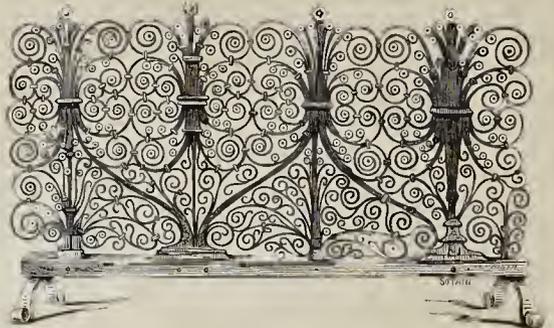

"The floors and ceilings throughout were considerably out of level. Some of the walls were saturated with filth and water, and others were broken and fallen down. The doors, window-sashes, and frames were mostly rotten and in a very dilapidated state; the stairs were also dilapidated and dangerous, and if a person were to jump upon them they would very probably give way; the fastenings to the doors were in nearly all cases broken or torn away. The roof was leaky, and admitted the rain. There was a closet used in common by the inmates of this and of seven other houses in the court, and it appeared by the report that it was in a bad state, owing to the drippings from the cistern. The only water supply was from this cistern above the closet."

In the result the report was adopted, and the houses will accordingly be demolished.

SCULPTURE IN FLORENCE.

"DEATH AND HONOUR," a group commemorative of those who fell in the late American war, recently executed in Florence by a young artist, Mr. Pierce Connelly, announces such talent and power of imagination as certainly should not pass unnoticed. Setting aside the accidental and local in his subject, the sculptor treats it in the purely abstract and moral aspect, or, we may say, as an allegory illustrative of an enduring truth. It is "Honour arresting the Triumph of Death," which is, in fact, the subject here presented in a group of five figures, Death, himself, being mounted on a horse, and with masterly skill in the treatment of a composition so difficult; the number of figures and serenity of action demanding so much both of inventive power and technical science. Besides Death and Honour, the other personages introduced are also allegorical representations of abstract forces, namely, Courage, Perseverance,

and Strength, who are all cast down before the career of that king of terrors, but not alike subjected to him. Strength, who seems to have first fallen, still holds his broken sword in his hand; Perseverance desperately grasps the scythe with which Death is mowing down his victims; Courage, though prostrate and actually beneath the lifted hoof of the conqueror's steed, rears himself with gallant effort, and aims a blow with his battleaxe at the enemy about to ride over him; Honour alone, the figure whose heroic grace and expressive action at once arrest attention, with helmeted head, but otherwise unarmed, and calmly triumphant, "severe in youthful beauty," opposes the headlong career of that shadowy king, and tears down the banner which, as well as the scythe, are the symbols of conquest borne by him. As for this personified Death, so rarely represented in Christian art save in forms that are grotesque and revolting, we see here an aged warrior, of wiry and sinewy frame, terrible, not hideous, in

aspect, with crowned head, and body partly clad in close-fitting chain-armor, his actions indicating the sudden check of an onward impetuous career, and the indignant astonishment excited by unlooked for opposition, strikingly expressive and dramatic.

This group has not yet been executed on a large scale, but is intended, as theme and composition obviously require, for the colossal. It seems to us to fulfil the high conditions of sculpture in illustrating the inner and moral reality of things, the principle that abides permanent amidst the shifting varieties of time and place.

Proposed Infirmary at Rotherham.—The building committee of the proposed new Infirmary at Rotherham have work before them, upwards of ninety sets of plans having been forwarded to the honorary secretary in reply to the advertisement offering prizes for the best designs.

ST. MATTHEW'S CHURCH, UPPER CLAPTON, MIDDLESEX.—MR. FRANCIS T. DOLLMAN, ARCHITECT.
[See p. 262, ante.]

ROYAL COMMISSIONERS' REPORT ON
THE BUILDING TRADE-UNIONS.

THE eleventh and final report of the Royal Commissioners, who were appointed to report on the working of trade-unions, is now in the hands of the public. The Commissioners seem to have paid especial attention to the unions connected with building trades. With the officers of these societies they commenced their investigations, and examined no fewer than thirteen of the officers connected with the carpenters', joiners', masons', plasterers', bricklayers', and painters' societies. They also examined thirteen gentlemen connected with the various branches of the trade, but who had no connexion with the union except so far as the working of them on the trade are concerned. The Commissioners in their report say under this heading—

"EFFECT OF UNIONS ON TRADE.

(51). The effect which unions have had in impeding the development of trade, whether by simply raising prices, or by diverting trade from certain districts, or from this country abroad, is a matter excessively difficult to determine. (52). There are many rules and practices of which the effect must necessarily be to enhance the price of commodities by raising the cost of production. But whether such rules and practices are not far less effectual than is commonly supposed, is a question incapable of solution without an investigation extending to a great variety of subjects besides that directly submitted to us. (53). The industries on which trades' unions may be supposed to have had an effect must be divided into two classes—those in which foreign competition cannot, and those in which it can, materially interfere with the productive industry of the country. (54). In the first class, there is nothing *a priori* to prevent the operation of trade-unions from raising the cost of commodities until the rise is checked by the diminution of consumption. Such an instance is afforded by the various trades in building. We are disposed to think that the operation of trade-unions may have tended to enhance in these trades of late years the cost of production, and that houses and other buildings might have been somewhat better and cheaper at the present time had not trade-unions interfered so extensively and so vexatiously with the proceedings of the employers. It does not necessarily follow that they have raised wages in those trades, and improved thereby the condition of the workman; the contrary, in the long run, is more probable. (55). The other class of trades—that class in which production may be interfered with by foreign competition—is far more important. But we are compelled to admit that we have been unable to arrive at any very definite solution of the problem whether or not trade-unions have had of late years a mischievous operation in this direction."

They frequently single out the evidence given in connexion with the building trades as worthy of remark as well as to show the working of the unions. We give a few of the many examples. Speaking of the monopoly of the work of a district, the Commissioners say—"A society of brickmakers claim an extent around Manchester in every direction equal to an area of 120 square miles as their peculiar district, within the limits of which they permit no bricks to be made except by Manchester union men, nor any bricks to be used except those made within the district. They accomplish the latter object by means of an alliance with the Manchester Bricklayers' Union, the members of which will not set any bricks not made within the above-named district."

Referring to the interference of trade-unions with the employers, the Commissioners say, "A union of bricklayers at Manchester interfered to insist that a Manchester builder, constructing a railway station at Bryn, should take at least half the men from Manchester; whilst the National Association of Operative Plasterers interfered to require an employer whose head office was at Manchester (although he had a branch office at Bolton) to pay Manchester wages for a job at Bolton." Again, the Commissioners are told by Mr. Conolly, who is a member of the Operative Stone Masons' Society, that the rules

"Are made for men, not for masters. We do not take masters into the account at all in the arrangement of the matter; we merely look upon them as men who step in with their capital, and who want to get the greatest profit they can out of their capital, whilst we want to get the greatest profit we can out of our labour; and we find that by an arrangement of this sort, without depriving society of the advantage of the skill of its members, we can gain our object."

Mr. Hughes and Mr. Harrison sign a dissent which they term "conclusions from evidence." They point to the great extent and increase of unionism, and to the improved character of unions of late years. Well-established unions, they urge, rather diminish the frequency and disorder of strikes, and are, on the whole, beneficial in their operation. It is affirmed that the workmen generally are not opposed to the use of machinery. State interference in the matter of apprentices is deprecated. It is difficult to estimate the effect of unions on foreign trade, but it is admitted that it is sometimes mischievous. Masters' associations are held to be

open to the same objections as those of the men. They recommend that unions should be capable of suing and recovering at law contributions, arrears, and fines against their own members. Unions ought not to be capable of being sued or dissolved. It is not deemed expedient to change the position of trade-unions as clubs. It is also deemed inexpedient to give a legislative character to Courts of Conciliation or Arbitration, but to give facilities for their establishment and for enforcing the agreements made under them.

ANTIQUITIES AT WEYMOUTH.

THERE has been lately exposed by the action of the sea encroaching on the land, about one mile and a half south-west of Weymouth, a circular construction of very ancient date, made of well-puddled clay, about 6 ft. or 7 ft. in diameter, and about 2 ft. deep, having two rectangular openings about 1 ft. wide, one to the south-east and another to the south-west. These openings were lined with slabs of Kimmeridge shale, about 2 in. thick on edge, and across these was laid a smaller slab. The south-eastern opening, however, had a third slab on edge midway between the two others, either to divide the outlet into two, or assist in supporting the top or covering slab. The clay forming the outer edge of the pan was sloped from the rim about 2 ft. outwards, till it reached the level of the ground. May it not have been an ancient salt-pan? About fifty yards off are remains of Saxon masonry, also a number of fragments of ancient British and Roman pottery, and articles used by the ancient Britons.

R. T. SMITH.

THE PROPOSED LAW COURTS' SITE.

At the second meeting of the Thames Embankment Committee appointed by the Society of Arts, Lord Elcho being in the chair, Sir Charles Trevelyan brought forward, as a written statement under six heads, his views on the advantages of the Thames Embankment site for the Law Courts. Mr. Edwin Field combated each of them *seriatim* with his usual vigour. Mr. Street took the view that we have felt compelled to adopt, that the change would not be a wise step. In the course of replies to Sir Charles Trevelyan, he said it must be remembered that on the Embankment site there was a fall of about 32 ft. from the Strand, which was a very serious difficulty; whereas, on the Carey-street site, by a slight alteration in the level of Carey-street the whole fall from front to back had been reduced to about 12 ft. From an architectural point of view he did not conceive that the building itself, or London in general, would be improved by the Embankment site being selected in preference to the higher one in Carey-street. They all knew the great effect which was produced by the upper part of St. Paul's standing up from the surrounding buildings; and his own opinion was that, looking only to his own reputation in time to come, it would be quite as much consulted by putting the Law Courts on the Carey-street site as on the bank of the river. He believed that the general impression as to the grandeur of Somerset House was derived much more from the view of the quadrangle from the Strand than from the river front. He was convinced that it would be damaged by any higher building adjoining it, which would be necessary in the case of courts of justice. There were one or two points which he had hoped would have been touched upon, one being the question of the railway-station, which, as sanctioned by the Act of Parliament, would be right across Surrey, Norfolk, and Arundel streets. It would be necessary to make the station a part of the building, in order to preserve anything like a good architectural effect; and there would be the danger of inconvenience arising from the smell of the burning coke, and from vibration. Then, if a rising road were constructed under the building, as was suggested, a great deal of valuable space would be wasted. His own opinion was, that the proper way of making an access to the building itself and to the Strand from the railway-station would be to have an open thoroughfare at the end, and that would at once get rid of about half the additional space. If they built close up to the Temple, they would have to pay for interfering with the ancient lights. He arrived altogether at the conclusion that the superior height of the Carey-street site gave it the advantage, and the fact of the building being slightly encumbered by other erections

he did not consider at all a drawback. On the contrary, it rather tended to make the perspective more picturesque, and to increase the apparent scale of the building. He would further only say at present that the Carey-street site gave a much better and wider opening towards the Strand than the other site; and also that it had the advantage of wide thoroughfares all round its four sides, so as to allow of all traffic to the offices being kept out of the building; whereas Sir C. Trevelyan's plan, by doing away with roads on the east and west points, would necessitate all the carriage traffic coming into the internal quadrangles, and so increasing the noise very greatly.

THE VOLUNTARY ARCHITECTURAL
EXAMINATION.

At the last meeting of the Institute of Architects the chairman announced that no application had been received from any candidate for the Voluntary Architectural Examination of 1869. In reference to this subject, the following resolutions of the council will be submitted to a special general meeting, to be held on the 6th of April next:—

1. That passing the Voluntary Examination ought to be followed by advantages such as will promote the advancement in life and in the profession of the Student.
2. That each Candidate who passes the Examination should receive a formal acknowledgment of his having passed.
3. That passed Students in the Class of Proficiency should become, *ipso facto*, Students of the Institute, without further payment, for as many years as they have paid guineas.
4. That the names of Candidates who have passed in the Class of Distinction be notified to the Board of Examiners for District Surveyorship Certificates, when such Candidates present themselves for Examination before that Board; and that their Examination Papers be also forwarded, if the Board requires to see them.

AN ENGINEER FOR CALCUTTA.

THE Justices of the Peace for Calcutta are seeking to obtain from England a properly qualified Engineer, and propose to offer these terms:—

1. Salary to be Rs. 600 per mensem, with an annual increase of Rs. 100 per month annually, up to a maximum of Rs. 1,000 per mensem.
2. His passage to India to be paid by the Justices.
3. That he be not engaged for any definite period, but that, in the event of his services being dispensed with before the expiration of three years, he receive three months' notice of the termination of his engagement, and that in that case his passage back to England be paid by the Justices.
4. That the engineer have the option of throwing up his appointment by giving three months' previous notice.
5. That, in the event of his doing so, he shall not be at liberty to accept any other employment in India.

The Calcutta *Engineers' Journal* combats the propriety of the last condition, urging that the return of his passage-money is as much as the Justices should require.

THE NEW NORTH-EASTERN AND THE
LONDON AND NORTH-WESTERN RAIL-
WAY STATION AT LEEDS.

FROM plans and specifications which were designed by Mr. T. Prosser, of Newcastle, the architect to the North-Eastern Railway Company, a new station has been erected in Leeds for the joint use of the North-Eastern and the London and North-Western Railway Companies. The station has been raised on arches, which cover about seven acres and a half of ground, and are computed, including the station itself, to have consumed about 18 millions of bricks. The building is situate near to Wellington-street, and is for the most part composed of iron and glass. In the mid-space are two elongated buildings, which provide waiting and refreshment rooms, looking-offices, &c., which will be used jointly by both companies. Facing the entrance from the street an oval-shaped building has been raised; to the left of which will be the looking, left-luggage, and parcel offices. These departments are separated by a passage 14 ft. wide and 75 ft. in length. There are two docks for passenger traffic, one belonging to each company. That set apart for the London and North-Western contains four lines of rails, with platforms on each side 25 ft. wide. The platforms are 630 ft. in length, and are covered for a distance of 302 ft. The dock owned by the North-Eastern Company has also four lines of rails, with platform accommodation to the extent of 940 ft. in length, the roofing over which extends to a distance of 513 ft. There are also several lines laid down, which will be used for goods

traffic. The wide spans and the altitude of the various ridges give the structure an imposing appearance. The greatest span is to be found on the side set apart for the London and North-Western Company at a point near to the hooking offices, where it is not less than 92 ft. across. Over that part of the station used by the other company there is a span of 68 ft.

The contractors for the whole of the roof-work were Messrs. Butler & Pitts, of Stanningley; whilst Messrs. Thompson & Co. contracted for the other work.

INDUSTRIAL PARTNERSHIPS FOR CABINETMAKERS.

Sir,—Returning to the position of the English cabinet-makers, in support of my hypothesis of industrial partnerships producing a great and beneficial change, one much desired by art patrons and all philosophic minds, there are numerous proofs of its success, and in businesses where there is not one tithing of the incentive necessary for its adoption as there is in the cabinet trade, where the workman is intrusted with material that is expensive, and if not used judiciously causes enormous waste, and also if not conscientious he can escape a great amount of physical labour by leaving it to others. It is necessary to do a sound, good work, but which cannot be discovered when put together except by some accident. And there is another thing which should be considered, the workman has to invest his capital in tools, which are very expensive, and when he has got the stock he has to keep that stock up, in doing which there is scarcely a week elapses that it is not necessary to replace some art tools or broken. They cost, in the first instance, about 25*l.*, and he must insure them,—the employer will not do it for him. Every expense in the manufacture of an article of furniture, except the material and the wages, falls upon the workman. There is no wonder he is anxious to be on his own account as soon as possible. It recurs to the reflective mind that the profits of business, either as employer of labour or as dealer, would be more usefully and beneficially employed if more equitably distributed. There are too many drosses. I consider the idea fallacious that education, as it is often expressed and generally understood, will be the harbinger of that happy millennium when no protests or complaints will be heard, and they will be only connected with history. Education awakens the faculties to perceive the anomalous position the worker of that intelligence holds, if he is a worker, relative to the capitalist, and creates the desire of greater equality, greater according to intelligence. There is proof in abundance in the many commercial houses, where their ablest assistants to a share in the profits; it simply sinks into an act of expediency, to prevent them commencing on an independent basis. Selfishness is an inherent principle in man; it grows with his growth; but physical science teaches us that we can make use of Nature's irrevocable laws, and wield her powers to our every requirement and happiness. Social science, if properly understood, would lead to the same goal. My views may appear utopian to some of your readers, but a case in point will not be out of place, which came under my notice a short time ago, and which carries conviction with its statement. Mr. Charles Goodall, printer and lithographer, of Leeds, entertained his workpeople at a repast, and he took occasion to express his opinion in respect to industrial partnerships, which he adopted two years ago, giving 12*½* per cent. of net profits amongst all workpeople employed on the works, the sole proprietary and management remaining in his own hands. He states his high opinion of the principle, where much care and skill was required of the operatives; he unhesitatingly said increased prosperity had manifested itself as the result of increased attention from the *workpeople*. They had also the fact that there was not an unsteady man in the whole place, nor any person who was not a credit to them; and he believed the more was above the average. Now this is a fact, and not theoretical. We enact laws to prevent our fellow-man from injuring us physically, and bind ourselves by the same to him. Why not socially? The neglected apprentice is a social wrong done at the expense of the community, and of the man individually. There are years of labour lost, as often he has to learn his trade when a man, and often never does learn it. Why should not the State step in and look to this evil?

WM. WARREN.

LIVERPOOL ARCHITECTURAL SOCIETY.

At the last meeting of this society, March 24th, Mr. J. Bunell occupied the chair (in the absence of the president), and Mr. Pictou exhibited a number of pencil sketches of various churches and other buildings taken during a tour in the South of England, and of buildings in Norwich, Lincoln, and other towns. He also offered to give a prize of two guineas for the best sketches from existing buildings made by any of the students during the summer recess.

The chairman drew attention to the fact that the time for sending in contributions to the Architectural Exhibition in London was drawing to a close, and hoped that the members of the society would endeavour to contribute largely.

Mr. G. F. Deacon, C.E., then read a paper "On the Aesthetics of Construction," of considerable importance and interest. Referring to diagrams illustrative of the various systems of iron bridge construction in use, he argued that those forms which indicated most obviously the lines of equilibrium of pressure, and showed most clearly the manner in which the structure performed the work intrusted to it, were also those in which the lines were most pleasing to the eye. The box and plate girder, where these lines were not obvious at all to the ordinary

spectator, he characterized as completely devoid of beauty. The straight lattice girder was not in reality much superior, but had a lighter effect to the eye. The bowstring girder, and the principle of two inverted parabolic ribs, adopted by M. Ruppert in his proposed designs for bridges for the Austrian and Asia Minor Railway, showed the visible lines almost coincident with the actual lines of compression and tension; and in the most beautiful of all forms, the suspension-bridge formed by the simple catenary curve, the coincidence was complete. By a table giving the relative weight of material, &c., required in these various forms of construction, he showed that in general the aesthetic beauty of lines of construction was in direct ratio to the economy and stability of the structure. From these premises he proceeded to apply the same considerations to more strictly architectural structures, representing especially that the Gothic style of architecture above all others carried constructive and artistic beauty hand in hand. A lengthened discussion followed, in which Mr. Pictou, Mr. Beloe, Mr. Statham, and the chairman took part.

ARCHITECTS' ACTIONS.

LAMBTON v. ELLIOTT.

THIS case was heard at the Newcastle County Court, before Judge Birchard. Mr. T. Forster appeared for the plaintiff, Mr. George Lambton, architect, Newcastle; and Mr. Joel appeared for the defendant, Mr. Elliott, grocer and draper, Choppington. In September last, the defendant engaged the plaintiff to prepare plans, &c., for a house, shop, and warehouse he proposed building at Choppington. Plans were prepared, tenders advertised for, and the lowest, amounting to 1,213*l.*, was accepted. The defendant, however, did not wish to expend so much money, and the plaintiff, at his request, altered the plans so as to reduce the cost to 940*l.*, and he made other alterations, reducing the cost to 560*l.* Ultimately the defendant wrote to the plaintiff stating that he did not require any further services from him. The plaintiff then sent in his bill for 47*l.* 7*s.* Mr. Charles Francis Johnson, engineer, who had been in the employment of Mr. Lambton, gave evidence as to the drawing of the plans and injustice of the claim. On the part of the defendant, Mr. Joel pointed out that the defendant gave plaintiff instructions to prepare plans for a building the cost of which was not to exceed 600*l.*; but the plaintiff prepared plans for a building to cost twice that amount; and the defendant came to the conclusion that the sooner he got rid of Mr. Lambton the better. He contended that the plaintiff had caused the expense, and brought the loss upon himself. His Honor said there was no doubt the plaintiff had been put to a great deal of trouble and expense. Both parties were to suffer in the action; and, after a great deal of difficulty, he had come to the conclusion that the plaintiff was entitled to recover. He gave a verdict for the plaintiff for 25*l.*

RECENT EXCAVATIONS IN ROME.

THE last pit dug for the British Archaeological Society of Rome on the line of the wall of Servius Tullius between the Coelian and the Aventine, is close under the cliff of the Aventine, and in this pit are now visible two of the subterranean chambers of the *Piscina Publica*, with the *Specus* or conduit of the *Aqua Appia* (made about three hundred years before the Christian era) quite perfect. It is 6 ft. high, with a triangular head, and 2 ft. or rather more wide. The earth has been cleared out of it for some yards, and several English gentlemen have been into it. This remarkable *Specus* had not been found perfect in any of the previous pits; the lower part of it only had been found, and those not accustomed to the subject could not well understand it, but now it is perfectly clear and distinct. This *Specus* is carried upon the Wall of Servius Tullius, built of large blocks of tuff as usual, and is partly cut out of the wall itself, which is now plainly visible and in a cleaner state here than it was found in the other pits across this valley. The most recent excavation is considered by all who have seen it a demonstration of the truth of Mr. Parker's observations. Two years ago he said that this wall and this aqueduct must have crossed the valley at this point; he was ridiculed by the head Roman antiquaries, and their German and French allies. Visconti the Roman, Dr. Hinzow the German, and Rosa the employé of the French Emperor, all agreed that Mr. Parker was entirely wrong, and called by the name of "impudent conjectures" his observations, which were in reality the result of long experience in the modern science of archaeology, which is the opposite of the old school of local antiquaries such as we had in England in the days of good King George III., and such as still are the antiquaries of Rome, few of whom have ever been twenty miles from the place in which they were born. Whereas the modern science of archaeology is grounded on comparison, like comparative anatomy. An experienced archaeologist can

compare the small remains in one place with more perfect remains of the same kind and of the same period elsewhere. He can describe a whole building or an entire ancient fortification from some small remains only, just as an experienced comparative anatomist can describe a whole bird or a whole animal from a single bone. It was in this manner that Mr. Parker was able to see what the primitive fortifications of Rome must have been, and to find remains of them everywhere as soon as he could obtain permission to dig and search for them.

THE PRIZE WORKS AT THE INSTITUTE OF ARCHITECTS.

IN March last the Council offered the silver medal of the Institute to the authors of the best essays on certain subjects; a Special Prize of 10*l.* for the best essay on the application to modern architecture of moulded, shaped, and coloured bricks, and terra-cotta; the Soane medallion (and a possible 50*l.*) for the best design for either a town hospital or a club-house; Mr. Hope's prize of ten guineas for a design for a theatre in accordance with modern requirements throughout, and in harmony with the style of architecture which prevailed during the thirteenth or fourteenth century; and Mr. Tite's prize of forty guineas for a design for the treatment of the river front and existing terrace of Somerset House, in connexion with the embankment road. They further offered the medal of the Institute, with five guineas, for the best illustrations of any building at home or abroad erected before the year 1700; besides book-prizes for students only. Here surely were strong inducements for study and work. Such offers are open doorways through which the student may walk early to a certain amount of distinction, which, though it may operate in only a small circle, will unquestionably help him on his upward way. The response is not adequate, still it is superior to that made on some previous occasions. Thus, for the Institute medal and five guineas there are four exceedingly creditable sets of illustrations of old buildings: Hatfield Hall, marked with a ring; the Abbey d'Or, Herefordshire, marked "Faith;" Wingfield Manor House, "Truth;" and the church of St. Mary Overy, Southwark, "Nemo." For the first, a ring, the council recommend the prize; for the other three a Medal of Merit each. The set of drawings which they recommend for the Soane medallion and 50*l.* under conditions, is a design for a club-house, French-Italian in style, very cleverly set forth in a mode of drawing that is recognizable, and marked "Faith." The design is disfigured by broken pediments, and the inevitable urn, but is in other respects very praiseworthy and deserves the prize. A set of designs marked "Austerne" has a tower that, considering the period and purpose, is simply ridiculous. The set marked "Hope,"—"Scotty" in character,—is Geometric in style, and not had of its kind. The gentleman who marks his design for a hospital "Ah!" must have made the exclamation when he saw how completely he had spoiled the work by his tower and over-hanging turrets. Mr. Tite's magnificent offer meets with no response. For Mr. Hope's prize the Council recommend the drawings for a Gothic theatre, marked "As you like it." It has a high wooden roof, a lofty tower, the main entrance close to the doors to pit and stalls, and is otherwise altogether unsuitable and useless. To set students striving to design Gothic theatres is not the best way to improve our vernacular architecture. An essay on the Revival of Italian Architecture, marked "Madio tulianus ibis" is recommended for the Institute medal; and one on Terra-cotta, with the motto "Wait and Hope," for the 10*l.* premium. The author of the gateway signed "Per vias rectas" well deserves the Student's Prize of hooks.

The Proposed Restoration of New Shoreham Church.—The project restoring the parish church of New Shoreham has been abandoned by the parishioners, the funds promised and collected (about 2,500*l.*) being insufficient to warrant the General Restoration Committee in commencing the work. In consequence of this, the whole of the funds in the hands of the County Committee has been returned to the several subscribers. It is much feared that this old church will shortly fall into utter ruin.

THE TRADES MOVEMENT.

Bricklayers in the Potteries.—Some weeks ago the bricklayers of the Staffordshire Potteries and Newcastle made an application to the builders for an increase of wages, to the amount of a farthing an hour, and a reduction of working hours to the extent of half an hour a day. The demand for increased pay was rejected, and, a reference to arbitration failing to effect the settlement of the difficulty, it became necessary to call in the services of an umpire. Mr. Davis, the stipendiary magistrate, who has before done good service to the building trade by acting as umpire, was again unanimously chosen as final referee. Mr. Davis heard the statements of the representatives of both the men and the masters, and put a number of questions for the purpose of informing himself thoroughly upon the subject in hand. At the close of a prolonged inquiry he intimated that he did not think he should be disposed to make any change in the hours, as preferred the present hours to a change such as the employers proposed, and the latter seemed to have no strong desire for a change. With respect to the question of wages, he would give it careful consideration.

Strikes of Masons.—Two hundred masons in the employ of the Duke of Portland, at Welbeck, have just struck work. A large number of dependent labourers have, consequently, been thrown out of work. The masons seek an increase of wages.

Amalgamated Society of Carpenters and Joiners.—The annual tea, *soirée*, and hall of this society has taken place at the Freemasons' Tavern, under the presidency of Mr. Thomas Hughes, M.P., who was supported by Mr. Edmond Beales, Mr. Mundella, M.P., Mr. Harrison, Professor Beesly, Mr. Baxter Langley, and other gentlemen. Upwards of 400 ladies and gentlemen sat down to tea. The chairman, in his opening address, said he heartily congratulated the society upon the progress it had made during the past year. He heard that the society's funds had increased upwards of 2,000*l.*, that 700 new members had been gained, and that fifteen or sixteen new branches of the society had been established during the past year. That was a very remarkable result. Those present knew that a Royal Commission had been inquiring into the conduct of trade societies. He himself was a member of that Commission, and there was another member (Mr. Harrison) in the room. The general result of the Commission was that the whole of the Commissioners came to the conclusion that the law of this country was unfair to trade societies, and must be altered. He would earnestly impress on these societies the paramount importance of taking care that their members produced the best work it was possible for them to produce. They ought to insist upon the establishment of arbitration courts for the settlement of questions between employers and their workmen. Until such courts were established the great labour question could never be solved. Mr. Applegarth, the secretary, then gave a report of the society's proceedings during the past year, and referred to the report of the Royal Commission, of which he strongly complained. He did not believe that any Parliament would sanction the four conditions which the Commission recommended should be imposed upon trade societies. What those societies wanted was the protection of their funds. They had a right to have their hard-earned savings properly invested. Let arbitration do its work, but as to the rest, let the working men alone. Other gentlemen addressed the meeting.

A HINT TO HOUSEHOLDERS.

OWING to the present custom of shooting the domestic coals into house-cellar through holes in the pavement, we Londoners—and I presume the inhabitants of other towns are fellow-sufferers with ourselves,—have to endure a considerable inconvenience and annoyance which might as well be spared us.

I am not about to complain of the coalheavers; on the contrary, I look to them as my especial helpers in the project of amendment I contemplate. My notion is, that any household who allows the pavement in front of his house to remain disfigured and soiled by the dust that has fallen from his coals during the process of delivery, commits an act of injustice on every passer-by,—on men, through the outrage done to their sense of propriety and cleanliness; on

women, by the same, and the addition of damage done to their dress. Now, for years past I have adopted a very simple plan, by which I save my own feeling of self-respect, and also all risk of annoying other people. Over and above the little *honorarium* the men who deliver coals at my house receive for their trouble, I give them 6*d.*, and a couple of buckets of water, and get them to wash down the pavement before they drive away. They are very glad of the job, and I and my household are equally well satisfied.

Do try to persuade some, if not all, of your readers to consult their neighbours' convenience by following the example of

ONE OF THE PUBLIC.

ANALYSTS' DIFFERENCES.

I SHOULD be glad to obtain, through the *Builder*, information on the following matter:—I observe in the *Builder* of some months back, it is stated that the epidemic which broke out at Terling, in Essex, had been traced to originate in the contamination of the well-water by sewage, and that analyses showed this water to have contained sewage. A similar account of sewage contamination to water supply and epidemical outbreak is also given of Guildford. I want to know where such analyses, together with Government inspector's report, can be obtained, supposing such to have been made, which I understand to have been done.

In looking over a number of analyses of water and of sewage, each by a different analyst, I find that scarcely any two of them agree. I do not mean that where two analysts each test the same water or sewage, or water and sewage drawn from the same source and at the same time, the result given by each is not correct; but I refer to the different modes of expressing such result: for instance, the standard quantity for analysis is taken at one gallon of 70,000 grains by one analyst; another takes 100,000 lb. or parts, and so expresses the result of analysis. So much for the quantity of substance operated upon.

In stating the actual analyses, one operator gives the quantity of earthy and alkaline salts, &c., and organic matter, simply as organic matter, and without any information as to its nature: this is usually expressed in grains.

Another gives the quantity of alkaline and earthy salts, &c., and instead of organic matter simply, he shows it as organic carbon, as organic nitrogen, and as ammonia, or nitrates: this would be in parts of the whole instead of grains per gallon.

Perhaps another would add the quantity of oxygen absorbed from permanganate of potash; and so on with each analyst. I cannot call to mind more than one or two who express the results similarly. I sometimes observe that another chemist will maintain that the process of analysis by incineration and permanganate for determining organic matter, the process of analysis by other chemists, is quite erroneous, and that a small quantity per gallon of one kind of organic matter—nitrogenous,—is detrimental to health; whereas a comparatively large quantity of another kind of organic matter—carbonaceous, or non-nitrogenous,—may be taken in water without hurt!

I have some knowledge of chemistry, but must confess I frequently cannot understand, and can draw no useful inference from analyses as frequently given, especially when two chemists operate upon the same water!

Can you give me any information why this is so, and how the public are to judge of results? And can you further inform me (or how such information may be obtained) the maximum amount of organic impurity,—whether as carbon, as nitrogen, or as ammonia,—that should be permitted in water for domestic purposes.

W. R.

THE CHANGES IN ST. SWITHIN'S CHURCH, LONDON.

THE restoration (as I suppose it will be called) of St. Swithin's Church, in Cannon-street, is so extreme an instance of the treatment which some of our City churches have met with at the hands of modern architects, that it would be well if public attention could be directed to it.

The St. Swithin's of a few months ago was a building in the style of the Roman Renaissance. The St. Swithin's of to-day is a building in no particular style, reminding one of the mongrel Gothic of the earlier years of James I., examples

of which may be seen in certain colleges at Oxford; buildings which are only redeemed from ugliness by the venerable aspect which the blackness and decay of the stone they are built of has impressed upon them in a degree to which their age does not entitle them. If the parishioners of St. Swithin and their architect are such purists in Gothic that the sight of a Classic church is intolerable to them, let them pull their church down and rebuild it in the Gothic style. To convert a Classic church into a Gothic one by any other means is impossible, as their recent attempt helps to prove.

But before we resolve either to destroy or convert our old Classic buildings, let us consider whether (even if it were possible) either one or the other measure is desirable. The architecture of the Roman Renaissance in England has an historical interest of its own, apart from its artistic character. Whether it be of itself admirable or not, it forms the subject of a very important chapter in the history of our national taste; and it performs one of the main functions of art, by reflecting the moral aspect of the period during which it prevailed.

Although, therefore, we may not wish to see Classic churches built at the present day, we ought not to wish to obliterate the memory of the Renaissance by destroying or disfiguring all that it has left us. We may think it wrong to imitate these buildings, but it requires no sacrifice of principle on our part to let them alone. We may prefer Wordsworth and Tennyson to the poets of the last age, but there is a place in our library for Pope notwithstanding, and our library would be imperfect without him.

The experiment of Gothicizing Classic churches has been tried elsewhere in London, and in one case with great splendour, and with a degree of taste and refinement which are wanting at St. Swithin's; but even there it is not successful, because it has attempted an impossibility.

There is great danger of this fashion becoming prevalent, unless it is checked at once by public remonstrance. It is rumoured that the parish authorities of the principal church in the City are thinking of filling with tracery the windows which were built for their predecessors by Sir Christopher Wren.

I, for one, confess that I can contemplate with equanimity the idea of a window without tracery, although I sign myself

A GOTHIC ARCHITECT.

VALUATION OF RATEABLE PROPERTY.

A BRIEF summary of the contents of the Government Bill to provide for uniformity in the assessment of rateable property in the metropolis has been given in our pages: the other Bill of the Government, applying the same system to the rest of England, has now been issued. The County Valuation Boards, which are to determine the percentage or rate of deductions to be made from gross value in calculating rateable value, are to consist of representatives of the assessment committees of the county, two to be elected by each committee from its own body, one to be a justice if there is a justice on the committee, and where a borough has a separate court of quarter sessions, or contains a population at the then last census, of not less than 10,000, the town council may elect one of their number or one of the borough justices to be on the Valuation Board. The members of the Valuation Board are to hold office for three years and be re-eligible. The Board is to have power to form committees of its own members, and may delegate to a committee all or any of the powers conferred on the Board by this Bill. The Bill provides that where the overseers of a parish, in making their valuation list, raise the gross or rateable value of a hereditament or insert one not previously assessed, or where the assessment committee do so (otherwise than in determining an objection), notice shall be sent to the person rated. Appeals against decisions of assessment committees are to be heard before the County Court Judge, an appeal lying to a superior court on a point of law. The valuation list subject to annual revision for alterations, new buildings, or reduction in value, is to be, during its three years' existence, conclusive for county rate, poor rate, &c., and every rate levied on the basis of value; for house-tax and income-tax; and for determining the qualification of jurors and guardians, and under the Acts relating to the sale of excisable liquors. The overseers are to make a new valuation list every third

year, and the Valuation Board may then revise the table of deductions to be made from gross value in determining the rateable value, but the stated maximum is not to be exceeded.

LETTERS PATENT FOR 1868.

MR. GEORGE SHAW has drawn up a condensed analytical list of letters patent for inventions granted and provisional protections applied for during the year 1868. From this summary of inventive effort we subjoin an indication of the progress discernible in materials and appliances connected with building trades. In all, there were 3,991 applications. Of this large number 11 related to improvements or inventions connected with sewers, drains, and cesspools; 13 with making and sweeping roads; 38 appertained to wheels for railways and other carriages; 4 to docks, breakwaters, and submerged works; 84 to funnels and consuming fuel; 116 to railways, locomotives, and railway carriages; 185 to steam engines and steam boilers; 33 to artificial fuel, matches, and splints; 6 to hats; 4 to bells and bell-hanging; 2 to castors for furniture; 32 belonged to latches, hinges, and springs for doors; 5 to fenders, fire-irons, and fire-guards; 39 to nails, bolts, screw-nuts, and rivets, and machinery for manufacturing the same; 21 related to the processes of sawing, planing, boring, &c., stone and slate; 54 to sawing, planing, and turning metals, wood, &c.; 79 to telegraphs, signals, and intercommunication in railway trains; 4 to surveying instruments; 14 to drawing, painting, and exhibiting pictures and photographs; 31 to windows, sashes, shutters, doors, and fencing; 3 to floors and flooring machinery; 52 to tunnels, bridges, arches, and portable and other buildings; 21 to lime, brick, and other kilns and coke ovens; 10 to artificial stone, plaster, and cements; 90 to bricks, tiles, and clay-pipes; 13 to glass manufacture; 19 to blinds, curtains, and shades; 43 to stoves, grates, fire-places, kitchen ranges, and culinary apparatus; 30 to warming and ventilating buildings; 11 to gas-burners; 33 to gas and water meters and regulators; 43 to cocks, taps, and valves; 31 concerned pipes and tubes for steam, water, and gas, and joints for the same; 21 related to water-closets and urinals; 16 to hydraulic machinery for raising and distributing water; 5 treated of the preservation and preparation of timber; and 2 appertained to coffins, hearses, and preservation of the dead. Satisfactory as this amount of activity thus indicated may be, it appears trifling to that fermenting in men's brains on the other side of the Atlantic.

ACCIDENTS.

At Leeds the wall of a railway hotel in process of demolition has fallen upon a number of workmen, crushing one of them to death, and seriously injuring others.

During a furious storm in Devon and Cornwall numerous trees have been rooted up and chimneys blown down, and the pinnacle of Totnes Church, Devon, was blown down and fell through the roof. Several narrow escapes were reported, but fortunately no lives were lost. All the trains upon the South Devon and Cornwall line were delayed, and telegraphic communication by the United Kingdom Company was entirely suspended.

At Dudley, a large engine stack, recently erected upon the works of Mr. Thomas Jones, at the Bnffry, has fallen. The catastrophe was, however, expected, and care was taken that no person should be within reach of the falling debris. It appears that most of the mine had been gotten before Mr. Jones commenced his tenancy, and the stack was built under the impression that the portion near the furnaces had, as is the general rule, been undisturbed. When the stack, which contained at least 100,000 bricks, began to show symptoms of falling, mining operations were commenced on the opposite side to the works, so that it might not fall across the boiler or works, and this end was accomplished before it was too late.

News of a serious accident come from Norfolk. In consequence of an unusually high tide, nearly 50 ft. of the east bank of the Ouse has subsided into the river. This took place about half a mile from the parish church of St. Germans, King's Lynn. It was feared that the prevailing rough weather might cause the tide to flow through the breach and inundate the surrounding country; but the bank was secured in time.

The new extension of the Midland Railway from Cudworth to Barnsley, which is near its completion, it is thought will not be opened so early as was intended, owing to a portion of the embankment giving way. The line crosses the main outlet which carries away the sewerage from the town to the river Dearne, which, at the time the branch was being constructed, was washed over by an inverted culvert. This appears to have given way, and caused the embankment to slip in several places for a distance of twenty yards.

On Wednesday morning, an accident occurred at the New Palace Club-house, King-street, St. James's, by which several persons were injured. It appears that the club-house in question is to be repaired, and while the workmen were pulling up a ladder over the balcony, a height of 20 ft., the stone balustrade suddenly gave way, and fell with a crash, hinging the workmen with it. They were picked up and placed in a cab, and conveyed to St. George's Hospital, where one, Patrick Quin, was found to be most seriously injured. The others were sent home.

THE ARCHITECTURAL EXHIBITION.

It should be remembered that the annual exhibition will be opened on Wednesday, May 5th next, and that all drawings must be sent to the galleries on Monday or Tuesday, the 5th and 6th days of April, after which days no drawings will be received.

The council, in their last report, say:—

"The council have regarded with great interest the improvement that they hope will be effected by the Royal Academy in regard to the space proposed to be given to architectural subjects in their exhibitions; they do not forget that the Architectural Exhibition was originated in a great measure on account of the inefficient and unworthy manner in which architecture was represented on the walls of the Academy; and should the Academy agree to give to architecture a fair and equitable proportion of their walls, they would gladly enter into an arrangement by which the present Architectural Exhibition might be merged into the annual one of the Academy; but until such arrangement is made they feel bound, in the interest of the profession, to do their best to continue the present exhibition."

PORTLAND CEMENT.

HAD the ship-builders at Liverpool been conversant with the properties of Portland cement, or informed as to the best mode of using it, they would not have rejected that of the quality described by "Manufacturers." In using cement of a high specific gravity, in contact with iron, great care is necessary. A slow-setting cement is not absolutely required for coating the inside of iron vessels, as the conditions under which it must be used are most unfavorable. Iron is obviously an unsuitable material for receiving a covering of cement; and the difficulty in using it increased by the interposition of a coat of red lead, with which it is usually painted. At this season, and in the necessarily confined hold of a ship, the process of cement-setting must be slow; in summer weather, or with a more favourable atmospheric temperature, the difficulty in question might not have arisen.

To apply Portland cement to the inside of an iron ship, in the most successful manner, it is necessary to mix up the cement with the smallest possible quantity of water, and to allow the mixture to remain for several hours before applying it with the trowel. It is difficult to prescribe any exact time it should be so left, but it must be used before the initial set has begun, so as not to prejudice its ultimate induration.

Heavy Portland cement—when obtained by an excess of fuel and not from a preponderance of clay—is naturally slow-setting, and in a ratio with its weight will be its final hardness. It is not present at least—practically impossible to combine in Portland cement the two qualities of quick-setting and maximum strength. Where protection to heavy cement joints is necessary, from water or other disturbing causes, careful engineers usually apply an internal facing of one of the quick-setting Roman cements.

Before the introduction of these cements Smeaton used plaster of Paris to protect the composite mortar (Aberthaw lime and puzzolana) joints of the Eddystone Lighthouse. That eminent engineer considered good mortar indispensable, and insured its quality by strict personal attention to its preparation. Eddystone Lighthouse mortar cost 3s. 8d. per cubic foot.

Heavy cement should be submitted to the greatest amount of mechanical pulverization, and should be rejected unless it will pass through a No. 40 (1,600 meshes to the square inch) gauze wire sieve. In America the engineers impose

the No. 80 gauge for the natural cements of that country; but to subject a heavy Portland cement to that test would add greatly to its cost. There can be no question of the impolicy of using imperfectly-ground heavy cement; to do so is sheer waste. HENRY REID.

SEWAGE IRRIGATION.

Banbury.—The experiment of applying the sewage of Banbury to the land succeeded so well last year that a large portion of the farm in the occupation of the local board has been laid down for irrigation in the course of the winter; and at a recent meeting it was resolved to prepare still more; in fact, the whole of the land to which the sewage can be applied is to be made ready to receive it. Mr. Hawkes, a successful practical farmer, and member of the board, said they would not be doing their duty to the ratepayers if they left a foot of their land without the benefit of the sewage. A large field is to be appropriated this year to the growth of root crops—mangold, turnips, and parsnips—to test the powers of the sewage in the production of these esculents.

Leamington.—The Leamington Local Board have accepted an offer from the Earl of Warwick to take the whole of the sewage of the town, for a term of thirty years, and dispose of it by irrigation on his lordship's estate, at a distance of from two to three miles south of Leamington. The Local Board are to lay down the requisite mains, construct the necessary works, and pump the sewage to a given point on the estate, and in return the Earl will pay the Board 450*l.* annually for the sewage.

CHESTER CATHEDRAL.

THE TENDERS for the restoration of a certain portion of the cathedral have been sent, and are as follow; the quantities were taken out by Mr. J. S. Lee, Mr. G. Gilbert Scott, R.A., as our readers know, is the architect:—

Barnsley (Birmingham)	£24,548	0	0
Hughes (Chester)	23,871	0	0
Holme & Nichol (Liverpool)	22,965	9	0
J. & W. Beaman (Bradford)	22,360	0	0
Wood (Worcester)	21,933	0	0
Thompson (Peterborough), accepted ..	21,293	0	0

THE ROMAN WALLS OF DAX.

WE understand that the fine Roman walls of Dax are again in danger. Some ten years ago Mr. C. Roach Smith exerted himself against a threatened injury to them, and contributed towards preventing it. The Emperor formerly interposed; but now the Prefect, to carry votes among the little shopkeepers, has consented that the walls shall be broken through. They are, or were, the most perfect in the North of Europe. Surely some of the numerous antiquarian societies of which England now boasts will bestir themselves to prevent the destruction of so important a monument.

PLYMOUTH GUILDHALL COMPETITION.

SIR,—Knowing that you are always ready to lend a helping hand to the correction of abuses, I venture to call your attention to the terms of the above competition advertised in your two last issues, with the hope that a few remarks from you may induce the committee to reconsider their instructions. The premiums offered appear, at first sight, liberal, but, on perusing the "instructions," we actually find that architects are requested to furnish designs and estimates for buildings intended to cost about 25,000*l.*, in return for which they have a chance of obtaining one of the three premiums; and it is stated in the "instructions" that "competitors must look solely to the premiums for their remuneration, as the Town Council will not engage to employ any of the architects whose plans may be accepted." I think this requires no comment, but I should hope that no member of the profession will compete under such conditions. PROVINCIAL.

DOINGS ON THE METROPOLITAN DISTRICT RAILWAY.

SIR,—In your last issue I observe your correspondent "S" gives a true statement of the shortcomings of the Metropolitan Railway.

I am an unfortunate instance,—as follows. On the 25th of March a ticket was given me one station short of the one asked for, full fare having been taken. On arrival at my destination I was seized by the authorities for an excess fare, and detained some time; then taken before the station master, in consequence of my refusal to pay the excess, having already paid full fare for the distance travelled; however, after all this bother, seeing I was determined not to pay, I was then liberated upon giving my address. N. W.

DISSENTING CHURCH-BUILDING NEWS.

Camden-road, London.—A memorial stone of a Presbyterian church which has been built in the Camden-road, and which is called after the name of its locality, has been laid by the Duke of Argyll. It was not a foundation-stone, for the building is entirely completed: it was only the last stone on the outer basement, which was laid in its place to commemorate the completion of the work. The new church is in the Italian Gothic style. The interior, with its centre nave and small side aisles, has rows of short, though massive, stone columns. The church in which the congregation formerly met used to be in the Caledonian-road, but a site having been obtained from the Marquis of Camden, it was determined to build the present structure. The schools were first erected and for a time used as a church till the completion of the edifice adjoining.

Northampton.—The Grafton-street new Baptist chapel has been opened for divine service. Mr. Ighiam was the architect, and Messrs. Clark & Heap were the builders. The new structure stands on the site of the old chapel; but its breadth, from north to south, is considerably larger, the waste ground at the back being included. The building consists of the chapel, an adjoining vestry, lower and upper school-rooms, the latter of which being also used as a lecture-room, baptistery, two school-rooms, and a basement or cellar, with fire-place and every convenience for providing tea. The chapel is 45 ft. by 45 ft. The lower school-room is 25 ft. by 29 ft.; and the upper school-room or lecture-room is 45 ft. by 25 ft. On the south side of the chapel is a commodious gallery, in which provision is made for a harmonium and choir. Whilst attached to the chapel, the school-rooms are externally of a different character, being much plainer, and without any marked design. The entrance to the school-room is from Harding-street. The chapel fronts Grafton-square. It will seat nearly 500 persons, and the total cost will be 2,000*l.*, including the purchase of the ground and similar items.

Bradford.—The new Wesleyan chapel now being erected in the Gillington-road, is intended to afford sittings for 810 persons, and to cost about 4,000*l.* Five class-rooms are obtained in the basement upon the south or Willow-street side, which, owing to the fall of the ground, admits of light and ventilation; the basement-floor also contains a room for the heating apparatus, and an entrance, lobby, lavatories, &c. The ground-floor has in front three entrances and vestibules which can be used conjointly for the body of the chapel and the galleries, or for each part independently. In the rear are vestries for the minister and deacons, and staircases leading downward to the class-rooms, and upward to the organ-loft and galleries. Separate entrances are also provided to the minister's vestry and the class-rooms. The fronts of the galleries are curved in a semi-circular shape at each end, and the ceiling of the chapel is also curved and divided by ribs into panels, which will be further enriched by moulding and plaster decorations. Amongst a limited number of local architects, Messrs. Andrews, Son, & Pepper were the successful competitors.

Chesterfield.—The foundation-stone of the United Methodist Free Church, Chesterfield, has been laid. The church is in course of erection in Marsden-street, and when completed will be capable of seating about 850 people. The church will be a brick building, and will cost 2,500*l.* Mr. Simpson, of Nottingham, is the architect; and Mr. R. Maw and Mr. J. Glossop, of Ambergate, are the contractors—the former for the building, and the latter for the woodwork.

Burscough.—A new Wesleyan chapel has been opened for divine service at Burscough Bridge. The building is calculated to seat about 500 persons. It has been erected by Mr. T. Bridge, builder, Burscough, from plans drawn by his son, Mr. T. Bridge, jun., architect. The chapel is built in the Early Pointed style of architecture, the material being brickwork, of different colours, in ornamental bands, &c., and coloured arches to be the various windows and doors; other ornamental brick and stone work being used throughout the building. The windows are chiefly uncoupled lancets, excepting in the various gables of nave, transepts, and chancel, where triplet windows are used; that to the nave being more decorated. The chief entrance to the chapel is by a porch of ornamental timber construction, surmounted by a gilded wrought-iron finial. At the junction of the roofs of nave and transepts

rises a spirelet to the height of 50 ft. from the ground, terminating in a gilded wrought-iron finial, and the several gables have also finials. The ceiling is divided into bays by arched principals, with pierced tracery work in the spandrels, and terminating on wood carved corbels. The nave measures 46 ft. by 30 ft.; transepts, 42 ft. 6 in. by 18 ft.; and chancel, 16 ft. by 8 ft. The entire cost of the building is about 950*l.*, about 600*l.* of which have already been raised.

Darlington.—The church in Northgate, erected by the United Presbyterians of Darlington, has been formally opened. The edifice consists internally of nave and aisles, with an apse at the east end. The entrance is by a double doorway in the west gable, leading into a vestibule. Over this vestibule is an end gallery. At the southwest angle of the building is placed the tower and spire. The upper stage of the tower is octagonal, having the cardinal faces occupied with the belfry windows, and the intermediate faces with buttresses, terminating in carved capitals and pinnacles. The spire, which is approaching completion, will have one tier of spire lights, and be terminated with a carved finial and ornamental vane. The total height of tower and spire will be 120 ft. Over the entrance doors in the west gable is a four-light window, consisting of a two-light and two single-light windows, enclosed under one hood mould. The window is filled with stained glass, by Mr. Tait, of Sirling, the gift of a member of the congregation. The north and south flanks are occupied by two-light windows, finished each with a small gablet rising above the eaves. The walling is of blocking course from Haughton Bank quarry, and the Ashlar dressings, window tracery, &c., are from the same quarry. Internally, the roof is divided into three spans, and supported by cast-iron columns. The nave roof is wagon-headed. The principal timbers are exposed to view, and stained and varnished, and the panels between are plastered and coloured a light blue. The pews are of deal, with burch ends and sloping backs, and are, together with all exposed woodwork about the building, stained and varnished. At the east end are placed vestries, and stairs to basement. In the basement are placed a large school-room, session-house, class-room, heating-place, &c. The style is Geometrical. The contractors for the various works are Messrs. Duck, Todd, Atkinson & Son, Hope, Johnson, and Harrow, all of Darlington. The heating apparatus has been supplied by Messrs. Lewis & Adams, of Middlesborough. The cost of the building, including site, &c., will be about 3,600*l.*; and it has been erected from the designs and under the superintendance of Mr. John Ross, of Darlington, architect.

SCHOOL-BUILDING NEWS.

Birmingham.—The memorial stone of the new Workhouse Schools for boys, about to be erected on land adjoining the workhouse at Birmingham Heath, has been laid by the chairman of the Board, Messrs. Martin & Chamberlain are the architects, and Messrs. Jeffery & Pritchard the contractors.

STAINED GLASS.

Hastington Crane Church, (Lancashire).—A series of three windows have been placed in the apical chancel of this church. The style of the edifice is Early English, and the windows are severally composed of two lights and quatrefoil in tracing. The centre window contains figures of St. Peter and St. Paul, with their usual accessories, beneath floriate canopies, the quatrefoils being filled with sacred emblems and figures of angels with inscribed scrolls. The two side windows contain, in each opening, two medallions, in which are pictured several subjects. A fourth window, being a memorial, is occupied by one subject extended over two lights, "Christ blessing little Children." These windows are from the works of Messrs. R. B. Edmondson & Son, of Manchester.

Lichfield Cathedral.—For more than twelve months past, the large window at the west entrance has been entirely blocked up by a screen of boarding, which has been fixed there during the time the alterations to the window have been in progress. The old window has been removed, the architectural design entirely altered by Mr. G. G. Scott, and a new one of stained glass, manufactured by Messrs. Clayton & Bell, of London, has been fixed. The chief features

are six large figures in the six divisions of the window, representing St. Michael, St. Joseph, the Virgin and Child, and, in the three others, the Magi. At the extreme top of the window is the representation of the Holy Trinity, and underneath the Virgin Mary and St. Simeon and Child. Beneath the six large figures above referred to are six separate Scriptural subjects, the other portions of the window being filled with designs of a floral and architectural character. The window is erected as a memorial of the late Rev. Canon Hutchinson.

COMPETITIONS.

Alexandra Park, Manchester.—Thirty-seven designs were sent in for the new public park for the Hulme district, at Moss-side, to be named after the Princess of Wales. The two premiums offered by the City Corporation for the best designs have both been gained by London artists; the former by Mr. A. G. Hennell, Southampton-buildings, Chancery-lane, and the latter by Mr. Fred. A. Klein, Cannon-street. Openness and breadth are the main features of the chosen design. There are no mazes, and only few retreats; the centre of the park is an open lawn, broken by no prominence, shadowed by no trees or shrub, but a wide, free expanse of green grass, inclosed by wooded banks and thereby also sheltered from the outside world, but on which the sun may shine and the winds blow freely. The second prize design very closely resembles the first, the chief exception to this statement being that the lawn and cricket-ground in Mr. Klein's design are made perfect circles, while in Mr. Hennell's the spaces are oval.

FROM IRELAND.

Portadown.—The newly-erected Presbyterian church—the second in Portadown—has been formally opened for public worship. The site chosen for the new building is but a short distance from the town, on the Armagh road, in the centre of a largely extended building district, the property of the Duke of Manchester, which will ere long be principally devoted to private dwelling-houses, a large number having already been erected and occupied. The building is Gothic in style, from the designs of Messrs. Body & Batt, of Belfast; and the contractor was Mr. John Collier. The frontage is of limestone, with freestone dressings, and ornamented by a large central window, filled in with cathedral glass and stained-glass margins, having moulded jambs, arch, and bosses, carved, likewise in freestone, from the Dungannon quarries of Mr. Kennedy, the pointed gable being surmounted by a pinnacle with carved finial. Accommodation has been provided for 350 of a congregation, and the pews are of pine, varnished, this portion of the work having been performed by Mr. Joseph Wright, jun.

BROKEN GLASS IN BLANK WINDOWS.

Sir,—Your correspondent "H. H. S." in his humorous letter of last week, has not introduced a single ray of light to my "blank" windows. If broken by a stone or other missile, such fracture could readily be distinguished from those already broken; in which case the glass is not "stained," as it would be if caused by a blow, but exhibits a sort of network of fractures.

The same day on which I wrote my former letter, a member of the establishment was on the scaffold with the workmen, and hearing a slight cracking noise, turned, and saw one of the blank squares break. He describes it as occupying several seconds from the time he heard the noise to the completion of the fracture. This is nothing supernatural, but what is it? Scientific men, including the manufacturers of the glass, have been consulted without at present ascertaining the true cause.

I heartily agree with "H. H. S." in condemning the use of "blanks." I would under no circumstances insert them in new buildings, and, where practicable, would abolish them in old buildings; but in the present instance it would require the skill of something more than a jerry-architect to dispense with them where their number about 100, the house being 300 years old.

W. B.
Longleaf.

Books Received.

The Handbook of the Year 1868: a Register of Facts, Dates, and Events, at Home and Abroad. With Appendices. By G. H. TOWNSEND. London: Wyman & Sons, Great Queen-street, 1869.

This volume is a well-compiled repository of interesting and important facts bearing upon religion, commerce, legislation, politics, literature, science, and art, forming an encyclopaedia of facts, dates, and events. The chronological

division does not profess to record everything of any public importance that may have occurred in course of the year, or to be an exhaustive summary of facts and occurrences, but is intended as an occasional aid to those who consult the alphabetically-arranged "register," which is the main portion of the work. As the original editor, Mr. Townend, remarks in the preface, it is

"Designed to supply a trustworthy record, within reasonable limits and upon a well-defined plan, of the principal changes, transactions, and events that have occurred in all parts of the globe during the past twelve months. It contains an epitome of the results of human action and endeavour in numerous directions, recording failure as well as success, disaster as well as triumph, and is in every respect 'an abstract and brief chronicle of the time.' In its pages will be found records of both persons and things; and though specially devoted to the illustration of 1868, it supplies the necessary links to connect the Past with the Present, and to bring clearly before the reader the events and the characters that have appeared upon the scene."

There is a large and well-selected and condensed mass of useful matter for reference throughout its even to eight hundred pages; and the appendices contain copies of diplomatic and state papers, Acts of Parliament, official documents, &c., and statistical and other tables. Amongst them are lists of the Houses of Lords and Commons. It would be an improvement in next year's issue were an alphabetical list of members' names appended to the Commons list of borough names. The editor of this work, Mr. Townsend, the author of "The Manual of Dates," had nearly completed it, we learn, when his brain gave way, and he has since died.

British Rainfall, 1868. On the Distribution of Rain over the British Isles, during the year 1868; with Remarks and Illustrations. Compiled by G. J. SYMONS, F.R.S. London: Stanford, 1869.

The results of observations at about 1,500 stations in Great Britain and Ireland are here given; and that result is that in England the rainfall of 1868 was 2 per cent. in excess, and in Ireland 6 per cent.; but that in Scotland the excess was really bewildering, being no less than 10 per cent. No doubt, the mountainous nature of much of the surface of Scotland had something to do with this excess.

The volume is illustrated, for frontispiece, with an engraving, showing the arrangement of rain gages, &c., on the grounds of Strathfield Turgis rectory, Reading, the management of the records of rainfall there, and of the various experimental and other apparatus by which it is indicated, being under the care of the rector, the Rev. G. H. Griffith, who has written an elaborate and able paper on the subject, included in the volume under notice; which may be regarded as the authorized record of rainfall; Mr. Symons being the Rainfall Secretary to the British Association. The experimental committee of the Royal Society, however, pay the expenses of the thermometrical work undertaken by the Rev. Mr. Griffith, which has met with their approbation.

Verse Foster's Drawing Copy-Books. London: Simpkin, Marshall, & Co.; Marcus Ward & Co. These very cheap books are intended mainly for self-instruction in schools which have not the advantage of a drawing-master. Each number contains both examples and paper for the pupil's copy. They have been adopted by the Commissioners of National Education in Ireland, and are well suited for the purpose for which they are required. Each book contains a distinct series of subjects, such as flowers, trees, boats, and ships, the human figure, animals, &c.

The following list of artists who are occupied on this series shows how earnest the projector is in his endeavours to provide the best copies obtainable. Each part costs 1d., or, on better paper, 3d. *The Human Figure*—Thomas D. Scott. *Animals*—Harrison Weir. *Landscapes*—R. P. Leitch, E. M. Wimperley, &c. *Marine Subjects*—E. Weedon, J. Callow, G. Whitaker. *Flowers*—W. H. Fitch, W. French, F. E. Hulme, W. G. Smith, W. S. Coleman, &c. *Architecture, Ornament, and Perspective*—W. G. Smith. *Geometry and Mechanics*—J. Mangnall.

A Practical Course of Military Surveying; including the Principles of Topographical Drawing. By Captain LENDY, F.G.S., &c. With an Atlas, mostly by Major PETLEY. New Edition. London: Atchley & Co. 1869.

That this able work has reached a second edition is a practical and well-merited testimony in its favour. We reviewed the work at considerable length some years ago. The author, it

may be recollected, is director of the Practical Military College at Sandhurst; and Major Petley is Professor of Military Surveying at the Royal Military College, Sandhurst. This edition contains many additional plates, &c. The practical part of the work has not been altered, and remains quite elementary, though deemed efficient for all field purposes. A brief sketch of the operations necessary for a trigonometrical survey has been added.

Street's Indian and Colonial Mercantile Directory for 1869. London: Street, Cornhill.

In this edition of the work under notice various additions and other improvements have been effected. It is not intended to supersede local directories, but to give a concise book of reference to every English, foreign, and colonial merchant. If reliable, and so far as we can we have tested it and found it so, this must be a very useful book to mercantile men, and indeed, to many others interested in India and the colonies. It is not only a directory, or series of directories, but gives much other valuable information as to trade returns and lists of trades, tariffs, populations, rates and times of steam and other transit, London agents of banks, principal products and articles of trade, tables of local weights and measures, &c. There is also a series of directories of shipping-agents, manufacturers, &c., more or less connected with India and the Colonies, in London and the principal towns throughout England, and at Glasgow.

Appley's Illustrated Hand-book of Machinery and Ironwork. By APPLEY BROTHERS, Engineers. London: Spou.

Although this is in truth a trade book of articles manufactured or sold by Messrs. Appley, of Southwark, relating as it does to cranes, engines, pumps, contractors' machinery and tools, colonial and agricultural and other machinery and plant, &c., it contains a large mass of useful matter, and is profusely illustrated. It gives the cost, working expenses, and reults obtained in the use of the various machines, with weights, measurements, &c.; and prices of tools, stores, &c., required by civil and mechanical engineers, merchants, and others, with numerous tables and memoranda.

VARIORUM.

"Power without Fuel: an Investigation of the Means by which it may be obtained from the Heat of Natural Sources." By James S. Baldwin. New York: Wilans & Co., Goldstreet, 1869. This pamphlet contains an account of certain improvements on the carbonic acid engine to fit it for work by means of waste heat, as of blast furnaces, kilns, and ironworks, as well as the heat of the sea, of artesian wells, &c.—Voltaire's "Histoire de Charles XII." has been long recognized as one of the best French reading-books for students of the language, and Mr. Tegg has done wisely in issuing a new edition. It is edited by the Chevalier de Chatelain, and is very neatly got up.—An elaborate paper "On the Relative Demand for Labour in the Agricultural and Manufacturing Districts, its Causes and Effects," in *Frazer's Magazine* of this month, with maps and diagrams, merits careful consideration. The same number contains a good account of Mr. Ferguson's book, "Tree and Serpent Worship."—"Debre's House of Commons and the Judicial Bench" (edited by R. H. Mair, and published by Dean & Son) is uniform with the "Peerage" and "Baronetage," already mentioned, and gives a brief biographical sketch of each member and his "arms." A list of "Parliamentary Expressions and Practices" supplies particulars that may be useful to general readers. It is altogether the best hook of its class.

Miscellaneous.

The Royal Birmingham Society of Artists.—The Spring Exhibition of this Society has been opened, with a collection of water-colour drawings and oil sketches (the latter not very numerous). This year's collection is considered to be very nearly, if not quite, equal to that which opened the series.

Honour to English Architects.—We have great pleasure in mentioning that Professor G. G. Scott, R.A., and Mr. G. E. Street, A.R.A., have been elected honorary members of the Imperial Academy of the Fine Arts at Vienna.

Worcester Diocesan Architectural Society.—The fifteenth annual meeting of this Society has been held at the Natural History Society's council-room, Worcester; Mr. G. J. A. Walker presiding. The report referred chiefly to the restoration of old and building of new churches in the diocese, and to the Cathedral restoration. Referring to the Grammar School in the Tything, the report says:—

"A handsome new building was opened in the Tything last summer, for the Grammar School founded at Worcester by Queen Elizabeth. It was designed by Mr. Perkins, in the picturesque but debased style of architecture which prevailed in England during that monarch's reign; having large mullioned windows, carved gables, and other characteristics of the Elizabethan period. The large schoolroom has a fine open-timbered roof, but is somewhat disproportionately lofty for its length. Indeed, the whole design would have been much more effective had the same amount of detail been distributed over a building half as long again; the principal facade, with its three large windows, each surmounted by an ornamental gable (the middle one containing a statue of Queen Elizabeth), and the tall tower rising from the centre of the high roof, having rather a crowded and overdone appearance. There is a class-room at the north end, also a porch and commonplace iron railings in front; but the structure altogether forns by far the most important and satisfactory architectural feature in this part of the city."

The Orphan Asylum at Henwick is thus noticed:—

"The Orphan Asylum at Henwick is approaching towards completion, and promises to form another example of the failure of public competition to secure the erection of buildings of even tolerably good architectural design. In this instance a most eccentric version of Gothic has been adopted. The front is cut up by all kinds of projections and irregularities, such as queer-shaped bay windows, stepped gables, over-hanging dormer windows, spiky pinnacles, &c.; there being an entire absence of any simplicity and repose which should especially characterize structures of this description. The internal arrangements may be good, but if so, there could be no reason why they might not have been combined with a well-proportioned and consistent facade."

A Copying Ink that Needs no Press.—Dr. Rud. Boetger, of Frankfurt, according to the *Scientific Review*, prepares thus a black copying ink, which flows easily from the pen, and will enable any one to obtain very sharp copies without the aid of a press.—One ounce of coarsely broken extract of logwood and two drachms of crystallized carbonate of soda are placed in a porcelain capsule with eight ounces of distilled water, and heated until the solution is of a deep red colour, and all the extract is dissolved. I then take the capsule from the fire, and stir well into the mixture one ounce of glycerine of a specific gravity of 1.25, fifteen grains of neutral chromate of potash dissolved in a little water, and two drachms of finely pulverized gum arabic, which may be previously dissolved in a little hot water so as to produce a mucilaginous solution. The ink is now complete and ready for use. In well-closed bottles it may be kept for a long time without getting mouldy, and, however old it may be, will allow copies of writing to be taken without aid of a press. It does not attack steel pens. This ink cannot be used with a copying press. Its impression is taken on thin moistened copying paper, at the back of which is placed a sheet of writing-paper.

Earthquake-proof Architecture.—The *New York Times*, following in the *Builder's* wake, says:—"The recent earthquakes on the Pacific coast have necessitated the adoption of some new style of building in that section of the country. More brick shells will not stand many heavy land shocks, and the architects of San Francisco are now busy over earthquake-proof plans of architecture. One of the new plans proposed is to build a compact wooden frame structure, and anchor it with brick walls. The frame would secure it against falling, and the wall would render it fire-proof. A large publishing-house in San Francisco is soon to erect a store upon this plan. Another method proposed is to build thick walls with iron girders inserted in them, and riveted at the angles. There has been considerable discussion among builders on this subject, and a new field is open for the ingenuity of architects. Anybody who will guarantee to put up a house that will stand an ordinary earthquake without damage, whether it be built of wood, stone, iron, paper, or rubber, can make his fortune on the Pacific coast."

Increase of Mortality in Whitehaven.—According to Dr. Robert Lumb's return, the mortality in Whitehaven for the month ending February 23 was at the rate of 33 per 1,000 per annum. This is a rate of mortality higher than the average of thirteen large towns. In the week ending March 6 the mortality in London was 24 per thousand, and in thirteen other large towns it was 26.

The Model Dwellings, Worcester.—An addition has just been made to the pile of buildings known as the Model Dwellings, Copenhagen-street, by the completion of the quadrangle on the west side. The experiment made by the company formed to promote the erection of these buildings has so far been successful. The new portion consists of eight dwellings arranged in two flats one above the other. Each habitation comprises a living-room with fire-grate and oven, cupboards, and other necessary conveniences, two bed-rooms, water-closet, sink-stone, meat-safe, plate-rack, and table. The rooms are lofty and ventilated, colour-washed, and woodwork painted. The average rental of these dwellings is 3s. 6d. per week, including all payments.

Fall of a Grand-Stand.—An accident has happened at the Rotherham steeplechases. Whilst one of these steeplechases was being run, several hundred persons viewed the race from the grand-stand, when suddenly the structure collapsed. Those on the lower tiers saved themselves by jumping to the earth as soon as they felt the vibration, but those above them on the fourth and fifth tiers fell from a height of about 6 ft., tumbling upon the heads of their neighbours. As soon as they gained their feet, it was found that two women were covered with part of the woodwork, and had each a broken leg. Others were rather seriously injured. Many persons had narrow escapes, and it is surprising that—looking at the extent, 176 ft. in length—no loss of life took place. It appears that the erection had been considered capable of bearing more weight than was upon it, but the earth being soft on account of recent rain, the supports were gradually buried in the ground. Mr. Joseph Blackmoor, of Rotherham, erected the stand.

Opening of a Sailors' Home at Rotherhithe.—For some time past an effort has been made to establish a sailors' home on the south bank of the Thames by the Society for the Promotion of Sailors' Homes. That effort has at length been successful, and a home at Rotherhithe has just been formally opened by Admiral Sir W. Hall, K.C.B., chairman and honorary managing director of the society. The new home is fitted up in a simple, unpretending style. It contains sleeping accommodation for about thirty men, each man having a little cot to himself; a convalescent room in which sick and desolate seamen will be taken care of gratis; dining, refreshment, and reading rooms; and there are also a lavatory, skittle-alley, quit-ground, &c. It is hoped that when the institution is fairly started it will be self-supporting.

Masonic Literature.—An American gentleman, Mr. Morris, of Kentucky, who has recently been travelling in Syria and Palestine, is now preparing for publication in the United States his observations on the Holy Land from a Masonic point of view. The book will be called "Handmarks of Solomon's Builders." Mr. Morris wishes to dedicate it to Raschid Pasha, the present Governor of Syria, who is a Turk and a Moslem, but, nevertheless,—like the chivalrous Abd-el-Kader, too, the ex-Emir of Algeria,—a Freemason and an enlightened man. The book will be illustrated with portraits of these and other Oriental Freemasons. It is to be hoped that Mr. Morris, during his travels, had his eyes open for Masons' Marks.

Nottingham School of Art.—In the Government examinations held last month as many as 178 candidates presented themselves for examination, and 314 papers were worked and forwarded to the Department of Science and Art, London, for the prizes, &c., to be adjudged. In free-hand drawing 100 papers, in worked, in practical geometry 66 papers, in perspective 55 papers, in model drawing 83 papers, and in mechanical drawing 10 papers—total, 314 papers.

Ulverstone (Lancashire).—A system of new sewers, embracing upwards of six miles in length, is being laid down at this place by the sewer authority. Mr. James Young, of Sunderland, is the contractor; Mr. Brierley, of Blackburn, the engineer. The works are to be completed in seven months.

St. George's Church, Queen's-square, Bloomsbury.—The restoration (2) of St. George the Martyr Church, Queen's-square, is now complete, and it was to be opened on Tuesday by the Bishop of London. Mr. S. S. Teulon is architect. Mr. M. Bromfield, sculptor, executed the figures and wood and stone carving.

Royal Institute of the Architects of Ireland.—At the last ordinary general meeting, Mr. Charles Geoghegan, Fellow, in the chair, Mr. Thomas Early, Associate, read a paper on "Stained Glass," in which he traced the history of the art, from the examples of the twelfth century, as at York, until recent times, dealing with the revival of some thirty years past, and his own experience in connexion with the Royal Commission for the decoration of the Houses of Parliament, and calling special attention to the effects of colour, the result of unequal thickness, and irregularity of surface in the old glass, which is lost by the smoothness of surface and equal density of most modern work. His paper was referred to the council for publication. Mr. Geoghegan's patent regulator for water under high pressure was exhibited at work in the rooms, and explained by the patentee. Dr. Kidd also explained, by diagrams, his invention having similar objects.

Institution of Civil Engineers.—At a recent meeting of this institution, an elaborate paper "On American Locomotives and Rolling Stock," by Mr. Zerah Colburn, was read. It was remarked that, in construction and working, the American railways represented little more than a modified application of English practice. When the systems of the railway machinery of the two countries were compared, many of the differences which first struck the eye were found to be external rather than fundamental; and so, too, many of the peculiarities of construction now retained in America were due to the initiative of English engineers. A discussion of Mr. Colburn's paper took place on the 18th ult.

Rating of the New Meat Market, Smithfield.—The report of the Finance and Improvement Committee recommends that the several premises situate within the New Metropolitan Meat and Poultry Market be respectively assessed to the rates made by authority of the commissioners, on rentals recommended by Mr. Hudson, in his valuation submitted to the last court, amounting to between 17,000l. and 18,000l. The City Commissioners of Sewers have adopted the report.

Valuation of Property.—There has just been published the text of a Bill which provides for a common basis of value for the purposes of Government and local taxation, and for uniformity in the assessment of rateable property in England. It is the measure prepared and brought in by Mr. Goschen, Mr. Arthur Peel, and Mr. Ayrton. It is proposed by this Bill to apply the principle of the measure framed by the Government for the assessment of property in the metropolis to the provinces, and the end is to be obtained by the creation of a similar kind of machinery. In the provinces a valuation board is to be elected in every county for the purpose of determining the percentage or rate of deductions to be made from the gross value in calculating the rateable value of hereditaments: the board to consist of representatives of the various assessment committees in the county, two from each. The bill contains 77 clauses, and there are various schedules attached.

Working Men's College Building Fund.—From a statement by the Council it appears that the ground in the rear of the house in Great Ormond-street (12,000 square feet in area) being the freehold property of the College, they are advised that such a building as is wanted can be well and substantially built, in a plain but good style, for about 2,000l. or 2,500l. Of this amount they have 1,000l. in hand and 200l. promised. Plans prepared by Mr. W. Webbe have been accepted, and the building will be commenced immediately. Financially the college is self-supporting. They have never yet asked money of the general public, and think they are justified in doing so now. Professor Maurice, the principal, signs the statement. Contributions may be sent (amongst others) to the London and County Bank, Oxford-street branch ("Working Men's College Account").

Fire at South London Music-hall.—The Music-hall in London-road, Blackfriars-road, has been gutted by fire. The walls, it appears, remain uninjured, and part of the premises are only damaged a little by water. The cause of the fire is believed to have been the dropping of a lighted fuse or some lighted tobacco through chimneys in the flooring into a cellar beneath. Plans are being prepared for restoring the hall on an enlarged scale.

Royal Microscopical Society.—The annual *soirée* of this Society was held at King's College, on Wednesday evening last; none of the objects exhibited surpassed in interest the produce of Dr. Carpenter's deep-sea dredgings: some of these objects were recently fished up by him from a depth of two thousand fathoms in the North seas.

The Public Health.—In the week ending Saturday, the 20th, the annual rate of mortality was very high. It was 25 per 1,000 in London, 34 in Edinburgh, and 27 in Dublin; 24 in Bristol, 22 in Birmingham, 32 in Liverpool, 34 in Manchester, 28 in Salford, 36 in Sheffield, 28 in Bradford, 33 in Leeds, 26 in Hull, 22 in Newcastle-upon-Tyne, and 47 in Glasgow.

Building in Brighton.—The Brighton papers speak well of a new building erected by Mr. Hudson, in Station-street, for storing valuable furniture. With a view to the easy removal of heavy packages, as also to the preservation of them from damp, dust, and vermin, the entire area of the stores has been floored with Pyrimont asphalt.

TENDERS.

For the erection of new shop and dwelling-house and other premises in the Irongate, Derby (exclusive of basement), for Mr. S. Evans. Messrs. Thompson & Young, architects.

E. Thompson.....	1,990 0 0
Gadaby.....	1,975 0 0
J. W. Thompson, junr.	1,484 0 0
Fryer (accepted).....	1,740 0 0

For the erection of a new Congregational Chapel, Doncaster, Essex. Mr. Charles Ferriew, architect, Chelmsford.

	Gross	Deduction for
	Tender	old materials.

The Builder.

VOL. XXVII.—No. 1366.

The Promenades of Paris.

VERY fine work under this title, by M. Alphand, director of the Promenades of Paris, is now in course of publication in that city; M. Davioud, architect, M. Hochereau, architect, and others, making the drawings to illustrate it.* It is of large size, printed in clear type on beautiful paper, and, of course, costs money. Judging, however, from the list of subscribers already entered, the publication promises to be remunerative, which probably would not be the case with any similar work in England. The number of books of equally costly character published in France, as compared

with such ventures in England, is very remarkable. It may be partly accounted for by the fact that while in France the Government often gives material aid to such undertakings, in England it taxes them heavily by requirements for public libraries. By all means, let copies be supplied to public libraries; but let the State, who is to benefit, pay for them.

Of "Les Promenades" some twenty parts are now out, and deal wholly with the Bois de Boulogne, illustrating and describing minutely every portion of it, giving the mode of formation, and the cost of the several works. The history of the place is, of course, sketched.

The Bois de Boulogne, the delight of the present race of French citizens, is all that remains of the vast forest of Rouvray, which formerly spread for miles along the right bank of the Seine, and where Dagobert I., according to the chroniclers, enjoyed the pleasures of the chase when he inhabited his castle at Clichy. The ancient forest, gradually divided and cut up, lost its old name from the commencement of the twelfth century, and was called the Wood of St. Cloud, from the name of a neighbouring village. In the year 1319, however, some pilgrims having erected at Mennèz-Saint-Cloud—a little hamlet in the wood—a church on the model of that at Boulogne-sur-Mer, the name of the hamlet was changed to Boulogne. The wood, following the fortune of the first inhabited portion of it, took the same name, and remains the Bois de Boulogne to the present day. Situated as it is, at the gates of the capital, and facing the smiling country that borders the left bank of the Seine from Mondon to Suresnes, the Bois de Boulogne has been for several centuries the favourite promenade of the Parisian population, and suc-

cessive sovereigns have sought how best to embellish and improve it. As a church gave the wood its name, so an abbey christened its most famous drive. The abbey of Longchamps (*Longus Campus*), founded in the year 1256, by Isabel of France, sister of St. Louis, is the most ancient of the princely residences in the wood recorded by history. It was at one time a place of pilgrimage, and afterwards a promenade frequented by the court and the city during the Holy Week, on pretext of listening to sacred singing,—a custom still kept in memory by the practice of the fashionable part of the population, who annually disport themselves there on the last days of that same week.

François Premier, after much improving the wood, erected from the designs, it is believed, of Primaticci, in 1530, the Château of Madrid, which was occupied by several succeeding sovereigns, and contained many marvels of art that have all disappeared, with the exception of some works of Della Robia. Another building in the wood was called the Château de la Muette, because of a hunting-box near, wherein were deposited every year the horns cast by the stags at their shedding time (*mue*). Here also was *Le Ranelagh*, set up under the direction of Marie-Antoinette, in imitation of the still well-remembered gardens in Chelsea of that name. The first Napoleon did much for the Bois; but in 1814 and 1815, when foreign armies occupied Paris, the wood was for the most part destroyed. The reparation was soon commenced; but our history must be brief. Louis Philippe's fortifications cut off certain portions of the land. After the revolution of 1818, the Bois de Boulogne ceased to belong to the Civil List, and reverted to the State.

In 1853 began the works which were to render it a place of recreation worthy of the capital. By a law passed on the 13th of July, 1852, it was ceded to the city of Paris, which undertook at its own cost to maintain it, and to execute works within four years, at the cost of 2,000,000 of francs. In 1854 it was determined to extend the Bois towards the Seine, and to enable the city to provide the funds that were required for the great works contemplated, laws were passed, prescribing the establishment of a hippodrome for horse-racing, the State taking upon itself half the cost of the land and works required for that purpose, and empowering the city to dispose of, for its profit, certain outlying portions of the Bois. The purchasers of this surrounding land were made to assist in enclosing it with a wrought-iron railing, of uniform design, and to cultivate as a garden a *zimo* of ground, about 30 ft. wide, next the railing.

Elsewhere a *ha-ha*, or, as our neighbours term it, a *saut de loup*, was formed, and the Bois being thus enclosed all round, seventeen entrance gateways were opened, and lodges for the residence of the keepers were erected. Besides these entrances and lodges, the completion of the design included the conversion of straight paths into sinuous ways, paved and otherwise; the formation of pieces of water, streams, and cascades; the production of extensive lawns around the lakes; the planting of large trees; the construction of grottoes and chalets; and the assimilating to the rest of the park the new land united to it.

All the works commenced in 1853 were completed in 1858, leaving the total area of the park 346 hectares, 5 ares, 39 centiares. To supply the cascades, an Artesian well of large diameter was sunk in the plain of Passy. This affords from 9,000 to 10,000 cubic metres in the twenty-four hours.

The drainage of the roads is effected by means of dry wells at certain intervals. The bottoms are not paved, and the permeability of the soil allows storm water to escape quickly. It is unnecessary to say that the works executed have led to a large expenditure; but this has been

covered to a considerable extent by the sale of the outlying lands, while great advantages have otherwise resulted from the works to both the State and the City.

To go a little into details, from the consideration of which a valuable lesson may be derived. Our author, M. Alphand, gives us the cost of—

	Francs.
The works	7,473,836
Purchase of adjoining properties	6,878,188
Sale of land and the value of parts not yet disposed of	14,382,004
From this to be deducted half cost of Hippodrome to be paid by the State ..	8,779,365
	5,602,639
Leaving the cost of the whole to the City of Paris	2,110,513
	3,462,126

Paris has thus, for the trifling sum of 138,480*l.*, obtained a promenade, the renown of which assists to bring multitudes of money-spending strangers to the city, while it affords healthful enjoyment to the population. To the State it has been even more advantageous. The price of land adjoining the Bois on all sides has been increased enormously: land, the value of which did not exceed from 1*l.* 5*o.* to 6*l.*, the *mètre*, is now worth from 20*l.* to 100*l.* the *mètre*. It is computed that on the surrounding land 487 châteaux or expensive villas, the cost of which, with the furnishing, cannot be put at a lower average than 8,000*l.* each, have been built and fitted up. These of course bring a large annual income to the State; and who shall further calculate the sums it has received in stamps and fees connected with the transfer of properties as well as from the taxes on materials and on the articles of food consumed by the workmen?

The works in the Bois de Boulogne include a number of buildings, such as a Kiosque for the Emperor, garden-seats, the Tower of Longchamps, and the lodges, or keepers' houses, at the different entrances to the Bois and elsewhere. The Kiosque, erected on an island in the great lake, is placed on a circular basement, the lower part being of freestone, the upper part of brick of two colours (*rejointoyées à l'Anglaise*). An external staircase leads to the apartment above, which is formed of woods of various colours, and has a balcony all round it. The roof is hnlous, covered with slates of two colours. Although of small size, this construction cost 1,040*l.* The prospect from the Kiosque is charming.

The lodges or pavilions are of six classes. Although each building differs from the other in plan and elevation, the use of similar materials and mode of construction gives to the lodges in each class a certain amount of resemblance. We are enabled to reproduce a few of the smaller illustrations of the book, representing three of these lodges, with the plan of each, as well as a view of the Pool of Suresnes; namely, the Porte de Passy, the Porte d'Anteuil, and the Porte Dauphine.*

The walls of these lodges are constructed of brick, disposed in horizontal bands of two colours, rising from a stone plinth; the window dressings, parapets, cornices, and so forth, being also of stone. The roofs, of high pitch, are covered with slates from Mézières and Angers, which differ slightly in colour, but harmonize with each other, and the chimney-pots are of terracotta, and all from the same model. One class of lodges has overhanging roofs, with ornamental barge-boards. The total expense of nineteen lodges was 15,180*l.* One of them, the Porte de Passy, of which we have given a view and plan, cost 780*l.*

We repeat our commendation of the admirable manner in which this work on the Promenades of Paris is being produced.

* "Les Promenades de Paris. Bois de Boulogne, Bois de Vincennes, Parcs, Squares, Boulevards." Par A. Alphand, directeur des Promenades de la Ville de Paris. In folio, illustrated with Chromolithographs, engravings on steel and on wood, drawn by MM. Davioud, Chief Architect of the City of Paris; Hochereau, Architect of the city; Dardozet, Antoine, Path, Engineers of the city; and by the best French artists, as MM. de Bar, Lancelotti, Grandisir, Gaidran, Freeman, &c. Paris: J. Rothschild, Agents for England; Messrs. Williams & Norgate, Henrietta-street, Covent-garden; Dulan & Co., 83ho-square; Messrs. Barthes & Lowell, Great Marlborough-street; Hardwicke, 11, Piccadilly.

THE KENSINGTON AMPHITHEATRE.

With the decline and fall of the Roman empire, the erection of amphitheatres ceased. Those characteristic buildings were probably far more numerous than we are accustomed to suppose, basing our ideas, as we do, on the small number of ruins yet remaining. But when we find, in so small a city as Pompeii, that an amphitheatre, proportionate to the population, existed, as well as a regular theatre, while another of the former buildings is yet standing at Pozzuoli, at a similarly small distance from the Campanian capital; and when we remember that the mutual jealousies and rancours between neighbouring cities (Pompeii and Nola to wit) would not allow the citizens of one to take part in the festivities of another, we have reason to conclude that an amphitheatre was regarded as a necessity for almost every town of tolerable magnitude during the imperial sway. In a country where earthquake has so often changed the face of nature, the mere negative evidence of the absence of any distinct class of ruins must weigh but little against our positive testimony as to the habits of the pleasure-loving Campanians.

The condition of several of those ruins, which are to be found in Italy, in Roman Gaul, in Itria, and, most notably, in Rome itself, is such as to give us a very distinct view of the general arrangement of the amphitheatres. No relics of the time preceding the Gothic invasion, nor portion of the art, the literature, or the poetry that have survived that great deluge, give us so full and distinct an idea of the savage habits of the masters of the world. In Pompeii, indeed, we view the scenes familiar to the daily life of the first Christian century, when Christianity had not yet secured a footing, but little removed as it was from the sensuous Southern habits of to-day. But in that very city,—the richest museum of antiquities yet laid open to this student,—the amphitheatres, though one of the latest, is one of the most important discoveries.

The central portion of these colossal buildings, the arena, was a level surface, covered, as its name imports, with sand. It was surrounded by, if not reared upon, vaults, and the arrangements for admitting the gladiators who were to exhibit their prowess; the wild beasts who were to contend with each other or with human opponents; the criminals who might be exposed to an unwilling strife with these monsters; and the necessary attendants, were all very carefully and completely. In some instances provision was made for flooding the arena, so as to have the means of presenting a sham sea-fight to the spectators. In the largest of these buildings, which was erected in the capital by the Emperor Vespasian, six acres of ground were encircled by the outer wall, of which surface the arena occupied rather less than a sixth part. This enormous structure, known as the Coliseum, was capable of containing more than a hundred thousand spectators.

The arena was bounded by a wall, of sufficient height to preserve the spectators who filled the coveted seats which most closely bordered the scene of action, from any untoward spring of maddened lion or stealthy panther. The form of the amphitheatre was generally elliptical, or oval; the proportions of the Coliseum being as 5 to 6, between the conjugate and the transverse diameters. By this arrangement a certain number of seats would be brought nearer to the very centre of the sport than could have been the case if the same number of spectators had been accommodated in a circular building.

The revival, fantastic and ill-omened as it may seem in this nineteenth century, of imperial style, and morals, and language in France, has stimulated some of the most able French artists to give us strikingly realistic glimpses at the cruel Roman life which glowered over the exhibitions of the amphitheatre. In our own country the *Retiarius* and the *Secutor* were replaced and long represented by the champions of the prize-ring. The struggles of the lion in the arena are yet recalled to the Spaniard by the bull-fight. With us bear-baiting is a thing of the past; and that once favourite sport, in which, on a miniature scale, the arena was represented by the cockpit, is no longer a national or a fashionable pursuit. But at the very time when the increasing civilization of modern manners, the displacement, it may be, of crimes of force by crimes of fraud, or the direction of the attention of our dangerous classes rather to profitable depredation than to brutalizing amusement, has banished the last relics of public bloodshed, we

see rising in our metropolis a veritable amphitheatre.

From the podium, or low wall surrounding the arena, the part of these ancient buildings which was intended to contain the spectators rose in a vast funnel, or inverted cone; resembling, on a colossal scale, the den of the antlion. This widening ascent was divided into steps, which, at all events in the minor amphitheatres, served at once for the seat of one tier of spectators and for the foot-rest of the row immediately behind them. The continuous bench, which in any somewhat similar arrangement among ourselves, allows the feet of persons seated in one row to be accommodated below the seat of those in the rank before, and below them, was not adopted in the more solidly constructed buildings of ancient Rome. For persons entitled to the dignity of a curule chair, space was reserved in a tribune, or place of honour: hut the arrangement of cushions on the stone steps was the extreme of luxury ordinarily allowed.

Lines of entrance and of exit, radiating from the centre of the arena, divided the series of seats into *cunei* or wedges. The apparently solid structure was really raised upon vaults and arches, and openings from the radiating passages led into corridors at different levels, by means of which the vast number of spectators entered and left the building, with an ease and rapidity of which the general arrangements of our own public buildings are far from enabling us to form any adequate and practical idea.

The theatre of the Royal Institution, on a miniature scale, is arranged somewhat on the principle of the seats of the amphitheatre. Exit from this room is rendered more tedious by the presence of the benches; but the difference in the facility of ingress and egress, compared with that which is presented by the aisles and galleries of a church, or by the straggling doorways of some other places of assembly, is not to be overlooked.

It is far from impossible to realize the scene which one of these vast buildings must have presented when thronged for some great festival. We are far less able to form an idea of the order of the service of the temples. At Athens, and other cities, most notably at Pestiun, we see the structure of these ancient places of worship almost untouched, by the tooth of Time. But how the suppliants were arranged in, or around, the naos, what processions of priests, or what throngs of fillets, filled the peristyles; how the service of the immortal gods was carried on, at a time when men were forbidden to approach their altars with unwashed hands, we know not. In some of the great ecclesiastical anniversaries which are yet held in *Magna Græcia*, pilgrims, hereof and bearing a gourd slung to a long staff, throng, at the present day, from distances extending to as much as three hundred miles, to the shrine of St. Nicolas of Bari, or the *Quattro Incononati*. The blindness and the fervor of the faith of these pilgrims are evinced by the humiliating penance of proceeding round the great church on their knees, with the forehead rubbing along the pavement. There is no question as to the earnestness of these tens of thousands of peasants. But, apart from such unusual instances, the processions now to be seen in Southern Europe (which to some extent may be regarded as the lineal descendants of the ancient rites) have a painful character of unreality, of irreverence, and of mockery. They can give us but little idea of the pagan worship at the time when the awe of the immortals was real; as, for instance, in the days of Herodotus.

But when we gaze upon the ruins of an amphitheatre, it requires but scant effort of the imagination to conjure up the terrible spectacle which that great concourse of men and women, intent on the life-struggle and thirsting for blood, must have presented to any eye that was turned, not on the arena, but on the spectators. The fierce gaze of the Spanish women on the mangled heroes of the bull-fight may tell us somewhat of the effect which the gladiatorial spectacles had on the children of the She-wolf. The scenes which, in our own country, might have supplied the painter with models, maddened with the frantic excitement of watching the death-struggles of a prisoner, are happily ended by the prohibition of the brutalizing exhibition of public executions. Still we may form no feeble idea of the stony glare of ruthless cruelty that met the gaze of the wounded gladiator, when he read his doom in the downward-turned thumbs of his thousands of judges; and we may read, with a thrill approaching to a shudder, the

simple and grateful words, "And I was delivered out of the mouth of the lion."

It is for no purpose of gladiatorial display; it is not for the revival of the sports of the prize-ring, the cockpit, or the bull-fight, that an amphitheatre capable of holding 16,000 persons is now silently and rapidly rising in Kensington. Shortly after the closing of the Great Exhibition of 1851, numerous representations were made to the commissioners of that Exhibition, on the part of Chambers of Commerce, learned societies, and other bodies of persons interested in science and in art, of the general want that was felt of a central place of assembly in London. The commissioners, agreeing in these views, devoted the surplus funds of the Great Exhibition to the purchase of an estate in South Kensington, with the view of providing a common centre of union for all such public bodies, and for the various departments of the industrial education. In the plans for this central institution, which were prepared under the enlightened direction of the Prince Consort, a vast hall of assemblage formed an important feature. The death of his Royal Highness arrested the steps which were in contemplation, but the scheme was revived in 1855, and the shell of the building is now raised to such a height as to give a fair idea of the architectural importance which will attach to the building when completed. Some views of it have already appeared in our pages.

The Kensington Amphitheatre covers a space of 200 ft. in the longest diameter, by 175 ft. in the conjugate, measured from the engraved plan. The design originally made was on the plan of a more eccentric ellipse. But it is probable that, in working out the details, the fact that concentric ellipses are not parallel, and that the excessive length of the longer diameter keeps proportionately increasing with every external slice that is added to the arena, rendered it impracticable to adhere to this figure. Draftsmen are aware that there is an ellipse in which the proportion of the diameters is such as to allow of a very close approximation to such a form which is drawn by means of arcs struck from only four centres, placed at the angles of a square. A figure of this nature has been adopted, and the difficulties of the incessantly changing elliptic curve are thus, we conclude, altogether avoided. There will, however, be far more complication in the roof than if a circular plan had been chosen.

The shell of the Albert Hall consists mainly of two concentric walls, between which are contained the staircases, corridors, and general arrangements for the service of the central hall, as well as a considerable number of good-sized, well-lighted rooms, which will be available for committee-rooms, offices for scientific societies, or other objects in harmony with the main design of the building. It is also intended to have a gallery at the top of this complex shell, lighted from the roof, which would be serviceable for the exhibition of sculpture or of paintings.

The external face of this shell is enriched with moulded *terra-cotta*, designed and manufactured from the clay of the Trent valley, expressly for this building. The mouldings on the basement are somewhat rough, but improvement is perceptible in the later specimens; and there can be little doubt that the result of this new application of the most ancient form of ceramic art will be at once economical and architecturally effective. We reserve, however, all opinion as to the merits of the building at present. The drawing of the exterior shows, above the basement, an order of square-headed windows divided by channelled piers. Above this is a balustraded row of circular-headed windows, divided by twin pillars. A third order follows, consisting of square-headed windows (about half the height of those in the lower tier), one above every alternate aperture, with a balustrade below, and a modelled frieze and projecting cornice above. The cornice hides a setback, which will be occupied, we presume, by the gallery skylight. In the great spheroidal roof, within the parapet that crowns the cornice, are arranged one order of dormer windows, and a second row of circular or elliptical lights. Three carriage porches will afford access from the Kensington and the Exhibition roads, with intermediate *parsons*, or flights of open steps, for pedestrian visitors. The southern end of the building will communicate with the conservatories of the Royal Horticultural Society.

The arrangement of the central hall presents a novel combination of the features of the theatre with those of the amphitheatre. Of course there is no stage; but a large organ, and

seats arranged for an orchestra, at the end of one of the larger diameters, will break the perfect regularity proper to a structure intended for spectators, rather than for auditors, for the former of which classes of attendants the Roman buildings of this nature were provided. The *arena* will be maintained, and, on such occasions as scientific gatherings, will form a most important part of the hall. From the *podium*, or fence wall of the *arena*, seats will arise step above step, as in the Roman amphitheatres. We regret to see that this part of the building is in course of construction as a piece of carpentry. The English public might perhaps object to dispense with the ugly but convenient expedient of the bench, a feature which is so immensely inferior, in a pictorial point of view, to the solid steps of the ancients. But it is on all grounds important that as little combustible material as possible should be employed in an edifice intended to contain so large a number of people. It is not so much the danger of fire as the danger of panic, which the architect should resolve to avoid. Panic in a crowded assembly is likely to be, if once excited, far more fatal than any other source of calamity; and in case of an alarm, real, fanciful, or even malicious, the confidence which might be placed in a building which manifestly owed little to the carpenter would be invaluable.

The arrangement of the *cunei*, wedges of seats as well as of the corridors and vomitories, will be amphitheatrical. But, before the hollow cone formed by the seats reaches the inner wall of the spacious hall, a series of three tiers of *loges* or boxes is interposed, running round that part of the building which is not occupied by the orchestra. This arrangement, resembling that of a theatre, will probably detract from the grandeur of the *coup-d'œil*. The majestic simplicity of the vast conical basin will be destroyed. On the other hand, the richness and picturesque effect of the scene will be increased. But we wish some gracefully moulded form had been adopted for the pillars which are to separate the boxes and to support the upper tiers. These are plain, solid, well-executed castings, forming plain Doric columns. Their frequent repetition will render them the most prominent elements of the physiognomy of the interior. We fear that this severity of outline will give a hardness and poverty to the tiers of boxes, which no decoration in the way of cornice and curtains can counteract. The floors of the boxes, and of the gallery which runs over the upper tier, are fireproof, being supported on Belgian wrought-iron girders, filled in with the customary expedient of concrete laid on battens.

The great feature of the hall will be the roof. The idea which may be formed of this colossal dome from drawings or models must fall very far short of the actual effect. The preparations which the contractors are making for raising the great ribs show that these builders are aware that their task is no child's play. The building has, of course, no central axis or point of support (the builders use a simple vernacular term), and it has therefore been necessary to construct a great wooden tower or framework, on which one end of each rib will be supported, until they are all fairly bedded and riveted together to the central ring or lantern. Substantial iron wall-plates rest on the interior portion of the shell, bind together the brickwork, and form a solid and tenacious abutment for the springing of the dome.

In the wooden model of the amphitheatre, which is to be seen in one of the private apartments of the South Kensington Museum, a species of *velarium* is shown beneath the roof, expanding like a gigantic umbrella. We think that this arrangement may be abandoned with advantage. The soffit of the roof, as shown in the engravings, is incomparably finer than any textile canopy, on so large a scale can be. If the light prove too strong, it can readily be dealt with by internal and external blinds or sun shades to each window. In the Italian amphitheatres a *velarium* was a matter, if not of necessity, at least of great luxury. That season of the year which often gives a rainless interval of six months, would naturally be selected for entertainments given in these great hypothetical places of concourse. But the fierce rays of the sun are dreaded by the Italian, whom experience has made acquainted with their dangerous power, scarcely less than rain. To shelter the spectators from the sun a tent-like roof, in the later days of imperial luxury, was provided, in the form of a sloping, pent-house-like canopy, declining from the top of the inner wall towards

the *arena*. Such an arrangement would be incompatible with a dome; and an upward slope, suggesting the idea of an enormous umbrella, could only hide the structure of the roof, to the great disadvantage of the pictorial effect.

DUBLIN SANITARY STATISTICS.

Dr. MAPOTHER, the Medical Officer of Health for Dublin, has recently presented to the Public Health Committee of that city his annual report, reviewing the vital statistics for last year. The report is eminently satisfactory, both as evidence of the existence of a thoroughly efficient sanitary executive in that city, and as recording an improvement in the standard of health there prevailing during 1868.

The death-rate in Dublin city per 1,000 persons living, which in 1866 and 1867 had been 29.5, and 28.9, further declined last year to 26.7. This rate, although three per 1,000 in excess of that which prevailed last year in London, compares favourably with the rates in Manchester, Liverpool, Glasgow, and several other large towns for the same period. It may be usefully noted that the annual death-rates in Dublin, in the four quarters of last year, were respectively 32.0, 24.1, 24.9, and 22.8; from these it appears that the principal excess of deaths occurred in the three months ending March, the excess being mainly due to the fatality of diseases of the respiratory organs.

In examining the death-rate of a city as evidence of its sanitary condition, it is natural first to ascertain the mortality from zymotic diseases. The report tells us, that of the 6,604* deaths registered in 1868 in the city of Dublin, 1,526 were referred to this class of diseases, against 2,309 and 1,673 in 1866 and 1867. Allowing for the mortality from cholera, these figures show a satisfactory and progressive decline in the deaths from these causes. The 1,526 deaths in 1868 formed 23.1 per cent. of the total deaths, a proportion which, although affording a large field for the future exertions of the Public Health Committee and the officer of health in Dublin, compares favourably with the proportion in London, where, during 1868, 25.2 per cent. of the deaths resulted from zymotic, and, as they have been justly termed, "preventable" diseases. Perhaps the deaths from typhus, typhoid, continued, and other forms of fever, may be most safely taken as an index of the sanitary condition of large towns. The deaths from all forms of fever which, in Dublin, in the three years 1865-7, had been 492, 480, and 309, further declined last year to 256 in 1868. If any further evidence were necessary of the declining prevalence of fever in Dublin, it is afforded by the report in the following statement:—"The Hardwicke and Cork-street Fever Hospitals received from city dwellings during 1868-8, 3,245, 2,536, 1,841, and 1,211 patients respectively, or in the ratio of 127, 99, 72, and 49 out of each 10,000 of the population." The report details at considerable length the machinery by which the medical officer of health, and his eight assisting sanitary sergeants of police, are immediately informed of all deaths from fever and other zymotic diseases, and what is almost more important, how they receive bi-weekly lists of the patients admitted to the fever hospitals; and, moreover, the addresses of all patients suffering from infectious diseases are furnished by the fourteen dispensary physicians. We must especially commend this portion of the report to all those interested in the sanitary administration of large towns.

Not only has the mortality from fever declined, but measles caused in 1868 less than a sixth of the deaths from that disease in 1867. Small-pox also, to which seventy and twenty-three deaths were referred in 1865 and 1866, has been almost eradicated, causing only one death in 1867 and not one in 1868. Scarletina and diarrhoea formed exceptions in 1868 to the declining mortality from this class of diseases. Scarletina was fatally prevalent in Dublin in the latter part of 1868, and resulted during the year in 377 deaths, whereas in 1865-6-7 only 43, 63, and 199 were respectively referred to this disease. It will be remembered that scarlatina was extensively fatal during 1868 in London, Manchester, and many other large towns, and assumed a severely epidemic form. The 367 deaths from diarrhoea in 1868, against 194 in 1867, is explained

by the intense heat of the summer. Four-fifths of these deaths were of children under five years of age, although infantile diarrhoea was far less fatal in Dublin than in many other large towns.

The mortality from diseases of the respiratory organs is always largely influenced by the general sanitary condition of a community; a low standard of health is especially conducive to phthisis. It is not, therefore, surprising to find that in recent years the mortality from this disease has declined, and extended system of sewerage. In the four years 1865-8, the deaths from phthisis have been 969, 929, 831, and 804 respectively. Bronchitis caused 855 deaths last year, and the disease is reported to be still one-third more fatal in Dublin than in London.

The periodical inspection of workshops in Dublin, which has till recently been but imperfectly carried out, the opening of more spaces for play-grounds, the improvement of the dwellings for the poor, and the erection of public baths, are pointed out among other measures, the adoption of which would probably still further reduce the mortality from diseases of the lungs.

Dr. Mapother shows that abundant and useful sanitary work has been carried on under his superintendence during the past year, which can scarcely fail to effect a still further decline in the death-rate during the current year; he, however, regrets, in conclusion, that the non-extension of the Local Government Acts to Ireland, and the general unsatisfactory state of the Sanitary Acts, through want of codification, considerably militate against the usefulness of himself and his assistants. It is to be hoped that the legislative failings here pointed out, the latter of which is also widely felt in England, may receive attention during the present session.

ON THE ART OF VALUING AGRICULTURAL LAND, AND ON THE INDICATIONS OF THE VARIOUS QUALITIES OF SOILS.*

WHEN pasture land contains a large proportion of the mosses, it is a sure sign of poverty, and more often of poverty caused by constant mowing and the want of manure than of natural barrenness.

On commons and unclaimed land the common brake or fern (*Pteris aquilina*) generally grows on the best land, and Irish gorse, heather, &c., on the inferior portions.

The general colour of the surface of pasture land is also some guide to its quality. The colour of all pastures changes with the season, and no land is green all the year round (though the best land looks green the longest), and a fresh green colour is often dependent on recent manuring; but in winter, when the frosts have stopped the growth of the grass, poor cold grass land turns brown, whilst good sound pastures are never brown, but assume a whitish hue.

I must now proceed to point to that which I had especially in my mind when I commenced preparing this paper—the primary indications to be obtained by an examination of the soil itself, by which, I think, the same results may generally be arrived at with greater directness and certainty. By far the larger proportion of the food of plants is derived from the air, through their leaves, or from water absorbed by their roots; and of the remainder, the greater part is obtained from animal or vegetable matter, applied to the land in the form of manure (not necessarily for any particular crop, because the soil has a remarkable power of absorbing and retaining a portion of such matters); so that it happens that the food supplied to the crops by the actual natural soil itself is confined to very small quantities of certain soluble mineral matters, such as the various combinations of lime and silica. What is, therefore, chiefly required of the soil, by plants, is not a supply of food, but mechanical support, under favourable conditions, for allowing a free circulation of the air, necessary for the decomposition and assimilation of organic matters, and for retaining a constant supply of moisture even in dry weather, without, on the other hand, retaining an undue amount of water in wet seasons, and allowing it to become stagnant, to the exclusion of the air. All soils are mainly composed of three substances—sand, clay, and lime—and every fertile soil must contain a proportion of each, because each in a slight degree enters into

* A table in the report gives the deaths in Dublin city as 5,694; but this is an evident misprint for 6,604, which figures are used above.

* See p. 264, ante.

the composition of plants; but it is on the mechanical condition or consistency, resulting from the proportions in which they are combined, the depth of the surface soil, and the character of the subsoil in reference to the retention of moisture, that the fertility or barrenness of the soil primarily and mainly depends. Thus, when mixed in good proportions, with good depth, with a slight preponderance of clay, a strong fertile loam is the result, capable of producing large corn crops; or, with a slight preponderance of sand, a deep sandy loam, producing great root crops and prolific market-gardens. Where one element is greatly in excess—a hungry sand or gravel, a thin barren chalk soil or a poor thin-skinned clay is the result; where the sand is greatly deficient, and the other two elements greatly in excess, a tenacious marl; or, where the lime is wanting, the weak clay soils, characteristic of the Silurian slate formation, and some others.

In the great majority of cases, the soil is only the subsoil altered by long exposure to atmospheric influences and cultivation, and with a supply of organic matter derived from the roots of plants. Thus, light land usually has a subsoil of sand, gravel, or rock, whilst a clay subsoil usually underlies a clay soil; but, when from special causes this is not the case, the effect on the fertility of the land is very striking. Thus, some of the finest old pasture lands will be found to have a strong soil of sufficient depth to retain moisture and manure, resting on a bed of gravel, which provides a perfect drainage. This is also managed artificially, to a great extent, in warping, on the Hamber, by taking advantage of the fact that the sand settles much faster than the clay, and allowing the water, when the current is checked, to flow first over a piece of land just beginning to be warped, and afterwards to reach the portion which has more nearly attained its intended level.

Although the mechanical condition is thus the chief cause of fertility or barrenness, there are in some cases other substances which have a direct influence on vegetation. The chief of them is phosphate of lime, which enters so largely into the composition of bones, but also exists in certain fossiliferous strata, and adds considerably to their fertility. On the other hand, certain salts of iron and other substances occasionally occur, which have a deleterious influence; and the fertility of alluvial land, deposited at the mouths of rivers, may, in great measure, be due to the amount of organic matter brought down along with the soil by the stream; especially if we recollect that a century or two ago the use of manure can hardly be said to have been known in many parts of this country, and the refuse from stables and cow-houses was not unfrequently thrown into a neighbouring stream.

But whatever other circumstances may have to be noted, the mechanical conditions of the soil remain by far the most material; and these are precisely the ones which can be most certainly arrived at by an examination of the soil itself. There is no difficulty with a good walking-stick in ascertaining the depth, nor in judging of the texture; and by examining the ditches and the sides of sand, gravel, clay, or chalk pits, the nature of the subsoil can often be learned, even without using a spade; and if his conclusions are based on a real examination of the land itself, the valuer is not liable to be misled by the results on vegetation of peculiar seasons, or the particular time of year when he sees the land. And when he has the opportunity of fairly testing his results by the crops, he will not find that he has been misled.

There is one science which is often spoken of as having an important bearing on the profession of a surveyor, but I have never seen any practical suggestion of how it can be rendered really available in the valuation of land; and that is, the science of geology. I am, however, myself, fully convinced that although a very complete knowledge of the science in all its details is not useful for the purpose, a knowledge of its general laws—the distribution of the strata, their order, thickness, general direction and dip, and a sufficient acquaintance with each to recognise it in passing across the country—is exceedingly useful in land valuing, provided the surveyor knows how practically to apply it. Mr. Bravender, in the paper before referred to, has taken great pains in preparing a careful and interesting enumeration of the soils found on each formation, and states whether they are barren or fertile; but as the practical result is that almost all of the formations contain both barren and fertile soils, I fear that all the

information we derive from that mode of treating the subject, if we consult a geological map before setting out on a valuation, is only a general idea of the sorts of land we are likely to find; but no real assistance in actually valuing it. It must be borne in mind that geological classification is chiefly palæontological and not mineralogical; and, even if it were, the various beds do not always come to the surface, but are overlain by all sorts of surface deposits, from small accumulations of soil in hollows to vast deposits of overlying drift. And the surface soils are often so mixed and varied, that most of the formations have both fertile and barren soils, according to the various mechanical conditions resulting from the accident of their particular position. I have been led to think, in the course of my observations of the soils on the various strata, that this subject is susceptible of an entirely different treatment; and the use to which I propose to apply geology in land valuing is to correct and modify the results of a direct examination of the soil, according to certain known characteristics of the various formations. Thus, to begin with the clays and heavy soils, which are the most easily compared. These consist principally of alluvial clays, the London and Plastic clays of the Tertiary system, the Weald, Kimmeridge, Oxford, and Lias clays, and the new red marl of the secondary system; the clays of the coal measures, and those weak clay soils devoid of lime, found amongst the Silurian and Cambrian systems, besides the prurer clay formed by the decomposition of granite. Now clay soils, on each of these formations, comprise a considerable range of difference, as respects consistency or texture, and depth; and it is not difficult to find specimens of soils in different formations, which, in these respects, and even in colour, and in everything that can be judged of by touch or sight, are as nearly as possible alike. What I have observed and am disposed to allow for in making valuations is, that, under these circumstances, there are certain formations, the soils on which will be of better quality, and others where they will be worse than they appear. The alluvial clays are, no doubt, the most fertile, even when judged by this standard, as one may well be led to suppose likely, considering the large proportion of organic matter which they generally contain. Next to them I should place the Lias clay. This formation comprises some very stiff, poor, thin-skinned land, as well as much that is better, and some of the best Leicestershire pastures; but when it is had it always looks so, and is, I believe, always more fertile in proportion to its texture and depth than some to be afterwards mentioned. It will be recollected, that this formation is associated with the Lias limestone containing all the great saurian fossils, and a very small percentage of phosphate of lime, in addition to an ample supply of the carbonate, may possibly account for what I have observed. The London clay also, though not in so great a degree, may be said to incline to fertility; and it will be noticed that this also rests upon a carbonate of lime in the form of chalk, though it does not possess the same supply of fossils. The Oxford clay, on the contrary, which bears the same relation to the middle oolitic series that the Lias does to the lower one, is certainly of a barren nature in comparison to either it or the London clay; i.e., a soil on the Oxford clay will be found slightly less productive than one of the same consistency and depth on either the Lias or London clay. I can offer no satisfactory explanation of this fact, but I feel sure it is a fact. Still more are the clay soils of the Weald of Sussex and Kent of an infertile nature; although they contain small deposits of shelly limestone, called Petworth or Sussex marble, this deposit is, probably, generally deficient in lime, whilst it is often associated with ironstone; but whatever the cause, I know that stiff and poor as it often looks, the Weald clay is even less fertile than its texture would indicate; and that a valuer, accustomed to other formations, will do well to make his calculations with great caution on entering the Weald. Of the other soils mentioned, the red marls are among the most fertile; the plastic and Kimmeridge clays do not occupy large areas, but most nearly resemble the London and Oxford clays respectively; the clays of the coal measures are often very poor, and those on the slate rocks especially so.

The lighter soils are not so easily compared, because they do not so closely resemble each other in appearance and texture. The similarity between two different clays is much closer

than, for instance, that between a light soil resting on the chalk containing flints, and made up chiefly of sand, gravel, and chalk; and one resting on the oolitic rock, containing small pieces of brown limestone, which, though a light thin soil, is in reality composed of particles of clay mixed with limestone, with only a small proportion of sand. Still, I think, some comparison may be made; and, I believe, it will be found that the same fertility observed in the Lias clay is preserved throughout the whole of the lower oolitic series, even to the great or Bath oolite; although Mr. Bravender, whose residence is near the worst part of it, instances this as a noted specimen of barren land. But, although its average rental value along the Cotteswold Hills is low (probably considerably below 1l. per acre), if its extremely shallow soil, lying on a hard rock for subsoil, on the tops of those hills, be considered, I think it is evidence of the wonderful property of this ruddy rock for retaining moisture, that the crops are not hurt up, as they certainly would be with a gravel or sandy subsoil, with only a similar depth of soil, which on the chalk would form hardly more than down land, and on slate rocks be almost worthless. And on other parts of its range, on Lincoln Heath, not to say in Oxfordshire and Nottinghamshire, its rental value rises to very respectable figures.

The narrow belt of inferior oolite sand between the Bath oolite and the lias, which runs through England, from Gushborough in Yorkshire to near Crowken, Sherborne, and Yeovil, in the south-west, is everywhere singularly fertile, and forms some of the best light, deep, arable land in the kingdom. This formation, again, is singularly full of fossils, and, like the adjoining lias, I suspect that it contains a trace of phosphate of lime. The sandstone of this formation contains the celebrated Cleveland iron, and I believe it is in great measure due to its containing a certain portion of lime that the iron can be made from it so economically, although it is not enough to supersede the use of other limestone as a flux. The green sand also, associated with the lower chalk, is essentially fertile; whilst the Hastings sand and ironstone of the Weald of Sussex are essentially barren.

I am not at present able to carry these comparisons out with certainty through the remaining varieties of light land, and therefore must be content to leave these notes somewhat imperfect on that point. This mode of comparing the different strata is one that has occurred to me, and which I have never heard suggested by any one else, and possibly it may be considered as fanciful; but I am rather desirous of calling especial attention to this part of my paper, because I should be much interested in hearing what others think of it.

In addition to those enumerated, many other signs of good or bad land are often pointed out, but I believe most of them naturally result from what has been already stated. Thus the size and colour of the stones in light stony soils is often much thought of, and there is no doubt that in the chalk, small water-worn gravel stones indicate a thin gravel immediately below the surface; whilst larger flat flints, though they make the ground look more stony, and cover a much greater surface, are split off by the plough from a more solid layer of flint below, which may have a very useful soil over it. Again, the colour of soils is often spoken of, but it varies so exceedingly in both good and bad land, that all I am inclined to say about it is, that the darker coloured soils usually contain the largest proportion of "humus" or vegetable matter, which is generally an advantage, but, like all things else, may be in excess, as in peat soils.

To sum up, then, my ideas about the indications of the intrinsic value of a soil—I think the valuer should form his conclusions primarily from an examination of the soil itself, as to its mechanical composition, depth, and subsoil; then he should modify these conclusions by his knowledge of the geology of the district, and check and confirm them by all the botanical evidence his observation may collect. By carefully carrying out this method, I believe he secures himself from being misled, either by high or low farming, dry or wet summers or winters, different seasons of the year, or any other causes, which are apt to affect the appearance of the surface, and sadly deceive those who look at what is upon the land, rather than at the land itself.

Having determined the intrinsic value of the soil, there are many other things to be considered before arriving at the rental value of a farm. One of the most important is the situa-

tion of the lands with reference to the homestead, a compact farm with a homestead in the centre being much more economical to work than one where the lands are scattered. But if the valuation be for the purpose of sale and not for letting, it will be well to recollect that what is inconvenient for one occupier may have a special value for another, and that a simple re-letting may bring each enclosure to its full value. The sizes of the enclosures and the quantity of land lost in wide fences may also be noted; but small fields generally imply small tenants who pay high rents, so that, practically, the great loss of space and labour resulting from too numerous hedges does not usually fall on the landlord. The particular position of a farm with reference to markets and railway stations, and its having a ready access by good roads, are very important points; but since, with our present railway system and easy communication, the values of the principal agricultural products are pretty nearly equalized over large areas, the rental value of the same quality of purely agricultural land, devoid of any accommodative character through proximity to towns or otherwise, will not be found very greatly to vary throughout the country, except in those districts where a marked alteration in climate materially affects the character or quality of the produce.

There are favourite counties where the number of years' purchase obtained for an estate is increased by competition, but I do not think the rents that farmers give vary to the same extent for similar land.

The elevation above the sea level and the climate make a great difference if the valuer's observations are extended over a sufficiently wide area. In the south-eastern and Midland counties the variations are not important. All along the west coast the dampness of the climate materially affects the course of husbandry, and gives a great preponderance to grass land.

The aspect should be noted. It is, of course, desirable that land should slope to the south rather than to the north, so as to receive the sun's rays at a larger angle, but it must be remembered that any steep slope is objectionable in whatever direction it may be.

Of the drainage of retentive soils I say nothing here, because, in the examination of the land itself, it will, of course, be ascertained whether it is dry (naturally or artificially), or whether it remains wet; but any liability to flood should be carefully allowed for. The character of the farm buildings, the presence or absence of hedgerow timber, adjoining woods, game and rabbits, are also modifying circumstances of importance, enough to occupy more than one paper for themselves, and I merely allude to them to show that the subject is not complete without them. The whole subject is one that must be very interesting to many of us; but it depends so entirely on personal experience and judgment, that it is very difficult to convey much information upon it in a written form. Still, I believe, that every attempt to reduce one's ideas to a systematic shape must be useful, if only that it tends to help us the better to arrange our observations, so that more of their results are permanently preserved in the mental storehouse for future use.

RIVERS POLLUTION AND SEWAGE IRRIGATION.

KINGSTON-UPON-THAMES.

THE important questions, how to diminish the present gross forms of rivers pollution, and how best to apply liquid town-sewage to agricultural purposes, require answers. Towns which pollute streams with their sewage are actionable at common law for such abuse, and Parliament has, in some degree, provided a way of escape through the powers of the Sewage Utilization Acts recently passed. Both questions are complicated in many ways. Some rivers are polluted by manufacturers as well as by towns. If, therefore, rivers are to be conserved from pollutions, there must be official supervision armed with powers covering the entire areas polluted (town and country), and capable of coercing all polluters and obstructors of streams.

Experiments and experience have proved that irrigation of land under grass cultivation is the most effective mode of purifying town-sewage; the real difficulty being, to find sites suitable for sewage farming, and means to convey the sewage to the land. There are evidence and experience enough to prove that sewage farming need not cause any nuisance injurious to human health; as, also, that where land can be obtained at even

an extravagant agricultural price, the operation may be made to pay; but there must clearly be a limit to the price to be paid. Land near large towns for instance, studded with houses (villa residences), surrounded by ornamental grounds, will not be available, for two reasons: firstly, local opposition; and, secondly, cost. Local opposition, in fact, means "cost." There are hundreds of acres of land surrounding large towns now letting at agricultural prices, but which would only be sold at building land value; that is, land letting at annual rents, from 3l. to 6l. per acre, but which would only be sold at 500l. or 1,000l. per acre, and under a forced sale after heavy costs. These things being so, no town would be warranted in paying such prices for a sewage farm.

The Kingston-upon-Thames Corporation proposed, recently, to acquire 150 acres of the "Ham Fields," stretching along the margin of the most beautiful portion of the Thames, partly above and partly below Teddington Lock. On the opposite side of the river stands Twickenham, and on both sides there are large mansions, which are inhabited because the district is open, beautiful, and free from manufactures and the suspicion of nuisance. The proposal of the Kingston Corporation has, however, set all these owners of property and residents in the district in violent opposition; and numerous signed memorials against the scheme have been received at the Home Office. An inquiry has taken place, and the Kingston Corporation proved certain well-known facts with respect to properly irrigated land—namely, that the effects and results of sewage irrigation are not necessarily injurious to health.

The land proposed to be taken in subsoil and surface soil was proved to be suitable for sewage irrigation—this portion of the valley of the Thames being alluvial, that is, a loamy gravel.

The Croydon witnesses on behalf of the Corporation proved that fresh sewage, applied to such land in proper volumes, would produce heavy crops of Italian rye grass, and would not create local nuisance nor disease.

Land valuers on behalf of the Corporation estimated the estate at 32,000l. (less than 150l. an acre), and the necessary works were estimated at 11,000l. The land is "freehold," subject to "Lammass rights;" and it was stated that in effecting a purchase a hostile lord of the manor and hostile commoners would have to be bought out. Evidence was given, in cross examination, that land in the immediate neighbourhood had been sold at prices varying from 500l. up to 1,000l. per acre; and that such prices would be contended for if the question of a forced sale ever came before an arbitrator. The opponents, however, declared their intention of resisting the purchase of this land for a sewage farm, by every legal means, at any price. Supposing that the Secretary of State assented to the preparing of a provisional order, this would be opposed on the "second reading," when it must go before a "select committee," and all the evidence, they said, and all the cost would be again incurred; and further, supposing the bill to have escaped this ordeal, there would be violent opposition in both Houses of Parliament, and according to any reasonable doctrine of chances, defeat would be certain. Evidence, it was stated, would be tendered by the opponents to prove that land can be obtained in the neighbourhood free from the objections raised against Ham Fields, as also that combination with other districts would make the proposed sewage irrigation works better and cheaper for all parties.

Those members of the Kingston Corporation who promoted the scheme profess to be angry with the Home Secretary for declining to sanction a prolonged inquiry; but when there is time for cooler judgment this feeling will doubtless wear away. There are two sides to most questions, and more than one way of parties interested looking at them; an official, however, ought to arrive at his opinions, if possible, free from bias, and then decide fearless of either praise or blame. The Kingston sewage irrigation would undoubtedly have saturated the subsoil of 150 acres opposite to a portion of the river drawn upon by the great water companies for the supply of London, and suspicion would have been thrown upon all the local wells. One of the open spaces in the most beautiful part of the Thames would thus have been vitiated by sewage utilization. The question, as may be learned on reading the published evidence, ceased to be one of nuisance or no nuisance, and became one of relative cost, in the first instance; and, if the corporation like to put it

so, of sentiment on behalf of the local proprietors. But besides the resident objectors there was a loudly-objecting public, in the persons of many commoners, who reasonably objected to the enclosure of so much open common land, over which, from time immemorial, there have been Lammass rights. Town sewerage and sewage farming are both necessary; but town authorities, in selecting sites for sewage irrigation, ought to have regard to local feeling, probable cost, and to public convenience. The margin of the river Thames opposite to Twickenham and parallel with Ham village ought not yet, at any rate, to be selected for town sewage farming.

THE DRAINAGE AND HEALTH OF LEICESTER.

WE have received, amongst other letters on this subject, and in reply to recent observations in our pages, one from Mr. E. S. Stephens, the borough surveyor, and another from one of the inspectors of the Leicester deep sewer works, who signs himself "Not Ashamed of my Job." The facts stated in our article of the 27th of March were derived from the report addressed to the members of the highway and sewerage committee of the town council of Leicester, signed Jas. Thompson, and dated February, 1869.

Mr. Stephens in his letter complains of the statement that the "sub-committee, in a great measure, traces the extraordinary death-rate from diarrhoea to radical defects in the main sewer of the town." The report gives three conclusions at which the sub-committee arrived in tracing the cause of the mortality from diarrhoea.

The 2nd conclusion is, "The inefficiency of some of the main sewers in carrying off the daily supplies of fecal and other offensive matter conveyed to them from the houses by side drains." To this are appended the following remarks:—"It will be in the remembrance of some members of the highway and sewerage committee that the main sewers were laid down by contract; that the contractor found his bargain unprofitable; and suspicions were entertained at the time that the work was done on incorrect principles—the lower tiers of bricks being laid in without mortar. In consequence it would be found, I firmly believe, were investigation to take place, that many of the sewers are nearly filled up with silt, and hence the sewage matter chooses them up, continually evolving gas of a most injurious description, which forces itself up the side drains into the houses, through the imperfect arrangements made for trapping the pipes in sculleries, and kitchens, and cellars."

Conclusion 3rd is, "The introduction into wells, by percolation, of the emanations of cesspools, the water being drunk by the inhabitants of the locality, and thus occasioning the disease."

Among the remedies proposed, No. 2 is "The taking up of the brick sewer by degrees, when proved faulty, and the substitution thereof of the pipe sewer. At Liverpool, I hear, a pipe sewer, nine miles long, is in course of construction." No. 4 is "The prompt discontinuance of the use of well-water in all quarters where the contact is near with the lower parts of cesspools, and other similar places of deposit."

At the end of the report is printed a letter written by a friend of Mr. Thompson's, and an eye-witness of the construction of the main sewer. The following is an extract from the letter:—"You will remember that Mr. Bown was appointed inspector, and it was generally understood that the appointment was to be a sinecure. When the sewer was being made, I was induced, by the rumours afloat, to go with a friend to see with my own eyes whether they were being laid without mortar. I went to some streets between Belgrave Gate and Humberstone Gate, and saw in a number of places that the lower half, at least, of the sewer was laid without any kind of cement; that a small quantity of mortar appeared on the top of the completed work; and that filling in with earth had commenced, so that the work was visible in all stages."

The suggestion as to the cause of this defective construction, is also contained in the same letter appended to the printed report, and is not as stated by Mr. Stephens, a sage suggestion of our own.

Mr. Stephens says the only inference he can draw from our observations is, that the writer "must be a large shareholder in the water company, and that his desire is to frighten the public into taking his water." Mr. Stephens evidently knows nothing of the *Builder*.

THE ARRANGEMENT OF FARMSTEADS.

At a recent meeting of the Tarporley Agricultural Society, Mr. R. Beckett, of Hartford, read a paper on "Cheshire Farmsteads," which contained suggestions that may be usefully attended to in other counties. We therefore print the pith of it:—

I have nothing particularly novel to propound, nor do I claim entire originality, either in the matter of this paper, or the plan accompanying it; so far from this, you will often find me indulging in quotations—of which I am fond—for when fitting they are as "grains of wheat in bushels of chaff." And as to my model plan, you will find many of its features in one or other of the other plans exhibited, whose authors' names are attached to them, and whose consent I have for bringing them before you. I have not the least intention of adding to the number of *unpractical* practical suggestions—which abound already—in proof of which I may say, that, although this model plan has not in its entirety in any particular case been carried out, yet in one place or another its main features are those of buildings I have myself erected within the last fourteen years, and have more or less received the approval of experienced farmers.

If I am asked what is the best advice I could give to those about to build, it would be something of this sort:—As "understanding a thing is half doing it," be thoroughly satisfied before you lay a brick that the plans not only show the accommodation you want, but that it is well and conveniently arranged for its purpose—ever remembering that as the area covered is a criterion of cost, so let as little room as possible be given to unnecessary passages and useless places. It is easy to correct what is wrong before you begin; it is not so when built, for then needless additional expense must be incurred or there it must remain, it may be, to the discredit of all concerned.

Then, if you build by estimate, be prepared with something more than the sum first named, for depend upon it there is truth in the old adage, "The charges of building and making of gardens are unknown." Rely more on the character of your tradesmen than on figures; and, above all, what you do build, build substantially. Give your orders as long beforehand as you can. To delay them until spring is advanced, and then to insist on the work being done in the few summer months, perplexes an employer, is injurious to the employed, and leads to disappointment and loss. Moreover, "Good and quickly seldom meet." Shakspeare says:—

"When we do mean to build,
We first survey the plot, then draw the model;
And when we see the figure of the house,
Then must we rate the cost of the erection,
Which if we find outweighs ability,
What do we then, but draw anew the model."

As the tenant is the most interested in the convenience of the buildings, it is but right that his opinion should be taken; and, indeed, so far as my experience goes, it generally is. But still I am no advocate for the sort of parliament which the Chronicler of a Clay Farm has so humorously described:—"The landlord, the tenant, the bricklayer, the carpenter, the workmen, and last, not least, the gaping neighbour, each has his opinion, and gives it freely enough. The result is generally a mongrel compromise between them all. No one voice, no one plan is predominant; and by the time the whole outcry is spent, the job is half a job, and the ship is expedit for a haporth of tar and an ounce of oakum! The extreme of cold, as well as the extreme of heat, will leave a listener on the fingers."

Position.—When you possess the power of choosing the situation, Lord Bacon's advice is, "Avoid ill ways, ill markets, and ill neighbours." The two last are, perhaps, greater ills than the first, and not easily avoided. Good accessible roads are unquestionably a greater consideration than central position, which writes on this subject have theorised so much about. Another authority says, "A house built in low or flat ground by a river side, makes work for the physician, apothecary, surgeon, coffin-maker, and grave-digger," so there is more in this question of locality than we are disposed to think.

Site.—This, as well as the last, does not often happen to be a matter of choice, but when it does it is just as well to recollect what an artist has said, "None but a fool would build a house on a hill unless there was another hill behind it as a shelter against northern storms." But there is one very material consideration these wise men

have not mentioned, and that is, a constant and abundant supply of good water, a *sine qua non* about a farmstead.

Aspect.—This, at any rate, in new buildings, can and ought to be considered. If in other dwellings comfort and health are affected by it, in a Cheshire farmstead, there is the other advantage—usefulness. Aspect is, to some extent, as necessary in a *farmhouse* as in a *greenhouse*, for if there is a manufactured article one may call vegetable, and which requires treating as such, it is cheese. The best front aspect is south-east; north and east are cold and cutting, south and west hot and wet. A reference to the plan before you will best explain what I deem the best disposition of the different rooms. The living-room is on the south-east, kitchen south-west, and the milk-house on the north and north-east. Of a milk-house Professor Voelcker says, "It should be dry, well-ventilated, and protected from the rays of the sun."

Arrangement.—Here again, I must refer you to the plan, mentioning only some of the points which strike me as important. As "One eye of a master is said to see more than ten of his servants," the living-room, with master's bedroom over it, should command a view of the farm-yard. A good sized back or working kitchen, with a soft-water tank under it, is provided. In this kitchen, the bulk of the rougher work and cheesemaking are done; the best kitchen being more of a dining and general living room for the servants.

Over this working kitchen I have placed the cheesemaking room, or rather rooms, for the smaller the room the more uniform the temperature. No farmhouse, at any rate, ought to be without a second staircase, if only for the complete separation of male and female dormitories. Good cellarage is indispensable; and attics, where the elevation will allow of them, are a great convenience.

For the arrangement of the farmery, I consider the cruciform plan as best adapted for our purpose, the double cow-sheds forming the main leg; the root-house, with chopping-room over it, filling in the intersection between this and the young stock sheds on the one side, and the cart and implement sheds on the other. Dutch hays have of late entirely superseded the old lock-up barns. These are placed against the root and chopping houses. Over the cart and implement sheds is the granary. Stables and loose boxes form a wing on the south-east side. Piggeries, yards, as well as sleeping sheds, should, I think, be roofed in, but open on at least two sides. Pigs, from their general treatment, might appear to be considered an exception to all other animals, which thrive and fatten best when sheltered and warm. A covered pigsty has also less of "rank compound of villainous smell" so common to open ones.

There are no lofts over the cattle sheds; the little convenience these may be being more than counterbalanced by their many disadvantages, such as injury done to the provender from exhalation, the health of the animals being affected by the confined space, and the discomfort to the milkers in hot weather. Add to this the danger of fire. I have known so many losses from fire traceable to these lofts, often from unprotected lights, that I wonder insurance offices do not levy an increased rate where they exist. Other depots for the provender must of course be provided in lieu of lofts. Liquid manure tanks, so popular a few years ago, are now, it is to be feared, very little cared for. Where they are not regularly emptied either for distribution on the land, or on to the manure, they are a doubtful advantage, for they then simply convert a visible and partial waste into an invisible and total loss. I do not recommend that the drains should be taken directly into the tank, but that they should deliver themselves on to the manure in the manure yard, which should be sunk for that purpose. The tank being in the opposite corner of the manure stand would thus only receive what the manure (or the next best thing, sand or soil, oarted in for the purpose) failed to absorb. The liquid should likewise be constantly pumped back again on to the manure or soil, and never be allowed to reach the overflow pipe.

A great want in our modern farmeries seems to be a sufficient number of good loose boxes for breeding and sick animals, and fair-sized straw-yards for young stock. That useful fluid, rain-water, is too often allowed to run to waste, instead of which I would provide a large underground tank, having a lift-pump and drinking-trough in the yard.

Stationary engines can hardly, in these days of locomotives, be said to be a necessity; and as "Tis use alone that sanctifies expense," I do not consider that engine-houses are a fair demand on a landlord's purse. Horse-power, both for preparing cattle-food and churning, is more economical in the long run. The rick-yard would, of course, adjoin the Dutch bays. I may mention here, I think it a too common practice to place this very near the buildings, for if a fire takes place, it results in the destruction of both buildings and produce. I have placed the higher building so as to protect the cattle-sheds and yards from the prevalent cold winds and wet.

Construction.—By this is meant both materials and their disposal. The strength of materials should always be proportioned to what is required of them, and of the two "stronger than strong enough," Tredgold, a great authority on this, says: "The strength depends more on the right position of the materials than on the substance." I will epitomise some practical points which suggest themselves.

All underground work, especially in wet situations, should be set in hydraulic mortar. Astbury, in this county, supplies an excellent quality of hydraulic lime. Good sand is essential to good mortar as well as good lime. External walls, especially of cheese-rooms and dairies, are better built with a cavity, thus resisting all external influences, whether from heat, cold, or damp. Brickwork can hardly be set too wet in summer, nor too dry in winter. Hereabouts we are not rich in good building-stones. Ramocorn provides a fair red sandstone, and Mow Cop and Biddulph Park an excellent grey grit. These last have but one fault, that is, the expense of working them.

In timber, there is nothing equals our famous oak for internal fittings to cattle-sheds, door-frames, and such like, especially as it is now much cheaper than formerly, iron having forestalled it so much in ship-building. For general purposes, American red and yellow pine are the best; American spruce is the cheapest and the worst. We have a maxim in carpentry which is worth remembering, namely, "kniss with wood, and tie with iron." All large doors, and those exposed to wind, should slide, where practicable.

For roof covering, tiles, although heavier than slates, have the advantage of being less costly; they are also slow and imperfect conductors of both heat and cold. All roofs should be spotted, and eaves and verges should overhang the walls at least a foot. Let there be as little to keep up in the way of external exposed wood and iron work as may be.

External Appearance.—It has been well said "houses are built to live in more than to look on; therefore let use be preferred before uniformity, except where both may be had." Both can be had, as we all know. It is well to remember "the difference of cost between good and bad building is very small, the difference in their appearance and utility immense." The architecture should be distinctive, that is, the appearance of a building should bespeak its character and use. The Elizabethan style is generally preferred. Much may be done by colour as well as outline. What dress is to an individual that colour is to an elevation.

Ventilation.—For a definition of this, I will quote from a lecture I heard a week or two ago, by Mr. Reid, ventilator, of Prescott. He says: "To define the word Ventilation—it is to be understood as being the due and suitable supply of air to any apartment or place not having free and unlimited communication with the open atmosphere. This definition therefore includes all buildings, and all parts of buildings; and the supplying to them of the most important and the most indispensable of all things necessary to sustaining the life and health of the occupants of such dwellings—for without clothing a person may live long, and without food may live days, but without air, life cannot be sustained even for a few minutes; therefore, air is the most absolutely indispensable of all life-sustaining substances. The definition also embraces the art and skill necessary to introduce such air in due quantity, at proper places, in a fit condition, and appliances to insure a continuous circulation into and out of every apartment.

So that, to be satisfactory, it implies ingress as much as egress—a free current without draughts. For admitting the air into cattle standings, a glazed drain tube, a little above the floor, pointing upwards and downwards, is not a bad expedient—the point of egress should be as high as possible. What are known as honnet-ridges, and louvre ventilators, are generally used

for the purpose. As to the ventilation of the rooms of a house, there is no doubt every room which is closed for hours together, should have two flues—one for smoke, the other for vitiated air. It certainly seems odd that we should devote such endless ingenuity and expenditure in securing the most perfect system of ventilation in our parlours and workhouses, and yet so entirely neglect it in our own dwellings. I cannot refrain from quoting here some remarks I met with a day or two ago on this subject—reflecting, though it does, on my own craft:—"The manner in which rooms are now constructed is, in my opinion, really criminal; one would suppose that every pains and care were taken to render them thoroughly uncomfortable and unwholesome as possible; they are positively as much like air-tight boxes as they can be. They have no properly-constructed inlets for fresh air, which is left to get in as it can through the chinks and crevices of ill-fitting doors or windows. It is a mercy, for the sake of their inmates, that the joiner does not more perfectly complete his work; were he so to do, the chances are that they would not 'live out half their days,' where the foul or respired air is guardedly retained as though tenacious of losing one's breath."

Light is only secondary to ventilation, and being cheaply come at, there is the less reason to withhold it. Continual darkness is without doubt injurious to sight, and so also is too glaring a light in front of an animal.

Heating of cheese-rooms either by hot air or hot water is the exception, and ought, we are told, to be the rule. The simplest plan, and I think the best, because the most easily regulated, is having a stove in the press-room, with its pipes passing through an aperture much larger than itself, in the floor of the cheese-room above.

Cost.—Bailey Denton, in his "Homesteads of England," a most admirable work, computes this at about 7l. per acre, which probably as an approximation is as near as one can hope to get; but it is evident this would vary in proportion to the extent of the farm. The number of cattle kept is so disproportionate to the acreage on different farms, that any average computation based on extent is necessarily very uncertain. The next thing which would follow upon cost—namely interest—is so unwelcome a theme, and so rarely brought into question in Cheshire, that we will, as the schoolboys say, "skip it," although, mid way, I am not a convert of those who seem to think a landowner is the only man in the world who should eschew an interest table.

I shall conclude with a few general remarks, which I hope you will not think irrelevant.

A landed estate has not inaptly been styled "an animal with its mouth ever open." It is, therefore, wiser to expect too little than too much.

There is one essential to a satisfactory homestead I have not yet mentioned, and that is, an occupant who appreciates it, and will see that as there is a place for everything, so everything shall be in its place. I care not how good and well arranged it may be, if misappropriation within and untidiness without are the rule, the effect can only be the reverse of pleasing. A good homestead without a good tenant is a lock without a key.

My views of what chiefly constitute a good Cheshire Farmstead are now before you, and all I can say is—

"If a better system's thine,
Impart it frankly, or make use of mine."

Most of you have the advantage of experience in the every-day working of them, which I have not; therefore, so far, your opinions are worth more than mine, and I trust you will not hesitate to give them as freely and candidly as I have tried to do. No one can be more interested in learning than I am, and none, I hope, more willing.

Notwithstanding we have in this country some of the best landowners, the best farms, the best farmers, and the best farmsteads in the world, we have a sufficient number of the latter, at least, which are so unworthy of the name of farmsteads as to render this subject worthy of our considerations.

The plan which the most successfully combines working convenience with economy of space, and the best facilities for manufacturing cheese and manure, must be the best, come from where it may.

Building Act.—It is understood that no endeavour will be made this session to obtain a new Metropolitan Building Act.

THE LIVERPOOL HEALTH REPORT.

THE usual annual report (for last year) on the health of Liverpool by Dr. Trench, the medical officer of health for the borough, has been printed, and we give a few extracts from it.

The average death-rate of the borough for 1868 was 2.91 per 1,000. The average during the previous ten years (1858 to 1867) was 3.2 per 1,000, or 3.1 per 1,000 more than in 1868. This is equivalent to a decrease of 1,552 in the number of deaths relatively to population, or, in other words, it may be regarded as a saving of 1,552 human lives when compared with the mortality of the previous decennial period. The deaths during 1867 were 14,513, or by seventy numerically less than in 1868; but if allowance be made for increase of population, at the rate of 1.68 per cent., then the returns of 1868 are more favourable than in 1867 by at least 172 deaths, or by a rate equal to 0.3 per 1,000 of the population. This decrease, though slight, is satisfactory, because the excessive heat and dryness of the seasons occasioned an unusual amount of infantile sickness throughout the country during the summer and autumnal months of 1868.

Zymotic diseases occasioned, during 1868, 3,944 deaths, and thus accounted for 27 per cent. of the total mortality from all causes. This rate is 3 per cent. more than what in ordinary years is found to be the proportional rate of zymotic deaths throughout the country; but it is 1.5 per cent. less than the proportional rate within the borough of Liverpool during the preceding decennial period.

Typhus and infantile remittent fever accounted within the borough of Liverpool for 841 deaths; or for 532 in the parish and 309 in the out-townships. The rate of their mortality was equal to 1.7 per 1,000 per annum of the estimated population; their per-centage rate relatively to deaths from all causes was 4.2 during the first, 3.8 during the second, 4.7 during the third, and 10.2 during the fourth quarter of the year. Their deaths included 432 males and 409 females; 239 persons below the age of 15; 231 between the ages of 15 and 30; and 371 above the age of 30.

During the months of August, September, and October, while summer and infantile diarrhoea were likewise extremely prevalent, there raged a wide-spread epidemic of the enteric type of continued fever. It first showed itself in the rural districts on the north and north-east of Liverpool, where, beneath a sandy soil of very moderate depth, the substratum is hoelder clay of great extent and thickness. Its attacks were not restricted to the weakly, the poor, the indigent, or the overcrowded; but, on the contrary, while it spared no class, its chief victims were the young and adolescent of families in comfortable circumstances. It was not on the whole a very fatal malady; its death-rate being much less than that of ordinary typhus.

The drainage of houses throughout the whole of the rural districts is at present necessarily imperfect. The land is flat, the clay substratum impervious to fluids, the subsoil water line near to the surface. The drains, such as they are, either terminate in cesspools, or empty into stagnant ditches, or enter the muddy and sluggish tributary streams of the river Alt, or allow their contents to percolate through the porous soil around the houses. In Bootle the sewers are unventilated, and notwithstanding the lessons so sadly taught by the death registry of Liverpool, the houses in that rising district are constructed in many respects without due regard to the principles of hygiene. The season was favourable to the injurious miasmata which result from vegetable decomposition aided by a high temperature.

The number of privies certified for conversion into water-closets throughout the borough, from July, 1863, to end of December, 1867, was 8,323; from January to December, 1868, both months inclusive, the number was 5,068.

The corporation, availing themselves of the provisions of the 29th Vict., cap. 28, have erected on land, purchased for the purpose, six blocks of tenements, containing in all 146 dwellings for the labouring class. The rents at which it is purposed to let the houses are extremely moderate, and the rent-charge includes sanitary and parish rates, and the water and gas used in the households. The St. Martin's Cottages cost, for site and buildings, 16,151l. They contain 84 two-roomed houses, at rents from 3s. to 4s. 3d.; 42 three-roomed ditto, 4s. to 5s. 3d.; 20 four-roomed ditto, 5s. 6d. to 6s. 6d.; gross total rents, 1,647l. 14s.

PROPOSED CHANNEL TUNNEL.

DUNGENESS TO CAPE GRINNEZ.

In a prospectus on this subject, Mr. George Remington, C.E., says,—

"The Wealden formation, consisting of very strong clay, beds of freestones, and freshwater limestone, extending from Dungeness across the Channel to Cape Grinnez; and having concluded that that was the proper course for the construction of the tunnel; I at once proceeded, at considerable expense, to prepare plans and sections, and laid them before the Board of Trade, the Minister of Works, Paris, and also placed copies in the hands of many noblemen, including the Earl of Derby, the Duke of Richmond, the Duke of Sutherland, and others.

The line is intended to commence at the town of Lydd, where it will join the branch railway from the South Eastern at Appledore. It will descend from Lydd at an inclination of 1 in 70, the distance of 31 miles to the point of Dungeness, where the level of the rails will be 249 ft. below the level of low-water spring tides; the rails would then rise from Dungeness shaft at the rate of 1 in 3,795 for about 7 miles, then fall at the rate of 1 in 1,200 for about 8 miles, to the centre shaft on the "Ridge"; from thence fall at the rate of 1 in 3,265 for 11 miles to Cape Grinnez, and then rise at the rate of 1 in 70, and 1 in 81, to join the French railways.

The height of the tunnel, as shown on the section, will be 30 ft. from the soffit of the arch to the centre of the invert, and there will be a clear headway of 20 ft. for the trains; the space between the rails and the invert will be occupied by a spacious sewer, running along the centre of the tunnel, and on each side of it two air tunnels, for the purpose of providing perfect ventilation. The width of the tunnel will be 25 ft.; it will be constructed of brickwork and masonry, surrounded with concrete, and also a mass of concrete will be placed upon the invert surrounding the air and drainage tunnels, and forming a bedding for the sleepers of the railway.

There will be three main shafts of large dimensions. The centre shaft on the "Ridge" will be protected by a break-water, formed of rubble and faced with ashlar; the other shafts are to be effected by means of wrought-iron tubular shafts from 8 ft. to 10 ft. square, or diameter, the inside strengthened with plates on the cellular principle. These piles will be provided with proper valves to regulate the ingress and egress of water during the time of sinking into position, and when sunk they will be supported by proper guy chains and tackle from anchor moorings placed in various directions around the piles, every pile forming a shaft of sufficient length to reach the entire depth of water and through the bed of the Channel down to the level of the tunnel. It is intended to weight the lower end of the piles, and to sink them into position on the principle of the angler's float. The water will then be pumped out by steam power, and the soil brought up from the interior and cast over on the outside, forming a cone round the pile; thus, very rapid progress may be made with the works according to the number of shafts put down."

Each temporary shaft, he estimates, will cost 19,800l. —

"Should it be decided on to employ ten intermediate shafts, it is quite clear that the tunnel may be carried on in twenty-six sections simultaneously, and, as the distance across the Channel is twenty-six miles, gives only one mile for each section, or two miles for a shaft; and, assuming only one yard advance per day for each heading, the whole works might be accomplished in 64 years; but by means of improved machinery for tunnelling I believe that much more rapid progress might be made."

He estimates the total cost of the works at 6,998,200l., and the probable net profit at 975,540l. per annum.

COMMUNICATION BETWEEN RAILWAY PASSENGERS AND GUARDS.

A PLAN, to some extent on the principle we have long advocated, of opening a way of personal communication for passengers who require it, while trains are in transit, has been invented by Mr. Henry Ledger, builder, Halms. The specification says:—"The object of this invention is the application of simple, inexpensive, and reliable apparatus, which cannot be tampered with, to railway carriages, in order that passengers may communicate or signal to the guard or driver of a train, and at the same time receive instantaneous personal assistance in case of necessity, whilst the train is in motion, from their fellow-passengers in any other compartment of the same carriage; and the application of this invention is also to afford a means of escape from any compartment, in case of fire or accident, whilst the train is in motion." The invention consists in providing a *thoroughfare of ample dimensions through the whole length of the carriages, and from one carriage to another, if necessary, by forming a doorway and fitting a door in each division or partition which now separates carriages into compartments, and, if necessary, in the ends of the carriages. These thoroughfares and doors are situated above the seats, and the doors are made to slide up and down in grooves behind the seats, so that when closed such doors give all the privacy to each compartment which at present exists. When closed, such doors are fastened by means of a self-acting hook, which is acted upon by a lever or series of levers connected to a rod running along the whole length of the roof of the carriage. In each compartment a chain is suspended, which is connected to an arm branching from the longitudinal rod before mentioned*

so that when such chain is pulled by a passenger, the longitudinal rod turns partially, and thus the hooks are caused to release all the doors in such carriage, so as to open up a communication through the sliding doorways between all the compartments. At the same time the doors in falling come in contact with two levers connected by chains, passing over guide-pulleys, to semaphore signals mounted on each side, or on each side of the roof of such carriage, so that such semaphores are thrown out to signal in which carriage the guard is wanted; whilst at the same instant the chains connected with the actuating lever of such semaphore are caused, by means of a peculiar clutch attached to them, to pull the ordinary cord or rope which passed from one end of the train to the other, and thus actuate the hammer of a gong situated either in the guard's van or on the engine, or both; or, if connected with the steam whistle, to cause it to sound an alarm. An indication is also given from which compartment the chain has been pulled, by means of a self-acting latch, which, when once released, renders it impossible to replace it in its original position without the use of a key made expressly to suit it. The whole mechanism of this apparatus is closed in so as to render it impossible to be tampered with.

An important provision of the Railways Regulation Act has now come into operation. Every train travelling more than twenty miles without stopping is to be provided with an efficient means of communication between the passengers and the servants of the company in charge of the train. There is a penalty of 10*l.* for each case of default, and passengers using the apparatus without sufficient cause will be liable to a fine of 5*l.*

In the Commons, in reply to a question, Mr. Bright said:—Some weeks ago a deputation of the principal railway companies north of London called at the Board of Trade, and recommended a new mode of communication between the guards and drivers, and between them and the passengers. After examining it, and hearing the statements of the deputation, the Board of Trade sanctioned the application of the system to those railway companies, and it is known as the rope system. As regards some other lines,—as, for instance, the South-Eastern, which does not generally, or even as a rule, run trains in connexion with the northern lines,—another system, called the electric, has been adopted, and sanctioned by the Board of Trade. If these means should not be found effective, then the Board of Trade will be ready to make such other recommendations and sanction such other plans as may be found more efficient.

NEWS FROM PARIS.

On the 4th inst. the veil which concealed the great bas-relief at the Louvre, representing Napoleon III., full size, on horseback, was removed. It is placed between the Lesdiguières and La Tremouille pavilions, above the public entrance to the court. This bas-relief is of bronze, set in white marble. Above there is an inscription commemorative of the termination of the works of the new Louvre, executed by order of the Emperor. He is represented in Roman costume, with naked legs and arms, and wears a crown of laurel on his head. It brings to mind the bas-relief equestrian statue of Henry IV. over the entrance-door of the Hôtel de Ville.

The Paris circular railway is at last wholly open to the public, the gap between the Courcelles and the Villette stations being completed. Three collisions have taken place on this line within a few days.

It must be very disagreeable for the owner or inhabitant of a house in an obscure street to be promised a first-class central street crossing his own, and to find that the new thoroughfare differs in level from his street to the extent of above 60 metres, or nearly 200 ft., a depth in which the Monument of London could be hid. The town surveyor calculated the difference of level as only a few metres between the old and new street, and tried to maintain it; but the *Sicéle* has proved that the most out-of-the-way carelessness combined with ignorance of municipal engineering has been allowed to prevail over the just complaints of the inhabitants. The Chamber of Deputies was lately occupied with this question, and a sharp but very wholesome discussion was the result. All persons who have visited Paris know the rue Neuve-Saint-Etienne-du-Mont,

now called the rue Rollin, leading from the rue Lacépède, near the Jardin des Plantes, to the Concarterras-Saint-Victor. This is the old street alluded to. Chroniclers inform us that Pascal died in this street, No. 22, in 1662; Descartes and Bernardin de Saint-Pierre lived in it; and No. 6 existed the convent of the Filles de la Congrégation de Notre Dame, where Madame Roland passed, when a young girl, several years.

The new street (Avenue Napoléon) leading from the New Opera to the Louvre is in a very forward state. As it does not form an oblique angle, like the rue de la Paix and other streets, with the Boulevard des Capucines, it has been so laid out as to be opposite and perpendicular to the façade of the New Opera-house. Its length is 800 metres, and breadth 30 metres—about 100 ft.—and during its passage through the *Batte des Moulins* serious displacements of level of adjoining streets will have to be made.

M. Michael Chevalier, the well-known statesman, said, a few months ago, that, by the position of the Opera and the construction of the Place de l'Opéra, one of the finest streets in Europe—the rue de la Paix—was spoiled. One of the French periodicals has borne out the provisions of this great statistician; it says, "*La rue de la Paix, si belle autrefois, ne semble plus aujourd'hui qu'une façon de ruelle, à côté de cette avenue colossale.*" The same paper seems to exult in the commercial prospects of this new thoroughfare, basing the calculations on the ruinous price paid for land at the corners of the avenue. This amounts to 6*l.* or 7*l.* per square metre, or from 6*l.* 1*g.* to 7*l.* a square foot (taking roughly 10 ft. to the square metre); whereas at the Boulevards, even near the New Opera, rue Scribe, and elsewhere, the land is only worth 5*l.* a square foot at present, even for the new palaces there rising up.

On the 4th inst., the "Achille le Clerc" architectural competition was decided by the judges, the subject proposed being "A Monument to the Memory of Rossini." The prize was awarded to Mr. A. Dillon, pupil of M. Questel.

We learn from the *Journal Officiel* (late *Moniteur*) that during the last fifteen years only the collections of the Imperial museums have been increased by 45,000 objects of art, such as paintings, statues, antiquities, &c., owing to the good taste and activity of the Comte de Nieuwerkerke. Objects of the richest artistic value are lying in the streets all through Paris, but the administration has had as yet no place to put them in, and therefore did not buy. There is no excess at present, for the museum space now available in the Louvre is immense. There are, since the restoring of the building, 142 saloons, including the two new galleries on the quay. In spite of all these resources, there is not room for what is in the inventories. The minister proposes to place the surplus in churches and galleries of provincial towns for a certain sum.

SUBURBAN VILLAGES.

The ceremony of laying a memorial stone in connexion with the first village about to be erected by the Suburban Village and General Dwellings Company has taken place at Loughborough Park, Brixton. This company, which is under the limited liability principle, has been established for the purpose of building houses in healthy suburbs, for the accommodation of the many thousands of the industrial classes in our large cities and towns who are suffering from "overcrowding." The ceremony was performed by the Earl of Shaftesbury. The objects of the company are set forth in an address, with this pretentious motto, taken from writings our readers know of:—

"Overcrowding" means want of pure air, and want of pure air means debility, continued fever, death, widowhood, orphanage, pauperism, and money loss to the living. It should be needless now to give proof of its deadly doings."

The leasehold of the Loughborough Park estate was purchased from the Ecclesiastical Commissioners on very reasonable terms, and this has been laid out in plots for dwellings. The whole extent of the ground thus required is about 26 acres. It has been planned out in six main streets, each house having its garden in the rear. The houses, which are to be built on plans by Mr. Fife, the architect, are to be cottage dwellings in ornamental brick, and built in six, eight, or ten rooms, exactly as the shareholder and intending occupier may wish. The rules of the society are so framed that any one can purchase

his house at once on payment of the amount down, or in one or two years; or he may spread over his payment in the form of rent for seven, fourteen, or twenty-one years. Thus, if a shareholder selects a number one house, the price of which is 200*l.*, and pays for it by yearly instalments in twenty-one years, he would have to pay 19*l.* a year and twenty-one years' ground-rent at 3*l.* 5*s.* a year, so that at the end of the twenty-one years he would have paid 470*l.*; but, on the other hand, it must be recollected that at the end of his twenty-one years the house becomes absolutely his own property, and that for the same description of house elsewhere he would have to pay at least one-third more rent, and at the end of his twenty-one years have no more title to the property than on the first day he entered on his occupancy. Mr. Habershon is the chairman of the company.

The Earl of Shaftesbury, at the laying of the stone, said he firmly believed that the great want of the day in our large towns, and some parts of the agricultural districts, was a better domestic condition for the mass of the working people. The efforts which had been made to alter the old state of things showed unmistakably that the great mass of the people did desire improved dwelling-places, and he rejoiced that companies were being inaugurated to improve the moral and social condition of the working-classes. The present movement had his cordial and hearty support.

OPENING OF AN ART AND INDUSTRIAL EXHIBITION AT CARLTON.

The Art and Industrial Exhibition at Carlton, promoted by the rector of the parish, has been formally opened by Earl Manservants. The rooms are well adapted for the purpose, and by the supervision of Mr. W. Bailey they have undergone a transformation. Amongst the articles exhibited were a large number of the products of local industry, prominent amongst them being several varieties of hosiery. Prizes have been offered by the rector, Mr. Forester, to the residents in the parish. Among the contributions are a model of a cottage by a brickmaker, and a second one by a bed-ridden bricklayer, living in Norfolk-lane, Nottingham. Joseph Barnett, of Derby, a youth of sixteen, shows a model of a steam machine, to which the first prize has been awarded. There is also a model of Carlton Schools made to form a chieftain. Near the end of the room are some etchings by Mr. Parker, a Lincolnshire schoolmaster, scarcely distinguishable from steel engravings.

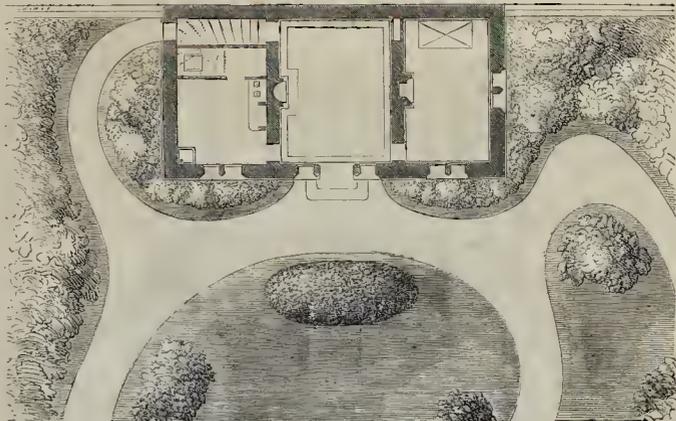

There is a collection of woods, all of which have been grown on the estate of the Duke of Rutland at Belvoir, and arranged by his grace's wood-reeve. There are specimens of various kinds of wood, from cedar down to hick-thorn, and the varieties and intricacies of grain are well brought out by the hand of the polisher. Among the varieties are English oak, knotted, twisted, light, dark, and diversified in size; sections of chestnut; and silver birch, elm, walnut, ash, maple, yew, alder, pear, cedar, mulberry, hawthorn, &c. The proportionate weight per foot is given, and also the soil in which each is grown, with other facts of interest.

THE WISBECH NEW CATTLE MARKET.

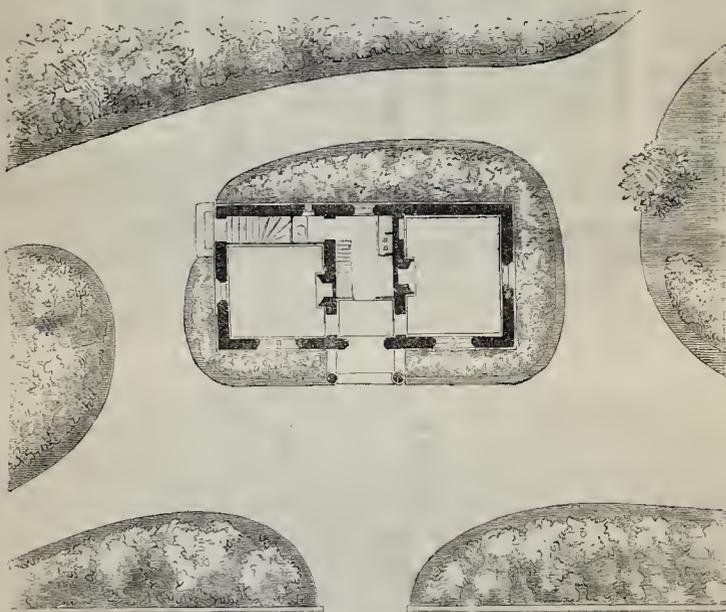

This market was opened on Thursday, the 1st inst., by the mayor. It stands upon the same site as the old one, and occupies about an acre, one-half being devoted to the cattle-yard.

There are two entrances, one for cattle and the other for sheep and pigs. The pens are of wrought iron, let into stone sills, and the cattle-stalls are wrought-iron rails with cast-iron posts. The pens and avenues between them are asphalted. The cattle-stalls are paved with granite squares, the roads and the cattle-yard being macadamized. There is also an asphalted walk, 5 ft. wide, completely round the cattle-yard, and a large watering-trough, supplied by the Waterworks Company, in the centre. A long covered shed is provided for calves and pigs, and an office which forms part of a Gothic front for the collector, and for settling accounts. The works were designed and carried out by Mr. Charles Mumford, C.E., the borough surveyor; the contractors being Messrs. Mellard, Southwell, & Co. of Rugeley, for the ironwork, 497*l.*; and Mr. J. J. Fast, of Melton Mowbray, for the other work, 1,199*l.* The market will accommodate about 1,400 sheep, 500 pigs, and 400 head of cattle.

THE NEW NATIONAL GALLERY.

The correspondence relative to the appointment of the architect for the New National Gallery has just been printed, by order of the House of Commons, on the motion of Mr. Beresford Hope, M.P. It will be remembered that eleven architects submitted designs in competition for this work; and the judges, of whom Mr. Hope was one, reported that they were not prepared to recommend any one individual design for adoption; at the same time, they thought it "due to the competitors to point to the design for a new gallery by Mr. Edward Barry, and to that for the adaptation of the existing gallery by Mr. Murray, as exhibiting the greatest amount of architectural merit."

The competitors, on seeing a statement, which, we believe, we were the first to publish, that it was intended to make no selection from the designs, addressed a unanimous protest to Lord John Manners, then First Commissioner of Works, in which they said:—

"We agreed to enter the competition on the distinct understanding with your Lordship's predecessor, the Right Hon. W. Cowper, that one of the competing architects would be selected for employment; and we most respectfully represent to your Lordship that a contrary course would be a breach of faith with us, and would confer a lasting injury upon every one of the competitors."

And Mr. Cowper, writing at the same time to Mr. Austin, said:—

"The expectation held out to architects to induce them to compete has always been that an impartial decision would be made and published between the competing designs, and that the successful competitor would be engaged as the architect of the building, even though the identical design was not adopted."

In drawing the instructions for the Courts of Justice competition, we stated distinctly that the successful architect would be employed; but in framing the other instructions I thought it better to reserve a discretion on this point, because the vote, for the building had not been passed by Parliament, and future proceedings must be subject to the action of Parliament; but I did not intend practically to place these competitors in a worse position than the others.

In inviting a limited number of tenders for works, the Office does not commit itself to accept the lowest, and yet there is a general understanding that the lowest tender will be accepted under all ordinary circumstances; and I suppose the competing architects must have understood that the one whose design had the award of the first place would be engaged."

The correspondence now printed opens with a letter from the Office of Works to Mr. E. M. Barry, A.R.A., dated 16th June, 1868, appointing him to be the architect for the New National Gallery. Mr. Barry, in his reply of 20th June, says:—

"In accepting the appointment, I have to express the high gratification it has afforded me, coming, as it does, after the report of the Judges of Designs in the recent competition, that of all the designs submitted to them, mine exhibited the greatest amount of architectural merit; and I have to assure the First Commissioner that this is the only point on which I am permitted to render the building suitable for the important purposes for which it is desired, and not unworthy of the nation as a work of art."

He further adds:—

"I shall be glad to be informed whether it is intended to proceed immediately with the new building."

This letter received from the Office of Works a reply, dated 26th June, which contains the following passage:—

"To prevent any possible future misunderstanding, the First Commissioner desires me to inform you, with regard to your remark as to the report of the Judges of Designs, that it was upon a consideration of all the circumstances attending the competition for the National Gallery and the Law Courts, that your appointment took place."

It is also stated:—

"I am to add that as soon as the ground is acquired, and the design approved of, it is intended to commence the building; and that instructions will shortly be sent to you, in relation to the communication with the trustees of the National Gallery, and of the National Portrait Gallery, with that object."

Mr. Barry remarks on the foregoing in a letter dated 4th July, 1868:—

"It is the first intimation I have received that the Government considered that there was any connexion between the competition for the National Gallery and any other matter; and I had supposed that my appointment as architect of the former was due to the fact that the Judges of Designs had decreed my design for a new building to possess the greatest amount of architectural merit; and to the statement of the competitors that their preference for the former was due to the belief that an understanding existed that one of the competing architects would be selected for employment. As, however, you refer to all the circumstances attending the competition for the National Gallery and the Law Courts, it may perhaps be permitted to advert to those circumstances, as far as they affect my position. I was honoured by invitations to send designs to both competitions, in common with Mr. Scott and Mr. Street. The latter gentleman and myself furnished designs in each competition, and I was the only competitor who was distinguished by the favourable mention of the judges in both cases."

Deeply as I appreciate the compliment of being appointed architect of the National Gallery, I shall have reason to regret having been placed in the position awarded to me by the judges of the two competitions, if I am to understand that in consequence of it, it has been thought right to appoint me to the lesser work, and to refuse me the opportunity of obtaining lasting fame and advantages, by having my name connected with the largest and most important public building of the age, in respect of which I have been specially recommended for employment (jointly with Mr. Street), by the Judges of Designs, whose award the competitors were told at the outset would be regarded as final by her Majesty's Government; and on the faith of which promise, I, in common with the other competitors, agreed to enter the competition."

The remainder of the Return is taken up with a report of the trustees and director of the National Gallery, and by subsequent correspondence placing Mr. Barry in communication with the trustees and director of the National Gallery, the trustees of the Portrait Gallery, and the officers of the Department of Science and Art at South Kensington.

A pamphlet by the Right Hon. A. H. Layard, M.P., is also specially brought under the notice of the architect by a letter dated 16th Nov., 1868, before the recent change of Government occurred.

OUR ANCIENT MONUMENTS.

In the House of Commons Sir H. Verney asked the First Commissioner of Works to consider whether measures could be adopted to place the ancient monuments now existing in the country under the protection of some authority which might prevent their destruction. Mr. Layard said the question was one of very considerable importance. Not only had a great many royal and very interesting sepulchral monuments been allowed to fall into decay, or been removed or destroyed, but many monuments of great archaeological value had shared the same fate. This was not creditable to the country.

In France and elsewhere care was taken to preserve such monuments as parts of the public property. When he (Mr. Layard) first came into office his attention was directed to the subject, and he addressed a letter to the Society of Antiquaries requesting them, if possible, to prepare him a list of monuments which they thought required public protection. That request was met in a cordial spirit by the distinguished president of the society (Lord Stanhope) and its members, and they had taken steps which would enable him to obtain such a list, and permit him to submit some proposal to the House for the preservation of such monuments. He hoped to be able to do something in that direction, but could not conceal that there were some difficulties in the way of legislation on this subject, arising from private rights and property. A case, for instance, had recently occurred where a monument of great national value was destroyed in such a manner as, if the accounts in the newspapers were true, showed an amount of vandalism which one could hardly believe was possible in those days.

SOUTH KENSINGTON MUSEUM.

Sir,—In your issue of February 6th there appeared some observations by your contributor, "Art Lover," on the objectionable name which attaches to the museum at South Kensington. I quite agree with him and others on the point, but I object to it still more strongly on the ground of its being singularly inappropriate that a great national institution should be known by no other name than that of the locality in which it happens to be situated. We are told that "a rose by any other name would smell as sweet;" yet I can hardly conceive, that had the British Museum been called the Bloomsbury Museum we should have felt it so worthy and appropriate an appellation. The term "Art Museum" would neither be sufficiently significant, nor yet would it meet the case; for, as "Art Lover" suggests, it would "ignore the British Museum," whilst, of course, for many reasons, it would never do to divide the honours of the name with that grand and matchless collection. In the desirability of having a name for the museum at South Kensington which shall be at once "short, euphonious, and acceptable to everybody," "Art Lover" suggests its being called the "Albert Museum." Now, although that suggestion has been made some time, so far as I have observed or been made able to learn from inquiry, no response has been made to it, and I, for one, take exception to it. I do not think there is any probability of the name of "Albert" ceasing to be honoured, nor any likelihood of its

dying out in the land, and, with all due respect for it, I submit that it appears to me inappropriate to apply to one of the distinctive and characteristic institutions of the country the name of any individual, however good and great he may have been.

"Honour to whom honour is due," is always desirable at proper times, and under proper circumstances; but in the case of a vast and ever increasing collection of works of art, the result of many princely gifts, of loans, and of immense cost to the country—which is maintained as a national institution at the expense, and under the control, of the Government of the country, and which has necessarily connected with it so many names which must ever be held in reverence and in honour—I do not think that a name of dignity and significance as to its ownership and its intentions should be given to it. It is the property of the nation (acquired by the gifts of many, and by purchase) for the general good, and therefore I would suggest that it be called "The National Museum." This appellation, I think, would meet all the requirements of the case. It is grand, simple, expressive, and appeals to the understanding of every one, whilst it is also short, euphonious, and not liable to any abbreviations; and we should then be following the precedent set us in the other magnificent collections of the nation, and should possess "the National Gallery" in Trafalgar-square, "The British Museum" in Bloomsbury, and "The National Museum" in South Kensington (in the latter of which is already included a part of the National Gallery).

BONUM NOMEN.

NEW HEAD-QUARTERS FOR 1st SUSSEX VOLUNTEER ARTILLERY CORPS AT BRIGHTON.

The old Eagle Foundry has been altered and converted into new head-quarters for the local artillery corps. The black frontage has been repaired and tuck-pointed. The gates open at once into the drill-hall, 106 ft. in length by 38 ft. in width; but on the left an orderly-room reduces the length of the hall to 88 ft. In the centre of the wall on the left-hand side of the drill-hall is a large opening, fitted with double sliding doors, forming the entrance to a gun-shed, 60 ft. by 38 ft., in which are placed four 18-pounder field-pieces; the room being amply sufficient to permit four detachments to drill at the same time, including limbering and unlimbering the guns. On the north side of this shed is an armourer's workshop. This room also affords space for the quarter-master's stores, and leading from it is the armoury, fitted with racks for 516 stand of arms. The arched roof and walls of the armoury are composed of masonry, strengthened by iron girders. The block of buildings described forms the northern and central portion of the premises. In the southern portion is a private room for the colonel and officers; and above are two rooms, one a reading and smoking room, 25 ft. by 18 ft. for the non-commissioned officers, and the other, 38 ft. by 25 ft., a reading and smoking room for the gunners. On the west side of the premises there is an eight-roomed house, which forms the residence of the sergeant-major. The work has been performed by members of the corps, at cost price,—that is, they merely charge for labour and material,—the carpenters' and builders' work being carried out under the superintendance of Sergeants Hilton and Bunting, upon plans furnished by Lieutenant Gouley (Gouley & Gibbins, architects), and the gasfitters by Sergeant Allen. The expense will not be covered by 1,000. The colonel advanced the money.

ABUSE OF LIBERTY.

Sir,—We boast of our liberty, and, no doubt, liberty is good if you know how to use it. Now, it seems to me there is a liberty greatly abused occasionally, connected with the province of the Builder, and that is the liberty which persons appear to possess of letting houses stand untenanted and running to ruin to the great annoyance of their neighbours. This has been the case for many years past of a row of houses at the corner of Stamford-street, Blackfriars; there they stand from year to year, in all their filthiness and dilapidation, a nuisance to the whole neighbourhood, simply because some crazy or crotchety wretch wills it, and there is no wholesome law to will otherwise. Oh, for a little wholesome curtailment of this unchastened liberty. H. W.

THE BELLS OF ST. MARGARET'S, WESTMINSTER.

ON the north side of the venerable Abbey stands the well-known and very interesting parish church of St. Margaret. Its tower contains a peal of ten bells, in the key of E flat; weight of tenor 26 cwt., & a clock.

During the sixteenth century this church, like many others, had only five bells for ringing in peal. But in the course of time these were increased to six, subsequently to eight, and at length to ten in number.

The following extracts from the "Churchwards' Accounts," indicate some of the various occasions on which the bells were formerly used:—

Table with 3 columns: Item description, Quantity, and Price. Items include ringing for Master Taysdale, the burial of Abbot Iltyspe, Christmas evens, the King's Graco, mending the second bell, ringing for joy of the great victory, the Queen's coronation, and various other church events.

Numerous items also occur for ringing on divers other occasions. See Nichol's "Illustrations of the Manners and Expences of Antient Times in England." to. 1797.

The bells now in the tower have no inscriptions besides the names or initials of founders, churchwards, &c. I will, however, give a statement showing by whom, and when they were severally cast:—

- 1. Lester & Pack, London, 1761.
2.
3.
4.
5. Samuel Knight, London, 1739.
6.
7.
8. Pack & Chapman, London, 1773.
9. Thomas Mears, London, 1831.
10. Lester & Pack, London, 1761.

As I have said, the church at one time had a peal of eight bells, and it is probable that these were all made in 1739 by Samuel Knight. Be this as it may, it is certain that the last three of the peal were subsequently recast or replaced.

I may remark, in passing, that Samuel Knight cast the grand peal of twelve bells at St. Saviour's, Southwark, of which I gave a descriptive account in the Builder of June 13, 1868.

In 1761, Lester and Pack added two new trebles to the peal of eight, above mentioned, recast the tenor, and thus completed the present peal of bells, upon which ten members of the Society of College Youths rang, on the 6th of March in the same year, a true peal of Grand-airs Caters, consisting of 6,040 changes, in three hours and thirty-five minutes. This was the opening peal upon the ten bells.

Several remarkable exploits of change-ringers from 1751 to 1828 are recorded upon tablets placed on the walls of the heltry.

Certain members of the "College Youths," and other Societies, still ring here occasionally, Mr. S. Smith being the steeple-keeper.

The clock was made in 1712, by Laugley

* I have given the weight of this bell as generally reported; but, like that of many other tenors, it is, in my opinion, over-rated.

Bradley, from whose hands came that of our Metropolitan Cathedral, and now strikes the quarters upon the 3rd, 4th, 5th, and 6th bells, the hour being struck on the tenor.

Having personally surveyed the bells and heltry, I may state, in conclusion, that the above account will, it is hoped, be found more trustworthy than any other yet published.

I need scarcely say that the Rev. Mackenzie E. C. Walcott has given the best history of the church in question in his "Memorials of Westminster," Svo., 1851. THOMAS WALESBY.

THE TRADE-UNION COMMISSION REPORT.

SIR,—As the last Report of the Commissioners is issued, I hope you will think a few thoughts on the matter by a working man worth inserting in the Builder. It appears that the Report is not likely to please the unionists, and there are others who have some fault to find with it. For the first it is too definite; its proposals clash with the primary objects of trade-unions, and would abolish their objectionable and oppressive features. The commonest of the press on the reports differ on almost every point; and if a workman thinks he can learn anything from them he will be disappointed. The portions of the Report which have been severe upon the report of the majority, and exceedingly kind to that of the minority, and would grant the unionists the sanction of the law to oppress those who differ from them.

I cannot see what is unfair or unjust in the report of the majority. It gives power to the workmen to combine, and would grant protection to the funds accumulated, provided their objects were not criminal. To me a long tale short, the report of the majority of the Commissioners differs much from the one by the minority, inasmuch as they would allow working men some freedom in the disposal of their labour, and would give non-unionists the right to gain a living, and to dispose of their article, labour, in the way they believe to be most conducive to their interests. It is generally acknowledged that we live in a free country, and that it is a citizen's duty to try and preserve it intact, and see that liberty and justice are not outraged or trampled upon by any portion of the community. Oppression in relation to labour has not yet been recognised by law, and the minority are certainly bold men in proposing that it shall be legal for a majority of workmen to starve the minority into conformity with their objects and views. Their report "recognises" that persons should be allowed to combine as to the men they will work for or for. No such combination to be penal, unless it has a criminal object, or uses criminal means." Upon the last point hangs all the objects of trade-unions. The Trades Commission proved conclusively there are men in this country who are troubled with oblique vision; who cannot see right from wrong; whose sense of justice is so blunted that they believe every one must, under pain of starvation, do as they do, and think as they think; these men could not, in our dignity and unjust proceedings, draw a distinction between what is just or what is penal. Broadhead and his followers thought their acts were glorious and commendable, and that the ends justified their crimes.

The question of combination, as to whom a workman or a number of workmen will work with or for, seems so commonplace, the difficulty to common minds seems to be so easily settled, that it is not worth any report at all. For instance, five men are working in a shop, and known as Jack, Bob, and Tom, Bill, and Joe. After working some time together in peace and harmony, they find they have it would be for their advantage to join a trade society. Bill and Joe, after due consideration, conclude their interests are best served by abstaining. The first three are not so satisfied with their decision, and find themselves extremely disagreeable, and at last determine that they shall not work with them, and by signing a round robin, or some other course, inform their employer of their decision. The employer is satisfied with the services of two men, and sooner than part with them, he would let the three first-named go, and would fill their places with others, but let all in their power to prevent the employer from getting others. The absurdity of the matter is, that the first three want to work for the employer, and yet will not because he employs others who will not do as they do. It is not then a question as to whom the trade-unionists will work with, but that all shops shall be union shops, and all workmen shall work upon the same conditions as themselves. Common sense would say that the three men, being dissatisfied with the employer's terms, would go away and find other employment; experience proves the contrary, and thus it is not a question as to whom they will work for, but that all employers shall keep their places open for trade-unionists, upon trade-union terms, and that outsiders shall not have permission to get a living anywhere in England. What the two or three commissioners want for their clients, and they might have concluded it in their report: it would have saved a deal of palaver and beating about the bush.—"We, the dissenting commissioners, recommend the Legislature to enact a law which will for ever endow the trade-unionists of England with a perpetual right to all employers and all shops, and that no outsider, no matter what his abilities or disabilities may be, shall trade in any domain, unless he forego his English birthright, and fulfil all the conditions the trade-union executives impose upon him." When that law is passed, as I suppose it will be as soon as the advanced Liberalism of the day will allow, as well as it is the fashion just now for advanced M.P.s and would be M.P.s to fraternize with trade-union leaders, and say such pleasant things together that commoners would suppose they were in the same business, I do not suppose the three commissioners will find what the consequences will be. At any rate, a large number of Englishmen in trade-union have already, as we would be reduced to starvation or pauperism, as there are several causes irrespective of the objection to trade-union rules, or trade dictation, which incapacitate working men from joining trade societies. In the first place, the question of health. The union requires a candidate to be in sound health, and pass the ordeal of a medical examination. There are many that would not pass such a scrutiny, and

yet are able to do a day's work as the others. 2nd. A candidate must be a competent workman. Whether that rule is intended to be carried out, of course I am unable to say; but I have seen some very incompetent society men as well as some of our trade-union tools, it is open to conclude that it will be enforced. Then all incompetent workmen, according to trade-union rules and legal enactments, would be prevented from gaining a living. I might still farther illustrate this part of the question; and if I intended to allude to what I believe would obviate and abolish the idea of a necessity of trade-unions, and also to show some fallacies in connection with that part of the question, I hope to have an opportunity for that in another issue of the Builder. JACK PLANK.

GOVERNMENT CONTRACTS.

SIR,—I had hoped that some one "learned in granite matters" would have responded to the suggestion of "A Layman," and have favoured us with some explanation of the subject. As a step in that direction, I wish to call your attention to a report of the proceedings of the House of Commons, on Friday night, April 2nd. On the motion to go into committee of supply, Mr. Monk wished to say, "that there were numerous prevalent amongst commercial men, that it was of no use offering to contract for Admiralty stores, unless they had friends to support them. He had heard of cases of contracts entered into to supply articles, which, if there had been fair competition, might have been supplied for something less than half the amount. He knew as a personal matter that many houses refused to tender to supply the Government, believing they had no chance. Then there was another matter with regard to articles supplied to the Admiralty, and also to other departments of the service. It was left to the decision of a 'peer' whether the articles should be ordered or not; and he knew as a positive fact, that in many instances viewers had refused to receive articles, without assigning any reason whatever. He thought they should be required to give some reason." &c.

To the alarming statement, made by one of our great merchants, there was no response on the part of any one, and the House went into Committee of Supply at once, and voted away millions.

It will probably be objected that the Trinity Board is not the Admiralty, but I think it may fairly be referred to in one of the other departments of the service referred to by Mr. Muniz. Besides, the Trinity Board is not open quite as much to the inquiry of Parliament and the public, as I think it might be. But, if we are to do these things, the great tree, we may expect them to be done in the dry." A CLERK OF WORKS.

APPRENTICES.

SIR,—Our trade has been inundated with apprentices, perhaps more than any other. A small master down at Brighton, for example, made it a constant practice to have more apprentices than journeymen—six of the former, four of the latter, was the usual ratio of the practice for years. Was there anything right, commendable, or fair about this? Creating and carrying out a business principally by the aid of apprentices, their work and their premiums ranging from 0/ (parish) to 50/ (parish) there have been anything wrong in the journeymen trying in some measure to restrain and regulate this practice? Can you be surprised at their looking with disfavour on such a system? Their trade swamped, and they themselves compelled to be the means of bringing it about, neither the master nor his family having any trouble in the matter, —all out door apprentices. In other countries the same system has prevailed; not so bad now, I believe, as a few years back. From Norfolk, I hear of a case of five apprentices to four journeymen, and this carried on year after year. Can such a system be justified? Is it just to other masters in the same town? Do you not see that such a one could easily undersell another that was content with three or four apprentices to eight journeymen? Again ask, is such a system right? Do the public expect cheapness on such an unjust system? Can it produce a good feeling between employer and employed? It does not produce good journeymen, as of course their fellow-men have been antagonistic throughout their term of apprenticeship. ONLY A TAILOR.

POPULAR NEW WORKHOUSE.

At the last meeting of the Poplar Board of Guardians Mr. Morris, the architect of the proposed new Workhouse buildings, represented the necessity of appointing a clerk of the works. He also stated that he would be glad to be informed if the Board contemplated any ceremonial in connection with laying the foundation-stone of the new house, and if so, what day they would fix upon, in order that the requisite arrangements might be made.

The Board resolved to advertise for applicants for the situation, fixing the salary at three guineas weekly. They also decided that the barman should be invited to lay the foundation-stone on the 11th of April.

The Clerk said that, according to agreement, Mr. Morris had written to the Board on the 29th of March, asking the contract for the erection of the new workhouse.

Resolved that a cheque be signed for the amount. The Clerk then said that Mr. Dobson was entitled to payment of the sum of 182/ for taking out the quantities of the new buildings at 1 per cent. on the outlay. A cheque was also signed in payment of this sum.

ENGINEER FOR CALCUTTA.

The appointment of Assistant Engineer to the Municipality of Calcutta has been given to Mr. Thomas W. Gardner, C.E. We understand that Mr. Gardner was some years ago a pupil of Mr. J. W. Bazalgette, of the Metropolitan Board of Works, and that he has been recently engaged in assisting to carry out the drainage works at Olesca.

* This will be sufficient answer for the nine gentlemen who have written to us wishing to know where to apply.

ARCHITECTS' ACTIONS.

Fisher v. Jackson.—In this action, tried at Liverpool, before Mr. Justice Brett and a special jury, Mr. Quain, Q.C., and Mr. Charles Russell were counsel for the plaintiff; Mr. Holker, Q.C., and Mr. L. Temple for the defendant.

The plaintiff is an architect and surveyor at Birkenhead, and the defendant, formerly member for North Derbyshire, is the owner of a considerable quantity of building land in and close to Birkenhead. The defendant was in the habit of letting his land for building, under agreement to make advances from time to time towards such building. The advances varied, but did not generally exceed 50 per cent. of the value of the erections made. In 1865 the plaintiff was employed by the defendant to superintend the building with a view to certifying for such advances, and also to see that the buildings were conformable to the agreed plans. The plaintiff now sought to recover a balance of 166l. 6s. in respect of 38 houses and two shops and premises in Vulcan-street, Birkenhead, claiming to be paid at the rate of five guineas per house. The defendant's contention, on the contrary, was that he had made a specific agreement to pay 1l. per house and 2l. per shop. If this were correct, the plaintiff's claim had been discharged by the payments made. The cause was tried at the late Winter Assizes, where the jury disagreed, and it now came on for a new trial.

In the result there was a verdict for the plaintiff—Damages, 166l.

THE MEDALS AND PREMIUMS OF THE INSTITUTE OF ARCHITECTS.

At a special general meeting of this Institute, held on Monday, the 5th inst., the recommendation of the council that the Royal Gold Medal for 1868-9 should, with her Majesty's gracious sanction, be awarded to Professor C. R. Lepsius, of Berlin, was formally adopted.

The Institute medals and prizes were (also in accordance with the recommendation of the council) awarded as follows:—

The Soane Medallion (with 50l., subject to certain conditions of continental study) to Mr. H. L. Florence.

Mr. Beresford Hope's prize of 10l., for the design of a theatre in accordance with Medvial principles, to Mr. E. J. Roede.

The Institute Silver Medal, with five guineas, for measured drawings, &c., illustrative of Hatfield Hall and St. Peter's Church, Wimborham, to Mr. E. C. Wilberforce.

In the same competition, Medals of Merit to Mr. T. E. Williams, for drawings of the Abbey Dore; Mr. E. B. Ferrey, for drawings of Wingfield Manor House; and Mr. W. Howes, for drawings of St. Mary Overy Church, London.

The Student's Prize, in books, for the design of a gateway leading to a courtyard, to Mr. A. S. Bird.

The Institute Prize, for an Essay "On the Revival of Italian Art in England during the Sixteenth and Seventeenth Centuries," to Mr. H. D. Sheppard.

A Medal of Merit, for an Essay "On Timber," to Mr. T. A. Britton.

A special Prize of 10l., for an Essay "On Bricks and Terra-cotta," to Mr. E. Locke.

The formal presentation of the Royal Medal, Institute Medals, and Prizes will take place on Monday, the 10th inst., at eight p.m., after which Mr. W. V. Papworth, fellow, will read a memoir of the late A. Ashpitel, F.R.S.

THE TRADES MOVEMENT.

A MEETING of the members of the Manchester Court of Arbitration and Conciliation has been held at the offices of the Chamber of Commerce, in Manchester. There were present Messrs. J. M. Bennett, H. J. Leppock, and J. Slagg, jun., representing the employers; Messrs. W. H. Wood, G. Townley, and C. Swain, representing the employed; and Mr. T. Browning, secretary. Mr. A. Milne, who had accepted the office of president, took the chair. The court reconsidered alterations which had been suggested in the draft of rules, and these being finally determined, the rules were formally adopted. The court being now fully constituted, will meet quarterly for the despatch of ordinary business in the months of January, April, July, and October, or at such other times as are provided for by the rules. According to the rules as now settled, the Manchester and Salford Court of Arbitration and Conciliation will be open to all trades and occupations within the parliamentary boroughs of Manchester and Salford. The object of the court will be to arbitrate on any question or dispute relating to wages or other matters that may by mutual agreement be referred to it from time to time by employers and employed, and by conciliatory means to interpose its influence and put an end to any disputes that may arise. The court is composed of a president and sixteen members, eight to be nominated by the Chamber of Commerce, and eight by the Trades' Council, all to be elected yearly.

There is a strike among the masons at Wellbeck. Several meetings of union men have been held. The Duke refuses to comply with their requests. Many are leaving the district, and it is anticipated that shortly the few who remain will commence work again. Men who do not belong to the union are set on when they apply.

At a numerously-attended meeting of employers of operative joiners held last week in

Edinburgh it was unanimously resolved that, taking into account the present state of the building trade and of the labour market, the request by the operatives for an advance on the current wages is uncalled for, and should not be complied with.

Paris is threatened with a strike of the men of all trades engaged in house-building. The men, it appears, require the masters to contribute certain sums monthly to their (the men's) charitable associations, and the masters resist. The men have nominated delegates to confer with the employers; but there is not much likelihood that an arrangement can be made. The workmen engaged in building operations are more numerous than those of any other trade in Paris. At the present moment it is said they are at least 150,000, and yet this is the period of the year at which building is least active.

STAINED GLASS FOR SHANGHAI.

STAINED glass is about to be forwarded to Shanghai, for a group of windows in the apse of the handsome church now being built there by the English residents, from the designs of Professor G. G. Scott. The subjects represented are—The Agony in the Garden of Gethsemane, the Carriage of the Cross, the Crucifixion, the Entombment, St. Mary Magdalene in the Garden, and the Angel announcing the Resurrection to the Three Holy Women at the Sepulchre. Each subject is surmounted with a small canopy laid upon a ground of rich colour. The windows are designed to commemorate the late Mr. George Henry Fitzroy, of Shanghai, and an inscription bearing his name is placed beneath the groups. The commission has been intrusted to Messrs. Lavers, Barrand, & Westlake, of London.

THE CLERK TO THE GUARDIANS OF KENSINGTON.

MR. SAMUEL CORNELL has retired from this post, and the *Kensington News*, a spiritual local sheet, urges that the parishioners should present to Mr. Cornell a substantial testimonial in recognition of the sterling worth which has marked his long devotion to their services. We endorse this recommendation most cordially. Mr. Cornell's whole life has been spent in the discharge of his duties, first in Chelsea and then in Kensington, always doing what he considered right, without fear or favour. The guardians themselves have presented to him their own testimonial in the form of a handsome clock; but the parishioners should do more than this. In these days, when self-seeking is the rule, the absence of it deserves to be marked prominently.

WELLCLOSE-SQUARE.

SIR,—Would you allow me for one moment the use of your machinery to flash the signal far and near to the world, that Wellclose-square, down east (own brother in desolation to Leicester-square, up west), is in danger of being again built upon? They have taken down the dingy central building, and are going to erect a *larger*! Is there no society, or association, or league, or Board of any kind, for the securing of Open Spaces in London? W. P. S. The building they are going to erect in the middle of Wellclose-square is to be for schools to St. Paul's Church, Dock-street (the Sailors' Home Church). These schools could be erected much better on a large piece of ground, now vacant, *next the church*. Shall it be schools, only, or schools, and Wellclose-square for a health-giving, heart-refreshing open space?

AMUSEMENTS.

Royal Italian Opera.—Some very successful performances have been given, mainly by members of Mr. Mapleson's company. "Rigoletto" last week was admirably done, although the personator of the heroine, Mdle. Vanzini (one of Mr. Gye's company, by the way), can scarcely be pronounced inexceptionable. With respect to Mr. Santley, Signor Mongini, and Signor Foli, the *Spartacite* of the opera, the word may be used in its fullest sense. The choruses too, notwithstanding a new conductor, Signor Li Casti, went admirably. "Fidelio" on Saturday drew a crowd, the admirers of Beethoven and Titiana united. In this, also, Mr. Santley was supereminently good. What is the mystery at Her

Majesty's Theatre? There certainly is one. Not merely is the house completely finished, and the gas lighted, according to contract, by Messrs. Trollope, but the act-drop, beautifully painted by Mr. Telbin, is in its place, and the dock and the painting-room are full of new scenery, ready for a performance.

The Gallery of Illustration, Regent-street.—Mr. and Mrs. German Reed's new entertainment, titled "No Cards," and written by Mr. W. S. Gilbert, the music by Mr. Reed himself, is a decided success: seldom have these two excellent persons, as well as excellent entertainers, been seen to greater advantage than they are in this ingenious and spirited production. The time will come when the future of one who, like Mrs. German Reed, has afforded the public for a long term of years wholesome delight, will be made the care of the nation. The new actor and singer whom they introduce, Mr. Arthur Cecil, is a decided acquisition. "Cox and Box," a musical version of the immortal "Box and Cox," written by Mr. Burnand, and the music composed by Mr. A. Sullivan, had achieved a success in private before it was produced here, but never went so well before. Mr. German Reed and Mr. Arthur Cecil represent the "Long Lost Brothers." The two pieces together make a capital evening, and on Thursdays and Saturdays as good a morning.

Exhibitions.—The Exhibition of the Society of British Artists, Suffolk-street, is now open. So, too, is the annual collection of French and Belgian pictures, Pall-mall. We must postpone notice of these until next week.

Polytechnic Institution.—Professor Pepper has at length obtained what he has long desired, the largest and most powerful induction-coil in the world. It has been made by Mr. Alfred Apps, and is 5 ft. in length and 2 ft. in diameter. The core wires weigh 125 lb., and these are covered with a primary coil composed of two miles and a quarter of cotton-covered wire, and a secondary coil consisting of 150 miles of wire covered with silk. The condenser is divided into six parts, and tinfoil has been substituted for glass, by which means, with plates of 125 square feet, a charging surface of 1,500 square feet is obtained. In the construction of the coil Mr. Apps has used 477 lb. of ebonite, and between the secondary coil and the outer insulator he has left an air space about 1½ in. wide, which it is found makes the working of the instrument much more reliable. At the private view the maximum length of spark obtained with forty-eight Bunsen cells, each containing a pint of nitric acid, was 24½ in., but it was stated that Mr. Apps had, in experiments made by himself, obtained still better results. With five cells he obtained a spark 10 in. long, and adding five cells at a time he obtained sparks of 14, 17, 21, 23, 23, 26, and (with forty cells) 27 in. in length respectively, a battery of fifty cells giving a spark of from 28 to 29 in. long. We are waiting an opportunity to see for ourselves some of the effects produced by this enormous machine. It will doubtless be turned to good purpose.

ACCIDENTS.

Burslem Parish Church.—During a severe gale of wind the centre portion of the chancel window of Burslem parish church was completely blown in. The project for rebuilding the church appears, of late, at least, to be making little or no progress, although no church in the district requires rebuilding more than it does.

Fire in Whittington Church.—Whilst a party of ladies were decorating the church, one of them noticed some large fragments of burnt wood inside the tower entrance. On ascending the tower, the floor of the bell chamber was discovered to be on fire. The fire was, however, put out without much difficulty. The woodwork of the tower is very old and dry, and the wind was strong at the time. The fire originated in a fine, on which one of the beams of the bell chamber is fixed.

Startling Occurrence at Preston.—The Preston Gas Company are erecting in Ribblesdale a tank, intended for the reception of a very large gas holder. In the erection of the tank, which is 150 ft. in diameter, and 450 ft. in circumference, in consequence of the wet weather which has lately prevailed, the dry well was left out, and the walls of the tank were propped up instead of being backed up. The workmen were waiting to put the dry well in, and while it had been getting ready the walls had been

shored. Mr. Greene, of the Preston Gas Company, having been informed that the walls looked to be in a rather dangerous condition, immediately proceeded to the spot, and, on arriving there, just had time to order a gang of navvies off, who were working on the wall at the moment, when instantaneously, as the last man had sprung off, the structure of brickwork, to the extent of some twenty yards, fell inwards with a deafening crash. No one is injured. The damage done is estimated at 1,000*l*.

Fall of a House Side at Wigton.—The side of an inhabited house has fallen, through the violence of the wind, at Wigton. The house is rather an old one, and is situate on the Market-hill, the back part being in the yard known as the Old Coach-house-yard. The side of the premises has been noticed for some time to be in a bad condition, and bricks had been laid down to have it repaired. It would seem that for some years the outer and inner parts of the wall have been separating, the wall looked bulged out, and the recent wet weather made it much worse.—A high chimney on a workshop in Water-street, Wigton, has also been blown down by the violence of the wind. It had looked tottering for a length of time. The large mass of bricks fell on to the roof of a house and smashed in the slates, but no one was inside.

SCHOOL-BUILDING NEWS.

Leicester.—St. Mary's Schools, which were originally erected by the Rev. Thomas Robinson, vicar of St. Mary's, at the latter end of the last century, having been found too small for the wants of the parish, have been taken down, and in their stead a more spacious and ornamental building has been erected. The schools, which are Gothic in design, are built of granite, lined with brick, with brick and stone dressings, the windows being filled in with cast-iron frames with ventilating casements. The school-rooms, which are of the following dimensions, 39 ft. 3 in. by 20 ft., 32 ft. by 24 ft., and 51 ft. by 20 ft., with one classroom 21 ft. by 11 ft., form the ground plan; and the rooms are provided with screens, so that they may be divided when required. The roofs are open-timbered; and the interior is lighted with nine decorated gas coronas, each having sixteen burners, which have been designed by Mr. A. Robinson, of the local Gas Office, and manufactured and supplied from his workshop. The total cost of the work is estimated at about 2,500*l*, and it has been carried out under the direction of Mr. Joseph Goddard, architect. The stonework was executed by Mr. J. Fim; the woodwork by Winkles Brothers; the plumbing and glazing by Mr. Bazzard; and the ironwork by Messrs. Richards & Co. The building, being sufficiently advanced towards completion, has been formally opened.

CHURCH-BUILDING NEWS.

Hertford.—At a recent meeting of the Committee for the rebuilding of St. Andrew's Church, Earl Cowper presiding, the Rev. C. N. Williams read the resolution of the last meeting, directing that the opinion of the architect should be obtained as to the feasibility and expediency of erecting the chancel and transepts at once, and postponing the erection of the nave until the requisite funds had been collected. The resolution also directed that the architect should be requested to give an estimate of the increased expenditure which would be incurred by erecting the church in two parts. Mr. Williams said that this resolution had been communicated to Mr. Johnson, who had since visited Hertford, and that he had consulted with Messrs. Dove, the contractors, who had also been down. Mr. Johnson reported that there was no structural difficulty in erecting the church in two parts, as suggested; and he sent in estimates from Messrs. Dove, showing the comparative cost of erecting the church complete according to the original plans, and incompletely with a view to the structure being finished hereafter. The estimate for the church completed was 3,265*l*.; in carcass, with glazing done, 2,680*l*.; chancel and transepts complete, with nave in carcass, 2,965*l*.; chancel and transepts complete, with temporary boarding sunk to old nave, making provision for the performance of divine service in the nave and aisles while the new works are going on, 2,233*l*. The latter estimate further showed that the cost of erecting the nave and aisles, if the order for the work were given before the withdrawal of the plant, would be 1,185*l*. Mr. Williams stated that there would be accom-

modation for 300 in the new chancel and transepts; and if the committee had not sufficient funds in hand to enable it to proceed with the building, when this part of the work was done, the temporary boarding would be taken down, and the new chancel and transepts thrown into the old nave, greatly increasing the accommodation. A resolution was agreed to, to the effect that it was desirable to adopt the estimate for building the chancel and transepts, at a cost of 2,233*l*. It was also resolved that the secretary be requested to write to the subscribers who had not paid their promised contributions, informing them that the Committee, bearing in mind that the great object of the subscribers was the providing of further accommodation for the parishioners, and being anxious that so important a work should not be neglected year after year, had resolved to erect a new chancel and transepts, leaving the remainder of the plans to be completed, according to the views, as soon as sufficient money was in the hands of the treasurer. The secretary was then requested to communicate with the Committee's solicitor, with a view to the drawing up of the contract.

Dorking.—The new aisle on the south side of St. Paul's Church has been recently completed. The new aisle, which is in the early Decorated English style, is 60 ft. in length by 23 ft. 6 in. in breadth. It has been built from the designs of Mr. Benj. Ferrey, architect, by Mr. Shearburn, of this town, builder. Considerable difficulty was experienced in the course of construction, in consequence of it having been necessary to take away the whole of the south wall and having to support the nave roof, in order that divine service might not be interrupted during the time the work was in hand. This difficulty, however, was overcome, and without causing the congregation any discomfort from speaking of. The total cost of the new aisle, including a porch at the west end, has been about 1,000*l*, towards which Mrs. Hope has contributed the sum of 300*l*. (besides erecting a window in memory of her late husband, Mr. H. T. Hope, at a similar cost), and Mr. J. Deverell, 500*l*, the remainder being made up by donations. The church was built in 1857 at the sole cost of the late Mr. J. H. Labouchere, and an aisle on the north side was added about five years since, also at the expense of that gentleman.

Manchester.—The foundation-stone has been laid of a church to be erected in Waterloo-road, Cheetham, to be dedicated to St. John the Evangelist. The church, the site and the structure of which are to cost 10,000*l*, is to be built and endowed at the cost of Mr. Lewis Loyd, of Monk's Orchard, Surrey. It will be constructed on designs prepared by Messrs. Paley & Anstyn, of Lancaster, architects. The style will be Early Gothic of the thirteenth century, and the edifice will be calculated to seat 600 persons. The total interior length will be 111 ft. from east to west, and the width 57 ft.; it will have the usual arrangements as to nave and side aisles, the nave being divided from the aisles by four pillars and arches. The tower at the west end of the side aisle will have a large porch or narthex. The chancel will have an apsidal termination, doubled by arches, the vestry on one side and the organ-chamber on the other. The church generally will be of simple construction, durability and permanence being aimed at rather than ornamentation. The exterior will be built of stone; and the interior, instead of with the ordinary plaster, will be lined with coloured bricks made specially. The roof will be covered with Staffordshire tiles. The tower will be 24 ft. square, and rise to a height of 130 ft. It will be covered with a lofty pyramidal roof, ornamented with tiles. The contractor for the building is Mr. J. Robinson, of Hyde.

Wintzlog.—Visitors to Tintagel will remember the picturesque old church which stands at the edge of the cliffs overlooking the sea. This church, which is ancient and archaeologically interesting, possessing as it does portions of Saxon as well as Norman work, is now in a sad state, and urgently requires restoration. The amount necessary for the work is 1,200*l*. Towards this the vicar, the Rev. R. B. Kingsman, has contributed liberally, as have his parishioners, who are less than 1,000 in number, and for the most part poor. The sum mentioned is beyond their resources, and it is hoped, says the *Western News*, that visitors who have pleasant recollections of this splendid coast, and those who are interested in archaeology, as well as that far larger class who have generous hands to help those who deserve to be helped, will aid in this work of restoration.

Pelton (Durham).—The little church here has just received an addition in the erection of a new south porch. The edifice being in an exposed situation, with its only entrance through the tower at the west end, it has always been considered very desirable that a more sheltered entrance should be provided, and with a view to such a provision the ground to the south-west has been preserved free from burials. By the liberality of a parishioner this pressing want has been supplied. The work was done by Mr. George Bailey, in ashlar, both externally and internally. It is in the Early English style, with polished red granite shafts to the columns, and other enrichments.

PROVINCIAL NEWS.

Portsmouth.—The foundation-stone has been laid, at Portsmouth, of the first of the docks proposed to be constructed on the extension works of the dockyard. The dock is situated at the south end of the works, and is designated "No. 12." The firm having the contract to construct the dock is Meers, Leather & Smith. The dock, which will be built on blocks, is to be 410 ft. long, 110 ft. wide at coping, 42 ft. 6 in. in breadth at floor, and 80 ft. wide at entrance. The depth of water at the entrance will be 30 ft. at high water (neaps), and 32 ft. 6 in. at high water (springs). The dock is to have a granite floor and Portland-stone altars, and is expected to be completed in about three years.

Basingstoke.—The arrangements for erecting a new building for the Mechanics' Institution have been so far completed. The successful tender was sent in by Mr. W. Pistell, of this town, who undertakes to erect the building according to plans prepared by Messrs. Messenger & Seymour, architects, London, for the sum of 865*l*.

Stone.—At a committee meeting, twelve tenders for the erection of the new town-hall were opened. That of Mr. John White, builder, Nottingham, for 2,130*l*., was accepted. The building, after plans of Mr. F. Bakewell, of Nottingham, architect, will be immediately commenced, and it is expected that it will be handed over to the trustees by the 1st of September next.

Books Received.

Collage Plans. Dedicated to the Landowners of Carmarthenshire and Pembrokehire. By JOHN FREDERICK VAUGHAN, EARL OF CAWDORE. London: William Ridgway. 1869.

The intention of this book is excellent; the spirit that prompts it, on the part of the Earl of Cawdor, cannot be too highly commended; but if such information as is here given be necessary in the United Kingdom, it shows the existence of even greater ignorance than the saddest croakers have ventured to believe. The plans are for the most cow-houses and dog-kennels that can be imagined: four walls with holes in them and a partition or two within. Nevertheless, and we are ashamed to say it, we must suppose that there are districts where even such rudimentary information as is here given may be useful.

When we mention that in no one of these plans, nor throughout the letter-press, is there any allusion or instruction as to the provision of a convenience, to meet the first necessity of decency, and without attention to which all other changes in the house are useless, the frightful condition of the dwellings on which these plans are intended to work an improvement will be obvious. A litterer, condemnation of the land-owners of Carmarthenshire and Pembrokehire than the Earl of Cawdor's book it would be difficult to concoct. Let us hope they will take it seriously to heart.

VARIORUM.

"Town Life among the Poorest." By John E. Morgan, M.D. Longmans. This is a paper read at the State-medicine Section of the British Medical Association, Oxford, in August last. It treats of overcrowding, &c., in our large towns; and, although there is nothing of importance in it that has not been urged by us over and over again, this is a subject whose echoes cannot be too often or too widely repeated till it reach every ear and pervade all society; and when public opinion has been thus fairly and fully brought to bear upon it, then it will be that the originators of the movement will have the satis-

faction of seeing useful and abundant fruits resulting from their exertions and those of their followers.—“Observations on Some of the Fundamental Principles and Existing Defects of National Education.” By Neil Arnott, M.D., F.R.S., Longmans. The author of this pamphlet here takes a slight but comprehensive view of the national divisions of human knowledge in all the three great kingdoms of nature, mineral, vegetable, and animal, and shows how science and art should be brought to bear upon education. The conclusion drawn from what he writes is that Government should cause to be prepared short summaries or outline statements of the chief branches of knowledge, as specified by the author; and “determine by law that none of its people should grow to maturity without being rendered able to read with facility and good understanding, and therefore with much satisfaction, any book suited to their age.” A valuable lesson, he remarks, would thus be given to others. The manuals suggested, the author adds, would be read as reading lessons, to be further explained, if requisite, when read, and might be made as interesting to young minds and general readers as Defoe’s “Life of Robinson Crusoe” is to ordinary boys.

Miscellaneous.

New Club House for Malvern.—Plans have been prepared by Messrs. Haddon, and tenders are about to be received to carry out the new Club House at Malvern. The entrance will be from Church-street by a stone porch, and on the ground-floor there are provided an entrance-hall, a reading-room, 24 ft. by 17 ft., with a square bay window jutting out at the angle, affording views up and down Church-street and the Graham and Promenade roads. There will also be a committee-room, 18 ft. by 14 ft., with bay window, a coffee or chop room, 18 ft. by 15 ft., a private entrance from the Promenade-road, with living-rooms and kitchen for attendants, lavatory, and other offices. On the first-floor will be two billiard-rooms, smoke-room, attendants’ bed-rooms, &c. The billiard and all the principal rooms will be heated by hot water. The style of architecture chosen is Italian, after the Palladian model. The principal facade it is proposed to face with Cradley stone ashlar, if the state of the exchequer will admit; if not, then with pressed red bricks. The dressings will be of Hollington stone. For the present it is only intended to carry up the front part of the building, containing one billiard-room, reading, committee, and smoking room, with offices. It is further contemplated to erect in connexion with this building a Masonic hall, embracing lodge, tyler’s, ante, and other rooms.

Medical Officers for the London Poor.—A return prepared by the Poor-law Board shows that the unions and parishes in the metropolis have 55 medical officers of workhouses and 159 of districts. Their remuneration for the year ending at Michaelmas last amounted to 28,699*l.*; and the guardians paid 6,796*l.* for cost of medicines. The number of sick poor attended in the year was 79,375 in-door, and 268,135 out-door.

Opening of Eccleshill New Mechanics’ Institute.—The Mechanics’ Institute, which has just been erected in Eccleshill, has been formally opened. The building, which has been erected from the designs of Mr. S. Firth, of Eccleshill, is at Stone Hall Hill, fronting Stoney Lane, and in view of the valley of the Aire. It is of the Doric order of architecture, externally plain. It occupies an area of 64 ft. by 40 ft.—500 square yards, and is two stories in height. On the ground-floor are a reading-room, 20 ft. by 10 ft., four class-rooms, and a library and a cooking-room, each 15 ft. by 12 ft. The whole of the second story is occupied by a large lecture-hall accommodating 600 to 700 persons.

South Kensington Museum.—During Easter week the visitors to the Museum, Meyrick, and other Galleries, have numbered 54,354. The long delay in the publication of the catalogue of the Armour is much to be regretted.

Finsbury Park Preservation Association.—This association, for the preservation of the open space formerly called Hornsey Wood House, is about to make application to the Government to interpose, and prevent the Metropolitan Board of Works from building on the frontage of Finsbury Park.

The Belgrave Market Bill.—It is proposed, as our readers know, to erect near Sloane-square, Chelsea, with a branch from the Metropolitan District Railway, a general market for flowers, fruit, vegetables, meat, fish, game, poultry, &c., provided with all the new requirements of civilization, aided by telegraph and direct underground railway communication, in order to command the supply from abroad and the three kingdoms. The Bill has now passed the second reading, and is referred to a Select Committee of the House of Commons. The site, consisting of about seven acres, on which the market will be erected, is in the middle of about a dozen roads, in the neighbourhood of Sloane-street and Queen’s-road, and in front of Chelsea Bridge.

Opening of Railway Bridge at Runcorn. The great viaduct over the Mersey at Runcorn, which has been constructed by the London and North-Western Railway Company to shorten the distance between Liverpool and London, has been opened for public traffic. The quickest train is the 10 a.m., which does the journey to Liverpool in 5 hours and 10 minutes. At Rugby an artesian well has been sunk for the supply of water to the engines. The water is let into cisterns between the rails, and is scooped up by the tender while the train is in motion. The Runcorn viaduct was planned by Mr. William Baker, engineer to the London and North-Western Company. The bridge—a wrought-iron open lattice girder—consists of three openings of 305 ft. each, the height to the under edge of the girders at spring tide high water being 75 ft. The piers are built upon the rock. The approaches are by two viaducts of brickwork, containing on the Lancashire side 65 arches, and on the Cheshire side 32 arches. These arches are built in blue Staffordshire bricks, and are of 61 ft. 6 in., and 40 ft. spans. The facings and piers of the bridge are of Bramley-fall stone.

A Scheme of Juvenile Emigration.—Miss Rye is going to try the experiment of deporting the street Arabs of London and other large towns to Canada and the Western States. She is encouraged to make the experiment, according to the *Pall Mall Gazette*, by the success which has attended the labours of Mr. Van Meter, who claims to have rescued 2,000 children from the slums of New York, and to have given them a fair start in the West. Miss Rye is prepared, she says, to start with a party of children for the West about August. The matter was pressed upon her attention by both press and people in America:—

“I propose,” she says, “taking only female children, and they are to be—1, orphans; 2, children who have been deserted five years; 3, foundlings, also deserted; and all to be of the age of from five to ten years. To start this work properly I shall want 1,000*l.* at least. Should I be able to raise this sum I shall take some small piece of land near London as a sheltering home until the children are ready to start, and another and similar place in Canada to receive them upon arrival in that country, and from which the children would be draughted as fit and suitable opportunities occurred. I am in treaty for a little property in the village of Niagara, and if it be ultimately so arranged that our ‘Western Wanderers’ Home’ should be in this locality, I have received many promises of help in kind to keep the children on our first arrival, and an assurance from the people of that one district that they will adopt, either for life or to bring up with a view to ultimate service, 25 of the children when I bring them.”

Property in England.—The assessments for income-tax purposes in 1866-67 of railways showed an increase (as compared with 1865-6) of 323,000*l.* in England and 111,000*l.* in Scotland. A similar assessment of mines showed an increase of 411,000*l.* in England and 138,000*l.* in Scotland. A similar assessment of ironworks showed an increase of 449,000*l.* in England and 109,000*l.* in Scotland. A similar assessment of gasworks showed an increase of 260,000*l.* in England. Something of the increase is probably attributable to the increased stringency with which the income-tax has been collected of late years.

Statue of the Prince Consort for London. At a meeting of the Common Council, held at Guildhall, the Lord Mayor presiding, Mr. Alderman Causton gave notice of his intention to move at the next Court that a statue, in commemoration of the late Prince Consort, be erected by the Corporation at a cost not exceeding 3,000 guineas, as the City of London memorial of his late Royal Highness.

Plymouth Guildhall Competition.—Three or four correspondents repeat the complaint of our correspondent “Provincial.” The Corporation should revise their officers.

The French Government and English Working Men.—An official letter from the French Government has just been received by the secretary of the Society of Arts, asking permission (which has of course been granted) to translate Mr. Coningsby’s report from the English volume of workmen’s reports on the Paris Exhibition, and republish it with the reports of the French workmen. The letter is couched in very complimentary terms to all the English reporters, and expresses regret that the whole of the book—owing to its bulk—cannot be used, instead of one report.

The Water supplied to Bristol.—The water used in Bristol in February contained (according to Professor Frankland’s analysis) in 100,000 tons, foreign solid matters amounting to 127 tons in the All Saints’-lane water, and 29 tons in the water supplied by the Bristol Waterworks. 100,000 tons of the All Saints’-lane water contained 67 tons, and the water supplied by the Bristol Waterworks 24 tons of carbonate of lime, or an equivalent quantity of other soap-destroying ingredients. Of the All Saints’-lane water the surgeon to the Bristol Dispensary says:—“It is not supplied by the waterwork-company. It is much used in the neighbourhood, and also by small trading vessels.” Professor Frankland remarks:—“This water is simply sewage oxidized and filtered. Its use for domestic purposes cannot but be attended with much risk to health, and the supply to the public ought to be stopped.” The Bristol Waterworks Company decline to state whence their supply is obtained.

Working People’s Hotels in New York. Mr. A. T. Stewart offered to bestow upon the poor of New York the entire profits of his business for as many years as he remained Secretary of the Treasury, but Congress, it is said, declined the offer. This, it seems, does not at all interfere with Mr. Stewart’s schemes of extensive and systematic benevolence in other directions. Among his property is a lot of land on Fourth Avenue (one of the most pleasant streets in the city), 100 ft. by 205 ft., for which several years ago he paid 220,000 dollars. He is now removing the buildings upon this lot, and will erect thereon, at a cost of 2,000,000 dollars, an iron building, seven stories high, and of band-women’s architecture. This is to be a “working-women’s hotel,” and in it sewing-girls, female clerks, and other working women are to be furnished with comfortable and wholesome apartments, and the best of food, for the smallest possible sum. The building will be ready for occupation in two years. When it is completed, Mr. Stewart will erect a similar hotel for working men in another quarter of the city. And this he bids fair to rival Mr. Peabody in the extent and munificence of his charities.

New Railway Regulation.—The following provisions in the Act 31 & 32 Vic., chap. 119, “To Amend the Laws relating to Railways,” for the safety of passengers, have taken effect.—“After the 1st of April, 1869, every company shall provide and maintain in working order, in every train worked by it which carries passengers and travels more than twenty miles without stopping, such efficient means of communication between the passengers and the servants of the company in charge of the train as the Board of Trade may approve. If any company makes default in complying with this section, it shall be liable to a penalty not exceeding 10*l.* for each case of default. Any passenger who makes use of the said means of communication without reasonable and sufficient cause shall be liable to a penalty not exceeding 5*l.*”

Open Spaces.—Mr. Thomas Chambers, M.P., has given notice that in committee on the Endowed Schools Bill he will move the following proviso to clause 25:—“Provided always that no open space now frequented or enjoyed by the public, within a radius of twenty-five miles from Charing-cross, shall be inclosed or otherwise dealt with as an endowment under this Act, without the special intervention of Parliament, even though dotes in money or kind may have been given arising from herbage, wood cutting, or other produce of such open spaces.”

Australian Glue.—A movement has been talked of in Geelong for the establishment of a company to manufacture glue, a person skilled in the process of making this article having stated his ability to supply it by a company at a price considerably less than it can be manufactured for in England.

Cleveland.—A new pier has been opened at the north end of the beach at Cleveland. The structure, which has cost about 12,000*l.*—the ironwork alone costing 8,000*l.* and weighing 350 tons—is upwards of 1,000 ft. in length, including the pier-head and approaches. The actual length of the pier is 500 ft. It is six years since the levels were taken, and the work was commenced two years ago. A new market-house—a Gothic structure—has just been opened at Cleveland.

Australian Meat for the London Poor.—Arrangements have been made by which the London public will be able to purchase engand-salt-cured Australian mutton and beef at 5d. and 6d. per lb, without bone, at the eighty and odd shops of the Afrated Bread Company, who will sell it on commission under an agreement with the Australian Meat Agency in Norton Folgate. The success which has attended the opening of an experimental establishment in that locality it said to have exceeded the most sanguine expectations of the company.

Halifax Borough Survey.—The accepted tenders for this survey are as follows:—
 Mr. Henry C. Roper, Dudley—
 No. 1, or Ovenden District 2150 0 0
 No. 2, or Northwram District ... 365 0 0
 No. 3, or Western District 105 0 0
 Mr. E. Brown, Newcastle—
 No. 4, or Town District 493 3 2
 Mr. Daniel Kershaw, Halifax—
 No. 5, or Skircoat District 280 0 0
 Mr. John Edmond, Leeds—
 No. 6, or Southwram District ... 377 5 0
 Total 1,770 8 2

Sheffield Architectural Society.—On Tuesday a meeting of the members of this society was held at the local School of Art, the Rev. J. Stacey, the president, in the chair. Dr. Syson, of Manchester, formerly of Watb, delivered an address on the functions of archaeological societies, dwelling specially on their usefulness as guardians of our national monuments and old churches, as educators of the middle class in art, and as sworn foes to architectural shams.

Royal Academy of the Fine Arts, Vienna.—English architects appear to have been specially favoured by this body. In addition to the two gentlemen mentioned in our last, we are glad to be able to say that Mr. E. M. Barry, A.R.A., and Mr. A. Waterhouse have been elected honorary members. Amongst other artists to whom the diploma of honorary membership has been forwarded we may name Mr. Frith, R.A.

Remedy for Damp Walls.—We have received a strong testimonial in favour of a water-proofing material invented by Mr. John Spiller, late assistant chemist to the War Department. We must leave those who manufacture it for him to make it known.

The House of Commons.—On Tuesday a long and interesting discussion ensued on Mr. Headlam's motion, touching the insufficiency of the present House, and the plans submitted for a new one. The motion was ultimately withdrawn. We will look into the question presently.

The Drinking-Fountain, Westminster. The costly drinking-fountain, erected by Mr. Buxton, M.P., at the corner of Great George-street, Westminster, and of which we gave a view some time ago, has been opened for public use.

TENDERS.

The Builder.

VOL. XXVII.—No. 1367.

Exhibition of French and Flemish Pictures.

NCE more, with the same good fortune that appears ever to attend this undertaking, Mr. Wallis has managed to convolve many choice examples of some of the best representatives of the French and Flemish schools of painting, and to have been even more fortunate than usual in the nature of the works collected, most of them appealing to the sympathies that "make the whole world kin." So much has been said and written in favour of the long apprenticeship, the strict discipline and regularity with which the Continental-art-student graduates in his profession, the means that enable him to acquire the requisite knowledge to practise it at last with the same degree of certainty attending the

learning of any other, and how much to be deplored it is that similar opportunities do not exist for the English, that it might be thought any one could become an able artist who chose.

To hear and to read, it would be thought that those foreign painters with whose works an acquaintance now is as common, or nearly so, here as at home, are but a fair sample, in fact, instead of being—as is surely the case—rare exceptions; as rare as the best of our own painters. It would be a very interesting experiment to compare the picture produce of any year throughout Europe; divide it under the several denominations of good, bad, and indifferent; and, making fair allowance for quantity, determine if England stands "where it did." M. Meissonier, of course, is inimitable: to be ranked with exceptions of the past, let alone the present. He is represented by two celebrated works,—one, the property of her Majesty the Queen, "Les Bons Amis" (76), very richly coloured, and finished to a marvel: the expression of gravity with which the fuddled toper strives to listen as the other two argue, just able to avoid sliding off his chair, is wonderfully comic, without the slightest approach to caricature; and an equestrian portrait of "Napoleon I., 1814" (75), lent by Mr. Ruskin, as perfect with regard to finish, also, as it is possible to be. This is cold and grey in tone, with a threatening storm-cloud for background.

Putting aside a very efficient method of educating them, there are qualities and a charm that enthrall the attention—matters beyond mere training, and that defy translation or adaptation—in M. T. E. Daverger's exquisite rendering of a subject so often illustrated before as to have become "stock" with the delineators of ordinary incidents, but which in its worth as an investment has seldom returned such interest as it does now. A mother, in a paroxysm of grief, is leaning over "The Empty Cradle" (15) that has so lately held her child, now lost to her; tearless, with burning eyes and parched throat, she is writhing with the anguish of her hereavement, watched by her own mother, whom experience

may have taught how unavailing all condolence is at such time; for her pity is for the living, not for the dead: a lad at the half-opened door is about to retreat on tip-toe, as he silently beholds that he is intruding on so solemn an occasion; and even the faithful dog stands gazing at the mourner's face, as if he, too, shared the grief he cannot help to assuage. All the accessories assist in telling the story,—a sad one, but, told with such intense pathos, and with no vulgar emphasis to destroy its effect, it leaves no painful impression on the mind, beyond that calculated to be of benefit. Another phase of family grievance provides M. Daverger with a theme for a second important work. A youth, the black sheep of the flock, has been "Led Astray" (67) by bad companions. He has been out without leave, roystering at some cheap masquerade, and is brought home in a condition easily imagined and often described, very much to the consternation of his sisters and grief of his mother, who is, however, interceding to prevent the sterner parent from inflicting the horsewhipping the youngster richly deserves. The incident is so clearly narrated by the artist that it horders more on theatrical representation than is usually the case with him; but the stage is so well dressed, and the actors so well up in their several parts, that it could only be a French performance.

For dramatic power, as well as for the aptitude with which M. A. Tadmara revivifies classic history by appropriate character of personations, and appropriated architecture, costume, and general accessories, his composition entitled "School for Vengeance" (51) is strikingly singular. The chronicles of the ages when cherished revenge for injuries—however old the injury, however long-cherished the idea of retaliation—was accounted a virtue are replete with such episodes as the education of Chlothilda's children. "Gondobald, king of the Burgunds, in order to be master of the whole country, had had his brother Sigibort murdered. Chlothilda, Sigibert's daughter, kept a prisoner in Lyons, Gondobald's residences, had devoted the whole of her life to avenge her family; and with this view trained her sons from childhood to fierce retaliation." A subject repulsive enough: and barbarity needs no recorder of its practices. Every day furnishes fresh evidence of how much of it lies latent even amongst civilised humanity, and any precedent of its fiercest expression is better forgotten. The affectionate mother is seated, with her attendants respectfully grouped about her, watching with a cold-blooded delight the successful efforts of her eldest son to hit the mark with the hatchet he is hurling at a target; the hoy himself—a pocket Hercules—behaves as if he knew what was expected of him, and accepted it as the great purpose of his life. This figure is capital in action, as, taking aim, he prepares to hurl the axe with an unmistakable precision and sturdy consciousness of coming strength and opportunity to make full use of it. His younger brother waits his turn, whilst the grandfather, with long plaited grey hair twined about his head, watches, with keen appreciation and a speculative view of being some day satisfied, the graceful agility of his hopeful descendant. There is a marked individuality in each of the heads of the many figures introduced in the picture, and, as already intimated, a general propriety in its treatment, its sombre but harmonious colouring and total effect, that make it valuable as a faithful tradition and a fine work of art.

It is to be hoped that M. J. Israel's chubby baby's early path will not diverge for some time to come from that which his "first steps" (132) are marking out for him—an equal desire to gratify his pa and delight his ma; but "as the twig is bent, the tree's inclined," and as in

totting along towards his father, who with outstretched arms entices his progress, he evinces that liability to fall common to his species; it would be unwarrantable to promise his safe conduct for long. To its simplicity and naturalness this picture owes its interest; it is very broadly and finely painted; and so is an interior with a fisher-wife "Waiting her Husband's Return" (112), by the same artist.

M. G. Brion's "Family Worship—Alsace" (19), with the convincing evidence of its excellence corroborated by the award of the medal of honour, is magnificently conspicuous for its executive power, the harmony of its deep tone and rich colouring, and the strongly-marked character of the listeners, as well as of the reader or expounder of the doctrine who holds them in such rapt attention. There is no attempt at ideality in this plain depiction of a household engaged in the exercise of their religious duties, but the feeling of quiet earnest piety generally expressed seems to reach the spectator, and to include him in the congregation of homely, ordinary-looking men, women, and children, for the most part, ministered to by one who, the oldest, is the most ungainly of them all, yet of such patriarchal and benevolent appearance as quite to account for any amount of respectful deference that might be paid him.

How far preferable is the impression left by contemplating this and cognate works to the most startling of sensational effects produced by others of the opposite tendency! Such, for instance, as (43), "The death of John the Baptist," by M. A. Glaise, with all the awful concomitants—the headless, rigid trunk stretched on the blood-streaked pavement, the severed head, and so forth. Without denying the exceptional abilities of the painter, one can but wish that such elaborate literal exactness were more exceptional still, if it be desirable to represent such matters at all, that fall even on the imagination. M. J. Caraud's two scenes from "The Marriage of Figaro" (10), Cherubino, the Countess, and Susan, and (33) Count Almaviva, the Countess, and Susan again, are highly finished genre performances, that depend mainly on pretty faces, excessively well imitated drapery, and good taste in arrangement. All these recommendations are to be found in these instances, though, perhaps, the faces might have been prettier.

A little gem, a peasant child poring over a book, entitled "Reading made Easy" (14), by M. E. Frere, is one of those things that come under the category of "joys for ever," for it might be looked at every day and a new charm discovered each time of inspection. (31) "Rival Pets," F. Willems, a lady dressed in satins, with two dogs to divide her favours, rests, and may safely rest, on the perfect workmanship it displays. And Madame Henriette Browne's monastic head, "A Seminarist," exhibits admirable quality of a larger and less elaborate style. In "Recovering" (91) M. G. de Jonghe has tried the complexions of two charming members of the fair sex by surrounding them with vivid yellow curtains and furniture to the proof that they were above proof, for it is an exquisite example of power and delicacy combined, and a picture, although it is composed but of an invalid, still in bed, but approaching convalescence near enough to receive a visitor to congratulate her, who, dressed in black, is the key-note of the harmonious arrangement of so much bright brimstone colour, and the key to its management.

"Faust's First Sight of Margerite" (95), by M. G. Koller—one of many draughts from the same fountain of inspiration—is distinguished by the clean, solid painting remarkable in all this painter's works, but with no novelty in its description of the episode: it could scarcely be better executed, however, though it appears to want air "F'nal Confessions" (105), by C. Boutinone:

so slight in narrative that it appears wonderful how much valuable workmanship and how many rare qualities should be made to hang on its so slender thread. Both mother and daughter—winning through refinement—are natural in their actions, and very expressive of the sentiments that are actuating them. The young lady has evidently disposed of her affections in a way her mother would deprecate. M. F. Heilbuth contributes a sketchy but dexterous performance; but why it should be called "Watteau" (118) "no fellow can make out"; and two portraits of very original style, "Wreckers' Wives making False Signals" (138), by M. G. Clinrin—some weird and wicked women making a fire on the coast with dried seaweed, and whatever other fuel they can find, to mislead their victims—and (183) "The Wreckers" themselves, creeping along the shore to get at a long-shot distance of their prey, are very clever and striking, but disagreeable pictures.

"Going out for a Day's Sport" (5), by M. E. Poittevin; "Travelling in Valaquis" (27), and "The Halt on the Road, Valaquis" (16), by A. Schreyer, two masterly works, produced with evident rapidity; "The Origin of the Corinthian Pillar" (61), "Capital" would be the better term) by M. P. Leyendecker, carefully studied, well drawn, but not quite pleasant in colour, from a prevalence of green; "Pleasures of the Imagination" (106), a fair reflector on "the inspiration which no language finds;" "After Mass" (120), by M. A. Weiss; and "The Unwilling Scholar" (108), by M. P. Seignac, are in their diversity sure to attract observation for their merit. M. C. Landelle contributes a life-size study of "A Fellah Woman" (139), rich in golden ornaments and academic grace; and M. Bongueron a laughing Italian peasant "In the Cornfield" (191): of consummate finish and refined treatment, but of too elegant a polish to convey the idea of absolute truth to those who recognise its nearer semblance in the less smooth but more subtle expression of it to be found, for instance here, "In the Hayfield" (209), by M. Jules Breton. It would seem very difficult indeed to surpass M. C. Bieschop in obtaining such force and splendour of colour as are to be witnessed in "The Lovers' Quarrel" (170), that attain almost an overpowering brilliancy, an obtrusive gorgeousness that exceeds probability, and, though fascinating to the sense of such agreeable influence, destroys all idea of reality.

It would be supererogation to write a word of more than general acknowledgment of the worth of the greater number of the items that constitute this collection; all are to be identified with a peculiar capability of making much of trifling materials by innate good taste and patient labour of imitating all that is to be represented in relation to the subject selected for illustration.

Such characteristics in their highest degree of value are to be found exemplified in (25) "More Free than Welcome," by M. J. G. Vibert, and the admiration it excites is entirely derived from them. A lady and a favoured cavalier have just sat down to dine, when an intruder disturbs them,—a priest, who evidently thinks he has a right to an invitation to join them, though he approaches the lady with the most respectful and deferential appearance of obsequence: the cavalier, it is quite plain, wishes him where, in all probability, he never prays he may go; and the annoyed mistress as clearly wishes herself well out of so embarrassing a predicament. In its entirety the picture rivals any of the Dutch school whose works it emulates.

M. A. Cabanel, however, is quite independent of such means of inviting attention as well selected accessories, wonderfully copied costume, and the like, so often prove. "La Naissance de Venus" (184), a small replica of his famous picture, offers nothing but the naked truth for a story, though it can scarcely be said to be confined to bare fact, for she is so idealized as to become and as becomes a mythologic personage, and super-exquisitely beautiful as the Cupids demonstrate they opine her, as they hover about her in enamoured wonderment. The drawing of this figure is beyond praise, and the Goddess of Love could hardly complain of her portrait failing to do her justice. But for the eyes of the goddess, the picture would be purely itself.

"True to his Post" (13), by M. Schenck, exhibits great skill in apprehending and depicting animal life, and painting landscape, or rather atmospheric influences; for one can hear the rain as it splashes on the rocky shelter that protects

but partially the sheep that cuddle together as even sheep do, so strong is family affinity and affection, in times of annoyance and trouble. But there is no shelter for the poor dog, the protector regarded in quite another light, perhaps, by those whom he protects: with shivering haunches he braves the storm from which his fidelity to his trust forbids him to screen himself, and from his exposed position on the sheltering boulder sees that his master is better located than himself. He is no evasive dog, that is very certain, and thinks of others rather than of himself. Seldom have pictures of this class been invested with so much interest, and very few are the painters who could so thoroughly impress the spectator.

(63) "Ejllbacka, on the Coast of Ekinstan," is a barren moonlit scene, with silence and solitude to make it poetical, by M. Whalberg. "Calm Weather" (143) is delightful in colour, and shows in what a masterly manner M. P. J. Clays can paint the sea and vessels, with their reflexions in its depths.

(195) "A Sedgy Stream," by the late M. Troyon, a charming landscape, recalls the recollection of others that have preceded this, and the fact that none will follow it.

COMPENSATION TO LAND AND HOUSE OWNERS.*

ALTHOUGH a work of this description is written mainly for the advantage of the profession of the law, yet it claims serious attention at the hands of the surveyor, not only on account of the enormous amount of business which has been and will be enjoyed by many men eminent in our profession, but because the best interests of the claimants are so much more dependent on the knowledge, tact, and skill of the surveyor than of the lawyer, more especially as the introductory steps of most claims are taken by the former, although in difficult cases no surveyor is wise who fails to take into his counsels a skilled member of the other profession.

It is some fifteen years since a work on this subject has been published—we are not forgetting that hook on "Railway Precedents" in 1866, which touches slightly on this subject amongst others—since which date decisions have been given in the Courts of Appeal which have considerably changed the position of many claimants. Our proceedings, as surveyors, must be guided in these matters by the dicta of the Courts, and we are thankful when these are gathered together from their scattered records. This volume being exclusively and intentionally devoted to that branch of the subject, it becomes a paraphrase of the Landis Clauses and the Railway Clauses Acts, 1845, with notes of the decisions on cases taken to appeal. To the experienced surveyor, therefore, it is too much, for the Acts are sufficient without the diminished equivalent, and a collection of the records of decisions would suffice; while to the beginner it is deficient, as lacking information on, to others, well-known and every-day practice—the result of chamber research rather than of the daily attendance in the Courts of the Sheriffs and Arbitrators. Yet, fatal mistakes may be made by even a tolerably experienced surveyor without information at his elbow such as this work conveys.

The volume seems to have suffered, even to the clipping of its grammar, in the desperate attempt to lessen its bulk; and yet that bulk might have been reduced by the extent of the Acts of Parliament in the appendix, or their paraphrases in the body of the work might have been omitted, and would have saved much repetition of cases. This was the plan adopted by *Shelford*, the notes of decisions being appended to each clause; and the former would appear to have been the first intention of the editor, for the Acts of Parliament are in no way noticed in the index, which is a serious oversight; and, while we are on the subject of indices, we may add that this is no better in that respect than other law books. A copious and accurate index is a necessary part of every volume, and, in its absence, the volume may frequently be called a sealed book. This is a common complaint against law books. In the index there are no such heads as *Disputed Compensation; Costs of Mandamus; Engines, or Locomotives, or User of Railway; Neglect to Act; Obstruction of Access; Summons by Yearly Tenant; Action of Mandamus; Invest-*

*ment, or Reinvestment; Right to a Jury or Arbitration by Yearly Tenant; Right of Renewal; and a dozen other important subjects mentioned in the volume; while, in some instances, the cases are indexed reversely,—that is, showing an opposite decision to that in the text. And in the advertisement it would have been better, we consider, to have stated what does not constitute an interest, for the case cited is the *refusal*, to consider a right of sporting as an interest.*

Having thus introduced the volume generally, we propose to point out some of its good points, as well as its failings, and to refer more in detail to some of the matters treated of; and we are led to do this because there are many novelties in practice which mainly depend on the decisions, and this book does not deal with them thoroughly.

The author has paid a tribute to skill in the general remarks on claims (p. 59). "The actual amount awarded will of course vary according to the views taken by the parties or arbitrators, or the ability with which the claim is laid before the jury." We remember a few lines to the same effect in the Dictionary of the Architectural Publication Society. "The estimates of the value and the damage must almost entirely depend upon the ability, knowledge, and skill of the surveyor." Again (p. 87), he says, "It is not at all easy to say what is exactly meant by, and how much is included in, the words, 'injuriously affected.' It is almost impossible for any but a practical surveyor to point out."

It is, perhaps, needless to say that both law and practice assume that no advantage is to be taken by either party; on the one hand, the company (or promoters) are to pay for every value and loss; and, on the other, no profit is to be made out of the company, but a liberal and full sum should be given and taken: that is the theory. In practice, alas! each party mostly struggles to overreach the other. Much of this is due to professional pride, but much, also, to extortion on one side and inadequate offers on the other. The result has been continual complaints of robbery and oppression. This will probably never be changed, so long as the tribunals are constituted as they are.

The subjects, very naturally, are divided by the author into chapters, the principal of which, as affecting us, are agreements in Parliament:—with companies after incorporation; compulsory powers; restrictions; injuriously affecting; modes of settling compensations; lessees and yearly tenants; costs; and special railway powers.

The subject of Parliamentary agreements has not hitherto received sufficient attention: the few paragraphs here are useful, but lead to doubt and disturbance, inasmuch as they unsettle our minds as regards the stability of any such contracts, unless they are incorporated in the Act; but we may say that we have not known any such agreements repudiated by respectable companies. It is more correct, perhaps, to say that many agreements made in the committee-rooms are valueless, unless they are money contracts, as they are rarely properly drawn up, and frequently are resolved into a written expression of some existing rights under the general Acts. In all such cases, persons expert in compensations, and a clause, if possible, obtained; companies, however, naturally object to commence admitting clauses when the consequence might be a legion of them.

Attention is properly drawn to the execution, after the passing of the Act, of documents otherwise than under seal. Certain notices may be signed by the secretary, but there is no reference in the work to the legality of such contracts as are made by the surveyors of the companies. If these are appointed under seal, we presume their Acts would bind the company. We know that injunctions have been obtained under such informal agreements. We remember also a case of great hardship not reported here, where a claimant withdrew his claim on an undertaking given by the counsel for the company to sell the freehold of a portion of the premises to him. The company repudiated this bargain, but the Court of Chancery compelled its fulfilment. He, however, enjoyed his triumph but briefly, for the company almost immediately served another notice to treat, and ejected him from the whole. His trade had in the mean time been nearly destroyed, and his claim thereby lessened.

In exercising the compulsory processes of the general Acts, both parties have a certain amount of power, the initiative being always taken by

* Compensation to Land and House Owners: a Treatise on the Law of Compensations, &c. By J. D. Ingram. Second edition. Edited by J. J. Elmes. Butlerworths, Fleet-street. 1869.

the promoters by the service of a "notice to treat." From that time the powers are, if he so choose, entirely in the hands of the claimant. The course of proceedings is not quite as laid down in pp. 135 and 136, where it is stated that if the parties do not concur in appointing a single arbitrator, "a request should be made by one party to the other, that the latter should appoint one. Then each should make his appointment in writing," &c. How this slip has occurred we cannot imagine, because the Acts are clear, and the authorities and decisions are all one way—namely, that the party requesting an appointment *must have already appointed* his own arbitrator. There is a very proper direction on p. 138, that "no person connected in any manner with, or employed by, the company, should be appointed arbitrator or umpire." How constantly is this wholesome advice violated in practice! How frequently does a regularly retained witness of to-day sit as judge on the adjoining property to-morrow! Is there no remedy for this? Unfortunately the Board of Trade is no refuge, because, if appealed to, to appoint an umpire, it names one of the very persons who may already have been refused, notwithstanding the representation that the refusal has been on the ground of employment by the company. Our own opinion has long been that the Board of Trade should appoint no one who does not give a pledge to act on neither side on the particular undertaking; that, in fact, an umpire should be entirely free from bias, and unconfounded by evidence given by himself in similar cases on the same line. Until this be done, the appeal to the Board of Trade is a delusion and a snare. We know of systematic refusals of companies' arbitrators to concur in appointing an umpire outside of the charmed circle, knowing the result of the appeal. This was not formerly so, the gentleman who was generally appointed having kept himself entirely independent of both parties. We believe that it was "companies'" influence which caused his being less frequently appointed. It may be said that the proper alternative is a jury. Those who are aware of the caprices of juries, and the manner in which the twelve men are brought together, are not inclined to prefer that tribunal in the cases of valuation to an independent professional judgment. It is the knowledge that that independent judgment is so difficult to obtain that causes so many inquiries before juries, doubtful as the result always is. In one respect a great improvement has been effected in jury cases by the Regulation of Railways Act, 1868, either party being at liberty to apply to a judge of any one of the superior courts; and if he think fit the inquiry is to be in one of those courts. No such inquiry has yet been held, and we do not see whether or not the right to special juries has been withheld. No notice is taken of a peculiar case of recent Metropolitan Acts, where the occupiers are entitled to six months' notice—we presume to prevent the scandal of rapid ejections in towns. These six months' "ratepayers'" notices have been held to be "notices to treat."

We should have been glad to have had some information upon the subject of an arbitrator's "neglecting to act." What is neglect in these cases? Our author answers by referring to the case of *Willoughby v. Willoughby*, in the Queen's Bench Reports. That case, however, is not in point. It was not a railway case, but simply a case of an award made after the time limited, and the court set it aside. The Lands Clauses Act enacts that "if either of the arbitrators refuse, or for seven days neglect to act, the other may proceed *ex parte*." We confess we never knew of a case of *ex parte* proceeding, but we have known of very many cases of real neglect; meaning by that expression that the arbitrator neither makes the statutory declaration, nor takes any steps towards the appointment of an umpire, and therefore no attempt at any settlement. Frequently, however, all approaches for a settlement have previously been made. Before proof of neglect could be adduced, most seven days' notice be given to the arbitrators? We are still without any means of knowing what is neglect—not neglect to appoint an umpire, because there remains the appeal to the Board of Trade.

In the case of a claimant requiring a jury to be summoned, the best mode is by action of mandamus, to which there appears to be no answer. It is desirable in all cases to have proof of a request having been made to the promoters for a jury.

There are several kinds of interests all sup-

posed to be antagonistic, but in reality most intimately connected and mutually supporting, and, unless by the collusion of a railway company in the way of a bargain with an owner for empty possession, which means that the owner is to give notices to quit to the yearly tenants (whose demands have of late years been more carefully considered than they were formerly), every interest is separately treated for by the company. There are anomalies, however, entirely in practice, which our leading surveyors, acting, as they do, almost solely in the interests of the companies, consent to adopt in the vain attempt to generalize instead of treating each case on its own merits. For instance, a freehold house may fairly be reckoned at 20 years' purchase—if at say 100*l.* a year, the value would amount to 2,000*l.*; but take the case of the adjoining house (and it is not a mere supposition, for the case has frequently come before the writer of this article) which has an original ground-rent of 10*l.*: this, on principle, is usually taken at 25 years' purchase, 250*l.*, and the tenant's interest, 90*l.*, at 16½ years' purchase, 1,500*l.*; total, 1,750*l.*, an error of 250*l.* In truth, every variation from the exact proportion of one of ground rent to one and a half of building rent is a disturbance of the equity of the several interests, and makes either the whole greater than the parts, or the parts greater than the whole.

There is no law on this state of affairs, and so long as surveyors are content to be unscientific, and guided by red tape, so long will injustice exist in our compensations. In truth, the ground-rents are, as regards London, almost invariably estimated too low, and, while in many cases the leasehold interests might fairly be estimated at the rate of 5 per cent., yet in a large number of cases 6 per cent. is much too high. The usual acknowledged proportion of ground-rent to building-rent is as 1 to 5; that is to say, the ground-rent should be, to be fairly apportioned, one-sixth of the full net rent. This again is subject to great exceptions, as in the city of London, and in the more desirable positions at the West-end, as well as in other large towns, where the additional value of property arises entirely from its position, or "ground-rent," to such a degree that sometimes the latter is two-thirds of the whole value. How would the calculation of the separate interests then tell on the totals? We will answer that question by a case where the value *per annum* was 450*l.*; this at 20 years' purchase was 9,000*l.*; ground-rent, 300*l.* at 25 years' purchase, 7,500*l.*; building-rent, 150*l.*, at 16½, 2,500*l.*, making a total of 10,000*l.*, or 1,000*l.* of error in one of the modes of calculation. It would thus seem that the large majority of "compensation" surveyors being retained by the railway companies, have rough-and-ready modes of ascertaining compensations, and have compelled the adoption of their illogical calculations, causing a mischief which it seems almost impossible now to prevent. No remedy exists for any error of this kind, nor perhaps would it be possible to ascertain on what grounds either juries or arbitrators' decisions could be reviewed by any court.

It may be sufficient to state, as regulating the principles of compensation, that the sum received from the sale is assumed to be reinvested in property of the same nature. It is not an uncommon notion amongst annuitants that they are entitled to an equal income in Consols. Though no case is mentioned in this book, we know of those where the Court of Chancery has sanctioned investments in similar limited leasehold property. It is to some extent desirable that there should in some cases be an amendment in the law, because even where the directors of a company are desirous to be liberal (a state of mind which is rare in those bodies), it is questionable whether they could conscientiously be so. A case in point is that of a charitable institution where a trade was carried on. The chairman of the institution was the actual lessee; the trade was carried on at a loss, being in competition with more skilled and efficient labour, the balance being provided by public voluntary aid. In such a case the company felt compelled to refuse any compensation for the loss of trade, the trade being unquestioned; and although the loss of the sale of the goods for a time would throw several hundred workmen either out of employment or on the charity of the world, yet as those hundreds of men had no legal interest in the premises, compensation was steadily refused, on the ground that nothing but the leasehold interest and the plant and fixtures could be paid for, and that to the person who nominally held

the lease. This case was not tried, as the company abandoned the undertaking; we were curious to see what a jury would say. Other charitable institutions have been hardly dealt with because they were not corporate bodies damaged. We shall continue our remarks in another number.

HOW TO USE OUR FUEL PROPERLY.*

Now that we have been told that we are getting through our great coal supply at an annually increasing rate that threatens to bring us to the end of our stock at no very distant date, it would be folly not to examine with minuteness all plans brought before us that bear upon the husbanding of our fuel. But setting aside this probably remote exhaustion of our supply, we should carefully consider all propositions setting forth modes of economising the use of fuel, for the weighty reason that money expended upon its wanton, ignorant, and unscientific waste could be beneficially laid out in objects that would conduce to the health, comfort, or mental elevation of the household in which extravagance is permitted. This is a subject upon which we have before dwelt at length, and to which we have often referred, feeling that a great addition to the domestic comfort of the whole country might be made by a little earnest attention and determination. A fresh endeavour in this direction has been made by Mr. Edwards, the author of a work on "Domestic Fireplaces," noticed in these columns. He urges that there is peculiar fitness in the present season in an invitation to consider the subject of waste of fuel because the national prosperity has flagged a little, and it may be deemed expedient to think over means by which money can be saved.

Mr. Edwards makes suggestions relating to improvements in our present cooking-stoves, that would, he says, reduce the cost of the fuel to a fourth of that at present required. A kitchen fire that annually consumes four sovereigns' worth of coal would thus need but one sovereign's worth, and its owner would remain in possession of three sovereigns to expend upon something more useful or beneficial than a volume of thick smoke ascending out of his chimneys to waste. The subject was taken up about seventy years ago by Count Rumford, who, in the great kitchens under his administration in Bavaria, reduced the consumption of fuel to one-fifth of that hitherto used. A biography of this remarkable person occupies a considerable portion of the book, and is instructive in showing the importance attached to saving in this department by one of the most methodical managers and administrators that ever lived. Count Rumford, we may briefly state for the benefit of those whose memories do not go quite so far back, was an American gentleman, by name Benjamin Thompson. In the declaration of American independence he was a loyal adherent to the English monarch, and was selected to carry the news of the evacuation of Boston to London, where he was warmly received by Lord Sackville, and provided with employment in his department, and soon created under-secretary of state. On a change of ministry he returned to America, reorganized the cavalry, went to Jamaica, and afterwards, when peace was declared, returned to Europe, intending to place his services in the hands of the Emperor of Austria against the Turks; but making the acquaintance of the Elector of Bavaria, he was invited to arrange his military affairs. The English Government gave consent, with the title of knight and a pension. In this new position Sir Benjamin Thompson reorganized the Bavarian army, established numerous schools, and put down mendicancy; and it was in providing dinners for the thousands of persons thus under his care that his wonder-working attention was directed to the great saving that might be effected in the use of fuel. Twelve hundred, and at some seasons 1,500, persons dined daily in the House of Industry he founded for the mendicants, upon soup and bread, at a cost of a penny each, and 200 dined daily on roast meat at a correspondingly small expenditure. The cost of the fuel required to cook 1,000 soap dinners in the public kitchen

* On the Extravagant Use of Fuel in Cooking Operations, with a short Account of Benjamin, Count Rumford, and his Economical Systems, and numerous practical Suggestions adapted for Domestic Use. By Frederick Edwards, Junr., author of "Our Domestic Fireplaces," &c. London: Robert Hartwicke, 182, Piccadilly, 1868.

of the military workhouse at Munich, after his mode, was 43d. In the hospital of La Pietà, in Verona, he instituted a similar economy; and his plan was adopted ultimately in the Foundling Hospital, the Royal Institution, and the Heriot's Hospital, Edinburgh. We will now describe the contrivances by which he arranged that so much cooking should be effected with so little fuel.

His leading idea was to cut off every source of waste. To this end he endeavoured to prevent all radiation into the cooking apartment, and to turn heat to the fullest account before it could find its way up the chimney shaft. First he substituted the close stove for the open fire with the gaping chimney. His stove consisted, indeed, of a number of small fire-places sunk into a level surface, each of which was provided with a vessel that fitted it accurately, and each little receptacle for fire was provided with a flue that surrounded the vessel with which it was furnished, and so carried round it the heat and smoke before they escaped. Mr. Edwards gives an illustration of Count Rumford's arrangements as made in the house of a gentleman in Munich, with sections and details of the cooking vessels. The stove has the appearance of a solid table or counter of brickwork, at one end of the kitchen, with a semi-circular recess in the centre of its front, in which a person could conveniently stand and adjust the different vessels upon the surface. We will condense the author's explanation:—

"Upon the horizontal surface of the brickwork are seen various cooking utensils, each fitted into an aperture so as to leave nothing but the covers and handles projecting above. Below each cooking utensil a small fire-place was arranged, consisting of a grate to contain the fuel, with an ash-pit below, and a door in front of it for the removal of ashes and the regulation of the supply of air. To the larger utensils another door, termed a stopper, was provided, through which fuel could be introduced to the fire-place. The smaller fire-places were refilled with fuel by removing the utensil in them for that purpose. In every fire-place there was a small flue, which compelled the smoke and heat to pass round every portion of the utensil before their escape, and their exit was further checked by a damper in the escape-flue, which was regulated so as to allow no heat to pass away as long as it could be safely retained. The utensil became in fact immersed in a sort of hot-air bath; and to complete the arrangement, each cover was made double, with a hollow space between the two parts filled with air, which, acting as a non-conductor, most materially checked the escape of heat. Flues from the different utensils passed horizontally into four main vertical flues formed in the brickwork at back, by which the smoke escaped daily into the chimney."

Over and above the block of brickwork thus perforated with fire receptacles and flues, and, as we should have mentioned before, with a boiler for hot water heated by the smoke and hot air from the three fire-places nearest to it, there was a hearth on which a fire could be lighted and two ovens heated. Instead, therefore, of an enormous fire burning to waste when but a little cooking was going on, this plan permitted of the use of the exact quantity of firing required, and the particular construction of the flues provided that all the heat should be utilized before it left the neighborhood of the vessel in which food was in course of preparation. Generally three of the small fire-places sufficed to cook a dinner: occasionally only one was lighted, while on occasions all would be in use together. That there might be no mistake as to the comparative consumption and cost of fuel, Count Rumford instituted a series of experiments, and ascertained beyond the possibility of doubt that twenty-eight gallons of water in a large boiler on an open fire required 62½ lb. of wood to bring it to the boiling point, and maintain it for two hours, while the same result could be obtained on a closed fire with the use of 13½ lb. Again, a copper pan on an open fire-place consumed 11½ lb. of wood in the process of holling its contents, while the same vessel required but 13½ lb. on a closed fire. Hence he laid it down as a fact that in the large open fire-places five times as much heat was required as was used when the fire-place was closed.

It is upon the basis made by Count Rumford's experience that Mr. Edwards has built his superstructure. He first traces the introduction and gradual adoption of the kitchener now in pretty general use in newly-built houses, and then makes a series of suggestions for its material improvement. The drawbacks to the present kitcheners are, they give out a great deal of heat; the scent of the cooking, having no open chimney to ascend, is apt to spread over the house; repairs to them are expensive; and they are not so frugal in their call upon the coal-cellar as they might be. These questions of heat, ventilation, wear, and economy are successively gone into by Mr. Edwards, and upon all he has something sensible to say. A great deal of the radiation

would be done away with by the use of tiles instead of metal, wherever possible; the ventilation might be improved by a funnel and tube over the fire-place communicating with the chimney above the height at which the small flues enter it; the necessity of frequent repairs might be reduced by the use of the most indestructible materials known; but the matter of extravagant consumption of fuel cannot be disposed of so easily. Waste of fuel means waste of heat. To prevent this in every portion and department of a kitchener, so many alterations would have to be made, that it would, when perfect, bear scarcely any likeness to its original appearance and construction. Four causes of waste are pointed out: too free admission of air, the exposure of a needlessly large surface of metal, too rapid draughts, and the use of a single fire for all purposes, whether great or small; and some half-dozen means are considered by which they might be cancelled. The fire-place, the ovens, the boiler, the dampers, and the hot-plate are all open to improvement. Mr. Edwards shows, in the first place, that the fire-place is unnecessarily deep. Now that people know how to prevent the peculiar taste that used to be urged as an objection to baked meat, the open fire is not used for roasting, nor, indeed, for anything more important than toasting bread: 6 in. or 8 in. of depth in the frontage of the fire, he therefore considers would be sufficient. The next thing he urges is, that the bottom on which the fire rests should be of fire-brick, pierced with a number of holes for the dust to fall through. Perhaps such of our readers as have used the plan now generally known as "The Builder's Fire" would go a little further, and consider the piercing not wanted. Another suggestion is based upon Count Rumford's conclusion, "that any air which entered a kitchen fire, and which was not required for combustion, was a thief, which stole the heat, and escaped with it up the chimney." To prevent this waste, the author recommends the use of the fire on the slow combustion principle, by closing the fire in front with a perforated door. His last hint brings him still nearer to "The Builder's Fire," though, as he thinks, further from his own recommendation of the nearly solid bottom in preference to bars. He would have a fire receptacle large enough to have a day's consumption of coal in it, on the top of which the fire should be lighted and the fuel gradually raised to it, as required, by simple machinery. But whether it would be strictly economical to light a fire that would go on burning all day, when only a dinner was required to be cooked with it, should be considered. The whole question of economy in the matter of fuel seems to be compressed into the possibility of using only the smallest quantity for the shortest time; and the lighting of a furnace that is to burn all day seems to be going away from the mark set up. It seems to us the plan of lighting the fire from the top might be useful without any subsequent winding of fuel from below. Mr. Edwards considers the ovens would be better heated if they were put on the top of the hot-plate, instead of below it; and he would adopt Count Rumford's plan of furnishing them with double doors having a non-conducting material between them. But his most striking improvement relates to the hot-plate. Here he brings more of Count Rumford's teaching to bear. Instead of the large metal surface, all of which is equally heated, and therefore much waste is going on because but little of it is in actual use, he would have the kitchener covered with tiles, except where he would provide a double row of metal rings with covers; and under these covers he would have all the hot air conducted in channels. As in the Bavarian stoves, utensils provided for the purpose could be fitted into either of the metal rings and there maintained in a bath of hot air. Mr. Edwards gives illustrations of kitcheners in which these improvements are shown. Mr. Burch's American kitchener, Norwegian cooking-stoves, and gas stoves are also shown with a view to the completeness of the work.

Among the illustrations is a section of the heating arrangements of a six-story house, containing the kitchen and attics, which are embraced in the scheme. From the boiler of a kitchener in the basement to the top of the house stretch ascending and descending pipes conveying hot water to a hot-water cistern, which is placed below one for cold water fixed beneath the roof. Branch pipes from this hot-water cistern supply the basins in the bedrooms, and the bath and basin in the bath-room. And in the hall is a hot-water coil, heated by the

circulation of hot water conveyed to it by branch pipes from the first-mentioned ascending and descending pipes. The simplicity and frugality of this scheme are weighty recommendations. But the usual difficulties are not altogether vanquished. When the bath is for use, for instance, and all the hot water in the boiler drawn off for it, how can the supply of heat to the coil be maintained? The passage of branch pipes between floors and ceilings, too, is always attended with disaster, sooner or later, either from carelessness or frost. Where such an arrangement is inevitable, the ceilings below the pipes should be rendered waterproof with a layer of asphalt, and every facility made on the floors above them for getting at them expeditiously. When an extra fierce kitchen fire has burnt for some time, it sometimes happens that the water in the cistern at the top of the house boils too with dreadful gurgling, hissing noises that alarm all hearers. So what with the chance of having the water cold always for some time after the bath is filled, when it is wanted hot for the coil, perhaps, from inclement weather; and the contrary possibility of having it too dangerously hot after a dinner-party, just as the fatigued household are going to rest; and the certainty of the pipes bursting some time or other from the effects of frost; we must not yet rest satisfied with our contrivances in this department.

Improvements are brought about slowly. National customs are not to be uprooted with one effort, like weeds in a garden, and many a long day must come and go before thriftiness is thoroughly understood in the English kitchen. Mr. Edwards may feel satisfied that he is doing something towards bringing this about.

THE RESULTS OF ASSOCIATION FOR PROVIDING DWELLINGS FOR THE WORKING CLASSES.

INSTITUTION OF SURVEYORS.

At a meeting of this Institution, on the 5th inst., Mr. T. Chatfield Clarke reviewed the progress made in providing dwellings for the working-classes. We print that portion of his paper which gives results:—

In the order I have proposed to myself, I desire first to refer to the work of the Metropolitan Association for Improving the Dwellings of the Industrious classes, as being the association that, on a charter involving much preliminary expense and with many restrictions, has proceeded in such a careful manner with various tentative experiments as to entitle the managers of such association to much praise.

It is satisfactory to learn from the clear and detailed accounts presented by this association, that several of their larger buildings are earning, after the payment of every expense, more than 5 per cent., and in one of their largest blocks, 6 per cent.

The statement of general results is as follows, to Midsummer, 1868:—

Paying on a capital of about 100,000*l.*, exclusive of loans and advances and provincial branches, this association was enabled to divide at the rate of 4 per cent. last Midsummer, though having earned nearly 5 per cent., accommodating a population of 3,342 persons at that date, and with the favorable rate of mortality of 14 per 1,000, the average rentals per room being, I estimate, from 2*s.* to 2*s.* 5*d.* per week.

Ranking next in interest, perhaps, is "The Improved Industrial Dwellings Company," from the spirited way in which, in a short space of time, so many blocks of buildings have been raised in various parts of the metropolis, on plans peculiar in their conception and original in the class of material used in their construction.

This company are going to avail themselves largely of the power to borrow from the Government at 4 per cent., to assist their undertaking, though the advantages likely to accrue from so doing have been lessened considerably by the great expense hitherto incurred in obtaining such loans.

With a productive capital, by the last report, of about 90,000*l.*, this company is enabled to pay 5 per cent., accommodating a population now of about 2,900 persons, but shortly hoping to increase that number, by their buildings projected, to 3,890 persons. No statistics of the health of the inmates have been kept, but from some partial observations in one locality they have been very favorable. The average rentals derivable are from 2*s.* 3*d.* to 2*s.* 6*d.* nearly per week per room.

The munificent and repeated gifts of Mr. Peabody next claim some notice—indeed, such an amount as the total of 350,000*l.* put in trust for this object must impress every one as an unexampled instance of a generous and high-minded man seeking in what way his great wealth can be devoted for the permanent good of the community of which he is not even a countryman.

In reviewing the action of the trustees hitherto, it is difficult to go into much detail as to the results, inasmuch as the accounts presented annually to the public are so meagre in character, no revenue account being published, and no analysis being given of the interests obtained on distinct blocks of building. It is much to be wished that the trustees would consider the advisability of furnishing more detailed accounts, as great interest is felt in the matter, and it might serve to remove from the public mind, by explanations, false results, possibly otherwise arrived at.

As to the scale and substantial character of the buildings, there cannot be a question with their large and airy secluded playgrounds, landries, and other conveniences; all must add very much to the comfort and convenience of the dwellers therein; but, judging by the recent letter of the secretary to the trust, it is a source of regret that it has been hitherto impossible to realize a larger rate of interest than 2½ per cent., "a sum," as he justly says, "much too small to induce those actuated even partially by a view to investment, to follow the same example."

The capital hitherto expended has been about 150,000*l.* with a total population of 1,971 persons, the rents demanded being at the rate of 2*s.* 6*d.* for one room, 4*s.* for two rooms, and 5*s.* for three rooms; the health statistics show a mortality of about 15 to 16 per 1,000.

The average wages of the working men in these buildings are stated to be about 2*s.* per week, and to be as carefully selected as possible to avoid a class who could pay higher rents.

The buildings erected by the Corporation of London in Farringdon-road next claim notice as a large and spirited undertaking, which sets a good example to like corporations.

These buildings are on the model (with some modifications) of those erected by The Improved Industrial Dwellings Company, with the addition of shops on the ground floor.

The outlay on this property has been about 54,000*l.*, showing on the average of three years a clear net receipt of rather over 4 per cent., beyond which there is a portion of the site not yet utilized.

The population in these buildings amounts to 872 persons in 168 tenements, and the average number of deaths is at the rate of 22 per 1,000, showing only a difference of 1 per 1,000 over the whole of the metropolis, but as compared with a small property not far off it shows a very favourable result, where the death-rate is 31 per 1,000.

The Society for Improving the Condition of the Labouring Classes claims to rank with the Metropolitan Association as setting up models for imitation, and as having led this movement. This Society, at the present moment, is not extending its operations, and does not consider itself committed to any continued series of erections. Its properties are various in character, several being occupied by single men and women, and it has also a public washhouse, which occasions the Society considerable expense and loss; it has also adapted existing houses, with every needful comfort, which yield, the report states, a fair average balance.

It is almost to be regretted, I think, that the mode of conducting the operations of this society does not seem to provide a clear balance to accumulate for the extension of their operations, or a sinking fund to redeem the leaseholds, as is the case with other societies, and the expenses seem large; but this society is working with a large amount of borrowed capital, obtained as to a considerable proportion at 5 per cent.; several of the blocks of buildings show in the accounts a considerable surplus of from 4 per cent. to 5 per cent., after deducting the charges upon same.

The capital account, not including a freehold property at Hull, shows an expenditure of about 37,000*l.*, an entire population of from 1,600 to 1,700 persons, and a death-rate of 15.5 per 1,000.

Miss Countess, whose name is so universally respected for her long and generous interest in the welfare of the poor in the metropolis, has also aided this movement by the erection, in Columbia-square, Shoreditch, of a large pile of

buildings, giving every facility for healthy living, and on a scale superior to others as to external decoration.

The outlay upon this undertaking has been in land and building about 45,000*l.*; the gross rents amount to about 1,840*l.* per annum, and the deductions upon the same to about one-third, yielding therefore, according to Mr. Darbishire's report, about 2½ per cent. per annum.

There are 189 tenements, let, I am informed, at very moderate rents, which Miss Countess will not permit to be raised, and commencing at 2*s.* per week. The number of inhabitants is about 716. These buildings have the advantage of landries, drying-rooms, baths, and other conveniences, and are much valued in the poor neighbourhood in which they are placed.

Mr. Gibbs has also erected a large pile of buildings, on the scale of those erected for the trustees of the Peabody Fund, in Rochester-row, Westminster, and it is a gratifying fact that after a large outlay in buying up the leases of old properties, so good a result comparatively should be derived; but here, also, taxation presses heavily on the success of the scheme in a financial point of view, the taxes, rates, gas, superintendence, and repairs, amounting to about 7½ of the gross rental derivable.

These buildings consist of 166 tenements, housing about 650 persons, at rents varying from 2*s.* 3*d.* for a single room to 5*s.* for a three-roomed tenement. The total outlay has been about 32,000*l.*, and a net dividend derived of something over 3 per cent.; the death-rate averaging for two years 19 in 1,000.

Sir Sydney Waterlow, with great boldness, before initiating the company with which his name is connected experimented in this matter in the erection of a block of buildings called "Langbourne Buildings," at a cost of nearly 8,000*l.*, containing 78 tenements, with about 390 inmates, and these (partly on account of the less cost of building when they were erected) yield, after deducting all expenses, and providing for repairs, a net result of over 9 per cent.; and these figures are obtained after a trial of five years.

The Right Honourable Russell Gurney, M.P., has also made a most interesting experiment in his own neighbourhood, which has a special value that not only does it locate the poor near to their work, but combines the element of retaining poor families in the neighbourhood adjacent to their richer brethren, in whom they may justly take a special interest.

The outlay was 2,500*l.*, giving accommodation for ten sets of dwellings, and from 50 to 60 persons; the rentals being 7*s.* 6*d.* for three rooms with conveniences attached, and yielding a full 5 per cent. on the outlay.

These buildings are constructed on the same design, and with similar material to those carried out by the Improved Industrial Dwellings Company.

Before closing this paper there are one or two other associations for this object in the metropolis which it is right to refer to; among others, the Marylebone Association for Improving the Dwellings of the Industrial Classes, and the Highgate Dwellings Improvement Company. With respect to the former, I am hardly able to present many particulars, but with a capital of about 27,000*l.*, spread over six properties, doubtless a considerable work is being effected. The dividend on the ordinary shares last declared was at the rate of 4 per cent., and 4½ per cent. on the preferential stock of the company.

With respect to the Highgate Dwellings Improvement Company, built also on similar plans to the Improved Industrial Dwellings Company, it provides on a total capital of about 6,000*l.*, though the expenditure of the same is not fully defined, for 96 rooms, and the company have been enabled to pay a dividend of 5 per cent. on rentals varying from 2*s.* to 2*s.* 3*d.* per room per week, and for two or three rooms in a somewhat less proportion.

In giving this sketch, I ought not to omit some other kindred societies and persons who have privately worked out schemes of the kind, and amongst others the Strand Buildings Company, the Central London Dwellings Improvement Company, the London Labourers' Dwelling Society, the Rev. Mr. Burgess, Mr. G. Barker, Mr. J. H. Harlowe, the Rev. Thos. Ainsworth, Mr. John Newson, and Mr. Hilliard may be mentioned; nor ought the labours of the late Prince Consort in this direction to be omitted, as tending probably more than any other person, by his high position and his pure and disinterested motives, to have infused energy and

excited inquiry in many minds that might otherwise have been directed into other channels.

Of the results of some of the above operations it may be briefly noted that the Strand Buildings Company, on an expenditure of 5,000*l.*, pays 4½ per cent.; the Central London Dwellings Improvement Company pays 3 per cent. on a capital expended of about 10,000*l.*; the London Labourers' Dwelling Society pays 5 per cent. on about 30,000*l.*, spent chiefly in renovating old buildings. As to that of the private owners, Mr. Hilliard receives from 6 to 7 per cent. on an outlay of about 14,000*l.*, and Mr. Newson is reported to have received a net 5½ per cent. on an outlay of 13,000*l.* or thereabouts.

I am aware in this paper I omit altogether any notice of cottage dwellings, both suburban and agricultural; but I should like to mention that the Metropolitan Association have an interesting experiment in suburban dwellings at Penge. I trust that some other member of the Institution may be found willing and more able than myself to deal with this question. It is by no means second in interest and importance to the subject considered in this paper; it also abounds with similar problems as to the difficulty of providing adequate accommodation for the humbler classes, at fairly remunerative rates.

With respect to the general results obtained from this paper, I trust they may be looked at as on the whole encouraging. With a total sum expended in the metropolis of about 650,000*l.*, housing approximately from 15,000 to 16,000 persons at moderate rents, giving an average return of 4½ per cent. on fifteen ascertained returns, with a death-rate in a great proportion of reported cases much below the average rate of mortality in the metropolis, and considerably below the rate in the poorer districts taken singly, and with a rate of interest derivable not varying much from that receivable for freehold property elsewhere, I trust we may look to the future with hope.

SOCIETY OF BRITISH ARTISTS.

The forty-sixth exhibition of the Society of British Artists may be better, perhaps, than has been the case for some seasons past. A fortuitous combination of atoms,—some of the smallest contributions to be the most honourably acknowledged,—numbering 1,058 works, including water-colour drawings and sculptures, besides oil pictures; with sufficient of the pleasing, the clever, and the natural; make the collection a popular one, and lift it above the average level of its tide of prosperity. Even now, however, there is nothing to awaken a fresh interest in the existence of this old institution; very little to revive a past one. The better known of the members do but repeatedly repeat repetition, until their works have become like dissolving views,—views that they were formerly so well able to explain, that there are few among the new-comers to Suffolk-street likely to interfere with the recollection of their early impressions.

Mr. G. Cole's large landscape (9) "Evening," will scarcely be called an atom, or thought to be an atom too large; it conveys an idea of truthfulness, and is one of those ordinary scenes that a sunset effect would invest with extraordinary beauty. Carefully studied, and well painted throughout, it invites the criticism of a great number of appreciators, and will satisfy the most of them. Mr. A. J. Woolmer contrives some half a dozen of those perplexing combinations of paint, poetry, and power that for so many years gone by have made him conspicuous on these walls. They have less of paint, and less of poetry and power, than formerly to recommend them, but are still attractive. (23)

"Milton found Sleeping by two Ladies," is the avenue of an Italian garden, has a mysterious grace and harmony of colour to condense in some measure its shortcomings. At his best, Mr. Woolmer relies too much on his imagination, and often shows little respect even for probability; but, looking back at such of his works as may best illustrate his peculiarities of style, it is hard to refrain from wishing it were more easy to learn from them how ideal and reality might be made more compatible. The difficulty must be a real one, and never more apparent, or to be deplored, than at present, when matter-of-fact representation only is so insisted on, and, of course, persisted in, to the exclusion of anything else that would distinguish the artist from the mere painter. Mr. J. B. Pyne has but one picture (33), "Bay of Naples, from the Villa Rocca Romano, Nuova Strada," to recall his

many triumphs when dealing with similar themes; Mr. J. Tennant, several, notably (97) "Hillsborough," "The Lantern Rock Light-house, and Part of the Town and Harbour of Ilfracombe;" and Mr. A. Clint, in (231) "The Harbour of Little Hampton," with a gorgeous sunset illumination, to wit, and many another instance, proves himself to be as clever and productive as ever.

There are bold life-size figures, by Mr. F. Y. Hurlstone, of Spanish boys; an illustration of "Desdemona and Othello before the Senate" (128), by Mr. W. Salter; soft-eyed, speckle-complexioned "Kate Kearney" (50), and other unimagineable and unimpeachable beauties, by Mr. C. Baxter; a very plain, if not ugly, statement of Mr. J. J. Hill's notion of "Happiness" (475), that does not fairly represent him, or it; and a variety of engagements of Mr. E. J. Cobbett's favourite models as expressionless, motionless, motiveless, and cleanly washed as heretofore. "Absent Thoughts" (328) is the title of one, and might well describe all.

(55) "The First Time of Asking," by Mr. W. Hensley, introduces a would-be happy pair undergoing the severe ordeal denoted, and as they look as if but a slight modicum of happiness would content them, it would be gratuitously unkind to remark their awkwardness, the more especially as the ceremony is only interesting to themselves. (397) "Little Woman" is far better worth looking at, as she nurses the big, stiff baby, and seems to have the cares of a household on her back, though but a child herself; possibly she will never be "asked" in church, as is often the case with very kind housewifely elder sisters and aunts. (71) "The First Step," by Mr. Haynes King, though but a conventional rendering of a very often depicted incident, is very carefully and nicely presented in this case; the same may be said of a smaller interior (307), "A Highland Home;" but (556) "Granny," a single figure of the old lady who does duty in "The First Step" as antithesis, is a step beyond—a very excellent study, highly finished, with no display of manipulative dexterity.

Mr. T. Roberts has taken great pains with his "fancy portraits" of Richard III. to substantiate Horace Walpole's opinion that the king was nothing like so ugly as he has often been painted. Who is? But in spite of all the careful labour bestowed, the cleverly-drawn and well-painted figure racked by painful dreams, "The Night before Bosworth" (78) will scarcely be accepted as a true and correct likeness. The draperies, armour, and other accessories bear too modern an appearance; a more ideal treatment of the subject, or any such a one, would convey it far more really to apprehension than the best mechanical skill could ever do if confined—as it is here—to the representation of bare appropriated facts. Mr. Roberts is more successful in another "Ghost Story" (565), where he has had but to describe the reader of, and the listener to, the tale, not the awful relation of it, the terror caused—not the cause of the terror—this is a favourable specimen, proving how well he can paint. In a third picture, "After Waterloo" (526), suggested by an incident in "A Soldier's Fortune," by Mrs. Marsh, he intimates that he does not limit himself to a special dealing with one class of subject. A hero has lost a limb in the great battle, and with no means of his own to procure a substitute, is bedridden longer in consequence than he otherwise need have been, until his good genius intervenes and makes him the grim but gratifying present of "the most perfect of wooden legs." The workmanship of this picture is less satisfactory than in former instances, and consequently it falls short of being quite so good as it might easily have been made if a prevailing hardness and paintiness had been overcome; and Susanna, the little daughter, shown to have been more indebted to nature: she is not pretty here. "Left in Charge" (83), by Mr. J. Gow, the custodian being a dog big enough to take care of himself, and, no doubt, faithful enough to be intrusted with the safe keeping of a cradled infant and any amount of property comprised in this composition, which is a pleasant one to look at, by reason of its subdued colouring, is one proof that Mr. Gow is a gain to the society; (347), "Quiet Thoughts," with the lady taking care of baby herself, is another. More ambitions, if less pleasing, the illustration of Goldsmith's readiness to oblige a fellow-lodger with the historical "Pot of Coals" (538), would seem to forestall further distinction.

There are not many of the exhibits here that can at all compete with those of Mr. E. C. Barnes:

"The Tease" (155), a young lady, in Middle Age dress, and with very old young proclivities, worrying the only specimen of the parrot-tribe she happens to have near her at the time—a cockatoo; and (572), the same handsome fair-haired heroine "Dissatisfied" with a more modern costume, with some show of excuse, for she does not look quite so well in it; besides having to divide the honour of attractiveness with a brunette who has equal claims to it; are signalled by extraordinary force and brilliancy, apparently obtained by easy means. Want of refinement is the chief objection to these productions, though it arises more from an excess of power that should be restrained, rather than positive vulgarity, and it is to be wished very much that the same remark were applicable more generally.

Mr. G. Pope's delicate Nunn, who typifies "Rest" (199), owes to her quiet nonobtrusive character an attention and respect not to be obtained by the louder demands of the "come and look at me" class of beauties that abound here; and Mr. A. Patten's contemplative gilt—(236), "Pancies, that's for Thoughts,"—when contrasted with, even (165), "The Blonde," by the same, though the latter be more clever in technical merit, and not at all exemplary in wider comparison, will sufficiently indicate the value of modesty and refinement as opposed to meretriciousness.

(313) "His Lordship," by Mr. P. B. Morris, is rather a plagiarism, and a weak one—a noble infant, surrounded by an adulatory crowd of menials. "Glory" (613), by the same—a wounded soldier, by the side of his dead charger, watching the sun rise—is better in executive quality, if even less novel in design. Mr. A. B. Houghton's "Playmates" (62), which may also be traced to a precedent, but he is sufficiently clever and original to defy such an imputation; Mr. Croft's Border-rider, "The Fugitive" (103); Mr. A. Provis's elaborate "Interior of a Welsh Farmhouse" (135); Mr. W. H. Weatherhead's "Arah Storekeeper" (136), though but an Academy study, and his "Lovelorn Damsel," in sixteenth-century costume, taking a solitary stroll (235) at the hour

"When from the boughs
The nightingale's high note is heard.
And gentle winds and waters near
Make music to the lonely ear,"

very nice in tone; Mr. V. W. Bromley's painter renovating an old dial, "Repairing the Ravages of Time" (300), a slight but characteristic trifle, though more completely satisfactory than his more finished warder jocularly forbidding the supply of provisions brought by a hard-featured handmaid for the solace of some favoured prisoner, since it is "Against Orders" (545), and "The End of a most Beautiful Tale" (578), by Mr. P. Hoyoll, are a fair sample of what the collection can boast in abundance. Mr. D. Pasmore's "Cavalier and Lady-love playing at Cards, with Hearts for Trumps," is distinguished by the flickering brightness common to him (45), but is rather more carefully made out in parts than usual; Mr. L. Smythe's fisherboy "Come Ashore" (51); Mr. E. Roberts's old dame who has ostensibly taken something out of a teacup that disagrees with her, and is consequently "Poorly" (196); Mr. Collinson's very highly elaborated "Irish Flower-girl" (225); Mr. T. J. Watson's broadly painted but sufficiently finished interior, with "Ransacking the old Cabinet" for incident (269); Mr. W. Bromley's fishman "Bothered" (420); Mr. T. Heesly's little lady her own hair-dresser,—"I won't come Smooth" (441); Mr. A. B. Donaldson's sombre and Venetian-looking "Students of the Collegio di Propaganda Fide at their Devotions," though rather too black, it may be said, without invidious allusion to one in particular who is so by nature (504); Mr. J. Ritchie's traveller "Fallen amongst Thieves," very tall thieves, with small heads,—depredators in open daylight (510); Mr. J. Hayllar's admirably-painted pedestrian wearing the Suffolk Conservative colour, "True Blue" (606); and Mr. J. K. Thomson's chilled victim to heart-pain apostrophising the "Cold Rivulet," and illustrating Tennyson, are selected out of more from having been more particularly observed. Mr. R. Buckner's Italian peasants at "Roadside Prayer" (626), somewhat old-fashioned and conventional, is agreeable by contrast where so much has been accepted hap-hazard as worthy of depiction. A study of a "Roman Beggar-girl," by the same (308), is very mannered, but to be classed with the better of the cognate examples present. To

those belong Mr. Barnes's "Spanish Girl" (4), though not quite pleasant in complexion and expression; Mr. J. Harwood's "Josephine" (27), that reminds one of Rothwell; Mr. A. Ludovico's unsophisticated little German peasant leaving home for church, "Sunday Morning—Bohemia" (37),—she is individualised as well as natural; and Mrs. Anderson's big "Fairy" (239), with golden hair and pomade that appeared to be a very efficacious "Catch 'em alive oh!" for butterflies, they clatter so thickly to enwrap her head. This is individualised, too, and as well not natural as it is the nature of fairies to be, but a mixture of "most beautiful things," according to receipt, and very well mixed and made out they are.

The multiplicity of the landscapes renders it too onerous a task to say more of them than to acknowledge their general merit, which is, on the average, high. Mr. J. P. Pettit's "Aiguille de Dru, Valley of Chamounix" (117), after the first fall of snow, October 15th, 1868, almost too faithfully copied to look true, for the influence of the weather destroys all perspective to the effect of destroying effect,—the chalets, figures, and cattle, whether far off or near, are equally visible, and look like toys surrounded by such an overwhelming mass of snow,—is one of the leaders, one of the most remarkable of the remarkable; and "The Fern Harvest," of quite an opposite character (168), with its misty, warm, autumnal season to describe in sky and on common, has enabled Mr. H. Moore to do wonders in his way. Mr. C. N. Hemy has a very graphic view of "The Thames, below Bridge" (191); and Mr. J. Danby a poetical adaptation of sea, rocks, and sunset-sky—"Algerine Pirates" (294).

The collection of water-colour drawings is quite a feature—an exhibition apart. With nothing calculated to astonish from particular excellence, there are many items to repay a search for what may be best amongst them, or considered best, for there is variety enough to minister to nearly all tastes; as "A View in Highgate Wood," by Mr. G. Lucas (958), very bright and sunny;—Do all Londoners know how soon they may get into the country?—Mr. E. J. Skiff's Britany washerwomen "At the Fountain" (959); "The Backwater," by Mr. W. W. Gosling (964); "The Old Well in the Campo Zanipolo, Venice" (990), very carefully, but somewhat too manneredly drawn, for the figures want vitality, and the colouring is too pure and pretty to look anything but colour, by Mr. J. Bouvier; "The Victor's Wreath," in preparation by a stout, handsome Roman wife, or daughter (1003), very well studied with regard to drawing and accessories, by Mr. A. Innes; Mr. E. Hall's little bit of truth, "An Autumn Nook" (1047); and Mrs. Backhouse's peasant child, "Happy as a Queen" (1058), will help to prove.

"The Blackpool on the Lledr, North Wales" (645), by Mr. J. J. Curnock; Mr. T. F. Wainwright's exquisite sheep, "By the Sea" (669); Miss A. Claxton's ontcast, who is sorry she is, like Topsy, "so drefful wicked" (681), though morbidly sensational, and exaggerated in every respect; Mr. J. Hardy's juvenile ristics "After the Butterfly" (682); "Fond Recollections," by Mr. J. C. Playfair (719); Miss S. S. Warren's "Beech-hill Common, Hants," with its quiet, rich evening effect" (736); "The Thames, near Booney, by Mr. W. W. Gosling again; and Mr. E. Taylor's hewching young sorceress (779), "The Witch," she is, are of better quality still; whilst Mr. H. Hardy's dogs, and the force he procures from the use of pure water-colour as exemplified in the workmanship of (773) "The Keeper's Boy," give to his drawing quite an exceptional character. We will say one word too for some sketches by Mr. Burrell.

Dedication Ceremony of Freemasons' Hall, London.—On Wednesday afternoon an imposing Masonic ceremony was performed in the new grand hall in Great Queen-street, by the Most Worshipful the Grand Master of English Masons, the Earl of Zetland, in the presence of the largest and most distinguished body of the craft ever before assembled. The ceremony was that of the dedication to the Order of Ancient Free and Accepted Masons of England of the new grand hall and offices, on the site of those which were pulled down some few years since. The Grand Master, when seated on his throne, was surrounded by upwards of 1,000 officers of lodges from all parts of the United Kingdom.

THE SCULPTURE AT THE UNIVERSITY OF LONDON, BURLINGTON GARDENS.

THE new building in Burlington-gardens, Regent-street, now fast proceeding under the direction of Mr. James Pennethorne, architect, already shows a very large amount of the sculpture with which the front is to be formed. Our

readers will, doubtless, be glad to have the following list of the statues, and of the artists by whom these have been executed. We would suggest before it be too late for easy remedy that a little further attention should be given to the figures at the extreme angles east and west, which as seen from various positions have the effect of reclining towards the south:—

Sculptors.	Position.	Subject.
Joseph Durham, A.R.A.	Four seated figures on portico. (Not yet up.)	Bentham, Milton, Newton, Hareley, Plato, Alcmeades, Justinian, Cicero, Galen, Aristotle, Locke, Bacon.
W. F. Woodington	Three standing figures on roof line of west half of centre portion.	Men of ancient times eminent in various departments of study included in the university course.
J. S. Westmacott	Three figures on east half of ditto.	Distinguished representatives of modern knowledge, half Britons and half foreigners.
William Theed	Three standing figures in niches of west wing.	Hume, Hunter, Sir H. Davy, Galileo, La Place, Goethe.
Patrick McDowell, R.A.	Three figures on east wing.	Distinguished representatives of modern knowledge, half Britons and half foreigners.
Mathew Noble	Three standing figures on roof line of west wing.	
E. W. Wyon	Three standing figures on roof line of east wing.	

THE DISCOVERIES OF ROMAN REMAINS AT BATH.

DISCOVERIES are still being made of Roman remains during the excavations on the site of the old White Hart. The remains of the Roman wall, discovered south of the temple platform when the foundations of the south wing of the hotel were put in, have been traced right across Stall-street, and left passing under the foundation of the Pump-room. A week or two ago there was found a fine fragment of the side cornice of the Great Temple; part of the trough of rain-water gutter remains on the top of the stone, as well as one-half of the spiritedly carved lion's head, which served to discharge the water at various distances along the cornice. The carving is bold and effective, and consists of an egg and tongue, formed of a sort of reversed fleur-de-lis, tied by a band in the centre; the half of each coming together forms the egg, and the point of flower the tongue. Beneath was a head mould formed of a running scroll. Part of the front cornice of the temple below the pediment has also turned up; it slightly differs in its design, and has enriched antivolts, and the scroll mould at the bottom is replaced by one of real pattern. Many other fragments of the massive wall stones were found, and one retained very perfectly the slots for large metal cramps used to join the stones of the wall, no mortar having been used; these must have been of lead or bronze, as no stain-marks of rust could be seen. One large mass took the united strength of 3 or 4 men to roll out of its bed; the wrought faces seemed to be formed by very correct sawing, requiring no alteration. The section of the soil at the site of the Great Temple supports the presumption that this building must have stood perfect or nearly so, less roof, as late as somewhere about 1070. In the angles of the carving are remains of the red paint used by the Romans to decorate or preserve the stone.

nuisances. Now, it occurs to me that the police might with the greatest propriety and usefulness be employed to aid in the enforcement of the sanitary laws.* I speak particularly of the smaller borough and county towns, and of the rural districts, where happily the duties of the police are very nearly a sinecure, and where the officers appointed for sanitary work are few and far between. I am quite prepared to understand the objection there might be raised to the intrusion of the police into and about our dwellings on the pretence of having "an eye to a drain," or with a view more clearly to apprehend a savoury or unsavoury smell; but this is not what is intended. Practically, take an inland town, with its thirty or forty police and its one nuisance inspector. There are many cases where one inspector only is allotted to towns having a population of 60,000 to 80,000 souls, and where the police go their weary and monotonous rounds day by day, in search of that thief who may be lurking in secret places to steal our goods and chattels, whilst the sanitary officer contends in vain against a hundred thievish causes which in open day steal our very lives and those of our children. Sixty intelligent and sharp-witted men are set to catch one Jack Frig, whilst one man alone has to detect and punish the wholesale hordes of malaria and disease.

I would select, say, half a dozen of the most intelligent and deserving officers, give them a trifling increase of pay, put them into the sanitary department of the town's police, mark their preference by a prominent S in real silver lace on the left arm, and having trained them with a few practical rules, send them out upon their double mission of preservers of the public peace (so seldom broken) and preservers of the public health (so generally violated). The rural police in the counties would be especially serviceable in this respect, seeing that in most of the out-of-the-way districts there is no organized sanitary work. JOSEPH BRIERLEY.

THE (ALBERT) MUSEUM, SOUTH KENSINGTON.

BEFORE continuing my "Notes," I must just say that I have read with much interest the suggestion of "Bonum Nomen" in last week's *Builder* respecting a name for the above Museum. I think, if London did not already possess,—as he himself remarks,—"the 'National Gallery' in Trafalgar-square" and "the 'British Museum' in Bloomsbury," his notion of calling the Museum at South Kensington "the National Museum" would be an excellent idea; but having the former, I fear sad confusion would arise with foreigners and country-folks between the *National Gallery* and the *National Museum*; and having the latter, I—being a staunch Britisher—cannot help considering the *British Museum* the national one. However, "Bonum Nomen" seems as desirous as myself to find a suitable appellation for our most excellent but nameless museum, and therefore I cordially shake hands—mentally—with my fellow-worker in the good cause.

* In the metropolis they are so.—Ed.

Meanwhile, pending the selection of a name, I may still be allowed to use my own pet cognomen, modestly placing it, as I have hitherto done, parenthetically, to show that as yet it only appears on surfface; though of course I think it an excellent designation, and naturally hope it may some day take its stand there of right. And now to return to my own especial work.

Although I have already particularized so many beautiful art-objects belonging to Mr. Boreford Hope on loan at the Museum, those that remain unnoticed in these "Notes" are still very numerous. Immediately to the right on entering, and below the large Spanish altarpiece painted with the legendary history of St. George, and brought from a destroyed church at Valencia, date fifteenth century, stands a glass case containing the following rare and costly articles:—a boat-shaped bowl cut out of a carbuncle, about 2½ in. long by 2 in. wide; a sword-hilt formed of the largest known aquamarine stone, chased gold handle, terminating at each end in a lion's head, the whole mounted in gold, and set with precious stones (it formerly belonged to Joachim Murat, king of Naples); an enormous pearl, the largest known, darkened almost to black at one end, and slightly resembling a clenched hand (it is mounted, at the wrist end, with a crown set with diamonds); a large Hungarian opal, very rich in varied colours, set in a square hilt enamel frame; a vinaigrette, bottle-shaped, carved out of an emerald, with cover of the same; a ring set with a wonderful sapphire, called "Le saphir merveilleux," of such a rich blue, and bordered with small diamonds; a plain gold ring, with a large diamond cut in the shape of a cross, which looks exactly as if the diamond were perforated with the cross form; an antique cameo sardonix ring, the under stratum white, the dark layer cut in high relief with bearded mask, having ruby eyes; a gold ring, formerly belonging to Pope Gregory XIII. and Pope Pius VI., having a boy's head in high relief cut in a jacinth, and set round with eight pearls, that are fastened on by a gold wire, or nail, pierced sideways through each; and the Mexican sun-opal, carved with the head of Apollo—the sun, that is to say—set in enamelled and gold, or gilt, frame, with rays, like flames, surrounding.

The hock of rock-crystal enclosing a drop of water, and the three pieces of amber, the one enclosing a small fish, and the others a fly and various insects, are all extremely interesting to see; as are the twenty-three specimens of double and single-eyed Oriental agates, mounted as rings, and the twenty-four specimens of Oriental striated agate, mocha stones and pelhies, bearing most a rangely natural representations of the human face and other objects. Mr. J. Tennant likewise shows nineteen specimens of mocha stones from India that are very beautiful and very interesting. The antique dark sand cameo bearing the head of a Roman emperor, on a white under stratum, belongs to Mr. Boreford Hope, as do the jacinth cameo hnt in high relief, of Cleopatra, fifteenth-century work; the massive gold ring with emerald intaglio head of Jupiter; and the small cross formed of six rare green brilliant diamonds set round with small white stones. A rich collection of precious stones, mounted as rings, adjoining the above, was bequeathed by the Rev. Chauncey Hare Townshend; the large rubies set round with diamonds, and the full-coloured and large turquoises, also diamond-framed, are especially beautiful.

Turning sharply round we find ourselves before the high glass case containing "the collection of miniatures, snuff-boxes, watches, jade and crystal ornaments, porcelain and decorative plate, lent by Lord Chesham." The title is sufficient warning of the task undertaken by any person who shall attempt to give even a superficial account of the various objects. The miniatures alone are forty-nine in number; Van Dyck's handsome young face stands bravely out from its companions, and first attracts the eye; an oil portrait of a gentleman in large ruff and embroidered coat is lifelike, and impressive from its calmness; there are two miniatures of Cromwell, and if both are true, the difference in them makes one feel how much more intellectual the face became with age and deeper matter for grave thought; there are also two of Louis XIV., of which the one said to be by Petitot is much the less refined in its expression; the costume of the neck-gear in the other, with the blue riband across the breast,—namely, necktie with long full ends of lace hanging down over a

A SANITARY POLICE.

HOME-BOUND during two or three days as an invalid, I happened to turn for an hour through an old volume of our ever-fresh and inimitable friend Punch. In the volume for the latter half of the year 1848, there occurs a most humorous reference to what Mr. Punch calls "A Sanitary Police," and beneath the guise of his laughter-enthralling jokes there is an idea so excellent, and a suggestion so palpable, that it is almost a wonder that it has lain unappropriated for twenty-one long years. Take a sample of the humour:—

"We should, however, suggest that to facilitate the arrangements of the General Board of Health a sanitary police force should be at once organized. This corps might be empowered to order the stagnant pool to move on, and in case of unlawful assemblies of large vegetable bodies, the sanitary policeman should have instructions to take them up at once without any other warrant." Again—"Large crowds of persons in small houses or single rooms might be declared illegal, and power should be given to the sanitary police to call upon them to disperse, while the law of arrest should at once be put in force against anything in the shape of a pestilential vapour."

Thus and thus does Mr. Punch, in 1848, raise his voice and his baton against prevailing

wide bow of red ribbon,—is picturesque, and would be worth reviving in these days of innovation on the too-long neglected and ugly costume of our modern heaux. There is very careful work in the miniature, painted in oil on jasper, of an elderly head, almost bald, the face bearing a straight rough moustache and pointed beard, and below, a square lace-edged collar; next comes the pretty likeness of Louis XV. in youth; a small oval engraving on mother-of-pearl of a naval engagement is careful and clever; and the oval miniature in oil of a lady in a large high lace ruff, amongst the folds of which the face only is visible, reminds one of Fitzgerald's fascinating fairy scenes, wherein the tiny beings are all dressed in flower-petal and leaves.

Of snuff-boxes, the most notable are an octagonal flat gold box, with painted enamel portrait of the Dauphin of France, in filigree border; a basket-shaped box of two pieces of lapis-lazuli mounted in chased gold; a square gold box, chased with "rooccoo" scrolls, set with diamonds, and having slabs of moss-agate on top and sides, and a miniature of a gentleman inside the lid; a gold box, cover inlaid with slab of bloodstone; another, with slabs of Labrador spar, mottled green brown and white; a red sardonyx basket-shaped box; an oval agate box marked with dark-brown spots; a square Oriental agate box of a light-brown colour; an oval one formed of two slabs of striped red and drab onyx; an oval moss-agate box; an oval gold box, with pieces of amber at top and bottom; a pale amber box in form of a hook, mounted in silver; an Oriental agate egg-shaped box; a red Oriental agate box, pomiform, with gold rim and hinge; a square bloodstone box, gold rim and hinge; a square amethyst-matrix box, on the lid a bull-dog couchant, diamond eyes and collar; a square gold box, inlaid with insects, flowers, and leaves in translucent enamel; an octagonal gold *bonbonnière*, covered with green translucent enamel and white flowers; an Oriental-work octagonal flat gold patch-box, the cover chased with Cupids and scrolls, eighteenth century; a circular gold *bonbonnière*, with raised beautifully-modelled flowers and leaves, enamelled in natural colours on green ground, very rich; and a circular gold and blue enamel *bonbonnière*, with dome-shaped slabs of agate top and bottom.

Very charming are the gold and purple-enamel oval toothpick-case, shuttle, and large clasp, the latter having hair, under glass surrounded with large pearls, in the centre; the two former bearing a cipher of diamonds, the toothpick-case being also set round with diamonds. There is a fluted oval bowl hollowed out of rock-crystal, the gold rim set with emeralds and rubies, and having a crystal cover to match; there are two oval crystal boxes, with lid, silver rim, and hinge; a rich one-handed bowl of root-of-amethyst, with red jasper stripes; four fine cups of clear pale jade, two with double handles, one with dragon handle, and one covered with over-lapping leaves; six cups and saucers of Oriental white agate, no handles, and various other agate cups and bowls. An oval basket-shaped amber box, with gold hinge and lid, the lid unfortunately broken, is very clear, and rich, and dark in colour; an amber cup, on turned stem, is also of dark amber; and there are three cane-handles of the pale. One bowl of red agate is spoiled by its stem, a frightful seated Hindu deity of gold, with necklace and ear-rings set with jewels,—possibly rare and valuable, but still very ugly; and a mild version of the above comment must apply to the two Oriental agate covered cups, composed of several pieces of varied form, built up one above another; and the lofty bloodstone cup, striped with red and yellow, and having a long thick stem and foot. One smaller Oriental agate cup on a foot white with brown stripes, has a thick fleshy-looking stem, that makes it wonderfully like a sea-anemone just beginning to think of stretching out its tentacles. I cannot see any beauty in the last-named object, nor yet in the alabaster column surmounted by an agate egg-shaped ornament, and having an agate base; nor in the bloodstone handle mounted at one end with a pointed piece of cornelian; nor the agate handle mounted with a piece of sard. The Oriental agate hemispherical bowl, with pierced base of enamelled green and white leaves, is good; also a small white oval agate bowl, with projecting handle at each end. The moss-agate teapot and cover, with silver rims, is quaint and rich; and there are besides an oval jasper bowl carved with cherubs' heads, on a stem and foot mounted with gold rim and enamelled flowers; an Oriental agate cup on silver stem of three helmeted

terminal figures, the foot chased with recumbent figures, and borders of sixteenth-century work; a crystal boat-shaped tazza on foot, with handle in form of a dragon's head, with enamelled wings and breast, and enamelled border and foot; a crystal bottle, pyriform, carved with cherubs' heads and festoons; a shell-shaped bloodstone howl, mounted with silver-gilt handles and foot, and a pretty little white Oriental agate scent-bottle with pointed stopper.

I cannot admire the three *Sèvres* vases of blue-du-roi, covered with gold spots; but the *Sèvres* easel-stand and cover of *gros-hien*, mounted in ormolu, with twisted scroll-handles, and chased square foot and marble plinth, is very elegant and of most careful workmanship. The three Chinese porcelain globular vases of celadon, mounted in ormolu, are handsome; as is the gourd-shaped *Sèvres* vase and cover, painted with a marine subject, by Morin, and groups of flowers. This vase was apparently intended to be mounted on an ormolu base, judging from the unshapely band of white, which is now its sole foot, and which is an eyesore, detracting from its otherwise rich and finished appearance.

A small German sun-dial, with compass, level, and indexes to show the hour and minute of the day, in original leather case, is curious. There are seven rich watches, one of which has a bloodstone case set with diamonds, and another a case of Oriental agate; two gold anchors, inscribed respectively, "Espérance—Keppel," and "Keppel—Victory," and a gold onseigne pierced and enamelled, and in the centre a white cross and blue knot, with "High Borlace" inscribed below: date 1759.

A *Sèvres* calaret of six pieces, covered with blue trellis-pattern enclosing roses on gold-spotted ground, and painted with medallions of pastoral emblems, is not particularly beautiful as to form. The Chelsea porcelain tea-service, gold indicated pattern on white ground, and painted with blue forget-me-nots, is interesting from the fact that some of the pieces are of "Crown-Derby," made to match the others, and marked with the crown and Italian capital D in puce colour, two crossed sticks, with three dots between each two ends, separating the crown and the D.

A toilet service of silver gilt, with white silver plaques of classical subjects in relief, and consisting of eighteen pieces large and small, is costly but not effective: though this may arise from the manner in which it has become tarnished; it is in the German style and dates from the end of the seventeenth century. The two Chinese melon-shaped silver canisters, chased with birds and flowers in relief, are much more satisfactory on account of the vigour and sharpness of their execution.

ART-LOVER.

THE CARLTON ART AND INDUSTRIAL EXHIBITION, NEAR NOTTINGHAM.

THIS exhibition of art and general industry, which was opened on Monday, the 29th ult., by Earl Manservants, comprises a very respectable collection of articles of local industry, and a valuable selection of rare and costly articles calculated to please the eye, improve the taste, and elevate the class among whom the originator of the Exhibition, the Rev. O. W. Forester, rector of Godling, is labouring.

The following lines on the opening of the Exhibition were written by Lady John Manners, of Belvoir Castle:—

I.
Treasures of art, and toil, and thought,
From far and near, are hither brought;
Castle and homestead, cottage, hall
Have kindly answer'd to our call;
Jewels of industry they send,
Which here, as in one casket, blend.

II.
From rich and poor, from young and old,
These gems of toil we here behold:
They prove that powerful fairies dwell
With all who labour to excel;
Genius and industry their name,
They lead to happiness and fame.

III.
In ancient times, men used to say,
"My son, to labour is to pray."
The power who gives the artist skill—
The lesson Nature's wonders preach;
Encourage all, in every sphere,
To use their father's gifts aright.

IV.
May art's creations ever teach
The lesson Nature's wonders preach;
Encourage all, in every sphere,
In doing well to persevere,
And seek, in humble faith and love,
Light, life, and help from One above.

BUILDINGS FOR WORKMEN, DEPTFORD.

ON Tuesday, the 6th, the new group of buildings for workmen, consisting of a mission hall, to hold 350; Institute library and reading-room, with lodge and soup kitchen, were opened at Deptford, Lord Sydney presiding, supported by the Bishop of Colombo (in the absence of the Bishop of Rochester from illness), and others. The buildings were erected mainly by the freeholder of a large estate there, Mr. James J. S. Lucas, who also gave the site at a cost of 1,800*l.* They were built by Mr. Saunders, under the designs of Mr. Joseph Peacock, architect, and are attached to St. John's Church, Lewisham-road, under the guidance of the Vicar, the Rev. C. F. S. Money.

THE SEWAGE QUESTION AT BRIGHTON AND BOLTON.

Brighton.—The town council have had a discussion on the outfall question, upon a report from the local works committee, who informed the council that they had had under consideration the desirability of constructing a new outfall for sewage opposite the west end of the King's-road, at the joint expense of the town council and the Brunswick-square and terraco commissioners, in lieu of the two present outfalls in that neighbourhood. The borough surveyor had submitted a report upon the existing outfall for the Brighton western district, which, he stated, was in a very dilapidated condition, and recommended that a new outfall be constructed and extended to a distance of 2,000 ft. from the shore, where the depth of water was about 14 ft. at low water and 3½ ft. at high water, with a strong current east and west. This outfall (3 ft. in diameter) would be sufficient to carry away the sewage of the Brunswick-square district, in addition to the Brighton western district, if, at any future time, the two should be combined. The works committee passed no resolution upon this recommendation, but reported that they hoped to be in a position to state to the council, at a meeting on the 21st of April, what course they would recommend to be adopted. The report of the works committee (which embodied the surveyor's report and recommendation) was, on the formal motion of Mr. Fahian, chairman of the committee, ordered to be entered on the minutes of the council's proceedings. Alderman Smithers then said if Mr. Fahian took no further steps in the matter, he should. He considered the report a most important one; and thought the council ought not to postpone this matter. Therefore he moved that the report now presented be approved and adopted, and that the works committee be requested to carry out the same as quickly as possible. After some discussion the motion was carried by a majority of 26 against 13.

Bolton.—Mr. Arnold Taylor, of the Local Government Act Department, has had an interview with the street committee of the Bolton corporation. Two schemes had been before them for some time for the interception of the sewage of the borough,—one by the borough engineer, costing about 12,000*l.*, and one by Mr. Councillor Lomax, surveyor, to cost about 5,000*l.* Complaints having been made to the Home-office that nothing was being done in the matter, Mr. Tom Taylor has been pressing the question upon the corporation, who have now adopted Mr. Lomax's scheme, with slight modifications.

ACCIDENTS.

Fall of a Bridge, Saltburn-by-the-Sea.—Messrs. Hopkins, Gilkes, & Co., of Middlesbrough, are building an iron bridge of 700 ft. in length across the glen, along which the Skelton heck runs at Saltburn-by-the-Sea, for Mr. J. T. Wharton, of Skelton Castle. The work has been in hand some time, and the whole of the piers—eight in number—which consist of cast-iron columns, were finished some time ago, and four of the girders, which are about 85 ft. in length, are fixed, and the flooring completed. On Monday a strong force of workmen was employed fixing a pair of tiers upon two of the piers, which are eight tiers in height, reaching about 130 ft. from the ground. Everything appeared to be progressing favourably, when suddenly one of the girders slipped from its holding upon the pier, swung to and fro, and then struck against the other pier, smashing the two girders and one of the piers absolutely into scrap iron. Three men were unfortunately killed.

LIVERPOOL ARCHITECTURAL SOCIETY.

At the meeting of this Society on the 10th ult. (Mr. W. H. Hay, vice-president, in the chair), Mr. R. Jähns, late of Berlin, read a paper under the title "Carl Friedrich Schinkel," being an endeavour to define the place and influence of Schinkel in connection with the revival of the Greek spirit in art. He claimed for Schinkel the character of a "prophet" in art, as being one of those who perceived the real origin and tendency of the movements of thought in his day, and who entered on his artistic career upon certain fixed and definite philosophical principles. This position he illustrated by quotations from the writings of the celebrated Berlin classicist, showing that his object and intention were not to revive the Greek style in its ancient forms, so much as to study its spirit and principles, and continue its historical development, instead of merely repeating the early history of classic art over again. The paper was illustrated by a great number of engravings and drawings of Schinkel's principal designs, both executed and unexecuted, including not only purely architectural design, but many beautiful sculptural designs for friezes and bas-reliefs, showing a complete knowledge of the difficulties of figure-drawing. Among the illustrations also were several lithographs of designs made for important scenes in the grand operas given at the Berlin theatre; some of which, intended for Mozart's "Zauberflöte" and Gluck's "Armida," were of a highly imaginative and original character. A lengthened discussion took place upon the principal points touched on in the paper.

INDUSTRIAL PARTNERSHIPS IN CABINET-MAKING.

SIR,—The letters in your journal on industrial partnerships in cabinet-making, show it is not widely known that the principle has been, for three years past, practically applied to the manufacture of furniture, a number of journeymen cabinet-makers having started a co-operative manufacturing society. They had long seen the tendency to deterioration in the quality and style of the work in the trade, fostered by the want of taste in the public, and the unfolding cry of the day, cheapness of production. To the mores tyro it must be evident that where cheapness is the one desideratum, excellence of work and taste in design are sure, to a certain degree, to be sacrificed. However, I think, that co-operative effort is a great step towards checking the evil; but more than that is required,—the technical education of the industrial workers, and a modification of their taste, by means of schools and easier access to the national and local museums,—so that, by having ever present to their minds an ideal standard of excellence, they will unconsciously strive to emulate it. The same means that tend to elevate the workmen will also gradually have that effect on public taste, and we shall then find that persons wishing to furnish will rather have an article thoroughly well made, even if severely simple in design, than a florid and showy piece of furniture, in which the joints will start, the dovetails loosen, and, in fact, become useless in three or four years. I do not subscribe to the idea that the required excellence of work cannot at present be attained by many of the London cabinet-makers; such as are attracted to our society, for instance, and who are capable of carrying out any design that might be submitted to them; and the remark applies to too many of our trade. Yet it must be borne in mind that the workman's efforts in that direction are stifled by his technical education of the industrial workers, and the employer is driven by the competition of his own class to procure a system by which those engaged in the trade suffer, and the underselling public obtain an article which may appear cheap, but in the end will prove anything but a bargain. Experience has confirmed my opinion that the general adoption of a system, such as we have successfully inaugurated, or the twin principle of industrial partnerships, as advocated by your correspondent, is necessary, before we can expect to realise that happy combination of taste and efficiency, together with the minimum cost of production, which is desired. EN. MEADS.

THE MÈN ROCK, OR TOLMÈN, RECENTLY DESTROYED.

You inserted in the Builder of April 10, p. 289, Mr. Layard's reply in the House of Commons to the question of Sir H. Verney respecting the preservation of our ancient monuments. The concluding sentences refer to "a monument of great national value," which, he stated, had recently been destroyed in a Vandalish manner. It may interest your readers to know that the relic of antiquity of which Mr. Layard spoke was the Mèn Rock or Tolmèn, in Western Cornwall, about 3½ miles south-west of Fenyryn; and I propose here to give a very brief outline of its appearance previous to its displacement into the quarry below. The Mèn Rock was one of those objects designated by Borlase as tolmèn or holid rocks. Two of a similar character occur in the island of St. Mary, Scilly, but these are not of such a curious formation as was the recently-displaced Tolmèn, in Constantine parish. Situated on a high ground, this latter rock was such a prominent and interesting feature, both from its

position and from its huge size, that it could not fail to be noticed even by a stranger to the locality. Borlase states that at least 750 tons of granite were contained in the stone itself, but I believe this estimation to be a rather exaggerated one, and a value probably nearer the truth would be about 500 tons. Even this is an immense weight to rest simply on the points of two rocks several feet apart; and, more remarkable still, beneath the huge stone there was an open passage large enough for a full-grown person to creep through without much difficulty or exertion. The length of the stone, which was oval in form, was about 33 ft., decreasing in width from 19 ft. in the middle to 18 ft. and 16 ft. at the north and south ends respectively. Its circumference measured approximately 100 ft. The passage beneath the stone was about 3 ft. square, and, through this, it has been customary among the ignorant and superstitious to pass men, women, and infants to cure them of lumbago and all spinal complaints. I have been unable to ascertain the exact date of the overthrow of the Mèn Rock; but it probably occurred some time during the second week in March last. The deed was done, I believe, without the knowledge of the proprietor of the ground, by a man to whom he had let the adjoining quarry, and to whose discredit and shame belongs, therefore, the blowing up by gunpowder of the bed of granite on which the stone lay.

When shall we have our pre-historic remains, all of which are so valuable in elucidating the history of an ancient race, preserved from further mutilation and destruction? The county of Cornwall is rich in these remains; but almost every year brings under our notice fresh acts of vandalism, which call for the strict inquiry of some learned and well-qualified body. The Ethnological Society of London has recently appointed a committee to look after our pre-historic monuments generally; why should not the local societies at Truro and Penzance, originally formed for the purpose of protecting the antiquarian relic of the county, follow the same good example? and, with the local influence and personal knowledge of their members, much might be done to prevent such an unpardonable act of vandalism, as the recent blowing up of the Mèn Rock, from again occurring. X. X.

MODERN BRICKLAYERS.

SIR,—I said "scamping times" advisedly, and your correspondent—their apologist—thinks they are hardly used thereby. I do not know whether any good would accrue if I were to stop now to enumerate the various practices in the building trade alone which are wrong and indefensible, and of modern date, but if he desires it, I shall have no objection to mention such as have come under my own observation. That facing bricks are cut down the middle lengthwise I know, having seen such recently, but it has been only in single course hands of costly material, and never with any pretence of veneering.

With the latter part of your correspondent's letter I would rather some third person—an architect—had dealt, and, with your permission, I will quote Mr. Garbett, in his recent communication to you on sundials (p. 184). He says, "I am obliged to say 'carpentry' not 'building,' because in no branch of building craft but the carpenter's do we any longer attempt more practical science than the builders of Timbuctoo." Such is the opinion of a living architect, and such is, I fear, the experience of many others, and it seems to offer a reason why bricklayers are seldom appointed to superintend brickwork. That there are honourable exceptions I am very sure, but they are rare, and it is deplorable to every thinking mind that an important body of men like the bricklayers should have lapsed into such a state as to produce so few men capable of conducting their own work in a proper manner. There is a very small percentage of the whole body who know enough of the practice of their art to set a nicely out and ganged arch, and fewer still who can set it out, especially if it be an elliptic or Gothic pointed, and one may inquire of a very, very large number, Why is a brick red?—or white? and get no answer; not to speak of such practical, every-day matters as the composition of mortars and cements, and their changes and behaviour. I am sorry to say all this; but it is true, and the statement of the fact may do good. I hope it will, for bricklaying has been a fine art

in past times, and may be as again, if we can get men to give their minds to it. At present, whoever acts about doing good brickwork has to educate his men up to it, and as there are always many unwilling to be taught, it is very up-hill work and discouraging. Why do not men, who now indulge in filthy talk at their work, who curse and swear at every sentence they utter, and which goes under the general term "scarfing grammar,"—why, I say, will not these men be persuaded to discuss their work and its connexions—geometry, geology, chemistry, colour, &c.—thus making themselves masters of their business, and able to undertake anything that may be expected of them. When will the trade societies become the successors to the old trade guilds, and require every man to undergo a theoretical and practical examination before he imposes himself upon the public as a tradesman? I must confess I like good work; and wish to see every workman a good workman; but as long as we pay all men alike, whether they be good, bad, or indifferent, and allow any additional wage offered to the good workman to be characterized as "blood money," we cannot admit a very powerful incentive to improvement, and so long will our trade, I fear, remain in the very unsatisfactory state in which it now is. E. G.

HAVE CHURCHES OF EVERY DENOMINATION A RIGHT TO USE BELLS?

In a paragraph, "The Bell-ringing of England," very lately published, occurs the following statement:—

"It is not generally known that the use of bells in churches and chapels is restricted to those of the Establishment; so that Dissenting bodies are not allowed their use in England, and the same law is applicable in Scotland."

Now, in order to show that this is a mistake on the part of the writer of the paragraph, I subjoin an extract from a judgment of Lord Chief Justice Jervis in the case of Soltan v. De Held, relating to the use of bells by a Roman Catholic community in such a manner as was alleged to be a nuisance, which was tried at the Croydon Assizes on the 13th, and reported in the Times of the 14th of August, 1851:—

"First, with regard to the right of using bells at all. By the common law, churches of every denomination had a full right to use bells, and it was a vulgar error to suppose that there was any distinction at the present time in this respect. At the same time, those bells might undoubtedly be made use of in such a manner as to create a nuisance; and in that case a Protestant church and a Roman Catholic one were equally liable."

"He would now tell them what, in his opinion, constituted a nuisance. The mere fact of ringing bells so many times in the day did not in itself constitute a nuisance—the nuisance must be of an enduring and substantial character, not such as would give offence and annoyance to a nervous mind, but which was calculated to cause permanent inconvenience and disturbance to men of ordinary mind and nerves."

The jury would say whether the evidence satisfied them of this in the present case."

I may add that the jury gave a verdict for the plaintiff—damages, 40s.

Upon the application of the learned counsel, his lordship said he thought it was a case in which he ought to certify. THOMAS WALESBY.

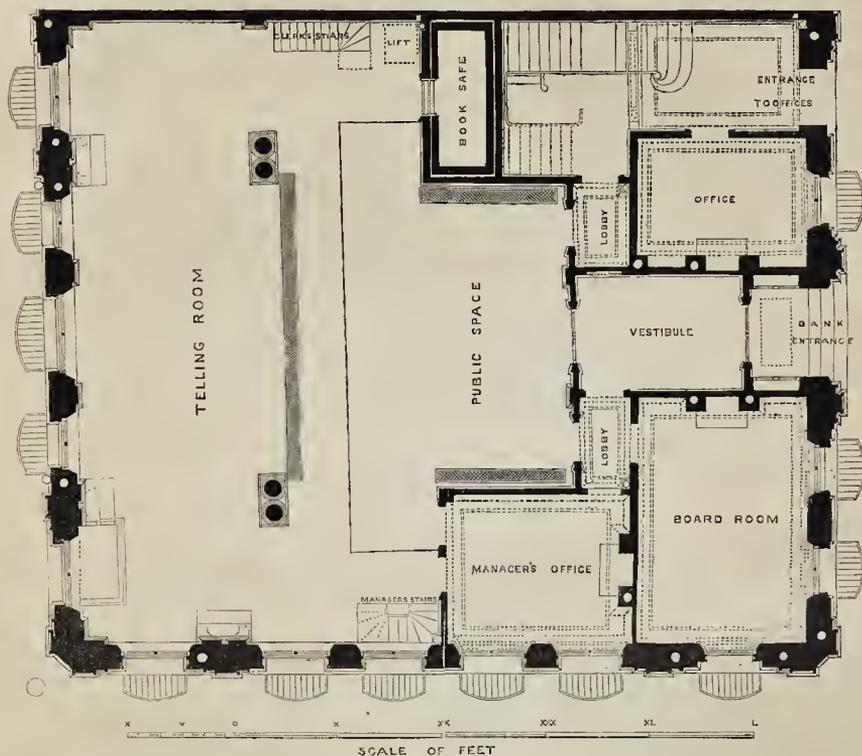

BRECON COUNTY GAOL COMPETITION.

THE designs sent in to the clerk of the peace for the above were six in number, and were opened in the presence of the committee of visiting magistrates on the 6th of March ult. After examinations, the committee recommended the design of Mr. Thomas F. Fillary, of 27, Leadenhall-street, London, as possessing marked advantages in its general details and arrangements over the others, to the Court of Quarter Sessions, which was held on the 6th inst., when their selection was finally endorsed, by vote of the whole court in favour of its adoption, and that it be carried out, after the publishing of the necessary notices, &c., in the local papers. The following were the estimates of the competitors, viz.:

Table with 2 columns: Name and Estimate. Mr. Lawrence, of Newport, Monmouthshire, £6,500. Mr. Fillary, London, 6,300. Mr. C. J. Phipps, F.S.A., 28, Mecklenburgh-square, London, 6,000. Mr. Nicholson, of Hereford, about 5,000. Mr. Williams, County Surveyor, Brecon, about 5,000. Mr. Sutton, Bromley Hall, County Surveyor, Nottingham, did not specify the amount in his report on his design.

Mr. Fillary's estimate will be considerably reduced by making use of the native stone externally, instead of impervious brick, as shown in his drawings and plan.

THE ALLIANCE BANK, LIVERPOOL.

Plan of Principal Floor.

THE ALLIANCE BANK, LIVERPOOL.

AN important building has just now been erected in Castle-street, Liverpool, for the purposes of the Alliance Bank, formerly carried on in Brown's Buildings.

The site upon which the building has been erected is conspicuous, and there is reason for supposing that it is immediately contiguous to the ground upon which the famous old Castle once reared its head. The building, which covers 525 superficial yards of ground, has three elevations, the principal entrance front being towards Castle-street, the other two fronts being to Derby-square and Lower Castle-street respectively. The whole of these fronts and the ornamental chimney-shafts are executed in stone of a light cream colour, from the Cefu quarries, near Knahon.

The entrance to the bank occupies a central position in the Castle-street front; and, to give it importance and to distinguish it from the entrance to the offices, which is also in this front, it has been made a prominent feature in the design. The style of architecture adopted is Italian, of the Venetian type.

The interior of the building has been finished in a substantial manner. The public room of the bank is handsomely fitted up. A spacious vestibule intervenes between the street and the public room, fitted at each end with folding-doors of oak, glazed with ornamental glass, to avoid draughts. Passing through the second pair of doors, the visitor stands immediately under a large dome, from which and the eight windows ample light is obtained in all parts of the room.

The side walls are divided into bays by pilasters of Devonshire marble, and panelled with detached columns of marble supporting the main ceiling beams. The bases and carved capitals to these columns and pilasters and the dressings to the various doors are of stone. An enriched impost band and frieze, ornamented with festoons of fruit and flowers, are continued

entirely round the walls, the space between them being filled in with panelling. The soffits of the main ceiling beams are finished with panelling, the ceiling itself is also divided in panels, and decorated. The dome is an important feature in the composition. The walls and ceilings have been painted in oil of subdued tints, gliding being introduced to obtain richness of effect. The floors of the vestibule and public space in front of the counter are laid with tiles; the floor behind the counter is of oak. The counter, enclosing screens and other fittings in the public room, are of Spanish mahogany, designed to be in character with the building. The board-room, and a private office for the manager of the bank, Mr. James Beckett, adjoin the public room.

The offices erected over the Bank are entered, as before stated, from Castle-street, the entrance-hall being spacious and well-lighted. From this hall access is obtained to the various floors—three in number—by a wide staircase of Hopton Wood stone. The walls of the staircase and entrance-hall are finished in Keene's cement, divided into panels, which will be painted in tints. Four rooms are provided as a mezzanine floor.

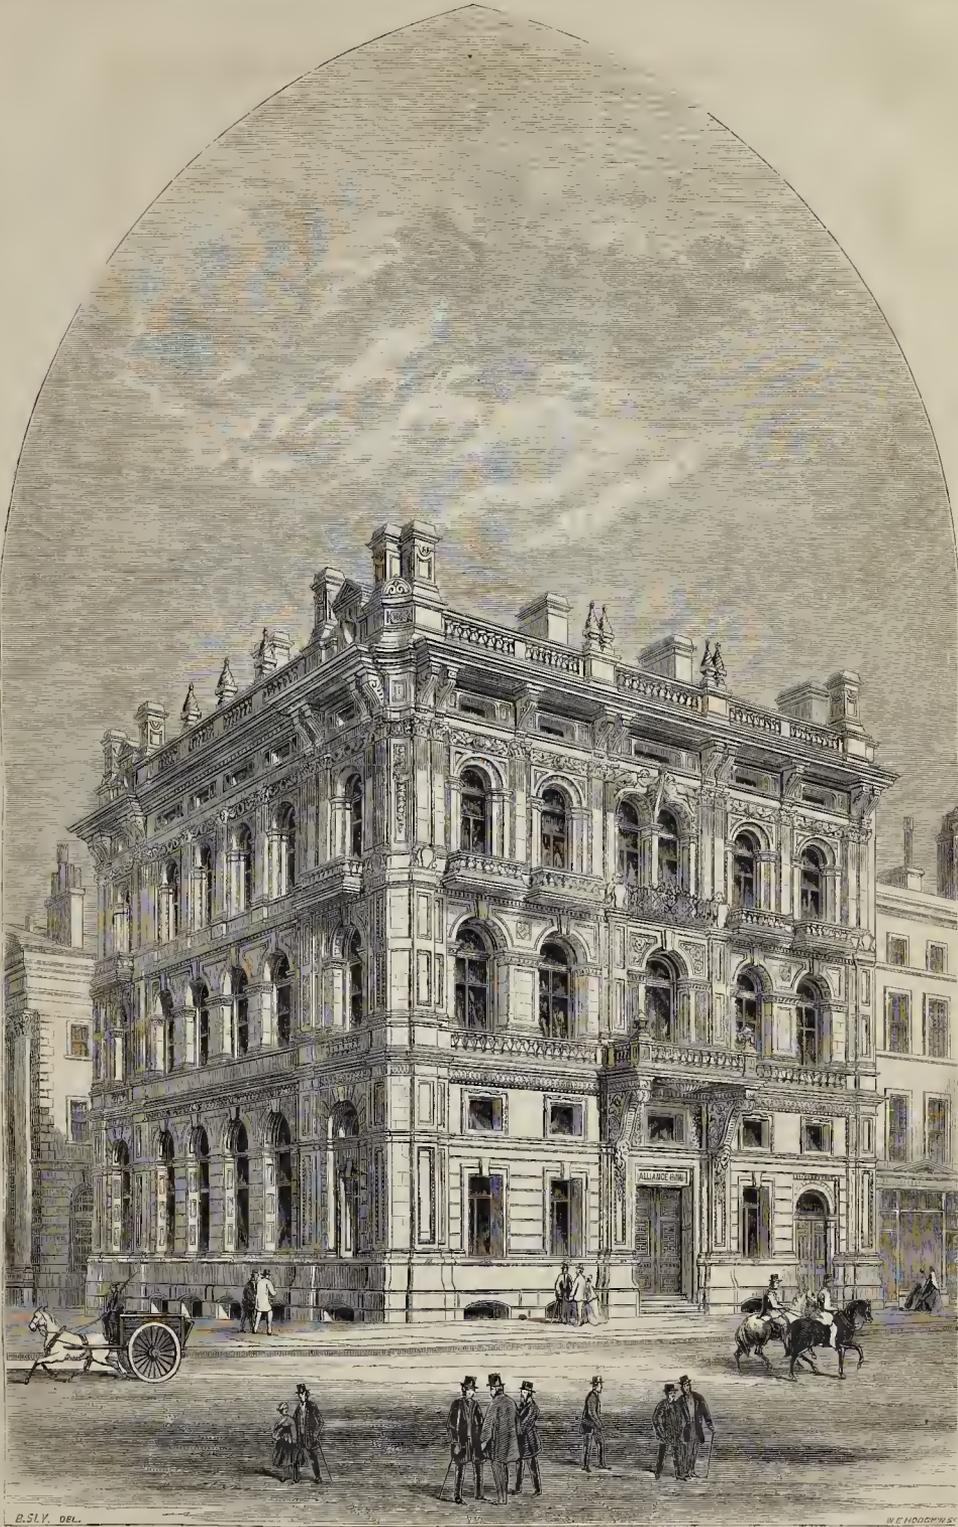

Descending to the basement, we find the strong-rooms belonging to the Bank, and notice that precaution has been taken in their construction to obtain security. Among other provisions is a passage running entirely round the strong-room, so that the manager, who has a private entrance to it, could at once detect if anything wrong were going on. For the removal of cash and books to these rooms, an hydraulic lift affords a ready means of communication with the banking-room. Retiring-room and lavatory accommodation is provided on the basement for the manager, and for the clerks, with ready access, by separate staircases. A portion of the basement fronting Castle-street is appropriated to the residence of the keeper of the premises; whilst the residue, or that portion fronting Lower Castle-street, is devoted to offices, to be

let off to wine merchants or others, in conjunction with the vaults in the sub-basement. The reason the vaults were introduced was, that in sinking for the foundation it was discovered that the rock on which a portion of the premises stand had been cut away, and the opinion of the builders was, that they had alighted upon the moat of the old castle, a view which would be favoured by the circumstance of a subterraneous passage having been discovered, leading, it is supposed, down to the river. Under the circumstances, therefore, foundations had to be built, this led to the formation of the fire-proof vaults.

The following are the dimensions of the building:—Area, 525 superficial yards; height from the street level to the main cornice, 66 ft.; ditto to the top of the ornamental chimneys, 78 ft. 6 in.; depth from the street to the vaults, 22 ft. The area of the banking-room is 263 yds.; height to the ceiling, 22 ft.; height to the eye of the dome, 33 ft.; diameter of the dome, 14 ft.

The contract for the whole of the work was taken by Messrs. Holme & Nicol, and they have been assisted by the following sub-contractors: viz., Mr. Dempster, masonry; Mr. Merrick, plumbing, painting, and glazing; Mr. Jones, slating, plastering, and modelling of decorations in banking-room; Mr. Oppenheimer, of Manchester, ornamental tiling; Mr. Green, of Manchester, sculpture. The late Jos. Smith and George Owen & Co. supplied the marble chimney-pieces, and Messrs. Pilkington & Sons the glass for the dome. The contract for decorating the public room, and the other rooms occupied by the Bank, and for supplying the necessary furniture, was taken by Messrs. J. R. & W. Jeffery & Co., and they have carried out the work entrusted to them satisfactorily. The hydraulic machinery was supplied by Messrs. Easton, Amos, & Anderson, of London.

The architects were Messrs. Lucy & Littler, whose designs were originally chosen in competition with those of other architects.

THE ALLIANCE BANK, CASTLE-STREET, LIVERPOOL. — MESSRS. LUCY & LITTLER, ARCHITECTS.

THE TRADES MOVEMENT.

The Potteries.—A reference was recently made to Mr. Davis, the stipendiary magistrate, as umpire in the arbitration of a difference between the builders and bricklayers of this district. The bricklayers had applied for a reduction of the hours of labour to the extent of half an hour a day, enabling them to leave off work at half past five, and an advance of a farthing an hour in their wages. Mr. Davis has given his decision, which is adverse to the operatives on both points. He says:—"I have come to the determination that the operatives have not made out a case for an alteration in the existing rules."

Sheffield.—We understand that the whole of the operative carpenters and joiners in this town are under notice. The object of the masters is that day payments be changed to the hour system. The men are believed to be adverse to the change, unless some rules are agreed to which would have the effect of enabling them to earn adequate wages in winter, as in Birmingham and some other towns.

Stockport.—The sawyers have struck for an advance of wages, equivalent to 17½ per cent., taking the work "all round." They have declined to accept the Manchester rates of payment.

Manchester.—The masons in the employment of all the principal firms in Manchester have struck work. The masters desire to introduce payment by the hour, which the men refuse to accept, and make a demand for a reduction of time, from 54½ to 48½ hours per week. There are also questions about quarry-dressed stone, and the introduction of machinery. It is greatly to be desired that the whole question should be referred to some disinterested party to effect a settlement. The masters, we understand, are willing to adopt arbitration. In the case of the operative joiners a similar result is feared, the masters having given the men notice that after May 1st they will pay by the hour, and the men in turn having given notice that they will expect from the same date a diminution of half an hour a day in their hours of labour. The case is rendered still more complicated by the masons and joiners wishing to begin and leave off work at different hours, an arrangement which the masters say would be prejudicial to their interests when carried into practical operation.

THE LIABILITY OF INFANTS.

COLLINS V. PHILLIPS.

This was an action brought at the Bloomsbury County Court before Mr. G. Lake Russell, Judge, by Mr. Collins, a builder, to recover the sum of 22l. 12s. 6d. for work done. Mr. Wright appeared for the plaintiff, and Mr. Williams for the defendant. The case was tried by a jury. Plaintiff stated that in March, 1868, he fitted up a shop for the defendant, who then carried on the business of a boot and shoe maker in Duke-street, Grosvenor-square. Defendant's name was put up on the trade cards very near the defendant's name; he also did some work for defendant's father at the same house. When he applied for payment he was told that defendant was under age. Defendant had since given up the shop in question, and had become a cab proprietor. The defence was, firstly, that defendant was an infant in the eye of the law when the work was done; and, secondly, that the father had paid for the work in the amount he paid to the plaintiff. His Honour left three questions for the jury to decide. Firstly, was defendant under age at the time the work was done, and did he give the order? Secondly, if so, was the work necessary? And thirdly, were the charges fair and reasonable? The jury, after a short consultation, gave a verdict for the plaintiff on each point. Judgment for the full amount of the claim and costs were therefore given.

A PALACE.

Sir,—When one reads of the reception that our own princes as well as others on the Continent meet with, and the magnificent palaces in which they are accommodated, it appears to me rather a surprise on our own country when we reflect that we have not a palace worthy of its name, or one that would command the attention of foreign princes, and this after the vast sums that have been squandered in streets, additions, &c., without a single result. If you go back to the period of George IV. not one vestige is left of his atrocious taste fortunately. Even if you look at Buckingham Palace, what is there that is satisfactory? Again, look at St. James's, which is also termed a palace; and Windsor Castle is really the only one that merits such a designation. The finest opportunity that offered of making a magnificent palace was at Kensington, which might and ought to have been secured, and no part of the land left off or sold for building purposes, which has been a great mistake. There is now no site scarcely left for such a purpose, and if there had been, the only mode at the present day would have been to have selected a certain number of talented and tasteful men to have completed by Royal patronage for such a purpose, by being liberally remunerated for the task. The style selected should be that of *Italian or Roman Architecture*, of the age of Palladio, and the architecture of Venice. As for Gothic, it would be out of the question, frittered away in absurd and extravagant ornament, to be, in the space of

some few months or years, obliterated with soot and dirt; and it is still to be hoped in the new law courts all this extravagance may be avoided, and that good and telling masses will predominate rather than trifling ornaments. Only witness the result of all this in the new Houses of Parliament, wherein, if a bolder outline, with a less profusion of ornament, had been adopted, there would have been less occasion to censure the talented architect. I hope still it may not yet be too late in the rising generation of our praiseworthy princes to set the example for a Royal palace worthy of this great country.

A SUBSCRIBER.

THE THAMES EMBANKMENT AND THE DISTRICT RAILWAY.

IN the House of Commons Lord Elcho, as chairman of the Thames Embankment Committee, called attention to the serious danger to private and public buildings in the metropolis from the vibration of the trains of the Underground Railway. He moved—

"That it be an instruction to the committee on the Metropolitan District Railway Bill to inquire and report whether any and what provision will be made by the railway company in constructing their line from Westminster to Cannon-street, with a view to prevent injury to adjacent buildings from the vibration caused by the passage of trains."

Mr. Dent, the chairman of the Select Committee on the Metropolitan District Railway Bill, said that the committee had reported on it that day, and it was now too late to move this instruction.

Mr. Layard said he thought good service was done by calling attention to this subject. He hoped the noble lord would either move the recommittal of the bill, or propose new clauses, on the third reading. He was informed that Somerset House would be endangered by the workings of the Underground Railway.

Lord Elcho, having said that he would consult with his right hon. friend as to the course he should adopt, withdrew his motion.

The following resolution was, on another occasion, agreed to on the motion of Lord Elcho:—

"That it be an instruction to the Select Committee on Hungerford-bridge and Wellington-street viaduct to inquire and report specially to the House whether any public buildings now existing, or that may hereafter be erected on the Thames Embankment site, are likely to be injuriously affected by the Metropolitan District Railway, or by any other railway or railways now in progress or sanctioned by Parliament on the embankment; and, if so, whether it would be possible in the construction of the railways to guard against such injury."

THE WORCESTER SOCIETY'S CRITICISMS.

Sir,—Will you kindly allow me space in your paper to briefly notice the "eccentric" remarks in the last report of the Worcester Architectural Society in reference to the new Orphan Asylum now in course of erection at Henwick, near Worcester, extracts from which appeared in the *Builder*; not that I have any fear those remarks will carry much weight with them, the author being well known—by the profession at least—for his partial criticisms.

Just and honest criticism is a wholesome thing, and of immense advantage and instruction to the uninitiated as well as the profession; but when it degenerates into a morbid desire to attack, a disposition and, indeed, determination to appreciate nothing (unless it be from the pencil of the personal friends of the critic), its influence becomes derogatory and damaging to the very cause it purports to uphold and advance.

I am not the first who has been malign in this society's reports. I remember the malignant disposition shown towards one of its own members a few years ago in reference to the St. Clement's schools at Worcester and the Bromsgrove Lacey Church, and the still more bitter feeling displayed in reference to the Worcester new Cemetery chapels, upon each of which occasions the *Builder*—well-known for its integrity and honesty of purpose—depreciated its action and mode of criticism.

In this instance the few general terms condemnatory of the architecture as applied to the building in question, although evidently intended to be damaging, are really so weak and meaningless that the spirit of a wilful desire to injure its authors, for not a single argument is adduced in support of the charges; and I am left with the alternative, therefore, of denying them *in toto*, and asserting that I am prepared to defend the building upon the true principles of Pointed architecture. It is true I expected nothing from the society except the treatment I received; and I ought to be thankful since I find the second part of the report asserted that the secretary had been less sharp in his criticisms than in former years.

WILLIAM WATKINS, Architect.

PROVINCIAL NEWS.

Derby.—Messrs. R. Bennett & Co., of Derby, London, and Nottingham, builders, are now proceeding with the new Government Offices, at the Victoria-street corner of the new St. James's-street, having undertaken the contract for its erection at a sum approaching to 6,000l. The elevation will be Classic, from designs by Mr. J. Williams, of London, the Government Post-office architect. The fabric, which will be of stone externally, will rise from a deep plinth of Devonshire marble. There will be two entrances from Victoria-street, that front to St. James's-street being for the public on Post-office business. Another, at the contrary end of the same front, will lead to the Revenue Offices, which will be on the second floor, and to the Postmaster's room and other offices. There will be two windows between on the ground floor, flanked by columns with deep sunk bases and projecting capitals. These will carry a string or series of stone lintels, which will extend along the entire front, and upon them the ornamentation will be fretted Grecian. Above these windows there will also be a plate-glass panel, corresponding with them in width, and flanked by carved corbels assisting to bear the first cornice, which will project from 4 ft. to 5 ft. Above this, the first floor will be lighted by four lofty windows, with balustraded balconies, and moulded architraves, finished with pedimental heads. Above these, the upper story will be of a somewhat plainer character, and the entire front will be completed by a projecting dental cornice, surmounted by a balustraded parapet. The St. James's-street front will be of precisely the same character as far as the main building extends. The sorting-room will extend beyond it, and will be a plainer structure, of one story only, but in keeping with the Classic order of the whole. It will be lighted by a large raised skylight, which will extend from the principal elevation to the end of the site. The entrance to the sorting-room will be by a central door in St. James's-street, which will be used by officials only. The Telegraph Office will be on the St. James's-street side, but the business connected with it will be transacted at a central counter in the public hall, which will be entered by the first door in Victoria-street, and which will occupy the entire area, except the Entrance Hall for the Revenue Offices. The space in the rear from St. James's-street of the sorting-room, and extending from the main structure, will be occupied by rooms for the clerks, sorters, &c., and the basement story of the public hall will be used for revenue stores, and will be fire-proof, as the floor over them will be on the principle of the contractors, who are the patentees for fire-proof flooring, whose principle has, we understand, been also adopted at the Derby and Derbyshire Infirmary.

Wareham.—For the proposed new Town-hall and Corn Exchange several designs have been submitted to the committee, but abandoned in consequence of not having sufficient support by subscriptions to carry either of them out. A design, with plan, was placed before the corporation at a recent meeting, and the Mayor was requested to ascertain the amount likely to be required to carry it out, or one somewhat similar. It was carried unanimously—

"That, inasmuch as money to the amount of 1,400l. or thereabouts will be required for the purpose of building a new town-hall, corn exchange, &c., and, as it appears that 500l. or thereabouts have been raised by voluntary contribution, the Corporation hereby consent to borrow (if required), on such terms and in such manner as may be hereafter determined upon, a sum not exceeding 900l. to complete the buildings."

And,—

"That the Corporation will not accept any tender for the building until the sum of 500l. already promised by subscription, be collected by the secretary."

Additional subscriptions meantime are solicited, and will be received by the Mayor.

Wolverhampton.—The Public Works Committee of the Town Council have been advertising for tenders for works required to be done in the erection of a new Town-hall upon the site of the present one in North-street. Several tenders were forwarded in answer to the advertisement, and the committee held a meeting to consider them. After opening and discussing the tenders, the committee adjourned in order that certain necessary inquiries might be made.

Bury Saint Edmunds.—The rectory-house at Hargrave has been restored and enlarged. The house formerly was small, and occupied as a double cottage. It is situated in front of the church, in its own grounds, and for the last 100 years no resident rector has been

able to reside therein. The old part is built of oak studding, and plastered externally. The additions are all of brick, and faced with white Suffolk bricks, with red bands. The window arches are executed to match. The gables have moulded large-boards, with ornamental finials. The interior has been renovated. The old roof tiles have been taken off, and the whole covered with slates. The floor of the hall is laid with red, black, and white local tiles, in pattern. In a limited competition, the tender of Mr. James Drake, of Ousden, builder, was accepted for 560*l.*, exclusive of the bricks, drains, and formation of roads, and he has just completed the same. The whole has been carried out under the direction of the architect, Mr. Ralph Chamberlain, of London.

STAINED GLASS.

Gloucester Cathedral.—The memorial window to the late Cazon Bankes has just been completed, according to the local *Chronicle*. It occupies the northernmost division of the east walk of the cloisters, and completes the series of nine painted windows lately erected on that side of the building. The window is by Messrs. Clayton & Bell, of London. The subjects are the healing of the daughter of the Syrophenician woman (Matt. xv., Mark vii.), and the raising of Jairus's daughter (Matt. ix., Mark v., Luke viii.), each subject occupying four lights. In the centre of the left-hand compartment is the woman of Canaan kneeling, and addressing the supplication "*Domine adjuva me*" (Lord help me) to our Saviour, who replies, "*Fiat tibi sicut vis*" (Do it unto thee even as thou wilt). Behind the woman is her daughter lying on a bed, and with a conventional representation of the departure of the unclean spirit. Behind our Lord are two disciples. The other compartment represents Christ taking the hand of the maiden who is lying on a bed; behind her are her father and mother, and behind Jesus the three apostles, Peter, James, and John. On the extreme left are two females (one seated) lamenting. The four tracery lights above are each filled with an angel holding a scroll inscribed "*Sanctus, Sanctus, Sanctus.*" The four remaining windows in the carols, or cells, in the south walk of the cloisters have just been filled in with ornamented quarries, having medallions of scrollwork, birds, &c., in the centre. This completes the work undertaken at the expense of Mr. Thos. Holt.

St. George's, Stamford.—A memorial window has just been placed at the east end of the chancel of this church, in memory of the late Mr. Titus Berry. The five-light window is of the Perpendicular style, the whole of which has been filled with stained glass executed by Mr. Wailes, of Newcastle. The subject represented is that of our Lord's Ascension, the figure of the Saviour being in the centre compartment, and his eleven apostles, with the Virgin Mary and Mary Magdalen, grouped in various attitudes in the side-lights. With the exception of the centre opening of the window, where our Lord is shown ascending to heaven amid rays of light, the figures are surmounted by canopied work, and this is repeated at the bottom of the window in the shape of pediments or bases, to raise the whole subject from the stonework of the sill. The panels in the tracery are filled with angelic figures engaged in adoration and praise. The window formerly contained the figures of St. Catherine, St. Anne teaching the Virgin, the head of a mitred ecclesiastic, and our Saviour blessing the elements, copied in 1705 from the celebrated piece by Carlo Dolce, at Burghley. The latter was the gift of John Langton (by whom it was executed), a celebrated writing-master of Stamford. He lived in the house now occupied by Mr. Hare, and in 1700 revived the art of glass-painting, staining, and tinging, in the way of the ancients, and made a new discovery for painting flowers and fruits on white glass. His handiwork has been recently discarded, and is now in private hands; but the ancient glass has been preserved, and is to be placed in one of the compartments of one of the south windows, which will be filled up, at the expense of a parishioner, with the figures of St. George and St. Paul, executed at Mr. Wailes's stained-glass works, Newcastle.

Cosley Church.—A memorial window has lately been placed in this church, by Mr. David Hill, Sedgley, to the memory of his deceased parents. The window is executed after the style in vogue about the earlier portion of the

sixteenth century. The composition is arranged with reference to the galleries, which cut off the upper part of the window. The subject of the lower panel is the procession to Calvary. Above this, arranged *en grisaille*, are busts of angels, and personages of the Old Testament. In the centre of the top compartment is a figure of St. James the Apostle. The window was executed by Messrs. Lavers, Barrard, & Westlake of London.

CHURCH-BUILDING NEWS.

Rhos Crowther, S. (Wales).—The church of Rhos Crowther, Pembrokeshire, has been reopened, after extensive restorations from the designs of Mr. Wehnert, architect, Milford. The churches of Manorbier, Hubberston, and St. Katherine's, Milford, have lately been restored by the same architect; and Walwy's Castle, Llys-y-fran and Llanstian Churches are now in course of restoration.

Holmside.—The foundation stone of a new church has been laid at Burnhope, in the ecclesiastical district of Holmside. Mr. T. C. Ebdy is the architect of the building. The style of the architecture is Geometrical Gothic, of the thirteenth century. The plan of the church consists of a nave, chancel, organ-chamber, vestry, and western porch. The east and west window will be filled with tracery, and the church throughout will have an open timber roof, supported on detached columns. The whole of the sittings will be free. The works have been in progress for some months. The contractor for the masonry is Mr. Robert Kell, junior, of Chester-le-street.

Pontefract.—The ancient parish church at Pontefract, after having been closed some time for repairs, has been reopened by the Archbishop of York. The present alterations have cost about 2,000*l.*, and of this sum more than half has been subscribed. It is intended that the seats, with the exception of corporation pews, shall be free and unappropriated. The principal contributor to the alteration fund was the Earl of Harewood, the lay rector, who gave 350*l.*, and this sum was devoted towards the erection of a new chancel. The plain windows that were formerly in the building have been replaced by Gothic ones. The old pews have been removed and replaced by open deal benches, and the floor has been lowered for some depth.

Slad (Gloucester).—The church of the Holy Trinity at the Slad, which has recently been enlarged and improved, has been reconsecrated by the Bishop of the Diocese. The old pews and galleries have been removed. On the north side a new aisle has been built, the old wall being pierced with arches, and thus considerable additional accommodation is afforded. The chancel has also been lengthened. The floor is inlaid with encaustic pavement. Modern stained deal pews have been placed in the church. The walls are cream-coloured, with mural decorations. A new organ, the gift of Mr. R. Hastings, has been erected. The architect is Mr. Benjamin Bucknall, and the builder Mr. W. Restall, Bisley. The work has been done at a cost of about 900*l.*

Otley.—The parish church at Otley has recently been restored and reopened. It is dedicated to All Saints, and was originally a Saxon fabric. The east or old church window is certainly very ancient. The south end of the church belonged to Denton, and the north end to Lindley, in all probability. They were then called chapels. The windows have evidently been long, narrow, and round-headed. The west, or new part of the church, it is conjectured, was built in the reign of Henry VIII. The great north door is very early. The church abounds with monuments. There are also five or six painted windows, one of which has been recently erected by subscription, in memory of the late Mr. F. Billam, of Newall Hall. Something was done towards the restoration of the edifice nearly twenty years ago, the colling which covered the roof having at that time been removed, and subsequently other improvements, which were much needed, have been effected. The chancel floor has been raised. All the plastering has been cleansed off the pillars, and they have been wrought to a face and the arches have been treated to correspond. New capitals and bases have been made to the pillars; the Norman windows in the chancel have been opened out; all the walls have been replastered; an opening has been made to the tower by the removal of a gallery; encaustic tiles have been placed upon the chancel floor, and the old oak

roof has been opened up; a new organ-chamber and a new vestry have been erected, and the whole of the church has been re-roofed, all the pews being of oak. A new warming apparatus has been inserted, and all the aisles are boarded and felted. These improvements have been designed by Mr. Rhodé Hawkins, architect, London, the contractors being Mr. Beckwith Maston, stonemason, Otley; Messrs. C. Chaffer & Co., plasterers, Otley; Mr. T. Hall & Co., Leeds, joiners; and Messrs. Suthill & Warrington, plumbers, Otley. The cost of the whole has been about 2,400*l.*, towards which sum subscriptions have been raised amounting to 1,700*l.* A number of special gifts have also been presented. The organ has been refitted and improved by Messrs. Forster & Andrews, of Hull.

Battersea (London).—A site has been obtained at Battersea Park for a new church. The district is a poor one. The church will be called St. Saviour's, and will make the third church erected in the parish during the last twelve months.

Newark-on-Trent.—The tower and spire of the parish church, in this town, being considered unsafe, Mr. G. G. Scott has recommended immediate and substantial repairs. The works are entrusted to Mr. John Fae, of Melton Mowbray, under Mr. Yeoman as clerk of the works.

Collaton (Devonshire).—Memorials of the founder of the church of St. Mary the Virgin, the late Rev. J. R. Hogg, have recently been placed in the chancel of this church, and consist of a rearedos, with wall-arcades on each side of it, and returning north and south, and two stained-glass windows on the south side. The rearedos and wall-arcades, designed by Mr. J. F. Bentley, architect, are like the church itself, of Early English Transitional style: the subject in the former is the Institution of the Holy Eucharist, executed of Caen stone in alto-relievo, by Mr. T. Pophers, sculptor, and the architectural portions by Mr. T. Earp, both of London. The Caen stone sculptured frame to the rearedos is composed of side panels of diaper patterns, resting on a moulding of white Mansfield stone, surmounted by traceries enclosing Christian emblems of the Sacrifice in the "Agnus Dei," and the legend of the "Pelican in her piety." The canopy, with groined soffits and cusped arches, carries a line of trefoils panelled with polished Irish green marble, beneath a carved cornice of conventional foliage and fruit, created by Gothic embattlement work, which last-named feature forms a symbol of the "Church Militant." The buttresses, with dispersed faces, support crocketed pinnacles and finials. The wall-arcades (also of Caen stone) spring from plinths of white Mansfield stone, and contain large panels of polished Staffordshire alabaster in hooped mouldings, with cusped headings, under a line of trefoils; also, between the panels are canopied angels holding on discs the "Alpha" and "Omega," and the whole design terminates in an embattled cornice. The windows are in the style also of the late part of the First Pointed period, and are from the designs of Mr. J. F. Bentley and Mr. R. H. J. Westlake (artist), both of London; and executed under the supervision of those gentlemen at the stained-glass works of Messrs. Lavers, Barrard, & Co. The Resurrection is the subject of the one window, and Christ's Charge to St. Peter that of the other. The panels of ornamentation contain angels holding on discs the Christian emblems of the Resurrection and St. Peter; and the conventional tree, foliage and fruit springing from the base and running through the borders to the arch, symbolically suggest thoughts of the "tree of life," and, to apply another allusion, "taking root downward and bearing fruit upward."

Tanhill (Leicestershire).—St. Ann's Church, which was re-consecrated by the Bishop of Chester on the 3rd inst., consists of a nave and chancel, 88 ft. by 31 ft.; the latter consisting of a raised platform, projecting westward, the width of the eastern bay; north aisle, 88 ft. by 18 ft. 6 in.; south transept and south chancel aisle, 18 ft. 6 in. wide. The numerous graves on the south side prevented a south aisle to nave being added. The open roof timbers are carried on attached shafts with carved caps. The church is entirely new, except the lower portion of south and west walls of nave, and the tower and spire and south transept. It is proposed ultimately to extend the church to the westward, and build a new tower and spire. The new east window is a large seven-light window, filled in with Perpendicular tracery. It is intended to fill this window with stained glass. The original

church was erected about thirty years ago, and had become far too small. The enlargement and rebuilding were mainly brought about by the vicar, the Rev. W. L. Clay. The contractor for the entire contract was Mr. George Harris, of St. Helen's. Mr. William Middlehurst was the sub-contractor for the masonry, which is of the local red sandstone; Mr. J. Westwood, for the plasterer's work; Mr. G. R. Stockwell, of Liverpool, executed the carving; Messrs. Cooper & Son, of Liverpool, the heating apparatus; Messrs. Forrest, of Liverpool, the glazing; and Messrs. Maw & Co., of Broseley, the plain and encaustic tiling. Mr. G. H. Ridsdale, of Liverpool, is the architect. The church has seat-room for 845 persons: 250 sittings are free.

Eaton Socon, Beds.—The parish church of this populous village, which has for the past twelve months been undergoing an extensive restoration, has been re-opened for public worship. The church is in the Decorated style of architecture, with the exception of the chancel, which is Perpendicular. The restoration has been conducted under the supervision of Messrs. Cory & Ferguson, architects, Carlisle. The roofs of the aisles have been replaced and re-lead; and the east bay of the nave has been restored to its original dark green and gold, with other embellishments, while the nave itself has been painted anew in a light greyish tint with ornamentation. The roof of the chancel was originally composed of oak, but from time to time had been repaired with deal; it has now been encased with oak, formed into panels and compartments, and left in its natural colour. The old whitewash has been cleared off the stonework, which has been pieced where required; and the plaster has been removed from the walls, and stucco substituted. The old square pews have now entirely disappeared, and modern oak seats, with carved poppy-heads, have succeeded them; a few of the same style, nevertheless, which were in the church before, have been restored. This latter portion of the work has been executed by Messrs. Moody, of Durham. The organ, which was formerly placed in a gallery at the west end, has been removed to a space between the east end of the north aisle and the vestry, and the old organ-chamber cleared away, so that the tower arch can now be seen. The organ has been rebuilt and enlarged, with the new swell and other modern improvements, by Messrs. Gray & Davison, of London. The new stone arch to form the west front of the organ-chamber is 20 ft. in height, and 10 ft. in the opening. Underneath the organ-chamber is formed a cellar for the reception of the hot-water apparatus, which warms the church by means of pipes traversing the several aisles, the heat being allowed emission by a fancy iron grating. This, it is said, has not proved injurious to the old memorial slabs, as they have all been retained in the flooring. The apparatus was supplied by Mr. George Bower, engineer, St. Neots. A new floor has been put in the tower for the ringers, who now approach the belfry by an outer entrance, instead of having to come into the church. Patterns of mosaic design in encaustic tiles (by Moore & Co., of Broseley, Salop), compose the flooring of the chancel. An old Norman font has been restored and replaced in the church, after being out for many years. The restoration will cost something like 2,600l. The local parties engaged in the work were Mr. William Wade, Eaton Ford, and Mr. Edey and Mr. Wildman, St. Neots.

DISSENTING CHURCH BUILDING NEWS.

Burton Joyce.—The foundation stone of a new church and schools for the Independents, at Burton Joyce, has been laid. The building will be in the Gothic style of the thirteenth century. Externally it will be faced with Bulwell stone and freestone dressings; internally it will consist of a chapel, school-room, and vestries. The chapel and school-room will be divided by an arcade, to be fitted with movable shutters, so as to admit of the two parts of the edifice being used separately or together on anniversary and other similar occasions. Accommodation will be provided for upwards of 200 persons in the chapel, and about the same number in the school. Mr. Tait, of Leicester, is the architect, and Messrs. J. Wright & Son, builders, Nottingham, are the contractors. The contracts for building the chapel, enclosing it, and heating it, amount to 1,000l. Other charges will probably bring up the amount to 1,100l. The site upon which the building stands has been given by Mr. S. Ruddock, of London.

Worcester.—The Free Church, Friar-street, has been opened for divine service. The old prison wall forms one side of the building, sustaining with other corresponding walls a steep-pitched roof. Its length is from north to south 83½ ft., and breadth 30 ft. The principal entrance is from Friar-street. The church will accommodate about 500 persons, and should more room be required a gallery can be constructed. At the south end is a window of three lancet lights, and the other windows are round-headed. Three coronas, having twenty burners each, hang from the ceiling, and the chapel will be warmed by a couple of stoves. The seats are open and free.

Tunstall.—The Goldenhill Wesleyan New Chapel, situated in High-street, and combining both chapel and schools, the foundation stone of which was laid in July last, has been opened for divine service. The building has been erected from the plans of Mr. Roberts, of Trentham, by Mr. John Grosvenor, of Bradley-green. The total cost, including the land, is expected to be 2,300l.

Todmorden.—The new Unitarian church, which has been erected at a cost of 25,000l. or 30,000l., by Messrs. Fielden Brothers, of Todmorden, has been opened. The spire, from the base to the extreme point of the vane, is 192 ft., in which is placed a peal of eight bells, and an illuminated clock. Internally the edifice is of rather costly character, and consists of chancel, nave, and side aisles. The pews are of English oak. The chancel is paved with Sicilian marble, and the aisles with Mansfield stone. An organ is placed on the south side of the chancel. The font is of white ornamented marble, inlaid, and rests on polished granite. The pulpit and reading-desk are of carved oak, and the former rests on a pedestal of marble and granite. Three stained-glass windows are placed in the chancel.

FROM SCOTLAND.

Portobello (near Edinburgh).—Building operations have been commenced at the north end of Brighton-place, immediately adjoining the Roman Catholic Chapel. The block of buildings now in course of erection will be three stories high, presenting a frontage to Brighton-place. The plans drawn are by Mr. Hay, architect, Edinburgh. The new block will embrace twelve dwellings—four main doors, and eight on the upper flat. These and other improvements have deprived two of the most popular local institutions, the Portobello Bowling and Golf Clubs, of their bowling and putting greens. Among the improvements referred to is the erection of a new and more commodious place for public meetings, concerts, and penny readings, &c., and he called "The New Public Hall," capable of accommodating 1,200 persons.

Paisley.—The new works for giving Paisley an additional supply of water have just been completed, and the branch supply for the town of Johnstone has been formally opened. The new reservoir is at Rowbank, about seven miles west of Paisley, on the elevated ground which is a continuation of the Braes of Gleniffer. The plans were prepared by Mr. Leslie, civil engineer, Edinburgh, and the new reservoir is estimated to contain about 75 millions cubic feet of water, being about equal to the supply at present obtained from the reservoirs at Stanely, about a mile to the south of Paisley. The entire expense of the new works will be about 70,000l., and the Provost of Paisley states that he believes the Commissioners will be able to carry through the undertaking without the slightest increase of the water rates. Hitherto Johnstone has had to depend entirely on a few pump-wells throughout the town, and in the summer weather the inhabitants were frequently sadly in want of good water. The turning on of the water was the occasion for a half-holiday in Johnstone. A number of temporary fountains were erected in Houston-square for the purpose of testing the pressure of the water, which proved sufficient to propel it several feet above the highest building, so that in case of fires the use of engines will no longer be necessary. The filters are about 300 ft. above the town.

Meigle.—The Parish Church at Meigle has been burned to the ground. A few of the parishioners had assembled in the church to attend divine service, when the fire was discovered. The building is heated by hot air, and flames were soon issuing from the outlet of the fire situated near the pulpit. The fire at once seized on the building, and spread with alarming

rapidity. Every effort was made to stay the progress of the flames, but without avail. In Meigle no proper apparatus for the extinguishing of fire exists, and the only means for suppressing the flames available was throwing the water on the budding from buckets. In about half an hour the roof fell in, and in less than one hour all that remained of the church were the walls. The edifice was improved last summer: a new roof was put on it, and the interior was renovated—the repairs entailing a considerable expenditure.

CASES UNDER THE METROPOLITAN BUILDINGS ACT.

CAUTION TO INEXPERIENCED GASFITTERS.

Mr. J. M. LAMB, gasfitter, of No. 10, High-street, St. John's Wood, was summoned to appear before Mr. D'Eyncourt, at the Marylebone Police-court, on the 16th inst., by Mr. Alexander Peebles, District Surveyor of North St. Marylebone, "for, that he being engaged in doing certain works at No. 44, High-street, St. John's Wood, did fix a pipe for conveying smoke or other product of combustion nearer than 9 in. to combustible material," Sec. 21, Paragraph 5.

From the opening statement of Mr. Harston (Rooks, Kent, & Harston), who attended with Mr. Peebles, it appeared that the defendant had been employed last February to fit up a gas-light containing twelve burners in this shop, which was fixed close under the ceiling, and the iron pipe for conveying from it the product of combustion was laid in between the wooden flooring joists, and from them it was only distant 2 in. or 3 in. on each side. The pipe ran along between the joists till it reached the bressummer, which was notched out to receive it, then turned upwards in a chase out in the front wall, and emerged into the external air in front of and against the wooden sill of the first-floor window, where it was fitted with a cap. No notice of these works had been given to the surveyor.

The gas was put out at eleven o'clock upon the night of Saturday, March the 6th, and at half-past six o'clock on the following Sunday morning the premises were discovered to be on fire in the flooring and bressummer. Had the premises been burnt out, the origin of this fire could not have been ascertained. For infringing Sec. 21 a penalty not exceeding 50s. is attached.

Mr. Harston called the fireman who attended and extinguished the fire, for the purpose of proving the state he found the premises in, and the position of the pipe, when a solicitor, upon behalf of the defendant, stated he could not resist a conviction; but that as his client had erred in ignorance of the law, and the district surveyor's motive was not to obtain a heavy fine, but a conviction, in order to put a stop to such irregularities, he trusted the magistrate would inflict a nominal penalty.

Mr. D'Eyncourt, after scrutinizing the various clauses of the Act, and that which rendered these proceedings imperative on the surveyor, said he was afraid unless he did inflict a heavy penalty, it would not act as a warning; however, as it was the first case of this description in that court, he would impose a fine of forty shillings and costs; but upon the occurrence of a similar offence, he would inflict a heavy penalty.

SCHOOLS OF ART.

The Hanley School.—The annual meeting of this institution has been held, Mr. G. Ridgway, the mayor, in the chair. The attendance was good, but not so large as on some former occasions. A considerable number of drawings and models were exhibited. The report of the headmaster, Mr. Carter, said:—

"The total number of individual students who attended the school for the year 1867 was 177, and for 1868 175, while the attendance has been unusually good and very much higher than was stated in my last report. I may here mention that for the past two years our chief strength lay in the elementary section as now fixed by the Department, and although the results at the time are not so apparent as in the advanced section, the works in the latter for the present year will sufficiently corroborate my assertion, for without a good foundation it would be hopeless to look for a satisfactory result in the more advanced stages. The public examination in the second grade took place as usual, on the 10th and 11th of March, 1868, when 29 students presented themselves for examination, of whom 32 were successful. The return of the examination, held in March in the present year, has not yet been made known."

Mr. G. Wedgwood, in moving a resolution, which was passed, expressing the satisfaction felt by the meeting at the progress made by the pupils, as evidenced by the master's report, the works exhibited, and the prizes awarded by the Department, said, as an old School of Art student both at Edinburgh and Hanley, he had much pleasure in moving this resolution, because he thought the results of the tuition given in the school were most gratifying. At the same time he was much disappointed that a town like Hanley, having a population of 40,000 inhabitants, only sent 175 pupils to its School of Art. He was glad to know that the school had always stood well in the matter of medals, but he did not consider that the number of medals awarded was a conclusive test of efficiency. It was not a few forced plants which were wanted, but a good average of general growth amongst all the

plants. That that was Mr. Carter's aim was shown by the drawings exhibited, which were free from any attempt at tricky effects, and were not what were called show drawings.

The Carlisle School.—The annual exhibition of drawings by students in this school has been opened, in the rooms of the Academy in Finkle-street. The collection of drawings comprises studies in various departments of art, and many of the specimens exhibit considerable ability. The geometrical and mechanical drawings are for the most part executed with precision, and some of the architectural sketches delineate faithfully different styles of architecture.

The Boston School.—A free exhibition of works by the students of this school has taken place. It was in every sense of the term a success, says a local paper; the productions were of a superior order, and the number of visitors greater than on any previous occasion; the art works were of a high class, and must be taken as an evidence of Mr. Howard's skillfulness as an art-teacher. The number of visitors admitted on Friday was 300, and that on Saturday upwards of 900.

Books Received.

A BATCH of reading-books (without any particular reference to our specialities) have just now reached us, foremost amongst which (*facile princeps*) is "The Fight of Faith," a story in two volumes, by Mrs. S. C. Hall, published by Chapman & Hall. Commencing with the persecution of the Huguenots in France, it ends with the Battle of the Boyne in Ireland. The heroine, Pauline de Chavernay, is an original conception, worked out with great care and delicacy, and resulting in a perfect picture. The other characters are also incisively marked, and incident follows incident throughout the volumes. It is no small praise to say that, as a literary production, "The Fight of Faith" is Mrs. Hall's best book, making the admirable author's announcement in the preface that it will be her last work of fiction the more to be regretted. The interest of the story is maintained unflinchingly throughout, in the latter half of it especially, which sets forth the life and death struggles between the Protestants and the Romanists in Ireland, and, once taken up, the volume can scarcely be put by until read through.—"Studies on Thackeray," by James Hannay (George Routledge & Son). Mr. Hannay has a deep reverence for Thackeray, and in these studies, looking at him as novelist, humorist, critic, and poet, sets it forth with earnestness and eloquence. They make an interesting little book.—"Pioneers of Civilization," by the author of "Crimson Pages" (J. Hogg & Son), deals with the soldier, the explorer, and the missionary, and is a recommendable hook for boys, likely to induce desires to see and do. It contains portraits and other illustrations.—"The Book of Ready-made Speeches" (Routledge & Son) is intended to supply hints to persons who are called on to make a speech, and are in the position of having nothing of their own to say.—"The Swiss Family Robinson" and "Evenings at Home" (Routledge & Son) have been put into words of one syllable by Mary Godolphin, who performed the same kind office for "Robinson Crusoe." Two better little books for the purpose could not have been chosen; they will be found of use in the education of the young.—"Poems," by Geo. Francis Armstrong. (Moxon, Son, & Co.) These poems seem to speak of a strong struggle against temptation,—a struggle probably not successful.—"The Quarterly Journal of Science" for April (Longmans) contains some excellent and interesting papers.—"On the Future Water Supply of London," by C. W. Henton, F.C.S.; "On the Projected Mersey Tunnel and Railway (from Liverpool to Birkenhead)," by Sir Charles Fox; "On Vesuvius;" "On Recent Spectroscopic Researches," by W. Huggins, F.R.S.; and there is also much interesting matter in the "Chronicles of Science."—"On Going to Sleep." By C. H. Moore (Hardwicke). This is a strictly physiological paper,—perhaps too physiological, since the true nature of waking and sleep,—showing wherein they differ as well as wherein they agree, and what it is for the one to be superinduced upon the other, or to take its place,—can never be clearly known apart from psychological inquiry and discovery of the true nature of mentalization and of the powers or

forces whereby it is carried on. It may be all very true, and we believe it to be true, that, "as a general rule, with more oxygen in the brain occurs the brighter wakefulness; with less oxygen the reader sleep; but what is the precise nature of wakefulness, and wherein does it essentially differ from sleep? An attempt was made incidentally to shed some light on these vital and fundamental questions, in a paper "On Geometrical and other Symbols,—the Psychological Key," in the *Builder* of July 11th, 1865.

Miscellaneous.

Fever in Dorking.—We learn from the *County Times* (Surrey) that an inquiry into the existence of fever in Dorking has been instituted by the Privy Council, and that Mr. Simon, in the name of the council, has taken the local authorities sharply to task. It would appear from the report of the council's inspector, that the water-supply of the town is very unsatisfactory; that the portion which is supplied by the water-works is not only scanty, and delivered without filtration, but is also stored in dangerous proximity to sewage. The inspector further reports that the sewerage of Dorking is urgently in need of improvement; that in parts of the town where there are no sewers, the filth is detained in cesspools close to houses, while in other parts the drains are so defectively constructed as to let sewer-air pass into the houses. To the defective sanitary arrangements referred to, Mr. Simon attributes the prevalence of fever. It is to be hoped that the vestry will immediately take measures for putting the drainage and water-supply of the town on a permanently improved footing.

The Opening of the Wedgwood Memorial Institute.—The art exhibition which is to be associated with the opening of the Wedgwood Memorial Institute at Burslem will be, it is asserted, the best ever seen in the Potteries. The Government, through the Department of Science and Art, will send a liberal selection of pictures, with pottery Medieval metal work, and other objects of art-industry, from the South Kensington Museum. What is equivalent to a *carte blanche* has been given to the committee to select from the Mayer Museum at Liverpool, which town, thanks to the untiring labours of Mr. G. Melly, M.P., will contribute on the most handsome scale to the exhibition. Many private collectors will lend valuable objects. Portraits of Wedgwood, Boulton, Darwin, Bentley, and probably Dr. Priestley, with various personal memorials of the great potter, will also form an attractive feature. Up to the present time works from the studios of not less than eighty artists of eminence have been promised.

National Industrial Home for Crippled Boys.—The annual meeting of this institution has been held at Willis's Rooms. The Earl of Shaftesbury presided. The home was established three years since, in a house at Kensington; but so numerous were the demands for admission that a second house was taken, both of which are now filled, by thirty-four boys. During the past year over 200 applications have been made for admission; but there being no room, it is impossible to entertain these deserving cases. The committee, however, in full confidence of aid in such a cause, have purchased a freehold house, with an acre of land, close to the new station at Kensington. The purchase-money exceeds 6,000*l.*, and a sum of about 4,000*l.* more will be necessary for proper workshops, plant, fittings, furniture, &c., making a total of 10,000*l.*; but it is believed that the institution will become self-supporting, as the boys have already been sufficiently instructed in the trades of carpenters, die-stampers, and tailors to earn their own living. A gentleman has offered to give 50*l.* on condition that nineteen other fifties be contributed on or before the 25th of June next.

Enlargement of the Britannia Works.—The foundations have been commenced for an entirely new foundry department. There will be nearly an acre of land within the walls of the building, and four large furnaces producing some 150 or 200 tons of castings weekly. Employment will be afforded to about two hundred additional hands. The general arrangement has been planned by Mr. James Howard, M.P., and the erection of the building placed in the hands of Mr. John Usher.

Remunerative Labour by Soldiers.—The latest reports on the result of employing soldier labour on incidental repairs of barracks, and on new works, have been issued. At Aldershot there has been a saving of about 10 per cent. on incidental repairs, rising up to 50 per cent. on some new works. A larger number of military superintendents are required for military labour than for work performed by civilians. At the Curragh the saving is estimated at 39 per cent. To work the system satisfactorily it is essential that the troops should remain for a considerable time at each station, and that they should be superintended by officers and non-commissioned officers of Royal Engineers. At Parkhurst there has been a saving of 30 per cent. The hearty co-operation of all concerned is essential for the successful employment of soldier labour. At Woolwich there has been a saving, estimated at 20 per cent. on incidentals, and 25 per cent. on new works. A continuance of the system will develop its advantages in a higher degree. It would be well, we should think, for its final success that the soldiers employed should uniformly receive some small benefit in the shape of additional pocket-money for the work done; especially since it must be recollected that no such employment was contemplated by the soldiers when they enlisted.

The Proposed New Gallery of Art for Liverpool.—At a recent council meeting, Mr. Pictou moved a recommendation of the library, museum, and education committee, to approve of plans of the new gallery of art prepared by the architect and surveyor, to whom, he said, they did great credit. The condition of the museum rate was not such at present as to afford the 10,000*l.* already granted for the excellent purpose in question, and in existing circumstances he felt it would be hopeless to ask the council for a grant. The committee, therefore, simply submitted the plans which they had obtained according to instructions, and proposed to wait till a more favourable opportunity for carrying them out. Mr. Melly moved that the plans be referred back, and brought up again for an estimate of the cost for the site and building, and an estimate as to how it was proposed to meet the outlay. Mr. Pictou expressed his willingness to accept the amendment, and, subject to this, the proceedings were confirmed.

The Half-yearly Reports of the Inspectors of Factories.—These reports, ending in October last, have just been issued. They are on this occasion more than usually bulky, forming an octavo volume of 350 pages. They chiefly bear upon the application of the new Factory Acts to the miscellaneous trades and occupations carried on in the United Kingdom. The report of the senior inspector, Mr. A. Redgrave, opens with the gratifying information that but few instances have occurred in which it has been necessary during the half-year to prosecute offenders under the Factory Acts. From the manner in which Mr. Henderson concludes his report, but little good, it would appear, is likely to be effected by the Factory Acts in the metropolitan in the way of assisting or promoting the education of the young. Upon two important points Mr. Baker's opinions appear to be widely at variance from those entertained by his colleague, Mr. Redgrave, who thinks that it is a waste of public money to call for reports upon accidents which occur in factories, and which are not caused by machinery; and he also questions the necessity of compelling employers to be at the expense of providing a surgical certificate for every young person or child they may employ.

Wire-Rope Transport.—The practical value of the wire-rope transport system, invented by Mr. C. Hodgson, C.E., is now being recognized by those engaged in working mines. Sir G. S. Robinson has given an order to the Wire Tramway Company to construct one of their patent ways, for carrying iron ore from his quarries to the Cranford Station.

The Bessemer Steel Trade.—It is understood that Mr. Bessemer has signified his willingness to reduce his royalties from 2*l.* to 2*s.* 6*d.* per ton, except for steel rails, for which a rebate of 20*s.* per ton is already allowed. Ordinary Bessemer steel will thus be reduced nearly 2*l.* per ton, and rails about 1*l.* 10*s.* This will permit steel rails to be sold in the market at a price but little higher than that of iron. If the Heaton process should solve the question of converting cheap pig-iron into steel, iron rails may, probably, be entirely displaced.

Royal Commission on Historical Documents.—The *Gazette* announces the appointment of a royal commission, the objects of which are stated as follows:—Whereas it has been represented unto us that there are belonging to many institutions and private families various collections of manuscripts and papers of general public interest, a knowledge of which would be of great utility in the illustration of history, constitutional law, science, and general literature, and that in some cases these papers are liable to be lost or obliterated; and, whereas, we are informed that many of the possessors of such manuscripts would be willing to give access to them, and permit their contents to be made public, provided that nothing of a private character or relating to the title of existing owners should be divulged; and, whereas it appears to us that there would be considerable public advantage in its being generally known where such papers and manuscripts are deposited, and that the contents of those which tend to the elucidation of history and to the illustration of constitutional law, science, and literature, shall be published. The *Gazette* then gives a list of the commissioners nominated to carry out the objects of the commission. Mr. Mayer, of Liverpool, suggested this in a pamphlet, and the suggestion was recently specially referred to in the *Builder*.

The Great Railways.—The London and North-Western is the oldest of the great railway systems, dating from the Liverpool and Manchester line as the parent germ, and coming down to the amalgamation, in 1864, of the Grand Junction, the Manchester and Birmingham, and the London and Birmingham. This system has never lost its lead as in different respects the greatest of our railway systems. In mileage about 1,400 miles—the Great Western comes nearest to it, but it and all others fall short of the London and North-Western in miles run by trains, in revenue, and in other respects. In 1867 the miles run by trains were as follows:—London and North-Western, 22,269,542 miles, revenue, 6,752,567*l.*; Great Western, 14,157,224 miles, revenue, 3,911,519*l.*; North-Eastern, 15,548,099 miles, revenue, 3,804,220*l.*; Midland, 13,084,287 miles, revenue, 3,139,855*l.*; Great Northern, 9,115,204 miles, revenue, 2,112,150*l.*; Great Eastern, 6,835,163 miles, revenue, 1,915,481*l.*; Lancashire and Yorkshire, 8,227,128 miles, revenue, 8,227,128*l.* As regards rolling stock of the companies just named, in 1867, the London and North-Western had 1,413 locomotives; the Great Western 812; the North-Eastern, 851; the Midland, 623; the Great Northern, 468; the Great Eastern, 380; and the Lancashire and Yorkshire, 455.—*The Engineer*.

Danish Church, Wellose-square.—The Danish Church in Wellose-square, between the Tower and Whitechapel, has been levelled to the ground. The edifice, which somewhat resembled the parish church of Kensington in its ugly nondescript style, was built in the reign of William III., for the use and benefit of the Danish seamen, who appear mostly to have congregated to that part of the metropolis. Inside it, at the south-eastern corner, stood a royal throne pew, intended for the use of any of the reigning house of Denmark. After it had ceased to be used by the Danes, the building itself appears to have experienced more than its fair share of vicissitudes. The lower part of the wall on the north and south sides is now all that is left. The site, an inclosure within the garden of the square, will be devoted to the erection of two new schools in connexion with St. George's mission. Endeavours are being made to prevent the erection on this site, so that it might be kept open.

New Public Offices.—Lord J. Manners asked the First Commissioner of Works if it was the intention of the Government to introduce a bill in this session for the acquisition of the property recommended to be purchased by the Treasury Commission for the concentration of the public offices, and for which the proper notices were given last November. Mr. Layard said a bill was in course of preparation, and when it was presented he would state what portions of the property were to be acquired.

A Welsh University.—It is expected that within two years the university of Wales will be in a full operation. A building, which has been purchased for the purpose, is receiving the necessary alterations, and other requisite steps are being taken.

The Manufacture of a Frying Pan.—A brief description of the *modus operandi* employed in the construction of that familiar domestic article the frying-pan will afford a general idea of the process of kitchen-ware manufacture. It is given in the *Engineer*. The disc plate is first heated, and then placed on the "hed" die of the first of three stamping-machines ranged in a row. The stamp is next released, and the disc receives its first impression, the required shape being completely attained by the two succeeding stamps. To restore the toughness of the iron—impaired somewhat by these three violent operations—and also to prepare it for the subsequent operation of tinning, the pan is reannealed, and then subjected to a systematic process of hammering, in which the hammer is made to fall with the greatest possible uniformity so as to insure a perfectly smooth and regular surface. This process requires a good deal of tact and agility in manipulation, and can only be successfully performed after long experience on the part of the workman. The "stripping" or paring of the rim is the next operation, by which all roughness of the outer edge is removed, after which, by a sort of scraping process, all particles of oxide are taken away. A second "hammering" is then effected before the pan is transferred to the "mounting shop." Here a forged iron handle—made of Staffordshire rods—is riveted on, and the frying-pan is then ready for the final process of tinning. The tinning shop is, as a rule, a large and well-ventilated building, fitted up with a number of vats containing sulphuric acid, and "baths" filled with molten tin. The dipping of the article to be tinned into the sulphuric acid—an operation expressively termed "pickling"—thoroughly cleanses it, and it is then ready for immersion in the tin "bath," which effects the required coating, and renders the article ready for use.

Birmingham Bells for Sydney.—The process of casting a peal of six bells, by Messrs. Bells, for the church at Yass, near Sydney, New South Wales, has been successfully effected. The moulds for this peal were set in the same pit with those for three other bells, including one for Mexico and another for Mr. Walker, of Berkswell Hall, the weight of the entire casting being about three and a half tons. The cost of the peal of six bells for New South Wales, together with the requisite beams, wheels, &c., complete, is about 320*l.* The inscription borne by the tenor bell in this peal is from Psalm cxxvii. 4.—"We sing the Lord's song in a strange land." The whole of the bells came out of the pit perfect, both the inner and outer surfaces being quite clear, and the tone pure.

The Roman Catholic Church of St. Mary of the Angels, Bayswater.—Extensive alterations have lately been made by the oblates of St. Charles to the Church of St. Mary of the Angels, Bayswater. They consist of two chapels ranging laterally with the north aisle, dedicated respectively to the Sacred Heart and St. Joseph; a baptistry at the west of the aisle; and an oratory, entered from and attached to the presbytery adjoining the church, and extending over the corridor leading to the refectory to the east of the first of the above-mentioned chapels. The style is described to us as that prevailing about the middle of the twelfth century. Mr. Bentley was the architect engaged.

A Present from the Queen.—The workmen of Messrs. Chubb & Sons, lock and safe makers to the Queen, have formed a library, comprising about 800 volumes of standard works. On Easter Tuesday they had the honour of receiving from her Majesty a copy of "Leaves from the Journal of our Life in the Highlands," with the following inscription, in the Queen's own handwriting, on the fly-leaf, "Presented to Messrs. Chubb & Sons' Workmen's Library, at Wolverhampton, by Victoria R., March 29th, 1869." Some other libraries have been similarly honoured.

United Presbyterian Church, Dublin.—The first United Presbyterian Church in Dublin has been opened for public worship. The edifice is constructed in the Gothic style of architecture. It is situated in Abbey-street. The centre is covered with an arched roof, supported on Grecian columns arched towards each other by masonry. Semi-wings running parallel along the church add to the space for sittings, for which there is accommodation for nearly 600. At the rear of the church there are a lecture-hall, reading-room, and vestry.

Subsidence of Land.—An occurrence in a field belonging to Marton Hall, Cheshire, has caused a great deal of excitement in the neighbourhood. It was discovered that a circular piece of ground, with a diameter of 60 yards, had, during the night, sunk to the depth of 20 yards, leaving a hole very similar in shape to a cone with the point downwards. There were two trees growing on the spot, but these have disappeared, water having risen to within about 14 yards below the level of the field. Many say that the withdrawal of brine from underneath to supply the Winsford Salt Works has caused the incident. On the same spot a kind of pit, about 8 yards across and 3 or 4 yards deep, is reported to have sunk in the same manner a few years ago.

Gas.—The price of gas at Sheffield is about to be reduced. The present prices are 3s. 6d. per 1,000, and 3s. for all consumed above a certain quantity. It is proposed to reduce these charges to 3s. 3d. and 2s. 9d. respectively.—The directors of the Swanson Gas Company have made a reduction in the price of gas of 3d. per 1,000 cubic ft., the past price being 3s. 6d.—Sentence has been passed upon John Firth, convicted some months ago at the West Riding Sessions of stealing 50,000 cubic ft. of gas, the property of the Halifax corporation. The fraud was effected by intercepting the gas from the mains of the corporation by means of a pipe introduced at a point where the gas could be obtained and used without the quantity being recorded by the meter. The presiding magistrate said the evidence showed that the Halifax corporation had been abominably robbed by a system of fraud which had been carried on for ten or eleven years, and sentenced the defendant to six months' imprisonment, with hard labour.

Tramways for the Metropolis.—The Tramways Committee have given their decision on the three Bills under their consideration. They find that the promoters have established their case so far as regards the construction of the southern line, less the loop between Hercules-buildings and Westminster Bridge; that some limitation must be placed on the proposed monopoly; and that, after a period to be fixed, the street authorities are to have the power of purchasing the tramways; that the police shall have power to regulate the traffic; and that the bye-laws shall be subject to the approval of the Home Office. The other bills have since been under consideration.

Open Spaces in the North of London.—A memorial, with 50,000 signatures appended, prays that her Majesty's Government will interpose on behalf of the public and inhabitants of the northern suburbs of the metropolis, with the Metropolitan Board of Works; and, if necessary, introduce an Act to restrain that Board from building upon, or letting for building, any part of the land purchased under the Finsbury Park Act, 1857, so that the whole of the land so purchased may form the said park, and be devoted to the use, recreation, and enjoyment of the public.

Lead and Rats.—A correspondent has sent us a length of lead-piping eaten into holes by rats in a space of time as short as from Saturday to Monday. It shows that lead should not be trusted to in positions where these "varmint" can get access to it. Greasy matter smeared on a pipe will occasionally induce them to eat through it; and gasfitters have a dangerous propensity sometimes thus to butter their bread for them.

The last new Thing in Sweets.—A London confectioner has appealed to Chancery to protect his copyright in a design for a sweetmeat—an imitation in sugar of an oyster, which is affixed to and sold upon a real oyster-shell. Vice-Chancellor James held that the sweetmeat was a "design" within the meaning of the Act, and granted an injunction.

Emigration of Pauper Children.—The Liverpool Workhouse committee have decided to entertain a proposal from Miss Rye to take all their orphan girls for her emigration scheme, each girl being supplied with 5*l.* by the parochial authorities. Mr. Ratbone, M.P., brought Miss Rye's scheme forward.

Proposed Sale of Painters' Hall.—The court of the Painters' Company, according to the *City Press*, are contemplating the sale of the hall in Little Trinity-lane, without, if information be correct, consulting the body of the livery upon the subject.

Proposed Withdrawal of the Liverpool Borough Architects' Resignation.—Mr. Robson has written to the corporation, expressing a desire to withdraw his resignation; and there has been some discussion on the subject, which has been referred to the finance committee. Some arrangements were being made for the separation of the office of surveyor, from that of architect, and for the settlement of the question of salaries to any future borough architect and borough surveyor.

The Society of Beefsteaks.—It is much to be regretted that a social club of this kind, which has become a part of literary history, should be broken up. It seems to us that the late members of it had really no right to wipe it out as they have done without giving the opportunity to others to carry it on if they would.

Bridlington.—At a recent meeting of the Local Government Board the clerk reported that he had entered into a contract with Messrs. Fraser & Prudhoe, of Sunderland, for erecting a groyne and barrier on the north beach at Bridlington Quay, according to plans and specifications prepared by Messrs. Meik & Nisbit, for 2,379*l*.

An Apparatus for Examining Ships' Bottoms.—A scientific lady, Mrs. Devoe, has invented an apparatus for the examination of ships' bottoms. It consists of a boat, into the sides and bottom of which are let panes of glass, and a series of reflectors and tubes, by which the magnesium light can be thrown upon any part of the ship's sides or bottom.

Fire at the Junior Carlton Club-house.—This club-house has been seriously damaged by a fire which broke out on Monday morning. The newspaper and waiters' room on the ground floor, the billiard-room on the third floor, and the roof were in great part destroyed. The building and contents are insured.

The Royal Society.—The number of candidates for the degree of F.R.S., from which list the council have to select a limited number for ballot, is forty-five. More than one-third of these belong to the medical and surgical profession.

TENDERS.

For re-erecting butchers' shop, Dover, for Mr. H. W. Thorp. Mr. Rowland Rees, jun., architect. Quantities supplied.—
 Reid & Co. £1,219 0 0
 Tunbridge & Denne. 1,150 0 0
 Adeock 1,009 0 0
 Matthews (accepted) 953 0 0

For sewerage, forming, and metalling roads at Colchester. Mr. John Leaming, surveyor.—
 Leo £352 10 0
 Nason & Sons 350 0 0
 Strickson 34 0 0
 Edwards 274 0 0

For building Mechanics' Institute at Basingstoke. Mr. Seymour, architect. Quantities supplied.—
 Jennings £1,250 0 0
 Darwell 998 0 0
 Harras 903 0 0
 Nightingale 843 0 0
 Macklin 830 0 0
 Muselwhite 809 0 0
 Hстал 875 0 0
 T. & W. Hohen 893 0 0

For new offices at Cowfold, Sussex, for Mr. R. Hooper. Messrs. Habershon & Brock, architects. Quantities supplied.—
 Pengoe £233 0 0
 Nightingale 488 0 0
 Porter 461 0 0
 Sharpe 449 0 0
 Fowler (accepted) 435 0 0

For Church at Ore, near Hastings. Messrs. Habershon & Brock, architects. Quantities supplied.—
 Howell £3,285 0 0
 Langridge 4,110 0 0
 Wilkins & Son 4,069 0 0
 Constable 3,851 0 0
 Nightingale 3,867 0 0
 Hughes (accepted) 3,564 0 0

For three cottages, Boundary-road, St. Laurence, Ramsgate, for Mr. Austin. Mr. John R. Collett, architect.—
 Kelson (accepted) £300 0 0

For the erection of chapel, College-street, Chelsea. Mr. J. Hall, architect. Quantities not supplied.—
 Bywaters £1,085 0 0
 Stimpson 1,069 0 0
 Taylor, Pitts, & Fern (accepted) 1,030 0 0

For Queen-street Chapel, Peterborough. Mr. J. Wallis Chapman, architect. Quantities supplied.—
 Chapel. Add for side galleries.
 Jepson £3,675 0 0
 E. & B. Andrews 3,347 0 0
 Thompson 2,848 0 0
 T. & G. Hinson 2,747 0 0
 Halliday & Cave 2,685 0 0
 Hobson & Taylor 2,555 0 0
 Nightingale 2,573 0 0
 Bell & Sons 2,558 0 0

For villa residence at Surbiton. Mr. E. Dates, architect.—
 Cooper & Collem £2,300 0 0
 Johnson 2,205 0 0
 Collins 2,286 0 0
 Nightingale 2,054 0 0
 Fowell 1,953 0 0

For alterations, repairs, and additions to No. 18, Howland-street. Mr. J. B. Wiley, architect.—
 Tull £767 0 0
 Eight 718 0 0
 James 698 0 0
 Foale 680 0 0
 Melville 643 0 0
 Bedford 623 0 0
 Yates 587 0 0
 Robson (accepted on finding security) 455 0 0
 Rankin 400 0 0
 Vickery 375 0 0

For taking down and rebuilding Crown and Mason's Arms Tavern, Cannon-row, Woolwich, for Mr. Edwin Dillhen. Messrs. William Gosling & Son, architects. Quantities supplied.—
 The contractor will be allowed to use any of the materials approved of by the architects:—
 Thompson £1,550 0 0
 Richardson 1,408 0 0
 Wigmore 1,450 0 0
 Hughes 1,120 0 0
 Hunt 1,290 0 0
 Huggins 1,275 0 0
 Wood 1,275 0 0
 Vickery 1,255 0 0
 Williams & Brown 1,247 0 0
 Edgheter 1,200 0 0
 Hohen 1,180 0 0
 Ginger 1,145 0 0
 Harrison & Edwards 1,135 0 0
 Stone 1,090 0 0
 Carter 1,042 0 0

For alterations and addition to a warehouse in Adde-street, City, &c. Mr. Herbert Ford, architect.—
 Moreland & Burton £490 0 0
 Young 941 0 0
 Henshaw 825 0 0
 Conder 898 0 0
 Kilby 769 0 0
 Crabb & Vaughan (accepted) 696 0 0

For reinstating premises destroyed by fire, St. Mary Axe. Mr. H. H. Collins, architect.—
 Williams £975 0 0
 King & Sons 686 0 0
 Cohen 550 0 0

For alterations and additions to a house, Dulwich Common. Mr. H. H. Collins, architect.—
 Robinson £676 0 0
 Stuart & Bennett 640 0 0
 Cohen 559 0 0
 Mitchell 525 0 0

For new banking premises at Tavistock, Devon. Mr. H. Elliott, architect.—
 Call & Pethick £2,240 0 0
 Hoach 2,207 10 0
 Hinch 2,145 0 0
 Condy Brothers 2,050 0 0
 Adams 2,049 0 0
 Matham 2,022 10 0
 Sargent 1,828 0 0
 Walters 1,866 0 0
 Blatnford (accepted) 1,869 0 0

For pulling down and rebuilding 10, Crombles-row, Commercial-road, E., for Mr. H. Jewell. Mr. G. F. Payne, architect. Quantities supplied:—
 Allow for old materials.
 Scrivener & White £1,357 0 0
 Enzor 1,248 0 0
 Harding 1,220 0 0
 Wicks, Bangs, & Co. 1,180 0 0
 Hearle 1,122 0 0
 Moyle (accepted) 836 0 0

For alterations to Roding House, Woodford Bridge, for Mr. C. Ritchie. Mr. J. W. Morris, architect.—
 Arbour £505 0 0
 Rivett 553 0 0
 Hinch 423 0 0
 Stevens 498 0 0
 Wicks, Bangs, & Co. 493 0 0
 Abrahams 404 0 0
 Albertson 409 0 0
 Sheffield 444 0 0

For completion of Church, Kenal New Town, Mr. B. White, architect.—
 Rivett £3,833 0 0
 Hill, Keddell, & Waldram 2,749 0 0
 Kinner 3,165 0 0
 Hearle 3,160 0 0
 Scrivener & White 2,971 0 0

Accepted for the erection of a chapel at Cross Banks, Batley, for the Wesleyan Methodist Society. Messrs. H. Sheard & Hanstock, architects:—
 Mason's Work. £1,247 0 0
 Joiner's, &c. Work. 2,790 0 0
 Plumber's and Glazier's Work. £64 15 6
 Plasterer's Work. £149 14 0
 Slater's, &c. Work. £59 14 0

For alterations and additions to Henley Cottage, Cheltenham, Croydon, for Mr. William Foster. Mr. Houghton Spencer, architect:—
 Giles £1,328 10 0
 Hooper 1,388 0 0
 Falkner 1,078 0 0
 Ward 1,038 0 0
 Farnener 987 10 0
 Wills 949 0 0
 Hunt 795 0 0
 Spencer 770 0 0
 Hall 763 0 0
 Patrick 680 0 0

For Mansion House-street, for Metropolitan Board of Works:—
 Nicholson £24,100 0 0
 Webb & Son 22,716 0 0
 Keeble 22,667 0 0
 Thirst & Co. 22,150 0 0
 Hill, Keddell, & Waldram 21,790 0 0
 Peeson 20,400 0 0
 Webster 19,490 0 0
 Anderson 19,390 0 0
 Yeare & Fry 19,390 0 0
 Mowlem & Co. 19,790 0 0

For enlargement of the infirmary of Paddington Work-house. Mr. Theo. R. Parker, architect. Quantities applied:—
 Merrit & Ashby £11,000 0 0
 Moore 10,449 0 0
 Green 9,945 0 0
 Williams 9,900 0 0
 Wigmore 9,900 0 0
 Manley & Rogers 9,847 0 0
 Croaker 9,790 0 0

The Builder.

VOL. XXVII.—No. 1368.

The Status of the Architectural Profession in the Provinces.

E recollect contemplating, one day, on the lid of a German toy-box of "bricks" for children, a "gilt and illustrated" representation of the supposed actual working of the ancient craft, typified by the contents under the lid. On one side were seen the labourers—the base manual workers—engaged on the shell of a half-finished mansion; on the opposite side, the noble proprietor, at whose bidding the work was proceeding, in the glory of military costume and cocked hat, his horse held by a humble dependant behind him, while before him,

clothed in modest black, and hat in hand, stood the equally humble *Bau-meister*, respectfully presenting a plan for the languid inspection of his aristocratic employer. Judging from incidental hints which turn up now and then, in conversation and in books, we surmise that there is a certain proportion of the British public out of the metropolis whose idea of the dignity of the architectural profession, and of the relation of its members to those who use their services, is very much that which seemed to be indicated in the childish illustration referred to. It has been our painful lot to hear (not without certain inward feelings) the declaration, from people in good society, that they could not by any possibility frame unto themselves an idea of the distinction between an architect and a builder, or even imagine what there could be in architecture to render it worthy to be called a "profession" at all, beside those noble and time-honoured professions, the army, the navy, and the "church," the killing of bodies, and the saving of souls. Certainly, from these views we have only heard from representatives of the old school of "County Family" aristocracy, the Squire Hazeldeans and their daughters, whose idea of life ranges between partridges and county-town balls. But in our current light literature it must be confessed that the architect is not on the whole treated very deferentially. He is commonly looked on as a sort of inferior, a character belonging to the "debatable land" between gentility and rusticity. "Dobbs," says the parson of the novel, "has made a very pretty thing of the church; he is really a clever fellow;" as if Dobbs were the village cabinet-maker, and had just turned out a decent piece of furniture. In one of Mr. Trollope's cleverest stories, the archdeacon declines to listen to Bishop Proudie's complaints of dilapidation in the Palace, hinting that the diocesan architect, "or his foreman," would be the proper person to speak to; and further on the same dignitary counsels one of his brother

clergy as to the alteration of the wine-cellar in his new rectory, with "leave it to me; these fellows" (*i. e.*, the architects) "know nothing about wine." We might certainly go with better hopes of "particular" wine to a contractor's cellar than an architect's, the difference being that between 15 and 5 per cent. upon "work executed." But when we contrast the manner in which the architect is alluded to (if alluded to at all) in the current literature of fiction, with the heroic part often allotted to the engineer in similar works, which teem with interesting engineering heroes with compressed lips, square chins, and broad foreheads; and when we consider the indifferent manner in which a "noble" or "honourable" client often ignores the claims of "his architect" to social recognition (the architect's "assistants" being of course "damned," in a body, by that one fact, as creatures too small for consideration), it is evident that we must either be what our Yankee consins would call "very small pumpkins" ourselves, or that a section of our natural employers must be under a great misapprehension about us.

"They manage these matters better in France." It was the hard lot of one of our professional friends, on one occasion, to travel through part of France in company with a fellow-countryman of the *genus* "snob." "I have filled up my passport," said the latter, "as *landed proprietor*: I advise you to do so; it procures one more respect and attention." "Thanks," was the reply; "I shall content myself with my professional title, and I will venture to predict that my *architect* will procure us more consideration than your *landed proprietor*;" and the event proved he was right. But in England the result would have been the opposite. In France an artist, as such, has a soul to be saved, and a position and title to recognition in good society. Many Englishmen have still in their blood the feeling embodied in Lord Chesterfield's advice to his son, to "pay fiddlers to fiddle for him." Yet with regard to the architectural profession more allowance must be made for the public than with regard to some other artistic professions. It is reasonable to conclude that the pure and unadulterated ignorance concerning architectural design, what it consists in, and why it should be at all, which is prevalent in this country, is at the bottom of part of the neglect with which our representatives are often treated. Most people see definitely what a painter or musician is, and that he does something which no one else can do, even if they look on that "something" as altogether trivial and ornamental. And if we glance at the cognate profession of engineering, and feel aggrieved at the importance attached by the British public thereto, and the popular glorifying thereof in biographies and novels, it must be remembered that the results of engineering skill are of such a nature as to be appreciable by the practical common-sense majority. We may, they think, do without cathedrals or monuments; but we cannot do without railways and viaducts; and every unprejudiced person must admit that engineering has been the great power of the present century, owing to a concatenation of circumstances, and that its professors are those who have recently done one of the most important parts of the world's work. But to the ordinary mind the exact work which has to be done by the architect is something not altogether perceivable, something impalpable, and which cannot be defined to their satisfaction. It is not engineering, they know, and they are told it is not simple building, and what it is precisely they cannot make out; the *raison d'être* of the profession is not clear to them; and it is difficult to know how it can become so, as long as our towns consist of congregated masses of endless ugliness, of itself sufficient to familiarise the eye with all that is mean, and stifle

the desire for anything like beauty or poetry in the disposition of our streets, and towns, and public buildings. Many people, indeed, before they have had occasion to employ an architect, have not the remotest idea as to the nature of the work done in the office; and we have often been witnesses to the unfeigned astonishment of a client at the number and elaboration of the drawings required in carrying out a building artistically. To show wherein the profession really consists, and to vindicate it as something essentially distinct from or superadded to engineering, is not our purpose in this essay, and would lead us to a disproportionate digression from our subject.

We fear, however, that it will scarcely be a fair statement of the case, to represent the present very partial recognition of the architectural profession among us, the want of appreciation of its real importance, as entirely chargeable on the want of right knowledge of a certain portion of British society. There is no smoke without fire. We have referred to French estimation of the profession, as contrasted with English. But the man who goes under the title of "architect" in France represents to the national mind a person educated duly and on a defined and known system; one who has passed through an *Ecole des Beaux Arts*, and has had his period of education systematically apportioned in such manner as to afford him the opportunity of learning satisfactorily the artistic and the practical portion of his profession in due order. But what does "architect" represent in England? It may represent, and happily we are glad to know that in not a few cases it does represent, a very accomplished, clever, and ready man, with a more varied stock of information than most men possess. But there is no guarantee, in the present system of architectural education, for its representing anything of the kind. In the best circumstances, an architect has, amongst us, picked up his own education at hap-hazard, and by his own exertions, commonly made in a desultory and unsystematic manner; and it is only after he has obtained the chance (which many never obtain) of carrying out a work of some importance, that the public can form any idea of his claims to respect as an accomplished professional man. And in less happy cases, it turns out occasionally that the "architect" has been originally a builder, a joiner, a mason, or that he has passed his apprenticeship in some office where surveying and valuation were the chief employments of his principal; and has, in fact, learnt nothing of architecture, properly so called, until the lucky day arrives when he gets, through friendship or interest, a commission to try his hand upon. There is nothing to prevent such a man, when once he gets a start, from representing himself to the public as on precisely the same level with the man who has spent years in studying the history of architecture, and the art of architectural designing; and if we so ill guard the inlet to our profession as to make no distinction in such matters ourselves, it is idle to expect that the public will make the distinction for us, except so far as that in the long run the really able man will generally, by a process of "natural selection," find his level. But again, with regard to those who really are competent and worthy practitioners of the profession, and every way entitled to the rank of "architect," is there so much attention to general cultivation of mind and manner as there ought to be with men who aspire to fill a good position in society? Mere ability and knowledge in his peculiar profession will not in itself render a man an agreeable companion, or one whose society will be sought for or valued by the best and most refined of his fellow men in other professions. And it must be confessed that indications appear, now and then, of a lamentably low standard of education and manner existing among some of those who

are, nevertheless, talented and hard-working members of their profession. We have heard, in no means despicable assemblies of members of the profession, ill-usage of a certain letter of the alphabet to an extent which reminded us of a sentence in the Book of Proverbs, about a "continual dropping;" and we have been startled by the assertion of the architect, that the works of Durandus, and some other Medieval lights, were better literature than Plato and Sophocles, which, for all the speaker knew of the matter, they might have been. This state of things is unfortunate, not only in its immediate results, but because it is also an indication that architecture as a profession is verging more and more into mere fine drawing and diligent copying, qualities which call little or no mental culture to their aid. The architects of the retiring generation were and are, many of them, men of quiet, refined habits, and of good education,—men to whom could be confided the task of planning mansions and public buildings with the view of securing at once dignity, grace, and practical fitness. They may have been wanting in force of character, and both their merits and defects are reflected in their works. The rising generation of architects seem too much characterized by a want of cultivation, an indifference to everything beyond the actual working part of their profession, which infallibly narrows the mind, and cannot advance the profession in the eyes of the educated portion of society. Their main strength seems to lie in clever, rapid, rough-and-ready drawing (*designing*, in many cases, it cannot be called), which they stick to with a diligence and perseverance that enable them to get through a great amount of this kind of work, and make a great show for their trouble; and they are apt to stigmatise "writing" architects as persons who can make admirable theories, but can carry nothing out. But rapid drawing does not necessarily mean rapid designing; often it is a substitute for designing altogether, and is unaccompanied by any real thought or consideration as to the best way of solving the problem committed to the architect. Money is made by the process, and will be made so long as the majority of the public are unable to distinguish between design and mere drawing. But if the new generation of architects elect to give so much of their time and labour to what is in fact merely the preparatory work in erecting a building, viz., the drawing and getting up of plans,—if they neglect the most usual accomplishments of modern education, take no interest in any of the great questions of the day, or in anything beyond the routine of professional work; and adopt a roughness of manner and want of polish, two results will naturally take place,—the more refined portion of society will be content to employ their services, and beg to be excused their company; and the best class of intellectual men, whatever natural talents they may possess for architectural designing, will not care to join the ranks of a profession which does not seem to offer them any work worthy of their energies, or any position in society, except in a few cases, equal to that filled by the members of some other professions, artistic and scientific.

COMPENSATION TO LAND AND HOUSE OWNERS.*

THERE is considerable uncertainty manifested in the volume we are considering † as regards easements. Doubt is expressed whether companies are empowered to purchase any easement, such as the easement of a tunnel instead of purchasing the land out and out (see p. 51), and the case of an arch over part of a manufactory is confused (p. 53). We believe that the effect of all the cases is that, although the parties may agree for an easement, it cannot be taken by compulsion, and an arch over, or a tunnel under, is equally a *taking* within the meaning of the Act. This, however, does not apply to such works as sewers by public boards, who can take such easements, but must pay for the depreciation and damage resulting. Another point rather loosely discussed is that of "statutory owners," as the author calls them, being parties having limited present interests. He fails to say that parties may insist on having life interests or other limited claims settled separately, leaving reversions and mortgages to arrange on their own account.

* See p. 298, ante.

† Ingram on Compensation to Land and House Owners.

The promoters cannot compel the limited owner to sell the reversionary interests; but if they take possession they may deposit one sum in the bank and give bonds to every person interested. A question has often been raised, but not decided, whether, if a claimant does not disclose a mortgage, he or the company should pay the six months' interest in advance in lieu of notice. The claimant receives the 10 per cent. compulsory sale on the whole, including the mortgage.

By a recent Act of Parliament (Railway Companies Act, 1867) a great impropriety in practice has been remedied. In the cases of taking possession of lands under the 85b section it was the law that a deposit of the value, as ascertained by a surveyor (always the nominee of the promoters), should be made in the Bank of England, and bonds given for a like sum. This in the case of owners in fee was sufficiently equitable; but in the cases of lessees, whose injury might be a hundredfold the value of the interest, it was manifestly absurd. (Under the new Act not only is the surveyor now independently appointed, but he is to take into consideration the damage as well as value. The compiler of this book has evidently not been aware of what has been done by bankrupt companies, when at p. 38 he says, as regards the old Act:—"Though the approval of the Justices is provided in case the parties differ" (*i.e.*, as to the sureties), "the sureties may be fixed upon by the company without notice to the claimant. But as the company are bound to deposit the amount of the claim or valuation, as well as to give a bond, no practical harm can arise from this construction.") Imagine a flourishing tradesman, having only a short lease, being turned into the street at a few days' notice, his protection being a deposit of a hundred or two of pounds, and a bond signed by one or two whose names had been appended to other bonds for hundreds of thousands of pounds! And yet this was the case until 1867.

It is not important to notice, except to show the misapprehension which may be created as to the nature of some cases, Wood's case against the Charing-cross Railway. It is mentioned on p. 33, where the plaintiff is described as an "obstinate landowner," the fact being that his land was taken possession of by the contractors for two lines of railway on viaducts without any deposit or bonds. An injunction was thereupon granted. A jury was shortly empanelled, and a settlement effected. The "obstinate landowner" here was in fact an ill-used man; difficulties had previously arisen, and, as usual when a little temper is displayed, were not smoothed away by high-handed proceedings.

As regards deposits, one of the most remarkable of the habitual proceedings of railway companies has never attracted attention nor is noticed in this work, namely, where they are effected by agreement with the claimants. The companies, seemingly as a matter of course, insert in their printed forms a clause by which the deposit is placed in the hands of their own bankers. Whether any such deposit really takes place we cannot say, but even if it does, such a deposit can scarcely be so equitable as when it is in independent hands, and there may be some special understanding between the companies and their bankers as regards interest. In any case it is an inducement to postpone the completion of the purchases. Endeavours, too, are often if not always made to alter the statutory interest of 5 per cent. on deposits to 4 per cent., and as companies have rarely been able to borrow at less than 5 per cent.—more frequently it is 6 per cent.—it follows that, with a part return from their bankers, they may in effect be borrowing from the landowners at about 2, or even 1 per cent.

A few words may be devoted to what is termed "compulsory sale;" the words appear in the index, but the text is on another subject.

It is a very ordinary custom to add a small per-centage to the value of the property—mostly 20 or 25 per cent. on land, and 10 per cent. on other property. In the northern counties, however, a much larger sum is added. This item is another of those lame ways of setting aside a difficulty instead of surmounting it. Prior to the Lands Clauses Act no such item was usual, parties then claiming for extra costs, expenses of reinstatement, loss of interest by delay, and other claims now condensed. In the case of property only, the 10 per cent. probably more than suffices, but in that of a small interest, such as a leasehold occupation of short duration, it is wholly inadequate. We should like to see a more reasonable system adopted instead of

this clumsy and almost lazy way of saving thought by the persistence in generalization. One or two of the assessors very properly set their faces against this item, but we doubt very much if they could with reason object to the equivalent claims under the separate heads. If the per-centage is adopted, it should unquestionably be on a sliding scale, when judgment would once more be brought into play. In the cases of "reinstatements" and "injuriously affecting," no per-centage is added—no one can say for what reason.

The skill of the surveyor is sorely taxed in cases of claims for approaches to land fit for building purposes where it is to be intersected by a railway. In inquiries of that kind the company need not define what bridges they will give, being under the orders of justices, nor can any one foresee what damage may result from any peculiar views of two magistrates.

The class of claims for "injuriously affecting" is perhaps the most anxious and interesting to professional men. The courts of appeal are evidently holding views perfectly consistent, although apparently contradictory, and whether from the varying modes of presenting the questions, or from the many new positions arising, each case seems to be decided upon its own merits. Thus it is that the notorious case of Ricketts v. The Metropolitan Railway in all probability would have had an opposite result but for the evidence on which the appeals were made. It was not alleged, as we think it should have been, that the land was injured; but it was proved that the custom fell off, and *ergo* the damage to the trade depreciated the land. It was not proved that the land had been injured; hence the disallowance of the claim. Nearly similar cases where the claims have been for the depreciation of the land, temporarily or permanently, have been adjudicated on and paid, thus showing that the nature of the proofs deterred the companies from raising any objection.

Very recently, in the case of Knock v. The Metropolitan Railway Company, the liability for injuriously affecting has been materially extended by a claim for injury to goods being allowed: there was a *locus standi* by reason of the property being damaged. How far the injury can be claimed for where the property is not injured it is not easy to say. One kind of case has been now given (since the publication of this book) permanently settled by the House of Lords in the case of Brand v. The Hammersmith Railway. This claim was for vibration and other injury caused by the proximity of the railway, and has been upheld by the highest tribunal. It had been previously held that injury legally ceased when the railway works were completed. It is now clear that the user of the railway may cause injury, to be compensated.

There is a curious oversight in page 59 and the note thereon, where it is stated that juries cannot legally give damage for other land than that taken. Sections 49 and 63 in the Lands Clauses Act alike authorise juries, justices, and surveyors, to assess all values and damages that can be foreseen,—indeed, the words of the clauses are identical. In the case of juries they may be given separately, but it is difficult to say for what purpose, unless it is to fix the stamp duties on the necessary deeds of conveyance.

It probably never was intended that in cases of property injuriously affected, when held by tenants for less than a year, they should be entitled to either an arbitration or jury where the claim is over 50l. This power sometimes more unfairly presses on a company than if they had the same right if the property was taken, because in the case of an injury only it must naturally be less than if the whole were taken, and the proportion of costs to the claim is proportionately greater, and it appears to have been the main object of the framers of the Act to avoid costly modes of settlement in small cases. The avidity, however, with which claimants seize on opportunities of having either juries or arbitrators shows that the Justices have not earned a character for sympathy with them.

The almost universal feeling of magistrates seems to be against claimants, but there have been some extraordinary exceptions; a change certainly seems to be demanded, because they have not the professional skill and knowledge to come to a conclusion of themselves, and the course of proceedings before them does not tend to enlighten them. Their jurisdiction would very properly be limited to cases where less than 50l. is claimed, or there should be a few selected

Justices. There is no inducement to make them acquire amongst themselves what is done, so as to obtain a greater unanimity and certainty in their decisions.

It is not generally known that a yearly tenant, having received a notice, can summon the company before any two justices acting together in petty session. This is not noted in Ingram's volume simply because no "esse" has arisen from it.

One of the greatest hardships we are aware of is created by bargain made between owners of small property and railway companies for empty possession, which means that in consideration of a larger sum of money the owner undertakes to give his tenants notice to quit, thus saving the company the compensations to the occupiers, and turning them into the street without recompense. To their honour he it said, most of the metropolitan companies have generally refrained from this hard bargain.

Two statements are made, the first, we suppose, founded on some case (which, however, is not quoted), that "a lease is entitled to compensation for (*inter alia*) the loss of his chance of a beneficial renewal." It was so in some of the early special Acts, but so far is it from being the case now that, except in the case of customary renewals, where some special rights exist under the Ecclesiastical Acts, even a power to determine a lease is taken advantage of, and the onus is to value only the shortest term. We acknowledge the severity of this arbitrary proceeding, but so long as the courts recognise the right of a railway company to determine tenancies when they have acquired the ownership, the converse cannot be maintained in the case of leases. The second statement is on page 64, where the foregoing case is flatly contradicted, and cases are cited to show that no claim for "chance of renewal" can be sustained.

Throughout the work the writer has confounded the word taken with required: the result is positive error. In the one case a yearly tenant has a right to a jury or arbitrator, and in the other he must appear before justices. Constantly the expression "required and taken" is adopted. There is no such expression in the 121st section, but that used is "required to give up possession." In page 181 this want of precision leads to a decided mis-statement on the subject.

We are brought now nearly to the close of the matter, and "costs" form the only point desirable to be noticed.

In all preliminary matters, and in settlements by agreement, no costs are legally payable. It has become a custom to do so, but the amount is absolutely under the control of the purchaser. The legal fact is stated in the book, but not the custom. When, however, the claimer has been "tried," costs are payable by the promoter, unless, in ordinary language, they have a verdict, *i.e.*, the sum offered has not been exceeded, in which case the costs are, as it were, divided. The mode of taxation, however, are very unsatisfactory: up to last year arbitrators very properly settled the costs. This appears to have displaced the companies who have succeeded in getting all costs taxed by the Masters of the Queen's Bench, there being a bill now before Parliament to complete the references of costs to those officers. In one respect only it is better, and that is the somewhat certain scale on which costs will be allowed, leaving it open to claimants to make an item of "extra costs" in their demands. This volume has not quite accurately given the law on taxation as it stood; but as probably the bill above named will pass, it will become accurate by anticipation.

We are amazed at one of the assertions on page 200, to the effect that it is extremely doubtful whether in the cases of "injuriously affecting," if no offer be made by the company, the claimant is entitled to the costs of the inquiry. The author can know nothing of the every-day proceedings of every company where these costs are as undoubted as in any ordinary action. Again, at page 202, a doubt is suggested whether lessees are entitled to half costs in a certain case. He must mean liable, as the company invariably pay the expenses of the court; and at page 203, because a lessee is not strictly an "owner," he may not be entitled to costs, "but the courts might, and probably would, interpret the word 'owners' so as to include all claimants." We think so too. We may add, that it never seems to have entered into any other mind that lessees' costs could be evaded.

The costs before justices are in their discretion, and vary in assessment as much as in their other

"discretions." Counsel, solicitors, and scientific witnesses are frequently employed, and yet we have known two guineas allowed for costs of the inquiry.

In the cases of apportionment of rents by justices, there is no power as to costs. This appears to have been another oversight in the general Acts.

Amongst the special railway matters as different from those of other public bodies are questions of certain kind of "injuriously affecting." In the case of interference with light and air, for instance, railway companies cannot be interrupted, but the claim must, once for all, include every anticipated damage. In the other cases the injury must be first complete, and a second inquiry in an action at law must be held, or the works can be stopped as in the case of ordinary adjoining owners. This, however, is not explained here, because it only arises in practice.

There are many other subjects to which we could call attention; but we have written enough to show the great interest pertaining to such a volume as this: and it would become a treatise instead of a review were we to extend this notice further. We cannot but hail this edition of a work especially designed as a book of reference.

HÔTEL DIEU, PARIS.

It seems that all the forces of the town of Paris are really concentrated upon the early completion of even a portion of the new Hôtel Dieu. All the best masons are there congregated, and if it were objected that the new theatres, operas, or the Château d'Eau are left nearly at a standstill, the reply would be, "The poor first." This vast structure is laid north and south, and stands upon a surface of nearly 5½ statute acres.

As to the site, various opinions have been put forth by professional men, medical and architectural, with regard to the propriety of keeping this hospital in the heart of the city, and they have rightly urged its removal. Some medical men state that, although the building is far advanced, the proximity of the Seine will be fatal to the inmates, and they want to change the destination of the new house.

The hospital is to contain 800 beds; but it will not receive generally more than 700 and odd sick, the wards for the remainder being reserved for cases of emergency, when a sudden change is prudently advisable from one ward to another.

Six pavilions, isolated on three sides, are to contain wards, one over another, of twenty, six or thirty beds; thus the fatal crowding of the inmates will be avoided. These pavilions have only two stories. This is to facilitate the circulation of air throughout the building. Chambers containing from one to ten beds are to be provided for those patients who require isolation.

The main ventilation is to be effected by large windows opening out on the façades of the pavilions. M. A. Tardien conceiving that it was impossible at all temperatures to obtain a sufficient supply of fresh air by these means, the authorities are preparing to install a system of artificial heating and ventilation combined. M. Tardien states in his own words:—

"Des ventilateurs mms par la vapeur font puiser l'air à une grande hauteur, cet air, après avoir circulé dans les calorifères, suivant les besoins du chauffage, débouche par des orifices disposés dans l'axe de chaque salle. Il s'éleva jusqu'au plafond et redescendra par couches successives pour servir à la respiration et à l'entraînement des miasmes. Quant à l'air vicié, il s'échappera par des ouvertures ménagées au niveau du plancher et aboutissant à une vase chimique, où un appel énérgique sera, entretenu et comme liver par la chaleur du réservoir d'eau chaude. Cette ventilation artificielle pourra porter le renouvellement de l'air à plus de cent mètres cubes par heure et par lit."

Hoisting machines, cranes, and hydraulic lifts are to be adopted. In fact, of all that modern science, ingenuity, and skill can apply to the alleviation of the sufferings of mankind, none will be found wanting,—they say.

THE TALKED-OF LAW COURTS.

WE must leave off saying the proposed Law Courts, for the whole matter is now in abeyance again. The present Chancellor of the Exchequer deals in surprises. After the advocate of the Embankment site and the Strand site had done their very best in support of their different views, the Chancellor of the Exchequer made a very elaborate speech, showed the House that the undertaking as it then stood would involve an expenditure of something like four millions in

stead of the one million and a half originally contemplated, and that the cost would fall on the public, notwithstanding what had been said to the contrary. It had been assumed, he continued, that there were only the two alternatives of Gargy-street and the Embankment; but he believed there was a third plan which he hoped the House would accept. There was a street called Howard-street, which ran half-way between the road on the Embankment and the Strand, parallel to both. Above that street the property was of considerable value, consisting of very good houses in Norfolk-street, Arundel-street, Essex-street, Surrey-street, and the Strand. Below it was of a very inferior character, consisting of premises of different kinds, which had been left, as it were, derelict by the Embankment. He believed that a piece of land, amounting to six acres, between roads 100 ft. wide, might be purchased there for 600,000. He was advised that on that piece of land might be erected buildings which would hold all the courts of justice, all the ancillary offices, and several others not so ancillary, and that it would be a high estimate to put that down at a cost of 1,000,000. So that together the cost would only be 100,000, more than the original estimate. All that might be made, without great expense, extremely ornamental on the side facing the river. On the other side, towards the Strand, not being exposed, it would not require to be so ornamental. For the façade of the building, he would suggest to the House to consider Inigo Jones's magnificent design for a palace for Charles I., which was to have consisted of a great quadrangle, occupying all the land between the river and the Horse Guards, with a façade of 874 ft. to the river. The plans and elevations of that building were in existence, and he would entreat the House to give every consideration to a scheme which had been the result of much consideration and of many anxious inquiries.

Ultimately the debate was adjourned, the Government accepting the responsibility of bringing forward a scheme.

It is obvious that if the plot of land pointed to by Mr. Lowe is sufficient for the building required, it must be a very different building from that necessitated by the Commissioners' instructions. A more remarkable piece was probably never made by a Royal Commission than that which is now before us.

OUR ANCIENT CASTLES.

At the last meeting of the Bath Literary and Philosophical Association, Prebendary Scarth read a paper on "Castellated Architecture," in which he described the castles of various periods.

At the close, the chairman, Mr. J. Goodwin, F.S.A., said that one feature in the paper they had all listened to with so much pleasure was to him of very peculiar interest—namely, the effectual way in which the Rev. Prebendary Scarth had dissipated the idea, very diligently maintained by authorities of no inconsiderable repute, of the remote antiquity of existing remains of castellated architecture in this country. Only that afternoon he had read a work of reference, far from meagre thought of, that the castle of Richborough, near Sandwich, in Kent, was not only built on the ground plan of the ancient Roman stationary camp in that locality, but retained features of the original Roman architecture; whereas if they looked to authentic illustrations they would find that only a few bare walls were standing, and it was very doubtful whether anything earlier than of Norman date was now extant there or in any other castellated remains in England. Even the Saxons, as explained by the lecturer, had left very little, if anything, of the kind behind them, and he strongly inclined to the opinion that it was to the massive solidity introduced by the Normans that they must look for the first and best examples of castellated architecture that had descended to us from early times.

Why upsetting the belief that there are in this country remains of castellated architecture of remote antiquity should give any antiquary particular pleasure, is not very obvious. The truth is, of course, pre-eminently desirable; but one school of antiquaries of the present day seem to think it their mission, oddly enough, to prove all English antiquities modern. Mr. J. Goodwin can scarcely know Richborough, except from the illustrations of which he speaks, and possibly has never seen Pevensey.

A NEW CATHEDRAL FOR CRAFTON, AUSTRALIA.

DESIGNS for a new cathedral at Crafton have been made by Messrs. Slater & Carpenter, and will be taken out by the Bishop of Crafton and Armidale, when it is expected a commencement will be made at once. The plan consists of a nave and aisles, 72 ft. long and 42 ft. wide; choir 38 ft. long, and of the same width. There are two towers placed to form quasi-transpts, as at Canova and Exeter; these are of lofty proportions, with shingle spires. The detail is necessarily very simple; the arcades have moulded caps, and only one order for the arches. Above is a clearstory of lancets forming internally a continuous arcade. At the east of the square-ended choir, are three arches opening into the octagonal chapter-house, communicating also with the ambulatories, as in "Becket's crown," at Canterbury (if the comparison indeed could be allowed). North and south of the chapter-house are placed the vestries, with porches opening also into the ambulatories of the choir. The chapter-house is finished with a high pyramidal roof, and over the three eastern arches of the choir is a large rose-window, with an internal enclosing arch. Stone can be procured in the neighbourhood of Grafton, but all skilled labour is very dear and scarce; it will therefore probably be many years before the chapter can enter their cathedral in its completed state. The choir will be first undertaken, and the works will gradually extend westwards.

THE HOLBORN VALLEY IMPROVEMENT.

This important work, long delayed, at last approaches completion. It is stated that the main line will be so far finished that the traffic may be expected to be resumed during this present summer or autumn.

After many years consumed in consideration of various schemes and in endeavours (not always happily resulting) to reconcile conflicting interests, the plan now being carried out was decided upon, and Mr. Haywood, the engineer to the Commissioners of Sewers of the City of London, was instructed to proceed with the necessary works. These have been in progress since May, 1863, and have been carried out without accidents of any consequence. The nature of the works themselves, and the delays in effecting the demolition of the old structures and roadways, embarrassed, too, by much litigation, are given as answers to those who complain of delay.

All passengers who remember the dangers and discomforts of old Holborn-hill will appreciate the relief afforded by the wide and level road which now spans the valley between Hatton-garden and Newgate-street; the necessity, in fact, of this new viaduct is so apparent, that in a year or two the public will scarcely think it credible that so obvious an improvement could have been so long delayed. Not only will the new viaduct afford a continuous line for traffic between the West-end and the City, but it will cause a large amount of most valuable land now lying nearly unemployed to be made immediately available for building purposes. In the neighbourhoods of old Smithfield, Snow-hill, and new Farringdon streets, already large warehouses and other commercial structures are rapidly rising, and in a few years the Holborn Valley Improvement will be the substantial centre of almost a new part of London.

The nature of the undertaking may be thus described.—Commencing from the Holborn end, the first feature is a wide circular open space, called the Holborn Circus, resembling its namesakes in Oxford-street and Piccadilly. From this the new road starts in continuation of the present line of Holborn, and takes an easy curve of about a quarter of a mile radius to the iron bridge which crosses Farringdon-street. On the north side of this circus Hatton-garden opens, and immediately near to it, on the north-east of the circle, is the commencement of a lateral road, which will presently be described. Upon the opposite side is the new entrance to Bartlett's-buildings and the intended opening into a projected street, at present terminating in St. Andrew's-court and Thavies-inn, which is to run diagonally in a south-westerly direction, and join Fleet-street near the site of the present Temple-bar. The width of the Holborn continuation is 80 ft. Before reaching the bridge over Farringdon-street, the road is carried by a smaller girder-bridge over Shoe-lane, and passes close to the Church of St. Andrew, Holborn,

removing a large portion of the present church-yard, and all the houses that formerly stood upon that side. Continuing on nearly a perfect level with the surface of the street at its point of starting, the new road crosses at Farringdon-street at an angle by means of a skew bridge, and thence passes up what was formerly Skinner-street, until it reaches the western end of Newgate-street. This forms the main line or simple viaduct of the Holborn Valley; but growing out of this are two secondary lines, scarcely less important.

The first of these is a new street starting from the Holborn Circus, and continuing in a north-easterly direction to Farringdon-road, immediately opposite to the new street leading to Smithfield Market. These roads will be 60 ft. in width, forming a continuous thoroughfare to the market and to the North-east of London. In connexion with this Shoe-lane is widened to 30 ft., and, passing under the viaduct, connects with a second auxiliary street, which, beginning at Farringdon-road, is carried nearly parallel with the viaduct for some distance, and then unites with it by an easy curve by the side of St. Sepulchre's Church. This street will join King-street, and thus give another line of access to the new market. With the buildings to be erected on either side, it will take the place of what was once known as Snow-hill.

The present level of the road-surface of a portion of Farringdon-street will be raised, so as to form more easy gradients for junction with the side streets.

Access is gained to the upper level of the roadway over Farringdon-street by steps for foot-passengers, enclosed by uniform buildings at each of the four corners of the viaduct. These buildings are intended as shops and for other commercial purposes, and form substantial abutments for the springing of the viaduct. The architecture of each of these is uniform, the style being a free rendering of what we suppose must be called modern Italian, a convertible and yet appropriate name for that which has not the pointed element too freely prevailing, and owns desire for beauty and common sense with some slight reference to Classic as its parents. How these four buildings will appear in reference to their position with the line of angle of the roadway, is an open question. Rectangular structures applied to a "skew" plan are always ticklish things to manage, and as the buildings are as yet not sufficiently developed to fairly allow a judgment to be formed, we shall be curious to see how Mr. Haywood's ingenuity escapes a somewhat difficult dilemma.

The impression left upon the mind after a first leisurely walk from Holborn to Newgate-street on the top of the new roadway is of a wide and level thoroughfare raised above the old pavements, and of a spacious bridge crossing the busy thoroughfare of Farringdon-street below. The improvement is so grand and yet so simple, and the direction taken by the new road so obviously the easiest and the best, that difficulties of construction and engineering details are in a manner lost sight of, and it is not until the work concealed from the eye is divined into that the true nature of the undertaking is understood. To know what has been accomplished, and to appreciate rightly the work, an observer must leave the upper level and penetrate the interior; to comprehend his subject he must do as all patient learners do, commence at the foundation.

The problem that the engineer had to work out appears at first sight a simple one. The postulates were a bridge crossing the great artery of Farringdon-street, and a level causeway on either side from Holborn on to Newgate-street. Then came considerations of detail that soon assumed a complex and difficult shape. Sewers, and gas, and water pipes had to be carried, levels had to be regarded, and connexions with lateral thoroughfares had to be maintained. Then arose questions of modes of construction. Obviously a solid embankment was not possible, and an open arcade would be a waste of valuable space. So the design gradually shaped itself into what may be briefly and accurately described as a plan consisting of two lateral passages, one on either side, supporting the pavement, and cross arches forming vaults between, and carrying the carriage roadway above.

As the great depth of the Holborn Valley caused the viaduct to be of considerable height at its point of crossing Farringdon-street, the engineer took advantage of this to subdivide his vaulted passages into stories, and there are accordingly one, two, and three as the dip of the

level permits. First is appropriated a space for areas and vaulted cellars of the houses, and then against these is at top a subway in which are the gas, water, and telegraph pipes; then a passage, and below these a vaulted chamber constructed with damp-proof courses through its walls, and of considerable depth, at the bottom of which, resting on a concrete bed, is the sewer. The sewer is intended to be open, and the accumulation of foul gases is expected to be prevented by upward ventilation; but as a matter of passing criticism we would suggest that there seems a source of trouble in prospect which might readily be obviated by constructing an enclosed sewer in the ordinary manner, and using the ventilating flues and pipes (that are provided for the purpose of carrying off effluvia) from the sewer direct instead of from the large chamber in which at present it is placed.

The height of these subways is 11 ft. 6 in., and their width 7 ft.; they are constructed of brickwork, excepting where carried over the London, Chatham, and Dover Railway, at which point they are of tubular form, and are constructed of iron. The subways are interrupted in the level course at the crossing of Shoe-lane and Farringdon-street, and dip down under the lower level by means of vertical shafts. In this connexion a question arises as to the means to be adopted to relieve the great pressure upon the water-pipes caused by this descent and ascent.

The subways contain ventilating shafts which are connected with trapped gullies in the roadway above, also with the pedestals of the lamp-posts perforated for the purpose, and with flues specially directed to be left in party walls of buildings,—all these contrivances being specially made for the carrying off of gases that may escape, especially from leakage from the gas mains. It is not anticipated, however, that the difficulties arising from this latter source of trouble will be so great as some supposed. It is well known that an enormous loss annually occurs to the gas companies from defective joints, the evidence of saturation of the earth around them showing invariably a most formidable leakage; but we have always been of opinion that this waste should not exist, and it remains to be seen whether true economy will not be found in a system which permits the pipes to be always accessible, and compels better workmanship by leaving it constantly exposed to test and examination. The temptation to conceal bad or careless work by burying it in the earth is too great for most workmen to resist. As it is, in these subways, defective joints will soon tell their own tale, and the smallest possible escape will be soon detected and easily stopped. It should be the policy of the gas companies to have men specially employed to examine the mains in the subways, and there is no doubt that the more careful workmanship that exposure of the whole pipe must necessitate will result in a gas-tight joint and a sensibly diminished waste. Provision is made for the easy ingress of workmen and materials, and the subways are lighted by means of gratings fitted with globes of thick glass. Their ventilation has been already alluded to.

The extensive range of vaults under the centre of the road is calculated to yield a considerable revenue. They are large, commodious, dry, and of an agreeable temperature, and for storage of goods and other commercial purposes may fairly be expected to be gladly appropriated. They will have tramways laid through them for the more easy carriage of goods, and the entrance to them will be in the abutments of the bridges over Shoe-lane and Farringdon-street.

The plan and sectional views that we give will make the mode of construction thus briefly described readily understood.

The extent of the viaduct from Holborn to Newgate-street is about 1,400 ft. in length, and the width between the building line 80 ft., affording space for a 50-ft. carriage-way in the centre, and two pavements, each 15 ft. wide on either side. The brickwork is composed of stocks, with Calt facings from the Medway, and the cement is Portland. The stone of the buildings is Portland, and the granite, black Guesney, red Ross, and Mull, with Aberdeen. The surface of the carriage-way will be paved with cubes of granite 9 in. by 3 in., hedged on fine ballast 4 in. thick, resting on concrete 12 in. deep, lying on coarse ballast, with a layer of 3-in. asphaltic next to the brick arches. The side pavements will be laid with 3-in. York flags, with perforated gratings, as before described, to light the subways.

The quantities of materials so far employed, may be roughly stated at about 16,000,000 of bricks, between 50,000 and 60,000 yards of concrete, 120,000 yards of digging and carting, 25,000 tons of stone, and, including the bridges, but exclusive of water and other pipes, about 12,000 tons of iron. The cost of the works can scarcely at present be approximated; it appears probable, however, that the construction account will seem small compared with the cost of purchase of site, settlement of compensation with owners and occupiers, and the money sunk in much unfortunate litigation.

The bridges afford the principal opportunity of ornamental display, that over Farringdon-street being the most important. This is constructed with cast-iron girders covered with flanged corrugated plating, and crosses the thoroughfare at an angle. It is divided by rows of piers into three spans, the outer rows resting upon the curb of the pavements. These piers, as well as the half-piers of the abutments, are of polished granite, very boldly wrought, and effective in design. The ornamental metal enrichments of the open girders is simple in its general arrangement, and far from commonplace.

The leading idea is of circular panels, connected by scroll work, and filled with emblematic devices, in which the civic emblazonry and the well-known griffins are appropriately conspicuous. The outer central piers dividing the pavement from the carriage-road, are carried above the railing on the parapet of the bridge, and terminate in pedestals on which are to be placed four stone statues of civic worthies of older times, which, when in place, will be well seen, and will form effective features. The panels composing the balustrading are already partially placed, and from the decoration that is hinted at by a small specimen on the northern front, promise to be light and cheerful, with colour and gilding, as well as of a substantial character. The ornamental castings, by the way, throughout struck us as clean and good, the artistic details being sharp and well preserved.

The height of the Farringdon Bridge will be 16 ft. at the curb, and a minimum of 21 ft. in the centre. At present the apparent altitudes exceed these; but, as before remarked, the surface-level of the street will be raised.

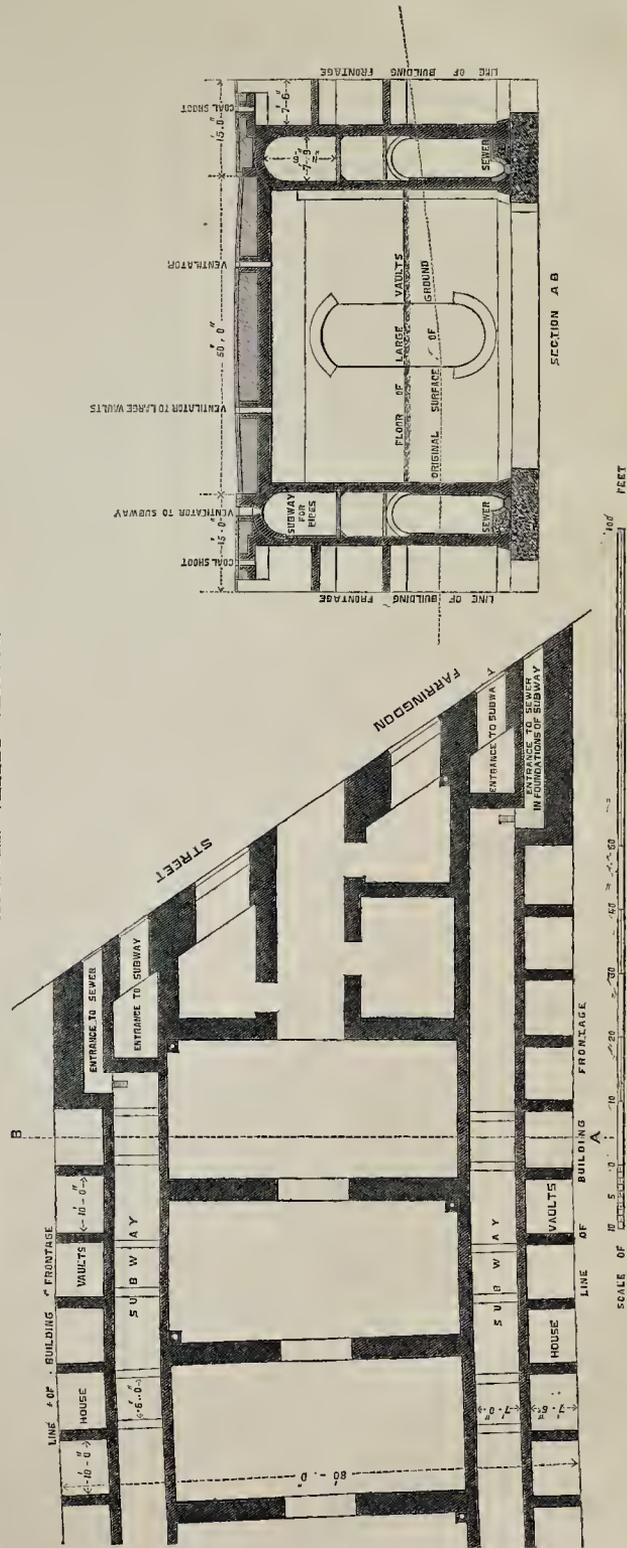

When completed, the effect of this wide level thoroughfare will be very satisfactory, and nowhere do the domes and lanterns when seen from the centre of the Farringdon Bridge. Much, of course, must depend upon the style and finish of the new buildings that will line its sides; but from present appearances it is not to be supposed that they will be otherwise than well designed, and of ornate and costly finish.

A large and handsomely embellished building for Messrs. Negretti & Zambra is rapidly approaching completion from the designs of Mr. Waterhouse. This stands upon the corner of the Circus at the junction of the new street, and next to it are the new premises for the Messrs. Fearon, the wine-merchants, in a similar state of forwardness, and for whom Mr. F. W. Porter is architect. Close by in Holborn is the site for a large building intended to be erected under the direction of Mr. Lockwood.

During the demolition of the old streets and houses nothing of any special value or interest was brought to light; the most noteworthy being the frequent discovery of all sorts of concealed passages for escapes and nooks for hiding plunder in the villainous old houses of Field-lane and its unsavoury neighbourhood, the removal of which alone should cause the Holborn Valley Improvement to be considered a blessing to this part of London. In carrying the new road through St. Andrew's Church-yard, a large slice of the ground was required, and this compelled the removal of a great number of human remains; between 11,000 and 12,000 were therefore decorously transferred to the City Cemetery at Ilford.

It now only remains to mention that the works of this important and most beneficial improvement are being carried out by the Improvement Committee of the Corporation of the City of London, from the designs and under the supervision of Mr. William Haywood; Mr. Robert Lidstone acting as his principal clerk of the works. Messrs. Hill, Keddell, & Waldram are the contractors for the whole; and the charge of the ironwork of the Farringdon Bridge, and of the greater portion of the remainder, is in the hands of Messrs. Cochrane & Groves.

HOLBORN VALLEY VIADUCT.

Plan of Part of Viaduct next Farringdon-street.

INSTITUTE OF PAINTERS IN WATER
COLOURS.

The summer exhibition of the Institute of Painters in Water-colours is less distinguishable than could be wished from the collection shown during the winter months, and this arises principally from the want of ambition amongst the younger members, who might be supposed to share a desire to support the *prestige* of the society, and may be espahle of the undertaking. The figure draughtsmen, with the exception of those who for years past have supplied the leading pictures at this gallery, show a want of inventiveness that in itself is very astonishing, and a harneness in conceiving the simplest incidents more astonishing still.

There are numerous small drawings that have scarcely cost as much thought as many an inferior magazine illustration, and that might have been acceptable in a gathering of sketches and studies, but leave no favourable impressions as finished works; for in too many cases the maker is not worth the method employed in making the most of it.

In landscapes, however, in coast-scenes, interiors, exteriors, and still-life, or in any respect where thought and creative faculty are less to be exercised, and executive skill is the great desideratum, the collection is rich, and in choice examples. A too ready excuse may always be found in the assertion that demand influences supply, when it would be more just to remember that the better quality of the supply would more certainly produce the demand. Mr. Louis Haghe's drawings, of which there are half a dozen this year, display most of the characteristics common to all he does. Well-selected themes to invest such capabilities as he excels in, are (37) "St. George's Chapel, Windsor: Burial of King Charles I.," and the hedchamber in which happened "The Arrest" (28) of the monarch; though the incidents depicted are of less consequence than the studied and ably represented interiors: by dint of clever light and shadow arrangement and sombre rich colouring, they are made very interesting.

"Cromwell on the Morning of the Battle of Naseby" (93); the Republican hero reading in his tent, his hard, stern features illuminated by the light of the lamp, is a more important production, rising to the dignity of historical illustration, and a very impressive and suggestive portrait. "Reading the New Sonnet" (157); the poet himself, perhaps, attired in black, surrounded by a well-dressed assemblage of late eighteenth-century fashion, is—doing as Sterne used to do—treating some of his acquaintances with the first taste of his latest effusion: this again is very remarkable for the apposite style of the room, furniture, and appointments, and a very pleasant example of the master.

Mr. E. H. Corbould is not so strongly represented as is customarily the case; but, as usual, his drawings are conspicuous for clearness and brilliancy, as well as for force. (63) "Joan of Arc forsaken," though little more than a single figure, is at once to be identified by the precise drawing and well-selected costume and equipments: the horse appears rather small, and there may be some difficulty in finding legs for some of the dead warriors, but there is this to be said, they will not require them again even if they are found. "My Grandfather's Choice" (16), a hepatched, bepowdered beauty of certain uncertain age, in qualified pink drapery, and with an unqualified green fan; and a ladylike, agreeable portrait of "The Lily of Oakwood" (40), form his share in the exhibition.

Mr. Henry Warren, besides a subject—enclated on a large scale—from Biblical history, "Abraham purchasing the Field and Cave of Macpelah" (143), with its correct redaction of Eastern habits and observances, has an "Arrival at the Well" (13), with (109) a procession conveying "The Queen of Sheba on her Way to visit Solomon," to represent him.

A study for the last work that had engaged the ntring industry and valuable acquirements of the clever, amiable Mr. Edward H. Wehnert (15), "Galileo before the Inquisition," a quaint fancy portrait, "Pavonina" (117), by Mr. J. M. Jopling; and two life-size companion-pictures by Mr. Guido Bach, very deftly, but somewhat slightly done,—(175), the one, of a pretty, perplexed maiden, whose thoughts may be supposed to be not totally concentrated on the means of bettering herself, since her adoration to the monk, "Father, advise me," implies some divided in-

clinations; and the other, "The Appeal" (181) of a rugged-faced petitioner of the rougher sex to a knight of mundane ideas with regard to favour, who shows no divided inclination, for he looks quite determined not to allow the appellant to get the better of him,—are amongst the more ambitious performances to be noted. Skillfulness, again, and careless drawing deteriorate from the claims of Mr. Bach's classical composition (198), "Psyche, having lost Cupid, appeals to Pan for advice to aid her in his recovery." There is so little needed to make this a favourable example of the pure resources of water-colour—emulating the qualities of fresco-painting—that the failing is the more observable and disappointing.

"A Mistake" (12), by Mr. Valentine W. Bromley, made by a gallant at a masquerade: he has declared his love to the wrong lady. It would have been a more sensational situation had she been a wronged lady, and in that the artist has missed a point. There is good workmanship to recommend good colour in this, but a want of story. Were the loved one rather more lovely (123), "Kiss and be Friends" would be a charming drawing; it indicates no common taste for refinement, and an originality of idea in treating simple episodes of an ordinary life's history so as to invest them with a peculiar interest. Such is the passing anger of an impetuous hoy-lover, who, after a tiff, is leaving the castle-home to chew the cud of an alternative dose that checks his sanguine hope of everlasting worldly happiness, armed with a weapon to bring down the deer—with more chance of success abroad, he it hoped, than he has had with the dear within walls, who, however, relenting, follows him to invite reconciliation before the wound should rankle. "The Ferry" (158), also by Mr. Bromley, is another short chapter of romance very well told, but of less merit than the former as a picture. "Persuasion" (22), by Mr. C. Green, is more remarkable for the care with which the variety of articles dealt in by the broker are made out than from much that interests in the pair, who, about to pair, are buying furniture, or in the persuader, who is trying to dispose of a clock to the best advantage.

(66) "A Cup of Tea," "The Writing Desk" (232), "Contentment" (234), and "The New Novel" (236), are nicely manipulated, and serve to indicate the nature of many of the items to be found on the walls and screens this year. "The Doubtful Coin" (45) that a tenant has offered to the steward amongst his rent-money, by Mr. H. B. Roberts; (57) "A Question of Time," the lover pleading his suit to a lukewarm listener, with a sundial to divide them and serve for their support—one of Mr. J. Absolon's prettiest productions on this occasion; (51) "Rhoda," more subdued in colour than usual, by Mr. A. Bouvier; more love-making, as described in "Enoch Arden" (207) and by Mr. G. G. Kilburne, are also noteworthy. With a photographic distinctness of outline and the utmost finish that could be lavished on this, throughout there is a want of vitality inseparable from camera reflexions. Both silent and loquacious swain, with "that one girl" on whom "either fix his heart" appear to have a very cool idea of the affections. Enoch is speaking his love, whilst Philip is like the parrot that said nothing, but thought the more.

"A Candidate for Adoption" (202), by Mr. A. C. Gow, selected by a wealthy lady from an orphan-school, is a pretty subject; "Old Comrades" (247), a monk, perched on the garden-wall of the monastery, conversing with an armed and mounted man of war about old times, when peace was not so compatible with his happiness as now,—an elaborated and clever drawing; and "Chamber Practice" of an old gentleman who is desirous of becoming an adept at fencing with other than fornicatory adversaries, are all distinguishable among the more valuable examples present. "Faust and Marguerite" (163), the garden scene, by J. D. Linton, is more curious than pleasing. Neither hero nor heroine has much in the way of personal advantages to boast of, and they, with their surroundings, are so lighted up with reflected light as to suggest a phosphorus diet had been prescribed for them by their worthy friend and enemy, Mephistopheles.

(178) "Near Selborne, Hants," by Mr. George Shalders, is unquestionably a most astonishing and perfect production of its class; though but a composition embracing an expansive tract of country with numerous sheep feeding and replying to be influenced by the effect of a gorge-

ons sunset sky: the harmonious brilliancy of the whole is to be marvelled at. Mr. Mole, if he do not work with an incredibly rapid pencil, must be indefatigable. No less than fourteen emanations repeat his name in the catalogue, though they are not all of the calibre of (39) "An Autumn Evening in South Wales," his principal work.

There are numerous landscapes of a very high degree of merit, charming drawings by Mr. H. G. Hine for witness, "On the Downs, near Willington, Sussex" (41), from eight or nine specimens; (17) "Reef at Peveril Point, Swanage, Dorset;" (27) "Downs near Folkington, Sussex;" and an unpretentious rendering of "Gravesend Reach, from Milton, Kent" (183). Others of the sea by Mr. J. G. Philip, such as "Rescue of a Derelict Ship" (15), "Effect of a Gale near Falmouth" (61), and similar works betokening close study: more by Mr. John Mogford, "Elizabeth Castle, Jersey" (26), "Tynemouth Priory, Northumberland—Evening" (150), and (173) "By the Sad Sea Waves," with exemplary specimens of Messrs. W. W. Deane, D'Egville, Leitch, Maplestone, McKewan, Pidgeon, Prout, Reed, Rowthorn, and Vacher, with their several methods, styles, and manners.

Mr. James Fahey, amongst a number of capital landscapes, has a very interesting picture (29), showing Barrow-in-Furness, Lancashire, in 1867, and as it was in 1846. It is painted for the present mayor, Mr. Jas. Ramsden, to whom much of the change is due, if we remember rightly.

Mr. Carl Werner's half-dozen works are marked by the strict adherence to fact that always distinguishes them—mannered though they be. They are valuable and faithful transcripts of Eastern buildings, and local propriety and truth extends to the smallest matters in all of them; their accessories are most appropriate. The interest is not confined to the immediate subject represented, but enlisted in a comprehensive view of life, habits, costumes, and customs, besides localities and buildings.

But how foolish it is, or it appears to be, to decry mannerism, when it secures such admiration as protects Mr. Edmund G. Warren's wonderful drawings from all effects of adverse comment: he needs no protection from infringement of copyright. The tact with which he adapts whatever he intends to represent—and one pity is, that he should restrict himself quite so much as he does—gains for him more credit for literal exactness than his works really possess, though there is more of prose than poetry in them, after all. Novelty in their author's description forms no part of the cause for their success, in treating such natural circumstances as are most likely to delight the spectator in scenes like "Harvesting by the Sea" (23), with its golden corn, turquoise and emerald sea, and exhilarating sky; or "Harvesting in Surrey" (149), with another such cheering sky, more aureate wealth, but with woodlands and hills for the distance that lends enchantment to the view—a very fine one—in lieu of the liquefied jewels. An admirable perspective arrangement and management in this composition is one of its most noticeable points. (186) "The Beches in the Wood,"—

"Where, the long drooping boughs between,
Shadows dark and sunlight seen,
Alternate come and go;"—

are represented with the appearance of extraordinary reality shared by similar drawings that have preceded it, and the perfection attained is a strong argument in favour of repetition, though the present instance of their use may make it all the more difficult for the artist to surpass himself in a future one. "Sheep Washing" (194), a fourth contribution, is brilliantly lighted by sunshine.

All these drawings, if they go no way towards refuting the proverb that "there is nothing new under the sun," at all events will enable those who possess them to enjoy at home, in the smoky, dusty atmosphere of hazy London, some of the calm pleasures of country out-door life.

The New Theatre, South Kensington Museum.—The Lord President of the Council has requested Sir Charles Wheatstone, Sir Michael Costa, Professor Tyndal, Lieut.-Col. Scott, R.E., Capt. Donnelly, R.E., and Mr. Bowley, to report on the acoustics of the new lecture theatre. There will be three trials—one by a lecture, with demonstrations, on Musical Pitch; a second by voices; and the third by instruments.

THE ÆSTHETICS OF CONSTRUCTION.*

No sooner had I taken up my pen, to put into shape the innumerable but disconnected ideas on the subject of the Æsthetics of Construction, which have from time to time engaged my attention, than I discovered my utter inability to place them in anything like the convincing form in which they have occurred to me, and which has induced me to choose them for the subject of this paper.

The principles I advocate are certainly not new; they are co-existent with the pleasure we derive from all natural forms and motions around us on the earth, and I had almost added, in the planetary and sidereal systems; but I must draw a line here.

The man who can gaze into the starlight night, and conceive at once the motion of each planet—the grand elliptic sweep—the influence of each upon each—the drawing nearer, and the drawing off—has a higher conception of the beauty of the Creator's work than he who can imagine the pure ellipse alone, and to whom the infinite perturbations are but irregularities which puzzle his brain, and dim the grandeur of the scene. Here then the pleasure derived depends chiefly upon the extent of mental culture and intellectual energy of the man. The impression of perfection and of consequent beauty is in a different degree conceived by each mind, and in both cases it is wholly artificial.

There is yet another man who will call the stars beautiful. He looks up into the silent night—all is confusion there—perchance the crescent moon is up, and a dim light covers the darkened portion of its sphere. Earth light! Did he ever think of that? If so, would he not call it more beautiful? The other minds see all the glory that he sees, but far more that he can never see.

Fortunately, the man for whom we build is born and bred in a world where the laws of nature, which he sees and admires unknowingly, are those in subjection to which our art is exercised. We build for none of the three first named. We build for a man who would perceive the absence of those laws, not because he understands them as the astronomer understands the paths of the planets, but because he has seen them around him all his life—the Creator has covered the earth with them, and we see no beauty where they are not.

The subject of my paper, then, is the consideration of the conditions under which we are pleasantly impressed by the presence, in our structures, of those natural laws with which we have become familiar, in a greater degree perhaps than we are prepared to believe, by the senses of sight and touch, and not of necessity by that higher mental power which analyzes mathematically the action of those laws. I only speak of the absence of mathematical analysis in the minds of those for whom we build, and do not by any means suggest its exclusion from the minds of the builders. I have always believed that the distinction between the professions of the architect and the engineer is, or ought to be, a distinction rather of degree than of kind. We are both of us constructors. We must investigate in common the resistance of materials to the simple strains; those, for instance, of compression, shearing, and tension; and we must, to become masters of our subject, be conversant, though perhaps in a different degree, with the more complex calculations arising from the combination of such strains, either in the same piece of a structure, or in pieces depending for their support upon one another. We must both of us consider without prejudice these elements in the works of eminent men who have preceded us, not with a view to servile imitation, but as a safe and well-tried foundation upon which to erect original, and, it is to be hoped, better works of our own.

This cursory glance at the minimum amount of scientific knowledge which it appears to me we ought to possess in common, suggests the consideration of that particular branch of æsthetics included under the general term *decorative*, which is altogether independent of construction, and which is excluded from the more immediate subject of this paper.

Our scientific speculations, which are themselves subservient to the adaptability of the result to the end in view, having brought the design in which we are engaged to a certain point, we must, in carrying out our enterprise, and without in any way hiding the work pro-

duced by our reasoning faculties, exercise in a greater or less degree our imaginative faculties; often for the purpose of adding pleasing outline or relief, always with a view to the development of that intrinsic beauty which, as I hope to show, is rarely absent from scientifically-designed structures.

Agreeable sensations arise in our minds from the contemplation of the beautiful in nature and the beautiful in art, from two distinctly different sources; the one depending solely upon our appreciation of the action of the mechanical forces of nature, the other affecting our senses in virtue of certain distributions of form, colour, or light and shade, for which we can lay down but few rules, and those of a merely empirical nature.

Take in your hand a frond of the common lady-fern. It has, for some reason, a most pleasing effect on the eye, and you call it beautiful. Paste the same frond on a sheet of paper in a vertical position, and to most minds more than half its beauty will have vanished. And why? On the first impulse one would be inclined to answer, "because it formerly hung in a beautiful curve, and we have now rendered it rigid and straight;" but a little consideration will show the incompleteness of such a reply. The circle is a beautiful curve, so is the spiral, so is the cycloid; but the fern, when bent into any of these, will have but little more beauty than it had as a straight line. Only one curve will answer the purpose, and that is the curve into which it naturally falls, the curve in which the force of gravity is exactly balanced by the resistance of the stalk to flexure.

Innumerable examples of a similar nature might be adduced, and I think they would one and all show, that there is a pleasurable effect produced upon the mind by forms resulting from, or balanced by, the direct action of the mechanical forces of nature, when those forces act in a manner which we apprehend intuitively, and are not complicated in their mode of producing their effect upon the senses by artificial means, or by the superimposition of one upon another. And this result is evidently altogether independent of the arrangement of the component parts—a division of the subject to which I have already alluded, as including all embellishments not necessary to those conditions of stability which the ordinary mind is capable of appreciating, but which may nevertheless be introduced to enhance the beauty of the structure.

The first of these effects appears to have a peculiar interest for the engineer, as it is the basis of a great problem; namely, how he is to produce, in those works which are pre-eminently dependent for beauty on their lines of construction, such forms as the mind will at once apprehend as curves natural to the conditions involved, and which it will not be slow to call beautiful; in short, such curves as are known by engineers as lines of equilibrium. The second, or decorative effect, it is the more immediate object of the artist to produce, and in all cases it should be subordinate and subsidiary to the first.

For the purpose of illustrating my statements, or, I would rather say, as the best arguments that I can adduce, I have collected engravings and photographs of a few of each type of designs for iron bridges executed or proposed; and I have numbered these types, not according to their scientific classification, but rather as they produce a pleasing effect or the reverse.

- Type 1. Box and plate girders.
- " 2. Lattice girders.
- " 3. Bowstring girders.
- " 4. Arched ribs with braced spandrels.
- " 5. Suspension-bridge with stiffening girders.
- " 6. The continuous parabolic system.
- " 7. Simple suspension-bridge with vertical rods.

If we consider for a moment the disagreeable impression produced upon us by the first of these types (and every Englishman has ample opportunities for considering it), we cannot fail to notice that it does not altogether arise from the monotonous oblong form, or even from the flat uninteresting face, of the structure. Cover it with mouldings and ornaments of cast iron—paint it in the best taste—decorate it as you will—you cannot redeem it from its uncomplaining ugliness. And why? Because it appears to be out of place; it is a form which seems to want some additional support; it is essentially deceptive. We cannot appreciate the beauty of construction, the principles of which we do not instinctively comprehend. In a limited

sense, those principles are correct enough. In the molecular structure of every straight beam there are curves of direct tension and compression, which clear up the mystery at once. The lines of compression are concave downwards, those of tension concave upwards. They cross each other in every case at right angles, and each cuts the neutral surface of the beam at an angle of 45°.

Although the two halves are in all respects similar, there are not two points in the half elevation of the web and flanges, at which the stress is at once the same in amount and direction. Along each individual curve the stress varies from centre to end, and every curve represents an amount of stress differing from that of every other. Then what an infinitely complicated piece of workmanship we should have, if we attempted to vary the section of our wrought-iron plate, in proportion to the duty that each point in their elevation has to perform. Practically we cannot do this. It is for the engineer to determine how far he can approximate to the theoretical conditions involved, and thus save material without necessitating more labour than the value of that material represents; and in most cases this can be done with great advantage. In small wrought-iron girders we may, perhaps, by due attention to the principles of stress, save 15 per cent. of the material necessary in a girder of equal strength, but of uniform section, and that without adding to the labour in the least. This per centage, however, is but a fraction of the weight which theoretical perfection represents as lost.

This type, then, is essentially bad in respect of its response to the theoretical conditions of a minimum weight of material. Nevertheless, in small spans the economy of labour consequent on simplicity of construction often compensates for this defect.

Type 2 is the straight lattice girder; and here the lines of stress are guided from their natural curves, and concentrated in the flanges and diagonals. This fact, however, does not assist the mind in conceiving the mode of action of the beam, and I am inclined to think that all the superiority of appearance is to be traced to the decorative effect produced by the open lattice work, and the reduction of apparent weight. Among the best known bridges of this class are, in England, those at Crumlin and Runcorn, and on the Continent, those over the Rhine at Cologne, and at Kehl, near Strasburg, and that over the Vistula at Dirschau. But one and all of these must be regarded as failures in an æsthetic sense. Probably Mr. Baker's towers at Runcorn, and the piers at Dirschau, are most in keeping with the works. The Gothic piers of the bridge at Kehl have a singular effect. Their appearance is very striking, but they do not harmonize well with the long horizontal lines of the girder, or with its lattice bars arranged at angles of 45°. The proximity of Strasburg Cathedral, too, is not calculated to impress one in favour of that puny cast-iron architecture.

The Bowstring girder is our next type, and it includes all those in which the top or bottom flange, or each, consists of a segmental or parabolic rib, connected together by diagonal lattice bars. The best known of those which have both flanges curved are Brunel's bridge at Saltash, and that over the Rhine at Mayence. All these structures are, as regards the iron work, more natural than either of the preceding types, and we must accord to them the merit of giving us the first clear idea of the manner in which they do their work. We may not feel satisfied with their appearance, but we must admit that it is, or may be made, much superior to that of either of the straight types.

We now come to the arch, respecting which I shall say more hereafter, but assuredly we cannot hesitate to assign to it, in our classification, a higher place than we would to those already mentioned. The mind at once perceives the natural and efficient manner in which it supports the load to which it is subject.

Our fifth type is the suspension bridge, stiffened in such a manner by lattice work as to be capable of bearing, without undue vibration, heavy rolling loads. It is sufficiently obvious that the effect of the simple parabolic or catenarian curve is, in a great measure, marred by the proportions of the stiffening girder.

In the late Paris Exhibition were exhibited two striking drawings, by Herr Carl von Ruppert, for bridges across the Bosphorus, and over one of the great chasms in the tertiary limestones of the Balkan. In carrying out the

* By Mr. G. F. Deacon, C.E. From a paper read at the Liverpool Architectural Society.

Austrian project of a railway to Asia Minor, it will be necessary to cross these places, and Von Ruppert has probably solved the difficulty in a very complete manner. It is well to mention that his investigations have been published, and they can leave no doubt in the mind of the reader that the Austrian engineer has brought together principles already well understood, with a boldness and originality resulting in a complete success.

There is but one more, and that is the pure suspension bridge. We cannot improve upon that simple catenary. Its mode of action is apparent at a glance, and its curve is evidently a natural one. But, unfortunately, we have no means of rendering it sufficiently rigid for railway purposes, without destroying its chief aesthetic characteristic.

Thus far I have endeavoured to lead you through the general principles, in virtue of which each of the seven types supports its load. You may feel inclined to change the order of one or two, but that will not affect the general result.

Had I based the classification upon the relative economy of material, upon the absolute weight of the superstructure which each would have required for the same span, and to bear the same moving load, it is at least gratifying to know that the arrangement would have been precisely the same, and that, although in small

spans, the order of ultimate economy is somewhat changed by the different proportions of labour to material required, it would not be felt in the large spans.

These general facts have been long known to the engineer; but Mr. Benjamin Baker has recently reduced them to approximately correct figures for different lengths of railway bridges up to the limiting spans, and I have prepared, from his investigations, the annexed table showing the weights of material in spans of 700 ft., and also in spans 100 ft. less than the limiting spans. The types are in principle the same as those I have described, though not arranged quite as Mr. Baker has classed them.

I have now laid before you the general arguments which, you will probably admit, prove, at least in regard to great bridges, the truth of the statement that, in equal spans, the aesthetic properties of the lines of the structure vary in direct proportion to the simplicity of the design, in a scientific sense, and in the inverse ratio of its actual cost.

These results are sufficiently remarkable; and if we can in every case find beauty and science walking hand in hand, as here, shall we not be able to do more in the course of both than we do at present? And this, I think, we can find in our works of stone and brick, without either the conditions of great size, or the cost of extra labour.

TABLE compiled from Mr. Baker's Analysis, showing the Approximate Weights of Wrought-iron or Steel in the Superstructure of Railway Bridges of six different Types; the working stress of the iron being taken at 4 tons, and that of the steel at 6½ tons per square inch of sectional area:—

Description.	700 feet Span.		Limiting Span minus 100 feet.	
	Iron.	Steel.	Weight of Steel in Tons.	Length of Span in Feet.
Box girder	61,030			
Lattice girder	17,360	4,410	27,315	900
Bowstring girder	6,650	2,730	68,055	1,300
Arched ribs with braced spandrels	3,500	1,805	393,429	1,900
Suspension with stiffening girder	3,645	1,715	276,450	1,900
Continuous girder with varying depth*	2,660	1,820	1,329,000	3,200

WATER ANALYSTS.

My attention has been drawn to a letter signed "W. R.," and headed "Analysts' Differences," which appeared in your columns on the 3rd of this month. I will endeavour to explain, perhaps I should say to apologise, for some of the matters complained of in that letter. I must premise that I have myself entered too deeply into water analysis controversies to be regarded as a perfectly impartial person. The great difficulty in water analysis is to get rid of the water; for it is only with the impurities of the water, amounting perhaps to 0.01 or 0.03 per cent., that we have to deal. Of this matter a very small fraction only is organic, and to get at, and estimate this, is on the face of it not an easy matter. We cannot remove the water without endangering the organic matter; hence the attempts to estimate the organic matter in the water. Up to the present date, no method exists by which an actual estimation of organic matter in water can be made. We can only attempt to estimate the leading constituents of the organic matter, and even to do this accurately, I believe, a task beyond our present powers. The enormous difficulty, and, what more directly concerns the public, the enormous cost, of these attempted precise estimations of organic matter, has driven chemists to attempt to find re-agents which shall directly indicate the condition of the water. The first of these was permanganate of potash. But though certainly it has a great tendency to decolorise in the presence of organic matter, it does so also in many cases where no organic matter is present; it deals, also, quite differently with different forms of organic matter. It is now nearly universally agreed that this re-agent is almost valueless for the purposes of water analysis. Occasionally we see in analysts' reports, that water contains so much organic matter—nature not specified. This datum is another term for loss on ignition of the residue; it represents a variety of matters, and may, I think, with the consent of all the first chemists, both here and abroad, be dismissed as valueless.

I will now try to point out what data have a real meaning, and within what limits they may be relied on.

* This type is nearly equivalent to Von Ruppert's system.

1. The estimation of ammonia in water, as now almost universally carried out, gives us not only ammonia existing as such, in the water, but also a certain amount, derived from the nitrogenous organic matter during the process of analysis. Its quantity should be exceedingly small. When it exceeds one part in ten millions, the water must be looked upon with great suspicion; in good water it is often not more than a fifth of this, and seldom more than half. I believe all chemists, without exception, regard the presence of ammonia in water as a bad sign, and would condemn any water which contained as much as one part in a million.

2. The estimation of nitrates. Very great diversity of opinion exists as to the value of this datum; however, other things being equal, we may safely say the less nitrates the better, especially if the water is required for stowage on shipboard, &c.

3. Estimation of total solids. The connexion between the salubrity of a water, and the amount of solids it contains, has never been satisfactorily established, but it is generally believed that waters containing large quantities of solid matter are undesirable, but we cannot pretend to fix the exact limit.

4. Estimation of nitrogen from organic matters. There are two processes which profess to make this estimation; the one by Frankland and Armstrong, the other by Wanklyn Smith and myself. Frankland and Armstrong aim at an estimation of the total nitrogen of the organic compounds; we, on the contrary, are content to obtain a portion of the nitrogen; and as we know for any given organic compound what proportion of the nitrogen we obtain, we are obviously in a position to calculate the quantity of any nitrogenous compound known or assumed to be present in the water. That we can and do effect this, we believe, not now questioned by any one. With regard to Frankland and Armstrong's estimation, if it can be satisfactorily made, it is here obviously exactly on a par with our own, but the only data we have as to its practicability are some test analyses, published by Frankland and Armstrong, the admitted errors of which are greater than the quantities to be estimated in ordinary waters.

The quantity of nitrogen or ammonia from organic matter certainly should not exceed one part in ten millions, and ought to be much less.

5. Estimation of carbon in organic matter. This estimation is only described by Frankland and Armstrong. I am unable to give an opinion as to the value of this datum.

The fact is, considered from a sanitary point of view, the chemical analysis of drinking-water has, till within the last few years, been of very little use. With regard to the methods of returning analyses, it is, no doubt, to be regretted that greater uniformity does not prevail. But this does not interfere with the comparableness of different analyses; as half a minute's calculation would suffice to bring the results into one system.

ERNEST T. CHAMMAN.

INDUSTRIAL EXHIBITIONS.

The Derby Art and Industrial Exhibition.—This projected exhibition of works of art and products of industry, in connexion with the new Drill Hall, which is being erected for the use of the First Battalion of Derbyshire Volunteers, in Derby, promises to be a success.

The exhibition is intended to consist of sculpture, oil paintings, water-colour drawings, portraits of Derbyshire worthies and eminent persons, engravings, photographs, porcelain, and earthenware (especially that of Derby); a loan collection from the Science and Art Department, Kensington Museum, London (in connexion with the schools of art in Derby); industrial objects and machinery; mineral products of the county in their raw state, &c.

The estimated space at the disposal of the committee, including the various rooms attached to the Central Hall, will, according to the local Advertiser, be as follows:—

Total wall surface	8,600 feet.
„ surface of screens	10,300 „
„ „ wall cases	1,900 „
„ „ „ floorstands and cases	1,900 „
	20,500 feet.

South Staffordshire Industrial and Fine Arts Exhibition.—The main building for the forthcoming exhibition of South Staffordshire Arts and Industries has been completed, and the various other departments are progressing. The main building is planned as a central nave 150 ft. long by 60 ft. in width, and 18 ft. high to the spring of the roof. The roof is of semi-octagon form, rising to a total height of 45 ft. from the floor. Around this nave and across the ends of the building is continued a wide and spacious gallery, approached by three broad staircases. On each side of the nave, and of equal length with it, are wings 10 ft. wide and 14 ft. high, and again projecting beyond the eastern wing is an annex for refreshment buffet, ante-room, and ladies' and gentlemen's retiring-rooms. The building is well lighted from the roof. The framing is of timber covered externally with corrugated iron, and internally with boarding on felt. The decoration has been very simply treated. The roof is carried by eleven ribbed principals, and these are coloured of a deep maroon relieved by a broad line of grey: the fish-plates and ironwork are tinted grey, the washers picked out in chrome yellow, and the nuts vermilion. The soffit of the roof, between the centre and second sky-light, are tinted grey with a design dividing it into panels drawn in vermilion: the ridge boarding and soffit are treated in similar colours. The side boarding is coloured sage green, and so much as will be exposed over the hanging space for paintings and art productions is lined with a simple pattern in vermilion. Around the front of the gallery is a railing in ironwork of a light design; the ironwork is bronzed, and the gallery cornice is picked out in colour, with a design of leaf and stem pencilled on the fascine. The end gallery facing the principal entrance to the building has been adapted to the proportions of the grand organ that is in course of erection. The architect is Mr. Bidlake, from whose designs the decorations have also been carried out; the contractor is Mr. F. N. Clerk (whose manager, Mr. Lysaght, has been in daily attendance). The rooms in Molineux House, as before stated, will be adapted for some of the lighter and more ornamental portions of the exhibits, and a covered way will be erected from the house to the main building above described. Earl Granville is to perform the opening ceremony. A notable piece of art-workmanship, in the form of a presentation key (the gift of Messrs. Chuht & Son), will be handed to his lordship, with which he will unlock the principal entrance, and declare the Exhibition open.

THE SANITARY TREATMENT OF THE REFUSE OF TOWNS, AND THE UTILIZATION OF SEWAGE.

At the Ordinary General Meeting of the Institution of Surveyors, April 19th, 1869, a paper on this subject, by Mr. William Menzies, was read. In the course of it he said,—

To the treatment of the refuse of towns I intend entirely to confine myself in this paper.

The first question that may be asked is, "What is a town?" My investigations would lead me to think that when there are some such number as 2,000 people living upon an area equal to the half of a square mile, or 320 acres, the community may be spoken of as residing in a "town" and not in a "village." From that number the population increases in density, until we have, in some cases, 100,000 on a square mile.

By way of illustrating my subject, we may very properly take a town with a population of 10,000 living upon a square mile, which is something like the average of English towns.

It is also necessary to define what the refuse of such towns includes.

Under the general name of "sewage," properly so called, are included the whole excreta of the inhabitants; all refuse water from houses, baths, washings of butchers' yards, the liquid part of stable drainage, and, in fact, all polluted water. This polluted water is principally the result of the use by the inhabitants of the water supply to the town, which we may assume, on a general average, at 20 gallons a head. The term "sewage," however, has hitherto included more or less of the rainfall, the washings of the streets, and the water from the roofs of the houses, and it is important to bear this in mind in the course of the following paper, as I have at first used "sewage" in its popular sense, inclusive of the rainfall, and have afterwards, for reasons which will become apparent in the course of the discussion, carefully distinguished between sewage properly so called, and a compound of sewage and rainfall mixed. I may say here, also, that it is proposed to leave out of the discussion, for the present, all reference to seaside towns, and confine myself to the much more difficult question of the consideration of those in the interior of the country. Although allusion will subsequently be made to this part of the subject, I shall also assume as a general conclusion that this sewage is not to be discharged into a river until it has been purified.

In proceeding to consider the method of treatment that should be adopted with "sewage," using the word in that more general sense, the subject divides itself into—

- 1st. The questions affecting the public health that attend upon the management of this sewage.
- 2nd. The efficiency and cost of whatever system is adopted for its removal.
- 3rd. The mode of dealing with this refuse when so removed.

The first principle, and one which will be almost universally accepted as of paramount importance, is that the removal of sewage should be complete, continuous, and safe, in all weathers, and in all seasons, without injury to the public health; and the second, that the sewage should produce, if possible, some return, when applied to the purpose for which nature evidently designed it, viz.,—the re-fertilization of the earth, from which mankind derive their food.

I could not admit that the water system cannot be made perfectly safe for the inhabitants, and successful in the utilization on the fields.

The feelings of the upper classes on this subject must also be considered, as they have a decided preference to the complete washing away of all impurities. Many other practical difficulties suggest themselves in the way of working such a process, and I am forced to the conclusion, that however excellent the earth system may be for cottages, growing villages, establishments built upon land belonging to such establishments, and all entirely under the supervision and perfect control of one supreme authority, with full power to enforce his regulations, and to visit and inspect when he pleases every portion of the building under his charge, I cannot see my way to recommend the attempt to be made in any such specimen town as we have selected; but must leave it to some one who has more confidence in the success of such a scheme.

Before proceeding to consider the question of

water carriage of this sewage, it appears desirable to state generally my views on the treatment of such sewage at the outlet. Vast sums of money have been spent in attempting purification by means of different processes, such as by using milk of lime, carbolic acid, animal charcoal, and a vast number of other substances which need not be mentioned, but universal failure followed, and it seemed to have been working against the natural law, that vegetation is the great purifier of all refuse, and that living plants should build up again into some useful and safe shape the polluted matter which is discharged from human dwellings. Any one who has been bred an agricultural engineer and surveyor naturally looks to the fields at once as the only safe agent to be entrusted with this work of useful purification.

Every one must admit the great benefit to the towns themselves that has resulted from the general adoption of systems of drainage and other sanitary measures. Although there appear to be exceptional cases, which are very puzzling, it is impossible to deny the fact; and the latter mentioned system has, apparently, judging by the mortality tables, done more good than the former; and believing that the systems of drainage hitherto adopted in England have been better than anything similar in the world, and that we must proceed most cautiously before proposing to change them; we must keep at the same time before us constantly the question,—“Have the present systems fulfilled all the requirements of the case? and will they, if followed out, solve the difficulty in all its aspects?” My own feelings and conviction lead me to believe they do not, and some of the evils which they have entailed will now be mentioned.

In proceeding to discuss the second system of drainage previously adverted to, viz., that of having very small pipes, only sufficient for the dry-weather flow of the sewage, and providing for the wet-weather discharge by sending the contaminated mass into some stream or ditch by an overflow, it is more difficult to produce a clear impression. It is obvious that the variations of such a system must be endless, and I would much rather give my opinion of it in the broad terms that, the nearer it approaches in any case to the older system of putting all the rainfall into the same drain as the sewage, the worse it is, and that I would much rather leave you to form your own judgment on its merits after I have endeavoured to explain to you the system, which I trust I am not assuming too much in saying, that if not for the country generally, at least for the Thames valley, I may take the credit of having introduced. That system is, that the rainfall shall in all cases, as a principle, be entirely separated from the sewage; the rainfall being conveyed to the nearest outlet, and the sewage to the most appropriate land for utilization.

Under the system of separation of rainfall from the sewage, the first advantage anticipated is that there will be no gullies or openings into the streets communicating with the foul drains by which effluvia can rise into the streets or court-yards. The second, that men will not require to enter into the drains, to clean out the sand and grit off the roads. The third, that no overflows of foul or sewage matter will be necessary. And the fourth and most important, that the treatment at the outlet by irrigation will be uniform, economical, and practically perfect. The fifth advantage is, that perfect and continuous removal of all sewage may be secured by a complete system of flushing, under command at all times and at all seasons; and it is worth observing that the greatest flushing will be necessary, or, rather, desirable, in the town in dry weather, just when the fields outside will take it best. The sixth advantage is, that when pumping is necessary, as it is in such a vast number of cases, the economy will be very great. The objections that have been raised to this system must be noticed.

The first is, that the water off the streets will be so polluted as to be unfit to be poured into a stream; to which the answer is, that the streets ought, therefore, to be thoroughly scavenged, as it cannot be maintained that any filth is to be left there till the rain washes it away.

The second objection is, that it will be enormously expensive to provide two sets of drains. This might be answered at once, by saying that efficiency is the first essential element; but the question of expense is open to full consideration. Every town, before it is drained for sewage purposes, has a system of surface drains of some sort existing, and the new sewage drains

may therefore be reduced to the smallest size, for removing the sewage alone, instead of being capable of removing sewage and maximum rainfall mixed. I shall allude to this more particularly hereafter, when speaking of the drainage of Windsor, Eton, and Oxford. We must look at the expense of the process from first to last, keeping in remembrance that the whole question is one affecting the rates on the town itself.

The last objection which has been raised is, that it is stated to be impracticable. On that point I would merely ask, "Has it ever been tried?" or, "where it has been tried has it failed?"

I hope to be able to convince all of my hearers that it is worth a trial, at least.

Without, however, perfect ventilation and flushing, no such system, nor indeed any system of drainage should ever be attempted.

The speaker then gave a very long account of what has been done with reference to the Thames Valley drainage, and said,—I have thought it advisable in this somewhat too long paper to restrict my remarks more especially to the much more debatable question of the principle upon which the drainage of towns should be conducted, as that must be settled first before any really satisfactory result can be obtained. Keeping my mind, I hope, at all times free from prejudice, and having had no object in view except arriving at the truth in my investigations, and influenced by a pardonable ambition before the community, I trust that this Institution will support us in the conclusion in which those who have been acting with me have daily become more confirmed of, that the system of entire separation of rainfall from sewage is the safest and most proper course to follow.

It is necessary that something should be said of the subsoil water under a town, and the method of dealing with it. The great advantages of lowering the level of this water are undeniable, and there are not such strong objections to admitting this as there are to admitting the rainfall into the foul drains; but, at the same time, in all practicable cases, it would be preferable to deal with it in some other way. That must be entirely judged of by local considerations, and the origin of the subsoil water must be traced, before any means are taken for lowering it effectually.

Reverting, finally, for one moment, to the question of separation of rainfall from sewage, I would merely point out that, if this system is right, large questions present themselves, such as, "Are all the older systems wrong? Must many towns, and London among them, be drained over again, by restoring their surface drainage, or what is to be done? Is the principle applicable to all towns, or only those special towns in the Thames valley?" A new Sanitary Commission has just been appointed by the Home Office, and we are curious to know what they will inquire into. Will they open this vast subject afresh, and examine all the engineers over again?—or, will they turn their attention to the many other sanitary subjects equally demanding attention.

Allow me to sum up what has been attempted to be proved in this paper.

Under the system of mixing sewage and rainfall together we have the danger, if not the certainty, of putrid deposits in the sewers, imperfect flushing of the drains, impure air in the street, large and expensive foul drains leading out of the town, dangerous storm overflows laden with putrid filth, cumbersome and excessive arrangements to make when pumping is necessary, putrid sewage discharged on the fields, unnecessarily extensive land to lay out for irrigation, and, when taken at all times, as it ought to be, liquid to distribute that must frequently be not only worthless as manure, but injurious to vegetation,—and this profitless labour and expense involved on all hands.

Under the "separate system" it is anticipated we shall have means of dealing rapidly and efficiently with the rainfall, perfect, safe, and continuous removal of the sewage while fresh, cheap and small foul drains, economy at the pumping-station, economy in the fields, valuable and comparatively innocuous liquid at all times to distribute on the land, and absolute control from first to last.

This question and its kindred subjects are, as pointed out by your president in his opening address, of the first importance; and as many members of this Institution will, during the next few years, be professionally engaged in considering them, free investigation will be of the

greatest benefit; and I may take the liberty of suggesting that the first and most pressing to be discussed is that to which this paper is almost entirely confined, viz., "What is the best system of removing and utilizing the refuse of the inland towns of this country?"

A vote of thanks was put and carried to Mr. Menzies for his paper, and a short discussion followed, in which Mr. J. H. Lloyd, Mr. W. Hope, and others, took part. The meeting then adjourned to Monday, May 3rd, when the discussion will be resumed, and a paper will be read by Mr. W. Hope, "On the Distribution and Utilization of Sewage."

A NEW WINDOW IN WESTMINSTER ABBEY.

WITHIN the last few days Messrs. Clayton & Bell have set up a stained-glass window in Poets' Corner (south transept), immediately over the monuments to Milton and others of our distinguished poets. The window is of two divisions, each containing a canopied figure of a poet of holy writ. In the one light is introduced David representing the poetry of the Old Testament; in the other St. John, as the author of the Apocalyptic poetry of the New Testament. David is in attitude of rapt inspiration, holding his pen, rather than using it, and looking upward, while on a scroll held in the left hand runs in Latin a passage from the Psalms—one of the poet's most fervid ascriptions of praise and glory to God.

The other figure, St. John laden with years, the St. John of Patmos, is attended by his symbolic eagle, and is engaged in writing his Apocalypse, a passage from which is written on the scroll which he holds across a writing-table. This work, which is too high up for proper examination, is one of the most elaborate in execution and powerful in colour that these able artists have executed. It is the gift of Dr. N. Rogers, who formerly lived in the parish, and along the base of the window is an inscription recording the donor.

GLASS IN SHAM WINDOWS.

SIR.—Loving such little puzzles as that offered by "W. B." in your issue of the 20th of March, permit me, though not offering a solution of the difficulty (for I have not seen the windows), to suggest a remedy.

Let the grooves in which the glass is to be set be deeper in the mullions than is actually required for the size of the pane—for the sake of the force of expansion,—and let the glass be set in cement instead of putty, the edges of the glass having first been wiped with an oily rag, that the cement may set towards the mullions, and not towards the glass. The edges of the glass need not be hedged in cement, but after the pane is placed in the grooves let the intervening outside space be filled with it. The cement should not be rammed into the grooves, as that might warp or bend the glass, and a very little warping or bending may induce the breakage when there is but a little difference between the outside and the inside temperature; and to further avoid the warping, the cleaning of the glass should be deferred until the cement has set. If this suggestion, being adopted, is found to answer, I must ask "W. B." to acknowledge it in the *Builder*.
Pro.

NEW OFFICES AND SHOW-ROOMS, MARK-LANE, LONDON.

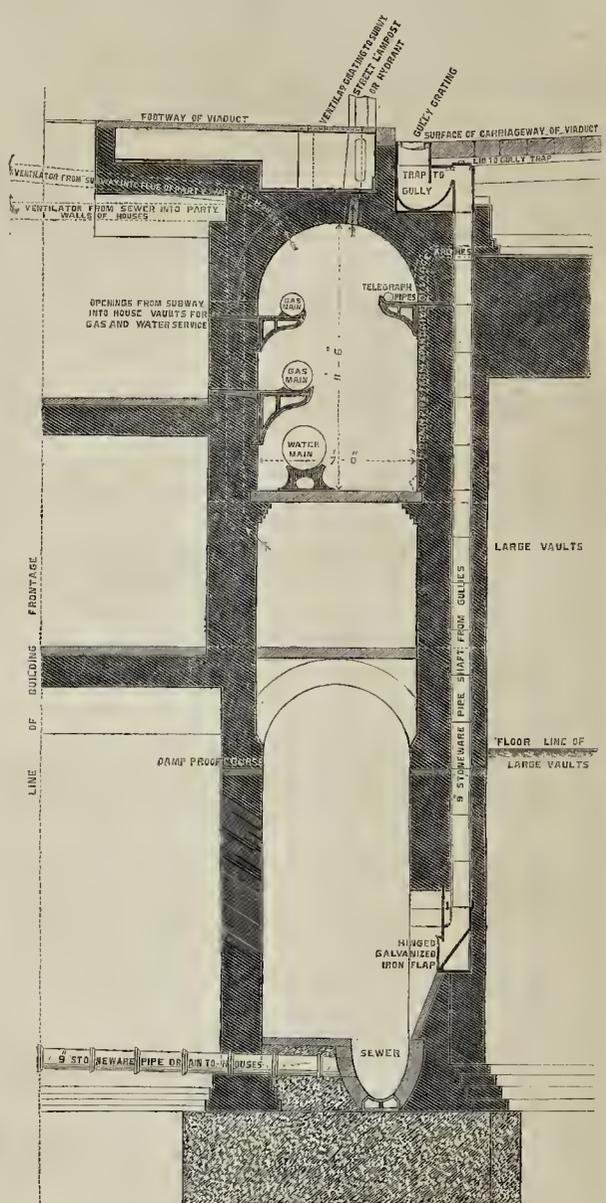

The building, No. 36, Mark-lane, as shown in the accompanying engraving, is constructed especially for mercantile offices and show-rooms for colonial produce, where great light is required, and has a frontage in Mark-lane of upwards of 70 ft.

It belongs to the City of London Real Property Company, and was carried out from the designs, and under the superintendence, of Mr. Edwin A. B. Crockett, architect.

The front is of Portland stone; the piers on ground and first stories being of grey Aberdeen granite, with shafts of red granite, all polished. The shafts to the second-floor windows are also of polished red granite, and those in front of the first-story piers, which carry the hood mouldings, those to the third-floor windows, and the bosses, are of polished serpentine marble. The vousoirs of arches are of Forest of Dean and red Mansfield stone alternately.

The entrance lobby is built of Cass stone, and barrel-vaulted with polished serpentine

HOLBORN VALLEY VIADUCT.—MR. W. HAYWOOD, C.E.

Section of Subway, &c.

[See p. 320, ante.

marble columns, supporting red Mansfield moulded and carved ribs, which divide the vault into three bays. The barrel-vault between these ribs springs from a carved string, and is inlaid with Forest of Dean stone to a pattern, the centre stone of each bay being a red Mansfield hemispherical quatrefoil, holding a polished serpentine marble hall.

The floors are carried on wrought-iron girders, resting on cast-iron columns and stanchions. The pavement of corridors is supported on ornamental cast-iron bearers, and is formed of York stone landings, covered with Maw's tiles. The

dado running round corridors and staircase is formed of glazed tiles, with a border of majolica. The wrought-iron gates at entrance were supplied by Messrs. Skidmore & Co., of Coventry.

Messrs. Handyside & Co., of Derby, supplied the cast and wrought ironwork, including the cast-iron balusters to staircase; Messrs. Jackson & Shaw were the builders; and Mr. C. J. Jones was the clerk of works. Mr. W. Flows, of Westminster, did the carving; and Messrs. Mannelle supplied the granite, and the Lizard Serpentine Company the marble.

LONDON STREET-ARCHITECTURE: OFFICES AND SHOW-ROOMS, MARK-LANE.—Mr. EDWIN A. B. GREGORY, ARCHITECT.

THE SOUTH METROPOLITAN DISTRICT ASYLUM.

The foundation-stone of the asylum for imbecile poor of the south metropolitan district at Caterham was laid on Saturday last. As our readers may recollect, this asylum is to be in all respects a duplicate of that now also in course of erection at Leavesden, in Herts. We gave full particulars of the designs in a leading article for July 26th, 1868, with view and plans. Some little progress with the extensive blocks has been made by the contractors for the new buildings at Caterham. The works, when complete, like those at Leavesden, will cost about \$5,000. The contractor is Mr. John Chappell, and the architects are Messrs. Giles & Biven. The site is in the parish of Caterham, near Croydon, and about four miles from the Caterham Junction of the London and Brighton Railway. The foundation-stone was laid in the vestibule of the central block, and the ceremony of laying it was performed by Dr. Brower, M.P., the chairman of the board. A numerous company was conveyed to Caterham for the purpose of witnessing the ceremonial, and for the convenience of the visitors a special train had been provided by the board. From Caterham Junction the contractors have laid a single line of railway, by means of which the materials for the new buildings are conveyed, and along this line, which is a rather up-hill piece of work, with a gradient which in some parts is about 1 in 30, the visitors were conveyed.

THE TRADES MOVEMENT.

The Bill of Mr. Mundella and Mr. T. Hughes upon trades-unions, based upon the report of the Trades Union Commission, is intended to repeal all the combination laws. It provides that any number of persons, whether workmen or employers, shall be at liberty to make any agreement with respect to the wages to be paid or the hours to be worked, and with respect to the persons or the mode by which the work is to be done, on any terms whatsoever. No combination established for merely giving effect to such agreement shall subject any person a party thereto to criminal prosecution. The Bill, however, shall not exempt from liability persons guilty of offences under the common law. The Bill legalises the formation of associations for mutual support in every trade or employment, the subscribing of funds, &c., provided no such association be formed to promote the commission of any offence, and it confers the benefit of the Friendly Societies Act upon such associations. The rules and by-laws of these associations are to be registered, and the person depositing the same must declare that no other rules or by-laws are in force. The Bill also provides for the protection of the funds of these societies, provided only that they are duly registered. The Government, it appears, will not oppose the Bill.

The relations between the builders and their workmen are likely to be disturbed this year by the attitude taken by both parties in respect to the hours of labour, rate of wages, &c., several notices and cross notices having been given by the masons, and joiners, and their employers. The greater portion of the stonemasons of Manchester have struck, their six months' notice having expired. The carpenters' notice expires on the 1st of May, but it is hoped that in the mean time the dispute may be settled by an appeal to the arbitration of Mr. Rupert Kettle, who has consented to arbitrate in the dispute between the operative carpenters and joiners of Manchester and their employers with reference to the introduction of the hour system by the latter. It is generally alleged by the workmen that this system would act very injuriously to the interests of the "out-door" men, who would in the winter months have to suffer a considerable curtailment of wages. Mr. Kettle has requested that in the interim all agitation of the matter may cease, and this course has been agreed to by both parties.

The house-painters of the West Riding have agreed to the appointment of a board of conciliation, to which it is to be referred all disputes respecting wages and other trade matters which may arise between the employers and employed. The board is to consist of nine employers and the same number of operatives, who are to be elected annually, and whose decision upon any matter is to be final.

The whole of the carpenters and joiners of Sheffield and the neighbourhood are under notice, preparatory to the introduction by the

masters of the hour system. It is stated that both sides are anxious to settle the matter in a friendly spirit. An interview between nine representatives of the Masters' Association and an equal number of operatives has taken place, and the propositions of the employers have been discussed. The workmen explained that they were anxious to be fully informed of the proposed alterations in the existing system of working, with which they were perfectly satisfied, in order that they might be laid before a general meeting of the trade. Several representatives of the operatives expressed the opinion that some of the new rules would require modification before they would be acceptable to the workmen. The men are anxious not to involve the unions in any dispute with the employers, and are willing to submit any points upon which the deputations fail to agree to arbitration.—The Sheffield trade have agreed to the establishment of a board of arbitration and conciliation, and representatives from the workmen and the manufacturers have already settled the rules, and appointed a president and board, as well as a joint secretary.

A serious workmen's strike has occurred in Belgium. The colliers and puddlers of the extensive coal works and machinery establishments of Messrs. Cockerell, at Seraing, near Liège, have struck; and, as is too often the case with Belgian workmen, they have resorted to acts of violence, which have led to the usual consequences, the calling out of the troops to restore order, and a collision with the rioters, in which several were killed and wounded.

THE WHITEY JET TRADE.

The local drawing class connected with the Mechanics' Institute is doing much for the jet trade, and it has risen from six to between fifty and sixty lads who attend during the winter months. The master is indefatigable, but he can only get them to a certain point, and a local correspondent wishes to know how they could obtain some models for the drawing class, or whether the Kensington Museum would aid them, there being no School of Art in the place. Designs in fruit, foliage, and flowers have been extensively used, but the material is rather fragile for some of the designs, and a desire for variety has led to other patterns being chosen, especially those allowing of greater solidity, and the best workmen are now imitating Roman cameos and antique gems in high relief. The material is becoming dearer than it was. There is in the town a very general wish to assist the workmen, and raise the manufacture in artistic excellence; but it is difficult to know in what way this can be best promoted. At present it would probably be impracticable to establish in the town a permanent School of Art; but it is worthy of consideration whether something might not be done to form a collection of models and such objects as are used in art-education, and to obtain occasionally the assistance of the living instructor; not merely for the sake of the jet manufacture only, but also for the promotion of art in some other trades of importance in the town, and to improve the public taste. We shall be glad to receive any suggestions to these ends.

DANGEROUS EXEMPTIONS CLAIMED BY RAILWAY COMPANIES.

On the north side of St. Paul's-road, Islington, on ground adjoining the North London Railway, Messrs. Mansfield & Prie have recently erected a wooden building 31 ft. long, 12 ft. wide, and about 13 ft. to ridge of roof. When the District Surveyor of South Islington inquired, he was informed it was intended for the Electric and International Telegraph Company. The builders, however, refused to give notice to the District Surveyor, as required by the Building Act, on the ground that the building belonged to the North London Railway Company, and they paid no attention to a notice of irregularity calling on them to construct the building of brick, stone, or other incombustible material, served on them by the District Surveyor. As soon as it was finished the Electric Telegraph Company, who had previously occupied an office close by, took possession, put up their boards, and carried on business. The District Surveyor then summoned the builders to the Clerkenwell Police-court, and on Tuesday last the case was heard before Mr. Ellison, sitting for Mr. Cooke.

The defendants, nominally Messrs. Mansfield & Prie, but really the North London Railway Company, were represented by a solicitor, who pleaded exemption under Sec. 6, which says the following buildings and works shall be exempt from the operation of the first part of the Act, viz. :—

"The buildings belonging to any canal, dock, or railway company, and used for the purposes of such canal, dock, or railway, under the provisions of any Act of Parliament."

Mr. Matthews, engineer to the company, gave evidence to the effect, that the Telegraph Company transmitted messages for the Railway Company. He said the Telegraph Company were paid for keeping the Railway Company's posts and wires in order, but denied that the Telegraph Company were paid anything for transmitting messages for his company, the accommodation afforded them being sufficient return. The District Surveyor said, if that would exempt the building from the control of the Act, the Railway Company might erect next to another equally dangerous wooden building, and let it to a potato-merchant, taking out the rent in potatoes for the stokers. The magistrate said he was afraid it was so, and that in the present case the summons must be dismissed. He had arrived at this opinion with the greatest possible reluctance, and fully agreed with the District Surveyor, in his opinion as to this disastrous state of things. He hoped soon to hear that the Railway Company had taken down the objectionable building. The summons was then dismissed.

During the past twelve months the District Surveyor has been forced, in the discharge of his duty, to compel dozens of poor costermongers and others to take down small wooden sheds erected for the storage of goods in their own yards, almost to the ruin of some of them. What respect for the law can be expected from these people when they see a powerful company able to erect with impunity a huge structure of wood abutting on the public highway? We commend this scandal to the attention of the Metropolitan Board of Works, that they may take steps to obtain such an alteration of the law by their proposed new Act as will prevent its recurrence. The North London Railway Company have here committed an act which will probably assist in cancelling the most unwise and unjust privilege of exemption railway companies now enjoy. In this same district we know of a carpenter's yard between dwelling-houses filled with dangerous wooden structures, the occupant of which sets common sense and the law at defiance by showing that they belong to a railway company, and that work for the company is done in the shops.

TEMPLE BAR AND THE STRAITS OF THE STRAND.

In the leading thoroughfare of the metropolis it is strange that a barrier like Temple Bar should be allowed to impede the stream of traffic, which every day, at intervals, becomes stagnant, and is retarded for at least half an hour, between Charing Cross and the Bank.

So soon as the driftway along the Embankment is completed to the Mansion House, the pressure upon this line will be much alleviated; but even then it will be requisite to remove the useless bit of architecture which intercepts the route of the thoroughfare by nearly one half of its capacity!

The narrowest part of the way on the whole line to St. Paul's is at the Bar, which measures 21 ft. on the Fleet-street side, and 24 ft. on the west side; the abutments of the piers taking up 5 ft. on either side, and thus giving an interval of 14 ft., barely sufficient for a double line of teams; whereas, if the structure were removed, there would be ample space for three lines, and that without any interference with the present range of houses, or the footways.

In many parts the Strand is of great width,—at Clement's Danes it is 172 ft., at St. Mary le Strand the traverse is at either end of the church 102 ft.,—and the mean width throughout is 60 ft. from house to house, save the portion backed by Holywell-street, which is only 36 ft., and this strait extends a length of about 150 yards, or the whole distance between the two sacred fanes of the highway.

Now this block of houses facing the Strand south, and Holywell-lane (15 ft. wide) north, is of nearly an equable width, varying from 5 ft. to 70 ft. throughout; it is as it has been for 150

ing the houses being still erect which stood in the times of the Alsatia; and, in fact, the range facing Holywell-street, and that fronting the Strand, are for the most part built back to back, some of the houses having front to both streets, and others being separated by only 5 ft. or 6 ft. of back area. Why such an aneurism, or antiquated constriction, in the principal arterial duct of a great and wealthy city, should have been allowed to remain, would be a puzzle for foreign visitors, who must notice the clearances of Holborn and the exaltation of the valley.

It may happen that the New Law Courts will necessitate a transformation of these slums, and that New Inn, Lyon's Inn, and their wretched abominations, will give place to respectable ranges of open and quadrated frontage. Without a wide lateral thoroughfare between the Strand and Holborn, either by Serle-street and Great Turnstile on the east, or by a continuation of the west side of Lincoln's-inn-fields from Little Turnstile, southward, in a direct line, the contemplated new Courts would be comparatively inaccessible, except from the Strand.

Now, as to the location of the Law Courts, whatever visionary speculators may predicate with respect to the lately-proposed site on the Embankment, there is no position so appropriate as the ground already cleared. Lying intermediate between Lincoln's-inn-fields, Gray's Inn, and the Temple, it would be most convenient to offices of law practitioners as they are at present situated; the difference of level between Carey-street and the Strand is less, and would be more easily adapted than the site along the Embankment, which would require the erection of two stories, 15 ft. high each, beneath the floors on the Strand level. Like the lower floors and vaults of Somerset House, all that portion of the structure must be comparatively dark, ill ventilated, and unsuitable for public offices; and the cost in attainment of the Norfolk and Salisbury estates would be far in excess of the old slums now demolished, whilst the scope of ground would not equal the extent of that already cleared.

Whichever site is chosen, it is clear that suitable streets of access must be formed on all sides of the Courts and Offices; and as a new thoroughfare struck out from Holborn by Little Turnstile must involve the clearance of some of the worst slums of central London, such an opening would tend to the improvement of the whole vicinity.

The shortest opening in nearly a direct line would be only 500 ft. between the south-west angle of Lincoln's-inn-fields and Newcastle-street, which opens into the Strand at the west end of Holywell-street, and this would involve the diagonal traverse of only Sheffield, Claro, and Holles streets.

A more direct line, issuing into the Strand opposite Sarney-street, would cut through Lyon's Inn and touch New Inn, but would cause demolitions and reconstructions extending nearly 1,600 ft. In such clearances, however, the value of the building ground having frontage to a street of at least 60 ft. would be considerable.

As it stands, Lyon's Inn is a disgrace to municipal authority, and the whole neighbourhood.—Holywell and Wych streets, together with New Inn,—seems to indicate that the most valuable positions and sites for building may continue in desolation for want of some directing authority.

T. H. H.

HOSPITAL COMPETITION, ROTHERHAM.

SINCE our last notice of this competition, which was written on March 15th ult., nominally the last day for receiving designs, the number has increased to 93 separate sets, including alternative plans.

Last week the exhibition of drawings was on private view; but it is now open to the public. The exhibition is held in an ordinary dwelling-house, containing seven very small rooms, and two lobbies, not in the public hall, as was at first expected. Each set of designs occupies a vertical compartment, one drawing in width, and five high. As many architects have submitted from 9 to 12 drawings, the superfluous ones are stowed away out of sight behind the bottom plan. Coloured showy views occupy prominent positions on the walls, whilst really important plans cannot be got at. In only one case was the written description of the design connected with the drawings, the remainder not being visible. A list of the mottoes and numbers of the plans has been drawn up and printed, show-

ing the amount of the architect's estimate, and the number of drawings comprising each design.

The cost which the conditions state that architects must not exceed is under 5,000l., but many of the estimates go considerably beyond that amount; one, indeed, being placed at 10,000l. The condition of cost is, surely, as important as any other rule of the competition, and the committee should require its strict enforcement.

Few of the architects appear to have visited the site previous to preparing their design, judging from the plans, or the bird's eye and other views submitted. The importance of direct south light for the wards, and their thorough isolation from the front or administrative block of buildings, as well as from each other, has been frequently overlooked.

As it is nearly impossible for a committee composed of unprofessional men to arrive at a fair selection, we earnestly recommend that they call in the assistance of some distinguished architect to guide them in their choice. The course will secure to them the confidence of the competitors, who otherwise would have just cause of complaint.

HOMAGE TO ART.

ON Monday last, the 19th inst., about three o'clock in the afternoon, an amusing incident occurred in the British Museum. It appears that three young ladies, apparently sisters, and of the respective ages of from 19 to 22 or 23 years, were passing along, taking the greatest interest in everything they saw. At length they chanced to come upon a sleeping Cupid. There he lay, with a most delicious dream-smile on his face; they gathered round him, and, with the true sympathy of woman, soon began to smile also.

"What a sweet child!" exclaimed one. "What a dear, lovely boy!" sighed another; and they gazed and revelled in silent ecstasy over this embodiment of the sculptor's genius. But the eldest of the three certainly put the climax on the whole, for, without any idea of the possibility of the thing, or the logical sequence of what she was about to say, she breathed forth, "What a handsome man he would have made!" We put three notes of admiration to this whispered expression, so warm and intense was the feeling that inhaled it into the world. What next and next? Why they all looked silently at each other, and at the dreaming marble before them, when, with that touch of nature which is said to make the whole world kin, they each bent over the sleeping God of Love, kissed him in turn, and went away with lingering looks behind.

Like most other mundane joys, it had, however, its shadow—but very light; in fact, so lightly did that shadow fall at the blissful moment, that those poetic daughters of Eve will not have known of its existence until they read these lines. To be plain, then, a young art-student was quietly encoined behind a group of statuary sketching something before him, and perfectly hidden from the sight of the ladies. When he saw the unusual turn which affairs had taken, he crouched down, and almost hid himself in his boots. Poor fellow, what a Barmecide feast was his!

"But time at last brings all things even,—
And if we do but wait the hour."

To him our readers owe the discovery.

THE INSTITUTION OF CIVIL ENGINEERS.

At the meeting, April 13th, Mr. C. Hutton Gregory, president, in the chair, the paper read was on "Experiments on the Standards of Comparison employed for testing the Illuminating Power of Coal Gas," by Mr. T. N. Kirkham.

It was observed that the standards of comparison at present in use were known to be wanting in that uniformity of result necessary for determining with accuracy the difference in the intensities of two lights. But as the amount of the variation had never been clearly defined, the author had instituted a series of experiments for the purpose of ascertaining the extent of these differences.

From these experiments the author believed it was evident that a more reliable method than that at present in use, for determining the correct illuminating power of the gas supplied to the public, was urgently needed; and he thought the following system would be found to give results approaching as nearly as practicable

to a truthful estimate: Let the illuminating power of the gas be determined by the aid of the present recognized photometer, fitted with a Carcel lamp, burning oil of the same quality, and verified in the same manner, as that adopted by the municipality of Paris as a standard; and let a sufficient number of experiments be made, so as to cover the errors that were known to exist, and the average of these be compared with the illuminating power, as shown by the jet photometer and the Dutton test, and then the "mean of comparison" might be taken as the illuminating power of the gas.

ANCIENT MONUMENTS IN IRELAND.

MR. AGAR-ELLIS, on Monday, in the House of Commons, asked the First Commissioner of Works whether Ireland would be included in any measure he might bring in for protection of ancient monuments, as indicated in his answer to the hon. member for Buckingham on the 2nd inst.

Mr. Layard said:—The Office of Works has no control or jurisdiction in Ireland. The Irish Board of Works is under the Treasury. There are many most valuable and interesting national monuments in Ireland which might be placed under proper supervision, as many such monuments in Scotland are, and I think that the time will come when they will no longer be taken care of and preserved. My attention has been called to the subject by many communications which I have received from Ireland, and I may especially allude to one from the President of the Royal Irish Society, Lord Talbot of Malahide, who has most kindly offered to be of any assistance to me in the matter. I can only say that if it should be determined to place the national monuments of Ireland, like many of those of Scotland, under the care and jurisdiction of the Office of Works, I would do my utmost to take measures to preserve them. But this is a matter which does not rest with me.

DURABILITY OF BATH STONE.

SIR.—I observe in your valuable periodical a perpetual outcry about bad building-stone, particularly as to what is known in the market by the name of Bath stone. These complaints I have no doubt are not without reason; but to any who make them I would say the fault is among your own people, and all your own.

The fact is, there is plenty of good stone to be got from the Bath quarries, which will last for centuries, if builders will get it from the right quarries, and the masons — particularly the *bankers*—will work it to be right bedded; instead of which, it is to be feared, the contractors prefer the inferior stone, because it is more easily worked, and many masons care little about the bed. Young ones do not understand it, so as it will split their moulds, and can be got rid of in the quickest way.

In the spring of 1854 I rebuilt the top of the tower of this parish church. The upper string course was to be of Bath stone, as well as the copings of the battlements and the embrasures. I went myself to the quarry at Combe Down in the autumn of 1853. There it was all worked, and there it lay exposed all through the winter. Early in the following spring it was sent down, and used; and there it now is in place, without an arris having perished; nor is there the slightest show of scaling or defect. Afterwards I had a deal of work from the same quarry,—crocketed bell-cot, barge tabling, window mullions, heads and jambs, and door jambs, &c., for substantial school buildings: not a single stone shows any sign of defect—all as perfect as when it was set, and a great deal harder; in fact, the drag will not touch it. Such is the nature of the best Combe Down stone. I had experience of it before I came into this county. I have no interest in the quarries; I wish I had, for I have heard they used to be rented at the rate of 1,000l. an acre; but I have no doubt Mr. Dardige or Mr. Snmption, of Combe Down, will be happy to supply any quantities equally durable.

There are plenty of old buildings in Bath adorned with carved work, and old chiroches in the neighbourhood, standing proofs of the durability of the sound and hard beds of the old Bath quarries.

If people would not be in such hurry to run up churches and mansions, and would take more care in selecting the stone and allow it to season, there would not be such cause for complaint.

Building by contract, under high pressure, driving it on at railway speed, is the bane of sound building. That was not the way they built when our noble cathedrals and churches and old castles were erected. It is said that William of Wykeham never allowed a stone to be set during the winter months—all which time the masons should be mending work under cover; but now it is "nil mora nil requies." But up goes the work sometimes, in spite of cold and frost, it may be even to a topmost spire!

What is the present condition of the stone-work in Portland-place? That is where the first stone from Bath was used in London, and was, I believe, from the Combe Down quarries.

Clyst St. George. H. T. ELLACOMBE.

UGLY WORK IN THE SOUTH KENSINGTON MUSEUM.

SIR,—It is well known to be the universal wish—and more especially so with all the authorities concerned—that the South Kensington Museum (or the "Albert Museum," as some people desire to have it called) should be rendered as pure and perfect as possible; and, therefore, I trust the remarks I am about to make will not be attributed to a propensity for finding fault.

An important and beautiful addition to the Museum is being created in the grand staircase to the "Keramic Gallery" now in course of decoration, and which, at great cost, and with admirable taste, is being decorated with mosaics and painting. This staircase is a favourite portion of the Museum to me, and I constantly go up and down it, to inspect the work, and to study any new feature that has been added, or developed, since my last visit. To-day, to my dismay, I perceived in one of the centre side-pieces on the staircase walls, a decoration which I cannot but consider a most fearful violation of good taste and of common sense.

As you doubtless remember, the top and bottom lines of these panels take the slant of the stairs and ceiling; in one of them was placed an "affixed" or "workmen say" but there it was—a sort of trophy consisting of an escutcheon, on which is a female mask with closed eyes; a trident; the "open hand" of the old Romans; Mercury's caduceus; and an oval ring, whose purpose I could not understand, below all. Some of these objects are made to slant while others are straight, and—oh! horror of horrors—the mask, or face, is all awry too! The right-hand corner of the mouth is drawn down an inch below the left; the closed right eye is treated the same; but the nose is tolerably level.

You may perhaps form an idea of the outrageously frightful appearance this distortion presents, suggesting a decapitated head that has been woefully ill-treated; or, at best, a gutta-serena toy face, squeezed out of shape. The colour, too, is quite-perhaps greenish; rather a death-like hue. The various objects—objects, with a witness—are in bas-relief; and as they are carefully executed, and by no means sparingly gilded, I fear that whoever designed or created this nightmare, has grown so accustomed to its ugliness as not to perceive its enormity. Pope has said,—

"Vice is a monster of so frightful mien
As, to be hated, needs but to be seen;

Yet seen too little, hides with his face,
We first endure, then pity, then embrace."

This argument of the poet can be the only excuse for the author of the above-mentioned having allowed anything so utterly at variance with the usual course of their proceedings, to be placed in this beautiful museum. Pray call their attention to the deformity I have mentioned, and, if they are all the while, and by ridiculing as they do of this nightmare, has grown so accustomed to its ugliness as not to perceive its enormity. Pope has said,—

One of the Public.
Before printing this letter we made an opportunity to visit the said museum, and read audibly the complaint in its entirety. If the panel be permitted to remain it will bring lasting ridicule on what otherwise promises to be an elegant work.—Ed.

PROPOSED REGISTRATION OFFICE FOR WORKMEN.

SIR,—I venture to address you upon a subject which I think is of some importance to those who are in the habit of reading your widely-circulated journal. I, as a builder, feel that there is a necessity for instituting some plan by which the employer of labour may make his requirements easily and expeditiously known. At present, if a builder requires a good and efficient foreman at a short notice, he is at his wit's end, should his staff be fully engaged. He probably makes inquiries of those in his line of business or publishes his wants through any channel he thinks most likely to make them generally known. But this process is slow and unsatisfactory, and he very likely, after all, sends a man who is a very inefficient superintendent to a work of importance.

It occurs to me that all this might be remedied by creating a registration-office in some central position in London, with a manager carefully selected for the post, in whom confidence for sound judgment and discrimination may be placed. The expenses need not be great and could be defrayed by small annual subscriptions from the builders. It should be the duty of this manager to receive personally each applicant for a situation, and he should character for ability and integrity—that is to say, his age, what works he had conducted, their extent, whom for, &c., and after these questions he should make it his business to test the accuracy of the statements made, and in point of fact, make himself thoroughly acquainted with the man's antecedents, or to use a book-keeping expression, "post up" his character for the ready inspection of any of the subscribers, so that an answer should have the privilege of knowing where to go, with some chance of being able, without loss of time, to find the sort of man he would want. I think there are numbers of foremen who would at once present themselves for registration. It would be necessary for the manager to have a personal interview, so that he might be able to judge by a *visu et tactu* examination whether the man knew his business, and to assist his judgment as to whether the applicant appeared to be shrewd, intelligent, and energetic.

It would be necessary to make it supportable by subscriptions, and not by inquiry-fees; for this reason, that it ought to be an office where both sides could feel that something was known both of the builder and foreman.

Such an establishment would enable many promising young men to work their way to the front. My knowledge of the men is this, that there are many intelligent, well-conducted, energetic, and trustworthy workmen, with all the elements of good foremen about them, and these would thus have a chance of bringing themselves before the notice of the builders, who, did they but know where to find them without delay, would be delighted to give such men an opportunity. Should the scheme answer, branch-offices could be granted to the parent institution, and the idea might be extended to the registration of workmen's names and addresses. Notices might also be posted at these branches, stating that at such a place bricklayers or masons, &c., were wanted. The builder would thus merely have to make his requirements known at the central office, from whence they could be promulgated, saving the workmen the present disheartening custom of walking from works to works to find employment, or seeking information from their mates as to where it is to be found. I am, of course, not sure that the scheme would answer, but my belief is that it would. However, if you will be good enough to give this suggestion a space in your paper it may have the effect of eliciting some remarks from employers, superintendents, and workmen. It seems to me that it would tend to bring all these classes into free communication with each other, and with immense advantage to all. I should take great interest in its development.

A BUILDER.

THE VOLUNTARY ARCHITECTURAL EXAMINATION.

The Institute of Architects have adopted the following Resolutions:—

1. That passing the Voluntary Examination ought to be followed by advantages such as will promote the advancement of life and in the profession of the Student.

2. That each Candidate who passes the Examination should receive a formal acknowledgment of his having passed.

3. That passed Students in the Class of Proficiency should become, *ipso facto*, Students of the Institute, without further payment, for as many years as they have paid guineas.

4. That the names of Candidates who have passed in the Class of Distinction be formally notified, by the Secretary, to the Board of Examiners for District Surveyorship Certificates, when such Candidates present themselves for Examination before that Board."

The Council have been requested to determine the manner in which the recommendation embodied in Resolution No. 2 shall be carried out.

INUNDATION OF A BATH-STONE QUARRY.

We understand that the flooding of Messrs. Pictor & Sons' Corsham Down Stone Quarry has completely subsided, and quarrying operations were recommenced on Monday, the 12th inst. The workmen and boys, nearly 100 in number, have been thrown out of work for the last twenty weeks, thereby causing great distress.

The flooding of the quarry is attributed to the heavy rainfall that we had at the close of last year. The volume of water, when it first broke in, was computed at 60,000 gallons per hour. This continued to flow until there was water enough in the quarry to fill a lake equal to three acres and a half in extent, averaging 9 ft. deep. The present working chambers were high and dry, but not accessible to the workmen, the entrance being on the lower level, the stone inclining from the bottom of shaft at 3 ft. in 100 ft., consequently completely blocking the only entrance; in fact, at that point the shaft was 15 ft. deep,—that is, 7 ft. higher in the water than the ceiling of the quarry. The proprietors are sinking another inclined shaft that will penetrate to the workings at a level above that reached by the water, so that should there be a flood again next winter the working of the quarry will not be delayed.

BRIGHTON BATHS.

The Brighton (Brill's) Baths Company are now having a first-class swimming-bath added to their premises at the bottom of East-street, with its accompanying hot-baths, shower, vapour, douche, and shampooing. The frontage of the new building in East-street is 96 ft.; its height, 45 ft. The chief feature of the lower facade will be polished granite columns, with sculptured stone capitals; five facing on East-street, and two on Pool-valley, with eight smaller pillars on the ground-floor and seventeen on the upper-floor. At the summit there will be a stone palisade. The grand entrance leads to a reading-room, 24 ft. square. Out of the reading-room the visitor can pass to the first-class swimming-bath or to warm-baths on the second floor. The swimming-bath is 61 ft. in diameter; the depth of water will be from 4 ft. to 6 ft. 6 in.; its area will be twice that of the second-class

swimming-bath, and it will be surrounded by twenty-two dressing-rooms, each 9 ft. by 7 ft., considerably larger than those of the second-class, and which will be more handsomely fitted up. The interior of the swimming-bath obtains its ornamental character from courses of coloured brick, intersected by Portland stone, from which latter springs the dome, formed of iron ribs, filled in with coloured brick, and a glass lantern as its apex. This dome will not be much smaller than that of the pavilion. Mr. G. G. Scott is the architect of the company.

DISASTERS.

On Saturday night, when "True to the Core" was finished at the Surrey Theatre, the crowd in the gallery rushed out, and pressed so heavily against the barrier on the second landing, where checks were being given, as to force it out of its place. Of course, a great portion of the crowd were precipitated down the lower stairs, and several people were seriously hurt. One man had his leg broken, another man had an arm broken, and a third had his ribs fractured.

A new Baptist chapel is now in course of erection in Everton-road, Liverpool. On Saturday morning some of the workmen, in removing a block of stone weighing between 3 cwt. and 4 cwt., placed it upon a newly-hilt arch. The latter at once gave way, precipitating the whole of them into a vault beneath. The block of stone fell upon a man and killed him.

The New Adelphi Music Hall, Union-street, Oldham, which was opened a few months ago by the Oldham Philharmonic Society, fell in on Monday morning, and has become a complete wreck. It having been ascertained that the building was unsafe, on Monday morning the lessee, Mr. Seal, and some of the others connected with the place were in the orchestra collecting their music, when the east wall gave unmistakable evidence of its unsoundness, and they therefore rushed for the outside. They were only just in time, and Mr. Seal was struck on the head by some of the debris, but he was not seriously hurt. The cause of this catastrophe is said to be the undermining of the foundations while excavating the adjoining new buildings.

ACCIDENTS.—OFFENCES.

Or all the tenements that are every day wantonly destroyed, none can compare with that mortal tenement which contains the principle of human life. It is one which no legislature can absolutely protect, excepting it may be in altering the circumstances, or circumscribing the conditions; and hence the great necessity of pointing out again and again, with all the wearisome iteration of which the subject will admit, that the horrible colliery calamities which we hear of every day are always to a greater or less extent preventable. There are to be sure different varieties of fatal accidents. If an earthquake happen; if a gulph spring open under a man's feet and swallow him up; or even let us suppose the recurrence of that awful catastrophe which happened to the ancient inhabitants of Pompeii and Herculaneum, he is overwhelmed in a single night with red-hot lava; these are fatal events against which in the present state of our knowledge there is no provision. The law pronounces such cases, and with justice, to be inscrutable visitations of Providence; in plainer words, to be "the act of God," in the face of which all human foresight and prudence is inoperative and ineffectual. There are, moreover, certain accidents connected with coal-mines and manufactories on which we have previously dwelt that would seem practically to come very near within the reach of this category. Putting aside the unfortunate temerity of the miners, and the laxity in adhering to well-known rules of prevention, —smoking in the mine, for example, in the midst of the dangerous fire-damp, opening their safety-lamps, and so forth,—it is obvious that 500 men cannot work in the bowels of the earth with the same degree of safety and security that they can do on its surface. And so on. There are, in short, classes of accidents and casualties to which human beings working in coal-pits are liable which are more or less beyond the control of the human will, and for the results of which therefore, in the great aggregate of fatality, we must hold the unfortunate victims, as well as society itself, almost, if not altogether, exempted. We sincerely trust that the State will at length intervene and contrive some special rules by

which these fatal accidents in collieries may be at least taken out of the category of wanton and reckless sacrifice of life. Nothing, we will add, is more discreditable to the present state of education in our public schools than to find men who have been liberally educated—graduates of our best universities not infrequently—profundly ignorant of the simple and elementary rules of physics and mechanics by which our civilization is increased. How, then, shall we expect more at the hands of poor miners, who have hardly any education at all? Since Mr. Stanley Jevons pointed out the growing and increasing difficulty of mining for coal, we have always felt that the process would involve an increasing waste of human life. The only antidote, we are afraid, is an increased intelligence on the part of the miners. No mere inspection, of necessity irregular and superficial, can supply this want. Let these men be as well educated and as well paid as railway engineers or other classes of men who risk their lives every day in a profession equally perilous, and, above all, let their voices be heard periodically—weekly, it might be—on the state of their mines; and, above all things, let them exercise more frequently their undoubted prerogative of entering well-founded complaints with the Government inspectors; and, without saying we can do everything to prevent this horrible loss of life, we may at least discover a method of circumscribing its extent. There must be some limit to coal-mining, just as there is to high speed on our railways; and it appears to us that no mine whatever should exist unless with separate shafts, and safety-chambers, ventilated from the surface, attached to every gallery.

SCHOOL-BUILDING NEWS.

Lynn.—A contract has been entered into for the erection of a building designed by Mr. Teulon, architect, for a boys' and girls' school in connexion with St. Nicholas's chapel, for the education of the children of the poor at the north end of the town; a site for the purpose having recently been purchased in an eligible situation in Pilot-street. The cost of the land and building is estimated at 1,900*l.*, and a large portion of that sum has been subscribed.

DISSENTING CHURCH BUILDING NEWS.

Totmorden.—The architect of the Unitarian Church erected here, as already noticed, by Messrs. Fielden Brothers (in memory of their deceased father), was Mr. John Gibson, of London; and the contractors for the wood work (chiefly oak) were Messrs. Clay & Son, of Manchester: the masonry was executed under the charge of the clerk of the works on the stone being supplied to him. Although the edifice has cost between 25,000*l.* and 30,000*l.*, it will only accommodate about 500 persons, so that the workmanship and materials have been of a very costly description.

PROVINCIAL NEWS.

Stockton.—The foundation stone of new stores proposed to be erected by the Stockton Industrial and Provident Co-operative Society has been laid. The site is in Wellington-street, at the top of St. John's-road. The building will have a frontage of 40 ft., and from the back to the front will measure 49 ft. The store will consist of grocery and drapery shops on the first floor, a dry goods warehouse, committee and reading rooms over the two shops, and cellars underneath. To place one large assembly-room at the disposal of the society, a partition has been placed between the reading and committee rooms, which can be removed at pleasure. The contract for the mason and wood work has been taken by Mr. Craggs, builder, for 709*l.* The site of the building has cost 154*l.*

CHURCH-BUILDING NEWS.

Easby.—The church, which has recently received a thorough restoration, under the hands of Mr. Gilbert Scott, has been reopened. The restoration has been effected at the joint expense of the Earl of Zetland and Mr. Leonard Jacques (patrons of the living). The edifice possesses interesting features, amongst which may be mentioned some curious wall paintings of rude design, which were only revealed at the time the

building was undergoing restoration. They adorn the north and south walls of the chancel, and are specimens of the decoration of the twelfth or thirteenth century. These have been restored at the instance of the Earl of Zetland, under the direction of Messrs. Burlinson & Grylls. They represent various incidents of Scripture history—the Creation, the Birth of Eve, &c. The total cost of the restoration will be about 2,000*l.*

Burton Latimer.—The parish church of Burton Latimer, dedicated to "the Blessed Virgin," has been reopened for divine worship, after undergoing a restoration. The work was commenced in June last, and the expense incurred amounts to something like 4,000*l.* The chancel has, perhaps, undergone the most restoration, 700*l.* having been expended on it. The screen, the top part of which exhibits some carving, formerly occupied a position at the further end of the chancel, where it was made to serve the purpose of a chancel screen. It has been restored, however, to its original position, that of dividing the chancel from the nave. The church has a raised boarded floor, and the high-backed pews have given way to the ordinary rush-bottomed chair. The clearstory walls are adorned by paintings of the twelve patriarchs. These are of comparatively modern date, and are, perhaps, of small intrinsic worth, but as they are in a good state of preservation it was thought advisable to retain them. On the wall of the north aisle is another, a representation of St. Catherine being broken on the wheel—the aisle being dedicated to St. Catharine. A west gallery, which served to hide an Early English arch, and a lancet window in the tower has been removed. The south aisle has been almost entirely rebuilt, the outer wall having been out of the perpendicular. The roof of the church, too, is almost wholly new. The whole of the windows have been newly glazed. A separate subscription is on foot for the purpose of providing a new pulpit and font. The restoration has been executed under the superintendence of Mr. Slater, of London. The restoration of the chancel, tower, and spire was done by Mr. Henson, of Wellingborough, builder; that of the body of the church by Messrs. Foster & Wynn, of Kempston. The hot-water apparatus with which the church is warmed was provided by Messrs. Rynington.

Grantham.—The re-opening of St. Wolfstan's Church, Grantham, after an extensive restoration, took place on the 1st instant. Mr. Gilbert Scott has superintended the work. The galleries have been removed, and a partition of wood and glass, which supported the organ and organ-gallery, and divided the aisle-church from the eastern half of the building, has been taken down. The walls have been cleaned, the columns repaired and restored. A new roof has been placed on the whole of the church, with the exception of a small portion at the south-west angle—where a portion of the old work remains in a sound state. This has cost about 12,000*l.* The roof of the chancel is coiled with oak, and covered with carved wood of the same material. There are carved borderings, with inscriptions of the same material. The pews have been removed, their places being temporarily supplied with rush-bottomed chairs. The organ, which cost some 2,000*l.*, has been enlarged and embellished at a cost of 900*l.* It is placed in the north end of the church. An open screen of carved oak, surmounted by a cross, has been erected between the chancel and the body of the church. It does not, however, interfere with the view of its dimensions. The pulpit and lectern are of the same material. A corona of lights depends from the roof. The total cost of the restoration has been between 16,000*l.* and 17,000*l.*

Chester.—The chief stone of the new Church of St. Thomas, for St. Oswald's parish, has been laid. The site is a plot of ground off the Park gate-road, near the Training College. The building will stand upon a gentle rising ground, about 7 ft. higher than the road. The style is Early English, and it will be built entirely of red Knookon stone, the inside of dressed ashlar, and having an open timber roof. The building will consist of tower, nave, and two aisles, with chancel and chancel aisle on the north side, the tower being on the south side of the chancel. The nave will contain a western entrance. There will also be an entrance by a porch at the north, with a priest's doorway at the chancel aisle. The vestry will be underneath the tower, with entrance from the south aisle. Beneath the tower there will be a chamber devoted to the

heating of the church. The nave and chancel aisle will be lighted with a two-light window. There will be an additional three-light window in the chancel, and another of the same description at the western end. The tower will be at the south-east angle, its height being 72 ft. from the parapet, the roof being spiral in form, and made of wood covered with lead. In the tower there will be bell and ringing chambers, the latter 13 ft. square. The total length of the church inside will be 130 ft. 6 in., and the total width 63 ft. 2 in. The edifice will afford accommodation for between 1,100 and 1,200. The total cost is between 10,000*l.* and 11,000*l.* Mr. Gilbert Scott is the architect; Mr. Roberts, of Chester, the builder; and the clerk of the works is Mr. Frater, who is also in charge of the works connected with the Cathedral Restoration. At present it has been arranged that only a portion of the building shall be erected, but sufficient to render it capable of being used as a place of worship. That portion will not include the tower, and it will depend upon the funds that are forthcoming at what time the church will be completed. The necessity for a new church for the parish of St. Oswald arose from the nave of the cathedral being used for the Sunday Evening Special Services, which prevented the use of the parish church.

Kirkley.—The foundation stone of the new church of St. Chad, Kirkley, has been laid. The old church was built in 1609, and as it was scarcely suited for the requirements of the present time, the Earl of Sefton, at the cost to himself of 10,000*l.*, has resolved to build a new one.

Newtown, near Wem, Salop.—The new church here was consecrated on the 17th inst. It consists of nave, chancel, bell turret, vestry, and porch, and provides accommodation for 214 persons. The roofs are open-timbered and covered with tile. The floor of the chancel, which is separated from the nave by a low screen, is paved with Maw & Co.'s encaustic tiles, the stona slah at the back of the altar being also laid with majolica and enamelled tiles. Grinshill stone has been used for the walling and all dressings. The style is Early English. The east window consists of flowered quarries and coloured roundels, the centre light containing a subject in painted glass representing our Lord appearing to St. Mary Magdalene: the artists were Messrs. Sanders & Co., of London. The church has been erected at a cost of 1,200*l.* by Messrs. Nevett, Ironbridge, from the designs of Mr. E. Haycock, jun., architect, Shrewsbury.

South Kensington.—The dedication stone of the new Church of St. Matthew, South Kensington, was laid on Monday, 12th April, by Mr. G. North. The church, when completed, will consist of nave and chancel, with aisles separated by arcades, and a tower at the west end of the south aisle. The style is Early Decorated, and the edifice is calculated to hold about 1,000 persons. The contract, which at present only includes the chancel and aisles, has been taken by Messrs. Myers. The architect is Mr. J. H. Hakewill.

Subbury.—The alterations and repairs of Lammarsh Church having been completed, the edifice has been reopened for divine service. The work has been done according to the plans of Mr. A. Blomfield, architect, by Mr. T. Holland, builder, Subbury. The work of restoration commenced by taking out a gallery and opening up the tower by a large Gothic arch, putting in a raised floor, and seats for schools. The east lancet windows are new, the mullions and tracery of the other windows have been restored, and two new windows have been inserted on the north side. A new vestry has been erected on the north side of the chancel, uniform with the church. The tower is now surmounted by a new octagon spire, covered in with ornamented lead, with dormer windows in each square. The spire adds 35 ft. to the height of the tower, making the total height more than 80 ft. The east gable is entirely rebuilt, with corner buttresses, and is surmounted at the apex by a stone cross. The porch has also been restored. The inside of the church has undergone a material alteration. The chancel, altar, and reredos are decorated with Maw & Co.'s encaustic tiles and with mosaic work. The stalls are all new, in stained wood. The screen has been restored with new spandrels, bosses, and cresting in old oak. The old ceiling beams have been taken out, and the ceiling panelled and otherwise ornamented. Other improvements have been effected, and the grave-yard, over an acre in extent, surrounding the church, has been

levelled, the mounds restored, and the walks newly laid out.

Matlock Bath.—The new church of Scarthen, in this parish, has been opened for divine service. The church has been built under the direction of Mr. Whyratt, architect, Manchester; and the whole of the sittings will be open and entirely free.

Hannington.—The parish church of the small village of Hannington, dedicated to St. Peter and St. Paul, has been re-opened for divine worship, after restoration. The church, previous to its restoration, was in a dilapidated condition. Everything connected with it is new except the walls, and they have been restored. The pitch of the roof has been raised. The restoration has been effected at a cost of about 900*l.*, under the superintendence of Messrs. Slater & Carpenter, of London, architects, the contractors being Messrs. Clark & Heap, of Northampton.

Books Received.

Law of Patents for Inventions. By F. W. CAMPBELL, Barrister-at-Law. London: Virtue & Co. This treatise sets forth the state of the law resulting from decisions more recent than those of any other work published up to the present time; although it is intended more for the use of inventors and patentees, engineers, mechanics, manufacturers, and others interested in patent matters, than for the instruction of lawyers. The author also gives explanatory notes on the law as to the protection of designs and trade marks.

VARIORUM.

"THE Ninth Annual Report of the Amalgamated Society of Carpenters and Joiners, from December, 1867, to December, 1868," Office, 113, Stamford-street, Waterloo-road. In his remarks, the general secretary, Mr. Applegarth, says:—

"The arrears of contributions owing to the society in 184, per member less, while our funds average 1*s.* 7*d.* per member more than at the end of 1867; nor is this all. We have opened thirteen new branches (three of them in Ireland), have added 714 to our number of members; and, after meeting an extraordinary expenditure, we have increased our balance in hand by 2,628*l.* 4*s.* 10*d.* During the past year, though we have had some trifling differences respecting wages and working hours, in no instance have we had occasion to resort to a strike.

There is little doubt but that the encouraging trade may to some extent account for this encouraging fact, but it is nevertheless true, that amongst our members there is an increasing desire for arbitration."

"It is most gratifying to observe the progress which has been made by our members during the past year in the direction of technical education. In many of the principal towns, and in several parts of London, classes have been formed, assisted by loans granted by the council from the contingent fund; and the progress which many members are making by close application to their studies is most encouraging. It is a matter of remark that, with the exception of a few employers of labour at Bradford, and others at Manchester, none, that I am aware of, have given any encouragement to a scheme which would be of the greatest value to their apprentices, and consequently to themselves."

—Doncaster in 1868. By William Sheardown. *Gazette* Office, Doncaster. The matter of this pamphlet was communicated to the *Doncaster Gazette* in the present year; and it gives a full account of the meteorology, vital statistics, town improvements, markets, railway system, &c., of Doncaster, for the past year.—Transactions of the Institution of Engineers in Scotland; Twelfth Session, 1868-9. This part of these Transactions is occupied with reports of two papers,—one by Mr. James Gale, C.E., the president, on some recent additions to the Loch Katrine waterworks; and the other by Mr. William Moodie, on an improved form of horizontal propeller, and results of experiments. The papers are illustrated by engravings.—The Sun not the Source of Heat and Light to the Solar System: a Lecture at Ryde. By George F. Harrington. Ryde: Mason. This lecture develops an ingenious but somewhat fallacious theory, which seems to be an inversion of an old one, according to which light alone actually emanated from the sun, while heat and actinism were generated in the planetary atmosphere. According to Mr. Harrington's theory, it is the actinism which generates the heat and light in the planetary atmosphere. This it does by bringing about a slow combustion between its oxygen and hydrogen, the nitrogen by its dilution of the oxygen preventing a more rapid configuration, which must otherwise occur by the combination of the oxygen which floats in the nitrogen with the hydrogen, which floats mainly above it, notwithstanding the law of the

diffusion of gases. Light, according to the author, is the "incandescence atoms" in process of combustion. But what is the meaning of incandescence atoms. It must just be luminous atoms, or atoms radiating light, so far as regards that light apart from the heat; and how can light be such atoms if it only emanates from them? This is no explanation of what light is, although it is an attempt to show whence it comes. The way in which the author attempts to prove that the space between the sun and planets must be an absolute void seems to be equally fallacious. On the whole, however, the author's theory is one worthy of consideration, although spectral analysis and the general drift of speculation as to the sun seem at present to be much against such a theory.

Miscellaneous.

Destruction of a Church in Exeter.—The New Congregational Church in this city, which had nearly reached completion, was unfortunately almost entirely destroyed by fire on Monday, the 12th ult. A large commodious building of considerable proportions, it has been erected from the designs of Mr. Tarring, of London, and with the exception of differently arranged roof timbers, and the omission of the clearstory, is almost a facsimile of his church at Huntingdon. On the whole, the building was most satisfactory, and if we except a profusion of rather coarse and commonplace stone carving, it promised to become a great ornament to the city. The *Devon Weekly Times* says:—"The fire originated in the roof of the building, but from what cause is not definitely stated. It is, however, reported that some of the men had lighted a fire in a little room, at the top of the building, near the tower, which they left unprotected while they ran to witness a circus procession, and when they returned the roof was in flames. The wind was blowing in the direction of the hospital, and the tower and scaffolding escaped; but the flames rapidly extended in the opposite direction, and the interior of the roof was a mass of fire in a few minutes. The loss occasioned by this disastrous fire will fall on the Insurance Company, and not on Messrs. Bragg & Dyer," the contractors.

Tewkesbury New Waterworks.—At the last quarterly meeting of the town council, Mr. McLandsborough, engineer to the Cheltenham Waterworks Company, laid before the members plans of the proposed works for the supply of water for the borough. The pumping-station will be placed on the Brick Kiln Meadow, and will consist of a Gothic engine and boiler house, and engine-man's residence, built with red and black bricks and Bath-stone dressings. The water will be drawn from the Severn, and first pumped into a large subiding reservoir, out of which it will pass on to the top of three filters filled with nearly 7 ft. of filtering material, through which it will pass, and thence flow into a covered pure-water reservoir, from which it will be again pumped into the service-reservoir placed on an ornamental tower, to be built on the top of the hill, near to the Mythe Tuto, from which the water will flow directly to the town. This tower will be about 80 ft. high from the ground. The water will reach to the tops of the highest houses in Tewkesbury. The works are estimated to cost 12,000*l.* The company, under their Act of Parliament, undertake to give a constant supply of water to the owners of property at the rate of 5*s.* per cent. on the rental, and to supply the cottage property at the rate of 2*d.* per week per cottage.

Salisbury Cathedral.—The restoration of the west front is now approaching completion. Most of the figures have been placed in the niches. Some half a dozen more are to be added, but still there will be many niches left vacant. The polishing of the marble shafts lately added to the windows, &c., in place of those which were decayed, is now in progress, and when finished the immense pile of scaffolding now completely covering the west end will be removed. The interior restorations have not yet been begun, but it is expected they will shortly be proceeded with. Funds, however, will be wanted for this.

National Portrait Exhibitions.—The receipts at the three exhibitions, in 1866, in 1867, and in 1868, were 8,845*l.*; expenditure, 10,134*l.* The deficiency is supplied by the Parliamentary vote for the Science and Art Department.

New Bridge at Halifax.—The foundation stone of a new bridge over the valley of the river Hobbie, at Halifax,—the construction of which is demanded by the large increase that has taken place in the amount of traffic between Bradford, Leeds, and the towns eastward since the original structure was built,—has been laid with much ceremony. The new bridge, which is to be of iron, with two spans of 180 ft., is to be built by the corporation of the town, at a cost of 21,000*l.* It is designed in the Decorated Gothic style of architecture, and the elevation shows two flat elliptical arches, each of 160 ft. span, with a rise of only 16 ft. The clear width between the parapets, available for traffic, will be 60 ft. The outside ribs, which are to be of cast iron, will be 4 ft. deep at the centre, and 5 ft. 3 in. deep at the springing, and will carry open-traceried spandrels at the haunches, crowned by a cornice, and a partly quartered and battlement parapet. The inside ribs, of which there will be six, are placed at a distance of 8 ft. 7 in. apart. The centre part for a space of 52 ft., will be composed of wrought-iron plates: the remaining parts of the ribs are to be of cast iron. The road will be formed by a layer of asphaltic concrete, upon which the paving is to be laid. The total weight of the cast-iron work will be 1,200 tons, and that of the wrought-iron work 150 tons. The iron to be used will be from the West Yorkshire Iron and Coal Company, Limited. The masonry of the central pier and of the abutments on each side the valley will be finished by five spires, like terminations, which will rise 15 ft. above the parapet on each side of the bridge, and will carry large octagonal lamps, to be supplied with gas for lighting the roadway. As a portion of the new bridge will stand upon the site of the old one, it is intended first to build one half of the new bridge, and then to divert the traffic from the present structure on to the new half. The present bridge will then be pulled down, and the remaining half completed. The roadway of the new bridge, when completed, will be 11 ft. above the level of the old one, and by this means a gradient almost level will be obtained from Cross Hills to the opposite side of the valley. The construction of the bridge, and also of a new road in lieu of the present Bridge Lane, rendered necessary by the increased width of the approach, has been let to Mr. Archibald Neill, of Bradford, for 21,000*l.* The construction of the ironwork has been sub-let by Mr. Neill to Messrs. Joseph Cliff & Co., also of Bradford. The bridge will be made from designs by Mr. John Fraser, C.E., of Leeds.

Civil and Mechanical Engineers' Society.—On Saturday last the members of this society visited the St. Thomas's Hospital and the Lambeth section of the Thames Embankment works, by permission of Mr. Henry Curry and Mr. Bazalgette. Amongst the gentlemen present were Mr. B. Haughton, president; Mr. G. E. Eachus, past president; Messrs. J. B. Walton, G. W. Usill, and R. M. Binocott, members of the Council, &c. Amongst other things worth noting, a sample of Portland cement as used on the Embankment works was broken in the presence of the members of the society, showing a tensile strength of 603 lbs per square inch of section.

Crystal Palace.—The programme of the sixteenth season is to be issued next week by the directors. The season will open on Saturday, May 1st, with a grand musical festival in honour of Rossini. The orchestra will be on a gigantic scale, approximating with to the Handel Festivals, consisting of upwards of 3,000 selected performers. The programme will include the Overtures to "Semiramide," "La Gazza Ladra," and "William Tell." The "Stabat Mater," a work eminently suited for interpretation by a large body of performers, will form part of the selection. On May 1st, likewise, a transparent scene, which has been specially painted for the Crystal Palace by Mr. Matt Morgan, representing the "silver" and "golden" illuminations of St. Peter's, at Rome, will be exhibited in the Concert-hall. Another novel attraction is the announcement of operas to be performed on the complete stage, which was last year erected in the Concert-hall. These will be played in English, supported by efficient companies, and will be under the management of Mr. George Perron, Mr. Manns conducting. The "Bohemian Girl," "Lurline," and other popular operas will be produced, the series commencing at the termination of the Whitsuntide amusements.

New Sanitary Commission.—An order has been issued by her Majesty revoking the commission appointed last November for inquiring into the operation of the sanitary laws, and appointing a fresh one with enlarged powers. The new commissioners are—C. B. Adderley, Earl of Romney, Earl of Ducie, Lord Robert Montagu, Russell Gurney, Stephen Cave, Sir Thomas Watson, C. B. Ewart, J. R. M'Clean, Samuel Whitbread, J. T. Hibbert, E. M. Richards, George Clive, F. S. Powell, Benjamin Shaw, James Paget, H. W. Acland, Robert Christian, Wm. Stokes, John Lamher, and F. T. Bircham, and Mr. W. H. Birley is secretary. This order gives power to inquire into the operation of the sanitary laws, so far as they apply to sewerage, drainage, water-supply, removal of refuse, control of buildings, prevention of over-crowding, and other means of promoting the public health.

The New Workhouse for Poplar Union. The foundation stone of this new workhouse has been laid. The buildings, which have been designed by Mr. J. W. Morris, of East India-road, are to be constructed on the double pavilion principle, for the accommodation of 800 paupers. The site is that of the present workhouse, portions of which will be removed as the new work progresses, the main block of the present structure facing the High-street being simply altered and adapted for the future administrative offices. A chapel is to be erected, with accommodation for 500 persons; and attached to the institution will be spacious labour-yards, workshops, mills, and a bakery. The contractors for the works are Messrs. Hill, Keddell, & Waldram, and the contract price is 32,480l. This building will be the first metropolitan workhouse constructed specially for accommodating able-bodied paupers. The expenditure on the new house will amount to 40,000l., which will have to be repaid, with interest at 5 per cent., by instalments extending over thirty years.

House Decoration.—At the Society for the Encouragement of the Fine Arts, last week, Dr. Dresser gave a lecture, the subject of which was how to decorate and furnish a house from an artist's point of view. The lecturer, commencing with the general principles that all art should be truthful in its utterance, all decorated objects appear to be what they are, and all excessive decoration avoided, proceeded to point out how this might be carried out in the furnishing and embellishment of a house. Amongst his suggestions were the following:—That of a creamy buff colour, with stars stencilled upon it, to replace the cold whiteness of our ceilings; the rejection of floral mural patterns that aped relief, being mere repetitions of pictorial objects, and therefore objectionable as backgrounds. In lieu of these last he recommended simple patterns having a bloomy effect, and he concluded his discourse by impressing upon his audience the importance of seeking after general harmony, and cautioning them against strong colours in large masses, repose, not glitter, being the great object.

Transplanting in the Night.—A gentleman anxious to ascertain the effect of transplanting at night, instead of by day, made an experiment, with the following result:—He transplanted ten cherry-trees while in bloom, commencing at four o'clock in the afternoon and commencing one each hour until one o'clock in the morning. Those transplanted during the daylight shed their blossoms, producing little or no fruit, while those planted in the dark maintained their conditions fully. He did the same with ten dwarf trees after the fruit was one-third grown. Those transplanted during the day shed their fruit; those transplanted during the night perfected their crop, and showed no injury from having been removed. With each of these trees he removed some earth with the roots. The incident is fully vouched for; and if a few more similar experiments produce the same result it will be a strong argument to horticulturists, gardeners, and fruit-growers to do such work at night.—*Dow Bells.*

Artists' General Benevolent Institution. The dinner in aid of this institution, the object of which is to afford relief to distressed meritorious artists, whether subscribers to its funds or not, as well as to their widows and orphans, merit and distress constituting the claims to its benevolence, is fixed to take place on the 8th of May. The Right Hon. Lord John Manners, M.P., will preside. Mr. John Everett Millais, R.A., is now hon. secretary.

Architecture in Carlisle.—At a recent meeting of the Carlisle City Council, on an application of Mr. J. Graham, a councillor, for leave to purchase from the Corporation a corner site of Cavendish-place and Alfred-street, at 8s. 6d. per square yard for building-ground as far as it is square, and 4s. 6d. for the three-corner plots adjoining, it was resolved, after some discussion,—

“That architects be invited to send in elevations for houses to be erected in Alfred-street, and that 2d. be given for the design approved by the council. In the meantime the sale of the site at the corner of Cavendish-place and Alfred-street, and other sites in Alfred-street, be postponed.”

A committee was appointed to carry out the arrangements, and the Town Clerk was instructed to insert an advertisement in the local papers, and also in the *Builder*, *Manchester Guardian*, and *Scotsman*.

A Warning.—Such Societies as the Literary Fund, the Artists' General Benevolent Institution, and others that distribute “doles in money or kind,” should at once petition against clause 259 in the Endowed Schools Bill, or they will find themselves forced to apply their funds for a purpose entirely different from that for which they were gathered.

The Burning of Theatres.—A boy is in custody for an attempt to set the Belfast Theatre on fire. In the middle of the night it was discovered that all the meters had been turned on, and the gas escaping, the place full of smoke, and that the under part of the stage had been on fire. The prisoner was caught in the act of escaping from the house.—The Bellini Theatre in Naples has been burnt to the ground.

TENDERS.

For the erection of a row of three villa residences, for Mr. W. Wallis, Watford, Herts. Mr. Frank E. Thick, architect.

Bennett	£2,132 0 0
Allen	1,984 0 0
Halley	1,835 11 0

For the erection of a villa residence, at Wandsworth for Mr. W. W. Barth, Messrs. Tolley & Dale, architects:—

Do, with back additions omitted.		
Knight	£312 0 0
Fawcett	819 0 0
Steele	745 10 0
Stark	651 10 0
Stark	630 0 0

For certain alterations at No. 1, Pan-lau-street, Finsbury, for Mr. E. Midwinter, Messrs. Tolley & Dale, architects:—

Green (accepted)	£400 0 0
------------------	-------	----------

For enlargement of the warehouse premises of T. Adams & Company, Limited, Nottingham. Messrs. T. C. Hine & Son, architects:—

Barker	£6,250 0 0
Stevenson & Weston	5,954 0 0
Bell & Son	5,943 0 0
Hall	5,900 0 0
Hall	5,847 0 0
Lynn	5,625 0 0
White	5,625 0 0
Deane & Co.	5,575 0 0
Wood & Son	5,511 0 0
Marrillott & Co.	5,500 0 0
Wood & Slight	5,494 0 0
Johnson & Wright	5,412 0 0
Fish	5,371 0 0

For building a new ward at the Faversham Union. Mr. B. Adkins, architect. Quantities by Mr. T. M. Hickman:—

Bull	£2,050 0 0
Bawyer	1,860 0 0
Foote	1,830 0 0
Eastcliffe	1,705 0 0
Judges	1,699 0 0
Austen	1,694 0 0
Adcock	1,693 0 0
Naylor	1,673 0 0
Whiting	1,630 10 0
Shrubsole	1,519 0 0
Sollitt	1,537 0 0

* Accepted, we are requested to say, in consequence of the little difference above the lowest tender, and the builder being a resident within the parish.

For alterations to Roding House, Chigwell. Mr. J. W. Morris, architects:—

Arber	£295 0 0
Mivett	232 10 0
Egan	232 10 0
Stevens	498 0 0
Wicks & Bangs	493 0 0
Abraham	484 0 0
Abertott	460 0 0
Sheffield (accepted)	414 0 0

For erecting two dwelling-houses and shops in Walworth-road, for the Rev. J. C. Clark, Mr. Robert Parris, architect. Quantities supplied:—

Newman & Mann	£2,626 0 0
Bottomly	2,595 0 0
Sharrington & Cole	2,577 0 0
Downs	2,463 0 0
Marland	2,397 0 0

For constructing the Western Outlet Sewer, from Woolton to Garston. Woolton sewerage, Contract No. 3. G. W. Goodison, C.E. (Reade & Goodison), engineer. Quantities supplied:—

Thomas	£5,080 12 6
Maugrove & Roper	4,780 0 0
Jones	4,762 0 0
Hauking	4,316 0 0
Lee	4,250 0 0
Mitchell	4,214 8 6
Harland	3,969 0 0
Martin, jun.	3,870 0 0
Dixon & Sleigh	3,650 0 0
Pilkington	3,689 0 0
Winnard, jun.	3,581 5 5
Rothwell	3,550 0 0
Hardacre	3,471 6 0
Standing & Littler (accepted)	3,419 12 0

For Serpentine marble shop front, &c., 85, Edgeware-road, for Mr. V. M. Blades, Mr. W. Seckham Witherington, architect:—

Drew	£319 0 0
Melville	316 0 0
Hawke	315 0 0

For repairs to twenty-five houses in Trafalgar-squares Peckham:—

Williams & Son	£1,467 0 0
Goodwin	1,349 0 0
Selkirk	1,200 0 0
Sharrington & Cole	1,197 0 0
Pierpont (accepted)	1,095 0 0

For house and shop at Rottingdean. Mr. T. Simpson, architect. Quantities supplied:—

Gorrage	£1,180 0 0
J. & W. Sawyer	1,683 0 0
Nightingale	970 0 0
Lawyer & Simmons	965 0 0

For additions to Boscobee, near Christchurch, Hants, for Sir Percy Shelley, bart. Mr. T. Dashwood, architect. Quantities supplied by Mr. L. C. Riddett:—

Futcher	£4,890 0 0
Adamson & Son	4,490 0 0
Jackson & Shaw	4,310 0 0
Bull & Sons	4,318 0 0

For new buildings, enclosing railings, gates, lodges, &c., for the Hambro Synagogue Burnt-ground, Victoria Park. Mr. H. H. Collins, architect:—

Stuart & Bennett	£1,060 0 0
King & Sons	1,025 0 0
Nagel	948 0 0
Colen (accepted)	850 0 0

For four pairs of cottages at Southgate, for Mr. Medwin. Mr. H. Phillips, architect:—

Linsell	£1,910 0 0
Marland	1,460 0 0
Conibley	1,455 0 0
Wills	1,455 0 0
Everitt	1,433 0 0
Quennell	1,400 0 0
Gibbs & Son (accepted)	1,336 0 0

For alterations, Cambridge Lodge, for Mr. H. Dodson, Pezze, Mr. H. White, architect. With Zinc. Greenhouse.

Croaker & Son	£380
Cooper & Cullum	340
Gibbs & Son	363
Accepted	45 10 0

For St. Augustin's Church, Highbury. Messrs. Habershon & Brock, architects:—

Brass	£10,375 0 0
Colls & Co.	8,393 0 0
Myers	7,925 0 0
Newman & Mann	7,720 0 0
Patman & Co.	7,600 0 0
Nightingale	7,573 0 0
Scrivener & White	7,398 0 0
Downes	7,050 0 0
Manley & Rogers	6,984 0 0

For additions and repairs to Hele's School buildings, Plympton St. Maurice, Devon. Mr. H. Elliott, architect:—

Sanders	£694 15 0
Seney & Hellings	558 0 0
Opie	490 0 0
Condy, Brothers	463 0 0
Bishop	450 0 0
Radcliffe & Crocker (accepted)	450 0 0
Webber & Rowse	407 10 0

For alterations to the British Queen Tavern, Trafalgar-road, East Greenwich, from Mr. A. Beckwith, Messrs. Shaw & Lockington, architects. Quantities supplied:—

Bricklayer, Carpenter's, &c., Work.		
Hiscock	£287 0 0
Wooding	228 0 0
Miller (accepted)	215 5 0
Painter's Work.		
Wall	£150 0 0
Prigley (accepted)	136 0 0

TO CORRESPONDENTS.

The Builder.

VOL. XXVII.—No. 1369.

Military Labour and the Builder.

IN the order of the day for going into a Committee of Supply being moved recently in the House of Commons, Mr. Hanbury Tracy called attention to an important subject, to which, on repeated occasions, we have devoted our columns. In any matter of real reform, which is neither a private crocheted nor a party move, a considerable amount of unconcerted unanimity will generally be found to prevail amongst its advocates. Approaching the question from different points of view, arguments of varying weight and character will be found to converge;

as the movements of various bodies of troops may be combined by a skilful general. When the reform is uncalled for, or illusory, these various arguments will be often found to be mutually antagonistic. But when, as in the present case, the purport is concordant, although the points of departure are distinct, conclusive evidence is afforded that the general in command is no other than the truth.

Mr. Hanbury Tracy's point of departure was the idea of the waste of public money which arises from the system of employing civilian labour in the construction and repair of works and buildings connected with the War Department. He moved a resolution to the effect that "an authorized system should be adopted for extending the system of 'military labours to military works' to all stations of her Majesty's army." The point of view thus selected may be described as the abstract and philosophical. That economical advantage is foregone by the idleness of the soldier, when not under drill, is a proposition which may seem almost self-evident. Mr. Headlam, in seconding the motion, enforced the arguments of the hon. mover, by testifying, from his own experience as Judge Advocate, the fact that many of the crimes of which soldiers are guilty are really committed in consequence of the lack of employment. Thus far, the motion met with the cordial sympathy of Mr. Cardwell, who regarded everything which diminished idleness among soldiers as a boon, seeing that, in the army, as out of it, idleness was a fruitful source of evil. But the difficulty of superintendence arose as a detailed objection to the enforcement of any general rule.

It is at this point that the arguments which we have previously urged appear, to our judgment, to come in with irresistible practical force. To a certain extent we may consider the ground to be cleared by the discussion in the House of Commons. The old-fashioned notion that a soldier must be nothing but a soldier, has dropped out of sight. We are no longer told that stooping to use the spade and pickaxe prevents a

man from standing upright at drill. We hear nothing of that spirit of the martinet which, Mr. Kinglake tells us, made the Russian emperor so averse to enter on the Crimean War, because he had at last put his army on so satisfactory a footing. That men are to be drilled to such perfection that it is a pity and a shame ever to allow them to do anything but appear on parade, was not urged on the present occasion.

The grand idea that the army might, to its own advantage no less than to that of the rest of the nation, be made to a considerable extent a self-supporting institution, was not, indeed, distinctly present to any speaker who joined in the debate. No one questioned the advisability of taking steps in that direction. The only obstacles that blocked the course were those of detail. But these are precisely the most formidable. For it is when we descend from the region of the theoretically advisable to that of the practical, that all depends on detail. Thus the opposition of commanding officers is rather hinted at than brought distinctly forward. It is hinted at, however, as a fatal obstacle. Want of superintendence was another stumbling-block. It seemed to be tacitly assumed by General Herbert that, when engineer officers were not available, no others were capable of taking the direction of works. Thus in discovering detailed causes for the postponement of a scheme which was intended to prevent the waste of public money, we find the argument employed by the Hon. General that "another difficulty to be got over was the financial one. When engineer officers were not available to superintend the labour of soldiers, it was in many instances cheaper to have work done by contract."

An argument of this nature has a wider range than its author appears to have contemplated. If urged against the general theory, that the army should be rendered, as far as possible, self-supporting, it has neither weight nor relevance. It is a simple admission of the inferior and inadequate state of our military education, outside of one very distinguished corps; and it implies more than it admits, for it seems to contemplate the adhesion to a system of passive resistance to improvement. Officers cannot be expected, this objection implies, to know anything about brickwork, or masonry, or carpentry, or any useful art. If they know—we were going to say, the art of war, but the art of war includes making the best possible instrument of the soldier—if they know their military hand-books, it is all that the country has any right to expect from them! The best friends and the most genuine admirers of the British army take a widely different view—a view diametrically antagonistic to that which would prevent a single brick from being laid without the presence of a lieutenant of Engineers.

The mode in which we have ourselves approached this important subject was derived from a long and wide practical experience. It includes not only a personal acquaintance with the great departments of our own public works, with the procedures of the Ordnance (as it was) and of the Admiralty, but one with that which is yet more germane to the matter in hand, namely, the practical education of the workman.

An engineer who, in the remoter districts of the British Isles, as well as in various parts of the continent of Europe, has had to form workmen out of clumsy, untaught, less than half-fledged, agricultural labourers, has an advantage in approaching the question of cost, which few other men can possess: and the experience to which we refer has been acquired under circumstances of difficulty compared to which the attempt to introduce remunerative labour into the army, bears no proportion at all. For with the civilian, moral obstacles occur which tax the utmost skill and the most sustained energy to overcome. In opening a new district for a road,

a harbour, or a railway, it is by no means a simple matter to commence operations. If the country be, indeed, entirely uninhabited, as in the *Landes* of the South of France, the difficulties may be said to be at a minimum. Then it is only necessary to collect the workmen, to house them, and to feed them. The obstacles, in this case, to a rapid and economical progress, arise either from the national or provincial jealousies of the labourers, if brought from different districts, or from their coming to the conclusion that they are masters of the situation, if they fraternize. Between this Scylla and Charybdis, however, it is not impossible to steer.

But in a country which is not desolate, but only remote, the case is different. The reasons for the employment of local labour are frequently irresistible. Sometimes it is matter of contract or of Governmental direction that such should be the case. Everywhere the local labourer expects employment, and regards it as a right. He brings to the works a good-will, an untrained pair of arms, and that resentment at the idea that any other workman is his better, which is always most keen in proportion to its unfounded character. Then the local magnates exert a disturbing and somewhat inconsistent influence. The invading engineer is expected to employ local labour, because it will reduce the poor-rates; but he is not to employ any but surplus labour, or to pay more than the local rate of wages, because in either case the agricultural labourer will be encouraged to strike against the farmer. We could cite not a few instances. In one, the local rate of wages for agricultural labour was eight-pence a day; the rate of payment at that time for the best-paid "navvy," the "getter" or pick-man, was 4s. 3d., and from that down to 9d. The county magistrates considered it outrageous that the contractor should pay more than the lower figure. The country people considered it unjust that "foreigners," who spent great part of their wages in beef and beer, should come into their country and earn from six to seven times as much for a day's work as they could do themselves. They could not understand that the sturdy giant, who would consume half-a-crown's worth of substantial solid and liquid food during his ten hours of labour, was actually converting his beef and beer into a measurable mechanical "duty." With the best will in the world, the countryman could not fill sixteen cubic yards of earth into a wagon, if he only ate eight-pennyworth of food. The actual cost of the mechanical duty, however effected, was far more. For a day or two pluck and resolve may do much, but in the long run mechanical law must prevail. For a man to do a man's work he must eat a man's dinner.

Little by little these difficulties were overcome. They are of a nature to be overcome by resolution, good temper, and perseverance. The eight-penny workmen, who could not at first do eight-pennyworth of work, learned in a few months to earn their half-crown per diem. They also managed to consume no inconsiderable portion of the value of that coin. They improved in *physique* no less than in skill; and in decent self-respect as well as respect for their betters. They learned to distinguish between the skilled and the unskilled workman, and to avail themselves of the advantage of the guidance of the former. And thus, in the particular case we have in view, by the time that one of the most out-lying districts of Great Britain was opened to the flow of an important stream of through, as well as of local, traffic, the peasantry of the districts served had been raised from a state that could hardly be denominated as anything better than that of savages, to be men who could command, as well as deserve, remunerative employment.

The material here employed was identical with that from which care and discipline form the British soldier. Few natives of Northern

Europe are so "unhandy" as the English rustic, "pure and simple." Few have in them the elements of so good a workman when educated. None, Marshal Soult thought, make better soldiers, and the patriotic Frenchman piously thanked God that their numbers were so few.

What the civil engineer had to deal with in the case we have quoted is the problem now before the Secretary at War. But, in the army, the case is every way more simple. For to teach the utterly untaught peasant, is a widely different task from teaching the disciplined man. The latter has, at all events, learned the moral part of the lesson, how to look up to the hetter instructed for guidance, and how to give prompt obedience to the voice of authority.

We cannot, therefore, hesitate to reiterate the opinion that the technical education of the soldier, not in the use of firearms alone, but in that of the pick, the spade, the trowel, the chisel, the saw,—in fact, in the general implements of the more rough and ready of the crafts of the builder,—is an imperative national duty. We insist, in the first instance, on this branch of military education, because self-defence is the first requisite. In case of war, the English soldier, taking him as he actually is, would be placed at a cruel disadvantage as compared with the soldier of some more provident nations. He would be almost as unfairly pitted against either the French or the American soldier as if he were sent with the old-fashioned musket to face the *Chassepot* and the repeating rifle.

Each day that is added to the history of arms of offence increases their irresistible power. There is no courage in facing the inevitable when it is evidently useless to do so. Cover from fire is becoming the first point to be regarded, even in the field. The troops that can most readily, in the face of the enemy, provide themselves with cover, will remain on the ground. The exposed masses will be not decimated, but annihilated.

In the construction of our military works, changed as they must all sooner or later be by the introduction of the Moncrief system, we have an admirable opportunity for giving the whole of our line this most essential education. We may at once render our troops hetter soldiers, more educated workmen, and productive labourers. But the attempt must be guided by a wise experience. No increase of the duties of the soldier must be introduced with a high hand. The demoralisation of the army would be the result of such an endeavour. The plan must be so digested as to tempt both officers and men to volunteer. And the simple, and no way dishonourable, temptation, must be a combination of distinction for extra service, with payment for work done.

No man of adequate experience can doubt that on the first attempt to execute public works, or large military works, by troops of the line, there would be no economy effected. If the men were paid by time, the work done would be over costed. If they were paid by piece, they would be altogether discontented with the remuneration; and the disproportion and discontent would be even greater on the part of the officers, on whose leisure the nation has no right to make any gratuitous demand not contemplated when they took their commissions.

But with systematic training, calling in, probably, in the first instance, the assistance of the civil engineer and a few of his subordinates, and deriving no little aid from those meritorious men, the non-commissioned officers of the Sappers, these financial difficulties would disappear. It must be borne in mind that a considerable pecuniary gain will be effected so soon as the troops are educated to their new implements. But, in the first instance, an outlay will be requisite. That outlay will be recouped, but it must not be deferred. The men must be encouraged—not disgusted. This encouragement, our civil experience tells us, can only be afforded by paying, in the first instance, by time. When the soldier has become a craftsman, he can be paid by the piece. He would be the gainer, and so would be the nation.

All minor and subsidiary crafts would follow, in their development, the establishment of the first practical success. To induce the soldier to become an engineer is a duty which we shall neglect at our peril. To attempt to force him to become one would be to repeat the costly folly of Louis XIV., who set his army to work to bring water for his fountains at Versailles. To lead and encourage him thus to become a man, instead of a machine, is that for which we are urgent. And when we have once taken this course; when every

commanding officer feels that he must rely on his own forces for what human hands may effect; when we come to take it for granted that a regiment of infantry ought to be at least as ready to provide for themselves defence and shelter as a party of hunters or of squatters would consider to be requisite in their own case, the minor and less essential details will follow. The men will learn naturally to assert themselves according to their trades. Aptness will go for much; civil experience, when it exists, will go for more. The framing of a code of regulations, providing for the due remuneration of all kinds of work, will not be a more insurmountable difficulty than the framing of an engineer's schedule of prices was, hore the time of the Stephensons. By adopting this course we shall at once raise the *morale* of the soldier; produce a far more efficient combatant, and a combatant who, like the Spartans, will consider defence of his own life a prime military duty; and tend towards the development of what the world has not yet seen, an army that shall be something more than a collection of men, *fruges consumere nati*, whose only mission is to waste and to destroy.

DIARY OF JOHN MANNINGHAM.*

AMONG the Harleian Manuscripts in the British Museum is a small book of 133 pages, scarcely 6 in. long by 4 in., in which, with small neat penmanship in close regular lines, one of the young gallants of the days of Queen Elizabeth and her successor jotted down observations, occurrences, the witty sayings of his friends, or of his contemporaries as related to him by his friends, notes of information he wished to remember, scraps of foreign news, the talk of the town, and the pith of the sermons he heard preached. The diminutive volume has been looked through more than once by historians seeking to know more of the life of those days of the ruff and rapier, or of individuals who lived in them; and they made out from its contents that the diarist was probably a student of the Middle Temple. They found jottings relating to such celebrities as Shakespeare, Ben Jonson, old Stowe the antiquary, Sir Thomas Bodley, the unhappy Sir Thomas Overbury, the scarcely less unfortunate Earl of Northumberland, who was imprisoned in the Tower for fifteen years; Sir Walter Raleigh, Sir Thomas More, Bacon, the Lord Keeper Egerton; the nimprossionable alter Raleigh, as well as author of the famous *Coke upon Lyttelton*; Pym, the Cecilis, Fleetwood, the recorder of Tudor London, as well as to a host of judges and divines; just as the diary of a young Templar of the present day might refer to the leading actors, statesmen, legal celebrities, and other public characters of our time. They also found notices of the queen, especially of her last illness and death; and of the proclamation of James, and the manner in which it was received; and of the family of Oliver Cromwell. The varied interest of this diary awakened a curiosity as to the authorship of it. Mr. Payne Collier, in his "Annals of the Stage," first pointed out that the writer must have been a barrister, and had numerous relations in Kent who he frequently visited. The late Mr. Joseph Hunter, searching for further "Illustrations of Shakespeare," took the trouble to follow the clues the diary afforded further, and succeeded in identifying its writer most satisfactorily. He found, by many ingenious references and inquiries that we need not follow, that the young gallant in question was John Manningham, the adopted son and heir of his cousin Richard Manningham, of Bradbourne, Kent, and was entered a student of the Middle Temple in 1597-8, and who, having been on the books of barrister; and was called to the degree of barrister; and ultimately, on the death of his cousin, whom he called his father-in-love, came into possession of the Bradbourne estate; married Anne Carle, the sister of his "chamber-fellow" at the Temple, and of Dr. Carle, Dean of Lichfield, had a family; and died 1621-2. Thus the little volume was invested with a fresh interest: its writer was no longer one of the nameless and indistinguishable persons that made up a Tudor crowd, but had an individual history: the estate he enjoyed

down among the cherry orchards and hop-gardens, the monument he placed in the noble old church at East Malling to the memory of his benefactor, his will, as well as that of his cousin, were all tangible facts like so many illustrations to it.

We now come to the point with which we are most concerned. The Diary of John Manningham has just been printed at the expense of Mr. Tite, and presented by him to the members of the Camden Society, of which he is president. He tells us he wished to make some acknowledgment of his sense of the honour the Society conferred upon him in appointing him the successor of the Marquis Camden, and at first thought of printing one of the manuscripts in his own library for presentation to the members; but on taking Mr. John Bruce into counsel, who pointed out the intrinsic interest of John Manningham's diary in the British Museum, he resolved upon selecting this instead. Mr. Tite also tells us that Mr. Bruce saw the relic safely through the press: and we may see for ourselves that he has prefaced it with a sane and succinct digest of its contents. Very pleasant reading is Mr. Bruce's account of the diary: fresh, short, full of movement and sparkle, like one of the Templar's spring afternoons upon the Thames, when he took wherry to Richmond "to be assured whether the Queens were living or dead." To Mr. Hunter's researches respecting the Manningham family he has added discoveries of his own, which he has woven into a connected narrative; but it is in the methodical assortment of the leading facts recorded in the diary that we are most gratified. He shows us through the volume, as it were, turning over every page with us, grouping incidents, pointing out individuals, explaining associations, accounting for every thing mentioned, save one. This one unexplained puzzle is "Kentish taylor." The diarist wrote one day in June, 1602, "Kentish taylor are nowe turned to such spectacles, soe that if a man put them on his nose he shall haue all the land he can see." Mr. Bruce consulted the late founder of the Kent Archaeological Society as to the nature of these hindling tails, but seems to have received no information to clear up the mystery before his death. Whether they have any connexion with the old legend of Kentish tails, he says, he knows not, and leaves the question in the dark. Perhaps some of our readers can throw a little light upon this matter.

We will now turn over the pages of this valuable accession to our stores of information of the Tudor period in our readers' company. The first date is March 28, 1602. This was Palm Sunday, and the entry relates to the sermon preached at the Temple. In this and all the sermons, in fine, it is curious to note the epigrammatic pungency, the *conceits*, the types, and the frequent Latin quotations. Thus one divine begins his sermon, "The love of the world is the divels eldest sonne;" and another thus, "The proverbe is that building is a thiefe, because it makes us lay out more money then we thought on;" but we pass on to more other entries of a more general nature. The next somewhat anachronologically relates to a visit to the diarist's father-in-love at Bradbourne:—

"At Bradborne with my cosen this Christmas, 1601. My cosen told me that Mr. Ribbers would give his cosen Cretwright 8,000*l.* for his leas of the Abbey of towne Mallinges, the reversion whereof the L. Cobham had purchased of hir M. jestie.

An old child sucks hard; i. e., children when they growe to age prone chareschie.

Peter Conrthope said it would be more beneficial if our wall and cloth were not to be transported but in colours; but my cosen said we may as well make it into clothes and garments, as dye it in colours before we carry it oner; for both variable, and as much obange in colour as fashion."

In this way the young Templar notes down the mixed information he gleans as he lives. His cousin, before the purchase of the Bradbourne estate, was a London merchant and a member of the Mercers' Company; consequently well fitted to give an opinion on the subject discussed above. In the course of this same visit he rode with his cousin's wife, probably behind him, to Maidstone, and dined with a cousin Gellibrand, a physician there, who showed him a skull in his study, and pointed out the seam, or suture, which he told him, midwives used in female children before the wit could enter, adding, "and that is a reason that women hee such foolcs ever after." Perhaps thus riding through the heart of the hop country put his cousin's wife in mind of her young days, for she told him when she was first married to her first husband she was riding behind him one day and slipped down, and he rode on without looking to

* Diary of John Manningham, of the Middle Temple, and of Bradbourne, Kent, Barrister-at-Law, 1602-3. Edited from the original manuscript by Mr. John Bruce, and presented to the Camden Society by Mr. William Tite, M.P., President of the Society. Westminster: printed by J. B. Nichols & Sons. 1865.

see what had become of her, or waiting to help her up again, "so shee went soe long a foote that shee tooke it soe unkinde that shee thought never to have come againe to him, but to have sought a service in some vnkowne place; but he tooke hir at last." This discipline under her first husband did not prevent her, from being perverse under the genial sway of her second, Richard Manningham; for we read further on that she contradicts him vehemently and obstinately before company, and then kisses his hand penitently, "with an extreme kind of flattery." On the 22nd of January, John Manningham is in London again, hearing and noting the news from Ostend, concerning the negotiation Sir F. Vere was deputed to make with the archduke; the arrest of several merchants for shipping more cloth than they were entitled to do by their licences; a grievance of the company of Pewterers; anecdotes, anagrams, epitaphs; a new order by the benchers that the students should not eat bread newer than two days old; an account of a play called "Twelve Night; or, What You Will," performed "at our feat," the arrest of a Cousin Norton, with his application to Sir Robert Cecil to bring one Copping, "a notable riche practiser," who has charge of his lunatic mother and their goods, to order; and town talk of various sorts; but in February he revisits his "cosen in Kent." On the 19th he was at Malling with Mr. Richers, and seems to hear much of a claim from Mr. Cartwright upon divers parcels of land belonging to Richard Manningham, called concealed land, which his cosin acknowledged to exist, but could not define how it was bounded. The countryside was then talking of Sir Robert Sydney having bought Oxford House, and selling it again "by parcels;" of Mr. Jo. Sedley building a house in Aylesford that cost above 4,000l., and yet had but fourteen acres of ground belonging to it, and the probability that Lord Bechurst would take it off his hands.

In May John Manningham was in London again, recording for that month scarcely anything but elaborate notes of the sermons he heard at the Temple Church, at "Paules Crosse," and at Westminster successively. In June his entries are more miscellaneous. He tells the talk be and Mr. Foster, of Lincoln's-inn, had, as they walked together to Westminster, about Sir Thomas More and his witticisms over his altered fortunes; how, when he was in office, his gentlemen attendants used to notify to his lady when he had left church, that she might follow; but on his deprivation of place he went himself and opened the door of her pew, saying "Madame, his lordship is gone before," alluding to his loss of dignity. "Come, wife, nowe wee may goe together and talke." Soon after this there is one of the frequent interruptions of the regularity of the entries to record information acquired in a visit to Huntingdonshire, where a horse-race was run at Sapley, in which Mr. Oliver Cromwell's horse won the "silver bell," and Mr. Cromwell, the uncle of the future Protector, "bad the glory of the day." This Mr. Oliver Cromwell was married to a distant connexion of Richard Manningham's first wife; hence probably the Templar's interest in him and his family.

"Upon marriage with the Lady Poliuzeina (the connexion to which we refer, Sir Henry Cromwell conveyed his lands unto his sonne, Mr. Oliver, in marriage. See Mr. Oliver, with his owne and his ladies living, is the greatest esquire in those partes, thought to be worth neere 5,000l. per annum. There livers a housefull at Hinchbrook, like a kennell.

On Easter-day, Dr. Chamberlaine was at Sir Henry Cromwell's, and ministered the Communion, but without booke."

Among the Templar's acquaintances was the Queen's chaplain, Dr. Parry, to whom he is indebted for most of the particulars he has dotted down about his sovereign lady. Once she told Dr. Parry she would not bear him preach on Good Friday, because she was sure he would preach against her; but heard him nevertheless. Another time she forbade Dr. Barlowe, who was also a chaplain, to come into her presence because he had preached against the Earl of Essex, and when he presumed to do so, notwithstanding, she taunted him curiously. "O, sir," said she, "wee heare you are an honest man: You are an honest man," &c. These items of royal vacillation he seems to have received when visiting Dr. Parry, before making another journey to Bradbourne. Further on, we shall find John Manningham waiting upon this divine at Court, dining with him in the Queen's palace, and finally hearing from his lips an account of the last moments of the grand old lioness. Meanwhile, he returned to London, a thirty-mile

journey only from Malling. We next come upon two consecutive entries relating to joiners:—

"Mr. Stenon Beckingham, of Hertfordshire, was brought into the Kings Bench at the suit of two poor ioyers whom he hath undone; they seeled his house, which came to a matter of some 80l., and they could hardly obtain anie thing by suit. A man of a hott colliard disposition, a creaking loud voyce, a greay whitish head, a reddish beard, of long starring mouchetons; wore an outworne muff with two old gold laces, a playne falling hand; his cuffs wrought with colored silke and gold, a satin doublet, a wrought wastecote, &c. at fawle quis coposost, haud fawlet it cum alio centeno posset, qui voo, facte, vestitu sua secum disidet. One of his witnesses would not answer anything for him vntill he were payd his charges in the face of the court. Soe little confidence had he in his credit who had dealt soe hardly with his ioyers.

On Fossar, an old ioyner dwelling [in] Paules Church-yard, a common and a good measure of ioyners work."

Soon after this his chamber-fellow told him how the founder of the Bodleian library had courted and won a rich widow in her garden while a fellow suitor waited in her house and held "his cardes" for him; and some one else told him of an epitaph upon a bellows-maker, to which the initials of Ben Jonson are attached:—

"Here lyes Jo. Potterell, a maker of bellowes,
Master of his trade, and king of good fellowes;
Yet for all this, at the houre of his death,
He that made bellowes could not make breath."
(B. J.)

And then thirteen closely-written pages are filled with the notes of an able sermon preached by Dr. King, rector of St. Andrew's, Holborn, at Paul's Cross, October 24, 1602; and two more with the speech of Mr. Croke, the recorder of London, on the nomination of Mr. Lee, as Mayor, at the bar, "in the Chequer," and the replies of the Lord Chief Baron Periam, and of the Lord Treasurer. The first of these said an improvement in the management of the city might be effected by a monthly search for idle persons and "unaisierles men," of whom there were then 30,000 in London, all of whom ought to be sought out and punished as they were "the very scumme of England," and the "sink of iniquity." The last said there were two things her majesty wished to see attended to in the city, to his certain knowledge: one was to make "in this time of plenty" great stores of corn in the magazines to serve for occasions, and from which the poor could be served in times of dearth; and the other was the foundation and furnishing of hospitals, neglects he advised the mayor to especially amend "while their fault sleeps in the bosom of bir Majesties clemency." "Theise were things," continued the Lord Treasurer, poet and statesman, better known as Earl Dorset, "must be better regarded than they have bin; otherwise, howsoever he honours the Citye in his priat person, yet it is his dutie in regard of his place to call them to account for it." And the young Templar, unimpressed with the municipal formalities, jots down below this the scuffling remark of one of his confères:—

"One said the Recorder was the mouth of the Citye; then the Citye hath a black mouth, said Harwell, for he is a very blacke man."

In November, among other talk, he notes how a grant of land was made to one Burke, in Ireland, and taken away from him again, to appease another Burke, who was jealous of the liberality; how Sir Robert undertakes nothing but what he can blame some one else for, should the enterprise be unsuccessful; how Plowden had such a check as he never had before for saying to a "circumventing justice" that "neither justice nor counsell could commit any to prison without a cause;" how the Earl of Northumberland was living apart again from his wife, the daughter of the first Earl of Essex, notwithstanding that she had brought him an heir, which he had said should be the "soder of their reconciliation," and was living at Sion House with the child, playing with it, but being otherwise "of a very melancholy spirit;" how Mr. Overbury, in telling that a thief had stolen his cloak from his chamber, said "the villaine had gotten a cloke for his knavery;" how his saucy landress answered him, "I was brought up as my freuds were able; when manners were in the hall, I was in the stable," when he rebuked her for her boldness; how "the old Lord Treasurers wit was as it seemes of Borrowe Englishe tenure, for it descended to bis younger sonne, Sir Robert;" and similar gossip. Then come a string of poses for a jet ring lued with silver, with their significations, a selection of aphorisms, more anecdotes, rumours, sermons, an anagram, with device—"John Swete: wee shine to: a companie of stars about the moon;" quotations from hooks, and, hy-and-hy, an account of the Queen's visit to Sir Robert Cecil:—

"On Monday last the Queen dyed at Sir Robert Cecil's new house in the Siran. Shee was very royally

entertained, richely presented, and marvelous well contented; but at hir departure shee strayed her foot. His hall was well furnished with choise weapons, which her Majesty took speciall notice of. Sundry deuses; at hir entrance, three women, a maid, a widow, and a wife, esche commending their owne states, but the virgin preferred; an other, on attired in habit of a Turke destroys to see hir Majesty, but as a stranger without hope of such grace, in regard of the retired manner of hir lord, complained; answered made, how gracious hir Majesty in admitting to presence, and howe able to discusse in anie language; which the Turke admired, and, admitted, presents hir with a riche mantle, &c."

In December he called upon Stowe the antiquary, and when he was at home again dotted down as much as he could remember of what the quaint old gentleman had told him. They seem first to have discussed his portrait prefixed to his survey of London. A "modell" of this, Stowe said, was found in the study of the Recorder Fleetwood, with the inscription, "Johannes Stowa, Antiquarius Angliæ." Then they touched upon the unremunerative character of the historian's labours, the old antiquary declaring, doubtless smiling at the retrospect, that he thought himself worthy of the title the Recorder conferred upon him, for he had no other gain for his "travaille." Perhaps the Templar led up to the next explanation by asking why many of the newest monuments were not mentioned in the survey. We can see the genuine antiquary in the reply that as the men who had placed these monuments had defaced or removed others of antiquity, he was determined, as far as he was concerned, that they should be deprived of that memory or record of which they had deprived others. And, lastly, the old gentleman told the young harrier a legal fact of which he does not seem to have been aware:—

"He told me that the cheife citizens of London in ancient tymes were called Barons, and soe divers Kinges wrote unto them, 'Portegretio et Baronibus suis Londoniæ,' and the ancient seale had this circumscription, 'Sigillum Baronum Londoniarum.' We may picture the slow, stiff how of the antiquary, then almost an octogenarian, and the dash and flowing ease with which John Manningham took his leave, and turned his face towards the Temple again.

Christmas sees the diarist once more at Bradbourne, where his cosin tells him the news of the county as before, and deutes him to see to some legal business for him. He made a round of family visits at this time, sleeping one night at his "cosen Chappans at Godmersham," dining one day at his "cosen Cranmers at Canterbury," sleeping another night at his "cosen Watts, hy Sandwich," who rode with him next day to Canterbury, where they dined together at his "cosen Cranmers." Between mention of this journey and the dinner there is a "rime" entered which probably Cousin Watts told him as they rode along the winty road and through the hare lanes, and now and then took to a bridle-path:—

"Sir Wa. Rawley made this rime upon the name of a gallant, one Mr. Noel,—
The word of denial, and the letter of fry,
Makes the gent. name that will never be thrify."
(Noe. L.)

And Noels answer,
The foe to the stommeche, and the word of disgrace,
Shewes the gent. name with the hold face."
(Raw. Ly.)

The next entries include notice of the good fortune of Mr. Bodley, which hath made the famous library at Oxford; more anecdotes, gossip, rumours, observations;—"the play at shuttlecock is become soe much in request at court that the making shuttlecockes is almost growne a trade in London;" all dated February, 1602. The next few pages, dated March, tells us more of the Court. We may be sure there was no play of shuttlecock going on when the young Templar made his way to Richmond on the 23rd of March, to ascertain the truth of the rumours that were in circulation of the Queen's death. He heard Dr. Parry preach and pray for her, both before and after the sermon, which assured him she was still living; and then he dined with him in the Privy Chamber, and understood from him and the Bishop of Chichester, the Dean of Canterbury, and Dean of Windsor, the particulars of her Majesty's malady; how she had been melancholy for three or four months, but within the last fortnight had become much worse, through her obstinacy in not taking any remedy, or food, or rest in bed; and how she now laid "very pensive and silent," almost speechless, yet conscious enough to delight in prayer, and hng the hand of the Archbishop when he spoke of Heaven and its joys.

"24 Mar. 1602. This morning about three at clocke her majestie departed this life, mildly like a lambe, easily like a ripe apple from a tree, cum leue quadam ferre, abaque gemita. Dr. Parry told me that he was present,

and sent his prayers before his soul; and I doubt not but shee is amongst the royall saints in Heaven in eternal joys."

This pious and loyal expectation of the young barrister seems to have been shared by a large proportion of her subjects. The regret was so general and so genuine that the people had no voice for shouting when the Council and a company of noblemen, headed by Sir Robert Cecil, proclaimed James the Sixth of Scotland King of England at ten o'clock the same morning at Whitehall gates and again in Cheapside; though they recovered themselves sufficiently towards nightfall as to light bonfires, and set the bells a-ringing. "I think," wrote the diarist, with his heart full of regard for the dead queen, "the sorrow for her Majesty's departure was so deep on many hearts they could not so suddenly showe any great joy, though it could not be lesse then exceeding greate for the succession of soe worthy a king." The content at the quiet accession of James was doubtless the greater for the expectation that had prevailed, that the queen's death would be signal for the many rival claimants of the throne to come forward; nevertheless, the transitory nature of all things must have jarred upon his mind when he wrote, before he went to rest on this eventful day, "This evening prayer at Paules the King was publickly prayed for in forme as our Queen used to be." Her fresh memory does not pass away from him so speedily, for, interspersed with various news from Scotland of the new monarch, and notices of the Scottish nobility with their "leeping, fumbling language," on the following pages, dated 1603, are entries such as:—

"Dr. Parry told me the Countess Kildare assured him that the Queen caused the ring wherewith shee was wedded to the crowne, to be cutt from hir finger some six weekes before hir death, but wore a ring which the Earl of Essex gave hir unto the day of hir death.

It is certain the Queen was not embowelled, but wrapt up in cere cloth, and that they cut it, through the covetousness of them that desired hir, of the allowance of cloth was given them for that purpose.

I heard the Queene left behinde hir in money, plate, and Jewels, the value of 12,000,000*l.*, whereof in gold is said, 400,000*l.*"

And thus we come towards the end of this communicative little hook. The last few lines record news from turbulent Ireland. Tyrone had submitted, not having heard of the Queen's death, and Tirrill had also given himself up; and then John Manningham had filled up his diary, and it was laid aside.

For our share of the pleasure of its perusal in our readers' company we cordially thank Mr. Tite.

VISION IN ITS RELATIONS TO THE FINE ARTS.*

The static arts,† painting, sculpture, architecture, have two modes of expression, and two—form and colour. For the appreciation of both we are dependent upon the eye; hence it follows as a natural sequence, that the conceptions of the beautiful for which we are indebted to this organ, are subject to certain restrictions imposed by the physical laws of vision. It may indeed be said that there is a science of Optical Aesthetics, whose laws have never yet been formulated. Raeb as the attempt may appear to subject our mental emotions to any sort of material control—savouring somewhat of irreverence, the contemplation of art-mysteries with the cold eye of the physicist—Aesthetics has no cause to dread the encroachment of the exact sciences upon her domain.

There is a law, the result of the limited capabilities of human vision, which affects our appreciation of size and colour alike.

This law, which was first recognized by M. Fechner, has been rightly regarded by him as psychological rather than physiological, seeing that it corresponds to the transformation of a material impression into a mental emotion.

We will endeavour to explain it, taking, in the first instance, the case of lines. Place two lines of equal length side by side: we evoke a consciousness of their equality. Let one of the lines be lengthened by the successive addition of equal increments, and the illusion will continue until the difference acquires a certain definite proportion to the original length. This proportion no doubt will vary in different individuals. In my own case it is about equal to a millimetre in lines of a decimetre in length, or as 1 : 100.

* Extracted from an article in the "Revue des Deux Mondes," by M. Auguste Laugel.

† Painting, sculpture, and architecture are classed by M. Laugel as static arts; music, as involving no additional element, that of time, as a dynamic art.

When this proportion is departed from, either in excess or defect, a sense of inequality is experienced; but where it is not altered, the two materially dissimilar images are identical in their effects.

This phenomenon, which is at once physiological and psychological, is easily explained by the consideration that our perceptive faculties are restricted within certain limits. It is worthy of notice that if we repeat these experiments with different lines of various lengths, we shall find that the proportion remains constant as long as the lines do not greatly exceed in length those which the eye is accustomed to regard.

From this we must conclude that our perception of size becomes more obtuse as the dimensions of objects are augmented; in familiar objects it is in direct proportion to the size of the objects themselves.

My eyes, which readily detect a difference of 1 millimetre in lines of a decimetre length, can appreciate no difference under 2 millimetres in lines of 2 decimetres; nor under 1 centimetre in those of 1 metre.

In very long lines the proportion is slightly increased—at first to 1 : 95; afterwards to 1 : 90. This increase takes place very slowly; so that generally speaking, the larger the object seen, the less capable we are of appreciating differences in its proportions.

This law is of great importance, and is equally applicable to all our perceptive faculties. Let us consider it in reference to the subject of Light. Illuminate a white screen by means of two wax candles of equal size, in front of which hang a ring or some such object, so as to throw two shadows upon the screen. By advancing or retiring one of the candles we modify the depth of the shadow cast by it, on the screen, and thus we are enabled to compare the luminous intensities of the candles themselves. The candle may be removed so far from the screen that the shadow becomes invisible. It exists still, but it is imperceptible. Measuring the respective distances of the candles from the screen, we shall find that at the instant of the disappearance of one shadow the luminous intensity are in the relative proportion of 1 : 100. This experiment shows that the eye is incapable of appreciating a difference in luminosity equal to $\frac{1}{100}$ of the intensity of a wax candle. Let us now substitute jets of flame or other brilliant objects for the candles, and repeat the experiments: the proportion remains the same: the eye accommodates itself anew to the circumstances of each case. The appreciable proportion becomes slightly increased with very bright objects, the luminous power of which greatly exceeds that to which the eye is accustomed. This, from the above cause, M. Helmholtz observes, can be detected slight cloudings and shadows upon surfaces which appeared to the eye to be equally and perfectly illumined throughout their whole extent.

A less delicate experiment will enable us to appreciate the universal applicability of this law. Take two nearly equal weights, one in each hand. The lighter the weights the more easily any slight difference between them can be detected. When once the arms are fatigued by heavy weights, the difference between which is small, the perceptive faculty becomes confused. When the weights are light, the appreciable differences are nearly proportionate to the weights themselves; but when the muscular tension is greatly increased, comparison becomes more and more difficult. In every case the mind compares its impressions with others of a like nature. It creates for itself a sort of standard, and its aptitude for appreciating differences of detail is proportioned to this standard. The mental effort is made unconsciously, and with the rapidity and certainty of an instinct.

Thus we are taught that our ideas of size are inseparable from those of measurement: whatever is undivided appears smaller than reality.

Here we have a second psychological law, equal in importance to that of Fechner. A multitude of examples might be adduced in proof of its existence.

Take two lines of equal length—one divided into a certain number of equal parts, the other undivided: the latter will appear the shorter. Divide a square surface by equidistant horizontal lines—it appears to gain in altitude; range the lines vertically, and its apparent breadth is increased. A right angle, subdivided by lines drawn from the apex, appears more obtuse than an ordinary right angle. A room

appears smaller when empty than when filled with furniture and other objects, which destroy the sense of distance. Painters know that their figures appear to grow, and swell out upon the canvas as the outlines become filled in.

The mind thus obeys a double law. First, it evokes a standard of comparison; and this standard having been found, it proportions its sensibility thereto. The human mind is not an inert mirror, across whose surface images flit capriciously. The lens of the eye does not more readily adapt itself to varying distances, than does our mental susceptibility to a diversity of impressions. It is by this peculiarity that we acquire our fixed impressions of natural objects, for it rarely happens that they are presented to us twice under precisely similar conditions, so as to produce images which are absolutely identical. The mysterious power which elaborates these impressions, in each case seizes upon the most permanent and indestructible element in the phenomenon. Sight-feeling intuitively becomes subordinated to sight-judgment. Of this we have proof in the fact that, if we desire to quicken our perceptive powers, it usually enforces to regard an object from an unaccustomed point of view.

To the amateur fixated regarding a picture through his hand as through a telescope, or with head bowed thoughtfully aside, the canvas seems to spring to life, the perspective to deepen out into the distance. Why is this? Simply because through these changes of position, the material side of the perceptive faculties resumes the predominance. Examine a landscape in any unusual manner, so that the visual ray may pass under the arm, or between the legs: all seems transposed,—colours and forms alike appear more defined, more pronounced. Paintings upon ceilings, which involve a certain constraint in the effort to observe them, appear harsh and crude. The unaccustomed position in which they are seen acts more surely on the retina than on the sensorium, and evokes a material rather than an ideal sensation. When the eye reposes under ordinary circumstances upon the horizon, it loses to some extent its susceptibility to colour. We find it difficult to distinguish distant hills; while the distance covers them, in place of a greenish hue, with a bluish or purplish haze. We make no effort to follow the endless undulations of wide-spreading plains. This natural dulness of apprehension in regard to the nicer gradations of colour, and of luminous intensity, permits the painter's art to produce its illusory effects; for the light with which objects are shown by it, after all, the feeblest and most diluted imaginable. If we contrast photographically the sunlight of one of Claude Lorraine's pieces with the light of the most miserable candle, we shall be astonished at the weakness of the former in comparison. Yet, in the picture, it suffices to light up the farthest depths, to gild the tops of the waves, to whiten the sails of the ships, to bring out the sunlit fronts of the buildings into marvellous relief.

The artist's work once before us, the eye accepts unhesitatingly the standard which he has been compelled by force of circumstances to adopt. Were it not for this precious faculty, the painter's art would be an impossibility,—the work of the most brilliant colourist would appear cold and poor.—Rembrandt's living forms would no longer be transmuted by that mystic aureola which fills the centre of his canvasses,—the "Sleeping Nymph" of Correggio would no longer repose in that glorious sunlight,—the most life-like conceptions would appear as faint ephes, thin shades!

The painter cannot cope with Nature in the intensity of his light; his resource lies in the skillful gradation of tints, and in contrasts. He should address himself to the imagination,—to the reflective powers; lure the observer's mind away from the material side of his subject; but when these primary conditions have been satisfied by due care in the selection and arrangement of the latter, it is still in his power, by attention to certain physical phenomena, to heighten the effect and lend to the ideal a material charm.

What these phenomena are, and what are their bearings upon questions of colour, size, and form, are points which we propose now briefly to discuss.

We all know that music takes cognizance of concords and discords of sound. Are there concords and discords of colour? Can certain tints be so blended as to produce upon the optic nerve effects analogous to those which harmony produces on the ear? Here it may be desirable to observe, once for all, that the laws of harmony

in colouring are at present but very imperfectly understood. The eye is gratified by the contrast of two complementary colours, because they illumine each other reciprocally—each appears the brighter for the contrast. But a pleasurable sensation appears also to arise from the toning down and general indistinctness which result from the juxtaposition of two closely-allied tints. The more we study the works of the great masters of the art, the more difficultly we experience in discovering any precise rule on the subject. Where the effect desired is brilliancy, distinctness, vigour, the painter instinctively resorts to the complementary colours, white and black, red and green, orange and blue, yellow and violet. When he wishes to employ three colours, he so arranges them that they may be as nearly as possible equi-distant on the prismatic scale. In the works of the Italian school we frequently meet with the union of red, green, and violet, or of red, blue, and yellow.

If, on the other hand, a softened effect is required, it must be sought in the application of tints which are more intimately related.

Lini, in his admirable frescoes, had no hesitation in intermingling draperies of violet, green, and pale blue—a colouring which harmonizes admirably with the mysterious softness of the rival of Leonardo. With equal hardihood, and with like success, we find him blending together all the various tints of reds and yellows. There are, in truth, no real discords in colour; but the admixture of different tints has different effects and varying expressions. White, rich hues, pure prismatic colours, are suggestive of joy, might, triumphal beauty; sorrow, abstraction, contemplation, require more complex and sober hues.

The painter should avoid any undue predominance of a single colour in his picture. The general effect should be, as far as possible, white or grey. Let the red be in excess, the retina will become fatigued, and the eye will, so to speak, see green, and the effect will be unnatural and dull. To give due luminous effect to a picture, the prismatic colours should be so distributed and balanced that the eye in travelling over the surface may not be fatigued by one colour more than another. It is marvellous with what skill this problem has been resolved in the vast compositions of Veronese. After prolonged contemplation of them, the eye retains a sensation of whiteness, of clearness, of distinct vision. On the other hand, there are pictures which produce the same effect upon the eye as a pane of coloured glass interposed between the landscape and the observer, which destroys every sense of reality.

For a like reason it is requisite to guard against placing pictures, especially if they be small in size, upon bright-coloured panels. Viewed against a violet background, a small picture looks yellow; on a red one, it appears green. In our opinion the most suitable colour is not white, for the thin tints of the painting would be impoverished by its juxtaposition, but a deep grey, as it is preferable to bring out the colours bodily, rather than to alter their effects by the contrast of complementary colours. The reddish-brown walls so common in museums are well enough suited to landscape pieces; but for portraits they are less so,—the latter often look best against a greenish background.

Here a question not unnaturally suggests itself as to the almost universal practice of enclosing paintings in gilt frames. To me it appears referrible to the fact that bright objects produce two dissimilar images simultaneously on the retina, and thus provoke a sense of relief or elevation. The brightness of the frame in these cases prepares the eye for the illusion by which the various details of the picture are thrown into the requisite degree of relief.

* * * * *

Leaving the subject of colour, we now come to the consideration of size and form. In painting, it is true, it is difficult to distinguish between colour and form; for on the flat surface of the canvas the artist can only produce the effect of distance by skillful gradations of colour. The study of the phenomena of vision shows us that our impressions of relief and of depression are due to the simultaneous reception on the retina of two images not rigidly coincident; but a picture presents a single image only, and can therefore never produce precisely the same impression as reality. Besides every picture has its own individual point of view, the centre of its perspective, the point to which all the visual rays converge. There is no need here of geometrical precision. The eye does not take in

the whole picture at one fixed glance; it travels over the surface, pauses for a second, travels on again, advances, recedes a little, ever preserving a certain liberty of movement. The size of the canvas should never be so great as to necessitate much movement in embracing its various parts, for in this case, as the position of the spectator changes, that of the picture should also change so as to appear under a new aspect. Hence the want of effect in long panoramic views. Hence it is, that wide compositions like Horace Vernet's "La Smola," and the "Caesar's Triumph" of Mantegna, at Hampton Court, violate a fundamental rule of art; they have no unity; the canvas is divided into a number of separate pictures, each one of which, no doubt, would be excellent if taken individually.

Theoretically, the image produced by a picture corresponds to one particular point of view. Consequently the size of the canvas should not exceed the limits of the field of vision. This is included by a horizontal angle of rather less than 100°, the vertical angle being still smaller, as the eyes and cheeks oppose material obstacles to its extension in that direction. Painters too often neglect these considerations. Landscape painters, more especially, rarely restrict their subjects within suitable limits. The frame should be as a window through which the prospect is seen; earth and sky should each appear in its due proportion. Whence, let us ask, do we derive that sense of the majestic which we all experience at the foot of a mountain, like the Jung-fra, or Monte Rosa, or Mont Blanc? It is that the whole field of vision is, as it were, filled by these overwhelming masses. We often hear it asserted that art can never reproduce these scenes! May it not be that the impressions they produce have never been thoroughly analyzed, and cannot, therefore, be placed upon the canvas? When we contemplate the ocean, sky and sea appear to divide the visual field as with a line, but the position of this line is by no means arbitrary: let it be placed too high or too low, and the effect is destroyed. A similar proportion is observable in landscapes of open plains. Ruysdael never fails in this particular, although his horizons have an unapproachable depth and reality about them. His clouds never float in a fantastic atmosphere. We see them, as it were, coming towards us in dense masses, lowering, full of wind. In his "Storm" we seem to feel the force of the hurricane, which bows all before it. In his "View on the Shore at Scheveningen," heavy volumes of cloud fill the entire sky, and brood over the ominous-looking, tempest-driven sea, whose turbid waves are yellow with the sand they have borne away from the shore. In this composition there is nothing more than the eye can embrace at a single glance, and yet without an effort the imagination is carried away for miles over those long sand-hills before the cold, gloomy, pitiless North Sea.

But when the painter essays the portrayal of human passion or emotion, this strict adherence to the truth is no longer indispensable. Art readily casts aside the trammels of a more rigorous perspective, and material objects often have an elliptic form, appears as a perfect sphere in the "Melancholy" of A. Durer—the artist's aim having been to suggest the idea of a sphere, interminable, interminate. So in the "Marriage of the Virgin," by Raffaele, the Temple in the distance is out of all proportion to the figures—it is far too small—but its rôle is to add a certain something to the general effect; to accentuate the composition; to give a more religious tone to the scene. Again, in the rival cartoon of "Paul Preaching," the architecture, the temples, columns, porticoes, are all types of the old Roman world, of which the speaker is a part. The laws of perspective are violated, but art is satisfied. The very stones, the monuments of an older civilization appear to re-echo the words of one who declares the tidings of a new dispensation! The miniature painters of the Middle Ages—the German and Flemish masters—often carried this licence beyond all bounds of moderation. Their compositions are too synthetic. Their delight was to crowd a dozen pictures into one; and, without regard to size or distance, to surround their subjects with numberless additional of suggestive accessories.

Since the Renaissance, more attention has been paid to material truth, but it has never degenerated into a geometrical precision which would overwhelm the ideal under a preponderance of material objects.

In painting we have two dimensions only, with which to produce the effect of three. A single image only is presented to the eye, an image which can therefore never produce a stereoscopic illusion. The only means available for the representation of distance are shadows, carefully graduated tints, outline.

To produce an effect of size, the artist has to appeal to that faculty, which we all instinctively possess, of estimating the magnitude of objects by their relative proportion, rather than by their absolute extent. A picture, as we have already said, should be as a window through which we view the objects themselves, the smallest being the farthest distant, the largest the nearest to us. A reduction of size in the objects depicted should thus, strictly speaking, involve a toning down of their hues. A small copy of a large composition should not be executed with precisely the same scale of colours as the original. But painters take advantage of the inherent indifference of the eye to the degree of intensity of luminous power; and the scope of their palette is, moreover, in reality so restricted that they are compelled, whatever may be the size of the objects represented, to aim at the most marked effects.

In passing through an art-gallery, we see compositions of all sizes, large and small alike, executed in precisely similar tints. Indeed, the special charm of miniature painting lies in the fact that the artist is enabled to disguise the poverty of his palette by reducing the size of objects without diminishing the richness of their colouring.

Bas-relief forms a sort of connecting link between painting and sculpture. The stereoscopic illusion which is wanting in paintings is here present, and the eye readily assigns their correct positions in nature to objects which are in reality confined between two closely contiguous planes. In these cases the imagination is singularly tractable, but we should guard against its abuse. Attempts to give a correct natural outline to certain portions of a bas-relief defeat their own ends: the eye becomes bewildered. Conventionality once admitted must be respected, for our perceptive faculties, though they readily adapt themselves to different standards of comparison, become speedily confused by the presence of several standards at once.

Bas-relief requires broad surfaces and strong lights, where the shadows are rapidly formed and sharply defined. Direct sunlight is specially favourable to its effects. The Greeks showed sound judgment in employing it freely in the exterior decoration of their temples.

Sculpture and architecture possess three dimensions. They have thus greater liberty in the reproduction of form. They are free from the restrictions of the painter's art, but they have difficulties of their own in the nature of the materials at the artist's disposal, the tardiness and material stability which they impose. An air of endurance, of immutability, of serenity, is essential to the sculptor's handiwork. A statue is seen from afar; the warm hues of nature are wanting, for even the advocates of polychromy have never exceeded a few light flat tints. It should speak to the imagination rather than to the eye. Its anatomy should be just, but it need not be the anatomy of the schools. The general effect would be spoiled by too great a profusion of details. The waving of the hair, the swelling of the muscles, the folds of the drapery, should rather serve as it were to abstract the idea of mechanical effort from the marble.

Fechner's law has a constant application alike to sculpture and to architecture. Within ordinary limits, as we have seen, the sensibility of the eye to matters of detail is in direct proportion to the size of the objects. Minute details are permissible in small subjects: the degree of finish should correspond with the size of the ornament. But in large statues, for a like reason, the artist should confine himself to broad details.

In architectural designs, the proportions of the human frame and of objects with which we are most familiar are usually exceeded. To this case, therefore, is applicable the portions of Fechner's law according to which our perceptive powers become weakened by an increase in the size of the object regarded. In this law we shall find the explanation of a long-recognized fact—viz., that in a perfect architectural design the taste is always offended by a reduction of the scale to one-half or one-third of the original size.

This is equally true in the opposite sense. In enlarging a monument, the larger the scale the simpler should be the details, the more marked

the accentuation,—all the proportions should be changed in unison with the increase of size.

Herein lies the real difficulty of architectural design. The architect has never a correct model before him. He is guided by traditions, by styles, by necessity, by the nature of his materials, by the laws of mechanics; but where is he to seek that knowledge which alone can infuse unity and life into his work? His plans and designs yield him at best but approximative notions. He must see his work with his mind's eye as it will stand completed; he must verify its proportions mentally: he must guard against confusion or excess of detail, and assure himself that in every portion of his design the means are in keeping with the end.

But there is a point to which we have not yet referred. Optical science makes us acquainted with a curious phenomenon known as *irradiation*, by virtue of which a white square viewed against a black background will appear larger (as well as brighter) than when seen against a white one. Now size is also irradiative. A square surface appears larger when surrounded by narrow mouldings; the narrowness of the latter gives an air of amplitude to the surface itself. Hence the value of these ornaments: they impart character to the surfaces they divide. Long lines, sharply cut, produce a happy combination of large and small dimensions which is peculiarly favourable to a general effect of size. Ornamentation is also productive of the same effect, provided it be not carried to excess. It should attract and arrest the eye at certain points only. The secret of architectural effect lies in alternation,—delicacy, and strength, narrow lines and broad surfaces.

Our perceptions of size are not altogether independent of climatic influences—our appreciative power is intimately connected with the intensity of the light. Under the brilliant suns of Greece, Egypt, and Southern Europe, the shadows become more transparent, light tints and shades become more intimately blended together. Here the projecting portions of a design should be strongly defined, detail should be simple and distinct, ornament would appear confused were it otherwise than simple in outline and vigorous in expression.

On the other hand, under the changing skies, and in the fitful but tempered light of more northern climes, the eye no longer derives gratification from the contemplation of the broad surfaces and pure outlines of the Greek school; the perceptive powers are heightened in regard to matters of detail; and architects find its greatest charm in the multiplicity of ornament and intricacy of detail of the Gothic style. Let a Gothic cathedral, a Flemish *hôtel de ville*, or a Medieval chateau, be transported to the sunny shores of Greece, and the outlines would no longer appear in harmony with nature. How much our imitations of Grecian architecture lose in character and beauty when set down in the heart of a modern city like Munich or Paris, we know but too well.

Having thus far analyzed the laws and limitations of our perceptive powers, it appears to me that the conclusion is forced upon us that art is only vision unfettered by experience; that its works are to us as material objects of which we have to seek the ideal. To discover the latter we have need to interpret the emotions they produce in us, and this interpretation is a mental effort which is performed with greater ease the oftener it is put in requisition.

PARLIAMENTARY "ART-PHOBIA."

READERS of our admirable contemporary, *Punch*, will probably not have forgotten the incident of the sturdy little specimen of a John Bull in frocks, who, being pitted against a prematurely intellectual cousin, whose precocious accomplishments he was called upon to emulate, laconically retorted,—“I can't speak *Punch*, and I can't sing; but I'll punch his head for him.” Without repeating hackneyed sentiments, as that “the child is father of the man,” and so forth, one may be permitted to say, in the vulgar tongue, that this is not a bad epitome or type of the attitude assumed by the Anglican mind when brought into opposition with purely æsthetic motives and principles. It is true that fighting is nowadays rather at a discount, and that we are no longer inclined to answer remarks on the superiority of French taste and elegance in details, by the heroic declaration that one Englishman can beat three Frenchmen. No;

political economy is superseding the use of arms, natural or artificial; and we ensconce ourselves now behind the shield of utilitarianism. We are a “practical” people; we are not to be taken in by dreams and sentimentalism. It is very well for Continental nations, who know no better, to lavish large sums upon schools of art and grand streets and buildings; we want to see the return for our money, and if my man attempts to seduce us into expending pounds, shillings, and pence upon mere artistic effect, we (metaphorically) button up our pockets, and indulge in reflections which might be shortly embodied in a certain vulgar ditty, whose burden is “You don't come over me.”

Without going into the question here as to the superiority of one site for our national temple of *Themis* over another, it may be said that the debate on the Law Courts, which amused our Legislative assembly for an evening last week, furnished no inapt illustration of this peculiar and so-called “practical” bent of the English mind. Throughout the debate there was a manifest reluctance, even on the part of those members whose names have been specially connected with art-interests, to base their preference for a site upon anything so shadowy and unreal as a mere consideration of architectural effect. There was a latent feeling, evidently, that such a consideration was beneath the dignity and business-like character of a British House of Commons. Those with whom such a motive really had any weight urged their argument only in a sidelong manner, as something which, in fact, they were half-ashamed of. Mr. Gregory, in the motion which initiated the discussion, placed architectural effect last in the order of advantages enumerated, though it is easy to see that the prospect of a grand river front was really uppermost in his thoughts. Then followed one practical lawyer, Sir Roundell Palmer, to demolish the edifice. “His honourable friend had made an imaginative speech, full of high flights of fancy” unparadonable in such a case, since “the question had been considered on its merits before this inflated structure of architectural fancies had risen.” He recoiled with horror from the idea that Parliament “would be tempted to authorise greater expense than was necessary by considerations connected with architectural beauty” (misguided Parliament!); but Government had evidently never intended to make sacrifices for “any such object.” The whole benefit of “concentration” was in danger of being lost by a sacrifice to “the demon of good taste.” The first provision was not made “for a magnificent architectural work” (I never is in England), though the learned gentleman admitted that if that was what was wanted, “no one could tell what it would cost.” It is to be hoped that it would cost some expenditure of thought and of brains, at least, which large buildings unfortunately too often make no demand upon at all. And, finally, according to the prudent Sir Roundell, the “whole world was to be changed in order to carry out the magnificent dreams of Sir Charles Trevelyan.” After this the speaker could scarcely be in a position to accuse his antagonist of “romancing.” Some of us might, after a sort, wish to see “the whole world changed;” but then there must be a *dignus vindicæ nodus*, perhaps more likely to be found in the eliminating of lawyers from the face of the earth, rather than in the mere question of the whereabouts of their habitation—“too cruel, anywhere,” as Lady Macbeth puts it. One might have expected that Mr. Beresford Hope, at least, would have attached due importance to architectural considerations; but he knew his audience too well; “he wished to approach the question not in a *dilettante*, but in a practical point of view.” Lord Bury, following suit in the same strain, “wished to look on this subject as a rate-payer and in a practical point of view.”

Both these speakers were favourable to a particular site on architectural grounds; but both masked their chief solicitude under cover of an appeal to the vulnerable part, the pocket. Lord John Manners said openly that the original motion under discussion “would have been more in place before the Society of Arts,” and “entreated the House to take a practical view of the question;” that is to say, to ignore everything but the material convenience of the legal gentlemen “for whose benefit,” as the Chancellor of the Exchequer observed, “mankind were made.” Finally, the Chancellor of the Exchequer, after hocking up the way with cartloads of figures, showed in the end a leaning towards a project for obtaining a fine architectural façade along the Embank-

ment at a more moderate cost than that of the already proposed Law Palace; but no sooner had such expressions inadvertently dropped from his lips than he, too, hastened to retract and modify, assuring the House “that he had no *dilettante* feeling at all on the matter, but—” &c.; and so, after much talking, an adjournment of architectural effect till a more convenient season.

Now, is there not something supremely ridiculous in all this? Here are a set of gentlemen, representing mostly the highest class of English education (we refer to the speakers in the debate in question, not to the House of Commons *en masse*), discussing the question of the position of a future immense building—a building which, if erected, will largely influence the architectural character and appearance of their capital city in one of its central and most frequented districts,—which, wherever placed, will block out from neighbours and passengers a great space of Heaven's light, and is therefore bound to give them *something* in return,—a building which, if grandly designed, upon a commanding site, where there is space on one side or another to view it properly, would be an object such as would draw visitors of other nations to comment on and admire it,—and yet the question whether such building shall be a grand decoration to the capital, or shall prove a gigantic eyecore to beholders for all time, is treated as a matter of indifference, or of merely trifling importance; and even those few who may be supposed to have strong feelings on this subject have not the courage to express them before an assembly which seems inclined only to turn them to ridicule. We venture to say that in no Continental legislative body, of anything like similar importance to the House of Commons, would such a question be treated as a matter of indifference. But the tone of the House through this debate was exactly that of the ordinary “intelligent British public” to which Mr. Locke so touchingly appealed. The said public is willing enough to have things decent; “neatness” is their *beau idéal*; but talk to them of the importance of rendering a great building an addition to the beauty of their land, persuade them to lapse for a few minutes into contemplation of the poetry of architecture, and their tone, on recovering from so unwonted a trance, is as that of Will Waterproof:—

“I ranged too high; what draws me down
Into the common day?
Is it the weight of that half-crown
Which I shall have to pay?”

The writer of the best book yet current on gentlemen's houses tells us that the English gentleman, as a rule, eschews anything like an attempt at architectural effect in his mansion, thinking such a thing “vulgar” and “pretensions.” This is only saying, in fact, that the average English gentleman is, in regard to matters of art, a dunce,—a sad truth, which we cannot think of disputing. The average English lawyer seems to be no better, and to be somewhat of an egotist into the bargain; and, as a natural result, we have the spectacle of accomplished lawyers and members of Parliament all up in arms because, when it is proposed to build a comfortable house for them, it is proposed also to build it and place it so as to be ornamental as well as useful, and declaring, almost in so many words, that so long as they are perfectly comfortable inside, they do not care whether the millions who are only concerned with the exterior of the building find in it a continual source of pleasure or a perpetual wearisome mass of unsightliness. It is not one of the least pleasing qualities of architectural beauty that its pleasures are for the many in their daily walks and passing to and fro, and that it is eminently the art in which courtesy is embodied; and as long as the lawyer continues to regale so magnificently upon the oyster, it is at least fair that the shell with which the public is presented should be duly gilt and illustrated.

A Warning.—Bramham College for Disenters, near Tadcaster, not far from Leeds, is, we are informed, suffering seriously from the ravages of fever. Two Leeds youths who were being educated there have died from typhus. The cause of this sickness in so healthily-situated and well-conducted an establishment is said to be the accidental percolation of deleterious matter through the earth into the well whence water was drawn for drinking purposes in the cillage.

A ROYAL AUTHOR ON TRADE-UNIONS.

A REMARKABLE book, from the pen of a distinguished author, has just appeared in Paris. The subject of the book is trade-unions; its author is the exiled Orleansist prince, the Comte de Paris. The prince has entered upon the study of his subject by a minute analysis of the vast body of evidence submitted to the English Royal Commissioners. He informs his readers that he has waded through ten folio volumes, which contain, in the shape of twenty thousand questions and a like number of answers, the laborious result of forty-eight long sittings. By the aid of Lord Stanley, a valuable appendix, consisting of a voluminous collection of documents relating to foreign working men's associations, has been added. These folios are the outcome of a long procedure, extending over nearly two years, during which period the Commission has examined members of almost every class, and almost every profession. Masters and men have been brought before them on the same bench.

What a labour for a prince! Sweet, indeed, are the uses of adversity when they lead so eminent a personage to face the toll of mastering a great question, relating neither to princes nor to the pageants of this world, but to the every-day toilers in our midst. The Count leans neither to the side of the masters nor the men, but deals with his materials in the spirit of the historian and the practical economist. His sentences are penned in a mood as calm and unimpassioned as though he were writing of events which took place a thousand years ago, and which had no connexion with the passions and the aspirations of to-day. The performance of the task is not less satisfactory than the tone which pervades it.

The Count de Paris is no advocate for trade unions, but having been at considerable pains to make himself master of the whole bearings of the case, he has discovered that such combinations are inevitable, and beyond the power of the legislature to cripple. Hence he counsels the State to allow them perfect freedom of action so long as they keep within the limits of the law.

On entering upon his task, the author declares it to be his aim to study, without any party feeling, a subject which should be regarded from a purely practical point of view. He thinks that the development of the principle of working-men's associations must be full of interest, not alone to those who expect therefrom an amelioration of their condition in life, but to society in general. He proceeds—“It appears to us that the new application of the fruitful principle of association will not only assure to society material profit, and an increase of the general wealth, but will render to public morals still more important services.” He apprehends that he shall be able to show that the two elements, capital and labour, formerly and now engaged in an unnatural and deadly struggle, will hereafter regain all their strength by a happy alliance. The first portion of the book opens with a high tribute to the working-classes, and the author expresses the hope that when his task has been closed, he shall have succeeded in meting out the justice which is due, not alone to the mighty manufacturing interests which so powerfully contribute to the advancement of civilization, but also to the honest and laborious working population, which, by “its solid qualities constitutes the strength and the honour of every great nation.” The Count de Paris's book, which, being addressed to French readers, is necessarily written in the author's native language, is entitled “*Les Associations Ouvrières en Angleterre*.” It is divided into ten chapters, the first of which has the somewhat “sensational” title “The Crimes of Sheffield.” In this chapter he affords his countrymen a most animated and picturesque account of the doings of Messrs. Broadhead & Co., as revealed before the notable Sheffield Commission. By way of exhibiting to our readers the style in which the book is written, we will translate a portion of the Count's description of the theatre of these events:—

“Sheffield lies almost in the centre of England, in the neighbourhood of many coal-mines, at the bottom of a densely-packed and always smoke-begrimed valley, in which is situated the active and populous capital of the steel and steam-hammers in all England, together with the immense population of Bessener, gigantic retorts in which settle at some time five or six tons of iron. Here, are manufactured cannon, and the plates for armoured ships. But in addition to these manufactures, there goes on at Sheffield the old industry of the town. Sheffield has lost its ancient monopoly of this trade; some of its branches have been subjected to a rude shock, and among the sufferers none have been more unfortunate than the saw-grinders. The working cutlers, few in number, jealous and exclusive,

formed themselves into associations, in the hope of obtaining thereby a rise in the rate of wages. They did not succeed, the only result being frequent ruptures between themselves and the masters.”

In this pictorial way the author goes on to describe the blowing up of the house of Peary-hough and the other murderous revelations brought to light by the Commission. When the Count has occasion to speak of the Royal Commission which was appointed by the Government to investigate the workings of unionism, he thus writes:—

“No party spirit inspired the Royal Commission. It contained all the necessary elements for eliciting a complete and searching discussion, for its members, to the number of ten, presided over by one of the worthiest of England's judges,—Sir William Erie,—belonged to the most opposite opinions. The House of Lords was represented by Lord Lichfield, whose appointment was due to his efforts, in 1865, at reconciliation between the iron-masters and their workpeople. The House of Commons was represented by four gentlemen, Sir Daniel Gooch, a director of the Great Western Railway, specially known for his participation in the work of laying the great Atlantic cable; the only member who belonged to the ministerial party. The three other members were, Lord Eicho, a moderate Liberal; Mr. Roebuck, a lawyer and an independent member of the Radical party; finally, Mr. Thomas Hughes, a popular who is imbued with democratic opinions. Besides these, there were Mr. Harrison, a lawyer, and the faithful ally of the last-named gentleman, Sir Edmund Head, formerly Governor of Canada; Mr. Booth; Mr. Merivale; and Mr. Mathews, an iron-master, who represented the great manufacturing interest. Divergences of opinion were made manifest even at the very first sittings, in the interrogation of witnesses. Each member having the right to put his own questions, conducted in his own particular form, to witnesses, these witnesses found themselves subjected, after their examination in the form of procedure in force in England as chief, to a “cross-examination,” on the part of a commissioner who was anxious to scrutinise the value of their statements, or to weaken the force of assertions which were opposed to his own special views. This is it probable that the Commission may at the last moment be divided among themselves and be unable to sign a common report.”

The sagacity of the prince has here led him to hazard a conjecture which has come to be quite verified in fact. A split in the Commission has actually taken place. The Count's hook was composed before Lord Lichfield and Messrs. Hughes and Harrison's “Conclusions from Evidence” was published,—the conclusions in question being totally opposed to those promulgated by the majority of the Commission.

In his second chapter the Count gives a description of the origin of trade-unions in this country, showing how long since is the day when the first attempt at organization was made. “The terrible plague of 1348 had carried off a fourth of the population and plunged the remainder into the depths of misery; but the natural march of human affairs carried, as usual, the remedy by the side of the disease: the scarcity of hand-labour very soon augmented its emoluments.” The survivors demanded higher wages, but the Legislature interposed and attempted to fix a maximum of wages. Here, then, was the first attempt at combination on the part of labour, and the first attempt of the Legislature, acting on the side of capital, to check its demands. With a bright and impartial pen the author pursues his account of the history of trade-unions till, reaching the period of the Luddites, he stops to describe that unhappy struggle in detail. He says:—

“In 1811 the hoarse trials of Nottingham suffered cruelly. The badly-paid workmen hired, at an exorbitant price, the looms of the employers, for whom they worked at home. The introduction of machinery, which threatened to still further reduce their earnings by coming into collision with this home-manufacture, precipitated the explosion. As is usually the case in such crises, this event occurred at a time when the masters, almost in a rained state themselves, were in the worst possible condition to secret concessions to their men. The result was, not a strike, but a veritable insurrection. Meeting at night in newly-introduced machines, and armed themselves into armed bands to destroy them. Every manufactory was attacked; many were pillaged or burnt; the mad movement spread into the adjacent counties, and very soon the Luddites—a name borrowed by them from one of their leaders—carried out their depredations on the most extensive scale. Their secret was so well kept that, at the outset, they eluded the most vigorous attempts at detection. During the space of six years they burst out at regular intervals, notwithstanding the execution of their principal leaders. Eighteen of these leaders were hanged at York in 1813.”

It will not be necessary to follow the steps of the author while describing the legal position of trade-unions,—a section of the book which is written with carefulness. In the third chapter he takes up the subject of the “organization of trade-unions.” Speaking of the contributions in money of the workman to his union, he says,—“When this painfully-accumulated capital shall no longer be in great part absorbed by the unproductive expenses of strikes, it will constitute for the working-man a new element of prosperity.”

We next come to certain chapters which are

devoted to an exposition of the operation of trade combination in such industries as house-building, the working of iron, coal-mining, iron ship-building, machinery, tailoring, printing, glass-blowing, &c., in which the Count discusses the mode of formation of the unions in these trades, their character, their development, and the use they have made of their power.

The ninth chapter of this interesting and, in some respects, unique book, deals with the “remedies for strikes” which opens with this impartial paragraph:—

“An unprejudiced examination has enticed to dispel the cruel and unjust suspicions which the crimes of Sheffield had brought upon the whole number of trade-unions. Certain scoundrels thought to serve the associations to which they belonged by their abominable deeds, but their isolated villainy ought never to recoil upon the general body of trade-unions. These latter are not more responsible for these dark deeds than the old chiefs of ‘The League’ were formerly for the murder of Henry IV. of France; or, more recently, the Confederate generals, for the assassination of President Lincoln. They may lie under the reproach of having been the authors of many acts much to be deplored; they have been accused of having organized a system of intimidation against those who opposed their authority—many of these things having been proved by the statements elicited by the Royal Commission. But these instances of wrong-doing will appear more far and far between to those who take into account the vast population from which these cases have been selected. Besides, these cases of wrong-doing show that associations of working-men stand in need of enlightenment, and of being directed into wiser ways, rather than of meriting universal condemnation.”

The Prince next proceeds to narrate what certain innovators have done towards the great work of conciliation between master and workman. He founds his sketch of these schemes upon the statements of Mr. Kettle, Mr. Mandella, and Mr. Briggs, the mining proprietor, of Normanton.

Want of space precludes our following the Count in his description of the enterprises of these and other well-intentioned gentlemen; and we proceed to the final chapter of the treatise, which has for its subject “the future of trade-unions and political liberty.” In this chapter, which displays in no slight degree a philosophical spirit and graphic eloquence, the author declares that, on the day when councils of arbitration shall render almost every form of strike useless and ineffectual, the funds which in the present order of things are absorbed in strike expenses will be left to form the monetary nucleus of co-operative associations, whose peaceful reign shall bring prosperity and improved social status to both employer and employed. Surely a consummation most desired to be wished for; and, let us hope, not an entirely Utopian and visionary idea.

This book, embodying the views of an illustrious foreigner, must possess a value to the thoughtful reader, as being illustrative of what men of enlightenment and culture among other nations think of unionism and its struggles here in England. The views expressed in the book are not those of a charlatan, or an advocate who has a particular cause to defend. It is the work of a man of high attainments, who in his leisure has brought great powers to the consideration of a vital question which is alike interesting to all classes of society.

ROYAL SANITARY COMMISSION.

THE first meeting of the commissioners was held on April 22nd, in Committee-room No. 14, House of Commons, at two p.m. Present,—Right Hon. C. B. Adderley in the chair, Earl of Romney, Earl Ducie, Right Hon. S. Cave, M.P., Col. M'Clean, M.P., Mr. Hibbert, M.P., Mr. Clive, Mr. Shaw, Dr. Acland, Right Hon. Lord Robert Montagu, M.P., Col. Ewart, Mr. Whitbread, M.P., Mr. Richards, M.P., Mr. Powell, Mr. Paget, F.R.S., and Mr. Birchan.

The chairman proposed that the first proceedings should be as follows:—

1. To take evidence on the operation of the sanitary laws,—(1.) Their machinery; (2.) Their administration, as to (a) areas, (b) local authorities, (c) powers; and the enforcement of the sanitary laws, and their defects; the central control over the local authorities.
2. That for the present, at all events, scientific controversies as to the best modes of carrying out sanitary improvements should be postponed.
3. Evidence to be taken,—first, from the Home Office and the Privy Council Office; next, from sample towns and districts.
4. A digest of judicial decisions on disputed cases under the Sanitary Acts since 1848, or in matters connected therewith, to be prepared immediately.

They commenced receiving evidence on April 26th, in Committee-room No. 14, Mr. Tom Taylor, secretary of the Local Government Act Office, being under examination. On Thursday, the 29th ult., Mr. Thring and Mr. Rohort Rawlinson were to be examined. The commission will continue to sit on Mondays and Thursdays, until the evidence required has been completed.

THE (ALBERT) MUSEUM, SOUTH KENSINGTON.

On entering the north court of the museum, a very fine statue of white marble, executed and lent by Mr. Woolner, immediately attracts attention. It represents the late David Sassoon, the magnificent Persian merchant of Bombay, and is intended to be set up in that city in a grand hall, which has been erected in his honour. In Bombay, as at Poona, Mr. Sassoon, laid out large sums of money in building schools and hospitals, and doing other good works, both during his lifetime, and by bequest, after his death. The statue represents its subject in the attitude of Oriental thanksgiving, standing upright, with the hands slightly extended, and the palms turned upward, as if ascribing to Heaven's gift all the earthly goods he had received.

The pose is grand and simple, and in perfect accord with the Eastern costume. The latter lends itself admirably to sculptural effect, and Mr. Woolner has been peculiarly happy in the treatment of his drapery, both as to the gracefulness of arrangement, and the varied texture of the materials represented. In accordance with our Western ideas, the act of looking up to God, would be attended with a rather more upturned position of the face; but the old Eastern nations are calmer in their outward expressions than we upstart peoples; and, doubtless, therefore, Mr. Woolner is equally correct in the position of the head as in all the other details of this very admirable and extremely satisfactory statue.

The cause of the differences observable between individual nations is always an interesting inquiry, and the great calm and self-possession of Oriental peoples as compared with those of the Western world, form a peculiarity that is very remarkable. It is constantly said that the vivacity of the southern inhabitants of Europe is mainly attributable to the warm generous climate their countries enjoy; if such be the case, why should Turks, Arabs, and Hindoos be so quiet and unobtrusive in their demeanour? It cannot be argued that their climates are cold and ungenial. For my own part, I think the cause might be successfully sought in the fact of the greater or less degree in which the women take part in the out-door life of each country. To women especially belonging, as their distinctive characteristic—the affections, which are demonstrative, and necessarily demonstrative or they cease to exist for want of aliment; to men belong the reflective powers of mind, which require tranquil meditative composure for their development. When, then, sudden, quick (spasmodic, if you will) actions, bringing life and bustle with them, are constantly being exhibited, calm and repose vanish, and man—who is an imitative animal—catching the infection of liveliness, copies and thus doubles these energetic demonstrations, until a general huzzah is the result; and this, going on from generation to generation, finally becomes the national character. On the other hand, when women from preference or necessity withdraw from public life and shut themselves up within their houses, out of sight and bearing of what is going on out-of-doors, the influence of their vivacious manner ceases to be felt, and men (who in some way or other are always in antagonism to, or rivalry with, their fellow-men) become silent and cautious the better to watch their neighbours' proceedings; sedate and collected so as to be on their guard against surprise, and to be ready to take advantage of any lucky turn in affairs that may ensue; and too often morose and reserved under loss and disappointment, for want of an auditor equally interested with themselves in their failure or success. Thus, as I remarked above, I think the great cause of the difference in national characteristics, arises from the degree in which women mingle in, or absent themselves from, the public life of each particular country.

To return from this long digression to the loan museum at South Kensington. In the south court, close to the east aisle, stands a small table glass-case containing several rich objects lent by Mrs. Sassoon, the widow, I pre-

sume, of the gentleman whose fine statue I have mentioned above. The most attractive specimen in the case is a very beautiful hemispherical box of gold with corresponding lid, of the shape, when shut up, and size, of a large orange. The gold is of a rich deep colour, the surface roughed; it is set with rubies, sapphires, and emeralds, in flowers, scrolls, and a central star, while round the edge of both box and lid—consequently forming a double band round the centre of the ball—runs a row of large rubies set closely together. This is a lovely thing, of the richest type of Oriental lavish luxury, but not in the least partaking of the "barbaric" in its grandeur.

Another interesting object is a watch given by Queen Charlotte to an Empress of China. It is of large size, and has a blue enamelled case set with diamonds in a rich star, with festoons of diamonds around, and a border of coloured enamel. The little coflet of gold, or gilt metal, is very pretty; it is in size about 4 in. long by 2 in. wide and 1½ in. high, and is formed of slabs of imitation lapis lazuli, on which are three medallions of dark translucent enamel, bearing a diamond star, and set round with pearls—the whole enclosed by a band of black enamel, ornamented with coloured flowers. Folding up the inside, are three trays of small instruments, such as scissors, bottles, a tiny spoon, and so forth, the handles and cases being of coloured enamel.

There are besides two curious gold amulets, encrusted with turquoise into various forms, with some Chinese writing in dark blue enamel; and two German coins or counters, dates 1758 and 1776, which are ingeniously preserved in a box of carved wood in the shape of a figure 8, each coin being sunk in a ring of white satin, which, again, is enclosed in a ring of pale jade on a white satin foundation. The oblong box of tortoise-shell, the cover decorated with raised Japanese work of shrubs and very natural-looking domestic fowls, is lent by Mr. E. Thompson, and the large round shallow bowl and cover of porcelain, with white scrolls and ornaments in relief on a light brown roughed-up ground, is lent by Mr. Barnes Dallas. In the same case are several gold coins—Chinese money—called "obang," lent by Captain W. Gore Jones, R.N. They are formed of a flat thin oval sheet of gold, the largest—the value of which is 18l.—being about 8 in. long by 4½ in. wide, and the smallest, worth 8s. 6d., 1½ in. by 1 in. They have stamps and inscriptions on them. The sword of honour, mounted in gold and jewelled, presented by his Highness Holkar, Maharajah of Indore, to the young son of the late Lieutenant-Colonel Townsend Hungerford, C.B., and lent by Mrs. Hungerford, though formed of the richest materials, is utterly devoid of taste or artistic merit. It is of modern Indian work, some of the stones are cut with facets, others are merely rounded and polished; as a whole it makes one regret that Orientals, who, when left to their own judgment, produce such exquisite work, especially where colour obtains, should be set to imitate Western productions they do not understand, and with which they have no sympathy.

Mr. Barnes Dallas, whose elegant porcelain box and cover I mentioned above, has sent a collection of interesting objects sufficient to fill one large upright glass case and half of another. The most noticeable, from being particularly handsome or especially curious, are the following:—A Chinese porcelain two-handled bottle, of flattened spherical form, yellow ground, with dark blue flowers; a square porcelain bottle, red ground and coloured flowers, with two rows of short hairs of white, gilded, and painted with spots, the bars in groups of three; the manner in which variety is obtained by occasionally dividing a bar into two shorter pieces, is very ingenious, the entire and the divided bars being placed apparently by caprice, yet really by design, as shown by the fact that the arrangement on all four sides of the bottle is exactly the same. The vase is mounted on a carved wood stand, and the effect of the whole is extremely rich and "cared-for." An ancient Chinese bottle of enamel and gilt brass is very admirable: it is of spherical form, but flat on one side, as if cut in half, so as to stand against a wall: the ground yellow, with blue flowers and leaves, and a circular gilt plaque in the centre, bearing a Chinese inscription. A similarly flattened tall, slender wall vase, of enamel, has a white ground with blue flowers, birds, leaves, and writing upon it. A double diamond-shaped vase and cover of enamelled copper, blue ground with coloured flowers, has rings at all the angles which serve, on the lower ones, for feet; it has a

carved and perforated wood cover and stand. A large enamelled bronze bird, resting on a natural root of a tree, is very clever as to attitude and form; a pair of terra-cotta bottles, ornamented with leaves and branches and admirably-modelled squirrels; two L-shaped boxes of blue turquoise enamel on copper, with flowers on the top and rosettes on the sides, fit ingeniously one to the other, so as to form a square; and there is an enamelled copper case to match the boxes, of flat scalloped form. A very pretty little box, of round scalloped shape, is made of lead covered with black lacquer, and ornamented with flowers and dragon-like forms in mother-of-pearl, and has mother-of-pearl masks holding a ring in the mouth for handles. An Oriental bronze bowl, with dragons in high relief and a Chinese inscription, is supported by wondrous birds. Two enamelled copper bottles, with long straight neck and two tubular loops, dark blue ground covered with flowers of rich bright colours. A small japanned cabinet, of four drawers and open shelves, is entirely faced with the natural bark of a tree, moss, leaves, &c. it is an interesting example of the ingenuity of this singular people—the Japanese—in turning the simplest materials to good account.

The tall tubular vase of jade, squared on the outside by a sort of billet-moulding, divided into three compartments, and mounted on a carved wood stand, is very elegant; and the various flower-holders, of red and white agate, crystal, red cornelian, Oriental agate, and white and pink cornelian, are very rich. These latter suggest to Western-world beholders, that *Fancy* might be advantageously allowed to have more liberty among our own manufacturers; there is no law to compel a flower-holder to appear for ever in the form of a vase or a glass, nor to be made only of glass or porcelain. Perhaps the richest-looking specimens in Mr. Dallas's collection, are the twelve small silver cups and saucers with raised blue and green enamelled flowers and leaves. On the saucers the enamel is nearly flat; but on the under part of the cups it is boldly raised, so as to form a sort of foot. The cups are in outline shaped like a loaf, with the stalk for handle, and are very similar one to another; but the saucers are of most varied form (in only one instance are there two alike), to wit, a trefoil, quatrefoil, cinq-foil, an oblong, a horseshoe, and so on.

Two diminutive Japanese pill-boxes, one of wood and lacquer, the other of metal, fitting into a brass frame, each box being about 1 in. long, 2 in. wide, and ½ in. thick, prove that these quaint folks are as wisely moderate in their consumption of medicine as are the homoeopaths.

A Chinese seal, apparently of iron, pyramidal in form, and about 2 in. high, is an excellent shape for the purpose. To prevent the fingers from slipping upwards, deep parallel channels are sunk on each of the four sides. The seal is apparently of iron, damascened with gold and silver. Two powder cups, one round and the other fluted, are engraved with Chinese characters, lined with grey enamel, and have jade handles; and there is a red and brown jade teapot, bamboo pattern, with spout and crossed handle, and covered with flowers and leaves in relief; and also a terra-cotta teapot of bamboo-pattern, and brown in colour. The white porcelain bowl, with crab, lobster, tortoise, and flowers in relief, seems a dream of Palissy-ware, or its forerunner; and there is a singular cylindrical cup formed of the root of a tree with blue enamelled interior, and five gilt bars in low relief on the top edge. There are, besides, a number of the clever and very amusing Japanese "nitchies," beautifully carved as usual, and coloured in parts; several curious Chinese books, both plain and coloured; six charming little coloured and four white porcelain snuff-bottles, with figures, animals, and dragons in relief; bottles and vases of glass in two layers, the upper and coloured layer being cut into designs that stand out on the white ground; and three cigar-cases of beautifully-plaited fibre of a light brown colour, in varied patterns and of Japanese manufacture.*

Not far from the above glass cases hangs a remarkable Chinese gong, somewhat resembling a double *fleur-de-lis* in form. It is of bronze, and an inscription upon it says it was presented to Mekok Sang monastery. Its height is 3 ft.

* Since the above was written, I find that Mr. Dallas's collection has been withdrawn from exhibition; nevertheless, I do not omit my description of it, for the objects I have specified are so noteworthy that they well merit the honour of having their memory embalmed in the pages of the *Builder*.

10 in. and width 2 ft. 10 in., and it has a suspending loop of bronze. It was given to the museum by the officers of the 1st Dragon Guards.

As I have, by mention of this gong, wandered from the *loza* portion of the vast collection at South Kensington, I may as well confine out of my usual course; for there are many objects among the purchases that seem imperatively to demand notice, and that it is impossible to pass unheeded by. Amongst these the wondrously beautiful "Paradise Lost" Shield* stands first and foremost. The shield is of silver and damascened iron, was executed by M. Morel-Ladenie, for the Messrs. Elkington, and was bought at the Paris Exhibition of 1857 for 2,000*l.* The form is a graceful oval, the height 2 ft. 10 in., and width 2 ft. 2½ in. In the central medallion, or compartment, Adam and Eve are seated in the Garden of Eden, under the shade of trees, on a bank covered with flowers and charmingly-executed ferns, while the Archangel Raphael stands before them and describes the defeat of the rebel angels. In the other divisions the events of the contest are displayed; while below, the Archangel Michael—a calm, dignified figure in damascened iron that admirably represents the armour he wears—is seen, vanquishing Satan; and beneath the feet of this group crouch Sin and Death. Above are displayed the signs of the zodiac and other objects. The delicate gold tracery introduced on the borders, or frames, to the various designs is very chaste and delicate, and the entire work is most admirable.

Near to the above shield, in a glass case among some objects on loan, are two excellent carved wood frames for miniatures; the one, in particular, of pear-tree wood and modern Florentine work, with much undercutting, is very sharp and true. It was bought for 12*l.* Below these frames are miniature profile busts in ivory, on stony ground, of Napoleon I. and the Empress Josephine: they are in separate frames, and the Emperor's bust is accompanied by warlike and other emblems; while that of the Empress has a dance of Apollo and the Muses below. The carving is extremely delicate and careful; they are signed "Zanigo," date from the beginning of the present century, and are lent by Mr. W. G. Rogers. On the shelf below is a noticeable table-top formed of various marbles and other minerals irregularly combined, called Borghese mosaic, the light-coloured being placed on the outside, and the darkest towards the centre, where they form a frame to a circular landscape of Roman mosaic; subject, the Foro Romano. A wide border of white mosaic encircles the whole slab, and into it are introduced sixteen various-sized medallions of buildings, figures, and busts, in very minute mosaic, in shades of green. The table-top is modern Roman work, and is lent by Mr. H. Vaughan.

ART-LOVER.

COLUMBIA-SQUARE MARKET.

Not long ago we gave some descriptive particulars of the market founded by Miss Burdett Coutts in Bethnal-green, together with a plan of the whole and a view of the interior of the market-hall, a handsome Gothic structure.* In our volume for 1866 we had previously published a view of one side of the market-square and other illustrations.† We now add to these a view of the north front of the market-hall as seen from New-street.

On Wednesday last the market was opened under the most propitious auspices, the weather being genial in the extreme, and the entire neighbourhood having put on a holiday aspect befitting the occasion. The majority of the shops were closed, and flags and banners waved from house-top to house-top, each bearing an inscription in honour of the event. Miss Burdett Coutts arrived at half-past two o'clock, and was received by a guard of honour composed of about 300 of the Tower Hamlets Volunteers. She was afterwards conducted by Mr. Johnson (chairman of the market committee) to a dais which had been erected in the centre of the quadrangle; and various formal introductions having taken place, the company present received the addition of the Duchess of Cambridge, Princess Mary of Teck, the Prince of Teck, the Duchess of Argyll, the Marquis of Lorne, the Duke of Wellington (lord lieutenant of the county), the Bishop of London, the Earl of Harrowby, the Marquis of Salisbury, Lord Medesdale, the Lord Mayor and the Sheriffs of

London and Middlesex, &c. A procession was then formed to meet the Archbishop of Canterbury.

The company being assembled on the dais, and Miss Coutts having taken her position in the centre, addresses from the tenants of the market and the workmen in the employ of Messrs. W. Cubitt & Co. were presented to her. The address of the workmen was to this effect:—

"Madam,—We, the workmen who have been engaged in building Columbia Market and industrial dwellings in connection therewith, desire to avail ourselves of the opportunity which the proceedings of to-day afford to express our grateful acknowledgments to you, and the admiration which we entertain for the many generous deeds which your name is associated. The care and solicitude you have continuously shown on behalf of the moral and social elevation of our class emboldens us to join in the congratulations of to-day, and we feel assured that the magnificent and beautiful structure now completed, and which your bounty has provided, will be another proof, added to many, of a rare generosity united with practical wisdom. Believing as we do that wealth is put to its highest and noblest purposes when given as the price of useful labour, we as workmen feel deeply indebted to you, and beg to offer our heartfelt thanks. We earnestly hope and pray that this edifice may realise the object of its design; that it may confer lasting benefits upon this locality; that its utility may be established, and the lesson of its beauty appreciated; and that it may remain a monument to a remote posterity of a loving spirit, a fostering care, and a bounteous benevolence. We pray that your valuable life may be long spared, and that your name may be warmly cherished and held in affectionate remembrance by all classes of the realm; and that others, looking at your example, may be encouraged to go and do likewise."

After other proceedings, the Archbishop of Canterbury said Miss Coutts had placed a letter in his hands which she wished him to communicate. His grace then proceeded to read the letter, commenting upon various passages of it as he went along. Miss Coutts, he said, thanked the workmen for the address they had delivered to her. It was a satisfaction for her to know that by their conduct while the works were in progress they had shown a good example to the neighbourhood. Miss Coutts also wished him to thank the tenants for the kind expressions in their address. He might be wrong, but he thought it was unusual for London landlords and tenants to meet in the same relations as those which characterized the meeting between Miss Coutts and her tenants to-day, and to interchange such kind expressions of regard as those which had been made. Miss Coutts hoped that the same good feeling would prevail between her and her Bethnal-green tenants as had been shown to-day. She thanked Messrs. Cubitt & Co. and their workmen for the manner in which the building had been erected. Apart from the beauty of the market, she rejoiced at the reconstruction of a neighbourhood which, from combined circumstances, had fallen into dilapidation and squalor. She was also happy to be able to say that the carrying out of the work had been unattended with any serious accident.

Mr. Darbshire, as architect, and Mr. George Plucknett, as representing Messrs. Cubitt & Co., had proper places in the ceremony.

The whole proceedings passed off happily.

THE THAMES EMBANKMENT.

At the meetings of the Society of Arts' committee, an Egyptian obelisk for the Embankment is being advocated. Sir Charles Trevelyan said, after the recent discussion of this subject, at the instance of Colonel Sir James Alexander, Lord Houghton was so good as to say to me, "You are quite right about bringing an Egyptian obelisk to this country; but the one to bring is not Cleopatra's Needle, but the remaining obelisk of Luxor, the fellow of the one which has been erected by the French in the Place de la Concorde." Luxor is the modern Arabic name, but the city is Egyptian Thebes of the hundred gates; and these beautiful obelisks, which are in the highest style of ancient Egyptian art, formed the portal of the great Temple of Thebes. These obelisks were given by Mohammed Ali, one to the French and the other to the English. The French brought theirs to Paris, first securing it in a kind of gigantic packing-case, and then, lowering it by means familiar to engineers, they conveyed it to a Nile boat, and so by water to Alexandria, and thence to the Seine. In the same way, and with the advantage of their experience, the other obelisk might, with the help of one of our many old Admiralty hulks, be easily brought to the Thames, and thence to the Temple-gardens.

Whatever may be the general advantages of public monuments, there will be a peculiar advantage in having in this country and in this great metropolis so perfect and beautiful a specimen of that by-gone civilization, the earliest

on record, inasmuch as it will suggest to all who see it that there have been other forms of civilization, which have had characteristic merits of their own. The English and French would then have fellow obelisks, and the Temple Gardens would form a site peculiarly appropriate to the one belonging to us. The difficulty which prevented the transfer of Cleopatra's Needle to Hyde Park will not occur in this case, the Temple Gardens being close to the Thames. In the centre of the Temple Gardens, with all London streaming before it on the Embankment and river, the obelisk would be in an extremely conspicuous situation.

ST. PAUL'S CHURCH, LITTLE EATON, DERBYSHIRE.

THE enlargement and general improvement of the church of Little Eaton, near Derby, having been completed, it has been re-opened for divine service. The old church having been found very inconvenient and too small for the congregation, an enlargement was determined on, and the Building Committee employed Messrs. Giles & Brookhouse, of Derby, architects, under whose direction the works have been carried out. With the exception of the tower and chancel, the church is almost new, and now forms a nave and north aisle, with stone arcade supporting double-span roofs. Accommodation for about 300 persons is provided. The roofs are supported by principals, and the spaces between them are thrown into moulded panels, with wrought boarding terminating at the feet of the principals, with a moulded and perforated cornice. The sittings are open, and, with the rest of the woodwork, slightly stained and varnished. The floors are laid with Whetstone's Coalville quarries, and the building is warmed by a Gurney's patent stove. The contractor for the whole of the work was Mr. Fryer, of Derby. The Rev. J. E. Carr, of the Outwoods, Little Eaton, has addressed a "protest" to the minister and churchwardens of Little Eaton, against "the pictorial representation of the Crucifixion, in other words the painted Crucifix, in the chancel window, which has been placed there without the consent of the parishioners;" and repeats an offer he had already made to give 50*l.* towards the liquidation of the debt upon the church of condition of its removal.

WESLEYAN CHAPELS.

THE fourteenth annual report of the Wesleyan Chapel Committee shows that since the Conference of 1867, the following cases have been sanctioned:—

126 Chapels, at an estimated cost of, ..	£126,654
8 Ministers' houses ditto ..	4,705
43 Schools ditto ..	30,281
74 Enlargements and alterations, ditto ..	24,532
22 Organs, ditto ..	4,511
72 Modifications of cases previously sanctioned, at an estimated additional outlay of ..	21,255

Total 345 cases .. £211,818

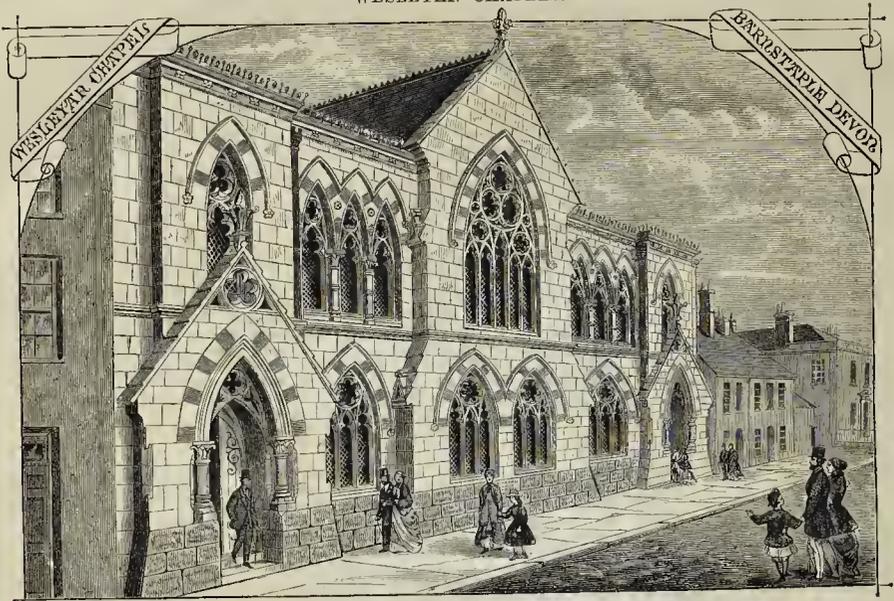

Compared with the cases sanctioned last year, there is an increase of nine chapels, and of 1,848*l.* in proposed outlay; an increase of twenty-four school-rooms, and of 22,781*l.* in proposed outlay; being the largest number of chapels, and, with one exception, the largest number of school-rooms sanctioned in any one year.

The report contains views and particulars of several of the chapels recently erected. Of these we illustrate two. It is noteworthy that no chapel is now put up without some attempt at architectural character.

Barnstaple Chapel.—For several years the congregations attending Wesleyan-Methodist services in Barnstaple have been steadily increasing; and the old Chapel having an unsightly exterior, and an uncomfortable and ill-ventilated interior, it was found necessary to erect a new edifice. A design was prepared by Mr. Alexander Lauder, of Barnstaple, architect, and the foundation-stone of the new building was laid on the 25th of February by Sir Francis Lyost. The cost of the building, besides old materials, was 1,620*l.* The builders were Messrs. Thomas Brown, W. Youngs, and J. and W. Oliver, of Barnstaple. The new building is erected on the site of the old chapel, in one of the principal streets, its length being towards the street. The plan comprises ground-floor, large gallery around three sides, and a choir gallery in the recess formed by the double staircases at the other side. The entrances to the galleries are separate from the entrances to the ground-floor, giving a ready ingress and egress to and from the building, also

* See pp. 137, 146, 147, ante. † Vol. xxiv., pp. 796, 797.

WESLEYAN CHAPELS.

MR. ALEXANDER LAUDER, ARCHITECT.

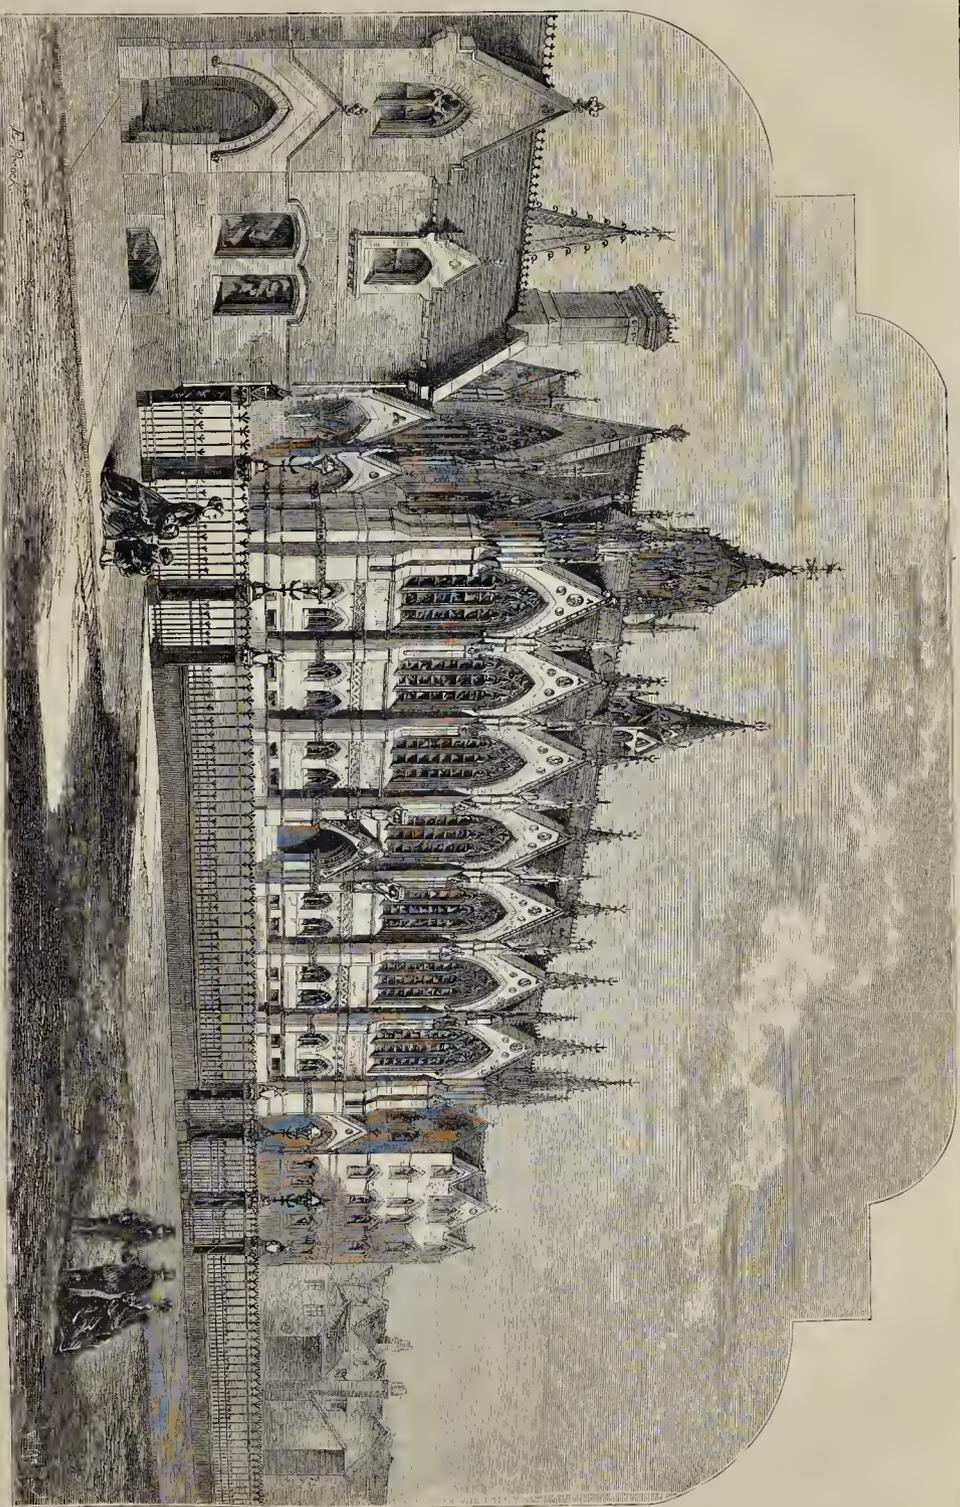

obviating draughts. The chapel will accommodate nearly 900 persons. The roof is open, ceiled to the collar, formed into panels and slightly stencilled in colour. The roof, with all other timber, is stained and varnished. The style is early fourteenth century Gothic.

Longsight Chapel, Manchester.—A few years ago Wesleyan Methodists in Longsight were few in number, worshipping in a hired room. In 1860 the former chapel, accommodating nearly 500 persons, was erected at a cost of 3,000*l.* The demand for accommodation still increasing, the trustees determined on erecting a more commodious place of worship. Freehold land, not subject to any chief rent, in an eligible situation, including a large vacant space behind the chapel, on which it is intended, eventually, to erect an extensive day and Sunday school establishment, was purchased at a cost of 1,372*l.* The new chapel is a Gothic structure, of the Early Decorated period, and has been erected from the designs and under the superintendence of Mr. George Woodhouse, architect. It will seat nearly 1,200 persons, 300 eligible sittings being free. The entire outlay, including land, chapel, organ, fittings, &c., will amount to at least 9,000*l.* The building is cruciform in plan, the total length being 106 ft., the width of the nave 48 ft., and across the transepts 76 ft., each transept being 28 ft. in breadth. The height from ground line to spring of roof is 27 ft., and to the ridge of nave 55 ft. The front gable of the nave, which faces to the main road, contains the principal entrance, which has moulded arch and label, supported by pillars, the whole surmounted by a large five-light window, with tracery in the head. To the right of the entrance there is an octagonal staircase, with tall slated spirelet roof, and on the left there is an entrance porch, with arch-headed door, surmounted by a gable, and by a tower, and spire, the total height of which is 120 ft. to the base of metal finial with which it is crowned. The nave has four two-light windows, with tracery in the heads; each transept has a circular window in the upper portion of the gable, and single light windows below the same. A wheel window is also placed in the back gable of the chancel, which forms the organ gallery, having vestries under for the minister and stewards, also heating chamber below. There is a gallery on each side of the chapel, extended into each transept, and also into the recess in front over the vestibles to the front and side entrances. The roofs are open-timbered, except a flat portion in the upper part of the nave roof, the height of which, above the floor line, is 40 ft. The walls are of stone, the wall-stone from Durnford Bridge, the ashlar from the Hindson's field quarry. Mr. J. Robinson, jun., of Hyde, was the builder.

LONGSIGHT WESLEYAN CHAPEL.

MR. GEORGE WOODHOUSE, ARCHITECT.

COLUMBIA-SQUARE MARKET: NORTH FRONT OF THE MARKET HALL.—MR. H. A. DARRSHIRE, ARCHITECT.

[See p. 345, ante.]

THE ART-UNION OF LONDON ANNUAL MEETING.

On Tuesday last the subscribers and their friends assembled in large numbers in the Adelphi Theatre, Strand, to receive the committee's report, and distribute the amount subscribed for the purchase of works of art. The president, Lord Houghton, having taken the chair, Mr. Lewis Pocock, F.S.A., honorary secretary, read the following

REPORT.

The Council of the Art-Union, in presenting their annual Report, have the satisfaction of stating the amount of subscriptions to be 11,100, 10s. 6d. The Council having been repeatedly requested by the subscribers and agents to produce a chromo-lithograph, for general distribution, instead of the accustomed engraving, the financial committee, selected for the present year a reproduction of one of Mulready's finest and most popular works, namely, "Choosing the Wedding Gown," probably one of the most elaborate and difficult subjects that have ever appeared in art. It is hoped, will prove as popular as the original painting.

The writers in the public press have expressed most favourable opinions, both with respect to the subject, and the execution, as will appear by the following extracts from two leading journals:—
"That this picture by Mulready it would be difficult to find, in the entire range of modern art, any work more eminently combining skilful composition and drawing, with a happy, though a merely, disposition of the theory of colour, whilst the sentiment and composition are no less excellent. The exquisitely easy pose of the bride's figure, the beauty of the old mistress, and the interest of the young paragon watches his betrothed, are all admirably given. The work is full of valuable instruction both for the draughtsman and the colourist."
When this picture was exhibited in 1845, it was felt that the popularity of the subject has not waned, *improved* by the number of copies constantly being made of the picture, and the fact that the Kensington Museum, and the crowd of visitors always attracted to it."

Again:—"Apart altogether from the chance of a valuable prize given for each guinea subscribed, 'Choosing the Wedding Gown' is a picture which should be collected by no fewer than thirty-four stones have been used in producing it; that is to say, it has passed thirty-four times through the press—a fact which, more than words, will convey an idea of the labour that has been expended on the work."

In the production of this work, by the mismanagement of those employed, and their neglectfulness as to the time required in drying the colours, the issue of the copies has been delayed to a degree which has proved extremely prejudicial to the returns of the year; and for this disapparently through arising from a merely technical cause beyond their control, the Council take this opportunity of apologising to those members who have had to wait for their impressions. A second cause has also acted very unfavourably on the success of the year, as a consequence, not only in England and on the continents of Europe and America, but has extended to the most remote regions of India, China, Australia and New Zealand; anticipated that, ere long, as on former similar occasions, a reaction will take place, and be followed by confidence and permanent increase in property. As a consequence, the Council have no reason to believe that the next year will again equal, if not exceed, the amount usually attained.

In consequence of the very successful result of the year, the Council have, in their annual meeting, in June last, issued the following advertisement:—
"To ASSISTERS.—The Council of the Art-Union of London offer a Premium of Two Hundred Guineas for a Series of original and artistically finished Drawings (size 12 in. by 8 in.), illustrating some poetical or historical work of a British author, or events in British history, the selection being left to the discretion of the artists. The Council propose to add a further sum of One Hundred Guineas if a series of very high character be submitted; at the same time they reserve the right of withholding any portion of the event of not receiving any work of adequate merit," &c.

In reply, thirty-four sets of designs, of various degrees of merit, were received, and, by the kind permission of the authorities at the South Kensington Museum, were there exhibited to the public. After due consideration the Council selected, as most deserving of the premium offered, a series illustrative of Charles Kingsley's well-known story of "Harroward the Wake." These drawings were afterwards found to be the work of H. O. Selous, already known to the subscribers for his admirable designs to the "Pilgrim's Progress,"—by a device for the Society's engraving and published in the Report for the year 1857, and by his picture of "The Surrender of Calais," engraved by Mr. Robinson for the subscribers of the year 1853. The Council have, in their annual meeting, and as they fulfil the stipulations of the advertisement in every particular, your Council have placed them in the hands of Mr. Charles Lewis to be engraved, and a copy of the series will be presented to each subscriber in the ensuing year. This story is a stirring and picturesque narrative of the last struggles of the Anglo-Danish people of England to resist the supremacy of the Normans, immediately after the battle of Hastings. Hereward, born in Bourne, was the son of Leofric, Earl of Mercia, and Lady Godiva, renowned in story for her ride through Coventry; and, in the first year of the Eastern counties, placing himself at the head of a few devoted followers, living a life which in some degree resembled the free life of the woods afterwards adopted by Robin Hood and his merry men. He was a valiant and a brave man, and the attempts of the emissaries of William the Conqueror to capture or subdue him, till, at last, partly in desperation and partly induced by the promises of amnesty and honour which he held out, he was resolved to go down to Winchester, and swear fealty and allegiance to the Norman monarch.

The very hair-breadth escapes and doughty deeds of the hero, vividly described by Mr. Kingsley, have been most strikingly illustrated by the pencil of Mr. Selous, and the Council feel confident that the volume of twenty volumes will be a worthy successor to the "Norman Conquest" of Mr. MacIac, and "The Ancient Mariner" of Sir Noel Paton.

In the year 1857 the Council issued a limited number of etchings by the members of the Etching Club, including Messrs. Rodgrave, Craswick, Horsley, Hoole, Cole, Taylor, &c., which gave great satisfaction, copies of that volume being now much sought after by amateurs."

The Council have the satisfaction of being able to announce that they are in treaty with the same Society for the production of another annual work to form a number of prizes, which, they have every reason to expect, may be ready for next year's distribution.

The Council have to announce with deep regret the retirement of Mr. Godwin, one of the honorary secretaries, to whose knowledge of art, and unwearied exertions for the welfare of the Society, from its first formation, much of its success is to be attributed.

He remains, greatly to the satisfaction of his colleagues, a member of the Council, and will, on every occasion, be ready to afford his valuable aid on all subjects connected with the Society.

Death has deprived the Art-Union of one of its most earnest and distinguished vice-presidents, the late Dean of St. Paul's, who, in the earlier years of the Association, as an active member of the Council, was ever ready to assist by his presence and advice.

It is a matter of congratulation to the Society that the Right Hon. Lord Stanley and the Very Rev. the Dean of Canterbury, have consented to be nominated Vice-Presidents.

Vacancies in the Council, caused by the retirement of Sir Gardner Wilkinson and Esq. S. Dallas, and the resignation of Sir Walter Strickland, Bart., and George William Reid, Esq., of the British Museum.

Very considerable progress has been made by the engravers who are engaged on the two great works in Westminster Palace, by Mr. MacIac, as announced in our Reports of the years 1865 and 1866.

The Reserve Fund now amounts to 14,911, 14s. 7d. The Council keep steadily in view the importance of obtaining a gallery and other premises for the purpose of the Association (the original object of this fund); they have likewise long had under consideration the practical mode of establishing a permanent exhibition in connexion with the Society.

Amount of subscriptions.....	£11,100 10 6
Cost of print of the year, report, exhibition, and almanack, including revenue of 24 per cent.....	43,573 8 10
General printing, rent, salaries, &c.....	2,634 13 8
Set apart for prizes.....	4,922 10 0
Total.....	£11,100 10 6

The Council have, as usual, to return their warm thanks to the local honorary secretaries and agents, both in this country and in every quarter of the globe, without whose zealous co-operation the sphere of the Society's action would be comparatively insignificant. It is a fact, continually alluded to in these reports, that, the influence of this Association, acting through the instrumentality of its agents, binds together the remotest regions by a common bond of appreciation of those products of genius which tend to refine and elevate the mind, and that, while the cotton and woollen goods, the hardware and crockery of England, are to be found in almost every clime inhabited by man, at the same time, by the agency of this Society, the natives of all parts of the world are supplied with sources of mental enjoyment and refinement, by the acquisition of engravings, or reduced copies, of the finest works of the first painters and sculptors of the day.

It may be mentioned that, in South Australia, we have no less than twenty agencies at work, under the able superintendance of Mr. Hawkes, Adelaide, and one amongst other conspicuous good services are Messrs. Wilkie, of Melbourne; Dennet, of Boston, U.S.; Dawson, of Montreal; De Cordova, of Kingston, Jamaica; and Ferris, near Sydney. There are also other different parts of Australia, six in New Zealand, eight in the West Indies, and numerous others.

The amount available for the purchase of works of art from the public galleries will be thus allotted:—

22 works at.....	£210 each.
21 ".....	15 "
12 ".....	20 "
12 ".....	35 "
12 ".....	35 "
10 ".....	35 "
8 ".....	40 "
5 ".....	45 "
6 ".....	50 "
4 ".....	60 "
4 ".....	70 "
3 ".....	100 "
2 ".....	150 "
1 work at.....	200 "

There will also be distributed,—
29 Bronzes of the Nelson Column,
10 Medallion Bronze Inkstands,
100 Statuettes, "The Wood-nymph."

Thus, with the parian busts given to all who have subscribed for ten years consecutively without gaining a prize, there will be 402 prizes, in addition to the work given to every subscriber.

The works selected by the prizeholders of the past year were, as usual, by the kind permission of the members of the Institute of Painters in Water-colours, exhibited in their gallery in Pall-mall. The Council are glad to be able to state that the pictures chosen showed a decided improvement, in point of merit, on those of recent years. It must be borne in mind that the task of selecting a picture for a prize is a very different matter now from what it was in the early days of the Society, when the sale of pictures was the exception; while now, as a rule, the greater portion of works of excellence are bought before they are exhibited. The British public has become essentially a picture-buying public, and to the advanced knowledge and interest in matters of art from which this arises, the Art-Union of London may boast of having contributed in no inconsiderable degree. The more difficulty there is in finding works of merit, the greater the necessity for using discrimination and care in the selection; and the Council are glad to find that, in addition to a much higher standard of appreciation of the qualities of a picture on

the part of the prizeholders, there is a continually-increasing disposition to come to the Committee appointed to afford them advice and assistance as to their choice, or to place the task of selection in their hands.

It is not to be supposed that a knowledge of the principles on which depend the power of forming a right judgment of works of art comes by nature, or that the science of "aesthetics" is not dependent on certain axioms and elementary rules, equally with mathematics or chemistry, or any other exact science. A recent writer on art has well observed that "it seems too obvious for argument that we ought to have rules within ourselves to know how to choose, or what to look at; that, in short, it is an eminently desirable thing to have a good taste. The difficulty is, that people often practically deny that there is any such thing in existence. It is true they acknowledge that taste is a substantive thing, ruled by definite laws, in general terms; but the moment that any one disagrees with them, do they not cry, 'That may be your taste, but mine is so and so?' And if reasons are given for disagreement, we often hear 'Tastes are not to be disputed,' quoted with all the gravity which can be given by translating a foolish proverb from the Latin.

The natural bias, without which nothing can be done, we cannot give; and hence the nine-tenths, as Locke called it, which comes to us all through education and knowledge, is clearly the only part which can be discussed to practical purpose. But this natural bias differs with every individual,—indeed, it precisely that which marks out every one's individuality; and hence, returning to art, there is no possibility that the greatest knowledge, uniformly diffused, would end in uniformity of taste. People are born to prefer red to blue, expression in action, figures to landscape, as they prefer extravagance to clear, or rhyme to blank verse; and tastes, to this degree, will differ to the end of the world."

Prizeholders are reminded that, at some of the exhibitions the prices of the works to be sold are printed in the catalogue, whilst at the Royal Academy and the old Water Colour Society, the prices are not so published; but at the former a clerk is always in attendance to answer the inquiries of purchasers, and at the latter the keeper attends in the gallery for the same purpose.

The National Collections, most valuable means of instruction, are yearly becoming larger and more important; and general and munificent benefactors, such as Mr. De la Beche, deserve to be widely known, as they rank with Mr. Peabody's benefaction, and Mr. Whitworth's scholarships. During many years Mr. Slade employed his leisure in the study of various branches of the fine arts, and became eminent as a connoisseur and collector, particularly of engravings and Venetian glass. By a codicil to his will he bequeathed to the British Museum a large portion of his private collection of engravings, to the value of 16,000*l.*, and the whole of his celebrated collection of Venetian glass, estimated to be worth upwards of 8,000*l.*

But a still more munificent and important bequest is that provided by another codicil of Mr. Slade's will, whereby the large sum of 45,000*l.* is set apart for the foundation and endowment of professorships and scholarships of fine arts; this sum having given "from a sincere wish and in the hope thereby to confer a benefit on society."

The following are the directions to the trustees and executors:—
A sum not exceeding 35,000*l.* to be devoted to the foundation and endowment, within two years after the testator's decease, of three or more professorships for promoting the study of the fine arts, to be termed the Slade Professorships of Fine Arts. The amount to be expended in founding and endowing each of these is left at the discretion of the trustees and executors. Out of the 45,000*l.* they are further to found and endow, within two years after the testator's decease, six exhibitions or scholarships of fine arts, to be called the Slade Exhibitions or Scholarships, each to be of 600*l.* per annum in amount to students in the fine arts under nineteen years of age for the profession in drawing, painting, or sculpture, and to be held for not more than three years. If after providing for these purposes, or for such of them as can and shall be effected within the two years aforesaid, any surplus remain it is to be disposed of within five years of the testator's death, as the trustees and executors may think fit, "for the encouragement, benefit, and advancement of the fine arts in England and Wales; and finally, if there still remain a portion of this surplus it shall fall into the residuary personal estate."

By these conditions it will be seen that, unless the arrangements proposed be promptly carried out, this munificent gift will be lost; the attention, therefore, of all interested is particularly directed to the subject.

By these noble gifts, Mr. Slade's name will certainly be preserved with reverence and affection, as a great benefactor of his country. Assuming that the professors will be chosen to teach the *theory of art* in its highest sense, and its widest relations, rather than to simply instruct in its *practical rudiments*, it may safely be predicted that art-knowledge will be regarded as part of a liberal education, and no less essential to a gentleman than classics or mathematics, and both professors and students will be influenced by other besides commercial considerations. Men of intellectual culture and refinement will be lured into the fine arts, to the credit of the profession; in short, Mr. Slade has deserved at least as well of his country as many of the successful commanders, politicians, and others, whom the nation delights to honour and commemorate in marble and in bronze.

The Art-Union of London has now been in operation thirty-two years, and, during that time, has collected for this purpose of aiding in the advancement of art, and thereby in the advancement of civilization, a sum exceeding 376,000*l.*; and when it is remembered that the greater part of this large amount could not have been so appropriated, but for the munificence of every individual who has contributed, and the good which must result from it to the whole nation become at once strikingly evident.

The Council, in conclusion, invite your renewed co-operation for the ensuing year, and they cannot too emphatically request those who are fortunate enough to be prizeholders to-day, to use the utmost discrimination in their selection, a matter in which the whole Society is concerned, to the end that the great object of the Association,—namely, the elevation of the general taste, and the advancement of the fine arts,—may be satisfactorily attained.

LEWIS POCOCK, Hon. Secy.
EMM. E. ARTHURSON, Hon. Secy.

The President, in moving the adoption of the report, said that the general tenor of it was sufficiently satisfactory to ensure its immediate approval. It was perfectly true that this society had partaken of the general depression of

commerce and the circulation of capital in this country. Indeed, it could not be expected to be otherwise, because the institution was supported by the superfluities of men; but he trusted that, if the state of commercial affairs should rally, the prospects of the Art-Union would become still brighter than they had ever been. Considering that there were 12,000 persons who subscribed to the association in various parts of the world, there was sufficient evidence that this was a matter of great general interest to the English people; and there could be no doubt whatever that it was of considerable use to art. He was sure that all present, ladies as well as gentlemen, would allow that *combining* was a universal passion, and he claimed for this society the exceptional privilege of making what was generally held to be a universal preceding subservient to the advancement of the highest intellectual cultivation and moral improvement.

Professor Westmacott seconded the motion, and observed that it was extremely desirable that those who had the opportunity of choosing pictures would be so far careful, that if they had any doubt as to the quality of the works before them they would not be too proud or conceited to ask the opinion of others who were older and more experienced than themselves. He dwelt forcibly on the fact that the state of art in this country mainly depends on the public,—that it was their duty to insist on the striving after a high standard in art by refusing to buy pictures of a low or unworthy character; and that if the artists of England are not hewn with a feeling for the beautiful, like those of the warmer South, they may be educated up to it. He had the pleasure to inform the company that he had seen the new Royal Academy, and he was proud to be enabled to state that they might now hold up their heads in the conviction that they possessed the finest exhibition-rooms in the world. The general arrangements as to light, the distribution of the pictures, and the space at the command of the visitors, were such as he felt assured would excite universal approbation. He was happy to have the opportunity of bearing this first public testimony to the excellence of the new building, which, it would be admitted, was not surpassed by any other structure in Europe devoted to the same purpose.

Sir Walter Stirling proposed a vote of thanks to the hon. secretaries, Mr. Peacock and Mr. Anthonis, accompanied with an expression of regret that Mr. Godwin had retired from that position since the last annual meeting.

Professor Donaldson, in seconding the resolution, alluded to what he termed the able and lucidly-written record of matters on art in England, which would be found embodied in the series of the Council's reports.

Mr. Peacock, in returning thanks, expressed his hearty concurrence in the eulogium on his late colleague, which had been pronounced both by Professor Westmacott, Sir W. Stirling, and Professor Donaldson, and his regret at losing the advantage of his co-operation as Hon. Secretary. He remarked that with the aid of the amiable and accomplished gentleman who had been appointed to the office, he felt no doubt of the successful continuation of the Society's operations.

Mr. Hayward moved a vote of thanks to Mr. Benjamin Webster for the use of his theatre, and to Mr. John Kinloch, the acting manager of the establishment, for his active co-operation.

Professor Westmacott seconded the motion, which was cordially agreed to.

A tribute of thanks was passed to the chairman, and the drawing of the money prizes was declared to be as follows:—

- 200l.—Shand, A., Old Churchyard, Liverpool.
 150l.—Cobden, Mrs. A. E., Dumfries; Robertson, J., Edinburgh.
 100l.—Hawker, W. C., Clondesley-square; Smith, E. A., Kensington; Walford, Mrs. W., Wolverhampton.
 75l.—Beach, E., Lincoln-square; Fairhurst, W., Halifax, Yorkshire; Kerr, G., Abchurch-lane; Pecker, J., Windsor.
 50l.—Eaton, H. T., Winchester; Edwards, T., 67, Lombard-street; Lucas, Alfred, Kentish-town-road; Wright, W., Runcorn.
 50l.—Jarvis, W. M., St. John's, N.B.; Manthorp, S., Colchester; Spinks, W., Oxford-terrace; Stewart, Dr., Alton; Taylor, J., Reading; Wright, W., Usklands, Runcorn.
 45l.—Copeman, W. J., Yarmouth; Hetherington, A., Alton; James, William, Haverester; Keene, Rev. J. J., Tasmania; Roberts, E., Regent's Park.
 40l.—Corbett, Miss E., Camden-road; Dean, J. J., Putney; Dixon, E. F., Whitehaven; Dodd, J., Sydney; Dowse, H. A., Queens-square; Haselton, C., New Bedford; Priestman, T., Preston Brook; Rolfe, H. L., Nicholas-lane.
 35l.—Brackenbury, W. T., Thorpe; Burgess, B., Demerara; Christian, B. D., Constantinople; Lawless, J., Exeter; Mortimer, F., Shepherd's-bush; Russell,

W. F., Wanganui; Thornton, Mrs., Brixton-hill; "Welcome," Knockholt; Withen, H., Fenchurch-street; Woodridge, C., Rochester.

30l.—Blake, E., Whiteladies; Bullock, W. J., Holland-road; Flaxman, J., (Warrimbool; Gaunt, W. H., Old Thorville; Gibson, C. W., Ballarat; Hall, H., Cambridge; Harris, W., Woolston; Holden, E. T., Walsall; Inderwick, E. S., Tregunter-road; M'Queen, F. C., Tottenham-court-road; Mumford, A., Walthamstow; Newson, D., Jinn.
 25l.—Adams, Miss, Barnet; Clorley, T. F., Moorgate-street; Forbes, Capt. H. F., Thacker & Co.; Francis, J., Bryndevon; Harbrough, G., Hobart Town; Hawker, W. C., Clondesley-square; Howie, C., Brentford; James, W. J., Hobart Town; Loder, F. W., South Audley-street; Nicholson, Sir Chas., bart., Devonshire-place; Read, R. C., Hobart Town; White, Benjamin, Bishopgate.

20l.—Eopley, A., Eversham; Forwell, E., Wotton-under-Edge; Hall, R., Bolton; Help, F. W., Dean-yard; Holt, C. W., Southborough; Lawrie, W., Inverness; Schaar, Mrs., Holland; Solomon, S., Cape Town; Turner, W. J., Wood-green; Vandy, G. J., Camberwell; Wilson, A., Dandee; Young, W., Bolton.

15l.—Bohl, A., Lima; Collins, G. N., Moreton Hampstead; Clark, C., Sawridge-wood; Clark, R., Cork; Davison, T., Boland-street; Dixon, H. J., Sheffield; Fricker, G. C., Hamilton, Victoria; Gilding, Miss, Edenbridge; Harrington, Elizabeth, Countess of Kensington Palace-garden; Leigh, S. G., Leeds; Manston, A., Liverpool; Moore, H. S., Holywell-place; Murto, J., Highbury; Noble, H. B., Moorgate-street; Pertwee, A., Woodham; Pridaux, Lady, Netherton Hall, Howton, W. G., Greenwich; Salmons, Mrs., Melham; Lohb, Mrs., Greenock; Whittington, J. B., Walleroo; Wright, E., Blackheath.

10l.—Aiken, C., Kentish place; Allingham, Mrs. E., Milton; Bond, W. T., Beccles; Camble, R., Ban; Montreal; Carver, E. J., Melbourne, Camba; Child, H., Hackney; Christie, Dr., Clifton, Yorkshire; Colvin, E. M., Melbourne; Holmes, R. W., Ballarat; Hugel, C. G., Crediton; Lightfoot, Mrs. G., Melham; Lohb, Mrs., Holland-road; Macpherson, D., St. Petersburg; Montrose, R. M., Melbourne; Newton, Miss, Clapton; Paradise, A. W., Bedford, C. G. H.; Patterson, Miss, Melbourne; Rogers, T. W., Fenchurch-street; Southcomb, T., Belfast, Victoria; Statley, Miss, Belize-road; Tysack, W. A., Cornhill; Weller, W., Littlehampton.

THURNHAM CASTLE.

THURNHAM, called also, from the hill on which it stands, "Godard's" Castle, near Maidstone, is a curious example of a Norman camp, placed upon what is evidently a British camp.

The camp crowned the high point of a very steep spur, which juts out between a depression on the one side, and a small deep combe on the other, in the great escarpment of the lower chalk, about four miles east-north-east of Maidstone. The earthworks were formed by scarping the central knoll, and perhaps raising it a very little, so as to form a slight mound, and thus especially strengthening its weak sides, those towards the root of the spur. On the lower or Thurnham front the defences, naturally strong, are reinforced by a ditch and bank, placed some little way down the hill, far below the body of the fortress, and intended to command the road which here winds up the ridge from the village and church of Thurnham, at the foot of the hill. The ground within this outer defence has been extensively opened for chalk, and is so disfigured by heaps of quarry rubbish, that but little can be accurately ascertained of its ancient dispositions.

The Norman castle occupied a platform close west of the mound, and probably included within the British camp. Here stand the remains of the gateway and court, but as a trace of masonry is still seen upon the mound, it may be that it was included in the encinte wall, or that upon it stood one of the circular or polygonal shell keeps which sometimes, with the Normans, took the place of the ordinary square keep, especially where there was an earlier mound to be fortified.

The ruins are not considerable. They are composed of the two parallel walls of a gatehouse, having on either hand two large round-headed recesses, dividing the passage into two bays, and there are besides two small lodge doors, also round-headed, on the east side.

Westwards from the gatehouse runs a low ornamental wall, about 13 ft. high, and 4 ft. thick, for about 80 ft., ending in a broad flat buttress, perhaps the base of a square tower. The wall thence may be traced southwards, along the edge of the skeep, whence it seems to have been continued towards the mound. A hollow way, cut in the chalk, winds from below, beneath, and close to the west of this wall, and, making a bend, enters the gatehouse from the north. There are no traces of ashlar. Much of the wall shows a face of coarse flints. The work may be late Norman.

On the summit of the knoll is a depression in the soil. This part of the work is so covered with thick bramble and underwood that it cannot be very accurately examined.

Thurnham or Turnham occurs in Domesday, and was one of the numerous manors given by the conqueror to Bishop Odo, and held under

him at the survey by Ralph Curpespine. It then contained a church, and had been held under the Concessor by Sbern Biga.

On Odo's fall, 19 W. C., it was granted to Gilbert Mamint by the tenure of castle guard under Dever Castle. The holders under Mamint were a knightly family, who took their name from the place. Robert de Turnham held it temp. H. II., and founded Comhwell Priory. Possibly he built the Castle. Robert had Rehert, who died s.p. 13 John; and Stephen, who died also s.p. 16 John.

In the reign of Ed. I. Thurnham was held by Sir Reger de Northwode, who died 13 Ed. I., leaving John, who married Jean de Badlesmere, and died 14 Ed. II. Their son Jehn died before his father, leaving Roger, who had Thurnham, and married Juliana, d. of Geoffrey de Say, chief lord of the manor. Their son, Sir John, third baron, died 2 R. II.; and his son, Reger de Northwode, who was never summoned to Parliament, alienated Thurnham, and died s.p., leaving a brother.

The Northwodes are said to have resided here, but the castle is thought to have been dismantled at an early period. Thurnham Castle is not named in the Ordnance map.

Binbury.

Binbury, called also Bingeury, is a very complete and very remarkable earthwork, in the parish of Thurnham. It stands upon the high table-land of the chalk, a mile or more from the escarpment, and about four miles from Maidstone. In the Ordnance map it is erroneously called a burrow.

The earthwork is composed of a circular mound about 50 yards across at its flat top, with steep sides, forming the scarp of a circular ditch, so that the platform of the mound is about 35 ft. above the bottom of the ditch, and 15 ft. above the level of the adjacent ground. The mound is wholly artificial, and perfectly regular, and with its ditch includes just an acre. Upon it are some fine old oaks, and both mound and ditch are thickly grown over with underwood, so that an accurate inspection or measurement is scarcely at present practicable. There are no traces of outworks. Towards the south-east the ditch has been filled up to form the garden of an adjacent farm-house of Tudor date, with more recent alterations. There are no traces of masonry connected with either mound or ditch. This was evidently a [Saxon] stronghold, intended to be defended by a palisade, and crowned by a house of timber. The outline is very perfect and well defined.

As the work is thrown up in a plain, where there were no natural advantages for defence, its owner probably selected the site as being within his estate, and convenient for the overlooking of his lands. In this it differs materially from Thurnham camp, which was probably the work of a tribe who lived by hunting and war, and therefore cared chiefly for an extensive view.

Bingeury has always been an important and independent manor, though in the parish of Thurnham. At Domesday it probably belonged with Thurnham to Sbern Biga, who is thought to have resided here and given his name to it. He was a very considerable Kentish landholder under the Concessor, and likely enough to have dwelt upon a mound of this size and strength.

It descended with Thurnham, and in the escheats of 12 Ed. II. Joan, widow of John de Northwode, was seized of the manors of "Thornham and Bengeury." C.

Society for the Encouragement of the Fine Arts.—On Thursday, the 22nd ult., at the rooms of this society, there was an exhibition of engravings of the English school, with a paper, "On the Technicalities of the Art," by Mr. John Sadler; Mr. G. R. Ward in the chair. Adverting to the antiquity of the art, and remarking on the slow progress of technical knowledge as a branch of education in England, Mr. Sadler proceeded to illustrate and explain the various modes of engraving on metal—in line, stipple, mezzotint, and aquatint—pointing out the peculiarities of each, the kind of treatment required for different subjects, and the mechanical difficulties that had to be surmounted, the principles that governed the art, condemning the mixed style now most in vogue, and concluded a very able and interesting paper with some allusions to the law of copyright in paintings, by which, he said, the interests of neither artist, engraver, nor publisher were protected.

THE NEW CHURCH AT KIRKBY.

At Kirkby, a village a few miles north of Liverpool, is a very ancient chapelry. It is a small dilapidated building, partly Gothic and partly base Renaissance, with high painted pews, flat ceiling, and low galleries on three sides. This having become unsatisfactory, is to be replaced by a larger structure. The Earl of Sefton, who owns the district, has selected a site north of the present church, and appointed Messrs. Paley & Austin, of Lancaster, architects. Estimates have been obtained from several builders of the town and neighbourhood, and the tender of Mr. Edward Gahnhit, of Liverpool, for 7,638*l.*, though not the lowest nor highest by nearly 2,000*l.*, was accepted.

The material used is the native red sandstone, dressed, in courses, throughout. Lord Sefton supplies stone and sand. The work has been proceeded with, and on the 31st of March his Lordship laid the foundation-stone of the new church, which is dedicated to St. Chad. The proceedings passed off with great *clat*, a feast being provided for all concerned.

The style adopted is Early Thirteenth-Century Gothic, and the building will consist of a nave and aisles, 88 ft. by 51 ft. inside, and a choir with groined ceiling, over which rises a square tower with saddle-back roof 128 ft. high. The vestry and organ-chamber are situated respectively north and south of choir. The chancel or sanctuary extends 20 ft. further east, and is rectangular. It has triple sedilia on the south side, and credence on the north side.

The aisles are narrow, and are divided from the nave by arcades of five bays each, resting on massive pillars, those on the north side being octagonal, and on the south circular, and support a lofty clearstory. At the west end of each aisle are placed north and south porches, to be open in front with seats. The south door will be effective.

It is intended to restore and place at the west end of the nave a very ancient font belonging to the old church, which has had its vicissitudes of fortune, and had been brought back from the vicarage garden, where the basin served the purpose of a flower-*pot*. This is of red sandstone, circular, about 17 in. in diameter, and 16 in. deep, and is rudely carved in panels on its circumference, with figures, one subject being Adam and Eve in Eden, with the serpent and the tree of knowledge. Serpents coiled together form a moulding underneath. The base is formed of a heavy twisted rope moulding in the same material, the relief being lost. Altogether it is an interesting relic of ancient times.

CHEAP RAILWAYS.

I THINK it is high time that we had some reform in our railway system, at least for villages and country places, where the roads are such that the gradients are not more than 1 in 12; I say 1 in 12, because I understand that it has been tried and found to answer; although a deeper gradient than that can be managed with light trains, and adding weight will give power to the engine, or adopting the horizontal wheel and screw friction. Before our forefathers a man could build a house anywhere, and he was at home, because the convenience was nearly as good in one place as another, viz. the common road; but now, unless the hills near to a railway, be nowhere, as the common saying is,—he is out of the world,—and then that cause the country places are neglected, their populations are decreasing, and people are flocking to the railways; also, the land in country places is getting poorer, because there is not sufficient animal and other kinds of manure to maintain the soil, while the towns are getting sicker, and the populations increasing so much, that the sewage and other refuse cannot be carried to the land, so that it is allowed to run into the rivers and pollute them. Our manure running into the sea instead of being used on the land, and the country places are seldom allowed to improve. I do not pretend to say this is a list of things can be stopped, but I think it ought to some extent be checked; at all events, some good can be done to the villages and other important country places. Where the gradients are not more than 1 in 12, instead of making a railway at a cost of some 40,000*l.* per mile, by driving through hill and dale, and cutting up in all sorts of valuable property, levelling and straightening, no matter whatever the cost, a line of rails on the road side, and one

engine would do all the work, both passengers and goods, for short distances; but where the approaches are favourable and practicable, the main-line carriages and trucks could run on the road branches, which I believe could be done at about three or four thousand pounds per mile, less perhaps than the road itself cost; so that there would not be such a large sum to pay for interest upon the first outlay, which is the killing of all railway schemes for country places. I believe if this could be done the net work of railways would be rapidly increased throughout the land; and in a few years we should have railways nearly at as little cost as we now have the roads made, and with the Mont Cenis three-wheel plan, or Mr. Farlie's Bogie engine, curves are no objects of great importance, no matter how sharp they are, so that we could travel on any road, no matter how circuitous, although the straighter and nearer level a road is the better; but the cost of making them so is a consideration; and where the traffic is light there would be no need to run more than ten or fifteen miles an hour, because for small places there is little need, and the speed could be increased as the traffic increased.

Some may urge that it would be dangerous to the horses and passengers on the road. I say, not so; for as to horses there would be very few on the road, the rails would do nearly all the work. Besides, the horses would become so accustomed to the trains that they would take no notice of them, as they now do near all railway trains. I have seen a horse grazing within a few feet of a train when passing, and he never as much as lifted his head from the grass; and as for foot passengers, they would also be fewer, and it is just possible to make it quite secure by fencing the rails off; and I think I could adopt a brake, the plan of which I can produce, with which the guard might stop a train when going at full speed in a very short time, so that on rather long branches, and where there are few passengers, he could stop and take a single passenger anywhere, like the driver of an omnibus does. There would be no levelling nor straightening of the roads where the gradients do not exceed 1 in 12, and the curves do not matter when going at a speed of say ten or fifteen miles an hour. It could be tried on one of the best roads first, and if it answers (and I have no doubt of it; in fact, it cannot fail), it would be very soon tried on another, and then another, and so on, till it had found all roads in England, where practicable: then the villages and country places would have a railway such as would do the work, and such as they could pay for. The great advantage of railways is having the smooth iron rail to run on, instead of the sandy road, where the wheels are always sinking more or less, according to the weight they carry, no matter how hard the road is: so that they are always pulling up an incline, even when the road is level. It is not so much in the steam-engine as the iron rail that we find the advantage of railways, but of course they both work well together. To apply a locomotive engine on the highways without iron rails is, to say the least of it, an uningenious plan, and they who have tried it cannot be possessed of good theory. It is impossible to have proper friction in the sand; and as the wheels are constantly sinking to some extent, the load needs more propelling, and the engine is less powerful to propel it.

There has been a great deal said lately about railways not paying, and a good many schemes have been thrown out of the House of Commons, on the ground that they would not pay, and that there were already more railways than could employ their shareholders; that is simply because they are so expensively made. If a railway or branch line is mooted for a village or country place, they say at once, "Oh, it will not pay;" and there is great difficulty in getting railway companies to make branch lines to villages, except where they see the danger of a competing company making a line, and so taking away their traffic. The branch lines cannot pay on the present expensive system, simply because there is not sufficient traffic in the district; but let a company make a line on the road between villages and towns, and I venture to say that they would find it to pay as well or better than most railways in England. Of course they would have to get an Act of Parliament before they could do so; that is just what I am now seeking to be done in order that the country may get relieved of the dreadful want of iron rails to run wheels on. I imagine it only wants to be seen to be appreciated, and, once begun, I believe it would go along faster than ever the other rail-

ways have done. The great advantage of the iron rails instead of the roads can be seen from the fact that, while the horse is loaded with 30 cwt. or 40 cwt. on an ordinary road, the same horse can draw 30 tons or 40 tons on the rails of the same level; so that to me it seems strange that we have dragged our loads so long on the rough roads, and that we have not adopted the smooth iron rails long ago,—not by horses, but by steam, whereby the transit can be so much facilitated, and time seems now of great importance; besides, the land which it takes to grow corn and other commodities for horses could be adapted to the growth of other things, so that it would have a tendency to make corn, milk, butter, &c., cheaper. Some would say, "Look how you would narrow the road, and then there would not be room left for the horses, carts, &c., on the road." I say there would be far more room left than there is now, in proportion to the work they would have to do; because, suppose the rails took, say, 9 ft. or 10 ft. from the road, there would in ordinary roads still be left about 20 ft., so there would be only one-third of the road taken; but I should think that nine-tenths of the traffic would be taken by the rails. There would be very little more to do than the laying of the sleepers and rails, so that the cost could not be great, and having only one line of rails, which would be quite ample, in nearly all places there would be no fear of collisions. The roads are made, and the surveyors or roadmakers have continually lowered the bills, and raised the valleys, so that a moderate uniform gradient is already secured, and I should think quite hard enough when the sleepers and rails are laid to bear the weight of the locomotive engine, so that the roads need but a very slight application to convert them into railways.

A locomotive engine with its train of carriages would be a clumsy monster to move on the highways without rails, but lay the rails, and it would do its work as well as on any other railway of the same gradient and curvature. There would be no need to apply the Mont Cenis 3-wheel plan, or Mr. Farlie's Bogie engine, except where there are very deep gradients and sharp curves; but where there is a reasonable gradient, say 1 in 30, or 1 in 40, the ordinary fast-wheel system would be the best and safest, and they can take moderately sharp curves, which can be seen on all railways, although curves detract a little from the power of the engine. As I said before, the best roads could be tried first, and on the ordinary fast-wheel plan, which could not fail, but would be a decided success. JOSEPH TAYLOR.

CONDITION OF WATER.

Sir,—Adverting to, and in continuation of, my communication in your issue of the 3rd ult., upon water impurity and other subjects, I trust that some of your correspondents may be induced to give the result of analyses of waters from wells at Terling, in Essex, and of other places in which it has been shown, or may reasonably be inferred, that an epidemic has arisen from the impurity of potable waters due to sewage contamination.

I take it that too much publicity cannot be given to such important sanitary matters as those which treat upon the quality of waters for domestic purposes. I apprehend, that in the purity of the water we drink, and the air we breathe, lies the grand secret of a healthy mortality bill; and when these are deteriorated, how almost universally does it arise each from the same source—sewage contamination, whose constituents are dissolved in the water, and diffused through the air.

And I believe, when the public is aware, and particularly those who are somewhat responsible in local government, that certain fatal results are known to have followed the use of water of a certain quality, that the like may be presumed to occur in usage of similar water, irrespective of locality. And, therefore, on comparing the results of new analyses with the old, a very useful inference may be drawn. I would not wish to be understood as saying that, because certain quantities of organic substances exist in water, such is dangerous, for this as a test is shown to be valueless; nor even when the impurities are known in much greater detail, as ammonia, nitrates, and other products of decomposing matter, as expressed in even the most elaborate analysis; for I conceive it is not these salts, *per se*, which cause disease, but rather that their presence and derivation are

indicative of some latent and subtle power, the nature of which we know not, but whose property is to generate and propagate certain forms of sickness when taken into the system; as we may wish impunity, and without detriment, partake of a chemical preparation of salts equivalent to those in bad and unwholesome water.

I am obliged to Mr. E. T. Chapman for his information in your last number; and, if the matter be appreciated, many of your readers are indebted to him.

I regret there is so much ambiguity in analyses, as I think is admitted by Mr. Chapman; but this one, like all branches of science, being progressive, may soon be improved. And what I more regret is that so little attention seems to be paid by local authorities to the condition of water. W. R.

THE HOLBORN VIADUCT DRAINAGE.

STR.—After all the speeches and lectures that have been delivered, and the reports and treatises that have been written, during the past twenty-five years, on the arrangement, construction, and ventilation of sewers, it is astonishing, at this time of day, to meet with such an ill-designed piece of sewer-engineering as that exhibited in the Holborn Viaduct. In the works of men in prominent stations we naturally look for and generally find genius, superior skill, happy thoughts, and scientific combinations, which we adopt as models to inspire us in planning similar works. But the work referred to, as regards its drainage and ventilating arrangements, cannot be selected for any merits to be copied, but rather for faults to be avoided. As such, therefore, it may safely be used by professors of engineering to lay before their pupils; for knowledge is gained as much by pointing to defects in inferior objects as to beauties in superior ones.

Running along within the foundation of the viaduct there are two canal-like open sewers—one near each side. Into these sewers the large houses proposed to be built along both sides are intended to be drained. Some years ago open sewers were thought to be so prejudicial to health that they were generally covered over or abolished. It may, therefore, be presumed that the sewer authorities of the City cannot have properly considered the drainage arrangements of the viaduct, or they would not have permitted such abominable things as open sewers to be formed within it.

The house-drains are without water-traps near the sewers. The effect of this will be that the gases engendered in the sewers will constantly force a passage up the drains into the houses, and by this means partly ventilate the sewers. It is a well-ascertained fact that this process goes on more or less in almost every house by the present method of sewerage; and, therefore, it is too bad that those who have the care of the sewers should do nothing to remedy the evil, but rather project and execute works which aggravate it.

Alongside each open sewer there is a paved pathway 4 ft. in width, like the towing-path to a canal. As myriads of rats congregate and multiply in the sewers in this locality, these paths will afford them excellent recreative promenades. Here they may gambol at pleasure climb up the walls, and, by numerous openings, disperse through the viaduct and the houses in search of provender.

Above the open sewers there are air spaces or chambers, 7 ft. in width, and 24 ft. in height, running the whole length of the viaduct, minus the cross streets. These chambers are neither more nor less than huge elongated aerogasmeters; for ventilating which, and for carrying off the effluvia from decomposing rat-excreta (large quantities of which will be sure to accumulate along the towing-paths), 9-in. pipes are carried up in the viaduct walls from near the top of the chambers.

The ventilating pipes are intended to be continued upwards in the party walls of the houses. The effect of this will be that the sewer gases will continually escape into the rooms through the joints of the pipes and the brickwork; for practically whatever pains are taken to stop, flush in, and secure the pipe and brick joints, shrinkage and subsidence, and vibration by heavy traffic, will cause fissures and cracks in the pipes and walls; and, consequently, leakage of foul air will take place into the rooms. As these are common occurrences, it surely is not wise to ventilate the sewers in this manner. If by the methods of construction and ventilation adopted

the object was to introduce streams of impure air from the sewers into the houses and rooms, no better plans could hardly be devised for the purpose. For gases, like liquids, insinuate through the smallest, almost imperceptible, chinks and crevices, and even through porous brick walls, to a greater or less amount, according to differences of temperatures; and, therefore, the foul air which will accumulate in the huge sewer-gasometer referred to, will pervade not only every space in the viaduct, but every room in the adjacent houses.

There is an old exploded contrivance consisting of a hinged iron flap fixed in a niche in the foul-air chamber at the bottom of each gully-shoot. As the hinges of this flap corrode (they all do so), the flap will stick fast, let foul air pass through the opening, and become worse than useless. No one should employ such a worthless thing as a flap-trap nowadays. The only commendable thing in the whole drainage arrangements of the viaduct is the water-trap under the gully grating.

Now what should be done to remedy error is this:—1st. Arch over the open sewers. 2nd. Put water-traps at the outlets of the house-drains next the sewers, so that foul air may not flow up the drains into the houses. 3rd. Take away the hinged iron flaps, and continue the gully-drains down into the sewers. 4th. Ventilate the sewers by the gully-shafts by carrying pipes from near the top under the water-trap of the gullies across the subway arches into the ventilating flues from the subways, which flues should by no means be continued upwards in the party walls of the houses as intended, but connected with specially constructed shafts carried up outside the houses; and 5th. Provide receptacles under the gutter channels for the street-sweepings and horse-droppings to be emptied every night.

The foregoing observations are commended to the serious consideration of those concerned, by
COMMON SENSE.

ARCHITECTURAL EDUCATION.

LIVERPOOL ARCHITECTURAL SOCIETY.

At the last meeting of this society, held on Wednesday, 21st ult., the honorary secretary (Mr. H. H. Statham, jun.) read a report that had been drawn up by a special committee of this body in reply to a communication from the honorary secretary of the Architectural Alliance on the subject of the condition of architectural education. The committee reported that the age at which architectural pupils generally left school was about fifteen or sixteen, and the usual term of articles was five years. Not more than forty architects who were known to practise in Liverpool on their own account (or about one-third of the whole number) were believed to have been articled. Perhaps not more than one-half of the students obtaining education with the view of entering the profession had passed through a school of art, including those who attended one of the Government schools in the evenings. Very little systematic instruction for the improvement of pupils appeared to be given, and there was too little opportunity afforded them of making acquaintance with the practical details of their profession by visiting and inspecting buildings in progress of erection, and for which they may have been engaged in making the drawings, the consequence being that the pupil obtained merely what might be termed a "drawing board" idea of architectural designs and construction. The committee were not aware that the study and sketching of existing buildings are especially encouraged by those who have pupils under them, though it had been urged upon the student members, at the meetings of that society, by various members who have from time to time offered prizes for the encouragement of this study among the students. After speaking of the small amount of support that had been given to the special architectural and building classes held some time since in the Queen's College, of the stores of architectural and fine-art work at the Free Public Library, and of the efforts put forward by that society for the benefit of students, the report went on to say that with regard to the improvement of, and addition to, the existing facilities for instruction, the committee were of opinion that much must depend upon the recognition by individual architects of their responsibility towards their articled pupils, and much also upon the industry and desire for improvement among the pupils themselves. The committee, however, believed that

the strongest inducement to the improvement of architectural education would be the establishment of a compulsory examination for those who wished to enter the profession. The committee concluded by saying it was much to be wished also that the use of a good professional library was available, either by the establishment of one national or of several provincial book societies.

The paper for the evening, which was read by Mr. A. Darbyshire, member of the Manchester Architectural Association, was entitled "The Science of Heraldry." The subject was considered with a view to a more extended application of the principles of heraldry to architecture, as an expressive symbolism, as a means of architectural decoration. Mr. Darbyshire reviewed the origin and the objects of heraldry, traced it down to the most modern times, and went at some length into its different sciences, explained the marshalling and cadency of heraldry, and also treated of its different charges, ordinaries, and sub-ordinaries.

THE SINAI EXPLORATIONS.

At the last ordinary meeting of the Royal Geographical Society, at the Royal Institution—Sir Roderick Murchison in the chair—the Rev. F. W. Holland read a paper "On the Recent Explorations in the Peninsula of Sinai." It was the object, he said, of Captains Wilson and Palmer, Messrs. Palmer and Wyatt, and Sergeant Macdonald, to make a trigonometrical survey. Accompanied by Mr. Holland, who acted as guide, and with three picked men of the Royal Engineers, they started from Suez in the middle of November, crossed the Desert, and arrived at Jehel Mousha, near which is the plain supposed to have been the camping ground of the Israelites. They observed many signs of former cultivation, and numerous hermit cells in all parts of the district, besides circles of stones, like the Druidical stone circles, and formed in the same manner. They took careful photographs and drawings of the inscriptions found on many of the stones, 12 of which contained Semitic and Greek characters together. These were found chiefly in the mining districts at Wady, Ajala, and others, and many of them seemed to have Christian signs and marks upon them, thus indicating a comparatively recent origin. However, Mr. Palmer was investigating them fully, and would publish his researches on his return. At Jehel Nakoms Mr. Holland saw the celebrated bell mountain, which consists of a steep bank of sand, 400 ft. high, facing the sea, and the sound, resembling the dull grating of an Æolian harp, is produced by the falling sand, the noise being greatest when the sand is most dry and heated. Not much was discovered to throw light upon the route of the Israelites.

EXPERIMENTS ON LIGHTING.

THE illumination of the Court of the Tuileries by the oxyhydrogen flame playing on a pencil of zircon, or on magnesia covered with zircon, has now continued for four months in a regular manner. Messrs. Tessié de Motay and Marchal, of Metz, whose chemical discoveries, or rather applications, have been very successful (as we have often noticed) in photographic operations on paper, glass, and porcelain, are the gentlemen whom the Emperor allowed to build a small wooden shed in the court of honour of the palace, and carry on practical operations for the "Drummond lights." Now, from temporary installation, the affair is to pass into a permanent one, and a suitable erection is to be provided.

We have examined the system, and watched its progress ever since M. Tessié de Motay and Marchal had revived the oxyhydrogen light for street illumination, by aid of the cheap production of oxygen, which is mixed at the burner with common coal-gas. We must confess that we were disappointed as to the *à giorno* lighting up of the square. The *individual light* of each burner, if we may so call it, is remarkably intense; but it is a mere point, and has not the same diffusive power even as the electric light in its lowest condition. If we recollect rightly, about thirty years ago a Bude light was placed in the centre of the upper yard (court of honour) of Dublin Castle. It formed a ring of light, 2 ft. in diameter, and about 3 in. high. This sole light was enough to illuminate perfectly the whole of the square, for the simple reason that there was *surface* oxyhydrogen intense flame. If the oxyhydrogen Tuileries

appliance had a number of jets placed a foot apart all round at a good height (to be calculated) the lighting might be accomplished with a pleasing result not yet afforded by the ill-conducted experiments we have witnessed. We cannot end this paragraph without recalling to mind a rather curious episode in the Bude lighting. Near Dublin Castle there is a celebrated lantern; and he put up Bude lights in his shop. They attracted the attention of every one. After a short period he took them away: in our asking him why, he replied, "Why, sir, they melted all my hats."

The Drummond, or any magnesium or incan light, may furnish a very intense point, even from an immense distance, but giving no more light than Sirius, &c., for illuminating the earth, unless a reflector be placed behind or a refracting or catadioptric lens in front. Then an intense light is projected forward in a pencil, whose *impinging area* is, however, so limited that the rest of the "scene" is darker than ever. Not so with the Bude light, by a proper disposition of the circular burner, — the speak of a ring-light — and a suitable supply of oxygen regulated according to the carburization of the gas, we can obtain a light fully equal to that of a harvest moon over a large area. As must be adapted for the open air, the question of heat is annulled.

DIOCESAN ARCHITECTS.

In the course of the debate on the Irish church Bill, Mr. Brodick said he had placed an amendment on the paper in order that justice might be done to a very small and deserving body of men, the diocesan architects, who were appointed under the 14th and 15th Victoria, known as Napier's Act. The bishop appointed in each diocese, and their duty was to superintend all the alterations of the glebe-houses, make periodical inspections, to report on the repairs necessary, and to see that those repairs were properly completed. They were, indeed, in useful functionaries, that he wished there were similar ones on this side of the water. There was no provision in the Bill for compensating these officers for the extinction of their employment. He had added the words "or emoluments" after "salaries," because they were paid by definite yearly salaries, but by a commission on the repairs they had superintended. One gentleman, who had filled this office for fifteen years, told him that his professional earnings from this source for the last three or four years had exceeded 100% per annum. These offices would not be continued because, as the glebe houses fell in and were purchased under the Bill, they became the property of the church body, which need not employ diocesan architects unless it chose to do so. He moved, on the 6, line 27, after "benefices," to insert "the amount of yearly salary or emoluments which diocesan architect appointed under the provisions of the Act of the 14th and 15th years of Victoria is entitled to receive."

The Attorney-General for Ireland said that the compensation clauses had been considered with care, and it was found impossible to extend compensation to every case and circumstance. In this particular case, the claims of those officials who called themselves diocesan architects would not be recognized, because there were no such officers. The diocesan architects constituted themselves officers, but there is no such officials known to the law. The amendment was negatived.

The question has been asked in the *Builder* — who now created the diocesan architects in England? and it will have to be answered for these days, with particulars as to what circumstances led to their appointment, and how we use they have made of their position.

ARCHITECTS IN THE COUNTRY.

With the greatest pleasure and thankfulness do I your admirable leader on the "Status of the Architectural Profession in the Provinces," and I trust will not suffer the matter to rest there, but will again an architect ought to be, and the position he ought to be capable of taking in society. I say "capable of" because unfortunately great numbers of architects seem utterly unacquainted with the habits of society, and take more naturally to the habits of a "Dobbs." And this defective education (or, rather, the want of it) is not confined to obscure practitioners; but is frequently more apparent, in professional matters, their designs (?) too frequently display an utter ignorance of all dates and styles; but if they have plenty of inappropriate and recy-

moodings, notchings, and chamfers, will "take" with committees as ignorant of art as themselves. But what can be expected when one is known to have been a joiner, another a cabinet-maker, or, as something superior, has been three years with a surveyor? Can it be wondered at that men of this stamp representing the profession, it is looked down on? Then, again, these gentlemen will, on hearing of a new scheme or other building being required, make drawings on speculation, or send photographs of works executed, and offer to make designs, free of cost, if not approved? Then the underhand practices in competition works are too well known to need any mention here. Such being unfortunately too frequently the case in the country, you may imagine how unpleasant it very frequently is for an architect who has been differently brought up, to hear his profession run down, and to feel at the same time how just in many cases is the condemnation. And this low standard of so many members of the profession is a most serious hindrance to united action, for with men of entirely different associations and ideas, it is impossible to cultivate the friendly feeling that should exist between members of so noble a profession. If the rules of the Institute were more strictly carried out, much good might be done, and good men be got to join it; but now they stand aloof, seeing many of its members guilty of the practice I have referred to.

Pray, then, Mr. Editor, confine your good work, and in so doing educate both architect and public.

A COUNTRY ARCHITECT.

DISPUTED LIABILITY.

On Tuesday an action was brought in the Marylebone County Court, before Sir J. Wilnot, bart., judge, by Mr. Pope, ironmonger, of the Edgware-road, to recover £3, from Mr. Wilkinson, architect, also of the Edgware-road.

Mr. Griffiths, barrister, appeared for the plaintiff; and Mr. Clarke for the defendant.

It appeared that Mr. Wilkinson required some work done by his offices in the Edgware-road, and employed a builder, Mr. Hatton, of Sutton, to do the work. Mr. Hatton owed Mr. Wilkinson a large sum of money, and was to work it out. Mr. Hatton's foreman went over to Mr. Pope's and obtained various articles for the work, to Mr. Pope sued Mr. Wilkinson for the cost of the articles, but he positively swore that he did not order Mr. Hatton, or the foreman to go to Mr. Pope's; in fact, Mr. Hatton swore that he had every requirement for the work at his warehouse, but his man went to Pope's to save himself the trouble of going to the warehouse for the goods.

Mr. Pollard said he did the work in question for Mr. Hatton, and the foreman instructed him to apply to Mr. Pope for what he required, and he did so.

Mr. Griffiths contended, for the plaintiff, that Mr. Wilkinson was aware that Mr. Pope supplied the goods; but his Honour said he entertained quite a different opinion. No doubt the goods were used in the work stated, but he believed that Mr. Wilkinson had no knowledge of it, and could not therefore be in any way liable. He should therefore give judgment for the defendant, with costs.

THE BUILDING TRADES.

THERE is said to be some danger of a general strike of stonemasons throughout the kingdom; and, in order to avert it, a pressing invitation to both masters and men to settle their dispute by arbitration has been signed by Lord Lichfield, Mr. Kettle, Mr. Mandella, Mr. Harrison, Mr. Hughes, Mr. S. Morley, and six of the principal trade secretaries.

At a meeting of the trade-unionists of the metropolis, convened by the London Trades' Council, a resolution was unanimously adopted, approving of the Bill lately introduced by Mr. T. Hughes and Mr. Mandella, as a measure calculated to remedy the grievances which had so long been a source of discontent to the workmen, and had seriously disturbed the relations between employers and employed.

THE TALKED-OF LAW COURTS.

MR. LOVE is quite determined to go on with his scheme, and Mr. Street, Mr. James Ferguson, Mr. Thring, and others, are at work upon it. The report is that Mr. Love intends that the style adopted shall be Italian; while Mr. Lyard goes in for Venetian Gothic, and Mr. Fergusson wants something new; but what that something is we do not happen to know.

On Tuesday last Mr. Lyard said in the House of Commons,—

"that the Government had finally decided to propose to the House a plan for the erection of the new Law Courts on the site mentioned by his right hon. friend the Chancellor of the Exchequer on the 20th ult. The site proposed to be acquired by the Government was that comprised between Somerset House and the Temple, bounded on the South by the Thames Embankment, and on the north by Howard-street and several small alleys and passages connecting that street with the Temple and the College. This site would furnish six acres of building ground. Mr. Street, who was now occupied in adapting the plans which he had already prepared for the Carey-street site to this new site, had informed him that he would be able to erect all the law courts, and every office necessarily dependent thereon, upon these six acres. It was his intention to introduce very shortly, if possible before Wilkesday, a Bill in which, should the House think it to meet it, would enable the Government to proceed without delay to acquire the proposed site, and to commence the erection of the Law Courts upon it. He should be prepared, on the introduction of that Bill, to give a full explanation as to the details of the plan contemplated by the Government, and to point out its great advantages over all other plans hitherto

suggested. At the same time he should be able to give such assurance to the House as would, he hoped, convince them that it might be carried out, including numerous and most convenient approaches, for the sum mentioned by his right hon. friend, viz., 1,200,000, or at a much less cost than any other scheme. He might state to the House that he had received a communication from the Chief Baron of the Exchequer (Sir Fitzroy Kelly), stating that he and all the judges, with one exception, were of opinion that upon every ground as regarded the bench, the bar, the solicitors, the suitors, and the public, the Thames Embankment should be preferred for the site of the Law Courts."

THE NEIGHBOURHOOD OF THE HOLBORN VIADUCT.

SIR,—After reading your account of the Holborn Viaduct in last week's *Builder*, I was, of course, struck with the immense importance of the undertaking and of the benefit conferred on London. Will you allow me to raise my humble voice in stating what I consider should be done in order to make what is already a great boon a still greater one? I see by the papers that about two acres of land formerly used as the playground of the Charterhouse School have been sold. Why not continue Charterhouse-street through Charterhouse-square to Old-street? This could be done now without pulling down a single house, and compensation necessarily would be of a trifling nature. By reference to an Ordnance map of that locality you will, I am sure, see the advisability of such a scheme.

W. GIBBS.

PROVINCIAL EXHIBITIONS.

The Devonport Exhibition.—An exhibition of arts, sciences, and manufactures will be held at the Devonport Mechanics' Institution in July or August next. The exhibition will be directly in connexion with the Institute, the secretaries and committees of which are now organizing it. Its professed object is,—

"To afford to artisans, students, and the inhabitants generally of the West of England, an opportunity of extending their knowledge of the application of science to those particular branches of art and manufacture, on the full development of which so much of social welfare mainly depends."

Another object is to benefit the funds of the institution. The last realised a considerable sum. Committees have been at work for several months past, and many meetings have been held. The exhibition will be held in the halls and rooms of the institution, and will be open for several days. A large number of prizes to lend articles has been received. A prize list has been published. The prizes are divided into thirteen classes, which include not merely works applying more directly to the arts and sciences, but also articles of every-day mechanical work and industry.

The South Staffordshire Exhibition.—The articles for exhibition are coming in, and in a short time the new main building will have all it needs to develop its outlines. The annex for the exhibition of machinery in motion is nearly completed. Mr. Lowe, the florist, has planted the grounds, which he has relaid, with home and foreign trees, firs, pines, and shrubs. Geometrical and other beds are prepared for flowers. Ornamental gates, hurdles, fencing, and garden iron furniture of all sorts are being placed upon the grounds. Mr. Lowe has provided a croquet-ground in a shady corner of the garden. The opening is fixed for Tuesday, May 11th.

CHURCH-BUILDING NEWS.

Halifax.—The corner stone of the chancel of the Church of St. Mary, situate in Rhodes-street, Halifax, has been laid. The church is the gift of Mr. Michael Stocks, of Upper Shildon Hall, near Halifax; and the stone was laid by his son, Major Stocks, of Latheron Wheel, Caisness, in place of his wife, who was to have performed the ceremony. The church will be built from designs by Messrs. Mallinson & Barber, architects, Halifax and Brighouse. The style is Geometrical Decorated. The principal entrance to the building is through the tower at the west end of the north aisle. There is also a doorway placed in a shallow porch in the second bay of the south aisle. The interior arrangement will show a nave, 47 ft. to the ridge, and the clearest pierced with spherical triangular tracery windows. The nave, which is 21 ft. 6 in. wide, is divided from the north and south aisles respectively by arcades of five or six arches. The centre aisle of the nave is 5 ft. wide, and the aisles 3 ft. wide, these latter being placed against the outer walls. A stone font, with a canopied

oak cover, will be placed at the western end of the central aisle or passage. The chancel is 34 ft. long and 20 ft. wide, with one bay on the north and south sides, screened off and appropriated to an organ-chamber and vestry. The chancel arch, the large five-light east window, and the Caen-stone reredos are features where the most decoration will be bestowed. The nave and aisles will have plain and open deal seats, and in the chancel will be two rows of oak stalls, the ends of seats and stalls to be filled with pattern panels in low relief. The roofs of the nave and aisles will be open-timbered, with moulded ribs and braces. The chancel roof will be constructed with coupled rafters, having carved moulded ribs, with a boarded ceiling at the back. Advantage is taken of the somewhat rapid fall of the site from west to east, in forming an under vestry the full width of the chancel, which may be used as a robing-room for choristers. The estimated cost of the building, without extras, is 5,500*l.* The contractors for the masonry are Messrs. J. & T. Cordingley; for joiner's work, Mr. J. Bedford; for plastering, &c., Mr. A. Bancroft; and for plumbing, Messrs. S. Fifth & Sons—all of Halifax. The works were commenced on the 12th of May, 1868, and have progressed to the top of the chancel and aisle walls.

Chichester.—St. Pancras Church has been reopened after enlargement. The church abuts against dwelling-houses at the east end, and is limited on the south and west by the street, and the architect (Mr. Gordon M. Hills, of London) found that the only way in which the enlargement could be carried out was by adding an aisle on the side. This has accordingly been done, the contractor for the works being Mr. J. Marshall, of Chichester, known in connexion with the restoration of the cathedral; and the result is additional accommodation for 125 persons. There were formerly 200 sittings, now there are 325, and the old seats have been replaced by benches of stained deal. The pulpit also is new, and is of an octagon form with open tracery on each side. The church has also been improved by the erection of a stone instead of, as before, a plaster arch, with the addition of shafts of polished Ippleden marble, the gift in part of Mr. Henry Halstead and Mr. Charles Townsend Halstead. The gaswork has been fixed free of cost to the parishioners by Mr. Robert Curch, of the Chichester gasworks, by whom the fittings and arrangements were also designed and presented. There are seven standards, each carrying a small brass corona.

Wolverhampton.—The new district church of St. Jude's, erected near Newbridge, on the right-hand side of the Patenhal-road, Wolverhampton, has been consecrated. The site for the church and parsonage, together with 2,000*l.* towards the endowment fund, was the gift of Miss Stokes. The building has been erected by Mr. Nelson, of Dudley, from the designs of Mr. Bidlake, of Wolverhampton, at a cost of 4,500*l.* The plan is cruciform. The nave is 92 ft. 6 in. long by 32 ft. 4 in. wide; the aisles 13 ft. 6 in. wide, and the chancel 35 ft. long by 23 ft. wide. On the north side of the chancel is the organ chamber, and on the south side the vestry. The tower is at the west end of the south aisle, and the entrances to the church are under the tower and a porch in the north aisle. The seating is divided into four bays by central and aisle passages. The shafts supporting the nave arches and clearstory wall are of Aberdeen granite polished, as are also the shafts to the chancel arch, the caps being carved. The style of architecture is Geometric Decorated, and the materials used are Cosmell stone for the walling, laid in level courses, rock-faced, with dressings of light-coloured stone. The timber work is deal, stained and varnished. The glazing is with cathedral tinted glass in lead lights of geometric design. The contractor for the heating apparatus was Mr. Blakemore, of Wednesbury; and for the gasfittings, Mr. Thomson, of Birmingham. The carving, which is executed in the conventional style, is by Mr. Forsyth, of Worcester. The architect has personally superintended the carrying out of the works. The edifice seats 812 adult persons.

Little Marske (Herefordshire).—The parish church of Little Marske is to be entirely rebuilt this summer, from plans furnished by Mr. Huggall, of Oxford. Messrs. Wall & Hook, of Brimscombe, are the builders. Earl Somers is lord of the manor, and one of his daughters is to lay the foundation-stone.

Emberton (Ducks).—The parish church of All Saints' has been re-opened for divine worship.

The church, which is of the Late Decorated period, with tower and spire of the Perpendicular character, has been new roofed, the clearstory walls, which were 16 in. out of the line, being put in their proper position. The north porch has been raised, and a new south porch, formerly the site of the vestry, has been erected; while the south aisle has been rebuilt, and new windows placed throughout the church, and stone mullions substituted for wood. The old fittings also have been replaced, the entire cost hitherto being about 1,700*l.* The new vestry which it is contemplated to erect will bring the total to 2,000*l.* The work has been carried out by Messrs. Winn & Foster, builders, Kempston, near Bedford. Mr. Bland, of Birmingham, was the architect employed.

Church Gresley.—At a numerous meeting in the vestry, it has been unanimously decided that earnest efforts at once be made to restore and enlarge the parish church. Mr. Blomfield, architect, has been named to provide plans and specifications.

DISSENTING CHURCH-BUILDING NEWS.

Bocking.—The Congregational chapel here has been reopened. The works have been carried out by Mr. J. Brown, builder, of Bocking, from the designs and under the direction of Mr. C. Pertwee, architect, Chelmsford. The exterior alterations are complete. The interior improvements comprise new lantern over the dome, new windows, floors, galleries, and plastering throughout, as well as reseating the entire area. The plain surface of the dome has been divided into panels by the introduction of ribs, and an enriched cornice is carried round the base, as also round the main walls of the building. The blank wall at the end has been relieved by a large circular-headed recess, enriched with stenciling, immediately in front of which stands the pulpit on a raised semi-circular dais or platform. In place of the double galleries a single gallery has been constructed round three sides of the building, with light open front, and in the centre, opposite the pulpit, stands the organ. The new lantern light now surmounts the roof, and terminates the dome, the improvement of which is considered one of the chief features in the alteration. In place of the old high-backed pews, under the galleries and in the body of the chapel are new low benches of plain varnished wood arranged in a radiatory manner to give the congregation a front view of the minister from every part of the chapel. The pulpit and deacons' platform are approached on either side by stairs; the front is of open panelling, with crimson cloth lining. The decorating of the recess was done by Mr. Garrood, of Chelmsford. The entrance-lobbies are paved with red and black tiles, and the benches have been cushioned in crimson by Messrs. J. E. Andrew, and A. Adkins, of Brain-tree and Bocking. The building is warmed by means of hot-water apparatus. Lighting is provided for by Mr. Crittall by twelve suspended star gas-burners, each star containing eight jets, and about a dozen smaller burners, of a similar description, to light the body of the chapel and under the gallery. The organ has a frontage in the Italian style, the diapering having been executed by Mr. Garrood, of Chelmsford, in gold and colour.

SCHOOL-BUILDING NEWS.

Northampton.—The new mission schools in St. Giles's parish have been opened. The building is of red brick, from a design by Mr. M. H. Holding, and forms two rooms, each about 35 ft. by 20 ft. The side walls are 14 ft. high to wall-plate, and it is lighted by circular-headed windows. In the south wall is an arcade of four arches to hold the Commandments, &c., which are being illuminated by a lady of the parish. The surface of the walls is relieved by string courses of coloured bricks and tiles. The roof is of a tolerably high pitch, and open to the ridge; the main timbers stained and varnished. The two rooms can be thrown into one by sliding doors. The north gable of the building, which fronts Dyehurch-lane, is also of red brick, with black bricks over the door and window arches; Bath stone is used over the doorway in glazed trefoil openings. The total cost is about 6,000*l.*, of which nearly 600*l.* have been raised.

Bowling (Bradford).—New schools have lately been erected at the back of the Congregational Chapel, in Essex-street, Bowling, with a frontage towards Frances-street. Hitherto the schools

have occupied the back portion of the chapel, which was originally designed with a view to its ultimate extension in the manner which has been carried out, and an additional length of 25 ft. has been obtained, affording 120 extra sittings on the ground-floor, and 70 by the extension of the side galleries. A platform for the organ is placed behind the pulpit, and doorways communicating with the vestries and schools have been placed on each side. The interior of the chapel has been redecorated from the designs of the architects. The new building has separate entrances for boys and girls, and contains, on the ground-floor, vestries for the minister and deacons, infant school-room, large class-room, ladies'-room, and a kitchen with boiler, &c., and a hoist to the room above. The entire area of the first-floor is devoted to the boys' and girls' school-room, is 78 ft. long and 31 ft. wide, and is provided with portable screens dividing it into five class-rooms. This room has an open roof. The building is heated by hot water. The schools have been designed to harmonise in style with the chapel. The windows and doors have semicircular heads, and are doubly recessed, and the centre gable is surmounted by a bell-turret. Messrs. Andrews, Son, & Peppor, of Bradford, were the architects.

PROVINCIAL NEWS.

Ricknansworth.—A company is being formed with a capital of 1,250*l.*, in 5*l.* shares, for the formation of a town-hall here. Shares to the amount of 1,030*l.* have already been subscribed.

Brighton.—The new county-court offices are progressing towards completion. They are situate in Church-street, and are being erected on plans designed by Mr. Thomas Charles Sorby, architect and county-court surveyor. The edifice has a frontage into Church-street, measuring 60 ft., with an elevation of about 30 ft., and a depth of 170 ft. It is Gothic in style, and built with red bricks, the "dressings" being of Bath stone, and it is roofed with Taylor's patent tiles. The principal entrance—the "Judge's Entrance"—is in Church-street, the stone work of it being carved. The public offices of the new court are in the south-west corner of the building, and are in size 31 ft. 6 in. by 20 ft., with waiting-rooms for the public measuring 35 ft. by 15 ft.; and these lead into the court, which is a distinct building—35 ft. wide, 41 ft. long, with an open roof, to the ridge of which is 40 ft. The roof timbers are stained, resting on carved stone corbels; and the court is lighted with ten "lead lights," furnished with Moore's patent Louvre ventilators. Adjoining the waiting-rooms to the north is the registrar's court, with a jurors' retiring-room at the back of it. On the east of the public offices is a private room for the registrar; another for the judge; also one for the high sheriff; together with a "strong room" for the safe custody of books and documents. The passages and waiting-rooms are floored with red and buff Staffordshire tiles, and the flooring of the court is covered with kamptulicon. The above-mentioned departments are all on the ground-floor, and the first floor—the building is only two stories in height—is devoted to apartments for the accommodation of the office-keeper. The work is being carried out by Mr. John Chappell, of Steyning and Brighton, under the superintendence of Mr. John Sharman. The hoarding surrounding the building has been removed, leaving a wall enclosing the different fronts of the new county court.

FROM SCOTLAND.

Leith.—During the past year a considerable number of new buildings have been erected here, and the state of the building trade bears a favourable comparison with recent years. Fears have been entertained that too many houses have been erected, and that difficulty will be experienced in getting them let, but it is not yet certain, according to our authority, the *Scotsman*, that the number will be beyond what will be needed. Within the year 500 dwelling-houses have been built, some of which are already occupied. More than 350 have been erected for the working-classes; thirty-seven are let, or are expected to be let, at rents varying from 20*l.* to 50*l.*, and the annual rents of the remainder are expected to be from 12*l.* to 20*l.* The houses are situated in healthy localities in the suburban parts of the burgh. No manufactories, lofts, or warehouses have been built during the year. The new industrial school in the Lochend-road is now rapidly nearing completion. Almost all the

houses have been built by speculators, who prefer selling to letting. The small houses, particularly if they have gardens or bleaching-grounds attached, meet with ready purchasers. It is expected that the building trade will continue brisk for some time to come. Large lots of ground have been fenced at Hermitage, Easterwood, Lochend-road, Leith-walk, North Leith, Bonnington, &c., and a more extensive house speculation will be soon commenced at Wardie.

STAINED GLASS.

Trinity Church, Tewkesbury.—Mrs. Laing, of the Mythe, has just had an ornamental window placed in this church to the memory of a youthful son who died many years ago. It depicts the incident of Christ blessing little children, and forms an ornament to the chancel, which was lately been improved. It is the work of Messrs. Heaton & Co., of London. In addition to this, Mrs. Laing is also causing the other windows of the church, seven in number, which were of the usual common glass, to be refitted with thick tinted glass, with coloured borders.

Miscellaneous.

The Royal Society.—On the 24th ultimo, Mrs. Sabine, the president of the Royal Society, received the fellows of that body and numerous visitors belonging to the different learned institutions of the United Kingdom, at the apartments of the society, in Burlington House, Piccadilly. The reception-rooms belonging to the Linnean Library, the Linnean meeting-room, the saloon, the council-room, and other interesting apartments were thrown open, and many inventions connected with science, besides many attractive works of art, were displayed. At the reception-room were displayed some drawings of Leonardo da Vinci, Luni, and some unknown Italian masters.

Destruction of All Saints' Church, Surrey-square, by Fire.—On Tuesday morning All Saints' Church, situated in Surrey-square, 1 Kent-road, was discovered to be on fire. An edifice was erected about four years since, of modern construction, with no tower, spire, or galleries; the organ being erected in recess of the northern aisle, next to the communion. At first an impression prevailed in the district that the church must have been wilfully set fire to; but, from careful inquiry, there seems to be no foundation for such conclusion. It was evident the fire originated in the vicinity of the organ, for it was in that part the flames were first observed. In about an hour the church was completely consumed, only the wall and stone pillars in the aisle standing. It was insured in the Royal Insurance Fire-office, but only to one-half of the expense of its erection.

The Sheffield Architectural Society.—Members of this society visited Worsnop on Saturday, this being the opening excursion for the season. The party first directed their attention to the new church now in course of erection, which bears the stamp of most modern churches, being arranged to accommodate a large number of people at a small cost. The lower only, which is partly built, is an exception. Proceeding thence to the Gate-house, the members assembled in the old school-room, when the President read a paper on the history of the Gate-house and Abbey Church. A cordial vote of thanks was proposed by the Rev. Mr. Lamh, seconded by Mr. Arnold Ward. After the service, the Abbey Church was examined with much interest. The Lion Hotel was the ultimate object.

The Drainage of Brighton into the Sea.—A long debate on this question has taken place in the town council. Mr. Alderman [name] moved—

That a special committee, consisting of ten members, be appointed to inquire into the present system of drainage to be seen in front of the town, and as to the practicability of diverting the drainage therefrom. That the committee be also authorized to inquire, by personal investigation, if necessary, into any systems adopted in other places for the utilization of sewage. That the committee have power to call in professional assistance for their investigations to aid them in making their report.

Mr. Lamb moved as an amendment, "That the appointment of the committee is inexpedient." The council divided, with the following result:—For Mr. Lamb's amendment, 26; against the amendment, 14.

Opening of the New Smithfield at Hanley.—The new cattle market at Hanley, provided by the town council, at a cost of about 3,000*l.*, has been opened. It contains an area of 8,000 square yards. The principal frontage, in Bethesda-street, will be about 100 yards in length. The accommodation to be provided, in the first instance, will be for 220 head of cattle, 1,620 sheep, and 100 pigs. The pens are formed of iron pillars with sockets, in which rails of wood are inserted. There will also be a "champering" ground for horses, 10 yards in width, along the west boundary wall. Some 2,000 square yards of land will remain within the inclosed area of the market, even after pens to the above extent have been all fixed, on which additional pens will be erected as they are required; but that place is levelled and sewered, and the foundations for the necessary pavement and pens are laid. When the whole area is thus covered, there will be ample accommodation for 380 cattle, and 3,600 sheep and pigs. The market will be surrounded on three sides by a boundary wall, and a toll-collector's office, a refreshment-room, and a settling-room will be provided. The new Smithfield has been designed and laid out by Mr. T. Hewson, the borough surveyor. This market is now the only institution of the kind for the supply of the North Staffordshire district.

The Valuation of Property (Metropolis) Bill.—A report has been presented to the Metropolitan Board of Works by their Parliamentary committee, stating the result of their interview with Mr. Goschen on the subject of the bill of the Poor-law Board, to provide for uniformity in the assessment of rateable property in the metropolis. The report stated that the committee had pointed out that the assessment committees should be appointed by the vestries, not by the guardian boards; that the appellate jurisdiction should be vested as at present, in the magistrates in Quarter Sessions, not by committees appointed by the Poor-law Board; that appeals as between parishes should be decided by a court composed of the representatives of each Quarter Sessions who had jurisdiction over the metropolitan area; and, lastly, that the operation of the bill should be limited to local taxation. It was admitted by Mr. Goschen, that with regard to the first objection, there was a good deal of force in it, and the proposal should be reconsidered. As to a Valuation Board, since it appeared that the vestries were opposed to it, the clause would probably be omitted. The suggestion as to the appellate jurisdiction Mr. Goschen was disposed "favorably to consider," and the plan proposed with regard to appeals as between parishes might be carried out. With reference to the last point urged, Mr. Goschen held out little hope of its being adopted. The report was unanimously adopted.

The Quarry Catastrophe in Cornwall.—It is now ascertained that no less than sixteen persons have lost their lives through the shocking accident which occurred on Wednesday before last at the Delahole Slate Quarries. These persons include thirteen men, two boys, and one woman. One man is reported to be lying through the effects of the injuries which he received. Four bodies have not as yet been recovered. It is estimated that the quantity of rock which fell the whole distance of 250 ft. amounted to no less than 150 tons. An inquest on the bodies was opened on Friday, the 23rd, before the county coroner, but after taking some formal evidence the inquiry was adjourned until Monday next. As might be imagined, the catastrophe has created great excitement throughout the district, and although 400 hands are employed in the quarry no work has been done since the accident.

The Public Buildings of the City.—Pursuant to an order of the Court of Common Council the City architect has presented an estimate, as far as practicable, of the probable amount of repairs that may be absolutely requisite for the ensuing half-year for the public buildings of the City. The amount is 7,650*l.*, as follows:—Mansion House, 1,000*l.*; Guildhall offices and courts, 500*l.*; markets, 200*l.*; police-stations, 150*l.*; Coal Exchange, 50*l.*; schools and almshouses, 350*l.*; Corporation buildings, 100*l.*; prisons, 200*l.*; bridges, 5,000*l.*; and other public buildings, 100*l.*—City Press.

Mr. James Pennethorne.—We hear with some surprise that Mr. Pennethorne's connexion with her Majesty's Office of Works has been terminated.

Kent Archaeological Society.—The council of this society held their Spring meeting on the 16th ult., at Chillington House, under the presidency of Earl Amherst. The meeting was held for the first time in the society's new apartments. It was resolved that the general meeting of the society should be held this summer at Malling, which is the centre of a neighborhood rich in architecture and antiquities, including Malling Abbey. Fifteen new members were elected, among whom were the Archbishop of Canterbury. The seventh volume of the Transactions of the society has just issued from the press, and contains Professor Willis's work on the Monastic Buildings of Canterbury Cathedral.

Straw Houses.—An English inventor has built some houses on a novel principle at New Hampton. The houses, says the *Scientific American*, are of a cheap order, designed for laborers. He compresses straw into slabs, soaks them in a solution of flint, to render them fire-proof, coats the two sides with a kind of cement or concrete; and of these slabs the cottages are built. By ingenious contrivances, the quantity of joiners' work is much reduced, and the chimney is so constructed as to secure warmth with the smallest consumption of fuel, and at the same time to heat a drying-closet. The cost of a single cottage of this description, combining "all the requirements of health, decency, and comfort," is 85*l.*

The Dore Gallery, New Bond Street.—In addition to various other new works by M. Gustave Doré, now in this gallery, there is a picture of the composer Rossini after death, from sketches made at the time. Though a painful work, it is deeply interesting, and least painful to those who knew the great master and his custom of closing his eyes even at the head of his own table, and when contributing to the liveliest conversation. Many difficulties are overcome in this painting,—the prevalence of white, for example,—and the result is a startling portrait, broad, truthful, and interesting to all Europe.

The Reredos in St. Edward's Church, Cambridge.—In a letter from King's College, signed W. R. Churton, in the local *Chronicle*, are the following remarks on this subject:—

"As one of the members of the University who took a leading part in the erection of the east window and reredos in St. Edward's Church as a testimonial to the labours of the present Dean of Ely during his incumbency of that parish, I request permission to protest against the manner in which this reredos has been defaced and stripped of its coloured decoration since the beginning of the present year. The design was furnished by the late Mr. P. Strange, and executed at some considerable cost by Messrs. Morris & Co., of Queen's-square, London. It was worked on good clunch, that shows no sign of decay; and if its falling were the reason of taking it off, it would have been quite time enough to have done that when they were prepared to put on something else."

Rejection and Dejection.—Bitter lamentations already reach us from various quarters, branching from Burlington House. We hear of established artists whose works have been wholly rejected, their art not meeting the views of the hangers. Surely, however, this is scarcely the right thing? If an artist has attained a certain position, and is pursuing creditably his profession, it seems hardly fair to cut him short for the year, because one of the hangers says this is not the sort of art that ought to be encouraged. However, we speak at present with great reserve, and hope the statements made to us may have been overdrawn.

A Concrete Pavement, which is called the "Patent Adamantean Concrete Pavement," is being laid in Great Carter-lane, near St. Paul's Cathedral, for the corporation of the City of London. The patentee claims for it that the mud, dust, noise, and wear of vehicles, are reduced to the minimum; that the heat or cold of this country will not affect the material; that it is non-absorbent, so that there will be no tendency for water or other impurities to enter from above, and the pavement can be washed down as easily as the deck of a ship. Time will show.

Llandaff.—The last stone of the new spire erected at Llandaff Cathedral has been fixed by the Bishop of the diocese. The spire is 180 ft. high. The last stone was hauled up by a winch, which the right rev. prelate turned "in a workmanlike manner." After having set the stone, his lordship made an address, in which he gave a lucid history of the restoration of the cathedral from its commencement.

Self-acting Photographic Apparatus.—An invention new to English operators is described in the last number of the "Illustrated Photographer." It is called the "Ophthalmos," and is in reality a camera provided with mechanical contrivances for automatically uncovering and covering the lens, and exposing the plate. It is sent up attached to a small balloon without an operator, and at any required height takes a picture of the surface of the earth beneath it with all the bearings of the compass accurately marked. It has often occurred to the writer of this that a time might come when a system of self-recording photography (microscopic perhaps) might "take note" of the progress of events, such as a battle, or of a spectacle of any kind, such as an eclipse, in a series of successive photographs at brief intervals, showing its whole progress from beginning to end; or the whole series of events in a banking house, with portraits of every one who entered, and of all their movements,—or in a ceremonial such as a coronation, a marriage, &c. But when this idea shall have been realized, we suppose we must not dare to say that we suggested it. The same satyric grin which now meets the suggestion, would then meet our claim to it!

The Shaw Memorial, Castlewellan.—At a meeting of the tenantry of the Earl Annesley's estates, which was convened for the purpose of taking the necessary steps to erect a memorial drinking-fountain in memory of the late Mr. George Shaw, J.P., who was for many years agent, a committee was formed to obtain plans, &c., in competition, and a premium was offered for the best design. Nine designs were sent in, and of these the committee have adopted the one prepared by Mr. Chappell, architect, Newtownards, and awarded him the prize. The memorial is to be executed in the Castlewellan granite.

Tewkesbury.—The waterworks have been begun. The contractors are—for engines, Rottledge & Ommaney, Salford; for service reservoir, Butt & Co., Kingsholm Foundry, Gloucester; for cast-iron pipes, T. Spittle, Newport; and for buildings, water-tower, and general works, T. Dixon, Worcester. It is intended to begin supplying the borough by Christmas.

Value of Property in Regent-street.—The old-established premises known as Newman's-yard, covering about a quarter of an acre, and held on Crown leases for fifty-four years unexpired at about 200l. per annum, have been sold by auction by Messrs. E. & H. Lamley, after a brisk competition, at the sum of 14,200l.

"Specifying" in Criminal Proceedings.—At the Birmingham sessions, the other day, two thieves escaped punishment because the recorder ruled that articles described in the indictment as "deal boards fixed to a building" should have been described as "woodwork belonging to a building."

Prizes for Drawing.—The Court of the Worshipful Company of Coachmakers have resolved to place one silver and one bronze medal of the Company at the disposal of the Council of the Society of Arts, to be presented to the candidates (actually engaged in the trade of coach-building) who shall pass the best examination in "Free-hand Drawing" and "Practical Mechanics."

Aluminum a Bell-metal.—A Belgian manufacturer has just had a bell cast of aluminum, and, we are informed, with very good results. It is, of course, extremely light, so that though large, it can be easily tolled. Its tone is said to be loud, and of excellent pitch.—*Scientific Opinion.*

London Over the Water.—It was stated by a member of the Lambeth vestry, on Thursday, the 22nd ult., that the sanitary condition of one portion of the parish in the neighbourhood of the vestry-hall was so bad that a brewer's drayman had refused to deliver beer there because he would not face the stench.

A Wonderful Feat in High Art for Lowe. (Subject for a Grand Cartoon in the Salle des Fes Festivals of the New Law Courts).—As a pendant to Lawson carrying off the Gates of "Caza"—Bob Lowe with Inigo Jones's front upon his back!—*Punch.*

Architectural Exhibition Society.—The opening *conversations* will be held in the Conduit-street Galleries, on Tuesday, the 4th inst.

TENDERS.

For alterations at Colonel Morrison's House, Cleygate, Escher. Mr. J. H. Rowley, architect:—	
Erast	£660 0 0
Crabb & Vaughan	646 0 0
Cullingham	625 10 0
Sharrington & Cole	597 10 0
Kilby	622 0 0
Shepherd	529 0 0
Snowdon	495 0 0
Cook	470 0 0
For the erection of the Martyrs' Memorial Church, St. John's-street, Clerkenwell, Mr. E. B. Lamb, architect:—	
Howard	£9,392 0 0
Brown & Robinson	8,729 0 0
Cooper & Cullum	8,168 0 0
Myers & Son	8,069 0 0
Jackson & Shaw	7,926 0 0
Carter & Son	7,890 0 0
Wright	7,735 0 0
Hill & Son	7,490 0 0
For the erection of a brewery at Maidenhead, for Mr. J. Fuller, Mr. C. Cooper, architect:—	
Woodbridge	£2,395 0 0
Price	2,299 0 0
Silver & Son (accepted)	2,267 0 0
For six almshouses for the widows of clergymen, Canterbury. Mr. John Green Hall, architect:—	
Gaskin & Oodden (accepted)	£2,160 0 0
For additions to Barton Mill, Canterbury (exclusive of boilers, engine, &c.). Mr. John Green Hall, architect:—	
Sollitt (accepted)	£897 0 0
For second portion of St. Paul's Schools, Stratford, Mr. Henry Ough, architect:—	
Rivet (accepted)	£1,350 0 0
For residence at Stratford-green, for Mr. F. Hildrey, Mr. Harcus A. Alexander, architect. Quantities not supplied:—	
Pavitt	£1,495 0 0
Waterer	1,475 0 0
Rivet (accepted)	1,471 0 0
For new workhouse at Penkridge. Mr. E. Holmes, architect:—	
Holt	£9,269 0 0
Debney	8,290 0 0
Cobb	8,200 0 0
Yates	7,799 0 0
Gough	7,684 0 0
Bell & Son	7,645 0 0
Batchell	7,625 0 0
Hunter & Bennett	7,589 0 0
Wilkes	7,536 0 0
Horseman	7,485 0 0
Lowat	7,380 0 0
Reception	7,260 0 0
Hilton	7,250 0 0
Matthews	7,232 0 0

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

IMPROVED MACHINERY, combined with STEAM POWER, is employed by J. W. BENSON in the Manufacture of Church, Tower, Stable, and Tell-tale Clocks, Sun and Wind Dials, Perpetual Calendars, and every description of Clock and Watch Work. Architects, Builders, Committees, &c. can be promptly supplied with estimates. A descriptive Pamphlet on Church and other Clocks, post-free, 2d. J. W. BENSON, by special appointment, Watch and Clock Maker to His Royal Highness the Prince of Wales, Stann Factory for Clocks and Watches, 53 and 60, Ludgate-hill; Showrooms, 25, Old Bond-street, London.

New ready, Super-rural Quartz, 3s. 6d. PART ONE OF OUR RURAL CHURCHES: their Histories, Architectures, and Antiquities. By SIDNEY COLENER. With Coloured Illustrations from Paintings by the Editor. This significant work will comprise illustrations of some of those of the Churches of our country that are most interesting and beautiful, each illustration being accompanied by a full descriptive account of the History, Architecture, and Antiquities of the Church, together with information on subjects of interest to its neighbourhood. The Book will be issued in Monthly Parts, each part containing Three full-sized Coloured Plates, executed with the utmost care in the best style of art. GROOMBRIDGE & SON, 5, Paternoster-row, London.

CRANSTON'S PATENT GLASS BUILDING FOR HORTICULTURE. Just published, free for 30 stamps, 3rd Edition.

DESCRIPTIVE BOOK, splendidly illustrated, and containing a full and complete account of the various kinds of Glass Buildings, by the Author and Patentee, JAMES CRANSTON, Architect, 1, Temple-row West, Birmingham. H. J. G. WILKES, Manchester.

In 8vo, with Coloured Diagrams, price 2s. 6d.

SOUND AND COLOUR, their Relations. By JOHN DENIS MACDONALD, M.D. F.R.S. Staff-Surgeon, R.N. London: LONGMANS & CO. 1869.

The Builder.

VOL. XXVII.—No. 1370.

The Exhibition of
Architectural Works
at the Royal Academy.

REAT additional interest belongs this year to the Annual Exhibition of Works of Art by the Royal Academy, on account of its change of site. The sense of freshness, order, light, and breathing space experienced on entering the new galleries next Burlington House, contrasted with recollections of a crowded day at Trafalgar Square, creates an immediate impression in favour of the new structure. The galleries, as our readers are aware, are in the rear of this fine old mansion, and are approached by a long temporary covered way from Piccadilly,

through the hall of the old house. Mr. Sydney Smirke's work is thus agreeably linked to the associations belonging to Lord Burlington.

The new galleries, of which we have already published the plan,* are in the form of a parallelogram, in which are three suites, ranged side by side,—two of five galleries each on the outer sides, and one of four in the centre, in which latter we find a central octagonal hall with ten salles thus arranged round it: a vestibule, a sculpture gallery, and a lecture-hall, forming three arms of the cross shape of the central suites, making fourteen galleries in all. Thus the new vestibule gives access to the octagonal hall devoted to sculpture, beyond which, and in a line with it, is the principal sculpture-room; and opening out of the hall, vestibule and sculpture-room to the right and left, are the picture galleries. The octagon also gives access to the lecture-hall, in which are hung the architectural drawings, engravings, miniatures, and a collection of character sketches made in Egypt by Mr. Goodall.

We must say a few additional words of the decorations. There are niches in the architrave of the octagon, in each of which is a bust of a painter; and on the bold cornice is written in mosaic letters, one line on each side of the eight sides, from one of Spenser's hymns:—

"The Hearts of men which
Fondly here admire
Fair-seeming shows, may
Lift themselves up higher,
And learn to love, with
Zealous humble duty,
The Eternal Fountain of
That Heavenly Beauty."

The walls generally are covered with a reddish chocolate paper, with leafy ornament of a similar tone, and are finished with a dado of walnut, with an ebony cornice. The ceilings are covered, and both coverings and spandrels glisten with gold, relieved by buff and chocolate and green lines. The architrave and pilasters of the semi-circular arcades leading from the centre hall,

as well as those of the most northern suite of galleries, are of coloured marbles, while the openings of communication between each of the rest of the surrounding suites are square-headed, and the architraves, pilasters, and reveals are of walnut. The largest room, or *Sala Regia*, in which the best pictures by the academicians and associates are hung, has a noble ceiling of the shape Italians call a "schifo," lighted by central skylights by day, and star burners suspended by gilt rods by night, the whole being richly ornamented, and then gilt upon a buff ground, relieved by lines of neutral colours. The floors are of polished marquetrie. The galleries are furnished with comfortable sofas, adding to the ease with which this year's display of art works can be examined.

The display in the architectural department is certainly unexpectedly small, and, as hitherto in the vacated halls in Trafalgar-square, architecture has not a department to itself, nor is it so worthily represented as it should be. We learn that part of the architectural drawings were hung in one of the galleries, planned by Mr. Smirke especially for them, but they were subsequently taken down to make room for the works of painters, and were then lessened in number, and, as they now are, suspended in two divisions on the walls of the lecture-room instead. And here, so few of the architectural designs being accepted, the rest of the room is, as we have said, devoted to the exhibition of miniatures, engravings, and Mr. Goodall's studies. That this lecture-room could never have been intended by Mr. Smirke, moreover, for the exhibition of pictures or drawings of any kind is evident from the fact that a large portion of the works have to be examined sideways from the stepped platform of the gallery, stage by stage, an arrangement so excessively awkward, that narrow escapes from serious fall were taking place the whole time of our visit by the viewers of the drawings, who, absorbed in the examination of the works, forgot they were standing on a series of stepped ledges, instead of on a flat floor, and, moving back, slipped over the steps, and scrambled against falling.

There are fifty-eight frames of architectural drawings. Ten of these are devoted to archaeological subjects, and three to continental sketches, leaving but forty-five frames to illustrate the art and progress of architecture of this great country during the past year, and what may not have been shown of it in previous years. Thirteen of the subjects are churches or ecclesiastical work, ten drawings are devoted to town-halls, four to country residences, two to public schools, three to colleges, one to a university, one to a lodge, one to a villa, one to stained glass, one to a monument, one to a ceiling, one to a sailors' home, one rectory, one wall decoration, one only to the Law Courts, one to Temple Bar, and three to Burlington House and the new buildings, those which are now in progress for the accommodation of the Royal, Linnean, and Chemical Societies. The names of the exhibitors include scarcely one provincial or colonial practitioner.

Probably the most important new edifice illustrated in a large fine drawing is the "New Building in course of erection for the University of Glasgow, Gilmore-hill, Glasgow" (977), for it affords a fine opportunity of marking the architectural age and in giving distinctive character to a large building in a part of Great Britain that has a national style peculiarly its own. Mr. G. G. Scott has endeavoured to graft on to his own Edwardian Domestic Gothic style that of the late ancient Scottish Baronial, and we cannot help thinking he fairly fails in the attempt. The form of the building is quadrangular, with towers at the corners, raised a story above the rest of the building, surmounted by high-pitched roofs with "corbie-stepped" gables and conical capped round

turrets at the angles; imitations of four Border Pele-towers, in fact, so pierced in their basement with windows as to show the want of solidity, that the style requires to give it due effect. The central tower, with spire, is a fine feature, in which there is little attempt to Scotch baronialism, but in the four angular towers, and in the treatment of the oriels under corbie-stepped gables, and wherever Mr. Scott has attempted (always tentatively), to Scotticise in his design; the massive fierce feudal characteristics of the native style have not been grasped, and the ensemble is not dignified. An isolated building, near to the main fabric, which in the absence of a plan we take to be a kitchen, is almost an exact reproduction of the Abbot's Kitchen at Glastonbury. Turning from what is intended to be a sublime design to one that is ridiculous, we see in Mr. E. Turner's "Design for the Improvement of Temple Bar" (966), the latest idea for the disposal of this relic of the City boundaries. Mr. Turner proposes to take down Temple Bar, build a flat four-centered arch across the whole width of the Strand on the same spot, and re-erect the bar, stone for stone, above it! with a gallery on the east side for foot-passengers, and one on the west for communication between the Law Courts and Temple. Thus the bar, in its new position, would be merely a ponderous, useless adjunct, utterly obstructing the view of Fleet-street, and the churches now freely seen.

At (973), we find an "Original Sketch for a Monument to a Friend," by Sir M. D. Wyatt. In a lofty arched recess a female figure repose upon a sarcophagus, with head raised on pillows, and hands uplifted. From a lofty candelabrum, in the centre of each side, spring festoons, which are held by kneeling angels at the base, and standing cherubs at the feet, the latter bearing a cross between them, and an altar, with surmounting cross, is between the former. The paneled and raised pictorial and sculptured ornamentations are most elaborate, and as rich as, and in the style of, the Raffaele Loggia in the Vatican. It certainly will be a grand era for architectural art, when such a monument as is here depicted can be erected to "a friend." We take the cost of the execution of such in marble to be, say only 30,000! nearly equal to the cost of that which we hear Mr. Stevens is at last completing, and will erect in the latter part of this year in St. Paul's Cathedral, as the national monument in memory of the Duke of Wellington, and a drawing or model of which we ought to have seen here.

Mr. G. E. Street, in two characteristic pen-and-ink drawings placed side by side (988, 989), shows two different treatments of church towers and spires,—that for the former, St. Peter's Church, Bournemouth, being a good adaptation of a Northamptonshire steeple, with the spire terminating behind parapets, and pinnacles rising at the corners out of them; and that for the latter, "in course of erection in Toddington Park for the Lord Sadeley," is one with a broad spire of pure Lincolnshire steeple type. There is an absence of that continentalism and mannerism in both these examples which are found in some of Mr. Street's designs. The helly stages,—always fine features,—are treated differently; in the broad-spire design the two lights are under one arch; in the parapeted-spire subject the helly lights are under two arches. In the latter the appearance of the tower is much weakened by piercing the first story with very large windows. The fact of the long-talked removal of the Charterhouse School is established, on inspection of Mr. P. C. Hardwick's large drawing of the "South-west View of the New Charterhouse Schools, Godalming, Surrey" (983). In this we observe several good and some indifferent features. The tower of entrance has a leaden spire rising from behind parapets. The church, close by and partly de-

* See pp. 105, 106, ante.

tached, with nave, aisles, and transepts, has a stone, square spire. Towers at each of the ends of the long wings of the building have square spires, with red-tile coverings. In the absence of a plan the general arrangements cannot well be traced; but we see the great hall is not made sufficiently distinctive. There is a free use of bow-windows, oriels, gabled dormers, octagon chimney-shafts, and a general raddy, thoroughly old-English tone about the buildings, which are designed in the style of the domestic architecture of the Late Decorated period. What will become of the fittings of the hall of the existing Charter-house Schools? By Leech's bequest the boys compete every year for a drawing prize by making an interior view of the quaint old place. We hope the old hall will be incorporated in the new building.

Mr. Sydney Smirke shows us an interesting drawing—"The intended Design for the Future Adaptation of Burlington House to the Purposes of the Royal Academy, as approved by her Majesty" (1141). It is an elevation of the entrance front, as proposed to be altered; is in pencil, shaded with Indian ink; bears his signature and date, April, 1867; and is signed by the Queen as "App^d. Victoria R." It is proposed, we see, to raise a blind story of niches and statues upon the present facade, facing towards Piccadilly. In Mr. Smirke's drawing the proportions of this addition are fairly in keeping with the architecture beneath it. But turn we now to Messrs. Banks & Barry's drawing (968), showing the same subject, in connexion with their own design, in "The View of Proposed Quadrangle as seen through Entrance Archway in New Front to Piccadilly," and we see how completely the proportions of a building can be spoiled by wrong perspective. Mr. Smirke's altered front is seen in the distance, and the height of the new story is so great that it appears to completely overwhelm the fabric on which it is proposed to be built. There is, too, a discrepancy between Mr. Smirke's and Messrs. Banks & Barry's drawing of the same building: the former shows a round arch arched portico at the base of the building; and in the latter it is square-headed. Look at Messrs. Banks & Barry's drawing, too, from the opposite end of the gallery, and Burlington House appears at least a quarter of a mile from the archway in Piccadilly.

Mr. H. Conybeare makes a curious mistake in describing his contribution as a "Romanesque Design for Parish Church at Hyde; interior, looking east" (969);—it is clearly Early Decorated throughout. The seven-light window occupying the whole of the width of the east end has an immense wheel within a wheel in the tracery; the outer one has six quatrefoils and six cinquefoils alternately, and the inner one five cinquefoils. With the exception of the misnomer of the title, and the poverty of size and arrangement of the altar-table, and the hardness and stiffness of the colouring, there are some good points in the design. There is certainly, however, a "Romanesque" design (1013), for it is simply a jumble of the Towers of Andernach on the Rhine, and the apses and octagon lantern of the churches of St. Gereon and the Apostles in Cologne; fortunately, we should say, for the author, his name does not appear in the catalogue. Among the many styles of drawing by which architectural buildings are represented here, some being in pencil, some in pen and ink, some in sepia, others in all the colours of the rainbow, the scratchy pen-and-ink bad imitation of Mr. Street's style by Mr. G. F. Jones is not to be commended. In his channel of Howorth Church, York (1002), misnamed in the catalogue, his drawing, especially the shading, is so sketchy and scratchy that it materially spoils the effect of the design; the repose of the architectural lines are sacrificed, and in the case of the dark lines in the panels of the roof, what is doubtless meant for decoration looks like iron cross-tie rods quite out of place. This interior should have been coloured, as it is evidently intended to be treated with polychromy, and, *vice versa*, the exterior view of the same chapel (1014) might have been in pen-and-ink instead of being treated as it is with a startling landscape, under a highly coloured sunset. There is a conscientiously wrought set of designs for the Manchester Town-hall, by Mr. J. O. Scott (967, 978, 996, 1020, 1021),—one which has been illustrated in our pages. Oddly enough, though this unaccepted design is so fully illustrated, the one actually adopted and in course of execution, by Mr. Waterhouse, is only shown by one small external view, also published by us,

and a view of a well staircase (986, 999). A polychromatic interior is shown in a minute drawing by Mr. J. D. Wyatt, of the "Interior View of the New Chapel for St. John's College, Cambridge, to be consecrated May 12th, 1869,"—G. G. Scott, R.A., architect" (1011). This work, which is said to have cost 50,000*l.*, deserves a larger and bolder representation. The colouring is mainly confined to the elaborate wooden groined roof. A band of figures, on a gold ground in niches, passes round the roof, halfway up its sides, and round the 7-sided apse at the same level, the horizontal line being broken at the centre of the apse by a vesica. The ribs are picked in in the manner of the famous groined roof of St. Jacques, at Liège. In a new lodge to public gardens at Boscombe, near Bournemouth, about to be erected (963), and a new villa at the same place (967), Mr. Edis favours a mixture of Old English and Old German domestic architectural treatment, pencilled as well as designed with much delicacy: hip-roofs he admires, gables he ignores. In the case of the villa, the upper story is marked by an ogee shingled covering to the walls, and a string-course; the tallness of the two lower stories is much aggravated by being string-courseless, and by the sudden fall of the ground giving an exaggerated base. It has a weird aspect.

The Law Courts and Thames Embankment question will not be much furthered by Mr. L. de Ville's "sketch showing the general appearance of the Law Courts if erected on the Thames Embankment site" (971). He would make the river frontage look like a vast cotton-mill. Upon a row of 34 arches similar to those on which Somerset House is built (also showing the elevation), he places four stories (Somerset House has three) of uniform rows of windows, 270 in total number, and in the centre a stark-straight chimney-like tower rises stiffly up to a prodigious height, nine stories above the main building,—15 stories high in all. With red bricks, stone quoins, purple slates, and with a modified French Renaissance chateau Henri Quatre treatment, Mr. T. H. Wyatt plans a mansion now erecting at Brockenhurst, in the New Forest, for Mr. John Morant (970). If the low wings on the left looked less like servant offices brought too prominently in view, or less like an addition made at a subsequent period to the main building, this would be as thoroughly compact a residence, worthy of the name of an English country mansion, as one would hope to see. We wish that Messrs. Banks & Barry's new facade to Piccadilly of the Burlington House new building (972) showed less of a repetition of that of the Board of Trade; twice repeated, we should say, for there is to be a wing of it on each side of the central gateway leading to the quadrangle. The extra tower-like story raised on this central point saves it from the monotony. In their St. Stephen's Church, South Dulwich, as completed (974), the authors show they can tackle Gothic as well as Classic work. There is a Kentish-raggy tone about the drawing. A tower and spire at the north-west corner, a clearstory to the nave with windows all gabled, a lean-to aisle with arched triplets, an apsidal chancel with lipped roof, and a gable to the later end of the apse only; bands of light brown and purple slates, and a deep zig-zag ornamentation of slate from the terra-metallic ridge downwards, are the features, with a careful and handsome treatment. For a "Sailors' Home, Bombay, about to be erected in the Calaba-road, Bombay, from the designs of J. M. Anderson" (985) we see no special provision for climate, or adaptation to native wants. It is certainly very unadapted in two stories, but looks very much like a railway station. Mr. G. G. Scott is about to erect, as we have before now said, a costly parish church for St. Mary Abbot's, Kensington (982), in the Geometric period merging from the Lancet. Mr. Scott confines himself to a reproduction of ancient styles, and he has taken the details of Salisbury Cathedral for the foundation of this design. Among the really practical drawings in the exhibition, Sir M. D. Wyatt sends a detail for a ceiling (980), and Mr. E. W. Godwin one for walls (1012). The former is a large sketch of delicate plaster-work in that Rococo style often met with in mansions a century old, upon buff, blue, mauve, and green grounds. The ceiling is panelled and coved, the walls are green, and for the want of a little gold relief, the general effect is pale even to sickness. In the latter the architect takes Mr. II. S. Marks, the painter, into his confidence, and the two conjointly produce some quaint decoration for the walls of Dromore Castle, with a half Pompeian,

half Japanese treatment, upon Early Pointed architecture. There is an unusual arrangement in there being no distinction made between either the architecture or decoration for the drawing-room, ante-room, or dining-room. The one Rectory-house exhibited is a most elaborate and costly affair. It has a Flamboyant traceried and crocketed tower and spire. The windows, especially the bow, have tracery in the heads, and cusped transoms. It is in red brick, with stone quoins; situated at Wrexham, Berks; and is altered from the designs of Mr. T. Bury (997). Mr. C. Barry's work shown as the "Interior of New Dulwich College" (1018), is in reality the interior of the hall of the college. It is remarkable for double-coved arrangement of roof; its wide span; for the griffins at the hammer-beam ends; and for a large window at the end.

Mr. Waterhouse is constructing new buildings for Gonville and Caius College, Cambridge, in a curious and somewhat heavy Jacobin style (975). The view shows two fronts; one next a narrow street of low old gabled houses, in which he introduces square oriels to every student's room on the first floor; he has an oriel at one corner of the building one story high, and at the corresponding corner one three stories high. There is a general appearance of heaviness every way, his oriels and other projections are not sufficiently well corbelled out to relieve them from an appearance of giving way from the weight.

In Mr. Crossland's interior of "St. Stephen's Church, Copley" (1008), everything is massive, appropriate, constructively real, and rightly subdued.

Mr. Law's competitive design for the "New Town-hall, Northampton" (1015), and Mr. Brydson's for "Bolton Town-hall" (995), may be dismissed briefly; they were evidently unsuitable, and therefore not accepted.

Mr. Street's rough pencil view of "Proposed New Examination Schools, at Oxford" (993), is remarkable for a sombre arrangement of narrow lancets to the upper hall, in six bays between buttresses, placed upon a row of large arches with tracery in them, beneath four of which are cusped doorways; this, and his beautifully coloured drawings of the "Palazzo Celsi, and Bridge of S. Bernardo, Venice" (1010), show his continental predilections.

Turn we now to the subjects strictly archaeological, exhibited by T. H. Watson, W. W. Deane (979), R. Groom (981), W. Richardson (991), and E. George, "Interior of Cathedral, Soissons" (1000), all of which are more or less painstaking and pictorial; and we close our review of the scanty representation of the national progress in architecture as portrayed in the new galleries of the Royal Academy.

THE FUTURE OF BRICKWORK.

THE recent impulse which has been given to ceramic manufacture, as applicable to architectural purposes, bids fair to effect a notable revolution in domestic building. Brick, the most ancient artificial building material, has been styled "ignoble." If we look at the rough stocks with which many buildings now in course of erection are supplied, the term is not undeserved. As far as our personal knowledge and recollection go, such bricks as we now see made use of in many places that we could name, would have been unsuitable a quarter of a century ago. English brickwork, with some honourable exceptions, is not only ignoble, but daily becoming more and more inartistic. The prevalence of the stucco taste of the Regency, the sham classically which replaced the honest, plain, well-banded brickwork of the time of the earlier Georges, and even of preceding reigns, has produced its natural effect on the brickmakers. Anything will do to be smeared over with cement. Quantity and cheapness, instead of excellence of quality, have therefore been aimed at; and although some few places still furnish a slightly, well-squared, well-coloured brick, those advanced works by which London is making its approach to Windsor, supply abundant examples of "ignoble" material.

There can be no doubt that our manufacture of this article has retrograded. Fire-brick, indeed, is produced in our time of a better quality than was considered necessary, or perhaps possible, in days when iron was smelted with wood. But the many curious forms of moulded brick, which are still to be seen in the chimneys and other parts of some of our old country mansions, are things of the past. They have

gone out of date with the chimneys themselves. The demon of economy, or rather the demon of cheap and equal discomfort, has equal dislike to tall chimneys and to moulded bricks. Compare the walls of some of our Metropolitan railway viaducts with some of those to which the elder inhabitants of London were accustomed to look with satisfaction!

As a protest and a counterpoise against the extreme degradation of a style of building which, when rightly carried out, is not devoid of its own appropriate beauty, we regard with the more satisfaction the introduction of moulded terra cotta, and the application to numerous architectural elements of the same skill, and the same material, that have hitherto been almost exclusively applied to the formation of bricks, of tiles, of drain-pipes, and of chimney-pots. Nor is it just to refer to the subject without some acknowledgment of the impulse which the collection, and the designs, of the South Kensington Museum have given to ceramic art in this country.

Throughout every branch of the manufacture of earthenware may be traced the great natural division of enamelled, and unenamelled, ware. That distinction is even more essential than that which is mainly relied on by writers on the subject, of hard and soft paste. The latter form, dependent primarily upon the character of the material employed, results from the application of a greater or a less degree of heat. But the distinctive character of the former results from the adoption of a second process: a material differing from that which forms the body of the article, is spread over the surface after a first firing, and a second application of heat is required to fuse this new face into a species of glass. In some cases the fusible glaze, or *covante*, is a simple natural product, as in the instance of the true, hard, porcelain of China. Then the body of the article, the "boxes," the Chinese writers on the subject call it, consists of a felspathic earth, the kaolin, which is entirely infusible, but liable to crack from overheating. The glaze, which the Chinese call the "flesh," and the French call the *covante*, consists of another kind of felspathic earth, of opposite qualities, fusible, and of course not liable to crack by heat.

The most ambitious, if not the earliest, attempt to decorate architectural work by inlaid ceramic ware, is to be found in the *della Robbia* ware of Italy. This earthenware is almost exclusively devoted to architectural purposes; statuets, and, very rarely, vases, being the only exception, and, indeed, they can be so called. The *della Robbia* ware is enamelled. It is thus entirely independent of the action of the atmosphere, and is applicable to such purposes as the decoration of baths and fountains, or for constant exposure to those violent changes of temperature that would be likely to prove destructive to more porous terra-cotta. The chief uses of this earthenware in architectural decoration have been either heraldic or religious; the arms of a sovereign or of a noble family, being represented, in their true tinctures, in a medallion built into the walls of a palace or *château*; and the representation of some religious scene, generally a *pietà*, a crucifixion, or a Madonna with her infant, being erected behind the altars of churches, or in the way-side chapels, or mere illuminated niches, with which we are so familiar in Italy.

The secret of the *della Robbia* ware, that is to say, of enamelling in high relief, and in bright and various colours, perished with the third generation of the family. *Girolamo della Robbia*, the grandson of *Luca della Robbia*, the inventor of the style, and the nephew of *Andrea*, who made a considerable advance both in the boldness of relief and in the variety of colours, died in France, whither he had been invited by King Francis I. to exercise his craft. He was the last possessor of the secret. The period of the production of this ware is, therefore, limited to little more than a century, Luca having produced his first work in 1438.

The modern French artists, whose skill has produced, even with advantage, almost all kinds of ancient ware, have as yet sent to this country but very poor specimens of imitated *della Robbia* ware. The efforts which have been made under the direction of the authorities at South Kensington are highly encouraging in their results. Moulded, coloured, and enamelled earthenware is to be seen forming columns in the refreshment-room at South Kensington. In colour, and in hardness of enamel, the results already attained may be regarded as satisfactory. Boldness of relief is wanting, but it is not in that direction that the efforts of the manufac-

urers have been bent. There can be little doubt that within a few years the works at Stoke-upon-Trent, and elsewhere, will be able to produce any description of coloured and enamelled earthenware which the architect may desire to use.

With many persons, however, especially in England, neither the glaze nor the vivid colouring of the enamelled ware finds favour. A true terra-cotta, an unglazed material, resembling the finest brick in its texture, but produced in artistic form, is likely, at all events at present, to be more in demand than the more brilliant substance. Even this dead or "matte" terra-cotta, however, is divided into two groups. Of course the varieties are many, resulting from the almost infinite variety in the chemical nature of the clay, simple or mixed, that forms the basis of the manufacture. Still the main division between a terra-cotta so hard as to resist the file or the chisel, resembling, indeed, very closely the texture of the old Flemish and German stoneware, and a material which, more like the finest brick, is susceptible of finish by the tool of the workman, cannot be lost sight of. The latter, of course, is susceptible of higher finish, and of effect equal to that of sculptured stone (at a much lower price). The former, though not subjected to any enamelling process, yet forms a sort of skin over its surface in the furnace, and, for external work, promises a greater durability.

These two descriptions of architectural terra-cotta may be advantageously examined and compared at South Kensington. In the Albert Hall, of which we gave a description recently, the latter, or stoneware terra-cotta, is employed. In the buildings which are now in progress for the art schools, and the finish and delicacy of the work will strike the student with admiration.

In this promising development in the artistic production of a purely artificial building material, we trace an important step in the secular progress of the builder's art. The general idea of that progress appears to us to be this: it consists in the substitution, first, of the skill of the craftsman for the mere brute force of the piler up of stones; and, subsequently, in the replacement of the manual dexterity of the craftsman by the science of the chemist. Just as smelting made ore available for the purposes to which, in the first instance, virgin metal was applied, and as, in our time, the process of electro-deposit enabled the worker in metal to take so gigantic a stride in advance of even the ablest founder, we conceive that we shall advance from the rude efforts of the earliest masons and pyramid builders, to the chemic-artistic architecture of the future.

The earliest human relics of which we can as yet speak with certitude as to their geological date (although we are as yet unable to attach any astronomical determination to the epoch), intimate the use of caverns for human abode. "Dens and caves of the earth" are spoken of as the natural homes of savage life. To supplement shelter by defence, and to rear enormous stones into a fence to protect the entrance of the cavern, would naturally be the earliest effort of man as a builder, if we consider that his faculties were gradually developed by experience. To protect a hill, instead of a cavern, would have followed, when the already improving intelligence had arrived at the power not only of seeking, but of constructing, a shelter. Whether these earlier steps were, or were not, actually taken, we have yet extant, in many localities, remains of massive walls of rude unwrought stones, so enormous in their size that it is hard to discredit the tradition which designates their praisers as the work of giants. Gigantic strength, to say the least of it, was required for the erection of these rude Cyclopean walls; while the evidence of skill displayed in their construction is not such as to lead us to suppose that any mechanical aid was made use of to lessen the toil of the builders. After a time, man, or the ancestors of what man now is, learned how to cut stone. In this invention we have probably an indication of the nearly contemporaneous discovery of the use of metal. The Cyclopean walls in which polygonal and partly-dressed stones are used, are thus to a certain extent identified with the earlier part of the Bronze period of the archaeologist.

Masonry, thus originated, had its own career, and its own history. The stone-cutter became more and more the master, both of his tools and of his material. He substituted coursed stones for polygonal blocks. In this change of style it

is probable that we find an indication of the first commencement of the art of quarrying. No longer contented with the endeavour to outline stones left on the surface of the ground, or on the scarp of the hills, the builders of the squared megalithic work attacked the rocks themselves, followed out and utilised beds and joints in the natural *strata*, and reproduced them in a mode of construction that still relied for its stability on the weight attendant on enormous bulk.

With coursed megalithic stone we seem to tread on historic ground. It is possible that the next great step may be that of the introduction of metal for bond. The simple juxtaposition of squared stones led to the employment of constructive means of bond, such as mortise and tenon joints, as we find them existing at Stonehenge, and grooved and tongued work, of which we find examples in the Great Pyramid. But, in the time of Solomon, although the use of the lewis was unknown, and projecting pins or blocks were left on the wrought faces of the stones in order to give means of attachment to the ropes that were used for their removal, the practice of dovetailing or mortising the stones themselves appears to have yielded to that of introducing metal ties or dowels. The discovery of lime cement, whenever that great chemical stride was taken, was destined to revolutionize masonry. When once it became known to the builder that he could produce an artificial substance, which, in the course of time, would harden into something like stone itself, and would thus bind together the separate elements of his work, the day of megalithic structure was passed. It could only be for the purposes of architectural splendour, or for the military reason of offering a more substantial resistance to the blow of the battering-ram, that walls were built of enormous stones, after the use of mortar had become established.

In these distinct steps, then, are to be traced the divisions of the pre-historic periods of masonry. First, the piling up of rocks; then the orderly arrangement of large unwrought stones; thirdly, the partial working, which produced polygonal megalithic work; fourthly, coursed cyclopean masonry; fifthly, grooved, dovetailed, or tenoned structure; sixthly, metal bond; and, seventhly, the general employment of mortar. Much service will be done to the history of architecture by the investigation of the existing ruins, in which traces of this gradual development of the art of the mason down to a period some 3,000 years back, are still to be detected.

We must not suppose that the transition from one style to another was abrupt, or that exact chronological value can as yet be assigned to structural characteristics. Thus, in one of the most ancient buildings of which the exact date is known, we find not only that mortar has been employed in the bulk of the ordinary masonry, but that cement of great excellence of composition has been spread between the joints and beds of large stones, so exactly wrought that the blade of a penknife cannot be introduced between the blocks. The granite masonry of the chambers of the Great Pyramid is as minutely and carefully finished as is the marble and limestone ashlar within the ducal mansion of Chatsworth. If we consider the difference of the material employed, we shall find that the work of the masons of the Memphite king Sopsith, 5,300 years ago, was as finished as, as well as no less colossal than, that of the masons of the Jewish king Solomon, 1,450 years later.

With the introduction of cement, the size of the blocks used in building naturally diminished. Reduction of size is not confined to stonework. The same diminution may be observed to coincide with the decreasing antiquity of brickwork. The bricks of the earlier Assyrian kings are larger than those of the later monarchs. In the brick pyramid single blocks of this artificial material have been measured of the dimensions of '525 metre and '315 metre, or 20½ in. and 12½ in. The small size of the Roman bricks contrasts distinctly with that of the more ponderous masses of the earlier builders.

The attempt to produce an artificial, homogeneous structure may be traced in various forms of work, some deserving of the admiration of the engineer, some being decidedly retrograde steps in the art of the builder. In countries where small stones are plentifully found, to the exclusion of large masses, as, for example, in chalk districts, where flints abound, a neatly-fitted rubble work of the natural material, built in a good lime cement, and protected at the

angles, or occasionally bonded, with courses of wrought stone, is an admirable style of work. With this may be contrasted an oolitic rubble, held together with grout. In our modern inferior work the use of what is called Roman or Portland cement, spread over the face of an ill-built wall, of rubble or of ill-shaped bricks, may be referred to as at once an instance of base and ignoble treatment of structure, and of the attempt to diminish skilled labour by chemical application.

A yet more striking instance of this tendency may be observed in the employment of concrete. In the first and simplest mode of applying this material, when a solid and widespread foundation is provided by its use, the builder has a great resource. In submarine works the employment of concrete made with hydraulic lime has been highly successful. More recently houses have been erected altogether of concrete. The sands of Egypt are being bound into large blocks of artificial stone by the enterprising constructor of the Suez Canal. To such a degree of excellence has the manufacture of artificial stone now attained in our own country, that its durability is considered to be superior to that of almost any natural substance.

In each of these different expedients to dispense with the simple form of squared and jointed masonry we trace an attempt to proceed in the same direction. Whether we regard the rough walls plastered with cement, the concrete house, the brick building with moulded enrichments, or covered with glazed tiles, we find the effort to make science supply the place of skill, and to supplement the labour of the craftsman, by the simpler process of the chemist. When we see how far nature is yet in advance of her most faithful minister and closest imitator, we may believe that we are only on the threshold of discovery in this field. If we compare a dome formed by nature—such, for example, as the egg of an ostrich—with one built by man, such as the vault of the Pantheon at Paris, or the unrivalled ceiling of King's College Chapel, at Cambridge, we see how far the chemical process excels that which is mechanical. It may be urged that we refer to the proceedings of vital and organic chemistry; but, although produced within a living being, the structure of the shell of the ostrich is mineral and inorganic. The shell of the oyster and that of the snail are external deposits, and the liquor contained in the gland of the latter animal has been successfully used as a cement, to repair broken *camei*, *intagli*, and other objects of art. In these chemically produced structures, homes and houses as they are for lower and more defenceless forms of life, we find not only perfect adaptation of form, the contour of the moulding substance being determined by the requirements of the soft cellular tissue, but extraordinary economy of material. The shell of the oyster or of the mussel may be thought a rude object when compared with the shadowy grandeur of such an edifice as the Cathedral of Milan. But if the great Italian architects had been able to dispose of their material with the economy which the poor mollusk has been taught to construct his home, what sort of temples would have glorified the abodes of civilisation!

It is, as we might naturally suppose, in Italy that the greatest advance has been made in the chemistry of building. The lime cements, the fine concrete formed with volcanic *lapilli*, the scagliola, and the material used for preparing walls to receive fresco painting, assume, in the hands of the practised masons of that country, a heauty and a strength to which we are altogether strangers in England, as applied, at least, to any ordinary work. The most remarkable example of the manner in which homogeneous and durable structure is produced from materials which are brought together in the form of fine gravel, sand, and lime is that of the beaten floors which are common throughout the Peninsula. In the Italian palaces, which are built not for years, but for centuries, the most luxurious and expensive floor, for a large apartment, is of marble. In the summer the coolness is most refreshing, and in the winter a thick carpet is spread over the polished surface. But the next highly prized is the beaten floor. This is made of a species of very fine concrete, composed partly of volcanic pebbles, and it is incessantly beaten by a gang of men for two days or a fortnight, as it dries and solidifies. The result is a smooth and level surface, finer than any stone except marble, and often to receive the work of the colourist. Designs of pavement or of carpeting are painted on these floors, and

their excellence is undeniable. A homogeneous floor of this nature, in which chemical change is accompanied by patient labour, is perhaps the nearest approach yet made by the art of the builder to the processes of that vital chemistry by which the strongest, the lightest, and the most elegant, of the habitations of the animals that dwell on the surface of the earth, have been constructed under the guidance of the Great Architect of the Universe.

In the highest effort of the art of the mason, the chemical action of lime appears to designate the course of improvement. In the plastic art of the ceramic builder, chemistry acts by the agency of fire. It may be, that in either case, we are yet young in the science of the builder.

SOCIETY OF PAINTERS IN WATER-COLOURS.

This year's—the 65th exhibition of the Society of Painters in Water-colours—is likely to be more than ordinarily attractive, from the numerous large drawings it contains. The members appear to have been actuated by a general desire to make it particularly conspicuous and distinct among the several water-colour exhibitions of the season; or, perhaps, to refute the supposition that two displays in the course of the year must necessarily occasion a rather exhaustive tax on the energies of the same exhibitors—and evidence to that effect might sometimes have been adduced here as elsewhere. However to be accounted for, they have provided for this summer's show ample contrast to mark the difference between it and a collection of sketches and studies. Diversity has some share in creating more than the usual interest; and if there be no more than ordinary proof of the excellence attained by the leading members even in the extra size of their works, others have manifested a laudable desire to emulate them in supporting the character of the institution.

The largest drawing is contributed by Mr. Birket Foster,—a combination of landscape and figures; village children for the more prominent, watching "The Meet" (75), very brilliantly and deftly described. The expanse of country under a splendid sky; the fresh, clean-looking fox-hounds, scarlet-coated huntsman, and the healthy rustic boys and girls variously clad in the striped cotton draperies and qualified-coloured clothes that Mr. Foster's peasant children always wear and look so well in; the precisely drawn tree trunks, crisp foliage, herbage, dried ferns, and the like—all brought together with such tact and skill as few possess in common with him—have conduced to a very successful and pleasant result. But with all the admiration due to such an evidence of power and knowledge, there is the want of some of the better qualities that distinguish the smaller productions of the painter; the charm of refinement that so greatly helps to make the simplest objects matters of interest; and the difference is sufficiently marked in comparison with a delightful little bit entitled "A Breakwater" (210); or again when the "Village Children" (274) are more poetically treated; or where a quiet evening effect enables him to show his appreciation of rich subdued colour, if it be but "A Mill Pool" (266) that reflects it.

Precedence, by right, belongs to those whose practice indicates a more exalted application of artistic ability; but Mr. Foster's picture is undoubtedly the leading feature of the present collection, by reason of its forcible appeal to popular taste.

More rich and rare are the gifts and acquisitions necessary to the proper enunciation of Mr. F. W. Barton's conception of "Cassandra Fedele" (20): the figure of a Muse, with appropriate attributes, and invested with the grace that refined feeling helped by such advantages as academic proficiency always secures. Though announced to be unfinished, it has an appearance of completeness,—a fitness of everything introduced,—that associates it with old rather than modern art: it might be the labour of love of some Venetian master. And for the matter of that, so might be Mr. E. Burne Jones's representation of a loosely-clad nymph drugging "The Wine of Circe" (197), but of one who idealizes the possessor of quite another idiosyncrasy. For fine colour this is one of Mr. Jones's best examples; the lady is sufficiently beautiful to look no better than she is, and is known to be, perhaps, by the black panthers—who do duty for the classic tame lions and wolves—in this large

and clever drawing. "A Lament" (43), by the same, though it might be something very fresh from Pompeii, has peculiarity if not originality, and a singular gracefulness to recommend it, even though it emulates immature art.

The rapidity and ease with which Mr. John Gilbert appears to get through any amount of work he may undertake are just as manifest in his pictures as in the thousands of woodcut illustrations with which he has whilom delighted his admirers. Whether Shakespearean illustrations like "Joan of Arc contemplating the Dead Bodies of John Talbot and his Son"—from King Henry VI., Part I., Act IV., Scene 7 (30)—with the heroine, who looks more addicted to fighting than "Mr. Corbould's milder impersonation, seated on her white charger, and surrounded by mounted and dismounted, armed and disarmed warriors; or "Lear and Cordelia" (121), with splendid British draperies for themselves, picturesque arrangements for their captors, in addition to characteristic heads and stalwart figures; or in the grey-toned funeral procession, "The Burial of Ophelia" (113), with a brilliantly attired Horatio in juxtaposition to the deep rich black of Hamlet; or in the subject from Gil Blas, including the renowned Doctor Sangrado visiting a doomed patient (234); and "The Introduction" (259), that might be from Gil Blas as well, with its tapestry background and showy costumes, all bespeak their author by the same bold, facile execution that has become as autographic now as any other signature could be to the capital light-and-shadow arrangement of any one of the subjects.

A little boy relating to his smaller sister "The Story of a Suit of Armour" (275) is one of the artist's most agreeable if less important productions; but objection may be taken to an over-prevalence of grey at the expense of brighter, warmer, and more natural-looking light in this case as in others.

For splendour of colour as much as for vigorous use of it, few can compete with Mr. Carl Haag. His portrait of "Kaheen Amran," the high priest of the Samaritan community at Nablous, reading the Pentateuch (131), is exemplary of the resources of the medium, and proof enough of its sufficiency to meet the requirements of general representation, even if a life-sized head of "A Dragoon" (78) were not a corroboration of the superlative merits water-colour can boast; and an artistic rendering of "The Acropolis of Athens," as seen from the monument of Philopappus, shows to what an extent this sense of colour can idealize even stones, and make them consonant with their inherent interest. Mr. F. W. Topham's Spanish group preparing decorations on "The Eve of the Festa" (151), and a handsome spinster surrounded by sheep in "A Pastoral" (12), are both prominent on other account than their size: they are very beautiful in tone. Mr. J. D. Watson's boy of lively damself "Carrying in the Peacock" (101), to grace some feast in old chivalric times, are cleverly drawn and painted in their quaint fifteenth-century costume, and betoken him to be of those from whom great things might be expected. The work has much of the clear brightness of a fresco that fits it admirably for mural decoration, the purpose for which it was designed. An interior of "A Smithy" (27), with a gally-olad, thirsty smith draining the last drops of ale from a tankard; and another interior, "The Family Pew," with an occupant whose drab has been from the metaphorical cap of sorrow, for she is in mourning and alone, are conspicuous for merit.

(142) "A Hunting Morning: Passing the Gipsy Tents," is Mr. F. T aylor's most important contribution; though two smaller examples,—(236) "In the New Forest," with some ponies that have stood still to be taken, for a wonder, and "A Good Scouting Day" (244), that beholds the huntman make the most of it, and not to mind small spills,—he is pulling his horse out of a ditch,—are of less value for being so small, for they are thoroughly indicative of Mr. T aylor's admirable style. Mr. T. R. Lamont has found inspiration in an old ballad telling how "Glasgerion" (170) was so good a harper as to barp himself into the favour, not only of the king and his nobles, but, by changing his tune, into the graces of the monarch's one fair daughter likewise. He is represented here as having "harpit them a' asleep."

"A" except the young princess,
Whom love did waking keep;
And first he has harpit a grave tune,
And says he has harpit a gay,
And mony's the sigh and the loving word
That pass'd aween them twae."

Whilst papa and his courtiers are being gently nursed in the arms of Morpheus; and the jester lies cuddled up close to the hearth, whence proceeds the only light that illumines the ardent pair of lovers, and the bright pair of red legs of the clown, that are made by a rather obtrusive feature in the composition, a very effective one, as having afforded Mr. Lamont an opportunity of showing great technical skill; it also evidences originality in dealing with, and research in finding, new subjects whereon to employ it.

Mr. H. Britton Willis is pre-eminent in the treatment of cattle and landscape: his most important contribution is one of these combinations (112), "Early Morning on the Snowdon Range," with a very successful imitation of natural effect.

Mr. Bradley, with far less aptitude for giving picturesque value to his drawings, exhibits the exceptional power of suggesting life-likeness and action. His "Wild Cattle of Chillingham Park," with bulls about to fight (182); "Oxen Ploughing on the Sussex Downs" (196), and "The Chiddingfold Foxhounds in Full Cry, Surrey" (198), are portrayed with astonishing vigour and apparent anatomical knowledge, and on a scale too large to admit of a doubt. Mr. Basil Bradley's works help to give variety to the collection, as does Mr. G. Rosenberg's carefully studied dead swan—"The Angler's Vengeance" (210).

Mr. Holman Hunt, who has lately joined the society, sends two finished studies—"Moonlight at Salerno" (255), with a curious effect produced by the last ray of sunset-colour tinging the horizon with its reflection; and the "Interior of the Cathedral at Salerno" (263). Mr. G. J. Pinwell, another new associate, in addition to a couple of quaint illustrations from Mr. Browning's "Pied Piper of Hamelin" (260), and (282), has a very choice drawing of some such group as may be frequently discerned on "A Seat in St. James's Park" (297). The itinerant musician counting her scanty gains; the poor gentleman, born to disappointment, whose life has been a gradual decline from what he was to what he is, with no other reflection for consolation but the one—that in great measure he has to thank himself for it; the expiring life-guardian and the captivated life-guardian of perambulatory and toddling treasures of a fatuous mamma, who thinks Jane has no followers, and children, the least foolish of that age, since they have not arrived at that point when the foolier think themselves wise,—are some of the individualities the artist has depicted with some approach to the delicate but precise finish of Mr. J. F. Lewis. Mr. E. K. Johnson's graceful and lady-like girl contemplating "The Brunt Letter" (300) is charming in her unobtrusiveness; a delightful little drawing, though in very opaque body-colour.

Mr. Jos. J. Jenkins devotes himself entirely to landscape now; and with him we will leave the figures for the present, though they are so much more easily talked of and praised or blamed than trees and stones and limpid brooks, rocks or the Rhine, mountains or Murray-described foreign experience of what may be found in any town all the world over. One need not travel very far to see such scenes as, for the most part, Mr. Jenkins transcribes, such as that under the influence of "Starlight" (9), or when, in some earlier of the twenty-four hours, "Sketching on the Thames" (109), "The Quiet Mill-race" (127); or, leaving the banks of the river, he finds material for his dissertation in rustic bridges, hedged fields, and the like, introducing a flock of sheep "Scared" (286) for incident, to lead point to his capital means of representation that one must needs be very obtuse not to acknowledge.

Mr. Alfred W. Hunt has concentrated his talents and attention to the production of one large and very great drawing, "Loch Coruisk" (155), with giant rocks "at random thrown,"—a masterpiece of workmanship. Mr. E. Daucan sends an exposition of his special supremacy in painting stormy seas and skies in (26) "St. Abi's Head, coast of Haddington;" Mr. G. Dodgson, several admirable examples, notably (148) "Woods at Evening;" Mr. J. Holland, amongst others, a gorgeous view of "Geneva, looking South-east" (126), and drawings that vie with those of Mr. E. A. Goodall in making Venice most Venetian and beautiful; and Messrs. George Frigg, C. Davidson, A. Glennie, W. and J. Callow, P. J. Natel, Collingwood Smith, G. H. Andrews, Francis Powell, C. Branwhite, T. Danby, A. P. Newton, T. M. Richardson, S. P. Jackson, and J. W. Whittaker, all contribute excellent examples of their several styles.

THE PUBLIC HEALTH IN THE FIRST THREE MONTHS OF 1869.

The influence of temperature upon the public health during the winter is so direct and so marked that it is somewhat difficult to institute useful comparison between the death-rates in the first three months of any year with those prevailing in the same period of other years. Nor will the mean temperature of the quarters afford us much assistance, as two or three weeks of frost may be followed by a longer period of warm weather, and thus raise the mean to about the average, whereas the effect of the frost upon the death-rate will not be neutralized. A continuance of frost tells with deadly effect upon the young and old of all classes, but with varying effect. In communities, as in individuals, however, the ratio of the effect of temperature upon health depends very largely upon their sanitary and physical condition. This varying proportion affords valuable information for the consideration of the relative health standards prevailing in different towns and countries.

As it may be said that there was during January, February, and March of this year an immunity from frost, we might fairly have expected to find that the death-rate in England and Wales in those three months had been considerably below the average. The cold winds and low temperature of March, however—more especially coming as they did at the close of an unusually mild winter—so raised the fatality from inflammatory diseases of the respiratory organs, as almost to counterbalance the low death-rates of the previous two months. The Registrar-General tells us in his quarterly return, just issued, that in England and Wales the annual death-rate during the first quarter of this year was 24.8 per 1,000. This average rate in the corresponding quarter of the ten previous years was 25.4. The rate last quarter was 2.5 per 1,000 above that which prevailed in the same three months of last year, but showed a marked decline upon those which ruled in the same periods of the five years 1863-67.

The effect of the steady diffusion of sanitary intelligence which has taken place in recent years should appear in a nearer approach of the town death-rates to those enjoyed by the inhabitants of the country. It appears that during last quarter the rate of mortality in the country districts of England was 22.6, while in town districts it was 26.6; thus showing a difference of mortality so great as 4 per 1,000. In the March quarters of the ten years, 1859-68, this difference averaged 4.2, and varied between 7.2 in 1867, and 2.9 in 1859. It would be too much to expect that sanitary efforts alone will bridge over this chasm by lowering the town death-rates more nearly to a level with those of rural districts. We must look to the practical application of Social Science, and perhaps more than all to the labours of the school-master to help forward this great work.

In the 14 large towns of the United Kingdom furnishing weekly returns, the average death-rate last quarter was 27.7 per 1,000, against 30.5, 28.9, and 25.4 in the corresponding quarters of the three years 1866-8. Arranged in the order of their death-rates last quarter, from the lowest, they were as follow:—

	1869.	1868.	1867.
Birmingham	29.7	24.2	25.4
London	29.4	23.3	26.8
Hull	26.3	22.1	22.7
Bristol	26.6	25.6	25.5
Bradford	30.9	22.9	23.8
Leeds	27.5	23.0	23.3
Salford	27.3	28.2	31.4
Dublin	29.1	29.6	34.6
Sheffield	28.4	23.4	27.3
Liverpool	29.4	30.0	33.3
Newcastle	30.4	25.8	37.1
Manchester	31.0	31.3	33.8
Edinburgh	33.0	28.0	27.5
Glasgow	40.1	30.2	33.6

Apart from the increase of deaths last quarter from the fatal prevalence of bronchitis and pneumonia, which was more or less shared by all the towns, and, indeed, throughout Great Britain and Ireland, the mortality in the above towns was disturbed by a varying proportion of deaths from zymotic causes. Birmingham, which heads the list, enjoyed all but an immunity from this class of diseases, excepting the prevalence of scarlatina in some parts of the town. Scarlatina, indeed, may be said to have been very generally epidemic. In London, for instance, 618 deaths were referred to this disease in the three months, against 339 and 368 in the corresponding quarters

of 1867-8. In Manchester and Salford it was still more fatal, the 494 deaths in Hulme township alone, including sixty-four deaths from the disease; in the city and borough over 200 fatal cases of scarlatina were returned, and in some measure accounted for their excessive death-rate. Small-pox was again fatal in Sheffield, vaccination being still neglected. Typhus continued epidemic in Liverpool throughout the quarter, but to a far less fatal extent than in former visitations of the disease in that town. As some set-off against the low position occupied in the above list by two such important towns as Liverpool and Manchester, it is satisfactory to observe that the death-rate in each during last quarter showed a further slight decrease upon the declining rates of recent years. In Liverpool, for instance, the death-rate in the first quarter of the four years 1866-9 has been successively 45.9, 33.3, 30.0, and 29.6. This, in the face of the general increase in 1869 upon 1868, shows a favourable result for the sanitary activity in Liverpool during the past few years under the able direction of Dr. Trench.

The Registrar-General shows that in 46 other large English towns the death-rate last quarter was 24.6, or more than one per 1,000 lower than in the 14 largest towns above mentioned. The rate was remarkably low in Brighton, Southampton, Plymouth, Chester, Coventry, Birkenhead, and Swansea; while an excessive rate was shown in Exeter, Macclesfield, Wigan, Rochdale, Blackburn, and Preston. The excess in nearly all these towns was in a great measure due to the fatal prevalence of zymotic diseases.

The dwellers in London may well be satisfied with the health of the metropolis during last quarter. Of the 14 largest towns, only Birmingham enjoyed a lower death-rate. If London is the ugliest city in the world, it is no small consolation to know that it is now about the healthiest. In Berlin last quarter the annual death-rate was 34.2, and in Vienna 33.2 per 1,000, against the 25.4 which prevailed in London. Typhus was very fatally prevalent during the past three months in Berlin, Brussels, and several other continental cities. London has almost subdued this disease in its worst and most virulent type.

Space will not allow us to dwell upon other and interesting features in the Registrar-General's last quarterly return. He tells us, however, that the births in England and Wales exceeded by nearly 8,000 those registered in any previous winter quarter on record, and that the excess of births over deaths was over 70,000 in the 90 days.

The natural increase in the population of the country during the quarter by excess of births over deaths, was disturbed by the continual outflow of emigrants. Of the 30,275 persons who left the ports of the United Kingdom in the first three months of 1869, 11,110 were English and 9,800 Irish; the latter showing a decrease on the first quarter of 1868, while the total number of emigrants had increased.

The effect of the stagnation in the nation's commerce, dating from the commercial crisis of 1866, continues to be apparent in the marriage rate: 17.7 per 1,000 persons were married in 1866, 16.7 in 1867, and only 16.3 in 1868, a lower rate than in any year since 1861.

CONVERSAZIONE OF THE ARCHITECTURAL EXHIBITION SOCIETY.

THE nineteenth annual exhibition of this society was opened on Tuesday evening with a *conversazione*, at the galleries in Conduit-street, and with considerable *éclat*. For three hours a stream of visitors paraded the rooms, admiring the numerous collection and subjects on the well-lighted walls. Many members of the profession, accompanied by ladies, were amongst the guests, Mr. James Fergusson, the president, receiving them. The *conversazione* was varied this year by the omission altogether of the usual addresses from the president and members. The omission, however, was supplied by the performance of a band of musicians, placed, in the absence of a music gallery, at a table in the centre of the great gallery.

The whole suites of galleries was opened on this occasion, and is devoted in this manner:—The west or first gallery exclusively to a series of 294 coloured sketches, partly Continental and partly of subjects taken from various places in Great Britain, by the late Rev. J. L. Feit, M.A., F.S.A., all framed uniformly in size; the great gallery to the architectural collection, in a

recess of which is an exhibition of Dr. Salvati's Venetian glass; and the uppermost suite to the models and designs of constructive and building appliances. Want of space prevents us this week from going into a detailed examination of the several works, and we shall therefore content ourselves for the present with a few general remarks upon the whole collection. The works of the late Mr. Petit are astonishing for their number and characteristic treatment; his rapidity of sketching must have been surprising, for his sisters, who have obligingly lent this collection, possess, we learn, some 15,000 drawings by the same hand that is now still. We regret that the Council have not arranged these 294 subjects in a chronological form, so as to mark the periods of his unique style. None of the drawings being dated, they are placed, accordingly, in a jumbled and confused form.

As to the architectural collection proper, the extraordinary treatment which architects have received at the Royal Academy, has been the means of preventing the exhibition of the best specimens of their works in either place. Led by the promises held out to the profession, of ample space and special provision for their designs, some hundreds were sent to the Royal Academy instead of to the Architectural Exhibition; the rejection, at the last moment at the former place of so many works, precluded the exhibition of them at either, and so between the two stools the architects this year have, to a considerable extent, fallen to the ground. There are, nevertheless, in all, in this collection, 295 frames of subjects, exclusive of the 294 sketches: 58 of these are views of ancient Continental buildings, and 7 of English antiquities; there are 33 examples of English country residences and villas, and one Irish. Ecclesiastical architecture is represented by designs and drawings of 57 churches and chapels in or for England, 2 for Scotland, and 2 in Wales. For schools there are 17 specimens; for sick asylums, 2; infirmaries, 3; small-pox hospital, 1; fever hospital, 1; and lunatic asylums, 5. For educational buildings on a large scale, there are for a college and a university 1 each; and for establishments dealing with crime, 1 for assize courts and 1 for police and sessions house. Of town-halls there are 9; business premises, 11; and corn exchanges, 3. For banks, markets, foun-mills, monuments, workhouses, stables, hotels, boat-houses, railway stations, bridges, rectories, hunting and other lodges, almshouses, road-side inns, and club-houses, there are isolated illustrations, mainly 1 of each. Of the details of the respective buildings represented there are 27 drawings, showing fonts, sculpture, a reared, a sacrum, porches, windows, dados, and staircases. From the 295 illustrations, we further ascertain the fact that 133, or less than half the total only, are of buildings executed or in progress.

ON THE DUTIES OF AN ARCHITECT WITH REFERENCE TO THE ARRANGEMENT AND CONSTRUCTION OF A BUILDING.

AFTER a paper on this subject by Mr. T. R. Smith, at the Society of Arts last week, a discussion ensued, in the course of which

Professor Kerr said, the impression left upon his mind was that it was a most unwise thing to be one's own architect; he did not know whether the main intention of the writer was to impress this upon the public mind, but he had certainly mentioned a list of dangers to be apprehended from the non-employment of an architect enough to frighten any one. The typical English gentleman, however, was usually determined to act as his own architect as far as he could, as he believed he knew his own requirements much better than any one else, and he (Professor Kerr) believed it to be the professional architect's duty to carry out his client's wishes to the best of his ability. He looked upon the architect as a practical man, and not at all as a sentimental person; his sentimental days were gone long ago, and he hoped they would never return. The architect was the servant of the public, employed for the purpose of doing that which they were not able thoroughly to do for themselves, viz., to design and scientifically arrange a building, so that it should be perfect in all its parts, so that all the refinements of the age might be duly provided for. When this was properly done he considered that a great deal more than 5 per cent. additional value was conferred upon the building. If the architect were an unskilful man, which might sometimes happen, the case

was different; but he was glad to say, for the credit of the profession in England at the present moment, that he knew of no profession in which there were fewer incompetent men, or where a man did more work for less money. Under these circumstances he fully appreciated the effort which Mr. Smith had made to impress upon his audience the importance of the architect's functions. With regard to the degree in which the owner of a house might be allowed to exercise his own fancy in the design, his (Professor Kerr's) opinion was that an intelligent client was entitled, within the limits which no English gentleman was likely to transgress, to dictate to his architect the conditions under which he chose to live; and a skilful architect would fulfil these conditions as perfectly as possible. He was bound to say that he had had clients whose assistance had been of the greatest possible service, and he knew of no greater gratification on the part of a professional man than to feel that he had honestly fulfilled the wishes of his client, and that by the exercise of his own skill he had accomplished that which a less careful man would have pooh-pooled as an impossibility. The lecturer, he was glad to see, had not followed the general rule according to which architects were spoken of in England. Their functions were generally divided into practical and artistic, the latter being considered by far the most important. This he considered a great mistake. He believed that it was, generally speaking, the truth that an architect, at any rate in his calmer moods, considered himself simply as the servant of the public, and it was a mistake to suppose that he wished to force his own principles of treatment on the public against their wish. That which had led architects to produce public buildings which had ultimately gone out of fashion, to say nothing more, was the pressure put upon them by dilettanti and others, who, with the best intentions, were not always possessed of that information which enabled them to give judicious advice. If architects, as a body, were more consulted on questions of public architectural art, architecture would not become more outrageous than it had been, but less so. Unless architects were encouraged in the other direction, he believed they would be induced to follow the dictates of common sense, and to remember that, after all, the English character was averse to any excess of display, either in ornament or anything else, and that the best condition of a good building should be that it fulfilled all its internal functions thoroughly and completely, and that any elaborate ornamentation was altogether a secondary consideration.

Mr. C. F. Hayward said, although he quite saw the wisdom of the course which had been adopted, he could not help regretting that the artistic portion of the subject had not been more touched upon. He could not at all agree with Professor Kerr that the time was gone by for sentiment with regard to architecture, and he should much regret if sentiment were entirely to leave him when designing a building. When troubles came, as they would come—troubles connected with contracts, with workmen, with clients, or with other professional matters—he could not help feeling that it would be a most disagreeable task to go on with the building if there were no sentiment connected with it. He would put it to any gentleman present not connected with the profession, if it would be possible to build a granary or factory in the same spirit as such a building as had been brought under their notice in the paper, a gentleman's country house. He must say that, independently of any question of remuneration, it was a great pleasure to an architect to build a good house for a good client, and he believed that was one of the reasons why an English country gentleman was so anxious to interfere with the arrangements of his building; he felt the influence of sentiment, and desired for the time being to be himself an architect, and could scarcely refrain from interfering, although he might know that he would do so to his own cost. It would be evident to any one that, whatever an architect was, he was a working man; and that in the present day was a very honourable term. Even if his own hands took no part in the work, still his mind and brain must be constantly on the stretch until the building was finished. Mr. Smith spoke of an architect designing or superintending the furnishing of a house as well as the house itself, and this he looked upon as a most important matter. Some clients would trust an architect with the carrying out of a building from the foundation to the chimney-top, and yet would not take his opinion with regard to the

design of a stove or a chimney-piece, and certainly not on the question of a paperhanging. This was a point which, in his opinion, ought to be more insisted upon as connected with the duties of an architect. As he understood it, an architect's duty was to carry out a building until it was externally and internally complete, and this could not be the case unless everything connected with it were under his immediate superintendence. He had great pleasure in seconding the vote of thanks.

Mr. Chatfield Clarke thought there were several points which must at once impress the mind of any one who contemplated building. The first was that he should employ an honest and capable architect; and the second, that, having done so, he should give him his full confidence; and this latter point was, in his opinion, one of the principal requisites to success in any building. The next point was to secure an honest and able contractor, for, as had been said, however desirous an architect might be of producing a good building, he could not do so if the builder were a determined rogue; and the result of his own experience was the same as that of Mr. Smith, that, however careful they might be, they could not make a bad builder do good work. Another point, which he considered of some moment, was, that when once a building had been planned, it should be altered as little as possible. A building was a conception as a whole, and, to a certain extent, might be considered as an inspiration, and therefore any subsequent piecemeal alteration very often interfered with the general effect of the structure. In conclusion, he would remark that building a house in the country was a very easy matter indeed compared with building in London. Very recently, in erecting quite a small building, which was not to cost more than 5,000*l.*, he had had eight or ten different negotiations on the subject of party walls, the rights of adjacent lights, difficulties connected with the Metropolitan Building Act, lines of frontage, and so on. Questions of lights and other matters were now refined upon to such an unnecessary and vexatious extent, that he believed it would be well if professional men were to take some means of calling public attention to the difficulties thus thrown in their way. He thought the manifest conclusion to be drawn from all that had been said was, that no wise man would enter on building operations of any extent without the assistance of a competent architect.

Mr. J. C. Wilson said there were a few questions which he should like to ask, not being a member of the profession. Did architects generally approve of deafening the floors of houses, as was frequently done in Scotland, by introducing a mixture of lime and ashes, which was found to keep the rooms warm in winter and cool in summer? Again, did they approve of making flues of a taper shape? He believed such a method would greatly tend to prevent chimneys from smoking. He should also like to know if architects approved of making a separate flue for ventilating purposes from each room to the roof of the house. He was not sure whether or not it was the practice amongst architects, when serving their apprenticeship, to learn the various trades connected with building, such as joinery, masonry, and so on. This course was adopted by engineers, and he believed with very great advantage, as it gave them a knowledge of materials and construction which they could hardly obtain in any other way. He also begged leave to throw out the suggestion whether it would be possible to build houses according to certain classes, and have them classed, much in the same way as ships were classed at Lloyd's, having regard simply to the quality of materials employed and the workmanship, so that the purchaser of a house which had been built and certified, say by the Institute of Architects, as belonging to a certain class, would know that he was buying something of a certain marketable value. Of course, no house would be classed at all which had not been built under the superintendence of a professional man. Whatever the public might think of the value of an architect's services, the members of the kindred profession were quite aware of the great ability and talent which were required to make a man a good architect, and he hoped the day was not far distant when the two professions would be found going more hand in hand than they had hitherto done, the architect doing that portion of an engineer's work which properly belonged to him, and the engineer, on the other hand, assisting the architect in all purely engineering matters.

Mr. Bishop said that last summer he had a

house built, the bills of quantities being got out by a surveyor from the architect's specification, and upon these quantities builders were invited to tender. He went through some of the details himself, and he found, to his astonishment, that on the average the results were 33 per cent. in excess. The consequence was that he had to call upon the different parties who were tendering, and explain the matter to them, and one contractor, who had made out his estimate, was able to reduce it by 400l., which was about 33 per cent. of the total.

Mr. Jones remarked that, having heard what was the amount of remuneration which architects received, he should be much obliged if Mr. Smith could inform him what amount of consideration would secure honesty in a clerk of works. It was quite possible for him to have a commission on both sides, whereas, unless he were quite loyal to the person building, there was every probability of the structure being defective. It was one of the greatest evils in the present day that so few workmen could be trusted; so that a man, unless he could do a thing himself, never had any certainty that it would be done honestly and properly according to his expectations.

Mr. Edwin Nash said all architects knew the difficulty of obtaining good clerks of works, and very often they were glad to have a building erected without such assistance, feeling that they could trust much better to the builder himself. A good clerk of the works was a most valuable man, but though there were some of that class, unfortunately there were a good many of the other; and being generally drawn from the ranks of workmen, it could not be expected that they would always be all that was desired. Architects did not object to deafening floors, which were very often treated in a similar manner to that described, nor did they object to taper chimneys, except as a question of expense, and some little arrangement being required in the management of the brickwork. The effect in the way of preventing smoky chimneys had not been much tried, but he believed it would be found beneficial, although of course there were objections; as, for instance, such chimneys would be much more exposed to the weather than those of one calibre throughout. One matter which had not been touched upon he considered of great importance in connexion with the architects' duties; he was too much harassed with practical office work of a dry technical character. This could not have been the case with Michaelangelo, Raphael, or the other great masters of former periods, or they never could have designed and carried on their magnificent works. He considered that architects ought to be far more of artists than they were, and unless a large amount of their dry business work were transferred to some one else, he thought English architects would never rise to the high standard of excellence which had been seen in former days.

Mr. Hyde Clarke said it had been hinted to him that the audience was to a great extent a professional one, and that the discussion had been principally carried on by architects; but as an old member of the Society of Arts, he might remark that the subject came strictly within their domain as a technological one, and one of very great importance to the public. The point of view from which it had been treated, was eminently practical, for every one was, in some degree, interested in the building of a house, which could not be said to the same extent with regard to building on a large scale, although on that also there was a bond of union between architects and an educated public,—the community of enjoyment in works of art. Unfortunately architects were too often neglected in such matters as house building, and he regretted that a greater number of what might be called the employers of architects were not present, to see, from the drawings which surrounded the room, the great quantity of work which an architect had to perform. The interesting paper which had been read showed the relations between the architect and employer, and pointed out to the latter the real value of the services rendered by that profession. If this were more generally known, he believed there would be a much better understanding between architects and the public. In every business but that of building the value of ability and directing power seemed to be understood. Even in a tailor's shop this was the case, but people were much fonder of having their houses from a "slop-shop" than their clothes; they were not always in the habit of having them made to fit, and yet

every one knew that even in the matter of a coat, a considerable amount of ability was required in order to ensure a successful result.

Mr. Ladd, as a professional man, felt much obliged to Mr. Smith for the manner in which he had presented his drawings to their notice. These plans showed the amount of work which had to be got through; and, when it was done in so complete and detailed a manner, he did not consider that the 5 per cent. was at all an adequate remuneration. These drawings set a good example to any young architects or pupils who might be present, and showed them how their duty should be fulfilled in carrying out any work which was placed in their hands. Very often, he was afraid, not one-fourth of the drawings—in proportion to the extent of the work—were made which were here shown, and in those cases probably 5 per cent. was enough. First-class architects, of course, would do their work thoroughly and well, and in such cases they were not over too under paid. In his opinion there should be different scales of remuneration according to the amount of detail in the building, which involved extra work on the part of an architect.

Mr. Tracy asked if there were any intelligible rule known to architects by which they constructed a house; for, according to his experience, smoky chimneys were the rule in dwellings of all classes, both those on which unlimited expense was lavished, as well as those built in the cheapest possible manner.

Mr. Smith, having thanked the meeting for the kind reception which his paper had received, said that notwithstanding the remarks of the last speaker, architects had a certain amount of knowledge with regard to the building of chimneys, and when they were carefully constructed on principles which were generally understood, they were not often complained of. It must be remembered, however, that it was a very delicate matter to arrange for a column of hot air to ascend, in all weathers and under all circumstances, so that it should never be liable to disturbance either by the opening or shutting of doors, by the starting of similar currents in other parts of the house, or by changes in the condition of the atmosphere inside or outside the building; still he was quite ready to admit that a good deal might yet be learned on the subject of flues. It was a very common practice to deafen the floors in good houses, but he knew nothing about taper chimneys, and should not like to take the responsibility of advising their introduction. Distinct ventilating flues were very desirable where expense was not an object, provided they were constructed upon an intelligible system. It was not usual for architects to go through any large series of workshops, but they not unfrequently spent some time in a joiner's shop, which was, no doubt, of considerable advantage. It would not be very easy to devise a classification for houses; and if it were done, he did not think it would be of any practical value. One of the most important points in the discussion was that raised by Professor Kerr, as to the share which the proprietor himself might take in the erection of a building. What he had said in the paper referred rather to a man acting as his own architect, which he did not deem by any means desirable; but, for his own part, the greater share his client took in the building the better he was pleased, not that the result was always better, but that so much responsibility was taken from his shoulders. He perfectly agreed that a client had a right to dictate his conditions, and it was the business of the architect to carry them out in the best way possible. He believed the best results were attained where the client contented himself with stating his conditions, and left to the professional man the carrying of them out. The whole question was complicated to some extent by a house being so familiar an object, and the furniture even more so. From this cause, probably, it was that an architect was so rarely allowed to give any opinion as to furniture, or even what were really parts of the house, such as chimney-pieces and wall papers. His own idea was that a man who wanted to make the most of his architect would use his skill and experience to the utmost, considering that he knew more than he himself did. Occasionally there were instances in which the client might detect matters which had escaped the attention of the architect, but, as a rule, it was the other way. Some of his brethren had rather complained of his not having said more of the artistic part of an architect's work, but the fact was he had been cautioned not to go into that matter, but to deal with the subject from a

technological point of view, as being more specially fitted for discussion in that room. The truth was, considerations of artistic excellence and beauty never ought to be absent from the mind of an architect, whose loyalty to his profession should make him endeavor to make the plainest and simplest building conform to the true principles of art. He could not agree with what Mr. Chatfield Clarke had said about the alteration of plans when once made; but that was simply an instance of the different way in which different minds worked, and probably it would be found that no two men arrived at the same end by the same road. He could not go into the question raised by Mr. Bishop as to the quantities without having all the particulars, but the remarks of Mr. Jones as to clerks of works were most important. No sum of money would purchase honesty in such functionaries, but at the same time he had had many, and had never had a thoroughly bad one. He always regarded it as one of the most important points to secure excellence in a clerk of works, and spared no pains, therefore, to ascertain what was his previous character.

The Chairman, Sir M. D. Wyatt, said he could not help feeling that the duties which an architect was called upon to render to his client had been, if anything, rather understated in the paper of Mr. Smith. One particular duty which had not been insisted on, but which was of great importance, was that of exercising patience. There were moments of difficulty in the progress of almost every great work when an immense deal of tact and patience was necessary sometimes even to keep the peace between half a dozen people, and to make things go smoothly, and this was worth at least one out of the 5 per cent. Another essential qualification was a combination of selfishness and friendliness. An architect, in the early stages of his intercourse with his client, could very frequently be of the greatest possible service, sometimes by telling a man that he must spend more money, and sometimes that he should spend less. It was important early in the negotiations to be what was the tendency of the client. Sometimes he might be a man with a great taste for art, but with limited means or heavy family claims; and if in a moment of selfishness an architect took advantage of that enthusiasm, and went on glorifying himself at his client's expense he did that which was improper and reprehensible. Again, the relations between the architect and his client being reciprocal, it was his bounden duty to act as a friend to his employer throughout; and from the moment that was clearly understood all mistrust would be removed, and the happiest relations would be established. Another quality which the architect should possess was that of justice. It was necessary for the protection of the employer that contracts should be in very strict terms; and where the employer was of a grasping disposition, the builder was often so much at his mercy, that unless the architect held a very fair hand between the two, great injustice might be committed. He should, therefore, strive, above all things, to earn in all his transactions a character for uprightness, taking care, on the one hand, to protect his client, but never allowing injustice to be done to the builder.

THE KING OF METALS.

NATURE in her beautiful and wonderful divisions completes the arrangement by marking out a ruler or head of the various divisions. To some "one" is given greater, grander attributes; it is marked out as being the chief of the order or species. Not only in things animate does this occur, but in things inanimate also. The stately and noble oak, the king of the forest, fosters the growth of tender parasites under its sturdy arms, yet braves the storm that brings destruction to its meeker neighbours. The greatness of these "kings of creation" does not always arise from great power. They usually have their equal in sustaining or resisting power: has not the king of the beasts, the majestic lion? Yet there is none to equal him in the "grandness" of his nature.

Our subject (see page 243, ante) is not only king in its qualities when brought into manufactures, but is so in its bearing naturally. The records are closely kept of where it is found, and in what condition, and the result shows that it is discovered in the purest condition of any metal. Most ores yield only a small percentage of even ounces to the ton, but gold is got without smelting, and wherever it exists it is visible to the eye without any artificial process. It is rare that

any other metal is found so; but with "our" metal it is the rule,—from 60 to 99 per cent. of pure metal, and be it marked there is little else but its "consort," silver, taken in its embrace. Californian gold averages of pure metal 875 to 885 per 1,000; Australian ditto 960 to 966. Appended is a list of various proportions, from which it will be seen how little else but silver is there:—

	Gold.	Silver.
Inarowski	6908	3038
Titiribi, Colombia	7400	2600
Teinidá	8240	1760
Ogas, Acaes	8450	1550
Senegal, Africa	8450	1530
Petropawlofski	8681	1319
Chandure, Canada	8973	1327
Riv. Lucio, W. Mexico	8794	1263
Baja, near Pampelona	8815	1185
Liana	8854	1142
California	8961	1005
Beresel	9188	803
Katherenberg	9409	555
Brazil	9490	565
Australia	9543	359
Katherenberg	9581	353
California	9642	358
Katherenberg	9896	016

Although gold has from time immemorial held the way, it is somewhat singular that there are no records of great finds in early times. Russia, until within a few years since, has been most productive, but nothing approaching recent discoveries is recorded, with the exception mentioned below. In North Carolina, a nugget weighing 37 lb. Troy was found; the largest mass as yet from California is 20 lb. In Paragnay a large mass of rock fell down and brought to light pieces from 1 lb. to 50 lb. in weight. In 1842, at Taganka, Russia, a mass was found of 100 lb. Troy, now in the Museum of Engineers, St. Petersburg. Australia eclipses all these by a trifle weighing 137 lb., sold for 5,532*l.*; another from Forrest Creek weighing 27 lb. 6oz. 13 dwts.*

Wherever gold is found it is visible to the eye without tests, we have said,—i.e., found in quantities worth searching for; perhaps its most natural condition is in quartz; here it is observable in small plates bright and pure; the beds of streams and ravines near will abound with it in grains and nuggets—the small plates rounded by friction with rock and stone. The rock, worn away by diluvial or ante-diluvial torrents, detaches the particles of gold, and they are deposited in little hollows of the soil, and their pureness making them very ductile, they get compressed into nuggets. This is the greatest source of supply of gold, and is the system Nature has adopted all over the globe, and one we claim as distinctive of gold; where large nuggets are found apart from these water-courses undoubtedly volcanic heat has been at work. The primeval condition of metals is a wondrous matter to think over. The round of nature in all things that generate can be in some degree marked out, but with inanimate metals it is different; the air is charged with metallic particles, sea water holds metal in solution, the fissures of the earth contain fluids impregnated with oxides of metals, yet among all these gold is not found. Certainly none of the popular metals can claim the same exemption. Scientific manufacturers have brought down its proud spirit, and if nature does not dissolve it, art has done so; and it does seem one of the few things that are new under the sun, that the decomposition should be a great necessity in trade. A large quantity of gold is consumed in photographing and in other ways, never to be recovered in our vision, but to be gathered together again—when? The gases that foster vegetation are set free by the destruction of coal; and vegetation produces coal, recreated, but there is no recreation in one subject (now a king and a subject too!), but simply a reproduction by being brought together; it passes through no different state of being. When Ophir was the source whence the Romans obtained their gold (believed to be on the coast of Madagascar), California and Australia were overlaid with gold: it was not being formed like other products of nature, but lay there grand in its distinctiveness, chaste in its associations, and glorious in its colour. What a wondrous power has the king of metals! There is a great nation now—great in the number of its people, great in its attributes, in their productions, in the space they occupy; but they lack gold, and their credit suffers. It is sensitive, and has been freighted from their shores, for it taketh to itself wings and flieth away at the prospect of disruption.

* *Vida Dana's* "Metallurgy" (American), in which valuable book there is an error in stating that gold can be beaten to 1,230,000ths of an inch in substance; long before it would come to this it would be reduced to powder.

TECHNICAL EDUCATION IN THE MIDLAND DISTRICT.

DURING the past fortnight Mr. Buckmaster, from the Science and Art Department, has held meetings in the different colliery centres near Chesterfield, for the purpose of promoting scientific instruction. These meetings were brought to a close by a conference, which was held under the auspices of the mayor in the Municipal Hall, Chesterfield. There was a large and influential attendance of the principal colliery owners and others interested in the promotion of educational questions. Mr. C. Binns, J.P., from Clay Cross, occupied the chair, and introduced Mr. Buckmaster, who, after explaining the Government scheme, said—"We have been blessed beyond other countries with an abundance of coal and iron, the raw material of our industrial prosperity and wealth. Where nature does most, man frequently does least, and in countries less gifted with mineral riches schools have been established to compensate by scientific instruction for their relatively unfavourable position. Watt saw the importance of this knowledge seventy years ago, and established a school at Soho to teach workmen elementary mechanics and the laws of heat. It is not supposed that abstract scientific knowledge will ever qualify a man to become a bailiff or overman. The practical part of a miner's business must be learnt in the mine; but superior intelligence will distinguish itself in every situation. What do you propose to do? The Government, through the Science and Art Department, is prepared to give very considerable assistance in promoting instruction in those sciences which relate to the industries carried on in this neighbourhood. The first necessity will be a science teacher. I fear it is now too late for persons to prepare for the science examinations which will be held throughout the country next month. Every science teacher, unless he have a degree, must pass an examination in the subject or subjects he proposes to teach. He must instruct a class under the supervision of a local committee. The class must receive not less than twenty-five lessons, and undergo an elementary examination by means of printed questions in the subject or subjects which have been taught, and on the result of this examination liberal payments will be made to the teacher. The pupils of these science classes are encouraged by prizes of books, certificates, medals, exhibitions, and scholarships, and 50 per cent. will be given towards the purchase of apparatus necessary for the proper instruction of the class. Under certain regulations, scholarships of the value of 10*l.* and 15*l.* a year are given to the best boys in our elementary schools. The scheme contains the maximum amount of help with the minimum amount of interference. Through the various meetings I have attended in this district I have fully explained the details of the science regulations and the conditions upon which the State is prepared to help forward a scheme of scientific instruction suited to the industrial and educational requirements of the country. It now remains to be seen what you are prepared to do. If you believe in this instruction, if you believe men are more amenable to reason as they become more educated, if you believe in the growth of that intellectual nature which God has given in various degrees to every man, then I ask your co-operation and help. It is useless for the State to multiply these agencies and opportunities if those for whom they are intended are careless and indifferent. Our unparalled prosperity has not been an unmitigated good; we have not developed in the same ratio as our wealth the culture of humanity. There is one way by which all difficulty can be overcome, and that is, to engage from next October to the end of April a competent science teacher capable of giving instruction in three or four sciences. Such a teacher would move from place to place within a convenient distance from Chesterfield, and teach classes, and from these classes other teachers and assistants would be raised up. Such a scheme has been in operation in East Lancashire, and is now in operation in the colliery districts around Newcastle, and I am informed that the scheme has worked with a success beyond anything which could be anticipated."

The chairman said he should be very sorry if the conference did not come to some practical result. He thought the scheme explained by Mr. Buckmaster capable of doing much good. Mr. Markham, of Staveley, said he should like to ask Mr. Buckmaster what he thought would be a fair guarantee for a science teacher?

Mr. Buckmaster said a teacher could be obtained for a guarantee of 100*l.* a year, but this guarantee must be understood as quite distinct from any payments to the teacher by the Science and Art Department.

The Rev. J. Booth—May I ask Mr. Buckmaster what fees are required of the pupils?

Mr. Buckmaster—This is very much a matter of local arrangement. I find at Staveley and Clay Cross there is a desire, and I believe it is the practice to provide a free elementary education; but any fees paid by pupils of science classes could go towards the guarantee fund. The only regulation of the department is, that the fees shall not be such as to exclude young men, and those who live by manual labour.

The following resolution was passed:—"That this meeting, having heard the explanation given by Mr. Buckmaster, hereby agrees to raise a guarantee fund of 100*l.* a year for five years, for the purpose of employing a competent science teacher, and that this meeting do resolve itself into a committee for that purpose."

In a few minutes nearly half the guarantee, in sums from 10*l.* to 10*l.* 6*d.*, was promised in the room. Mr. Busby was solicited to forward a circular to gentlemen in the district who were not present at the meeting, asking their countenance and support to the undertaking.

SAN ZENONE, VERONA.

SOME days back I was working in the church of San Zenone, when the custodian told me that it was intended to raise part of the pavement above the steps leading to the choir, to see if there were any arches similar to those in the aisles of the church through which the steps lead to the crypt. The two capitals seen in the crypt would seem to indicate the existence of arches at one time in the history of the church. Under the direction of an architect, the workmen very carefully raised some of the marble slabs above the steps, and, to the delight of all present, we discovered the crown of an arch immediately under the pavement. Very carefully removing the sand and rubbish, portions of a fresco were discovered, and then two rows of bas-reliefs similar in form to those on the arches in the aisles. The designs of the bas-reliefs are quite different from those upon the other arches, and they are in perfect preservation, the sharp cutting as fresh as ever, and the colour remaining clearly distinguishable.

Half the arch was uncovered, and upon the spandrel there is a fresco, consisting of scroll work, a large bird, and several figures. The subject is not clearly discernible at present, the other part being no doubt upon the other spandrel still covered; the colours are fresh, and but very little injured. The style of work is similar to that of many others in San Zenone,—very early, the outlines strongly marked, no attempt at gradation of colour, the folds of drapery, &c., simply indicated by lines.

In some places the surface had been broken, revealing the existence of a previous fresco different in design and colour.

This discovery has raised the question of the advisability of opening up the arches, so that the crypt may be seen perfectly from the main point of the church, and restoring the church to the condition it was in before the erection of the steps in the sixteenth century.

Of course the cost is the principal difficulty, unless the municipality undertake the work. There is, indeed, but little chance of its being done unless help can be obtained from other sources.

To open the arches, erect a balustrade above them, and also two small flights of steps in the aisles in place of the large one in the nave, which would seem to have been the original condition of the church by the presence of markings in the aisles, walls of steps on either side, and upon the balustrade to place the statues of Christ and the Twelve Apostles, will cost over 100*l.* English, and the parish of San Zenone is too poor to furnish such a sum.

JOHN BUNNEY.

Post-office Savings Banks.—A return relating to Post-office Savings Banks has just been published. It was moved for by Sir F. Goldsmid, and differs somewhat from the usual return furnished in pursuance of the Act of Parliament, inasmuch as it supplies various additional particulars. It shows, for instance, that the total amount received from depositors, including interest, to the 31st of December, 1868, was 27,153,571*l.* 5*s.* 1*d.*, and the total amount repaid to depositors was 15,186,915*l.* 16*s.* 8*d.*, leaving a balance due to depositors of 11,966,652*l.* 8*s.* 5*d.* The total number of deposits and withdrawals was 11,516,496*l.*, the average cost of each transaction having been 6*s.* 2*d.* Prior to the passing of the Post-office Savings Bank Act, 1861, it was estimated that the average cost of each transaction would be 7*d.*

CARL FRIEDRICH SCHINKEL.*

HAVING the honour to speak about Schinkel, I am rather in a peculiar and difficult position towards you, my professional English friends—peculiar in as far as I do not belong to your great nation, and therefore difficult, as all the profound sentiments and all the different sources of feelings and views, the artistic disposition, and judgment and taste, are generally developed just as differently between two nations as the nations themselves.

Possibly I cannot but speak as a German, which I am proud to be, from a more or less German point of view, particularly when I speak about my countrymen. But I think truth of mind, real nobility of intellect, and independent artistic feelings are coins which have the same value in every part of the world, and amongst every nation, and which do not require a letter of introduction stamped on in the form of the likeness of any king or queen to render them valid, even if it were possible for this to do so. From this cosmopolitan point of view, I will commence the solution of my task, and try to speak to you about a great man, one of the noblest princes of the royal family of superior men of all times.

How shall I do it? Göthe says, "You are like those you understand." In considering these words, I should almost doubt whether I should be able to do justice to the high genius of Schinkel, and should, from the beginning, almost despair of undertaking to depict the material of his intellect, and the forms of its appearing. As I hope to convince you, the material of his intellect was of too high a nature to hear even the ill-founded expressions of devoted admiration; and though full of this admiration as I am myself, I will not trouble you to listen to its effusion, as I cannot approve of the course generally followed in talking about great people. If we never had seen the sun, no talking about its brilliancy and life-creating powers would be able to give us an idea of the blessing spread by the participation of it. Our eyes must see the whole of our being must feel it, by being exposed directly to its action, and will feel it as sure as we are men. Therefore I am sure you will recognize Schinkel's genius as surely as truthfulness towards your best artistic feelings, convictions, and judgment abides in you.

Although Schinkel was an architect principally, I cannot, in characterizing him, first speak of him as such, as it is not his architectural mind exclusively that makes him great; it is far more his philosophic, artistic disposition and profoundness of so high and extraordinary a class which gives us the key to understand him, this solely and totally being the foundation of the structure of his artistic being, the formula for the results of his activity, and the unit for the measure of his merits. It was this high artistic philosophic disposition and capacity which enabled him not only to be a great architect, but also a great painter and a great sculptor, being at the same time gifted with a rare fancy and very great technical talents, and in most of his works, wherever opportunity and circumstances allowed, the architect, the painter, and the sculptor speaks to us simultaneously.

Let us, therefore, first make the acquaintance of some of his æsthetic views and ideas as they come to hand; for instance:—

"Beauty of form is the theory of created things become visible (that is, apprehended by us instinctively)." Or,

"Beauty in form is the logical consequence of recreation grown visible."

"Beauty cannot exist by itself, but only in connexion with objects."

"The vocation of man is to develop the created according to the logical consequences of its laws, and that with self-conviction, and not arbitrarily."

"Independence of thought is increased by the education of the reasonable, sublime, and beautiful. None of these ingredients may be omitted, because even the moral is enhanced by the beautiful, and it is, for instance, of importance whether a beneficial act shows itself with beauty or without. In the first case the act will thoroughly and really render happy and encourage, while in the second it will offend. There is thus an action of the arts on the moral state. The freedom of sentiment represented by certain means through art in the empire of the beautiful excludes every element of egotism."

"The aim of an artist is, that all should parti-

cipate in the delight of the very highest, and this alone is moral and virtuous."

"The beautiful seems to be one of the foundations of the whole existence on which the life of reason depends. Without this foundation it is only a huddle with barbarism."

"Man in every respect should aim at beauty, in order to influence all his motives and render the results of their actions beneficial. Then the idea of duty in a rougher sense will disappear, and he will always act in celestial delight, which is the necessary consequence of producing the beautiful. In other words, every action should be a task of art to him."

Time will not allow me to quote any more, but you will feel through these ideas the spirit of a mind which is able to feel in a highly superior manner, and the aim of which is directed altogether to the idea of the beautiful as the commencement and the end of all earthly and transcendent intentions. Thus he was able to be a worthy priest of art, and of morals through art.

But not only did he preach maxims of this kind on paper or in conversation, but he acted also from this high point of view, and the whole of his works in architecture, painting, and sculpture are only translations of these pure ideas into stone and mortar, into paint and marble. He was a true moralist in art, and as it is impossible for fashion to govern the moral, as moral is unchangeable, equally impossible is it also that Schinkel should have sacrificed any of his art, so holy to him, to do degrading, slavish homage to fashion in art. His philosophical ideas were independent, and so were his artistic creations.

Perhaps they would often have had more the appearance of so-called originality if his intellectual independence had only been founded on the idea of doing something different from what had been done before. This being too low for him, too destitute of high principle and aim, the germs of his ideas were always beauty in its artistic-philosophical sense—beauty of form by its correspondence with natural law—beauty in aim by true, total, and most correspondent fulfilment of requirement.

Before we converse about Schinkel's position towards his epoch, the beginning and middle of this century, in which he lived, we must draw our attention to the state of things as he found them, and to the conditions and circumstances under which he had to develop his ideas and exercise his activity.

The commencement of the nineteenth century signals the latter end of a long and severe illness of the social state of things in nearly the whole of civilized Europe for two centuries previous. All the bands of the general laws of a moral existence had been broken, and the natural consequences were the total loss of consciousness of the nations. The poisoning effect of this was felt everywhere, but, thanks to a wise Providence, the stationary development of affairs now took a favourable turn, and gave the leading nations an opportunity of becoming conscious of their physical power, and thus scattered the seed for a new epoch of formation, which now immediately began.

A feeling of respect for law again prevailed; the state of anarchy was now to be looked upon as belonging to an unworthy past; the illness was overcome; the individual mind of nations began to reflect on the reason of it, in order consciously to be able to prevent its return. Thus a strong and predominant historical feeling is created; philosophers, statesmen, and artists look back to the time and state of things long past away, in order to refresh themselves, to heal the burning wounds late events had inflicted, and to relieve the loneliness and barrenness of feelings by the acknowledgment of their unworthiness.

The recollection of classical times and its spirit did, naturally, not fail to produce its attraction again, being, on account of its everlasting freshness, its simplicity and pure fancy, the most healthy mental food for the state of re-convalescence. But the classical spirit did not only attract again—it soon was cherished and loved. Particularly in architecture we see the leading nations—Germans, French, and English, taking the greatest part in this movement. Since Winkelmann in Berlin, who particularly has the merit of drawing public attention to the remaining relics of the ancients, great praise is due to two Englishmen, Stuart and Revett, for they drew the precious treasures of art to light again, and not only so, but gave them to the whole civilized world, by measur-

ing, copying, and drawing whatever was left to be found of them. Thus the language of forms of the Greek architecture became known again, and the grammatical laws of it began to be understood more or less.

But before this was the case, the grandeur, truthfulness, and beauty of the ancient Greek productions were high enough to fix the attention of the nations firmly upon them; the elements were too new, the idea of reforming or remodelling them therefore very distant, and the long-forgotten charms induced the mind to rest upon them quietly, and enjoy their sunshine.

In England imitations and copies of the ancient buildings soon were seen, and thus, for instance, in London, St. Pancras Church was, in 1819, built in Euston-square, by Inwood. This, singular to say, is an exact copy of the Erechtheion at Athens, at each side of which two imitations of the Pandrosion are given. In order to do the utmost and keep it up to the standing of the day and its customs, the old tower of the winds, the monument of the Andronikos at Thyrre, was placed inside of this Erechtheion, but as it is too small alone, and would not have looked like a somewhat fashionable church tower, the same monument was simply placed again on the top of the first one—certainly an idea about as bright as that of Columbus in making the egg stand.

So is St. Philip's Chapel, by Repton, in Regent-street, merely a copy of Lysikrates's lantern put on the top of an extra clock-case, for the purpose of producing a genuine Greek clock tower; and so on.

These facts seem to be singular, but are quite in accordance with one of the principal English peculiarities; that is, the great respect for everything that has once attained a name and standing, without going deeper into the real cause of the reputation attached to the object. The great weight of so-called authority and real authority has governed the English mind more than any other, and does so still.

Unhappily, nevertheless, the development of classical architecture in England, after the first powerful movement of transplanting it, soon lost its prospects; and very naturally so too, because the spirit of it did only meet an inclination of the public mind, which was interested in making itself acquainted with it, being something new and fresh, imposing, and generally acknowledged. But there was no real sympathy, no natural disposition for the reception of classical spirit, and I venture to say that this will never be very different in England. Nobody could say that this is not as it ought to be—not at all. But the English mind is differently constructed; the English mind is a Gothic mind, and as little as a column or pilaster can do the same service as a buttress, so little is a real English mind suited to possess a real genuine classical architectural disposition.

But, after all, the classical fashion of these days, although it died away, because it did not exceed this state of infancy, had undoubtedly had an excellent effect on the history of architecture in England, as means to a more philosophical way of looking into the æsthetic questions and requirement of architectural constructions.

Thus much about England, whose Gothic architecture has even benefited by it, and now perhaps occupies the first rank in the civilized Gothic world. Let us now see how Germany, and particularly Berlin, the centre of intellectual life in Germany, was influenced by the new movement in architecture.

The effect was similar to that experienced in England as far as the unconditional reception of the refreshing elements of the renewed and completed traditions went, but the understanding with which this was done was very different.

It was generally felt that these traditions were not only to be looked upon as worthy of imitation and a happy and refreshing contrast to the late past; but it was far more felt that they were the source of ideas for the formation of the future, corresponding with the national German philosophical disposition.

Thus no inducement was felt to make an attempt at direct copying only for the sake of copying, but, in fact, an eager study of the alphabet of Greek forms began, in order to be able to read the Greek spirit in artistic form, to learn to understand it thoroughly, to make it the means of education to the artistic views and taste, and thus to lay the foundation for consequent development of ideas and actions resulting thereof. Schinkel was already in his earlier days the bearer, and, perhaps, the leader of these ideas, and the whole of his work throughout his

* By Mr. R. Johns: from a paper read at Liverpool Architectural Society.

life was the fertile embodiment of them. This mental influence was so widespread and intensive that it entirely governed the taste of the day without making it a slave in any respect, the means of his government and his intentions only being true love to art and the highest independence and freedom of thought. His actual endeavours, crowned by rare and extraordinary success, were thus, not only to regenerate Greek architecture, but far more, to form new words and a new language, fit for the use of the present day by means of its best elements. That he did not do this from a prejudicial point of view, but with depth and breadth of genuine artistical tact and nobility of feeling, you will best understand by listening to his own words. He says, for instance, referring to one of his most important works:—

"I followed the simple and superior style of the pure Greek art, which was enabled by an undisturbed development to reject every element strange to its nature; and thus, in opposition to modern art, preserving the character of innocence, used all my mental powers and talents for the most organic formation of details in every part. This totally ideal style, though in direct contradiction to many conditions and requirements of our modern life, was, of course, to be modified accordingly."

"The ideal in architecture is only totally realized when a building entirely corresponds as a whole, and in all its parts, mentally and physically, with its purpose."

"From this alone, it is clear that the ideal is to be modified at every period by its new requirements,—that all the artistic material already inherited by art from the different periods of past history correspond more or less with the requirements of the present day, and therefore must be modified in their application; and it will also be seen that even entire new inventions are necessary to reach the aim, and that in order to

produce a real historic work (not archaeological), not only limited historic matter is to be repeated, which would not produce a new history, but a new matter is to be created, which really allows history to continue."

Again he says,— "It also seems necessary to me to place the different spheres, within which the feeling of an architect must necessarily be formed, distinctly opposite to each other, in order to enable him to survey at the same time the entire extent of his art. At first it is to be taken into consideration what our days require in their architectural undertakings. In doing so we at once commence to criticise the elements in these undertakings. We try to learn which are congenial to the spirit of the day, and which are not, and whether the undertakings of this kind are infringed by wrong views, prejudice, ignorance, want of fancy, and suspicion of new inventions suitable in assisting to remove and overcome difficulties connected with the undertaking."

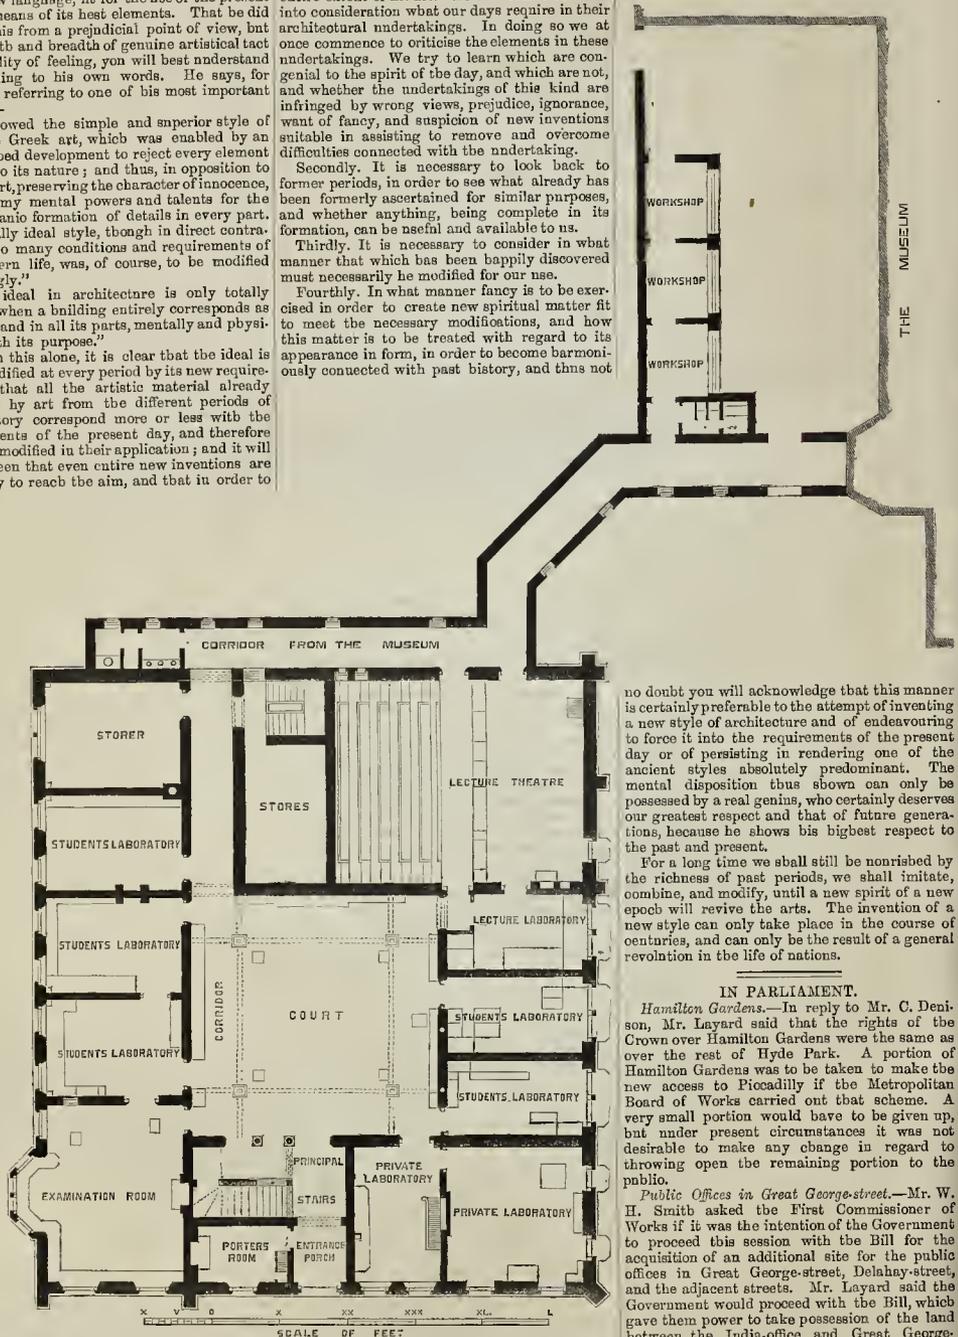

Secondly. It is necessary to look back to former periods, in order to see what already has been formerly ascertained for similar purposes, and whether anything, being complete in its formation, can be useful and available to us.

Thirdly. It is necessary to consider in what manner that which has been happily discovered must necessarily be modified for our use.

Fourthly. In what manner fancy is to be exercised in order to create new spiritual matter fit to meet the necessary modifications, and how this matter is to be treated with regard to its appearance in form, in order to become harmoniously connected with past history, and thus not

only preserve the style in the work, but much more, in a beautiful manner, combine the charm of novelty with the feelings of the style impressed upon the spectator. Thus a happy creation of the present day results, particularly enhanced in its charming effect by the acknowledgment of the primitive style."

In these remarks you will certainly see very delicate treatment of one of the most serious questions of art of the present day, and I have

THE CLARENDON LABORATORY, OXFORD.

Plan.

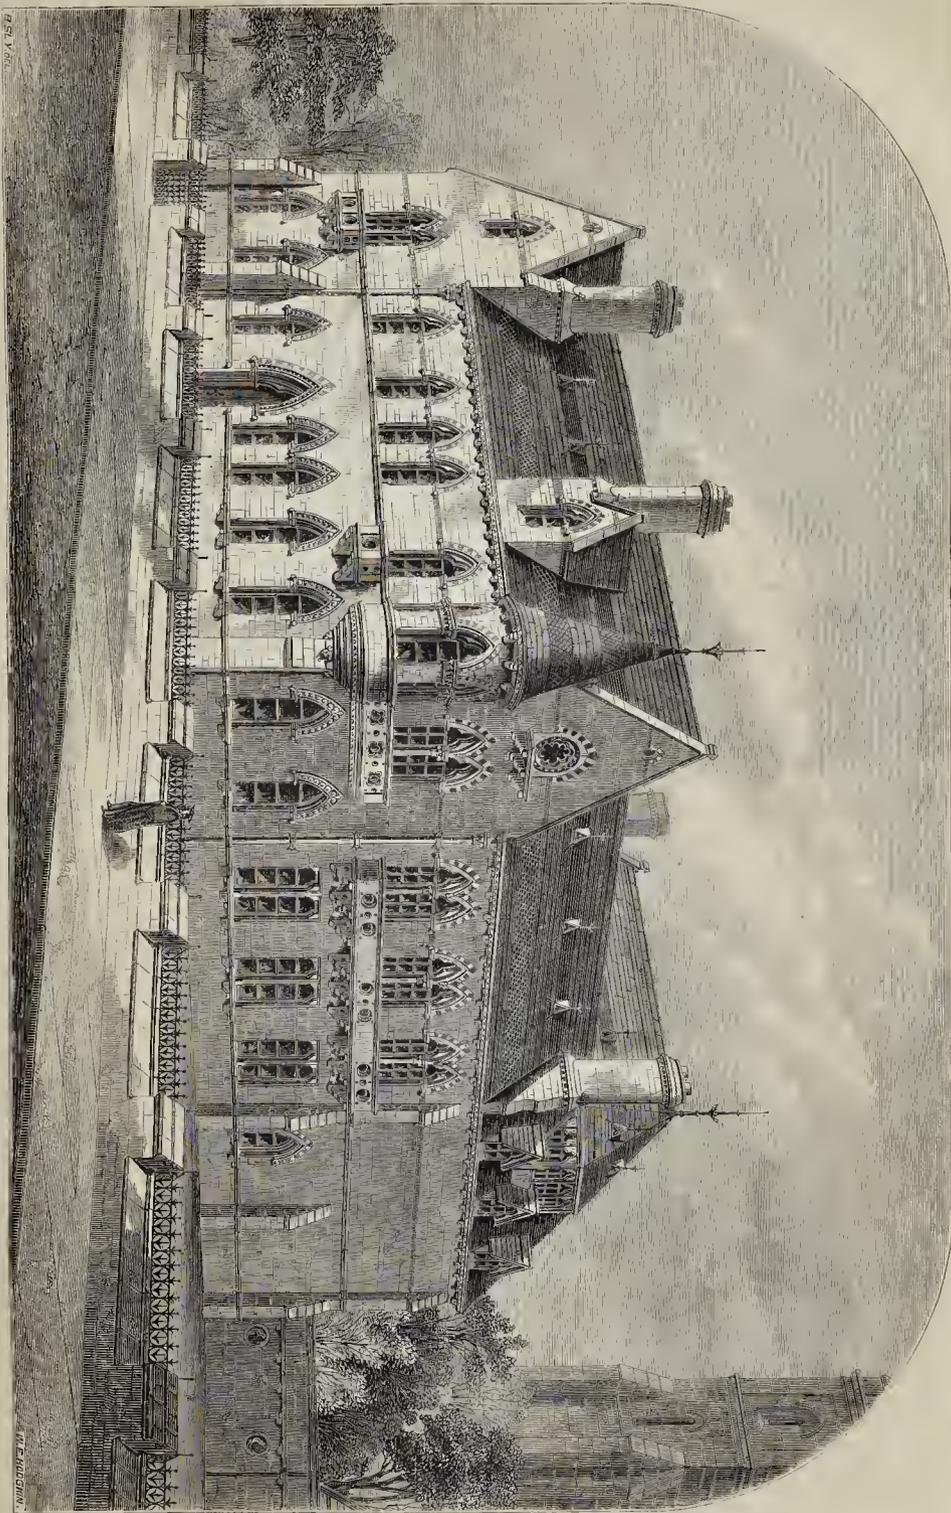

no doubt you will acknowledge that this manner is certainly preferable to the attempt of inventing a new style of architecture and of endeavouring to force it into the requirements of the present day or of persisting in rendering one of the ancient styles absolutely predominant. The mental disposition thus shown can only be possessed by a real genius, who certainly deserves our greatest respect and that of future generations, because he shows his biggest respect to the past and present.

For a long time we shall still be nourished by the richness of past periods, we shall imitate, combine, and modify, until a new spirit of a new epoch will revive the arts. The invention of a new style can only take place in the course of centuries, and can only be the result of a general revolution in the life of nations.

IN PARLIAMENT.

Hamilton Gardens.—In reply to Mr. C. Denison, Mr. Layard said that the rights of the Crown over Hamilton Gardens were the same as over the rest of Hyde Park. A portion of Hamilton Gardens was to be taken to make the new access to Piccadilly if the Metropolitan Board of Works carried out that scheme. A very small portion would have to be given up, but under present circumstances it was not desirable to make any change in regard to throwing open the remaining portion to the public.

Public Offices in Great George-street.—Mr. W. H. Smith asked the First Commissioner of Works if it was the intention of the Government to proceed this session with the Bill for the acquisition of an additional site for the public offices in Great George-street, Delahay-street, and the adjacent streets. Mr. Layard said the Government would proceed with the Bill, which gave them power to take possession of the land between the India-office and Great George-street. It was intended to exclude from the Bill certain houses in Great George-street, Delahay-street, and Duke-street, according to the deposited plan.

THE CLARENDON LABORATORY, OXFORD MUSEUM.—Mr. T. N. DAVIS, ARCHITECT.

CLARENDON LABORATORY, OXFORD.

THE museum built at Oxford, under the direction of Messrs. Deane & Woodward, a few years ago, attracted, as our readers will remember, much attention, partly because of its architectural character, partly because of the battle which raged in the University between the New and the Old as to the introduction or exclusion of complete means of scientific education. It seems strange that already within ten years the fine accommodation requires extension. The department of physics, ably presided over by Professor Clifton, F.R.S., is to be wholly remodelled—indeed created. Mr. T. N. Deane, who also designed the new buildings at Christ Church, is the architect of the work. The funds were provided by the judicious wisdom of Mr. Gladstone, Lord Carnarvon, and Sir William Heathcote, trustees of a fund left by the great Lord Clarendon, and arising from the sale of his works. The fund had been long accumulating, and in consequence of the terms of the will the disposal of it came absolutely into the trustees' hands. Looking at the needs of national scientific education, they acted wisely in erecting the Clarendon Laboratory for the study of physics, the most precise and the most fundamental of the circle of natural sciences. The building is arranged to meet the requirements of the three courses into which the study of physics must be divided, viz., experimental lectures on the principles of the science, mathematical lectures on the physical theories, and practical study of experimental methods.

In the portion of the building to be used as the Laboratory, arrangements have been made for properly fixing the different instruments used in accurate experiments, the apparatus required for each branch of physics being placed in a separate room. A student wishing to use any instrument, will perform his experiments with the apparatus thus fixed, and will not move it to a place allotted to himself; in this respect a physical laboratory must differ from a chemical laboratory, as it is often impossible to move physical apparatus without causing great delay, and often injury to the instrument.

On the ground-floor, the theatre for experimental lectures occupies the east side, and is joined at the south end by a store-room, to be used also as a laboratory for preparing experiments for the lectures; joining this on the south side, are two rooms for spectrum analysis and radiant heat. At the south-west corner and half the west side, are the private laboratories of the professors, and the remainder of the west side is devoted to the entrance passage, the porter's room, and the staircase. At the north-west corner is the room for instruments used in weighing and measuring; and joining this, on the north side, are two rooms for heat, one room for static electricity, and a room for acoustics. On the first floor, on the south side, is a large room for the study of optics. At the south-west corner is the private room of the professor, and joining it, on the west side, the library and students' common room. At the north-west corner is a lecture-room for theoretical lectures, and on the north side are the rooms for dynamic electricity.

In the roof of the west side is a long gallery for optical experiments, and over the south end of the theatre are the photographic rooms.

The central space, which is open from the ground to the roof, and is surrounded by a gallery, is to be used for storing the apparatus which is not in use; and in it experiments, for which a considerable height is required, are to be performed.

The basement contains a room for the study of magnetism, store-rooms, and battery-rooms.

Some small workshops are attached to the main building, and a covered passage connects it with the museum.

The theatre will accommodate 150 students, and forty students can work simultaneously in the laboratories. The cost of the building will be about 10,300. The builder is Mr. Symm, of Oxford; the local superintendent, Mr. Bramwell.

OBITUARY.

THE Liverpool local papers recently announced the death of a lady whose talents may well call for a passing tribute in the pages of a journal devoted to art generally, and specially to art in connexion with architecture. The family to which she belonged was already known to those who take interest in art; and the names of Mrs. Samuel Huggins, as a critical writer on archi-

lecture, and of Mr. Wm. Huggins, as an accomplished animal painter, will be familiar to many readers of the *Builder*. Their sister, Miss Sarah Huggins, whose sudden and unexpected death will have been a source of regret to all who knew her or her works, shared the artistic talents of her brothers, though not their reputation, except among a comparatively limited circle. Debarred by weak health and a retiring disposition from competing on equal terms with others in the race for distinction, she nevertheless followed her art as perseveringly and conscientiously as any of those more favoured and stronger labourers in the same field who work under the eye of a critical public. Miss Huggins turned her attention, in the first instance, to the depicting of flower and fruit subjects, in which she showed remarkable truthfulness of tone and colour, and extreme delicacy and finish in details: qualities which she afterwards carried to even greater excellence in her "still-life" compositions. She did not perhaps possess the dash of some of our better known water-colour artists, and which they turn to such account; but her truthful adherence to nature, and her exquisite colour and finish, rendered her works highly acceptable to those who would rather be pleased than astonished.

Her residence in Chester for some years, within reach of numerous subjects for picturesque architectural studies, led Miss Huggins to turn her attention to architecture; and such was her natural versatility of talent, that she succeeded at once, in this new walk of art, as completely as she had before succeeded in the totally different class of studies previously alluded to. Her interior views of Chester Cathedral, and of other buildings in and about Chester, and more recently also in the neighbourhood of Liverpool, exhibit a union of general effectiveness combined with the most accurate and finished representation of detail, such as is very seldom met with in drawings of this class, even by artists of much higher pretensions. Most particularly remarkable was her truthful representation of texture in the various material of a building; brick, timber, and stone, in all states of decay and weather-staining, being imitated with the utmost reality, yet without any undue or over-minute touching. Every one who has attempted the colouring of architectural interiors will understand the difficulty of accomplishing this.

Miss Huggins had exhibited pictures regularly for some years in Liverpool, and in most of the provincial exhibitions, and also occasionally in the Royal Academy Exhibition; which latter circumstance may be a sufficient guarantee of her talents with those who have no other means of judging. Some of her works had also found their way into the principal houses in the neighbourhood of Liverpool, but owing, as before observed, to ill-health and a reluctance to put herself forward, her talents were left to be mainly recognised by the generosity of her brother artists, from whom she enjoyed much sincere individual appreciation; and many distinguished artists might be named who were among the admirers of her works, and who held and expressed a high opinion of her powers. Indeed, all those who have seen her works, and who know anything of art, will feel that this short tribute to her memory is not undeserved or uncalled for; and it will not be thought out of place, in a journal like this, to call attention to the merits of one of that class of quiet, conscientious, and painstaking art-workers, whose labours are none the less genuine and worthy, though their praises are not in everybody's mouth; more especially when, as in the subject of the present remarks, talent and industry have been combined with a character and conduct exemplary in every relation of life.

H. H. STATHAM, Jun.

NOTE ON SCIENTIFIC ORIGIN OF ARTISTIC NOTIONS.

THERE are perhaps few things more striking to Englishmen in Roman Catholic countries than the frequent representation of the Crucifixion. Every church and place of worship has pictures or models; even the roadsides are adorned with effigies of the same subject.

In some parts of the Rhine valley this is particularly noticeable; a region luxuriating in madhouses, there these mournful signposts stand, at every turning of the road. There they stand of wood or plaster, gilded and plain, red and yellow, a warm flesh colour and ghastly, the

pure white bodies stained with huge, hot-looking red blood streaks; every freak of the artist's imagination leads him to devise some new horror. But the most frigid of all, the most exceedingly horrible, is one painted wholly in blue, *icy cold*. Even on a hot summer's day the impression is a lasting one; the fearful appearance of that blue Christ is not easily to be forgotten.

That colour has meaning is perhaps one of the simplest and most easily believed in of artistic propositions; and the expression of that meaning has for some time past developed itself into an art. It acknowledges that reds and yellows are warm tints, and that blue is a cold one. It is this one little undisputed law we would concern ourselves with just now. How can the rule be accounted for?

One of our most celebrated essayists, Blair, accounts for this and many other items in taste by supposing that at some primitive period individual taste of a majority assigned such meanings and such arbitrary rules, educated them, strengthened and confirmed them to posterity. To account for such laws,—for laws we admit them to be,—simply by perception and consciousness, is somewhat vague and unsatisfactory; and now that we are admitted more fully into the secrets of science, it is needless to build on so slight a foundation.

It is very gratifying to one's innate consciousness, however, that modern science fully confirms that which perception has already supposed. Newton's theory of the composition of the colour of bodies was the result of laborious experimenting, and his conclusion was that white light is not homogeneous, but formed of several lights unequally refrangible, which he called *simple* or *primitive* lights. It is owing to their difference in refrangibility that they become separated in traversing the prism.

On this theory, too, by a process called "diffusion," bodies decompose light by reflection, and their colour depends on their reflecting power for the different simple colours. Those which reflect all colours in the proportion in which they exist in the spectrum are white; those which reflect none are black. Between these two limits there are of course infinite tints, according to the greater or less extent to which bodies absorb some colours and reflect others. The red colour of a geranium is caused by its absorbing all the rays except the red, which are irregularly reflected in all directions.

Like the solutions of all the greatest problems in science, that belonging to our subject is exceedingly simple. Why is red called a warm colour? Why should a blue figure produce such a chilling effect? Science affords a clue to the mystery. These rays may have their respective heating powers tested, and it is found that the reds and yellows absolutely do possess the greatest amount of heat, and the blues the least. With a sensitive thermometer, the result will be striking. Where the blue ray mark will be but 58° Fahr., in the yellow it will have reached 62°, and a little beyond the red it will be 79°.

Some, among others Mellorie, have found the greatest heat in the yellow ray; but this seeming discrepancy is, in truth, none. An analysis of our sensations will show us that both red and yellow produce a sensation of warmth, the different states of our nerves corresponding to the difference in media through which the rays have been examined.

A scientific proof may be thus afforded,—a thing needed by many,—that our artistic notions are not founded upon the mere arbitrary whim of some leader among men, or upon the power of a majority to influence the education of impressions.

To this test must all our notions come. Will science substantiate them?

Even in this century of education and enlightenment there exist still a few whose rule of life is "I know what I like," and who look upon artistic laws and rules of art as creations of fanciful, and wretched conceited and egotistic, brains, and who delight in having things done "my way."

From these emanate that Icelandic Tartarus, a blue drawing-room; in this refrigerator style a study may still be seen in Kensington; and the old blue drawing-room of Hampton Court may still, though hut in pictures, freeze the spectator.

These matter-of-fact unsensitive men are, however, convincible by a thoroughly good scientific proof, and souls deaf to a discord and blind to the appeals of a sunbeam are still willing and able to stride up, to, and knock till they are opened, the wide, willing doors of scientific research.

S. S.

THE PRINCE CONSORT'S STATUE FOR
THE NATIONAL MEMORIAL.

SIR,—As the memorial in Hyde Park approaches completion, the guise in which we are to represent the figure of him to whom it is raised becomes a matter for serious consideration.

As no decision upon the subject has been arrived at, and no sculptor, so far as I am aware, been entrusted with the task of designing the statue of the Prince, I feel myself free to offer the following remarks upon the question, which have been suggested by the perusal of a brief pamphlet by Mr. Bell, of Kensington, who is now engaged upon one of the marble groups of sculpture to be placed at the base of the memorial, and an inspection of a model for a figure of the Prince designed by the same gentleman.

The central figure in the Hyde Park memorial whatever its design, must be viewed in two aspects, in relation to the Prince, as a good and fitting representation of him, and in relation to the edifice in which it is placed, as in harmony with the sentiment that pervades it, and in conformity with his leading architectural features. At the first blush only two attitudes of the figure suggest themselves as possible,—an erect and a sitting attitude. By the almost universal consent of all men whose opinions on the matter are worth listening to, the standing figure is deemed inadmissible,—not only because there would be a greater chance of failure in a standing than in a sitting figure, but also because the attitude would signify nothing in the Prince's bearing, person, or character, that a sitting posture would not signify equally well, while the latter would be more dignified than an erect attitude, and more in harmony with the style of building, the repose by which it is characterized, and the nature of the memorial.

But granting that of the two attitudes the sitting is preferable to the erect, yet, if we are desirous of something more than a mere facsimile effigy in marble, if we look for something that shall impress us with an idea, however feeble, of the virtue and goodness of the man whose virtue and goodness we would specially commemorate, will a sitting figure give us that something? I think not. Spiritualize the countenance as much as we will, we cannot, without the aid of some startling gesture, some striking facial expression (both in this instance inadmissible), cause a seated figure to represent anything more than a man seated. How is a figure in a sitting posture, whose features must evidence no strong emotion of the mind, but must, on the contrary, be cast in a mould of dignified and placid repose, to signify the possession of virtue or goodness in the man it represents, however correct it may be as a likeness? A man in the flesh cannot, by sitting in an attitude of dignified repose, impress a spectator with an adequate idea of his humility, his piety, his preference of virtue to vice, or his love of the fine arts, even when permitted a considerable play of the facial muscles; much less, then, a man in marble, who has no muscles to move.

And if a seated figure, such as I have described, would not satisfy us viewed as a representation of the good Prince whose memory we would perpetuate, neither, looking at it in relation to the edifice in which it is to be placed, would it fulfil the requirements, æsthetic and architectural, of the situation.

The general character of the memorial is ecclesiastical, or, more correctly perhaps, devotional. It points heavenwards; it is surmounted by the emblem of our faith: in the absence of the groups of sculpture symbolical of the four quarters of the globe and the various departments of art, science, and industry, we should not hesitate to pronounce it a funeral monument: as it is, we should prefer to call it a shrine. To accord, therefore, with the character of the edifice, the figure should be in some sort spiritualized. But how are we to spiritualize a sitting figure except by making an idol of it? Were we desirous of erecting an object of worship,—an idol,—we should fashion a seated figure, and raise a shrine over it. But while the memorial is designed to perpetuate the remembrance of the virtues of a good man, it is not raised to his glorification. The object we have in view is not to exalt the creature at the expense of God, but in all meekness and reverence to honour God through the creature.

Apart, however, from these considerations which probably will not have much weight with a numerous class of men who affect to despise what they would term the sentimental sculpture, there is a serious architectural objection to a

sitting figure. It would be too low. There would be so much space between the head of the figure and the canopy that the latter would be rendered unnecessarily heavy. It is true the figure might be elevated, but this could only be effected by raising the pedestal to a height out of proportion not only to the statue itself but also to the structure in which it is placed.

Again, in every building of a pyramidal form (and if we draw straight lines from the four corners of the base to the top of the cross, we shall enclose a pyramid) I believe it to be an admitted rule that all interior pyramids similarly formed by drawing lines from a conspicuous point in the central line or axis to other conspicuous points outside that line shall, if produced, have their bases either coincident with or wholly within the base of the exterior pyramid. Thus, taking the statue of the Prince as the most conspicuous object through which the central line or axis runs, if we draw straight lines from the head of the figure to the apex of each of the four secondary groups of sculpture immediately beneath it, and produce them in the same direction, they ought to fall within the area of the base of the exterior pyramid. With a standing figure they would fall within it, but with a sitting figure they would fall without it. If, therefore, the rule I have assumed to exist be good, a sitting figure is inadmissible, and I have shown that a standing figure would, for many reasons, be less satisfactory than a sitting figure; therefore, both attitudes, in my judgment, are excluded. What possible attitude then remains? I will leave Mr. Bell to tell us in his own words:—

"In this country, which too frequently selects that its memorials should be prosaic, it may appear a bold proposition to suggest that the statue of the Prince should kneel: and possibly were he still in life, some objection might be raised to it; but now that his good lies before us complete, it appears the only attitude that can fully express the sentiment of religious duty that informed his actions."

In the model of the kneeling figure designed by Mr. Bell, the Prince is represented as a Christian knight clad in armour. The surcoat bears the Royal arms quartered with his own, and over all the mantle of a Knight of the Garter falls in graceful folds. The head is bare, and inclined slightly forward, and the hands are crossed over the breast grasping a sword on the blade, on which is engraved the Prince's motto, *Treu and fast*.

The artist, in a short printed description of the figure, says:—

"The general form, as a mass, is symmetrical, and in all views the head is central; exactly so in the front and back views, and only slightly forward of the centre at the side views to the degree of inclination of the head, which I conceive is just. It is adapted to be looked at in all views, and from close beneath as well as from a distance."

The only question in my mind is whether viewed in front, even from a little distance, the figure would not have the appearance of being cut off at the knees, or just above them. Not to say that a capricious critic would be apt to liken the figure to that of brave Widdrington, of whom we are told that when his legs were both cut off he fought upon his stumps, it must be remembered that where an unusual attitude is adopted, the eye or the mind does not in fancy supply what is not actually visible, but, on the contrary, rather notes its absence. The knees of a man who is kneeling attract our attention more than any other part of his person, because we do not often in private life see a man in such an attitude; not so, however, with the feet of one who stands or sits. In the case of a sitting figure the feet are frequently hidden by drapery; at any rate, when from the position of the statue they are not immediately visible, we mentally supply the omission. However, to carry out the argument to its logical conclusion, custom, or use, the continued presence of the kneeling figure would do away with the novelty, and so remedy the defect, if defect it be.

Considered in relation to the edifice a kneeling figure would in every way be more suitable than a sitting figure. It would, in the first place, stand higher, and so lessen the space between the head of the figure and the canopy,—no unimportant matter, as we have shown on architectural grounds. Then it would accord better with the general design of the memorial, and be in greater harmony with the sentiment of the whole composition. Not that on this account we anticipate a more favourable reception for the proposition from the non-artistic public, since as a nation we do not understand sentiment either in architecture or sculpture. We fall in love with something glaringly unreal,

because it is pretty and catching, like Marochetti's *Cœur de Lion* in Old Palace Yard, or else we run mad after something positively ugly, because it is prosaically real like Mign's *Reading Girl*.

Were the present proposition carried into effect there would be plenty of people who would wish to be informed why the Prince should be represented as saying his prayers, or why so peace-loving a man should be clad in armour utterly ignoring the symbolism of the design, or really ignorant that the knight in armour kneeling, not necessarily in prayer, but in a devotional pose, is typical of the Christian who having fought the good fight against sin boldly and manfully before the world, kneels meekly and humbly before the God in whom he trusts to receive the reward of his piety and valour.

So much eulogy has been lavished upon the Prince, that many people are inclined now to run into the opposite extreme, and declare him to have been greatly overrated. They tell us that the high position he occupied placed him above the temptations to or which beset ordinary mortals, but forget that the very position which exempted him from some, exposed him to other and no less dangerous temptations. But he resisted them all. Instead of aspiring to the acquisition of political power, he was content to stand outside the arena of public life; and, although conscious that in genius and ability he need yield to none of the statesmen of the day, he never permitted himself to oppose, or even to interfere with, the counsels of the constitutional advisers of the sovereign. With every excuse afforded by the tradition of courts and the practice of princes for pursuing a contrary course, he led a pure, chaste, and blameless life, and, by his example and personal influence, materially aided the Queen in her determination to diffuse a more healthy atmosphere and a purer moral tone than had existed in previous reigns over those high circles of society of which she was the centre and their visible head. How effectual for good the personal influence of the Prince was, let the rapid deterioration in manners and morals among the upper classes since his death bear witness.

It cannot, therefore, be considered unfitting that a man who, resisting the temptations of the flesh and the world, practised an active Christianity in a situation where it is seldom more than professed, should be handed down to posterity in the National Memorial under the figure of a Christian knight. While, then, I agree with Mr. Bell, that his proposition is a novel one in the present state of art in this country, I cannot but commend his boldness in putting it forward. C. C.

COLUMBIA MARKET.

SIR,—I was induced by what I had read as to the beauty of the new market to go and see it on Saturday evening last. Curiosity, no doubt, had drawn a large number of persons there, mostly of the working classes, who perhaps intended also to obtain therefrom the Sunday's dinner. On entering, the first impression as to the general appearance was favourable, but disappointment as to the supply was soon felt. Mingling with the crowd, I could not help hearing frequent expressions such as "We can get better and cheaper at home." The butchers' shops, scattered on three sides, are not numerous, and the width of the colonnade is so narrow that the crowd made it anything but pleasant to stop to purchase. This of course will not always be so, though of a Saturday night inconvenience will be felt. One butcher's shop, which certainly had a very clean and respectable appearance, caused some jocosse bantering,—the beautiful-looking legs of mutton hung all round the interior were *dummes*—capital specimens of art!—but the good-tempered salesman outside met the jeers with which he was now and then assailed with astonishing equanimity as he endeavoured to obtain customers for his real provender. The best supply seemed to be in the vegetable market: good fresh broccoli were sold at 2d. to 3d. each, and secured a large demand. The open spaces was occupied by the usual itinerant vendors of miscellaneous articles, shouting amid the occasional crack of the "shot for nuts," and making the place ring with the hubbub of a country fair.

The hall, grand as it may be in an architectural sense, has the appearance of a cathedral planted on one side. "What is the use of it?" some bystanders asked. Why spend so much

money on such an immense building, the interior of which is dwarfed by a few small shops cramped into the sides like so many porches? The polished granite columns, no doubt, are the admiration of everybody, and the vast expanse above seemed to add to the solemnity which such a building usually creates; at least, there was a feeling that the edifice had something of a sacred character about it which the Gothic arches and their inscriptions tended to confirm. By the bye, why should the mottoes and inscriptions be carved in such letters as but few can read? Surely in a place intended for the education of the unlettered, the plainest type should be employed, and not such as at best of times are a puzzle and an enigma? Contrast, for instance, the inscriptions over the entrance of the outside of the hall with those of the Market-house inn by its side. Two figures are supporting the mottoes—

The Sober
The Vigilant | The Useful
The Courteous

in such letters that it is almost impossible to make them out. While I stood endeavouring to decipher them, two or three persons told me they had tried for several minutes to do so, but had failed. Now, having rubbed your eyes over this attempt, look on the left,—“The Market House: Combe & Co.’s Entire,” in plain bold gilt letters that everybody can read. It is quite a relief. (The House, by the bye, was crammed with customers, who thus demonstrated that the market contained a stimulant!) It almost looked as if the advice to “be sober” was sinking into the eye of the presence of such company. Even the “Lodgings for a Single Man” chalked on one of the upper windows of the inn by a domestic painter was understood with greater ease than the Gothic hieroglyphics of the scientific carvers. When the romance of the illuminating lamps is worn off, and the centre gas lamp is duly lighted, in conjunction with the present good supply of gas in the shops, business no doubt will be carried on with spirit, and the inhabitants find it advantageous to make their marketing there; but people will not go from home and their own neighbourhood without the inducement of a large, cheap, and good supply, better, perhaps, than they can elsewhere obtain.

ONE OF THE PEOPLE.

THE NATIONAL ARMOURY IN THE TOWER.

For some years, persistently and alone, we have set forth the unsatisfactory, not to say disreputable, condition of the national armoury in the Tower of London, and have called for the appointment of a competent person to bring it into proper order, and to maintain it in a state of efficiency worthy of the country, and in which artists and the public are entitled to find it. It gives us great satisfaction to be able to announce a step forward in the direction we have pointed out. Mr. J. R. Planché, Somerset Herald, has been appointed by the Government to arrange the collection. An order has been sent to the Tower that he is to have all assistance necessary, and he has already made a preliminary survey previously to reporting to the Government what he considers should be done. At present nothing is fixed as to a permanent appointment, but the authorities having now had their attention fairly roused, will scarcely fail to recognise the necessity of this step. With Mr. Planché for superintendent, and a proper use of the funds which the sight-seeing public and art-loving students furnish, and will, of course, supply to a greater amount than ever, we might hope soon to have one of the finest collections of arms and armour in the world.

THE TRADES MOVEMENT.

Lancaster.—A notice recently given by their employers by the operative stonemasons of Lancaster, requiring a reduction in the hours of labour, has come into operation. An interview between the parties took place, the result of which was, that the masters refused to accede to the demands of the men. The building trade of Lancaster was never known to be in a more flourishing condition than it has been of late.

Leeds.—In connexion with the dispute in Leeds, it would seem that there is a very general feeling of antagonism amongst the plumbers to the proposals of the masters, and especially as regards the hour system. There is, however,

no trade society in the town, and up to the present time no organized opposition has manifested itself. It is thought that they will be mainly influenced by the action taken by the masons and plasterers, and should these strike, or, as the men say, be locked out, the result will be, that building operations will be practically at a standstill.

York.—Apprehensions entertained that there would be a general strike among the operatives employed in the building trades here have not been realized; but although the masons as a body have resumed work, and stated that they are satisfied with the proposition of the employers to pay them 6½d. per hour in summer, and 7d. and 7½d. per hour in winter, which would raise the wages about 4d. per week in summer and 10d. per week in winter, amounting in the former period to 11. 10s. 4d., and in the latter to 11. 7s. 10d. The bricklayers, or at least those of them who were dissatisfied with 6½d. per hour in summer and 6½d. per hour in winter, have not so readily made up their minds. They have held two meetings with closed doors, but it is believed that they have arrived at no definite result. A number of the bricklayers, however, have no connexion with any association.

Sheffield.—Some time ago notices were given to the operative carpenters and joiners of this town, that after the 1st of May, the employers intended to introduce the hour system. Several deputations from the employers and the operatives have since met. At the first interview the employers submitted a new code of working rules, but these were rejected by a general meeting of the men, and a modified code was prepared, and laid before the deputation. The men stated that they were only authorised by the constituents to ascertain the requirements of the masters, and to report the result to a general meeting. On behalf of the employers it was stated that they were prepared to submit the matter to arbitration. The deputation reported the result of their conference to a meeting of about four hundred operatives. It was affirmed that the employers were not at one as to the hour system, and it was contended that no sufficient reason had been advanced for disturbing existing arrangements. After an animated discussion, it was resolved to reject the hour system altogether. With respect to arbitration, it was contended that, unless the employers were united no permanent advantage could result from that course, as it was believed a majority of the masters look with little favour upon the proposed change, being generally satisfied with the existing system. A resolution was subsequently adopted, requesting the men in each shop to appoint deputations to wait upon their employers, and the meeting was adjourned.

Bradford.—There is every probability now of a lock-out in the building trade at Bradford, the operative stonemasons having refused to confirm the agreement which their deputation had come to with the deputation of their masters in so far as that agreement relates to payment by the hour and the employment of machine-worked stone; and the meeting of masters resolved to publish the whole of their correspondence, and to fall back upon their original notice, expiring on the 3rd of May, though still willing to refer the dispute to an arbitrator, and to abide by his decision. The lock-out has since taken place.

Miscellaneous.—There are partial strikes or lock-outs of masons at Bolton and Wolverhampton. The strike among the Huddersfield masons has been averted.

Darlington.—The wages question in the North of England iron trade has been under consideration by a Court of Conciliation and Arbitration, with Mr. Rupert Kettle as arbitrator. It is understood that a compromise had been offered on both sides, which has resulted in some advance of wages. The proceedings were private.

PROPOSED INQUIRY FOR IMPROVING THE INSTITUTE.

THE annual meeting on Monday night was pleased to grant me a special general meeting, at which to offer the proposal that a committee be appointed to inquire into the operations of the Institute generally, and to suggest measures for increasing its efficiency. Owing to want of time, all I was able to explain was that as the Institute has now existed for nearly forty years, without any considerable modification of its original system, it might be thought only reasonable to expect that various improvements, chiefly per-

haps of detail, would, on inquiry, be found desirable, in order more completely to adapt its operations to the advanced and still rapidly advancing condition of professional affairs. I was very glad to find the proposition not only cheerfully entertained, but I may say universally and hopefully approved. What I beg you to permit me now to say is that I should be happy to receive from members and friends of the Institute, the profession, and the art, such opinions as they may think fit to entrust to me, in order that I may prepare myself to introduce the formal motion for the appointment of the committee with as wide a knowledge as possible of what is really floating in people’s minds. With its large and influential membership, its high public character, and its established financial prosperity, I cannot help thinking the Institute of Architects might do a great deal of useful work; and any suggestions to this end, if addressed to me in writing, I shall be very glad to consider.

ROBERT KEEL.

22, Old Burlington-street.

LAMBETH INFIRMARY COMPETITION.

WE understand that the Board of Guardians have adopted Mr. Hunt’s award in the above, giving the first premium to Mr. Wilson, the second to Messrs. Stenning & Lepard, and the third to Messrs. R. E. Tyler & Chester Foulsham.

THE GREAT BELL OF MOSCOW;
OR, TZAR KOLOKOL.

ACCORDING to the best authorities, the present “Tzar Kolokol,” or King of Bells, was made in 1733-4, and subsequently suspended over the spot where it was cast, at no great height from the surface of the ground. It hung by immense beams and cross beams, and was covered by a wooden edifice, which having caught fire in 1737, the bell became hot, and doubtless was cracked in consequence of cold water being then thrown upon it in order to extinguish the fire.* It fell to the ground, and a large fragment about 6 ft. in height, was broken out of it. There it lay for many years; but in 1837 the Emperor Nicholas caused it to be removed, with the broken fragment, and placed upon a noble pedestal of granite, standing near to the tower of Ivan Veliki, where it is now to be seen, being surmounted by a hall and cross.

With respect to the dimensions and weight of this “mountain of metal”—which would make about a dozen “Big Bens,”—instead of filling several columns with the loose and conflicting statements of various writers, I will give an extract from Lyall’s “Character of the Russians, and detailed History of Moscow,” London, 1823:—

“The different methods employed in taking the measurements account in part for the variation of the statements of different authors.”

* According to the scale of the plate and accompanying section, copied from those of the emperor, the diameter at the mouth of the great bell is 21 feet 8 inches; consequently its circumference must be 65 feet, or 21 yards and 2 feet; its height, not including the top, through which the beams pass for its suspension, is 17 feet.”

Dr. Lyall also tells us that Mr. Murray, the engineer, examined the bell with the most scrupulous attention in 1817, by desire of Mr. Wilson, of Alexandrovskii; and that

“Mr. Wilson himself copied the inscriptions, which I have verified, and which, when compared with those on the same sheet with the drawing executed for the emperor, were found to correspond, notwithstanding that a few words on the bell were almost illegible.”

The following are the inscriptions on the bell, as translated in the work above mentioned:—

“By order of the blessed and eternally worthy of memory Great Godour, Tzar, and Great Duke, Alexei Nicholavitch, Autocrat of all Great, Little, and White Russia, this great bell was cast, for the chief cathedral, dedicated to the honorable and famous Assumption of the most holy Mother of God, containing eight thousand pounds of copper [and tin], in the year 7188 from the creation of the world, and from the birth by the flesh of God the Word 1654. It began to announce divine service in the year 7167 from the creation of the world, and in the year 1701 [1700] from the birth of Our Lord; in which year, on the 19th June, in consequence of a great fire which happened in the Kremlin, it was damaged.”

“Till the year 7239 from the beginning of the world, and the year 1751 from the birth into the world of Christ, it remained mute.”

* Four of the peal of bells at Oundle Church were cracked under somewhat similar circumstances in August, 1838.

"By order of the most pious, most potent, and great Gosudarina, the Empress Anna Ivanovna, Autocratess of All Russia, in glory of God, in the acknowledged Trinity, and in honour of the most holy Mother of God, this bell was cast for the chief cathedral of her famous assumption, from the eight thousand poods of copper [and tin] of the former bell that was destroyed by fire, with the addition of two thousand poods of copper [and tin], in the year 7242 from the creation of the world, and in the year of our Lord 1734, in the 4th year of her most prosperous reign."

Dr. Lyall then goes on to say:—

"Contrary to the reports of innumerable writers, Russian, German, French, English, &c., that the great bell contains 12,000 poods, or 459,000 Russian pounds of copper [and tin], or a sum equal, nearly equal, or superior to that in German, French, or English weight, we have the most positive evidence from the second inscription that this mountain of metal only contains 10,000 poods, equal to 400,000 Russian pounds, or to 369,000 English pounds" [or, 160 tons 14 cwt. 1 gr. 4 lb.].

Before concluding, I should state that this monarch of bells was cast by Michael Monterino; and it has been so often misrepresented and caricatured in pictorial works, that I may add it is remarkable for beauty of form and just proportions.

The bell is also variously ornamented. On one side is represented the Tzar Alexoi Michaelovitch, above him the Saviour; on the right of the Saviour the Virgin Mary, and on the left John the Baptist. On the other side of the bell is a figure of the Empress Anna Ivanovna in imperial robes, and a figure above it of the Saviour, with the Apostle St. Peter on the right, and the prophetess Ann on the left, besides numerous seraphims and other ornaments.

As I have said, the diameter at the mouth of the great bell, according to the scale of the plate in Lyall's work, is 21 ft. 8 in., its height being 17 ft. And it is worth noting, that this statement agrees with certain measurements of the bell made in 1868-9.

THOMAS WALESBY.

PATENTEES.

Sir,—I beg to suggest to the notice of yourself, and, with your permission, and aid, to your readers, the advantages to be derived from a combination of patent and other mechanical appliances. Favourable and just to inventors as the security of patent-right is, it frequently occurs that the success of inventors is to give the public a multiplicity of useful articles applicable to one purpose, all of equal merit and service, whereby the most benefit is not given to the inventors or the public, as it would be were inventors to agree to supersede their individual patented articles by a combined invention, enjoying the several excellences of each patent.

The national and international exhibitions have most probably stimulated inventors to a great degree of merit; but in these days of close competition, and in some measure depression, our manufacturers suffer. I beg to hope my hint may be of service in leading our patent inventors or others of merit to endeavour to excel even their own individual excellences by a combination of merit; as surely thereby will the certainty of success be theirs, and the most pleasure arise to the public, who have not always convenience or inclination to purchase every article they admire of a number of desirable articles of various recommendatory purports.

Against foreign competitors excelling our inventive genius this unity would be a bar, and thereby our manufacturing interests be protected in whatever branch of art they are applied, as in iron, steel, and other metal workings, silk, flax, cotton, or other fabrics, &c.

As the origin of most patented articles or manufactures is from a consultation of artistic minds or a consideration of improvement of some already-introduced appliances, we have to suit a purpose, which inventors seek to render more serviceable to the public by some novel advantages, as the unity of patent excellences must tend at all times or agree to give most success and satisfaction to all concerned, and therefore is, I beg to consider, worthy the notice of the public.

UNITY WITH EXCELLENCE.

PROPOSED REGISTRATION OFFICE FOR WORKMEN.

Sir,—I quite concur with your recent correspondent, that there is great need for such an office as he suggests, which would give the opportunity to many men like myself of selling their ability in the best market, but who often row ball in the attempt for want of the first introduction. Likewise it would be the means of inspiring workmen to more energy to make themselves capable to be placed upon the books, with a better hope of a real chance than he has now under the present system of selection of foremen. Hoping I shall soon see such an establishment formed, which, if carried out as suggested, I have no doubt would work beneficially.—I am, &c.

A JOURNEYMAN CARPENTER.

VERMILION.

As you have more than one published suggestion of zinc respecting pigments, colour, and colouring, I venture to ask you to submit to the consideration of chemists and colour-makers what, I think, may prove a solution of the question why so few manufacturers (perhaps only one) can produce vermilion of the utmost splendour of which it is (viz., sulphuretted mercury) is susceptible.

A friend of mine, a consulting commercial chemist, tells me that a manufacturer lately applied to him with a sample of his best vermilion, which, when seen alone, my friend pronounced "first-rate;" but when placed by the side of

a sample from another maker it became "bridle-dust" in comparison. My friend, the chemist, confessed himself non-plussed; and both he and his client came to the conclusion that the difference must be the result of some mystery of manipulation.

The suggestion I made seemed to me so obvious that I was surprised to find that the thought had never occurred to either party. I asked, "What sort of quicksilver do these vermilion-makers use?" The answer compels me to conclude that they use it "neat as imported;" if so, it is quite clear that they do not know what they use; they cannot tell what amount of lead (sulphuret of lead is as black as soot), zinc, tin, bismuth, &c., enters into a compound which (for the sake of colour) ought to contain no atom of anything but pure mercury and pure sulphur. To insure this purity as far as possible, the mercury must be distilled, and the sulphur "sublimed" (volatilized) at the lowest available temperature. Moreover, I would venture to suggest that it might be possible and desirable to bring about the combination of the mercury with the sulphur whilst both are in a state of vapour. J. H. M.

PROVINCIAL NEWS.

Chattercoats.—A new hotel is about to be erected at this marine village on the north-eastern coast. It will be in the centre of the bay, and have a fine sea view. Mr. Thomas Oliver is the architect.

STAINED GLASS.

Edenham Church, Bourn (Lincolnshire).—About eighteen months since three stained-glass windows were erected in the north aisle of this church, to the memory of the late Lord and Lady Willoughby de Eresby, by subscription of the tenantry and friends. Another window has just been erected as a memorial of a former incumbent and his daughter. It is a three-light window, with tracery of the Perpendicular period of architecture, and is the easternmost window of the south aisle. The subject represented is the Resurrection of our Lord, which extends over the three lower openings. The centre is occupied by Our Saviour rising from the Tomb; the angel, which is in the dexter opening, having rolled away the stone, is seated upon it in the act of adoration. In the sinister opening are shown the figures of Mary Magdalene, Joanna and Mary the Mother of Jesus. In the foreground are represented the Roman Guard, some asleep, others, in confusion and alarm, making their escape. A text is placed at the bottom of the window, "I am the resurrection and the life; he that believeth in me, though he were dead, yet shall he live." The group is surmounted by passion-dower enrichment. In the tracery are angels, &c. The windows were designed and executed by Messrs. Baillie & Mayer, of London.

Wellington Church.—A new memorial tower window has been put up in this church. The subject is the Birth of our Lord. The individual to whose memory it is dedicated by one of his surviving relatives, having in his lifetime adorned the eastern apse with a representation of the Crucifixion, it was thought that the western end would be most appropriately occupied with the corresponding design of the Nativity. The type of the edifice being of the character so commonly met with in the Georgian period of architecture, precluded a Gothic treatment of the incident; but the window being of a large space, good scope was afforded to the artist for pictorial effect. The main object in the group—the Infant Saviour—is represented lying in the manger with outstretched arms, symbolical of His entrance of the world. At His right side the Virgin Mother kneels in adoration, and at His left Joseph is seated. In the background, through the stable, are shown the shepherds, and the angels announcing the glad tidings; and above the roof of the stable, a company of heavenly messengers bear a scroll with the sentence of rejoicing,—"Glory to God in the highest." Surrounding the scenery is a border of ornamentation, composed of the stem, leaf, and flower of the Lily, upon a ground of deep ruby; the whole being inclosed by a mosaic framework. The work is seen with the disadvantage of a feeble light borrowed from the small window on the western side of the tower. The artists were the Messrs. O'Connor, of London.

Wakefield Parish Church.—The window in the tower of All Saints, Wakefield, has lately been filled with painted glass, in memory of the late Mr. Thomas Bolton, at the expense of his son, also lately deceased. It has been executed by Messrs. Hardmans, of Birmingham. The subject is the "Day of Judgment," and is divided into three portions: first, the coming of our Lord in glory attended by saints and angels; second, the dead summoned from their graves, and rising

to meet Him; third, angels in heaven worshipping. The lower portion of the window represents the summoning of souls to judgment.

St. James's, Boroughbridge.—A memorial stained-glass window has been placed in this church. The design, which has been executed by Messrs. Hughes & Ward, of London, is founded on Simeon receiving the infant Saviour in the Temple.

CHURCH-BUILDING NEWS.

Arthuret (Cumberland).—The ancient church here has been renovated, chiefly at the cost of the Graham family. The edifice, both externally and internally, has undergone a thorough renewal, although its form, with one slight exception, is unaltered. The tower, except as regards the doorway in it, has not been touched, the principal portion of the external improvements having been made at the east end. Originally the roof of the chancel was flat, and somewhat lower than that of the nave. It has now been raised so that the whole of the roof from the tower to the end of the chancel is of the same height. The old east window has been restored, and the gable surmounted by a cross. The other external alterations require little notice, being merely renovations of the old walls. In the interior, however, everything is changed, the whole of the arrangements having been altered. The old flat plaster ceiling has been removed from the roof, and succeeded by an open roof of oak. The floor, except in the centre aisle, has been hoarded. The pillars and arches, which were previously covered with plaster, have been stripped of their covering and cleaned. In order to increase the number of sittings, the centre aisle has been made narrower by elongating the seats, which have been converted from square pews into open benches. The western and chief doorway has been enlarged. On the north side of the chancel a Gothic oak screen has been erected in front of the pews appropriated to the use of the Graham family. On the south side is a small vestry. The chief feature of the chancel, and, indeed, of the church, is the window erected in memory of Sir James Graham. It is 18 ft. in height, and 14 ft. in breadth. It contains six lights, all filled with stained glass. In the lower panels are representations of the twelve apostles, accompanied by the different symbols which distinguish them. Above the apostles, six other panels are filled with figures of angels, each carrying in her hand a harp or trumpet. Above these, again, the interstices caused by the transverse shafts of the window are filled up with the symbols of the four evangelists; and the whole is surmounted by an argent dove with outstretched wings, in a circular panel. The border round the figures is of a floral design, coloured with a deeper tint than the figures. The building has been renovated under the superintendance of Mr. D. Birkett, of Carlisle, architect, the window being from the establishment of Messrs. John Scott & Son, of Carlisle.

Ewburst.—The parish church has been for the last few weeks in the hands of Mr. Wm. Vaughan, of Maidstone, huilder, who has undertaken the contract for its restoration, and is proceeding with it, under the direction of Mr. Robert Wheeler, of Tanbridge Wells, architect. The building has for many years been in a very dilapidated state, and at last was considered almost dangerous.

Hailey.—The village church of Hailey, which has been entirely rebuilt, has now been consecrated. The new church stands in a portion of the field in front of the vicarage, one side of the churchyard adjoining the road through the village. The style is of the thirteenth century. Hailey-stone facings are used both inside and out. The roof is of Baltic timber, unstained and unvarnished. Milton freestone is used both inside and out. The whole of the church is laid with tiling, and the arrangement of the edifice provides a heating-vent, chancel (with accommodation and fitting for a surpliced choir), nave, south porch, north aisle, and vestry at the west end of the aisle. The church is seated throughout with rush-bottom chairs, with a kneeler to each chair, and will accommodate about 240, including the choir. A dwarf stone wall separates the chancel from the nave. The altar, of English oak, is approached by a flight of seven steps. It is symbolically framed in English oak, and the slab is incised with five crosses. The reredos is built into the east wall of the chancel, and contains a super-altar of red Mansfield stone. The upper portion of the reredos is divided into three com-

partments containing frescoes of the Three Persons of the Trinity. The three-light east window has been filled with stained glass to the memory of the Rev. J. Hyde, a former vicar of Hailey. The principal feature of the centre light is the Crucifixion, and those in the side lights are the figures of our Saviour as the Good Shepherd, and as celebrant initiating the Eucharist. The sides of the east wall at the veresole are lined with encaustic tiles. The side lights of the chancel are partially filled with stained glass. No clerk of works has been employed. The builder was Mr. A. Grove, and the architect Mr. Clapton C. Rolfe. The total cost of the building is about 2,000l.

Miscellaneous.

Professor Huxley on Physical Science in Education.—At a recent annual dinner of the Liverpool Philomatic Society, Professor Huxley spoke on the subject of the introduction of scientific training into the general education of the country. Upon no subject has the public mind been more educated, he was happy to say, than upon this particular topic of the introduction of science into education; and physical science was already recognised as a part of the curriculum at Harrow and Rugby, and some of our great schools, while ample preparations were being made for its introduction at Eton and elsewhere. He would ask any one present who had chanced to take the profession of an engineer how much time he had lost because when he had left school he had had to take to pursuits which were absolutely novel and strange to him. In the interests of mankind and of fair play, why would not the clergy get some little tincture of physical science, and put themselves into a position to understand the difficulties which were forced upon the mind of every thoughtful and intelligent man? The professor, in concluding, said he hoped the time would come when it would not be regarded as a blasphemous proposition that there should be opened in every parish in this country Sunday schools for science. That might be supplemented by a series of Sunday evening discourses upon secular matters, and upon topics which would enlighten them, and enable them to bear better the toil of daily life.

The National Education League.—This League has been started in Birmingham, with the concurrence of educational reformers in various parts of the country, and has already made rapid progress. The object of the League is to establish a system which shall secure the education of every child in England and Wales. The means by which this object is to be attained are stated in a circular issued by the provisional committee of the League. When a sufficient number of persons have joined, it is proposed to call a general meeting in Birmingham, to nominate a governing council, and to form branches throughout the kingdom. The general meeting will probably be held early in the autumn; and in the mean time communications may be made to Mr. George Dixon, M.P., Broad-street, Birmingham, chairman of the provisional committee. The members already include several hundred gentlemen known as promoters of education, and fresh accessions are being daily received. The name of twenty members of the House of Commons are already upon the list, and we observe those of Mr. T. Hugbee and Mr. Mundella among them.

The late Mr. Frederick Hering, Architect.—We mention with great regret the decease of this gentleman, which took place at his residence in Argyll-street, Regent-street, on the 2nd inst. Mr. Hering, who belonged to a family of artists, was an accomplished and amiable man, but seems to have obtained few opportunities to distinguish himself in his profession. The elaborate shop-front at the corner of the Quadrant and Regent's-circus, which he designed for Messrs. Swan & Edgar, some years ago, was described in our pages at the time. Mr. Hering was in his 70th year when he died.

A New Exhibition.—So large a number of pictures have been rejected by the Academy on the present occasion, many of them admittedly excellent, that a committee has been formed to arrange, if practicable, a supplementary exhibition. Whether they will succeed in their endeavours is not yet quite certain.

Clubhouse in Birmingham.—The first building erected in this town solely for the purposes of a clubhouse has been opened. The edifice is at the top of Newhall-street, in the centre and the highest part of the town; it is within a few yards of the Bank of England and all the other banking houses. The style of architecture is Italian, with elaborate detail and carving. The fronts are to two streets, are two stories in height, and are of stone, from the Pilling quarries, Derbyshire, with a balustrade protecting the basement area; the ground-floor is rusticated, and has square-headed windows, with boldly-carved keystones and recessed pilasters in the reveals. The entrance, which is in Colmore-row, opposite to Bennett's-hill, has four massive columns with rich Corinthian capitals; the first-floor windows have balconies in front; the windows are circular-headed, with pilasters, consoles, cornices, and pediments, with carved keystones to the arches, epandrels, and other parts; these are of varied design, the triple windows being still further enriched, to make them as salient points in the elevation; above them is a carved frieze of foliage with shields, charged with armorial bearings, including that of Mr. Colmore, of Cheltenham, who is the ground landlord. The cornice surmounts the frieze, and the whole structure is finished with a balustrade and pedestals bearing vases. On the ground-floor there is an entrance-hall leading to a corridor, out of which open a dining-room 41 ft. by 21 ft., the morning-room, 60 ft. by 21 ft., luncheon-room, &c.; the two first-named rooms have richly panelled ceilings and details in character with the principal part of the work. The great staircase is divided into three compartments by stone columns, and lighted by triplet windows of large size. The first-floor, which has a corridor extending the whole length of the building, leads to a drawing-room, library, billiard-room, &c. The cost is about 16,000l. The architect is Mr. Yeoville Thomason, of Birmingham.

Northern Architectural Association.—At the quarterly meeting of this association, held under the presidency of Mr. Watson, the committee which had been named to report on the articles of association of the Glasgow Institute of Architects, expressed their opinion that however useful the same might prove to their Scottish brethren, they would not materially improve the condition of that association; besides, a large expense would be incurred by the adoption of the Act. The committee recommended that the members of the Northern Architectural Association should not apply for incorporation. Mr. Charlton moved that the report should be adopted, which was seconded and carried. With regard to the Architectural Alliance letter, on the scheme for the education of pupils, the committee were of opinion that it would be desirable, before sending answers to the various questions proposed, that the association should consider the same *seriatim*, and that a statement should be forwarded by the secretary. The report was received, and the discussion was adjourned.

Civil and Mechanical Engineers' Society.—The gentlemen of this association made their second visit to works this session on Saturday last, when they visited the new Blackfriars Bridge, which is shortly to be opened for public traffic, permission being granted to them by Mr. Cabrit, the engineer. Mr. F. W. Bryant, the resident engineer, escorted the members over the works. Afterwards the society's members inspected the Blackfriars section of the Thames Embankment, by permission of Mr. Bazalgette. This Saturday the members, by permission of the architect, will visit the new Royal Italian Opera now being built in the Hay-market.

The Munich International Exhibition.—Endeavours are being made to obtain from England architectural designs, models, and appliances; but it is to be feared almost too late, as the exhibition is to open at the beginning of July next. The special committee for this department consists of Messrs. R. Gottgetreu, k. Professor; Hügel, Banrath; E. Lange, k. Professor; G. F. Seidel, k. Baubeamter; and Zenetti, Stadt-Banrath.

Concrete Buildings.—Mr. D. Osborn, of Great Berkhamstead, has erected several Portland cement concrete buildings in that locality. At Rickmansworth Lord Ebury has employed Mr. Osborn to erect buildings with this material.

New Lunatic Asylum for Lancashire.—At Preston a special meeting of the magistrates of Lancashire has been held to consider the propriety of erecting another lunatic asylum for the county. It was stated that authority had been obtained by the General Finance Committee to purchase a site in Whittingham, near Preston, and that one of the instructions of the committee was that the asylum should accommodate 1,000 patients. The cost would be 20,000l. It was resolved that a committee be appointed to provide an additional asylum, and that 20,000l. be borrowed on the county rates for the purpose.

Progress of Invention.—It appears from a Parliamentary return that 3,991 patents were applied for in 1868, and up to the 11th of March last 1,715 of the applications had been granted. The total number for 1868 cannot be known until the 30th of June, owing to the six months allowed patentees (from the dates of their several applications) in which to have their patents sealed and to file their final specifications. The return shows the progress of invention. It begins with 1650, when no patent was granted. Just a century later, in 1750, there were only 7; in 1850 there were 523; and in 1867, 2,292.

The Fine Art Copyright Consolidation and Amendment Bill.—On the motion of Lord Westbury in the House of Lords, this Bill has been read a second time and referred to a select committee. His lordship pointed out that while there was protection for the author's life and 25 years afterwards in Spain; 30 years afterwards in Germany; and 50 years afterwards in France; protection was only accorded in England for 28 years altogether in one class of artistic works, and for 7 years altogether in another class. The new Bill granted protection for the author's life and 30 years afterwards, with certain exceptions. The Earl of Kimberley appeared to think that, as one of the public, he had a right to reap the fruits of an artist's brain, after his death at all events, if not before; although his lordship certainly could not lay hold of the pecuniary fruits of their industry or talent in a similar way.

Science and Art Classes for Ely and Cambridge.—A movement is in progress for the establishment of classes in elementary science and drawing at Ely, in connexion with the Science and Art Department at South Kensington. Some time ago it was proposed to establish similar classes in Cambridge. The project fell through; but it is possible a fresh attempt will be made under more favourable circumstances to bring this really important subject before the attention of the University and town. Professor Kingsley, in his address to the Cambridge School of Art at the late distribution of prizes, pointedly referred to the matter, and the archdeacon of Ely, and others then present, suggested that the new classes proposed might be carried on in connexion with the Cambridge School of Art.

Printers' Almshouses.—We understand that the required sum for erecting the celebration wing to these almshouses has been received or promised, with the exception of about 200l. It is to be hoped that this comparatively small amount will soon be subscribed, and promises realised, to enable the council to appoint a building committee to carry out immediately this much desired object. Subscriptions are received by the treasurer, Mr. W. Clowes, Duke-street, Stamford-street; or by the collector, Mr. C. Pope, 14, Derby-street, Argyle-square, W.C.

University of Glasgow.—Session 1868-9. Certificates of proficiency in engineering science (Mr. Macquorn Rankine, professor) have been granted to Messrs. Anthony S. Bower, C.E., St. Neots, Hunts; Walter Deed, C.E., Colchester; James J. Galloway, C.E., Paisley; James Gilchrist, jun., C.E., Garnkirk; Alexander Malcolm, C.E., Balfron; Robert McFalls Melliss, jun., C.E., Glasgow; George D. Neill, C.E., Greenock; and John Russell, C.E., Glasgow.

Fever.—Amongst the Liverpool detectives fever seems to prevail. Two of them have died of it on one and the same day, and at that time two or three others were prostrated by it. At Tickhill, Doncaster, fever is prevalent in an epidemic form. The Doncaster Board of Guardians have had a discussion on the subject, and have written to the local authorities at Tickhill drawing their serious attention to it. In course of the discussion it was stated that defective drainage and contamination of wells were the cause.

The Drainage of Frankfort-on-the-Maine.—Mr. Gordon, late surveyor of Carlisle, who a few years ago left Carlisle for Frankfort-on-the-Maine, having been appointed principal resident engineer to the Board of Works at that place, is at present engaged in carrying out an extensive system of sewerage in that town. The editor of the *Carlisle Journal* has obtained an estimate of the work and the cost of it, from which he gathers that the total length of new sewers is nearly fifty-six English miles, and is estimated to cost 282,103*l.* The secondary division comprises extensions or additions, and improvements to existing sewerage works, and the length is fourteen English miles and a half, and will cost according to estimate 49,103*l.* The grand total length of the whole sewerage is about seventy miles, and will cost, on the whole, 331,211*l.* Mr. Gordon has been invited by Prince Ludwig to visit Darmstadt, for the purpose of inspecting the drainage of the palace, with a view to advising as to its improvement.

A Weekly Return of Work in Birmingham.—A week's work in Birmingham in its aggregate results is something wonderful. According to the *Engineer*, it comprises the fabrication of fourteen millions of pens, six thousand bedsteads, seven thousand guns, three hundred millions of cut nails, one hundred millions of buttons, one thousand saddles, five millions of copper or bronze coins, twenty thousand pairs of spectacles, six tons of papier-mâché ware, 30,000*l.* worth of jewellery, four thousand miles of iron and steel wire, ten tons of pins, five tons of hairpins, hooks and eyes, and eyelets, one hundred and thirty thousand gross of wood screws, five hundred tons of nuts, screw-bolts, spikes, and rivets, fifty tons of wrought-iron binges, three hundred and fifty miles length of wax for vestas, forty tons of refined metal, forty tons of German silver, one thousand dozens of fenders, three thousand five hundred bellows, a thousand roasting-jacks, one hundred and fifty sewing-machines, eight hundred tons of brass and copper wares, besides an almost endless multitude of miscellaneous articles, of which no statistics can be given, but which like those unnumbered, find employment for hundreds and thousands of busy hands, and are destined to supply the manifold wants of humanity from China to Peru.

Accidents.—The new church in the course of erection on Southernhay, Exeter, belonging to the Independents, has been destroyed by fire. The building was nearly finished, and while the men were engaged varnishing the roof, flames burst from it at the west end, near the tower. The fire rapidly extended to the other end of the roof which became one mass of flames. The roof fell in, and the woodwork inside, including the large galleries, was speedily burnt up. Three of the city engines were at work, and by their efforts some of the glass work and the walls were saved.—An excavator was engaged in digging a foundation at the back of the Mare-street Baptist Chapel, Hackney, and had got to the depth of 12 ft., when one of the sides fell in, and he was buried under several tons of earth. When extricated he was found to be dead.

While a number of workmen were engaged in removing some old cottages, in order to make room for the enlargement of the foundry of Mr. Asa Lees, Huddersfield-road, Oldham, one of the inside walls fell down, and buried beneath it a labourer engaged in the work. He was killed at once.

Telegraphic Communication in the Bristol Royal Infirmary.—Mr. Grafton, C.E., of London, is now erecting in the Bristol Infirmary a mechanical telegraph to communicate orders to all the wards in that institution. The point from which the communication is to be made, says the local *Times*, is from the porter's lodge, on the ground floor, where there is affixed a large dial, on which there are twenty points, traversed by a hand. At each of these points will be placed a word, such as "casualty," "meals," "visitors out," "house-surgeon," "matron," &c., so that, by turning the wooden hand to any of these points, a similar hand will indicate the same thing on a similar dial in each of the wards. This will prevent the running about from ward to ward to look for a person, or give any summons which is necessary. The expense (which will be about 250*l.*) will be paid by an anonymous friend of the infirmary.

Works of Living Artists in France.—The exhibition of the works of living artists was opened in Paris on the 1st of May. The *habitués* consider it scarcely up to the mark.

Bursting of a Reservoir.—At the Banister Hall Print Works, Higher Walton, a village a few miles from Preston, there are two extensive reservoirs in connexion with the works, one of them a very large one, covering nearly two acres of land, which was used for clean water purposes. At the time of the accident it contained a depth of 18 ft. of water. Between twelve at night and three in the morning this immense sheet of water burst through its banks into the river Darwen, near which it was situated. The reservoir had been filled too full the previous day, and water having filtered into rat-holes that lined its banks, worked its way through until a continuous opening had been made, and the banks being only composed of clay, a large gap was soon opened, and the water rushed out into the Darwen with immense velocity, carrying all before it. In a very short time the reservoir was quite empty. The fissure is twenty yards wide by over six yards deep.

Fire at Albury Park.—The Duke of Northumberland's mansion at Albury Park has been on fire. The intimation of the fire reached the duke and duchess at Northumberland House. Through the carelessness, it is said, of workmen employed at Albury, a candle had been left burning, and the flame communicated with some part of the building. Fortunately the fire was discovered before it had gained much hold, and a great destruction of property was avoided. The fire occurred in a part of the building remotely connected with the valuable and extensive library formed by the Duchess of Northumberland's father, and with the principal apartments, which are adorned with some of the rarest specimens of the ancient masters. When the duke and duchess, with Earl Percy arrived, the fire was under the entire control of the engines from Guildford. The damage is trifling, and is covered by insurance. Within a few hours of the extinction of the fire, a second outbreak of a more serious character took place in another part of the mansion, which looks suspicious.

Improvements in Mummification.—An odd discovery has just been made by a man of Grenoble, by which it is calculated that cemeteries and graveyards will become superfluous. At the decease of an individual the body is plunged into a liquid invented by the man of Grenoble, and in about five years the individual is turned into stone. The secret of the petrification is known only to the discoverer. He says that in a thousand years' time, if persons will only preserve their relatives and friends, they will be able to build houses with them, and thus live in residences surrounded by their ancestors! Altogether an absurdity.

Designs for Channel Steamers.—The Council of the Society of Arts offer the Gold Medal of the Society, and the large Silver Medal of the Society, for the best and the second-best block model of a steamer, which shall afford the most convenient shelter and accommodation to passengers on the deck of the vessels crossing the Channel between France and England.

Architectural Alliance.—The annual meeting of this association is to be held in London on the 12th inst.

Ruled Paper.—Messrs. Letts & Co. prepare paper ruled (in pencil-ink) in squares by graduation of $\frac{1}{4}$ in. from $\frac{1}{4}$ to the full. On paper thus prepared rough plans can be drawn and coloured in without the ruled line showing objectionally.

City Memorial of the Prince Consort.—At the last Court of Common Council it was resolved to place a stained-glass memorial window at the western end of the Guildhall, to the memory of Prince Albert. There is also reason to believe that a statue, the gift of a private individual, will be erected.

Fine Arts Copyright.—The Select Committee on the Fine Arts Copyright Consolidation and Amendment (No. 2) Bill consists of the Lord Privy Seal, Earl Stanhope, Carnarvon, and Somers, Viscount Hardinge, the Bishop of Oxford, Lords Portman, Overstone, Lyvedon, Westbury, Houghton, and Romilly.

TENDERS.

For erecting a billiard-room over the present skating-ground, at the Prince of Orange, Greenwich, exclusive of gaslights, for Mr. Chas. Wall. Mr. Henry Roberts, architect. Quantities supplied:—
 Dining..... 2325 0 0
 Penn..... 402 0 0

For the erection of a warehouse, in the Minories, Messrs. Carter. Mr. G. Barnes Williams, architect:—
 Exchange..... 2,450 0 0
 Hill, Keddell, & Co..... 3,681 0 0
 King & Sons..... 3,400 0 0
 Abby & Sons..... 3,240 0 0
 Brass..... 3,773 0 0
 Abby & Horner..... 3,690 0 0

For iron and glass roof over seed market of the Lond. Corn Exchange, Mark-lane. Mr. G. Barnes Williams, architect:—
 Messrs. Phillips..... 2,080 0 0

For the erection of shops and premises at Peckham. Mr. H. G. Hayward, architect:—
 Ennor..... 42,007 0 0
 Boston..... 2,000 0 0
 Hill & Keddell..... 1,999 0 0
 Colla & Sons..... 1,978 0 0
 Gammon..... 1,951 0 0
 King & Sons..... 1,940 0 0
 Tully..... 1,976 0 0

For the erection of three warehouses, at Wells-street Oxford-street. Mr. J. Deason, architect:—
 Downman..... 42,470 0 0
 Foster..... 4,950 0 0
 Hyde..... 3,900 0 0
 High..... 3,784 0 0
 King & Sons..... 3,780 0 0
 Scriven & White..... 3,773 0 0
 Cooper & Culham..... 3,470 0 0

For the erection of stabling, at Tangley Par Worpleston, Surrey, for Mr. Thos. Osborn. Mr. H. Peak, architect:—
 T. & J. Lee (accepted)..... 2,341 0 0

For the erection of a pair of cottages on the Woodbridge Road Estate (erection of plumber's, glazier's, and painter's works), for Mr. Higlett. Mr. H. Peak, architect:—
 Stradwick..... 2,322 0 0
 West..... 329 0 0
 Gans..... 290 0 0
 Taylor & Downes..... 290 0 0
 Swayne & Sons (accepted)..... 257 10 0

For new school-room and alteration of present school-rooms, Belmont-street, Brighton. Mr. Thos. Simpson, architect. Quantities supplied:—
 Patching & Co..... 4,890 0 0
 Dean & Dickerson..... 4,890 0 0
 Cheeman & Son..... 890 0 0
 Baker..... 835 0 0
 Lockyer..... 832 0 0
 Sawyer..... 793 0 0
 Nash & Co..... 783 0 0
 Barnes..... 740 0 0

For Little Park House, near Newbury, Berks. Quantities supplied by Messrs. Pain & Clark:—
 House. Stable.
 Henshaw..... 25,739 0 0 4724 0 0
 Manley & Rogers..... 4,737 0 0 693 0 0
 Bracher & Son..... 4,903 0 0 678 0 0
 Ebbs & Sons..... 4,810 0 0 617 0 0
 Bull & Sons..... 4,400 0 0 607 0 0
 Accepted.

For alterations at Fairlawn, Acton. Quantities supplied by Messrs. Pain & Clark:—
 Little..... 21,010 0 0
 Bracher & Son..... 2,900 0 0
 Tully..... 1,295 0 0
 Ebbs & Son..... 1,247 0 0
 Cook & Green..... 1,054 0 0
 Manley & Rogers..... 1,945 0 0

For building stables, coach-houses, &c., in Blackmar street, Borough, for Messrs. Hoadley. Mr. Josiah Houle, architect:—
 Little..... 24,109 0 0
 Patman & Potheringham..... 4,185 0 0

 Saunders..... 2,793 0 0
 Watton..... 2,599 0 0

DRAUGHTSMAN WANTED, by the Preston Local Board of Health. ...

PARTNERSHIP - WANTED, a PARTNERSHIP in an old or well-established Builder's Firm. ...

T. A. RICHARDSON, Architectural Artist. PERSPECTIVES OUTLINED, ETCHED, or artistically COLOURED. ...

THEODOLITE PRACTICE AND LEVELLING - A Gentleman of thirty years' experience will give a Course of Instruction in Engineering Fieldwork. ...

GILDERS, thoroughly experienced in House Work, Decorative Furniture, and Gilding in all its branches. ...

ROCHESTER HIGHWAY DISTRICT - The Highway Board for the above district hereby give notice that their Meeting will be held on the 11th day of May. ...

REQUIRED, in an Architect's and Surveyor's Office, a competent JUNIOR ASSISTANT; also an OFFICE YOUTH. ...

SMITH, BELLHANGER, and GAS-FITTERS - A first-class JOBBING HAND WANTED for an Ironmonger's Shop. ...

WANTED, by a GENERAL FOREMAN, Charge of a Job - Carpenter by trade. ...

WANTED, by the Aston Board of Guardians, an efficient CLERK of WORKS, to take the charge of the erection of the New Workhouse. ...

WANTED, TWO or THREE good GLAZIERS. Well accustomed to church work. ...

WANTED, by an Architect in the country, an ASSISTANT. One who has been accustomed to Gothic and knows something of construction. ...

WANTED, a MANAGER for the DECORATIVE DEPARTMENT. Must possess considerable experience and be of good address. ...

WANTED, a Young Man, about 30 years of age, thoroughly acquainted with the TIMBER TRADE, to take part in managing a business. ...

WANTED, a good FOREMAN of MASONS, for a Job in the country, about seventy miles from London. ...

WANTED, by a thoroughly practical Man (Carpenter and Joiner) a RE-ENGAGEMENT as GENERAL FOREMAN. ...

TO BUILDERS, PAINTERS, &c. WANTED, by an experienced, practical Man, a SITUATION as WORKING FOREMAN of PAINTERS. ...

TO BUILDERS AND PLUMBERS. WANTED, by a Young Man, a constant SITUATION as a good PLUMBER, GAS-FITTER, &c. ...

WANTED, by a Young Man, aged 23, a SITUATION as BUILDERS CLERK. In a first draughtsman, and accustomed to quantities and estimates. ...

TO ARCHITECTS. WANTED, by the son of a first-class ARCHITECT in the West of England, a SITUATION as EMPLOYER. ...

WANTED, by an experienced M.n. just completing a Church, a RE-ENGAGEMENT as CLERK of the Building Trade, and as a Fielding draughtsman. ...

WANTED, an ENGAGEMENT, by a MEASURING and QUANTITY CLERK. Twelve years' experience. ...

TO ARCHITECTS, BUILDERS, &c. WANTED, by the Advertiser, aged 22, a RE-ENGAGEMENT as DRAUGHTSMAN, &c. and to attend generally to the duties of the office. ...

TO BUILDERS, CONTRACTORS, LAND HOLDERS, AND OTHERS. WANTED, by a Man who will shortly be DIS-ENGAGED, and has a first-class portable 12 horse power Steam Engine and all appliances for building purposes. ...

WANTED, a SITUATION as ARCHITECT'S ASSISTANT. Good testimonials. Salary moderate. ...

WANTED, by a Youth, a RE-ENGAGEMENT. Can trace and copy plans neatly, square dimensions, abstract line and materials, and put into bill; also measure up timber, &c. ...

TO BUILDERS, DECORATORS, HOUSE AND ESTATE AGENTS, &c. WANTED, by an experienced CLERK, a RE-ENGAGEMENT as COLLECTOR, BOOKKEEPER, or any youth in circumstances. ...

TO BUILDERS AND CONTRACTORS. WANTED, RE-ENGAGEMENT as SHOP FOREMAN of JOINERS, by an active, thoroughly qualified, and experienced man. ...

TO BUILDERS AND CONTRACTORS. WANTED, by a respectable Young Man, a SITUATION where he would be able to obtain a general knowledge of all the building trade. ...

TO BUILDERS AND OTHERS. WANTED, a RE-ENGAGEMENT as a BUILDERS CLERK, who will act as an office boy as well as present employer, who is retiring from business. ...

TO ENGINEERS AND OTHERS. WANTED, STEAM BOILERS to SET, FIREWORKS. Good references if required. ...

TO DECORATORS AND BUILDERS. WANTED, by an experienced DECORATIVE PAINTER, PAPERHANGING, &c. ...

WANTED, a SITUATION as PAINTER, GRAINER, and PAPERHANGER. Town or country. ...

TO BUILDERS, &c. WANTED, for a respectable Youth, aged 15 (the son of a builder), a SITUATION in the office. ...

WANTED, a RE-ENGAGEMENT, as GENERAL MANAGING FOREMAN. In charge of a Country Job, or otherwise. ...

WANTED, by the Advertiser, PLASTERING, FIREWORKS, &c. First-class references from London Builders. ...

TO ARCHITECTS, SURVEYORS, &c. WANTED, by a SURVEYOR, a SITUATION, in either of the above offices. ...

WANTED, a RE-ENGAGEMENT, as GENERAL OUT-DOOR FOREMAN. Good testimonials, and well up in all branches. ...

WANTED, by a thoroughly practical, active, and steady Man, a RE-ENGAGEMENT as FOREMAN of JOB, or to manage a good Jobbing Business. ...

TO BRICKLAYERS AND BUILDERS. WANTED, by a steady Young Man, a SITUATION, as a BRICKLAYER, &c. ...

TO CLERKS OF WORKS, &c. WANTED, by an ARCHITECT in the West of England, a CLERK of WORKS to superintend the various buildings he has now in course of erection. ...

TO BUILDERS AND PLUMBERS. WANTED, by a good PLUMBER, a JOB, or a SITUATION in Three Branch Hall, in town or country. ...

TO BUILDERS AND CONTRACTORS. WANTED, by a Young Man, aged 29, a SITUATION as GENERAL CLERK. ...

TO PAINTERS AND BUILDERS. WANTED, by the Advertiser, a SITUATION as PAINTER, &c. or General Hand in a small shop. ...

TO GRAINERS AND MARBLERS. WANTED, immediately, a first-class GRAINER and MARBLER, in an old established firm. ...

TO BUILDERS. WANTED, a SITUATION as JUNIOR CLERK, by a Young Man, aged 21. ...

TO SURVEYORS AND BUILDERS. WANTED, a RE-ENGAGEMENT, by a Young Man, well acquainted with office duties, drawing, taking out of drawings, &c. ...

TO BUILDERS, MILL PROPRIETORS, &c. WANTED, by a well-educated, persevering Man, of many years' experience, a SITUATION as FOREMAN, or to work as General Foreman, or any other suitable position. ...

TO BUILDERS, PLUMBERS, &c. WANTED, a SITUATION, by a good practical PLUMBER, GAS-FITTER, &c. ...

WANTED, by the Advertiser (Carpenter by trade), a SITUATION as GENERAL FOREMAN, or to take Charge of a Job, Town or country. ...

TO PLUMBERS AND BUILDERS. WANTED, by a good PLUMBER, a SITUATION, as PLUMBER and GAS-FITTER. ...

TO ARCHITECTS. WANTED, RE-ENGAGEMENT in London, as ASSISTANT. Good draughtsman, tolerably well versed in all the duties of the office. ...

WANTED, a RE-ENGAGEMENT, by a thoroughly practical Man, Joiner by trade, a SITUATION, in town or country, as FOREMAN of JOB. ...

WANTED, by a good GRAINER, a SITUATION, or JOB. Can be well recommended, and specimens sent. ...

WANTED, a RE-ENGAGEMENT, as CLERK of WORKS, OUTDOOR FOREMAN, by a thoroughly practical Man. Middle age, Joiner by trade. ...

TO ARCHITECTS. WANTED, a RE-ENGAGEMENT, temporarily, as a good practical, and a good pencilled draughtsman. ...

WANTED, a SITUATION as BUILDER'S CLERK, by a thoroughly practical Man. Good knowledge of every branch of the business, measuring, estimating, and drawing. ...

TO BUILDERS, ROAD-MAKERS, AND CONTRACTORS. WANTED, by a first-class practical Man, a SITUATION, as a CARRIAGE FAVOUR, Street Mason Granite Dresser (Wood, Bricks, Dutch Chalkers, or Tiles), &c. ...

THE Advertiser, eight years in the profession, the last with an eminent London Architect, will not mind to participate with a view to another ENGAGEMENT, although not yet disengaged. ...

TO BUILDERS, BUILDERS, AND OTHERS. THE Advertiser, a thoroughly good Three-branch Hand, wishes for a PERMANENCY. ...

TO TIMBER MERCHANTS. THE Advertiser, aged 31 (married), is in want of a SITUATION as FOREMAN and SALESMAN in a TIMBER YARD and SAW MILL. ...

TO BUILDERS OR MASTER PLUMBERS. THE Advertiser, a thorough practical PLUMBER, wishes to take with a JOB or a CONTRACT. ...

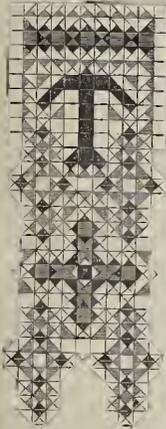

TO BUILDERS, &c. WANTED, by the Advertiser, a SITUATION as JUNIOR CLERK, by a Young Man, aged 21. ...

TO ARCHITECTS AND BUILDERS. THE Advertiser, three years and a half experience in an Architect's Office, fair draughtsman, good knowledge of quantities, and measuring up work, desires an ENGAGEMENT. ...

The Builder.

VOL. XXVII.—No. 1371.

*The Properties of Iron and its Applicability to Building Purposes.**

THE study of metallurgy is essential to the architect who desires to do justice to the interests of his clients. None of the mechanical arts have shown such progress of late years as the manufacture of metals. In the working of iron the improvements have been so great, that within the past ten years processes which before that time had been pronounced impossible have been practically demonstrated as easy of achievement, and the qualities of this invaluable metal have not only greatly improved, but the mysteries of its organization and inner

nature are daily becoming more clearly revealed. Castings in soft steel can now be made in contradiction of all past assertions, whilst the simple but most marvellous discovery by Mr. Saxby of the application of magnetic tests as a means of discovering unsuspected flaws in manufactured iron, promises to add a most important safeguard to the use of a material which is now so largely increasing. The Bessemer process of the conversion of iron ore into steel by a comparatively cheap and reliable process has, it is well known, introduced a new element into the manufacture of this metal, whilst the costly and long-continued experiments of Government have given to the world facts which engineers and practical men have not been slow to take advantage of.

The result is that we have now a supply of iron equal in its qualities to all the demands that the nature of its use may make upon it. The iron of the heavy armour-plate of our ships of war; the metal of our guns; the material of which girders and columns, railway tyres and rails, are made; and the iron of domestic use and for outlery, hardware, and the like, have all their one common origin, and yet differ so much in their qualities, that very little observation is needed to admit that the treatment by which results so opposed can be gained from the same basis must be one of great practical difficulty, and requiring thorough scientific knowledge. Workers of iron will tell you that every day convinces them there is something more to learn, and enormous as has been the stride made

in the past few years, each onward step only shows that the resources of art are illimitable, and the value of the metal so freely and abundantly given to man becomes the more appreciated, as its qualities develop.

There is at present a warm controversy on the respective merits of iron and steel for mechanical purposes; but, perhaps, the true and simple view of the question may be found in the opinion of Mr. Zerol Colburn: "Steel," says he, "is only iron in its best and most valuable form." Steel is, in fact, no more a different material from iron, than are wrought-iron or cast-iron from each other. The time may come when the distinctive name of "steel" will be banished altogether, and the generic name iron, with some mineral or other distinctive prefix to mark its special quality, will express better what it meant.

The study of metallurgy will be seen to have especial interest for all engaged in the practical application of scientific researches. The engineer and the architect employ metals largely in the construction of their works, and as a conscientious practitioner would scarcely content himself with accepting the dicta of those employed in carrying out his designs as to the description and dimensions of the materials he may seek to use, but would wish to satisfy himself on so important a matter, a careful study of treatises on metallurgy becomes essential.

Our own iron-masters are a different race of men to what the last century produced; the immense improvements made by science in the treatment of metals has compelled an amount of study and patient experiment which none but enthusiastic, unprejudiced minds would find congenial. We in England may be proud of some of our enormous iron-works, and of the laborious processes so continually carried on therein, but we must not blind ourselves to what is going on abroad. The iron trade at home has had a blow, whilst within the past twelve years the same branch of industry in France has made an astounding commercial progress. We believe that a careful analysis of the causes of the seeming stagnation in our own trade, and the increase of that of the Continent, will show no real cause for alarm, and for reasons that may presently be seen. This popular belief, however, is widely spread, and there seem grounds for such belief in the indications that meet the public eye. There are genuine French locomotives to be seen running on our English lines,—as a few years ago there were American; and what is more, encouraging by their performance those who imported them. Krupp's tyres are required by English engineers to be used by their specifications, when the very best Bessemer steel can be obtained at half their price in this country. French and Belgian iron are largely bought by our merchants and ship-builders, and Belgian shipwrights are getting contracts from English firms, and are expanding their works with English capital; whilst on the other side of the picture are seen our men "on strike," and hundreds of our furnaces silent and cold. To strengthen this alarm, came the Paris Exhibition, the display in which acted upon all superficial observers to the prejudice of this country. But, why we consider there is no real cause of alarm, and believe that accurate statistics of our iron trade at home will show no diminution, is that, in fact, the whole system of iron-working has, within the period alluded to, undergone an entire revolution. This seems the simple explanation of it, and this important revolution has been brought about by the introduction of the Bessemer process, and by consequent demand for hematite or spathic ore.

The result, then, is this: heretofore the great necessity of iron-working has been coal; and those localities which best supplied the fuel have been in the most flourishing state. The old centres of the iron trade were, therefore, natu-

rally placed in such localities where coal-fields abounded in the purest fuel: hence Yorkshire, Staffordshire, and Wales were in the foremost ranks. Moreover, it was well known that the quality of the iron manufactured depended almost entirely on its working; that is, on the amount of fuel burnt in producing and re-working it. In fact, quality of ore was secondary to abundance of coal in the old days of the puddling-furnace. But the introduction of the Bessemer invention has changed all this. The metal resulting from this process depends entirely upon the purity of the ore employed, and as the consumption of coal is not only enormously lessened, but, by the application of the invention known as Siemens's gas furnace, coal of inferior quality may be partially used, the choice of a locality for conducting the working of iron with adequate economy and success is dependent now on its supply of pure ore, not upon that of coal. Now we know how tardy we good folks of England are to adopt largely any new thing however good, and the simple state of the present question is, that new ironworks are slowly being established in new districts more locally favourable for carrying on the requirements of the new process, and the old furnaces are becoming disused. Again, observance of facts shows that at the present day there is a demand only for the cheapest kinds of iron, and for the very best. For the cheapest iron, our old-established Staffordshire ironmasters cannot remuneratively to themselves compete, and our best is not as yet made in sufficient quantities.

So these reasons will serve to show how the apparent retrogression in the commercial prosperity of our iron trade has been brought about, and what are the hopes of the future. Already in Wales the long-neglected purer iron ores are being reopened as the Bessemer process becomes introduced, and in time Wales will take a proud position, and be prepared not only to make the cheapest kinds of iron, but also the best qualities known now as steel. The vexed question of puddlers' strikes has also had much to answer for in the past, but happily the wider introduction of the new system will render ironmasters less dependent on such unfortunate interruptions of important works.

The wider use of Bessemer steel will afford architects an extended range for carrying out constructive and ornamental details. Its extraordinary malleability, in a certain state of manufacture, is a most valuable quality, whilst its great strength and lightness permit delicacy and minute finish.

The subject of metallurgy, some features of which we have thus far briefly sketched, is fully treated in the recently-published volumes whose names appear at the head of this notice.

For the first, on the "Elasticity, Extensibility, and Tensile Strength of Iron and Steel," we are indebted to Sweden. The work is, in fact, a report by the author, Knut Styffe, Director of the Royal Technological Institute at Stockholm, prepared by the instruction of a Royal Commission from the king of Sweden upon the fitness of Swedish iron for railway purposes, and embodies a series of protracted and interesting experiments of which the results are fully and impartially given. The tests applied for the purpose are minutely described, and the effects of temperature as modifying the conditions of the material are elaborately examined. The results of all the experiments are clearly set forth in tables, which will be found most useful to the student. On p. 70 is a résumé of the results of experiments made upon tension, which gives in condensed form so much valuable information, that we regret space will not permit quotation; the student is referred, therefore, to the volume itself. The second chapter is devoted to the application of the foregoing results, and the useful nature of its contents may be seen from the following sketch of its various headings:—

* "Iron and Steel, The Elasticity, Extensibility, and Tensile Strength of Iron and Steel." By Knut Styffe, Director of the Royal Technological Institute at Stockholm; translated from the Swedish, with an original Appendix, by Christer P. Sandberg, Inspector of Railway Plant to the Swedish Government, Assoc. Inst. Civ. Eng.; with a Preface by John Perry, M.D., F.R.S. London: John Murray, Albemarle-street, 1869.

"A Practical Treatise on Metallurgy," adapted from the last German edition of Professor Kopp's "Metallurgy," by William Crookes, F.R.S., &c., and Ernst Rühlmann, Ph.D., M.E. In three volumes. Vol. II. Copper, Iron, London: Longmans, Green, & Co., 1869.

"Iron and Steel Manufacture: a Series of Papers on the Manufacture and Properties of Iron and Steel." By Ferdinand Kohn, C.E. London: William Mackenzie, 1868 (Reprinted from "Engineering," revised and enlarged by the Author).

"Iron: its History, Properties, and Processes of Manufacture." By W. Fairbairn, C.E., LL.D. Third edition, revised and enlarged. Edinburgh: Adam & Charles Black, 1868.

1. Preference of steel to iron for such purposes as require a combination of strength and lightness. 2. And for such as require strength and hardness to resist wear. 3. Importance of extensibility in materials employed for machinery and buildings.* 4. Relative capacity of steel and iron to endure sudden shocks. 5. Best material for articles occasionally subject to severe shocks. 6. Choice of material for articles commonly subject to slight shocks or vibrations. 7. Most suitable degree of hardness for steel to be used for tyres, axles, &c. 8. Employment of iron, which has become stiff by mechanical treatment. 9. And of iron containing phosphorus. 10. And of iron containing slag. 11. Advantages of a pure iron for general forgings.

The next chapter is devoted to experiments on tensions at low and high temperatures, and contains a theory which it is fair to say the translator of the work does not endorse, asserting that although the experiments are most carefully and impartially performed, the conclusions arrived at are justly open to hesitation. These remarks are given in an appendix by the translator, and relate to the reasons assigned by the author for the breakage of metals during severe frost. Professor Styffe seems to assert that the absolute strength of iron and steel is not diminished by the influence of cold on the metal itself, but that the liability of fracture of railway tyres and rails, for example, occurs from the elasticity of their supports being destroyed by the freezing of the ground, and the hardening of the sleepers. On this opinion being contested, the author still asserted that frost could have no influence on iron in its resistance to blows, provided the elasticity of the supports was undiminished; so, to ascertain the real position of the case, experiments were made of a practical nature by Sandberg (the translator of the work) at Stockholm in the winter and summer of 1867. These experiments are fully detailed in the appendix, but the following facts may be briefly gleaned. Iron rails were supported on blocks of granite built up on solid granite rock, and were broken into halves, so that the conditions of each portion under experiment should be precisely the same. These were then tested by the falling of a heavy weight, one in winter at 10 degrees Fahrenheit, and the other in summer at 81. The result was, that the one thus tested in the winter would not sustain much more than one-fourth of the blow that it resisted in the summer.

The concluding chapter details experiments on Flexion at different degrees of temperature, and although short, is comprehensive.

The translation is clearly written, and the style simple and interesting. The tables are copious, and the illustrations exceedingly well drawn and engraved. The volume is a fitting companion to many others from the same publishing house, and, like all of Mr. Murray's issues, is handsomely printed, on good paper, and in large and readable type. It is a valuable contribution to the literature of metallurgy, and will be found of practical utility.

The "Practical Treatise on Metallurgy," by Crookes and Röhrig," thus forms the second of the series on our list, is a thick octavo volume of nearly nine hundred pages. It is in itself the second volume, and is to be followed by a third. The production of copper forms about a third portion of the work, the remainder being devoted to iron.

The scope of this present volume may be understood from the comprehensive table of contents, and the value to a reader is considerably enhanced by a very clear index at the end. This feature is one, the necessity for which cannot be too often insisted upon, and in this case it is given with commendable amplitude and intelligibility.

The work is an exhaustive and comprehensive treatise on metallurgy, and is so clearly written, and so well and intelligently arranged, that no student will regret obtaining it as a work for reference and study. The language is simple, and an immense amount of information is given in short, pleasantly fluent sentences, that render reading easy and convert a severe study into an agreeable task. A feature in the work is the separation of chapters into heads, and these into

shorter subdivisions, each one readily distinguished by its own heading in distinctive type, thus materially assisting the student in his search for special information. We have scarcely ever read a book arranged with so much judgment in this respect; the clearness of the construction, the classification of the subjects, combined with the simplicity and directness of the language, are the best possible proofs of the mastery of the matters treated on by Messrs. Crookes and Ernst Röhrig. The book itself modestly is called an adaptation from a German work, the metallurgy of Professor Kerl, and is put into a readable form that will largely commend itself. It is well printed, illustrated with upwards of 270 wood engravings, and is published by Messrs. Longmans, Green, & Co.

The last on our list, "Iron and Steel Manufacture," by Ferdinand Kohn, C.E.,* consists mainly of papers written by the author for the pages of *Engineering*, and added to these are further elucidations from his own pen, and some interesting descriptions of important ironworks by Mr. Zerah Colburn, C.E. The volume is of large quarto size, contains a great number of valuable engravings, and is dedicated to Mr. Henry Bessemer. In the preface the author modestly gives the reasons which induced him to present the work to his readers, and as these state in brief the whole scope of the work, we will let him speak for himself.

"In collecting into a volume a series of articles on the manufacture of iron and steel, which have appeared in *Engineering* during the last two years, the author believes that he has undertaken a work of utility rather than ambition. The republication of articles which have appeared in a widely circulated professional journal, and of which a considerable number have been reprinted, translated, and quoted in the leading professional papers in this country, in America, and on the Continent, may, perhaps, at first sight, appear uncalled for and superfluous; but the fact that in their original form these papers are irregularly scattered through seven different volumes, and that some of these volumes are out of print; the fact that no systematic record of the important progress made during the last five years in all branches of iron and steel metallurgy, is in existence at this moment; and the fact that the attention of the public has at no time been more closely and more generally given to this subject than is the case at present; these facts, the author believes, will be found sufficient to justify the compilation of the present volume."

In the work will be found full descriptions of all the most important ironworks, accounts of the processes employed, and illustrations of the machinery. There is much very valuable information simply and interestingly told, but the serial form is unpleasantly prominent, and we cannot refrain from the remark that we wish the writer had re-written and re-arranged the work in smaller form, with only a selection from the illustrations; then we should have had a most readable and handy book, which at this time could have been warmly welcomed.

Towards the end of the work is an excellent account of the iron and steel in the Paris Exhibition, and of the celebrated works of F. Krupp, at Essen, in Rhonish Prussia. The volume concludes with a description, with illustrations, of the machinery employed in testing metals for constructive and engineering purposes. It is published by William Mackenzie, 22, Paternoster-row, London, and is well printed and substantially bound. The illustrations are large and well executed, and the type and paper correspond.

The value to an architect of such volumes as the above, which afford a means for the study of metallurgy, need not further be insisted upon; the subject itself is interesting, and repays investigation largely. In excuse it may be urged that in an architect's practice there is not left much leisure for scientific study, but no man exists but may so methodise his time as to be continually learning, and the developments of improved iron-manufacture are so rapid and important, that none can safely rely on the unsatisfying information to be got from published tables such as are too generally hunted up when reference is made as to the dimensions of a requisite girder or a column. The good architect will, by keeping himself informed of what is daily going on, be able to intelligently direct the use of materials that are now so largely employed; the art-worker, too, and the art-designer, have a common interest in investigating the applicability of new results of metal

manufacture; and finally the important iron trade of our country will reach a more healthful state as knowledge becomes extended and prejudice removed.

COMPETITIVE DESIGNS FOR ST. LUKE'S PAROCHIAL SCHOOLS, GOLDEN LANE.

It is a difficult task for an architect to arrange a complete National School establishment upon a confined site in a crowded neighbourhood in the city of the metropolis. The regulations of the Committee of Council on Education are, under the most favourable circumstances of site, sufficiently exacting; but when these have to be combined with large requirements, low cost, difficulties as to rights of way, limited space and approaches, and circumscribed means of obtaining light and ventilation, the task becomes even more onerous. The trustees and committee of St. Luke's Parochial School, Golden Lane, have presented this puzzle. They offer premiums of 50*l.* and 30*l.* respectively for the best and second best designs for the new boys' and girls' schools, which are to include residences for a married master, the unmarried mistress, and the assistant master, each to themselves, besides committee-rooms, and various offices; and to this invitation thirty-three competitors have responded with drawings 199 in number, 32 being based on a Gothic treatment and 1 Italian. These have been on view in the old School-house, in Golden Lane, for the last ten days.

There is a remarkable feature in connection with this competition that deserves attention at once. By an omission in the instructions, or in the absence of a personal inspection of the site, nearly all the competitors have ignored the fact that the Metropolitan Board of Works forbid the re-erection of any building over the gateway at one end of the frontage of the new site. The site, which has a frontage to Old-street, on the Finsbury Prebend estates, is now occupied by old holdings, including a house built over a gateway leading from the street to a timber yard in the rear. It is proposed to clear away all the existing buildings, including the erection over the gateway, for the new schools. The Board of Works, however, step in, and prohibit the trustees from rebuilding on this private gateway, although the site is included in the lease to the trustees of the school by the Ecclesiastical Commissioners. The competitors, losing sight of this prohibition, have planned the schools to include the curtailed space. Excluding this important consideration, the designs exhibit a large amount of careful thought. The difficulties by which the subject is beset are exemplified by the various imperfect modes in which the accommodation is provided. In some of them the playgrounds are placed in the basement, as cellars, with absolutely little or no light; in some the entrances are to be used in common by the children of both sexes; in others but one staircase is employed for access in common to both the schools and all the residences; in nearly all, the schoolrooms are placed one above the other; in a few the residences for the masters and mistresses, married and single, are placed in the attic floor, on the flat-system, with kitchens, bedrooms, larders, and sanitary conveniences all in too close and most inconvenient proximity, and with wearisome approach.

Setting aside those competitors who are debarred from all consideration by failing to comply with the instructions as to the scale of the drawings, or by excess of expenditure, viz.:—"Health and Education," and "Dit," whose estimated cost is 5,000*l.* instead of 3,000*l.*, the average of the rest; and "Fides," who shows a wide street at the corner of his building which does not exist, and whose scale is 1.8th instead of $\frac{1}{2}$ in. to the foot; we come to nearly the only design whose external façade presents (as all buildings should), at a glance, the purpose for which it is intended. "Antonio Masa" places the schools as a centre, with high roof and bell-turret straddling it, rising above the residences which flank it on either side. If the ground-floor were raised to give more light to the kitchens of the houses, and to the playgrounds in the basement; if the girls' school on the first floor had more height (it is only 13 ft., while the boys' school, on the second floor, with better chance of light, is 16 ft.), and better provision were made for light and air to the sanitary conveniences, and advantage taken of the side-lights to be obtained from the unbuilt upon

* The meaning of the word "extensibility," which frequently occurs in the work, is explained to be as nearly translated as one English word could represent the Swedish, and to mean that property by which the metal assumes a greater or less permanent elongation, in opposition to elasticity, by which the metal comes back again to its original dimensions. Such, at all events, is our comprehension of the intended meaning of the author in using the Swedish word "tågbärdhet."

gateway, this design would be improved; already it has elements of success about it. Cost 2,750*l.* In the Classic design of "St. Luke" the second, or top story is devoted entirely to the objectionable arrangement of the whole of the culinary, sitting, sleeping, and sanitary apartments of the masters and mistresses, married and single, in one flat! The partitions dividing these numerous rooms rest upon the ceiling of the boys' school, a room 40 ft. 6 in. by 31 ft., and 18 ft. in height. The drawings show no sufficient provision for the construction of the partitions over this room of 31 ft. span. The playgrounds are in the basement, and the ground floor is raised a good flight of steps to give light to these; but the children have first to go up the flight of steps to the entrances at the ground floor, and down internal flights of stairs to reach the playgrounds. The street elevations are promising and neat, but have nothing of a scholastic character about them; they are alternative in design, the one to cost 3,290*l.*, the other 3,275*l.*

"*Qui parit virgo odit filium*" is too ecclesiastically monastic, and too rich for such a plain prosaic parish as St. Luke's. The interior is sacrificed for the exterior, and we doubt whether such a highly adorned Early Gothic building could be erected for anything like the estimated sum of 3,000*l.* The partnership design marked "Work" is more to the purpose. The authors avoid all expensive decoration, they state, keeping the facade as plain as a public building, of the character would allow, feeling assured that the committee would prefer the money spent in sufficiency of accommodation and stability rather than frittered away in prettiness of design or needless ornamentation;" and this they contrive to do for an estimated cost of 2,976*l.* 13*s.* 4*d.*

The designs of "A. Z." are wrought out with special regard to the site. The author places the playground in the basement, the sitting-rooms for the master and committee-room on the ground-floor, the main domestic accommodation for the teachers on the first floor, the boys' school on the second floor, and the girls' school on the third floor, and a considerable space is reserved in the rear for light. In many respects this design is satisfactory, but the girls' school is sacrificed for the accommodation required in the provision of the committee and attendant rooms. The playgrounds in the basement must be very dark, as they are only 9 ft. high, and the ceiling of them is not raised more than a couple of feet above the pavement of the street. This author does not avail himself of side light from the gateway, and shows in his external perspective view the dilapidated house over the gateway as if it were to remain attached to the school.

"Education" has fallen into the common error of proposing to build over the prohibited gateway space, and hence, as the entire arrangements are affected by this mistake, the plans are impracticable. "*Dum Spiro Spero*" is bad in the following respects: there is but one staircase, to be common for the boys' and girls' school, and master and mistresses residences; and the playground is in a cellar. The superficial area of the boys' school is very large compared with some others, being 1,800 sq. ft.; the lowest area shown is 1,182 ft. There seems to be a general misunderstanding as to the superficial measurement required by the Privy Council for each child. One of the competitors naming it at 6 ft., and another at 10 ft. Under the figure of a Maltese cross, one competitor shows the trustees how to build for the low sum of 2,500*l.* a school without any playgrounds, and by using the space tabooed by the Board of Works, crowds a good deal of accommodation into the site, by an arrangement of giving the ground-floor to the girls, the first story, or middle flat, to the residences, and the second, or upper flat, to the boys. Another, "St. Luke," No. 1 in order of arrangement, would place the boys' and girls' playgrounds in a basement or cellar, lighted by a deep area 5 ft. wide in the back, and one 2 ft. 6 in. in the front; the boys' school and class-rooms on the ground-floor (the latter lighted by windows in the 5 ft. narrow back yard), the girls' school on the second floor, and the teachers' residences on the second floor; the kitchens being placed in the basement dark cellars. This is the author who states that 10 ft. are required by the Privy Council on Education for each scholar. "*Cum Marti Minerva*," in two alternative plans, arranges the different floors round an internal yard or well, about 80 ft. by 10 ft., and thus gives very imperfect light to every apartment lighted from

it. A sensible feature in them is that of the boys' school, in the upper story, which has an open roof 20 ft. high to the collar beams. "*Sagittarius*" exhibit a book containing a photograph of their perspective view, and lithographs from their plans, which have some good points. In this design the girls' school is on the ground floor, the boys' on the first floor. "*Ad initio*" places the playground in the basement,—that for the boys in the front, and that for the girls in the rear. The boys' school occupies the whole frontage of the ground floor. "Nature is my Guide" stows away the teachers in apartments in the attic, and makes the stairs to boys' school on the first floor common to both. "Fair-play" soars no higher in the architectural treatment of his exterior than the plain brick character which distinguishes the buildings generally in the parish of St. Luke.

"Anglican" builds over the private gateway, and even blocks up the gateway itself. The author has evidently not taken the trouble to inquire into the nature of the site at all. "*Utilitas*" is utility with a vengeance, without any convenience at all. The boys are to enter the school direct from the street, without any porch, lobby, or cap and cloak place; a regular old-fashioned, rough and ready, out-of-date,—one of the very old-school sort of men,—the author must be, surely. "Much for Little" crowds all the establishment into two stories only, besides the basement. The playgrounds are simply dungeons. The doors of entrance for both girls and boys are close together in the centre of the ground-floor, with only a mullion between them. If the boys and girls could assemble and be dismissed at separate hours, this arrangement might do. The assistant master is to have dreary and dismal quarters in the rear of the ground-floor. In "*Vive valeque*" we have a still worse contrivance for the non-separation of the sexes. There is but one entrance for both girls and boys; the girls have to pass through the boys' playground to get to the stairs to their schools, which said stairs are also, in fact, common to both boys' and girls' schools.

The author of the designs marked with a red quatrefoil, is distinguished from the rest, by dividing his frontage into four stories, thus: the ground-floor to playgrounds, with arches next the street; the first floor to the girls' school; the second floor residences in a flat; the third floor to the boys' school, which has six three-light tracery windows all gabled. The staircase accommodation and the sanitary provisions are lamentably deficient.

" Bonns" ignores the private passage, and adopts what we may call the dove-cot style—there are so many fanciful pigeon-house projections in the facade; and illustrates his plans in three shabby drawings.

There are always to be found, in a general competition like this, the works of inappropriate, slovenly, or 'prentice hands, and there is no exception of the kind here; these we pass by.

We come now to but one conclusion on rising from a careful examination of these designs, and it is this: the trustees demand more accommodation than the site can possibly admit of. If the new parochial schools are to be satisfactorily wrought-out, the trustees must forthwith abandon the provision of a committee and waiting rooms, and if they cannot obtain the sanction of the Board of Works to the restitution of that portion of their site from which they are to be deprived they must at least secure the right to have lights in the uncovered gateway. Where so very much is required to be crowded in a small place of the scholastic establishment proper, we cannot see why a school and class-rooms could not be used as a committee-room and waiting-rooms, seeing that the trustees could arrange to sit when these are not otherwise in use; and it is imperative that more space should be secured for light and ventilation by that offered in the gateway. The trustees will of course proceed to adjudicate the premiums offered, for there is ample and worthy material for their decision; but the first-selected designer will certainly have to rearrange his plans entirely to secure the above considerations before the drawings can be placed in the contractor's hands.

Since the above was in type, the trustees have adjudicated the premiums as follows:—To Mr. John Toner, of Furnival's-inn, the author of the designs "A. Z.," the first premium; to Mr. S. Hewitt, of Great Russell-street, the second, for his plans marked "*Cum Marti Minerva*;" and additional prizes of five pounds each have been

awarded to Messrs. Hill & Stevens for their designs, with the motto of St. Luke, and "Antonio Masa," in the person of Mr. J. Niblett, the parish surveyor. We are confirmed in our opinion, by the trustees' adjudication of the prizes, that the author of the accepted design will have to re-arrange his plans.

THE ARCHITECTURAL EXHIBITION, CONDUIT STREET.

RESUMING the notice of this Exhibition which we commenced in our last number, let us be gallant and first give *place aux dames*, for two ladies enter the field with the host of architects. In a little beautiful drawing (4 in. by 2 in.) by Lucy H. Bloxham, that might be taken for a page from a missal, entitled an "Illuminated Fly-leaf for Prayer-Book, on Vellum" (10), this lady unfortunately gives a Berlin-woolly character to her work by dividing the diapered ground on which the two figures of St. Peter and St. Paul lie, into little squares. In the more ambitious work of the Lambeth National Bronze Medalist, Helen J. A. Miles ventures boldly on architectural ground with her "Design for a Library Door" (162). At a first glance we mistake it for a drawing of the Ghiberti Gates, and we are not far wrong, for the lady divides her door into eight panels, containing subjects in high relief, with prominent busts between them, and surrounds them with pilasters and panels in many respects similar to the great Florentine work. Her subjects illustrate the works of eight Greek, Italian, German, and English poets to be executed in bronze, viz., Homer's "Iliad," Dante's "Purgatory," Tasso's "Jerusalem," Goethe's "Faust," Chaucer's "Griselda," Spenser's "Fairy Queen," Shakspeare's "Cymbeline," and Milton's "Comus," and an allegorical group of mosaic fills the arch. We should like to see the building that this contributor would make to correspond with her library door. It would be very costly, at any rate.

Proceeding now with the works of the sterner sex, we find an instance of that injudicious overcrowding of buildings on confined sites too frequent in the case of town workhouses, by referring to "Photographs of the New Poor-house, Southampton," by T. A. Skelton (264). The plans and views show a perfect sea of walls and wards intersecting each other, and such a crowding of the different ward-blocks for master, vagrants, receiving, and refractory, for able men and women, for aged and married couples, dining-hall, kitchen, idiots, lunatics, infirmary, and infectious, that the airing yards are woefully curtailed. All the buildings overlook a crowded church to which they are adjacent; the site cannot be cheerful or healthy. The classification is kept up throughout in the different blocks, and these are again planned on the central-corridor system. There are no wards for sick vagrants, and this is an omission. In the "Perspective View of the Residence of Mr. J. Greer, at Pinner" (34), Messrs. Walford, Donkin, & Evill show what can be done in a very artistic manner, by a careful arrangement of ordinary brickwork, combined with varied heights in the building, which give gables at different elevations; and a use of Taylor's ruddy ridge and farrow tile. At the artist's great summer and autumn rendezvous, Bettws-y-Coed, North Wales, there is to be built a new church of local granite, with Cefn stone dressings, to hold 300 persons, and to cost 2,000*l.*, and Mr. Charles H. M. Milham shows the design for it in two external views (47, 48). The main part of the fabric is thoroughly English in tone, but a very eccentric bell-turret appears, which is an adaptation of an old Welsh one, if we remember rightly. "That is the best drawing in the Exhibition," we heard several persons exclaim, pointing to the "Promoted Design for the Bristol Assize Courts," by Messrs. E. Godwin & Chrisp (50); and certainly the authors have given us their work in a most careful brown ink elevation, that looks at a distance like an engraving. Young students, and all draughtsmen inclined to be slovenly, should look at this drawing carefully. Mr. John Foster, in his sheet of fourteen sketches of timber houses and churches in Normandy (4), and in his more finished set of eight well-known churches, also in Normandy (11), is an illustration of a slovenly commencement, and gradual progress achieved by care and finish. The mountainous Welsh districts offer fine opportunities of hold material and site for an architecture that should be, and often is, made cha-

characteristic of the locale; then why plant down a half-timbered Cheshire villa at the entrance to the least easy way up to mighty Snowdon, as Mr. John Ladds shows us he would do in his "Design for Glynrhonwy Lodge" (53)? It is a sound practical idea that dictates the illustration of a fine old parish church by large elevations to scale, like those of St. Nicholas's Church, Great Yarmouth, exhibited by Mr. J. P. Seddon (55, 56). The value of the illustration, however, is less when there is, as in this case, no scale attached. Besides the absence of a scale, the omission of a plan is frequently felt by those who would examine a design carefully. How, for instance, can the merits of Mr. T. H. Watson's design for Small-pox Hospital for the Metropolitan Asylum District, Homerton, be tested from his south view (57)? or such a matter-of-fact building as the Workhouse, Darlington, by Mr. C. J. Adams (181), from his perspective view; or, again, how can we ascertain whether the internal arrangements for the Fever Hospital for the Metropolitan Asylum District, Homerton (also an unsuccessful design), by Mr. T. H. Watson (177), are good, when we have nothing to indicate them in the isometrical view shown? Certainly there are labels on the grass, shown oddly in the drawing against the blocks, to indicate one to be for typhus, a second for scarlet, and a third for enteric fevers, but otherwise the view is absolutely useless.

Mr. J. W. Walton gives us two views of Lower Stoneham Hall, Flintshire, restored by him (109), and plenty of little instructive plans in the corners of the views, by which we can at once see the spirit of the whole design. The adoption of a style which admits of nothing but straight-headed mullions and transoms to the windows throughout, not a single arch of any kind being employed, gives a very prim aspect to the building; and it is a mistake to make the entrance to the house through a room jointly used as a "hall and library." Books suffer readily from damp; and they will suffer in an entrance-hall with an outer door, perchance, in it.

The "unsuccessful" designs of Messrs. Blackmoor & Withers (so they properly name them in the catalogue), for the Baptist Chapel and St. Mark's Church, Sheffield (92, 95, 101, 102), certainly do not meet our views; the one is not unlike a bazaar, and both are damaged by the flashy figures introduced. There is a certain class of drapers'-show-card-artists in all large towns, and Messrs. Blackmoor & Withers have injudiciously sought the co-operation of one of these to slash the figures into their drawing.

Photography is largely employed for this exhibition, and in many cases where taken from buildings completed, with considerable success. We will mention some of the best and largest of them, though they are nearly all well known:—St. George's Church, Doncaster (155, 156), E. Wormald, photographer; Mechanics' Institute, Leeds (191), and Town-hall, Leeds (190), both designed by Mr. C. Broderick. Mr. G. Corson has a set from buildings executed by him in or near Leeds, "Auction Rooms" (185); "Business Premises" (187), and a "Studio and Dwelling, of Edmund Wormald" (188), all in Leeds; the latter has a clever, acute-angled oriol, corbelled out from the first floor, and is an excellent street front, somewhat too Alhambresque in detail to be practical. He also shows the "Entrance Porch" (186), and a "View from the South" (189), of Fozhill, near Leeds;—a very fine mansion for a city magnate, designed by Mr. Corson, with intense Medieval fervour, even to the lamp-post.

Mr. G. Trenchard exhibits one of his characteristic *multum in parvo* designs in "Fernbank, Tufnell Park, Holloway, lately erected" (205). There are few architects who get so much effect out of a plain brick villa for little cost as this author. In the "Designs for proposed Villas and Pavilions on the Manor Estate, South Fyning, and to which first premium was awarded" (207), Mr. A. G. Hennell shows seven little views of villas in the Italian, half-timbered, cottage orné, and what we may term the conservatory styles. Posterity will be sorely puzzled by such a mixture.

"The Middlesbrough Exchange—Interior of Hall" by Mr. C. J. Adams (200), and "Perspective View of the Colston Hall, Bristol," by Messrs. Porter & Wood (195), the interior so crowded with an audience as to make the hall appear about 150 ft. span, have both been illustrated by us. It is a pity that Mr. E. R. Robson has entrusted the "Perspective View of the Municipal Offices, Liverpool" (179), to a stranger to draw. The view, though large, is faintly and feebly shaded; the draughtsman can be neither

an architect nor a colourist; we forbear to give his name, though it is on the drawing. In three highly-finished drawings under one frame—one of entrance-hall and two of a drawing-room—Mr. F. Pantoniuss shows "Series of Designs for the Decoration and Furnishing a Gentleman's Seat in Ireland" (180), in the modernaphael style; an adaptation of the Louis Quatorze style. Mr. Ewan Christian contributes a careful drawing of "Trinity Church, Folkestone, as designed for the Right Hon. the Earl of Radnor, the nave, base of tower, chancel, and south porch of which were completed last year" (75). This is a design that must be seriously affected by the non-erection of the tower and spire. These are placed at the junction of the semicircular apse with the transepts. The lancet style is adopted with much taste throughout, and we have only one objection to make, and it is to the snow-traps formed by joining all the gables over the aisle-windows together. For "Police and Sessions Courts for the City of Manchester, now in course of erection" (77), Mr. Thos. Worthington gives us, in a red brick building, a Venetian tower at a corner, based upon that of St. Mark; varied, however, by the introduction of arched parapets and queer corner turrets at the summit, and by weakening the base in piercing it with a door and window too near the corner for safety to the fabric. It will be an effective structure, nevertheless.

Mr. C. Buckeridge shows some of his quaint and conscientiously wrought-out early Gothic designs, by means of prints by the anastasio process. Unfortunately the plates are so wavy that much of the dignity of the designs is sacrificed. This is notably in "South-west View of Avon-Dasset Church, Warwickshire, now in the course of erection" (91), where the waviness of the paper gives an appearance of the windows and buttresses being out of the perpendicular. In the interior of the same church (152), and that of "Chapel for the Convent (Anglican) of the Holy Trinity, Oxford" (153), Mr. Buckeridge throws his strength upon the ornamentation of the altar and retabulum at the east end. Messrs. Bell & Almond exhibit "Designs for Glass and Decoration for East End of St. Gabriel's, Bromley, Middlesex" (132), and "Design for Glass Decoration for the East End of Shoultham Church" (161). In both of these a very elaborate reredos and retabulum are shown; but as they are not shaded in the elevation it is impossible to tell whether they are to be in sculpture or mere wall-decoration; in the latter subject, some saints painted on the wall-space on each side of the windows look in every respect like stained glass; they correspond almost exactly in treatment with the glass in the window in a line with them. In their "Mosaic Reredos for St. Edmund's, Salisbury, now being executed" (163), the Ten Commandments are introduced. The "Decorations of the Gaiety Theatre" are so well known and have been so often described that we need only mention to those interested in the subject that they will find here a section of the theatre (165), the "Frieze over the Proscenium" (164), and the "Lunettes" (166), as designed by Mr. C. J. Phipps, with Mr. H. S. Marks, the painter, as his collaborateur.

Mr. A. Waterhouse has a considerably larger and finer view of the Manchester Town-hall (117) than that which he shows in the Royal Academy. The point of view is from Albert-square, and the building presents more of a town-hall aspect from this than any other front. In the "First Sketch of the Interior of the Church of St. Barnabas, Oxford" by Mr. A. W. Bloufield (61), we see that he has taken the basilica of San Clemente in Rome as his model, even to the row of apostles on mosaic ground in the upper part of the domed apse. A large cross is suspended by a chain from the second tie-beam of the roof from the East to mark the boundary between priest and people. The ciborium over the high altar is very rich, and the arrangements and decorations throughout are of the highest-church kind. Another author has gone to Rome for an example. The "Church of St. Bridget, Wavertree, Liverpool," now in course of erection; total cost, 6,600*l.* (exclusive of frescoes only); columns of Irish red and black marble; accommodation for 800 (204), by Mr. E. A. Heffer, is a miniature adaptation of the basilica of Santa Maria Maggiore,—flat panelled and coffered ceiling and all. There are two good Italian designs for a mansion to be erected at Mentone, South of France, by Mr. T. T. Smith (197, 202). They are both placed on the terrace of a mountain, both have loggie in towers, and seem to be so little varied as to make us doubt

whether they are not alternative designs. It is not clearly mentioned in the catalogue whether they are both to be erected. Mr. F. Chatsfield Clarke sends a pen-and-ink view of a house now being erected at Blackheath for Mr. B. H. Hartley (183). It looks too much like a pair of semi-detached villas. His sheets of office details from works (140, 145) are a little too elementary for an exhibition like this. In the "Selected Design for New Baptist Chapel, Sheffield," sent in competition (110) by Innocent & Brown, we have a clever adaptation of an ecclesiastical building to a corner site upon a hill.

There is a pretty drawing, by Mr. E. S. Cole, of the rear view of the University College building at Aberystwyth, designed by Mr. J. P. Seddon (46). The building is well known on account of its strange fate, and castellated architecture. "Competitive Design for new Church at Walsall" (27), by Albert Hartshorne, is modest in design, and of a pleasing tone, for it is apparently proposed to be of red sandstone.

Selecting for commendation briefly the strictly archaeological or pictorial works,—*"Les Halles, Ypres"* (1*A*); *"Whitby Abbey"* (1*B*), by Mr. G. E. Street; *"French Châteaux, traced from original drawings"* (7) (excellent examples of the style); the *"Pen-and-ink Sketches of Boxgrove, Supton, and Clymping Cbarches, Sussex"* (15), W. Young; *"Rue St. Jean, Gaen"* (21); *"Dol, Brittany;"* and *"Dinan"* (22), by A. Darlyshire; and the photographs and chromo-lithographs of Russian buildings and views, contributed by Mr. Wyatt Papworth,—we come to the photograph of the "New Central Station, Leeds" (now being completed for the Great Northern Railway Company (259), by Messrs. E. N. Hadfield & Son, and which we have before now described).

There are some good photographed specimens of Medieval sculpture, by Theodore Pfyffers, W. Theed, and J. F. Roulferr; also some elaborate coloured views by Mr. Thomas Allon; and completing our review by gentle reference to the series of designs for different subjects by members of the Class of Design of the Architectural Association, upon screen No. 3, amongst which should be noticed Mr. R. F. Deal's designs for a warehouse for a river front, we close in the assurance to our readers that though there is nothing very startling in the collection, there is yet a large amount of varied work, and that with Mr. Petit's collection it well repays a visit.

THE SITE FOR THE LAW COURTS.

MR. LAYARD, on Monday night, brought in the Bill for changing the site of the new Law Courts, and repeated the arguments advanced by Mr. Lowe on a former evening, when he first suggested the change. The Carey-street site, he stated, with approaches, would cost 4,000,000*l.*, while Mr. Tie's plan to separate the Offices and Courts would cost 2,710,000*l.*, and Sir C. Trevelyan's 3,250,000*l.* But the more moderate plan contemplated by the Government on the Embankment would only cost 1,600,000*l.*—600,000*l.* for the land, and 1,000,000*l.* for the building,—and that this would not be exceeded Mr. Layard pledged his reputation. The site was the plot of ground bonded on the north by Howard-street, on the south by the Embankment, on the east by the Temple, and on the west by King's College. It was six acres in extent, and on it could be built, in a line with Somerset House, eighteen courts with their offices, with the capacity of extending either offices or courts northwards as necessity arose. Mr. Layard explained the various advantages possessed, as he thought, by the new site; such as the facility of approaching it by road, river, and rail, &c., and he said that its adoption would lead to no delay. The plans and drawings for the Carey-street site would not be ready for a year, and by this Bill it was proposed to suspend the Standing Orders and proceed as if notices had been given in November last. The Government would be bound to exercise its compulsory powers by July, 1870, and there would be no delay, as the Duke of Norfolk, who owned most of the land, was understood to be anxious not to throw any difficulty in the way. Amongst other recommendations, he mentioned that he was negotiating for the sale of the Carey-street site for the price given for it, and that the style of the new building, for which the plans and drawings would soon be ready, would most probably be Italian Gothic, as Mr. Lowe's notion of utilizing Inigo Jones's facade had been given up.

Sir Roundell Palmer gave notice at once that

he would move the rejection, on the second reading, of what he characterised as the worst scheme yet proposed, and the certain ruin of a great public improvement. He warmly defended the Commissioners against Mr. Lowe's charges of extravagance and reckless inflation of the original estimates, and made an animated attack on the new plan. It had no approaches east or west; its levels were bad; it would advance to the very edge of the railway cutting; it would block up the Strand; and the building, put down in a hole where nobody could see it except from the river, would be no ornamentation to the metropolis. The profession was almost unanimously, and certainly by a large majority, against it; and finally he declared that there was nothing he would not do to upset the plan.

The bill was brought in.

The present plan of the Government offers no single excuse for the change of site: even the arguments that were used to support Sir Charles Trevelyan's original site disappear. If a smaller building than was at one time thought necessary will suffice, it can as well be placed on the Strand (or misnamed Carey-street) site, already in our possession, as next the Embankment, and with infinitely better effect with reference to the adornment of London than if it be buried behind the houses on the south side of the Strand. The land already bought offers a noble position for a noble building; and its superiority with reference to the greatest convenience to the greatest number is so universally admitted as to require no argument.

THE EXHIBITION OF THE ROYAL ACADEMY.

If there be no great increase in the number, no great accession of particular interest in the nature of the works exhibited this year by the Royal Academy in their splendid new home, compared with those of former times, when their local habitation was less worthy of their name, it certainly appears to be a longer day's work than ever used to be the case, to see all that is to be seen. This is partly attributable to the fact of every picture included in the collection asserting a right by its position to a thorough examination; so many are to be seen, and so well worth seeing, and of these a few of superlative excellence grace the fine galleries, though it happens that both members and associates are more generally represented by the numerical strength of their contributions rather than by examples that precedent would allow individual reputation to rest on.

To inaugurate the new era, to commence the second century of the Academy's existence with a production that will help to commemorate it, Sir Edwin Landseer has specially distinguished himself—even in comparison with himself—by the more than renewed power manifested in his chief work. "The Swannery invaded by Sea-eagles" (120) is a magnificent attestation of consummate skill; wonderful for the force of its representation. Its reality gives it that eloquence an Æsop would fail to impart to birds that speak in fable, if he attempted to describe in the epitome tyrannic and unexpected invasion. The peaceful swans have fought to the death in defending their "arch-necked princesses" and their little ones; it is almost possible to hear the flutter of blood-bedahled wings and the scream of the eagle struggling in its efforts to rise in the impotence of a broken pinion. Even whilst most admiring the unparalleled ability displayed in the depiction of savage onslaught, its very truthfulness exacts something like distaste with the astonishment at all its marvellous perfection.

Two slight but masterly studies of lions (30 and 32), and a brace of setters complacently watching a covey of birds on "The Parnigan Hill" (224), are further examples of Sir Edwin's wonderful dominion in animal painting, of the perfection attained in the use of the brush, never yet excelled, and of the aptitude for giving vitality to everything zoological he may select for his exercise.

Mr. Millais maintains his right to be considered thoroughly original; he is of those who recognise grandeur in simplicity: his full-length portrait of "Nina, daughter of Mr. Frederick Lehmann" (127), is a charming picture, a work of extraordinary heauty: the faculty of direct imitation chastened by rare taste in the adjustment of whatever is to be imitated, is evident in it. With him everything is paintable, any arrangement of colours perfectly practicable for the most agreeable results. He has been fortun-

nate, too, in his sitter,—a type of fair golden-haired childhood, who is posed in the most natural of attitudes, with innate grace enough to account for it. The little lady has become the gem of such an artistic setting as would enhance the lustre of the brightest. In direct opposition to this, the fancy portrait of "Vanessa" (357) has afforded him an opportunity of showing how he can manage to harmonise the most intensely positive of colours; for, in spite of the gorgeously embroidered drapery, the head is very life-like, and so forthily painted as to assume its right of being first considered; though the former work, with its exquisite refinement, derived in great measure from the inimitable combination of delicate hues and tones, is by far the greater achievement. Mr. Millais was quite independent of adventitious aid in making a picture of Mr. John Fowler, the engineer, and a very valuable one (225), for it is a likeness stamped with the simplicity of direct resemblance. "The Gambler's Wife" (104), in sorrowful contemplation as she stands in the lately vacated room at dawn, examining the cards, the instruments of impending ruin, is pathetic without being sentimental, and with two highly-finished water-colour drawings, well supplements Mr. Millais's more important contributions.

Mr. Macdonald is very conspicuous in a composition that exhibits some of his best characteristics,—"King Cophetua and the Beggar-Maid," for whom he was "glad and faine" to stultify his expressed disdain for "lovers' looks" (171). The king, seated in his tent, or rather at the entrance of it, is regarding with novel interest the fair object of his very impulsive matrimonial intentions; for she is very fair and winsome, though in rags, and hiding his cup-bearer to fill him the wine, with which he prefaces the declaration that,—

"She shall be queen this beggar may do,
If she'll not say me nay."

His armed warriors, courtiers, and attendants, are variously influenced; some seeing at once, others unable to comprehend "what there really is to see in the young woman." As usual, minute elaboration pervades this picture; and the skilful drawing, wealth of accessories, and invention of ornamental detail, are as remarkable as in any preceding instances of their employment.

Mr. Frith has been diverse in his choice of subjects: one from contemporary domestic history, an episode of old, new, and ever-recurring events, for it happens to most men with marrying prospects. In "Hope and Fear" (82) are two subjects of the hind god's atonement in one frame—in a frame to become one, subject to papa's approval, which is being requested with a proper degree of earnestness by a very nice young gentleman of eligible appearance; but papa has arrived at that age to know that appearances are deceitful; he has long ago learnt the price of bread and butter, and babies' shoes, and hesitates whilst cogitating on the proposal, for he has too many hooks by the best authors in his well-furnished library not to be very clever and wise, and is one of the least likely to be addicted to sensational romances. Harriet Georgina—for she has a nominative expressiveness about her besides the nominal—fears he would hesitate, and has sought shelter and sympathy in the drawing-room and her mamma's arms. It need scarcely be told how nicely and naturally Mr. Frith has related this chapter from the volumes of every-day interest, or how much his relation with the two positions—the one awful, and the other fearful—has increased their intensity by illustrating them so admirably. His principal work "Altiadora, pretending love for Don Quixote, feigns a swoon at the sight of him" (123), is very finely painted; the figure of the impostor—though it appears rather disproportionately small from the waist to where the feet would be—and the imposing figure of the imposed-upon Don, are specially distinguishable for extraordinary technical value. Still more power is exhibited in a capital portrait of "A Man in Armour" (253), one of the very best portraits in the galleries.

"Nell Gwyn" (291) "selling oranges and pippins, with pertinent wit, gratis, to liberal fops who would buy the first and return the second with interest," as Dr. Doran says, will scarcely realize a conception of the archness and captivating charms of this "smartest and most audacious of orange-girls" she has not the look of the period to indicate her attractiveness for the swells who so

delighted in her impudence. The costumes are very brilliant and tasteful, with the exception of Nell's, which appertains more to the country than the town. A smaller picture, of the scene from "Twelfth Night" wherein Malvolio, married to the countess in imagination, soliloquizes (391), shows the same dexterity, the manipulative proficiency attained by the painter that has made him so popular.

Mr. Faed always secures a wide circle of appreciators by his appeal to common sympathies. The poor little crossing-sweeper, who, "Homeless," is sleeping in unhappy ignorance of rent and taxes on the steps of a porched doorway (73), whose unconsciousness of water-rate and of what the meaning of soap may be, have made him in his wretchedness and ragged attire, an object of interest to so many more than the policeman treading his beat at dawn of day, and blinking in the lamplight as creatures deprived of natural rest, and forbidden to take even forty winks on a doorstep, are wont to do,—is, by the aid of Mr. Faed's most fascinating style of depiction, raised to poetic significance. N.B.—Why have painters never made a hero of a policeman? Anybody in the class answering the riddle may "take us up."

Look, too, at the old pedlar-woman, who has "Only Herself" to care for, or take care of her, and sighs for social intercourse (119); "Alone with Her Thoughts!" As a song may awaken some scenes long forgotten—some haunts long forsaken,—so the laughter of childhood has brought back her home. But, alas! for the vision! she's alone—all alone. Mr. Faed has never succeeded better in enforcing the gist of his appeal, than in these expressive types of homelessness and loneliness. The command he has of executive means enables him to do wonders in the most ordinary appliances of them; as in "Letting the Cow into the Corn" (205) he represents a Scotch lassie indulging in a day-dream; or in "Faults on Both Sides" (231), a couple of peasant-lovers, who have quarrelled for the pleasure of making it up again; or in the impersonation of shrewd Scotch character (264), "Donald Mac Tavish;" all these indicate his capability of making much of very small matters.

Mr. Elmore is another who glories in a style: rich colour and strong opposing effects have given great force to his "Judith" (395); painted life-size, as standing at the entrance of the tent from which artificial light is illuminating the shadows cast by the stronger light of the moon, she appears stealthily approaching to wreak her vengeance on Holofernes. "Katherine and Petruchio" (164), however, are not lifted out of the ordinary level of their usual representation by any extraordinary conception; finally drawing has in some degree counteracted the worth of clever painting. "Home Life in Algiers" (229), and "Algerine Jewesses" (462) testify to their probable naturalness by their peculiarity of characterization, and are, besides, very carefully and cleverly portrayed. Mr. Elmore's other contributions are, a young wife "Watching and Weiting" at dawn, for her husband's return (95); "A Sketch from Nature" of a young lady sketching from nature, very bright and decided in its rendering (823); and a fine portrait of "John Simon, F.R.S.," medical officer of her Majesty's Council (879).

Mr. Leighton stands alone this year for the academic knowledge and ideal grace with which he qualifies his study and treatment of the nude. He has several large subject pictures conceived in classic taste, and although derived from dead language he invests them with sufficient vitality to realize them for general apprehension as facts. "Helios and Rhodus" (864) illustrates one of the mythic identifications of islands with nymphs who are lovely and of course loved, and gives a name and a purpose for a fine picture; "Dædalus and Icarus" (469), who revive the antique in form and physiognomy; and "St. Jerome" (377), his diploma work, with the saint kneeling in prayer before a crucifix; and, last and best for good drawing and agreeable colour, "Electra at the Tomb of Agamemnon" (705), are his other contributions.

Mr. Calderon has managed to give some novelty to his handsome pair of lovers, who are in a boat drifting down the stream, whilst the gallant rover is resting on his oars, gazing at the proud beauty who has enslaved him, and "Sighing his soul into his lady's face" (128), and she, with downcast eyes, trails a lily in the water, for the sake of having something to do, as they float along. The fifteenth-century costumes, picturesque boat, and the admirably manner in

which it is painted, makes this a very favourable example. "Catherine of Lorraine, urging Jacques Clément to assassinate Henri III." (67), is another and more ambitious performance by the same artist: the character and expression of both actors are very appropriate to the situation, which is a very dramatic one, and the work is distinguished by rich subdued colouring, and solid masterly execution, though the drawing is faulty in parts that would soonest betray it; the hands of the monk appear to be very large. (643) "The Fruit-seller," a water-colour drawing, would scarcely be taken for Mr. Calderon's.

Mr. Lewis is to be seen in unusual force; the marvellous intricacy of his pictures is positively bewildering. The interior of a bazaar in Cairo, with "an intercepted correspondence" to put into extra flutter its occupants, if their imperturbable natures could ever allow them to be in any flutter at all, is the most elaborate of them. A young girl has been detected in establishing communication, by means of flowers, with some one she prefers to the old Turk, her lord and master, and who is giving her a lecture on her impropriety, disclosed by a black slave with the last floral *billet-doux* in her hand as evidence in proof, while the other ladies of the seraglio are looking on with various degrees of interest expressed. Some think it good fun; others think the delinquent will not find it so, and are very glad of it—for there is such a thing as a jealous woman in Turkey, though they do live in such a united happy-family kind of way with cats and gazelles: one languid lady evidently thinks her a fool for being found out; but, after all, the wonder at the achievement is not created by the subject of it, but by the rendering of the accumulation of objects represented: the most opposite of colours in dazzling brightness brought in contact; the most elaborate embroideries, decorations, lattice-work, and a profusion of rich materials of all descriptions, with patterns it takes patience even to examine, are all precisely given with more than photographic fidelity.

Mr. Hook has painted, on rather a large scale, some "Cottagers making Cider" (124); the composition is as unpretentious as its title, for he has relied on the rare power he has of conveying absolute naturalness into all that he represents, in preference to a more sophisticated attempt at picture-making for gaining interest. However, the sturdy peasants engaged in the operation, the rude mill and press, with other implements used in the process; the apples of many a sort, and the landscape to be seen from beneath the cart-shed that shelters all the cider-makers and the cider-making, are of that picturesque nature that the result, as added by the artist, is a very agreeable one, besides being an example of Mr. Hook's peculiar forte. Two children perched on the rocks, "Caught by the Tide" (332), and signalling a distant boat, are surrounded by a sea that is a perfect triumph of representation; and a happy fisher family preparing for breakfast in "The Boat" (217), their fresh residence—"It served them for kitchen and parlor and all"—are delightful in their freshness, their pure natural truth.

THE DISTRIBUTION AND AGRICULTURAL USE OF TOWN SEWAGE.*

For the last eight years I have studied deeply and carefully the question how to dispose of the sewage of London; and my pecuniary stake in the successful solution of this question has been and is so large, that it is, perhaps, the best guarantee that I have left no stone unturned in my endeavours to ascertain the truth. The various experiments conducted by the Metropolitan Sewage Company, both at Barking Creek and on their experimental farm a little beyond Barking, as well as those conducted by myself on a smaller scale on my own land, have given me an opportunity of acquiring knowledge in this particular branch of agriculture, which, I believe I may safely say, no one else has enjoyed; and it is only the consideration of these exceptional advantages which has made me presume so far as to address the Institution of Surveyors on such a subject.

In considering the utilization of sewage by irrigation, we may usefully divide it into three heads;—first, *Conveyance* of the sewage from the town to the country; secondly, *Distribution*

throughout the district proposed to be irrigated; thirdly, *Application* of the sewage to the actual soil or crops.

Now, with regard to the first question I need say very little. An experienced surveyor will naturally avail himself of the readiest means at his command for conveying a large body of noxious liquid from one district to another. He will be guided by local circumstances and local materials in designing his work, and the nature of the work will, in some degree of course, also depend upon whether the levels of the ground permit of gravitation either by purely natural fall, or by means of a short lift, or necessitate forcing by expensive machinery. I will merely remark that there is of course a great convenience for distribution in what I may term the luxury of pressure. If the main culvert or sewer be an iron pipe of any description, through which the sewage is forced by powerful engines, it becomes a very easy and simple matter to attach a pipe at any point for supplying any land, no matter where situated; but if the main outfall conveys the sewage by gravitation only, then the sewage can only be distributed by the same means, and of course can only be taken to land on a lower level than the outfall, and this, in many places, becomes a most serious difficulty.

But this brings me in fact to the consideration of the second division of the question, namely, *Distribution*.

The distribution of the sewage of a small town of 10,000 or 20,000 inhabitants is a simple enough affair, for it is distributed on one farm only, and that farm is of course chosen so as to be more or less in a ring fence; but if it is desired to deal with the sewage of a great city, much more contriving is necessary. For short distances and low pressures, earthenware pipes may sometimes be used for the lateral channels, but they are not satisfactory; and it must always be recollected that the bursting or leakage of a sewage pipe is a somewhat serious affair, even in the country. Iron pipes are, of course, always the hardest and neatest things to deal with, but they are expensive. Earth ditches are perfectly effectual, and are, perhaps, the most convenient of all for communicating with other minor branches; but unless the lie of the land coincides exactly with the fall required to be given to distributing channels, the earth ditches soon become very expensive in construction, and wasteful in the space occupied. And in view of the several difficulties and drawbacks attending the use of either ditches or earthenware or iron pipes, I have devised a new method of distributing sewage, which, I think, is likely to prove useful in some localities. It is very simple,—consisting merely of sheet iron troughs, with a semicircular section, supported upon rough wooden legs of any required size and length. Such iron troughs, at whatever elevation from the ground,—and in most cases a very few feet are quite sufficient,—occupy no more space than a ditch would occupy when running with a fall coincident with that of the land itself. Therefore, there is no permanent waste of land in a broad embankment, and the outlay becomes less than the outlay in constructing a raised up ditch when a very few inches in height are attained. If any unusual height is necessary, to bridge over a hollow for instance, the section of the trough may be slightly altered, and, instead of being semicircular the diameter may be diminished, and to the prolongation of the sides of the smaller semicircular trough thus formed may be riveted stronger plates to act as girders, and so the original sectional area would be preserved. With troughs so constructed, having a few angle irons bent all round them outside, a very strong and durable kind of semicircular bridge would be obtained. I may mention that I have made an experiment with about a mile and a half of semicircular troughing far thinner than that which would be used in a permanent work, and that this troughing is placed at an unusual height, being for a great part of its length from 16 ft. to 22 ft. above the ground. It is, moreover, in a most exposed situation, and has, nevertheless, stood all the severe gales of last winter without the very smallest sign of giving way.

Difficulties for the first few years may arise in arranging for the distribution of the whole sewage of a large town over a wide area of land, if there are a few obstructive people in the area who fancy that they could make more by standing out and refusing to take the sewage, than by taking it, if compulsory powers have not been obtained. But, even in this case, it would be a pecuniary rather than a physical

difficulty; for, in the neighbourhood of any large town, the country roads are always numerous, and power may always be obtained from Parliament, on the precedent of the Metropolitan Sewage Company's Act, for conveying the sewage in pipes under and along the line of roads. There need, therefore, be no greater difficulty in designing the different channels by which the sewage of a large town may be distributed to any given number of farms, than there is in an analogous kind of work which has been executed by very many gentlemen now present, namely, draining several separate estates into one common outfall. It is simply inverting the process, and, instead of collecting the water from the various estates into one main channel by which it would run away, bringing the water down the one main channel, and then distributing it over the various estates.

Now, with regard to the purely agricultural question of the application of sewage to the soil or crops. I have seen and heard a great deal of vague and loose writing and talking on the different modes of laying out land for irrigation, but further experience has only served to confirm me in my original opinion, that the proper way of laying out land for sewage is, wherever the fall of the land will at all permit it, to lay it out in rectangular "panes," or lands thrown up to a ridge in the centre, a small carrier of say 8 in. or 9 in. wide being cut along the top of the ridge, by which to irrigate the land. This system combines many advantages, and so far as I see, presents no drawbacks. First of all, the rectangular form admits of easy and simple cultivation by horse and steam power, without turn-wrest ploughs, or any other special apparatus, and this of itself is so great an advantage as almost to outweigh anything that could be urged in favour of any other system. But this is also the cheapest way of laying out land; for it is manifest that from the ridge to the furrow there will always be a sufficient fall for the flow of the sewage; therefore the actual watering of the plants can be done with certainty and regularity, and all that requires to be attended to is the fall to be given to the carrier in the ridge, and to regulate this, unless the land is either very flat or very irregular in formation, very little soil need be shifted, except along the line of the ridge. Moreover, if, during the first year that the land is laid out, there may be a little too much fall from the ridge to the furrow in one place, or rather too little in another, owing to the shifting of the land to fill up hollows and level rises in the length of the ridge, this irregularity will be diminished every time that the land is worked, and so, in the course of a few years, will gradually disappear. Last year I laid out a small experimental field, of some nine acres, on this system under peculiar disadvantages, as the point to which alone I could bring the sewage was slightly lower than most other parts of the field; and although there was very little difference of level in any part, yet such difference as there was, was against me. The field was also irregularly shaped, one of its sides being more than twice as long as the opposite side, and one of its corner angles very acute, and another very obtuse; but, as I ran my lands so as to abut upon or tail off on the side between these two angles, this difficulty vanished; for, of course, it did not the least signify whether the end of each land was square or not. I also laid out the lands of slightly varying breadths and of an increasing slope, beginning with a very flat land and rising to a very steep one,—the last land having a fall of 1 in 10 from the ridge to the furrow. The most convenient size of land is 40 ft. or 45 ft. wide from furrow to furrow, with a slope of 1 in 20 from furrow to ridge. The best mode of conducting the work in laying out lands in this way is, after any small amount of cross ploughing or filling up old furrows, and other similar work that may be necessary, has been got through, to plough the land into ridges approximating to the desired height. These ridges should then be rolled very heavily, when it will be seen whether or not their fall is sufficiently continuous to admit of a carrier being dug in them as they are; and if it is found that any shifting of earth is required, the rolling of the ridge will have answered the purpose of making the carting lighter. You will observe that the simplicity of this mode of laying out land, as compared with attempting to alter the levels of the entire surface of a field, is very great; the labour is, in fact, minimized, and, moreover, for the future cultivation of each

* From a paper by Mr. William Hope, read at the ordinary general meeting of the Institution of Surveyors, on May 3rd.

individual crop, the form of lands which I have described is, I find, very convenient. Of course, the size of each land is known with accuracy; therefore, all the future cultivation, whether ploughing, or hoeing, or weeding, or harvesting, may be done by piece-work, and the quantities of sewage applied and the bulk of produce obtained can be checked and ascertained with very great ease; and thus the farmer has a better opportunity of finding out the exact profit that he makes upon any particular crop.

With regard to the cost of such laying out, this must, of course, depend upon the prior formation of the ground; but my friends, Messrs. John Fowler & Co., hit at any time be happy to undertake throwing up the ridges for 11. an acre; and of course the money, whatever it may be, spent in forming these ridges is practically in substitution of the ordinary ploughing that the land must receive,—so that this part of laying out the land may practically be done for the cost of, perhaps, one extra ploughing.

We will suppose, then, that as suitable a district as possible, both with regard to the quality of its soil and the general lie of the land, has been chosen for the application of the sewage of a town, and that the land has been laid out in ridges, as I have described. There remains, then, the question over what area and to what crops to apply the sewage; and, clearly, the area on which it is applied must depend, in some measure, upon the crops selected. One important crop must always be grass; because this is the only crop that is always on the ground, and always more or less in a growing condition. It is the only crop, therefore, to which sewage can be applied more or less usefully on all days in the year; and, wherever any large quantity of sewage is to be disposed of, there is always a population to consume grass, whether in the form of meat, or of dairy produce, or of horse-labour.

A very considerable quantity of the sewage of any town can, therefore, always be used in the production of grass, without any danger of overstocking the market. The experience that we have had, both at the Lodge Farm, in the occupation of the Metropolis Sewage Company, and on my own experimental field, shows that sewage is equally applicable to cereal crops as to grass, green crops, and vegetables; but, no doubt, a greater return per acre can be obtained by the production of the latter, because a greater quantity of sewage can be utilized by them than by cereals, and, therefore, it is desirable that the bulk of the sewage should be applied to either grass, green crops, or market-garden vegetables. But, in a case where sewage is carried to a considerable distance from a town, into a purely farming district, experience proves that sewage is quite as applicable to cereal crops as to any other during the periods of the year when it can be so applied; and in the early spring, before the summer green crops are sown, probably sewage may be more usefully applied to winter wheat and oats than to anything else. The third crop of wheat, on the same land, the third year running, can now be seen growing, and apparently very healthy, upon a poor gravel at the Lodge Farm; and this result has been obtained exclusively by the use of sewage, and of a surprisingly small quantity. Last year there was a very fair crop indeed of 5½ quarters to the acre, and the sewage applied was only about 500 tons,—equal, in round numbers, at a penny a ton, to about a couple of guineas; and the first year that we tried sewage upon wheat, it was put to one portion of the same field which looked particularly bad. Two portions of this field were carefully measured, and one was left as it was, and the other was sewage with about the same quantity of sewage as mentioned before. The result was very remarkable. The unsewaged portion gave 3 loads of straw to the acre, and 3 quarters 5 bushels of grain; the sewage portion gave, as was naturally to be expected, a large increase of straw, 4½ loads to the acre, or 50 per cent. of increase; and the figures of the grain were still more satisfactory, being inverted—namely, 5 quarters and 3 bushels to the acre.

We should now consider the quantity of sewage per acre which may be usefully applied to crops of grass, roots, and vegetables, to which the main bulk of the sewage must always be applied. With regard to grass, I have frequently had controversies with various persons, including some well-known agriculturists, as to the proper kind of grass to which to apply sewage, and also as to the proper time of sowing the proper quantity of sewage to be applied, and the result to be

looked for. Some persons have imagined that sewage can be beneficially applied to ordinary natural grasses year after year, and they cite the Craigenlenny meadows at Edinburgh as an example; and cases have been brought to my notice where I myself have been quoted as supporting this notion; but it is an idea which I am altogether opposed to. The water and manure, which together compose sewage, stimulate the growth of all the hardier and ranker kinds of natural grasses to such an extent that in the course of time they choke and kill out all the finer kinds, and the grass becomes the rank, nasty stuff that we see at Craigenlenny.

Many persons imagine that sewage cannot be applied to any crop, without positive injury, during hard frosts or snow; but this is not the case. The sewage is always above the freezing point, and more so than ordinary running water. The actual contact with the sewage must, therefore, be beneficial to the plants, in protecting them from cold.

The water supply of London, as proved by the official returns, exceeds thirty gallons per head per diem. This would give upwards of 48 tons of sewage per head in the course of the year; so that, if we take 50 tons as an easy calculation in round numbers for the quantity of sewage per head flowing out of any town, we shall not be very far wrong. In this way 5,000 tons would represent the sewage of 100 persons; so that, as the sewage of 100 persons is the maximum amount that can be properly utilized by a crop of Italian rye grass, and as the rye grass can be grown only once in two years, we should get fifty persons per acre as the maximum proportion of population which is at all safe to apply. But, of course, it never would suit the convenience of any farmer to grow nothing but a never-ending see-saw of Italian rye grass and potatoes.

With regard to other crops, we have grown 52½ tons of mangold wurzel per acre at the Lodge Farm from the application of 1,100 tons of sewage to land which was completely worked out by white crops. Now 1,100 tons would be equal, according to the same rough calculation, to the sewage of only 22 persons per acre; but I do not at all say that this is the proper quantity to apply to such a crop as mangold wurzel.

When I talk of 70 tons per acre as a weight of mangold which ought to be obtained every season by the use of sewage, it is not such an unreasonable thing as it at first appears. And if we apply 2,000 tons per acre to a crop of mangold, it would be equivalent roughly to one acre for every 40 persons; and my own opinion is, that some such proportion should be the very minimum of land which should be laid out for the utilization of the sewage of any town. And it would be greatly for the advantage both of the town and of the farmer if an increased area were put under, at all events, the possibility of irrigation; for, how often would not the farmer, if his land were laid out for it, be only too glad to give an occasional dressing to a crop of wheat that looked sickly after the March storms, to a crop of turnips that he was afraid of losing from the fly, or even to a crop of potatoes in such a summer as we had last year?

And now a few words as to the money value of town sewage. When used for market-garden vegetables its value is exceptionally great, as the vegetables produced are of the finest possible quality; being grown with maximum rapidity, on which the quality of vegetables specially depends. Now it is well known that market-gardeners apply from 10s. to 20s. worth of solid manure to the acre, around London, at all events; while, to produce the finest crops of cabbages, cauliflowers, or celery, only takes from 500 to 1,000 tons of sewage, according to the particular species of seed used, and the particular age at which it is desired to send the crop to market. Taking, then, the highest of these quantities, or 1,000 tons, as equal to the lowest value for a garden dressing of ordinary manure, or 10s. an acre, we should have a total value of 2,400 pence for 1,000 tons of sewage, or nearly 2½d. per ton; and I have no reason to suppose that this is at all beyond what a market-gardener could afford to pay, having regard to the superior result which he obtains. And it is somewhat curious that this value does not differ very considerably from the only reliable valuation that was ever made of the chemical ingredients in town sewage. To be on the safe side, I have always taken 1d. a ton as the standard price at which the Metropolis Sewage Company should sell the sewage to the farmer; and a very few

rough calculations will show that this is a very safe estimate indeed.

To take the case of Italian rye grass. We have seen that 90 to 100 tons of grass ought to be grown from 5,000 tons of sewage in the course of one entire growing season. Now, 5,000 tons at 1d. are equal to 20l. 16s. 8d., to which we must add, say 4l. an acre for rent and taxes; 1l. an acre for application of sewage, interest on improvement expenditure, and other small items; the mowing of ten crops a year by machine (for which I may mention the rye grass is particularly suitable) at 3s., 1l. 10s.; carting 100 tons to the homestead at 6d., 2l. 10s.; or a total of 29l. 16s. 8d.—say, 30l.

If we take such a crop as mangold-wurzel and apply 2,000 tons at 1d., we have a charge for sewage of 8l. 6s. 8d. per acre; taking the same figures of 4l. for rent and taxes, and 1l. for application of sewage, &c., 80s. for cultivation, 10s. for seed, 10s. for hoeing, and 70s. for harvesting 70 tons of roots, we have a total charge of 19l. 6s. 8d. per acre, and taking the same price of 15s. per ton for the value of the food obtained, we have a total yield of 52l. 10s. per acre, or a net balance to the farmer of 33l. 3s. 4d.; and I think you will all agree that, as we have produced 52½ tons of mangold at the Lodge Farm from 1,100 tons of sewage, I am not going too far in reckoning upon 70 tons of mangold from 2,000 tons of sewage.

It may be objected that I am dealing with the sewage of a great city, and not of a small town; but though the rainfall is less in London in proportion to the population, yet the water supply is greater, and the two together give 75 or 80 tons of sewage per head per annum instead of 50; so if this diluted sewage is of the value I have described, an acre of sewage equal to only 50 tons per head per annum cannot be worth less. Now, 50 tons at 1d. are equal to 4s. 2d.; at 2d. 8s. 4d.; and at 2½d. 10s. 5d.; so that as the urban population of England, living in towns of 2,000 inhabitants and upwards, exceeds ten millions, and as almost all these towns are duly polluting the rivers in conformity with the "Town Improvement Act, 1847," they are propagating scarlet fever and typhus at a direct cost to the towns of five millions a year, in addition to the indirect loss to the land and to the working classes; so that we may reckon the loss to the country in gold exported to pay for foreign manure, grain, beef, mutton, hides, wool, hain, butter, and cheese, at not less than fifteen millions sterling annually.

GENERAL MEETING: INSTITUTE OF BRITISH ARCHITECTS.

The report of the council read at the annual meeting, on the 3rd inst., showed that the Institute, in regard to the steadily increasing numbers of its members, and the condition of its funds, continues to prosper. The present number of fellows is 264, and of associates 244, making a total of 508. In other classes of membership the numbers are as follow:—13 honorary fellows, 9 honorary members, and 78 honorary and corresponding members, making, with ordinary fellows and associates, a total of 608 members. There are also 10 contributing visitors, 9 students, and 10 temporary students.

We give two or three paragraphs from the report:—

"Several meetings of the Professional Practice Committee have been held to deliberate on important questions, both of a private and public nature. In December last they received a deputation from the London Builders' Society, who were desirous of submitting, for the consideration of the Institute, the details of an arbitration clause proposed to be incorporated with future forms of contract. In the course of the conference many points were raised, which rendered it desirable that the professional relations between architects and builders, as well as between builders and their employers, should be discussed *in extenso*; and, with this object in view, a sub-committee was appointed, who, after collecting from various sources sufficient material for their purpose, will shortly report the result of their labours."

"The Committee for the 'Conservation of Ancient Monuments and Remains' has, happily, had but few instances of threatened destruction or neglect brought before its notice within the last twelve months. It has, however, tendered its advice on some matters of importance, and generally with a satisfactory result. The preservation of the Church of St. Mary Somerset, in Thames-street, one of the works of Sir Christopher Wren, which was proposed to be removed during the recent alterations in the City, may be mentioned as an instance in which the timely intervention of this committee has been successful."

"The question of artistic education for architects, after a lapse of some years, was again revived at the last annual meeting of 1868. It is necessary to explain that, although the consideration of this subject originated with the members of the Institute, it was left, so long ago as 1862, in the hands of a general committee, consisting of members

of various art societies, &c., in which the Institute was only represented by delegates. A meeting of these delegates was therefore held in November, 1868, and the general committee was re-elected to assemble, and has since held several meetings."

"In regard to the library, now comprising what may be fairly described as the most valuable collection of works on architecture in London, the completion, during the past year, of purchases made with the president's donations (by adding about 170 volumes of English and foreign architectural works of great interest and value), has formed an important epoch in the history of the Institute. The supplementary catalogue issued at the beginning of the present year includes all these works, and their arrangement under the headings of 'Author' and 'Subject,' greatly facilitates reference; this catalogue also includes every work added to the library from the session 1865-66 to the end of the session 1867-68."

"The department of architectural drawings, prints, and photographs has not been forgotten. The librarian is now engaged in making a catalogue of this valuable collection, which will soon be conveniently arranged and made accessible to members. Attention is specially directed to a list, about to be reprinted, of works essential in such a library, but still deficient. Among others may be mentioned those required to complete the volumes of Piranesi, and certain editions of Vitruvius."

"The collection of casts possessed by the Institute, and hitherto preserved in one of the basement rooms, has been offered as a loan to, and as such accepted by, the authorities of the Architectural Museum, where they will be more accessible for inspection. The opening of the new buildings of the museum at Westminster is a matter for congratulation, not only to the zealous promoters of that undertaking, but to the profession at large, and the council trust that, while it will undoubtedly prove advantageous to the student, it may also tend, in conjunction with other institutions, to develop public interest, and educate national taste on the subject of architecture, in regard to its artistic as well as its antiquarian aspect."

The balance-sheet showed the sum of 2,382*l.* 8*s.* 3*d.* on the receipt side, and 86*l.* 13*s.* 6*d.* less on the disbursement side. The statement of assets and liabilities showed a balance of 8,318*l.*

The following office-bearers were elected:—
